Specifies that the rule definition applies to a specific host as determined by its IP address.

**source_host_address**
The IP address of the source host to filter against expressed in IPv6 colon notation.

**dest_host_address**
The IP address of the destination host to filter against expressed in IPv6 colon notation.
redirect css service (for downlink, by IP packets)

**dest_address**
The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the `destWildcard` parameter.

**destWildcard**
This option is used in conjunction with the `dest_address` option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

**fragment**
Indicates packet redirection is to be applied to IP packet fragments only.

**Usage**
Block IP packets when the source and destination are of interest.

**Important:** A maximum of 16 rule definitions can be configured per ACL. Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
redirect css service (for downlink, by source IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source in the downlink (from the Mobile Node) direction.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
redirect css service svc_name[log]downlink source_address source_wildcard
before redirect css service svc_name[log]downlink source_address source_wildcard
after redirect css service svc_name[log]downlink source_address source_wildcard
no redirect css service svc_name[log]downlink source_address source_wildcard
```

**after**
Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**before**
Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**no**
Removes the rule definition which exactly matches the options specified.

**css service svc_name**

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the `show active-charging service all` command to display the names of all configured charging services.
redirect css service (for downlink, by source IP address masking)

svc_name must be a string of 1 through 15 characters in length.

downlink
Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log
Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address
The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the source_wildcard parameter.

source_wildcard
This option is used in conjunction with the source_address option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

Usage
Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.

**Important:** A maximum of 16 rule definitions can be configured per ACL.

Example
The following command defines a rule definition to redirect packets to a charging service named chgsvc1.

```
redirect css service chgsvc1 downlink 1:1:1:1:1:1:1
```
redirect css service (for downlink, by TCP/UDP packets)

Used to redirect subscriber sessions to a charging service based on the transmission control protocol/user datagram protocol packets in the downlink (from the Mobile Node) direction.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
redirect css service svc_name[ log]downlink { tcp|udp } { { source_address
source_wildcard|any|host source_host_address} [eq source_port|gt
source_port|lt source_port|neq source_port|range start_source_port
end_source_port]} { { dest_address dest_wildcard|any|host dest_host_address
} [eq dest_port|gt dest_port|lt dest_port|neq dst_port|range start_dest_port
end_dest_port]}
```

**before redirect css service svc_name[ log]downlink { tcp|udp } { { source_address
source_wildcard|any|host source_host_address} [eq source_port|gt
source_port|lt source_port|neq source_port|range start_source_port
end_source_port]} { { dest_address dest_wildcard|any|host dest_host_address
} [eq dest_port|gt dest_port|lt dest_port|neq dst_port|range start_dest_port
end_dest_port]}

**after redirect css service svc_name[ log]downlink { tcp|udp } { { source_address
source_wildcard|any|host source_host_address} [eq source_port|gt
source_port|lt source_port|neq source_port|range start_source_port
end_source_port]} { { dest_address dest_wildcard|any|host dest_host_address
} [eq dest_port|gt dest_port|lt dest_port|neq dst_port|range start_dest_port
end_dest_port]}

**no redirect css service svc_name[ log]downlink { tcp|udp } { { source_address
source_wildcard|any|host source_host_address} [eq source_port|gt
source_port|lt source_port|neq source_port|range start_source_port
end_source_port]} { { dest_address dest_wildcard|any|host dest_host_address
} [eq dest_port|gt dest_port|lt dest_port|neq dst_port|range start_dest_port
end_dest_port]}

**after**
Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**before**
Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

```no```
Removes the rule definition which exactly matches the options specified.

```css service svc_name```
The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the `show active-charging service all` command to display the names of all configured charging services. `svc_name` must be a string of 1 through 15 characters in length.

```downlink```
Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

```log```
Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

```tcp | udp```
Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.
- `tcp`: redirect applies to TCP packets.
- `udp`: redirect applies to UDP packets.

```source_address```
The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the `source_wildcard` parameter.

```source_wildcard```
This option is used in conjunction with the `source_address` option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:
- • Zero-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be identical.
- • One-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.
any
Specifies that the rule definition applies to all packets.

host
Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address
The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address
The IP address of the destination host to filter against expressed in IPv6 colon notation.

eq source_port
Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to any integer value from 0 to 65535.

gt source_port
Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

lt source_port
Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

neq source_port
Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

range start_source_port end_source_port
Specifies that all source TCP ports within a specific range are to be filtered.
start_source_port is the initial port in the range and end_source_port is the final port in the range.
Both start_source_port and end_source_port can be configured to any integer value from 0 to 65535.

dest_address
The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the dest_wildcard parameter.

dest_wildcard
This option is used in conjunction with the dest_address option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:
IPv6 ACL Configuration Mode Commands

- Zero-bits in this parameter mean that the corresponding bits configured for the dest_address parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the dest_address parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

<table>
<thead>
<tr>

<tr>
<td>range start_dest_port end_dest_port</td>
<td>Specifies that all destination TCP ports within a specific range are to be filtered. start_dest_port is the initial port in the range and end_dest_port is the final port in the range. Both start_dest_port and end_dest_port can be configured to any integer value from 0 to 65535.</td>
</tr>
</tbody>
</table>

**Usage**
Block IP packets when the source and destination are of interest but for only a limited set of ports.

**Important:** A maximum of 16 rule definitions can be configured per ACL. Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

**Example**
The following command defines a rule definition that redirects packets to the charging service named chgsvc1, and UDP packets coming from any host are matched.

```
redirect css service chgsvc1 downlink udp any
```
The following sets the insertion point to before the rule definition above.

```
before redirect css service chgsvc1 downlink udp any
```
The following command sets the insertion point after the rule definition above.

```
after redirect css service chgsvc1 downlink udp any
```
The following deletes the rule definition above.
no redirect css service chgsvc1downlink udp any
redirect css service (for uplink, any)

Used to redirect subscriber sessions based on any packet received in the uplink (to the Mobile Node) direction. This command is also used to set the access control list insertion point.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
redirect css service svc_name [log] uplink any
before redirect css service svc_name [log] uplink any
after redirect css service svc_name [log] uplink any
no redirect css service svc_name [log] uplink any
```

**after**

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**before**

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**no**

Removes the rule definition which exactly matches the options specified.

**css service svc_name**

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the `show active-charging service all` command to display the names of all configured charging services.
`svc_name` must be a string of 1 through 15 characters in length.

**uplink**

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.
IPv6 ACL Configuration Mode Commands

**redirect css service** (for uplink, any)

### log
Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

### any
Indicates all packets will match the redirect regardless of source and/or destination.

**Usage**
Define a catch all rule definition to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

**Important:** It is suggested that any rule definition which is added to be a catch all should also have the `log` option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.

**Important:** A maximum of 16 rule definitions can be configured per ACL.

**Important:** Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

**Example**
The following command defines a rule definition that redirects packets to the charging service with the name `chgsvc1` and any source IP.

```
redirect css service chgsvc1 uplink any
```

The following sets the insertion point to before the first rule definition above.

```
before redirect css service chgsvc1 uplink any
```

The following command sets the insertion point after the second rule definition above.

```
after redirect css service chgsvc1 uplink any
```

The following deletes the first rule definition above.

```
no redirect css service chgsvc1 uplink any
```
redirect css service (for uplink, by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address in the uplink (to the Mobile Node) direction.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
redirect css service svc_name[log] uplink host source_host_address
before redirect css service svc_name[log] uplink host source_host_address
after redirect css service svc_name[log] uplink host source_host_address
no redirect css service svc_name[log] uplink host source_host_address
```

**uplink**
Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

**after**
Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**before**
Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**no**
Removes the rule definition which exactly matches the options specified.

**css service svc_name**
The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the `show active-charging service all` command to display the names of all configured charging services. `svc_name` must be a string of 1 through 15 characters in length.
IPv6 ACL Configuration Mode Commands

redirect css service (for uplink, by host IP address)

---

**uplink**

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

---

**log**

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

---

**host**

Specifies that the rule definition applies to a specific host as determined by its IP address.

---

**source_host_address**

The IP address of the source host to filter against expressed in IPv6 colon notation.

---

**Usage**

Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.

---

**Important**: A maximum of 16 rule definitions can be configured per ACL. Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
redirect css service (for uplink, by ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets in the uplink (to the Mobile Node) direction.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
redirect css service svc_name [log] uplink icmp {any | host
source_host_address | source_address source wildcard} {any | host
dest_host_address | dest_address dest wildcard} [icmp_type [icmp_code]
before redirect css service svc_name [log] uplink icmp {any | host
source_host_address | source_address source wildcard} {any | host
dest_host_address | dest_address dest wildcard} [icmp_type [icmp_code]
after redirect css service svc_name [log] uplink icmp {any | host
source_host_address | source_address source wildcard} {any | host
dest_host_address | dest_address dest wildcard} [icmp_type [icmp_code]
no redirect css service svc_name [log] uplink icmp {any | host
source_host_address | source_address source wildcard} {any | host
dest_host_address | dest_address dest wildcard} [icmp_type [icmp_code]
```

**after**
Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**before**
Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**no**
Removes the rule definition which exactly matches the options specified.
css service svc_name

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the show active-charging service all command to display the names of all configured charging services.

svc_name must be a string of 1 through 15 characters in length.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the source wildcard parameter.

source_wildcard

This option is used in conjunction with the source_address option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon notation.
IPv6 ACL Configuration Mode Commands

redirect css service (for uplink, by ICMP packets)

---

**dest_address**

The IP address(es) to which the packet is to be sent. This option is used to filter all packets to a specific IP address or a group of IP addresses. When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the `dest_wildcard` parameter.

---

**dest_wildcard**

This option is used in conjunction with the `dest_address` option to specify a group of addresses for which packets are to be filtered. The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

---

**icmp_type**

Specifies that all ICMP packets of a particular type are to be filtered. The type can be any integer value between 0 and 255.

---

**icmp_code**

Specifies that all ICMP packets of a particular code are to be filtered. The type can be any integer value between 0 and 255.

---

**Usage**

Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk. The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

**Important:** A maximum of 16 rule definitions can be configured per ACL. Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
redirect css service (for uplink, by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets in the uplink (to the Mobile Node) direction.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
redirect css service svc_name [ log ] uplink ip { any | host source_host_address | source_address source_wildcard } { any | host dest_host_address | dest_address dest_wildcard } [ fragment ]
```

```
before redirect css service svc_name [ log ] uplink ip { any | host source_host_address | source_address source_wildcard } { any | host dest_host_address | dest_address dest_wildcard } [ fragment ]
```

```
after redirect css service svc_name [ log ] uplink ip { any | host source_host_address | source_address source_wildcard } { any | host dest_host_address | dest_address dest_wildcard } [ fragment ]
```

```
no redirect css service svc_name [ log ] uplink ip { any | host source_host_address | source_address source_wildcard } { any | host dest_host_address | dest_address dest_wildcard } [ fragment ]
```

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**before**

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**after**

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**no**

Removes the rule definition which exactly matches the options specified.
The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the `show active-charging service all` command to display the names of all configured charging services. `svc_name` must be a string of 1 through 15 characters in length.

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses. When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the `source_wildcard` parameter.

This option is used in conjunction with the `source_address` option to specify a group of addresses for which packets are to be filtered. The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be ignored.

The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

Specifies that the rule definition applies to all packets.

Specifies that the rule definition applies to a specific host as determined by its IP address.

The IP address of the source host to filter against expressed in IPv6 colon notation.

The IP address of the destination host to filter against expressed in IPv6 colon notation.
**dest_address**

The IP address(es) to which the packet is to be sent. This option is used to filter all packets to a specific IP address or a group of IP addresses. When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the `dest_wildcard` parameter.

**dest_wildcard**

This option is used in conjunction with the `dest_address` option to specify a group of addresses for which packets are to be filtered. The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be ignored.

**fragment**

Indicates packet redirection is to be applied to IP packet fragments only.

**Usage**

Block IP packets when the source and destination are of interest.
redirect css service (for uplink, by source IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source in the uplink (to the Mobile Node) direction.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
redirect css service <svc_name> [log] uplink <source_address> <source_wildcard>
before redirect css service <svc_name> [log] uplink <source_address> <source_wildcard>
after redirect css service <svc_name> [log] uplink <source_address> <source_wildcard>
no redirect css service <svc_name> [log] uplink <source_address> <source_wildcard>
```

**after**
Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed. This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

**before**
Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed. This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

**no**
Removes the rule definition which exactly matches the options specified.

**css service <svc_name>**
The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the `show active-charging service all` command to display the names of all configured charging services. `svc_name` must be a string of 1 through 15 characters in length.

**uplink**
Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

**log**
Default: packets are not logged. Indicates all packets which match the filter are to be logged.
source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the source_wildcard parameter.

source_wildcard

This option is used in conjunction with the source_address option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

Usage

Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.

Example

The following command defines a rule definition to redirect packets to a charging service named chgsvcl.

```
redirect css service chgsvcl uplink 1:1:1:1:1:1:1:1
```
redirect css service (for uplink, by TCP/UDP packets)

Used to redirect subscriber sessions to a charging service based on the transmission control protocol/user datagram protocol packets in the uplink (to the Mobile Node) direction.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
redirect css service svc_name[log] uplink { tcp|udp } {{ source_address source_port|neq source_port|range start_source_port end_source_port} {{ dest_address dest_port|eq dest_port|lt dest_port|lt dest_port|neq dest_port|range start_dest_port end_dest_port}}
before redirect css service svc_name[log] uplink { tcp|udp } {{ source_address source_port|neq source_port|range start_source_port end_source_port} {{ dest_address dest_wildcard|any|host dest_host_address} [ eq dest_port|gt dest_port|lt dest_port|neq dest_port|range start_dest_port end_dest_port]}
after redirect css service svc_name[log] uplink { tcp|udp } {{ source_address source_port|neq source_port|gt source_port|lt source_port|neq source_port|range start_source_port end_source_port} {{ dest_address dest_wildcard|any|host dest_host_address} [ eq dest_port|gt dest_port|lt dest_port|neq dest_port|range start_dest_port end_dest_port]}
no redirect css service svc_name[log] uplink { tcp|udp } {{ source_address source_port|neq source_port|range start_source_port end_source_port} {{ dest_address dest_wildcard|any|host dest_host_address} [ eq dest_port|gt dest_port|lt dest_port|neq dest_port|range start_dest_port end_dest_port]}
```

**after**
Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed. This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

**before**
Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed. This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

**no**
Removes the rule definition which exactly matches the options specified.
IPv6 ACL Configuration Mode Commands

redirect css service (for uplink, by TCP/UDP packets)

```plaintext
css service svc_name
```

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the `show active-charging service all` command to display the names of all configured charging services. 

- `svc_name` must be a string of 1 through 15 characters in length.

```plaintext
uplink
```

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

```plaintext
log
```

Default: packets are not logged.

- Indicates all packets which match the redirect are to be logged.

```plaintext
tcp | udp
```

Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.

- `tcp`: redirect applies to TPC packets.
- `udp`: redirect applies to UDP packets.

```plaintext
source_address
```

The IP address(es) form which the packet originated.

- This option is used to filter all packets from a specific IP address or a group of IP addresses.
- When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the `source_wildcard` parameter.

```plaintext
source_wildcard
```

This option is used in conjunction with the `source_address` option to specify a group of addresses for which packets are to be filtered.

- The mask must be entered as a complement:
  - Zero-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be identical.
  - One-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be ignored.

```plaintext
any
```

Specifies that the rule definition applies to all packets.

```plaintext
host
```

Specifies that the rule definition applies to a specific host as determined by its IP address.

```plaintext
source_host_address
```

The IP address of the source host to filter against expressed in IPv6 colon notation.

```plaintext
dest_host_address
```

The IP address of the destination host to filter against expressed in IPv6 colon notation.
eq source_port
Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to any integer value from 0 to 65535.

gt source_port
Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

lt source_port
Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

neq source_port
Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

range start_source_port end_source_port
Specifies that all source TCP ports within a specific range are to be filtered.
start_source_port is the initial port in the range and end_source_port is the final port in the range.
Both start_source_port and end_source_port can be configured to any integer value from 0 to 65535.

dest_address
The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the dest wildcard parameter.

dest_wildcard
This option is used in conjunction with the dest_address option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the dest_address parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the dest_address parameter must be ignored.

eq dest_port
Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

gt dest_port
Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.
IPv6 ACL Configuration Mode Commands

**lt dest_port**

Specifies that all destination TCP port numbers less than the one specified are to be filtered.

*dest_port* must be configured to any integer value from 0 to 65535.

**neq dest_port**

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.

*dest_port* must be configured to any integer value from 0 to 65535.

**range start_dest_port end_dest_port**

Specifies that all destination TCP ports within a specific range are to be filtered.

*start_dest_port* is the initial port in the range and *end_dest_port* is the final port in the range.

Both *start_dest_port* and *end_dest_port* can be configured to any integer value from 0 to 65535.

**Usage**

Block IP packets when the source and destination are of interest but for only a limited set of ports.

**Example**

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and UDP packets coming from any host are matched.

```
redirect css service chgsvc1 uplink udp any
```

The following sets the insertion point to before the rule definition above.

```
before redirect css service chgsvc1 uplink udp any
```

The following command sets the insertion point after the rule definition above.

```
after redirect css service chgsvc1 uplink udp any
```

The following deletes the rule definition above.

```
no redirect css service chgsvc1 uplink udp any
```
redirect nexthop

The following commands redirect subscriber sessions to a nexthop IP address based on various parameters:
redirect next-hop (by IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
redirect next-hop next-hop_addr { context context_id | interface interface_name } [ log ] source_address source_wildcard
```

```plaintext
after redirect next-hop next-hop_addr { context context_id | interface interface_name } [ log ] source_address source_wildcard
```

```plaintext
before redirect next-hop next-hop_addr { context context_id | interface interface_name } [ log ] source_address source_wildcard
```

```plaintext
no redirect next-hop next-hop_addr { context context_id | interface interface_name } [ log ] source_address source_wildcard
```

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**after**
Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

**before**
Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**no**
Removes the rule which exactly matches the options specified.

```plaintext
next-hop next-hop_addr
```
The IP address to which the IP packets are redirected.
**context context_id**

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the `show context all` command to display context names and context IDs.

**interface interface_name**

The name of the logical interface to which the packets should be redirected. `interface_name` must be an alpha and/or numeric string from 1 to 79 characters in length.

**log**

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

**source_address**

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the `sourceWildcard` parameter.

**sourceWildcard**

This option is used in conjunction with the `source_address` option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

**Usage**

Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of redirect rules as it does not require a rule for each source and destination pair.

**Important:** The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information. Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
redirect nexthop (any)

Used to redirect subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Product
All

Privilege
Security Administrator, Administrator

Syntax

redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log ] any

after redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log ] any

before redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log ] any

no redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log ] any

after
Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before
Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no
Removes the rule which exactly matches the options specified.

nexthop nexthop_addr
The IP address to which the IP packets are redirected.
**context context_id**

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the `show context all` command to display context names and context IDs.

**interface interface_name**

The name of the logical interface to which the packets should be redirected. `interface_name` must be an alpha and/or numeric string from 1 to 79 characters in length.

**log**

Default: packets are not logged. Indicates all packets which match the redirect are to be logged.

**any**

Indicates all packets will match the redirect regardless of source and/or destination.

### Usage

Define a catch all rule to place at the end of the list of rules to provide explicit handling of rules which do not fit any other criteria.

**Important:** It is suggested that any rule which is added to be a catch all should also have the `log` option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security. The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information. Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
redirect next-hop (by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
redirect next-hop nexthop_addr { context context_id | interface interface_name } [ log ] host source_ip_address
```

```
after redirect next-hop nexthop_addr { context context_id | interface interface_name } [ log ] host source_ip_address
```

```
before redirect next-hop nexthop_addr { context context_id | interface interface_name } [ log ] host source_ip_address
```

```
noredirect next-hop nexthop_addr { context context_id | interface interface_name } [ log ] host source_ip_address
```

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

```
after
Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.
```

```
before
Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.
```

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

```
nore
Removes the rule which exactly matches the options specified.
```

```
nexthop nexthop_addr
The IP address to which the IP packets are redirected.
```
**IPv6 ACL Configuration Mode Commands**

**redirect nexthop (by host IP address)**

```
context context_id
```

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

```
interface interface_name
```

The name of the logical interface to which the packets should be redirected. **interface_name** must be an alpha and/or numeric string from 1 to 79 characters in length.

```
log
```

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

```
host
```

Specifies that the rule applies to a specific host as determined by its IP address.

```
source_host_address
```

The IP address of the source host to filter against expressed in IPv6 colon notation.

**Usage**

Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

**Important:** The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information. Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
redirect nexthop (by source ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log ] icmp { source_address source wildcard | any | host source_host_address } { dest_address dst wildcard | any | host dest_host_address } [ icmp_type [ icmp_code ] ]
```

```
after redirect interface_name nexthop_addr nexthop_addr { context context_id | interface interface_name } [ log ] icmp { source_address source wildcard | any | host source_host_address } { dest_address dst wildcard | any | host dest_host_address } [ icmp_type [ icmp_code ] ]
```

```
before redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log ] icmp { source_address source wildcard | any | host source_host_address } { dest_address dst wildcard | any | host dest_host_address } [ icmp_type [ icmp_code ] ]
```

```
no redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log ] icmp { source_address source wildcard | any | host source_host_address } { dest_address dst wildcard | any | host dest_host_address } [ icmp_type [ icmp_code ] ]
```

**after**
Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**before**
Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.
redirect nexthop (by source ICMP packets)

For redirect nexthop commands, the rule which exactly matches the options specified.

**nexthop** nexthop_addr
The IP address to which the IP packets are redirected.

**context** context_id
The context identification number of the context to which packets are redirected. At the executive mode prompt, use the show context all command to display context names and context IDs.

**interface** interface_name
The name of the logical interface to which the packets should be redirected. interface_name must be an alpha and/or numeric string from 1 to 79 characters in length.

**log**
Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

**source_address**
The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the source_wildcard parameter.

**source_wildcard**
This option is used in conjunction with the source_address option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

**any**
Specifies that the rule applies to all packets.

**host**
Specifies that the rule applies to a specific host as determined by its IP address.

**source_host_address**
The IP address of the source host to filter against expressed in IPv6 colon notation.
IPv6 ACL Configuration Mode Commands

```
dest_host_address
The IP address of the destination host to filter against expressed in IPv6 colon notation.
```

```
dest_address
The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the `dest_wildcard` parameter.
```

```
dest_wildcard
This option is used in conjunction with the `dest_address` option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be ignored.
```

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

```
icmp_type
Specifies that all ICMP packets of a particular type are to be filtered. The type can be any integer value between 0 and 255.
```

```
icmp_code
Specifies that all ICMP packets of a particular code are to be filtered. The type can be any integer value between 0 and 255.
```

**Usage**

Define a rule to block ICMP packets which can be used for address resolution and possibly be a security risk. The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

**Important:** The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
redirect nexthop (by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log ] ip { source_address source_wildcard | any | host source_host_address } { dest_address dest_wildcard | any | host dest_host_address } [ fragment ] [ protocol num ]
```

```
after redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log ] ip { source_address source_wildcard | any | host source_host_address } { dest_address dest_wildcard | any | host dest_host_address } [ fragment ] [ protocol num ]
```

```
before redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log ] ip { source_address source_wildcard | any | host source_host_address } { dest_address dest_wildcard | any | host dest_host_address } [ fragment ] [ protocol num ]
```

```
no redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log ] ip { source_address source_wildcard | any | host source_host_address } { dest_address dest_wildcard | any | host dest_host_address } [ fragment ] [ protocol num ]
```

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.
redirect nexthop (by IP packets)

- **`no`**
  Removes the rule which exactly matches the options specified.

- **`nexthop nexthop_addr`**
  The IP address to which the IP packets are redirected.

- **`context context_id`**
  The context identification number of the context to which packets are redirected. At the executive mode prompt, use the `show context all` command to display context names and context IDs.

- **`interface interface_name`**
  The name of the logical interface to which the packets should be redirected. `interface_name` must be an alpha and/or numeric string from 1 to 79 characters in length.

- **`log`**
  Default: packets are not logged.
  Indicates all packets which match the redirect are to be logged.

- **`source_address`**
  The IP address(es) form which the packet originated.
  This option is used to filter all packets from a specific IP address or a group of IP addresses.
  When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the `source_wildcard` parameter.

- **`source_wildcard`**
  This option is used in conjunction with the `source_address` option to specify a group of addresses for which packets are to be filtered.
  The mask must be entered as a complement:
  - Zero-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be identical.
  - One-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

- **`any`**
  Specifies that the rule applies to all packets.

- **`host`**
  Specifies that the rule applies to a specific host as determined by its IP address.

- **`source_host_address`**
  The IP address of the source host to filter against expressed in IPv6 colon notation.
redirect nexthop (by IP packets)

`dest_host_address`
The IP address of the destination host to filter against expressed in IPv6 colon notation.

`dest_address`
The IP address(es) to which the packet is to be sent. This option is used to filter all packets to a specific IP address or a group of IP addresses. When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the `destWildcard` parameter.

`destWildcard`
This option is used in conjunction with the `dest_address` option to specify a group of addresses for which packets are to be filtered. The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

`fragment`
Indicates packet redirection is to be applied to IP packet fragments only.

`protocol num`
Indicates that the packet filtering is to be applied to a specific protocol number. `num` can be any integer ranging from 0 to 255.

**Usage**
Block IP packets when the source and destination are of interest.

**Important:** The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information. Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
redirect nexthop (by TCP/UDP packets)

Used to redirect subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log ] { tcp | udp } { { source_address source wildcard | any | host source_host_address | eq source_port | gt source_port | lt source_port | neq source_port } } { { dest_address dest wildcard | any | host dest_host_address | eq dest_port | gt dest_port | lt dest_port | neq dest_port } }
```

**after**
Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**before**
Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.
redirect nexthop (by TCP/UDP packets)

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

- **no**
  Removes the rule which exactly matches the options specified.

- **nexthop** *nexthop_addr*
  The IP address to which the IP packets are redirected.

- **context** *context_id*
  The context identification number of the context to which packets are redirected. At the executive mode prompt, use the `show context all` command to display context names and context IDs.

- **interface** *interface_name*
  The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 to 79 characters in length.

- **log**
  Default: packets are not logged. Indicates all packets which match the redirect are to be logged.

- **tcp | udp**
  Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.
  - **tcp**: redirect applies to TPC packets.
  - **udp**: redirect applies to UDP packets.

- **source_address**
  The IP address(es) from which the packet originated.
  This option is used to filter all packets from a specific IP address or a group of IP addresses.
  When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the `sourceWildcard` parameter.

- **source_wildcard**
  This option is used in conjunction with the `source_address` option to specify a group of addresses for which packets are to be filtered.
  The mask must be entered as a complement:
  - Zero-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be identical.
  - One-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.
any
Specifies that the rule applies to all packets.

host
Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address
The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address
The IP address of the destination host to filter against expressed in IPv6 colon notation.

eq source_port
Specifies a single, specific source TCP port number to be filtered. source_port must be configured to any integer value from 0 to 65535.

gt source_port
Specifies that all source TCP port numbers greater than the one specified are to be filtered. source_port must be configured to any integer value from 0 to 65535.

lt source_port
Specifies that all source TCP port numbers less than the one specified are to be filtered. source_port must be configured to any integer value from 0 to 65535.

neq source_port
Specifies that all source TCP port numbers not equal to the one specified are to be filtered. source_port must be configured to any integer value from 0 to 65535.

dest_address
The IP address(es) to which the packet is to be sent. This option is used to filter all packets to a specific IP address or a group of IP addresses. When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the destWildcard parameter.

destWildcard
This option is used in conjunction with the dest_address option to specify a group of addresses for which packets are to be filtered. The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the dest_address parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the dest_address parameter must be ignored.
**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

- **eq dest_port**
  Specifies a single, specific destination TCP port number to be filtered. `dest_port` must be configured to any integer value from 0 to 65535.

- **gt dest_port**
  Specifies that all destination TCP port numbers greater than the one specified are to be filtered. `dest_port` must be configured to any integer value from 0 to 65535.

- **lt dest_port**
  Specifies that all destination TCP port numbers less than the one specified are to be filtered. `dest_port` must be configured to any integer value from 0 to 65535.

- **neq dest_port**
  Specifies that all destination TCP port numbers not equal to the one specified are to be filtered. `dest_port` must be configured to any integer value from 0 to 65535.

**Usage**

Block IP packets when the source and destination are of interest but for only a limited set of ports.

**Important:** The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information. Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
The IPv6 to IPv4 Tunnel Interface Configuration Mode is used to create and manage the IP interfaces for addresses, address resolution options, etc.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
redirect nexthop (by TCP/UDP packets)
**destination address**

Configures the destination of the tunneled packets for a manual tunnel.

**Product**
- All

**Privilege**
- Security Administrator, Administrator

**Syntax**

```
destination address address
no destination
```

```
no
```

Removes configuration for the specified keyword.

```
text
```

Specifies the descriptive text to use. `text` must be 0 to 79 alpha and/or numeric characters with no spaces or a quoted string of printable characters

**Usage**

Set the description to provide useful information on the interface’s primary function, services, end users, etc. Any information useful may be provided.

**Example**

```
description sampleInterfaceDescriptiveText
```
end

Exits the interface configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

   end

Usage

Change the mode back to the Exec mode.
exit

Exits the Interface Configuration Mode and returns to the Context Configuration Mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Return to the context configuration mode.
mode

Configures the mode of IPv6 to IPv4 tunneling. The default is set to manual mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
mode ( 6to4 | manual )
default mode
```

- **6to4**
  Configures automatic 6to4 IPv6 to IPv4 tunnels as specified in RFC 3056.

- **manual**
  Configures point-to-point manual IPv6 to IPv4 tunnels by specifying IPv4 address of the tunnel remote end.

- **default**
  Resets the mode of IPv6 to IPv4 tunneling to manual mode.

Usage
There can be only one 6to4 tunnel possible in a context. Once a 6to4 tunnel is configured, all subsequent tunnels will be configured as manual tunnels.

Example
The following command configures the mode to 6to4.

```
mode 6to4
```

The following command configures the mode to 6to4.

```
mode manual
```
source

Configures the source of tunneled packets.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax

```
source { address ip_address |interface interface_name }
```

```
no source
```

- **address ip_address**
  - Specifies the IPv4 address to use as the source address of the tunnel.
  - ip_address is the IP address in dotted-decimal notation.

- **interface interface_name**
  - Specifies the name of a non-tunnel IPv4 interface, whose address is used as the source address of the tunnel.

- **no**
  - Removes configuration for the specified keyword.

Usage

Configures the source IPv4 address of the tunnel by either specifying the IP address (host address) or by specifying another configured non-tunnel IPv4 interface. The source address must be an existing interface address before it is used. State of source address will affect the operational state of the tunnel.

Example

The following command configures the source address of the tunnel.
```
source address 1.2.3.4
```

The following command specifies the source interface as testsourcel.
```
source interface testsourcel
```
tos

Configures the type of service (TOS) settings of the outer IPv4 header of the tunneled packets.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax

tos {copy | value tos_value }

default tos

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>copy</td>
<td>Copies the DC octet of IPv6 packet to the TOS octet of IPv4 packet.</td>
</tr>
<tr>
<td>default</td>
<td>Configures default setting for the specified keyword.</td>
</tr>
<tr>
<td>value</td>
<td>Configures the raw TOS value ranging from 0 to 255. The default is 0.</td>
</tr>
</tbody>
</table>

Usage
Sets the TOS parameter to be used in the tunnel transport protocol or instructs to copy TOS value from the original IPv6 DC byte to the TOS value of the encapsulating IPv4 header.

Example
The following command sets the tos value to 1:

tos value 1
**ttl**

Configures the TTL (Time to live) value of the outer IPv4 header of the tunneled packets.

**Product**
PDSN, HA

**Privilege**
Security Administrator, Administrator

**Syntax**
```
ttl value ttl_value
```

- **default**
  Configures default setting for the specified keyword.

- **value**
  `value` is a range from 1 to 255. The default is 16.

**Usage**
Configures the TTL parameter to be used in the tunnel transport protocol.

**Example**
The following command sets the TTL value to 25.
```
ttl value 25
```
Chapter 137
ISAKMP Configuration Mode Commands

The ISAKMP Configuration Mode is used to configure Internet Security Association Key Management Protocol (ISAKMP) policies that are used to define Internet Key Exchange (IKE) security associations (SAs).

Modification(s) to an existing ISAKMP policy configuration will not take effect until the related security association has been cleared. Refer to the clear crypto security-association command located in the Exec Mode Commands chapter of the Command Line Interface Reference for more information.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
authentication

Configures the ISAKMP policy authentication mode.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
authentication preshared-key
[ default | no ] authentication
```

**default**
Restores the default setting of this parameter. The command is enabled by default.

**no**
Disables the preshared key authentication mode.

**preshared-key**
Specifies that the policy will be authenticated through the use of the pre-shared key.

Usage
When the system is configured to use ISAKMP-type crypto maps for establishing IPSec tunnels, this command is used to indicate that the policy will be authenticated through the use of the pre-shared key configured in the ISAKMP crypto map.

Example
The following command sets policy authentication mode to use a pre-shared key:

```
authentication preshared-key
```
encryption

Configures the encryption protocol to use to protect subsequent IKE SA negotiations.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
encryption { 3des-cbc | des-cbc }
[ default | no ] encryption
```

- **default**
  Restores the default setting of this parameter.

- **no**
  Removes a previously configured encryption type.

- **3des-cbc**
  Specifies that the encryption protocol is Triple Data Encryption Standard (3DES) in chain block (CBC) mode.

- **des-cbc**
  Specifies that the encryption protocol is DES in CBC mode. This is the default setting.

Usage

Once the D-H exchange between the system and the security gateway has been successfully completed, subsequent IKE SA negotiations will be protected using the protocol specified by this command.

Example

The following command sets the IKE encryption method to 3des-cbc.

```
encryption 3des-cbc
```
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**

PDSN, HA, GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Returns to the Exec mode.
**exit**

Exits the current configuration mode and returns to the Context configuration mode.

**Product**
PDSN, HA, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
```bash
exit
```

**Usage**
Return to the Context Configuration mode.
### group

Configures the Oakley group (also known as the Diffie-Hellman (D-H) group) in which the D-H exchange occurs.

#### Product
PDSN, HA, GGSN

#### Privilege
Security Administrator, Administrator

#### Syntax

```
[ default | no ] group

default
Restores the default setting of this parameter.

no
Removes a previously configured group.

{ 1 | 2 | 5 }

Default: 1
The number of the Oakley group. The following groups are allowed:

- **1**: Enables Oakley Group 1 using a 768-bit modp as defined in RFC 2409.
- **2**: Enables Oakley Group 2, using a 1024-bit modp as defined in RFC 2409.
- **5**: Enables Oakley Group 5, using a 1536-bit modp as defined in RFC 3526.

#### Usage
Specifies the Oakley group that determine the length of the base prime numbers that are used during the key exchange process.

#### Example
The following command sets the group to 5 which specifies 1536-bit base prime numbers.
```
group 5
hash

Configures the IKE hash protocol to use during IKE SA negotiations.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

hash { md5 | sha1 }
[ default | no ] hash

default
Restores the default setting of this parameter.

no
Removes a previously configured hash algorithm.

md5
Specifies that the hash protocol is Message Digest 5 truncated to 96 bits.

sha1
Specifies that the hash protocol is Secure Hash Algorithm-1 truncated to 96 bits. This is the default setting for this command.

Usage
Use this command to configure the hash algorithm used during key negotiation.

Example
Set the hash algorithm to Message-Digest 5 by entering the following command:
hash md5
**lifetime**

Configures the lifetime of the IKE Security Association (SA).

**Product**
PDSN, HA, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
lifetime seconds

default lifetime
```

- `default`
  Restores the default setting of this parameter.

- `seconds`
  Default: 86400
  The number of seconds for the SA to live. `seconds` must be an integer from 60 to 86400.

**Usage**

Use this command to set the time that an ISAKMP SA will be valid. The lifetime is negotiated with the peer and the lowest configured lifetime duration is used.

**Example**

The following command sets the SA lifetime to 100 seconds:

```
lifetime 100
```
Chapter 138
IP VRF Context Configuration Mode Commands

The IP Virtual Routing and Forwarding Context Configuration Mode is used to create and manage the VRF context instance for GRE tunneling interfaces for addresses, address resolution options, etc.

```
Exec Mode
  configure
    Global Configuration Mode
      context name
        Context Configuration Mode
          Ip vrf vrf_name
            IP VRF Context Configuration Mode
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the interface configuration mode and returns to the Exec mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

`end`

**Usage**

Change the mode back to the Exec mode.
**exit**

Exits the Interface Configuration Mode and returns to the Context Configuration Mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```sh
exit
```

**Usage**

Return to the context configuration mode.
ip maximum-routes

This command configures the maximum number of routes in an IP VRF routing table configured in this context.

Product
All

Privilege
Security Administrator, Administrator

Syntax

ip maximum-routes max_routes
no ip maximum-routes

max_routes
Sets the maximum number of routes in a specific IP VRF context.
max_routes must be an integer between 1 through 16384 on ASR 5000 system.

Usage
Use this command to configure the maximum number of routes in a particular VRF routing table. When the number of routes in the VRF is more than the maximum limit configured, a critical log is generated indicating that the number of routes is over the limit. Once the number of routes in the VRF goes under the limit, a clear log is generated.

The maximum routes configured using this command will be sent to the threshold configuration logic for appropriate action. For more information on threshold configuration, refer threshold route-service bgp-routes and threshold poll route-service interval commands in Global configuration mode.

Example
The following command sets 1000 routes as a maximum limit for specific VRF context:

   ip maximum-routes 1000
**mpls map-dscp-to-exp**

This command provides mapping of final differentiated services code point (DSCP) bit value in IP packet header to final Experimental (EXP) bit value in MPLS header for incoming traffic.

### Product
All

### Privilege
Security Administrator, Administrator

### Syntax
```
mpls map-dscp-to-exp dscp dscp_bit_value exp exp_bit_value
```

**dscp dscp_bit_value**
This keyword specifies the final DSCP bit value which is to map with the final EXP bit value in MPLS header for incoming traffic.

*dscp_bit_value* specifies the value of DSCP bit values separated in 8 groups and represented with integers between 0 through 7.

The default representation of DSCP value in 8 groups is given in the following table:

<table>
<thead>
<tr>
<th>DSCP Marking Value</th>
<th>DSCP Map Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>0-7</td>
<td>0</td>
</tr>
<tr>
<td>8-15</td>
<td>1</td>
</tr>
<tr>
<td>16-23</td>
<td>2</td>
</tr>
<tr>
<td>24-31</td>
<td>3</td>
</tr>
<tr>
<td>32-39</td>
<td>4</td>
</tr>
<tr>
<td>40-47</td>
<td>5</td>
</tr>
<tr>
<td>48-55</td>
<td>6</td>
</tr>
<tr>
<td>56-63</td>
<td>7</td>
</tr>
</tbody>
</table>

**exp exp_bit_value**
This keyword specifies the final EXP bit value in MPLS header to which the final DSCP bit value 0 to 7 (represented in 8 values) coming from incoming traffic will be mapped.

*exp_bit_value* is the value of EXP bit in MPLS header and must be an integer between 0 through 7.

### Usage
Use this command to map the final DSCP value coming from incoming IP traffic to a final EXP value in MPLS header. This mapping determines the QoS and service parameters to which the packet is assigned.

### Example
The following command maps the DSCP value 3 (24 to 31) to EXP bit 3 in MPLS header:

```
mpls map-dscp-to-exp dscp 3 exp 3
```
**mpls map-exp-to-dscp**

This command provides mapping of incoming Experimental (EXP) bit value in MPLS header to internal differentiated services code point (DSCP) bit value in IP packet header for outgoing traffic.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```bash
mpls map-exp-to-dscp exp exp_bit_value dscp dscp_bit_value
```

- **exp exp_bit_value**
  This keyword specifies the incoming EXP bit value in MPLS header to which the internal DSCP bit value 0 to 7 (represented in 8 values) in IP traffic will be mapped.
  `exp_bit_value` is the value of EXP bit in MPLS header and must be an integer between 0 through 7.

- **dscp dscp_bit_value**
  This keyword specifies the DSCP bit value is to be mapped with the incoming EXP bit value in MPLS header.
  `dscp_bit_value` specifies the value of DSCP bit values separated in 8 groups and represented with integers between 0 through 7.

The default representation of DSCP value in 8 groups is given in the following table:

<table>
<thead>
<tr>
<th>DSCP Marking Value</th>
<th>DSCP Map Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>0-7</td>
<td>0</td>
</tr>
<tr>
<td>8-15</td>
<td>1</td>
</tr>
<tr>
<td>16-23</td>
<td>2</td>
</tr>
<tr>
<td>24-31</td>
<td>3</td>
</tr>
<tr>
<td>32-39</td>
<td>4</td>
</tr>
<tr>
<td>40-47</td>
<td>5</td>
</tr>
<tr>
<td>48-55</td>
<td>6</td>
</tr>
<tr>
<td>56-63</td>
<td>7</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to map the incoming EXP bit value in MPLS header to DSCP bit value in IP traffic. This mapping determines the QoS and service parameters to which the packet is assigned.

**Example**
The following command maps the EXP bit value 4 to DSCP value 6 (48 to 55) in IP header:

```
mpls map-exp-to-dscp exp 4 dscp 6
```
Chapter 139
IuPS Service Configuration Mode Commands

The IuPS Service configuration mode is used to define properties for the IuPS service which controls the Iu-PS interface connections to Radio Network Controllers (RNCs) of the UMTS Terrestrial Radio Access Network (UTRAN).

```
IuPS Service Configuration Mode
  iups-service name
    context name
      configure
        Global Configuration Mode
          context name
            Exec Mode
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
access-protocol

This command configures the access protocol parameters for the IuPS service.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

access-protocol sccp-network sccp_net_id
no access-protocol sccp-network sccp_net_id

no
Removes a previously configured access protocol value.

sccp-network sccp_net_id
Specifies the Signaling Connection Control Part (SCCP) for this IuPS service to use. sccp_net_id must be an integer from 1 to 16.

Usage
Use this command to configure access protocol parameters for the current IuPS service.

Example
The following command specifies that the current Iu-PS service should use SCCP 1:

access-protocol sccp-network 1
blacklist-timeout-gtpu-bind-addresses

This command specifies the time period that a GTP-U bind address (loopback address) will not be used (is blacklisted) in RAB-Appliance requests after a RAB assignment request, with that GTP-U bind address, has been rejected by an RNC with the cause - Unspecified Error. This is a failure at the RNC’s GTP-U IP interface.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

blacklist-timeout-gtpu-bind-addresses seconds

default blacklist-timeout-gtpu-bind-addresses

default
Resets the blacklist time to 60 seconds.

seconds
Number of seconds that the GTP-U bind (loopback) address will not be used in a RAB-Appliance request. seconds: Must be an integer from 1 to 1800.

Usage
Use this command to configure the blacklist period.

Example
The following command specifies a 15 minutes blacklist period.

blacklist-timeout-gtpu-bind-addresses seconds 460
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
```plaintext
d exit
```

**Usage**
Return to the Exec mode.
**exit**

Exits the current configuration mode and returns to the previous configuration mode, the context configuration mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
```
exit
```

**Usage**
Return to the context configuration mode.
**gtpu**

This command configures parameters for the GTP user (GTP-U) dataplane.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
gtpu { bind ip_addr | echo-interval seconds | max-retransmissions number | retransmission-timeout seconds }

no gtpu { bind address ip_addr | echo-interval | max-retransmissions | retransmission-timeout }

default gtpu { echo-interval | max-retransmissions | retransmission-timeout }
```

- **no**
  Removes the configured parameter value.

- **default**
  Sets the specified parameter to its default setting.

- **bind address ip_addr**
  This command binds the specified IP address to the Iu-PS GTP-U endpoint.
  `ip_addr`: Must be an IP v4 IP address in dotted decimal notation.

- **echo-interval seconds**
  Default: 60
  Configures the rate, in seconds, at which GTP-U echo packets are sent to the UTRAN over the Iu-PS interface.
  `seconds`: Must be an integer from 60 through 3600.

- **max-retransmissions number**
  Default: 5
  Configures the maximum number of transmission retries for GTP-U packets.
  `number`: Must be an integer from 0 through 15.

- **retransmission-timeout seconds**
  Default: 5
  Configures the retransmission timeout for GTP-U packets in seconds.
  `seconds`: Must be an integer from 1 through 20.

**Usage**
Use this command to configure GTP-U parameters for the Iu-PS interface.

**Example**
The following command binds the IP address 192.168.0.10 to the Iu-PS interface for communication with the UTRAN:

```
gtpu bind address 192.168.0.10
```
iu-hold-connection

Defines the type and duration of the Iu hold connection.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

    iu-hold-connection { always [ hold-time time ] | requested-by-ms [ hold-time time ] }
    [ default | no ] iu-hold-connection

default
Resets the Iu hold connection parameters to requested-by-ms and 100 second duration.

no
Removes the configuration information for the specified Iu hold connection parameter.

always
Specifies that there is always to be an Iu hold connection procedure.

requested-by-ms
Specifies that there is only an Iu hold connection procedure if requested by the MS/UE. This is the default setting for Iu-hold-connection.

hold-time time
This variable configures the interval (in seconds) that the SGSN holds the Iu connection. time: must be an integer from 10 to 3600. Default is 100.

Usage
Define the amount of time the Iu connection will be held open.

Example

    iu-hold-connection always hold-time 120
**iu-recovery**

This command enables the Iu recovery function.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
iu-recovery

no iu-recovery
```

**Usage**
Enable or disable Iu recovery function that should be used whenever sessions are recovered.

**Example**
The following command disables the Iu Recovery function:
```
no iu-recovery
```
iu-release-complete-timeout

Configures the SGSN’s timer for waiting for an Iu Release Complete message from the RNC.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
  iu-release-complete-timeout time

  default iu-release-complete-timeout
```

- **default**
  Resets the timer to its default setting.

- **time**
  This variable defines the amount of time (in seconds) that the SGSN waits to receive an ‘Iu Release Complete’ message from the RNC.
  Default: 10.
  `time`: Must be an integer from 1 to 60.

**Usage**
Configure the number of seconds that the SGSN waits to receive the Iu Release Complete message.

**Example**

```
iu-release-complete-timeout 20
```
loss-of-radio-coverage ranap-cause

This command sets the detection cause included in the Iu Release message. This command is unique to releases 9.0 and higher.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```yaml
loss-or-radio-coverage ranap-cause cause_number

default loss-of-radio-coverage ranap-cause
```

**default**
This keyword resets the configuration to the default cause ID number.

**ranap-cause cause_number**
This number identifies the reason the SGSN has detected, from Iu Release messages, for the loss of radio coverage (LORC). This value is included in the IE messages the SGSN sends to either the GGSN or the GGSN and the peer SGSN to indicate LORC state. The range of reasons is a part of the set defined by 3GPP 25413.

`cause_number`: Must be an integer from 1 to 512.
Default: 46 (MS/UE radio connection lost)

**Usage**
By defining a cause code, the SGSN knows to detect the LORC state of the mobile from Iu Release messages it receives for the subscriber. This configuration also instructs the SGSN to include the defined cause code for the LORC state in the IE portion of various messages sent to the GGSN and optionally the peer SGSN. This command is one of the two commands required to enable the SGSN to work with the GGSN and, optionally the peer SGSN, to implement the Overcharging Protection feature (see the SGSN Overview in the SGSN Administration Guide for feature details. The other command needed to implement the Overcharging Protection feature is the gtp private extension command explained in the SGSN APN Policy Configuration Mode chapter of the Command Line Interface Reference.

**Example**
Use the following command to set the cause code to indicate that there are no radio resources available in the target cell, cause 53.

```yaml
loss-or-radio-coverage ranap-cause 53
```
plmn

Configures the PLMN (public land mobile network) related parameters for the IuPS service. This command is applicable to releases 8.1 and higher.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

no plmn id

no
Removes the PLMN ID from the configuration.

mcc mnc_num
Specifies the mobile country code (MCC) portion of the PLMN’s identifier. mcc_num is the PLMN MCC identifier and can be configured to any integer value between 100 and 999.

mnc mnc_num
Specifies the mobile network code (MNC) portion of the PLMN’s identifier. mnc_num is the PLMN MNC identifier and can be configured to any 2 or 3 digit value between 00 and 999.

network-sharing common-plmn mcc mnc_num mnc mnc_num
When network sharing is employed, this set of keywords is required to define the PLMN ID of the common PLMN. The common PLMN is usually different from a local PLMN.

plmn-list mcc mnc_num mnc mnc_num
When network sharing is employed and more than two PLMNs are available, then use the plmn-list keyword to begin a list of all additional PLMNs.

Usage

Use this command to configure the PLMN associated with the SGSN. There can only be one PLMN associated with an SGSN unless one of the following features is enabled and configured: network sharing or multiple PLMN.

For network sharing, use the network-sharing keywords to identify more than one PLMN. Including the PLMN identified initially. None have precedence. They are all treated equally but they must each be unique. In a MOCN configuration, the PLMN list will not be used as there would only be one local PLMN.

For multiple PLMN support, the SGSN can support up to 8 Iu-PS configurations for PLMNs. These Iu-PS service configurations must be associated with the SGSN via the ran-protocol command in the SGSN Service configuration mode.
Example
Use the following command to identify a PLMN and instruct the SGSN to perform network sharing with a single PLMN:

```
plmn id mcc 313 mnc 23 network-sharing common-plmn mcc 404 mnc 123
```
rab-assignment-response-timeout

Configures the RAB assignment timer.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
rab-assignment-response-timeout time

default rab-assignment-response-timeout
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>default</code></td>
<td>Resets the timer to its default setting.</td>
</tr>
<tr>
<td><code>time</code></td>
<td>This variable configures the amount of time (in seconds) that the SGSN waits to receive a RAB assignment from the RNC.</td>
</tr>
</tbody>
</table>

`time`: must be an integer from 1 to 60.  
Default: 8.

**Usage**

This command defines time the SGSN waits for the completion of the RAB assignment procedure.

**Example**

Change the timer setting to 11 seconds.

```
rab-assignment-response-timeout
```
radio-network-controller

This command creates an instance of an RNC configuration to associate with the IuPS service for the SGSN. This command is only available in release 8.0; use the rnc command for releases 8.1 and higher.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

radio-network-controller id rnc_id mcc mcc_num mnc mnc_num
no radio-network-controller id rnc_id mcc mcc_num mnc mnc_num

no
Removes the configuration information for the specified RNC.

id rnc_id
Define the instance number of the RNC configuration.
  rnc_id: Must be an integer from 0 to 4095.

mcc mcc_num
Specifies the mobile country code (MCC).
  mcc_num: Must be an integer between 100 and 999.

mnc mnc_num
Specifies the mobile network code (MNC).
  mnc_num: Must be an integer between 00 and 999.

Usage
Use this command to configure information for the IuPS service to use to contact specific RNCs. This command also provides access to the RNC configuration mode.

Example
The following command creates or accesses an instance of an RNC configuration.

  radio-network-controller id 1 mcc 131 mnc 22
relocation-complete-timeout

This command specifies the maximum time for the SGSN to wait for a Relocation Completion from the core network.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
relocation-complete-timeout timeout_value
default relocation-complete-timeout
```

- **default**
  resets the configuration to a 5 second wait time.

- **timeout_value**
  time in seconds that the SGSN waits for relocation to be completed.
  `timeout_value`: Must be an integer from 1 to 60.
  Default: 5 seconds.

**Usage**

Use this command to configure the number of seconds the SGSN will wait for a relocation to be completed. This timeout needs to be set with sufficient time so that SRNS procedure aborts can be avoided if the peer fails to respond in a timely fashion in the case of a hard handoff.

**Example**

The following command sets the wait time for 10 seconds.

```
relocation-complete-timeout 10
```
reset

Defines the configuration specific to the RESET procedure.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
reset { ack-timeout time | guard-timeout time | max-retransmissions retries |
          sgsn-initiated }
```

```
default reset { ack-timeout | guard-timeout | max-retransmissions | sgsn-initiated }
```

```
no reset sgsn-initiated
```

---

**default**

Returns to the default settings for the Reset procedure.

---

**no**

Removes the SGSN-initiated reset procedure from the configuration.

---

**ack-timeout time**

Configures the interval (in seconds) for which the SGSN waits for RESET-ACK from the RNC.

`time` must be an integer from 5 to 10.

Default: 10.

---

**guard-timeout**

Configures the interval (in seconds) after which the SGSN sends RESET-ACK to the RNC.

`time` must be an integer from 5 to 10.

Default: 10

---

**max-retransmissions**

Configures the maximum retries for RESET message.

`retries` must be an integer from 1 to 2.

Default: 1.

---

**sgsn-initiated**

Enables SGSN initiated RESET procedure.

Default: disabled.

---

**Usage**

Configures the parameters that determine a RESET.
Example
Use the following to have the SGSN initiate the RESET procedure:

   reset sgsn-initiated
rnc

This command creates or accesses an instance of an RNC (radio network controller) configuration.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

rnc id rnc_id

nornc id rnc_id

   no
   Removes the configuration information for the specified RNC.

   idrnc_id
   Set the identification number of the RNC configuration instance.
   rnc_id: Must be an integer from 0 to 4095 for 8.1 releases. Must be an integer from 0 to 65535 for releases 9.0 and higher.

Usage
Use this command to configure information for the IuPS service to use to contact specific RNCs. This command also provides access to the RNC configuration mode.

Example
The following command creates an RNC configuration instance

   rnc id 1
security-mode-complete-timeout

This command configures the security mode timer.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
security-mode-complete-timeout time

default security-mode-complete-timeout
```

**default**

Resets the timer configuration to the default settings.

**time**

Configures the interval (in seconds) the SGSN waits for the security mode from the MS to complete.

- `time` must be an integer from 1 to 60.
- Default is 5

**Usage**

Use this command to configure the timer that determines how long the SGSN waits for a Security Mode Complete message from the MS (mobile station).

**Example**

```plaintext
security-mode-complete-timeout 7
```
srns-context-response-timeout

This command configures the SGSN context response timer.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
srns-context-response-timeout time
```

```
default srns-context-response-timeout
```

```
default
Resets the timer configuration to the default setting.
```

```
time
Configures the interval (in seconds) for which the SGSN waits for an SRNS Context Request message. 
 time must be an integer from 1 to 60. 
 Default: 5.
```

Usage
Configures the time to wait before the SGSN sends a response to the SRNS ‘context request’ message.

Example
```
srns-context-response-timeout 7
```
tigoc-timeout

This command configures the TigOc interval.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

tigoc-timeout time

default tigoc-timeout

default
Resets the timer configuration to the default setting.

time
This command sets the time in seconds.
time: Must be an integer from 1 to 10.
Default: 5.

Usage
Define the amount of time that the SGSN ignores any overload messages for TigOc interval after receiving one overload message from the RNC.

Example
Use the following command to change the default TigOc interval:

tigoc-timeout 4
tintc-timeout

This command configures the TinTc interval.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
tintc-timeout time
```

default tintc-timeout

default
Resets the timer configuration to the default setting.

time
Set the number of seconds to wait. 
time: Must be an integer from 1 to 10.
Default: 5.

Usage
Define the number of seconds that the SGSN waits before decrementing (by one) the traffic level of the RNC.

Example

```
tintc-timeout 4
```
Chapter 140
LAC Service Configuration Mode Commands

The LAC Service Configuration Mode is used to create and manage L2TP services within contexts on the system. L2TP Access Concentrator (LAC) services facilitate tunneling to peer L2TP Network Servers (LNSs).

```
Exec Mode
   configure
      Global Configuration Mode
         context name
            Context Configuration Mode
               lac-service name
                  LAC Service Configuration Mode
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
allow

This command configure the system to allow different attributes in the LAC Hostname AVP and Called-Number AVP for L2TP messages exchanged between LAC and LNS.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
allow {aaa-assigned-hostname | called-number value apn}
[ no | default ] allow {aaa-assigned-hostname | called-number value apn}
```

**no**
Disable the configured attribute and returns to the behavior that uses the LAC-Service name as the HostName AVP.

**aaa-assigned-hostname**
When enabled if AAA assigns a valid Tunnel-Client-Auth-ID attribute for the tunnel, it is used as the HostName AVP in the L2TP tunnel setup message.
This keyword works in conjunction with `local-hostname hostname` keyword applied with `tunnel l2tp` command in APN configuration mode.
When Tunnel parameters are not received from the RADIUS Server, Tunnel parameters configured in APN are considered for the LNS peer selection. When APN configuration is selected, local-hostname configured with `tunnel l2tp` command in the APN for the LNS peer will be used as a LAC Hostname.

**called-number value apn**
This keyword configures the system to send APN name in Called-Number AVP as a part of ICRQ message sent to the LNS. If this keyword is not configured, Called-Number AVP will not be included in ICRQ message sent to the LNS.

**Usage**

Use this command to configure the attribute for the HostName AVP for L2TP messages exchanged between LAC and LNS.
LAC Hostname will be different for the subscribers corresponding to the different corporate APNs. In the absence of a AAA assigned HostName, the LAC-Service name is used as HostName. By default the LAC-Service name is used as the HostName AVP.

**Example**
The following command enables the use of the value of Tunnel-Client-Auth-ID attribute for the HostName AVP:

```
allow aaa-assigned-hostname
```
Use the following command to reset the behavior so that the LAC-Service uses the LAC-Service name as the HostName AVP:

```plaintext
no allow aaa-assigned-hostname
```
bind

This command assigns a local end point address to the LAC service in the current context.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax
bind ip_address [max-subscribers]
no bind ip_address

Usage
Use this command to bind a local end point IP address to the LAC service.

Example
The following command binds the local end point IP address 10.10.10.100 to the LAC service in the current context:

\[\text{bind 10.10.10.100}\]

The following command removes the binding of the local end point to the LAC service:

\[\text{no bind}\]
data sequence-number

Enables data sequence numbering for sessions that use the current LAC service. Data sequence numbering is enabled by default.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
data sequence-number
no data sequence-number
```

```
no
```

Disables data sequence numbering for sessions.

Usage
An L2TP data packet header has an optional data sequence numbers field. The data sequence number may be used to ensure ordered delivery of data packets. This command is used to re-enable or disable the use of the data sequence numbers for data packets.

Example
Use the following command to disable the use of data sequence numbering:

```
no data sequence-number
```

Use the following command to re-enable data sequence numbering:

```
data sequence-number
```
default

This command sets the specified LAC service parameter to its default value or setting.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
default {data sequence-number | hide-attributes | keepalive-interval | load-balancing | local-receive-window | max-retransmission | max-session-per-tunnel | max-tunnel-challenge-length | max-tunnels | proxy-lcp-authentication | retransmission-timeout-first | retransmission-timeout-max | trap all | tunnel-authentication}
```

data sequence-number
Enables data sequence numbering for sessions.

hide-attributes
Disables hiding attributes in control messages sent from the LAC to the LNS.

keepalive-interval
Sets the interval for send L2TP Hello keepalive if there is no control or data transactions to the default value of 60 secs.

load-balancing
Sets the load balancing algorithm to be used when many LNS peers have been configured to the default of round robin.

local-receive-window
Sets the window size to be used for the local side for the reliable control transport to the default of 16.

max-retransmission
Sets the maximum number of retransmissions to the default of 5.

max-session-per-tunnel
Sets the maximum number of sessions per tunnel at any point in time to the default of 512.

max-tunnel-challenge-length
Sets the maximum length of the tunnel challenge to the default of 16 bytes.

max-tunnels
Sets the maximum number of tunnels for this service to the default of 32000.
proxy-lcp-authentication
Sets sending of proxy LCP authentication parameters to the LNS to the default state of enabled.

retransmission-timeout-first
Sets the first retransmit interval to the default of 1 second.

retransmission-timeout-max
Sets the maximum retransmit interval to the default of 8 seconds.

trap all
Generates all supported SNMP traps.

tunnel-authentication
Sets tunnel authentication to the default state of enabled.

Usage
Use the default command to set LAC service parameters to their default states.

Example
Use the following command to set the keep alive interval to the default value of 60 seconds:
default keepalive-interval
Use the following command to set the maximum number of sessions per tunnel to the default value of 512:
default max-session-per-tunnel
**hide-attributes**

Enables hiding certain attributes (such as proxy-auth-name and proxy-auth-rsp) in control messages sent from the LAC to the LNS. The LAC hides such attributes only if tunnel authentication is enabled between the LAC and the LNS.

**Product**
PDSN, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
```
hide-attributes
no hide-attributes
```

**Usage**
Use this command to hide certain attributes from control messages when tunnel authentication is enabled between the LAC and the LNS.

**Example**
The following command enables hiding attributes:
```
hide-attributes
```
keepalive-interval

This command specifies the amount of time to wait before sending a Hello keep alive message.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
keepalive-interval seconds
no keepalive-interval
```

- **no**
  Disables the generation of Hello keep alive messages on the tunnel.

- **seconds**
  Default: 60
  The number of seconds to wait before sending a Hello keep alive message. The number can be configured to any integer value from 30 to 2147483648.

Usage

Use this command to set the amount of time to wait before sending a Hello keep alive message or disable the generation of Hello keep alive messages completely. A keep alive mechanism is employed by L2TP in order to differentiate tunnel outages from extended periods of no control or data activity on a tunnel. This is accomplished by injecting Hello control messages after a specified period of time has elapsed since the last data or control message was received on a tunnel. As for any other control message, if the Hello message is not reliably delivered then the tunnel is declared down and is reset. The transport reset mechanism along with the injection of Hello messages ensures that a connectivity failure between the LNS and the LAC is detected at both ends of a tunnel.

Example

Use the following command to set the Hello keep alive message interval to 120 seconds:
```
keepalive-interval 120
```

Use the following command to disable the generation of Hello keep alive messages:
```
no keepalive-interval
```
### load-balancing

Configures how LNSs are selected for this LAC service.

**Product**

PDSN, GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
load-balancing {balanced | prioritized | random}
```

**balanced**

LNS selection is made without regard to prioritization, but in a sequential order that balances the load across the total number of LNS nodes available.

**prioritized**

LNS selection is made based on the priority assigned in the Tunnel-Preference attribute. An example of this method is three LNS nodes, with preferences of 1, 2, and 3 respectively. In this example, the RADIUS server always tries the tunnel with a preference of 1 before using any of the other LNS nodes.

**random**

Default: Enabled

LNS selection is random in order, wherein the RADIUS server does not use the Tunnel-Preference attribute in determining which LNS to select.

**Usage**

Use this command to configure the load-balancing algorithm that defines how the LNS node is selected by the LAC when there are multiple peer LNSs configured in the LAC service.

**Example**

The following command sets the LAC service to connect to LNSs in a sequential order;

```
load-balancing balanced
```

The following command sets the LAC service to connect to LNSs according to the priority assigned through the Tunnel-Preference attribute:

```
load-balancing prioritized
```
**local-receive-window**

Specifies the number of control messages the remote peer LNS can send before waiting for an acknowledgement.

**Product**
PDSN, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
local-receive-window integer
```

*integer*

Default: 4

The number of control messages to send before waiting for an acknowledgement. The number can be configured to any integer value from 1 to 256.

**Usage**

Use this command to set the size of the control message receive window being offered to the remote peer LNS. The remote peer LNS may send the specified number of control messages before it must wait for an acknowledgement.

**Example**
The following command sets the local receive window to 10 control messages:

```
local-receive-window 10
```
max-retransmission

Sets the maximum number of retransmissions of a control message to a peer before the tunnel and all sessions within it are cleared.

**Product**

PDSN, GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
max-retransmission integer
```

- `integer`
- Default: 5
- The maximum number of retransmissions of a control message to a peer. This value must be an integer in the range of 1 to 10.

**Usage**

Each tunnel maintains a queue of control messages to be transmitted to its peer. After a period of time passes without acknowledgement, a message is retransmitted. Each subsequent retransmission of a message employs an exponential backoff interval. For example; if the first retransmission occurs after 1 second, the next retransmission occurs after 2 seconds has elapsed, then the next after 4 seconds. If no peer response is detected after the number of retransmissions set by this command, the tunnel and all sessions within are cleared.

Use this command to set the maximum number of retransmissions that the LAC service sends before closing the tunnel and all sessions within it.

**Example**

The following command sets the maximum number of retransmissions of a control message to a peer to 7:

```
max-retransmissions 7
```
max-session-per-tunnel

Sets the maximum number of sessions that can be facilitated by a single a tunnel at any time.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

max-sessions-per-tunnel integer

integer
Default: 512
The maximum number of sessions. This value must be in the range of 1 to 65535.

Usage
Use this command to set the maximum number of sessions you want to allow in a tunnel.

Example
The following command sets the maximum number of sessions in a tunnel to 5000:
max-sessions-per-tunnel 5000
max-tunnel-challenge-length

Sets the maximum length of the tunnel challenge in bytes. The challenge is used for tunnel authentication purposes during tunnel creation.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
max-tunnel-challenge-length bytes
```

`bytes`

Default: 16
The number of bytes to set the maximum length of the tunnel challenge. This must be a value from 4 to 32.

Usage
Use this command to set the maximum length, in bytes, for the tunnel challenge that is used during tunnel creation.

Example
The following command sets the maximum length of the tunnel challenge to 32 bytes:
```
max-tunnel-challenge-length 32
```
max-tunnels

The maximum number of tunnels that the current LAC service can support.

**Product**

PDSN, GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
max-tunnels integer
```

**Usage**

Use this command to set the maximum number tunnels that this LAC service can support at any on time.

**Example**

Use the following command to set the maximum number of tunnels for the current LAC service to 20000:

```
max-tunnels 20000
```
peer-lns

Adds a peer LNS address for the current LAC service. Up to 8 peer LNSs can be configured for each LAC service.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax
peer-lns ip_address [encrypted] secret secret [crypto-map map_name { [encrypted] isakmp-secret secret }] [description text] [ preference integer ]
no peer-lns ip_address

no peer-lns ip_address
Deletes the peer LNS at the IP address specified by ip_address. ip_address must be entered in standard IPv4 dotted decimal notation.

ip_address
The IP address of the peer LNS for the current LAC service. ip_address must be entered in standard IPv4 dotted decimal notation.

[encrypted] secret secret
Designates the secret which is shared between the current LAC service and the peer LNS. secret must be a string from 1 to 256 alpha and/or numeric characters and is case sensitive.

encrypted secret secret: Specifies that encryption should be used when communicating the secret with the peer LNS.

crypto-map map_name { [encrypted] isakmp-secret secret }
map_name is the name of a crypto map that has been configured in the current context. map_name must be a string from 1 to 127 alpha and/or numeric characters and is case sensitive.

isakmp-secret secret: The pre-shared key for IKE. secret must be a string from 1 to 127 alpha and/or numeric characters and is case sensitive.

encrypted isakmp-secret secret: The pre-shared key for IKE. Encryption must be used when sending the key. secret must be a string from 1 to 127 alpha and/or numeric characters.

description text
Specifies the descriptive text to use to describe the specified peer LNS. text must be 0 to 79 alpha and/or numeric characters with no spaces or a quoted string of printable characters.

preference integer
This sets the priority of the peer LNS if multiple peer LNSs are configured. integer must be a value ranging from 1 to 128.

Usage
Use this command to add a peer LNS address for the current LAC service.
**Example**
The following command adds a peer LNS to the current LAC service with the IP address of 10.10.10.100, sets encryption on, specifies the shared secret to be 1b34nnf5d and sets the preference to 3:
peer-lns 10.10.10.100 encrypted secret 1b34nnf5d preference 3
The following command removes the peer LNS with the IP address of 10.10.10.200 for the current LAC service:
no peer-lns 10.10.10.200
proxy-lcp-authentication

Enables and disables the sending of proxy LCP authentication parameters to the LNS.

**Product**
PDSN, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
proxy-lcp-authentication
no proxy-lcp-authentication

no
Disables the sending of proxy LCP authentication parameters to the LNS.

proxy-lcp-authentication
Default: Enabled
Enables the sending of proxy LCP authentication parameters to the LNS.
```

**Usage**

Use this feature in situations where the peer LNS does not understand the proxy LCP Auth AVPs that the system sends and does not do an LCP renegotiation and tears down the call.

**Example**

Use the following command to disable the sending of proxy LCP authentication parameters to the LNS;
```
no proxy-lcp-authentication
```
Use the following command to re-enable the sending of proxy LCP authentication parameters to the LNS
```
proxy-lcp-authentication
```
retransmission-timeout-first

Each tunnel maintains a queue of control messages to transmit to its peer. After a period of time passes without acknowledgement, a message is retransmitted. This command sets the initial timeout for retransmission of control messages.

Privilege
Security Administrator, Administrator

Syntax
```
retransmission-timeout-first integer
```

integer
Default: 1
The amount of time to wait before sending the first control message retransmission. This value is measured in seconds and must be an integer from 1 to 100.

Usage
Use this command to set the initial timeout before retransmitting control messages to the peer.

Example
The following command sets the initial retransmission timeout to 3 seconds:
```
retransmission-timeout-first 3
```
retransmission-timeout-max

This command configures maximum amount of time between two retransmission of control messages.

Privilege
Security Administrator, Administrator

Syntax
```plaintext
retransmission-timeout-max integer
```

integer

Default: 8

integer is the maximum time in seconds to wait before retransmitting control messages and must be an integer between 1 through 100.

Usage
Use this command to set the maximum amount of time that can elapse before retransmitting control messages.

Each tunnel maintains a queue of control messages to transmit to its peer. After a period of time passes without acknowledgement, a message is retransmitted. Each subsequent retransmission of a message employs an exponential backoff interval.

Example
The following command sets the maximum retransmission time-out to 10 seconds:
```plaintext
retransmission-timeout-max 10
```
single-port-mode

This command enables/disables the L2TP LAC service always to use standard L2TP port 1701 as source port for all L2TP control and data packets originated from LAC node.

**Product**
PDSN, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[no | default] single-port-mode
```

- **no**
  
  Disables the configured single source port configuration from this LAC service.

- **default**
  
  Default: Enabled
  
  Sets this command to default state of disabled. By default single source port configuration for L2TP LAC packets is disabled.

**Usage**

Use this command to enable or disable the single port mode for L2TP LAC service.

If this feature is enabled, then L2TP LAC service will always use standard L2TP port 1701 as source port for all L2TP control/data packets originated from LAC (instead of the default scheme in which each L2TPMgr uses a dynamic source port). L2TPMgr instance 1 will handle all L2TP calls for the service.

**Caution:** Changing this configuration, while the service is already running, will cause restart of the service.

**Example**

The following command enables the LAC service to use port 1701 as source port for all L2TP control and data packets:

```
single-port-mode
```
snoop framed-ip-address

When enabled, this feature allows the LAC to detect IPCP packets exchanged between the mobile node and the LNS and extract the framed-ip-address assigned to the mobile node. The address will be reported in accounting start/stop messages and will be displayed for subscriber sessions.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax
snoop framed-ip-address
no snoop framed-ip-address
default snoop framed-ip-address

no
Disables the feature. Accounting start/stop will occur before the PPP session is established and the framed IP address field will be reported as 0.0.0.0.

default
Disabled.

Usage
This feature is available to address simple IP roaming scenarios. If this feature is enabled, the accounting start will be sent only after the framed-ip-address is detected. If the framed-ip-address is not detected within 16 seconds, an accounting start will be sent for the session with the 0.0.0.0 address. If the session is disconnected during the detection attempt, accounting start/stop will be sent for the session. If the session renegotiates IPCP, an accounting stop will be generated with a framed-ip-address from the old session and an accounting start will be generated with an IP address for the new session. IPv6 address detection is not supported.

Important: When this feature is enabled and the show subscribers all command is invoked, the framed-IP-address is displayed for the PDSN Simple IP subscriber in the output display.
trap

This command generates SNMP traps.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```plaintext
trap all
no trap all
```

Disables SNMP traps.

Usage
Use this command to enable/disable all supported SNMP traps.

Example
To enable all supported SNMP traps, enter the following command:
```
trap all
```
tunnel-authentication

Enables tunnel authentication. When tunnel authentication is enabled, a configured shared secret is used to ensure that the LAC service is communicating with an authorized peer LNS. The shared secret is configured by the `r_peer-lns` command in the LAC service configuration mode, the `R_tunnel 12tp` command in the subscriber configuration mode, or the `Tunnel-Password` attribute in the subscribers RADIUS profile.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
tunnel-authentication
no tunnel-authentication

no
```

Disables tunnel authentication
Tunnel authentication is enabled by default.

Usage
Disable or enable the usage of secrets to authenticate a peer LNS when setting up a tunnel.

Example
To disable tunnel authentication, use the following command:
`no tunnel-authentication`
To re-enable tunnel authentication, use the following command:
`tunnel-authentication`
tunnel selection-key

This command enables the support to create tunnels between L2TP service and an LNS server on the basis of value of attribute “Tunnel-Server-Auth-ID” received from AAA server.

Privilege
Security Administrator, Administrator

Syntax
```
tunnel selection-key { tunnel-server-auth-id | none } 
[default] tunnel selection-key
```

**default**
This keyword disables the creation of tunnel between LAC service and LNS based on key value received in attribute, “Tunnel-Server-Auth-ID” from AAA server.

**tunnel-server-auth-id**
Default: Enabled
This keyword enables the creation of tunnels between LAC service on GGSN and an LNS server on the basis of domain attribute, “Tunnel-Server-Auth-ID”, value received from AAA server.

**none**
Default: Enabled
This keyword disables the creation of multiple tunnels between a pair of LAC service on GGSN and LNS server. LAC will not make use of key to choose a tunnel with LNS in this setup.

**Usage**
Use this command to enable or disable the creation of additional L2TP tunnels between LAC service on GGSN and LNS server on the basis of “Tunnel-Server-Auth-ID” attribute value received from AAA Server in Access-Accept message. This value of attribute is treated as a key for tunnel selection and creation.

When the LAC needs to establish a new L2TP session, it would first check if there is already an existing L2TP tunnel with the peer LNS based on the value of key configured. If no such tunnel exists for the key, it will create a new Tunnel with the LNS.

Default configuration have selection-key as **none**. Hence, LAC will not make use of key to choose a tunnel with LNS, in default setup.

Maximum number of session as configured with **max-sessions-per-tunnel** command will be applicable for each tunnel created through this command. By default each tunnel supports 512 sessions.

If LAC service needs to establish a new tunnel for new L2TP session with LNS and the tunnel create request fails because maximum tunnel creation limit is reached, LAC will try other LNS addresses received from AAA server in Access-Accept message for the APN/subscriber. If all available peer-LNS are exhausted, LAC service will reject the call.

**Example**
The following command enables the use of “Tunnel-Server-Auth-ID” attribute value received from AAA Server in Access-Accept message as a key for tunnel selection and creation:
```
tunnel selection-key tunnel-server-auth-id
```
Chapter 141
Line Configuration Mode Commands

The Line Configuration Mode is used to manage the terminal line characteristics for output formatting.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**default**

Restores the default length or width for the output to the display terminal.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
default { length | width }
```

<table>
<thead>
<tr>
<th>length</th>
<th>width</th>
</tr>
</thead>
</table>

**Usage**

Reset the output display properties if they had been changed during a session.

**Example**

```
default length
default width
```
end

Exits the line configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Change the mode back to the Exec mode.
exit

Exits the line configuration mode and returns to the global configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
exit
```

**Usage**
Return to the global configuration mode.
length

Configures the output for the displays length (number of rows).

Privilege
Security Administrator, Administrator

Syntax
length number

number

Specifies the number of rows (lines) of output that can be displayed at one time for the display (output) terminal. number must have a value of 0 or be in the range from 5 through 512 where the special value 0 implies an infinite number of rows.

Usage
Set the current session’s display terminal has different display characteristics than the defaults. The special infinite value (0) is typically used when logging the output of a session from a remote machine since this will result in no pagination of output.

Example
The following commands set the length of the display to infinite and 33, respectively.

length 0
length 33
**width**

Configures the output for the displays width (number of columns/characters wide).

**Privilege**

Security Administrator, Administrator

**Syntax**

```
width number
```

Specifies the number of columns (characters) of output that can be displayed at one time for the display (output) terminal. `number` must have a value in the range from 5 through 512.

**Usage**

Set the current session’s display terminal has different display characteristics than the defaults.

**Example**

```
width 160
```
Chapter 142
Link Configuration Mode Commands

The Link configuration mode defines the MTP3 link parameters for a specific link in a linkset of an SS7 routing domain instance.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**arbitration**

This command configures link arbitration.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
arbitration { active | passive }
no arbitration
```

**Active**

The SSCOP initiates the transmission of PDUs.

**Passive**

The SSCOP waits to receive PDUs.

**Usage**

Sets the configuration to initiate transmission of PDUs.

**Example**

```
arbitration active
```
end

Exits the current mode and returns to the Exec Mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Change the mode back to the Exec Mode.
exit

Exits the current mode and returns to the previous mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```bash
exit
```

**Usage**

Returns to the previous mode.
**mtp2-lssu-len**

This command sets the length of the link status signal unit (LSSU) which carries link status information used to manage link alignment and indicate the status of the signaling points to each other.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
mtp2-lssu-len #_octets
default mtp2-lssu-len
```

- **default**

  Using this keyword with the command resets the length to the default of 1 octet.

- **#_octets**

  Sets the number of octets for the length of the LSSU.

  `#_octets`: Must be either 1 or 2.

**Usage**

Use this command to define the maximum amount of link status information that is to be shared between signaling points.

**Examples**

Set the LSSU length to 2 octets - the maximum length.

```
mtp2-lssu-len 2
```
**lmtp3-discard-priority**

Configure MTP3 message discard priority.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
mtTp3-discard-priority priority
default mtTp3-discard-priority
```

- **default**
  Resets the priority to the default value.

- **priority**
  `priority`: must be an integer between 0 and 3. Default is 0.

**Usage**

Use this command to manage MTP3 messaging.

**Example**

```
mtTp3-discard-priority 2
```
**mtp3-max-slt-try**

Configure maximum number of times to retry SLT (signaling link test).

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
mtp3-max-slt-try retries
```

```
default mtp3-max-slt-try
```

- **default**
  
  Resets the number of retries to the default value.

- **retries**
  
  - `retries`: must be an integer between 1 to 65535.
  - Default is 10.

**Usage**

Use this command to troubleshoot MTP3 link mismatch.

**Example**

```
mtp3-max-slt-try 35
```
mtp3-msg-priority

Configures the priority for sending MTP3 management messages.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
mtp3-msg-priority priority
```

default mtp3-msg-priority

```
default
    Resets the number of priority to the default value.
```

```
priority
    priority: must be an integer from 0 to .
    Default is 0.
```

Usage
Use this command to set the priority for sending MTP3 management messages.

Example

```
mtp3-msg-priority 3
```
**mtp3-msg-size**

Configures the size of messages from layer 3 to layer 2.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
  mtp3-msg-size size
  default mtp3-msg-size
```

**Usage**

Use this command to set the maximum message size, in bytes.

**Example**

```
mtp3-msg-size 4096
```
mtp3-p1-qlen

Configure the size for the MTP3 p1 queue length.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

mtp3-p1-qlen size

default mtp3-p1-qlen

default
Rests the number of size of the priority 1 queue to the default value.

size

size: integer from 1 to 65535. Size should be less than MTP3 p2 qlen and p3 qlen. Default is 1024.

Usage

Use this command to configure the queue length threshold for raising the congestion priority to level 1.

Example

mtp3-p1-qlen 128
**mtp3-p2-qlen**

Configure the size of the priority 2 queue.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
**mtp3-p2-qlen** size

default mtp3-p2-qlen
```

**default**
Resets the number of size of the priority 2 queue to the default value.

```
size
size: integer from 1 to 65535. Size should be less than MTP3 p3 qlen and greater than p1 qlen. Default is 1024.
```

**Usage**
Use this command to configure the queue length threshold for raising the congestion priority to level 2.

**Example**
```
mtp3-p2-qlen 256
```
mtp3-p3-qlen

Configure the size of the priority 3 queue.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

mtp3-p3-qlen size

default mtp3-p3-qlen

default
Resets the number of size of the priority 3 queue to the default value.

size

size: integer from 1 to 65535. Size should be greater than MTP3 p1 qlen and p2 qlen . Default is 1024.

Usage
Use this command to configure the queue length threshold for raising the congestion priority to level 3.

Example

mtp3-p3-qlen 1024
mtp3-test-pattern

Configures the character string for the test message.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

mtp3-test-pattern pattern

default mtp3-test-pattern

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resets the pattern to the default value.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>pattern</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern: 1 to 15 alphanumeric characters.</td>
</tr>
<tr>
<td>Default is SGSN-ORIGINATED.</td>
</tr>
</tbody>
</table>

Usage
Use this command to define a test pattern string for the signalling link test match (SLTM).

Example
mtp3-test-pattern TEST1-HomeOffice
priority

Configures the MTP3 Link Priority.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
priority pri_value
no priority
```

- **no**
  - Removes the priority configuration.

- **pri_value**
  - `pri_value`: 0 represents highest priority and 15 represents the lowest priority.

**Usage**

Use this command to configure the link priority within the MTP3 link set.

**Example**

```
priority 2
```
signaling-link-code

Configures the signaling link code (SLC).

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
signaling-link-code code
no signaling-link-code
```

**Usage**
Use this command to uniquely identify the signaling link to be used for MTP3 management messages.

**Example**

```
signaling-link-code 4
```
**ssc-f-nni-n1**

Configures the SSCF NNI N1.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```bash
ssc-f-nni-n1 value

no ssc-f-nni-n1
```

<table>
<thead>
<tr>
<th><strong>default</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Removes the ssc-f-nni-n1 configuration.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>value</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>value</strong>: integer from 1 to 65535. Default is 1000.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to identify the network-to-node interface (NNI) between the MTP3 and SSCOP layers.

**Example**

```bash
ssc-f-nni-n1 4064
```
sscop-max-cc

Configure the maximum value for the SSCOP connection control (CC) state variable.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
sscop-max-cc value
no sscop-max-cc

default
Removes the sscop-max-cc configuration.

value
value: integer from 1 to 65535.
Default is 4.
```

Usage
Use this command as part of the configuration responsible for managing the SSCOP connection. This command sets the number of times retries.

Example

```
sscop-max-cc 256
```
**sscop-max-pd**

Configures the maximum acceptable value for the SSCOP state variable VT(PD).

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
sscop-max-pd value
no sscp-max-pd
```

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removes the <strong>sscop-max-pd</strong> configuration.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>value: integer from 1 to 65535. Default is 500.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to define the maximum number of data PDUs transmitted between POLL PDUs.

**Example**

```plaintext
sscop-max-pd 2500
```
**sscop-max-stat**

Configures the maximum number of elements included in a status PDU.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sscop-max-stat value
no sscop-max-stat
```

**default**
Removes the sscop-max-stat configuration.

**value**

```
value: integer from 3 to 65535. This parameter should be an odd integer greater than or equal to 3. Default is 67.
```

**Usage**
Received in response to a POLL PDU, the STAT PDU includes information about the number of SD PDUs that have been received.

**Example**

```
sscop-max-stat 56000
```
timeout

This command enables configuration of an array of signaling and flow control timers - for MTP, SSCF, and SSCOP.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

\texttt{timeout \textit{timer}}
\texttt{no \textit{timeout \textit{timer}}}

\texttt{no}

Adding \texttt{no} to the \textit{timeout} command removes the timer configuration.

\texttt{timer}

Repeat the command as needed to configure all required timers.

\begin{itemize}
  \item \texttt{mtp3-tmr-t1} - mtp3 t1 timer, default value is 500ms
  \item \texttt{mtp3-tmr-t12} - mtp3 t12 timer, default value is 800ms
  \item \texttt{mtp3-tmr-t13} - mtp3 t13 timer, default value is 800ms
  \item \texttt{mtp3-tmr-t14} - mtp3 t14 timer, default value is 2000ms
  \item \texttt{mtp3-tmr-t17} - mtp3 t17 timer, default value is 800ms
  \item \texttt{mtp3-tmr-t2} - mtp3 t2 timer, default value is 700ms
  \item \texttt{mtp3-tmr-t22} - mtp3 t22 timer, default value is 180s
  \item \texttt{mtp3-tmr-t23} - mtp3 t23 timer, default value is 180s
  \item \texttt{mtp3-tmr-t24} - mtp3 t24 timer, default value is 500ms
  \item \texttt{mtp3-tmr-t3} - mtp3 t3 timer, default value is 500ms
  \item \texttt{mtp3-tmr-t31} - mtp3 t31 timer, default value is 5s
  \item \texttt{mtp3-tmr-t32} - mtp3 t32 timer, default value is 10s
  \item \texttt{mtp3-tmr-t33} - mtp3 t33 timer, default value is 20s
  \item \texttt{mtp3-tmr-t34} - mtp3 t34 timer, default value is 60s
  \item \texttt{mtp3-tmr-t4} - mtp3 t4 timer, default value is 500ms
  \item \texttt{mtp3-tmr-t5} - mtp3 t5 timer, default value is 500ms
  \item \texttt{mtp3-tmr-t7} - mtp3 t7 timer, default value is 1000ms
  \item \texttt{sscf-nni-tmr-t1} - sscf nni t1 timer. default value is 5s
  \item \texttt{sscf-nni-tmr-t2} - sscf nni t2 timer. default value is 30s
  \item \texttt{sscf-nni-tmr-t3} - sscf nni t2 timer. default value is 10ms
  \item \texttt{sscop-tmr-cc} - sscop cc timer. default value is 200ms
\end{itemize}
• **sscop-tmr-idle** - sscop idle timer (UNI 3.1 only). default value is 100ms
• **sscop-tmr-keep-alive** - sscop keep alive timer. default value is 100ms. For stability purposes, tmrKeepAlive >= tmrPoll and tmrKeepAlive < tmrNoResponse
• **sscop-tmr-no-rsp** - sscop no response timer. default value is 1.5s. For stability purposes, tmrNoResponse > tmrKeepAlive
• **sscop-tmr-poll** - sscop poll timer. default value is 100ms. For stability purposes, tmrPoll <= tmrKeepAlive
Chapter 143
Linkset Configuration Mode Commands

The Linkset configuration mode defines the MTP3 linkset parameters for a specific SS7 routing domain instance.

| Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s). |
adjacent-point-code

This command defines the point-code for the adjacent (next) network element in the SS7 network.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
adjacent-point-code point-code
no adjacent-point-code
```

**point-code**
Point-code is an SS7 address for an element in the SS7 network. Point-codes must be defined in dotted-decimal format in a string of 1 to 11 digits. Format options include:

- 0.0.1 to 7.255.7 for point-code in the ITU range.
- 0.0.1 to 255.255.255 for point-code in the ANSI range.
- 0.0.1 to 15.31.255 for point-code in the TTC Range.
- a string of 1 to 11 digits in dotted-decimal to represent a point-code in a different range.

**no**
Removes the adjacent-point-code configuration for this linkset in the SS7 routing domain.

**Important:** Removing the linkset configuration will result in the termination of all of the links within the linkset.

**Usage**
Use this command to define the point-code for the adjacent element in the SS7 network.

**Example**

```
adjacent-point-code 6.202.7
```
**end**

Exits the current mode and returns to the Exec Mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Change the mode back to the Exec Mode.
exit

Exits the current mode and returns to the previous mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Returns to the previous mode.
**link**

This command creates an MTP3 link configuration for the SS7 linkset and enters the Link configuration mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
link id id [ link-type [ atm-broadband | highspeed-narrowband | lowspeed-narrowband ] ]
no link id id
```

- **no**
  Disables the specified link configuration.

---

**Important:** Removing the link configuration will result in the termination of traffic on the specified link.

- **_octets**
  Sets the number of octets for the length of the LSSU.

- **id**
  This number uniquely identifies the link in the linkset.
  id: an integer between 1 and 16.

- **link-type**

---

**Important:** This keyword is not yet functional - the feature is still in development.

This keyword is applicable only to releases 8.1 and higher.
Identifies the signalling type for this link; options include:

- atm-broadband
- high speed-narrowband
- low speed-narrowband

**Usage**

Access the Link configuration mode to make changes to the configuration for a link.

**Example**

Access configuration for link 4.
link id 4
**self-point-code**

This command defines the SS7 network point-code to identify this SGSN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
self-point-code  point-code

no self-point-code
```

**point-code**

Point-code is an SS7 address for an element in the SS7 network. Point-codes must be defined in dotted-decimal format in a string of 1 to 11 digits. Format options include:

- 0.0.1 to 7.255.7 for point-code in the ITU range.
- 0.0.1 to 255.255.255 for point-code in the ANSI range.
- 0.0.1 to 15.31.255 for point-code in the TTC Range.

- a string of 1 to 11 digits in dotted-decimal to represent a point-code in a different range.

**no**

Removes the self-point-code configuration for this linkset in the SS7 routing domain.

**Important:** Removing the self-point-code will result in the termination of all traffic on this link.

**Usage**

Use this command to define the SS7 point-code to identify this system.

**Example**

```
self-point-code 6.192.7
```
Chapter 144
LMA Service Configuration Mode Commands

The LMA Service Configuration Mode is used to create and manage the Local Mobility Anchor configuration supporting Proxy Mobile IP on a PDN Gateway in an eHRPD and E-UTRAN/EPC network.

```
Exec Mode
    configure
        Global Configuration Mode
            context name
                Context Configuration Mode
                    lma-service name
                        LMA Service Configuration Mode
```
**aaa accounting**

Enables the LMA to send AAA accounting information for subscriber sessions.

**Product**
P-GW

**Privilege**
Administrator

**Syntax**

```
[ default | no ] aaa accounting
```

- **default**
  Sets the command to the default condition of enabled.

- **no**
  Disables the ability of the LMA to send AAA accounting information.

**Usage**

Use this command to enable the LMA service to send all accounting data (start, stop, and interim) to the configured AAA servers.

**Important:** In order for this command to function properly, AAA accounting must be enabled for the context in which the LMA service is configured using the `aaa accounting subscriber radius` command.

**Example**
The following command disables aaa accounting for the LMA service:

```
no aaa accounting
```
bind address

Binds the LMA service to a logical IP interface serving as the S2a (HSGW) or S5/S8 (S-GW) interface and specifies the maximum number of subscribers that can access this service over the configured interface.

Product
P-GW

Privilege
Administrator

Syntax

bind address ip_address [ max-subscribers num ]

no bind address

no
Removes the interface binding from this service.

ip_address
Specifies the IPv6 address of the interface configured as the S2a or S5/S8 interface. ip_address is specified in colon separated notation.

max-subscribers num
Default: 3000000
Specifies the maximum number of subscribers that can access this service on this interface. num must be configured to an integer between 0 and 3,000,000.

Important: The maximum number of subscribers supported is dependant on the license key installed and the number of active PSCs in the system. A fully loaded system with 13 active PSCs can support 3,000,000 total subscribers. Refer to the license key command and the Usage section (below) for additional information.

Usage
Associate the LMA service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an S2a or S5/S8 interface that provides the session connectivity to an HSGW (S2a) or S-GW (S5/S8). Only one interface can be bound to a service. The interface should be configured prior to issuing this command.

This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.

When configuring the max-subscribers option, be sure to consider the following:

- The total number of S2a or S5/S8 interfaces you will configure
- The total number of subscriber sessions that all of the configured interfaces may handle during peak busy hours
- An average bandwidth per session multiplied by the total number of sessions
- The type of physical port (10/100Base-T or 1000Base-Tx) that these interfaces will be bound to
Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.

Example
The following command would bind the logical IP interface with the address of 4551::0db8:85a3:08d3:3319:8a2e:0370:1344 to the LMA service and specifies that a maximum of 300,000 simultaneous subscriber sessions can be facilitated by the interface/service at any given time:

```
bind address 4551::0db8:85a3:08d3:3319:8a2e:0370:1344 max-subscribers 300000
```
end

Exits the current mode and returns to the Exec Mode.

**Product**
All

**Privilege**
Administrator

**Syntax**
```
end
```

**Usage**
Change the mode back to the Exec mode.
exit

Exits the current mode and returns to the previous mode.

Product
All

Privilege
Administrator

Syntax
exit

Usage
Return to the previous mode.
refresh-advice-option

Configures inclusion of a refresh advice option in the binding acknowledgement message sent by the LMA.

Product
P-GW

Privilege
Administrator

Syntax

[ default | no ] refresh-advice-option

- **default**
  Returns the command setting to the default setting of disabled.

- **no**
  Disables the inclusion of the refresh advice option in the binding acknowledgement message sent by the LMA

Usage
Use this command to enable the LMA to include this option in a binding acknowledgement sent to the requesting MAG. The option provides a “hint” to the MAG of when it should refresh the binding. As defined in RFC 3775 “Mobility Support in IPv6”, the binding refresh advice option can only be present in the binding acknowledgement sent from the mobile node's home agent in reply to a registration request. A refresh interval parameter determines the amount of time until the mobile node must send a new registration to the home agent to avoid de-registration and loss of session.

**Important**: Refer to the refresh-interval-percent and reg-lifetime commands for a complete understanding of registration (binding) lifetimes and refresh intervals.
refresh-interval-percent

Configures percentage of the granted registration lifetime to be used in the refresh interval mobility option in a binding acknowledgement message sent by the LMA service.

Product
P-GW

Privilege
Administrator

Syntax

```
refresh-interval-percent number
default refresh-interval-percent
```

```
default
Resets the command value to the default setting of 75.

number
Default: 75
Sets the percent value for session lifetimes for this service.
number must be an integer value from 1 to 99.
```

Usage

Use this command to configure the amount of the granted registration lifetime to be used in the refresh interval mobility option in the binding acknowledgement message sent by the LMA service to the requesting MAG.

Refreshing a binding or registration is based on the granted registration lifetime. Since a refresh request must be within the granted range of a registration lifetime, this command provides a method of setting the interval of when a refresh request is sent.

As described in RFC 3775 “Mobility Support in IPv6”, if a binding refresh advice option is present in the binding acknowledgement, the refresh interval field in the option must be a value less than the binding lifetime (also returned in the binding acknowledgement). The mobile node then should attempt to refresh its registration at the shorter refresh interval. The home agent will still honor the registration for the lifetime period, even if the mobile node does not refresh its registration within the refresh period.

Important: Refer to the refresh-advice-option and reg-lifetime commands for a complete understanding of registration (binding) lifetimes and refresh intervals.

Example

The following command sets the refresh interval percent to 90:

```
refresh-interval-percent 90
```
reg-lifetime

Configures the Mobile IPv6 session registration lifetime for this service.

Product
P-GW

Privilege
Administrator

Syntax

reg-lifetime seconds

default reg-lifetime

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resets the command value to the default setting of 600.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 600</td>
</tr>
<tr>
<td>Sets the time value for session lifetimes for this service.</td>
</tr>
<tr>
<td>seconds must be an integer value from 1 to 262140.</td>
</tr>
</tbody>
</table>

Usage
Use this command to limit PMIPv6 lifetime on this service. If the PBU contains a lifetime shorter than what is specified, it is granted. If the lifetime is longer, then HA service will limit the granted lifetime to the configured value.

Important: Refer to the refresh-interval-percent and refresh-advice-option commands for a complete understanding of registration (binding) lifetimes and refresh intervals.

Example
The following command sets the registration lifetime for Mobile IPv6 sessions using this service to 1200 seconds (20 minutes):

    reg-lifetime 1200
revocation

Enables the MIP revocation feature and configures revocation parameters.

Product: P-GW
Privilege: Administrator

Syntax:

- `revocation { enable | max-retransmission number | retransmission-timeout msecs }`
- `default revocation { enable | max-retransmission | retransmission-timeout }
- `no revocation enable`  

- `default`
  Resets the keyword to its default value.

- `no`
  Disables revocation for this service.

- `enable`
  Default: disabled
  Enables the MIP registration revocation feature for the LMA service. When enabled, if revocation is negotiated with a MAG and a MIP binding is terminated, the LMA can send a Revocation message to the MAG. This feature is disabled by default.

- `max-retransmission number`
  Default: 3
  The maximum number of retransmissions of a Revocation message before the revocation fails. `number` must be an integer value from 0 through 10.

- `retransmission-timeout msecs`
  Default: 3000
  The number of milliseconds to wait for a Revocation Acknowledgement from the MAG before retransmitting the Revocation message. `msecs` must be an integer value from 500 through 10000.

Usage:

Use this command to enable or disable the MIP revocation feature on the LMA or to change settings for this feature.

Example:

The following command sets the maximum number of retries for a Revocation message to 6:
The following command sets the timeout between retransmissions to 10:

```
revocation retransmission-timeout 10
```
sequence-number-validate

Confirms sequence number validation of the received MIPv6 control packets by the LMA service according to RFC 3775.

**Product**

P-GW

**Privilege**

Administrator

**Syntax**

[ default | no ] sequence-number-validate

**default**

Resets the command value to the default setting of enabled.

**no**

Disables the feature.

**Usage**

Use this command to configure the sequence number validation of the received MIPv6 control packets (PBUs) by the LMA service. This feature validates MIPv6 control packets and insures that any incoming packets with a sequence number prior to the last number received is consider invalid. If this service has no cache entry of the home address included in the PBU, it will accept any sequence value in the initial PBU from the mobile node.
setup-timeout

The maximum amount of time allowed for session setup.

Product
P-GW

Privilege
Administrator

Syntax

```
setup-timeout seconds

default setup-timeout
```

```
default

 Resets the command value to the default setting of 60.

 seconds

 Default: 60 seconds

 The maximum amount of time, in seconds, to allow for setup of a session in this service. `seconds` must be an integer value from 1 through 1000000.
```

Usage

Use this command to set the maximum amount of time allowed for setting up a session.

Example

The following command sets the maximum time allowed for setting up a session to 5 minutes (300 seconds):

```
setup-timeout 300
```
timestamp-replay-protection

Designates timestamp replay protection scheme as per RFC 4285.

Product
P-GW

Privilege
Administrator

Syntax

```
timestamp-replay-protection tolerance seconds

[ default | no ] timestamp-replay-protection tolerance
```

```
default
Resets the command value to the default setting of 7.

no
Disables the timestamp replay protection feature.

seconds
Default: 7
Defines the acceptable difference in timing (between timestamps) before rejecting packet, in seconds.
seconds must be an integer value between 0 and 65535.
```

Usage

Use this command to define the acceptable difference in timing (between timestamps) before rejecting packet.

Example

The following command sets the acceptable difference for timestamps to 10 seconds:

```
timestamp-replay-protection tolerance 10
```
The LNS Service Configuration Mode is used to create and manage L2TP services within contexts on the system. LNS services facilitate tunneling with peer LACs.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
aaa accounting

Enables the sending of AAA accounting information by the LNS.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

[no] aaa accounting

no

Disables this option.

Usage
Use this command to enable the sending of AAA accounting information by the LNS. By default this is enabled.

Example
The following command enables the sending of AAA accounting information by the LNS:

aaa accounting
authentication

Configures the type of subscriber authentication for PPP sessions terminated at the current LNS.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
authentication { [ [ allow-noauth ] [ chap chap_priority ] [ mschap mschap_priority ] [ pap pap_priority ] ] | msid-auth }
```

**allow-noauth**

Default: Disabled
This option configures the LNS to allow PPP sessions access even though they have not been authenticated.
This command issued by itself causes the LNS to not attempt authentication for any PPP sessions.
When the allow-noauth option is used in conjunction with commands specifying other authentication protocols and priorities to use, then if attempts to use those protocols fail, the system will treat the allow-noauth option as the lowest priority.
If no authentication is allowed, then NAI construct will be implemented in order to provide accounting records for the PPP session.

**chap  chap_priority**

Default: 1
This option configures the LNS to attempt to use the Challenge Handshake Authentication Protocol (CHAP) to authenticate the PPP session.
A *chap_priority* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.
*chap_priority* must be an integer from 1 through 1000. The lower the integer, the higher the preference.
CHAP is enabled by default as the highest preference.

**mschap  mschap_priority**

Default: Disabled
This option configures the LNS to attempt to use the Microsoft Challenge Handshake Authentication Protocol (MSCHAP) to authenticate the PP session.
A *mschap_priority* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.
*mschap_priority* must be an integer from 1 through 1000. The lower the integer, the higher the preference.

**pap  pap_priority**

Default: 2
This option configures the LNS to attempt to use the Password Authentication Protocol (PAP) to authenticate the PPP session.
A *pap_priority* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.
**authentication**

`pap_priority` must be an integer from 1 through 1000. The lower the integer, the higher the preference. PAP is enabled by default as the second highest preference.

**msid-auth**

Default: Disabled
This option configures the LNS to attempt to authenticate the PPP session based on the Mobile Station Identity (MSID).

**Usage**

Use to specify how the LNS service should handle authentication and what protocols to use. The flexibility is given to configure this option to accommodate the fact that not every mobile will implement the same authentication protocols.

The chassis is shipped from the factory with the LNS authentication options set as follows:

- allow-noauth disabled
- chap enabled with a priority of 1
- mschap disabled
- msid-auth disabled
- pap enabled with a priority of 2

**Important:** At least one of the keywords must be used to complete the command.

**Example**

The following command configures the LNS service to allow no authentication for PPP sessions and would perform accounting using the default NAI-construct of username@domain:

```
authentication allow-noauth
```

The following command configures the system to attempt authentication first using CHAP, then MSCHAP, and finally PAP. If the allow-noauth command was also issued, when all attempts to authenticate the subscriber using these protocols failed, then the subscriber would be allowed access:

```
authentication chap 1 mschap 2 pap 3
```
avp map called-number apn

This command maps an incoming AVP to a GGSN APN for authentication and authorization of the call.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
{ default | no } avp map called-number apn
```

**Usage**
For LNS calls received through a LAC, the ICRQ message includes an APN name in the Called Number AVP. This mapping function enables a GGSN system to provide RADIUS authentication/authorization via a defined APN in place of an LNS configuration. If the mapped APN has not been defined within the GGSN configuration then the call will be rejected.

**Example**
Enter the following command to enable mapping:

```
avp map called-number apn
```

Enter the following command to disable mapping:

```
no avp map called-number apn
```
bind

This command assigns the IP address of an interface in the current context to the LNS service.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

bind ip_address  [max-subscribers max_value ]
no bind ip_address

no
Unassign, or unbind, the local end point to the LNS service.

ip_address
The IP address of an interface in the current context. This must be a valid IPv4 address, using dotted-decimal notation.

max-subscribers max_value
Default: 10000
The maximum number of subscribers that can be connected to this service at any time. max_value must be an integer from 1 through 2500000.

Usage
Use this command to bind the IP address of an interface in the current context to the LNS service.

Example
The following command binds the current context interface IP address 192.168.100.10 to the current LNS service:

bind 192.168.100.10

The following command removes the binding of the IP address from the LNS service:

no bind
data sequence-number

Enables data sequence numbering for sessions that use the current LNS service. Data sequence numbering is enabled by default.

**Product**
PDSN, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[no] data sequence-number
```

- **no**
  Disables data sequence numbering for sessions.

**Usage**
An L2TP data packet header has an optional data sequence numbers field. The data sequence number may be used to ensure ordered delivery of data packets. This command is used to re-enable or disable the use of the data sequence numbers for data packets.

**Example**
Use the following command to disable the use of data sequence numbering:

```
no data sequence-number
```

Use the following command to re-enable data sequence numbering:

```
data sequence-number
```
default

This command sets the specified LAC service parameter to its default value or setting.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

default { authentication | data sequence-number | ip source-violation | keepalive-interval | load-balancing | local-receive-window | max-retransmission | max-session-per-tunnel | max-tunnel-challenge-length | max-tunnels | proxy-lcp-authentication | retransmission-timeout-first | retransmission-timeout-max | setup-timeout | single-port-mode | subscriber | trap all tunnel-authentication}

authentication

Sets the authentication parameters for PPP sessions to the following defaults:
- allow-noauth disabled
- chap enabled with a priority of 1
- mschap disabled
- msid-auth disabled
- pap enabled with a priority of 2

data sequence-number

Enables data sequence numbering for sessions.

ip source-violation

Sets the IP source violation parameters to the following defaults:
- drop-limit 10
- period 120 seconds
- reneg-limit 5

keepalive-interval

Sets the interval for send L2TP Hello keepalive if there is no control or data transactions to the default value of 60 secs.

local-receive-window

Sets the window size to be used for the local side for the reliable control transport to the default of 4.

max-retransmission

Sets the maximum number of retransmissions to the default of 5.
max-session-per-tunnel
Sets the maximum number of sessions per tunnel at any point in time to the default of 65535.

max-tunnel-challenge-length
Sets the maximum length of the tunnel challenge to the default of 16 bytes.

max-tunnels
Sets the maximum number of tunnels for this service to the default of 32000.

proxy-lcp-authentication
Sets sending of proxy LCP authentication parameters to the LNS to the default state of enabled.

retransmission-timeout-first
Sets the first retransmit interval to the default of 1 second.

retransmission-timeout-max
Sets the maximum retransmit interval to the default of 8 seconds.

setup-timeout
Sets the maximum time allowed for session setup to the default of 60 seconds.

single-port-mode
Disables assignment of only port 1107 for incoming tunnels and allows dynamic assignment of ports.

subscriber
Sets the name of the default subscriber configuration to use.

tunnel-authentication
Sets tunnel authentication to the default state of enabled.

trap all
Generates all supported SNMP traps.

tunnel-switching
Sets the ability of the LNS to create subsequent tunnels to the default of enabled.

Usage
Use the default command to set LAC service parameters to their default states.

Example
Use the following command to set the keep alive interval to the default value of 60 seconds:

default keepalive-interval
Use the following command to set the maximum number of sessions per tunnel to the default value of 512:

```
default max-session-per-tunnel
```
ip source-violation

This command configures settings related to IP source-violation detection.

**Product**
PDSN, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ip source-violation { clear-on-valid-packet | drop-limit num | period secs | reneg-limit num }
```

```
o ip source-violation clear-on-valid-packet
```

---

**clear-on-valid-packet**

Default: disabled
Configures the service to reset the reneg-limit and drop-limit counters after receipt of a properly addressed packet.

**drop-limit** num

Default: 10
Sets the number of allowed source violations within a detection period before forcing a call disconnect. If num is not specified, the value is set to the default.
num can be any integer value from 1 to 1000000.

**period** secs

Default: 120
The length of time, in seconds, for a source violation detection period to last. drop-limit and reneg-limit counters are decremented each time this value is reached.
The counters are decremented in this manner: reneg-limit counter is reduced by one (1) each time the period value is reached until the counter is zero (0); drop-limit counter is halved each time the period value is reached until the counter is zero (0). If secs is not specified, the value is set to the default.
secs can be any integer value from 1 to 1000000.

**reneg-limit** num

Default: 5
Sets the number of allowed source violations within a detection period before forcing a PPP renegotiation. If num is not specified, the value is set to the default.
num can be any integer value from 1 to 1000000.

---

**Usage**

This function is intended to allow the operator to configure a network to prevent problems such as when a user gets handed back and forth between two PDSNs a number of times during a handoff scenario.
This function operates in the following manner:
When a subscriber packet is received with a source address violation, the system increments both the IP source-violation reneg-limit and drop-limit counters and starts the timer for the IP-source violation period. Every subsequent packet received with a bad source address during the IP-source violation period causes the reneg-limit and drop-limit counters to increment.

For example, if reneg-limit is set to 5, then the system allows 5 packets with a bad source address (source violations), but on the 5th packet, it re-negotiates PPP.

If the drop-limit is set to 10, the above process of receiving 5 source violations and renegotiating PPP occurs only once. After the second 5 source violations, the call is dropped. The period timer continues to count throughout this process.

If at any time before the call is dropped, the configured source-violation period is exceeded, the counters for drop-limit is decremented by half and reneg-limit is decremented by 1. See period definition above.

Example
To set the maximum number of source violations before dropping a call to 100, enter the following command:

```
ip source-violation drop-limit 100
```
keepalive-interval

This command specifies the amount of time to wait before sending a Hello keep alive message.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
keepalive-interval seconds
no keepalive-interval

seconds
```

Disables the generation of Hello keep alive messages on the tunnel.

Usage

Use this command to set the amount of time to wait before sending a Hello keep alive message or disable the generation of Hello keep alive messages completely. A keep alive mechanism is employed by L2TP in order to differentiate tunnel outages from extended periods of no control or data activity on a tunnel. This is accomplished by injecting Hello control messages after a specified period of time has elapsed since the last data or control message was received on a tunnel. As for any other control message, if the Hello message is not reliably delivered then the tunnel is declared down and is reset. The transport reset mechanism along with the injection of Hello messages ensures that a connectivity failure between the LNS and the LAC is detected at both ends of a tunnel.

Example

Use the following command to set the Hello keep alive message interval to 120 seconds:
```
keepalive-interval 120
```

Use the following command to disable the generation of Hello keep alive messages:
```
nocfg
```

Keepalive-Interval
local-receive-window

Specifies the number of control messages the remote peer LAC can send before waiting for an acknowledgement.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
local-receive-window integer
```

*integer*
Default: 4
The number of control messages to send before waiting for an acknowledgement. The number can be configured to any integer value from 1 through 256.

Usage
Use this command to set the size of the control message receive window being offered to the remote peer LAC. The remote peer LAC may send the specified number of control messages before it must wait for an acknowledgment.

Example
The following command sets the local receive window to 10 control messages:

```
local-receive-window 10
```
max-retransmission

Sets the maximum number of retransmissions of a control message to a peer before the tunnel and all sessions within it are cleared.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
max-retransmission integer
```

```
ing \textit{integer}

Default: 5
The maximum number of retransmissions of a control message to a peer. This value must be an integer from 1 through 10.
```

Usage

Each tunnel maintains a queue of control messages to be transmitted to its peer. After a period of time passes without acknowledgement, a message is retransmitted. Each subsequent retransmission of a message employs an exponential backoff interval. For example; if the first retransmission occurs after 1 second, the next retransmission occurs after 2 seconds has elapsed, then the next after 4 seconds. If no peer response is detected after the number of retransmissions set by this command, the tunnel and all sessions within are cleared.
Use this command to set the maximum number of retransmissions that the LAC service sends before closing the tunnel and all sessions within it.

Example

The following command sets the maximum number of retransmissions of a control message to a peer to 7:

```
max-retransmissions 7
```
max-session-per-tunnel

Sets the maximum number of sessions that can be facilitated by a single tunnel at any time.

**Product**
PDSN, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
max-sessions-per-tunnel integer
```

- **integer**
  - Default: 512
  - The maximum number of sessions. This value must be from 1 through 65535.

**Usage**
Use this command to set the maximum number of sessions you want to allow in a tunnel.

**Example**
The following command sets the maximum number of sessions in a tunnel to 5000:

```
max-sessions-per-tunnel 5000
```
max-tunnel-challenge-length

Sets the maximum length of the tunnel challenge in bytes. The challenge is used for tunnel authentication purposes during tunnel creation.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
max-tunnel-challenge-length bytes
```

**bytes**
Default: 16
The number of bytes to set the maximum length of the tunnel challenge. This must be a value from 4 through 32.

Usage
Use this command to set the maximum length, in bytes, for the tunnel challenge that is used during tunnel creation.

Example
The following command sets the maximum length of the tunnel challenge to 32 bytes:
```
max-tunnel-challenge-length 32
```
max-tunnels

The maximum number of tunnels that the current LNS service can support.

**Product**
PDSN, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
max-tunnels integer
```

- `integer`
  
  Default: 32000
  
  The maximum number of tunnels. This value must be an integer from 1 to 32000.

**Usage**

Use this command to set the maximum number of tunnels that this LNS service can support at any one time.

**Example**

Use the following command to set the maximum number of tunnels for the current LNS service to 20000:

```
max-tunnels 20000
```
nai-construction domain

Designates the alias domain name to use for Network Access Identifier (NAI) construction.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
no nai-construction-domain
```

```
domain_name { @ | % | - | \ | # | / }
```

The desired domain name alias followed immediately by a separator from the valid list. `domain_name` must be a string of from 1 through 79 alphanumeric characters.

Usage
Use this command to specify the domain alias and separator to use for NAI construction. The specified domain name must be followed by a valid separator (@ | % | - | \ | # | /).

Example
To specify a domain alias of mydomain with a separator of @, enter the following command:
```
nai-construction-domain mydomain@
```
To delete the current setting for the NAI construction domain alias, enter the following command:
```
no nai-construction-domain
```
peer-lac

Adds a peer LAC address for the current LNS service. Up to 8 peer LACs can be configured for each LNS service.

**Product**
PDSN, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
peer-lac {ip_address | ip_address/mask} [encrypted] secret secret [description text]
no peer-lac ip_address
```

**no peer-lac ip_address**
Deletes the peer LAC IP address specified by `ip_address`. `ip_address` must be entered in standard IPv4 dotted decimal notation.

**ip_address**
The IP address of a specific peer LAC for the current LNS service. `ip_address` must be entered in standard IPv4 dotted decimal notation.

**ip_address/mask**
A network prefix and mask enabling communication with a group of peer LACs. `ip_address` is the network prefix expressed in dotted decimal notation. `mask` is the number of bits that defines the prefix.

**[encrypted]**
Specifies the encrypted shared key between the LAC and the LNS service. This keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the secret keyword is the encrypted version of the plain text secret. Only the encrypted secret is saved as part of the configuration file.

**secret secret**
Designates the secret which is shared between the current LNS service and the peer LAC. `secret` must be a string from 1 to 127 alpha and/or numeric characters and is case sensitive.

**description text**
Specifies the descriptive text to use to describe the specified peer LAC. `text` must be 0 to 79 alpha and/or numeric characters with no spaces or a quoted string of printable characters.

**Usage**

Use this command to add a peer LAC address for the current LNS service. Specific peer LACs can be configured by specifying their individual IP addresses. In addition, to simplify configuration, communication with a group of peer LACs can be enabled by specifying a network prefix and a mask.
Example
The following command adds a peer LAC to the current LNS service with the IP address of 10.10.10.100, and specifies the shared secret to be 1b34nnf5d:
peer-lac 10.10.10.100 secret 1b34nnf5d
The following command enables communication with up to 16 peer LACs on the 192.168.1.0 network each having a secret of abc123:
peer-lac 192.168.1.0/28 secret abc123
The following command removes the peer LAC with the IP address of 10.10.10.200 for the current LNS service:
no peer-lac 10.10.10.200
### proxy-lcp-authentication

Enables/disables proxy LCP authentication.

**Product**

PDSN, GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy-lcp-authentication</td>
<td>Enables the processing proxy LCP authentication parameters from the LAC.</td>
</tr>
<tr>
<td>no proxy-lcp-authentication</td>
<td>Disables the processing of proxy LCP authentication parameters from the LAC.</td>
</tr>
</tbody>
</table>

**Usage**

When enabled, if proxy LCP authentication parameters are received from the LAC and are acceptable, the LNS resumes the PPP session from the authentication phase and goes to the IPCP phase. When disabled, PPP is always started from the LCP phase, ignoring and discarding any proxy LCP authentication parameters received from the LAC. Disable this feature in situations where accept proxy LCP Auth AVPs that the peer LAC sends should not be expected.

**Example**

Use the following command to disable the processing of proxy LCP authentication parameters from the LAC:

```plaintext
no proxy-lcp-authentication
```

Use the following command to re-enable the processing of proxy LCP authentication parameters from the LAC:

```plaintext
proxy-lcp-authentication
```
retransmission-timeout-first

Configures the initial timeout for the retransmission of control messages to the peer LAC.

Privilege
Security Administrator, Administrator

Syntax
```
retransmission-timeout-first integer
```

integer
Default: 1
The amount of time to wait before sending the first control message retransmission. This value is measured in seconds and must be an integer from 1 to 100.

Usage
Each tunnel maintains a queue of control messages to transmit to its peer. After a period of time passes without acknowledgement, a message is retransmitted.

Example
The following command sets the initial retransmission timeout to 3 seconds:
```
retransmission-timeout-first 3
```
retransmission-timeout-max

Configures the maximum amount of time that can elapse before retransmitting control messages to the peer LAC.

Privilege
Security Administrator, Administrator

Syntax
```
retransmission-timeout-max integer
```

integer
Default: 8
The maximum time to wait before retransmitting control messages. If this limit is reached, the tunnel, and all sessions within it, is cleared. This value is measured in seconds and must be an integer in the range of 1 to 100.

Usage
Each tunnel maintains a queue of control messages to transmit to its peer. After a period of time passes without acknowledgement, a message is retransmitted. Each subsequent retransmission of a message employs an exponential backoff interval. For example; if the first retransmission occurs after 1 second, the next retransmission occurs after 2 seconds has elapsed, then the next after 4 seconds. This continues until the limit set by this command is reached. If this limit is reached, the tunnel, and all sessions within it, is cleared.

Example
Use the following command to set the maximum retransmission time-out to 10 seconds:
```
retransmission-timeout-max 10
```
setup-timeout

Configures the maximum amount of time, in seconds, allowed for session setup.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
setup-timeout seconds
```

seconds
Default: 60
The maximum time to wait, in seconds, for the setup of a session. seconds must be an integer from 1 through 1000000.

Usage
This command controls the amount of time allowed for tunnel establishment with a peer LAC. If this timer is exceeded the tunnel setup is aborted.

Example
The following command configures a maximum setup time of 120 seconds:

```
setup-timeout 120
```
**single-port-mode**

When enabled, this command sets the LNS to use only the default local UDP port (port 1701) for the life of a tunnel.

**Product**

PDSN, GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>single-port-mode</code></td>
<td>Enable single port mode</td>
</tr>
<tr>
<td><code>no single-port-mode default single-port-mode</code></td>
<td>Disable single port mode</td>
</tr>
<tr>
<td><code>no</code></td>
<td>Disable single port mode</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to control the L2TP LNS tunnel local UDP port assignment mode. If single-port-mode is enabled, the LNS-service uses the standard UDP port (port 1701) for the life of the incoming tunnel. Otherwise, it assigns a new local UDP port number for a tunnel when it responds to a tunnel create request received on the standard port number. This is done for load distributing the tunnel processing between multiple tasks within the system to increase the capacity and performance. Even though all L2TP LACs are required to support such dynamic port assignments during tunnel establishments, there exist some LACs that do not support port assignment other than port 1701. This single-port-mode feature can be enabled to support such LAC peers. This configuration must be applied for the LNS-Service before the `R_bind` command is executed.

**Example**

The following command enables single port mode for the current LNS service:

```
single-port-mode
```
**trap**

This command generates SNMP traps.

**Product**

PDSN, GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
trap all  
no trap all
```

Use this command to enable/disable all supported SNMP traps.

**Example**

To enable all supported SNMP traps, enter the following command:

```
trap all
```
**tunnel-authentication**

Enables/disables L2TP tunnel authentication for the LNS service.

**Product**

PDSN, GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
tunnel-authentication
no tunnel-authentication

no
```

Disables tunnel authentication
Tunnel authentication is enabled by default.

**Usage**

When tunnel authentication is enabled, a configured shared secret is used to ensure that the LNS service is communicating with an authorized peer LAC. The shared secret is configured by the `R_peer-lac` command, the `R_tunnel l2tp` command in the Subscriber Configuration mode, or the `Tunnel-Password` attribute in the subscribers RADIUS profile.

**Example**

To disable tunnel authentication, use the following command:
```
no tunnel-authentication
```

To re-enable tunnel authentication, use the following command:
```
tunnel-authentication
```
tunnel-switching

Enables/disables the LNS service from creating tunnels to another LAC for an existing tunnel.

**Product**
PDSN, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
tunnel-switching
no tunnel-switching
```

```
no

Disable tunnel switching.
Tunnel switching is enabled by default.
```

**Usage**

Tunnel switching is when the LNS has a tunnel connected to a LAC and creates a tunnel to a different LAC and routes the data from the original LAC through the new tunnel to the other LAC.

**Example**

To disable tunnel switching in the LNS, enter the following command;

```
no tunnel-switching
```
The Loopback Interface Configuration Mode is used to create and manage loopback interfaces that provide IP addresses that are always available and reachable from any interface within the same given context.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
description

Configures the description text for the current interface.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
description text
no description
```

- **no**
  Clears the description for the interface.

- **text**
  Specifies the descriptive text to use. `text` must be 0 to 79 alpha and/or numeric characters with no spaces or a quoted string of printable characters

Usage

Set the description to provide useful information on the interface’s primary function, services, end users, etc. Any information useful may be provided.

Example

description sampleInterfaceDescriptiveText
end

Exits the interface configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
end
```

**Usage**

Change the mode back to the Exec mode.
exit

Exits the interface configuration mode and returns to the context configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Return to the context configuration mode.
ip address

Configures the IP options for the current interface.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
ip address {ip_address/ip_mask | ip_address/bitmask} [secondary | srp-activate]
o ip address ip_address
```

no ip address ip_address

no
Deletes the specified IP address from the interface configuration.

```
address {ip_address/ip_mask | ip_address/bitmask} [secondary | srp-activate]
```

Configures the IP address and network mask for the interface.

- `ip_address/ip_mask` specifies an IP address and the subnet mask pair which is used to identify the IP address of the interface. `ip_address` must be specified using the standard IPv4 dotted decimal notation. Currently, the only value accepted for ip_mask is 255.255.255.255.
- `ip_address/net_mask`: the IP address and the length in bits of the network mask. This must be an IP address entered in dotted decimal notation and a mask (192.168.1.0/32). Currently, the only value accepted for bit_mask is 32.

The `secondary` keyword is used to configure a secondary IP address on the interface. This is referred to as multi-homing of the interface.

The `srp-activate` keyword activates the IP address for Interchassis Session Redundancy.

Usage

Create and manage loopback interfaces for the current context.

Example

The following command configures IP address to associate with the interface:

```
ip address 1.2.3.4 255.255.255.255
```

The following command removes the associated IP address for the interface:

```
no ip address 1.2.3.4
```
ip vrf

This command configures the IP VPN Routing/Forwarding instance for the current interface.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
ip vrf forwarding vrf_name
no vrf forwarding
```

no

Deletes the specified IP VPN routing/forwarding instance from the interface configuration.

```
vrf_name
```

Specifies the preconfigured IP VPN routing/forwarding instance name which is to be used with this interface. `vrf_name` must be a preconfigured VPN routing/forwarding instance name with `ip vrf forwarding` command in Context Configuration Mode.

Usage

Use this command to associate a preconfigured IP VPN Routing/Forwarding instance for the current interface.

Example

The following command associates a preconfigured IP routing/forwarding instance named `vrf_1` with this interface:

```
ip vrf forwarding vrf_1
```
ipv6 address

Configures the IPv6 options for the current interface.

Product
All

Privilege
Security Administrator, Administrator

Syntax

ipv6 address ipv6_address ip_mask [ srp-activate ]
no ipv6 address ipv6_address

no
Deletes the specified IPv6 address from the interface configuration.

address ipv6_address ip_mask [ srp-activate ]
Configures the IP address and network mask for the interface.
ipv6_address ip_mask specifies an IP address and the subnet mask pair which is used to identify the IPv6 address of the interface. ipv6_address must be specified using the standard IPv6 dotted decimal notation.
The srp-activate keyword activates the IPv6 address for Session Recovery.

Usage
Create and manage loopback interfaces for the current context and enable Session Redundancy Protocol (SRP) when appropriate.

Example
The following command configures an IPv6 address to associate with the interface and enables SRP:

ipv6 address 2001:268:2008::1021/128 srp-activate
Chapter 147
MAG Service Configuration Mode Commands

The MAG Service Configuration Mode is used to create and manage a Mobility Access Gateway service in an HSGW (eHRPD network) or a P-MIP S-GW (LTE-SAE network). The MAG is the PMIP client and communicates with the Local Mobility Anchor (LMA) configured on a PDN Gateway.

```
Exec Mode

configure

Global Configuration Mode

context name

Context Configuration Mode

mag-service name

MAG Service Configuration Mode
```
**bind address**

Binds the service to a logical IP interface serving as the S2a (HSGW) or S5/S8 (S-GW) interface and specifies the maximum number of subscribers that can access this service over the configured interface.

**Product**
HSGW, S-GW

**Privilege**
Administrator

**Syntax**

```plaintext
bind address ip_address [ max-subscribers num ]
```

**no bind address**

---

**no**
Removes the interface binding from this service.

**ip_address**
Specifies the IPv6 address of the interface configured as the S5/S8 interface. `ip_address` is specified in colon separated notation.

**max-subscribers num**
Default: 1500000
Specifies the maximum number of subscribers that can access this service on this interface. `num` must be configured to an integer between 0 and 3000000.

---

**Important:** The maximum number of subscribers supported is dependant on the license key installed and the number of active PSCs in the system. A fully loaded system with 13 active PSCs can support 3,000,000 total subscribers. Refer to the license key command and the Usage section (below) for additional information.

**Usage**

Associate the MAG service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an S2a or S5/S8 interface that provides the session connectivity to/from a PDN gateway. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.

This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.

When configuring the `max-subscribers` option, be sure to consider the following:
- The total number of S2a or S5/S8 interfaces you will configure
- The total number of subscriber sessions that all of the configured interfaces may handle during peak busy hours
- An average bandwidth per session multiplied by the total number of sessions
- The type of physical port (10/100Base-T or 1000Base-Tx) that these interfaces will be bound to
Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.

**Example**
The following command would bind the logical IP interface with the address of 4551:0db8:85a3:08d3:3319:8a2e:0370:1344 to the MAG service and specifies that a maximum of 300,000 simultaneous subscriber sessions can be facilitated by the interface/service at any given time:

```
bind address 4551:0db8:85a3:08d3:3319:8a2e:0370:1344 max-subscribers 300000
```
encapsulation

Configures data encapsulation type to be used for specific MAG service.

Product
HSGW, S-GW

Privilege
Administrator

Syntax

encapsulation { gre | ipip }
default encapsulation

default
Resets the encapsulation type to be used by this service to the default option of GRE.

{ gre | ipip }
gre: Specifies that GRE encapsulation is to be used for PMIPv6 tunnel data between the MAG and the LMA. This is the default for this command.
ipip: Specifies that IP-in-IP encapsulation is to be used for PMIPv6 tunnel data between the MAG and the LMA.

Usage
Use this command to select the encapsulation type to be used for PMIPv6 tunnel data between the MAG and the LMA.

Example
The following command sets the encapsulation data to IP-in-IP:

encapsulation ipip
end

Exits the current mode and returns to the Exec Mode.

**Product**
All

**Privilege**
Administrator

**Syntax**
```
end
```

**Usage**
Change the mode back to the Exec mode.
exit

Exits the current mode and returns to the previous mode.

Product
All

Privilege
Administrator

Syntax
exit

Usage
Return to the previous mode.
information-element-set

Identifies the information element set of mobility options to be used in Proxy Binding Update (PBU) messages sent by the MAG to the LMA.

Product
HSGW, S-GW

Privilege
Administrator

Syntax

information-element-set { custom1 | standard }

default information-element-set

default

Resets the command to the default value of “standard”.

{ custom1 | standard }

custom1: Specifies that a custom set of mobility options to be used in proxy binding update messages that are sent in Vendor Specific Mobility Options. These options are:
• User Location Info
• Hardware Identifier
• Access Network Charging Identifier

standard: Specifies that a standard set of mobility options are to be used in proxy binding update messages. The 3GPP specification, 29.275 defines these as Protocol Configuration Options.

Usage

Use this command to identify the type of information element set of mobility options to be used in PBU messages sent from the MAG to the LMA. The mobility options can be either standards-based (3GPP 29.275) or custom (vendor-specific as defined by 3GPP 29.275).

Example

The following command identifies the information element set of mobility options to use in PBU messages as custom:

information-element-set custom1
max-retransmissions

Configures maximum number of retransmissions of Proxy MIP control messages to the LMA.

**Product**
HSGW, S-GW

**Privilege**
Administrator

**Syntax**

```
max-retransmissions num

default max-retransmissions
```

**default**
Rests the maximum number of allowed retransmissions to the default value of 5.

**num**
Default: 5
Specifies the maximum number of times the MAG service will attempt to communicate with the LMA before it marks it as unreachable. count can be configured to any integer value between 1 and 4294967295.

**Usage**
Use this command to limit the number of retransmissions to LMA before marking it as unreachable. If the value configured is reached, the call is dropped.

**Example**
The following command configures the maximum number of retransmissions for the MAG service to 3:

```
max-retransmissions 3
```
**reg-lifetime**

Configures the Mobile IPv6 session registration lifetime for this service.

**Product**
HSGW, S-GW

**Privilege**
Administrator

**Syntax**

```plaintext
reg-lifetime seconds
```

**default reg-lifetime**

```plaintext
default
```

Reset the command value to the default setting of 600.

```plaintext
seconds
```

Default: 600
Sets the time value for session lifetimes for this service.

*seconds* must be an integer value from 1 to 262140.

**Usage**

Use this command to limit PMIPv6 lifetime on this service. If the PBA from the LMA contains a lifetime shorter or longer than what is specified, it is used instead.

**Example**

The following command sets the registration lifetime for Mobile IPv6 sessions using this service to 1200 seconds (20 minutes):

```plaintext
reg-lifetime 1200
```
renew-percent-time

Configures percentage of lifetime at which a registration renewal is sent to the LMA.

Product
HSGW, S-GW

Privilege
Administrator

Syntax

```
renew-percent-time percent
default renew-percent-time
```

default
Resets the command to the default value of 75.

percent
Default: 75
Specifies the time when the registration renewal is sent to the LMA. `percent` is a percentage value of the registration lifetime and must be an integer value from 1 to 100.

Usage
Use this command to specify when a registration renewal is sent to the LMA for subscribers using this service.
If the registration lifetime is 600 seconds (10 minutes) and this command is set to 75 (percent), then the registration renewal message is sent after 450 seconds of the registration lifetime has expired.

Example
The following command sets the registration renewal time for subscribers using this service to 90 percent of the registration lifetime:

```
renew-percent-time 90
```
retransmission-policy

Configures the retransmission policy for Proxy MIP control message retransmissions.

Product
HSGW

Privilege
Administrator

Syntax

retransmission-policy { exponential-backoff | normal }

default retransmission-policy

- default
  Returns the command to its default setting of exponential-backoff.

{ exponential-backoff | normal }

- exponential-backoff
  Specifies that the Proxy Binding Update retransmission uses an exponential backoff to increase the retransmission timeout for each retry.

- normal
  Specifies that the Proxy Binding Update retransmission uses the configured retransmission timeout value for all PBU retransmission retries.

Usage

Use this command to specify the retransmission policy for PMIP control messages.

Example

The following command sets the retransmission timeout policy for PMIP control packets to “normal”:

retransmission-policy normal
retransmission-timeout

Configures the maximum allowable time for the MAG service to wait for a response from the LMA before it attempts to communicate with the LMA again (if the system is configured to retry the LMA) or marks the LMA as unreachable.

Product
HSGW, S-GW

Privilege
Administrator

Syntax

retransmission-timeout time

{ default | no } retransmission-timeout

default
Resets the timeout setting to the default value of 3.

no
Deletes a previously configured timeout value.

time
Default: 3 seconds (300)
Specifies the maximum allowable time, in milliseconds, for the MAG service to wait for a response from the LMA before it: a) attempts to communicate with the LMA again (if the system is configured to retry the LMA) or b) marks the LMA as unreachable.
time must be an integer value between 100 and 100000.

Usage
Use the retransmission timeout command in conjunction with the max-retransmissions command in order to configure the MAG services behavior when it does not receive a response from a particular LMA.

Example
The following command configures a retransmission timeout value of 5 seconds:

retransmission-timeout 5
Chapter 148
MAP Service Configuration Mode Commands

The MAP Service Configuration Mode is used to configure properties for Mobile Application Part (MAP) service. Mobile Application Part (MAP) is a protocol which provides an application layer for the various nodes in the core mobile network and GPRS and UMTS core network to communicate with each other in order to provide services to mobile phone users. The MAP service provides the application-layer protocol support used to access the Home Location Register (HLR).

---

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
access-protocol

Configures access protocol parameters for the MAP service as defined for a specific SCCP network instance.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
access-protocol sccp-network sccp_id
no access-protocol

sccp-network sccp_id
Specifies the ID number of the SCCP network to use for the SGSN connection.
sccp_id: Must be an integer from 1 to 16.

no
Removes the access protocol SCCP network instance ID from the configuration.
```

**Usage**
Use this command to associate access protocol parameters to a specific instance of the MAP service for an SCCP network.

**Example**
The following command associates the access protocols with the SCCP network ID #10:

```plaintext
access-protocol sccp-network 10
```
**application-context-name**

Configure the operation timer(s) for one or more MAP application contexts.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
application-context-name application operation-timer value
default application-context-name application operation-timer
```

**default**

Resets the operation timers for all applications to system defaults.

**application**

Select one of the following applications to enable the application:

- **authentication-failure-report**: Sets the reporting operation timer for authentication failure. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **cancel-location**: Sets the cancel location operation timer. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **check-imei**: Sets the check-IMEI operation timer. The setting range for this timer is 15 to 30 seconds for releases 8.0 and 8.1 and 1 to 30 seconds for releases 9.0 and higher. The default setting is 15 seconds.
- **delete-subscriber-data**: Sets the delete subscriber data operation timer. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **mo-fwd-sm**: Sets the operation timer for forwarding mobile-originated SMS. The setting range for this timer is 1 to 10 minutes and the default setting is 1 minute (60 seconds).
- **ms-purge**: Sets the operation timer for MS-purge function. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **mt-fwd-sm**: Sets the operation timer for forwarding mobile-terminated SMS. The setting range for this timer is 1 to 10 minutes and the default setting is 1 minute (60 seconds).
- **ready-for-sm**: Sets the operation timer for the ready for SMS operation. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **send-authentication-info**: Sets the operation timer for the sending authentication information operation. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **stand-alone-insert-subscriber-data**: Sets the operation timer for the standalone insert subscriber data operation. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
• **ugl-insert-subscriber-data**: Sets the operation timer for the insert subscriber data portion of the update GPRS location operation. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.

• **update-gprs-location**: Sets the operation timer for the update GPRS location operation. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.

```plaintext
operation-timer value
```

Configures the operation timer for the selected application. Timer values are indicated above.

**Usage**

Repeat this command entering a different application each time to enable multiple applications.

**Example**

```plaintext
application-context-name stand-alone-insert-subscriber-data operation-timer operation-timer 20
```
auth-vectors

Configures the number of authorization vectors to be requested from the home location register (HLR) during call setup to provide subscriber authentication.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
auth-vectors number-to-request number

default auth-vectors number-to-request
```

- **default**
  Resets the number of vectors requested from the HLR to the system default.

- **number-to-request number**
  
  `number`: Must be an integer from 1 to 5 to define the number of authorization vectors be requested from the HLR.
  Default is 5.

**Usage**

Set the number of requests to be received from the HLR.

**Example**

```
auth-vectors number-to-request 4
```
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Return to the Exec mode.
equipment-identity-register

Defines the address of the equipment-identity-register (EIR) used by the SGSN.

Product  
SGSN

Privilege  
Security Administrator, Administrator

Syntax

equipment-identity-register { isdn E.164_num | point code pt_code } [ source-ssn ssn | checkimei-every-n-events times]

no equipment-identity-register { isdn E.164_num | point codept_code }

no

Deletes the EIR configuration.

isdn number

Enter the E.164 number of the EIR.

number: must be a string of 1 to 15 digits.

point code pt_code

Enter SS7 point code address of the EIR in dotted-decimal format according to variant settings:

- ITU Range 0.0.1 to 7.255.7
- ANSI Range 0.0.1 to 255.255.255
- TTC Range 0.0.1 to 15.31.255
- or a string of 1 to 11 characters

source-ssn ssn

Identifies the subsystem number (SSN) to be used.

ssn must be an integer from 1 to 255.

checkimei-every-n-events times

Configures the frequency with which a ‘check IMEI’ message is sent to the EIR. When set, the SGSN skips sending the ‘check IMEI’ message for the first N-1 received attach requests.

times must be an integer from 1 to 15.

Important: This feature must be enabled by enabling verify-equipment-identity in the gmm retrieve-equipment-identity imei command of the SGSN Operator Policy configuration mode.

Usage

Configure the identity of the EIR that the SGSN uses and the interaction parameters.
Example

equipment-identity-register point code 7.255.7
exit

Exits the current configuration mode and returns to the global configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Return to the context configuration mode.
This command enters the configuration mode for the home location register (HLR). The HLR is a database containing the subscriber profile information for all mobile stations (MS) / user equipment (UE) connecting to a specific GPRS or UMTS core network.

**Important:** The commands and options for this mode are documented in the HLR Configuration Mode chapter.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
hlr
```
policy

This command configures the Transaction Capabilities Application Part (TCAP) -specific MAP policy for either ANSI or ITU SS7 variants.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

[ default ] policy tcap { use-received-destination-address | use-received-source-address }

use-received-destination-address
Selecting this keyword overwrites stored CG and CD addresses with a new address received in first TC CNT msg

use-received-source-address
Selecting this keyword instructs the MAP service to use the received source address for the dialog.

Usage
Use this command to determine how TCAP will handle MAP messages.

Example

policy tcap use-received-destination-address
short-message-service

This command enables and disables the short message service (SMS service) and provides access to the SMS service configuration mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

\[
\text{[ no ] short-message-service}
\]

\[
\text{no}
\]

Disables the SMS service.

**Usage**
Enter the command to access the SMS service configuration mode to fine tune the SMS functionality.

**Example**

short-message-service
Chapter 149
MIP HA Assignment Table Configuration Mode Commands

The Mobile IP HA Assignment Table Configuration Mode is used to assign specific HA IP addresses to ranges of Mobile Node IP addresses.
end

Exits the current configuration mode and returns to the Exec mode.

**Product**

PDSN, HA

**Privilege**

Security Administrator, Administrator

**Syntax**

```bash
end
```

**Usage**

Returns to the Exec mode.
exit

Exits the current configuration mode and returns to the Context configuration mode.

**Product**
PDSN, HA

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Return to the Context Configuration mode.
hoa-range

This command assigns ranges of Mobile Node (MN) IP addresses to specific Home agent IP addresses.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

hoa-range ip_address ip_address2 ha ip_address3
no hoa-range ip_address ip_address2 ha ip_address3

no
Remove the specified Home Agent assignment from the assignment table.

ip_address ip_address2
Specifies a range of MN IP addresses. ip_address and ip_address2 must be specified in either IPv4 dotted decimal notation or IPv6 colon notation.

ha ip_address3
Specifies the IP address of the Home Agent to assign to MNs that are within the specified range. ip_address3 must be specified in either IPv4 dotted decimal notation or IPv6 colon notation.

Usage
Use this command to assign ranges of MN IP addresses to specific HAs.

Important: A maximum of 8 MIP HA assignment tables can be configured per context with a maximum of 8 MIP HA assignment tables across all contexts.

Important: A maximum of 256 non-overlapping hoa-ranges can be configured per MIP HA Assignment table with a maximum of 256 non-overlapping hoa-ranges across all MIP HA Assignment tables.

Example
The following command assigns any MN IP address that falls in the range of 192.168.100.0 through 192.168.101.0 to the HA with the IP address of 192.168.200.10:

    hoa-range 192.168.100.0 192.168.101.0 ha 192.168.200.10
Chapter 150
MIPv6HA Service Configuration Mode Commands

The MIPv6 HA Service Configuration Mode is used to create and manage MIPv6 access privileges.

---

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
aaa accounting

Configures the sending of subscriber session AAA accounting by the HA service.

**Product**
PDSN, HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
aaa accounting
no aaa accounting
```

**Usage**
Enabling the HA service will send all accounting data (start, stop, and interim) to the configured AAA servers.
The chassis is shipped from the factory with the AAA accounting enabled.

**Important:** In order for this command to function properly, AAA accounting must be enabled for the context in which the HA service is configured using the `aaa accounting subscriber radius` command.

AAA accounting for the HA service can be disabled using the `no` version of the command.

**Example**
The following command disables aaa accounting for the HA service:

```
no aaa accounting
```
**bind**

Designates the address of the MIPv6HA service and specifies the maximum number of subscribers that can access this service over the interface.

**Product**
PDSN, HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
bind address IPv6_address [ max-subscribers count ]
no bind address
```

- **address**
  
  Specifies the IPv6 address (address) of the MIPv6HA service. The IPv6 address size is 128 bits. The preferred IPv6 address representation is: xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx where each x is a hexadecimal digit representing 4 bits.

- **max-subscribers count**
  
  Default: 3000000
  
  Specifies the maximum number of subscribers that can access this service on this interface. **count** can be configured to any integer value between 0 and 3,000,000.
default

Restore default values assigned for specified parameter.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax

```
default { aaa | refresh-advice-option | refresh-interval-percent | reg-lifetime | sequence-number-validate | setup-timeout | simul-bindings | subscriber | timestamp-replay-protection }
```

**default**
Restores the default values assigned for specified parameter.

**aaa**
Restores the aaa setting configured by the aaa command to its default of enabled.

**refresh-advice-option**
Restores the refresh-advice-option setting to its default of disabled.

**refresh-interval-percent**
Restores the refresh-interval-percent setting to its default of 75.

**reg-lifetime**
Restores the Mobile IP session registration lifetime setting configured by the reg-lifetime command to its default: 600 seconds.

**sequence-number-validate**
Restores the sequence-number-validate setting to its default of enabled.

**setup-timeout**
Restores the maximum amount of time allowed for setting up a session to the default: 60 seconds.

**simul-bindings**
Restores the simultaneous bindings setting to its default: 1.

**subscriber**
Configures settings for the default subscriber.

**timestamp-replay-protection**
Restores the timestamp-replay-protection scheme according to RFC 4285.

Usage
After the system has been modified from its default values, this command is used to set/restore specific parameters to their default values.

**Example**
The following command is used to return the simultaneous bindings setting parameter to it’s default value:

```plaintext
default simul-bindings
```
end

Exits the HA service configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Change the mode back to the Exec mode.
**exit**

Exits the HA service configuration mode and returns to the context configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Return to the context configuration mode.
**refresh-advice-option**

Confirms inclusion of refresh advice option in Binding Acknowledgement sent by Home Agent (HA).

**Product**
PDSN, HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
refresh-advice-option
```

**Usage**

Includes the refresh advice option in the binding acknowledgements sent by the home agent. Default is disabled.
refresh-interval-percent

Configures percentage of the granted lifetime to be used in the refresh interval mobility option in Binding Acknowledgement sent by Home Agent (HA).

**Product**
PDSN, HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
refresh-interval-percent value
```

- **value**
  - Value represents a percentage. Default is 75.

**Usage**
Use this command to configure the amount of the granted lifetime to be used in the refresh interval mobility option in Binding Acknowledgement sent by Home Agent (HA).

**Example**
The following command sets the refresh-interval-percent value to 50%:

```
refresh-interval-percent 50
```
**reg-lifetime**

Specifies the longest registration lifetime that the HA service will allow in any Registration Request message from the mobile node.

**Product**
PDSN, HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
reg-lifetime time

no reg-lifetime
```

- **no**
  Sets the registration lifetime to infinite.

- **time**
  Specifies the registration lifetime.
  time is measured in seconds and can be configured to any integer value between 1 and 262140. Default is 600.

**Usage**

Use to limit a mobile nodes lifetime. If the mobile node requests a shorter lifetime than what is specified, it is granted. However, Per RFC 2002, should a mobile node request a lifetime that is longer than the maximum allowed by this parameter, the HA service will respond with the value configured by this command as part of the Registration Reply.

The chassis is shipped from the factory with the registration lifetime set to 600 seconds.

**Example**
The following command configures the registration lifetime for the HA service to be 2400 seconds:

```
reg-lifetime 2400
```

The following command configures an infinite registration lifetime for MIPv6 calls:

```
no reg-lifetime
```
sequence-number-validate

Configures sequence number validation of the received MIPv6 control packet by the Home Agent (HA) according to RFC 3775.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax

sequence-number-validate

Usage
Use this command to configure the sequence number validation of the received MIPv6 control packet by the Home Agent (HA) as per RFC 3775. Default is enabled.
setup-timeout

The maximum amount of time allowed for session setup.

**Product**

PDSN, HA

**Privilege**

Security Administrator, Administrator

**Syntax**

```
setup-timeout seconds
```

- **seconds**
  
  Default: 60 seconds
  
  The maximum amount of time, in seconds, to allow for setup of a session. must be an integer from 1 through 1000000. Default is 60 seconds.

**Usage**

Use this command to set the maximum amount of time allowed for setting up a session.

**Example**

To set the maximum time allowed for setting up a session to 5 minutes (300 seconds), enter the following command:

```
setup-timeout 300
```
simul-bindings

Specifies the maximum number of “care-of” addresses that can simultaneously be bound for the same user as identified by NAI and Home address.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax

```
simul-bindings number
```

<table>
<thead>
<tr>
<th>number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures maximum number of &quot;care of&quot; addresses that can be simultaneously bound for the same user as identified by their NAI and home address. number can be configured to any integer value between 1 and 3. Default is 1.</td>
</tr>
</tbody>
</table>

Usage
The chassis is shipped from the factory with the simultaneous sessions set to 1. Per RFC 2002, the HA service creates a mobile binding record (MBR) for each subscriber session it is facilitating. Each MBR is associated with a care-of address. As the mobile node roams, it is possible that the session will be associated with a new care of address. Typically, the HA service will delete an old binding and create a new one when the information in the Registration Request changes. However, the mobile could request that the HA maintains previously stored MBRs. This command allows you to configure the maximum number of MBRs that can be stored per subscriber if the requested.

Example
The following command configures the service to support up to 2 addresses per subscriber:

```
simul-bindings 2
```
timestamp-replay-protection tolerance

Designates timestamp replay protection scheme as per RFC 4285.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax

timestamp-replay-protection tolerance
tolerance

Defines the acceptable difference in timing (between timestamps) before rejecting packet, in seconds. tolerance must be an integer between 0 and 65535. The default is 7 seconds.

Usage
Use this command to define the acceptable difference in timing (between timestamps) before rejecting packet.
Chapter 151
MME-HSS Service Configuration Mode Commands

The MME-HSS Service Configuration Mode is used to create and manage the HSS servers on Diameter protocol.

```
Exec Mode
  configure
    Global Config Mode
      context name
        Context Config Mode
          mme-hss-service name
            MME HSS Service Config Mode
```
diameter dictionary

Specifies the Diameter Credit Control dictionary for the MME-HSS service.

Product
All

Privilege
Security Administrator, Administrator

Syntax

diameter dictionary { custom1 | standard }
default diameter dictionary

default
Sets the dictionary to default for HSS service.

custom1
Default: Disabled
This keyword sets the Diameter dictionary to customer specific dictionary. This is a customer specific
diameter dictionary.

standard
Default: Enabled
This keyword sets the Diameter dictionary to Standard dictionary. This is standard MME-HSS dictionary.

Usage
Use this command to select the Diameter dictionary for MME-HSS service.

Example
The following command sets the Diameter dictionary to IETF RFC 4006 specific:
diameter dictionary standard
diameter endpoint

This command associates a preconfigured Diameter origin endpoint with this MME-HSS service to manage S6a interface between MME and HSS.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] diameter endpoint <endpoint_name> [-noconfirm]

- no
Removes previously associated Diameter origin endpoint from this MME-HSS service.

- endpoint_name
This is a preconfigured Diameter endpoint in Context configuration mode. The endpoint must be present in all Diameter messages and is the endpoint that originates the Diameter message.
<endpoint_name> must be an preconfigured diameter endpoint name.
If named endpoint is not configured earlier the system will create it and switch to the Diameter Endpoint Configuration mode in Context Configuration mode.

- -noconfirm
Indicates that the command is to execute without any additional prompt and confirmation from the user.

**WARNING:** If this keyword option is used with no diameter endpoint <endpoint_name> command the Diameter endpoint named <endpoint_name> will be deleted with all active/inactive subscribers without prompting any warning or confirmation.

Usage

Use this command to associate a Diameter origin endpoint to create Diameter-based S6a interface in this MME-HSS service to provide AAA functionality to EPS bearer context.
If named endpoint is not configured earlier the system will create it and switch to the Diameter Endpoint Configuration mode in Context Configuration mode.
Refer Diameter Endpoint Configuration Mode Commands chapter for more information on Diameter endpoint configuration parameters.

Example

The following command associates the preconfigured Diameter endpoint hss_1 with this MME-HSS service for S6a interface support.

diameter endpoint hss_1
If named endpoint is not configured earlier the system will create it and switch to the Diameter Endpoint Configuration mode in Context Configuration mode and following prompt will appear:

```
[context]host(config-ctx-diameter)#
```
end

Exits the current mode and returns to the Exec Mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
   end

Usage
   Change the mode back to the Exec mode.
**exit**

Exits the current mode and returns to the previous mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
exit
```

**Usage**

Return to the previous mode.
failure-handling

This command configures the failure handling behavior in the event of a failure with the MME-HSS service. It also defines the action on various error codes on Diameter interface during authentication or session activities.

Product
MME

Privilege
Security Administrator, Administrator

Syntax

```
failure-handling {authentication-information-request | check-identity-request | notify-request | purge-ue-request | update-location-request} {diameter-result-code start_error_code[to end_error_code] | request-timeout} action {continue | retry-and-terminate | terminate}
```

```
no failure-handling {authentication-information-request | check-identity-request | notify-request | purge-ue-request | update-location-request} diameter-result-code start_error_code[to end_error_code]
```

default failure-handling {authentication-information-request | check-identity-request | notify-request | purge-ue-request | update-location-request} request-timeout

---

**no**
Removes the preconfigured failure handling procedures for MME calls in an MME-HSS service.

---

**default**
Sets the default action for failure handling procedure for MME calls in an MME-HSS service. For default actions on Diameter result/error codes see Usage section of this section.

---

**authentication-information-request**
This keyword configures the MME-HSS service to handle the failures in Auth-Information-Request message.

---

**check-identity-request**
This keyword configures the MME-HSS service to handle the failures in Check-Identity-Information-Request message.

---

**notify-request**
This keyword configures the MME-HSS service to handle the failures in Notify-Request message.

---

**purge-ue-request**
This keyword configures the MME-HSS service to handle the failures in Purge-UE-Request message.

---

**update-location-request**
This keyword configures the MME-HSS service to handle the failures in Update-Location-Request message.
**diameter-result-code start_error_code [to end_error_code]**

This keyword configures the MME-HSS service to handle the failures for various request message having specific single or range of Diameter result code in request message.

*start_error_code* specifies the individual error code on Diameter protocol and must be an integer from 3000 through 5999. This will be the starting of code if a range of error codes is specified with optional keyword *to* *end_error_code*.

*to* *end_error_code* is used to specify a range of error codes to handle by this command.

*end_error_code* specifies the end error code on Diameter protocol and must be an integer from 3000 through 5999.

**request-timeout**

This keyword configures the MME-HSS service to handle the failures for various request messages if response to that message is not received before timeout duration exhausted.

**action {continue | retry-and-terminate | terminate}**

This keyword specifies the action to be taken on failure of any message as policy of failure handling.

- **continue**: On receipt of any error, this action configuration will allow the MME-HSS service to continue with the session procedure without any interruption.

- **retry-and-terminate**: On receipt of any error, this action configuration will instruct the MME-HSS service to retry with the procedure. Sustem will retry up to the configured number of attempts and terminate the session/procedure if it received subsequent number of errors after retry attempts.

- **terminate**: This action configuration will allow the MME-HSS service to terminate the session procedure without any retry attempt on the event of any failure.

**Usage**

Use this command to configure the failure handling behavior in the event of a communication failure with the MME-HSS service.

Following are the default action for Diameter result codes:

- For all protocol error codes 3000 to 3999 the default action is terminate. For all transient error codes 4000, 4001, 4004 to 4180, and 4182 to 4999 the default action is continue.
- For transient error codes 4002, 4003, and 4181 the default action is retry.
- For error code 4001 the default action is terminate.
- For permanent error codes 5000 to 5999 the default action is terminate.

**Example**

The following command will allow MME-HSS service to continue if any failure in Auth-Information-Request message occurred with Diameter error code 3050:

```
failure-handling authentication-information-request diameter-result-code 3050 action continue
```
request timeout

This command configures the application request timeout between MME-HSS service and HSS node. The MME system will wait for this duration before retransmitting the request to corresponding HSS node.

Product
MME

Privilege
Security Administrator, Administrator

Syntax

```plaintext
request timeout dur

[ no | default ] request timeout

---

no
Disables the configured application request timeout value.

---

default
Sets the application request time out duration to default value of 300 seconds.

---

dur
Default: 300 seconds
Specifies the application request timeout duration in seconds. The MME will wait for this duration before retrying the request with corresponding HSS.
dur must be an integer from 1 through 300.
```

Usage
Use this command to set the waiting period for MME-HSS service in seconds after which the request is deemed to have failed or system will resend the request.

Example
The following example configures the application request timeout duration to 300 seconds:
```
default request timeout
```
test

This command test the configured S6a interface between MME-HSS service and HSS server.

Product
MME

Privilege
Security Administrator, Administrator

Syntax

test s6a_inf_name
[ no | default ] test

no
Removes the configured S6a test interface from this MME-HSS service.

default
Sets the S6a test interface to default interface configured from MME service.

s6a_inf_name
Specifies the name of the S6a interface which is to be used for testing the connectivity between MME and HSS node.

s6a_inf_name is a preconfigured interface for S6a reference on system and must be an alpha and/or numerical string of 1 through 63 characters.

Usage
Use this command to set the S6a interface for testing between MME and HSS node.

Example
The following command configures S6a test interface to s6a_1:

```
test s6a_1
```
Chapter 152
MME Service Configuration Mode Commands

The MME Service Configuration Mode is used to create and manage the LTE Mobility Management Entity (MME) services for LTE/SAE network. This service works in conjunction with MME-HSS Service and eGTP Service.
apn

This command associates/disassociates an Access Point Name (APN) templates to use in MME service.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Syntax**

```
apn
```

```
no apn
```

**no**
Disassociates a previously associated APN template with this MME service.

**apn_name**
Specifies the name for a pre-configured APN template to associate with this MME service.

**-noconfirm**
Indicates that the command is to execute without any additional prompt and confirmation from the user.

**WARNING**: If this keyword option is used with **no apn** command the APN named **apn_name** will be deleted with all active/inactive subscribers without prompting any warning or confirmation.

**Usage**
Use this command to associate a pre-configured APN template with an MME service. The APN is a logical name for a packet data network and/or a service that the SGSN/GGSN supports access to. Multiple APN templates can be associated with an MME service.

**Example**
The following command associates an APN template called *isp1* to an MME service:

```
apn isp1
```
**associate**

This command associates/disassociates the supportive services like an Evolved GPRS Tunnelling Protocol (eGTP) service or an MME-HSS service with an MME service.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Syntax**

```
associate { egtp-service egtp_svc_name | mme-hss-service hss_svc_name } [ context ctx_name ]
```

```
no associate { egtp-service | mme-hss-service }
```

**no**
Disassociates a previously associated eGTP service or MME-HSS service with this MME service.

**egtp-service egtp_svc_name**
Associates an eGTP service with MME service.
*egtp_svc_name* specifies the name for a pre-configured eGTP service in a context to associate with this MME service. For more information on eGTP service, refer egtp-service command in Context Configuration Mode Commands chapter.

**mme-hss-service hss_svc_name**
Associates an MME-HSS service with MME service.
*hss_svc_name* specifies the name for a pre-configured MME-HSS service in a context to associate with this MME service. For more information on MME HSS service, refer mme-hss-service command in Context Configuration Mode Commands chapter.

**context ctx_name**
Specifies the specific context name where eGTP or MME-HSS service is configured. If this keyword is omitted, the named eGTP or MME-HSS service must exist in the same context as the MME service.
*ctx_name* is name of the configured context of the eGTP or MME-HSS service service. This can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

**Usage**
Use this command to associate a pre-configured eGTP or MME-HSS service with an MME service.
The eGTP service provides eGTP-U and eGTP-C protocol interface support between EPS nodes. For more information on eGTP service and supported interface type, refer eGTP Service Configuration Mode Commands chapter in Command Line Interface Reference.

⚠️ **Important**: Only one eGTP service can be associated to a service. The eGTP service should be configured prior to issuing this command.
The MME-HSS service provides S6a interface support on Diameter protocol between MME and HSS. For more information on MME-HSS service and other parameters, refer MME-HSS Service Configuration Mode Commands chapter in Command Line Interface Reference.

**Important:** Only one MME-HSS service can be associated to a service in this release. The eGTP service should be configured prior to issuing this command.

**Caution:** This is a critical configuration. The MME service can not be started without this configuration. Any change to this configuration would lead to restarting the MME service and removing or disabling this configuration will stop the MME service.

**Example**
The following command associates a pre-configured eGTP service called egtp1 in dst_ctx context to an MME service:

```
associate egtp-service egtp1 context dst_ctx
```

The following command associates a pre-configured MME-HSS service called hss1 in the same context as MME service to an MME service:

```
associate mme-hss-service hss1
```
bind s1-mme

This command binds the MME service to a logical IP interface serving as the S1-MME interface.

Product
MME

Privilege
Security Administrator, Administrator

Syntax

bind s1-mme address address
no bind address

no
Removes a previously configured IP address use for binding the SCTP (local bind address) to communicate with the eNodeBs using S1-MME interface.

address
Specifies the IP address (address) in IPv4 or IPv6 notation for the interface configured as an S1-MME interface.

Usage
Use this command to associate or tie the MME service to a specific logical IP address that will be used for binding the SCTP socket to communicate with the eNodeB using S1AP. A maximum of one IP address can be configured with this command for one MME service.
The MME passes the IP address during setting up the SCTP association with the eNodeB.

⚠️ Caution: This is a critical configuration. The MME service can not be started without this configuration. Any change to this configuration would lead to restarting the MME service and removing or disabling this configuration will stop the MME service.

Example
The following command would bind the logical IP interface with the address of 192.168.3.1 to the MME service to interact with eNodeB.

bind s1-mme address 192.168.3.1

The following command disables a binding that was previously configured:

no bind s1-mme address
dns

This command associates/disassociates the Domain Name System (DNS) client service configured for DNS query in a context to select P-GW and S-GW in an MME service.

Product
MME

Privilege
Security Administrator, Administrator

Syntax

```
dns { pgw | sgw } [ context ctx_name ]
no dns { pgw | sgw }
```

no
Disassociates a previously associated context having DNS client service configured for DNS query to select P-GW or S-GW with this MME service.

pgw
This keyword associates the named context with DNS client service for DNS query for selection of P-GW with MME service.

sgw
This keyword associates the named context with DNS client service for DNS query for selection of S-GW with MME service.

context ctx_name
This optional keyword associates the specific context name where DNS client service is configured to select P-GW and/or S-GW for this MME service. If this keyword is omitted DNS client service must be configured in the same context as MME service.

ctx_name is name of the configured context of the DNS client service. This can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage
Use this command to associate a pre-configured context where a DNS client service is configured with an MME service.
The DNS Client service configured in a context provides the DNS query support to locate P-GW or S-GW from and MME service. For more information on DNS Client service and support, refer DNS Client Service Configuration Mode Commands chapter in Command Line Interface Reference.
A maximum of one DNS client service for P-GW and one DNS client service for S-GW can be associated with an MME service.

Example
The following command associates a pre-configured context `dns_ctx1` where a DNS client service is configured for DNS query to P-GW from an MME service:

```
dns pgw context dns_ctx1
```

The following command associates a pre-configured context `dns_ctx2` where a DNS client service is configured for DNS query to S-GW from an MME service:

```
dns sgw context dns_ctx2
```
This command defines the Evolved Mobility Management timer parameters like timeout durations for timers for the NAS message retransmission in MME service.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Syntax**

```
default emm {mobile-reachable-timeout | t3412-timeout | T3413-timeout | T3422-timeout | T3423-timeout | T3450-timeout | T3460-timeout | T3470-timeout }

no emm implicit-detach-timeout
```

- **default**
  - Resets the specified timer timeout to the system default value.

- **no**
  - Removes the specified EMM timeout definition from the configuration.

- **implicit-detach-timeout**
  - `detach_dur`
  - Default: 5640
  - Sets the timer timeout duration after which subscriber will implicitly detached from the network if there is no activity. Generally this timer value is 240 seconds (4 minutes) more than the timeout value of T3423 timer. This timer starts when mobile reachable timer expires while the network is in EMM-IDLE mode and ISR is activated and stops when NAS signalling connection established.

- **mobile-reachable-timeout**
  - `mob_reach_dur`
  - Default: 5640
  - Sets the timeout timer duration after which reachability procedure will be discarded and reattempt starts.

- **t3412-timeout**
  - `t3412_dur`
  - Default: 5400
  - Sets the timeout duration for T3412 timer. This timer is used for periodic tracking area update (P-TAU). When this timer expires, the periodic tracking area updating procedure starts and the timer is set to its initial value for the next start. This timer starts when the UE goes from EMM-CONNECTED to EMM-IDLE mode and stops when the UE enters EMM-CONNECTED mode.

- **T3413-timeout**
  - `t3413_dur`
  - Default: 10
Sets the timeout duration for T3413 timer. The timer starts when MME initiates the EPS paging procedure to the EMM entity in the network and requests the lower layer to start paging. This timer stops for the paging procedure when a response received from the UE.

t3413_dur is timeout duration in seconds and must be an integer from 1 through 20.

**T3422-timeout t3422_dur**

Default: 10

Sets the timeout duration for T3422 timer. This timer starts when MME initiates the detach procedure by sending a DETACH REQUEST message to the UE and stops upon receipt of the DETACH ACCEPT message.

t3422_dur is timeout duration in seconds and must be an integer from 1 through 20.

**T3423-timeout t3423_dur**

Default: 5400

Sets the timeout duration for T3423 timer. This timer starts when UE enters the EMM-DEREGISTERED state or when entering EMM-CONNECTED mode. It stops while the UE is in EMM-REGISTERED.NO-CELL-AVAILABLE state and Idle mode Signalling Reduction (ISR) is activated.

t3423_dur is timeout duration in seconds and must be an integer from 1 through 11160.

**T3450-timeout t3450_dur**

Default: 6

Sets the timeout duration for T3450 timer. This timer starts when MME initiates the Globally Unique Temporary Identifier (GUTI) reallocation procedure by sending a GUTI REALLOCATION COMMAND message to the UE and stops upon receipt of the GUTI REALLOCATION COMPLETE message.

This timer is also used for Tracking area update procedure.

t3450_dur is timeout duration in seconds and must be an integer from 1 through 20.

**T3460-timeout t3460_dur**

Default: 6

Sets the timeout duration for T3460 timer. The timers starts when the network initiates the authentication procedure by sending an AUTHENTICATION REQUEST message to the UE and stops upon receipt of the AUTHENTICATION RESPONSE message.

t3460_dur is timeout duration in seconds and must be an integer from 1 through 20.

**T3470-timeout t3470_dur**

Default: 6

Sets the timeout duration for T3470 timer. The MME starts this timer when the network initiates the identification procedure by sending an IDENTITY REQUEST message to the UE and stops upon receipt of the IDENTITY RESPONSE message.

t3470_dur is timeout duration in seconds and must be an integer from 1 through 20.

**Usage**

Use this command to set EMM timers.

Following tables describe the triggers and states for timers:
### Table 28. EPS mobility management timers – UE side

</table>

NOTE 1: The default value of this timer is used if the network does not indicate another value in an EMM signalling procedure.

NOTE 2: The value of this timer is provided by the network operator during the attach and tracking area updating procedures.

NOTE 3: The value of this timer may be provided by the network in the ATTACH ACCEPT message and TRACKING AREA UPDATE ACCEPT message. The default value of this timer is identical to the value of T3412.

NOTE 4: The value of this timer is provided by the network operator when a service request for CS fallback is rejected by the network with EMM cause #39 “CS domain temporarily not available”.

</table>

NOTE 1: Typically, the procedures are aborted on the fifth expiry of the relevant timer. Exceptions are described in the corresponding procedure description.

This command can be repeated to set each timer as needed. The retransmission of all type of NAS messages can be configured through `nas-max-retransmissions` command.

Example
The following command sets the timeout value for EPS paging procedure timer T3413 for 10 seconds.

```
emmm t3413-timeout 10
```
end

Exits the current mode and returns to the Exec Mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Change the mode back to the Exec mode.
encryption-algorithm-lte

This command configures the precedence for LTE encryption algorithms to use for security procedures through this MME service.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Syntax**
```
encryption-algorithm-lte priority1 {128-eea0 | 128-eea1 | 128-eea2}
[priority2 {128-eea0 | 128-eea1 | 128-eea2}] [priority3 {128-eea0 | 128-eea1 | 128-eea2}]
default encryption-algorithm-lte
```

**default**
Sets the default LTE encryption algorithm for security procedures with configured priority value. Default configuration of LTE encryption algorithm is:
- priority1 with 128-eea0 encryption algorithm
- priority2 with 128-eea1 encryption algorithm
- priority3 with 128-eea2 encryption algorithm

**priority1**
Specifies the preference of integrity algorithm for security procedures on this MME service as priority 1. Least value has highest preference.

**priority2**
Specifies the preference of integrity algorithm for security procedures on this MME service as priority 2. Least value has highest preference.

**priority3**
Specifies the preference of integrity algorithm for security procedures on this MME service as priority 3. Least value has highest preference.

**128-eea0**
Default: Enabled
This keyword sets the Null ciphering algorithm (128-EAA0) for LTE encryption as the encryption algorithm for security procedures.

**128-eea1**
Default: Disabled
This keyword sets the SNOW 3G synchronous stream ciphering algorithm (128-EAA1) for LTE encryption as the encryption algorithm for security procedures. SNOW 3G is a stream cipher that forms the base of the 3GPP confidentiality algorithm UEA2 and the 3GPP integrity algorithm UIA2.
**128-eea2**

Default: Disabled
This keyword sets the Advance Encryption Standard (AES) ciphering algorithm (128-EEA2) for LTE encryption as the encryption algorithm for security procedures.

**Usage**

Use this command to set the LTE encryption algorithms for security procedures to use with this MME service.

⚠️ **Caution:** When this command is executed, all the existing priority to algorithm mappings will be removed and the newly configured ones will be applicable for security procedures.

⚠️ **Caution:** Configuration of same algorithm to multiple priorities is prohibited.

**Example**
The following command sets the 128-EEA1 as the LTE encryption algorithm with priority 2 for security procedures with an MME service.

```
encryption-algorithm-lte priority2 128-eea1
```
esm

This command defines the Evolved Session Management timer parameters like timeout durations for timers for the retransmission of NAS messages in MME service.

Product
MME

Privilege
Security Administrator, Administrator

Syntax

default esm {t3485-timeout|T3495-timeout}

default
Resets the specified Evolved Session Management timer timeout to the system default value.

t3485-timeout \textit{t3485\_dur}
Default: 6
Sets the timeout duration for T3485 timer. This timer is used for default EPS bearer context activation procedure.
This timer starts when the MME sends ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST message to UE and stops when receives ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT or ACTIVATE DEFAULT EPS BEARER CONTEXT REJECT message from UE.
\textit{t3485\_dur} is timeout duration in seconds and must be an integer from 1 through 60.

T3495-timeout \textit{t3495\_dur}
Default: 6
Sets the timeout duration for T3485 timer. This timer is used for default EPS bearer context deactivation procedure.
This timer starts when the MME sends DEACTIVATE EPS BEARER CONTEXT REQUEST message to UE and stops when receives DEACTIVATE EPS BEARER CONTEXT ACCEPT or DEACTIVATE EPS BEARER CONTEXT REJECT message from UE.
\textit{t3495\_dur} is timeout duration in seconds and must be an integer from 1 through 60.

Usage
Use this command to set Evolved Session Management timers.
Following tables describe the triggers and states for timers:

\textit{Table 32. EPS session management timers – Network side}

<table>
<thead>
<tr>
<th>Timer</th>
<th>State</th>
<th>Cause of Start</th>
<th>Normal Stop</th>
<th>On Expiry1st, 2nd, 3rd, 4th EXPIRY (NOTE 1)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>State</td>
<td>Cause of Start</td>
<td>Normal Stop</td>
<td>On Expiry1st, 2nd, 3rd, 4th EXPIRY (NOTE 1)</td>
</tr>
<tr>
<td>-------</td>
<td>-------</td>
<td>----------------</td>
<td>-------------</td>
<td>---------------------------------------------</td>
</tr>
</tbody>
</table>
| T3485 | Bearer Context Active Pending | • ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST sent  
• ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST sent | • ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT received or  
• ACTIVATE DEDICATED EPS BEARER CONTEXT REJECT received | Retransmission of the same message |
| T3495 | Bearer Context Inactive Pending | DEACTIVATE EPS BEARER CONTEXT REQUEST sent | DEACTIVATE EPS BEARER CONTEXT ACCEPT received | Retransmission of DEACTIVATE EPS BEARER CONTEXT REQUEST |

NOTE 1: Typically, the procedures are aborted on the fifth expiry of the relevant timer. Exceptions are described in the corresponding procedure description.

This command can be repeated to set each timer as needed. The retransmission of all type of NAS messages can be configured through `nas-max-retransmissions` command.

**Example**
The following command sets the timeout value for default EPS bearer context activation procedure timer T3485 for 10 seconds.

```
esm t3485-timeout 10
```
**exit**

Exits the current mode and returns to the previous mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Return to the previous mode.
**imei**

This command sets the mobile equipment identity (MEI) query criteria with different attributes like IMEI and IMEI-SV for UE related procedures.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Syntax**

```
imei-query-type {none | imei | imei-sv}
default imei-query-type
```

- **default**
  
  Sets the UE query criteria to its default type of “none”.

- **imei**
  
  This keyword sets the MEI query type to IMEI. International Mobile Equipment Identity (IMEI) will be used as criteria for MEI query with this MME service.

- **imei-sv**
  
  This keyword sets the MEI query type to IMEI-SV. International Mobile Equipment Identity (IMEI) and software version (SV) will be used as criteria for MEI query with this MME service.

- **none**
  
  This keyword sets the MEI query type to “none”. Neither IMEI nor IMEI-SV will be used as criteria for MEI query with this MME service.

**Usage**

Use this command to MEI query criteria for UE related procedures with an MME service. MME has to do following procedure with reference to MEI query:

- Retrieve MEI from UE during security mode procedure
- Store in local IMSI DB
- Send MEI to HSS in ULR
- Send MEI to SGW in Create Session Request
- Monitor subscriber support using MEI as a key

Query type described with this command will be applicable for all above mentioned procedures.

**Example**

The following command sets the MEI query type to IMEI for UE related procedures:

```
imei-query-type imei
```
integrity-algorithm-lte

This command configures the precedence of LTE integrity algorithms to use for security procedures through this MME service. By default integrity algorithm is enabled on MME service, which cannot be disabled.

Product
MME

Privilege
Security Administrator, Administrator

Syntax

**default integrity-algorithm-lte**

default
Removes the preconfigured integrity algorithm and sets the default LTE integrity algorithm for security procedures. Default configuration of LTE integrity algorithm is:
- priority1 with 128-eia1 integrity algorithm
- priority2 with 128-eia2 integrity algorithm

priority1
Specifies the preference of integrity algorithm for security procedures on this MME service as priority 1. This is the mandatory and default priority keyword.

priority2
Specifies the preference of integrity algorithm for security procedures on this MME service as priority 2.

128-eia1
Default: Disabled
This keyword sets the SNOW 3G synchronous stream ciphering algorithm (128-EIA1) for LTE integrity as the integrity algorithm for security procedures. SNOW 3G is a stream cipher that forms the base of the 3GPP confidentiality algorithm UEA2 and the 3GPP integrity algorithm UIA2.

128-eia2
Default: Enabled
This keyword sets the Advance Encryption Standard (AES) ciphering algorithm (128-EIA2) for LTE integrity as the integrity algorithm for security procedures.

Usage

Use this command to set the LTE integrity algorithms for security procedures to use with this MME service.

⚠️ **WARNING:** Integrity algorithm is a mandatory aspect and can not be disabled in MME service.

⚠️ **Caution:** When this command is executed, all the existing priority to algorithm mappings will be removed and the newly configured ones will be applicable for security procedures.
Caution: Configuration of same algorithm to multiple priorities is prohibited.

Example
The following command sets the AES ciphering algorithms (128-EIA2) as the LTE integrity algorithm with priority as 1 for security procedures with an MME service.

```
integrity-algorithm-lte priority1 128-eia2
```
location-reporting

This command enables the location reporting functionality for UE on MME service.

Product
MME

Privilege
Security Administrator, Administrator

Syntax

[no | default] location-reporting

- default
  Disables the location reporting feature on MME service.

- no
  Disables the location reporting feature on MME service.

Usage
Use this command to enable/disable the UE location reporting feature on MME service.

Example
The following command sets the MME service to provide the location reporting functionality for UE:

location-reporting
max-bearers per-subscriber

This command specifies the maximum number of EPS bearers that a subscriber may simultaneously use to access this MME service.

Product
MME

Privilege
Security Administrator, Administrator

Syntax
```
max-bearers per-subscriber max_bearer
default max-bearers per-subscriber
```

- **default**
  Configures the maximum EPS bearers for a subscriber to use simultaneously to default value of 11.

- **max_bearer**
  Default: 11
  Specifies the maximum number of EPS bearers for a subscriber may simultaneously use to access this MME service.
  `max_bearer` can be configured to any integer value between 1 and 11.

Usage
Use this command to set the maximum number of EPS bearers that a subscriber may simultaneously use to access this MME service.

Example
The following command specifies that a maximum of 6 simultaneous EPS bearers can be facilitated for a subscriber at any given time.
```
max-bearers per-subscriber 6
```
max-paging-attempts

This command configures the maximum number of paging attempt retransmission allowed for network requested service creation to a subscriber while first attempt failed.

Product
MME

Privilege
Security Administrator, Administrator

Syntax

```
max-paging-attempts max_paging_retry
default max-paging-attempts
```

default

Configures the maximum number of retransmission of paging request to default value of 3.

```
max_paging_retry
```

Default: 3

Specifies the maximum number of paging attempt retransmission allowed for network requested service creation to a subscriber while first attempt failed.

```
max_paging_retry
```
can be configured to any integer value between 1 and 10.

Usage

Use this command to set the maximum number of paging attempt retransmission allowed for network requested service creation to a subscriber while first attempt failed.

Example

The following command specifies that a maximum of 6 paging attempt retransmission allowed for network requested service creation to a subscriber while first attempt failed for a subscriber at any given time.

```
max-paging-attempt 6
```
max-pdns per-subscriber

This command specifies the maximum number of PDNs that a subscriber may simultaneously access through this MME service.

Product
MME

Privilege
Security Administrator, Administrator

Syntax

```
max-pdns per-subscriber max_pdns
default max-pdns per-subscriber
```

```
default
Confirms the maximum PDNs for a subscriber simultaneously access through this MME service to default value of 3 PDNs.
```

```
max_pdns
Default: 3
Specifies the maximum number of PDNs that a subscriber may simultaneously access through this MME service.
```

```
max_pdns can be configured to any integer value between 1 and 11.
```

Usage

Use this command to set the maximum number of PDNs that a subscriber may simultaneously access through this MME service.

Example

The following command specifies that a maximum of 2 simultaneous PDNs can be accessed by a subscriber at any given time through this MME service.

```
max-pdns per-subscriber 6
```
mme-id

This command configures the MME identifier with an MME service. MME identifier is constructed with MME group ID and MME Code.

Product
MME

Privilege
Security Administrator, Administrator

Syntax

```
no mme-id
```

```
mme-id group-id grp_idmme-code mme_code
```

Caution: Removing the MME identifier is a disruptive operation; the MME service shall be removed from the service.

```
  group-id grp_id
```

Specifies the group identifier of for the group of which this MME is belongs to.

`grp_id` must be an integer value from 0 through 65535.

```
mme-code mme_code
```

Specifies the unique code for this MME service.

`mme_code` must be an integer value from 0 through 255.

Usage

Use this command to set the MME identifier for this MME service. This MME identifier will be the identity of this MME in network.

Caution: Changing or removing the MME identifier is a disruptive operation; the MME service shall be re-started or removed from service.

Example

The following command configures the MME identifier with group id as 1025 and MME code as 101 for this MME service.

```
mme-id group-id 1025 mme-code 101
```
nas-max-retransmission

This command sets the retransmission counter for all type of NAS messages in an MME service.

Product
MME

Privilege
Security Administrator, Administrator

Syntax

```
nas-max-retransmissions nas_retrans_count

default nas-max-retransmissions
```

**default**
Resets the retransmission counter to the system default value of 4.

```
nas_retrans_count
```
Default: 4
Sets the maximum number of retransmission of NAS messages permitted during any procedure after which activation procedure will be discarded.

`nas_retrans_count` is number of retransmission allowed and must be an integer from 1 through 10.

Usage
Use this command to set maximum number of retries allowed for any type of NAS messages. NAS Messages send by the MME which require a response from the UE for procedure completion are retransmitted. Retransmission happens based on timer expiry. The timers are configured through `emm` and `esm` command. The NAS messages are retransmitted as per configuration, and if no response from the UE is received, the pending transaction is abandoned. If the transaction is a DETACH or PDN DISCONNECT REQUEST, the transaction is completed without further UE signaling. The timeout duration configured through `emm` and `esm` command will be applicable between two retries.

Example
The following command sets the maximum number of retries allowed as 4 for all type of NAS messages in an MME service.

```
default nas-max-retransmissions
```
**nri**

This command specifies the Network Resource Identifier (NRI) stored in bit 17 to bit 23 of Globally Unique Temporary Identity (GUTI) to be retrieved by MME service.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Syntax**

```
nri length length [ value value]
no nri [ value ]
```

**no**
Removes the configured NRI value and location in GUTI for retrieval by this MME service.

**length length**
Specifies the length of bits to be used in the GUTI to retrieve NRI information. This starts from bit 23 to bit 17 of GUTI.

*length* must be an integer from 1 to 6.

**value value**
Specifies the value of NRI to retrieve from GUTI. This value should not exceed the maximum possible value for the specified bit length. For example, if length specified is 3 bit the value should not exceed 7 and if length specified is 5 the value should not exceed 31.

*value* must be an integer from 0 to 63.

**Usage**

Use this command to retrieve the NRI stored in GUTI bit 17 to bit 23.

**Example**
The following command specifies the length of NRI information as 5 bit and value to retrieve as 23 from GUTI:

```
nri length 5 value 23
```
pgw-address

This command configures the PDN Gateway (P-GW) address to use P-MIP protocol for S5 and S8 interface and other parameters with MME service. By default S5 and S8 use GTP protocol for this.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Syntax**

```
pgw-address address [ s5-s8-protocol pmip] [ weight value]
no pgw-address address [ s5-s8-protocol pmip ]
```

**no**
Removes a previously configured IP address of P-GW along with S5 and S8 interface of P-MIP protocol type and other parameters from this MME service.

**address**
Specifies the IP address of the P-GW.
*address* must be an IP address in IPv4 or IPv6 notation.

**s5-s8-protocol pmip**
Specifies that P-MIP type of protocol to use for S5 and S8 interfaces with P-GW. By default S5 and S8 interface uses GTP protocol.
*pmip* Sets the protocol to Proxy-MIP for S5 and S8 interface as by default GTP is the applicable protocol.

**weight value**
Assigns the weight to P-GW address to use as a preferred P-GW.
*value* must be an integer from 1 through 100. Lowest value has the least preference.

**Usage**
Use this command to configure the PDN Gateway (P-GW) addresses to use with MME service. This command also changes the default protocol or GTP to P-MIP for the S5 and S8 interface and weight to share the load between associated P-GWs. A maximum of 16 P-GW addresses can be configured with this command.

This command only changes the use of protocol in S5 and S8 interface. By default P-GW uses GTP protocol for S5 and S8 interfaces. By this command user can change the protocol to P-MIP for S5 and S8 interface. When weight is used, the weights of the P-GW(s) (that are operational) are totaled and then weighted round-robin selection is used to distribute new default bearer context among the P-GW(s) according to their weights.

**Example**
The following command associates the P-GW IP address of 192.168.3.1 to the MME service with S5 and S8 protocol as P-MIP and weight as 90.
```
pgw-address 192.168.3.1 s5-s8-protocol pmip weight 90
```
The following command removes the above configured P-GW IP address and other parameters:

```
no pgw-address 192.168.3.15-s8-protocol pmip
```
plmn-id

This command configures the Public Land Mobile Network (PLMN) identifier for this MME service. PLMN identifier is made of Mobile Country Code (MCC) and Mobile Network Code (MNC). A maximum of 16 PLMN id can be configured in an MME service.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Syntax**

```
plmn-id mcc mcc_value mnc mnc_value
no plmn-id mcc mcc_value mnc mnc_value
```

no
Removes the configured PLMN identifier for this MME service.

⚠️ **Caution:** Removing the PLMN identifier is a disruptive operation; the MME service shall be re-started.

```
mcc mcc_value
```
Specifies the mobile country code (MCC) part of PLMN identifier.

*mcc_value* must be an integer value from 101 through 998.

```
mnc mnc_value
```
Specifies the mobile network code (MNC) part of PLMN identifier.

*mnc_value* must be an integer value from 01 through 99 or 100 through 998.

**Usage**

Use this command to set the PLMN identifier for this MME service.

⚠️ **Caution:** Changing or removing the PLMN identifier is a disruptive operation; the MME service shall be re-started.

A maximum of 16 PLMN identifiers are supported for an MME service.

**Example**
The following command configures the PLMN identifier with MCC value as 102 and MNC value as 20 for this MME service.

```
plmn-id mcc 102 mnc 20
```
policy idle-mode

This command configures the user-defined policies of session management for LTE subscriber in an MME service.

Product
MME

Privilege
Security Administrator, Administrator

Syntax

```
policy idle-mode detach {explicit | implicit}
```

```
[default] policy idle-mode detach
```

`default`
Sets the policy of idle mode detach for a subscriber to its default behavior as implicit.

`idle-mode detach`
This keyword configures the IDLE mode detach behavior of a UE.

`detach`
This keyword defines the detach procedure while UE is in IDLE mode.

`explicit`
Default: disabled
This keyword enables the explicit detach while a UE is in IDLE mode. System will page UE before detach procedure started and then perform explicit detach procedure.

`implicit`
Default: Enabled
This keyword enables the implicit detach while a UE is in IDLE mode. System never send any message to UE before detach and performs explicit detach procedure immediately.

Usage
Use this command to set the user-defined policies for session management in this MME service.

Example
The following command sets the idle mode detach policy to explicit for a user in this MME service.

```
policy idle-mode detach explicit
```
policy overload

This command configures the traffic overload policy to control congestion in this service.

**Product**
MME

**Privilege**
Administrator

**Syntax**

cache overload { drop | reject }
default policy overload

default
Sets the traffic overload policy action to default behavior of reject.

drop
Default: Disabled
Specifies that the system is to drop the incoming packets with new session requests to avoid overload on MME node.

reject
Default: Enabled
This keyword configures the system to reject the new session/call request and responds with a reject message when threshold for allowed call session is crossed on MME node.

**Usage**
Use this command to set the user-defined policies for new call connection attempted during overload in an MME service.
Congestion policies at the service-level can be configured for service. When congestion control functionality is enabled at service level, these policies dictate how services respond should the system detect that a congestion condition threshold has been crossed.

**Example**
The following command sets the nw call connect policy to reject the new session/call request in an MME service.
policy overload reject
policy pdn-reconnection

This command configures the action by MME when a PDN connection request to an already connected APN is being processed by MME service.

Product
MME

Privilege
Security Administrator, Administrator

Syntax

policy pdn-reconnection {multiple | reject | restart}

[default] policy pdn-reconnection

default
Sets the policy of PDN reconnection to its default behavior of reject.

multiple
Default: Disabled
This keyword allows multiple connections to a PDN with same APN and PDN Type. In this case, the existing connection is left unchanged, and the MME attempts to establish an additional connection to the PDN.

reject
Default: Enabled
This keyword configures set the action of MME to deny or reject the request, by sending a PDN connection reject command. This is the default behavior.

restart
Default: Disabled
This keyword deletes the existing connection and initiate an attempt to establish a new connection.

Usage
Use this command to set the user-defined policies for PDN reconnection attempt procedures initiated by UE in an MME service.
While a UE is attached, the UE can request connections to PDNs. The PDNs are identified by APN (Access Point Name) and PDN Type (ipv4, ipv6 or ipv4v6).
If the UE requests connection to a PDN for which a connection with the same APN name and PDN type already exists, the MME can; 1) deny or Reject the request, by sending a PDN connection reject command; 2) allow multiple connections to a PDN with same APN and PDN Type; or 3) delete the existing connection, and attempt to establish a new connection.

Example
The following command sets the PDN reconnect policy to delete the existing PDN and start the attempt to establish a new connection in an MME service.

policy pdn-reconnection restart
s1-mme sctp port

This command configures the source SCTP port that will be used for binding the SCTP socket to communicate with the eNodeB using S1AP with this MME service.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Syntax**

```
s1-mme sctp port port_num
default s1-mme sctp port
```

**default**
Sets the SCTP port to default value of 699 to communicate with the eNodeBs using S1-MME interface.

**port_num**
Specifies the SCTP port number to communicate with the eNodeBs using S1-MME interface. `port_num` must be an integer between 1 through 65535.

**Usage**
Use this command to assign the SCTP port with SCTP socket to communicate with the eNodeB using S1AP. A maximum of one SCTP port can be associated with one MME service.

**Example**
The following command sets the default SCTP port number 699 for to interact with eNodeB using S1AP on S1-MME interface.

```
default s1-mme sctp port
```
**setup-timeout**

This command configures the timeout duration for call setup of MME calls in this MME service.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Syntax**

```
setup-timeout dur
default setup-timeout
```

---

default

Sets the call setup timeout duration to default value of 60 seconds.

---

dur

Default: 60

Specifies the call setup timeout duration for MME calls after which attempt will be discarded.

dur must be an integer between 1 through 10000.

---

**Usage**

Use this command to configured the timeout duration in seconds to setup an MME call with an MME service. One this duration exhausted Call setup procedure will be discarded with this MME service.

---

**Example**

The following command sets the default setup timeout duration of 60 seconds for MME calls:

```
default setup-timeout
```
sgw-address

This command configures the Serving Gateway (S-GW) address to use P-MIP protocol for S5 and S8 interface and other parameters with MME service. By default S5 and S8 use GTP protocol for this.

Product
MME

Privilege
Security Administrator, Administrator

Syntax

```
sgw-address address [ s5-s8-protocol pmip ] [ tai tac tac_value [ mcc mcc_value mnc mnc_value ] [ weight weight_value ]
no sgw-address address [ s5-s8-protocol pmip ] [ tai tac tac_value [ mcc mcc_value mnc mnc_value ] ]
```

**no**
Removes a previously configured IP address of S-GW along with S5 and S8 interface of P-MIP protocol type and other parameters from this MME service.

**address**
Specifies the IP address of the S-GW.
`address` must be an IP address in IPv4 or IPv6 notation.

**s5-s8-protocol pmip**
Specifies that P-MIP type of protocol to use for S5 and S8 interfaces with P-GW. By default S5 and S8 interface uses GTP protocol.
`pmip` Sets the protocol to Proxy-MIP for S5 and S8 interface as by default GTP is the applicable protocol.

**tai tac tac_value**
Specifies the tracking area identifier (TAI) for S-GW. It configures the Tracking Area Code (TAC) for S-GW in MME service.
`tac_value` must be an integer from 1 through 268435455.

**mcc mcc_value**
Specifies the mobile country code (MCC) part of tracking area identifier.
`mcc_value` must be an integer value from 101 through 998.

**mnc mnc_value**
Specifies the mobile network code (MNC) part of tracking area identifier.
`mnc_value` must be an integer value from 01 through 998.

**weight weight_value**
Assigns the weight to P-GW address to use as a preferred S-GW.
`weight_value` must be an integer from 1 through 100. Lowest value has the least preference.
Usage

Use this command to configure the Serving Gateway (S-GW) addresses to use with MME service along with tracking area Identifier and tracking area code. This command also configures the S5 and S8 interface protocol type and priority and weight to share the load between associated S-GWs. A maximum of 16 S-GW addresses can be configured with this command.

This command only changes the use of protocol in S5 and S8 interface. By default S-GW uses GTP protocol for S5 and S8 interfaces. By this command user can change the protocol to P-MIP for S5 and S8 interface. When weight is used, the weights of the S-GW(s) (that are operational) are totaled and then weighted round-robin selection is used to distribute new default bearer context among the S-GW(s) according to their weights.

Example

The following command associates the S-GW IP address of 192.168.3.1 to the MME service with S5 and S8 protocol as P-MIP along with tracking area code as 20 and weight as 90:

```
pgw-address 192.168.3.1 s5-s8-protocol pmip tai tac 20 weight 90
```

The following command removes the above configured S-GW IP address, P-MIP protocol setting, and other parameters:

```
no sgw-address 192.168.3.1 s5-s8-protocol pmip tai tac 20
```
**ue-db**

This command configures the UE database which is maintained by MME as cache of EPS context per UE keyed by IMSI/GUTI to allow UE to attach by GUTI and reuse previously established security parameters. This cache will be maintained in each session manager where the first attach occurred for an UE.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ue-db purge-timeout dur_mins
default ue-db purge-timeout
```

- **default**
  Resets the UE database purge timer timeout to the system default value of 10080 mins.

- **purge-timeout dur_mins**
  Default: 10080
  Sets the timeout duration for MME to store UE database in cache memory.
  This timer starts when UE goes in dormant.
  `dur_mins` is timeout duration in minutes and must be an integer from 1 through 20160.

**Usage**

Use this command to set timeout duration for MME to hold UE database information in cache memory. The MME DB acts as a cache for storing subscriber related information. This subscriber related information helps in reducing signaling traffic. The MME DB is a part of the Session Manager and interfaces between the Session Manager Application and Evolved Mobility Management Manager to provide access to the cached data.

**Example**

The following command configures the MME database cache timer to hold the UE information up to 7 days (10080 minutes) in MME Database.

```
default ue-db purge-timeout
```
Chapter 153
Network Service Entity - Peer NSEI Configuration Mode Commands

The Network Service Entity (NSE) - Peer NSEI configuration mode configures the Frame Relay parameters for the peer NSE. This mode is a sub-mode of the Global Configuration mode. This sub-mode provides the commands and parameters to define the management functionality for the Gb interface between a BSS and an SGSN over a 2.5G GPRS Frame Relay network connection.

Upon accessing this mode, the prompt should be similar to:

```
[local]as5000(nse-fr-peer-nsei-2344)#
```

where the 2344 represents a user-defined instance.

---

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
bssgp-timer

This command has been deprecated.
end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

dend

Usage

Return to the Exec mode.
exit

Exits the current configuration mode and returns to the previous configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Return to the global configuration mode.
**NS-VC**

This command creates a network service virtual circuit (NSVC) for this frame relay NSE and enters the configuration sub-mode to define the NSVC parameters. These parameters are described in the NSVC Configuration Mode chapter elsewhere in this CLI Reference Guide.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] ns-vc id ns-vc_id
```

- **no**
  Removes the specified NSVC configuration.

- **id ns-vc_id**
  This keyword defines the NSVC configuration identifier.
  *ns-vc_id*: Must be an integer from 0 to 65535

**Usage**

Access the NSVC configuration mode.

**Example**

Gain access to the NSVC configuration mode to change the 4th instance.

```
ns-vc id 4
```
Chapter 154
Network Service Entity- IP Local Configuration Mode Commands

The Network Service Entity (NSE) - IP Local configuration mode is a sub-mode of the Global Configuration mode. This sub-mode configures the local endpoint for NS/IP with the commands and parameters to define the management functionality for the Gb interface between a BSS and an SGSN over a 2.5G GPRS IP network connection.

Upon entering this mode, the prompt will appear in a manner similar to:

[local]asr5000(nse-ip-local)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
all-nsvc-failure-action

Configure how the SGSN handles the NSE when all NSVCs go down.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
all-nsvc-failure-action clear-nse
default all-nsvc-failure-action

default
By default, the NSE is not cleared if all NSVCs go down.

clear-nse
Instructs the SGSN to clear NSE if all NSVCs to the BSC are down.
```

**Usage**

Enable the SGSN to clear NSE information when all NSVCs go down.

**Example**

```plaintext
all-nsvc-failure-action clear-nse
```
bssgp-timer

This command has been deprecated.
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Return to the Exec mode.
exit

Exits the current configuration mode and returns to the global configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Returns to the global configuration mode.
max-ns-retransmissions

This command configures the maximum number of transmission retries counter.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
[ default ] max-ns-retransmissions { alive count | sns-proc count }
```

- **default**
  Resets the specified counter configuration to the default value.

- **alive count**
  Sets the maximum number of alive retries.
  `count`: Must be an integer between 0 and 10. Default is 3.

- **sns-proc count**
  Sets the maximum number of retries for the SNS procedure
  `count`: Must be an integer between 0 and 5. Default is 3.

Usage
Sets the maximum for NS transmission retries.

Example

```
max-ns-retransmission alive 4
```
ns-timer

This command sets the network service (NS) counters for the SNS procedure and testing.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

\texttt{ns-timer \{sns-prov timeout\_val|\ test timeout\_val\}}

default ns-timer \{sns-prov | test\}

\underline{default}

Resets the selected timer configuration to its default value.

\underline{sns-prov timeout\_val}

Sets the SNS procedure timeout value in seconds.
\textit{timeout\_val}: Enter an integer from 1 to 10. Default is 5.

\underline{test timeout\_val}

Sets the test procedure timeout value in seconds.
\textit{timeout\_val}: Enter an integer from 1 to 60. Default is 30 seconds.

Usage

Set NS timers to help manage the NSE-IP connection.

Example

The following example sets the test timer to 4 seconds:

\begin{verbatim}
ns-timer test 4
\end{verbatim}
nsvc-failure-action

This command enables and disables the sending of an NS-STATUS message with cause ‘ip-test fail’ when NSVC goes down.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
nsvc-failure-action send-ns-status
```

```
default nsvc-failure-action
```

**default**
Resets the command configuration to its default value. The default action is not to send an NS-STATUS message. This is applicable only to NSVCs that are auto-learned and not configured.

**send-ns-status**
Enables the sending of the NS-STATUS message.

**Usage**
Use this command to enable or disable sending an NS-STATUS messages when an NSVC goes down.

**Example**
Enable sending of the message:

```
nsvc-failure-action send-ns-status
```
nsvl

This command creates and instance of a Network Service Virtual Link (NSVL) and enters the NSVL configuration mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

[ no ] nsvl instance nsvl_id

no

Removes the identified NSVL definition from the configuration.

nsvl_id

Identifies a specific NSVL configuration instance.

nsvl_id: Must be an integer from 0 to 3.

Usage

Access the NSVL configuration mode.

Example

nsvl instance 2
peer-network-service-entity

This command has been replaced by the Network Service Entity - Peer NSEI Frame Relay configuration mode.
retry-count

This command has been replaced by the `max-ns-retransmissions` command.
timer

This command has been replaced by the `ns-timer` command.
Chapter 155
Network Service Virtual Connection Configuration Mode Commands

The Network Service Virtual Connection (NSVC) configuration mode is a sub-mode of the Network Service Entity (NSE) - Frame Relay Peer NSEI (NSE-FR for short) configuration mode. This sub-mode provides the commands and parameters to define the management functionality for a specific NSVC of the Gb interface between a BSS and an SGSN in a 2.5G GPRS frame relay network connection.

Upon accessing this mode, the prompt will appear similar to:

[local]asr5000(nse-fr-peer-nsei-2344-nsvci-2)# where the numerics are user-defined ids for the configuration instances.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

end

Usage
Return to the Exec mode.
exit

Exits the current configuration mode and returns to the previous configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Returns to the network service entity - frame relay configuration mode.
Chapter 156
Network Service Virtual Link Configuration Mode Commands

The Network Service Virtual Link configuration mode is a sub-mode of the Network Service Entity - IP configuration mode. This sub-mode provides the commands and parameters to define the NSVL of the Gb interface between a BSS and an SGSN in a 2.5G GPRS IP network connection.

Upon entering this mode, the prompt should appear similarly to the following:
[local]asr5000(nse-ip-local-nsvl-1)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Returns to the Exec mode.
**exit**

Exits the current configuration mode and returns to the previous configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Returns to the network service entity - IP configuration mode.
nsvl-address

This command configures the IP address of the NSVL end-point.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

nsvl-address ip-address ip_address context ctxt_name port port_num

<table>
<thead>
<tr>
<th>ip-address  ip_address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identifies the address of the NSVL.</td>
</tr>
<tr>
<td>ip_address: Must be specified using the standard IPv4 dotted decimal notation or colon notation for IPv6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>context  ctxt_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identifies the specific context associated with this NSVL address.</td>
</tr>
<tr>
<td>ctxt_name: Enter up to 79 alphanumeric characters.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>port  port_num</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the UDP port to associate with the NSVL end-point.</td>
</tr>
<tr>
<td>port_num: Must be an integer from 1 to 65535.</td>
</tr>
</tbody>
</table>

Usage
Use this command to configure the IP address, context name and port number for the NSVL end-point.

Example

nsvl-address ip-address 1.1.1.1 context sgsn2 port 3735
weight

This command configures the signaling or data weight for NSVL.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax
weight { data data_weight | signaling signaling_weight }

<table>
<thead>
<tr>
<th>data data_weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Defines the data weight for the NSVL.</td>
</tr>
<tr>
<td>data_weight: Must be an integer from 0 to 255. Default is 1.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>signaling signaling_weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Defines the signaling weight for the NSVL.</td>
</tr>
<tr>
<td>signaling_weight: Must be an integer from 0 to 255. Default is 1.</td>
</tr>
</tbody>
</table>

Usage
Configure the weight of the signaling or data for the NSVL.

Example
weight data 234
Chapter 157
NTP Configuration Mode Commands

The Network Timing Protocol Configuration Mode is used to manage the NTP options for the entire system.
enable

Enables the use of the network timing protocol for updating the system clock.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
enable [context]
```

*context*
Default: local
Specifies the context for which NTP is to be enabled. *name* must refer to a previously configured context.

**Usage**
Set the NTP server to be used for the system. Only one NTP server may be active at any given time. If this command were issued in a different context followed by the current context, the prior context’s NTP server would be disabled and the current context’s NTP server would be used.
If any NTP server is enabled, the chassis system clock will be synchronized to the active NTP server which covers all contexts for timing synchronization.
The use of a given context for NTP server assignment is to inherit the domain and IP routing options of the configured context.

**Example**
```
enable sampleContext
```
end

Exits the NTP configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```
exit

Exits the NTP configuration mode and returns to the global configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Return to the global configuration mode.
**server**

Configures an NTP server for use by the local NTP client in synchronizing the system clock.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
server ip_address[prefer][version number][minpoll poll_period][maxpoll poll_period]
no server ip_address
```

- **no**
  Indicates the server specified is to be removed from the list of NTP servers for clock synchronization.

- **ip_address**
  Specifies the IP address of the NTP server to allow for clock synchronization. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

- **prefer**
  Indicates the NTP server specified to be the preferred server. Only one server can be set to preferred. The preferred server is first contacted for clock synchronization.

**Important:** Use of the prefer keyword is not recommended.

- **version number**
  Default: 4
  Specifies the network timing protocol version to use for server communications. *number* must be a value in the range from 1 to 4.

- **minpoll poll_period**
  Default: 6
  Specifies the minimum polling interval for NTP messages, in seconds, as a power of 2. *poll_period* is the power or exponent. For example, if you specify the number 10, the value is $2^{10}$ and the resultant poll period is 1024 seconds. *poll_period* must be an integer from 6 through 17.

- **maxpoll poll_period**
  Default: 10
  Specifies the maximum polling interval for NTP messages, in seconds, as a power of 2. *poll_period* is the power or exponent. For example, if you specify the number 10, the value is $2^{10}$ and the resultant poll period is 1024 seconds. *poll_period* must be an integer from 6 through 17.
Configure the network timing protocol servers in the network as changes occur.

**Important:** Adding, removing, or modifying an NTP server configuration entry causes the NTP client to restart and restart the synchronization process with all configured NTP servers.

**Example**
The following command adds the NTP server with address 1.2.3.4 to the list of NTP servers.

```
server 1.2.3.4
```

The following marks the server with IP address 1.2.3.4 as the preferred NTP server.

```
server 1.2.3.4 prefer
```
The ORB Element Manager Configuration Mode is used to manage the ORBEM server options for the current context.
activate

Activates/deactivates a client for the ORB element management system interface.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
activate client id
no activate client id

id name
```

Indicates the client specified is to be deactivated. When omitted, the client is activated.

Specifies the client to be activated. `name` must refer to a previously configured client.

**Usage**

Activate clients after they have been configured or deactivated by the system or by configuration.

**Example**

```
activate client sampleClient
no activate client sampleClient
```
client

Configures/removes a client from the ORB element manager system interface.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
client id name [encrypted] password pwd
no client id name
```

Refer to the [syntax](#) documentation for more information.

no
Indicates the client specified is to be removed from the configuration.

```
id name
```

Specifies the client to be configured. *name* must be from 1 to 10 alpha and/or numeric characters in length.

encrypted
Indicates password specified is encrypted.
The *encrypted* keyword is intended only for use by the chassis while saving configuration scripts. The system displays the *encrypted* keyword in the configuration file as a flag that the variable following the *password* keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

```
password pwd
```

Specifies the password for the client. *pwd* must be from 1 to 35 alpha and/or numeric characters.

Usage

Clients for ORB element manager access must be configured prior to being activated.

Example

The following commands set the password for client *sampleClient* specifying a plain text password and an encrypted password as well.

```
client id sampleClient password secretPassword
client id sampleClient encryptedPassword f54gj801sd
```

The following deletes *sampleClient* from the configuration.

```
no client id sampleClient
```
default

Restores the system default values for the option specified.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
default \{ event-notif-iiop-port | event-notif-service filter | event-notif-siop-port | iiop-port | iop-address | max-attempt | session-timeout | siop-port \}
```

**event-notif-iiop-port**
Restores the port number for the inter-ORB event notifications to the system default: 7778.

**event-notif-service filter**
Restores the ORB Notification Service filter to its default behavior of sending all “error” level and higher events, and “info” level events for the orbs facility, CLI command logs, and license change logs.

**event-notif-siop-port**
Restores the port to use for secure socket layer inter-ORB event communication to the system default: 7777.

**iiop-port**
Restores the port number for the inter-ORB communications to the system default: 14132.

**iop-address**
Restores the IP address for the inter-ORB communications to the system default: IP address of current context.

**max-attempt**
Restores the maximum number of failed login attempts before which the client is deactivated to the system default: 3 attempts.

**session-timeout**
Restores the amount of idle time (no activity) before a session is terminated to the system default: 300 seconds.

**siop-port**
Restores the secure socket layer I/O port for inter-ORB events to the system default: 14131.

**Usage**

Restore the ORB element manager options to a well known values, the system defaults.
Example

default event-notif-i1op-port

default max-attempt
end

Exits the ORBEM configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Change the mode back to the Exec mode.
**event-notif-iiop-port**

Configures the port number for the Internet inter-ORB event notifications.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
event-notif-iiop-port number
```

*number*
Default: 7778
Specifies the port number to use as a number between 1 and 65535.

**Usage**
Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for standardized inter-ORB communications. Event notification port configured is only used if the Internet inter-ORB transport is enabled via the `iiop-transport` command with the event notification service being enabled as well.

**Example**

```plaintext
event-notif-iiop-port 25466
```
event-notif-service

Enables/disables the ORB Notification Service and allows the configuration of filters dictating which event notifications are sent.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
(event-notif-service [filter {event-id event_id[to final_event_id] | facility event_facility_level event_level}] |
no event-notif-service [filter {event-id event_id[to final_event_id] | facility event_facility_level event_level}] )
```

no
Indicates the event notification service is to be disabled.

**event-id event_id [to final_event_id]**

Specifies an event filter based on event identification (event ID) number.
`event_id` is a specific event ID to filter or is the initial event ID in range if the `to` keyword is used. It can be configured to any integer value between 1 to 100,000.
`to` allows the specification of a range of event IDs to filter. When used, `final_event_id` specifies the last event ID in the range to be filtered. It can be configured to any integer value between 1 to 100,000 but should be a value greater than the initial event ID.

**facility event_facility_level event_level**

Specifies an event filter based on facility type and notification severity level.
`event_facility` specifies the facility type and can be any one of the following:
- **a10**: A10 interface facility
- **a11**: A11 interface facility
- **a11mgr**: A11 Manager facility
- **aaa-client**: AAA client facility
- **aaamgr**: AAA manager logging facility
- **aaaprox**: AAA Proxy facility
- **acl-log**: Access Control List logging facility
- **acctrl**: Active Charging Service (ACS) Controller facility
- **acsmgr**: Active Charging Service (ACS) Manager facility
- **alarmctrl**: Alarm Controller facility
- **all**: All facilities
ORBEM Configuration Mode Commands

- **asf**: Voice Application Server Framework logging facility
- **asfprt**: ASF Protocol Task (SIP) logging facility
- **asngwmgr**: ASN Gateway Manager facility
- **asnlrmgr**: ASN Paging/Location-Registry Manager facility
- **bgp**: Border Gateway Protocol (BGP) facility
- **cli**: CLI logging facility
- **cscf**: IMS/MMD CSCF
- **cscfmgr**: SIP CSCF Manager facility
- **csp**: Card Slot Port controller facility
- **css**: Content Service Selection (CSS) facility
- **css-sig**: Content Service Selection (CSS) RADIUS Signaling facility
- **dcardctr**: IPSEC Daughtercard Controller logging facility (not used at this time)
- **dcardmgr**: IPSEC Daughtercard Manager logging facility (Not used at this time)
- **dhcp**: DHCP facility (GGSN product only)
- **dhost**: Distributed Host logging facility
- **diameter**: Diameter endpoint logging facility
- **diameter-ecs**: ECS Diameter signaling facility
- **dpath**: IPSEC Data Path facility
- **drvctrl**: Driver Controller facility
- **evlog**: Event log facility
- **famgr**: Foreign Agent manager logging facility
- **gss-gcdr**: GTPP Storage Server GCDR facility
- **gtpe**: GTP-C protocol logging facility (GGSN product only)
- **gtpcmgr**: GTP-C protocol Manager logging facility (GGSN product only)
- **gtpp**: GTP-PRIME protocol logging facility (GGSN product only)
- **gtpu**: GTP-U protocol logging facility (GGSN product only)
- **h248prt**: H.248 Protocol logging facility
- **hamgr**: Home Agent manager logging facility
- **hat**: High Availability Task (HAT) process facility
- **ims-authorizatn**: IMS Authorization Service facility
- **ip-arp**: IP Address Resolution Protocol facility
- **ip-interface**: IP interface facility
- **ip-route**: IP route facility
- **ipsec**: IP Security logging facility
- **ipsgmgr**: IP Services Gateway facility
- **ips**: IP Pool Sharing Protocol logging facility
- **l2tp-control**: L2TP control logging facility
• l2tp-data: L2TP data logging facility
• l2tpdemux: L2TP Demux Manager logging facility
• l2tpmgr: L2TP Manager logging facility
• li: Lawful intercept facility (Logs are visible only to system accounts with li-administrator privileges.)
• mobile-ip: Mobile IP processes
• mobile-ip-data: Mobile IP data facility
• multicast-proxy: Multicast Proxy logging facility
• netwstrg: Network Storage facility
• npuctrl: Network Processor Unit Control facility
• npumgr: Network Processor Unit Manager facility
• nsctrl: Charging Service Controller facility (supported in conjunction with ECSv1)
• nsmgr: Charging Service Manager facility
• nsproc: Charging Service process facility
• orbs: Object Request Broker System logging facility
• ospf: OSPF logging facility
• ppp: PPP link and packet facilities
• radius-acct: RADIUS accounting logging facility
• radius-auth: RADIUS authentication logging facility
• radius-coa: RADIUS change of authorization and radius disconnect
• rct: Recovery Control Task logging facility
• rdt: Redirect Task logging facility
• resmgr: Resource Manager logging facility
• rip: RIP logging facility (RIP is not supported at this time.)
• rohc: RObust Header Compression facility
• rsvp: Reservation Protocol logging facility
• sct: Shared Configuration Task logging facility
• sessctrl: Session Controller logging facility
• sessmgr: Session Manager logging facility
• sft: Switch Fabric Task logging facility
• sipcdprt: Sip Call Distributor facility
• sitmain: System Initialization Task main logging facility
• snmp: SNMP logging facility
• srdb: Static Rating Database
• srp: Service Redundancy Protocol (SRP) logging facility
• ssh-ipse: SSH IP Security logging facility stat: Statistics logging facility
• stat: Statistics logging facility
• system: System logging facility
ORBEM Configuration Mode Commands

- tacacsplus: TACACS+ Protocol logging facility
- threshold: threshold logging facility
- udr: User detail record facility (used with the Charging Service)
- user-data: User data logging facility
- user-l3tunnel: User layer-3 tunnel logging facility
- vpn: Virtual Private Network logging facility
- wimax-data: WiMAX DATA
- wimax-r6: WiMAX R6

**event_notif-service**

---

*event_level* specifies the severity level of the event notification to filter and can be configured to one of the following:

- critical: display critical events
- error: display error events and all events with a higher severity level
- warning: display warning events and all events with a higher severity level
- unusual: display unusual events and all events with a higher severity level
- info: display info events and all events with a higher severity level
- trace: display trace events and all events with a higher severity level
- debug: display all events

**Usage**

This command is used to enable or disable the ORB Notification Service. Additionally, it can be used to configure filters dictating which events are sent. This service is disabled by default. Filters can be configured for a specific event identification number (event ID), a range of event IDs, or specific severity levels for events for particular facilities. When no filters are configured and the service is enabled, the ORB Notification Service sends all “error” level and higher events, and “info” level events for the orbs facility, CLI command logs, and license change logs.

Multiple instance of this command can be executed to configure multiple filters.

**Example**

The following command enables the ORB Notification service:

```
event-notif-service
```

The following command disables the ORB Notification service:

```
no event-notif-service
```

The following command configures a filter for the ORB Notification Service allowing only event IDs 800 through 805 to be sent:

```
event-notif-service filter event-id 800 to 805
```

The following command configures a filter for the ORB Notification Service allowing only “critical” level notifications for the A11 facility:

```
event-notif-service filter facility all level critical
```
**event-notif-siop-port**

Configures the port to use for secure socket layer inter-ORB event communication.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
event-notif-siop-port number
```

*number*
Default: 7777
Specifies the port number to use as a number between 1 and 65535.

**Usage**
Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for inter-ORB communications using SSL.

**Example**

```plaintext
event-notif-siop-port 25466
```
exit

Exits the ORBEM configuration mode and returns to the global configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Return to the global configuration mode.
**iiop-port**

Configures the port number for the internet inter-ORB communications.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] iiop-port number
```

- **no**
  
  Disables the iiop port.

- **number**
  
  Default: 14132
  
  Specifies the port number to use as a number between 1 and 65535.

**Usage**

Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for standardized inter-ORB communications.

Internet inter-ORB port is only used if the Internet inter-ORB transport is enabled via the `iiop-transport` command.

**Example**

```
iiop-port 25466
```
iiop-transport

Enables/disables use of the Internet Inter-ORB Protocol for management across the network.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
iiop-transport
no iiop-transport
```

no
Indicates no internet inter-ORB protocol communication is to take place across the network.

Usage
Enable the transport of Internet Inter-ORB Protocol messages to support remote management across the network.
The chassis is shipped from the factory with the Internet Inter-ORB transport disabled.

Example
The following commands enable and disable the ORB-based management across the network, respectively.

```
nioiop-transport
no iiop-transport
```
iop-address

Enables/disables use of the Internet Inter-ORB Protocol for management across the network.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
iop-address ip_address
```

*ip_address*
Specifies the IP address to use for inter-ORB communications for the current context. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

**Usage**
Change the inter-ORB IP address when the IP address of the current context should not be used. The IP address of the local context may not be appropriate when the ORB configuration across nodes would cause conflicts with the IP addresses.

The chassis is shipped from the factory with the inter-ORB IP address defaulted to the IP address of the current context.

**Example**

```
iop-address 1.2.3.4
```
max-attempt

Configures the maximum number of failed login attempts before which the client is deactivated.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
max-attempt count
```

`count`

Default: 3 attempts

Specifies the number of failed login attempts prior to deactivating a client. The value must be within the range of 1 through 10.

**Usage**

Adjust the maximum number of attempts to a smaller value to increase the security level of the system.

**Example**

```
max-attempt 3
```
**session-timeout**

Configures the amount of idle time (no activity) before a client session is terminated.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
session-timeout seconds
```

*seconds*
Default: 300 seconds
Specifies the number of seconds of idle time before a client session is terminated. The value must be in the range of 1 through 86400.

**Usage**
Reduce the session timeout when the maximum number of sessions allowed is frequently being reached. Setting this to a lower value will help release idle sessions faster to allow use by other clients.

**Example**

```
session-timeout 1800
```
**siop-port**

Configures the secure socket layer I/O port for inter-ORB events.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
siop-port number
```

*number*

Default: 14131
Specifies the port number to use as a number between 1 and 65535.

**Usage**
Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for inter-ORB communications.

**Example**

```
siop-port 25466
```
ssl-auth-policy

Configures the secure socket layer peer authentication policy used by the ORBEM server.

Product
All

Privilege
Security Administrator, Administrator

Syntax

ssl-auth-policy { auth-none | auth-once | auth-once-fail | auth-peer | auth-peer-fail }

auth-none | auth-once | auth-once-fail | auth-peer | auth-peer-fail

Default: auth-none
auth-none: ORBEM server does not authenticate the peer
auth-once: ORBEM server authenticates the peer once (no fail)
auth-once-fail: ORBEM server authenticates the peer once (fail if no certificate)
auth-peer: ORBEM server authenticates the peer every time (no fail)
auth-peer-fail: ORBEM server authenticates the peer every time (fail if no certificate)

Usage
Use to configure the peer authentication policy used by the SSL transport of ORBEM.

Example
The following command sets the policy to authenticate the peer once without failure.
ssl-auth-policy auth-once
ssl-certificate

 Defines the certificate to be used by the SSL transport of ORBEM.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
ssl-certificate { string certificate | file url }
```

**string certificate**

Specifies an ORBEM SSL certificate. `certificate` is a string of up to 4096 alpha and/or numeric characters.

**file url**

Default: /usr/ssl/certs/orbscert.pem

Specifies an ORBEM SSL certificate file and location. `url` is a string of up to 1024 alpha and/or numeric characters.

**Usage**

Use to configure the certificate to be used by the SSL transport of ORBEM. Note that if file option is used, the certificate content is read from the url and converted into quoted string.

**Example**

The following command defines the certificate cert3.pem file as being located in the `/usr/ssl/certs` directory:

```plaintext
ssl-certificate file /usr/ssl/certs/cert3.pem
```

The following command defines the certificate string (the string shown is abbreviated):

```plaintext
ssl-certificate string "-----BEGIN CERTIFICATE-----

ssl-private-key

Configures the SSL private key used by the ORBEM server.

Product
All

Privilege
Security Administrator, Administrator

Syntax

ssl-private-key { string key | file url }

string key
Specifies an ORBEM SSL private key. key is a string of up to 4096 alpha and/or numeric characters.

file url
Default: /usr/ssl/certs/orbscert.pem
Specifies the ORBEM SSL private key file location. url is a string of up to 1024 alpha and/or numeric characters.

Usage
Use to configure the private key to be used by the SSL transport of ORBEM. Note that if file option is used, the private key is read from the url and converted into quoted string.

Example
The following command defines the private-key cert3.pem file as being located in the /usr/ssl/certs directory:
ssl-private-key file /usr/ssl/certs/cert3.pem
The following command defines the private-key string (the string shown is abbreviated):
ssl-private-key string "-----BEGIN RSA PRIVATE KEY-----

Chapter 159
OSPF Configuration Mode Commands

The OSPF Configuration sub-mode is used to configure the OSPF routing protocol. This mode includes commands that configure OSPF routing parameters.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
area authentication

Enables authentication for the specified OSPF area.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
area {ipaddress|decimal_value} authentication [message-digest] no area {ipaddress|decimal_value} authentication [message-digest]
```

no

Disables authentication for the specified area.

ipaddress

The IP address, in IPv4 dotted-decimal notation, of the area where authentication will be enabled.

decimal-value

The identification number of the area where authentication will be enabled. This must be an integer from 0 through 4294967295.

message-digest

Sets the OSPF authentication type to use the message digest 5 (MD5) authentication method.

Usage

Use this command to enable authentication of OSPF areas.

Example

The following command enables authentication for an OSPF area defined by the IP address 192.168.100.10 and the OSPF authentication type to MD5:

```
area 192.168.100.10 authentication message-digest
```
area default-cost

This command configures the default cost for an area.

**Product**
PDSN, HA, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
area { ipaddress | decimal_value } default-cost cost_value
no area { ipaddress | decimal_value } default-cost cost_value
```

**Usage**
Use this command to configure the default cost for an OSPF area.

**Example**
The following command sets the default cost for an OSPF area defined by the IP address 192.168.100.10 to 300:

```
area 192.168.100.10 default-cost 300
```
**area nssa**

Define an area as an NSSA (Not So Stubby Area) and configure OSPF parameters for it.

**Product**
PDSN, HA, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
area {ipaddress|decimal_value} nssa [default-information originate] [no redistribution no-summary] [translate always] [translate candidate] [translate never]
```

- **ipaddress**
The IP address, in IPv4 dotted-decimal notation, of the NSSA area.

- **decimal-value**
The identification number of the NSSA area. This must be an integer from 0 through 4294967295.

- **default-information originate**
Originating default information to the NSSA area.

- **no redistribution**
Do not redistribute external routes to the NSSA area.

- **no summary**
Do not inject inter-area routes into NSSA.

- **translate always**
Configure NSSA-ABR to always translate.

- **translate candidate**
Configure NSSA-ABR for translate election. (This is enabled by default.)

- **translate never**
Configure NSSA-ABR to never translate.

**Usage**

Use this command to define NSSA areas.

**Example**
The following command defines the area designated by the IP address 192.168.100.10 as an NSSA area:
area nssa

area 192.168.100.10 nssa
area stub

This command defines an area as a stub area.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax
```
area { ipaddress | decimal_value } stub [ no-summary ]
```

**ipaddress**
The IP address, in IPv4 dotted-decimal notation, of the stub area.

**decimal_value**
The identification number of the stub area. This must be an integer from 0 through 4294967295.

**no-summary**
Disables (stops) the ABR from sending summary LSAs into the stub area.

Usage
Use this command to define an OSPF area as a stub area.

Example
The following command defines the OSPF area defined by the IP address 192.168.100.10 as a stub area:
```
area 192.168.100.10 stub
```
area virtual-link

This command configures a virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Product
- PDSN, HA, GGSN

Privilege
- Security Administrator, Administrator

Syntax

```
area { ipaddress|decimal_value} virtual-link router_id_address
```

- `ipaddress`
The IP address, in IPv4 dotted-decimal notation, of the transit area.

- `decimal-value`
The identification number of the transit area. This must be an integer from 0 through 4294967295.

- `router_id_address`
The router id, in dotted-decimal notation, of the ABR to be linked to.

Usage
Use this command to create a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example
The following command creates a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20:
```
area 192.168.100.10 virtual-link 192.168.200.20
```
area virtual link authentication

This command configures the OSPF authentication method to be used by the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

**Product**
- PDSN, HA, GGSN

**Privilege**
- Security Administrator, Administrator

**Syntax**

```plaintext
area {ipaddress|decimal_value} virtual-link router_id_address {message-digest | null | text }
```

- **ipaddress**
The IP address, in IPv4 dotted-decimal notation, of the transit area.

- **decimal-value**
The identification number of the transit area. This must be an integer from 0 through 4294967295.

- **router_id_address**
The router id, in dotted-decimal notation, of the ABR to be linked to.

- **message-digest**
Set the OSPF authentication type to use the message digest (MD) authentication method.

- **null**
Set the OSPF authentication type to use no authentication, thus disabling either MD or clear text methods.

- **text**
Set the OSPF authentication type to use the clear text authentication method.

**Usage**
Use this command to set the authentication method for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

**Example**
The following command sets the authentication method for a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20 to use no authentication:

```
area 192.168.100.10 virtual-link 192.168.200.2 null
```
area virtual-link authentication-key

This command configures the authentication password for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax
area {ipaddress|decimal_value} virtual-link router_id_address authentication-key [encrypted] password authentication_key

- **ipaddress**
The IP address, in IPv4 dotted-decimal notation, of the transit area.

- **decimal-value**
The identification number of the transit area. This must be an integer from 0 through 4294967295.

- **router_id_address**
The router id, in dotted-decimal notation, of the ABR to be linked to.

- **encrypted**
Use this if you are pasting a previously encrypted authentication key into the CLI command.

- **password authentication_key**
The password to use for authentication. **authentication_key** is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication password. This variable is entered in clear text format.

Usage
Use this command to specify the authentication password for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example
The following command creates an authentication password of 123456 for a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20:

area 192.168.100.10 virtual-link 192.168.200.20 authentication-key password 123456
area virtual link intervals

This command configures the interval or delay type, and the delay time in seconds, for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

area {ipaddress|decimal_value} virtual-link router_id_address[dead-interval value][hello-interval value][retransmit-interval value][transmit-delay value]

ipaddress
The IP address, in IPv4 dotted-decimal notation, of the area.

decimal-value
The identification number of the transit area. This must be an integer from 0 through 4294967295.

router_id_address
The router id, in dotted-decimal notation, of the ABR to be linked to.

dead-interval value
The interval, in seconds, that the router should wait, during which time no packets are received and after the router considers a neighboring router to be off-line. value must be an integer from 1 through 65535.

hello-interval value
The interval, in seconds before sending a hello packet. value must be an integer from 1 through 65535.

retransmit-interval value
The interval, in seconds, that router should wait before retransmitting a packet. value must be an integer from 1 through 65535.

transmit-delay value
The interval, in seconds, that the router should wait before transmitting a packet. value must be an integer from 1 through 65535.

Usage
Use this command to set the intervals or delay types for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.
Example
The following command sets the retransmit interval for a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20 to 60 seconds:
area 192.168.100.10 virtual-link 192.168.200.20 retransmit-interval 60
area virtual link message-digest-key

This command enables the use of MD5-based OSPF authentication for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax
```
area {ipaddress|decimal_value} virtual-link router_id_address message-digest-key key_id md5 [encrypted] password authentication_key
```

- **ipaddress**
The IP address, in IPv4 dotted-decimal notation, of the transit area.

- **decimal-value**
The identification number of the transit area. This must be an integer from 0 through 4294967295.

- **router_id_address**
The router id, in dotted-decimal notation, of the ABR to be linked to.

- **message-digest-key key_id**
Specifies the key identifier number. key_id must be an integer from 1 through 255.

- **encrypted**
Used this if you are pasting a previously encrypted authentication key into the CLI command.

- **password authentication_key**
The password to use for authentication. authentication_key is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication password. This variable is entered in clear text format.

Usage
Use this command to enable the use of MD5-based OSPF authentication for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example
The following command enables the use of MD5-based OSPF authentication for a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20, sets the MD5 Key ID to 25, and the password to 123456:
```
area 192.168.100.10 virtual-link 192.168.200.20 message-digest-key 25 md5 password 123456
```
capability graceful-restart

This command configures graceful-restart. By default, capability is set to enabled.

**Product**
PDFN, HA, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
capability graceful-restart

   no capability graceful-restart

no

Disables capability graceful-restart.
```

**Usage**

Use this command to configure graceful-restart.

**Example**
The following command configure capability graceful-restart:

```plaintext
capability graceful-restart
```
default-information originate

This command creates a default external route into an OSPF routing domain.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax
\[
\text{default-information originate [always][metric metric_value][metric-type \{1 | 2\}][route-map route_map_name]}
\]

always
Indicates that the route should always be advertised, regardless of whether the software has a default route or not.

metric metric_value
Sets the OSPF metric used in creating the default route. This must be an integer from 1 through 16777214.

metric-type \{1 | 2\}
Sets the default route metric type.
1 : Sets the OSPF external link type for default routes to Type 1.
2 : Sets the OSPF external link type for default routes to Type 2.

route-map route_map_name
Specifies the name of the default route-map to be used. This must be specified as a string of 1 through 79 alphanumeric characters.

Usage
Use this command to set the default external route into an OSPF routing domain.

Example
The following command sets the default external route to originate from the routemap named rmap1:
\[
\text{default-information originate route-map rmap1}
\]
default metric

This command configure the default metric value for the OSPF routing protocol.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax
```
default-metric metric_value
```

- `metric_value`
  The metric value to set. This must be an integer from 1 through 16777214. The default metric value setting is 26385.

Usage
Use this command to set the default metric for routes.

Example
The following command sets the default metric to 235:
```
default-metric 235
```
distance

This command configures the OSPF route administrative distances for all OSPF route types or based on specific route type.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax
distance*distance_value*|ospf [[external*distance_value*][inter-area*distance_value*][intra-area*distance_value*]]

distance_value
is an integer, ranging from 1 to 255, that sets OSPF route administrative distances. The default distance value is 110.

ospf { [ external*distance_value* ] [ inter-area*distance_value* ] [ intra-area*distance_value* ] }

Set the distance value for the specified route type.

external*distance_value* Set the OSPF route administrative distance for routes from other routing domains, learned by redistribution. This must be an integer from 1 through 255. The default is 110.

inter-area*distance_value* sets the OSPF route administrative distance for routes from one routing area to another. This must be an integer from 1 through 255. The default is 110.

intra-area*distance_value* sets the OSPF route administrative distance for all routes within an area. This must be an integer from 1 through 255. The default is 110.

Usage
Use this command to set the administrative distance for OSPF routes.

Example
The following command sets the administrative distance for all OSPF route types to $30$:
distance $30$

distribute-list

This command enables the filtering of networks in outgoing routing updates.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

distribute-list route_access_list out {connected|rip|static}

route_access_list
The name of the OSPF route access list to use. This is an alphanumeric string up to 63 characters in length.

connected
Filter connected routes.

rip
Filter RIP routes. (RIP is not supported at this time.)

static
Filter static routes.

Usage
Use this command to enable the filtering of outgoing route updates by using the specified route access list.

Example
The following command uses the route access list named ral1 to filter outgoing routing updates for all connected routes:
distribute-list ral1 out connected
end

Exits the NTP configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
   end

Usage
   Change the mode back to the Exec mode.
exit

Exits the NTP configuration mode and returns to the global configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Return to the global configuration mode.
**ip vrf**

This command configures the VRF instances for OSPF routing protocol.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ip vrf vrf_name
no ip vrf vrf_name
```

**no**
Disables the VRF instances and removes the configured VRF context association for OSPF routing.

```
vrf_name
```

`vrf_name` is name of a preconfigured virtual routing and forwarding (VRF) context configured in Context configuration mode through `ip vrf` command.

**Usage**

Use this command to configure the IP VRF forwarding also to associate the preconfigured VRF context with the specific tunnel interface.
This command creates and enters the OSPF VRF Configuration Mode if required to configure the VRF context instances for OSPF routing.

**Example**
The following command enables preconfigured VRF context instance `ospf_vrf1` for OSPF routing and enters the OSPF VRF Configuration mode:

`ip vrf ospf_vrf1`
neighbor

This command configures OSPF routers that interconnect to non-broadcast networks.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
neighbor ip_address[poll-interval poll_interval_value][priority priority_value]
```

**ip_address**
The interface IP address of the OSPF neighbor. This must be a valid IP address entered in dotted-decimal notation.

**poll-interval poll_interval_value**
Default: 120
Set the number of seconds in the dead neighbor polling interval. This must be an integer from 1 through 65535

**priority priority_value**
Default: 0
Set the 8-bit number that represents the router priority value of the non-broadcast neighbor associated with the IP address specified. This must be an integer from 0 through 255. This keyword does not apply to point-to-multipoint interfaces.

Usage
Use this command to configure OSPF routers that connect to non-broadcast networks.

Example
The following command specifies an OSPF router neighbor with the IP address of 192.168.100.10:
```
neighbor 192.168.100.10
```
**network area**

This command enables OSPF on an interface and defines the OSPF area for that network.

**Product**
PDSN, HA, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
network network_ip_address/network_mask area {area_id|area_ip_address}
```

- network_ip_address/network_mask
  The network address and mask that specify the interface on which OSPF will be enabled. This is entered in dotted-decimal notation, followed by the “/” and the mask. Example: 192.168.1.0/24.

- area_id
  The OSPF area identification number for the specified network. This must be an integer from 0 through 4294967295.

- area_ip_address
  The IP address of the OSPF area for the specified network. This must be entered in dotted-decimal notation.

**Usage**

Use this command to specify the IP address of the network interface that the OSPF router will use.

**Example**

The following command specified that the OSPF router will use the interface at IP address 192.168.1.0 with a netmask of 24:

```
network 192.168.1.0/24
```
ospf graceful-restart

This command helps configure graceful-restart specific settings.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
ospf graceful-restart grace-period grace_period | helper never policy only-reload only-upgrade
```

- `grace-period grace_period`
  
  OSPF graceful restart grace period (seconds) is the time in which OSPF restarts, it should be and integer between 1 to 1800. Default grace period is 60 seconds.

- `helper never policy`
  
  Helps configure OSPF helper settings.
  
  `never`: Specifies never as helper.
  
  `policy { only-reload | only-upgrade }`: Allows ospf graceful-restart helper policy.
    
    - `only-reload`: Allows ospf graceful-restart helper policy only-reload.
    
    - `only-upgrade`: Allows ospf graceful-restart helper policy only-upgrade.

Usage

Use this command to configure graceful-restart specific settings.

Example

The following command sets the graceful restart grace period to 60 seconds:

```
ospf graceful-restart grace-period 60
ospf graceful-restart helper policy only-reload
ospf graceful-restart helper policy only-upgrade
```
ospf router-id

This command configures the router ID for the OSPF process.

**Product**
PDSN, HA, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
```
ospf router-id ip_address
```

*ip_address*
The router ID for the OSPF process. This must be an IP address entered in dotted-decimal notation

**Usage**
Use this command to set the router ID for the current OSPF router process.

**Example**
The following command sets the router ID to 192.168.200.1:
```
ospf router-id 192.168.200.1
```
passive-interface

This command enables the suppression of OSPF routing updates on the specific interface.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
passive-interface interface_name
```

interface_name
The name assigned to a logical interface within the specific context. An interface name can be from 1 through 79 alphanumeric characters.

Usage
Use this command to suppress router updates on an interface in the current context.

Example
The following command suppresses OSPF routing updates on the interface named Intfcl:

```
passive-interface Intfcl
```
redistribute

This command redistributes routes into OSPF. This means that any routes from another protocol are redistributed to OSPF neighbors using the OSPF protocol.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax
redistribute { bgp | connected | rip | static } [metric metric_value] [metric-type {1 | 2}] [route-map route_map_name]

bgp
Specifies that BGP routes will be redistributed.

**Important:** BGP routing is only supported for use with the HA.

connected
Specifies that connected routes will be redistributed.

rip
Specifies that RIP routes will be redistributed. (RIP is not supported at this time.)

static
Specifies that static routes will be redistributed.

metric metric_value
Sets the OSPF metric used in the redistributed route. This must be an integer from 1 through 16777214.

metric-type {1 | 2}
Default: 2
Sets route metric type that is applied to redistributed routes.
1 : Sets the OSPF external link type for routes to Type 1.
2 : Sets the OSPF external link type for routes to Type 2.

route-map route_map_name
Filter routes through the specified route map before redistribution. route_map_name specifies the name of the route-map to use and must be specified as a string of 1 through 79 alphanumeric characters.

Usage
Use this command to define what routing protocols should have their routes redistributed into OSPF.
Example
The following command defines that BGP routes should be redistributed:
redistribute bgp
refresh timer

This command adjusts the OSPF refresh timer.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

`refresh timer value`

value

Default: 10
The minimum amount of time, in seconds, to wait before refreshing an LSA. This must be an integer from 10 through 1800.

Usage

Use this command to define the amount of time to wait before refreshing an LSA.

Example

The following command sets the refresh timer to 90 seconds:

```
refresh timer 90
```
router-id

This command configures the router ID for the OSPF process.

**Product**

PDSN, HA, GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
router-id ip_address
```

- **ip_address**
  - The router ID for the OSPF process. This must be an IP address entered in dotted-decimal notation

**Usage**

Use this command to set the router ID for the current OSPF router process.

**Example**

The following command sets the router ID to **192.168.200.1**:

```
routing-id 192.168.200.1
```
timers spf

This command adjusts the SPF timers.

**Product**
PDSN, HA, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
  timers spf delay_value hold_time_value
```

- `delay_value`
  Default: 5
  The delay time, in seconds, between receiving changes to an SPF calculation. This must be an integer from 0 through 4294967295.

- `hold_time_value`
  Default: 10
  The hold time, in seconds, between consecutive SPF calculations. This must be an integer from 0 through 4294967295.

**Usage**

Use this command to set the SPF delay and hold timers for the current OSPF router process.

**Example**

The following command sets the delay timer to 15 and the hold timer to 15:

```
timers spf 15 15
```
Chapter 160
OSPF VRF Configuration Mode Commands

The OSPF VRF Configuration sub-mode is used to configure the virtual routing and forwarding (VRF) context instances for OSPF routing protocol. This mode includes commands that configure VRF instance for OSPF routing parameters.

```
Exec Mode
  configure
    Global Configuration Mode
      context name
        Context Configuration Mode
          router ospf
            OSPF Configuration Mode
              ip vrf vrf_name
                OSPF VRF Configuration Mode
```

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
area

This command configures the various parameters, including authentication, area identification, virtual link id, delay/interval values for the specified OSPF area using specific VRF instance.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

[no] area { ip_address | decimal_value } {authentication [ message-digest ] | default-cost cost_value | nssa [default-information-originate] [no-redistribution no-summary] [translate-always] [translate-candidate] [translate-never] | stub [no-summary] | virtual-link router_ip_address [authentication {message-digest | null | text}] [authentication-key {encrypted password encrypted_string | password password_string}] [message-digest-key key_id md5 [encrypted password encrypted_string | password password_string]})} [dead-interval] [hello-interval] [retransmit-interval] [transmit-delay]

no
Disables/removes configured parameters for the specified OSPF area using specific VRF instance.

ip_address
Specifies the IP address in IPv4 dotted-decimal notation, of the area where authentication will be enabled.

decimal_value
Specifies the identification number of the area where parameters to be configured. This must be an integer from 0 through 4294967295.

message-digest
Sets the OSPF authentication type to use the message digest 5 (MD5) authentication method.

default-cost cost_value
Sets the default cost for an OSPF area.

cost_value is the default cost to be configured for the specified area and must be an integer from 0 through 16777215.

nssa [default-information-originate] [no-redistribution no-summary] [translate-always] [translate-candidate] [translate-never]
Configures and defines an area as an NSSA (Not So Stubby Area) and configures OSPF parameters for it.

default-information-originate: This optional keyword configures the OSPF VRF instances to originate default information to the NSSA area.

no-redistribution: This optional keyword configures the OSPF VRF instance to not to redistribute external routes to the NSSA area.
**no-summary**
This optional keyword configures the OSPF VRF instance to not to inject the inter-area routes into NSSA.

**translate-always**
This optional keyword configures the NSSA-ABR always to translate. By default this is disabled.

**translate-candidate**
This optional keyword configures the NSSA-ABR always to translate election. By default this is enabled.

**translate-never**
This optional keyword configures the NSSA-ABR never to translate. By default this is disabled.

---

**stub [no-summary]**
This keyword specifies an OSPF area as an stub area configures the NSSA-ABR never to translate. By default this is disabled.

no-summary: This optional keyword disables (stops) the ABR from sending summary LSAs into the stub area.

---

**virtual-link router_id**
Specifies the router identifier which provides a virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone. 

*router_id* must be an IP address in IPv4 dotted-decimal notation of the ABR to be linked to.

---

**authentication {message-digest | null | text}**
Configures the OSPF authentication method to be used by the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

message-digest: Set the OSPF authentication type to use the message digest (MD) authentication method.
null: Set the OSPF authentication type to use no authentication, thus disabling either MD or clear text methods.
text: Set the OSPF authentication type to use the clear text authentication method.

---

**authentication-key**
Configures the authentication password for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

---

**message-digest-key key_id**
Specifies the MD key identifier number for virtual link connection.

*key_id* must be an integer from 1 through 255.

---

**md5**
Sets the message digest to MD5 for virtual link connection.

---

**[encrypted] password passwd_string**
Specifies the password required for virtual link connection authentications. The keyword **password** is optional and if specified **passwd_string** must be from 1 to 63 alpha and/or numeric characters. The password specified must be in an encrypted format if the optional keyword **encrypted** was specified. The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.
**dead-interval value**
Specifies the dead interval, in seconds, that the router should wait, during which time no packets are received and after the router considers a neighboring router to be off-line. *value* must be an integer from 1 through 65535.

**hello-interval value**
Specifies the hello interval, in seconds before sending a hello packet. *value* must be an integer from 1 through 65535.

**retransmit-interval value**
Specifies the delay between retransmission, in seconds, that the router should wait before retransmitting a packet. *value* must be an integer from 1 through 65535.

**transmit-delay value**
Specifies the interval, in seconds, that the router should wait before transmitting a packet. *value* must be an integer from 1 through 65535.

**Usage**
Use this command to configure/set the various network/connection/authentication parameters of OSPF areas using specific VRF instance.

**Example**
The following command enables authentication for an OSPF area defined by the IP address 192.168.100.10 and the OSPF authentication type to MD5:

```
area 192.168.100.10 authentication message-digest
```

The following command sets the default cost for an OSPF area defined by the IP address 192.168.100.10 to 300:
The following command defines the area designated by the IP address 192.168.100.10 as an NSSA area where translation of NSSA candidate is enabled by default:
```
area 192.168.100.10 nssa
```

The following command defines the OSPF area defined by the IP address 192.168.100.10 as a stub area:
```
area 192.168.100.10 stub
```

The following command creates a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20:
```
area 192.168.100.10 virtual-link 192.168.200.20
```

The following command sets the authentication method for a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20 to use no authentication:
```
area 192.168.100.10 virtual-link 192.168.200.20 null
```

The following command creates an authentication password of 123456 for a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20:
```
area 192.168.100.10 virtual-link 192.168.200.20 authentication-key password 123456
```

The following command enables the use of MD5-based OSPF authentication for a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20, sets the MD5 Key ID to 25, and the password to 123456:
```
area 192.168.100.10 virtual-link 192.168.200.20 authentication-key md5 password 123456
```

The following command sets the retransmit interval for a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20 to 60 seconds:
area 192.168.100.10 virtual-link 192.168.200.20 retransmit-interval 60
default-information originate

This command creates a default external route into an OSPF routing domain.

**Product**
PDSN, HA, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
default-information originate [always] [metric metric_value] [metric-type {1 | 2}] [route-map route_map_name]
```

- **always**
  Indicates that the route should always be advertised, regardless of whether the software has a default route or not.

- **metric metric_value**
  Sets the OSPF metric used in creating the default route. This must be an integer from 1 through 16777214.

- **metric-type {1 | 2}**
  Sets the default route metric type.
  1: Sets the OSPF external link type for default routes to Type 1.
  2: Sets the OSPF external link type for default routes to Type 2.

- **route-map route_map_name**
  Specifies the name of the default route-map to be use. This must be specified as a string of 1 through 79 alphanumeric characters.

**Usage**

Use this command to set the default external route into an OSPF routing domain.

**Example**

The following command sets the default external route to originate from the routemap named `rmap1`:

```
default-information originate route-map rmap1
```
default metric

This command configures the default metric value for the OSPF routing protocol.

**Product**
PDSN, HA, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
default-metric metric_value
```

- **metric_value**
  The metric value to set. This must be an integer from 1 through 16777214. The default metric value setting is 26385.

**Usage**
Use this command to set the default metric for routes.

**Example**
The following command sets the default metric to 235:

```plaintext
default-metric 235
```
end

Exits the NTP configuration mode and returns to the Exec mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Change the mode back to the Exec mode.
exit

Exits the NTP configuration mode and returns to the global configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Return to the global configuration mode.
neighbor

This command configures OSPF routers that interconnect to non-broadcast networks.

**Product**
PDSN, HA, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
neighbor ip_address [poll-interval poll_inter_value] [ priority priority_value]
```

- **ip_address**
The interface IP address of the OSPF neighbor. This must be an IP address entered in dotted-decimal notation.

- **poll-interval poll_inter_value**
  Default: 120
  Set the number of seconds in the dead neighbor polling interval. This must be an integer from 1 through 65535

- **priority priority_value**
  Default: 0
  Set the 8-bit number that represents the router priority value of the non-broadcast neighbor associated with the IP address specified. This must be an integer from 0 through 255. This keyword does not apply to point-to-multipoint interfaces.

**Usage**
Use this command to configure OSPF routers that connect to non-broadcast networks.

**Example**
The following command specifies an OSPF router neighbor with the IP address of 192.168.100.10:

```
neighbor 192.168.100.10
```
network area

This command enables OSPF on an interface and defines the OSPF area for that network.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
network ip_address/ip_mask area {area_id | area_ip_address}
```

**ip_address/ip_mask**
The network address and mask that specify the interface on which OSPF will be enabled. This is entered in dotted-decimal notation, followed by the “/” and the mask. Example: 192.168.1.0/24.

**area_id**
The OSPF area identification number for the specified network. This must be an integer from 0 through 4294967295.

**area_ip_address**
The IP address of the OSPF area for the specified network. This must be entered in dotted-decimal notation.

Usage
Use this command to specify the IP address of the network interface that the OSPF router will use.

Example
The following command specified that the OSPF router will use the interface at IP address 192.168.1.0 with a netmask of 24:
```
network 192.168.1.0/24
```
**ospf router-id**

This command configures the router ID for the OSPF process.

**Product**

PDSN, HA, GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
ospf router-id ip_address
```

*ip_address*

The router ID for the OSPF process. This must be an IP address entered in dotted-decimal notation

**Usage**

Use this command to set the router ID for the current OSPF router process.

**Example**

The following command sets the router ID to 192.168.200.1:

```
ospf router-id 192.168.200.1
```
passive-interface

This command enables the suppression of OSPF routing updates on the specific interface.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
passive-interface interface_name
```

- **interface_name**
  The name assigned to a logical interface within the specific context. An interface name can be from 1 through 79 alphanumeric characters.

Usage
Use this command to suppress router updates on an interface in the current context.

Example
The following command suppresses OSPF routing updates on the interface named *IntfCl*:

```
passive-interface IntfCl
```
redistribute

This command redistributes routes into OSPF. This means that any routes from another protocol are redistributed to OSPF neighbors using the OSPF protocol.

**Product**
PDSN, HA, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
redistribute {bgp | connected | rip | static} [metric value] [metric-type {1 | 2}] [route-map route_map_name]
```

- **bgp**
  Specifies that BGP routes will be redistributed.

  **Important**: BGP routing is only supported for use with the HA.

- **connected**
  Specifies that connected routes will be redistributed.

- **rip**
  Specifies that RIP routes will be redistributed. (RIP is not supported at this stage.)

- **static**
  Specifies that static routes will be redistributed.

- **metric value**
  Sets the OSPF metric used in the redistributed route.
  Value must be an integer from 1 through 16777214.

- **metric-type {1 | 2}**
  Default: 2
  Sets route metric type that is applied to redistributed routes.
  1: Sets the OSPF external link type for routes to Type 1.
  2: Sets the OSPF external link type for routes to Type 2.

- **route-map route_map_name**
  Filter routes through the specified route map before redistribution. route_map_name specifies the name of the route-map to use and must be specified as a string of 1 through 79 alphanumeric characters.

**Usage**
Use this command to define what routing protocols should have their routes redistributed into OSPF.

Example
The following command defines that static routes should be redistributed in an OSPF area:

```
redistribute static
```
refresh timer

This command adjusts the OSPF refresh timer.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax
refresh timer value

value
Default: 10
The minimum amount of time, in seconds, to wait before refreshing an LSA. This must be an integer from 10 through 1800.

Usage
Use this command to define the amount of time to wait before refreshing an LSA.

Example
The following command sets the refresh timer to 90 seconds:
refresh timer 90
router-id

This command configures the router ID for the OSPF process.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
router-id ip_address
```

- `ip_address`:
  The router ID for the OSPF process. This must be an IP address entered in dotted-decimal notation.

Usage
Use this command to set the router ID for the current OSPF router process.

Example
The following command sets the router ID to `192.168.200.1`:

```
router-id 192.168.200.1
```
timers spf

This command adjusts the Shortest Path First (SPF) timers.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

timers spf delay_value hold_time_value

  delay_value
  Default: 5
  The delay time, in seconds, between receiving changes to an SPF calculation. This must be an integer from 0 through 4294967295.

  hold_time_value
  Default: 10
  The hold time, in seconds, between consecutive SPF calculations. This must be an integer from 0 through 4294967295.

Usage
Use this command to set the SPF delay and hold timers for the current OSPF router process.

Example
The following command sets the delay timer to 15 and the hold timer to 15:

timers spf 15 15
Chapter 161
Out-Address Configuration Mode Commands

The Out-Address configuration mode provides the commands to configure the outgoing addresses for SCCP entities.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Change the mode back to the Exec mode.
exit

Exits the configuration mode and returns to the Global configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
exit
```

Usage
Return to the Global configuration mode.
gt-address

Configures the SCCP short address.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
gt-address gt_address

  gt_address
  A string of 1 to 15 digits to define the GT-address
```

Usage
Define the GT-address

Example

```
gt-address 010405525397
```
gt-format

The GT-format provides four formats that can be used during GTT.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
[gt-format] format_num
```

- `format_num`:
  1: Selects GT-format 1 options which include `nature-of-address` and `odd/even`. Once selected, the system enters GT-Format1 configuration mode.
  2: Selects GT-format2 options which include `translation-type`. Once selected, the system enters GT-Format2 configuration mode.
  3: Selects GT-format3 options which include `encoding-scheme`, `numbering-plan`, and `translation-type`. Once selected, the system enters GT-Format1 configuration mode.
  4: Selects GT-format4 options which include `encoding-scheme`, `nature-of-address`, `numbering-plan`, and `translation-type`. Once selected, the system enters GT-Format4 configuration mode.

Usage
Select the a GT-format that include encoding-scheme as part of the GTT process.

Example

```
gt-format 3
```
ni-indicator

Configures the National and International indicator to use during the GTT process.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
i-indicator ni_ind
```

- **ni_ind**
  Select one of the following as the appropriate type of national indicator for the address structure:
  - `national`
  - `international`

**Usage**
Select the international indicator to be used for out-going addresses.

**Example**

```
i-indicator international
```
point-code

Selects and configures the SS7-type point code for use with the out-going address.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
point-code pt_code
```

pt_code
Enter 1 to 11 digits in the point code format predefined during variant selection of GTT association.

Usage

Define an ITU point code to be used for out-going address processing.

Example

```
point-code 6.255.6
```
routing-indicator

Selects the type of routing and the indicator to be included in the out-going message.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
routing-indicator routing_ind
```

```
routing_ind
Select one of the following options:
  • gt: Inserts an indicator that identifies routing based on global title.
  • ssn: Inserts an indicator that identifies routing based on the subsystem number.
```

Usage
Select global title as the appropriate routing indicator.

Example

```
routing-indicator gt
```
ssf

Selects the subservice field as factor in the out-going address processing. `ssf` sets the network indicator in the subservice field for SS7 Message Signal Units (MSUs). The indicator carried in the message’s routing information typically identifies the structure of the point code as a message from within a nation or as a message coming from outside the national - international.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

`ssf sub_svc_fld`

**sub_svc_fld**
Select one of the following options:

- **international**: The network indicator identifies the message as international with a point code structure that does not match the national point code structure,

- **national**: The network indicator identifies the messages as having a national point code structure.

- **reserved**: Provides an alternate network indicator for national messages.

- **spare**: Provides an alternate network indicator for international messages.

Usage
Select the international NI for inclusion in out-going address subservice fields.

Example

`ssf international`
SSN

Selects the subsystem number to be included in the out-going message.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
ssn  sub_sys_num
```

```
sub_sys_num
Enter an integer from 1 to 255.
```

Usage
Use subsystem number 44 in the out-going address.

Example

```
ssn 44
```
Chapter 162
PDG Service Configuration Mode Commands

The PDG Service Configuration Mode is used to specify the properties required for the UEs in the WLAN (Wireless Local Access Network) to interface with the PDG/TTG.
aaa attribute

Sets the attributes that the system uses in AAA messages.

Product
TTG

Privilege
Security Administrator, Administrator

Syntax

aaa attribute { 3gpp-negotiated-qos-profile string }

no aaa attribute

------------------------
3gpp-negotiated-qos-profile string
------------------------
Specifies the 3GPP negotiated QoS profile to use in AAA messages during IMS emergency call handling. string must be in the range of 1 to 31 characters.

no aaa attribute
Removes a previously configured AAA attribute.

Usage
Specifies the 3GPP negotiated QoS profile to use in AAA messages during IMS emergency call handling.

Example
The following command specifies the 3GPP negotiated QoS profile to use during IMS emergency call handling:

```text
aaa attribute 3gpp-negotiated-qos-profile 100
```
associate sgtp-service

Identifies the SGTP service to be associated with the PDG service to enable TTG functionality on the PDG/TTG. TTG functionality supports GTP-C (GTP control plane) messaging and GTP-U (GTP user data plane) messaging between the TTG and the GGSN over the Gn’ interface.

**Important:** This command can be used before the associated service instance is created and configured but care should be used to match the service names.

**Product**
PDG/TTG

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] associate sgtp-service sgtp_service_name [ context sgtp_context_name ]
```

- **no**
  - Removes the service association definition from the configuration.

- **sgtp-service sgtp_service_name**
  - Specifies which SGTP service configuration, by naming the SGTP service instance, to associate with this PDG service.
  - `sgtp_service_name` must be a string of 1 through 63 alpha and/or numeric characters with no spaces.

- **context sgtp_context_name**
  - Defines the context in which the SGTP service was created. If no context is specified, the current context is used.
  - `sgtp_context_name` must be a string of 1 through 63 alpha and/or numeric characters with no spaces.

**Usage**

Use this command to associate the SGTP service to be associated with the PDG service to enable TTG functionality on the PDG/TTG.

**Example**

The following command associates SGTP service `sgtp_service_1` with this PDG service:

```
associate sgtp-service sgtp_service_1 context sgtp_context_1
```
certificate-selection

Configures the PDG/TTG to select the trusted certificate (and the private key for calculating the AUTH payload) to be included in the first IKE_AUTH message from the PDG/TTG based on the APN (Access Point Name). The selected certificate is associated with the APN included in the IDr payload of the first IKE_AUTH message from the UE.

**Product**
PDG/TTG

**Privilege**
Security Administrator, Administrator

**Syntax**

```
certificate-selection apn-based

no certificate-selection
default certificate-selection
```

**certificate-selection apn-based**

Selects a trusted certificate for the first IKE_AUTH message based on the APN.

**no certificate-selection**

Disables APN-based certificate selection and resumes sending a certificate bound to a crypto template.

**default certificate-selection**

Sets the default certificate selection method to a certificate bound to a crypto template.

**Usage**

Configures the PDG/TTG to select the trusted certificate to be included in the first IKE_AUTH message based on the APN.

**Example**

Use the following example to enable APN-based certificate selection:

```
certificate-selection apn-based
```
bind

Binds the PDG service IPv4 address to a crypto template and specifies the maximum number of sessions the PDG service supports.

Product: PDG/TTG

Privilege: Security Administrator, Administrator

Syntax:

```
bind address ipv4_address { crypto-template string} mode { ttg | pdg } [ max-sessions number]
```

```
no bind
```

no bind

Removes a previously configured binding.

---

**address**

Specifies the IPv4 address of the PDG service with which the UE attempts to establish an IKEv2/IPSec tunnel. This address must be a valid IP address within the context. This is a mandatory parameter.

---

**crypto-template string**

Specifies the name of the crypto template to be bound to the PDG service. This is the name of the IPSec policy to be used as a template for PDG/TTG subscriber session IPSec policies. The crypto template includes most of the IPSec and IKEv2 parameters for keepalive, lifetime, NAT-T, and cryptographic and authentication algorithms. There must be one crypto template per PDG service. This is a mandatory parameter.

*string* is any value from 0 - 127 alpha and/or numeric characters.

---

**mode { ttg | pdg }**

Default: There is no default value.

Specifies whether the PDG service provides TTG or PDG functionality, as follows:

- In TTG mode, PDN connectivity is provided through the GGSN. PDG functionality is provided by the combined TTG and GGSN.
- In PDG mode, PDN connectivity and PDG functionality are provided directly through the PDG service.

This is a mandatory parameter.

---

**Important:** PDG mode is not supported in this software release.

---

Dependencies:

When you configure the PDG service to be in TTG mode, you must also configure the SGTP service using the `associate sgtp-service` command, as the TTG needs to connect with the GGSN to complete the PDG functionality.
The following behaviors occur when the PDG service operates in TTG mode:

- If the SGTP service associated with PDG service is not configured, the PDG service is not started.
- If the SGTP service associated with PDG service is not started, the PDG service is not started.
- If the SGTP service associated with PDG service is stopped, the PDG service is stopped.
- If the SGTP service associated with PDG service is re-started, the PDG service is re-started.
- If the SGTP service is not yet configured, whenever the SGTP service is started, the PDG service is started.

Note that starting or stopping the PDG service has no impact on the SGTP service.

**max-sessions number**

Default: 1000000

Specifies the maximum number of sessions to be supported by the PDG service. 

`number` can be any integer value from 0 - 1000000. 

If the max-sessions value is changed on an existing system, the new value takes effect immediately if it is higher than the current value. If the new value is lower than the current value, existing sessions remain established, but no new sessions are permitted until usage falls below the newly-configured value.

**Usage**

Use this command in PDG Service Configuration Mode to bind the IP address used as the connection point for establishing IKEv2/IPSec sessions to a crypto template. You can also use it to define the maximum number of sessions the PDG service supports.

**Example**

The following command binds a PDG service with an IP address of 1.2.3.4 to the crypto template `crypto_template_1`, sets the mode to TTG, and sets the maximum number of sessions to 500000:

```
bind address 1.2.3.4 crypto-template crypto_template_1 mode ttg max-sessions 500000
```
ip gnp-qos-dscp

Configures the quality of service (QoS) differentiated service code point (DSCP) used when sending data packets over the Gn' interface in the uplink direction.

Product
PDG/TTG

Privilege
Security Administrator, Administrator

Syntax

ip gnp-qos-dscp { background dscp| conversational dscp| interactive dscp| streaming dscp| interactive [ traffic-handling-priority traffic_priority] { allocation-retention-priority allocation_retention_priority} } +

no ip gnp-qos-dscp { background dscp| conversational dscp| interactive dscp| streaming dscp| interactive [ traffic-handling-priority traffic_priority] { allocation-retention-priority allocation_retention_priority} } +

default ip gnp-qos-dscp

no

Disables the overriding of the ToS (Type of Service) field and enables the pass-through option.

background dscp

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP background class, in which the data transfer is not time-critical (for example, in e-mail exchanges). This traffic class is the lowest QoS.
dscp: Set the DSCP for the specified traffic class. See the dscp section below.

conversational dscp

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP conversational class, in which there is a constant flow of traffic in both the uplink and downlink direction. This traffic class is the highest QoS.
dscp: Set the DSCP for the specified traffic pattern. See the dscp section below.

interactive [ traffic-handling-priority traffic_priority ]

Specifies the DSCP marking to be used for packets of sessions subscribed to three possible traffic priorities in the 3GPP interactive class, in which there is an intermittent flow of packets in the uplink and downlink direction. This traffic class has a higher QoS than the background class, but not as high as the streaming class. traffic_priority is the 3GPP traffic handling priority and can be the integers 1,2 or 3.

allocation-retention-priority allocation_retention_priority

Specifies the DSCP for the interactive class if the allocation priority is present in the QoS profile.
allocation-retention-priority can be the integers 1, 2, or 3.
DSCP uses the values in the following table based on the traffic handling priority and allocation/retention priority if the allocation priority is present in the QoS profile.
Important: If you only configure DSCP marking for interactive traffic classes without specifying ARP, it may not properly take effect. The CLI allows this scenario for backward compatibility however, it is recommended that you configure all three values.

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP streaming class, in which there is a constant flow of data in either in the uplink or downlink direction. This traffic class has a higher QoS than the interactive class, but not as high as the conversational class.

dscp: Set the DSCP for the specified traffic pattern. See the dscp section below.

default

- background: be
- interactive
- Traffic Priority 1: ef
- Traffic Priority 1: af21
- Traffic Priority 1: af21
- streaming: af11
- conversational: ef

Specifies the DSCP for the specified traffic pattern. dscp can be configured to any one of the following:

<table>
<thead>
<tr>
<th>DSCP Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>af11:</td>
<td>Assured Forwarding 11 per-hop-behavior (PHB)</td>
</tr>
<tr>
<td>af12:</td>
<td>Assured Forwarding 12 PHB</td>
</tr>
<tr>
<td>af13:</td>
<td>Assured Forwarding 13 PHB</td>
</tr>
<tr>
<td>af21:</td>
<td>Assured Forwarding 21 PHB</td>
</tr>
<tr>
<td>af22:</td>
<td>Assured Forwarding 22 PHB</td>
</tr>
<tr>
<td>af23:</td>
<td>Assured Forwarding 23 PHB</td>
</tr>
<tr>
<td>af31:</td>
<td>Assured Forwarding 31 PHB</td>
</tr>
<tr>
<td>af32:</td>
<td>Assured Forwarding 32 PHB</td>
</tr>
<tr>
<td>af33:</td>
<td>Assured Forwarding 33 PHB</td>
</tr>
<tr>
<td>af41:</td>
<td>Assured Forwarding 41 PHB</td>
</tr>
<tr>
<td>af42:</td>
<td>Assured Forwarding 42 PHB</td>
</tr>
<tr>
<td>af43:</td>
<td>Assured Forwarding 43 PHB</td>
</tr>
<tr>
<td>be:</td>
<td>Best effort forwarding PHB</td>
</tr>
<tr>
<td>ef:</td>
<td>Expedited forwarding PHB</td>
</tr>
</tbody>
</table>
More than one of the above keywords can be entered within a single command.

Usage

DSCP levels can be assigned to specific traffic patterns in order to ensure that data packets are delivered according to the precedence with which they’re tagged. The diffserv markings are applied to the IP header of every subscriber data packet transmitted over the Gnp’ interface(s).

The four traffic patterns have the following order of precedence: background (lowest), interactive, streaming, and conversational (highest). Data packets falling under the category of each of the traffic patterns are tagged with a DSCP that further indicate their precedence as shown in the following tables:

<table>
<thead>
<tr>
<th>Drop Precedence</th>

The DSCP level can be configured for multiple traffic patterns within a single instance of this command.

Example

The following command configures the DSCP level for the streaming traffic pattern to be ef:

```
ip gnp-qos-dscp streaming ef
```

The following command configures the DSCP levels for the conversational, streaming, interactive and background traffic patterns to be ef, ef, af22, and af41, respectively:

```
ip gnp-qos-dscp conversational ef streaming ef interactive af22 background af41
```
ip qos-dscp

Configures the quality of service (QoS) differentiated service code point (DSCP) used when sending data packets over the Wu interface in the downlink direction.

Product
PDG/TTG

Privilege
Security Administrator, Administrator

Syntax

ip qos-dscp { background dscp | conversational dscp | interactive dscp | streaming dscp | interactive [ traffic-handling-priority traffic_priority ] { allocation-retention-priority allocation_retention_priority } } +

no ip qos-dscp { background dscp | conversational dscp | interactive dscp | streaming dscp | interactive [ traffic-handling-priority traffic_priority ] { allocation-retention-priority allocation_retention_priority } } +

default ip qos-dscp

no

Disables the overriding of the ToS (Type of Service) field and enables the pass-through option.

background dscp

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP background class, in which the data transfer is not time-critical (for example, in e-mail exchanges). This traffic class is the lowest QoS.

dscp: Set the DSCP for the specified traffic class. See the dscp section below.

conversational dscp

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP conversational class, in which there is a constant flow of traffic in both the uplink and downlink direction. This traffic class is the highest QoS.

dscp: Set the DSCP for the specified traffic pattern. See the dscp section below.

interactive [ traffic-handling-priority traffic_priority ]

Specifies the DSCP marking to be used for packets of sessions subscribed to three possible traffic priorities in the 3GPP interactive class, in which there is an intermittent flow of packets in the uplink and downlink direction. This traffic class has a higher QoS than the background class, but not as high as the streaming class.

traffic_priority is the 3GPP traffic handling priority and can be the integers 1, 2 or 3.

allocation-retention-priority allocation_retention_priority

Specifies the DSCP for the interactive class if the allocation priority is present in the QoS profile.

allocation-retention-priority can be the integers 1, 2, or 3.

DSCP uses the values in the following table based on the traffic handling priority and allocation/retention priority if the allocation priority is present in the QoS profile.
<table>
<thead>
<tr>
<th>Allocation Priority</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Traffic Handling Priority</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>ef</td>
<td>ef</td>
<td>ef</td>

<td>af21</td>
<td>af21</td>
<td>af21</td>
</tr>
<tr>
<td>3</td>
<td>af21</td>
<td>af21</td>
<td>af21</td>
</tr>
</tbody>
</table>

**Important:** If you only configure DCSP marking for interactive traffic classes without specifying ARP, it may not properly take effect. The CLI allows this scenario for backward compatibility however, it is recommended that you configure all three values.

**streaming dscp**

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP streaming class, in which there is a constant flow of data in either the uplink or downlink direction. This traffic class has a higher QoS than the interactive class, but not as high as the conversational class.

`dscp`: Set the DSCP for the specified traffic pattern. See the `dscp` section below.

**dscp**

Default:
- background: be
- interactive
- Traffic Priority 1: ef
- Traffic Priority 1: af21
- Traffic Priority 1: af21
- streaming: af1
- conversational: ef

Specifies the DSCP for the specified traffic pattern. `dscp` can be configured to any one of the following:

<table>
<thead>
<tr>
<th>dscp</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>af11: Assured Forwarding 11 per-hop-behavior (PHB)</td>
<td>af33: Assured Forwarding 33 PHB</td>
</tr>
<tr>
<td>af12: Assured Forwarding 12 PHB</td>
<td>af41: Assured Forwarding 41 PHB</td>
</tr>
<tr>
<td>af13: Assured Forwarding 13 PHB</td>
<td>af42: Assured Forwarding 42 PHB</td>
</tr>
<tr>
<td>af21: Assured Forwarding 21 PHB</td>
<td>af43: Assured Forwarding 43 PHB</td>
</tr>
<tr>
<td>af22: Assured Forwarding 22 PHB</td>
<td>be: Best effort forwarding PHB</td>
</tr>
<tr>
<td>af23: Assured Forwarding 23 PHB</td>
<td>ef: Expedited forwarding PHB</td>
</tr>
<tr>
<td>af31: Assured Forwarding 31 PHB</td>
<td></td>
</tr>
<tr>
<td>af32: Assured Forwarding 32 PHB</td>
<td></td>
</tr>
</tbody>
</table>
More than one of the above keywords can be entered within a single command.

**Usage**

DSCP levels can be assigned to specific traffic patterns in order to ensure that data packets are delivered according to the precedence with which they’re tagged. The diffserv markings are applied to the IP header of every subscriber data packet transmitted over the Wu interface(s). The four traffic patterns have the following order of precedence: background (lowest), interactive, streaming, and conversational (highest). Data packets falling under the category of each of the traffic patterns are tagged with a DSCP that further indicate their precedence as shown in the following tables:

<table>
<thead>
<tr>
<th>Drop Precedence</th>
<th>Class 1</th>
<th>Class 2</th>
<th>Class 3</th>
<th>Class 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low</td>
<td>af11</td>
<td>af21</td>

<td>5</td>
<td>Class 4</td>
</tr>
<tr>
<td>6</td>
<td>Express Forwarding (ef)</td>
</tr>
</tbody>
</table>

The DSCP level can be configured for multiple traffic patterns within a single instance of this command.

**Example**
The following command configures the DSCP level for the streaming traffic pattern to be ef:

```
ip qos-dscp streaming ef
```

The following command configures the DSCP levels for the conversational, streaming, interactive and background traffic patterns to be ef, ef, af22, and af41, respectively:

```
ip qos-dscp conversational ef streaming ef interactive af22 background af41
```
ip source-violation

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

**Product**
PDG/TTG

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ip source-violation { clear-on-valid-packet | drop-limit num period secs }
default ip source-violation { drop-limit num period secs }
no ip source-violation clear-on-valid-packet
```

---

**clear-on-valid-packet**
Default: disabled
Configures the service to reset the drop-limit counters upon receipt of a properly addressed packet.

---

**drop-limit num**
Default: 10
Sets the maximum number of allowed IP source violations within the detection period before dropping a call. If num is not specified, the value is set to the default value.
num can be any integer value from 1 to 1000000.

---

**period secs**
Default: 120
Sets the detection period in seconds for IP source violations. If secs is not specified, the value is set to the default value.
secs can be any integer value from 1 to 1000000.

---

**default ip source-violation { drop-limit num period secs }**
Sets or restores the IP source violation detection defaults, as follows:
drop-limit: Sets or restores the maximum number of IP source violations within the detection period before dropping the call to the default value of 10.
period: Sets or restores the detection period for IP source violations to the default value of 120 seconds.

---

**no ip source-violation clear-on-valid-packet**
The drop-limit counters are not reset upon receipt of a properly addressed packet.

---

**Usage**
Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.
Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session. This function operates in the following manner: When a subscriber packet is received with a source IP address violation, the system increments the IP source violation drop-limit counter and starts the timer for the IP source violation period. Every subsequent packet received with a bad source address during the IP source violation period causes the drop-limit counter to increment. For example, if the drop-limit is set to 10, after 10 source violations, the call is dropped. The detection period timer continues to count throughout this process.

Example
The following command sets the drop limit to 15 and leaves the other values at their default values:

```
ip source-violation drop-limit 15
```
max-tunnels-per-ue

The maximum number of IKEv2/IPSec tunnels allowed per UE by the PDG/TTG. This maximum number is specified per PDG service.

**Product**
PDG/TTG

**Privilege**
Security Administrator, Administrator

**Syntax**

```
max-tunnels-per-ue integer
```

default max-tunnels-per-ue

```
integer
Default: 11
The maximum number of IKEv2/IPSec tunnels allowed per UE. This value must be an integer from 1 to 11.
```

```
default max-tunnels-per-ue
Sets the maximum number of IKEv2/IPSec tunnels allowed per UE to its default value, which is 11.
```

**Usage**
Use this command to set the maximum number of IKEv2/IPSec tunnels allowed per UE.

**Example**
Use the following command to set the maximum number of IKEv2/IPSec tunnels allowed per UE to 2:
```
max-tunnels-per-ue 2
```

plmn id

Configures location specific mobile network identifiers used to help translate local emergency and service-related numbers. Default is disabled.

Product
PDG/TTG

Privilege
Security Administrator, Administrator

Syntax

```
plmn id mcc mcc_number mnc mnc_number
no plmn id mcc mcc_number mnc mnc_number
```

**mcc mnc_number**

Specifies the mobile country code (MCC) portion of the PLMN’s identifier.
mcc_number is the PLMN MCC identifier and can be configured to any integer value between 200 and 999.

**mnc mnc_number**

Specifies the mobile network code (MNC) portion of the PLMN’s identifier.
mnc_number is the PLMN MNC identifier and can be configured to any 2 or 3 digit integer value between 00 and 999.

**no plmn id mcc mcc_number mnc mnc_number**

Removes a previously configured PLMN identifier for the PDG service.

Usage

The PLMN ID is included in the RAI (Routing Area Identity) field of the PDP Create Request messages sent to the GGSN. Multiple PDG services can be configured with the same PLMN identifier. Up to five PLMN IDs can be configured for each PDG service.

Example

The following command configures the PLMN identifier with an MCC of 462 and MNC of 02:

```
plmn id mcc 462 mnc 02
```
**setup-timeout**

Specifies the maximum time allowed to set up a session in seconds.

**Product**
PDG/TTG

**Privilege**
Security Administrator, Administrator

**Syntax**

```
setup-timeout integer

default setup-timeout
```

---

**setup-timeout integer**

Default: 60
Sets the session setup timeout value.
integer is a value in the range of 2 - 300 seconds.

**default setup-timeout**

Sets or restores the default session setup timer value to 60 seconds.

---

**Usage**
The PDG/TTG clears both the user session and tunnels if a call does not initiate successfully before the session setup timer expires.

---

**Example**
The following command sets the session setup timeout value to the default value of 60 seconds:

```
default setup-timeout
```
The PDIF Service Configuration Mode is used to configure the properties required for a mobile station to interface with a PDIF.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
aaa attribute

Sets the system attributes for AAA messages.

Product
PDIF

Privilege
Security Administrator, Administrator

Syntax

aaa attribute { 3gpp2-bsid string | 3gpp2-service-option integer | calling-station-id integer | 3gpp2-serving-pcf <ip-address> }

no aaa attribute

default aaa attribute 3gpp2-service-option integer

no
Removes a previously configured AAA attribute.

default
Returns the specified aaa attribute to the original default system settings.

3gpp2-bsid string
Specifies the base-station ID and consists of the SID + NID + CELLID.
string must contain 12 hexadecimal upper-case ASCII characters.

3gpp2-service-option integer
Default: 4095
Specifies the radius attribute value when sending authentication and accounting messages.
integer can be configured to any value in the range 0 - 32767

calling-station-id integer
Calling station phone number.
integer can be configured to any value from 1 - 15 numbers.

3gpp2-serving-pcf
Use this command to generate attribute values without creating a new ASR 5000 image.

Usage
If the RADIUS protocol is being used, accounting messages can be sent over a AAA interface to the RADIUS server.
3gpp2-serving-pcf attribute value (if configured) is sent in both RADIUS authentication and accounting messages. If the attribute value is not configured (or explicitly 'not configured' using no command), radius
attributes are still included with just type and length. This is because inclusion/exclusion of radius attributes are still controlled through the dictionary, not with CLI.

Example
The following command identifies the base station ID:

```plaintext
aaa attribute 3gpp2-bsid 0ab23289acb3
```
aaa authentication

Sets the aaa authentication for first and second phase authentication when multiple authentication is configured on the system.

Product
PDIF

Privilege
Security Administrator, Administrator

Syntax

aaa authentication { { first-phase | second-phase } | { context-name name aaa-group name } }

no aaa authentication { first-phase | second-phase }

no aaa authentication { first-phase | second-phase }

Removes any existing authentication configuration.

first-phase context-name name aaa-group name

Specifies the context name and the aaa group name configured in the context for the first authentication phase.
context-name name: Context where aaa server group is defined. name must be a string of size 1-79.
aaa-group name: Name of the aaa-group to be used for authentication. name must be a string of size 1-63.

second-phase context-name name aaa-group name

Specifies the context name and the aaa group name configured in the context for the second authentication phase.
context-name name: Context where aaa server group is defined. name must be a string of size 1-79.
aaa-group name: Name of the aaa-group to be used for authentication. name must be a string of size 1-63.

Usage

Two phase-authentication happens in IKEv2 setup for setting up the IPSec session. The first authentication uses Diameter AAA EAP method and second authentication uses RADIUS AAA authentication. The same AAA context may be used for both authentications. PDIF service allows you to specify only a single AAA group, which could normally be used for the first authentication method.
A given AAA group only supports either Diameter or RADIUS authentication. If the NAI in the first authentication is different from NAI in the second authentication each NAI can point to a different domain profile in the PDIF. Each domain profile may be configured with each AAA group, one for Diameter and the other for RADIUS.

Example

Use the following to configure first-phase authentication for an aaa group named aaa-10 in the pdif context:
first-phase context-name pdif aaa-group aaa-10
bind

Binds the service IP address to crypto template and configures the number of sessions the PDIF can support.

Product
PDIF

Privilege
Security Administrator, Administrator

Syntax

bind address address { crypto-template string } [ max-sessions number ]

no bind

no
Removes a previously configured binding.

address
Specifies the IP address of the service.

crypto-template string
Specifies the name of the crypto template to be bound to the service.
string is any value from 0 - 127 alpha and/or numeric characters.

max-sessions number
Default is 3000000
Specifies the maximum number of sessions to be supported by the service.
number can be any integer value from 0 - 300000

Usage
Binds the IP address used as the connection point for establishing the IKEv2 sessions to the crypto template. It can also define the number of sessions the PDIF can support.

Example
The following command binds a service with the ip address 13.1.1.1 to the crypto template T1 and sets the maximum number of sessions to 200000:

    bind address 13.1.1.1 crypto-template T1 max-sessions 200000
default

Sets or restores the default condition for the selected parameter.

**Product**

PDIF

**Privilege**

Security Administrator, Administrator

**Syntax**

```
default { ( aaa attribute 3gpp2-service-option ) | duplicate-session-detection |
            hss ( failure-handling mac-address-validation-failure | mac-address-validation |
                  update-profile ) | ip source-violation ( drop-limit | period ) | setup-timeout |
            subscriber name | username mac-address-stripping ) }
```

**aaa attribute 3gpp2-service-option**

Configures the default value to 4095.

**duplicate-session-detection**

Configures the default to be NAI-based.

**hss { failure-handling mac-address-validation-failure | mac-address-validation |
        update-profile }**

Configures the HSS server defaults:
- **failure-handling mac-address-validation-failure**: By default, the MAC address is validated by IMS-Sh interface.
- **mac-address-validation**: By default, validating the MAC address is disabled.
- **update-profile**: By default, updating the PDIF profile is disabled.

**ip source-violation ( drop-limit | period )**

Configures IP source-violation detection defaults.
- **drop-limit**: Default number of ip source violations permitted in detection period before the call is dropped is 10.
- **period**: Default detection period is 120 seconds.

**setup-timeout**

Default call setup time limit is 60 seconds.

**subscriber name**

Configures the default subscriber name. *name* is a string of 1-127 characters.

**username mac-address-stripping**

Default is to disable stripping the MAC address from the username.
Usage
Configures the default settings for a given parameter.

Example
Use the following example to configure the default call setup time limit:

```
default setup-timeout
```
**duplicate-session-detection**

Configures the PDIF to detect duplicate call sessions using old IMSI or NAI addresses and clear old call information.

**Product**
PDIF

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no | default ] duplicate-session-detection { imsi-based | nai-based }
```

- **no**
  Stops duplicate session detection.

- **default**
  Configures the default setting, which is NAI-based detection.

- **imsi-based**
  Configures the PDIF to detect duplicate call sessions based on the IMSI address.

- **nai-based**
  Configures the PDIF to detect duplicate call sessions based on the NAI address. This is the default setting.

**Usage**

If an MS leaves the Wi-Fi coverage area and subsequently comes back online, it may initiate a new session setup procedure. After both the device authentication with HSS and the subscriber authentication with AAA server are completed, PDIF runs the internal mechanism to see whether there was any other session bound with the same IMSI. If an old session is detected, PDIF starts clearing this old session by sending a proxy-MIP Deregistration request to the HA. PDIF resumes new session setup by sending a proxy-MIP registration request. When the old session is aborted, PDIF sends Diameter STR messages and RADIUS Acct STOP messages to corresponding AAA servers.

PDIF allows duplicate session detection based on either the NAI or IMSI addresses. When detecting based on NAI, it is the first-phase (device authentication) NAI that is used.

**Example**
The following command configures duplicate session detection to use IMSI addressing:

```
duplicate-session-detection imsi
```
end

Exits the current mode and returns to the Exec Mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Change the mode back to the Exec Mode.
exit

Exits the current mode and returns to the previous mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Returns to the previous mode.
hss

Configures the HSS server parameters.

Product: PDIF

Privilege: Security Administrator, Administrator

Syntax:

```
no
Removes a previously configured HSS profile.

default
Resets the defaults for this command.

failure-handling mac-address-validation-failure
Configures the way the HSS server is to handle errors.
If HSS returns a list of MAC addresses and if PDIF fails to match the subscriber MAC address against the
list, then the session is always terminated.

action { continue | terminate }
Configures the action to be performed depending on the failure type.
continue: Ignore a mac-address-validation-failure and continue the session.
terminate: Terminate the session on a mac-address-validation-failure.

mac-address-validation
Default: disabled
If mac-address-validation is enabled, the PDIF queries the HSS server for a list of MAC addresses associated
with the Mobile Directory Number (MDN).

update-profile
Default: disabled.
Update the HSS server with the subscriber profile.
```

Usage:

An HSS server is used to provide MAC address validation and store part of the subscriber profile. This
command enables or disables validation and profile updates, and configures how the system responds to
failures: terminate or continue a session.
An ims-sh-service and Diameter interface needs to be configured to communicate with the HSS server.

**Example**
The following example enables mac-address validation:

```
hss mac-address-validation
```
**ims-sh-service**

Associates the IMS-Sh-service parameters.

**Product**
PDIF

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
ims-sh-service name name

no ims-sh-service name name
```

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
</table>
| Removes a previously configured IMS-Sh-service.

<table>
<thead>
<tr>
<th>name</th>
</tr>
</thead>
</table>
| Names the IMS-Sh-service in the pdif-service context.

**Usage**

This command is used to name the IMS-Sh-service.

**Example**

The following command names the IMS-Sh-service ims1:

```plaintext
ims-sh-service name ims1
```
ip source-violation

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.

Product
PDIF

Privilege
Security Administrator, Administrator

Syntax

```
ip source-violation { clear-on-valid-packet | drop-limit num | period secs }
no ip source-violation clear-on-valid-packet
```

**clear-on-valid-packet**

Default: disabled
Configures the service to reset the reneg-limit and drop-limit counters after receipt of a properly addressed packet.

**drop-limit num**

Default: 10
Sets the number of allowed source violations within a detection period before forcing a call disconnect. If *num* is not specified, the value is set to the default.

*num* can be any integer value from 1 to 1000000.

**period secs**

Default: 120
The length of time, in seconds, for a source violation detection period to last.

If *secs* is not specified, the value is set to the default.

*secs* can be any integer value from 1 to 1000000.

Usage

This function is intended to allow the operator to configure a network to prevent problems such as when a user gets handed back and forth between two PDIFs a number of times during a handoff scenario.

This function operates in the following manner:

When a subscriber packet is received with a source address violation, the system increments the IP source-violation drop-limit counter and starts the timer for the IP-source violation period. Every subsequent packet received with a bad source address during the IP-source violation period causes the drop-limit counter to increment.

For example, if the drop-limit is set to 10, after 10 source violations, the call is dropped. The period timer continues to count throughout this process.

Example

The following command sets the drop limit to 15 and leaves the other values at their defaults:
ip source-violation drop-limit 15
**mobile-ip**

Sets the MIP FA context for the specific PDIF service.

**Product**
PDIF

**Privilege**
Security Administrator, Administrator

**Syntax**

```
mobile-ip foreign-agent context string [ fa-service string ]
no mobile-ip
```

- **no**
  Removes previously configured parameters.

- **foreign-agent context string**
  Provides the context name in which the FA is configured. *string* is any value in the range 1 - 79 alpha and/or numeric characters.

- **fa-service string**
  Designates the name of the FA service in the FA context. *string* is any value in the range 1 - 79 alpha and/or numeric characters.

**Usage**

Shows in which context the FA is located and names the FA service.

**Example**

This command configures MIP for the FA context named fa1:

```
mobile-ip foreign-agent context fa1
```
setup-timeout

Configures the maximum time allowed to set up a session.

Product
PDIF

Privilege
Security-Administrator, Administrator

Syntax

setup-timeout integer

default setup-timeout

default
Default session setup timer: 60 seconds.

setup-timeout integer
This command manually sets the session setup timer. integer is a value in the range 2 - 300 seconds.

Usage
PDIF clears both user session and tunnels if a call does not initiate successfully before the timer expires.

Example
The following command sets the setup-timeout to the default 30 seconds:

default setup-timeout
username

Configures mac-address-stripping on a username coming in from a mobile station session.

**Product**
PDIF

**Privilege**
Security Administrator, Administrator

**Syntax**

```
username mac-address-stripping
[ default | no ] username mac-address-stripping

no
Returns the configuration to the default condition.

default
Configures the parameter default, which is disabled.

mac-address-stripping
Configures mac-address stripping from the Network Access Identifier (NAI).
```

**Usage**

When enabled, PDIF strips the MAC address from a mobile username NAI before sending to the RADIUS AAA server.

**Example**
The following example disables mac-address-stripping.

```
no username mac-address-stripping
```
Chapter 164
PDSN Service Configuration Mode Commands

The PDSN Service Configuration Mode is used to create and manage PDSN service instances for the current context.
aaa 3gpp2-service-option

Specifies the value for the 3gpp2-service option.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

aaa 3gpp2-service-option number
no aaa 3gpp2-service-option number

Usage
Disables the aaa 3gpp2-service option configuration.

Usage
Allows the configuration of a default service option value to be sent in accounting when service option values are not received from PCF. The PDSN will default the service option value to the configured value if the value is not specified by the PCF.

Example
The following command sets the service option to be 40:

aaa 3gpp2-service-option 40
access-flow traffic-validation

if access-flow traffic-validation is enabled for the service and the subscriber then the flows are checked against the filter rules. If the packets does not match the filter rules, and N violations occur in K seconds, the rp connection is downgraded to best-effort flow, if it is not already a best-effort flow

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

access-flow traffic-validation threshold violations limit interval seconds

[no | default] access-flow traffic-validation

[no | default]
Disable traffic validation for the service.

threshold { [violations limit] [interval seconds]}
violations limit: Sets the parameters that determine traffic access violations. This is determined by setting the maximum number of violations within a set time period. must be an integer from 1 through 100000.
interval seconds: Sets the time interval, in seconds. must be an integer from 1 through 100000.

Usage
Use this command to enable traffic validation for the current PDSN service.

Example
The following command enables traffic validation for the current PDSN service and sets the limit allowed to 100 violations within 5 seconds:

access-flow traffic-validation threshold violations 100 interval 5
access-network

Configures access network parameters.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
access-network { accounting identifier | realm realm_name }
```

**accounting identifier**
Configures accounting for the access-network. This value must be a string from 1 to 128 characters in length.

**realm realm_name**
Configures the realm for the access-network. `realm_name` must be a string from 1 to 128 characters in length.

**Usage**
Use this command to configure access-network parameters for accounting and realms.

**Example**
The following command creates an `access-network realm` named `realm2`.

```plaintext
access-network realm realm2
```
airlink bad-sequence-number

Configures PDSN behavior for airlink related parameters.

Product
PDSN

Privilege
Security Administrator, Administrator

```
airlink bad-sequence-number {accept | deny [use-deny-code {poorly-formed-request | unsupported-vendor-id}]}[no | default] airlink bad-sequence-number
```

[no | default]
Disables the deny of bad-sequence number and accept it.
It is the default behavior.

**accept**
Accepts the A11 RRQ messages that have an Airlink Sequence number less than or equal to a previously received sequence number.
It is the default behavior.

**deny**
Rejects the A11 RRQ messages that have an Airlink Sequence number less than or equal to a previously received sequence number.
It uses **poorly-formed-request** option by default to deny a request.

**use-deny-code {poorly-formed-request | unsupported-vendor-id}**
These are optional keywords that used with **deny** sub-command to deny the A11 RRQ messages that have either an unsupported vendor Id or A11 Requests with bad/poor formation.
**unsupported-vendor-id** denies request on the basis of vendor Id.
**poorly-formed-request** will deny the A11 request on the basis of request formation or structure. It is the default deny code for **deny** sub-command.

**Usage**
This command is used to configure the airlink parameters for A11 RRQs.
When configured it denies the A11 RRQ messages that have an Airlink Sequence number less than or equal to a previously received sequence number.

**Example**
The following command would configure the system to deny all A11 RRQ messages having unsupported vendor Id or bad structure of message, including those having airlink sequence number less than or equal to a previously received sequence number:

```
airlink bad-sequence-number deny
```
allow alt-ppp

Allows proprietary modified versions of PPP type sessions to connect this PDSN service.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```
allow alt-ppp
no allow alt-ppp
```

Usage

This command is used to deviate from standard PPP protocol and use a proprietary modified version of PPP with a pre-defined non-negotiable PPP parameters. It is a vendor-specific licensed feature command.
always-on-indication

Enables/disables the inclusion of 3GPP2 Always On Indicators in messages to the PCF.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax
always-on-indication

no always-on-indication

Usage
This command is available when the 3GPP2 Always-On RP Extensions feature-use license is installed. When enabled, this command causes the PDSN service to include the Always On Indicators in the Normal Vendor Specific Extension (NVSE) part of an A11 Session Update message to the PCF. The indicator will only be sent for those subscriber sessions in which Always On functionality is enabled as determined after a successful authentication: the 3GPP2-Always-On attribute is set to a value of 1 (Active) for subscribers configured on a AAA server, or the always-on parameter is set for locally configured subscribers. This functionality is enabled by default.
authentication

Configures the PDSN service authentication parameters.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```
authentication { { [ allow-noauth ] [ chap chap_priority ] [ mschap
mschap_priority ] [ pap pap_priority ] } | msid-auth }
```

---

**allow-noauth**

Default: Disabled
This option configures the system to provide subscribers with network access even though they have not been authenticated. This command issued by itself would cause the system to not attempt to authenticate subscribers.

When the allow-noauth option is used in conjunction with commands specifying other authentication protocols and priorities to use, then if attempts to use those protocols fail, the system will treat the allow-noauth option as the lowest priority.

If no authentication is allowed, then NAI construct will be implemented in order to provide accounting records for the subscriber.

---

**chap chap_priority**

Default: 1
This option configures the system to attempt to use the Challenge Handshake Authentication Protocol (CHAP) to authenticate the subscriber.

A `chap_priority` must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.

`chap_priority` must be an integer from 1 through 1000. The lower the integer, the higher the preference.

CHAP is enabled by default as the highest preference.

---

**mschap mschap_priority**

Default: Disabled
This option configures the system to attempt to use the Microsoft Challenge Handshake Authentication Protocol (MSCHAP) to authenticate the subscriber.

A `mschap_priority` must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.

`mschap_priority` must be an integer from 1 through 1000. The lower the integer, the higher the preference.

---

**pap pap_priority**

Default: 2
This option configures the system to attempt to use the Password Authentication Protocol (PAP) to authenticate the subscriber.
A `pap_priority` must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on. `pap_priority` must be an integer from 1 through 1000. The lower the integer, the higher the preference. PAP is enabled by default as the second highest preference.

### msid-auth

Default: Disabled

This option configures the system to attempt to authenticate the subscriber based on their Mobile Station Identity (MSID).

#### Usage

Use to specify how the PDSN service should handle authentication and what protocols to use. The flexibility is given to configure this option to accommodate the fact that not every mobile will implement the same authentication protocols.

The chassis is shipped from the factory with the authentication options set as follows:
- `allow-noauth` disabled
- `chap` enabled with a priority of 1
- `mschap` disabled
- `msid-auth` disabled
- `pap` enabled with a priority of 2

**Important:** At least one of the keywords must be used to complete the command.

#### Example

The following command would configure the system to allow no authentication for subscribers and would perform accounting using the default NAI-construct of `username@domain`:

```
authentication allow-noauth
```

The following command would configure the system to attempt subscriber authentication first using CHAP, then MSCHAP, and finally PAP. If the `allow-noauth` command was also issued, if all attempts to authenticate the subscriber using these protocols fail, then the subscriber would be allowed access:

```
authentication chap 1 mschap 2 pap 3
```
bind

Binds the PDSN service to a logical IP interface serving as the R-P interface. Specifies the maximum number of subscribers that can access this service over the interface.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

bind address address [ max-subscribers count ]

no bind address address max-subscribers max#

- **no**
  Removes a previously configured binding.

- **address**
  Specifies the IP address (address) of the interface configured as the R-P interface. address is specified in dotted decimal notation.

- **max-subscribers count**
  Default: 500000
  Specifies the maximum number of subscribers that can access this service on this interface.

- **count** can be configured to any integer value between 0 and 500,000.

**Important:** The maximum number of subscribers supported is dependant on the license key and the number of active PACs/PSCs installed in the system. A fully loaded system with 13 active PACs/PSCs can support 500,000 total subscribers. Refer to the license key command for additional information.

**Usage**

Associate or tie the PDSN service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an R-P interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.

This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.

When configuring the **max-subscribers** option, be sure to consider the following:

- The total number of interfaces that you will configure for use as R-P interfaces
- The maximum number of subscriber sessions that all of the interfaces may handle during peak busy hours
- The average bandwidth for each of the sessions
- The type of physical port (10/100Base-Tx or 1000Base-T) to which these interfaces will be bound
Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.

Example
The following command would bind the logical IP interface with the address of 192.168.3.1 to the PDSN service and specifies that a maximum of 600 simultaneous subscriber sessions can be facilitated by the interface/service at any given time.

```plaintext
bind address 192.168.3.1 max-subscribers 600
```

The following command disables a binding that was previously configured:

```plaintext
no bind address
```
 bcmcs

Sets the BCMCS group username and password for RADIUS access.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```
bcmcs { custom | flow-id value { header-compression rohc { rohc-profile name name } } | grpusrname group_name | [ encrypted ] grppassword group_password | ptt {destination-context disconnect-dscp-label rohc-profile-name}}
```

custom
Customise the BCMCS configuration.

flow-id value
Set the BCMCS flow-id. This value must be a hex string between 0x1000 and 0xFFFFFFFF. Making this entry opens a new mode: bcmcs-flow-id.

header-compression rohc Configure ROHC parameters.
rohc-profile name name: Configure ROHC parameters name, name should be string of size 1 to 63.

grpusrname group_name
Sets the BCMCS group name for RADIUS access requests. This value must be a string from 1 to 127 characters in length.

[ encrypted ] grppassword group_password
Set the BCMCS group password for RADIUS access requests. This value must be a string from 1 to 63 characters in length.
Password can be encrypted or clear.

ptt {destination-context dest_name | disconnect-dscp-label dscp-label_value| mtu | rohc-profile-name profile_name }

destination-context: Specify the intended destination context name. This value must be string of 1 to 79 characters in length.
disconnect-dscp-label: Configures the DSCP label to be present in the In Call Signalling packet based on which In Call Signalling and Media Flows will be disconnected. This value must be a Hexadecimal number between 0x0 and 0xF.
mtu: Configures maximum transmission unit. This value must be ranging from 100 to 2000. Default is 1500.
rohc-profile-name: Profile name of the ROHC compresser and decompressor. This value should be a string of 1 to 63.
Usage

Use this command to set the BCMCS group username and password for RADIUS access requests.

Example

```bash
bcmcs grpusername group_name bcmcs grppassword group_password
```
data-available-indicator

Enable sending Data Available Indicator extension in R-P Registration Reply.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

data-available-indicator

no data-available-indicator

no
Default: Disabled
Disable the sending of the Data Available Indicator extension in R-P Registration Reply.

**Usage**
Use this command to enable or disable the sending of the Data Available Indicator extension in R-P Registration Reply.

**Example**
Use the following command to enable sending the Data Available Indicator extension in R-P Registration Reply:

data-available-indicator

Use the following command to disable sending the Data Available Indicator extension in R-P Registration Reply:

no data-available-indicator
data-over-signaling

Enable the data-over-signaling marking feature for A10 packets.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
data-over-signaling
no data-over signaling
```

**no**
Default: Enabled
Disable the data-over signaling feature for A10 packets.

**Usage**
Use this command to enable or disable the data-over signaling feature for A10 packets.

**Important**: This is a customer-specific command.

**Example**

```
no data-over-signaling
```
default

Sets / Restores default value assigned for specified parameter.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```
default { authentication | gre { checksum | checksum-verify | protocol-type | sequence-numbers } | inter-pdsn-handoff mobility-event-indicator | ip { local-port | source-violation { drop-limit | period | reneg-limit }} | lifetime | max-retransmissions | pf-monitor | policy { overload | service-option } | registration-accept handoff session-disconnect-in-progress | registration-deny { handoff connection-setup-record-absent | max-deny-reply-limit | new-call { connection-setup-record-absent | reverse-tunnel-unavailable } | session-already-active | session-already-closed | session-already-dormant | terminate-session-on-error | use-zero-gre-key | session-already-closed | terminate-session-on-error | registration-discard { bad-extension | gre-key-change } | registration-update wait-timeout | retransmission-timeout | service-option | setup-timeout }
```

`registration-update wait-timeout`

Sets the PDSN service to not wait before sending Registration-Update when PPP is terminated for an active RP session.

`authentication`

Sets/restores the authentication setting to their defaults which are as follows:
- allow-noauth disabled
- chap enabled with a priority of 1
- mschap enabled with a priority of 3
- msid-auth disabled
- pap enabled with a priority of 2

`gre { checksum | checksum-verify | protocol-type | sequence-numbers }`

`checksum`: Disables the introduction of the checksum field in outgoing GRE packets.
`checksum-verify`: Disables verification of the GRE checksum (if present) in incoming GRE packets.
`protocol-type`: Restores the GRE protocol type the default protocol-type any
`sequence-numbers`: Restores the GRE sequence number parameters to the default sequence-numbers enabled

`inter-pdsn-handoff mobility-event-indicator`

Disables support for the Mobile Event Indicator during inter-PDSN handoffs.
PDSN Service Configuration Mode Commands

**ip local-port**
Restores the ip local-port setting to its default value of 699.

**ip source-violation {drop-limit | period | reneg-limit}**
Sets the source violation parameters to the defaults or sets the defaults to the specified value as follows:

- **drop-limit**: Sets the number of source violations within a detection period before forcing a call disconnect to the default: 10.
- **period**: Sets the length of time, in seconds, for a source violation detection period to last to the default: 120 seconds.
- **reneg-limit**: Sets the number of source violations within a detection period before forcing a PPP renegotiation to the default: 5.

**lifetime**
Restores the lifetime setting to its default: 1800 seconds.

**max-retransmissions**
Restores the max-retransmissions setting to its default: 5.

**pcf-monitor**
Restores the PCF monitoring settings to the defaults.
Default interval: 900
Default num-retry: 5
Default timeout: 5

**policy { overload | service-option }**
Restores the policy overload and/or policy service-option setting to its default values as follows:

- overload disabled
- sequence-numbers enforced enabled

**registration-accept handoff session-disconnect-in-progress**
Resets the PDSN to deny registration requests when a handoff disconnect is still in progress.

**registration-deny { handoff connection-setup-record-absent | max-deny-reply-limit | new-call { connection-setup-record-absent | reverse-tunnel-unavailable } | session-already-active | session-already-closed | session-already-dormant | terminate-session-on-error | use-zero-gre-key**

**handoff connection-setup-record-absent**
- **connection-setup-record-absent**: Accept handoff R-P sessions that do not have an Airlink Connection Setup record in the RRQ Request.

**max-deny-reply-limit**: Resets the maximum number of retries of erroneous registration reply message from PCF for a session before PDSN terminates the session. to the default. Default is 3.

**new-call connection-setup-record-absent**: Configures the PDSN not to reject calls that do not have the PDSN connection setup record in the RRQ.

**new-call reverse-tunnel-unavailable**: Configures the PDSN not to reject calls if the GRE key for a user collides with that of another user.
session-already-active: <span class="emphasis">disables</span> the PDSN from denying RP renew and dereg requests for active R-P sessions.

session-already-closed: <span class="emphasis">disables</span> the PDSN from denying RP renew and dereg requests for absent R-P sessions.

session-already-dormant: <span class="emphasis">disables</span> the PDSN from denying RP renew and dereg requests for dormant R-P sessions.

terminate-session-on-error: Disables the PDSN from terminating a session if an erroneous registration request message is received for the session.

use-zero-gre-key: Configures the PDSN not to set the GRE key to zero (0) when denying a new R-P session.

registration-discard { bad-extension | gre-key-change }

bad-extension: Set the PDSN so that it does not immediately discard registration requests that have multiple vendor information elements of the same type.

gre-key-change: Sets the PDSN so that it does not discard Registration Requests that have a GRE key that is different than the one for the existing IMSI session.

handoff connection-setup-record-absent: Sets the PDSN so that it does not discard A11 Handoff requests that do not contain the Airlink Setup record.

registration-update wait-timeout

Sets the PDSN service to not wait before sending Registration-Update when PPP is terminated for an active RP session.

retransmission-timeout

Restores the retransmission-timeout setting to its default: 3 seconds.

service-option

Restores the service-option setting to its default list of service options as follows:

- 7: PCF specific
- 15: PCF specific
- 22: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS1 forward, RS1 reverse)
- 23: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS1 forward, RS2 reverse)
- 24: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS2 forward, RS1 reverse)
- 25: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS2 forward, RS2 reverse)
- 33: 3G High Speed Packet Data
- 59: PCF specific

setup-timeout

Restore the maximum amount of time allowed for setting up a session to the default of 60 seconds.

Usage

After the system has been modified from its default values, this command is used to set/restore specific parameters to their default values.
Example
The following command is used to return the lifetime parameter to its default value:

    default lifetime
default subscriber

Specifies the name of a subscriber profile configured within the same context as the PDSN service from which to base the handling of all other subscriber sessions handled by the PDSN service.

**Product**  
PDSN

**Privilege**  
Security Administrator, Administrator

**Syntax**

```plaintext
default subscriber profile_name

no default subscriber profile_name
```

- **profile_name**  
  Specifies the name of the configured subscriber profile. `profile_name` can be between 1 and 63 alpha and/or number characters and is case sensitive.

**Usage**

Each subscriber profile specifies “rules” such as permissions, PPP settings, and timeout values. By default, the PDSN service will use the information configured for the subscriber named default within the same context. This command allows for multiple PDSN services within the same context to apply different “rules” to sessions they process. Each set of rules can be configured under a different subscriber name which is pointed to by this command.

Use the `no default subscriber profile_name` command to delete the configured default subscriber.

**Example**

To configure the PDSN service to apply the rules configured for a subscriber named `user1` to every other subscriber session it processes, enter the following command:

```plaintext
default subscriber user1
```
dormant-transition

Configures the PDSN behavior to terminate A10 session, when the PDSN receives the A11-RRQ (Type 4) before the session for the original MN is established completely.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[no | default] dormant-transition initial-session-setup
```

- **no**
  Terminates the A10 session, when PDSN receives the A11-RRQ (Type 4) before the original session established completely.

- **default**
  Keeps the A10 session live in case of A11-RRQ (Type 4) is received before the original session is established completely.

**Usage**

When the status of A10 session goes to dormant before the session for the original MN is established completely, the different MN may possibly send the A11-RRQ (Type 4) to the PDSN and PPP renegotiation may start.

This command is used to terminate the A10 session when the PDSN receives the A11-RRQ (Type 4) before the session for original MN is established completely.

**Example**

Following command is used to release the A10 session in case of receiving A11-RRQ (Type 4) before the original session is established completely:

```
no dormant-transition initial-session-setup
```

end

Exits the PDSN service configuration mode and returns to the Exec mode.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Change the mode back to the Exec mode.
exit

Exits the PDSN service configuration mode and returns to the context configuration mode.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Return to the context configuration mode.
fragment

It enables/disables fragmentation of PPP data.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

fragment ppp-data
[ no | default ] fragment ppp-data

no
Disables the fragmentation of ppp data.

default
Default enables ppp data fragmentation.

Usage
This command is to indicate to the RP module to NOT fragment PPP payloads being sent to the PCF, if the total packet size (PPP+GRE+IP) exceeds 1500 bytes. Disabling fragmentation may cause the sessmgr to perform outer IP fragmentation of the outgoing packet, if the resulting packet exceeds the MED MTU.
gre

Configures Generic Routing Encapsulation (GRE) parameters for the A10 protocol within the PDSN service.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```
gre { checksum | checksum-verify | flow control | ip-header-dscp value { all-control-packets | setup-packets-only } | flow-control-timeout { seconds | msec milliseconds } action { resume-session | disconnect-session } | protocol-type { any | byte-stream | ppp } | reorder-timeout milliseconds | sequence-mode { none | reorder } | segmentation | sequence-numbers | threegpp2-ext-header qos-marking }
```

```
no gre { checksum | checksum-verify | flow-control | ip-header-dscp | segmentation | sequence-numbers | threegpp2-ext-headers qos-marking }
```

```
default gre { checksum | checksum-verify | flow-control | ip-header-dscp | segmentation | sequence-mode | sequence-numbers | threegpp2-ext-headers qos-marking }
```

```
no
```

Disables the specified functionality.

```
default
```

Restores the specified parameter to its default setting.

```
checksum
```

Default: disabled

Enables the introduction of the checksum field in outgoing GRE packets.

```
checksum-verify
```

Default: disabled

Enables verification of the GRE checksum (if present) in incoming GRE packets.

```
ip-header-dscp value { all-control-packets | setup-packets-only }
```

Default: Disabled

Used to configure the QoS Differentiated Services Code Point (DSCP) marking for GRE packets.

- **Value**: Represents the DSCP setting. It represents the first six most-significant bits of the ToS field. It can be configured to any hex value from 0x0 through 0x3F.

- **All-control-packets**: Dictates that the DSCP marking is to be provided in all GRE control packets.
**setup-packets-only**: Dictates that the DSCP marking is to be provided only in GRE setup packets.

```plaintext
flow-control [action {disconnect-session | resume-session}] [timeout {seconds | msec milliseconds}]
```

Default: no gre flow-control

Enables 3GPP2 GRE flow control which causes the PDSN to send flow control enabled Normal Vendor Specific Extensions (NVSE) in A11 RRPs.

- **action**: Specifies the action to be taken when timeout is reached:
  - **disconnect-session**: (default): Ends the session and releases the call.
  - **resume-session**: Switches flow control to XON and resumes delivery of packets to the RAN.

- **timeout**: Sets the amount of time wait for an XON indicator from the RAN (after receiving an XOFF). Also sets the action to be taken if the timeout limit is reached.

Default: 10 seconds, disconnect-session

- **seconds**: Specifies the amount of time in seconds before the timeout is reached. **seconds** must be an integer from 1 through 1000.

- **msec milliseconds**: Specifies the amount of time in milliseconds before the timeout is reached. **milliseconds** must be an integer from 1 through 1000000.

```plaintext
protocol-type { any | byte-stream | ppp }
```

Specifies the protocol used for GRE encapsulation that is acceptable to

- **any**: Specifies that the PDSN service will accept GRE packets encapsulated using any protocol.

- **byte-stream**: Specifies that the PDSN service will accept GRE packets only encapsulated using byte stream. Using byte stream encapsulation, PPP packets are framed at different intervals and sent.

- **ppp**: Specifies that the PDSN service will accept GRE packets only encapsulated using the Point-to-Point Protocol (PPP). Using PPP encapsulation, PPP packets are framed at regular intervals and sent.

```plaintext
reorder-timeout
```

Default: 100

Configures max number of milliseconds to wait before processing reordered out-of-sequence GRE packets. **milliseconds** must be an integer from 0 through 5000.

```plaintext
segmentation
```

Default: disabled

Enables GRE Segmentation for the PDSN service.

```plaintext
sequence-mode { none | reorder }
```

Default: none

Configures handling of incoming out-of-sequence GRE packets.

- **none**: Specifies that sequence numbers in packets are ignored and all arriving packets are processed in the order they arrive.

- **reorder**: Specifies that out of sequence packets are stored in a sequencing queue until one of the conditions is met:
  - The reorder timeout occurs: All queued packets are sent for processing and the accepted sequence number is updated to the highest number in the queue.
- The queue is full (five packets): All packets in the queue are sent for processing, the reorder timer is stopped and the accepted sequence number is updated to the highest number in the queue.
- An arriving packet has a sequence number such that the difference between this and the packet at the head of the queue is greater than five. All the packets in the queue are sent for processing, the reorder timer is stopped and the accepted sequence number is updated to the highest number that arrived.
- A packet arrives that fills a gap in the sequenced numbers stored in the queue and creates a subset of packets whose sequence numbers are continuous with the current accepted sequence number. This subset of packets in the queue is sent for processing. The reorder timer continues to run and the accepted sequence number is updated to the highest number in the subset delivered.

**sequence-numbers**

Enables insertion of GRE sequence numbers in data that is about to be transmitted over the A10 interface. Data coming into the system containing sequence numbers but that is out of sequence is not re-sequenced.

**threegpp2-ext-headers qos-marking**

When threegpp2-ext-headers qos-marking is enabled and the PCF negotiates capability in the A11 RRQ, the PDSN will include the qos optional data attribute in the GRE 3gpp2 extension header.
The `no` keyword, enables qos-marking in the gre header based on the tos value in the header.

**Usage**

The `gre protocol-type` command can be used to prevent the PDSN service from servicing PCFs that use a specific form of encapsulation.
Use the `no gre sequence-numbers` command to disable the inclusion of GRE sequence numbers in the A10 data path.
The chassis is shipped from the factory with the authentication options set as follows:

- `protocol-type any`
- `sequence-numbers enabled`

**Example**

Use this command to configure the PDSN service to exclude byte stream encapsulated GRE traffic:

```
gre protocol-type ppp
```
inter-pdsn-handoff mobility-event-indicator

Configures the PDSN to support the Mobility Event Identifier (MEI) during inter-PDSN handoffs. The presence of the Mobility Event Indicator (MEI) and Access Network Identifier (ANID) elements in an A11 handoff request represents an Inter-PDSN handoff.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
inter-pdsn-handoff mobility-event-indicator
no inter-pdsn-handoff mobility-event-indicator

no
Disables support for the MEI during inter-PDSN handoffs.
```

**Usage**

Use this command to configure support for the MEI during inter-PDSN handoffs.

**Example**

Use the following command to enable support for the MEI during inter-PDSN handoffs:

```plaintext
inter-pdsn-handoff mobility-event-indicator
```
ip header-compression rohc

This command enters PDSN Service ROHC Configuration Mode. The ROHC configuration mode lets you configure ROHC parameters that PDSN conveys to the PCF in the initial A11 RRP message before PPP authentication. By default, ROHC is disabled for a PDSN service.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

ip header-compression rohc
default ip header-compression rohc
no ip header-compression rohc

default
Set all PDSN Service ROHC Configuration Mode values back to the defaults and disable ROHC for this PDSN service.

no
Disable IP header compression for this PDSN Service.

Usage
Use this command to enter the PDSN Service ROHC Configuration Mode or disable ROHC for the current PDSN service.

Example
The following command enters PDSN Service ROHC Configuration Mode:

ip header-compression rohc

The following command disables ROHC for the current PDSN service and sets all of the values for commands in PDSN Service ROHC Configuration Mode back to their default settings:

default ip header-compression rohc
ip local-port

Configures the local User Datagram Protocol (UDP) port for the R-P interfaces’ IP socket.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```
ip local-port number
```

*number*
Default: 699
Specifies the UDP port number.

*number* can be any integer value between 1 and 65535.

Usage

Specify the UDP port that should be used for communications between the Packet Control Function (PCF) and the PDSN.

**Important:** The UDP port setting on the PCF must match the local-port setting for the PDSN service on the system in order for the two devices to communicate.

Example

Use the following command to specify a UDP port of 3950 for the PDSN service to use to communicate with the PCF on the R-P interface:

```
ip local-port 3950
```
ip source-violation

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.

Product
PDSN, PDIF

Privilege
Security Administrator, Administrator

Syntax

```
ip source-violation { clear-on-valid-packet | drop-limit num | period secs | reneg-limit num }
no ip source-violation clear-on-valid-packet
```

**clear-on-valid-packet**
Default: disabled
Configures the service to reset the reneg-limit and drop-limit counters after receipt of a properly addressed packet.

**drop-limit num**
Default: 10
Sets the number of allowed source violations within a detection period before forcing a call disconnect. If `num` is not specified, the value is set to the default. `num` can be any integer value from 1 to 1000000.

**period secs**
Default: 120
The length of time, in seconds, for a source violation detection period to last. drop-limit and reneg-limit counters are decremented each time this value is reached.

The counters are decremented in this manner: reneg-limit counter is reduced by one (1) each time the period value is reached until the counter is zero (0); drop-limit counter is halved each time the period value is reached until the counter is zero (0). If `secs` is not specified, the value is set to the default. `secs` can be any integer value from 1 to 1000000.

**reneg-limit num**
Default: 5
Sets the number of allowed source violations within a detection period before forcing a PPP renegotiation. If `num` is not specified, the value is set to the default. `num` can be any integer value from 1 to 1000000.

Usage
This function is intended to allow the operator to configure a network to prevent problems such as when a user gets handed back and forth between two PDIFs PDSNs a number of times during a handoff scenario. This function operates in the following manner:

When a subscriber packet is received with a source address violation, the system increments both the IP source-violation reneg-limit and drop-limit counters and starts the timer for the IP-source violation period. Every subsequent packet received with a bad source address during the IP-source violation period causes the reneg-limit and drop-limit counters to increment.

For example, if reneg-limit is set to 5, then the system allows 5 packets with a bad source address (source violations), but on the 5th packet, it re-negotiates PPP.

If the drop-limit is set to 10, the above process of receiving 5 source violations and renegotiating PPP occurs only once. After the second 5 source violations, the call is dropped. The period timer continues to count throughout this process.

If the configured source-violation period is exceeded at any time before the call is dropped, the reneg-limit counter is checked. If the reneg-limit counter is greater than zero (0), the reneg-limit is decremented by 1. If the reneg-limit counter equals zero, the drop-limit is decremented by half.

---

**Example**
The following command sets the drop limit to 15 and leaves the other values at their defaults:

```
ip source-violation drop-limit 15
```
lifetime

Specifies the time that an A10 connection can exist before its registration is considered expired.

**Product**

PDSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
lifetime time
no lifetime
```

The `no lifetime` command specifies that an A10 connection can exist for an infinite amount of time.

**time**

Default: 1800

Specifies the time that an A10 connection can exist before its registration is considered expired.

- `time` is measured in seconds and can be configured to any integer value between 1 and 65534.

**Usage**

Set a limit to the amount of time that a subscriber session can remain up whether or not the session is active or dormant. If the lifetime timer expires before the subscriber terminates the session, their connection will be terminated automatically.

Use the `no lifetime` command to delete a previously configured lifetime setting. If after deleting the lifetime setting you desire to return the lifetime parameter to its default setting, use the `default lifetime` command.

**Example**

The following command specifies a time of 3600 seconds (1 hour) for subscriber sessions on this PDSN service:

```plaintext
lifetime 3600
```
max-retransmissions

Configures the maximum number of times the PDSN service will attempt to communicate with a PCF before it marks it as unreachable.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```
max-retransmissions count
```

count

Specifies the maximum number of times the PDSN service will attempt to communicate with a PCF before it marks it as unreachable.

count can be configured to any integer value between 1 and 1,000,000.

Usage
If the value configured for the max-retransmissions is reached the call will be dropped.
The chassis is shipped from the factory with the Internet maximum number of retransmissions set to 5.

Example
The following command configures the maximum number of retransmissions for the PDSN service to 3:

```
max-retransmissions 3
```
mobile-ip foreign-agent context

For Mobile IP support, specifies the context in which the FA service(s) are configured.

<table>
<thead>
<tr>
<th>Product</th>
<th>PDSN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Privilege</td>
<td>Security Administrator, Administrator</td>
</tr>
</tbody>
</table>

**Syntax**

```
mobile-ip foreign-agent context context_name [fa-service name]
no mobile-ip foreign-agent context context_name [fa-service name]
```

**context_name**

Specifies the name of the previously configured context that facilitates the FA service(s).

context_name must be between 1 and 79 alpha or numeric characters and is case sensitive.

**[fa-service name]**

This optional keyword allows you to link the PDSN service to a particular FA service in the specified context. name is the name of the FA service to link to.

**Usage**

FA services on the system can be configured either in the same or different contexts from those facilitating PDSN services. When they are configured in separate contexts, this command configured with a PDSN service instructs the PDSN service to route traffic to the context facilitating the FA service.

Use the `no mobile-ip foreign-agent context` to delete a previously configured destination context.

**Example**

The following command instructs the PDSN service to use the context named FA-destination for FA functionality:

```
mobile-ip foreign-agent context fa-destination
```
**msid length**

Specifies the allowed configurable Mobile Station IDentifier (MSID) length.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ default ] msid length [ min min_length ] max max_length
```

- **default**
  Specifies the default length of MSID (10 to 15) as per standard.

- **min min_length**
  Specifies the minimum length for MSID.
  *min_length* is any Integer value between 10 to 15, but should be less than *max_length* specified with **max**.

- **max max_length**
  Specifies the maximum length for MSID.
  *max_length* is any Integer value between 10 to 15, but should be more than *min_length* specified with **min**.

**Usage**
MSID length can be configured either in the standard length or different customized length form. This command is used to specify the allowed length of MSID.

**Example**
The following command specifies an MSID length between 12 and 15:

```
msid length min 12 max 15
```
nai-construction

Specifies a domain alias that will be used to represent the context which the PDSN service should use for AAA functionality.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```
nai-construction domain alias
no nai-construction domain
```

**domain alias**

alias represents the “domain” name that you would like to associate with the context in which AAA functionality is configured. alias can be between 1 and 79 alpha and/or numeric characters and is case-sensitive.

Usage

Enabling NAI will be constructed for the subscriber in the event that their mobile station (MS) does not negotiate CHAP, PAP, or MSCHAP. If this option is selected, no further attempts will be made to authenticate the user. Instead, the constructed NAI will be used for accounting purposes.

The context specified by this command would be used to provide the communication with the RADIUS accounting server.

Use the `no nai-constructed domain` command to deleted a configured alias.

**Important:** This command should only be used if the PDSN service is configured to allow no authentication using the authentication allow-noauth command.

Additionally, the `aaa constructed-nai` command in the Context Configuration mode can be used to configure a password for constructed NAI.

Example

The following command configured a domain alias of aaa_context for the PDSN service to use when an NAI is constructed for a subscriber session:

```
nai-construction domain aaa_context
```
new-call conflict

Enable or disable to send A11-RUPD to current PCF, when system receives the A11-RRQ(Type1) from new PCF during the session exists.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```
new-call conflict terminate-session-old-pcf [no | default] new-call conflict terminate-session-old-pcf
```

**no**

Disable to send A11-RUPD to current PCF, when system receives the A11-RRQ(Type1) from new PCF during the session exists.

**default**

Enable to send A11-RUPD to current PCF, when system receives the A11-RRQ(Type1) from new PCF during the session exists.

Usage
This configuration supports to enable or disable to send A11-RUPD to current PCF, when the system receives the A11-RRQ(Type1) from new PCF during the session exists.
If the configuration is **no new-call conflict terminate-session-old-pcf** system will not send registration update to old PCF on receiving a new call (A11-RRQ(Type1)) request for an existing active/dormant session. The default behavior is to send registration updates.

Example
The following command configured a system to send a registration update on receiving an A11-RRQ (Type 1) request for an existing active/dormant session:

```
new-call conflict terminate-session-old-pcf
```
pcf-monitor

When this is enabled, the PDSN monitors all the PCFs that have sessions associated with it. The PDSN stops monitoring a PCF if it is determined to be down. Once a PCF is determined to be down, the PDSN tears down all sessions that correspond to the PCF and generates AAA Accounting Stop messages. All the PCFs that are connected to the PDSN service are monitored.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```
pcf-monitor [ interval seconds | max-inactivity-time seconds | num-retry num | timeout seconds ]
no pcf-monitor
```

**pcf-monitor**

Entering the command with no keywords enables the PCF monitoring function with all parameters set to the defaults.

**no**

Disables the pcf monitoring function.

**interval seconds**

Default: 900 seconds
Sets the amount of time to wait between ping request messages.
seconds must be an integer in the range from 60 through 3600.

**max-inactivity-time seconds**

Default: 120 seconds
The maximum amount of time (seconds) with no A10 traffic from a PCF before the ICMP-ping mechanism is triggered.
seconds must be an integer from 1 through 3600.

**num-retry num**

Default: 5
Sets the number of times that the PDSN retries to ping the PCF. When num-retry for a given PCF has been exhausted with no response, sessions that correspond to the non-responsive PCF are terminated and Accounting Stop records for each terminated session are generated.
num must be an integer in the range from 0 through 100.

**timeout seconds**

Default: 5 seconds
The amount of time to wait for a response before retrying.
seconds must be in the range from 1 through 10.

Usage
Use this command to enable the PDSN service to monitor the PCFs that have sessions associated with the PDSN service.

Example
The following command enables PCF monitoring with parameters set to the defaults:

```
pcf-monitoring
```

The following command enables PCF monitoring and sets the timeout to 10 seconds:

```
pcf-monitor timeout 10
```

The following command disables pcf-monitoring:

```
no pcf-monitor
```
pcf-session-id-change restart-ppp

This feature manages current session and PPP renegotiation on GRE-key change without any change in PCF/PANID/CANID. This command disables or enables the PPP renegotiation restart on receiving an RP registration request from the current PCF with GRE key (PCF session Id) change. With this command the PDSN aborts and restarts the call causing PPP renegotiation.

This is enabled by default.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

[no | default] pcf-session-id-change restart-ppp

no
Disables the pcf-session-id-change restart-ppp function.
With this option PDSN does not restart the PPP renegotiation on GRE key change from current PCF in an RP registration request, unless it indicates change in PCF/PANID/CANID.

default
Set the pcf-session-id-change function to the default state on enabled.

Usage
GRE key (PCF session ID) is sued to identify the data packet for a session and is negotiated through the A11 signaling messages between PCF and PDSN. By default PDSN aborts and restart the PPP renegotiation on receipt of any RP registration request with change in GRE key or PCF session Id.
With use of no pcf-session-id-change restart-ppp command PDSN is configured to disable the restart of call or PPP renegotiation on receipt of any RP registration request with changed GRE key, unless it has any PCF/ANID/CANID change. PDSN silently switches the GRE key for the session, retaining the existing PPP session.

Example
The following command disables the PPP renegotiation restart action on receipt of any RP RRQ with changed GRE key from same PCF/PANID/CANID.

no pcf-session-id-change restart-ppp
**pdsn type0-tft attempt-inner-match**

Configures a type0 traffic flow template (tft) to a type1 traffic flow template.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
pdsn type0-tft attempt-inner-match
no pdsn type0-tft attempt-inner-match
```

**Usage**
This CLI is used make PDSN match inner IP packets for an AIMS call. When enabled, the PDSN tries to match a type-0 tft to match both outer and inner packet, so that MN can use a Type-0 filter for HoA traffic which are tunneled.
This is disabled by default.

**Example**
The following command enables type0 tft:

```
pdsn type0-tft attempt-inner-match
```
peer-pcf

Confogures settings for any PCF that has a connection with this PDSN.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
peer-pcf ip_address bcmcs_framing { hdlc-like | segment-based }
```

- `ip_address`
  - `ip_address` must be specified using the standard IPv4 dotted decimal notation or colon notation for IPv6.

- `bcmcs_framing { hdlc-like | segment-based }
  - Specifies the type of bcmcs_framing to use for this PCF connection.
    - `hdlc-like`: applies HDLC-like framing for all BCMCS flows
    - `segment-based`: applies segment-based framing for all BCMCS flows

**Usage**

Use this command to configure the settings for any PCF that is connected to this PDSN. You can also specify bcmcs framing settings to use for the connection.

**Example**

The following command configures the peer-pcf for an IP address of 131.2.3.4:

```
peer-pcf 131.2.3.4
```
policy

Configures PDSN service policies.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

policy overload { redirect address [ weight weight_num ] [ address2 [ weight weight_num ] ... address16 [ weight weight_num ] ] } | { reject [ use-reject-code { admin-prohibited | insufficient-resources } ] }  

policy msid-match msid_with_wildcards { redirect address [ weight weight_num ] [ address2 [ weight weight_num ] ... address16 [ weight weight_num ] ] }  

policy pcf-zone-match zone_number { redirect address [ weight weight_num ] [ address2 [ weight weight_num ] ... address16 [ weight weight_num ] ] }  

no policy { msid-match msid_with_wildcards | overload [ redirect address ] | pcf-zone-match zone_number | rrq mei-from-current-pcf (suppress-ppp-restart) | service-option | unknown-cvse enforce }  

Deletes a previously set policy or removes a redirect IP address.

overload: This keyword without any options deletes the complete overload policy from the PDSN service.

overload redirect address [ address2 ... address16 ]; deletes up to 16 IP addresses from the overload redirect policy. The IP addresses must be expressed in IP v4 dotted decimal notation.

rrq mei-from-current-pcf suppress-ppp-restart: suppresses the PPP restart, when RRQ containing MEI comes from the current PCF. This is disabled by default.

service-option: Resets the PDSN service to accept calls that do not contain the service option(s) configured using the service option command.

unknown-cvse enforce: When unknown-cvse policy is enforced, PDSN will deny RRQs with unknown CVSEs (unknown vendor id, unknown app type or unknown app subtype) with an error code. When disabled, PDSN will process the CVSE like an NVSE. If an unknown vendor-id, app-type or app-subtype is encountered during the processing of a CVSE, the entire CVSE will be ignored and rest of the RRQ will be processed.

policy overload { redirect address [ weight weight_num ] [ address2 [ weight weight_num ] ... address16 [ weight weight_num ] ] } | { reject [ use-reject-code { admin-prohibited | insufficient-resources } ] }  

Specifies how a PDSN service should handle an overload condition.

redirect: This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the PDSN service rejects new sessions with an A11 Registration Reply Code of 88H (unknown PDSN address) and provides the IP address of an alternate PDSN. This command can be issued multiple times.
address: The IP address of an alternate PDSN expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values. weight weight_num When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. weight_num must be an integer from 1 through 10.

reject: This option will cause any overload traffic to be rejected. The PDSN will send an A11 Registration Reply Code of 82H (insufficient resources).

use-reject-code admin-prohibited: When this keyword is specified and traffic is rejected, the error code admin prohibited is returned instead of the error code insufficient resources. This is the default behavior.

use-reject-code insufficient-resources: When this keyword is specified and traffic is rejected, the error code insufficient resources is returned instead of the error code admin prohibited.

policy msid-match msid_with_wildcards { redirect address [ weight weight_num ] [ address2 [ weight weight_num ] ... address16 [ weight weight_num ] ] }

Specifies how a PDSN service should handle an incoming call that matches a list of wildcard MSIDs.

msid_with_wildcards: An MSID in which up to 16 digits have been replaced with the wildcard ‘$’. This defines the list of possible matches for incoming calls.

redirect: This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the PDSN service rejects new sessions with an A11 Registration Reply Code of 88H (unknown PDSN address) and provides the IP address of an alternate PDSN. This command can be issued multiple times.

direct: The IP address of an alternate PDSN expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values. weight weight_num When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. weight_num must be an integer from 1 through 10.

policy pcf-zone-match zone_number { redirect address [ weight weight_num ] [ address2 [ weight weight_num ] ... address16 [ weight weight_num ] ] }

Specifies how a PDSN service should handle an incoming call that matches a predefined zone number.
zone_number: An integer between 1 and 32 that defines the zone incoming calls must match for redirection.

redirect: This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the PDSN service rejects new sessions with an A11 Registration Reply Code of 88H (unknown PDSN address) and provides the IP address of an alternate PDSN. This command can be issued multiple times.

address: The IP address of an alternate PDSN expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values. weight weight_num When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. weight_num must be an integer from 1 through 10.
Usage
Policies can be implemented to dictate PDSN service behavior for various conditions such as overloading. The system invokes the overload policy if the number of calls currently being processed exceeds the licensed limit for the maximum number of sessions supported by the system. The system automatically invokes the overload policy when an on-line software upgrade is started.
Use the no policy { overload|service-option } command to delete a previously configured policy. If after deleting the policy setting you desire to return the policy parameter to its default setting, use the default policy command.
The chassis is shipped from the factory with the policy options set as follows:
- overload disabled
- sequence-numbers enforced enabled

⚠️ Caution: Incorrect configuration of the policy msid-match and policy pcf-zone-match keywords could result in sessions failing to be established. For example, if PDSN1 is configured to redirect sessions to PDSN2 while PDSN2 is configured to redirect sessions to PDSN1, a loop is created in which all sessions would fail to be connected. In addition, sessions will not be established if the PDSN to which the sessions are being redirected is unavailable.

Example
The following command configures the PDSN service to redirect traffic to two different destinations with weights of 1 and 10 respectively:

```
  policy overload redirect 192.168.1.100 weight 1 192.168.1.200 weight 10
```
Sets PPP tunneling parameters for subscribers in the current PDSN service.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
ppp { tunnel-context context_name | tunnel-type { 12tp | 12tp-secure | none } }
```

```plaintext
no ppp tunnel-context
```

- **no**
  Clears the configured tunnel context entry.

- **tunnel-context context_name**
  The name of the context that has a LAC service configured to handle all tunnels from this PDSN service.

- **tunnel-type { 12tp | 12tp-secure | none }**
  - **12tp**: Force all subscriber sessions in this PDSN service to use L2TP tunneling.
  - **12tp-secure**: Force all subscriber sessions in this PDSN service to use L2TP tunneling and use IPSEC to ensure a secure connection.
  - **none**: Do not force L2TP tunneling. This is the default.

**Important**: If the context specified by the `ppp tunnel-context context_name` command does not have a LAC service configured and `tunnel-type` is set to `12tp` or `12tp-secure`, the call is rejected.

**Important**: If the PPP tunnel context has not been set or has been cleared with the `no ppp tunnel-context` command and `tunnel-type` is set to `12tp` or `12tp-secure`, the context where the current PDSN service resides is used. If that context does not have a LAC service configured the call is rejected.

**Usage**

Use this command to enable or disable forced L2TP tunneling for all subscribers using this PDSN service. Also use this command to define which context defines the L2TP tunneling parameters.

**Example**

To set the tunnel context to the context named `context1` and enable forced L2TP tunneling, use the following commands;

```plaintext
ppp tunnel-context context1 ppp tunnel-type 12tp
```

To enable forced L2TP tunneling with IPSEC security, use the following commands;
To disable forced tunneling, use the following command:

```
ppp tunnel-type none
```

To clear the setting for the tunnel context, use the following command:

```
no ppp tunnel-context
```
qos-profile-id-mapping

This command creates the customized QoS profile identifier to QoS mapping for IMS authorization support through a Ty interface at the PDSN service level.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax

```
qos-profile-id-mapping profile-id id_num { description desc | downlink-bw dl_bw | drop-rate drop_percentage | latency latency_duration | qos-class {class-A | class-B | class-C | class-D | class-E | class-F } uplink-bw ul_bw }+
```

```
[ default | no ] qos-profile-id-mapping profile-id id_num
```

```
default
Configures the specified QoS profile ID for QoS mapping with default values in this PDSN service.
```

```
no
Removes the configured QoS profile ID mapping in this PDSN service.
```

```
profile-id id_num
Specifies the profile identifier for QoS parameters to be used as the customized profile ID or modifies the QoS parameters in a profile ID (id_num) coming from RAN.
id_num must be an integer between 0 and 65535.
```

```
description desc
Specifies the user defined description for profile identifier.
desc must be an alpha and/or numeric string between 1 and 32 characters.
```

```
downlink-bw dl_bw
Default: 32
Specifies the downlink (towards the MN) data traffic bandwidth in kilo-bits per second for this QoS profile.
dl_bw must be an integer value between 0 and 100000.
```

```
drop-rate drop_percentage
Default: 0
Specifies the permitted packet drop rate in percentage for traffic flow to this QoS profile.
drop_percentage must be an integer value between 0 and 100.
```

```
latency latency_duration
Default: 1000
Specifies the permitted latency duration in milli-seconds for this QoS profile.
latency_duration must be an integer value between 0 and 1000.
```
**qos-profile-id-mapping**

```plaintext
qos-class {class-A | class-B | class-C | class-D | class-E | class-F }
```

Default: Class-C

Specifies the type of QoS class associated with this QoS profile
class-A: Specifies the A type of QoS class.
class-B: Specifies the B type of QoS class.
class-C: Specifies the C type of QoS class.
class-D: Specifies the D type of QoS class.
class-E: Specifies the E type of QoS class.
class-F: Specifies the F type of QoS class.

```plaintext
uplink-bw ul_bw
```

Default: 32

Specifies the uplink (from the MN) data traffic bandwidth in kilo-bits per second for this QoS profile. `ul_bw` must be an integer value between 0 and 100000.

More than one of the above keywords can be entered within a single command.

**Usage**

Use this command to define the values associated with the profile ID on the PDSN. This profile ID is used during the mapping to and from the authorized QoS to the QoS parameters for the A10 link. This mapping is required because the PDSN only knows the profile IDs and not the actual configured values for the profile ID in the RAN. Also this configuration allows the use of custom profile IDs for the subscribers. If no values are defined with a QoS profile ID, the values from matching QoS profile ID from RAN will be applicable to the subscriber traffic.

**Example**

The following command sets the downlink bandwidth to 32 kbps, latency duration as 1000 ms, uplink bandwidth to 32 kbps, and QoS class to Class-C for the QoS profile ID 11 in a PDSN service:

```
default qos-profile-id-mapping profile-id 11
```
qos update

Use this command to set QoS update parameters for policy mismatches or wait timeouts.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```
qos-update [ policy-mismatch | wait-timeout seconds action [ drop-packets | disconnect-session | downgrade-to-best-effort ] ]
```

**policy-mismatch**
PDSN raises a TFT violation if there is a QoS policy mismatch.

**wait-timeout action [ drop-packets | disconnect-session | downgrade-to-best-effort ]**
Sets the wait time for A11 RRQ for QoS changes. `seconds` must be an integer from 1 through 1000.

- **action**: configures the action on the wait-timeout
  - **disconnect-session**: Drops the call if the A11 RRQ has not been received for the QoS update. This includes all of the IP flows for the session.
  - **downgrade-to-best-effort**: Drops packets if the A11 RRQ has not been received for the QoS update. Sends the forward traffic over best effort (flow FF or FE if available).
  - **drop-packets**: Drops packets if the A11 RRQ has not been received for the QoS update.

Usage
This command provides a PDSN service level configurable to configure an action, if the PCF ignores the QoS Update request from PDSN. It sets the amount of time to wait and the action to take, if no RRQ is received before the timeout. The action can be to drop packets for the flow, disconnect the session or to downgrade to best effort.

Example

```
qos-update policy mismatch
```

The following command sets `wait-timeout` to 60 seconds and invokes `downgrade-to-best-effort` if the A11 RRQ has not been received for the QoS update:

```
qos-update wait-timeout 60 action downgrade-to-best-effort
```
registration-accept

When the PDSN is tearing down a session and the MN moves over to a new PCF and initiates a new session, the PDSN by default does not accept the handoff until it tears down the old session. This command allows the PDSN to accept registration requests when a handoff disconnect is in progress.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

- registration-accept handoff session-disconnect-in-progress
- no registration-accept handoff session-disconnect-in-progress

**Usage**
Use this command to allow the PDSN service to accept registration requests when a handoff disconnect is still in progress.

**Example**

registration-accept handoff session-disconnect-in-progress
registration-ack-deny terminate-session-on-error

Configure the PDSN service to terminate an A11 session when a Registration ACK received from the PCF has an error status.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
registration-ack-deny terminate-session-on-error
no registration-ack-deny terminate-session-on-error
```

**Usage**
Use this command to enable the PDSN service to terminate A11 sessions on a Registration ACK error from the PCF.

**Example**
Use the following command to enable this functionality in the PDSN:

```
registration-ack-deny terminate-session-on-error
```
registration-deny

Configures parameters related to registration rejection.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```bash
registration-deny { handoff connection-setup-record-absent [ use-deny-code { poorly-formed-request | reason-unspecified } | max-deny-reply-limit num | mismatched-coa-source-address | new-call { connection-setup-record-absent | reverse-tunnel-unavailable } | session-already-active | session-already-closed | session-already-dormant | terminate-session-on-error | use-zero-gre-key

no registration-deny { handoff connection-setup-record-absent | max-deny-reply-limit | mismatched-coa-source-address | new-call { connection-setup-record-absent | reverse-tunnel-unavailable } | session-already-active | session-already-closed | session-already-dormant | terminate-session-on-error | use-zero-gre-key
```

</tr>
</tbody>
</table>

**max-deny-reply-limit num**

Default: 3

Configures max number of retries of erroneous registration request message from PCF for a session before PDSN terminates the session. num can be from 1 to 10.

**mismatched-coa-source-address**

Default: disabled

Denies RP requests which have a care-of-address field that is different from the request source address.
PDSN Service Configuration Mode Commands

**registration-deny**

- new-call { connection-setup-record-absent [ use-deny-code { poorly-formed-request | reason-unspecified } | reverse-tunnel-unavailable ] }

  **connection-setup-record-absent**: Configures the PDSN to reject calls that do not have the airlink connection setup record in the RRQ.
  **use-deny-code { poorly-formed-request | reason-unspecified }**: When rejecting calls that do not have the airlink setup record, use the specified deny code.
  **reverse-tunnel-unavailable**: Configures the PDSN to reject calls if the GRE key for a user collides with that of another user.

- **session-already-active**
  PDSN denies Registration requests for sessions that are already active with the error code “poorly formed request”.

- **session-already-closed**
  PDSN denies RP renew and dereg requests with error code 0x8E for absent R-P sessions.

- **session-already-dormant**
  PDSN denies Registration requests for sessions that are already dormant with the error code “poorly formed request”.

- **terminate-session-on-error**
  Default: Disabled.
  Configures PDSN to terminate session if erroneous registration request message is received for the session.

- **use-zero-gre-key**
  Configures the PDSN to set the GRE key to zero (0) when denying a new R-P session.

**Usage**

Use this command to configure parameters relating to the rejection of registration requests.

**Example**

To reject calls that do not have the airlink setup record in the RRQ, enter the following command:

```
registration-deny new-call connection-setup-record-absent
```

To reject calls if the GRE key collides with that of another user, enter the following command:

```
registration-deny new-call reverse-tunnel-unavailable
```

To set the GRE key to 0 (zero) when a new R-P session is denied, enter the following command:

```
registration-deny new-call use-zero-gre-key
```
registration-discard

Configures the PDSN service to discard any Registration Request message containing multiple information elements of the same type or a different GRE key for existing IMSI session.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

registration-discard { bad-extension | gre-key-change | handoff connection-setup-record-absent }

no registration-discard { bad-extension | gre-key-change | handoff connection-setup-record-absent }

no
Disables the discarding of Registration request messages containing multiple information elements or different GRE keys.

bad-extension
Default: Disabled
Configures the PDSN to discard Registration Request message containing multiple information elements of same type.

gre-key-change
Default: Disabled
Configures PDSN to discard Registration Request message containing different GRE key for existing IMSI session. Default is disable

handoff connection-setup-record-absent
Default: Disabled
When enabled, discards A11 Handoff requests that do not contain the Airlink Setup record.

Usage
Use this command to configure the PDSN service to discard and Registration Requests that contain multiple information elements of the same type or discard Registration Requests that contain GRE keys that have different GRE keys for the existing IMSI session.

Example
To configure the PDSN service to discard of Registration Requests that have multiple information elements of the same type, enter the following command:

registration-discard bad-extension
To configure the PDSN service to discard registration Requests that contain a GRE key that is different than the existing one for the existing IMSI session, enter the following command:

```
registration-discard gre-key-change
```
registration-update

Configures registration update related parameters for the PDSN.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
registration-update { pdsn-code-nvse | wait-timeout secs }
```

```
no registration-update { pdsn-code-nvse | wait-timeout secs }
```

**no**
If this option is used with the `pdn-code-nvse` keyword, then pdsn-code-nvse configuration is disabled.
If this option is used with the `wait-timeout` keyword, a separate A11 timer is not used. The PDSN waits
for the ppp retransmit-timeout and then sends the A11 Update. If a value is provided, then the "ppp
retransmit-timeout" is ignored and a separate A11 timeout is started immediately upon sending the LCP
Term-Ack. The A11 Update is then sent when the timer expires.
A value of 0 sends the A11 Update immediately after sending the LCP Term-Ack.

**pdn-code-nvse**
Adds the PDSN code NVSE in all A11 registration update messages.

**secs**
The number of seconds to wait. `secs` must be an integer in the range from 0 through 16.

**wait-timeout**
After the Mobile Node terminates a PPP session between the PDSN and the Mobile Node, the PDSN service
waits for the specified time period to receive an A11 RRQ from the PCF before it sends out a Registration-
Update to clear the Session from the PCF.

**Usage**
Use this command to configure registration update related
The `wait-timeout` keyword configures the PDSN to wait the specified amount of time before sending
out a Registration-Update to clear the Session from the PCF.

**Example**
Use the following command to set the registration wait-timeout to 16 seconds:

```
registration-update wait-timeout 16
```
retransmission-timeout

Configures the maximum allowable time for the PDSN service to wait for a response from the PCF before it a) attempts to communicate with the PCF again (if the system is configured to retry the PCF) or b) marks the PCF as unreachable.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```
retransmission-timeout time
no retransmission-timeout
```

time

Specifies the maximum allowable time for the PDSN service to wait for a response from the PCF before it a) attempts to communicate with the PCF again (if the system is configured to retry the PCF) or b) marks the PCF as unreachable.

time is measured in seconds and can be configured to any integer value between 1 and 1,000,000.

Usage

Use the retransmission timeout command in conjunction with the max-retransmissions command in order to configure the PDSN services behavior when it does not receive a response from a particular PCF.

Use the no retransmission-timeout command to delete a previously configured timeout value. If after deleting the lifetime setting you desire to return the lifetime parameter to its default setting, use the default retransmission-timeout command.

The chassis is shipped from the factory with the retransmission timeout set to 3 seconds.

Example

The following command configures a retransmission timeout value of 5 seconds:

```
retransmission-timeout 5
```

The following command deletes a previously configured retransmission-timeout setting:

```
no retransmission-timeout
```
sdb-indication

Configures parameters pertaining to Short Data Burst (SDB) functionality.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

sdb-indication { echo-request | server-address ipaddress/mask packet-length-range min min_range max max_range }

no sdb-indication { echo-request | server-address ipaddress/mask }

no
Disables short-databurst indication.

echo-request
Default: Disabled
Enables the inclusion of the SDB indicator in the LCP Echo Request message(s).

server-address ipaddress/mask
Configures the IP address of the PTT server.
ipaddress is the IP address expressed in dotted decimal notation.
mask is the number of mask bits.

packet-length-range min min_range max max_range
Configures the packet length associated with the specified server.
min min_range configures the minimum packet length as an integer value between 1 and 65535.
max max_range configures the maximum packet length as an integer value between 1 and 65535.

Usage
This command controls the use of Short Data Burst functionality between the PDSN, PCF, and Push-to-Talk (PTT) servers.

Important: This command is for use with a customer-specific implementation and requires a valid Short Data Burst feature-use license to be installed.

Example
The following command configures a PTT server address of 192.168.1.200 with a mask of 16, a minimum packet size of 200, and a maximum packet size of 400:
sdb-indication server-address 192.168.1.200/16 packet-length-range min 200 max 400
service-option

If the service option policy is enabled, this command specifies the service options supported by the PDSN service.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
service-option number
no service-option number
```

`number`
Default: 7, 15, 22, 24, 25, 33, 59, 67
Specifies a specific Service Option (SO) number that this PDSN service is allowed to support.
number can be configured to any integer value between 1 and 1000.

**Usage**
Use the service option command in conjunction with the policy service option enforce command to configure specific SO numbers that are supported. If a particular SO number is not configured, then any subscriber session received with that SO number will be rejected and an A11 Registration Reply Code of 86 (poorly formed request) will be sent.
By default, PDSN services are configured to support the following service option numbers:
- 7: PCF specific
- 15: PCF specific
- 22: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS1 forward, RS1 reverse)
- 23: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS1 forward, RS2 reverse)
- 24: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS2 forward, RS1 reverse)
- 25: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS2 forward, RS2 reverse)
- 33: 3G High Speed Packet Data
- 59: High Rate Packet Data
- 67: RP A10 connection

**Important:** Option 67 is used for auxiliary connections for Rev-A calls. PPP encapsulation of data packets does not flow over this service option connection. ROHC can be performed without PPP for this service option.

Use the `no service-option number` command to delete a previously configured service option. If after deleting the service option setting you desire to return the service option parameter to its default setting, use the `default service-option` command.
Example
The following command enables a service option of 12:

    service-option 12

The following command disables the default service option 59:

    no service-option 59
setup-timeout

The maximum amount of time allowed for session setup.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**
```
setup-timeout seconds
```

*seconds*
Default: 60 seconds
The maximum amount of time, in seconds, to allow for setup of a session. *seconds* must be an integer from 1 through 1000000

**Usage**
Use this command to set the maximum amount of time allowed for setting up a session.

**Example**
Use the following command to set the maximum time allowed for setting up a session to 300 seconds:
```
setup-timeout 300
```
simple-ip allow

This command is used to disable or re-enable Simple-IP sessions from making a connection before authorization takes place.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[no|default] simple-ip allow
```

**no**
When a session attempts PPP authentication, it is assumed that it is a Simple-IP session and it is disconnected before the user is authenticated (RADIUS or local authentication). Also, if `allow-noauth` is enabled and PPP authentication is not performed, after IPCP the session is disconnected if it is discovered that it is a Simple-IP session.

**default**
Reset this command to allow Simple-IP sessions to connect.

**Usage**
Use this command to prevent Simple-IP sessions from connecting to a PDSN service.

**Example**
The following command configures the PDSN service so that it will reject any Simple-IP sessions:

```
no simple-ip allow
```

The following command configures the PDSN service to allow Simple-IP sessions:

```
simple-ip allow
```
spi

Configures the security parameter index (SPI) between the PDSN service and the PCF. This command also configures the redirection of call based on PCF zone.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```
spi remote-address { pcf_ip_address | ip_addr_mask_combo } spi-number number { encrypted secret enc_secret | secret secret } [ description string ] [ hash-algorithm { md5 | rfc2002-md5 } ] [ replay-protection { nonce | timestamp } ] [ timestamp-tolerance tolerance ] [ zone zone_id ]
```

```
no spi remote-address pcf_ip_address spi-number number
```

**remote-address**

- **pcf_ip_address**: Specifies the IP address of the PCF. `pcf_ip_address` is an IP address expressed in IP v4 dotted decimal notation.
- **ip_addr_mask_combo**: Specifies the IP address of the PCF and specifies the IP address network mask bits. `ip_addr_mask_combo` must be specified using the form ‘IP Address/Mask Bits’ where the IP address must either be an IPv4 address expressed in dotted decimal notation or an IPv6 address expressed in colon notation and the mask bits are a numeric value which is the number of bits in the subnet mask.

**spi-number**

Specifies the SPI (number) which indicates a security context between the PCF and the PDSN in accordance with IOS 4.1 and RFC 2002. number can be configured to any integer value between 256 and 4294967295.

**encrypted secret**

- **enc_secret**: Specifies the encrypted shared key (enc_secret) between the PCF and the PDSN service. `enc_secret` must be between 1 and 254 alpha and/or numeric characters and is case sensitive.
- **secret**: Specifies the shared key (secret) between the PCF and the PDSN services. `secret` must be between 1 and 127 alpha and/or numeric characters and is case sensitive.

The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

**description**

This is a description for the SPI. `string` must be an alpha and or numeric string of from 1 through 31 characters.
hash-algorithm { md5 | rfc2002-md5 }
Default: md5
Specifies the hash-algorithm used between the PDSN service and the PCF.
md5: Configures the hash-algorithm to implement MD5 per RFC 1321.
rfc2002-md5: Configures the hash-algorithm to implement keyed-MD5 per RFC 2002.

replay-protection { nonce | timestamp }
Default: timestamp
Specifies the replay-protection scheme that should be implemented by the PDSN service.
nonce: Configures replay protection to be implemented using NONCE per RFC 2002.
timestamp: Configures replay protection to be implemented using timestamps per RFC 2002.

timestamp-tolerance tolerance
Default: 60
Specifies the allowable difference (tolerance) in timestamps that is acceptable. If the difference is exceeded, then the session will be rejected. If this is set to 0, then time stamp tolerance checking is disabled at the receiving end.
tolerance is measured in seconds and can be configured to any integer value between 0 and 65535.

zone zone_id
Specifies the different PCF zones to configure in PDSN service. Mapping of a zone-number to a set of PDSNs can be done per PDSN service basis.
zone_id must be an integer value between 1 and 32. A maximum of 32 PCF zones can be configured for a PDSN service.

Usage
An SPI is a security mechanism configured and shared by the PCF and the PDSN service. Please refer to IOS 4.1 and RFC 2002 for additional information.
Multiple SPIs can be configured if the PDSN service is communicating with multiple PCFs.

Important: The SPI configuration on the PCF must match the SPI configuration for the PDSN service on the system in order for the two devices to communicate properly.

Use the no version of this command to delete a previously configured SPI.
This command used with zone zone_id redirects all calls on the basis of PCF zone to the specific PDSN on the basis of parameters configured at policy pcf-zone-match command.

Example
The following command configures the PDSN service to use an SPI of 256 when communicating with a PCF with the IP address 192.168.0.2. The key that would be shared between the PCF and the PDSN service is q397F65.

spi remote-address 192.168.0.2 spi-number 256 secret q397F65

The following command deletes the configured SPI of 400 for an PCF with an IP address of 172.100.3.200:

no spi remote-address 172.100.3.200 spi-number 400
The following command creates the configured SPI of 400 for an PCF with an IP address of 172.100.3.200 and zone id as 11:

```
spi remote-address 172.100.3.200 spi-number 400 zone 11
```
spi zone

Configures the security parameter index (SPI) between the PDSN service and the PCF with mapping between a zone number to a set of PDSNs per PDSN service to redirect call on the basis of PCF zone.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```
spi zone zone_id

no spi zone zone_id
```

```
zone zone_id
Default: 60
```

Specifies the different PCF zones to configure in PDSN service. Mapping of a zone-number to a set of PDSNs can be done per PDSN service basis.

```
zone_id must be an integer value between 1 and 32. A maximum of 32 PCF zones can be configured for a PDSN service.
```

Usage

An SPI is a security mechanism configured and shared by the PCF and the PDSN service. Please refer to IOS 4.1 and RFC 2002 for additional information.

Multiple SPIs can be configured if the PDSN service is communicating with multiple PCFs.

This PCF zone option is used for call redirection on the basis of PCF zone. When a new call arrives the PDSN, it checks whether the PCF, from which the call arrived, belongs to a particular zone. If

```
Important: The SPI configuration on the PCF must match the SPI configuration for the PDSN service on the system in order for the two devices to communicate properly.
```

Use the no version of this command to delete a previously configured SPI.

Example

The following command configures the PDSN service to use an SPI of 256 when communicating with a PCF with the IP address 192.168.0.2. The key that would be shared between the PCF and the PDSN service is q397F65.

```
spi remote-address 192.168.0.2 spi-number 256 secret q397F65
```

The following command deletes the configured SPI of 400 for an PCF with an IP address of 172.100.3.200:

```
no spi remote-address 172.100.3.200 spi-number 400
```
threshold a11-rrp-failure

Set an alarm or alert based on the number of A11 Registration Response failures for the PDSN service.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```
threshold a11-rrp-failure high_thresh [ clear low_thresh ]
no threshold a11-rrp-failure
```

```
no
Delete the alert or alarm.
```

```
high_thresh
Default: 0
The high threshold number of A11 Registration Response failures that must be met or exceeded within the
polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.
```

```
clear low_thresh
Default: 0
The low threshold number of A11 Registration Response failures that must be met or exceeded within the
polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.
```

**Important**: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm
model, the system assumes it is identical to the high threshold.

Usage
Use this command to set an alert or an alarm when the number of A11 Registration Response failures is equal
to or greater than a specified number.
Alerts or alarms are triggered for the number of A11 Registration Response failures based on the following
rules:

- **Enter condition**: Actual number of A11 Registration Response failures > High Threshold
- **Clear condition**: Actual number of A11 Registration Response failures £ Low Threshold

Example
The following command configures a number of A11 Registration Response failures threshold of 1000 and a low
threshold of 500 for a system using the Alarm thresholding model:

```
threshold a11-rrp-failure 1000 clear 500
```
PDSN Service Configuration Mode Commands

threshold a11-rrp-failure
threshold a11-rrq-msg-discard

Set an alarm or alert based on the number of Discarded A11 Registration Requests for the PDSN service.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

threshold a11-rrq-msg-discard high_thresh [ clear low_thresh ]

no threshold a11-rrq-msg-discard

no

Deletes the alert or alarm.

high_thresh
Default: 0
The high threshold number of Discarded A11 Registration Requests that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

clear low_thresh
Default: 0
The low threshold number of Discarded A11 Registration Requests that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of Discarded A11 Registration Requests is equal to or greater than a specified number.
Alerts or alarms are triggered for the number of Discarded A11 Registration Requests based on the following rules:

• **Enter condition:** Actual number of Discarded A11 Registration Requests > High Threshold
• **Clear condition:** Actual number of Discarded A11 Registration Requests £ Low Threshold

Example

The following command configures a number of Discarded A11 Registration Requests threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:

threshold a11-rrq-msg-discard 1000 clear 500
tft-validation wait-timeout

This command configures the TFT validation wait timeout value for QoS changes. The QoS update timer triggers automatic QoS updates based on dynamic policies.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```
tft-validation wait-timeout seconds
```

```
no tft-validation wait-timeout seconds
```

```
no

Removes the wait-timeout timer.
```

Usage
Configures the TFT validation wait time value for A11 RRQ for QoS changes. `seconds` must be an integer from 1 through 65535.

Example
Use the following command to set the TFT validation wait-timeout to 5 seconds:

```
tft-validation wait-timeout 5
```
threshold a11-rac-msg-discard

Set an alarm or alert based on the number of Discarded A11 Registration Acknowledgements for the PDSN service.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold a11-rac-msg-discard high_thresh [ clear low_thresh ]
no threshold a11-rac-msg-discard
```

**no**
Deletes the alert or alarm.

**high_thresh**
Default: 0
The high threshold number of Discarded A11 Registration Acknowledgements that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

**clear low_thresh**
Default: 0
The low threshold number of Discarded A11 Registration Acknowledgements that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

**Important**: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**
Use this command to set an alert or an alarm when the number of Discarded A11 Registration Acknowledgements is equal to or greater than a specified number.
Alerts or alarms are triggered for the number of Discarded A11 Registration Acknowledgements based on the following rules:

- **Enter condition**: Actual number of Discarded A11 Registration Acknowledgements > High Threshold
- **Clear condition**: Actual number of Discarded A11 Registration Acknowledgements ≤ Low Threshold

**Example**
The following command configures a number of Discarded A11 Registration Acknowledgements threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:
threshold all-rac-msg-discard 1000 clear 500
threshold all-ppp-send-discard

Set an alarm or alert for the PDSN service based on the number of packets that the PPP protocol processing layer internally discarded on transmit for any reason.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

threshold all-ppp-send-discard high_thresh [clear low_thesh]
no threshold all-ppp-send-discard

no
Deletes the alert or alarm.

high_thesh
Default: 0
The high threshold number of discarded PPP send packets that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

clear low_thesh
Default: 0
The low threshold number of discarded PPP send packets that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
Use this command to set an alert or an alarm when the number of discarded PPP send packets is equal to or greater than a specified number.
Alerts or alarms are triggered for the number of discarded PPP send packets is based on the following rules:
• Enter condition: Actual number of discarded PPP send packets > High Threshold
• Clear condition: Actual number of discarded PPP send packets £ Low Threshold

Example
The following command configures a number of discarded PPP send packets threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:

threshold all-ppp-send-discard 1000 clear 500
PDSN Service Configuration Mode Commands

threshold all-ppp-send-discard
**threshold init-rrq-rcvd-rate**

Set an alarm or alert based on the average number of calls setup per second for the context.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold init-rrq-rcvd-rate high_thresh [ clear low_thresh ]
no threshold init-rrq-rcvd-rate
```

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
</table>
| Deletes the alert or alarm.

<table>
<thead>
<tr>
<th>high_thresh</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 0</td>
</tr>
</tbody>
</table>
| The high threshold average number of calls setup per second must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 1000000.

<table>
<thead>
<tr>
<th>clear low_thresh</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 0</td>
</tr>
</tbody>
</table>
| The low threshold average number of calls setup per second that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 1000000.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**
Use this command to set an alert or an alarm when the average number of calls setup per second is equal to or greater than a specified number of calls per second.

Alerts or alarms are triggered for the number of calls setup per second based on the following rules:

- **Enter condition:** Actual number of calls setup per second > High Threshold
- **Clear condition:** Actual number of calls setup per second £ Low Threshold

**Example**
The following command configures a number of calls setup per second threshold of **1000** and a low threshold of **500** for a system using the Alarm thresholding model:

```
threshold init-rrq-rcvd-rate 1000 clear 500
```
Chapter 165
PDSN Service RoHC Configuration Mode Commands

The PDSN Service RoHC Configuration Mode is used to configure RoHC (Robust Header Compression) parameters the PDSN service conveys to the PCF in the initial A11 RRP message before PPP authentication.

Important: The commands, keywords and variables in this mode are available dependent on platform type, product version, and installed license(s).
threshold init-rrq-rcvd-rate
cid-mode

This command enters the RoHC Profile Compression Options Configuration mode. This mode allows you to configure options that apply during RoHC compression for the current RoHC profile.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```
cid-mode { large | small } max-cid integer
```

default cid-mode

default
Reset all options in the RoHC Profile Compression Configuration mode to their default values.

large
Use large packets with optional information for RoHC

small
This is the default packet size.
Use small RoHC packets.

max-cid integer
Default: 15
The highest context ID number to be used by the compressor. integer must be an integer from 0 through 15 when small packet size is selected and must be an integer from 0 through 31 when large packet size is selected.

Usage
Use this command to set the RoHC packet size and define the maximum

Example
The following command sets large RoHC packet size and sets the maximum CID to 100:

```
cid-mode large max-cid 100
```

The following command sets the cid-mode to the default settings of small packets and max-cid 0:

```
default cid-mode
```
end

Returns the CLI prompt to the Exec mode.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Change the mode back to the Exec mode.
exit

Exits this configuration mode and returns to the PDSN Service configuration mode.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Return to the PDSN Service configuration mode.
mrru

This command sets the size of the largest reconstructed reception unit, in octets, that the decompressor is expected to reassemble from segments. The size includes the CRC. If MRRU is negotiated to be 0, no segment headers are allowed on the channel.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

mrru num_octets

default mrru

default
reset the value of this command to its default setting

num_octets
Default: 0
This is the number of octets for the maximum size of the largest reconstructed reception unit allowed. num_octets must be an integer from 0 through 65535.

Usage
Use this command to set the size, in octets, of the largest reconstructed reception unit, in octets, that the decompressor is expected to reassemble from segments.

Example
The following command sets the largest reconstructed reception unit to 1024 octets:

mrru 1024

The following command resets the mrru size to its default of 0 octets:

default mrru
profile

This command specifies the header compression profiles to use. A header compression profile is a specification of how to compress the headers of a specific kind of packet stream over a specific kind of link. At least one profile must be specified.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

profile { [ esp-ip ] [ rtp-udp ] [ udp-ip ] [ uncompressed-ip ] }

default profile

default
Default: esp-ip rtp-udp udp-ip uncompressed-ip
This command sets the RoHC profile configuration back to its default setting.

default

esp-ip
This enables RoHC Profile 0x0003 which is for ESP/IP compression, compression of the header chain up to and including the first ESP header, but not subsequent subheaders.

rtp-udp
This enables RoHC Profile 0x0001 which is for RTP/UDP/IP compression

udp-ip
This enables RoHC Profile 0x0002 which is for UDP/IP compression, compression of the first 12 octets of the UDP payload is not attempted.

uncompressed-ip
This enables RoHC Profile 0x0000 which is for sending uncompressed IP packets.

Usage

Use this command to specify the RoHC header compression profiles to use.

Example

The following command sets the profiles to use as esp-ip and rtp-udp:

profile esp-ip rtp-udp
Chapter 166
Peer-Server Configuration Mode Commands

The Peer-Server configuration mode provides the commands to define and manage the peer server configuration part of the SS7 routing on an SGSN.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the configuration mode and returns to the Exec mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Change the mode back to the Exec mode.
exit

Exits the configuration mode and returns to the Global configuration mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
```
exit
```

**Usage**
Return to the Global configuration mode.
mode

Configures the operational mode of the peer-server.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
mode { loadshare | standby }
```

- **loadshare**
  Sets the peer-server to load share. This is the default.

- **standby**
  Sets the peer-server to be in standby mode.

Usage

Configure the operational mode of the peer-server.

Example

Configure the peer-server for standby mode.

```
mode standby
```
name

Defines the unique identification - the name - of the peer-server in the SS7 routing domain.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
name name
```

*name* must be a string of 1 to 64 alphanumeric characters to define a unique identification for the peer-server within the specific SS7 routing domain. Double quote must be used to create a name that includes spaces.

Usage
Create an easily remembered alphanumeric name for the peer-server.

Example

```
name "Berlin West"
```
pssp

Creates the peer-server-process (PSP) instance and enters the PSP configuration mode. See the PSP Configuration Mode chapter in this guide for information on the configuration commands.

⚠️ **Important:** This command configures a mandatory parameter in the configuration of the peer server.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[no] psp instance id

id

id Uniquely identifies the specific peer-server-process configuration. The Id must be an integer from 1 to 4.
```

**Usage**
Use this command to define the peer-server-process (PSP) instance ID number for the SGSN configuration.

**Example**

```
psp instance 3
```
**routing-context**

Defines the ID of the routing context for the peer-server to use.

**Important:** This command configures a mandatory parameter in the configuration of the peer server.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
routing-context id
```

**Example**

```
routing-context 15
```
self-point-code

This command defines the point-code to identify the SGSN as a peer server.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```plaintext
self-point-code point-code
no self-point-code
```

point-code
Point-code is an SS7-type address for an element in the SS7 network. Point-codes must be defined in dotted-decimal format in a string of 1 to 11 digits. Options include:
- 0.0.1 to 7.255.7 for point-code in the ITU range.
- 0.0.1 to 255.255.255 for point-code in the ANSI range.
- 0.0.1 to 15.31.255 for point-code in the TTC Range.
- a string of 1 to 11 digits in dotted-decimal to represent a point-code in a different range.

no
Removes the self-point-code configuration for this linkset in the peer server.

**Important:** Removing the self-point-code will result in the termination of all traffic on this link.

Usage
Use this command to define the point-code to identify the SGSN.

Example

```plaintext
self-point-code 6.192.7
```
Chapter 167
P-GW Service Configuration Mode Commands

The P-GW (PDN Gateway) Service Configuration Mode is used to create and manage the relationship between specified services used for either GTP or PMIP network traffic.
associate

Associates the P-GW service with specific pre-configured services and/or policies configured in the same context.

Product
P-GW

Privilege
Administrator

Syntax

associate { egtp-service name [ lma-service name ] | lma-service name [ egtp-service name ] | qci-qos-mapping name }

no associate { egtp-service | lma-service | qci-qos-mapping }

Usage

Use this command to associate the P-GW service with other pre-configured services and/or policies configured in the same context.

Example

The following command associates this service with an eGTP service called egtp1:

associate egtp-service egtp1
authorize-with-hss

Identifies the function to use for subscriber authorization.

Product
P-GW

Privilege
Administrator

Syntax

[ default | no ] authorize-with-hss

[ default | no ]

Resets the command to the default setting of “authorize locally” from an internal APN authorization configuration.

Usage

Use this command to specify that the system will use the S6b interface to acquire subscriber authorization from a 3GPP AAA server and the HSS.
**P-GW Service Configuration Mode Commands**

---

**dns-client context**

Specifies the context to use where the DNS client resides to send DNS queries.

**Product**
P-GW

**Privilege**
Administrator

**Syntax**

```
dns-client context name
[ default | no ] dns-client context
```

**default**

Returns the command to the default setting of targeting the DNS client in the context where the P-GW service resides.

**no**

DNS query is disabled.

**name**

Specifies the name of the context where the DNS client is used for the resolution of PCSCF-FQDN received from S6b interface. *name* must be an existing context and be from 1 to 79 alpha and/or numeric characters.

**Usage**

Use this command to specify the context where the DNS client resides to perform P-CSCF-FQDN resolution from the S6b interface.

**Example**

The following command identifies the *egress1* context as the context where the DNS client resides:

```
dns-client context egress1
```
end

Exits the current mode and returns to the Exec Mode.

Product
All

Privilege
Administrator

Syntax
   end

Usage
Change the mode back to the Exec mode.
exit

Exits the current mode and returns to the previous mode.

**Product**
All

**Privilege**
Administrator

**Syntax**
```
exit
```

**Usage**
Return to the previous mode.
fqdn

Configures a Fully Qualified Domain Name for this P-GW service used in messages between the P-GW and a 3GPP AAA server over the S6b interface.

Product
P-GW

Privilege
Administrator

Syntax

fqdn host domain_name realm realm_name

[ default | no ] fqdn

---

**default**

Returns the command to the default setting of “null”.

---

**no**

Remove the configured FQDN from this services configuration.

---

**host domain_name**

Specifies the domain name of the P-GW service. `domain_name` must be from 1 to 255 alpha and/or numeric characters.

---

**realm realm_name**

Specifies the realm name of the P-GW service. `realm_name` must be from 1 to 255 alpha and/or numeric characters.

---

Usage

Use this command to identify the P-GW service using an FQDN required when sending messages over the S6b interface to a 3GPP AAA server.

---

Example

The following command configures the FQDN for this P-GW service as `123abc.com` with a realm name of `all.com`:

```
fqdn host 123abc realm all.com
```
**gx-li context**

Configures the name of the context where lawful intercept packets are delivered to the lawful intercept server.

**Product**
P-GW

**Privilege**
Administrator

**Syntax**

```
gx-li context name
```

```
default gx-li context
```

**default**

Return the command to the default setting of the P-GW context (where this service resides).

```
name
```

Specifies the name of the context where the LI interface is configured for transmitting LI packets to an LI server. *name* must be from 1 to 79 alpha and/or numeric characters.

**Usage**

Use this command to specify the name of the context where the LI source address is configured to send packets to a LI server. By default, the P-GW context will be used.

**Important:** A LI source IP address and interface must be configured in the context specified by this command.

**Example**

The following command identifies the context to use for LI server traffic as *aaa3*:

```
gx-li context aaa3
```
newcall

Configures the P-GW to accept or reject requests for a static IP address if the address is already in use by another session.

Product
P-GW

Privilege
Administrator

Syntax

newcall duplicate-subscriber-requested-address { accept | reject }

no newcall duplicate-subscriber-requested-address

Usage
Use this command to configure the behavior of the P-GW service when receiving requests for static IP address already in use by other sessions.

Important: This command is only applicable to sessions using services supporting duplicate address abort. These services include HA, GGSN, and P-GW.

Example
The following command allows for the acceptance of requests for static IP addresses already in use by other sessions:

    newcall duplicate-subscriber-requested-address accept
plmn id

Configures Public Land Mobile Network identifiers used to determine if a mobile station is visiting, roaming, or belongs to this network.

**Product**
P-GW

**Privilege**
Administrator

**Syntax**

```
plmn id mcc number mnc number [ primary ]
```

- **mcc number mnc number**
  - `mcc number`: Specifies the mobile country code (MCC) portion of the PLMN’s identifier. `number` is the PLMN MCC identifier and must be an integer value between 100 and 999.
  - `mnc number`: Specifies the mobile network code (MNC) portion of the PLMN’s identifier. `number` is the PLMN MNC identifier and can be configured to any 2 or 3 digit integer value between 00 and 999.

- **primary**
  - When multiple PLMN IDs are configured, the `primary` keyword can be used to designate one of the PLMN IDs to be used for the AAA attribute.

**Usage**
The PLMN identifier is used to aid the P-GW service in the determination of whether or not a mobile station is visiting, roaming, or home. Multiple P-GW services can be configured with the same PLMN identifier. Up to five PLMN IDs can be configured for each P-GW Service.

**Example**
The following command configures the PLMN identifier with an MCC of 462 and MNC of 02:

```
plmn id mcc 462 mnc 02
```
session-delete-delay

Configures a delay in terminating a session.

Product
P-GW

Privilege
Administrator

Syntax

```
session-delete-delay timeout [ msec ]
[ default | no ] session-delete-delay timeout
```

- **default**
  Reset the command to the default setting of 10000 msecs.

- **no**
  Disables the feature.

- **timeout msec**
  Default: 10000
  Specifies the time to retain the session before terminating it. \textit{msec} must be an integer from 1000 to 60000.

Usage
Use this command to set a delay to provide session continuity in case of break-before-make scenario.

Example
The following command sets the session delete delay to the default setting of 10,000 msecs:

```
session-delete-delay timeout
```
Chapter 168
Policy Control Configuration Mode Commands

Policy Control Configuration mode is used to configure the Diameter dictionary, origin host, host table entry and host selection algorithm for IMS Authorization service.

```
Exec Mode

configure

Global Configuration Mode

context name

Context Configuration Mode

ims-auth-service svc_name

IMS Authorization Configuration Mode

policy-control

Policy Control Configuration Mode
```
apn-name-to-be-included

This command configures the APN name to be included in CCR Gx messages.

Product
GGSN, IPSG, PGW

Privilege
Security Administrator, Administrator

Syntax

apn-name-to-be-included { gn | virtual }

default apn-name-to-be-included

default
Applies the default setting for this command.
Default: gn

gn | virtual
Specifies which APN name must be sent in the Gx messages.
gn: Send the real APN name.
virtual: Send the virtual APN name if present, else send the real APN name.

Usage
Use this command to configure the APN name to be included in the CCR Gx messages to the PCRF—the real APN name or the virtual APN name.

Example
The following command configures sending the real APN name in Gx messages:

apn-name-to-be-included gn
**custom-reauth-trigger**

This command enables custom reauth event triggers.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```bash
custom-reauth-trigger { none | { preservation-changed | reactivation-changed } + }

default custom-reauth-trigger
```

**default**

Configures the default setting for this command.

**none**

Disables all custom event triggers.
This is the default setting.

**preservation-changed**

Enables preservation-changed event trigger.

**Important:** This keyword is for use with a customer-specific implementation, and will be available only if a valid license is installed.

**reactivation-changed**

Enables reactivation-changed event trigger.

**Important:** This keyword is for use with a customer-specific implementation, and will be available only if a valid license is installed.

**Usage**

Use this command to enable/disable custom reauth event triggers.
It is recommended that the preservation-changed and reactivation-changed triggers both be enabled. As, when the bearer goes into preservation mode with the preservation-changed trigger, the reactivation-changed trigger must also be enabled for the bearer to get reactivated subsequently.
If only the preservation-changed trigger is enabled, and the bearer goes into preservation mode, the bearer will never get reactivated. The reactivation triggers will be ignored. If only the reactivation-changed trigger is enabled, reactivation of the already active bearer does not take place, and the reactivation triggers are ignored.
Example
The following command disables all custom event triggers:

```
custom-reauth-trigger none
```
diameter dictionary

Specifies the Diameter Policy Control Application dictionary for the IMS Authorization Service through Gx/Ty interface.

Product
All

Privilege
Security Administrator, Administrator

Syntax

diameter dictionary { Standard | dpca-custom1 | dpca-custom10 | dpca-custom11 |
               dpca-custom12 | dpca-custom13 | dpca-custom14 | dpca-custom15 | dpca-custom16 |
               dpca-custom17 | dpca-custom18 | dpca-custom19 | dpca-custom2 | dpca-custom20 |
               dpca-custom3 | dpca-custom4 | dpca-custom5 | dpca-custom6 | dpca-custom7 | dpca-
               custom8 | dpca-custom9 | gxa-3gpp2-standard | gxc-standard | pdsn-ty | r8-gx-
               standard | std-pdsn-ty | ty-plus | ty-standard }

default diameter dictionary

default
Sets the Diameter dictionary to standard for Gx or Ty interface.

dpca-custom1
Custom-defined Diameter dictionary for the Gx interface.

dpca-custom2
Custom-defined Diameter dictionary for Rel. 7 Gx interface.

dpca-custom3
Custom-defined Diameter dictionary for the Gx interface in conjunction with IP Services Gateway (IPSG).

dpca-custom4
Standard Diameter dictionary for 3GPP Rel. 7 Gx interface.

dpca-custom5
Custom-defined Diameter dictionary for Rel. 7 Gx interface.

dpca-custom6 ... dpca-custom20
Custom-defined Diameter dictionaries.

gxa-3gpp2-standard
Gxa 3GPP2 standard dictionary.
diameter dictionary

**gxc-standard**
Gxc standard dictionary.

**pdsn-ty**
Custom-defined Diameter dictionary for Ty interface.

**r8-gx-standard**
R8 Gx standard dictionary.

**standard**
Default: Enabled for Gx support in 3GPP networks.
Standard Diameter dictionary for the 3GPP Rel. 6 Gx interface.

**std-pdsn-ty**
Default: Enabled for Ty support in 3GPP2 networks.
Standard Diameter dictionary for Ty interface.

**ty-plus**
Enhanced custom-defined Diameter dictionary for Ty interface.

**ty-standard**
Specifies standard Diameter dictionary for Ty attributes.

---

**Usage**

Use this command to specify the Diameter dictionary for IMS Authorization Service.

---

**Example**
The following command sets the **standard** dictionary for Diameter Policy Control functions in 3GPP network.

```
diameter dictionary standard
```
diameter host-select reselect

This command controls pacing of the reselection or switching of the PCRF after a change occurs in table configuration for an IMS Authorization Service.

Default: Disabled

Product
All

Privilege
Security Administrator, Administrator

Syntax

diameter host-select reselect subscriber-limit subs_limit time-interval duration

{ default | no } diameter host-select reselect

default
Applies the default setting for this command.
Sets the PCRF reselection or switching to default state.

no
Removes the configured PCRF reselection method and disables the reselection or switching of PCRF.

subscriber-limit subs_limit
Specifies the limit of subscribers to switch or reselect the PCRF for subscribers not more than subs_limit in time duration of duration second(s).
subs_limit must be an integer from 1 through 1000000.

time-interval duration
Specifies the time duration, in seconds, to reselect PCRF for subscribers not more than subs_limit in time duration of duration second(s).
duration must be an integer from 1 through 3600.

Usage
Use this command to specify the pacing of reselection or switching of the PCRF in an IMS authorization service..
In case IMS authorization session have been opened on certain PCRF on the basis of the current selection table, and the current active table configuration is changed, the IMSA starts selection procedure for the PCRF. Existing sessions on current PCRF from earlier table is required to close and reopened on the selected PCRF from the new table. This reselection periodicity is controlled by this command and it indicates the number of subscriber sessions subs_limit to be reselected or moved in duration seconds.
For example, if this command is configured with 100 subscribers and 2 seconds, then the system reselects the PCRF for no more than 100 subscribers per 2 seconds.
Example
The following command sets the system to reselect the new PCRF for no more than 1000 subscriber in 15 seconds:

```
diameter host-select reselect subscriber-limit 1000 time-interval 15
```
diameter host-select row-precedence

This command adds/appends rows with precedence to a Diameter host table or MSISDN prefix range table.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
diameter host-select row-precedence precedence_value table { { 1 | 2 } host host_name [ realm realm_id ] [ secondary host host_name [ realm realm_id ] ] | { prefix-table { 1 | 2 } msisdns-prefix-from msisdns-prefix_from msisdns-prefix-to msisdns_prefix_to host host_name [ realm realm_id ] [ secondary host sec_host_name [ realm sec_realms_id ] algorithm { active-standby | round-robin } ] } } [ -noconfirm ]
```

```
no diameter host-select row-precedence precedence_value table { 1 | 2 } | prefix-table { 1 | 2 }
```

Removes the row with the specified precedence from the specified Diameter host table.

```
diameter host-select row-precedence precedence_value table { 1 | 2 } host host_name [ realm realm_id ] [ secondary host sec_host_name [ realm sec_realms_id ] ]
```

This command adds/appends a row in the specified Diameter host table.
In StarOS 8.0, a maximum of 16 rows can be added to a table. In StarOS 8.1 and later, a maximum of 128 rows can be added per table.

**Important:** In StarOS 8.1 and later, `precedence_value` must be an integer from 1 through 128. In StarOS 8.0 and earlier, `precedence_value` must be an integer from 1 through 100.

- `table { 1 | 2 }`: Specifies the Diameter host table to add/append the primary and secondary Diameter host addresses.
- `host host_name`: Specifies the primary host name. `host_name` must be an alpha and/or numeric string of 1 through 127 characters in length.
- `realm realm_id`: Specifies the primary realm ID. `realm_id` must be an alpha and/or numeric string of 1 through 127 characters in length.
- `secondary host sec_host_name [ realm sec_realms_id ]`: Specifies the secondary host name and realm ID:
  - `host sec_host_name`: Specifies the secondary host name. `host_name` must be an alpha and/or numeric string of 1 through 127 characters in length.
  - `realm sec_realms_id`: Specifies the secondary realm ID. `realm_name` must be an alpha and/or numeric string of 1 through 127 characters in length.
no diameter host-select row-precedence precedence_value table prefix-table { 1 | 2 } }

Removes the row with the specified precedence from the specified MSISDN prefix range table.

diameter host-select row-precedence precedence_value table prefix-table { 1 | 2 } msisdn-prefix-from msisdn_prefix_from msisdn-prefix-to msisdn_prefix_to host host_name [ realm realm_id ] [ secondary host sec_host_name [ realm sec Realm_id ] algorithm { active-standby | round-robin } [ -noconfirm ]

Use this command to configure the MSISDN prefix range based PCRF selection mechanism for Rel. 7 Gx interface support, wherein the PCEF is required to discover and select an appropriate PCRF to establish control relationship at primary PDP context activation. This command adds a row in the specified MSISDN prefix range table. A maximum of 128 rows can be added per prefix range table.

row-precedence precedence_value: Specifies precedence of the row in the table.

**Important:** In StarOS 8.1 and later, precedence_value must be an integer from 1 through 128. In StarOS 8.0 and earlier, precedence_value must be an integer from 1 through 100.

prefix-table { 1 | 2 }: Specifies the MSISDN prefix range table to add the primary and/or secondary Diameter host addresses.

msisdn-prefix-from msisdn_prefix_from: For a range of MSISDNs, specifies the starting MSISDN.

msisdn-prefix-to msisdn_prefix_to: For a range of MSISDNs, specifies the ending MSISDN.

**Important:** To enable the Gx interface to connect to a specific PCRF for a range of MSISDNs/subscribers configure msisdn_prefix_from and msisdn_prefix_to with the starting and ending MSISDNs respectively. The MSISDN ranges must not overlap between rows. To enable the Gx interface to connect to a specific PCRF for a specific MSISDN/subscriber, configure both msisdn_prefix_from and msisdn_prefix_to with the same MSISDN.

host host_name: Specifies the primary host name. host_name must be an alpha and/or numeric string of 1 through 127 characters in length.

realm realm_id: Specifies the primary realm ID. realm_id must be an alpha and/or numeric string of 1 through 127 characters in length.

secondary host sec_host_name [ realm sec Realm_id ]: Specifies the secondary host name and realm ID: host sec_host_name: Specifies the secondary host name. sec_host_name must be an alpha and/or numeric string of 1 through 127 characters in length.

algorithm { active-standby | round-robin }: Specifies the algorithm for selection between primary and secondary servers in the MSISDN prefix range table. Default: active-standby

active-standby: Specifies selection of servers in the Active-Standby fashion.

round-robin: Specifies selection of servers in the Round-Robin fashion.

**Important:** The Round Robin algorithm for PCRF selection is effective only over a large number of PCRF selections, and not at a granular level.
-noconfirm
Specifies that the command is to execute without any additional prompt and confirmation from the user.

Usage
Use this command to add, update, or delete rows specified with a precedence from a Diameter host table or MSISDN prefix range table.
In the Rel. 7 Gx implementation, when the Gateway interworks with multiple PCRFs, the Gateway can configure the primary and secondary server based on the MSISDN-prefix range in the MSISDN prefix range table. Using this command, you can add a new prefix row into the MSISDN prefix table.
If a row with the precedence that you add already exists in a table, the existing prefix row is removed and the new row is inserted with the same precedence.

Example
The following command adds a row with precedence 12 in table 2 with primary host name as star_ims1 and secondary host name as star_ims2 to Diameter host table.

diameter host-select row-precedence 12 table 2 host star_ims1 secondary host star_ims2
diameter host-select table

This command selects the Diameter host table or the MSISDN prefix range table, and the algorithm to select rows from the Diameter host table.

Product
All

Privilege
Security Administrator, Administrator

Syntax

diameter host-select table { { 1 | 2 } algorithm { ip-address-modulus [ prefer-ipv4 | prefer-ipv6 ] | msisdn-modulus | round-robin } | prefix-table { 1 | 2 } } { default | no } diameter host-select table

default
Applies the default setting for this command.

no
Removes previous configuration.
When no table is selected, the system will not communicate with any PCRF for new sessions.

diameter host-select table { 1 | 2 } algorithm { ip-address-modulus | msisdn-modulus | round-robin } table { 1 | 2 }

algorithm { ip-address-modulus [ prefer-ipv4 | prefer-ipv6 ] | msisdn-modulus | round-robin }

Default: round-robin

• ip-address-modulus [ prefer-ipv4 | prefer-ipv6 ]: This algorithm divides the IP address, in binary, of the subscriber by the number of rows in the table, and the remainder is used as an index into the specified table to select the row.

• prefer-ipv4: Specifies that IPv4 addresses are to be used, if an IPv4v6 call is received, for selecting the rows in the host table.

• prefer-ipv6: Specifies that IPv6 addresses are to be used, if an IPv4v6 call is received, for selecting the rows in the host table.

• msisdn-modulus: This algorithm divides the MSISDN value in binary without the leading “+” of the subscriber by the number of rows in the table, and the remainder is used as an index in the specific table to select the row.

• round-robin: This algorithm rotates all rows in the active table for selection of the row in round-robin fashion. If no algorithm is specified this is the default behavior.

Important: The Round Robin algorithm is effective only over a large number of selections, and not at a granular level.
**diameter host-select table prefix-table { 1 | 2 }**

Specifies the MSISDN Prefix Range table to be used in case of MSISDN prefix range based PCRF discovery mechanism.

**Usage**

Use this command to configure the Diameter host table and row selection methods to select host name or realm for PCRF.

When this command is used to change which table the system should be using, user must re-determine which E-PDF the system should be using for each subscriber. If a different E-PDF results from the configuration change in the table, the system will wait for all of the IMS sessions for the subscriber to be no longer active and then the system either closes/opens Gx sessions with the old/new PDFs respectively, or the system deactivates the PDP contexts of the subscriber.

Here is an example of how row selection is configured for three hosts that the system will use for load-balancing. Operator can configure six rows in a table, as follows.

<table>
<thead>
<tr>
<th>Modulo 6</th>
<th>Primary Host</th>
<th>Secondary Host</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>3</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>3</td>
<td>2</td>
<td>3</td>
</tr>
<tr>
<td>4</td>
<td>3</td>
<td>1</td>
</tr>
<tr>
<td>5</td>
<td>3</td>
<td>2</td>
</tr>
</tbody>
</table>

In the above table, the three hosts are named 1, 2, and 3. When all hosts are working, the load will be distributed among all the three hosts. If host 1 fails, then the load will be distributed between the remaining two hosts. In this scenario, the modulo 6 results of 2 and 4 will return rows that have primary hosts but no working back-up host.

In the Rel. 7 Gx implementation, the GGSN/PCEF is required to discover and select an appropriate PCRF to establish control relationship at primary PDP context activation. The ip-address-modulus, msisdn-modulus, and round-robin algorithms are supported by the GGSN/PCEF for PCRF discovery. In addition, the active/standby and round-robin algorithms are used for selection between primary and secondary servers based on the MSISDN Prefix Range Table.

**Example**

The following command specifies `table 1` with `round-robin` algorithm to select the rows with host name for E-PDF in Diameter host table.

```
diameter host-select table 1 algorithm round-robin
```
diameter origin endpoint

This command binds the origin endpoint configured in Context Configuration mode to the IMS Authorization service for Diameter Policy Control Application (DPCA).

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
diameter origin endpoint  endpoint_name
```

```
no diameter origin
```

**Usage**

Use this command to bind a configured Diameter origin endpoint to the IMS Authorization service for DPCA. This IMS authorization service searches all system contexts until it finds one with a matching Diameter origin endpoint name specified.

**Example**
The following command binds a configured endpoint named test to the IMS authorization service:

```
diameter origin endpoint test
```
**diameter request-timeout**

This command configures the request-timeout setting for Diameter-IMSA Gx interface.

**Product**  
GGSN

**Privilege**  
Security Administrator, Administrator

**Syntax**

```plaintext
diameter request-timeout timeout
default diameter request-timeout
```

- `default`  
  Applies the default setting for this command.

- `timeout`  
  Specifies the timeout period in seconds.  
  `timeout` must be an integer from 1 through 300.  
  Default: 10 seconds

**Usage**

Use this command to configure the request-timeout setting for Diameter-IMSA Gx interface.

**Example**

The following command configures the Diameter request-timeout setting to 20 seconds:

```plaintext
diameter request-timeout 20
```
end

Exits the current mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to change to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
li-secret

This command configures an Lawful Intercept shared secret key value for LI session. This value needs to be the same between PCRF and PCEF for Lawful Interception to happen.

**Product**
MME, P-GW, S-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] li-secret [ encrypted ] key key_value
[ no ] li-secret
```

- **no**
  This keywords removes the configured secret key value for LI. This is the default mode.

- **encrypted**
  This keyword displays the secret value in an encrypted format and only `show configuration` `showsecrets` will make the secret value visible.

- **key key_value**
  This keyword configures a secret key value for Lawful Intercept shared secret key. `key_value` must be an alphabetic and/or numeric string of size 1 to 128 characters.

**Usage**

Use this command to configure a shared secret key value with or without encryption. This value needs to be the same between PCRF and PCEF (network function service node) for Lawful Interception to happen. It this command is not configured, by default LI secret key will be used. The command will display the secret value in an encrypted format and only `show configuration` `showsecrets` command will make the secret value visible.

**Example**

Following command sets the encrypted LI secret key to a value for LI session.

```
li-secret encrypted key secret_key_value
```
failure-handling

This command configures Diameter failure handling behavior.

Product
All

Privilege
Security Administrator, Administrator

Syntax

In StarOS 8.0:

```
failure-handling { continue | retry-and-terminate | terminate | diameter-result-code { any-error | result_code } ccfh { continue | retry-and-terminate | terminate } [ cc-request-type { initial-request | terminate-request | update-request } ] } }

no failure-handling diameter-result-code { any-error | integer result_code } [ cc-request-type { initial-request | terminate-request | update-request } ] }
```

In StarOS 8.1 and later:

```
failure-handling cc-request-type { any-request | initial-request | terminate-request | update-request } { diameter-result-code { any-error | result_code [ to end_result_code ] } } { continue | retry-and-terminate | terminate }

no failure-handling cc-request-type { any-request | initial-request | terminate-request | update-request } [ diameter-result-code { any-error | result_code{ to end_result_code} ] ] }
```

---

**no**
Disables previous failure-handling configuration.

**continue**
Specifies that in the event of a failure the user session continues. DPCA/Diameter will make periodic request and/or connection retry attempts and/or will attempt to communicate with a secondary peer depending on the peer config and session-binding setting.

**retry-and-terminate**
Specifies that in the event of a failure the user session continues for the duration of one retry attempt with the server. If this retry attempt also fails, the session is terminated.

**terminate**
Specifies that in the event of a failure the user session be terminated.

**diameter-result-code { any-error | result_code [ to end_result_code ] }**
Specifies failure handling behavior for any/specific result-code(s) to identify the type of failure and failure handling action for specific credit control request type.
**any-error**: Specifies failure handling behavior for those result-codes for which failure-handling behavior has not been specified.

**result_code**: Specifies a Diameter failure result code. *result_code* is the code returned for a failure handling action and must be an integer from 3000 through 4999.

**to end_result_code**: Use to specify a range of Diameter failure result codes. *end_result_code* must be an integer from 3000 through 4999, and must be greater than *result_code*.

<table>
<thead>
<tr>
<th>continue</th>
<th>retry-and-terminate</th>
<th>terminate</th>
</tr>
</thead>
</table>

As in StarOS 8.1 and later.

Specifies the credit control failure handling action.

- **continue**: In the event of a failure the user session continues. DPCA/Diameter will make periodic request and/or connection retry attempts and/or will attempt to communicate with a secondary peer depending on the peer config and session-binding setting.

- **retry-and-terminate**: In the event of a failure the user session continues for the duration of one retry attempt with the server. If this retry attempt also fails, the session is terminated.

- **terminate**: In the event of a failure the user session is terminated.

**ccfh { continue | retry-and-terminate | terminate }**

As in StarOS 8.0:

Specifies the credit control failure handling (CCFH) action with or without credit control request type.

- **continue**: In the event of a failure the user session continues. DPCA/Diameter will make periodic request and/or connection retry attempts and/or will attempt to communicate with a secondary peer depending on the peer config and session-binding setting.

- **retry-and-terminate**: In the event of a failure the user session continues for the duration of one retry attempt with the server. If this retry attempt also fails, the session is terminated.

- **terminate**: In the event of a failure the user session is terminated.

**cc-request-type**

As in StarOS 8.0:

This optional keyword defines the type of credit control request with failure result code and credit control failure handling action for a session.

- **any-request**: Specifies the request type as any request for a new session.

- **initial-request**: Specifies the request type as initial request for a new session.

- **terminate-request**: Specifies the request type as terminate request for a session.

- **update-request**: Specifies the request type as update request for an active session.

**Usage**

Use this command to configure the Diameter Policy Control Application (DPCA) failure handling behavior. When an unknown rulebase comes in CCA, changing of rulebase and failure handling is managed in the following manner:

- If the new and existing rulebases have the same CCA policy, then switch to the new rulebase is successful.

- If the new rulebase is valid and has CCA-enabled, in CCA-Initial/Update request, switch to the new rulebase is successful.
• If the new rulebase is valid and does NOT have CCA enabled, whereas the existing rulebase has credit enabled, or vice versa, in CCA-Initial/Update request:

  - CCFH-Continue: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.
  - CCFH-RETRY&TERMINATE: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.
  - CCFH-TERMINATE: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.

• If the new rulebase is invalid, in CCA-Initial/Update request:

  - CCFH-Continue: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.
  - CCFH-RETRY&TERMINATE: Terminates on successful CCA-T, or terminates after successful/failed retry to secondary.
  - CCFH-TERMINATE: Terminates on successful/failed CCR-T to Primary.

The default failure handling behavior is:

```
failure-handling diameter-result-code any-error ccfh terminate
```

---

**Example**

The following command sets the DPCA failure handling to `retry-and-terminate` and return a result code of 3456 for credit control request type `initial-request`:

As in StarOS 8.0:

```
failure-handling diameter-result-code 3456 ccfh retry-and-terminate cc-request-type initial-request
```

As in StarOS 8.1 and later:

```
failure-handling cc-request-type initial-request diameter-result-code 3456 retry-and-terminate
```
reauth-trigger

This command specifies the trigger events to initiate re-authorization for a subscriber in IMS authorization service.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
[ default ] reauth-trigger { all | { an-gw-change | bearer-loss | bearer-recovery | plmn-change | policy-failure | qos-change | rat-change | sgsn-change | tft-change | tft-delete } + }
```

**Default**
Applies the default setting for this command.

**all**
Sets the IMS authorization service to initiate re-authorization process for a subscriber on all events listed in this command.

**an-gw-change**
Sets the IMS authorization service to initiate re-authorization process for a subscriber whose access network gateway changed.

**bearer-loss**
Sets the IMS authorization service to initiate re-authorization process for a subscriber on loss of bearer or service.

**bearer-recovery**
Sets the IMS authorization service to initiate re-authorization process for a subscriber when a bearer or service recovered after loss of bearer or service.

**default-bearer-qos-change**
Sets the IMS authorization service to initiate re-authorization process when QoS is changed and DEFAULT_EPS_BEARER_QOS_CHANGE event triggered for the default EPS bearer context of a subscriber in LTE network.

**plmn-change**
Sets the IMS authorization service to initiate re-authorization process for a subscriber on change in Public Land Mobile Network (PLMN) of subscriber.

**policy-failure**
Sets the IMS authorization service to initiate re-authorization process for a subscriber on failure of credit and charging policy for subscriber.
\textbf{qos-change}
Sets the IMS authorization service to initiate re-authorization process for a subscriber on change in Quality of Service level/rating of subscriber.

\textbf{rat-change}
Sets the IMS authorization service to initiate re-authorization process for a subscriber on change in Radio Access Type (RAT) of subscriber node.

\textbf{sgsn-change}
Sets the IMS authorization service to initiate re-authorization process for a subscriber on change in SGSN for subscriber node.

\textbf{tft-change}
Sets the IMS authorization service to initiate re-authorization process for a subscriber on change in Traffic Flow Template (TFT) of subscriber session.

\textbf{tft-delete}
Sets the IMS authorization service to initiate re-authorization process for a subscriber when Traffic Flow Template (TFT) of subscriber session is deleted by a system administrative user.

\textbf{Usage}
Use this command to set the triggers to initiate QoS re-authorization process for a subscriber in IMS authorization service.

\textbf{Example}
Following command sets the re-authorization trigger to \texttt{bearer-loss}, so that re-authorization of subscriber session is initiated on loss of bearer.

\texttt{reauth-trigger bearer-loss}
Chapter 169
PVC Configuration Mode Commands

The Permanent Virtual Connection (PVC) configuration mode commands bind IP interfaces or SS7-Frame Relay links a PVC as well as configure PVC operational parameters for a specific port.

Important: The commands or keywords/variables that are available are dependent on platform type, version, and installed license(s).
bind

This command binds IP interface or SS7 link to the PVC.

**Important:** Prior to attempting the binding, the interface and context or the SS7 routing information and link must have been configured.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```bind { interface interface_name context_name | link ss7-routing-domain rd_id linkset-id id link-id id}  
no bind { interface interface_name | link ss7-routing-domain rd_id linkset-id id link-id id}  
no
```

- **interface_name**
  Defines the name of the virtual interface to be bound to the PVC. `interface_name` must be a unique string consisting of 1 to 79 alphanumeric characters.

- **context_name**
  Specifies the name of the context to be bound to the virtual interface. `context_name` must be a unique string consisting of 1 to 79 alphanumeric characters.

- **ss7-routing-domain rd_id**
  Identifies a specific SS7 routing domain. `rd_id` must be an integer from 1 to 12

- **linkset-id id**
  Identifies a specific linkset within the routing domain. `id` must be an integer from 1 to 33

- **link-id id**
  Identifies a specific link within the linkset. `id` must be an integer value 1 - 16

**Usage**

Use this command to bind the PVC to an interface or a specific link.
PVC Configuration Mode Commands

Example

bind ss7-routing-domain 1linkset-id 23link-id 2
**encapsulation aal5**

Specify the data encapsulation type for the ATM adaptation layer 5 (AAL5) frames for the PVC.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
encapsulation aal5 { llc-snap | vc-mux }
```

- **llc-snap**
  Frames protocol is identified in the AAL5 using logical link control (LLC) encapsulation.

- **vc-mux**
  Frames are not encapsulated and use virtual circuit multiplexing (VC-MUX) to identify the protocols used for the AAL5 frames.

**Usage**
Use this command to identify the protocol type for the circuit.

**Example**

```
encapsulation aal5 vc-mux
```
end

Exits the PVC configuration mode and returns to the Exec mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Change the mode back to the Exec mode.
exit

Exits the PVC configuration mode and returns to the ATM port configuration mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
```
exit
```

**Usage**

Return to the port configuration mode.
shaping

Specify the type of traffic shaping (rates) for this PVC.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
shaping { cbr pcr pcr_num | ubr pcr pcr_num | ubr+ pcr pcr_num mrc mrc_num | vbr pcr pcr_num scr src_num mbs mbs_num }
```

- **cbr**
  Constant bit rate
  - pcr - peak cell rate = cells per second
  - `pcr_num` must be an integer from 75 to 1412830

- **ubr**
  Unspecified Bit Rate
  - pcr - peak cell rate = cells per second
  - `pcr_num` must be an integer from 75 to 1412830

- **ubr+**
  Unspecified Bit Rate with Minimum Cell Rate.
  The PCR and MCR values should be set to maintain the following relationship: \( PCR \geq (MCR + \text{minRate}) \),
  where the current recommended minRate is 75.
  - pcr - peak cell rate = cells per second
  - `pcr_num` must be an integer from 75 to 1412830
  - mcr - minimum cell rate
  - `mrc_num` must be an integer from 75 to 1412830

- **vbr**
  Variable Bit Rate, NRT (not real time) type.
  The PCR and MCR values should be set to maintain the following relationship: \( PCR \geq (MCR + \text{minRate}) \),
  where the current recommended minRate is 75.
  - pcr - peak cell rate = cells per second
  - `pcr_num` must be an integer from 75 to 1412830
  - scr - sustained cell rate
  - `src_num` must be an integer from 75 to 1412830
  - mbs - maximum burst size
  - `mbs_num` must be an integer from 75 to 1412830

Usage

Use this command to configure the shaping for egress traffic on this PVC.
Example

shaping cbr pcr 56000
**shutdown**

Disables/enables traffic over the current VLAN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
shutdown
no shutdown
```

**Usage**

Enables the VLAN. When omitted the VLAN is shutdown.

```
no
```

Enables/Disables specified port or card. Command action depends on mode issued from. Shut down a VLAN. This command is necessary to bring a VLAN into service by enabling it via the `no` keyword.

**Example**

To disable a VLAN from sending or receiving network traffic use the following command:

```
shutdown
```

To enable a VLAN use the following command:

```
no shutdown
```
Chapter 170
PVC Interface Configuration Mode Commands

The PVC (permanent virtual connection) Interface configuration mode is used to create and manage the IP parameters for PVC interface(s) associated with an OLC (ATM-type) for a specific context.

All configuration information specified with these commands is displayed using the Exec mode.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**description**

Defines descriptive text to provide useful information about the current interface.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

description text

no description

**no**
Erases the port’s description from the configuration file.

text

text: must be a string of 1 to 79 alphanumeric characters with no spaces or a string within double quotes that includes printable characters. The description is case-sensitive.

**Usage**
Set the description to provide helpful information, for example the port’s primary function, services, end users. Define any information, the only limit is the number of characters, 79.

**Example**

description "PVC12 connects server 1 to home office."
**end**

Exits the PVC interface configuration mode and returns to the Exec mode.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
end
```

**Usage**

Change the mode back to the Exec mode.
exit

Exits the interface configuration mode and returns to the context configuration mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
exit
```

Usage
Return to the context configuration mode.
The commands in this section are used to configure the IP parameters for the PVC interface.

**Important:** Before configuring the OSPF parameters in this section, you need to enable OSPF using the router command and OSPF configuration sub-mode commands accessed in the Context configuration mode and documented in the Context Configuration Mode chapter of this Command Line Interface Reference.
**ip access-group**

This command identifies the access control list (ACL) to be associated with this PVC interface in this context.

**Important:** Prior to using this command, the access list must be created for this context with the `ip access-list` command in the Context configuration mode and then the ACL must be configured using the commands described in CLI chapter ACL Configuration Mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ip access-group name { in | out }
no ip access-group name { in | out }
```

- `no`
  Indicates the specified access group to be removed from the access list.

- `name`
  Specifies the access control list (ACL) rule to be added or removed from the group.
  `name` is a string of 1 to 79 alpha and/or numeric characters with no spaces.

**Important:** Up to 8 ACLs can be applied to a group provided that the number of rules configured within the ACL(s) does not exceed the 128 rule limit for the interface.

```
in | out
in: specifies list is for in-bound access control.
out: specifies the list is for out-bound access control.
```

**Important:** Even though “in” or “out” can be specified, context-level ACL rules are automatically applied to both directions.

**Usage**

Use this command to add IP access lists configured for the same context to an IP access-group. The list can be configured to apply to all inbound and/or outbound traffic.

**Example**
The following adds ACL access-list-1 to the IP access-group associated with this PVC for this context.

```
ip access-group access-list-1 in
```
### ip address

Defines the primary IP address and the network mask to be associated with this PVC interface for this context. This command can also be used to configure the secondary IP address.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ip address ip_address ip_mask [ secondary ]

no ipaddress ip_address
```

**Usage**

Configures or deletes the IPv4 or IPv6 addresses and subnet mask to be associated with this PVC.

**Example**

The following configures the secondary IP address to associate with the interface.

```
ip address 131.2.3.4 255.255.255.0 secondary
```

The following set of commands removes the primary IP address from the PVC interface configuration for this context.

```
no ip address secondary address
no ip address primary address
```
**ip mtu**

Configures the maximum transmission unit (MTU) to be supported on this interface.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ip mtu value
no ip mtu
```

<table>
<thead>
<tr>
<th><strong>no</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Disables and/or restores the option to the system default.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>mtu value</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures the maximum transmission unit in octets.</td>
</tr>
<tr>
<td><em>value</em>: Enter an integer between 576 and 1600. Default is 1500.</td>
</tr>
</tbody>
</table>

**Usage**

Change the maximum transmission unit size to 1300.

**Example**

```
ip mtu 1300
```
**ip ospf authentication-key**

This command configures the password or key to be used for OSPF (Open Shortest Path First) authentication with neighboring routers.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ip ospf authentication-key [ encrypted ] password auth_key
no ip ospf authentication-key
```

- **no**
  Deletes the authentication key.

- **encrypted**
  Enter this keyword if you are pasting a previously encrypted authentication key into the `password auth_key` for this command.

- **password auth_key**
  `auth_key` is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication key (password). This variable is entered in clear text format.

**Usage**
Use this command to set the authentication key used when authenticating with neighboring routers.

**Example**
To set the authentication key to 123abc, use the following command;

```
ip ospf authentication-key password 123abc
```

Use the following command to delete the authentication key;

```
no ip ospf authentication-key
```
ip ospf authentication-type

This command configures the OSPF authentication method to be used with OSPF neighbors over the logical interface.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
ip ospf authentication-type { message-digest | null | text }
no ip ospf authentication-type { message-digest | null | text }
```

- **no**
  Disable this function.

- **message-digest**
  Set the OSPF authentication type to use the message digest (MD) authentication method.

- **null**
  Set the OSPF authentication type to use no authentication, thus disabling either MD or clear text methods.

- **text**
  Set the OSPF authentication type to use the clear text authentication method.

Usage

Use this command to set the type of authentication to use when authenticating with neighboring routers.

Example

To set the authentication type to use clear text, enter the following command;

```
ip ospf authentication-type text
```
**ip ospf cost**

This command configures the cost associated with sending a packet over this logical interface.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ip ospf cost value

no ip ospf cost
```

---

**no**
Disable this function.

**value**
Default: 10
The cost to assign to OSPF packets. This must be an integer from 1 through 65535.

---

**Usage**
Use this command to set the cost associated with routes from the interface.

---

**Example**
Use the following command to set the cost to 20;

```
ip ospf cost 20
```

Use the following command to disable the cost setting;

```
no ip ospf cost
```
ip ospf dead-interval

This command configures the dead-interval and the delay time in seconds, for OSPF communications.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
ip ospf dead-interval value
no ip ospf dead-interval
```

no
- Deletes the value set and returns the value to its default.

value
- The interval, in seconds, that the router should wait. During this interval, if no packets are received then the system considers the neighboring router to be off-line. This interval is typically 4 times the duration of the hello-interval.
- value must be an integer from 1 through 65535. Default: 40

Usage
Use this command to set the dead-intervals or delays for OSPF communications.

Example
To set the dead-interval to 100, use the following command:

```
   ip ospf dead-interval 100
```

To delete the setting for the dead-interval and reset the dead-interval value to its default of 40, use the following command:

```
   no ip ospf dead-interval
```
ip ospf hello-interval

This command configures the delay time in seconds, for OSPF hello interval.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ip ospf hello-interval value
no ip ospf hello-interval
```

- **no**
  Deletes the value set and returns the value to its default.

- **value**
  The interval, in seconds, between sending hello packets. This value is typically set to be 1/4 of the value of the **dead-interval**.
  value must be an integer from 1 through 65535. Default: 10

**Usage**
Use this command to set the delays for the hello-interval.

**Example**
To set the hello-interval to 25, use the following command;

```
ip ospf hello-interval 25
```

To delete the setting for the hello-interval and reset the hello-interval value to its default of 10, use the following command

```
no ip ospf hello-interval
```
ip ospf message-digest-key

This command enables the use of MD5-based OSPF authentication.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
ip ospf message-digest-key key_id md5 [ encrypted ] password authentication_key
no ip ospf message-digest-key key_id
```

no
Deletes the key.

```
message-digest-key key_id
```
Specifies the key identifier number. key_id must be an integer from 1 through 255.

```
encrypted
```
Use this if you are pasting a previously encrypted authentication key into the CLI command.

```
password authentication_key
```
The password to use for authentication. authentication_key is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication password. This variable is entered in clear text format.

Usage
Use this command to create an authentication key that uses MD5-based OSPF authentication.

Example
To create a key with the ID of 25 and a password of 123abc, use the following command;

```
   ip ospf message-digest-key 25 md5 password 123abc
```
To delete the same key, enter the following command;

```
   no ip ospf message-digest-key 25
```
**ip ospf network**

Configures the OSPF network type.

**Product**
- SGSN

**Privilege**
- Security Administrator, Administrator

**Syntax**

```
ip ospf network { broadcast | non-broadcast | point-to-multipoint | point-to-point }

no ip ospf network
```

- **no**
  Disable this function.

- **broadcast**
  Sets the network type to broadcast.

- **non-broadcast**
  Sets the network type to non-broadcast multi access (NBMA).

- **point-to-multipoint**
  Sets the network type to point-to-multipoint.

- **point-to-point**
  Sets the network type to point-to-point.

**Usage**

Use this command to specify the OSPF network type.

**Example**

To set the OSPF network type to broadcast, enter the following command:

```
ip ospf network broadcast
```

To disable the OSPF network type, enter the following command:

```
no ip ospf network
```
**ip ospf priority**

This command designates the OSPF router priority.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
ip ospf priority value
no ip ospf priority value
```

**Usage**

Use this command to set the OSPF router priority.

**Example**

To set the priority to 25, enter the following command:

```
ip ospf priority 25
```

To disable the priority, enter the following command:

```
no ip ospf priority
```
**ip ospf retransmit-interval**

This command configures the retransmit-interval and the delay time in seconds, for OSPF communications.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ip ospf dead-interval value
no ip ospf dead-interval
```

**Usage**
Use this command to set the retransmit-intervals or delays for OSPF communications.

**Example**
To set the dead-interval to 25, use the following command;

```
ip ospf retransmit-interval 25
```
ip ospf transmit-delay

This command configures the transmit-delay the OSPF communications parameters.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
ip ospf transmit-delay value
no ip ospf transmit-delay
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Deletes the value set and returns the value to its default.</td>
</tr>
<tr>
<td>transmit-delay value</td>
<td>The interval, in seconds, that the router should wait before transmitting a packet. value must be an integer from 1 through 65535. Default: 1</td>
</tr>
</tbody>
</table>

Usage
Use this command to set the transmit-delay.

Example
To set the transmit delay to 5 seconds, use the following command;

```
ip ospf transmit-delay 5
```

To delete the setting for the transmit-delay or reset the transmit-delay value to its default of 1, use the following command

```
no ip ospf transmit-delay
```
Chapter 171
QCI - QoS Mapping Configuration Mode Commands

The QoS Class Index (QCI) to QoS Mapping Configuration Mode is used to map QoS Class Indexes to enforceable QoS parameters. Mapping can occur between the RAN and the Serving Gateway (S-GW), the Mobility Management Entity (MME), and/or the PDN Gateway (P-GW) in an LTE network or between the RAN and the eHRPD Serving Gateway (HSGW) in an eHRPD network.

```
Exec Mode

configure

Global Configuration Mode

qci-qos-mapping name

QCI – QoS Mapping Config Mode
```
**end**

Exits the current mode and returns to the Exec Mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Change the mode back to the Exec mode.
exit

Exits the current mode and returns to the previous mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous mode.
qci

Creates and maps QCI values to enforceable QoS parameters.

Product
HSGW, P-GW, S-GW

Privilege
Administrator

Syntax

qci num

[ delay-class num precedence-class num reliability-class num

[ downlink { encaps-header { copy-inner | dscp-marking hex } | user-datagram
dscp-marking hex [ encaps-header { copy-inner | dscp-marking hex } ] } ]

[ gbr ]

[ max-packet-delay num max-error-rate num

[ non-gbr ]

[ uplink { encaps-header { copy-inner | dscp-marking hex } | user-datagram dscp-
marking hex [ encaps-header { copy-inner | dscp-marking hex } ] } ]

[ default | no ] qci num

  default
  Resets the default values for the select QCI value.

  no
  Disables the selected QCI value.

  num
  Specifies the QCI value to be enabled. num must be an integer value between 1 and 32.
  QCI values 1 through 9 are standard values. Only undefined values (10 through 32) can be defined.

Important: QCI values 1 through 9 are defined in the 3GPP Specification TS 23.203 “Policy and charging control architecture”.

delay-class num precedence-class num reliability-class num

delay-class num: Pre-release 8 value for configuring packet delay. num must be an integer value between 1 and 32.
precedence-class num: Pre-release 8 value for configuring packet precedence. num must be an integer value between 1 and 32.
reliability-class num: Pre-release 8 value for configuring packet reliability. num must be an integer value between 1 and 32.

downlink { encaps-header { copy-inner | dscp-marking hex } | user-datatype dscp-marking hex [ encaps-header { copy-inner | dscp-marking hex } ] } }

Configures parameters for downlink traffic.
encaps-header: Specifies that the DSCP marking must be set on the encapsulation header for IP-in-IP, GRE, or GTP encapsulation.
user-datatype dscp-marking hex: Specifies that the UDP DSCP marking is to be defined by this keyword. hex must be an integer value between 1 and 32.

{ copy-inner | dscp-marking hex }

•copy-inner: Specifies that the DSCP marking is to be acquired from the UDP headers within the encapsulation.

•dscp-marking hex: Specifies that the DSCP marking is to be defined by this keyword. hex must be an integer value between 1 and 32.

gbr

Specifies that this QCI type is Guaranteed Bit Rate (GBR).

max-packet-delay num max-error-rate num

max-packet-delay num: Specifies the maximum packet delay in milliseconds that can be applied to the data with the QCI. num must be an integer value from 1 through 1000. Default is 10ms for QCI values greater than 9.
max-error-rate num: Specifies the maximum error loss rate of non-congestion related packet loss. num must be an integer value from 1 through 6 specifying 10-1 through 10-6. Default is 3 (or 10-3) for QCI values greater than 9.

Important: Defaults for QCI values less than 9 are defined in the 3GPP Specification TS 23.203 “Policy and charging control architecture”.

non-gbr

Specifies that this QCI type is non-Guaranteed Bit Rate (non-GBR).

uplink { encaps-header { copy-inner | dscp-marking hex } | user-datatype dscp-marking hex [ encaps-header { copy-inner | dscp-marking hex } ] } }

Configures parameters for uplink traffic.
encaps-header: Specifies that the DSCP marking must be set on the encapsulation header for IP-in-IP, GRE, or GTP encapsulation.
user-datatype dscp-marking hex: Specifies that the UDP DSCP marking is to be defined by this keyword. hex must be an integer value between 1 and 32.

{ copy-inner | dscp-marking hex }

•copy-inner: Specifies that the DSCP marking is to be acquired from the UDP headers within the encapsulation.

•dscp-marking hex: Specifies that the DSCP marking is to be defined by this keyword. hex must be an integer value between 1 and 32.
Use this command to create and map QCI values to enforceable QoS parameters.

**Example**
The following command creates a QCI value of 15 and defines the uplink encapsulation header as using the DSCP marking from the encapsulated UDP header:

```
qci 15 uplink encaps-header copy-inner
```
Chapter 172
QCI - RAN ID Mapping Configuration Mode Commands

The QoS Class Index (QCI) Mapping Configuration Mode is used to map RAN profile IDs to QoS Class Indexes via the HRPD Serving Gateway (HSGW) in an eHRPD network.

- Exec Mode
- configure
- Global Configuration Mode
- profile-id-qci-mapping-table name
- QCI – RAN ID Mapping Config Mode
end

Exits the current mode and returns to the Exec Mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.
exit

Exits the current mode and returns to the previous mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
   exit

Usage
Return to the previous mode.
profile-id

Maps a QCI ID to a RAN profile ID and modifies data flow bit rate ranges.

Product
HSGW

Privilege
Administrator

Syntax

```
profile-id  id  qci  num  [  uplink  {  gbr  rate  [  mbr  rate  ]  |  mbr  rate  [  gbr  rate  ]  }  
            downlink  {  gbr  rate  [  mbr  rate  ]  |  mbr  rate  [  gbr  rate  ]  }  ]
```

```
o  profile-id  id
```

- **no**
  Removes the specified profile ID entry from this map.

- **id**
  Specifies the profile ID to which a QCI ID will be mapped. `id` must be an integer value from 1 to 65535.

- **qci  num**
  Specifies the QCI number to which the profile ID will be mapped. `num` must be an integer value from 1 to 255.

- **uplink**
  Specifies that the guaranteed bit rate (GBR) and/or maximum bit rate (MBR) setting that follow this keyword will be applied to the uplink data flow.

- **downlink**
  Specifies that the guaranteed bit rate (GBR) and/or maximum bit rate (MBR) settings that follow this keyword will be applied to the downlink data flow.

- **gbr  rate**
  Specifies the guaranteed bit rate for the uplink or downlink data flow. `rate` must be an integer value from 0 to 4294967295.

- **mbr  rate**
  Specifies the maximum bit rate for the uplink or downlink data flow. `rate` must be an integer value from 0 to 4294967295.

Usage

Use this command to map a QCI ID to a RAN profile ID and, optionally, modify data flow bit rate ranges.
Example
The following command maps a QCI ID (1) to a profile ID (10) and sets the uplink guaranteed bit rate to 10000 and the downlink guaranteed bit rate to 20000:

```
profile-id 10 qci 1 uplink gbr 10000 downlink gbr 20000
```
Chapter 173
Radio Network Controller (RNC) Configuration Mode Commands

The Radio Network Controller (for release 8.0) or RNC (for releases 8.1 and higher) configuration mode defines the parameters related to the SGSN connection with an RNC.

The command prompt for this mode will appear as:

```
<context_name> <hostname>(config-ctx-iups-service-rnc)#
```

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
associate-gtpu-bind-address

This command defines the GTP-U loopback address and associates (binds) this address with a particular interface (non-loopback) address.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] associate-gtpu-bind-address ip_address to-interface-address ip_address
```

- **no**
  - Removes the loopback address definition and interface association from the current RNC configuration.

- **ip_address**
  - Must be specified using the standard IPv4 dotted decimal notation.

**Usage**

Use this command to setup an association between a loopback address and a non-loopback address.

**Example**

```
associate-gtpu-bind-address x.x.x.x to-interface-address y.y.y.y
```
description

This command defines an alphanumeric string that is intended to provide descriptive information about the radio network controller (RNC). This is used for operator reference only.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

description string

no description

Syntax:

no
- Removes the description string from the current RNC configuration.

string
- Specifies the alphanumeric string that is stored. Must be from 1 through 255 alphanumeric characters. Strings with spaces must be enclosed in double-quotes. See the example below.

Usage
Use this command to set a description for reference by operators.

Example
The following command sets the description to identify an RNC.

description "RNC1 Carrier2 Uganda"
**direct-tunnel**

This command enables/disables the direct tunnel feature through the interface to the radio network controller (RNC).

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
direct-tunnel not-permitted-by-rnc
default direct-tunnel
```

- **default**
  Sets the direct tunnel support on RNC to default mode; i.e. enabling direct tunnel.

- **not-permitted-by-rnc**
  Default: enabled
  Disables the direct-tunnel support on radio network controller (RNC).

**Usage**
Use this command to disable/enable the direct-tunnel function on RNC.

**Example**
Following command disables the direct tunnel support on RNC:

```plaintext
direct-tunnel not-permitted-by-rnc
```
end

Exits the configuration mode and returns to the Exec mode.

Product  
All

Privilege  
Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.
exit

Exits the configuration mode and returns to the Global configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Return to the Global configuration mode.
**lac**

This command identifies a Local Area Concentrator (LAC) and a Remote Area Concentrator (RAC) and associates them with this RNC definition.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

\[
\text{[no]} \text{ lac} \text{ lac_id rac rac_id}
\]

- **no**
  Deletes the LAC and RAC information from the system configuration.

- **lac_id**
  A unique numeric identifier for the LAC associated with the RNC.
  \text{lac_id} must be an integer between 1 and 65535.

- **rac_id**
  A unique numeric identifier for the RLAC associated with the RNC.
  \text{rac_id} must be an integer between 1 and 255.

**Usage**

Creates an association with a specific LAC and RAC.

**Example**

\text{lac 545 rac 23}
overload-action disable

This command maps an action to be taken if traffic reaches or exceeds defined levels. The command can be re-entered multiple times to create definitions for each parameter.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

overload-action disable { activate | attach | auth-challenge | modify-request | paging-downlink-data | ptmsi-reallocation | service-request-data | sms }

traffic-level traffic-level

[ no | default ] overload-action disable { activate | attach | auth-challenge | modify-request | paging-downlink-data | ptmsi-reallocation | service-request-data | sms }

no
Removes the defined overload action from configuration.

default
Resets the traffic level to the default level for the associated overload action.

activate traffic-level traffic-level
The system rejects new requests to activate PDP contexts if the defined traffic-level is exceeded.
traffic-level: An integer 1 to 15.
Default: 14

attach traffic-level traffic-level
The system rejects new requests for GPRS attach if the defined traffic-level is exceeded.
traffic-level: An integer 1 to 15.
Default: 15

auth-challenge traffic-level traffic-level
The system skips performing authentication challenges if the defined traffic-level is exceeded.
traffic-level: An integer 1 to 15.
Default: 4

modify-request traffic-level
The system rejects requests to modify a PDP context if the defined traffic-level is exceeded.
traffic-level: An integer 1 to 15.
Default: 12
Radio Network Controller (RNC) Configuration Mode Commands

overload-action disable

---

**paging-downlink-data traffic-level traffic-level**

If the defined traffic-level is exceeded, then paging is not performed for data during downlinks if RABs are not available.

traffic-level: An integer 1 to 15.

Default: 11

---

**ptmsi-reallocation traffic-level traffic-level**

The system skips performing ptmsi-reallocation if the defined traffic-level is reached or exceeded.

traffic-level: An integer from 1 to 15.

Default: 4

---

**service-request-data traffic-level traffic-level**

The system rejects service requests to accept data and establish new RABs if the defined traffic-level is reached or exceeded.

traffic-level: An integer from 1 to 15.

Default: 10

---

**sms traffic-level traffic-level**

The system rejects SMS signaling if the defined traffic-level is reached or exceeded.

traffic-level: An integer 1 to 15.

Default: 8

---

**Usage**

Instruct the system to reject service requests to establish new RABs if the traffic level reaches 3.

---

**Example**

overload-action disable service-request-data traffic-level 3
paging-non-searching-indication

This command instructs the SGSN to include the non-searching indicator flag in the page-request message.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

paging-non-searching-indication { non-searching | searching }

[ no | default ] paging-non-searching-indication

no | default
This is the default. Entering no or default with this command disables the inclusion of the flag.

non-searching
Set the non-searching-indication to non-searching in the page-request message.

searching
Set the non-searching-indication to searching in the page-request message.

Usage
Use this command to determine which type of search indicator flag will be included in the page-request message.

Example

paging-non-searching-indication non-searching
pointcode

Configures the point code of the RNC.
The access protocol that is part of the IuPS Service configuration mode must be configured prior to defining the RNC’s point code.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

[ no ] pointcode pt_code

no
Deletes the RNC’s point code information from the system configuration.

pt_code
Point code in dotted-decimal format:
● ITU Range 0.0.1 to 7.255.7
● ANSI Range 0.0.1 to 255.255.255
● TTC Range 0.0.1 to 15.31.255
● string of 1 to 11 characters

Usage
Use this command to identify the point code of the associated RNC.

Example

pointcode 1.234.2
rab-modify-procedure

This command configures how the RAB (radio access bearer) assignment procedure will be modified.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
rab-modify-procedure { normal-modify | release-and-establish }
```

```
default rab-modify-procedure
```

default
Returns the configuration to the default setting for this command parameter.

```
normal-modify
```

Selects the normal RAB modify procedure.

```
release-and-establish
```

Instructs the system to release and establish the RAB procedure.

**Usage**

Set the procedure to establish the radio access bearer (RAB).

**Example**

```
rab-modify-procedure normal-modify
```
ranap paging-cause-ie

This command sets the paging cause value and either includes or suppresses the Paging Cause IE in responses to Paging Requests due to various sources. This command is available in releases 8.1 and higher.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```text

| default | no | ranap { paging-cause-ie { all | background-data | conversational-data | gmm-signalling | gs-signalling | interactive-data | sm-signalling | sms-signalling | streaming-data }

---

default
Resets the specific parameters value to default.

---

no
Suppresses the Paging Cause IE so that it is not included in responses to Paging Requests from respective sources.

---

all
Using all sets the action for the Paging Cause IE value for all paging due to all sources.

---

background-data [ value ]
Default: 3 (terminating background call)
Set the Paging Cause IE value for paging due to background data.
value: Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

---

conversational-data [ value ]
Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to conversational data.
value: Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

---

gmm-signalling [ value ]
Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to gmm-signalling.
value: Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.
**gs-signalling** [ value ]

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to VLR Paging Request.
value: Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

**interactive-data** [ value ]

Default: 2 (terminating interactive call)
Set the Paging Cause IE value for paging due to interactive data.
value: Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

**sm-signalling** [ value ]

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to SM signaling.
value: Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

**sms-signalling** [ value ]

Default: 4 (terminating low priority signaling)
Set the Paging Cause IE value for paging due to SMS signaling.
value: Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

**streaming-data** [ value ]

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to streaming data.
value: Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

**Usage**

This command can be used to set the value (meaning) of the Paging Cause IE included in responses to Paging Requests or it can be used to suppress the inclusion of the Paging Cause IE in the responses. These actions can be configured for paging for all sources or for a specified source.

The following values are applicable to all Paging Cause IEs:
- 0 - Terminating conversational call
- 1 - Terminating streaming call
- 2 - Terminating interactive call
- 3 - Terminating background call
- 4 - Terminating low priority signaling
- 5 - Terminating high priority signaling

**Example**

Use the following command to set Paging Cause value to 3 for paging due to GMM signaling without affecting cause values for other sources:

```
ranap paging-cause-ie gmm-signalling 3
```

Use the following command to suppress the Paging Cause IE from all Paging Requests to the RNC:
no ranap paging-cause-ie all

Either of the following commands will cause the Paging Cause IE to be included in Paging Requests with the default value for SM signaling without affecting the cause for other sources:

  ranap paging-cause-ie sm-signalling
  default ranap paging-cause-ie sm-signalling
**ranap signalling-indication-ie**

This command enables/disables the inclusion of the Signaling Indication IE in either or both the RAB Assignment Request and/or the Relocation Request RANAP messages.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```bash
ranap signalling-indication-ie { rab-assignment-request [ relocation-request ] | relocation-request [ rab-assignment-request ] }

no ranap signalling-indication-ie

default ranap signalling-indication-ie
```

- **no**
  Sets the configuration so that the SGSN never includes the IE.

- **default**
  Resets the configuration to the default - the SGSN includes the IE in the messages if preconditions are met (see Usage section).

```bash
rab-assignment-request | relocation-request
```

Including one or both of these keywords configures what type of RANAP message will include the IE.

**Usage**
The command enables the operator to determine whether the signalling indication information element is included in either or both the RAB Assignment Request and Relocation Request messages during the PDP context setup procedure.

For this command configuration to work so that the IE is included, two preconditions must be met:

- Received QoS traffic class for the context must be interactive
- Received QoS has a signalling indication value as optimized

When an RNC receives this IE, the RNC assumes that the customer is using IMS signaling and allocates massive amounts of bandwidth, potentially causing cell congestion. This command enables the operator to determine the usage of this IE which provides the operator with additional session management control.

**Example**
Use the following command to include the signalling indication IE in the RAB Assignment Request:

```bash
ranap signalling-indication-ie rab-assignment-request
```
release-compliance

This command allows the SGSN to support 3GPP release 6 HSPA or release 7 HSPA+.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
release-compliance { pre-release-7 | release-7 }

default release-compliance
```

- **default**
  Returns the configuration to the default value, which is `release-7`.

- **pre-release-7**
  Identifies 3GPP Release 6 (R6) as the release the RNC is compliant with.

- **release-7**
  Identifies 3GPP Release 7 (R7) as the release the RNC is compliant with.

**Usage**

Use this command to match the 3GPP release support by the RNC. As the 3GPP releases each support differing data rate options - R6 supports HSPA and R7 supports HSPA+ - then selecting the compliance is a method of preforming data rate management on a per RNC basis.

**Example**

Enable HSPA fallback to R6 compliance:

```plaintext
release-compliance pre-release-7
```
reset-resource

This command enables the operator to control message length by configuring the number of IuConIDs sent in each RANAP Reset Resource messages.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax
reset-resource max-iuconid-per-msg number

default reset-resource max-iuconid-per-msg

default
Resets the number of Iu connection Ids included in the Reset Resource messages. Default is 250.

max-iuconid-per-msg number
Sets the number of Iu connection Ids to be included in the Reset Resource messages.
number: Integer from 1 to 250.
Default: 250

Usage
Id numbers for each Iu connection are included in the RANAP Reset Resource messages. Including this potentially long stream of numbers can make the message very long. With this command, the operator can control the size of the messages by controlling the number of Id messages included in the messages.

Example
Limit the number of Iu connection Ids to 30:

reset-resource max-iuconid-per-msg 30
Chapter 174
Remote Address List Configuration Mode Commands

The Remote Address List Configuration Mode is used to configure address lists for the Remote Address-based Accounting feature on a per-context basis.

```
Exec Mode
  configure
    Global Configuration Mode
      context name
        Context Configuration Mode
          radius accounting
          ip remote-address
          list number
            Remote Address List Config Mode
```
address

This command configures addresses for the Remote Address List.

**Product**
PDSN, HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
address ip_address netmask subnet
noaddress ip_address netmask subnet
```

- **no**
  
  Removes a previously configured address.

```
address ip_address
```

  Specifies the IP address of the remote device.

  *ip_address* is the IPv4 address expressed in dotted-decimal notation.

```
netmask subnet
```

  Specifies the subnet mask of the remote device.

  *subnet* is the netmask expressed in dotted-decimal notation.

**Usage**

Use this command to configure remote address lists for use with the Remote Address-based accounting feature. A maximum of 10 address can be configured per list.

**Example**

The following command adds an IP address of 192.168.100.1 with a subnet mask of 255.255.255.0 to the list:

```
address 192.168.100.1 netmask 255.255.255.0
```
**end**

This command exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Use this command to change to the Exec mode.
exit

This command exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
Chapter 175
RoHC Profile Common Options Configuration Mode Commands

The RoHC Profile Common Options Configuration Mode is used to set timers that, upon expiration, release header compression contexts.

```
Exec Mode
configure
   Global Configuration Mode
      rohc-profile profile-name name
         RoHC Profile Configuration Mode
            common-options
               RoHC Profile Common Options Config Mode
```
delay-release-hc-context-timer

Sets a delay in releasing RoHC contexts allowing for context continuation during intra-gateway handoffs.

**Product**
HSGW, PDSN

**Privilege**
Administrator

**Syntax**

```
delay-release-hc-context-timer  seconds
no delay-release-hc-context-timer
```

**Usage**
Use this command to set a delay in releasing a header compression context. This command is necessary when employing RoHC and mobility. Typically, when an RP connection is released, the header compression context is also released immediately. However, in mobility situations, such as intra-PDSN handoffs, the header compression context should be preserved. Adding a delay to cover the handoff time allows the context to be maintained.

A header compression context contains the compression/decompression configuration and statistics for the session.

**Example**
The following command sets the header compression release delay to 20 seconds:

```
delay-release-hc-context-timer 20
```
end

Exits the current mode and returns to the Exec Mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
end
```

**Usage**

Change the mode back to the Exec mode.
exit

Exits the current mode and returns to the previous mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
```
exit
```

Usage
Return to the previous mode.
inactive-traffic-release-hc-context-timer

Set an inactivity timer that is checked when inactivity is detected on an SO67 A10 bearer connection with negotiated RoHC parameters. If the inactivity continues to the end of the configured time, the header compression context is released.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

inactive-traffic-release-hc-context-timer seconds

no inactive-traffic-release-hc-context-timer

Usage
Use this command to set a timer that is started upon detecting inactivity on the bearer channel. Upon expiry, the header compression context is released. Enable this feature to allow for efficient memory utilization.

Example
The following command sets the bearer channel inactivity timer to 60 seconds:

inactive-traffic-release-hc-context-timer 60
The RoHC Profile Compression Configuration Mode is used to configure RoHC (Robust Header Compression) Compressor parameters. RoHC is not supported on GGSN.

**Important:** The availability of commands, keywords and variables in this mode are dependent on platform type, product version, and installed license(s).
context-timeout

Context timeout in seconds.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

context-timeout seconds

default context-timeout

default
Returns the command to its default value.

seconds
Default: 20 seconds
The context timeout value in seconds. seconds must be an integer from 0 through 100.

Usage
Use this command to set the context timeout.

Example
The following command sets the context timeout to 10 seconds:

context-timeout-period 10
end

Returns the CLI prompt to the Exec mode.

**Product**
HSGW, PDSN

**Privilege**
Administrator

**Syntax**

```
end
```

**Usage**

Change the mode back to the Exec mode.
exit

Exits this configuration mode and returns to the previous mode.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

```
exit
```

Usage
Return to the previous mode.
ipid-history-size

The number of IP-IDs of previously sent packets to store. An IP ID is a 16-bit header field that stores IPv4 Identification information.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

```
ipid-history-size number

default ipid-history-size
```

**default**
Returns the command to its default value.

**number**
Default: 8
The number of IP IDs to store. `number` must be an integer from 1 through 32.

**Usage**
Use this command to set the number of IP IDs to store in the history.

**Example**
The following command sets the history size to 24 IP-IDs:

```
ipid-history-size 24
```
max-jitter-cd

The upper boundary of jitter expected on the communication channel between the compressor and decompressor.

**Product**

HSGW, PDSN

**Privilege**

Administrator

**Syntax**

```plaintext
max-jitter-cd num_ms
default max-jitter-cd
```

**default**

Returns the command to its default value.

- **num_ms**
  
  Default: 150
  
  The number of milliseconds for the maximum jitter setting. `num_ms` must be an integer from 0 through 999999999.

**Usage**

Use this command to set the maximum amount of jitter allowed on the communication channel between compressor and decompressor.

**Example**

The following command sets the jitter limit to 1000ms (1 second):

```
max-jitter-cd 1000
```
max-sliding-window

The width of the sliding window for W-LSB (Windows-based Least Significant Bits) encoded values.

**Product**
HSGW, PDSN

**Privilege**
Administrator

**Syntax**

```
max-sliding-window size
```

```
default max-sliding-window
```

**Usage**
Use this command to set the size of the sliding window used to compute jitter for W-LSB encoded values.

**Example**
The following command sets the sliding window size to 500:

```
max-sliding-window 500
```
multiple-ts-stride

Enables or disables the use of repeated transmission of RTS_STRIDE for timer-based compression.

**Product**
HSGW, PDSN

**Privilege**
Administrator

**Syntax**

```
[ no ] multiple-ts-stride

no
Disables the use of repeated transmission of RTS_STRIDE for time-based compression.

multiple-ts-stride
Enables the repeated transmission of RTS_STRIDE for timer-based compression.
```

**Usage**
Use this command to enable or disable a gateway’s ability to repeatedly transmit RTS_STRIDE for timer-based compression.
new-context-blocking-time

Time period in seconds for blocking the establishment of new contexts after the compressor has received a feedback reject.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

new-context-blocking-time seconds

default context-timeout

Usage
Use this command to set the context blocking time after the compressor has received a feedback reject.

Example
The following command sets the context blocking time to 10 seconds:

    new-context-blocking-time 10
num-pkts-ts

The number packets per RTP timestamp (TS).

Product
HSGW, PDSN

Privilege
Administrator

Syntax

 num-pkts-ts num_pkts

default num-pkts-ts

default
Returns the command to its default value.

 num_pkts
Default: 6
The number of packets for the timestamp. num_pkts must be an integer from 0 through 999.

Usage
Use this command to set the number of packets for each RTP timestamp (TS).

Example
The following command sets the number of packets per timestamp to 50:

 num-pkts-ts 50
num-pkts-u-mode

The number packets sent when operating in U-Mode (unidirectional mode).

**Product**
- HSGW, PDSN

**Privilege**
- Administrator

**Syntax**

```
num-pkts-u-mode num_pkts
default num-pkts-u-mode
```

**default**
Returns the command to its default value.

```
um_pkts
Default: 1
The number of packets sent in U-Mode. num_pkts must be an integer from 0 through 999.
```

**Usage**
Use this command to set the number of packets sent when in U-Mode.

**Example**
The following command sets the number of packets for U-Mode to 50:

```
um-pkts-u-mode 50
```
num-updates-ir

This command configures the number of IR (Initiation and Refresh state) updates.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

```
num-updates-ir num_pkts

default num-updates-ir
```

default

Returns the command to its default value.

```
um_pkts
```

Default: 4

The number of packets sent in U-Mode. num_pkts must be an integer from 0 through 999.

Usage

Use this command to set the number of packets sent when in U-Mode.

Example

The following command sets the number of packets for U-Mode to 50:

```
num-updates-ir 50
```
optimistic-repeats

For transition from the FO (First Order) to the SO (Second Order) state, the compressor should be confident that the decompressor has all the parameters needed to decompress according to a fixed pattern. The compressor obtains its confidence about decompressor status by sending several packets with the same information according to the lower compression state. If the decompressor receives any of these packets, it is in sync with the compressor. This command defines the number of repeated packets to send to the decompressor.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

```
optimistic-repeats num_pkts

default optimistic-repeats
```

**default**

Returns the command to its default value.

```
num_pkts
```

Default: 6

The number of packets to repeat with the same information to assure synchronization with the decompressor. `num_pkts` must be an integer from 0 through 10.

Usage

Use this command to set the number of packets to repeat to the decompressor to assure synchronization before transition states.

Example

The following command sets the number of repeated packets to 5:

```
optimistic-repeats 5
```
**rtp-sn-p**

The value of p in RTP SN (RTP Sequence Number) calculation. Least Significant Bits (LSB) encoding is used for header fields whose values are usually subject to small changes. With LSB encoding, the k least significant bits of the field value are transmitted instead of the original field value, where k is a positive integer. After receiving k bits, the decompressor derives the original value using a previously received value as reference (v_ref). The scheme is guaranteed to be correct if the compressor and the decompressor each use interpretation intervals as follows:

- In which the original value resides
- And in which the original value is the only value that has the exact same k least significant bits as those transmitted.

The interpretation interval can be described as a function:

\[ f(v_{\text{ref}}, k) = \left[ v_{\text{ref}} - p, v_{\text{ref}} + (2^k - 1) - p \right] \]

Where p is an integer.

**Product**

HSGW, PDSN

**Privilege**

Administrator

**Syntax**

```
  rtp-sn-p  p_value
```

```
default rtp-sn-p
```

- **default**
  - Returns the command to its default value.

- **p_value**
  - Default: 6
  - The number to use for the value of p in the RTP SN calculation. p_value must be an integer from 0 through 999.

**Usage**

Use this command to set the value to use for p when performing the RTP SN calculation.

**Example**

The following command sets the value of p to 100:

```
rtp-sn-p 100
```
**rtp-sn-p-override**

Allow an override of p in RTP SN calculation. This is disabled by default.

**Product**
HSGW, PDSN

**Privilege**
Administrator

**Syntax**

```
[ default | no ] rtp-sn-p-override
```

- **default**
  Returns the command to its default value of disabled.

- **no**
  Disables overriding p in RTP SN calculation.

**Usage**

Use this command to enable an override of p in RTP SN calculation.

**Example**

The following command enables the override of p in the RTP SN calculation:

```
rtp-sn-p-override
```
rtp-time-stride

This command sets the time interval used for one TS (RTP Time Stamp) stride. This is used when timer-based encoding is enabled.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

    rtp-time-stride  num_ms

    default  rtp-time-stride

---------

default

    Returns the command to its default value.

---------

num_ms

    Default: 20
    The number of milliseconds to use for TS_STRIDE. num_ms must be an integer from 0 through 999999999.

---------

Usage

    Use this command to set the length of the TS_STRIDE in milliseconds.

---------

Example

    The following command sets TS_STRIDE to 100ms:

        rtp-time-stride 100
rtp-ts-deviation

This command sets the maximum percentage of deviation allowed for input RTP packets for timer-based compression.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

```plaintext
rtp-ts-deviation percentage
```

```plaintext
default rtp-ts-deviation percentage
```

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns the command to its default value.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 25</td>
</tr>
<tr>
<td>Specifies the maximum percentage of deviation allowed for input RTP packets for timer-based compression. percentage must be an integer value from 0 through 100.</td>
</tr>
</tbody>
</table>

Usage
Use this command to set the maximum percentage of deviation allowed for input RTP packets for timer-based compression.

Example
The following command sets the time increment to 1000:

```plaintext
rtp-ts-deviation 25
```
**rtp-ts-stride**

Amount by which TS (RTP time stamp) is incremented. This is used for Scaled RTP TS encoding.

**Product**
HSGW, PDSN

**Privilege**
Administrator

**Syntax**

```
rtp-ts-stride num_ms
```

```
default rtp-ts-stride
```

**default**

Returns the command to its default value.

```
num_ms
```

Default: 160
The number of milliseconds to use incrementing TS. `num_ms` must be an integer from 0 through 999999999.

**Usage**

Use this command to set the amount by which TS is incremented for Scaled RTP TS encoding.

**Example**

The following command sets amount by which TS is incremented to 100ms:

```
rtp-ts-stride 100
```
**sliding-window-ts**

**Description** The sliding window used to compute jitter.

**Product** HSGW, PDSN

**Privilege** Administrator

**Syntax**

```
sliding-window-ts size
```

default sliding-window-ts

**default**

Returns the command to its default value.

```
size
```

Default: 4
Set the size of the sliding window. `size` must be an integer from 1 through 1000.

**Usage**

Use this command to set the size of the sliding window used to compute jitter for the current RoHC profile.

**Example**

The following command sets the sliding window size to 500:

```
sliding-window-ts 500
```
The total jitter experienced after compression for IPV4.

Product
HSGW, PDSN

Privilege
Administrator

Syntax
```
total-jitter-ipv4 time
```
```
default total-jitter-ipv4
```

**default**
Returns the command to its default value.

- **time**
  Default: 270
  Specifies the time interval to use in milliseconds. `time` must be an integer from 0 through 999999999.

**Usage**
Use this command to set the jitter limit after compression.

**Example**
The following command sets the jitter after compression limit to 900ms:
```
total-jitter-ipv4 900
```
**total-jitter-ipv6**

The total jitter experienced after compression for IPV6.

**Product**
HSGW, PDSN

**Privilege**
Administrator

**Syntax**

```
total-jitter-ipv6 time
```

```
default total-jitter-ipv6
```

**default**

Returns the command to its default value.

```
time
```

Default: 580
Specifies the time interval to use in milliseconds. `time` must be an integer from 0 through 999999999.

**Usage**

Use this command to set the jitter limit after compression.

**Example**

The following command sets the jitter after compression limit to 900 ms:

```
total-jitter-ipv6 900
```
unimode-timeout-to-fo-state

The time period in seconds before falling back to the FO (First Order) state.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

unimode-timeout-to-fo-state num_ms

default unimode-timeout-to-fo-state

default

Returns the command to its default value.

num_ms

Default: 3
Timeout period in seconds. num_ms must be an integer from 0 through 10.

Usage

Use this command to set the timeout before falling back to the FO state when in Unimode.

Example

The following command sets the fall back timeout to 3 seconds:

unimode-timeout-to-fo-state 3
unimode-timeout-to-ir-state

The time period in seconds before falling back to the IR (Initiation and Refresh) state.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

unimode-timeout-to-ir-state  num_ms

default unimode-timeout-to-ir-state

default
Returns the command to its default value.

num_ms
Default: 5
Timeout period in seconds. num_ms must be an integer from 0 through 20.

Usage
Use this command to set the timeout before falling back to the IR state when in Unimode.

Example
The following command sets the fall back timeout to 3 seconds:

unimode-timeout-to-ir-state 3
use-calculated-rtp-time-stride

This command overrides the configured value of rtp-time-stride with a calculated value.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

[ default | no ] use-calculated-rtp-time-stride

default
Returns the command to its default value of enabled.

no
Disables the use of calculated RTP time stride override.

Usage
This command overrides the configured value of rtp-time-stride with a calculated value.

Example
The following command overrides the configured value of rtp-time-stride.

use-calculated-rtp-time-stride
use-calculated-rtp-ts-stride

This command overrides the configured value of rtp-ts-stride with a calculated value.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

```plaintext
[ default | no ] use-calculated-rtp-ts-stride
```

default
Returns the command to its default value of enabled.

no
Disables the use of calculated RTP TS time stride override.

Usage
This command overrides the configured value of rtp-ts-stride with a calculated value.

Example
The following command overrides the configured value of rtp-ts-stride.

```
use-calculated-rtp-ts-stride
```
**use-ipid-override**

Enable and disable overriding the IP-ID (IPv4 Identification header field).

**Product**
HSGW, PDSN

**Privilege**
Administrator

**Syntax**

```
[ default | no ] use-ipid-override
```

- **default**
  Returns the command to its default value of disabled.

- **no**
  Disables the IP-ID override.

**Usage**

Use this command to enable overriding the IP-ID.

**Example**

The following command enables the IP-ID override feature:

```
use-ipid-override
```

The following command disables the IP-ID override feature:

```
o use-ipid-override
```

The following command also disables the IP-ID override feature:

```
default use-ipid-override
```
use-optimized-talkspurt

Disable and enable the use of optimized talkspurt.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

[ default | no ] use-optimized-talkspurt

---

default
Returns the command to its default value of enabled.

---

no
Disable the use of optimized talkspurt.

Usage
Use this command to enable and disable the use of optimized talkspurt

Example
The following command enables the use of optimized talkspurt:

use-optimized-talkspurt

The following command disables the use of optimized talkspurt:

no use-optimized-talkspurt
use-optimized-transience

Enable or disable the use of optimized transience.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

[ default | no ] use-optimized-transience

---

**default**

Returns the command to its default value of enabled.

---

**no**

Disables the use of optimized transience.

---

Usage

Use this command to enable or disable the use of optimized transience.

---

Example

The following command enables the use of optimized transience.

```
use-optimized-transience
```

The following command disables the use of optimized transience.

```
no use-optimized-transience
```
use-timer-based-compression

Enables timer-based compression of the RTP time stamp (TS) at the compressor.

**Product**
HSGW, PDSN

**Privilege**
Administrator

**Syntax**

```
[ default | no ] use-timer-based-compression
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>default</td>
<td>Returns the command to its default value of enabled.</td>
</tr>
<tr>
<td>no</td>
<td>Disables the use of timer-based compression.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to enable or disable the use of timer-based compression.

**Example**

The following command enables the use of timer-based compression.

```
use-timer-based-compression
```

The following command disables the use of timer-based compression.

```
no use-timer-based-compression
```
use-uncomp-profile

Uses the Uncompressed Profile (0x0000) if required at the compressor.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

[default | no ] use-uncomp-profile

default
Returns the command to its default value of disabled.

no
Disables the use of the Uncompressed Profile.

Usage
Use this command to enable or disable the use of the Uncompressed Profile.

Example
The following command enables the use of the Uncompressed Profile.

use-uncomp-profile

The following command disables the use of the Uncompressed Profile.

no use-uncomp-profile
Chapter 177
RoHC Profile Configuration Mode Commands

The RoHC Profile Configuration Mode is used to configure RoHC (Robust Header Compression) Compressor and Decompressor parameters. The profiles can then be assigned to specific subscriber sessions when RoHC header compression is configured. RoHC is not supported on GGSN.

Important: The availability of commands, keywords and variables in this mode is dependent on platform type, product version, and installed license(s).
common-options

Enters the RoHC Profile Common Options Configuration Mode where inactivity and delay timers are set to support dynamic header compression contexts and context preservation during handoffs.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

[ default ] common-options

default
Reset all parameters in the RoHC Profile Common Options Configuration Mode to default values.

Usage
Use this command to enter the RoHC Profile Common Options Configuration Mode where parameters for maintaining header compression contexts and inactivity timers can be configured. Entering this command results in the following prompt:
[context_name]host(config-rohcp-profile-<profile_name>-common)#
RoHC Profile Common Options Configuration Mode commands are defined in the RoHC Profile Common Options Configuration Mode Commands chapter.
compression-options

Enters the RoHC Profile Compression Options Configuration Mode allowing configuration of options applied during RoHC compression for the current RoHC profile.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

[ default ] compression-options

default
Reset all options in the RoHC Profile Compression Configuration Mode to their default values.

Usage
Use this command to enter RoHC Profile Compression Configuration Mode to set the compression options that are used for subscriber sessions using the current RoHC profile. Entering this command results in the following prompt:
[context_name]host(config-rohcprofile-<profile_name>-comp)#
RoHC Profile Compression Options Configuration Mode commands are defined in the RoHC Profile Compression Configuration Mode Commands chapter.

Example
The following command enters RoHC Profile Compression Options Configuration Mode:

    compression-options

The following command sets all compression options to their default values:

    default compression-options
decompression-options

Enters the RoHC Profile Decompression Options Configuration Mode allowing configuration of options applied during RoHC decompression for the current RoHC profile.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

```
[default ] decompression-options
```

**default**
Reset all options in the RoHC Profile Decompression Options Configuration Mode to their default values.

Usage
Use this command to enter RoHC Profile Decompression Options Configuration Mode to set the decompression options used for subscriber sessions using the current RoHC profile. Entering this command results in the following prompt:

```
[context_name]host(config-rohcprofile-<profile_name>-decomp)#
```

RoHC Profile Decompression Options Configuration Mode commands are defined in the RoHC Profile Decompression Configuration Mode Commands chapter.

Example
The following command enters RoHC Profile Decompression Options Configuration Mode:

```
decompression-options
```

The following command sets all decompression options to their default values:

```
default decompression-options
```
end

Returns the CLI prompt to to the Exec mode.

Product
HSGW, PDSN

Privilege
Administrator

Syntax
end

Usage
Change the mode back to the Exec mode.
**exit**

Exits this configuration mode and returns to the previous mode.

**Product**
HSGW, PDSN

**Privilege**
Administrator

**Syntax**
```
exit
```
Chapter 178
RoHC Profile Decompression Configuration Mode
Commands

The RoHC Profile Decompression Configuration Mode is used to configure RoHC (Robust Header Compression) Decompressor parameters.

**Important:** The availability of commands, keywords and variables in this mode are dependent on platform type, product version, and installed license(s).
accept-delayed-pkts

Accepts delayed packets

Product
HSGW, PDSN

Privilege
Administrator

Syntax

[ default ] accept-delayed-pkts

default
Returns the command to its default value of disabled.

Usage
This command helps reduce packet loss during context repair.

Example
Use the following command to enable the system to accept delayed packets:

accept-delayed-pkts
context-timeout

Ensures that no expired contexts are used for data compression.

Product
HSGW, PDSN

Privilege
Administrator

Syntax
context-timeout  seconds

default  ]  context-timeout

default
Returns the command to its default value.

seconds
Default: 20 seconds
The context timeout value in seconds. seconds must be an integer from 0 through 100.

Usage
The RoHC stack should periodically clean up expired contexts and release memory in case there is no data activity for the call on this context. The context cleanup period is internally calculated to be set to half of the context-timeout value. This will ensure that no expired contexts are used for data compression.

Example
The following command sets the context-timeout parameter to 30 seconds:

context-timeout  30
**crc-errors-fo**

This command sets the limits for when a NACK message is sent when in the FO (First Order) state. A NACK is sent when out of a specified number of packets a specified number of them have CRC errors.

**Product**
HSGW, PDSN

**Privilege**
Administrator

**Syntax**

```
crc-errors-fo-k num_errors

crc-errors-fo-n num_packts

default crc-errors-fo-k

default crc-errors-fo-n
```

---

```
default
```

Returns the command to its default value.

```
crc-errors-fo-k num_errors
```

Default: 1
The number of received packets within a specified number of received packets that triggers the sending of a NACK. `num_errors` must be an integer from 1 through 10.

**Important:** `num_errors` must be less than or equal to the value specified with the `crc-errors-fo-n` command.

```
crc-errors-fo-n num_packts
```

Default: 1
The number of packets to check for CRC errors. `num_packts` must be an integer from 1 through 10.

---

**Usage**

Use this command to set the parameters that trigger sending a NACK message when in the FO state.

---

**Example**

To configure a NACK to be sent when 4 out of the last 10 packets have CRC errors when in the FO state, use the following commands:

```
crc-errors-fo-k 4
crc-errors-fo-n 10
```

crc-errors-so

This command sets the limits for when a NACK message is sent when in the SO (Second Order) state. A NACK is sent when out of a specified number of packets a specified number of them have CRC errors.

**Product**
HSGW, PDSN

**Privilege**
Administrator

**Syntax**

- `crc-errors-so-k num_errors`
- `crc-errors-so-n num_packets`
- `default crc-errors-so-k`
- `default crc-errors-so-n`

  **default**
  Returns the command to its default value.

  `crc-errors-so-k num_errors`
  Default: 1
  The number of received packets within a specified number of received packets that triggers the sending of a NACK. `num_errors` must be an integer from 0 through 10.

  **Important**: `num_errors` must be less than or equal to the value specified with the `crc-errors-so-n` command.

  `crc-errors-so-n num_packets`
  Default: 1
  The number of packets to check for CRC errors. `num_packets` must be an integer from 1 through 10.

**Usage**
Use this command to set the parameters that trigger sending a NACK message when in the SO state.

**Example**
To configure a NACK to be sent when 4 out of the last 10 packets have CRC errors when in the SO state, use the following commands:

```
crc-errors-so-k 4
```
```
**end**

Returns the CLI prompt to to the Exec mode.

**Product**
HSGW, PDSN

**Privilege**
Administrator

**Syntax**
```plaintext
dec
```

**Usage**
Change the mode back to the Exec mode.
exit

Exits the this configuration mode and returns to the previous mode.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

exit

Usage
Return to the previous mode.
nack-limit

Sets the number of unsuccessful decompressions allowed before a NACK is sent.

**Product**
HSGW, PDSN

**Privilege**
Administrator

**Syntax**

```
nack-limit limit
default nack-limit
```

- **Default**
  Returns the command to its default value.

- **limit**
  Default: 0
  Specifies the number of unsuccessful decompressions allowed. *limit* must be an integer from 0 through 20.

**Usage**
Use this command to set the maximum number of unsuccessful decompressions before a NACK message is sent.

**Example**
The following command sets the number of unsuccessful decompressions allowed to 10:

```
nack-limit 10
```
optimistic-mode-ack

When this is enabled, if a type 2 IR-DYN packet is successfully decompressed, an optional ACK is sent in U-mode.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

[ default | no ] optimistic-mode-ack

default
Returns the command to its default value of enabled.

no
Disables the sending of the optional ACK.

Usage
Use this command to enable and disable the sending of an optional ACK in U-mode when a type 2 IR-DYN packet is successfully decompressed.

Example
To enable the sending of the optional ACK, enter the following command:

   optimistic-mode-ack

To disable the sending of the optional ACK, enter the following command:

   no optimistic-mode-ack
**optimistic-mode-ack-limit**

When enabled, this command sets the number of packets to send ACKs for.

**Product**
HSGW, PDSN

**Privilege**
Administrator

**Syntax**

```plaintext
optimistic-mode-ack-limit num_pkts

default optimistic-mode-ack-limit
```

- **default**
  Returns the command to its default value.

- **num_pkts**
  Default: 3
  The number of packets to send ACKs for. `num_pkts` must be an integer from 0 through 20.

**Usage**
Use this command to set the number of packets to send the optional ACK for when a type 2 IR-DYN packet is successfully decompressed.

**Example**
Enter the following command to set the number of packets to send and ACK for to 6:

```
optimistic-mode-ack-limit 6
```

Use the following command to set the number of packets to send an ACK for back to the default of 3:

```
default optimistic-mode-ack-limit
```
piggyback-wait-time

The time in milliseconds to wait for a feedback packet to be picked up as piggybacked feedback by the associated compressor.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

```
piggyback-wait-time msecs
```

```
default piggyback-wait-time
```

```
default
Returns the command to its default value.
```

```
msecs
Default: 80ms
Specifies the time in milliseconds to wait for a feedback packet to be picked up. $msecs$ must be an integer value from 0 through 1000.
```

Usage
Use this command to set the time in milliseconds to wait for a feedback packet to be picked up as piggybacked feedback by the associated compressor.

Example
The following command sets the wait time to 120 ms:

```
piggyback-wait-time 120
```
preferred-feedback-mode

Specifies the preferred feedback mode to use between the compressor and the decompressor

Product
HSGW, PDSN

Privilege
Administrator

Syntax

preferred-feedback-mode { bidirectional-optimistic | bidirectional-reliable | unidirectional }

default preferred-feedback-mode

default
Default: bidirectional-optimistic
Returns the command to its default setting.

bidirectional-optimistic
This mode is similar to the Unidirectional mode, with the exception of a feedback channel used to send error recovery requests from the decompressor to compressor.

bidirectional-reliable
Reliable mode makes extensive use of a feedback channel to avoid packet loss from context invalidation. A secure reference model is used instead of the optimistic approach used in the other modes. With the secure reference model, the confidence of the compressor depends on acknowledgements from the decompressor for every context updating packet. Periodically the compressor sends context updating packets repeatedly until an acknowledgement is received from the decompressor.

unidirectional
Packets are sent in only one direction, from the compressor to the decompressor.

Usage
Use this command to specify the preferred feedback method to use between the compressor and the decompressor for the current RoHC profile.

Example
Use the following command to set the preferred feedback mode to bidirectional-reliable:

preferred-feedback-mode bidirectional-reliable
rtp-sn-p

The value of p in RTP SN (RTP Sequence Number) calculation. Least Significant Bits (LSB) encoding is used for
header fields whose values are usually subject to small changes. With LSB encoding, the k least significant bits of the
field value are transmitted instead of the original field value, where k is a positive integer. After receiving k bits, the
decompressor derives the original value using a previously received value as reference (v_ref). The scheme is
guaranteed to be correct if the compressor and the decompressor each use interpretation intervals as follows:

- In which the original value resides
- And in which the original value is the only value that has the exact same k least significant bits as those transmitted.

The interpretation interval can be described as a function:

\[ f(v_{\text{ref}}, k) = [v_{\text{ref}} - p, v_{\text{ref}} + (2^k - 1) - p] \]

Where p is an integer.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

rtp-sn-p value

default rtp-sn-p

default

Returns the command to its default value.

value

Default:
Specifies the number to use for the value of p in the RTP SN calculation. value must be an integer from 0 through 999.

Usage

Use this command to set the value to use for p when performing the RTP SN calculation.

Example

The following command sets the RTP Sequence Number integer “p” value to 100:

rtp-sn-p 100
rtp-sn-p-override

Allow an override of p in RTP SN calculation. This is disabled by default.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

\[
\text{[ default | no ] rtp-sn-p-override}
\]

- **default**
  Returns the command to its default value of disabled.

- **no**
  Disables overriding p in RTP SN calculation.

Usage
Use this command to allow an override of p in RTP SN calculations.

Example
The following command enables the override of p in the RTP SN calculation:

```
rtp-sn-p-override
```
sliding-window-ts

Computes jitter as described in RFC 3095,[4.5.4]

Product
HSGW, PDSN

Privilege
Administrator

Syntax

```
sliding-window-ts size
```

default sliding-window-ts

```
default
Returns the command to its default value.
```

```
size
Default: 4
Set the size of the sliding window. size must be an integer from 1 through 1000.
```

Usage
Use this command to set the size of the sliding window used to compute jitter for the current RoHC profile.

Example
The following command sets the sliding window size to 500:

```
sliding-window-ts 500
```
**use-clock-option**

Controls usage of RoHC clock option. The clock option informs the compressor of the clock resolution of the decompressor. This is needed to allow the compressor to estimate the jitter introduced by the clock of the decompressor when doing timer-based compression of the RTP timestamp.

**Product**

HSGW, PDSN

**Privilege**

Administrator

**Syntax**

```
[ default | no ] use-clock-option
```

- **default**
  Returns the command to its default value of enabled.

- **no**
  Disable use of the RoHC clock option.

**Usage**

Use this command to enable and disable the use of the RoHC clock option.

**Example**

The following command enables RoHC clock option usage:

```
use-clock-option
```

The following command disables RoHC clock option usage:

```
no use-clock-option
```
use-crc-option

Controls usage of the RoHC crc option. The CRC option contains an 8-bit CRC computed over the entire feedback payload, without the packet type and code octet, but including any CID fields.

Syntax

[ default | no ] use-crc-option

- **default**
  - Returns the command to its default value of enabled.

- **no**
  - Disable use of the CRC option.

Usage

Use this command to enable and disable the use of the RoHC CRC option.

Example

The following command enables RoHC CRC option usage:

```
use-crc-option
```

The following command disables RoHC CRC option usage:

```
no use-crc-option
```
use-feedback

Controls use of the feedback channel. A feedback channel sends error recovery requests and (optionally) acknowledgments of significant context updates from the decompressor to the compressor.

Product
HSGW, PDSN

Privilege
Security Administrator, Administrator

Syntax

[ default | no ] use-feedback

default
Returns the command to its default value of disabled.

no
Disable use of the feedback channel.

Usage
Use this command to enable and disable the use of the RoHC feedback channel.

Example
The following command enables RoHC feedback channel usage:

    use-feedback

The following command disables RoHC feedback channel usage:

    no use-feedback
use-jitter-option

Controls usage of RoHC jitter option. The jitter option allows the decompressor to report the maximum jitter it has observed.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

[ default | no ] use-jitter-option

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns the command to its default value of enabled.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disable use of the jitter option.</td>
</tr>
</tbody>
</table>

Usage
Use this command to enable and disable the use of the RoHC jitter option.

Example
The following command enables RoHC jitter option usage:

```
use-jitter-option
```

The following command disables RoHC jitter option usage:

```
no use-jitter-option
```
use-reject-option

Controls usage of RoHC reject option. The reject option informs the compressor that the decompressor does not have sufficient resources to handle the flow.

Product
HSGW, PDSN

Privilege
Administrator

Syntax

```
[ default | no ] use-reject-option
```

- **default**
  Returns the command to its default value of disabled.

- **no**
  Disable use of the reject option.

Usage
Use this command to enable and disable the use of the RoHC reject option.

Example
The following command enables RoHC reject option usage:

```
use-reject-option
```

The following command disables RoHC reject option usage:

```
no use-reject-option
```
use-sn-not-valid-option

Controls usage of the RoHC SN not valid option. The sn-not-valid option indicates that the SN of the feedback is not valid. A compressor must not use the SN of the feedback to find the corresponding sent header when this option is present.

Product  
HSGW, PDSN

Privilege  
Administrator

Syntax

```
[ default | no ] use-sn-not-valid-option
```

- **default**  
  Returns the command to its default value of enabled.

- **no**  
  Disable use of the sn-not-valid option.

Usage

Use this command to enable and disable the use of the RoHC sn not valid option.

Example

The following command enables RoHC sn not valid option usage:

```
use-sn-not-valid-option
```

The following command disables RoHC sn not valid option usage:

```
no use-sn-not-valid-option
```
use-sn-option

Controls usage of RoHC sn option. The sn option provides 8 additional bits of SN (Sequence Number. Usually RTP Sequence Number.)

Product

HSGW, PDSN

Privilege

Administrator

Syntax

[ default | no ] use-sn-option

default

Returns the command to its default value of enabled.

no

Disable use of the sn option.

Usage

Use this command to enable and disable the use of the RoHC sn option.

Example

The following command enables RoHC sn option usage:

use-sn-option

The following command disables RoHC sn option usage:

no use-sn-option
Chapter 179
Route-map Configuration Mode Commands

The Route-Map Configuration sub-mode is used for the OSPFv2 and BGP-4 routing protocols. This mode includes commands that configure matching rules and set actions to perform on matched routes.

```
Exec Mode
  configure
  Global Configuration Mode
    context name
      Context Configuration Mode
        route-map name { deny | permit }
          Route-map Configuration Mode
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the context configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Change the mode back to the Exec mode.
exit

Exits the context configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the global configuration mode.
match as-path

Match an AS path access list

Product
HA

Privilege
Security Administrator, Administrator

Syntax

```
match as-path AS_list
no match interface AS_list
```

Usage
This command is used for BGP-4 routing to specify an AS path access list to be matched. Refer to the `ip as-path access-list` command for more information.

Example
To match entries in an AS path access list named ASlist1, enter the following command:
```
macth as-path ASlist1
```
match interface

Specifies the next-hop interface name of a route to be matched.

Product
All

Privilege
Security Administrator, Administrator

Syntax

match interface interface-name
no match interface interface-name

Usage
Use this command to specify the next hop interface name for routes to be matched.

Example
To match routes that have the next hop interface specified as Interface123, enter the following command:
match interface Interface123
To disable matching routes that have the next hop interface specified as Interface123, enter the following command:
no match interface Interface123
match ip address

This command matches routes with entries in a route-access-list or prefix-list.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```bash
match ip address {prefix-list|route-access-list} list_name
no match ip address {prefix-list|route-access-list} list_name
```

- **no**
  Disable matching from the specified prefix list or route access list.

- **prefix-list**
  This command matches any routes with entries in a prefix-list.

- **route-access-list**
  This command matches any routes with entries in a route-access-list

- **list_name**
  The name of the IP prefix list or IP route access-list. This variable can be a string from 1 to 63 alphanumeric characters in length.

Usage

Use this command to match routes specified in a route-access-list or prefix-list.

Example

To match routes that are specified in a prefix list named `Prefix100`, enter the following command:

```bash
match ip address prefix-list Prefix100
```

To disable matching routes that are specified in a prefix list named `Prefix100`, enter the following command:

```bash
no match ip address prefix-list Prefix100
```
**match ip next-hop**

This command matches next-hop IP addresses with entries in specified standard prefix-list or route-access-list.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
match ip address next-hop {prefix-list | route-access-list} list_name
no match ip address next-hop {prefix-list | route-access-list} list_name
```

- **prefix-list**
  This command matches any routes that have a next-hop router address that has an entry in the specified prefix list.

- **route-access-list**
  This command matches any routes that have a next-hop router address that has an entry in the specified route-access-list.

- **list_name**
  The name of the IP prefix-list or IP route-access-list. This variable is a string from 1 through 63 alphanumeric characters in length.

**Usage**

Use this command to match next-hop IP addresses that have entries in the specified prefix-list or route-access-list.

**Example**

To match next-hop addresses with entries in a prefix-list named *Prefix100*, enter the following command:
```
match ip address next-hop prefix-list Prefix100
```

To disable matching next-hop addresses with entries in a prefix-list named *Prefix100*, enter the following command:
```
no match ip address next-hop prefix-list Prefix100
```
match metric

This command matches routes that have the specified route metric.

Product
All

Privilege
Security Administrator, Administrator

Syntax

match metric metric_value
no match metric metric_value

no
Disables matching of the specified route metric.

metric_value
This is the route metric to match. This must be an integer ranging from 0 through 4294967295.

Usage
Use this command to match routes that have the specified route metric.

Example
To match routes with the route metric of 1200, enter the following command:
match metric 1200
To disable matching routes with a route metric of 1200, enter the following command:
no match metric 1200
match origin

This command matches the origin code learned from BGP. This command is for route maps that are used with BGP routing only.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

```
match origin {egp | igp | incomplete}
no match origin {egp | igp | incomplete}
```

- **no**
  Disables matching of the origin code.

- **egp**
  Match origins learned from the External Gateway Protocol (EGP)

- **igp**
  Match origins learned from the local Interior Gateway Protocol (IGP)

- **incomplete**
  Match origins with unknown heritage.

Usage

Use this command to match origin codes for BGP routing.

Example

To match origin codes learned from EGP, enter the following command:

```
match origin egp
```
**match route-type external**

Match external OSPF routes of the specified type.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
match route-type external { type-1 | type-2 }
```

```
no match route-type external { type-1 | type-2 }
```

**type-1**

Only match type-1 external routes.

**type-2**

Only match type-2 external routes.

**Usage**

Use this command to match external routes of a specific type.

**Example**

The following command matches all external routes that are type-2:
```
match route-type external type-2
```

The following command disables matching external routes that are type-2:
```
no match route-type external type-2
```
match tag

This command matches routes with the specified route tag value.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
match tag tag_value
no match tag tag_value
``` 

```plaintext
no
```

Disable matching routes with the specified route tag value.

```plaintext
tag_value
```

The route tag value to match. This must be an integer from 0 through 4294967295.

**Usage**

Use this command to match routes that have the specified route tag value.

**Example**

Use the following command match routes that have a route tag value of 1234:

```plaintext
match tag 1234
```

Use the following command to disable matching routes that have a route tag value of 1234:

```plaintext
no match tag 1234
```
**set as-path**

Modify an AS path for a route by adding the specified AS numbers to the front of the path.

**Product**

HA

**Privilege**

Security Administrator, Administrator

**Syntax**

```
set as-path prepend \texttt{ASN}
no set as-path prepend \texttt{ASN}
```

**no**

Disable prepending the AS path. Any previously set prepends are removed.

**prepend**

Prepends the autonomous system path.

**ASN**

AS number(s) to be prepended to the AS path. You can specify up to 16 different AS numbers to be prepended in the order specified. Each AS number must be separated by a space. \texttt{ASN} must be an integer from 1 through 65535.

**Usage**

Use this command to add up to 16 specified AS numbers to the front of the AS path.

**Example**

The following command prepends the AS numbers 100, 200, and 1000 to matching AS paths:

```
set as-path prepend 100 200 1000
```
**set ip next-hop**

Set the IP address that is applied as the next hop for routes.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
set ip next-hop ip_address
no set ip next-hop ip_address
```

**Usage**

Use this command to set the IP address that is used as the next hop for routes.

**Example**

To set the next hop for routes to the IP address `192.168.2.100`, use the following command:

```
set ip next-hop 192.168.2.100
```

To disable setting the next hop for routes to the IP address `192.168.2.100`, use the following command:

```
no set ip next-hop 192.168.2.100
```
set metric

This command sets the route metric for matched routes to the specified value.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
set metric metric_value
no set metric metric_value
```

*metric_value*

This is the metric value that is set for routes. This must be an integer from 1 through 4294967295.

**Usage**
Use this command to set the route metric for matched routes.

**Example**

To set the route metric to 12345, use the following command;
set metric 12345

To disable setting the route metric to 12345, enter the following command;
no set metric 12345
set metric-type

This command sets the route metric type to either Type-1 or Type-2 in the AS-external-LSA.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
set metric-type {type-1|type-2}
no set metric-type {type-1|type-2}
```

- **type-1**
  Set the route metric to external type-1.

- **type-2**
  Set the route metric to external type-2

**Usage**
Use this command to set the route metric to either external type-1 or external type-2.

**Example**
To set the route metric to type-1, enter the following command:
```
set metric type-1
```
To disable setting the metric to type, enter the following command:
```
no set metric type-1
```
set origin

This command sets the BGP origin code to the specified value. This command is for route maps that are used with BGP routing only.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

```
set origin {egp | igp | incomplete}
no set origin {egp | igp | incomplete}
```

- **no**
  Disables setting the origin code.

- **egp**
  Set the origin code to specify that the path is from a remote External Gateway Protocol (EGP) system.

- **igp**
  Set the origin code to specify that the path is from a local Interior Gateway Protocol (IGP) system.

- **incomplete**
  Set the origin code to specify that the path is from an unknown system.

Usage
Use this command to set a specified origin code for BGP.

Example
To the origin code to EGP, enter the following command:

```
set origin egp
```
**set tag**

This command sets the route tag value for matched routes.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
set tag tag_value
no set tag tag_value
```

**Usage**

Use this command to set the route tag value that is applied to all matched routes.

**Example**

To set the route tag value to 12345, enter the following command:
```
set tag 12345
```

To disable setting the route tag value to 12345, enter the following command:
```
no set tag 12345
```
set weight

Set the weight in the routing table for matching routes to the specified value.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
set weight value
no set weight value
```

- **no**
  Disable setting the routing weight value.

- **value**
  The weight in the routing table to assign. must be an integer from 1 through 4294967295.

**Usage**
Use this command to set the routing table weight on matched routes.

**Example**
The following command sets the routing table weight for matched routes to 1000:
```
set weight 1000
```
Chapter 180
RS-232 Port Configuration Mode Commands

The RS-232 Port Configuration Mode is used to manage the RS-232 ports on the SPIO cards.
default

Restores the port’s default speed and communication mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
default {preferred slot | terminal {all | databits | flowcontrol | parity | speed | stopbits}}
```

```
preferred slot
```
Sets the port for non-revertive operation for port redundancy auto-recovery; requiring an administrative user to manually issue a port switch to command to return service to the original port.

```
terminal { all | databits | flowcontrol | parity | speed | stopbits }
```

Sets the terminal settings for the rs-232 port to their default settings.

- **all**: Restore all settings to their default values.
- **databits**: Restore the databits setting to its default value of 8.
- **flowcontrol**: Restore the flowcontrol setting to its default value of none.
- **parity**: Restore the parity setting to its default value of none.
- **speed**: Restore the speed setting to its default value of 9600.
- **stopbits**: Restore the stopbits setting to its default value of 1.

Usage

Restores port-level parameters to their default values.

Example

The following command restores all terminal settings to their default values:

```
default terminal all
```
end

Exits the port configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```text
end
```

**Usage**
Change the mode back to the Exec mode.
exit

Exits the port configuration mode and returns to the global configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
  exit

Usage
Return to the global configuration mode.
preferred slot

Assigns revertive or non-revertive control to port redundancy auto-recovery.

Default: non-revertive operation

Product

PDSN, FA, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```plaintext
preferred slot slot#
no preferred slot slot#

no
Disables revertive, or auto-recovery, operation for selected port.

slot#
Identifies the physical chassis slot where the SPIO card is installed.
```

Usage

This command enables or disables revertive port redundancy, wherein after a port failover, when the original port is restored to service (i.e. link up) the system will return service to that port automatically. Disabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue a port switch to command to return service to the original port. This command must be issued on a per port basis, allowing you to configure specific ports to be used on individual LCs or SPIO cards. For example, ports 1 through 4 could be configured as “preferred” on the LC in slot 17 while ports 5 through 8 are “preferred” on the LC in slot 33. In this scenario, both LCs would be in an Active operational state while still providing LC and port redundancy for the other.

Important: This command is not supported on all platforms.

Example

```
preferred slot 24
```
**snmp trap link-status**

Enables/disables the generation of an SNMP trap for link status changes.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
   snmp trap link-status
   no snmp trap link-status
```

```
   no
```

Disables the sending of traps for link status changes.

**Usage**
Enable link status change traps when a monitoring facility can use the information or if there are troubleshooting activities are in progress.

**Example**

```
   snmp trap link-status
   no snmp trap link-status
```
**terminal**

Configures the console port on the SPIO.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
terminal { carrierdetect { off | on } | databits { 7 | 8 } | flowcontrol { hardware | none } | parity { even | none | odd } | speed { 115200 | 19200 | 38400 | 57600 | 9600 } | stopbits { 1 | 2 } }
```

---

**carrierdetect { off | on }**

Default: none

Specifies whether or not the console port is to use carrier detect when connecting to a terminal.

---

**databits { 7 | 8 }**

Default: 8

Specifies the number of data bits used to transmit and receive characters.

---

**flowcontrol { hardware | none }**

Default: none

Specifies how the flow of data is controlled between the SPIO and a terminal.

---

**parity { even | none | odd }**

Default: none

Specifies the type of error checking used on the port.

- **even** - Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits even.
- **none** - Disables error checking.
- **odd** - Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits odd.

---

**speed { 115200 | 19200 | 38400 | 57600 | 9600 }**

Default: 9600

Specifies the flow of data in bits per second between the console port and terminal.

---

**stopbits { 1 | 2 }**

Default: 1

Specifies the number of stop bits between each transmitted character.

---

**Usage**

Sets the SPIO’s console port parameters for communication with the terminal device.
Example
The following command sets the SPIO’s console port. The terminal must support these values.
```bash
terminal carrierdetect off databits 7 flowcontrol hardware parity even speed 115200 stopbits 1
```
Chapter 181
Rulebase Configuration Mode Commands

The Rulebase Configuration Mode is used to create and manage Active Charging Service Rulebase configurations.

```
Exec Mode

active-charging
  service name

ACS
  Configuration
  Mode

rulebase name

Rulebase
  Configuration
  Mode
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
action priority

This command configures the action priority for a ruledef / group-of-ruledefs in the rulebase.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

no action priority action_priority

no
Removes the previously configured action priority from this rulebase.

priority action_priority
Specifies a priority for the specified ruledef / group-of-ruledefs in this rulebase.
The priority controls the ordering of the instance of the CLI command. Lower numbered priorities are
examined first. Up to 2048 instances may be configured, totaled among all rulebases.
action_priority must be an integer from 1 through 65535.

dynamic-only
Default: disabled
Enables matching of dynamic rules with static rules for this action priority on a flow.
The dynamic-only option causes the configuration to be defined, but not enabled. If enabled, the action
associated with this option will not be matched against a flow until it is enabled from a dynamic charging
interface like Gx. Gx can disable or enable this action entry in the rulebase using Gx messages.

static-and-dynamic
Default: enabled
The static-and-dynamic option causes the configuration to be defined and enabled, and allows a dynamic
protocol (such as, the Gx-interface) to disable or re-enable the configuration.

Important: When R7 Gx is enabled, “static-and-dynamic” rules behave exactly like “dynamic-only” rules. I.e.
they must be activated explicitly by the PCRF. When Gx is not enabled, “static-and-dynamic” rules behave exactly like
static rules.

timedef timedef_name

Important: This keyword is only available in StarOS 8.1 and StarOS 9.0 and later releases.

Associates the specified time definition with the ruledef/group-of-ruledefs. Timedefs enable
activation/deactivation of ruledefs/groups-of-ruledefs such that they are available for rule matching only
when they are active.
timedef_name must be the name of a timedef, and must be an alpha and/or numeric string of 1 through 63 characters in length. A timedef can be used with several ruledefs/group-of-ruledefs. When a packet is received, and a ruledef/group-of-ruledefs is eligible for rule matching, if a timedef is associated with the ruledef/group-of-ruledefs, before rule matching, the packet-arrival time is compared with the timeslots configured in the timedef. If the packet arrived in any of the timeslots configured in the associated timedef, rule matching is undertaken, else the next ruledef/group-of-ruledefs is considered.

**Important:** The time considered for timedef matching is the system’s local time.

ruledef ruledef_name
Assigns the specified ruledef to this rulebase.
ruledef_name must be the name of an existing ruledef, and must be an alpha and/or numeric string of 1 through 63 characters in length.
If the specified ruledef does not exist, there will be no ruledef triggers for this action priority within this rulebase.

**Important:** If the ruledef specified here is deleted or is not configured, the system accepts it without applying any ruledef under current rulebase for this action priority.

group-of-ruledefs group_name
Assigns the specified group-of-ruledefs to this rulebase.
group_name must be the name of an existing group-of-ruledefs, and must be an alpha and/or numeric string of 1 through 63 characters in length.
When a group-of-ruledefs is specified, if any of the ruledefs within the group matches, the specified charging action is performed, any more of the action instances are not processed.

**Important:** If the group-of-ruledefs specified here is deleted or is not configured, the system accepts it without applying any ruledefs under current rulebase for this action priority.

charging-action charging_action_name
Specifies the charging action.
charging_action_name must be the name of an existing charging action, and must be an alpha and/or numeric string of 1 through 63 characters in length.
If the specified charging action does not exist, there will be no charging action triggers for this action priority within this rulebase.

**Important:** If the charging action specified here is deleted or not configured, the system accepts it without applying any charging action under current rulebase for this action priority.

monitoring-key monitoring_key
Associates the specified monitoring-key with ruledefs for usage monitoring.
monitoring_key must be an integer from 1 through 4000000000.
description description
Adds specified text to the rule and action.
description must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage
Use this command to configure action priorities for ruledefs / group-of-ruledefs in a rulebase.
This CLI command can be entered multiple times to specify multiple ruledefs and charging actions. The
ruledefs are examined in priority order, until a match is found and the corresponding charging action is
applied.

Example
The following command assigns a rule and action with the action priority of 23, a ruledef of test, and a charging
action of test1 to the current rulebase:
action priority 23 ruledef test charging-action test1
**bandwidth default-policy**

This command configures the default bandwidth policy for the current rulebase.

**Product**
ECS

**Privilege**
Security Administrator, Administrator

**Syntax**

```
bandwidth default-policy policy
no bandwidth default-policy
```

no

Removes previously configured default bandwidth policy.

```
policy
```

Specifies the default bandwidth policy to be configured for the current rulebase. `policy` must be an alpha and/or numeric string of 1 through 63 characters in length.

**Usage**

Use this command to configure the default bandwidth policy for the current rulebase. This bandwidth policy will be used for subscribers using this rulebase for whom in the APN/Subscriber Configuration Mode the `default active-charging bandwidth-policy` command is configured, or no bandwidth policy is configured.

**Example**
The following command configures a bandwidth policy named `standard` for the rulebase:

```
bandwidth default-policy standard
```
billing-records

This command configures the type of billing to be performed for subscriber sessions.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

```
billing-records { egcdr | radius | rf | udr udr-format udr_format_name } +
no billing-records
```

- **egcdr**
  Generates an enhanced G-CDR (eG-CDR) and/or UDR with specified format on the occurrence of an interim trigger condition at the end of a subscriber session, or an SGSN-to-SGSN handoff.

- **radius**
  Generates postpaid RADIUS accounting records at the start and end of a subscriber session, and on the occurrence of an interim trigger condition. RADIUS accounting records are generated for each content ID.

  **Important:** In the GGSN, if in the APN configuration the “accounting-mode” is set to “none”, the system continues to send ACS-generated RADIUS accounting messages. In the PDSN, if in the subscriber default configuration the “accounting-mode” is set to “none”, the system does not send any RADIUS accounting messages (including ACS accounting messages).

- **rf**
  Enables Rf accounting.

- **udr udr-format udr_format_name**
  Generates UDRs with specified format on the occurrence of an interim trigger condition, at the end of a subscriber session or handoff.
  `udr_format_name` must be the name of an existing UDR format, and must be a string of 1 through 63 characters in length.

- **+**
  Indicates that more than one of the keywords can be entered in a single command.

Usage
Use this command to generate enhanced G-CDRs (eG-CDRs), RADIUS CDRs and/or UDRs for billing records. The format of eG-CDRs for the default GTPP group is controlled by the `Inspector` command in the Context Configuration Mode.

If, in the APN configuration, the “accounting-mode” is set as default (GTPP), and in the rulebase configuration “billing-records egcdr” is configured, both G-CDRs and eG-CDRs are generated if configured. If, in the APN, the accounting-mode is set to “none” G-CDRs will not be generated.

**Example**
The following command sets the billing record to UDR with UDR format named `udr_format1`:

```
billing-records udr udr-format udr_format1
```
cca diameter requested-service-unit

This command configures Diameter specific AVPs in Requested-Service-Unit group AVP with DCCA Credit Control Requests (CCRs).

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
cca diameter requested-service-unit sub-avp { time cc-time duration | units cc-service-specific-units charging_unit | volume { cc-input-octets bytes | cc-output-octets bytes | cc-total-octets bytes } + }
```

```plaintext
no cca diameter requested-service-unit sub-avp
```

**no**
Disables the Diameter AVP configuration for DCCA CCRs.

```plaintext
time cc-time duration
```
Specifies requested service unit for charging time duration in seconds in included sub-AVP. 
**duration** specifies charging time in seconds and must be an integer from 1 through 4,294,967,295.

```plaintext
units cc-service-specific-units charging_unit
```
Specifies requested service unit by service specific units in bytes/packets in included sub-AVP. 
**charging_unit** specifies service-specific charging unit and must be an integer from 1 through 4,000,000,000.

```plaintext
volume { cc-input-octets bytes | cc-output-octets bytes | cc-total-octets bytes } +
```
Specifies requested service unit for charging octets by input, output and total volume in included sub-AVP. 
**cc-input-octets**: Specifies input charging octets. 
**cc-output-octets**: Specifies output charging octets. 
**cc-total-octets**: Specifies total charging octets. 
**bytes**: Specifies volume in bytes, and must be an integer from 1 to 4,000,000,000. 
**+**: More than one of the above keywords can be entered within a single command.

**Usage**
Use this command to include sub-AVPs based on time, volume, and service specific unit in Requested-Service-Unit group AVP with CCRs through Gy interface.

**Example**
The following command sets the time based sub-AVP with charging duration of 45 seconds in Requested-Service-Unit group AVP on DCCA CCRs:

```plaintext
```
cca diameter requested-service-unit sub-avp time cc-time 45
cca quota

This command is used to set various time and threshold-based quotas in the prepaid credit control service.

Product
All

Privilege
Security Administrator, Administrator

Syntax

{ no | default } cca quota { holding-time content-id cont_id | retry-time }

holding-time holding_time
Specifies the value for the Quota Holding Time (QHT). QHT is used with both time-based and volume-based quotas.
holding_time must be an integer from 1 to 4000000000.
After holding_time seconds has passed without user traffic, the quota is reported back and the charging stops until new traffic starts.

content-id cont_id
Specifies the content ID (Rating group AVP) to use for the Quota holding time for this rulebase.
cont_id is the specified content id for credit control service in an active charging service and must be an integer from 0 through 4,294,967,295.

retry-time retry_time [ max-retries retries ]
Default: 60
Specifies the retry time in seconds for the quota request.
retry_time must be an integer from 0 to 86400. To disable this assign 0.
This defines the maximum frequency at which the CC application tries to obtain quota for a subscriber passing traffic for a category with no/exhausted quota.
For a subscriber not passing traffic, the CC application will not try to obtain quota (except once at session start time, if so configured). i.e. the quota request from the no quota state is sent in response to user packets only, never based on a timer.
When subscriber hits a charging action that is a flow redirect, operator can optionally specify that this redirection shall clear the retry-time timer.
This allows the immediately following chargeable user traffic to trip a quota request, even if it would otherwise have been subject to the retry time limit. Such configuration allows quite large value for retry-time in quota charging or top up scenario.
max-retries retries option configures the maximum number of retries allowed for blacklisted categories. This option has default value of maximum retries of 65535 retries.
retries must be an integer from 1 through 65535. To disable this assign 0.

Usage
Use this command to set the prepaid credit control quotas.
cca quota retry time allows operator to set the amount of time that the ACS waits before it retries the prepaid server for a content id for which quota was exhausted earlier.
When server sends the quota holding time (QHT) it has highest priority to use that QHT irrespective of the value configured in rulebase or Credit Control Application configuration mode. QHT configured here has second priority for the content ID (rating group) configured here.

In case of QHT is not available from server and rulebase configuration mode, the QHT values configured at Credit Control Application configuration mode is used.

Example
The following command sets the prepaid credit control request retry time to 30 sec.:

```
cca quota retry-time 30
```

The following command sets the system to use the QHT from Credit Control Application mode:

```
no cca quota holding-time content-id content_id
```

The following command sets the system to ignore the QHT from Credit Control Application mode:

```
default cca quota holding-time content-id content_id
```

The following command sets the prepaid credit control request retry time to 60 seconds and maximum numbers of retries to 65535.

```
default cca quota retry-time max-retries
```
CCA QUOTA TIME-DURATION ALGORITHM

This command is used to define the algorithm used to compute time duration for prepaid credit control application quotas in the rulebase service.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
cca quota time-duration algorithm { consumed-time seconds | plus-idle | continuous-time-periods seconds | parking-meter seconds } [ content-id content_id ]
```

**Default cca quota time-duration algorithm**

```
cca quota time-duration algorithm { consumed-time | continuous-time-periods | parking-meter } [ content-id content_id ]
```

default

Sets the default configurations.

**consumed-time seconds**

Default: 0 (disabled)
Specifies the Quota Consumption Time (QCT) in seconds. QCT is used with active time-based quotas and to determine chargeable time envelopes for the purposes of consuming time quota.
Time envelope is the basis for reporting active usage. For each time envelope, the quota consumption includes the last QCT (duration between first packet and last packet + QCT).

**plus-idle**

Defines the idle time for QCT.
When used along with `consumed-time` it indicates the active usage + idle time, when no traffic flow occurs.

**continuous-time-periods seconds**

Default: 0 (disabled)
Specifies the charging quota continuous period in seconds.
The Continuous Time Periods (CTP) mechanism constructs a time-envelopes out of consecutive base time intervals in which traffic has occurred up to and including a base time interval which contains no traffic. As with Quota-Consumption-Time envelopes, the end of an envelope can only be determined “retrospectively”.
Again, as with Quota-Consumption-Time, the envelope for CTP includes the last base time interval, i.e. the one which contained no traffic.
seconds must be an integer from 1 through 4294967295.

**parking-meter** seconds

Default: 0 (disabled)

Specifies the Parking Meter (PM) period, in seconds, for particular rating group. This mechanism utilizes time quota, but instead of consuming linearly—once a decision to consume has been taken—the granted quota is consumed discretely in “chunks” of the base time interval at the start of each base time interval. Traffic is then allowed to flow for the period of the consumed quota. The time interval seconds defines the length of the Parking Meter. A time-envelope corresponds to exactly one PM (and thus to one base time interval). seconds must be an integer from 1 through 4294967295.

**content-id** content_id

Specifies the content ID (Rating group AVP) to use for the CCA Quota time duration algorithm selection in this rulebase. content_id is the specified content ID for credit control service in an active charging service, and must be an integer from 1 through 65535.

**session-time**

Specifies the session period in seconds. This is the default setting.

**Usage**

Use this command to set the various time charging algorithms/schemes for prepaid credit control charging. If operator chooses parking-meter seconds style charging, then time is billed in seconds chunks.

**Example**

The following command sets time duration to 400 seconds for prepaid credit control time duration algorithm:

```plaintext
cca quota time-duration algorithm consumed-time 400
```
cca radius accounting

This command specifies the accounting interval duration for RADIUS prepaid service parameters.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] cca radius accounting interval interval
```

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removes previously configured RADIUS accounting interval in the rulebase.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>interval interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 0 (Disabled).</td>
</tr>
<tr>
<td>Specifies the time interval, in seconds, between accounting actions.</td>
</tr>
<tr>
<td>interval must be an integer from 0 through 3600.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to specify the RADIUS accounting interval between accounting of a prepaid subscriber. The same parameters are applicable for RADIUS server group.

**Example**
The following command defines RADIUS accounting interval of 20 seconds for RADIUS prepaid service in a rulebase.
```
cca radius accounting interval 20
```
cca radius charging

This command specifies the charging context where RADIUS parameters are configured.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

[ no ] cca radius charging context vpn_context [ group group_name ]

no
Removes the previously configured RADIUS charging context in a rulebase.

context vpn_context
Specifies the charging context where RADIUS prepaid charging are configured.
vpn_context is an alpha and/or numeric string of 1 through 63 characters in length.

group group_name
Specifies the RADIUS server group name configured for RADIUS prepaid charging parameters.
group_name must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage
Use this command to specify the RADIUS charging context where RADIUS prepaid charging parameters are configured. The same parameters are applicable for RADIUS server group.

Example
The following command defines RADIUS charging context prepaid_rad1 for RADIUS prepaid charging in a rulebase:
cca radius charging context prepaid_rad1
cca radius user-password

This command specifies the RADIUS prepaid service subscriber’s user password parameters in a Rulebase.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] cca radius user-password [ encrypted ] password password
```

- **no**
  Removes the previously configured RADIUS prepaid service user password in a rulebase.

- **[ encrypted ] password password**
  Specifies the password to use for the user being given privileges for prepaid services within the current rulebase. The `encrypted` keyword indicates that the password specified uses encryption. `password` without encryption must be an alpha and/or numeric string of 1 through 63 characters, and when encrypted must be alpha and/or numeric string of 1 through 127 characters in length. The `encrypted` keyword is intended only for use by the system while saving configuration scripts. The system displays the `encrypted` keyword in the configuration file as a flag that the variable following the `password` keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

**Usage**
Use this command to specify the RADIUS user password for prepaid services within the current rulebase.

**Example**
The following command defines the user password `user_123` without encryption for a prepaid service subscriber with RADIUS charging in a rulebase.

```
cca radius user-password password user_123
```
charging-rule-optimization

This command enables and sets the charging rule-optimization level for rule matching in a rulebase.

Product
All

Privilege
Security Administrator, Administrator

Syntax

charging-rule-optimization { high | low | medium }

default charging-rule-optimization

default
Sets the default charging rule search and matching optimization level.
Default: Low

high
Enables the highest efficient rule-searching organization with high memory utilization.

low
Enables minimally efficient rule-searching organization with minimal memory utilization.

medium
Enables moderately efficient rule-searching organization with medium memory utilization.

Usage
Use this command to specify the amount of internal optimization that is done for improved performance when evaluating each instance of the action CLI command.

Example
The following command specifies the highest optimization level for rule search and matching in a rulebase.

charging-rule-optimization high
constituent-policies

This command configures the bandwidth, CBB, and Firewall/Firewall-and-NAT constituent policies. The combination of the values of all three policies will uniquely identify a rulebase associated.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
constituent-policies { bandwidth-policy bandwidth_policy | cbb-policy cbb_policy | firewall-policy fw_policy | fw-and-nat-policy fw_nat_policy }+
```

**no constituent-policies**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Removes the previous configuration.</td>
</tr>
</tbody>
</table>

**bandwidth-policy bandwidth_policy**

Specifies the Bandwidth policy.
`bandwidth_policy` specifies the bandwidth policy name, and must be a string of 1 through 63 characters in length.

**cbb-policy cbb_policy**

Specifies the CBB policy.
`cbb_policy` specifies the CBB policy name, and must be a string of 1 through 63 characters in length.

**firewall-policy fw_policy**

*Important:* This keyword is customer-specific.

Specifies the Firewall policy.
`fw_policy` specifies the Firewall policy name, and must be a string of 1 through 63 characters in length.

**fw-and-nat-policy fw_nat_policy**

*Important:* This keyword is customer specific, and is only available in StarOS 8.1.

Specifies the Firewall-and-NAT policy.
`fw_nat_policy` specifies the Firewall-and-NAT policy name, and must be a string of 1 through 63 characters in length.

**Usage**
Use this command to configure the bandwidth, CBB, and Firewall/Firewall-and-NAT constituent policies that will identify a rulebase. The combination of the values of all three policies will uniquely identify a rulebase associated.

Example
The following command configures the constituent Bandwidth policy named test123:

```
constituent-policies bandwidth-policy test123
```
content-filtering category policy-id

This command configures the Content Filtering Category Policy Identifier for Policy-based Content Filtering support in a rulebase.

**Product**
CF

**Privilege**
Security Administrator, Administrator

**Syntax**

```
content-filtering category policy-id cf_policy_id

no content-filtering category policy-id [ cf_policy_id ]
```

- **no**
  Removes the Content Filtering Category Policy configuration from the rulebase.
  In StarOS 8.1 and later, optionally the policy ID can be specified. If the specified policy ID is invalid, or is not configured in the rulebase, an error message is displayed. If no policy ID is specified, whatever policy is configured, if any, is removed from the rulebase.

```
category policy-id cf_policy_id
```

Configures the specified Content Filtering Category Policy in the current rulebase.

*cf_policy_id* must be the ID of an existing Content Filtering Category Policy, and must be an integer from 1 through 4294967295.

**Important:** In case the specified Content Filtering Category Policy does not exist, all packets will be passed regardless of the categories/actions determined for such packets.

**Important:** The category policy ID configured using the `category policy-id cf_policy_id` command in the APN/Subscriber Configuration mode prevails over this configuration.

**Usage**

Use this command to configure the Content Filtering Category Policy ID for Policy-based Content Filtering support in a rulebase.

The Content Filtering Category Policy is created/deleted in the Active Charging Service Configuration mode, and is configured in the Content Filtering Policy Configuration mode.

**Example**

The following command configures the policy ID 101 in the rulebase:

```
content-filtering category policy-id 101
```
content-filtering flow-any-error

This command configures allowing/discarding of Content Filtering packets in case of ACS error scenarios.

**Product**
ECS, CF

**Privilege**
Security Administrator, Administrator

**Syntax**

```
content-filtering flow-any-error { deny | permit }
default content-filtering flow-any-error
```

<table>
<thead>
<tr>
<th><strong>default</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures the default setting.</td>
</tr>
<tr>
<td>Default: Permit</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>deny</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures Content-Filtering flow-any-error as Deny.</td>
</tr>
<tr>
<td>All the denied packets will be accounted by “discarded-flow-content-id” configuration in the Content Filtering Policy ID Configuration Mode. I.e. this very content ID will be used to generate UDRs for the denied packets in case of Content Filtering.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>permit</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures Content-Filtering flow-any-error as Permit.</td>
</tr>
</tbody>
</table>

**Usage**
Use this command to allow/discard content filtering packets in case of ACS error scenarios.

**Example**
The following command allows content filtering packets in case of ACS error:
```
content-filtering flow-any-error permit
```
content-filtering mode

This command enables the specified Content Filtering mode within a rulebase.

**Product**

CF

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
content-filtering mode { category { static-only | static-and-dynamic } | server-group cf_server_group }
no content-filtering mode
```

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removes/disables a previously configured content filtering mode in this rulebase.</td>
</tr>
<tr>
<td>It implies that content filtering in not to be performed for this rulebase.</td>
</tr>
<tr>
<td>This is the default mode.</td>
</tr>
</tbody>
</table>

| category { static-and-dynamic | static-only } |
|---|
| This keyword specifies the category-based content filtering mode. |
| **static-only** Configures Content Filtering mode as Static only. Compares all URLs against internal database to determine the category or categories of the requested content. |
| Use of this category-based content filtering support requires configuration of the require active-charging content-filtering category CLI command in the Global Configuration mode. |
| **static-and-dynamic** Configures Content Filtering mode as Static-and-Dynamic, wherein first static rating of the URL is performed, and only if the static rating fails to find a match dynamic rating of the content that the server returns is performed. |

**Important:** Before enabling static-and-dynamic rating in the rulebase, it must be enabled at the global level as the resources required for dynamic rating are allocated at the global level. To enable static-and-dynamic rating at the global level, in the Global Configuration Mode, use the require active-charging content-filtering category static-and-dynamic CLI command.

<table>
<thead>
<tr>
<th>server-group cf_server_group</th>
</tr>
</thead>
<tbody>
<tr>
<td>This keyword enables and configures the CFSG mode within a rulebase to manage an external content filtering server with an ICAP client system.</td>
</tr>
<tr>
<td>cf_server_group specifies the name of a pre-configured unique content filtering server group in Content Configuration Mode, and must be an alpha and/or numeric string of 1 through 63 characters in length.</td>
</tr>
<tr>
<td>If this keyword is used every ACS attempt to establish TCP connections to every server in the named group.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to enable and apply the content filtering mode within a rulebase to manage a content filtering server with an ICAP client system.
Example
The following command enables the content filtering mode for external content filtering server group \textit{CF\_Server1} with in this rulebase.

\texttt{content-filtering mode server-group CF\_Server1}

The following command enables the category based static and dynamic content filtering mode for with in this rulebase.

\texttt{content-filtering mode category static-and-dynamic}
**dynamic-rule**

This command configures the order of comparing the dynamic rules to static rules for the flow.

**Product**

GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
dynamic-rule order { always-first | first-if-tied }
no dynamic-rule order

no

Removes the previously configured dynamic rule comparing order for this rulebase.

order { always-first | first-if-tied }

This command configures the way in which rules are selected for matching from dynamic rules list (per subscriber) and static rules list (from rulebase).

• **always-first**: If this option is configured, then all the dynamic rules are matched against the flow prior to any static rule.

• **first-if-tied**: If this option is configured, then rules are matched against the flow based on their priority with condition that dynamic rules match before a static rule of the same priority.

**Usage**

Use this command to configure the way in which rules are selected up for matching from dynamic rules list (per subscriber) and static rules list (from rulebase).

**Example**

The following command configures to match all dynamic rules against the flow prior to any static rule:

```plaintext
dynamic-rule order always-first
```
**edr suppress-zero-byte-records**

This command disables/enables the creation of EDRs when there is no data for the flows.

**Product**
ECS

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no | default ] edr suppress-zero-byte-records
```

- **no**
  Disables the suppression of zero-byte EDRs.

- **default**
  Sets the default configuration.
  Default: `no edr suppress-zero-byte-records`

**Usage**

Use this command to disable/enable the creation of EDRs that are empty. The situation where there is a zero-byte EDR would typically be possible when two successive EDRs are generated for a flow. This CLI command suppresses the second such EDR for the flow.

**Example**

The following command disables the creation of zero-byte EDRs:

```
edr suppress-zero-byte-records
```
edr transaction-complete

This command configures the generation of an EDR on the completion of a transaction.

**Important**: This command is only available in StarOS 8.1 and StarOS 9.0 and later.

**Product**
ECS

**Privilege**
Security Administrator, Administrator

**Syntax**

```
edr transaction-complete http edr-format edr_format

{ default | no } edr transaction-complete
```

**default**
Sets the default configuration.
Default: same as `no edr transaction-complete`

**no**
Disables the generation of EDR on transaction completion.

**http**
Specifies EDR generation on transaction completion for HTTP protocol.

**edr-format edr_format**
Specifies the EDR format name.
`edr_format` must be an alpha and/or numeric string of 1 through 63 characters in length.

**Usage**
Use this command to configure the generation of an EDR on the completion of a transaction. In this release EDR generation is supported only for HTTP protocol.

**Example**
The following command configures the generation of EDRs on the completion of transactions for HTTP protocol specifying the EDR format as `test123`:
```
edr transaction-complete http edr-format test123
```
**edr voip-call-end**

This command enables generating Event Data Record (EDR) on the completion of voice calls.

**Product**
ECS, P2P

**Privilege**
Security Administrator, Administrator

**Syntax**
```
edr voip-call-end edr-format edr_format_name
```

```
{ default | no } edr voip-call-end
```

- **default**
  Configures the default setting.
  Default: `no edr voip-call-end`

- **no**
  Specifies to disable EDR generation on the completion of a voice call.

- **edr-format edr_format_name**
  Specifies EDR format name.
  `edr_format_name` must be an existing EDR format’s name, and must be a string of 1 through 63 characters in length.

**Usage**
Use this command to enable generating EDR on the completion of voice calls. This facilitates P2P voice duration reporting.

**Example**
The following command specifies generating EDR on completion of voice calls using the EDR format `test13`:
```
edr voip-call-end edr-format test13
```
**egcdr inactivity-meter**

**Description** This command is obsolete. It is included in the CLI for backward compatibility with older configuration files. When executed performs no function. Use `egcdr threshold interval interval [ regardless-of-other-triggers ]` command for this functionality.
egcdr service-data-flow

This command assigns volume or interval threshold values to the interim Service Data Flow Containers in Flow Based Charging (FBC).

Product
GGSN, ECS

Privilege
Security Administrator, Administrator

Syntax

egcdr service-data-flow threshold { interval interval | volume { downlink | total | uplink } bytes }

{ no | default } egcdr service-data-flow threshold { interval | volume }

no
Removes the previously configured eG-CDR service data flow threshold for FBC.

default
Disables the egcdr service data flow threshold settings for FBC.

interval interval
Specifies the time interval (in seconds) for closing the eG-CDR if the minimum time duration thresholds for service data flow containers satisfied in flow based charging. This option is disabled by default.
interval must be an integer from 60 through 400,000,000.

volume
Specifies the uplink/downlink volume octet counts for the generation of the interim eG-CDRs to service data flow container in FBC.

• downlink bytes - Sets the limit for the number of octets downlink after which the eG-CDR is closed. bytes (in bytes) must be an integer from 10,000 through 400000000. Default is 400,000,000.

• total bytes - Sets the limit for the total number of octets (uplink+downlink) after which the eG-CDR is closed. bytes (in bytes) must be an integer from 10,000 through 400,000,000. This configuration is disabled by default.

• uplink bytes - Sets the limit for the number of octets uplink after which the eG-CDR is closed. bytes (in bytes) must be an integer from 10,000 through 400,000,000. Default is 400,000,000.

Usage
Use this command to specify an eG-CDR threshold to generate it and write it to eG-CDR in service data flow container during flow based charging (FBC).

Example
The following command sets an eG-CDR threshold interval of \textbf{6000} seconds:

```
egcdr service-data-flow threshold interval interval 6000
```
egcdr tariff

This command sets the eG-CDR tariff time information to close and open new eG-CDR.

**Product**
GGSN, ECS

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] egcdr tariff minute minute hour hour
```

- **no**
  - Removes the previously configured eG-CDR tariff.

- **minute minute**
  - Specifies the minute in a specified hour.
  - `minute` must be an integer from 0 through 59.

- **hour hour**
  - Specifies the hour of the day. `hour` must be an integer from 0 through 23.

**Usage**

Use this command to specify an eG-CDR tariff time. Up to 4 different time-of-day may be configured. When any tariff time reached the current eG-CDR will be closed and a new eG-CDR will be opened.

**Example**

The following command defines an eG-CDR tariff for the 23rd minute of the 22nd hour of the day:

```plaintext
egcdr tariff minute 23 hour 22
```
egcdr threshold

This command sets the eG-CDR volume or interval values to generate the interim eG-CDRs and write them to eG-CDR file.

Product
GGSN, ECS

Privilege
Security Administrator, Administrator

Syntax

```
egcdr threshold { interval interval [ regardless-of-other-triggers ] | volume { downlink | total | uplink } bytes }
{ no | default } egcdr threshold { interval | volume }
```

**no**
Removes previously configured eG-CDR threshold.

**default**
Disables the egcdr threshold settings.

**interval interval [ regardless-of-other-triggers ]**
Specifies the time interval (in seconds) for closing the eG-CDR if the minimum time duration thresholds are satisfied. This option is disabled by default. interval must be an integer from 60 to 4000000.

**regardless-of-other-triggers**: This option enables the eG-CDR generation at the fixed time interval irrespective of any other eG-CDR triggers that may have happened in between.

**volume**
Specifies the uplink/downlink volume octet counts for the generation of the interim eG-CDRs.

- **downlink bytes** - Sets the limit for the number of octets downlink after which the eG-CDR is closed. bytes (in bytes) must be an integer from 100,000 through 4,000,000,000. Default is 4,000,000,000.

- **total bytes** - Sets the limit for the total number of octets (uplink+downlink) after which the eG-CDR is closed. bytes (in bytes) must be an integer from 100,000 through 4,000,000,000. This configuration is disabled by default.

- **uplink bytes** - Sets the limit for the number of octets uplink after which the eG-CDR is closed. bytes (in bytes) must be an integer from 100,000 through 4,000,000,000. Default is 4,000,000,000.

Usage

Use this command to specify an eG-CDR threshold to generate it and write it to eG-CDR file.
Example
The following command defines an eG-CDR threshold interval of 600 seconds:

```
egcdr threshold interval 600
```
egcdr time-duration algorithm

This command is used to define the algorithm used to compute the duration for time utilization in eG-CDR for specific Rulebase.

Product
---
All

Privilege
---
Security Administrator, Administrator

Syntax
---

```plaintext
egcdr time-duration algorithm { consumed-time con_time [ plus-idle ] | continuous-time-periods ctp_seconds | parking-meter seconds }
{ default | no } egcdr time-duration algorithm

no
Removes the previously configured eG-CDR time-duration algorithm.

default
Sets default time duration value to time duration algorithm for eG-CDR generation.

consumed-time con_time [ plus-idle ]
Default: 0 (disabled)
Defines the actual consumption time in seconds. This is used to determine the actual used chargeable time envelopes for the purposes of consuming time quota.
Time envelope is the basis for reporting active usage. For each time envelope, the time consumption includes the time duration between arrival of last packet and first packet only.
con_time must be an integer from 1 through 4,294,967,295.
plus-idle: Defines the idle time between arrival of two packets to include in time usage record in eG-CDR.
When used along with consumed-time it indicates the active usage + idle time, when no traffic flow occurs.

continuous-time-periods ctp_time
Defines the continuous time period to compute the usage record in eG-CDR.
ctp_time sets the audition in seconds to start a counter on arrival of first packet and there after include only that period in charging in which one or more packets arrived. The period where no packets arrived or traffic detected no usage will be computed. ctp_time must be an integer from 1 through 4294967295.

parking-meter seconds
Defines the parking meter (PM) period in seconds.
Parking meter is the method with which the usage time is set in the content-id containers in eG-CDRs. When a parking meter value is set, the user is charged for time in increments of the value set. For example; if the parking meter value is set to 300 seconds (5 minutes) and the subscriber only uses one minute, the charge is for 5 minutes.
seconds must be an integer from 1 through 4294967295.
Usage
Use this command to set the various time charging algorithms/schemes for time usage in eG-CDR. For example, packets arrive at times T1, T2, T3 and T4. Then the typical time usage might be computed to be T4 – T1. However, if say there is an idle period between times T2 and T3, then system will compute the time usage to be (T2 – T1) + (T4 – T3).

consumed-time in above scenario calculates the time duration as (T2 – T1) + (T4 – T3) where consumed-time with plus-idle calculates the time duration as (T2-T1)+I + (T4 – T3)+I or (T4-T1).

Example
The following command sets consumed time duration to 400 seconds:

`egcdr time-duration algorithm consumed-time 400`
end

Returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to change to the Exec mode.
exit

Exits the Rulebase Configuration Mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to change to the parent configuration mode.
**extract-host-from-uri**

If the host field is not present in HTTP/WSP header, this command will extract host from URI, and store it in the host field.

**Product**
ECS

**Privilege**
Security Administrator, Administrator

**Syntax**

```
extract-host-from-uri { http | wsp } +
{ default | no } extract-host-from-uri
```

- **default**
  Configures the default setting.
  Default: `no extract-host-from-uri`

- **no**
  Removes the previous extract-host-from-uri configuration for all protocols.

- **http | wsp**
  Specifies protocol(s) for extract-host-from-uri configuration.

- **+**
  Indicates that more than one of the previous keywords can be entered within a single command.

**Usage**

If the host field is not present in HTTP/WSP header, this command will extract host from URI, and store it in the host field to enable “http host” and “wsp host” rule matches using the stored value.

**Important:** Applying the `extract-host-from-uri` command a second time will overwrite the previous configuration. For example, if you apply the command `extract-host-from-uri http wsp http` and then apply the command `extract-host-from-uri http wsp`, extraction of host from URI will happen only for WSP analyzer.

**Example**

The following command configures extraction of host from URI for both HTTP and WSP protocols:

```
extract-host-from-uri http wsp
```
**fair-usage**

This command configures a waiver on top of average available memory credits per session for the Fair Usage feature.

**Product**

ECS, CF, FW, NAT, P2P

**Privilege**

Security Administrator, Administrator

**Syntax**

```
fair-usage session-waiver-percent waiver_percent
default fair-usage session-waiver-percent
```

**default**

Configures the default setting.
Default: 20 percent

**session-waiver-percent waiver_percent**

Specifies the Fair Usage session waiver above average available memory for subscribers using the rulebase. `waiver_percent` must be an integer from 0 through 1000.

**Usage**

Use this command to configure a waiver on top of average available memory credits per session as a rulebase configuration.

**Example**

The following command configures the Fair Usage Session Waiver setting to 25 percent:

```
fair-usage session-waiver-percent 25
```
firewall dos-protection

This command configures protection for subscribers from Denial-of-Service (DoS) attacks.

**Important:** In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] firewall dos-protection { all | flooding { icmp | tcp-syn | udp } | ftp-bounce | ip-unaligned-timestamp | mime-flood | port-scan | tcp-window-containment | source-router | teardrop | winnuke }
```

**default firewall dos-protection**

no
Disables protection for subscribers from all or specified DoS attack(s).

**default**
Disables protection from all DOS attacks.

**all**
Enables protection against all DoS attacks supported by the Stateful Firewall service.

**flooding { icmp | tcp-syn | udp }**
Enables protection against specified flooding attack:
- **icmp:** Enables protection against ICMP Flood attack
- **tcp-syn:** Enables protection against TCP Syn Flood attack
- **udp:** Enables protection against UDP Flood attack

**ftp-bounce**
Enables protection against FTP Bounce attacks.
In an FTP Bounce attack, an attacker is able to use the PORT command to request access to ports indirectly through a user system as an agent for the request. This technique is used to port scan hosts discreetly, and to access specific ports that the attacker cannot access through a direct connection.

**ip-unaligned-timestamp**
Enables protection against IP Unaligned Timestamp attacks.
In an IP Unaligned Timestamp attack, certain operating systems crash if they receive a frame with the IP timestamp option that is not aligned on a 32-bit boundary.

**mime-flood**
Enables protection against HTTP Multiple Internet Mail Extension (MIME) header flooding attacks. In a MIME Flood attack an attacker sends huge amount of MIME headers which consumes a lot of memory and CPU usage.

**port-scan**
Enables protection against Port Scan attacks.

**tcp-window-containment**
Enables protection against TCP sequence number out-of-range attacks. In a Sequence Number Out of Range attack the attacker sends packets with out-of-range sequence numbers forcing the system to wait for missing sequence packets.

**source-router**
Enables protection against IP Source Route IP Option attacks. Source routing is an IP option mainly used by network administrators to check connectivity. When an IP packet leaves a system, its path through various networks to its destination is controlled by the routers and their current configuration. Source routing provides a means to override the control of the routers. Strict source routing specifies the path through all the routers to the destination. The same path in reverse is used to return responses. Loose source routing allows the attacker to spoof both an address and sets the loose source routing option to force the response to return to the attacker's network.

**teardrop**
Enables protection against Teardrop attacks. In a Teardrop attack, overlapping IP fragments are exploited causing the TCP/IP fragmentation re-assembly to improperly handle overlapping IP fragments.

**winnuke**
Enables protection against WIN-NUKE attacks. This is a type of Nuke denial-of-service attack against networks consisting of fragmented or otherwise invalid ICMP packets sent to the target, achieved by using a modified ping utility to repeatedly send this corrupt data, thus slowing down the affected computer until it comes to a complete stop. The WinNuke exploits the vulnerability in the NetBIOS handler and a string of out-of-band data sent to TCP port 139 of the victim machine causing it to lock up and display a Blue Screen of Death.

**Usage**
Use this command to enable firewall protection from different types of DoS attacks. This command can be used multiple times for different DoS attacks.

**Important:** The DoS attacks are detected only in the downlink direction.
The following command enables protection from all supported DoS attacks in the Inline Firewall Service:

```
firewall dos-protection all
```
firewall flooding

This command configures Firewall protection from Packet Flooding attacks.

**Important:** In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
firewall flooding { { protocol { icmp | tcp-syn | udp } packet limit packets } | { sampling-interval interval } } 
```

```
default firewall flooding { { protocol { icmp | tcp-syn | udp } packet limit } | { sampling-interval } }
```

```
default
Sets the specified firewall flooding configuration to the default value.
```

```
protocol { icmp | tcp-syn | udp }
```

Specifies the transport protocol:

- **icmp**: Configuration for ICMP protocol.
- **tcp-syn**: Configuration for TCP-SYN packet limit.
- **udp**: Configuration for UDP protocol.

```
packet limit packets
```

Specifies the maximum number of specified packets a subscriber can receive during a sampling interval. `packets` must be an integer from 1 through 4294967295. Default: 1000 packets per sampling interval for all protocols.

```
sampling-interval interval
```

Specifies the flooding sampling interval, in seconds. `interval` must be an integer from 1 through 60. Default: 1 second. The maximum sampling-interval configurable is 60 seconds.

**Usage**

Use this command to configure the maximum number of ICMP, TCP-SYN, / UDP packets allowed to prevent the packet flooding attacks to the host.
Example
The following command ensures a subscriber will not receive more than 1000 ICMP packets per sampling interval:

`firewall flooding protocol icmp packet limit 1000`

The following command ensures a subscriber will not receive more than 1000 UDP packets per sampling interval on different 5-tuples. That is, if an attacker is sending lot of UDP packets on different ports or using different spoofed IPs, those packets will be limited to 1000 packets per sampling interval. This way only “suspected” malicious packets are limited and not “legitimate” packets.

`firewall flooding protocol udp packet limit 1000`

The following command ensures a subscriber will not receive more than 1000 TCP-Syn packets per sampling interval.

`firewall flooding protocol tcp-syn packet limit 1000`

The following command specifies a flooding sampling interval of 1 second:

`firewall flooding sampling-interval 1`
firewall icmp-destination-unreachable-message-threshold

This command configures a threshold on the number of ICMP error messages sent by the subscriber for a particular data flow.

**Important:** In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

default firewall icmp-destination-unreachable-message-threshold messages then-block-server

{ default | no } firewall icmp-destination-unreachable-message-threshold

- **default**
  Sets the default configuration.
  Default: No limit

- **no**
  Removes the previous configuration.

- **messages**
  Specifies the threshold on the number of ICMP error messages sent by the subscriber for a particular data flow. `messages` must be an integer from 1 through 100.

**Usage**
Use this command to configure a threshold on the number of ICMP error messages sent by the subscriber for a particular data flow. After the threshold is reached, it is assumed that the server is not reacting properly to the error messages, and further downlink traffic to the subscriber on the unwanted flow is blocked. Some servers that run QChat ignore the ICMP error messages (Destination Port Unreachable and Host Unreachable) from the mobiles. So the mobiles continue to receive unwanted UDP traffic from the QChat servers, and their batteries get exhausted quickly.

**Example**
The following command configures a threshold of 10 ICMP error messages:

```
firewall icmp-destination-unreachable-message-threshold 10 then-block-server
```
**firewall max-ip-packet-size**

This command configures the maximum IP packet size (after IP reassembly) allowed over firewall.

### Important:
In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
firewall max-ip-packet-size packet_size protocol { icmp | non-icmp }

default firewall max-ip-packet-size protocol { icmp | non-icmp }
```

- **default**
  Sets the maximum IP packet size configuration to the default value.
  Default: 65535 bytes (for both ICMP and non-ICMP)

- **packet_size**
  Specifies the maximum packet size.
  `packet_size` must be an integer from 30000 through 65535.

- **protocol { icmp | non-icmp }**
  Specifies the transport protocol:
  - `icmp`: Configuration for ICMP protocol.
  - `non-icmp`: Configuration for protocols other than ICMP.

**Usage**

Use this command to configure the maximum IP packet size allowed for ICMP and non-ICMP packets to prevent packet flooding attacks to the host. Packets exceeding the configured size will be dropped for “Jolt Attack” and “Ping-Of-Death Attack”.

**Example**

The following command allows a maximum packet size of 60000 for ICMP protocol:

```plaintext
firewall max-ip-packet-size 60000 protocol icmp
```
firewall mime-flood

This command configures firewall protection from MIME Flood attacks.

**Important**: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product: FW
Privilege: Security Administrator, Administrator

Syntax:

```markdown
firewall mime-flood { http-headers-limit max_limit | max-http-header-field-size max_size }

default firewall mime-flood { http-headers-limit | max-http-header-field-size }
```

**default**

Sets the specified firewall MIME flood configuration to the default setting.

**http-headers-limit max_limit**

Specifies the maximum number of headers allowed in an HTTP packet. If the number of HTTP headers in a page received is more than the specified limit, the request will be denied.

*max_limit* must be an integer from 1 through 256.

Default: 16

**max-http-header-field-size max_size**

Specifies the maximum header field size allowed in the HTTP header, in bytes. If the size of HTTP header in the received page is more than the specified number of bytes, the request will be denied.

*max_size* must be an integer from 1 through 8192.

Default: 4096 bytes

Usage:

Use this command to configure the maximum number of headers allowed in an HTTP packet, and the maximum header field size allowed in the HTTP header to prevent MIME flooding attacks.

Example:

The following command sets the maximum number of headers allowed in an HTTP packet to 100:

`firewall mime-flood http-headers-limit 100`

The following command sets the maximum header field size allowed in the HTTP header to 1000 bytes:

`firewall mime-flood max-http-header-field-size 1000`
firewall mime-flood
**firewall no-ruledef-matches**

This command configures the default action for packets when no Firewall Ruledef matches.

**Important:** In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, use the `access-rule no-ruledef-matches` command available in the Firewall-and-NAT Policy Configuration Mode.

**Product**
FW, NAT

**Privilege**
Security Administrator, Administrator

**Syntax**

```
firewall no-ruledef-matches { downlink | uplink } action { deny [ charging-action charging_action ] | permit [ bypass-nat | nat-realm nat_realms ] }
```

```
default firewall no-ruledef-matches { downlink | uplink } action
```

- **default**
  Configures the default action for packets with no Firewall ruledef match.
  Default: uplink direction: permit, downlink direction: deny

- **downlink | uplink**
  Specifies the packet type:
  - **downlink**: Downlink packets with no Firewall ruledef match.
  - **uplink**: Uplink packets with no Firewall ruledef match.

- **action { deny [ charging-action charging_action ] | permit [ bypass-nat | nat-realm nat_realms ] }**
  Specifies the default action for packets with no Firewall ruledef match.
  - **permit [ bypass-nat | nat-realm nat_realms ]**: Permit packets. Optionally specify:
    - **bypass-nat**: The `bypass-nat` keyword is only available in StarOS 8.3 and later.
    - **nat-realm**: Specifies to bypass Network Address Translation (NAT).
    - **nat-realm nat_realms**: Specifies a NAT realm to be used for performing NAT on subscriber packets. `nat_realms` must be an alpha and/or numeric string of 1 through 31 characters in length.

**Important:** If neither `bypass-nat` or `nat-realm` are configured, NAT is performed if the `nat policy nat-required` CLI command is configured with the `default-nat-required` option.

- **deny [ charging-action charging_action ]**: Deny specified packets.
Optionally, a charging action can be specified. `charging_action` must be the name of a charging action, and must be a string of 1 through 63 characters in length.

**Usage**

Use this command to configure the default action to be taken on packets with no Firewall ruledef matches. If, for deny action, the optional charging action is configured, the action taken depends on what is configured in the charging action. For the firewall rule, the “flow action”, “billing action”, and “content ID” of the charging action will be used to take action. If flow exists, flow statistics are updated. Allowing/dropping of packets is determined in the following sequence:

- **Check** is done to see if the packet matches any pinholes. If yes, no rule matching is done and the packet is allowed.
- Firewall ruledef matching is done. If a rule matches, the packet is allowed or dropped as per the `firewall priority` configuration.
- If no firewall ruledef matches, the packet is allowed or dropped as per the `no-ruledef-matches` configuration.

For a packet dropped due to firewall ruledef match or no match (first packet of a flow), the charging action applied is the one configured in the `firewall priority` or the `firewall no-ruledef-matches` command respectively.

In StarOS 8.1, in the case of Policy-based Firewall, the charging action applied is the one configured in the `access-rule priority` or the `access-rule no-ruledef-matches` command respectively. For action on packets dropped due to any error condition after data session is created, the charging action must be configured in the `flow any-error charging-action` command.

**Example**

The following command sets Firewall to permit downlink packets with no ruledef matches:

```
firewall no-ruledef-matches downlink action permit
```
**firewall policy**

This command enables/disables Stateful Firewall support for all subscribers using this rulebase.

### Important:
In StarOS 8.0, this command is available in the APN/Subscriber Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
firewall policy firewall-required
{ default | no } firewall policy
```

- `default`:
  Sets the default firewall support setting for all subscribers using this rulebase.
  Default: Disabled

- `no`:
  Disables firewall support for all subscribers using this rulebase.

- `firewall-required`:
  Enables firewall support for all subscribers using this rulebase.

**Usage**

Use this command to enable/disable firewall support for all subscribers using this rulebase.

**Example**
The following command enables Stateful Firewall support:

```
firewall policy firewall-required
```

The following command disables Stateful Firewall support:

```
no firewall policy
```
**firewall priority**

This command adds and specifies the priority and type of a firewall ruledef in the rulebase, and allows to configure a single or range of ports to be allowed on the server for auxiliary/data connections.

**Important:** In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, use the `access-rule priority` command available in the Firewall-and-NAT Policy Configuration Mode.

**Product**
FW, NAT

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
firewall priority priority [ dynamic-only | static-and-dynamic ] firewall-ruledef firewall-ruledef { { deny [ charging-action charging_action ] } | { permit [ nat-realm nat_realm | [ trigger open-port { aux_port_number | range start_port_number to end_port_number } direction { both | reverse | same } ] ] } }

no firewall priority priority
```

- **no**
  Removes the previously configured firewall ruledef priority from the rulebase.

- **priority**
  Specifies the firewall ruledef’s priority in the rulebase.
  `priority` must be unique, and must be an integer from 1 through 65535.

- **[ dynamic-only | static-and-dynamic ] firewall-ruledef firewall-ruledef**
  Specifies the firewall ruledef to add to the rulebase. Optionally, the firewall ruledef type can be specified.

  - **dynamic-only**: Firewall Dynamic Ruledef—Predefined ruledef that can be enabled/disabled by the policy server, and is disabled by default.
  - **static-and-dynamic**: Firewall Static and Dynamic Ruledef—Predefined ruledef that can be disabled/enabled by the policy server, and is enabled by default.

  `firewall-ruledef` must be the name of a predefined firewall ruledef, and must be a string of 1 through 63 characters in length.

- **deny [ charging-action charging_action ]**
  Denies packets if the rule is matched. An optional charging action can be specified. If a packet matches the deny rule, action is taken as configured in the charging action. For firewall ruledefs, only the terminate-flow action is applicable, if configured in the specified charging action.

  `charging_action` must be a string of 1 through 63 characters in length.
permit [ nat-realm nat-realm ] [ bypass-nat ] [ trigger open-port { aux_port_number | range start_port_number to end_port_number } ] ]

Permits packets.

nat-realm: Specifies the NAT realm to be used for performing NAT on subscriber packets matching the firewall ruledef.

If the NAT realm is not specified, then NAT will be bypassed. That is, NAT will not be applied on subscriber packets that are matching a firewall ruledef with no NAT realm name configured.

nat-realm specifies the NAT realm name, and must be a string of 1 through 31 characters in length.

bypass-nat: Specifies that packets bypass Network Address Translation (NAT).

**Important:** If the nat-realm is not configured, NAT is performed if the nat policy nat-required CLI command is configured with the default-nat-realm option.

trigger open-port { aux_port_number | range start_port_number to end_port_number}: Permits packets if the rule is matched, and allows the creation of data flows for firewall. Optionally a port trigger can be specified to be used for this rule to limit the range of auxiliary data connections (a single or range of port numbers) for protocols having control and data connections (like FTP). The trigger port will be the destination port of an association which matches a rule.

aux_port_number: Specifies the number of auxiliary ports to open for traffic, and must be an integer from 1 through 65535.

range start_port_number to end_port_number: Specifies the range of ports to open for subscriber traffic.

start_port_number must be an integer from 1 through 65535. This is the start of the port range and must be less than end_port_number.

end_port_number must be an integer from 1 through 65535. This is the end of the port range and must be greater than start_port_number.

direction { both | reverse | same }:

Specifies the direction from which the auxiliary connection is initiated. This direction can be same as the direction of control connection, or the reverse of the control connection direction, or in both directions.

both: Provides the trigger to open port for traffic in either direction of the control connection.

reverse: Provides the trigger to open port for traffic in the reverse direction of the control connection (from where the connection is initiated).

same: Provides the trigger to open port for traffic in the same direction of the control connection (from where the connection is initiated).

Usage

Use this command to add firewall ruledefs to the rulebase and configure the priority, type, and port triggers. Port trigger configuration is optional. Port trigger can be configured only if a rule action is permit.

The rulebase specifies the firewall rules to be applied on the calls. The ruledefs within a rulebase have priorities, based on which priority matching is done. Once a rule is matched and the rule action is permit, if the trigger is configured, the appropriate check is made. The trigger port will be the destination port of an association which matches the rule.

Multiple triggers can be defined for the same port number to permit multiple auxiliary ports for subscriber traffic.

Once a rule is matched and if the rule action is deny, the action taken depends on what is configured in the specified charging action. If the flow exists, flow statistics are updated and action is taken as configured in the charging action:

- If the billing action is configured as EDR enabled, EDR is generated.
If the content ID is configured, UDR information is updated.

If the flow action is configured as “terminate-flow”, the flow is terminated instead of just discarding the packet.

If the billing action, content ID, and flow action are not configured, no action is taken on the dropped packets.

**Important:** For firewall ruledefs, only the terminate-flow action is applicable if configured in the specified charging action.

For a packet dropped due to firewall ruledef match or no match (first packet of a flow), the charging action applied is the one configured in the `firewall priority` or the `firewall no-ruledef-matches` command respectively.

In StarOS 8.1, in the case of Policy-based Firewall, the charging action applied is the one configured in the `access-rule priority` or the `access-rule no-ruledef-matches` command respectively.

For action on packets dropped due to any error condition after data session is created, the charging action must be configured in the `flow any-error charging-action` command.

The GGSN can dynamically activate/deactivate dynamic firewall ruledefs for a subscriber based on the rule name received from a policy server. At rule match, if a rule in the rulebase is a dynamic rule, and if the rule is enabled for the particular subscriber, rule matching is done for the rule. If the rule is disabled for the particular subscriber, rule matching is not done for the rule.

**Example**

The following command assigns a priority of 10 to the firewall ruledef `fw_rule1`, adds it to the rulebase, and permits port trigger to be used for the rule to open ports in the range of 100 to 200 in either direction of the control connection:

```
firewall priority 10 firewall-ruledef fw_rule1 permit trigger open-port range 100 to 200 direction both
```

The following command configures the firewall ruledef `fw_rule2` as a dynamic ruledef:

```
firewall priority 7 dynamic-only firewall-ruledef fw_rule2 deny
```
firewall tcp-first-packet-non-syn

This command configures the action to take on TCP flow starting with a non-syn packet.

---

**Important:** In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

---

**Product**

FW

**Privilege**

Security Administrator, Administrator

**Syntax**

```
firewall tcp-first-packet-non-syn { drop | reset }
```

```
default firewall tcp-first-packet-non-syn
```

- **default**
  - Sets the default action setting.
  - Default: drop

- **drop | reset**
  - Specifies the action to take on TCP flow starting with a non-syn packet.
  - **drop**: Drops the packet or session
  - **reset**: Sends reset

**Usage**

Use this command to configure action to take on TCP flow starting with a non-syn packet.

**Example**

The following command configures action to take on TCP flow starting with a non-syn packet to drop:

```
firewall tcp-first-packet-non-syn drop
```
firewall tcp-idle-timeout-action

This command configures action to take on TCP idle timeout expiry.

**Important:** In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
firewall tcp-idle-timeout-action { drop | reset }
```

```
default firewall tcp-idle-timeout-action
```

default
Sets the default action setting.
Default: reset

drop | reset
Specifies the action to take on TCP timeout expiry.
drop: Drops the packet or session
reset: Sends reset

**Usage**
Use this command to configure action to take on TCP idle timeout expiry.

**Example**
The following command configures action to take on TCP idle timeout expiry to drop:

```
firewall tcp-idle-timeout-action drop
```
firewall tcp-reset-message-threshold

This command configures a threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. After this threshold is reached, further downlink traffic to the subscriber on the unwanted flow is blocked.

**Important:** This command is only available in StarOS 8.3 and later. In StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

`firewall tcp-reset-message-threshold messages then-block-server`

{ default | no } `firewall tcp-reset-message-threshold`

**default**

Configures the default setting.
Default: The same as `no firewall tcp-reset-message-threshold`

**no**

Removes the previous configuration.

**messages**

Specifies the threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. `messages` must be an integer from 1 through 100.

**Usage**

Use this command to configure a threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. After the threshold is reached, assuming the server is not reacting properly to the reset messages further downlink traffic to the subscriber on the unwanted flow is blocked. This configuration enables QCHAT noise suppression for TCP.

**Example**

The following command sets the threshold on the number of TCP reset messages to 10:

`firewall tcp-reset-message-threshold 10 then-block-server`
firewall tcp-syn-flood-intercept

This command enables and configures the TCP intercept parameters to prevent TCP SYN flooding attacks by intercepting and validating TCP connection requests for DoS protection mechanism configured with the dos-protection command.

**Important:** In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
firewall tcp-syn-flood-intercept { mode { none | watch [ aggressive ] } } | watch-timeout intercept_watch_timeout

default firewall tcp-syn-flood-intercept { mode | watch-timeout }

default

Sets the default values of TCP intercept parameters for SYN Flood DoS protection.
```

```plaintext
mode { none | watch [ aggressive ] }

Specifies the TCP SYN flood intercept mode:
- **none:** Disables TCP SYN flood intercept feature.
- **watch:** Configures TCP SYN flood intercept feature in watch mode. The firewall passively watches to see if TCP connections become established within a configurable interval. If connections are not established within the timeout period, the firewall clears the half-open connections by sending RST to TCP client and server. The default watch-timeout for connection establishment is 30 seconds.
- **aggressive:** Configures TCP SYN flood Intercept or Watch feature for aggressive behavior. Each new connection request causes the oldest incomplete connection to be deleted. When operating in watch mode, the watch timeout is reduced by half. If the watch-timeout is 30 seconds, under aggressive conditions it becomes 15 seconds. When operating in intercept mode, the retransmit timeout is reduced by half (i.e. if the timeout is 60 seconds, it is reduced to 30 seconds). Thus the amount of time waiting for connections to be established is reduced by half (i.e. it is reduced to 150 seconds from 300 seconds under aggressive conditions).

Default: **none**
```

```plaintext
watch-timeout intercept_watch_timeout

Specifies the TCP intercept watch timeout, in seconds.
```

**Default:**

- `intercept_watch_timeout` must be an integer from 5 through 30.
- Default: 30
Usage
This TCP intercept functionality provides protection against TCP SYN Flooding attacks. The system captures TCP SYN requests and responds with TCP SYN-ACKs. If a connection initiator completes the handshake with a TCP ACK, the TCP connection request is considered as valid by system and system forwards the initial TCP SYN to the valid target which triggers the target to send a TCP SYN-ACK. Now system intercepts with TCP SYN-ACK and sends the TCP ACK to complete the TCP handshake. Any TCP packet received before the handshake completion will be discarded.

Example
The following command sets the TCP intercept watch timeout setting to 5 seconds:
firewall tcp-syn-flood-intercept watch-timeout 5
**flow any-error**

This command specifies the charging action to be used for packets dropped by Firewall due to any error conditions.

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
flow any-error charging-action charging_action
default flow any-error
```

**default**

Configures the default action for packets dropped by Firewall due to any errors.
Default: Update the flow stats if flow is available

**charging-action charging_action**

Specifies the charging action based on which accounting action is taken on packets dropped by Firewall due to any errors.

**Important:** The charging action specified here should preferably not be used for action on packets dropped due to firewall ruledef match or no-match (in the `firewall priority` and `firewall no-ruledef-matches` commands) and the content ID within the charging action must be unique so that dropped counts will not interfere with other content IDs.

**charging_action** must be the name of a charging action, and must be a string of 1 through 63 characters in length.

**Usage**

Use this command to configure the charging action for packets dropped by Firewall due to any error conditions, such as, a packet being inappropriate based on the state of the protocol of the packet's session, or Firewall DoS protection causing the packet to be discarded, and so on.
For a packet dropped due to firewall ruledef match or no-match (first packet of a flow), the charging action applied is the one configured in the `firewall priority` or the `firewall no-ruledef-matches` command respectively.
In StarOS 8.1, in the case of Policy-based Firewall, the charging action applied is the one configured in the `access-rule priority` or the `access-rule no-ruledef-matches` command respectively.
For a packet dropped due to any error condition after data session is created, the charging action used is the one configured in the `flow any-error charging-action` command.
If the charging action applied on a packet is the one specified in the `flow any-error charging-action` command, flow statistics are updated and action is taken as configured in the charging action:
- If the billing action is configured as EDR enabled, EDR is generated.
- If the content ID is configured, UDR information is updated.
If the flow action is configured as “terminate-flow”, the flow is terminated instead of just discarding the packet.

If the billing action, content ID, and flow action are not configured, no action is taken on the dropped packets.

Example
The following command specifies the charging action test2 for accounting action on packets dropped/discarded by Firewall due to any error:

```
flow any-error charging-action test2
```
flow control-handshaking

This command specifies how to charge for the control traffic associated with an application.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

```
flow control-handshaking { charge-to-application { [ all-packets ] [ initial-packets ] [ mid-session-packets ] [ tear-down-packets ] } | charge-separate-from-application }

default flow control-handshaking

no flow control-handshaking [ charge-to-application ]
```

```
no flow control-handshaking [ charge-to-application ]

Removes the previous flow control-handshaking configuration. The control packets will use whatever
content-id is determined by the normal use of the action CLI commands.
In this command, the optional keyword charge-to-application is deprecated and has no effect.

default flow control-handshaking

Configures the default setting.
Default: The same as no flow control-handshaking.

charge-to-application

This keyword configures the charging action to include the flow control packets either during initial
handshaking only or specified control packets during session for charging.

all-packets

Specifies that the initial setup packets will wait until the application has been determined before assigning the
content-id, and all mid-session ACK packets, as well as, the final tear-down packets will use that content-id.

initial-packets

Specifies that only the initial setup packets will wait for content-id assignment.

mid-session-packets

Specifies that the ACK packets after the initial setup will use the application's or content-id assignment.

tear-down-packets

Specifies that the final tear-down packets (TCP or WAP) will use the application's or content-id assignment.
charge-separate-from-application

This keyword configures the charging action to separate the charging of the initial control packets or all subsequent control packets from regular charging.

Usage

Use this command to configure how to charge for the control traffic associated with an application ruledef. Applications like HTTP use TCP to set up and tear down connections before the HTTP application starts. This CLI command controls whether the packets that set up and tear down the connections should use the same content ID as the application’s flow.

In normal mode 3-way handshake TCP packets (SYN, SYN-ACK, and ACK) and closing or intermittent packets (FIN, RST, etc.) directed and charged based on configured matched rules. This command makes the system to wait for the start and stop of layer 7 packet flow and content ID and charge the initial, intermittent, and closing TCP packets as configured to the same matching rules and content ID as of the flow.

This CLI command also affects applications that do not use TCP but use other methods for control packets, e.g., WAP where WTP/UDP may be used to set up and tear down connection-oriented WSP.

Example

Following command enables the charging for initial TCP handshaking control packets and wait for content-id of data traffic flow:

```
flow control-handshaking charge-to-application initial-packets
```

The following command enables charging all mid-session ACKs as well as tear-down packets to application:

```
flow control-handshaking charge-to-application mid-session-packets tear-down-packets
```
flow end-condition

This command sets the end condition of the session flows related to a user session and triggers the EDR generation.

**Product**
ECS

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
flow end-condition { { content-filtering | normal-end-signaling | timeout + } | { { hagr | handoff | session-end } [ flow-overflow ] + } [ url-blacklisting ] }
edr edr_format

no flow end-condition
```

**no**
Removes the previously configured end condition of the EDR flow related to a user session.

**content-filtering**
Specifies to create an EDR with format named `edr_format` when category-based content filtering application action leads to a flow end. Possible Content-filtering actions redirect-url, terminate-flow, content-insert.

**hagr**
Specify to create an EDR with format named `edr_format` when flow ended due to session handoff according to Interchassis Session Recovery support.

**handoff**
Specify to create an EDR with format named `edr_format` when flow ended due to hand-off. Whenever a handoff occurs, ACS closes the EDRs for all current flows using the EDR format `edr_format`, and begin new statistics collection for the flows for the EDRs that will be generated when the flows actually end.

**normal-end-signaling**
Specifies the flow end condition as normal when a flow end is signaled normally like detecting FIN and ACK for a TCP flow, or a WSP-DISCONNECT terminating a connection-oriented WSP flow over UDP) and create an EDR for the flow using the EDR format `edr_format`.

**session-end**
Specify to create an EDR when a subscriber session ends. By this option ACS creates an EDR with format named `edr_format` for every flow that has had any activity since last EDR was created for the flow on session end.

**timeout**
Specify to create an EDT with format named `edr_format` when a flow ends or deleted due to a timeout condition.
flow end-condition

flow-overflow

**Important:** This keyword is only available in StarOS 8.3 and later. And, is only applicable when used with the `hagr`, `handoff`, and `session-end` keywords.

Specifies generation of flow-overflow EDR for conditions that affect the callline. If any of the specified end-conditions that affect subscriber information stored at ACS (i.e. callline) is configured the “flow-overflow” EDR is generated.

url-blacklisting

Specifies to create an EDR with format named `edr_format` when URL Blacklisting application action leads to a flow end.

+ More than one of the keywords can be entered within a single command.

edr `edr_format`

Specifies the EDR format name to record EDR in specified flow end condition. `edr_format` is a pre-configured format, and must be a unique alpha and/or numeric string 1 through 63 characters in length.

**Usage**

Use this command to enable or disable the capturing of EDRs based on flow end condition.

**Example**

The following command defines the end condition as handoff for flow and creates an EDR with as per format named `EDR_format1`:

```
flow end-condition handoff edr-format EDR_format1
```
flow limit-across-applications

This command limits the total number of simultaneous flows per Subscriber/APN sent to a rulebase regardless of the flow type, or limit flows based on the protocol type under the Session Control feature.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

```
flow limit-across-applications { limit | non-tcp limit | tcp limit }
```

```
no flow limit-across-applications [ non-tcp | tcp ]
```

- **no**
  - Removes previously configured flow limit related to a rulebase.

- **limit**
  - Specifies the maximum number of flows across all applications for a rulebase.
  - `limit` must be an integer from 1 through 4000000000.
  - Default: No limits

- **non-tcp limit**
  - Specifies the maximum limit of non-TCP type flows.
  - `limit` must be an integer from 1 through 4000000000.
  - Default: No limits

- **tcp limit**
  - Specifies the maximum limit of TCP flows.
  - `limit` must be an integer from 1 through 4000000000.
  - Default: No limits

Usage

Use this command to limit the total number of flows allowed for a rulebase regardless of flow type, or limit flows based on the protocol—non-TCP (connection-less) or TCP (connection-oriented).

If a subscriber attempts to exceed these limits system discards the packets of new flow. This limit processing of this command has following aspects for UDP, TCP, ICMP and some of the exempted flows:

UDP/ICMP: System waits for the flow timeout before updating the counter and removing it from the count of number of flows.

TCP: After a TCP flow ends, system waits for a short period of time to accommodate the retransmission of any missed packet from one end. TCP flows those are ended, but are still in wait period for timeout are exempted for this limit processing.

Exempted flows: System exempts all the other flows specified with the `flow limit-for-flow-type` command in the Charging Action Configuration Mode set to no.
Example
The following command defines the maximum number of 200000 flows for a rulebase:

```
flow limit-across-applications 200000
```
fw-and-nat default-policy

This command configures the default Firewall-and-NAT policy for an ACS Rulebase.

**Important:** This command is only available in StarOS 8.1 and StarOS 9.0 and later. This command must be used to configure the Policy-based Firewall-and-NAT feature.

**Product**
- FW, NAT

**Privilege**
- Security Administrator, Administrator

**Syntax**

```
fw-and-nat default-policy fw_nat_policy
no fw-and-nat default-policy
```

**Usage**
Use this command to configure the default Firewall-and-NAT policy for an ACS rulebase. This policy is used for a subscriber only if:
- In the APN/subscriber configuration modes, the `default fw-and-nat policy` command is configured.
- Or, a policy to use is not received from the AAA/OCS.

For more information, see the *Personal Stateful Firewall Administration Guide*.

**Example**
The following command configures a Firewall-and-NAT policy named `standard` to the rulebase:

```
fw-and-nat default-policy standard
```
ip reassembly-timeout

This command configures how long to hold onto IP fragments for reassembly, while waiting for the complete packet to arrive.

**Product**
ECS

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
ip reassembly-timeout timeout_duration

default ip reassembly-timeout
```

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sets the timeout timer to 5000 milliseconds.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>timeout_duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the user configured value to timeout timer to hold fragmented packets before reassembly.</td>
</tr>
<tr>
<td><code>timeout_duration</code> is the duration, in milliseconds, and must be an integer from 100 through 30000.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to configure duration for timeout timer to hold IP fragmented packets before reassembly is needed.

IP fragmented packet are retained, until either all fragmented packets have been received or the configured timeout has expired for the oldest fragment. If all fragments have been received, a temporary complete packet is reconstructed for analysis. Then all fragments are forwarded in order from first to last. If all fragments are not received, the fragments will be forwarded without being passed through the protocol analyzers, except for the IP analyzer.

**Example**

The following command sets the timeout timer to 15000 milliseconds:

```plaintext
ip reassembly-timeout 15000
```
ip reset-tos

This command enables the system to reset the IP Type of Service (ToS) value to zero.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

[ default | no ] ip tos-reset

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sets the default configuration.</td>
</tr>
<tr>

</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removes the previous configuration.</td>
</tr>
</tbody>
</table>

Usage

Use this command to reset the ToS field of any packet after it reaches ECS, or to broaden the range of values that are used in the ToS field in the IP header of any packet.
**nat binding-record**

Configures the NAT binding record generation setting.

**Important:** This command is only available in StarOS 8.3. In StarOS 9.0 this command is available in the Firewall-and-NAT Policy Configuration Mode.

**Product**

NAT

**Privilege**

Security Administrator, Administrator

**Syntax**

```
nat binding-record edr-format edr_format [ port-chunk-allocation ] [ port-chunk-release ] +
{ default | no } nat binding-record
```

- **default**
  
  Configures the default setting.
  
  Default: port-chunk-release

- **no**
  
  Deletes the previous NAT binding record configuration.

- **edr-format edr_format**
  
  Specifies the EDR format name.
  
  edr_format must be an alpha and/or numeric string of 1 through 63 characters in length.

- **port-chunk-allocation**
  
  Specifies generating NAT bind record when a port chunk is allocated.

- **port-chunk-release**
  
  Specifies generating NAT bind record when a port chunk is released.

- **+**
  
  Indicates that more than one of the previous keywords can be entered within a single command.

**Usage**

Use this command to configure the NAT binding record generation setting.

**Example**
The following command configures an EDR format named `test123` and specifies generating NAT binding record when a port chunk is allocated, and when a port chunk is released:

```
nat binding-record edr-format test123 port-chunk-allocation port-chunk-release
```
**nat policy**

This command enables/disables Network Address Translation (NAT) processing for all subscribers using this rulebase.

**Important:** In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT, this command is available in the Firewall-and-NAT Policy Configuration Mode.

**Important:** Before enabling NAT processing for a subscriber, Firewall must be enabled for the subscriber. See the `firewall policy` CLI command.

**Product**
NAT

**Privilege**
Security Administrator, Administrator

**Syntax**

```
nat policy nat-required [ default-nat-realm realm_name ]
{ default | no } nat policy
```

- **default**
  Sets the default NAT processing setting for all subscribers using this rulebase.
  Default: Disabled

- **no**
  Disables NAT processing for all subscribers using this rulebase.

- **nat-required**
  Enables NAT processing for all subscribers using this rulebase.

```
default-nat-realm realm_name
```

**Important:** This keyword is only available in StarOS 8.3 and later.

Specifies the default NAT realm to be used if one is not already configured.

*realm_name* must be an alpha and/or numeric string of 1 through 31 characters in length.

**Important:** Including the default NAT realm, a maximum of three NAT realms are supported.

**Usage**

Use this command to enable/disable NAT processing for all subscribers using this rulebase.
Once NAT is enabled for a subscriber, the NAT IP address to be used is chosen from the NAT realms defined in the rule priority lines within the rulebase. See the `firewall priority` CLI command.
NAT enable/disable status in the rulebase can be changed any time, however the changed NAT status will not be applied for active calls using the rulebase. The new NAT status is only applied to new calls.

**Example**
The following command enables NAT processing:

```
nat policy nat-required
```

The following command disables NAT processing:

```
no nat policy
```
nat suppress-aaa-update

This command suppresses the sending of NAT bind updates (NBU) to the AAA server when PPP disconnect happens.

**Important:** This command is customer-specific. For more information please contact your local service representative. In StarOS 9.0, this command is available in the Firewall-and-NAT Policy Configuration Mode.

**Product**
NAT

**Privilege**
Security Administrator, Administrator

**Syntax**

```bash
nat suppress-aaa-update call-termination

default nat suppress-aaa-update
```

**Usage**

Use this command to suppress the sending of NAT bind updates (NBU) to the AAA server when PPP disconnect happens, as these NBUs would be cleared at the AAA after receiving the accounting-stop. This enables to minimize the number of messages between the chassis and AAA server. When not configured, NAT bind updates are sent to the AAA server whenever a port chunk is allocated, de-allocated, or the call is cleared (PPP disconnect).

**Example**

The following command suppresses the sending of NAT bind updates (NBU) to the AAA server when PPP disconnect happens:

```bash
nat suppress-aaa-update call-termination
```
**p2p dynamic-flow-detection**

This command enables the P2P analyzer to detect P2P applications configured for the Active Charging service.

**Product**

P2P

**Privilege**

Security Administrator, Administrator

**Syntax**

```
p2p dynamic-flow-detection
{ default | no } p2p dynamic-flow-detection
```

- **default**
  Configures the default setting.
  Default: `no p2p dynamic-flow-detection`

- **no**
  Disables detecting P2P applications with the P2P analyzer.

**Usage**

Use this command to set up dynamic-flow detection. This allows the P2P analyzer to detect the P2P applications configured for the Active Charging service.
post-processing priority

This command configures the post-processing priority and action to be taken on the specified ruledef in the rulebase.

**Important:** This command is only available in StarOS 8.3 and later.

**Product**
ECS

**Privilege**
Security Administrator, Administrator

**Syntax**

```
post-processing priority priority { group-of-ruledefs group_name | ruledef ruledef_name } charging-action charging_action_name [ description description ]
```

```
no post-processing priority priority
```

```
priority priority
```
Specifies priority for the ruledef/group-of-ruledefs in the rulebase.

*priority* must be an integer from 1 through 65535, and must be unique.

```
group-of-ruledefs group_name
```
Assigns the specified group-of-ruledefs to the rulebase.

*group_name* must be the name of a group-of-ruledefs, and must be an alpha and/or numeric string of 1 through 63 characters in length.

**Important:** The group-of-ruledefs specified must be configured for post-processing. See the **group-of-ruledefs-application** CLI command in the Group-of-Ruledefs Configuration mode.

```
ruledef ruledef_name
```
Assign the specified ruledef to the rulebase.

*ruledef_name* must be an alpha and/or numeric string of 1 through 63 characters in length.

**Important:** The ruledef specified must be configured for post-processing. See the **rule-application** CLI command in the Ruledef Configuration mode.

```
charging-action charging_action_name
```
Specifies the charging action.

*charging_action_name* must be an alpha and/or numeric string of 1 through 63 characters in length.

```
description description
```
Specifies optional description for this configuration.

*description* must be an alpha and/or numeric string of 1 through 31 characters in length.
Usage

Use this command to configure the post-processing priority and action to be taken on a ruledef in the rulebase.

Example

The following command configures the ruledef named `test_ruledef` with a priority of 10, and the charging action named `test_ca` for post processing:

```
post-processing priority 10 ruledef test_ruledef charging-action test_ca
```
post-processing dynamic

This command configures specified ruledefs/group-of-ruledefs as dynamic post-processing ruledefs/group-of-ruledefs enabling to differentiate between normal post-processing rules from pre-configured ones. Default: Disabled

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

post-processing dynamic { group-of-ruledefs group_name | ruledef ruledef_name }
charging-action charging_action [ description description ]

no post-processing dynamic { group-of-ruledefs group_name | ruledef ruledef_name }

no
Removes the specified post-processing dynamic configuration.

group-of-ruledefs group_name
Assigns the specified group-of-ruledefs to the current rulebase.
group_name must be an alpha and/or numeric string of 1 through 63 characters in length.

ruledef ruledef_name
Assigns the specified ruledef to the current rulebase.
ruledef_name must be an alpha and/or numeric string of 1 through 63 characters in length.

charging-action charging_action
Specifies charging action.
charging_action must be an alpha and/or numeric string of 1 through 63 characters in length.

description description
Specifies optional description for this configuration.
description must be an alpha and/or numeric string of 1 through 31 characters in length.

Usage
Use this command to configure specific ruledefs/group-of-ruledefs as dynamic post-processing ruledefs/group-of-ruledefs enabling to differentiate between normal post-processing rules from the pre-configured ones. This makes possible enabling/disabling ruledefs/groups-of-ruledefs entry from external server.

Example
post-processing dynamic

The following command specifies the ruledef named `test_rule` as a dynamic post-processing ruledef configured with the charging action `ca13` and a description of `testing`:

```
post-processing dynamic ruledef test_rule charging-action ca13 description testing
```
qos-renegotiate timeout

This command configures the timeout setting for the Quality of Service (QoS) Renegotiation feature.

**Important:** This command is controlled by the dynamic-qos-renegotiation license.

### Product
All

### Privilege
Security Administrator, Administrator

### Syntax

```plaintext
qos-renegotiate timeout timeout
no qos-renegotiate timeout

no
Disables timeout setting if previously configured.

timeout timeout
Specifies the timeout period for QoS Renegotiation feature in this rulebase.
`timeout` must be the timeout period, in seconds, and must be an integer from 0 through 4294967295.
If set to 0, timeout is disabled.
```

### Usage

Use this command to configure timeout setting for the QoS Renegotiation feature.

### Example

The following command sets the QoS renegotiate timeout period to 1000 seconds:

```
qos-renegotiate timeout 1000
```
radius threshold

This command sets the interval and volume thresholds to generate the interim RADIUS CDRs and write them to CDR file for ECS postpaid billing.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
radius threshold { interval interval | volume total volume }
{ no | default } radius threshold { interval | volume total }
```

- **no**
  Removes the previously RADIUS threshold configuration.

- **default**
  Configures the default settings.

- **interval interval**
  Default: Disabled
  Specifies the time interval (in seconds) for generating RADIUS interim accounting requests. This option is disabled by default. **interval** must be an integer from 60 through 40000000.

- **volume total volume**
  Default: Disabled
  Specifies the limit for the total number of octets (uplink+downlink) after which a stop-start pair will be sent to RADIUS. **volume** must be an integer from 100,000 to 4,000,000,000.

**Usage**

Use this command to specify a time interval threshold to generate interim RADIUS CDRs and write it to RADIUS CDR file for postpaid billing.

**Example**
The following command defines a time threshold interval of 600 seconds for RADIUS CDRs:

```
radius threshold interval 600
```
route priority

This command controls routing of packets to protocol analyzers.

Product
All

Privilege
Security Administrator, Administrator

Syntax

no route priority route_priority

no
Removes the specified route configuration from the current rulebase.

priority route_priority

Specifies the route priority for the ruledef in the current rulebase.
route_priority must be an integer from 1 through 65535.
Lower numbered priorities are examined first. Up to 1024 instances can be configured across all rulebases.

ruledef ruledef_name

Specifies the ruledef to evaluate packets to determine the analyzer.
ruledef_name specifies the name of an existing ruledef configured for the route application using the rule-application command in the Ruledef Configuration Mode.

analyzer

Specifies the analyzer for the ruledef, and must be one of the following:
  • dns: Route to DNS protocol analyzer.
  • file-transfer: Route to file analyzer.
  • ftp-control: Route to FTP control protocol analyzer.
  • ftp-data: Route to FTP data protocol analyzer.
  • http: Route to HTTP protocol analyzer.
  • imap: Route to IMAP protocol analyzer.
  • mms: Route to MMS protocol analyzer.
  • p2p: Route to the P2P protocol analyzer.
  • pop3: Route to POP3 protocol analyzer.
  • pptp: Route to PPTP protocol analyzer.
  • rtcp: Route to RTCP protocol analyzer.
- \textbf{rtp}: Route to RTP protocol analyzer.
- \textbf{rtsp}: Route to RTSP protocol analyzer.
- \textbf{sdp}: Route to SDP protocol analyzer.
- \textbf{secure-http}: Route to secure HTTP protocol analyzer.
- \textbf{sip \{ advanced \}}: Route to SIP protocol analyzer.

For SIP calls to work with NAT/Stateful Firewall, a SIP ALG is required to do payload translation of SIP packets and pin-hole (dynamic flow) creation for media packets. A SIP routing rule must to be configured for routing the packets to the SIP ALG for processing. If the optional keyword \texttt{advanced} is configured, the packets matching the routing rule will be routed to SIP ALG for processing and not to ECS SIP analyzer. If not configured, then packets will be routed to ECS SIP analyzer for processing.

Also, see \texttt{firewall nat-alg} CLI command in the ACS Configuration Mode.

- \textbf{tftp}: Route to TFTP protocol analyzer.
- \textbf{smtp}: Route to SMTP protocol analyzer.
- \textbf{wsp-connection-less}: Route to WSP connection-less protocol analyzer.
- \textbf{wsp-connection-oriented}: Route to WSP connection-oriented protocol analyzer.

\textbf{Important}: To route packets to the P2P analyzer, the ruledef should have rules to match all IP packets. Otherwise, the analyzer may not detect all P2P traffic.

\textbf{Important}: Use the \texttt{show active-charging analyzer statistics} command in the Exec Mode to see the list of supported analyzers.

\texttt{description description}

Enables to add a description to the rule and action for later reference in saved configuration file. \textit{description} must be an alpha and/or numeric string of 1 through 63 characters in length.

\textbf{Usage}

Instances of this CLI command control which packets are routed to which protocol analyzers. Packets sent to Active Charging are always passed through the IP protocol analyzer. This CLI command controls which higher layer analyzers are also invoked.

<table>
<thead>
<tr>
<th>Analyzer</th>
<th>Common ways to route to the analyzer</th>

<td>TCP destination port or source port is POP3 (110).</td>
</tr>
<tr>
<td>rtp and rtcp</td>
<td>RTSP has embedded RTP/RTCP payloads (you need to enable RTP dynamic flow detection to catch those flows); or, RTSP or SDP (for SDP within SIP) creates an RTP/RTCP flow over UDP (in addition to enabling the aforementioned dynamic flow detection, you must make sure that UDP packets are routed to the UDP analyzer) or, RTP/RTCP uses predefined UDP port numbers (e.g. default UDP port numbers of 5004/5005).</td>
</tr>
<tr>
<td>rtsp</td>
<td>TCP destination port or source port is RTSP (554).</td>
</tr>
<tr>
<td>p2p</td>
<td>Use the <strong>p2p dynamic-flow-detection</strong> CLI command to enable detection of the different P2P applications specified by the <strong>p2p application</strong> CLI command; that will cause every TCP or UDP packet to be automatically routed here.</td>
</tr>
</tbody>
</table>

**Example**

The following command assigns a route and rule action with the route priority of 23, a ruledef of test, and an analyzer **test_analyzer** with description as **route_test1** to the current rulebase:

```
route priority 23 ruledef test analyzer test_analyzer description route_test1
```
rtp dynamic-flow-detection

This command enables the RTSP and SDP analyzers to detect the start/stop of RTP and RTCP flows.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

[ no | default ] rtp dynamic-flow-detection

no
Disables the previous RTP dynamic flow detection configuration.

default
Sets the default RTP dynamic flow detection configuration.
Default: no rtp dynamic-flow-detection

Usage
Use this command to enable the RTSP and SDP analyzer to detect the start/stop of RTP and RTCP flows. This command is used in conjunction with the route priority command.

Example
The following command enables RTP dynamic flow detection:

rtp dynamic-flow-detection
ruledef-parsing

This command configures whether to consider/ignore the port number embedded in the application header (for example, the "80" in www.starentnetworks.com:80) when comparing the ruledef expressions to the packet contents.

Product: ECS
Privilege: Security Administrator, Administrator
Syntax:

[ no ] ruledef-parsing ignore-port-numbers-embedded-in-application-headers analyzers { http rtsp sip wsp }

default ruledef-parsing

no
Disables the previous configuration.

default
Sets the default configuration.
Default: no ruledef-parsing ignore-port-numbers-embedded-in-application-headers analyzers { http rtsp sip wsp }—not ignoring port numbers that are embedded in application headers

ignore-port-numbers-embedded-in-application-headers analyzers { http rtsp sip wsp }

Specifies to ignore the port numbers present in application header.
Specifies analyzers for which port number must be ignored.

Usage
Use this command to make the HTTP, RTSP, SIP, and WSP analyzer ignore port numbers embedded in application headers.

Example
The following command makes the HTTP analyzer in the current rulebase ignore port numbers embedded in application headers:

ruledef-parsing ignore-port-numbers-embedded-in-application-headers analyzers http
tcp 2msl-timeout

This command configures how long to retain the TCP flow after the FIN has been acknowledged.

**Product**
ECS

**Privilege**
Security Administrator, Administrator

**Syntax**
```
tcp 2msl-timeout seconds
{ default | no } tcp 2msl-timeout
```

- **default**
  Sets the default setting.
  Default: 2 seconds

- **no**
  Disables the timeout and sets the system to delete the flow immediately upon seeing the FIN be acknowledged.

- **seconds**
  The period of time, in seconds, to keep the TCP flow.
  seconds must be an integer from 1 through 20.

**Usage**
Use this command to configure how long to retain the TCP flow after the FIN has been acknowledged.
Acknowledgment to the FIN is not guaranteed to be received by the destination, then the FIN could be resent and re-acknowledged. In this scenario, it is desirable to still have the flow, so that the re-sends do not create a new flow.

**Example**
The following command sets the timeout to 4 seconds:
```
tcp 2msl-timeout 4
```
tcp check-window-size

This command enables/disables TCP window-size check.

**Product**
ECS

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ default | no ] tcp check-window-size
```

- **default**
  Sets the default setting.
  Default: enabled, i.e. packets after the erroneous packet (with size > receiver’s window size) will hit tcp-error ruledef.

- **no**
  Disables the window-size check, and will continue with normal L7 parsing.

**Usage**

Use this command to enable/disable TCP window-size check for packets out of TCP window.

**Example**

The following command enables TCP window-size check:

```
tcp check-window-size
```
tcp mss

This command configures the TCP Maximum Segment Size (MSS) in TCP SYN packets.

**Important:** This command is only available in StarOS 8.1 and later releases.

**Product**
ECS

**Privilege**
Security Administrator, Administrator

**Syntax**

```
tcp mss tcp_mss { add-if-not-present | limit-if-present } +
{ default | no } tcp mss
```

- **default**
  Removes the previously configured setting.

- **no**
  Removes the previously configured setting.

- **tcp_mss**
  Specifies the TCP MSS value.
  `tcp_mss` must be an integer from 496 through 65535.

- **add-if-not-present**
  Adds the TCP MSS if not present in the packet.

- **limit-if-present**
  Limits the TCP MSS if present in the packet.

**Usage**
Using this command, TCP MSS can be limited if already present in the TCP SYN packets. If there are no errors detected in IP header/TCP mandatory header and there are no mem allocation failures, TCP optional header is parsed. If TCP MSS is present in the optional header and its value is greater than the configured MSS value, the value present in the TCP packet is replaced with the configured one.
If the TCP optional header is not present in the SYN packet and there are no errors in already present TCP header, the TCP MSS value configured will be inserted while sending the current packet out.

**Example**
The following command limits the TCP maximum segment size to 3000, and if not present adds it to the packets:
```
tcp mss 3000 limit-if-present add-if-not-present
```
tcp out-of-order-timeout

**Description** This command has been deprecated, and is replaced by the tcp packets-out-of-order command.
tcp packets-out-of-order

This command configures processing of TCP packets that are out of order, while waiting for the earlier packet(s) to arrive.

**Product**
ECS

**Privilege**
Security Administrator, Administrator

**Syntax**

tcp packets-out-of-order { timeout duration_ms | transmit [ after-reordering | immediately ] }

default tcp packets-out-of-order { timeout | transmit }

---

**timeout duration_ms**
Default: 5000 milliseconds
Specifies the timeout period for re-assembly of TCP out-of-order packets. duration_ms is the timeout period in milliseconds, and must be an integer from 100 through 30000.

---

**transmit [ after-reordering | immediately ]**
Configures the TCP out-of-order segment behavior after buffering a copy.

- **after-reordering**: Sends the TCP out-of-order segment after all packets are received and successfully reordered. If reordering is not successful due to a timeout, the received packets are forwarded without being passed through the protocol analyzers. If memory allocation fails or the received packet is partial retransmitted data, the packet will be forwarded immediately without being passed through the protocol analyzers, except for the IP analyzer.

- **immediately**: Sends the TCP out-of-order segment immediately after buffering a copy. The packets are transmitted as they are received without any in-line services or charging action processing, but also a copy of each packet is held onto. When the missing packet is received, complete deep packet inspection of all the packets and all relevant in-line services is done, and then the last packet is forwarded.

Default: **immediately**

---

**Usage**
This command configures how to process TCP packets that are out of order, while waiting for the earlier packet(s) to arrive.

**Example**
The following command sets the timeout timer to 10000 milliseconds:
tcp packets-out-of-order timeout 10000
timestamp rounding

This command enables the configuration of timestamp rounding in an EDR or eG-CDR.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

```
timestamp rounding { edr | egcdr } { ceiling | floor | round-off }
{ no | default } timestamp rounding { edr | egcdr }
```

```
no | default
Default: round-off
Sets the default setting for timestamp rounding.
```

```
edr
Perform the timestamp rounding for EDRs.
```

```
egcdr
Perform the timestamp rounding for eG-CDRs.
```

```
floor
This keyword always discards the fractional part of the second.
```

```
round-off
This keyword sets the fractional part of the seconds to nearest integer value. If fractional value is greater than or equal to 0.5, it adds 1 to the number of seconds and discards the fractional part of second.
```

Usage
Use this command to configure the timestamp rounding setting. The specified rounding will be performed before system attempts any calculation. For example using round-off, if the start time is 1.4, and the end time is 1.6, then the calculated duration will be 1 (i.e., 2 \(\times\) 1 = 1). This command may be repeated for each type of EDR or eG-CDR.

Example
The following command sets the EDR timestamp to nearest integer value second; i.e. 34:12.23 to 34:12.00:
```
timestamp rounding edr round-off
```
transport-layer-checksum

This command enables/disables checksum verification for TCP and UDP packets.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

[ no ] transport-layer-checksum verify-during-packet-inspection [ tcp | udp ]

default transport-layer-checksum

no
Disables the checksum calculation for the specified packet type.

default
Sets the default configuration.
Default: transport-layer-checksum verify-during-packet-inspection—to perform the checksum verification calculation on all TCP and UDP packets.

[ tcp | udp ]
Specifies that either TCP or UDP packets should be verified or not verified.
If neither of these keywords is specified the command applies to both TCP and UDP packets.

Usage
Use this command to disable or enable performing checksum verification calculations on TCP or UDP packets.
If the checksum is not verified, the packets will go through the TCP/UDP analyzers (and deeper analyzers, if so configured with the route CLI command) regardless of the value of the TCP/UDP checksum.
If the checksum is verified, only packets with good checksums will go through the TCP/UDP analyzers (and deeper analyzers, if so configured).

Example
The following command disables checksum verification calculations on all TCP and UDP packets:

no transport-layer-checksum verify-during-packet-inspection
udr threshold

This command defines and enables the threshold limit to generate User Detail Records (UDRs) that provide Comma Separated Value (CSV) records written periodically in a fixed schema designed to reflect a total billable quantity.

Product
All

Privilege
Security Administrator, Administrator

Syntax

udr threshold { interval interval | volume { downlink bytes [ uplinkbytes] | totalbytes| downlinkbytes[ uplinkbytes] }}

default udr threshold { interval | volume }

no udr threshold { interval | volume { downlink [ uplink ] | total | uplink [ downlink ] } }

no
Removes the previous configuration.

default
Sets the default configuration.
Default: no udr threshold interval: no udr threshold volume—disables the UDR threshold settings.

interval interval
Default: 0 (Disabled)
Specifies the time interval in seconds for closing the UDR if the minimum time duration thresholds are satisfied. This option is disabled by default.
interval must be an integer from 60 through 40000000.

volume
Specifies the uplink/downlink volume octet counts for the generation of the interim UDRs.

• downlink bytes: Sets the limit for the number of octets downlink after which the UDR is closed. bytes (in bytes) must be an integer from 100,000 to 4,000,000,000. Default is 4,000,000,000.

• total bytes: Sets the limit for the total number of octets (uplink+downlink) after which the UDR is closed. bytes (in bytes) must be an integer from 100,000 to 4,000,000,000. By default, this configuration is disabled.

• uplink bytes: Sets the limit for the number of octets uplink after which the UDR is closed. bytes (in bytes) must be an integer from 100,000 through 4,000,000,000. Default is 4,000,000,000.

UDR records are generated whenever either threshold is reached.
Use this command to enable the thresholds for generation of UDRs.

Example
The following command specifies that UDR records should be generated every 10 minutes (600 seconds):

```
udr threshold interval 600
```
.udr trigger

Use this command to assign first packet trigger to interim UDRs—for generating UDR for first packet hit per rating group/content ID.

Important: This command is only available in StarOS 8.3 and later.

Product
ACS

Privilege
Security Administrator, Administrator

Syntax

[ no ] udr trigger first-hit-content-id

default udr trigger

no
Disables assigning first packet trigger to interim UDRs.

default
Configures the default setting.
Default: Disabled

first-hit-content-id
Specifies interim UDR generation on first packet hit per rating group/content ID.

Usage
This command enables generating UDR for first packet hit per rating group/content ID. Generation of UDR will be triggered when this CLI command is present in the rulebase.

Example
The following command assigns first packet trigger to interim UDRs, for generating UDR for first packet hit per rating group/content ID:

.udr trigger first-hit-content-id
url-blacklisting action

This command enables/disables URL Blacklisting functionality for the rulebase, and configures the action to be taken when a URL matches one in the URL Blacklist.

Product
ECS, CF

Privilege
Security Administrator, Administrator

Syntax
url-blacklisting action { discard | redirect-url url | terminate-flow | www-reply-code-and-terminate-flow reply_code } [ edr ]

{ default | no } url-blacklisting action

- [ default | no ] url-blacklisting action
  Disables the URL Blacklisting feature for this rulebase.

- discard
  Configures URL Blacklisting discard action.

- redirect-url url
  Configures URL Blacklisting redirect-url action.
  url specifies the redirect URL/URI. url must be a fully qualified URL/URI, and must be a string of 1 through 1023 characters in length.

- terminate-flow
  Configures URL Blacklisting terminate-flow action.

- www-reply-code-and-terminate-flow reply_code
  Configures URL Blacklisting terminate-flow action with reply code.
  reply_code specifies the reply code, and must be an integer from 100 through 599.

Usage
Use this command to enable/disable URL Blacklisting functionality, and configure the EDRs to be generated on Blacklisting match and the action to be taken.

Example
The following command enables URL Blacklisting functionality, and configures the terminate-flow action with reply code 300:
url-blacklisting action www-reply-code-and-terminate-flow 300
The following command disables URL Blacklisting feature in the rulebase:
no url-blacklisting action
url-preprocessing

This command enables/disables a group-of-prefixed-urls for preprocessing.

**Important:** This command is customer specific. For more information, please contact your local service representative.

**Product**
ECS

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] url-preprocessing bypass group-of-prefixed-urls group_name
```

- **no**
  - Removes configuration for the specified group-of-prefixed-urls.

- **group_name**
  - Specifies the group-of-prefixed-urls name.
  - `group_name` must be an alpha and/or numeric string of 1 through 63 characters in length.

**Usage**

Use this command to enable/disable a group-of-prefixed-urls. Multiple groups can be enabled.

**Example**

The following command enables looking for prefixed URLs of the group-of-prefixed-urls named `test5`:

```
url-preprocessing bypass group-of-prefixed-urls test5
```
wtp out-of-order-timeout

**Description** This command has been deprecated, and is replaced by the `wtp packets-out-of-order` command.
**wtp packets-out-of-order**

This command configures how to process WTP packets that are out of order, while waiting for the earlier packet(s) to arrive.

**Product**
ECS

**Privilege**
Security Administrator, Administrator

**Syntax**

```
wtp packets-out-of-order { out-of-order-timeout timeout | transmit [ after-reordering | immediately ] }  
default wtp packets-out-of-order { out-of-order-timeout | transmit }  
default
```

**default**
Configures the default setting.

**out-of-order-timeout timeout**

Specifies the maximum duration for which WTP out-of-order packets are retained, in milliseconds, before reassembly is needed.

- **timeout** is the timeout duration in milliseconds, and must be an integer from 100 through 30000.
- Default: 5000 milliseconds

**transmit [ after-reordering | immediately ]**

Specifies the WTP out-of-order segment behavior after buffering a copy:

- **after-reordering**: Send WTP out-of-order segment after it becomes ordered
- **immediately**: Send WTP out-of-order segment immediately after buffering a copy
- Default: **immediately**

**Usage**

Use this command to configure TCP out-of-order segment options.

- If out-of-order-timeout is specified, out-of-order packets are retained, until either all packets have been received or the configured timeout has expired for the oldest packet. If all packets have been received, a temporary complete packet is reconstructed for analysis. Then all packets are forwarded in order from first to last. If all packets are not received, the packets will be forwarded without being passed through the protocol analyzers, except for the IP analyzer.
- If **after-reordering** transmitting is specified, the packets are held onto and reordered. After successfully reordering the packets, they are processed in the proper order. If reordering is not successful due to timeout (wtp out-of-order-timeout), the received packets are forwarded without being passed through the protocol analyzers.
- If **immediately** is specified, the packets are transmitted as they are received without any in-line services or Charging Action processing, however a copy of each packet is retained. When the missing packet is received, complete deep packet inspection of all the packets and all relevant in-line services is undertaken, and then the last packet is forward (unless otherwise configured by the in-line services or Charging Action).
Example
The following command sets the timeout timer to 10000 milliseconds:

```
wtp out-of-order-timeout 10000
```
xheader-encryption

This command configures X-Header Encryption feature parameters.

⚠️ **Important:** This command is license dependent. For more information, please contact your local sales representative.

**Product**
ECS

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
xheader-encryption { certificate-name certificate_name | re-encryption period period }

default xheader-encryption re-encryption period

no xheader-encryption { certificate-name | re-encryption }
```

**default**
Configures the default setting.
Default: no re-encryption

**no**
Removes the previously configured setting for the specified parameter.

**certificate-name certificate_name**
Specifies name of the encryption certificate to be used for X-Header Encryption feature.
*certificate_name* must be the name of a certificate, and must be an alpha and/or numeric string of 1 through 63 characters in length.

**re-encryption period**
Specifies how often to re-generate the encryption keys.
*period* specifies the re-encryption time period in minutes, and must be an integer from 1 through 10000.

**Usage**
Use this command to configure the X-Header Encryption feature’s certificate and re-encryption parameters.

**Example**
The following command configures the X-Header Encryption feature to use the certificate named *testcert*:

```
xheader-encryption certificate-name testcert
```
Chapter 182
Ruledef Configuration Mode Commands

The Ruledef Configuration Mode is used to create and manage ACS rule definitions.

**Important:** Up to 10 rule matches can be configured in one ruledef.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
bearer

The following commands define rules for analyzing traffic based on the bearer channel:
**bearer 3gpp apn**

This command defines a rule definition to analyze and charge user traffic based on APN of the bearer flow.

---

**Important:** This command is only available in StarOS 8.1 and later.

---

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] bearer 3gpp apn [ case-sensitive ] operator value
```

- **no**
  - Removes the specified rule definition.

- **[ case-sensitive ]**
  - Default: Disabled
  - This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  - Specifies how to logically match the information in the analyzed field.
  - *operator* must be one of the following:
    - `!=`: does not equal
    - `!contains`: does not contain
    - `!ends-with`: does not end with
    - `!starts-with`: does not start with
    - `=`: equals
    - `contains`: contains
    - `ends-with`: ends with
    - `starts-with`: starts with

- **value**
  - The name of the matching APN in bearer flow.
  - *value* must be an alpha and/or numeric string of 1 through 62 characters in length, and can contain punctuation characters.

---

**Usage**

Use this command to specify a rule definition to analyze user traffic based on APN of the bearer flow.
Example
The following command creates a rule definition to analyze user traffic for an APN named \texttt{apn12}:

\begin{verbatim}
bearer 3gpp apn = apn12
\end{verbatim}
bearer 3gpp imsi

This command defines a rule definition to analyze and charge user traffic based on the International Mobile Station Identification number (IMSI) in bearer flow.

**Important:** This command is only available in StarOS 8.1 and later.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] bearer 3gpp imsi { operator imsi | { !range | range } imsi-pool imsi_pool }
```

- **no**
  - Removes the specified rule definition.

- **operator**
  - Specifies how to logically match the IMSI.
  - `operator` must be one of the following:
    - `!=`: Does not equal
    - `=`: Equals

- **imsi**
  - Specifies the mobile station identifier.

- `{ !range | range } imsi-pool imsi_pool`
  - `!range` | `range`: Specifies the range criteria:
    - `!range`: Not in the range of
    - `range`: In the range of

  - `imsi-pool imsi_pool`: Specifies the IMSI pool name. `imsi_pool` must be a string of 1 through 63 characters in length.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on IMSI.

**Example**

The following command creates a rule definition to analyze user traffic for the IMSI number 9198838330912:

```
bearer 3gpp imsi = 9198838330912
```
bearer 3gpp imsi
bearer 3gpp rat-type

This command defines a rule definition to analyze and charge user traffic based on the Radio Access Technology (RAT) in bearer flow.

**Important:** This command is only available in StarOS 8.1 and later.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
[ no ] bearer 3gpp rat-type operator rat
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `==`: equals

- **rat**
  The rat type associated with the bearer flow.
  - `geran`: GSM EDGE Radio Access Network type
  - `utran`: UMTS Terrestrial Radio Access Network type
  - `wlan`: Wireless LAN type

Usage
Use this command to specify a rule definition to analyze user traffic based on RAT type.

Example
The following command creates a rule definition for analyzing user traffic for the WLAN RAT type `wlan`:

```
bearer 3gpp rat-type = wlan
```
bearer 3gpp sgsn-address

This command defines a rule definition to analyze and charge user traffic based on SGSN address associated in 3gpp bearer flow.

**Important:** This command is only available in StarOS 8.1 and later.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] bearer 3gpp sgsn-address operator address
```

**no**
Removes the specified rule definition.

**operator**
Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
- `!=`: does not equal
- `==`: equals

**address**
Specifies IP address of the SGSN node. `address` must be an SGSN IP address expressed in standard IPv4 or IPv6 dotted decimal notation.

**Usage**
Use this command to specify a rule definition to analyze user traffic based on IP address of SGSN node. This command replaces the `bearer sgsn-address` command.

**Example**
The following command creates a rule definition for analyzing traffic for an SGSN node with IP address of `19.88.3.8`.

```plaintext
bearer 3gpp sgsn-address = 19.88.3.8
```
bearer 3gpp2 bsid

This command defines a rule definition to analyze and charge user traffic based on the 3GPP2 service Base Station Identifier (BSID) for bearer.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] bearer 3gpp2 bsid [ case-sensitive ] operator bs_id

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  operator must be one of the following:
  - !: does not equal
  - !contains: does not contain
  - !ends-with: does not end with
  - !starts-with: does not start with
  - ==: equals
  - contains: contains
  - ends-with: ends with
  - starts-with: starts with

- **bs_id**
  The name of the matching 3GPP2 service Base Station ID (BSID) in bearer flow.
  bs_id must be an alpha and/or numeric string of 1 through 12 characters in length, and can contain punctuation characters.

Usage
Use this command to specify a rule definition to analyze user traffic based on 3GPP2 service Base Station Identifier (BSID).

Example
The following command creates a rule definition for analyzing user traffic for a 3GPP2 BSID named `bs001_xyz`:

```
bearer 3gpp2 bsid = bs001_xyz
```
bearer 3gpp2 service-option

This command defines a rule definition to analyze and charge user traffic based on the 3GPP2 service with service options for bearer.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```bash
[ no ] bearer 3gpp2 service-option operator option_code
```

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removes the specified rule definition.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>operator</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies how to logically match the information in the analyzed field.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>operator</th>
</tr>
</thead>
<tbody>
<tr>
<td>operator must be one of the following:</td>
</tr>
<tr>
<td>• !=: does not equal</td>
</tr>
<tr>
<td>• &lt;=: less than or equals</td>
</tr>
<tr>
<td>• =: equals</td>
</tr>
<tr>
<td>• &gt;=: more than or equals</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>option_code</th>
</tr>
</thead>
<tbody>
<tr>
<td>The code of the matching 3GPP2 service option in bearer flow.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>option_code</th>
</tr>
</thead>
<tbody>
<tr>
<td>option_code must be an integer from 0 through 1000.</td>
</tr>
</tbody>
</table>

Usage
Use this command to specify a rule definition to analyze user traffic based on 3GPP2 service’s service option code.

Example
The following command creates a rule definition for analyzing user traffic for a 3GPP2 service’s service option as = 1034:

```bash
bearer 3gpp2 service-option = 1034
```
bearer apn

This command defines a rule definition to analyze and charge user traffic based on APN bearer.

**Important:** In StarOS 8.1 and later, this command is deprecated and is replaced by the `bearer 3gpp apn` command.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] bearer apn [ case-sensitive ] operator value
```

- **no**
  Removes the specified rule definition.

- **[ case-sensitive ]**
  Default: Disabled
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **value**
  The name of the matching APN in bearer flow.
  `value` must be an alpha and/or numeric string of 1 through 62 characters in length, and can contain punctuation characters.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on APN name.
Example
The following command creates a rule definition for analyzing user traffic for an APN name `apn12`:

```
bearer apn = apn12
```
bearer imsi

This command defines a rule definition to analyze and charge user traffic based on International Mobile Station Identification number (IMSI) in bearer flow.

**Important:** In StarOS 8.1 and later, this command is deprecated and is replaced by the `bearer 3gpp imsi` command.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] bearer imsi { operator imsi | { !range | range } imsi-pool imsi_pool }
```

- **no**
  - Removes the specified rule definition.

- **operator**
  - Specifies how to logically match the IMSI.
  - **operator** must be one of the following:
    - `!=`: Does not equal
    - `==`: Equals

- **msid**
  - Specifies the Mobile Station Identifier.

- `{ !range | range } imsi-pool imsi_pool`
  - **!range | range**: Specifies the range criteria:
    - `!range`: Not in the range of
    - `range`: In the range of
  - **imsi-pool imsi_pool**: Specifies the IMSI pool name. `imsi_pool` must be a string of 1 through 63 characters in length.

**Usage**
Use this command to specify a rule definition to analyze user traffic based on IMSI number of mobile station.

**Example**
The following command creates a rule definition to analyze user traffic for an IMSI number `9198838330912`:

```
bearer imsi = 9198838330912
```
bearer rat-type

This command defines a rule definition to analyze and charge user traffic based on the Radio Access Technology (RAT) in bearer flow.

**Important:** In StarOS 8.1 and later, this command is deprecated and is replaced by the `bearer 3gpp rat-type` command.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] bearer rat-type operator rat
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!eq`: does not equal
  - `eq`: equals

- **rat**
  The rat type associated with the bearer flow.
  - `geran`: GSM EDGE Radio Access Network type
  - `utran`: UMTS Terrestrial Radio Access Network type
  - `wlan`: Wireless LAN type

**Usage**
Use this command to specify a rule definition to analyze user traffic based on RAT type.

**Example**
The following command creates a rule definition for analyzing user traffic for the WLAN RAT type `wlan`:

```
bearer rat-type = wlan
```
bearer sgsn-address

This command defines a rule definition to analyze and charge user traffic based on SGSN address associated in bearer flow.

**Important:** In StarOS 8.1 and later, this command is deprecated and is replaced by the `bearer 3gpp sgsn-address` command.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] bearer sgsn-address operator address
```

**no**
Removes the specified rule definition.

**operator**
Specifies how to logically match the information in the analyzed field.

*`operator`* must be one of the following:
- `!=`: does not equal
- `=`: equals

**address**
The IP address of SGSN node.

*`address`* must be an SGSN IP address expressed in standard IPv4 or IPv6 notation.

**Usage**
Use this command to specify a rule definition to analyze user traffic based on IP address of SGSN node.

**Example**
The following command creates a rule definition for analyzing user traffic for an SGSN node with IP address of 19.88.3.8:

```
bearer sgsn-address = 19.88.3.8
```
bearer traffic-group

This command defines a rule definition to analyze and charge user traffic based on the traffic group number associated to the bearer flow.

**Important:** This functionality is only available if the license for Content Access Control (P/N: 699-00-0011) has been purchased and installed.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
[ no ] bearer traffic-group operator grp_num
```

- **no**
  
  Removes the specified rule definition.

- **operator**
  
  Specifies how to logically match the information in the analyzed field. **operator** must be one of the following:
  
  - `!=`: does not equal
  - `<=`: less than or equals
  - `=`: equals
  - `>=`: greater than or equals

- **grp_num**
  
  Specifies the traffic group number. **grp_num** must be an integer from 1 through 255.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the traffic group value. See the **fa-ha-spi** command in the **HA Service Configuration Mode Commands** chapter for more information.

**Example**

The following command creates a rule definition for all traffic groups assigned a value greater or equal to 23:

```
bearer traffic-group >= 23
```
The following commands define rules for packets based on Credit Control Application:

cca quota-state

This command specifies the quota state of a subscriber for prepaid credit control service.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] cca quota-state operator { limit-reached | lower-bandwidth }

    no
    Disables the configured credit control quota state for this rule definition.

    operator
    Specifies how to logically match the information in the analyzed field. operator must be one of the following:
        ● !=: does not equal
        ● <=: lesser than equal
        ● ==: equals
        ● >=: greater than equal

    limit-reached
    This state matches an affirmative end-of-quota indication for this rule definition from the prepay server.

    lower-bandwidth
    This state matches the lower-bandwidth quota state of a rating group.

Usage
This command supports URL redirection cases and creates a rule for subscriber prepaid quota state as exhausted or not exhausted.
If a subscriber has exhausted the quota but has not exhausted the qualified period, a different charging-action can applied based on the cca quota-state CLI.

Example
The following command creates a rule for subscriber to send end-of-quota indication when credit control prepay quota limit reached:

    cca quota-state = limit-reached
cca redirect-indicator

This command configures the value of the redirect-indicator state of the credit control application.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] cca redirect-indicator operator indicator
```

- **no**
  Disables the configured credit control redirect indicator for specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  **operator** must be one of the following:
  - !=: does not equal
  - <=: less than or equals
  - ==: equals
  - >=: greater than or equals

- **indicator**
  Specifies the redirect indicator for AVP used for redirection of URL in RADIUS dictionary used for prepaid service.
  **indicator** must be an integer from 0 through 4294967295.

**Important:** For the RADIUS server configured with different values to return for this AVP the ECS requires rule definitions to match the different values for system to associate with Charging Actions that have different redirect URLs configured.

**Usage**

This command is used to configure an AVP to be used from a dictionary that defines the AVP for the redirect-indicator.

For example, a RADIUS dictionary specifies the 3gpp2-release-indicator to be used for redirect indicator when RADIUS is used as the credit control application. In this case, the value for 3gpp2-release-indicator that is returned by the RADIUS prepaid server for a quota request for a given content-id is retained by system and associated with the flow.

**Example**

Following command specifies redirect indicator as 1234 for URL redirect AVP:
cca redirect-indicator = 1234
copy-packet-to-log

This command prints every packet that hits this rule to a log statement.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] copy-packet-to-log

no
Disables the feature.
```

**Usage**
Use this command to print every packet that hits this rule to a log statement.
The following commands define rules for packets based on the DNS:
**dns answer-name**

This command defines a rule definition to analyze and charge user traffic based on the DNS answer-name.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] dns answer-name [ case-sensitive ] operator value
```

**no**
Removes the specified rule definition.

**case-sensitive**
Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

**operator**
Specifies how to logically match the information in the analyzed field.
- `!=`: does not equal
- `!contains`: does not contain
- `!ends-with`: does not end with
- `!starts-with`: does not start with
- `=`: equals
- `contains`: contains
- `ends-with`: ends with
- `starts-with`: starts with

**value**
The value of the specified field.
**value** must be an alpha and/or numeric string of 1 through 255 characters in length, and can contain punctuation characters.

**Usage**
Use this command to specify a rule definition to analyze user traffic based on answer name.

**Example**
The following command creates a rule definition for analyzing user traffic for a answer name of `test`:
dns answer-name = test
dns any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for DNS packets.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] dns any-match operator condition

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:
- ! =: does not equal
- = : equals

condition
Specifies the condition for this rule definition. condition must be one of the following:
- FALSE
- TRUE

Usage
Use this command to specify an any match rule definition for analyzing user traffic for charging purposes.

Example
The following command defines an any match rule definition for analyzing DNS user traffic:

```bash
dns any-match = TRUE
```
dns previous-state

This command defines a rule definition to analyze and charge user traffic matching the previous state expressions for DNS packets.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] dns previous-state operator dns_state

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
• !: does not equal
• =: equals

dns_state
dns_state must be one of the following:
• dns-timeout
• init
• req-sent
• resp-error
• resp-success

Usage
Use this command to specify a rule definition to analyze user traffic based on the DNS previous state.

Example
The following command creates a rule definition for analyzing user traffic using a previous state of req-sent:

dns previous-state = req-sent
dns query-name

This command defines a rule definition to analyze and charge user traffic based on the DNS query-name.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] dns query-name [ case-sensitive ] operator value

no
Removes the specified rule definition.

case-sensitive
Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
  • !=: does not equal
  • !=contains: does not contain
  • !=ends-with: does not end with
  • !=starts-with: does not start with
  • =: equals
  • contains: contains
  • ends-with: ends with
  • starts-with: starts with

value
The value of the specified field.
value must be an alpha and/or numeric string of 1 through 255 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the DNS query name.

Example
The following command creates a rule definition for analyzing user traffic using a query name of test:
dns query-name = test

dns return-code

This command defines a rule definition to analyze and charge user traffic based on the DNS return-code.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] dns return-code operator dns_response
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `=`: equals

- **dns_response**
  `dns_response` must be one of the following:
  - `format-error`
  - `name-error`
  - `no-error`
  - `not-implemented`
  - `refused`
  - `server-failure`

**Usage**
Use this command to specify a rule definition to analyze user traffic based on a DNS return code.

**Example**
The following command creates a rule definition for analyzing user traffic using a DNS response of `refused`:

```
dns return-code = refused
```
**dns state**

This command defines a rule definition to analyze and charge user traffic based on the DNS state.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] dns state operator dns_state
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  **operator** must be one of the following:
  - `!=`: does not equal
  - `==`: equals

- **dns_state**
  **dns_state** must be one of the following:
  - `dns-timeout`
  - `init`
  - `req-sent`
  - `resp-error`
  - `resp-success`

**Usage**
Use this command to specify a rule definition to analyze user traffic based on a DNS state.

**Example**
The following command creates a rule definition for analyzing user traffic using a DNS state of `req-sent`:

```
dns state = req-sent
```
**dns tid**

This command defines a rule definition to analyze and charge user traffic based on the DNS Transaction Identifier (TID).

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] dns tid operator tid_value
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!=`: does not equal
  - `<=`: less than or equals
  - `=`: equals
  - `>=`: greater than or equals

- **tid_value**
  Specifies the DNS transaction identifier for this rule definition. `tid_value` must be an integer from 1 through 65535.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the DNS TID.

**Example**

The following command creates a rule definition for analyzing user traffic using a DNS TID value of `test`:

```
dns tid = test
```
email

This command defines a rule definition to analyze and charge user traffic based on the conditions based on e-mail parameters.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] email { cc | content { class | type } | from | size | subject | to } [ case-sensitive ] operator value
```

- **no**
  Removes the specified rule definition.

- **cc**
  Specifies to match on the information in the CC field of e-mail message.

- **content { class | type }**
  Specifies to match on the information in the “content-type” or “content-class” field of e-mail message.

- **from**
  Specifies to match on the information in the “from” field of e-mail message.

- **subject**
  Specifies to match on the information in the “subject” field of e-mail message.

- **to**
  Specifies to match on the information in the “to” field of e-mail message.

- **size**
  Specifies to match with the total size of e-mail message in bytes.

- **case-sensitive**
  Default: Disabled
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field of e-mail message.
  - `!=`: does not equal
  - `!contains`: does not contain
**email**

- `!ends-with`: does not end with
- `!starts-with`: does not start with
- `=`: equals
- `contains`: contains
- `ends-with`: ends with
- `starts-with`: starts with

*operators* must be one of the following for *size*:
- `!=`: does not equal
- `<=`: less than or equals
- `=`: equals
- `=>`: greater than or equals

<table>
<thead>
<tr>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>The value of the specified field. <em>value</em> must be an alpha and/or numeric string (allows punctuation characters) as follows:</td>
</tr>
<tr>
<td>• <strong>cc</strong>: A string of 1 through 512 characters in length</td>
</tr>
<tr>
<td>• <strong>content</strong>: A string of 1 through 128 characters in length</td>
</tr>
<tr>
<td>• <strong>from</strong>: A string of 1 through 64 characters in length</td>
</tr>
<tr>
<td>• <strong>size</strong>: A range of bytes from 1 through 400000000 bytes</td>
</tr>
<tr>
<td>• <strong>subject</strong>: A string of 1 through 128 characters in length</td>
</tr>
<tr>
<td>• <strong>to</strong>: A string of 1 through 512 characters in length</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to specify a rule definition to analyze user traffic based on different fields and parameters of e-mail message.

**Example**

The following command creates an email rule definition for analyzing user traffic for the occurrence of triangular in the ‘cc’ field of e-mail message:

```
email cc contains triangular@xyz.com
```
end

This command returns the CLI prompt to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to change to the Exec mode.
exit

This command exits the Ruledef Configuration mode and returns to the Active Charging Configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the Active Charging Configuration mode.
file-transfer

The following commands define rules for analyzing traffic based on file transfers:
file-transfer any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for file transfer.

Product  
All

Privilege  
Security Administrator, Administrator

Syntax  

```plaintext
[ no ] file-transfer any-match operator condition
```

- **no**  
  Removes the specified rule definition.

- **operator**  
  Specifies how to logically match the information in the analyzed field. 
  `operator` must be one of the following:
  - `! =`: does not equal
  - `= =`: equals

- **condition**  
  Specifies the condition for this rule definition. 
  `condition` must be one of the following:
  - `FALSE`
  - `TRUE`

Usage  
Use this command to specify a rule definition to analyze user traffic based on the file transfer any match status.

Example  
The following command creates a file transfer rule definition for analyzing user traffic using a file transfer any match status of `FALSE`:

```plaintext
file-transfer any-match = FALSE
```
**file-transfer chunk-number**

This command defines a rule definition to analyze and charge user traffic based on number of chunks in a file transfer.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] file-transfer chunk-number operator value
```

<table>
<thead>
<tr>
<th>Parameter</th>

</tr>
</thead>
<tbody>
<tr>
<td>value</td>
</tr>
<tr>
<td>Specifies the number of chunks for this rule definition. value must be an integer from 1 through 65535.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the number of chunks in a file transfer.

**Example**
The following command creates a file transfer rule definition for analyzing user traffic using 150 number of chunks:

```
file-transfer chunk-number = 150
```
file-transfer current-chunk-length

This command defines a rule definition to analyze and charge user traffic based on length of current chunk in a file transfer.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] file-transfer current-chunk-length \{ operator \} \{ value \}

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:

- ! =: does not equal
- <=: less than or equals
- :=: equals
- >=: greater than or equals

value
Specifies the length in bytes of current chunk for this rule definition. value must be an integer from 1 through 4000000.

Usage
Use this command to specify a rule definition to analyze user traffic based on the length of current chunk in a file transfer.

Example
The following command creates a file transfer rule definition for analyzing user traffic using current length of chunk as 150000 bytes:

file-transfer current-chunk-length = 150000
file-transfer declared-chunk-length

This command defines a rule definition to analyze and charge user traffic based on declared length of chunk in a file transfer.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] file-transfer declared-chunk-length operator value

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
- • ! =: does not equal
- • < =: less than or equals
- • = =: equals
- • > =: greater than or equals

value
Specifies the declared length, in bytes, of chunk for this rule definition.
value must be an integer from 1 through 4000000.

Usage
Use this command to specify a rule definition to analyze user traffic based on the declared length of chunk in a file transfer.

Example
The following command creates a file transfer rule definition for analyzing user traffic using declared length of chunk as 2500000 bytes:

file-transfer declared-chunk-length = 2500000
file-transfer declared-file-size

This command defines a rule definition to analyze and charge user traffic based on declared size of file in a file transfer.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] file-transfer declared-file-size operator size
```

`no`
Removes the specified rule definition.

`operator`
Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
- `!`: does not equal
- `<=`: less than or equals
- `=`: equals
- `>=`: greater than or equals

`size`
Specifies the declared size of file, in bytes, for this rule definition. `size` must be an integer from 1 through 40000000.

**Usage**
Use this command to specify a rule definition to analyze user traffic based on the declared size of file in a file transfer.

**Example**
The following command creates a file transfer rule definition for analyzing user traffic using declared size of file as 2500000 bytes:

```
file-transfer declared-file-size = 2500000
```
file-transfer filename

This command defines a rule definition to analyze and charge user traffic based on declared name of the file in a file transfer.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] file-transfer filename [ case-sensitive ]operator size
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `!=contains`: does not contain
  - `!=ends-with`: does not end with
  - `!=starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **string**
  Specifies the string for this rule definition.
  `string` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the declared name of file in a file transfer.

**Example**

```
The following command creates a file transfer rule definition for analyzing user traffic using declared name of file as *star1*:

```
file-transfer filename contains star1
```
file-transfer previous-state

This command defines a rule definition to analyze and charge user traffic based on the previous state of file transfer.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] file-transfer previous-state operator previous_state

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
  • !=: does not equal
  • ==: equals

previous_state
previous_state must be one of the following:
  • init: Specifies previous state as initialization.
  • request-sent: Specifies previous state as request sent.
  • transfer-error: Specifies previous state as transfer error.
  • transfer-ok: Specifies previous state as transfer ok.

Usage
Use this command to specify a rule definition to analyze user traffic based on a previous state of file transfer.

Example
The following command creates a file transfer rule definition for analyzing user traffic using a previous file transfer state of init:

    file-transfer previous-state = init
file-transfer state

This command defines a rule definition to analyze and charge user traffic based on the current state of file transfer Finite State Machine (FSM).

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] file-transfer state operator state

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:
- !=: does not equal
- ==: equals

state
state must be one of the following
- init: Specifies current state as initialization.
- request-sent: Specifies current state as request sent.
- transfer-error: Specifies current state as transfer error.
- transfer-ok: Specifies current state as transfer ok.

Usage
Use this command to specify a rule definition to analyze user traffic based on state of file transfer. Following table describes the details of file transfer FSM states with event:

<table>
<thead>
<tr>
<th>Event</th>
<th>init</th>
<th>request-sent</th>
<th>transfer-ok</th>
<th>transfer-err</th>
</tr>
</thead>
<tbody>
<tr>
<td>FTP &quot;RETR&quot; command or HTTP &quot;GET&quot; request received with chunk encoding</td>
<td>request-sent</td>
<td>Discarded</td>
<td>Discarded</td>
<td>Discarded</td>
</tr>
<tr>
<td>HTTP 2xx response received</td>
<td>transfer-ok</td>
<td>Discarded</td>
<td>Discarded</td>
<td>Discarded</td>
</tr>
<tr>
<td>HTTP 4xx or HTTP 5xx response received</td>
<td>transfer-error</td>
<td>Discarded</td>
<td>Discarded</td>
<td>Discarded</td>
</tr>
<tr>
<td>FTP reply received with reply status as file transfer complete/successful</td>
<td>Discarded</td>
<td>transfer-ok</td>
<td>Discarded</td>
<td>Discarded</td>
</tr>
<tr>
<td>FTP reply received with reply status as file transfer unsuccessful</td>
<td>Discarded</td>
<td>transfer-error</td>
<td>Discarded</td>
<td>Discarded</td>
</tr>
</tbody>
</table>
Example
The following command creates a file transfer rule definition for analyzing user traffic using a file transfer state of
init:

```
file-transfer state = init
```
file-transfer transferred-file-size

This command defines a rule definition to analyze and charge user traffic based on transferred size of file in a file transfer.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
[ no ] file-transfer transferred-file-size operator size
```

- `no`
  - Removes the specified rule definition.

- `operator`
  - Specifies how to logically match the information in the analyzed field.
    - `operator` must be one of the following:
      - `!=`: does not equal
      - `<=`: less than or equals
      - `=`: equals
      - `>=`: greater than or equals

- `size`
  - Specifies the transferred size of file, in bytes, for this rule definition.
    - `size` must be an integer from 1 through 4000000000.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the transferred size of file in a file transfer.

**Example**

The following command creates a file transfer rule definition for analyzing user traffic using transferred size of file as 2500:

```
file-transfer transferred-file-size = 2500
```
ftp

The following commands define rules for analyzing traffic based on File Transfer Protocol (FTP):
ftp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for FTP.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] ftp any-match operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `! =`: does not equal
  - `= =`: equals

- **condition**
  Specifies the condition for this rule definition. `condition` must be one of the following:
  - `FALSE`
  - `TRUE`

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the FTP any match status.

**Example**

The following command creates an FTP rule definition for analyzing user traffic using an FTP any match status of `FALSE`:

```
ftp any-match = FALSE
```
ftp client-ip-address

This command defines a rule definition to analyze and charge user traffic based on FTP client IP.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] ftp client-ip-address operator ip_address
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!`: does not equal
  - `<=`: less than or equals
  - `=`: equals
  - `>=`: greater than or equals

- **ip_address**
  `ip_address` must be the client’s IP address expressed in IPv4 dotted decimal or IPv6 colon notation.

**Usage**
Use this command to specify a rule definition to analyze user traffic based on an FTP client IP.

**Example**
The following command creates an FTP rule definition for analyzing user traffic using a client IP of `1.1.1.1`:

```
ftp client-ip = 1.1.1.1
```
ftp client-port

This command defines a rule definition to analyze and charge user traffic based on FTP client port.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] ftp client-port operator port
```

- `no`
  Removes the specified rule definition.
- `operator`
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!=`: does not equal
  - `<=`: less than or equals
  - `=`: equals
  - `==>`: greater than or equals
- `port`
  Specifies the port number for this rule definition. `port` must be an integer from 1 through 65535.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on an FTP client port.

**Example**

The following command creates an FTP rule definition for analyzing user traffic using ftp client port 10:

```
ftp client-port = 10
```
ftp command args

This command defines a rule definition to analyze and charge user traffic based on FTP command argument.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] ftp command args [ case-sensitive ] operator argument

no
Removes the specified rule definition.

case-sensitive
Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
• !=: does not equal
• !contains: does not contains
• !ends-with: does not end with
• !starts-with: does not start with
• =: equals
• contains: contains
• ends-with: ends with
• starts-with: starts with

argument
Specifies the argument for this rule definition.
argument must be a string of 1 through 127 characters in length.

Usage
Use this command to specify a rule definition to analyze user traffic based on an FTP command argument.

Example
The following command creates an FTP rule definition for analyzing user traffic using an FTP command argument of test:
ftp command args = test
**ftp command id**

This command defines a rule definition to analyze and charge user traffic based on FTP command ID.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] ftp command id [ operator command_id ]
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. 
  `operator` must be one of the following:
  - `!=`: does not equal
  - `<=`: less than or equals
  - `=`: equals
  - `>=`: greater than or equals

- **command_id**
  Specifies the command identifier for this rule definition.
  In StarOS 9.0 and later, `command_id` must be an integer from 0 through 18.
  In StarOS 8.3 and earlier, `command_id` must be an integer from 0 through 15.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on an FTP command ID.

**Example**

The following command creates an FTP rule definition for analyzing user traffic using an FTP command ID of 10:

```
ftp command id = 10
```
ftp command name

This command defines a rule definition to analyze and charge user traffic based on FTP command name.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```plaintext
[ no ] ftp command name operator command_name
```

</tbody>
</table>
Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP command name.

Example

The following command creates an FTP rule definition for analyzing user traffic using the FTP command name of *list*:

```shell
ftp command name = list
```
ftp connection-type

This command defines a rule definition to analyze and charge user traffic based on FTP connection type.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] ftp connection-type operator connection_type
```

- `no`
  - Removes the specified rule definition.

- `operator`
  - Specifies how to logically match the information in the analyzed field.
  - `operator` must be one of the following:
    - `!=`: does not equal
    - `<=`: less than or equals
    - `==`: equals
    - `>=`: greater than or equals

- `connection_type`
  - Specifies the connection type for this rule definition.
  - `connection_type` must be one of the following:
    - `0`: unknown
    - `1`: control connection
    - `2`: data connection

**Usage**

Use this command to specify a rule definition to analyze user traffic based on an FTP connection type.

**Example**

The following command creates an FTP rule definition for analyzing user traffic using an FTP connection type of 1:

```plaintext
ftp connection-type = 1
```
ftp data-any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for FTP data packets.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```bash
[ no ] ftp data-any-match operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  - `operator` must be one of the following:
    - `! =`: does not equal
    - `= =`: equals

- **condition**
  Specifies the condition for this rule definition.
  - `condition` must be one of the following:
    - `FALSE`
    - `TRUE`

**Usage**
Use this command to specify a rule definition to analyze user traffic based on the any match status for FTP data packets.

**Example**
The following command creates a rule definition for analyzing user traffic using data-any-match status for FTP data packet set as `FALSE`:

```bash
ftp data-any-match = FALSE
```
ftp filename

This command defines a rule definition to analyze and charge user traffic based on FTP file name.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] ftp filename [ case-sensitive ] operator string

no
Removes the specified rule definition.

case-sensitive
Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
• !=: does not equal
• !contains: does not contain
• !ends-with: does not end with
• !starts-with: does not start with
• =: equals
• contains: contains
• ends-with: ends with
• starts-with: starts with

string
Specifies the string for this rule definition. string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage
Use this command to specify a rule definition to analyze user traffic based on an FTP filename.

Example
The following command creates an FTP rule definition for analyzing user traffic using an FTP filename of test:

ftp filename = test
ftp pdu-length

This command defines a rule definition to analyze and charge user traffic based on FTP Protocol Data Unit (PDU) length.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] ftp pdu-length operator pdu_length

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

• !=: does not equal
• <=: less than or equals
• ==: equals
• >=: greater than or equals

pdu_length
Specifies the FTP PDU length, in bytes, for this rule definition.
pdu_length must be an integer from 0 through 65535.

Usage
Use this command to specify a rule definition to analyze user traffic based on FTP PDU length (header + payload) in bytes.

Example
The following command creates an FTP rule definition for analyzing user traffic using an FTP pdu length of 9647 bytes:

ftp pdu-length = 9647
ftp pdu-type

This command defines a rule definition to analyze and charge user traffic based on FTP Protocol Data Unit (PDU) type.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] ftp pdu-type operator pdu_type

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

• !: does not equal
• <=: less than or equals
• =: equals
• =>: greater than or equals

pdu_type
Specifies the PDU type for this rule definition.
pdu_type must be one of the following:

• 0: unknown
• 1: command
• 2: reply

Usage
Use this command to specify a rule definition to analyze user traffic based on an FTP PDU type.

Example
The following command creates an FTP rule definition for analyzing user traffic using an FTP PDU type of 0:

ftp pdu-type = 0
ftp previous-state

This command defines a rule definition to analyze and charge user traffic based on the previous state of FTP.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] ftp previous-state operator previous_state

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
  • !=: does not equal
  • ==: equals

previous_state
Specifies the previous state.
previous_state must be one of the following:
  • command-sent
  • init
  • response-error
  • response-ok

Usage
Use this command to specify a rule definition to analyze user traffic based on a previous state.

Example
The following command creates an FTP rule definition for analyzing user traffic using a previous FTP state of init:

ftp previous-state = init
ftp reply code

This command defines a rule definition to analyze and charge user traffic based on the FTP reply code.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] ftp reply code operator code
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `<=`: less than or equals
  - `=`: equals
  - `>=`: greater than or equals

- **code**
  Specifies the code for this rule definition.
  `code` must be an integer from 100 through 599.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on an FTP reply.

**Example**
The following command creates an FTP rule definition for analyzing user traffic using an FTP reply code of 199:

```
ftp reply code = 199
```
ftp server-ip-address

This command defines a rule definition to analyze and charge user traffic based on the FTP server IP.

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP server IP address.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP server IP of 1.1.1.1:

```
ftp server-ip-address = 1.1.1.1
```
ftp server-port

This command defines a rule definition to analyze and charge user traffic based on the FTP server port.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
[ no ] ftp server-port operator port
```

<table>

<tr>
<th>port</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the FTP server port.</td>
</tr>
<tr>
<td>port must be an integer from 1 through 65535.</td>
</tr>
</tbody>
</table>

Usage
Use this command to specify a rule definition to analyze user traffic based on an FTP server port.

Example
The following command creates an FTP rule definition for analyzing user traffic using ftp server port 25:

```
ftp server-port = 25
```
ftp session-length

This command defines a rule definition to analyze and charge user traffic based on the FTP session-length.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] ftp session-length operator session_length

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
• !=: does not equal
• < <=: less than or equals
• =: equals
• >=: greater than or equals

session_length
Specifies the FTP session length for this rule definition.
session_length must be an integer from 1 through 4000000000.

Usage
Use this command to specify a rule definition to analyze user traffic based on the FTP session’s total length.

Example
The following command creates a rule definition for analyzing user traffic using an FTP session length of 40000:

ftp session-length = 40000
ftp state

This command defines a rule definition to analyze and charge user traffic based on the FTP state.

Product
All

Privilege
Security Administrator, Administrator

Syntax
[
  no
] ftp state operator { close | command-sent | init | response-error | response-ok }

  no
  Removes the specified rule definition.

  operator
  Specifies how to logically match the information in the analyzed field. 
  operator must be one of the following:
  • !=: does not equal
  • ==: equals

  close
  Analyzes FTP transmissions that are in a closed state.

  command-sent
  Analyzes FTP transmissions that are in a command sent state.

  init
  Analyzes FTP transmissions that are in the initialized state.

  response-error
  Analyzes FTP transmissions that are in the response error state.

  response-ok
  Analyzes FTP transmissions that are in the response ok state.

Usage
Use this command to specify a rule definition to analyze user traffic based on the current ftp session state.

Example
The following command creates an FTP rule definition for analyzing user traffic using a current FTP state of open:

[ no ] ftp state operator { close | command-sent | init | response-error | response-ok }
ftp state = open
ftp url

This command defines a rule definition to analyze and charge user traffic based on the FTP URL.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] ftp url [ case-sensitive ] operator string

no
Removes the specified rule definition.

case-sensitive
Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

• !=: does not equal
• !=contains: does not contain
• !=ends-with: does not end with
• !=starts-with: does not start with
• =: equals
• contains: contains
• ends-with: ends with
• starts-with: starts with

string
A unique name that you specify for the FTP URL.
string must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage
Use this command to specify a rule definition to analyze user traffic based on FTP file location/path for transfer.

Example
The following command creates an FTP rule definition for analyzing user traffic using an FTP URL string of ftp://rfc.ietf.org/rfc/rfc1738.txt:
ftp url = ftp://rfc.ietf.org/rfc/rfc1738.txt
ftp user

This command defines a rule definition to analyze and charge user traffic based on the FTP user.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] ftp user [ case-sensitive ] operator ftp_user

- no
  Removes the specified rule definition.

- case-sensitive
  Default: Disabled
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- operator
  Specifies how to logically match the information in the analyzed field.
  operator must be one of the following:
  • !=: does not equal
  • !=contains: does not contain
  • !=ends-with: does not end with
  • !=starts-with: does not start with
  • =: equals
  • contains: contains
  • ends-with: ends with
  • starts-with: starts with

- ftp_user
  A unique name that you specify for the FTP user. ftp_user must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage
Use this command to specify a rule definition to analyze user traffic based on the FTP user.

Example
The following command creates an FTP rule definition for analyzing user traffic using an FTP user of user1:

```
ftp user = user1
```
The following commands define rule for analyzing traffic based on Hypertext Transport Protocol (HTTP):
# http attribute-in-data

This command enables configuring dynamic header field in application payload.

## Product

All

## Privilege

Security Administrator, Administrator

## Syntax

```
[ no ] http attribute-in-data field_name [ case-sensitive ] operator string
```

<table>
<thead>
<tr>

<td>Specifies value of the extension header. field_name must be an alpha and/or numeric string of 1 through 127 characters in length.</td>
</tr>
</tbody>
</table>

## Usage

Use this command to configure dynamic header field in application payload.
http attribute-in-url

This command enables configuring dynamic header field in URL.

Product  
All

Privilege  
Security Administrator, Administrator

Syntax

[ no ] http attribute-in-url field_name [ case-sensitive ] operator string

no
Removes the specified rule definition.

case-sensitive
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive. 
Default: Disabled

operator
Specifies how to logically match the information in the analyzed field. 
operator must be one of the following:
  • !=: does not equal
  • !contains: does not contain
  • !ends-with: does not end with
  • !starts-with: does not start with
  • =: equals
  • contains: contains
  • ends-with: ends with
  • starts-with: starts with

field_name
Specifies the name of the field.  
field_name must be an alpha and/or numeric string of 1 through 31 characters in length.

string
Specifies value of the extension header.  
field_name must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to configure dynamic header field in URL.
http any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for HTTP.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] http any-match [operator condition]
```

- `no`
  Removes the specified rule definition.

- `operator`
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `! =`: does not equal
  - `=`: equals

- `condition`
  Specifies the condition for this rule definition. `condition` must be one of the following:
  - `FALSE`
  - `TRUE`

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the HTTP any match status.

**Example**

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP any match status of FALSE:

```
http any-match = FALSE
```
http content disposition

This command defines a rule definition to analyze and charge user traffic based on the optional “content disposition” field of HTTP entity header.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] http content disposition [ case-sensitive ] operator content_dispos
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  **operator** must be one of the following:
  - !=: does not equal
  - !contains: does not contain
  - !ends-with: does not end with
  - !starts-with: does not start with
  - ==: equals
  - contains: contains
  - ends-with: ends with
  - starts-with: starts with

- **content_dispos**
  This field offers a mechanism for the sender to transmit presentational information to the recipient, allowing each component of a message to be tagged with an indication of its desired presentation semantics.
  **content_dispos** must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on an HTTP content type. This feature is to support RFC 2616 for HTTP and RFC 1806 for Content Disposition.
Example
The following command creates an HTTP rule definition for analyzing user traffic using content-disposition field in an HTTP entity header as *successful*:

```
http content disposition = successful
```
http content length

This command defines a rule definition to analyze and charge user traffic based on HTTP content length.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] http content length operator content_length

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  - `!=`: does not equal
  - `<=`: less than or equals
  - `=`: equals
  - `=>`: greater than or equals

- **content_length**
  Specifies the HTTP body length, in bytes, for this rule definition.
  `content_length` must be an integer from 1 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP content length.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP body length of 10000:

```
http content length = 10000
```
http content type

This command defines a rule definition to analyze and charge user traffic on the basis of content-type field in HTTP entity header.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] http content type [ case-sensitive ] operator content_type

no
Removes the specified rule definition.

case-sensitive
Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:
• !=: does not equal
• !contains: does not contain
• !ends-with: does not end with
• !starts-with: does not start with
• ==: equals
• contains: contains
• ends-with: ends with
• starts-with: starts with

content_type
A unique content type that you specify for the HTTP rule definition. content_type must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage
Use this command to specify a rule definition to analyze user traffic based on content-type field in HTTP entity header.

Example
The following command creates an HTTP rule definition for analyzing user traffic using an HTTP content type of "abc100."

```
http content type = abc100
```
http error

This command defines a rule definition to analyze user traffic for invalid HTTP packets and other errors while parsing HTTP packets.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] http error operator condition

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removes the specified rule definition.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>operator</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies how to logically match the information in the analyzed field.</td>
</tr>
<tr>
<td>operator must be one of the following:</td>
</tr>
<tr>
<td>*!=: does not equal</td>
</tr>
<tr>
<td>*=: equals</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the condition for this rule definition.</td>
</tr>
<tr>
<td>condition must be one of the following:</td>
</tr>
<tr>
<td>*FALSE</td>
</tr>
<tr>
<td>*TRUE</td>
</tr>
</tbody>
</table>

Usage

Use this command to define a rule definition to analyze user traffic for invalid HTTP packets and any other errors while parsing HTTP packets. For example, FSM error, invalid header field values, ACS memory and buffer limit, packet related errors.

ECS supports pipelining of up to 32 HTTP requests on the same TCP connection. Pipeline overflow requests are not analyzed. Such overflow requests are treated as http-error. The billing system, based on this information, decides to charge or not charge, or refund the subscriber accordingly.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP error status of TRUE:

```
http error = TRUE
```
http first-request-packet

This command defines a rule definition to analyze and charge user traffic based on the HTTP first-requestACKET.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] http first-request-packet operator condition
```

- **no**
  - Removes the specified rule definition.

- **operator**
  - Specifies how to logically match the information in the analyzed field.
  - `operator` must be one of the following:
    - `!=`: does not equal
    - `==`: equals

- **condition**
  - Specifies the condition for this rule definition.
  - `condition` must be one of the following:
    - `FALSE`
    - `TRUE`

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the HTTP first request packet.

**Example**

The following command creates an HTTP rule definition for analyzing user traffic testing for the first-request-packet equals `TRUE`:

```
http first-request-packet = TRUE
```
http header-length

This command defines a rule definition to analyze and charge user traffic based on HTTP header length.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] http header-length operator header_length
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!`: does not equal
  - `<`: less than or equals
  - `=`: equals
  - `>`: greater than or equals

- **header_length**
  Specifies the HTTP header length, in bytes, for this rule definition. `header_length` must be an integer from 0 through 65535.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on HTTP header length.

**Example**
The following command creates an HTTP rule definition for analyzing user traffic using an HTTP header length of 10000:

```
http header-length = 10000
```
http host

This command defines a rule definition to analyze and charge user traffic based on HTTP host.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] http host [ case-sensitive ] operator host_name
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  *operator* must be one of the following:
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **host_name**
  A unique name that you specify for the HTTP host.
  *host_name* must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on an HTTP host name.

**Example**

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP host of `host1`:

```
http host host1
```
http host = host1
**http payload-length**

This command defines a rule definition to analyze and charge user traffic based on HTTP payload length.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] http payload-length operator payload_length
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `<=`: less than or equals
  - `==`: equals
  - `>=`: greater than or equals

- **payload_length**
  Specifies the HTTP payload (content) length, in bytes, for this rule definition.
  `payload_length` must be an integer from 1 through 400000000.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on an HTTP payload length.

**Example**

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP payload length of 10000 bytes:

```
http payload-length = 10000
```
http pdu-length

This command defines a rule definition to analyze and charge user traffic based on HTTP Protocol Data Unit (PDU) length.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] http pdu-length operator pdu_length

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:

- \(!=\): does not equal
- \(<\leq\): less than or equals
- \(\leq\): equals
- \(>\leq\): greater than or equals

pdu_length
Specifies the HTTP PDU length, in bytes, for this rule definition. pdu_length must be an integer from 0 through 65535.

Usage
Use this command to specify a rule definition to analyze user traffic based on an HTTP PDU length (header + payload) in bytes.

Example
The following command creates an HTTP rule definition for analyzing user traffic using an HTTP PDU length of 10000 bytes:

http pdu-length = 10000
http previous-state

This command defines a rule definition to analyze and charge user traffic based on HTTP previous state.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] http previous-state operator previous_state

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  operator must be one of the following:
  - `!=`: does not equal
  - `=`: equals

- **previous_state**
  Specifies the HTTP previous state for this rule definition.
  previous_state must be one of the following:
  - `init`: init state
  - `response-error`: response error state
  - `response-ok`: response ok state
  - `waiting-for-response`: waiting for response state

Usage
Use this command to specify a rule definition to analyze user traffic based on an HTTP previous state.

Example
The following command creates an HTTP rule definition for analyzing user traffic using an HTTP previous state of `response-ok`:

```
http previous-state = response-ok
```
http referer

This command defines a rule definition to analyze and charge user traffic based on HTTP referer link.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```plaintext
[ no ] http referer [ case-sensitive ] operator referer_name
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  *operator* must be one of the following:
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **referer_name**
  A unique name that you specify for the HTTP referer.
  *referer_name* must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP referer name. This feature provides the ability to operator to ECS collect or track all URLs visited during a particular subscriber session. These URLs would include the entire string of visited URLs including all referral links. This information output is used in an EDR format to use for reporting or billing functions.

For example, if subscriber begins a web session on his phone and click on the “Sports” link from his home deck and then choose ESPN and from ESPN move to an advertiser link, operator can capture all URLs for
that entire session, and during this period ECS collects the URLs for a particular subscriber session and be limited to time duration or number of URLs visited. ECS supports EDRs for this and EDRs generated contains HTTP URL and the HTTP referer fields along with other fields.

Example
The following command creates an HTTP rule definition for analyzing user traffic using an HTTP referer to cricket.espn.com

```plaintext
http referer = cricket.espn.com
```
http reply code

This command defines a rule definition to analyze and charge user traffic based on HTTP reply.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] http reply code operator reply_code

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:
- !=: does not equal
- <=: less than or equals
- ==: equals
- >=: greater than or equals

reply_code
Specifies the HTTP response for this rule definition. reply_code must be an integer from 100 through 599.

Usage
Use this command to specify a rule definition to analyze user traffic based on an HTTP reply code.

Example
The following command creates an HTTP rule definition for analyzing user traffic using an HTTP reply code of 356:

http reply code = 356
http request method

This command defines a rule definition to analyze and charge user traffic based on HTTP request method.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```plaintext
[ no ] http request method operator request
```

- **no**
  - Removes the specified rule definition.

- **operator**
  - Specifies how to logically match the information in the analyzed field.
  - **operator** must be one of the following:
    - `!=`: does not equal
    - `=`: equals

- **request**
  - Specifies the HTTP request for this rule definition.
  - **request** must be one of the following requests:
    - `connect`
    - `delete`
    - `get`
    - `head`
    - `options`
    - `post`
    - `put`
    - `trace`

Usage

Use this command to specify a rule definition to analyze user traffic based on HTTP request method.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP request method of `connect`:

```plaintext
http request method = connect
```
http session-length

This command defines a rule definition to analyze and charge user traffic based on HTTP session length.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] http session-length operator session_length

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:
- !=: does not equal
- <=: less than or equals
- ==: equals
- >=: greater than or equals

session_length
Specifies the HTTP total session length for this rule definition. session_length must be an integer from 1 through 4000000000.

Usage
Use this command to specify a rule definition to analyze user traffic based on the total HTTP session length.

Example
The following command creates an HTTP rule definition for analyzing user traffic using a total HTTP session length of 200000:

http session-length = 200000
http state

This command defines a rule definition to analyze and charge user traffic based on HTTP state.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] http state operator state

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
• !=: does not equal
• ==: equals

state
Specifies the HTTP state for this rule definition.
state must be one of the following:
• close: closed state
• response-error: response error state
• response-ok: response ok state
• waiting-for-response: waiting for response state

Usage
Use this command to specify a rule definition to analyze user traffic based on an HTTP state.

Example
The following command creates an HTTP rule definition for analyzing user traffic using an HTTP state of init:

    http state = init
http transaction-length

This command defines a rule definition to analyze and charge user traffic based on HTTP transaction length (combined length of one HTTP GET Request message and associated one or more response message).

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] http transaction-length { operator trans_length | { range | !range
range_from to range_to } }
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!`: does not equal
  - `<`: less than or equals
  - `=`: equals
  - `>`: greater than or equals

- **trans_length**
  Specifies the HTTP transaction length, in bytes, for this rule definition.
  `trans_length` must be an integer from 1 through 400000000.

- **range**
  Enables or disables the range criteria for length of transaction.
  `range`: Enables the range criteria for HTTP transaction length.
  `!range`: Disables the range criteria for HTTP transaction length.

- **range_from**
  Specifies the start of range, in bytes, for HTTP transaction length.

- **range_to**
  Specifies the end of range, in bytes, for HTTP transaction length.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on HTTP transaction length (one HTTP GET Request message + one or more associated response message/s) in bytes.

**Example**

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP transaction length of 10200 bytes:

```
http transaction-length = 10200
http transfer-encoding

This command defines a rule definition to analyze and charge user traffic based on HTTP encoding.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```plaintext
[ no ] http transfer-encoding [ case-sensitive ] operator string
```

no
Removes the specified rule definition.

case-sensitive
Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field.
opeator must be one of the following:

- `!`: does not equal
- `!contains`: does not contain
- `!ends-with`: does not end with
- `!starts-with`: does not start with
- `=`: equals
- `contains`: contains
- `ends-with`: ends with
- `starts-with`: starts with

string
A unique name that you specify for HTTP transfer encoding.
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage
Use this command to specify a rule definition to analyze user traffic based on an HTTP transfer encoding string.

Example
The following command creates an HTTP rule definition for analyzing user traffic using an HTTP transfer encoding string of user1:

```
http transfer-encoding = user1
```
http uri

This command defines a rule definition to analyze and charge user traffic based on HTTP uniform resource identifier (URI).

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] http uri [ case-sensitive ] operator string

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
</table>
| Removes the specified rule definition.

<table>
<thead>
<tr>
<th>case-sensitive</th>
</tr>
</thead>
</table>
| Default: Disabled. This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

<table>
<thead>
<tr>
<th>operator</th>
</tr>
</thead>
</table>
| Specifies how to logically match the information in the analyzed field. operator must be one of the following:
- !=: does not equal
- !=contains: does not contain
- !=ends-with: does not end with
- !=starts-with: does not start with
- =: equals
- contains: contains
- ends-with: ends with
- starts-with: starts with

<table>
<thead>
<tr>
<th>string</th>
</tr>
</thead>
</table>
| A unique name that you specify for the HTTP URI. string must be an alpha and/or numeric string of 1 through 127 characters in length. string allows punctuation characters and it does not include the “host” portion.

Usage
Use this command to specify a rule definition to analyze user traffic based on an HTTP URI.

Example
The following command creates an HTTP rule definition for analyzing user traffic using an HTTP URI string of http://www.somehost.com:

```
http uri = http://www.somehost.com
```
http url

This command defines a rule definition to analyze and charge user traffic based on HTTP URL.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] http url [ case-sensitive ] operator string

no
Removes the specified rule definition.

case-sensitive
Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

• !=: does not equal
• !contains: does not contain
• !ends-with: does not end with
• !starts-with: does not start with
• =: equals
• contains: contains
• ends-with: ends with
• starts-with: starts with

string
A unique name that you specify for the HTTP URL.
string must be an alpha and/or numeric string of 1 through 127 characters in length. string allows punctuation characters and includes “host + URI” for HTTP PDUs.
For example, in case of the URL “http://www.google.fr”, the host is “http://www.google.fr”, and the URI is “/”: 

Hypertext Transfer Protocol GET / HTTP/1.1\nRequest Method: GET
Request URI: / Request Version: HTTP/1.1 Accept: */*
Accept-Language: fr
Accept-Encoding: gzip, deflate
User-Agent: Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1; SV1)
Host: www.google.fr
**Usage**

Use this command to specify a rule definition to analyze user traffic based on an HTTP URL.

**Example**

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP URL string of http://rfc.ietf.org/rfc/rfc1738.txt:

```
http url = http://rfc.ietf.org/rfc/rfc1738.txt
```
**http user-agent**

This command defines a rule definition to analyze and charge user traffic based on the user agent information in “user-agent” field of HTTP header.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] http user-agent [ case-sensitive ] operator string
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `!=contains`: does not contain
  - `!=ends-with`: does not end with
  - `!=starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **string**
  This matches the HTTP user agent information in HTTP header.
  `string` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the HTTP “user-agent” field.

**Example**
The following command creates an HTTP rule definition for analyzing user traffic using an HTTP user agent as *xyz.123*:

```
http user-agent = xyz.123
```
http version

This command defines a rule definition to analyze and charge user traffic based on HTTP version information in header.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] http version [ case-sensitive ] operator string

no
Removes the specified rule definition.

case-sensitive
Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
• ! =: does not equal
  • ! contains: does not contain
  • ! ends-with: does not end with
  • ! starts-with: does not start with
  • =: equals
  • contains: contains
  • ends-with: ends with
  • starts-with: starts with

string
This matches the HTTP version information in HTTP header.
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage
Use this command to specify a rule definition to analyze user traffic based on the HTTP version.

Example
The following command creates an HTTP rule definition for analyzing user traffic using an HTTP version of http/2:

http version
http version = http4.2
**http x-header**

This command configures and matches rules based on extension-headers (x-headers). All x-header fields must begin with “x-.”

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] http x-header name [ case-sensitive ] operator string
```

- **no**
  Removes the specified rule definition.

- **name**
  A unique value that you specify to use for the x-header.
  `name` must be an alpha and/or numeric string of 1 through 31 characters in length.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **string**
  This matches the HTTP x-header information in HTTP header.
  `string` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

**Usage**
Use this command to configure and match rules based on extension-headers (x-headers). This allows additional header fields to be defined without changing the protocol. The extension-header can be any header fields which are not specified in RFC.

**Example**
The following command creates a rule definition for analyzing user traffic containing extension-header of *test_field* and value of *test_string*:

```
http x-header test_field = test_string
```

icmp

The following commands define rules for analyzing traffic based on Internet Control Message Protocol (ICMP):
icmp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for ICMP.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] icmp any-match operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. 
  `operator` must be one of the following:
  - `! =`: does not equal
  - `= :`: equals

- **condition**
  Specifies the condition for this rule definition. 
  `condition` must be one of the following:
  - `FALSE`
  - `TRUE`

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the icmp analyzed state.

**Example**

The following command creates a icmp rule definition for analyzing user traffic using an ICMP any match state of `FALSE`.

```
icmp any-match = FALSE
```
icmp code

This command defines a rule definition to analyze and charge user traffic based on the ICMP code.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] icmp code operator code
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!`: does not equal
  - `<`: less than or equals
  - `=`: equals
  - `>`: greater than or equals

- **code**
  Specifies the ICMP code is for this rule definition. `code` must be an integer from 0 through 255.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the ICMP code.

**Example**

The following command creates an ICMP rule definition for analyzing user traffic using an ICMP code as 23:

```
icmp code = 23
```
icmp type

This command defines a rule definition to analyze and charge user traffic based on the ICMP type.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] icmp type operator type
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!`: does not equal
  - `<`: less than or equals
  - `=`: equals
  - `>`: greater than or equals

- **type**
  Specifies the ICMP type for this rule definition.
  `type` must be an integer from 0 through 255. For example, 0 for ECHO Reply, 3 for Destination Unreachable, and 5 for Redirect.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the ICMP type.

**Example**

The following command creates an ICMP rule definition for analyzing user traffic using an ICMP type as 123:

```
icmp type = 123
```
icmpv6

The following commands define rules for analyzing traffic based on Internet Control Message Protocol Version 6 (ICMPv6).
icmpv6 any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for Internet Control Message Protocol Version 6 (ICMPv6).

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] icmpv6 any-match operator condition

- no
  Removes the specified rule definition.

- operator
  Specifies how to logically match the information in the analyzed field.
  operator must be one of the following:
  • ! =: does not equal
  • =: equals

- condition
  Specifies the condition for this rule definition.
  condition must be one of the following:
  • FALSE
  • TRUE

Usage
Use this command to specify a rule definition to analyze user traffic based on the ICMPv6 analyzed state.

Example
The following command creates an ICMPv6 rule definition for analyzing user traffic using an ICMPv6 any match state of FALSE:

    icmpv6 any-match = FALSE
**icmpv6 code**

This command defines a rule definition to analyze and charge user traffic based on the ICMPv6 code.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] icmpv6 code operator code
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `<=`: less than or equals
  - `=`: equals
  - `>=`: greater than or equals

- **code**
  Specifies the ICMPv6 code is for this rule definition.
  `code` must be an integer from 0 through 255.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the ICMPv6 code.

**Example**

The following command creates an ICMPv6 rule definition for analyzing user traffic using an ICMPv6 code as 23:

```
icmpv6 code = 23
```
icmpv6 type

This command defines a rule definition to analyze and charge user traffic based on the ICMPv6 type.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] icmpv6 type operator type
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  - `!` or `!=`: does not equal
  - `<` or `<=`: less than or equals
  - `=`: equals
  - `>` or `>=`: greater than or equals

- **type**
  Specifies the ICMPv6 type for this rule definition.
  `type` must be an integer from 0 through 255. For example, 0 for ECHO Reply, 3 for Destination Unreachable, and 5 for Redirect.

**Usage**
Use this command to specify a rule definition to analyze user traffic based on the ICMPv6 type.

**Example**
The following command creates an ICMPv6 rule definition for analyzing user traffic using an ICMPv6 type as 123:

```
icmpv6 type = 123
```
if-protocol

This command allows different content IDs with certain protocols to be associated with the same.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
if-protocol [ http | wsp-connection-less | wsp-connection-oriented ] content-id content_id
```

```
no if-protocol [ http | wsp-connection-less | wsp-connection-oriented ]
```

**no**

Removes the specified rule definition.

**http**

Specifies HTTP protocol for the rule definition.

**wsp-connection-less**

This routes the packets to WSP connection less protocol.

**wsp-connection-oriented**

This routes the packets to WSP connection oriented protocol.

**content-id content_id**

Specifies content ID used to give to the rule definition.

`content_id` must be an integer from 1 through 65535.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on if-protocol.

**Example**

The following command creates an if-protocol rule definition for analyzing user traffic using http and a content ID of 23:

```
if-protocol http content-id 23
```
The following commands define rules for analyzing traffic based on Internet Message Access Protocol (IMAP):
imap any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for IMAP message packets.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] imap any-match operator condition

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:

• !=: does not equal
• =: equals

condition
Specifies the condition for this rule definition. condition must be one of the following:

• FALSE
• TRUE

Usage
Use this command to specify a rule definition to analyze user traffic based on the any-match analyzed state.

Example
The following command creates IMAP rule definition for analyzing user traffic using an IMAP any match state of FALSE:

imap any-match = FALSE
imap cc

This command defines a rule definition to analyze and charge user traffic based on the recipient address in the Carbon Copy (cc) field of e-mail in the IMAP message.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] imap cc [ case-sensitive ] operator cc_address
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  The `operator` must be one of the following:
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **cc_address**
  Specifies the string for this rule definition.
  The `cc_address` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the recipient address in the “cc” field of e-mail in the IMAP message of analyzed state.

**Example**
The following command creates IMAP rule definition for analyzing user traffic using recipient address `triangular@xyz.com` in the “cc” field of e-mail in the IMAP message:

```
imap cc contains triangular@xyz.com
```
imap command

This command defines a rule definition to analyze and charge user traffic based on the embedded IMAP commands in the IMAP message.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] imap command operator commands
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `! =`: does not equal
  - `=`: equals

- **commands**
  Specifies the command for this rule definition.
  `commands` must be one of the following:
  - `append`
  - `authenticate`
  - `capability`
  - `check`
  - `close`
  - `copy`
  - `create`
  - `delete`
  - `examine`
  - `expunge`
  - `fetch`
  - `list`
  - `login`
  - `logout`
  - `lsUB`
  - `noop`
imap command

• rename
• search
• select
• starttls
• status
• store
• subscribe
• uid-copy
• uid-fetch
• uid-search
• uid-store
• unsubscribe

Usage
Use this command to specify a rule definition to analyze user traffic based on the embedded command in the IMAP message of analyzed state.

Example
The following command creates IMAP rule definition for analyzing user traffic using presence of close command in the IMAP message;

imap command = close
imap content class

This command defines a rule definition to analyze and charge user traffic based on the “content-class” field of e-mail in the IMAP message.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] imap content class [ case-sensitive ] operator content_class

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  **operator** must be one of the following:
  - • !=: does not equal
  - • !contains: does not contain
  - • !ends-with: does not end with
  - • !starts-with: does not start with
  - • =: equals
  - • contains: contains
  - • ends-with: ends with
  - • starts-with: starts with

- **content_class**
  Specifies the string for this rule definition.
  **content_class** must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the “content-class” field of e-mail in the IMAP message of analyzed state.

Example
The following command creates IMAP rule definition for analyzing user traffic using content class as `javax.mail.internet.MimeMultipart` in the "content-class" field of e-mail in the IMAP message:

```
imap content class contains javax.mail.internet.MimeMultipart
```
imap content type

This command defines a rule definition to analyze and charge user traffic based on the “content-type” field of e-mail in the IMAP message.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] imap content type [ case-sensitive ] operator content_type

no
Removes the specified rule definition.

case-sensitive
Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
- !=: does not equal
- !contains: does not contain
- !ends-with: does not end with
- !starts-with: does not start with
- =: equals
- contains: contains
- ends-with: ends with
- starts-with: starts with

content_type
Specifies the string for this rule definition.
content_type must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage
Use this command to specify a rule definition to analyze user traffic based on the “content-type” field of e-mail in the IMAP message of analyzed state.

Example
The following command creates IMAP rule definition for analyzing user traffic using content type `TEXT/plain; charset=iso-8859-1` in the 'content-type' field of e-mail in the IMAP message:

```
imap content type contains TEXT/plain; charset=iso-8859-1
```
**imap date**

This command defines a rule definition to analyze and charge user traffic based on the “date” field of e-mail in the IMAP message.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] imap date [ case-sensitive ] operator date
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **date**
  Specifies the string for this rule definition.
  `date` must be an alpha and/or numeric string of 1 through 127 characters in length.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the “date” field of e-mail in the IMAP message of analyzed state.

**Example**
The following command creates IMAP rule definition for analyzing user traffic using date Fri, 21 Nov 1997 11:00:00 -0600 in the “date” field of e-mail in the IMAP message:

```
imap date contains Fri, 21 Nov 1997 11:00:00 -0600
```
imap final-reply

This command defines a rule definition to analyze and charge user traffic based on the “final-reply” value of the last IMAP final-reply message.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] imap final-reply operator condition

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:
  • !=: does not equal
  • ==: equals

condition
Specifies the ‘final-reply’ condition value for the last IMAP final-reply message to match the information in the analyzed field. condition must be one of the following:
  • bad: final reply is invalid or bad.
  • no: there is no final reply.
  • ok: final reply is valid.

Usage
Use this command to specify a rule definition to analyze user traffic based on using the final-reply value of the last IMAP final-reply message of analyzed state.

Example
The following command creates IMAP rule definition for analyzing user traffic using the final-reply condition value as bad for the last IMAP final-reply message:

imap final-reply = bad
**imap from**

This command defines a rule definition to analyze and charge user traffic based on the “from” field of e-mail in the IMAP message.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] imap from [ case-sensitive ] operator from_string
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `< ! = >`: does not equal
  - `< ! contains >`: does not contain
  - `< ! ends-with >`: does not end with
  - `< ! starts-with >`: does not start with
  - `< = >`: equals
  - `< contains >`: contains
  - `< ends-with >`: ends with
  - `< starts-with >`: starts with

- **from_string**
  Specifies the string for this rule definition.
  `from_string` must be an alpha and/or numeric string of 1 through 127 characters in length.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the “from” field of e-mail in the IMAP message of analyzed state.
The following command creates IMAP rule definition for analyzing user traffic using occurrence of triangular in the “from” field of e-mail in the IMAP message:

```
imap from contains triangular
```
imap mail-size

This command defines a rule definition to analyze and charge user traffic based on the size of e-mail in retrieved by IMAP from server.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] imap mail-size operator mail_size

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:

• !=: does not equal
• <:= less than or equals
• :=: equals
• >=: greater than or equals

mail_size
Specifies the total size of mail in bytes retrieved by IMAP from server for this rule definition. mail_size must be an integer from 0 through 4000000000.

Usage
Use this command to specify a rule definition to analyze user traffic based on the size of e-mail in the IMAP message of analyzed state. This rule uses size of the given mail retrieved by IMAP from server.

Example
The following command creates IMAP rule definition for analyzing user traffic using size of e-mail as less than or equal to 23400 bytes in the IMAP message:

imap mail-size <= 23400
imap mailbox-size

This command defines a rule definition to analyze and charge user traffic based on the number of e-mail messages in a mailbox of an IMAP e-mail user.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] imap mailbox-size operator mail_qty

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
- !: does not equal
- <: less than or equals
- =: equals
- =>: greater than or equals

mail_qty
Specifies the total number of e-mail messages in a mailbox of the IMAP user for this rule definition.
mail_qty must be an integer from 0 through 65535.

Usage
Use this command to specify a rule definition to analyze user traffic based on the size of mailbox of an IMAP message user of analyzed state. This rule uses number of E-mails messages contained in a mailbox.

Example
The following command creates IMAP rule definition for analyzing user traffic using number of e-mail messages in a mailbox to less than or equal to 1024:

imap mailbox-size <= 1024
imap message-type

This command defines a rule definition to analyze and charge user traffic based on the type of message in IMAP packet header.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```bash
[ no ] imap message-type operator type
```

<table>
<thead>
<tr>
<th>no</th>
<th>Removes the specified rule definition.</th>
</tr>
</thead>
<tbody>
<tr>
<td>operator</td>
<td>Specifies how to logically match the information in the analyzed field. operator must be one of the following:</td>
</tr>
<tr>
<td></td>
<td>• !=: does not equal</td>
</tr>
<tr>
<td></td>
<td>• ==: equals</td>
</tr>
<tr>
<td>condition</td>
<td>Specifies the message-type condition/value for the IMAP e-mail message to match the information in the analyzed field. condition must be one of the following:</td>
</tr>
<tr>
<td></td>
<td>• command-continuation-reply: message with command-continuation-reply type.</td>
</tr>
<tr>
<td></td>
<td>• final-reply: message is of final reply type.</td>
</tr>
<tr>
<td></td>
<td>• request: there is of request type.</td>
</tr>
<tr>
<td></td>
<td>• untagged-reply: message of reply type, but without any tag.</td>
</tr>
</tbody>
</table>

Usage
Use this command to specify a rule definition to analyze user traffic based on using the type of message in “message-type” filed of the last IMAP message of analyzed state.

Example
The following command creates IMAP rule definition for analyzing user traffic using the message type as request for the IMAP message:

```bash
imap message-type = request
```
**imap previous-state**

This command defines a rule definition to analyze and charge user traffic based on the previous state of IMAP message.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] imap previous-state operator state
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  *operator* must be one of the following:
  - `!=`: does not equal
  - `==`: equals

- **state**
  Specifies the previous state of the IMAP message to match the information in the analyzed field.
  *state* must be one of the following:
  - `init`: message in initialization state.
  - `request-sent`: message in request-sent state.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on using the previous state of the IMAP message of analyzed state.

**Example**

The following command creates IMAP rule definition for analyzing user traffic using the previous state as *init* of the IMAP message which was in initialization state:

```
imap previous-state = init
```
imap session-length

This command defines a rule definition to analyze and charge user traffic based on the IMAP session length.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] imap session-length operator session_length
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!`: does not equal
  - `<`: less than
  - `<=`: less than or equals
  - `=`: equals
  - `>=`: greater than or equals

- **session_length**
  Specifies the total length of IMAP session, in bytes, for this rule definition.
  `session_length` must be an integer from 1 through 4000000000.

**Usage**
Use this command to specify a rule definition to analyze user traffic based on the length of IMAP session of the analyzed state.
The session length is calculated by adding together the IP payloads (i.e., starting after the IP header) of all relevant IMAP session packets.

**Example**
The following command creates IMAP rule definition for analyzing user traffic using session length as less than or equal to 4000 bytes for the IMAP session:

```
imap session-length <= 4000
```
imap session-previous-state

This command defines a rule definition to analyze and charge user traffic based on the previous state of IMAP session.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] imap session-previous-state operator state
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. **operator** must be one of the following:
  - `!`: does not equal
  - `=`: equals

- **state**
  Specifies the previous state of the IMAP session to match the information in the analyzed field. **state** must be one of the following:
  - `authenticated`: session authenticated
  - `connected`: session connected
  - `init`: session initialized
  - `mailbox-selected`: mailbox selected

**Usage**

Use this command to specify a rule definition to analyze user traffic based on using the previous state of the IMAP session of analyzed state.

**Example**

The following command creates IMAP rule definition for analyzing user traffic using the previous state as `init` of the IMAP session which was initialized:

```
imap session-previous-state = init
```
imap session-state

This command defines a rule definition to analyze and charge user traffic based on the current state of IMAP session.

Product

</tr>
</tbody>
</table>

Usage

Use this command to specify a rule definition to analyze user traffic based on using the current state of the IMAP session of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using the current state as connected of the IMAP session which is in connecting state:

```
imap session-state = connected
```
**imap state**

This command defines a rule definition to analyze and charge user traffic based on the current state of IMAP request message.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] imap state operator state
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  *operator* must be one of the following:
  - `! =`: does not equal
  - `= =`: equals

- **state**
  Specifies the current state of the IMAP request message to match the information in the analyzed field.
  *state* must be one of the following:
  - `request-sent`: request message sent
  - `response-fail`: request response failed
  - `response-ok`: request response is good

**Usage**

Use this command to specify a rule definition to analyze user traffic based on using the current state of the IMAP request message of analyzed state.

**Example**

The following command creates IMAP rule definition for analyzing user traffic using the current state as `response-fail` of the IMAP request message when request response is failed:

```
imap state = response-fail
```
imap subject

This command defines a rule definition to analyze and charge user traffic based on the ‘subject’ field of e-mail in the IMAP message.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] imap subject [ case-sensitive ]operatorsubject

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  **operator** must be one of the following:
  - !:= does not equal
  - !contains: does not contain
  - !ends-with: does not end with
  - !starts-with: does not start with
  - := equals
  - contains: contains
  - ends-with: ends with
  - starts-with: starts with

- **subject**
  Specifies the string for this rule definition.
  **subject** must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the “subject” field of e-mail in the IMAP message of analyzed state.

Example
The following command creates IMAP rule definition for analyzing user traffic using occurrence of *My test* in the “subject” field of e-mail in the IMAP message:

```
imap subject contains My test
```
imap to

This command defines a rule definition to analyze and charge user traffic based on the ‘to’ field of e-mail in the IMAP message.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
[ no ] imap to [ case-sensitive ] operatorsubject
```

- **no**
  - Removes the specified rule definition.

- **case-sensitive**
  - Default: Disabled.
  - This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  - Specifies how to logically match the information in the analyzed field.
  - `operator` must be one of the following:
    - `!`: does not equal
    - `!contains`: does not contain
    - `!ends-with`: does not end with
    - `!starts-with`: does not start with
    - `=`: equals
    - `contains`: contains
    - `ends-with`: ends with
    - `starts-with`: starts with

- **to**
  - Specifies the string for this rule definition.
  - `to` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the “to” field of e-mail in the IMAP message of analyzed state.

**Example**

```
The following command creates IMAP rule definition for analyzing user traffic using occurrence of \textit{xyz.com} in the “to” field of e-mail in the IMAP message:

\texttt{imap to contains xyz.com}
The following commands define rules for analyzing traffic based on Internet Protocol (IP):
**ip any-match**

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for IP.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] ip any-match [ operator ] [ condition ]
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!`: does not equal
  - `=`: equals

- **condition**
  Specifies the condition for this rule definition.
  `condition` must be one of the following:
  - `FALSE`
  - `TRUE`

**Usage**
Use this command to specify a rule definition to analyze user traffic based on the IP analyzed state.

**Example**
The following command creates IP rule definition for analyzing user traffic using an IP any match state of `FALSE`:

```
ip any-match = FALSE
```
ip downlink

This command defines a rule definition to analyze and charge user traffic matching the direction of IP packet to downlink (to subscriber).

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] ip downlink operator condition

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
- ! =: does not equal
- =: equals

condition
Specifies the condition for this rule definition.
condition must be one of the following:
- FALSE
- TRUE

Usage
Use this command to specify a rule definition to analyze user traffic based on the IP packet direction as downlink.

Example
The following command creates IP rule definition for analyzing user traffic using an IP packet direction to downlink (to subscriber):

ip downlink = TRUE
ip dst-address

This command defines a rule definition to analyze and charge user traffic based on IP destination address.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] ip dst-address { operator { ip_address|ip_address/mask } | { !range | range } host-pool host_pool }

- **no**
  Removes the specified rule definition.

- **operator { ip_address | ip_address/mask }**
  - **operator**: Specifies how to logically match the IP destination address.
  - Must be one of the following:
    - `!=`: does not equal
    - `<=`: less than or equals
    - `=`: equals
    - `>=`: greater than or equals
  - **ip_address**: Specifies IP address of the destination node for outgoing traffic in IPv4 or IPv6 standard notation. `ip_address` must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation.
  - **ip_address/mask**: Specifies IP address of the destination node for outgoing traffic in IPv4 or IPv6 standard notation with subnet mask bit. `ip_address/mask` must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

- **{ !range | range } host-pool host_pool**
  - **!range | range**: Specifies the range criteria:
    - `!range`: Not in the range of
    - `range`: In the range of
  - **host-pool host_pool**: Specifies the host pool name. `host_pool` must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on IP destination address.

Example
The following command creates IP rule definition for analyzing user traffic using an IP destination address of 1.1.1.1:

```
ip dst-address = 1.1.1.1
```
ip error

This command defines a rule definition to analyze user traffic for invalid IP packets and other errors while parsing IP packets.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] ip error operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  *operator* must be one of the following:
  - $!=$: does not equal
  - $=$: equals

- **condition**
  Specifies the condition for this rule definition.
  *condition* must be one of the following:
  - *FALSE*
  - *TRUE*

**Usage**

Use this command to define a rule definition to analyze user traffic for invalid IP packets and any other errors while parsing IP packets.

**Example**

The following command creates an IP rule definition for analyzing user traffic using an IP error status of *TRUE*:

```
ip error = TRUE
```
ip protocol

This command defines a rule definition to analyze and charge user traffic based on the protocol being transported by IP packets.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] ip protocol operator{protocol_assignment|protocol }
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the IP protocol.
  `operator` must be one of the following:
  - `!=`: Does not equal
  - `<=`: Less than equals—available only in StarOS 8.1 and later
  - `=`: Equals
  - `>=`: greater than equals—available only in StarOS 8.1 and later

- **protocol_assignment**
  Specifies the protocol by assignment number.
  `protocol_assignment` must be an integer from 0 through 255.
  For example, 1 for ICMP, 6 for TCP, and 17 for UDP.

- **protocol**
  Specifies the protocol by name. `protocol` must be one of the following:
  - `ah`
  - `esp`
  - `gre`
  - `icmp`
  - `icmpv6`
  - `tcp`
  - `udp`

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the IP protocol.
Example
The following command creates IP rule definition for analyzing user traffic using a protocol assignment of 2:

```
ip protocol = 2
```
**ip server-ip-address**

This command defines a rule definition to analyze and charge user traffic matching the IP address of the destination, i.e. from the subscriber, of the connection.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] ip server-ip-address { operator { ip_address | ip_address/mask } | { !range | range } host-pool host_pool }
```

- **no**
  Removes the specified rule definition.

- **operator { ip_address | ip_address/mask }**
  **operator**: Specifies how to logically match the server IP address. `operator` must be one of the following:
  - `!=`: does not equal
  - `<=`: less than or equals
  - `==`: equals
  - `=>`: greater than or equals

- **ip_address**: Specifies the server IP address in IPv4 or IPv6 standard notation. For uplink packets (from subscriber) this field matches the destination IP address in the IP header, and for downlink packets (to the subscriber) it matches the source IP address in IP header. `ip_address` must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation.

- **ip_address/mask**: Specifies the server IP address in IPv4 or IPv6 standard notation with subnet mask bit. For uplink packets (from subscriber) this field matches the destination IP address in the IP header, and for downlink packets (to the subscriber) it matches the source IP address in IP header. `ip_address/mask` must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

- **{ !range | range } host-pool host_pool**

  **!range | range**: Specifies the range criteria:
  - `!range`: Not in the range of
  - `range`: In the range of

  **host-pool host_pool**: Specifies the host pool name. `host_pool` must be a string of 1 through 63 characters in length.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the server IP address.
Example
The following command creates an IP rule definition for analyzing user traffic using an IP server address of 1.10.1.1:

```
  ip server-ip-address = 1.10.1.1
```
ip src-address

This command defines a rule definition to analyze and charge user traffic based on IP source address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip src-address { operator { ip_address | ip_address/mask } | { !range | range } } host-pool host_pool
```

no

Removes the specified rule definition.

```
operator { ip_address | ip_address/mask }
```

operator: Specifies how to logically match the IP source address.

```
operator must be one of the following:
- !: does not equal
- <=: less than or equals
- =: equals
- >=: greater than or equals
```

```
ip_address: Specifies IP address of the source node for incoming traffic in IPv4 or IPv6 standard notation. ip_address must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation.
```

```
ip_address/mask: Specifies IP address of the source node for incoming traffic in IPv4 or IPv6 standard notation with subnet mask bit. ip_address/mask must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.
```

```
{ !range | range } host-pool host_pool
```

```
!range | range: Specifies the range criteria:
- !range: Not in the range of
- range: In the range of
```

```
host-pool host_pool: Specifies the host pool name. host_pool must be a string of 1 through 63 characters in length.
```

Usage

Use this command to specify a rule definition to analyze user traffic based on IP source address.

Example

The following command creates an IP rule definition for analyzing user traffic using an IP source address of 1.1.1.1:
ip src-address = 1.1.1.1
ip subscriber-ip-address

This command defines a rule definition to analyze and charge user traffic matching the IP address of the subscriber (either source address or destination address).

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] ip subscriber-ip-address { operator { ip_address | ip_address/mask } | { !range | range } host-pool host_pool }

no
Removes the specified rule definition.

operator { ip_address | ip_address/mask }
operator: Specifies how to logically match the subscriber IP address.
operator must be one of the following:
  • ! =: does not equal
  • <=: less than or equals
  • =: equals
  • >=: greater than or equals

ip_address: Specifies the subscriber IP address. Depending on the direction of packet this IP address will be either the IP source address or the IP destination address. ip_address must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation.
ip_address/mask: Specifies the subscriber IP address with subnet mask bit. Depending on the direction of packet this IP address will either be the IP source address or the IP destination address.
ip_address/mask must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

{ !range | range } host-pool host_pool

!range | range: Specifies the range criteria:
  • !range: Not in the range of
  • range: In the range of

host-pool host_pool: Specifies the host pool name. host_pool must be a string of 1 through 63 characters in length.

Usage
Use this command to specify a rule definition to analyze user traffic based on the subscriber IP address.
Example
The following command creates an IP rule definition for analyzing user traffic using an IP address of 161.10.1.1 for subscriber:

```
ip subscriber-ip-address = 161.10.1.1
```
ip total-length

This command defines a rule definition to analyze and charge user traffic based on IP total length.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] ip total-length operator total_length

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. 
  `operator` must be one of the following:
  - `!=`: does not equal
  - `<=`: less than or equals
  - `==`: equals
  - `>=`: greater than or equals

- **total_length**
  Specifies the total length of the IP packet including payload that is for this rule definition. 
  `total_length` must be an integer from 0 through 4096.

Usage

Use this command to specify a rule definition to analyze user traffic based on the IP total length.

Example

The following command creates an IP rule definition for analyzing user traffic using an IP total length of 2000 bytes:

```
ip total-length = 2000
```
ip uplink

This command defines a rule definition to analyze and charge user traffic matching the direction of IP packet to uplink (from subscriber).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[ no ] ip uplink operator condition

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field. operator must be one of the following:

- ! =: does not equal
- =: equals

condition

Specifies the condition for this rule definition. condition must be one of the following:

- FALSE
- TRUE

Usage

Use this command to specify a rule definition to analyze user traffic based on the IP packet direction as uplink.

Example

The following command creates IP rule definition for analyzing user traffic using an IP packet direction to uplink (from subscriber):

    ip uplink = TRUE
ip version

This command defines a rule definition to analyze and charge user traffic based on the IP version.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] ip version operator ip_version

**no**
Removes the specified rule definition.

**operator**
Specifies how to logically match information in the analyzed field. 
operator must be = (equals).

**ip_version**
Specifies the IP version. ip_version must be one of the following:
-IPv4
-IPv6

Usage
Use this command to define a rule definition to analyze and charge user traffic based on the IP version.

Example
The following command creates an IP rule definition to analyze user traffic for the IP version IPv6:

```
ip version = ipv6
```
mms

The following commands define rules for analyzing traffic based on Multimedia Messaging Service (MMS):
mms any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for MMS.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] mms any-match operator condition

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
• ! =: does not equal
• =: equals

condition
Specifies the condition for this rule definition.
condition must be one of the following:
• FALSE
• TRUE

Usage
Use this command to specify a rule definition to analyze user traffic based on the mms any match status.

Example
The following command creates an MMS rule definition for analyzing user traffic using an MMS any match status of FALSE:

mms any-match = FALSE
mms bcc

This command defines a rule definition to analyze and charge user traffic based on MMS Blind Carbon Copy (BCC).

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] mms bcc [ case-sensitive ] operator string

no
Removes the specified rule definition.

case-sensitive
Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
• !=: does not equal
• !contains: does not contain
• !ends-with: does not end with
• !starts-with: does not start with
• ==: equals
• contains: contains
• ends-with: ends with
• starts-with: starts with

string
Specifies the string for this rule definition.
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage
Use this command to specify a rule definition to analyze user traffic based on an MMS BCC value.

Example
The following command creates an MMS rule definition for analyzing user traffic containing an MMS BCC value of test1:

mms bcc test1
mms bcc contains test1
mms cc

This command defines a rule definition to analyze and charge user traffic based on the Carbon Copy (cc) field of MMS message.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
[ no ] mms cc [ case-sensitive ]operator string
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  The operator must be one of the following:
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **string**
  Specifies the string for this rule definition.
  The string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS cc value.

Example
The following command creates an MMS rule definition for analyzing user traffic containing an MMS CC value of test1:

```
mms cc contains test1
```
mms content location

This command defines a rule definition to analyze and charge user traffic based on MMS content location.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```bash
[ no ] mms content location [ case-sensitive ] operator string
```

**no**
Removes the specified rule definition.

**case-sensitive**
Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

**operator**
Specifies how to logically match the information in the analyzed field.

- `!=`: does not equal
- `!contains`: does not contain
- `!ends-with`: does not end with
- `!starts-with`: does not start with
- `=`: equals
- `contains`: contains
- `ends-with`: ends with
- `starts-with`: starts with

**string**
Specifies the string for this rule definition.

*string* must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS content location value.

Example
The following command creates an MMS rule definition for analyzing user traffic containing an MMS content location value of test1:

```
mms content location contains test1
```
mms content type

This command defines a rule definition to analyze and charge user traffic based on MMS content type.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```plaintext
[ no ] mms content type [ case-sensitive ] operator string
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  *operator* must be one of the following:
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **string**
  Specifies the string for this rule definition.
  *string* must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS “content-type” field value.

Example

The following command creates an MMS rule definition for analyzing user traffic containing an MMS content type as `image`: 
mms content type contains image
mms downlink

This command defines the rule definition to analyze and charge user traffic based on MMS message downlink condition.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] mms downlink operator condition

no
Removes the specified rule definition.

operator
 Specifies how to logically match the information in the analyzed field. operator must be one of the following:
- !=: does not equal
- ==: equals

condition
Indicates the downlink (from the Mobile Node direction) status. condition must be one of the following:
- FALSE
- TRUE

Usage
Use this command to specify a rule definition to analyze user traffic based on an MMS downlink status.

Example
The following command creates an MMS rule definition for analyzing user traffic with an MMS downlink value to TRUE:

mms downlink = TRUE
**mms from**

This command defines the rule definition to analyze and charge user traffic based on the from field in MMS message.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] mms from [ case-sensitive ] operator string
```

- **no**
  
  Removes the specified rule definition.

- **case-sensitive**
  
  Default: Disabled.
  
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  
  Specifies how to logically match the information in the analyzed field.
  
  `operator` must be one of the following:
  
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with` : ends with
  - `starts-with`: starts with

- **string**
  
  Specifies the string for this rule definition.
  
  `string` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the “from” field of an MMS message.

**Example**

...
The following command creates an MMS rule definition for analyzing user traffic containing `test1` in the “from” field of MMS message:

```
mms from contains test1
```
mms message-id

This command defines a rule definition to analyze and charge user traffic based on the “message-id” of an MMS message.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] mms message-id [ case-sensitive ] operator string

no
Removes the specified rule definition.

case-sensitive
Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

• !=: does not equal
• !(contains): does not contain
• !(ends-with): does not end with
• !(starts-with): does not start with
• ==: equals
• contains: contains
• ends-with: ends with
• starts-with: starts with

string
Specifies the string for this rule definition.
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage
Use this command to specify a rule definition to analyze user traffic based on an MMS message ID value.

Example
The following command creates an MMS rule definition for analyzing user traffic containing an MMS message ID of test1:

```
mms message-id contains test1
```
mms pdu-type

This command defines a rule definition to analyze and charge user traffic based on the MMS Protocol Data Unit (PDU) type.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] mms pdu-type operator pdu_type

- no
  Removes the specified rule definition.

- operator
  Specifies how to logically match the information in the analyzed field.
  operator must be one of the following:
  • !=: does not equal
  • ==: equals

- pdu_type
  Specifies the MMS PDU type used for this rule definition.
  pdu_type must be one of the following:
  • mms-pdu-type-m-acknowledge-ind
  • mms-pdu-type-m-delivery-ind
  • mms-pdu-type-m-http-get
  • mms-pdu-type-m-notification-ind
  • mms-pdu-type-m-notify-rsp-ind
  • mms-pdu-type-m-retrieve-conf
  • mms-pdu-type-m-send-conf
  • mms-pdu-type-m-send-request
  • mms-pdu-type-m-wsp-get
  • mms-pdu-type-m-response

Usage
Use this command to specify a rule definition to analyze user traffic based on type of an MMS PDU.

Example
The following command creates an MMS rule definition for analyzing user traffic for MMS PDU:

```
  mms_pdu-type = mms_pdu-type-m-http-get
```
**mms previous-state**

This command defines a rule definition to analyze and charge user traffic based on MMS previous state.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] mms previous-state operator previous_state
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `=`: equals

- **previous_state**
  Analyzes the previous state of the MMS transmissions.
  `previous_state` must be one of the following:
  - `delayed-ack-pending`
  - `delayed-m-notify-rsp-sent`
  - `delayed-retrieval-pending`
  - `immediate-retrieval-pending`
  - `init`
  - `m-send-conf-rcvd`
  - `m-send-req-sent`
  - `notification-ind-rcvd`
  - `notify-rsp-sent`
  - `retrieval-pending`
  - `retrieved-conf-received`
  - `send-success`

**Usage**

Use this command to specify a rule definition to analyze user traffic based on an MMS previous state.
Example

The following command creates an MMS rule definition for analyzing user traffic using an MMS previous state of retrieval-pending:

```
mms previous-state = retrieval-pending
```
mms response status

This command defines a rule definition to analyze and charge user traffic based on MMS response status code.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] mms response status operator status_code

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:
- !: does not equal
- := equals

status_code
Specifies the code for this rule definition. status_code must be an integer from 128 through 136.

Usage
Use this command to specify a rule definition to analyze user traffic based on an MMS response status.

Example
The following command creates an FTP rule definition for analyzing user traffic using an MMS response status code of 129:

mms response status != 129
mms state

This command defines a rule definition to analyze and charge user traffic based on the current state of MMS message.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[m no] mms state operator mms state

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:
- !=: does not equal
- <: equals

mms state
Analyzes the state of the mms transmissions. mms_state must be one of the following:
- delayed-ack-pending
- delayed-m-notify-rsp-sent
- delayed-retrieval-pending
- delivery-failed
- delivery-success
- immediate-retrieval-pending
- m-send-conf-rcvd
- m-send-req-sent
- notification-ind-rcvd
- notify-rsp-sent
- retrieval-failed
- retrieval-pending
- retrieval-success
- retrieve-conf-received
- send-success
Usage
Use this command to specify a rule definition to analyze user traffic based on current state of MMS message.

Example
The following command creates an MMS rule definition for analyzing user traffic using current state of MMS message as `retrieval-failed`:

```
mms state = retrieval-failed
```
mms status

This command defines a rule definition to analyze and charge user traffic based on MMS status.

Product
All

Privilege
Security Administrator, Administrator

Syntax

\[ \text{[ no ] mms status} \\text{operator status} \]

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  - \( \text{!}= \): does not equal
  - \( = \): equals

- **status**
  Specifies the status for this rule definition.
  \( \text{status} \) must be an integer from 128 through 132.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS status.

Example

The following command creates an MMS rule definition for analyzing user traffic using an MMS status of 130:

\[ \text{mms status} = 130 \]
mms subject

This command defines a rule definition to analyze and charge user traffic using “subject” field of MMS message.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] mms subject [ case-sensitive ]operator string

no
Removes the specified rule definition.

case-sensitive
Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field. 
operator must be one of the following:
  • !=: does not equal
  • !contains: does not contain
  • !ends-with: does not end with
  • !starts-with: does not start with
  • ==: equals
  • contains: contains
  • ends-with: ends with
  • starts-with: starts with

string
Specifies the string for this rule definition. 
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage
Use this command to specify a rule definition to analyze user traffic based on “subject” field of an MMS message.

Example
The following command creates an MMS rule definition for analyzing user traffic for occurrence of test1 in “subject” field of MMS message:

```
mms subject contains test1
```
mms tid

This command defines a rule definition to analyze and charge user traffic based on MMS Transaction Identifier (tid).

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] mms tid [ case-sensitive ] operator tid_value
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **tid_value**
  The value of the specified field.
  `tid_value` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

**Usage**
Use this command to specify a rule definition to analyze user traffic based on an MMS TID.

**Example**
The following command creates a rule definition for analyzing user traffic using an MMS TID value of test:
mms tid = test
**mms to**

This command defines a rule definition to analyze and charge user traffic using “to” field of MMS message.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] mms to[ case-sensitive ]operator to_value
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **to_value**
  The value of the specified field.
  `to_value` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on an MMS to rule definition.

**Example**

The following command creates a rule definition for analyzing user traffic using an MMS to value of `test`: 
mms to = test
mms uplink

This command defines a rule definition to analyze and charge user traffic based on MMS uplink.

Product
All

Privilege
Security Administrator, Administrator

Syntax

\[
\text{[ no ] mms uplink operator condition}
\]

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  **operator** must be one of the following:
  - \(\neg\) equals
  - \(=\) equals

- **condition**
  Indicates the uplink (from the Mobile Node direction) status.
  - **FALSE**
  - **TRUE**

Usage
Use this command to specify a rule definition to analyze user traffic based on the MMS uplink.

Example
The following command creates a rule definition for analyzing user traffic using an MMS uplink value of \text{TRUE}:

\[
\text{mms uplink} = \text{TRUE}
\]
mms version

This command defines a rule definition to analyze and charge user traffic based on MMS version.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] mms version operator version

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

  • !=: does not equal
  • ==: equals

version
Specifies the version for this rule definition.
version must be an integer from 1 through 65535.

Important: MMS Protocol Analyzer supports decoding of MMS version 1.0 only.

Usage
Use this command to specify a rule definition to analyze user traffic based on the MMS version.

Example
The following command creates a rule definition for analyzing user traffic using an MMS version of 1.0:

    mms version = 1.0
multi-line-or all-lines

Defines whether to apply the OR operator to all lines in a rule definition.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
[ no ] multi-line-or all-lines
```

- **no**
  Removes the previous configuration.

Usage
If multi-line-or is enabled for a rule definition, the logical OR operator to all the rule-lines in the rule definition is applied to decide if the rule definition matches or not. If multi-line-or is not configured, the logical AND operator is applied.
p2p

The following commands define rules for analyzing traffic based on Peer-to-Peer protocols:
p2p any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for Peer to Peer (P2P).

Product
ECS

Privilege
Administrator, Config-administrator

Syntax

[ no ] p2p any-match operator condition

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
  • =: equals

condition
Specifies the condition for this rule definition.
condition must be one of the following:
  • TRUE: The rule matches any P2P traffic.
  • FALSE: The rule does not match any P2P traffic.

Usage
Use this command to specify a rule definition to analyze user traffic based on the P2P any match status.

Example
The following command creates a rule definition for analyzing user traffic using an P2P any match status of TRUE:

p2p any-match = TRUE
**p2p protocol**

This command configures the system to detect specific P2P protocols for charging purposes. This command is not used for detection purposes.

**Product**
ECS

**Privilege**
Administrator, Config-administrator

**Syntax**

```plaintext
[ no ] p2p protocol operator protocol
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. `operator` must be `=` (equals).

- **protocol**
  Specifies the protocol for charging purposes. `protocol` must be one of the following:
  - actsync
  - aimini
  - applejuice
  - ares
  - battlefld
  - bittorrent
  - dblink
  - directconnect
  - edonkey
  - fasttrack
  - feidian
  - filetopia
  - freenet
  - fring
  - gadugadu
  - gnutella
  - gtalk
  - halflife2
• hamachivpn
• iax
• imesh
• iptv
• irc
• iskoot
• jabber
• manolito
• msn
• mute
• nimbu
• oovoo
• openft
• orb
• oscar
• paltalk
• pando
• pandora
• popo
• pplive
• ppstream
• qq
• qqgame
• qqlive
• quake
• rdp
• secondlife
• skinny
• skype
• slingbox
• sopcast
• soulseek
• steam
• tvants
• tvuplayer
• uusee
• vpnx
vtun
warcft3
winmx
winnny
wofwarcraft
xbox
yahoo
zattoo

Usage
Use this command to configure detection of protocols for charging purposes. For detection purposes use the `p2p detection protocol` in the Active Charging Service Configuration Mode.

Example
The following command configures the system to detect orb protocol for charging purposes:

```
p2p protocol = orb
```
p2p traffic-type

This command defines a rule definition to analyze and charge user traffic based on the type of traffic, such as voice or non-voice.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] p2p traffic-type operator condition

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:

• ! =: does not equal
• =: equals

condition
Specifies the condition for this rule definition. condition must be one of the following:

• voice

Usage
Use this command to configure the system to detect voice or non-voice P2P traffic. When the detection of a protocol is enabled then the detection of sub-type is enabled by default.

Example
The following command configures the system to detect voice traffic:

p2p traffic-type = voice
pop3

The following commands define rules for analyzing traffic based on Post Office Protocol 3 (POP3):
pop3 any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for POP3.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] pop3 any-match [ operator condition ]
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. 
  `operator` must be one of the following:
  - `!=`: does not equal
  - `==`: equals

- **condition**
  Specifies the condition for this rule definition.
  `condition` must be one of the following:
  - `FALSE`
  - `TRUE`

**Usage**
Use this command to specify a rule definition to analyze user traffic based on the POP3 any match status.

**Example**
The following command creates an POP3 rule definition for analyzing user traffic using a POP3 any match status of `FALSE`:

```
pop3 any-match = FALSE
```
pop3 command args

This command defines a rule definition to analyze and charge user traffic based on the POP3 command arguments.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] pop3 command args [ case-sensitive ] operator argument

no
Removes the specified rule definition.

case-sensitive
Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
  • !=: does not equal
  • !contains: does not contain
  • !ends-with: does not end with
  • !starts-with: does not start with
  • ==: equals
  • contains: contains
  • ends-with: ends with
  • starts-with: starts with

argument
A unique value that you specify to use for the command argument.
argument must be an alpha and/or numeric string of 1 through 40 characters in length, and can contain punctuation characters.

Usage
Use this command to specify a rule definition to analyze user traffic based on a POP3 command argument.

Example
The following command defines a rule definition for analyzing POP3 user traffic using a command argument of test:
pop3 command args = test
pop3 command id

This command defines a rule definition to analyze and charge user traffic based on the POP3 command ID.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] pop3 command id operator command_id

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
• !=: does not equal
• <=: less than or equals
• ==: equals
• >=: greater than or equals

command_id
A unique value that you specify to use for the command argument.
command_id must be an integer from 1 through 12.

Usage
Use this command to specify a rule definition to analyze user traffic based on a POP3 command ID.

Example
The following command defines a rule definition for analyzing POP3 user traffic using a command ID of 8:

pop3 command id = 8
pop3 command name

This command defines a rule definition to analyze and charge user traffic based on the POP3 command name.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] pop3 command name operator command_name

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
- ! =: does not equal
- =: equals

command_name
command_name must be one of the following:
- apop
- dele
- list
- noop
- pass
- quit
- retr
- reset
- stat
- top
- uid1
- user

Usage
Use this command to specify a rule definition to analyze user traffic based on a POP3 command name.
The following command defines a rule definition for analyzing POP3 user traffic using a command name of \textit{list}:

\begin{verbatim}
pop3 command name = list
\end{verbatim}
pop3 mail-size

This command defines a rule definition to analyze and charge user traffic based on the POP3 mail size.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
{ no } pop3 mail-size {operator mail_size | { { range | !range }
rangle_from to range_to} }
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `<=`: less than or equals
  - `=`: equals
  - `>=`: greater than or equals

- `{ range | !range } range_from to range_to`
  Enables or disables the range criteria.
  `range`: Enables the range criteria.
  `!range`: Disables the range criteria.
  `range_from` specifies the start of range, and must be an integer from 1 through 4000000000.
  `range_to` specifies the end range. `range_to` must be an integer from 1 through 4000000000, and must be greater than `range_from`.

- **mail_size**
  Specifies the mail size for this rule definition.
  `mail_size` must be an integer from 1 through 4000000000.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on POP3 mail size.

**Example**

The following command defines a rule definition for analyzing POP3 user traffic using a mail size of 40000:

```plaintext
pop3 mail-size = 40000
```
pop3 mail-size

Ruledef Configuration Mode Commands
**pop3 pdu-length**

This command defines a rule definition to analyze and charge user traffic based on the POP3 Protocol Data Unit (PDU) length.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] pop3 pdu-length { operator pdu_length | { range | !range
range_from to range_to } }
```

**no**
Removes the specified rule definition.

**operator**
Specifies how to logically match the information in the analyzed field.

- `!=`: does not equal
- `<=`: less than or equals
- `=`: equals
- `>=`: greater than or equals

```
{ range | !range } range_from to range_to
```

Enables or disables the range criteria.

- **range**: Enables the range criteria.
- **!range**: Disables the range criteria.

- **range_from**: Specifies the start of range, and must be an integer from 0 through 65535.
- **range_to**: Specifies the end range. **range_to** must be an integer from 0 through 65535, and must be greater than **range_from**

**pdu_length**
Specifies the POP3 PDU length for this rule definition.

**pdu_length** must be an integer from 0 through 65535.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a POP3 PDU length (header + payload) in bytes.

**Example**
The following command defines a rule definition for analyzing POP3 user traffic using a PDU length of 1000 bytes:

```
pop3 pdu-length = 1000
**pop3 pdu-type**

This command defines a rule definition to analyze and charge user traffic based on the POP3 PDU type.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] pop3 pdu-type operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `=`: equals

- **condition**
  Specifies the packet type for this rule definition.
  `condition` must be one of the following:
  - `command-packet`
  - `data-packet`
  - `relay-packet`

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a POP3 PDU type.

**Example**
The following command defines a rule definition for analyzing POP3 user traffic using a PDU type of `relay-packet`:

```
pop3 pdu-type = relay-packet
```
**pop3 previous-state**

This command defines a rule definition to analyze and charge user traffic based on the POP3 previous state.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
[ no ] pop3 previous-state operator previous-state
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  **operator** must be one of the following:
  - `!`: does not equal
  - `=`: equals

- **previous_state**
  Specifies the previous state for this rule definition.
  **previous_state** must be one of the following:
  - `connected`: connected state
  - `data transaction`: data transaction state
  - `init`: initialized state
  - `reply-error`: reply error state
  - `reply-ok`: response ok state
  - `waiting-for-reply`: waiting for reply state

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a POP3 previous state.

**Example**

The following command creates a POP3 rule definition for analyzing user traffic using a POP3 previous state of `connected`:

```
pop3 previous-state = connected
```
pop3 reply args

This command defines a rule definition to analyze and charge user traffic based on the POP3 reply arguments.

Product
All

Privilege
Security Administrator, Administrator

Syntax

\[ \text{no } \] \text{pop3 reply args [ case-sensitive ]operator argument} \]

- \text{no}
  Removes the specified rule definition.

- \text{case-sensitive}
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- \text{operator}
  Specifies how to logically match the information in the analyzed field.
  \text{operator} must be one of the following:
  - \text{!=}: does not equal
  - \text{!contains}: does not contain
  - \text{!ends-with}: does not end with
  - \text{!starts-with}: does not start with
  - \text{=} : equals
  - \text{contains}: contains
  - \text{ends-with}: ends with
  - \text{starts-with}: starts with

- \text{argument}
  A unique value that you specify to use for the reply argument.
  \text{argument} must be an alpha and/or numeric string of 1 through 512 characters in length, and can contain punctuation characters.

Usage
Use this command to specify a rule definition to analyze user traffic based on a POP3 reply argument rule definition.

Example
The following command defines a rule definition for analyzing POP3 user traffic using a reply argument of \text{test}:
pop3 reply args = test
pop3 reply id

This command defines a rule definition to analyze and charge user traffic based on the POP3 reply ID.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] pop3 reply id operator reply_id

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:
- !=: does not equal
- :=: equals

reply_id
Specifies the reply ID for this rule definition. reply_id must be one of the following:
- 0: Unknown reply
- 1: +OK reply
- 2: -ERR reply

Usage
Use this command to specify a rule definition to analyze user traffic based on a POP3 reply ID.

Example
The following command defines a rule definition for analyzing POP3 user traffic using a reply ID of 2:

```bash
pop3 reply id = 2
```
pop3 reply status

This command defines a rule definition to analyze and charge user traffic based on the POP3 reply status.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[ no ] pop3 reply status operator reply_status

---

no

Removes the specified rule definition.

---

operator

Specifies how to logically match the information in the analyzed field. 
operator must be one of the following:

- !=: does not equal
- ==: equals

---

reply_status

Specifies the reply ID for this rule definition.
reply_status must be one of the following:

- +OK: reply OK
- -ERR: reply error

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 reply status.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a reply status of +OK:

pop3 reply status = +ok
pop3 session-length

This command defines a rule definition to analyze and charge user traffic based on the POP3 session length.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
{ no | pop3 session-length { operator session_length | { range | !range } range_from to range_to }

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
- !=: does not equal
- <=: less than or equals
- =: equals
- >=: greater than or equals

session_length
Specifies the session length used for this rule definition.
session_length must be an integer from 1 through 400000000.

{ range | !range } range_from to range_to
Enables or disables the range criteria for PoP3 session length.
range: Enables the range criteria for Pop3 session length.
!range: Disables the range criteria for PoP3 session length.
range_from: Specifies the start of range of PoP3 session length, and must be an integer from 1 through 400000000 but less than or equal to range_to.
range_to: Specifies the end of range of PoP3 session length, and must be an integer from 1 through 400000000 but greater than or equal to range_from
```

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the POP3 session length.

**Example**
The following command creates a POP3 rule definition for analyzing user traffic using a POP3 session length of 40000:
pop3 session-length = 40000
**pop3 state**

This command defines a rule definition to analyze and charge user traffic based on the POP3 state.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```bash
[ no ] pop3 state operator state
```

- **no**
  - Removes the specified rule definition.

- **operator**
  - Specifies how to logically match the information in the analyzed field.
  - `!=`: does not equal
  - `==`: equals

- **state**
  - Specifies the POP3 state for this rule definition.
  - `state` must be one of the following:
    - `close`
    - `connected`
    - `data-transaction`
    - `reply-error`
    - `reply-ok`
    - `waiting-for-reply`

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a POP3 state.

**Example**

The following command creates a POP3 rule definition for analyzing user traffic using a POP3 state of `close`:

```
pop3 state = close
```
### pop3 user-name

This command defines a rule definition to analyze and charge user traffic based on the POP3 user name.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] pop3 user-name [ case-sensitive ] operator user_name
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **user_name**
  A unique value that you specify to use for the user name.
  `user_name` must be an alpha and/or numeric string of 1 through 64 characters in length, and can contain punctuation characters.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a POP3 username rule definition.

**Example**

The following command defines a rule definition for analyzing POP3 user traffic using a user name of `test`:
pop3 user-name = test
The following commands define rules for analyzing traffic based on the Real-time Transport Control Protocol (RTCP):
**rtcp any-match**

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for RTCP.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] rtcp any-match operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `=`: equals

- **condition**
  Specifies the condition for this rule definition.
  `condition` must be one of the following:
  - `TRUE`: The rule matches any RTCP traffic
  - `FALSE`: The rule does not match any RTCP traffic

**Usage**
Use this command to specify a rule definition to analyze user traffic based on the RTCP any match status.

**Example**
The following command creates a rule definition for analyzing user traffic using an RTCP any match status of `TRUE`:

```
rtcp any-match = TRUE
```
rtcp jitter

This command defines a rule definition to analyze and charge user traffic based upon the amount of jitter in the RTCP protocol.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] rtcp jitter operator value

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  *operator* must be one of the following:
  - !: does not equal
  - <: less than or equals
  - =: equals
  - =>: greater than or equals

- **value**
  This value represents the amount of jitter to test against.
  *value* must be an integer from 0 through 4294967295.

Usage

Use this command to set a rule based on the jitter in the RTCP protocol.

Example

The following command test for jitter greater than or equal to 12954:

```
rtcp jitter >= 12954
```
rtcp parent-proto

This command defines a rule definition to analyze and charge user traffic based on the parent protocol of the RTCP flow.

**Important:** This command is only available in StarOS 8.1 and StarOS 9.0 and later.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] rtcp parent-proto operator parent_protocol
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. 
  `operator` must be one of the following:
  - `!=`: does not equal
  - `=`: equals

- **parent_protocol**
  Specifies the RTCP parent protocol for this rule definition.
  `parent_protocol` must be one of the following:
  - `rtsp`: Real Time Streaming Protocol
  - `sip`: Session Initiation Protocol

**Usage**

Use this command to specify a rule definition to analyze and charge user traffic based on the parent protocol of the RTCP flow.

**Example**

The following command creates an RTCP rule definition to analyze user traffic based on the parent protocol of the RTCP flow being SIP:

```
rtcp parent-proto = sip
```
**rtcp pdu-length**

This command defines a rule definition to analyze and charge user traffic based upon the Real-time Transport Protocol (RTCP) Protocol Data Unit (PDU) length.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
[ no ] rtcp pdu-length operator pdu_length
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `<=`: less than or equals
  - `==`: equals
  - `>=`: greater than or equals

- **pdu_length**
  Specifies the RTCP length, in bytes, for this rule definition.
  In StarOS 8.1 and later, `pdu_length` must be an integer from 1 through 65535. In StarOS 8.0, `pdu_length` must be an integer from 1 through 2000.

**Usage**
Use this command to specify a rule definition to analyze user traffic based on an RTCP PDU length (header + payload) in bytes.

**Example**
The following command creates a rule definition for analyzing user traffic using an RTCP PDU length of 10000 bytes:
```
rtcp pdu-length = 10000
```
**rtcp rtsp-id**

This command defines a rule definition to analyze and charge user traffic using a RTSP ID associated with Real-time Transport Control Protocol (RTCP).

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] rtcp rtsp-id [ case-sensitive ] operator string
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  **operator** must be one of the following:
  - `!`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **string**
  Specifies the string for this rule definition.
  **string** must be an alpha and/or numeric string of 1 through 32 characters in length.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on an MMS message ID value.

**Example**

The following command creates an RTCP rule definition for analyzing user traffic containing an RTSP message ID of `test1`:
rtcp rtsp-id contains test1
rtcp session-length

This command defines a rule definition to analyze and charge user traffic based on the Real-time Transport Protocol (RTCP) session length.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] rtcp session-length operator session_length
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!=`: does not equal
  - `<=`: less than or equals
  - `==`: equals
  - `>=`: greater than or equals

- **session_length**
  Specifies the RTCP total session length for this rule definition.
  In StarOS 8.1 and later, `session_length` must be an integer from 1 through 4000000000. In StarOS 8.0, `session_length` must be an integer from 1 through 40000000.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the RTCP total session length.

**Example**

The following command creates an RTCP rule definition for analyzing user traffic using a total RTCP session length of 200000:

```
rtcp session-length = 200000
```
rtcp uri

This command defines a rule definition to analyze and charge user traffic using uniform resource identifier (URI) associated with Real-time Transport Control Protocol (RTCP).

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] rtcp uri [ case-sensitive ] operator string

no
Removes the specified rule definition.

case-sensitive
Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
- !: does not equal
- !contains: does not contain
- !ends-with: does not end with
- !starts-with: does not start with
- =: equals
- contains: contains
- ends-with: ends with
- starts-with: starts with

string
Specifies the string for this rule definition.
string must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage
Use this command to specify a rule definition to analyze user traffic based on an RTCP URI.

Example
The following command creates an RTP rule definition for analyzing user traffic using an RTCP URI string of rtsp://www.example.org:
rtcp uri = rtsp://www.example.org
rtp

The following commands define rules for analyzing traffic based on the Real-time Transport Protocol (RTP):
rtp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for RTP.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] rtp any-match operator condition

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:
  • !=: does not equal
  • ==: equals

condition
Specifies the condition for this rule definition. condition must be one of the following:
  • FALSE
  • TRUE

Usage
Use this command to specify a rule definition to analyze user traffic based on the RTP any match status.

Example
The following command creates an MMS rule definition for analyzing user traffic using an RTP any match status of TRUE:

rtp any-match = TRUE
rtp parent-proto

This command defines a rule definition to analyze and charge user traffic based on the parent protocol of the RTP flow.

**Important:** This command is only available in StarOS 8.1 and StarOS 9.0 and later.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] rtp parent-proto operator parent_protocol
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. 
  `operator` must be one of the following:
  - `!=`: does not equal
  - `==`: equals

- **parent_protocol**
  Specifies the RTP parent protocol for this rule definition. 
  `parent_protocol` must be one of the following:
  - `rtsp`: Real Time Streaming Protocol
  - `sip`: Session Initiation Protocol

**Usage**

Use this command to specify a rule definition to analyze and charge user traffic based on the parent protocol of the RTP flow.

**Example**

The following command creates an RTP rule definition to analyze user traffic based on the parent protocol of the RTP flow being SIP:

```
rtp parent-proto = sip
```
**rtp pdu-length**

This command defines a rule definition to analyze and charge user traffic based on the RTP Protocol Data Unit (PDU) length.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] rtp pdu-length [operator pdu_length]
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `<=`: less than or equals
  - `=": equals
  - `>=": greater than or equals

- **pdu_length**
  Specifies the RTP PDU length, in bytes, for this rule definition.
  In StarOS 8.1 and later, `pdu_length` must be an integer from 1 through 65535. In StarOS 8.0, `pdu_length` must be an integer from 1 through 2000.

**Usage**
Use this command to specify a rule definition to analyze user traffic based on an RTP PDU length (header + payload) in bytes.

**Example**
The following command creates an HTTP rule definition for analyzing user traffic using an RTP PDU length of 1000 bytes:

```plaintext
rtp pdu-length = 1000
```
rtp rtsp-id

This command defines a rule definition to analyze and charge user traffic based on the RTSP ID associated with RTP flow.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] rtp rtsp-id [ case-sensitive ] operator string

no
Removes the specified rule definition.

case-sensitive
Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
• !=: does not equal
• !contains: does not contain
• !ends-with: does not end with
• !starts-with: does not start with
• =: equals
• contains: contains
• ends-with: ends with
• starts-with: starts with

string
Specifies the string for this rule definition.
string must be an alpha and/or numeric string of 1 through 32 characters in length.

Usage
Use this command to specify a rule definition to analyze user traffic based on an MMS message ID value.

Example
The following command creates an RTP rule definition for analyzing user traffic containing an RTSP message ID of test1:
rtp rtsp-id contains test1
**rtp session-length**

This command defines a rule definition to analyze and charge user traffic based on RTP session length.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
[ no ] rtp session-length operator session_length
```

- **no**
  
  Removes the specified rule definition.

- **operator**
  
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!`: does not equal
  - `<`: less than
  - `<=`: less than or equals
  - `=`: equals
  - `>=`: greater than or equals

- **session_length**
  
  Specifies the RTP total session length for this rule definition. In StarOS 8.1 and later, `session_length` must be an integer from 1 through 4000000000. In StarOS 8.0, `session_length` must be an integer from 1 through 4000000.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the RTP total session length.

**Example**

The following command creates an RTP rule definition for analyzing user traffic using a total RTP session length of 200000:

```
rtp session-length = 200000
```
rtp uri

This command defines a rule definition to analyze and charge user traffic based on the uniform resource identifier (URI) associated with RTP flow.

</table>

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTP URI.

Example
The following command creates an RTP rule definition for analyzing user traffic using an RTP URI string of \textit{rtsp://www.example.org}:

\texttt{rtp uri} = \texttt{rtsp://www.example.org}
rtsp

The following commands define rule for analyzing traffic based on Real Time Streaming Protocol (RTSP):
rtsp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for RTSP.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] rtsp any-match operator condition

---

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:
- !=: does not equal
- ==: equals

condition
Specifies the condition for this rule definition. condition must be one of the following:
- FALSE
- TRUE

Usage
Use this command to specify a rule definition to analyze user traffic based on the RTSP any match status.

Example
The following command creates an RTSP rule definition for analyzing user traffic using an RTSP any match status of FALSE.

rtsp any-match = FALSE
rtsp content length

This command defines a rule definition to analyze and charge user traffic based on RTSP content length.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] rtsp content length operator content_length
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!=`: does not equal
  - `<=`: less than or equals
  - `==`: equals
  - `>=`: greater than or equals

- **content_length**
  Specifies the RTSP body length, in bytes, for this rule definition. `content_length` must be an integer from 0 through 65535.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on an RTSP content length.

**Example**

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP body length of 10000:

```
rtsp content length = 10000
```
rtsp content type

This command defines a rule definition to analyze and charge user traffic based on RTSP content type.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] rtsp content type [ case-sensitive ]operator content_type

no
Removes the specified rule definition.

case-sensitive
Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
  • !=: does not equal
  • !contains: does not contain
  • !ends-with: does not end with
  • !starts-with: does not start with
  • =: equals
  • contains: contains
  • ends-with: ends with
  • starts-with: starts with

content_type
A unique name that you specify for the RTSP content type.
content_type must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage
Use this command to specify a rule definition to analyze user traffic based on an RTSP content type.

Example
The following command creates an RTSP rule definition for analyzing user traffic using an RTSP content type of abc100:
rtsp content type = abc100
rtsp date

This command defines a rule definition to analyze and charge user traffic matching the ‘date’ field in the RTSP message type.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] rtsp date [ case-sensitive ] operator date_string

no
Removes the specified rule definition.

case-sensitive
Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

• !=: does not equal

• !=contains: does not contain

• !=ends-with: does not end with

• !=starts-with: does not start with

• =: equals

• contains: contains

• ends-with: ends with

• starts-with: starts with

date_string
A unique name that you specify for the date in RTSP header.
content_type must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic matching date string in RTSP header.

Example
The following command creates an RTSP rule definition for analyzing user traffic using a match for date string of 12_04_2006 in RTSP message header:

\texttt{rtsp date = 12\_04\_2006}
rtsp previous-state

This command defines a rule definition to analyze and charge user traffic based on RTSP previous state.

Product
- All

Privilege
- Security Administrator, Administrator

Syntax

```plaintext
[ no ] rtsp previous-state operator previous_state
```

- **no**
  - Removes the specified rule definition.

- **operator**
  - Specifies how to logically match the information in the analyzed field.
  - `!`: does not equal
  - `=`: equals

- **previous_state**
  - Specifies the RTSP previous state for this rule definition.
  - `previous_state` must be one of the following:
    - `init`
    - `open`
    - `play`
    - `ready`
    - `record`

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTSP previous state.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP previous state of `ready`:

```plaintext
rtsp previous-state = ready
```
rtsp reply code

This command defines a rule definition to analyze and charge user traffic based on RTSP reply.

Product
All

Privilege
Security Administrator, Administrator

Syntax

\[ \text{[ no ] rtsp reply code} \ \text{operator code} \]

\text{no}
Removes the specified rule definition.

\text{operator}
Specifies how to logically match the information in the analyzed field. \text{operator} must be one of the following:
- \text{!#}: does not equal
- \text{<=}: less than or equals
- \text{==}: equals
- \text{>=}: greater than or equals

\text{code}
Specifies the RTSP response for this rule definition. \text{code} must be an integer from 100 through 599.

Usage
Use this command to specify a rule definition to analyze user traffic based on an RTSP return code.

Example
The following command creates an RTSP rule definition for analyzing user traffic using an RTSP return code of 356:

\text{rtsp reply code} = 356
rtsp request method

This command defines a rule definition to analyze and charge user traffic based on RTSP method.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
[ no ] rtsp request method operator method
```

**no**
Removes the specified rule definition.

**operator**
Specifies how to logically match the information in the analyzed field.
**operator** must be one of the following:
- `!`: does not equal
- `=`: equals

**method**
Specifies the RTSP method for this rule definition.
**method** must be one of the following requests:
- `announce`
- `describe`
- `get-parameter`
- `options`
- `pause`
- `play`
- `record`
- `redirect`
- `set-parameter`
- `setup`
- `teardown`

Usage
Use this command to specify a rule definition to analyze user traffic based on an RTSP method.

Example
The following command creates an RTSP rule definition for analyzing user traffic using an RTSP method of announce:

\[ \text{rtsp request method} = \text{announce} \]
rtsp request packet

This command defines a rule definition to analyze and charge user traffic based on RTSP request packet.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] rtsp request packet operator condition

---

no

Removes the specified rule definition.

---

operator

Specifies how to logically match the information in the analyzed field. operator must be one of the following:

- !=: does not equal
- ==: equals

---

condition

Specifies the condition for this rule definition. condition must be one of the following:

- TRUE: is request
- FALSE: is response

---

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTSP request packet.

---

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP response packet:

    rtsp request packet != FALSE
**rtsp rtp-seq**

This command defines a rule definition to analyze and charge user traffic based on sequence “seq” field in the RTP-Info header of the RTSP message.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] rtsp rtp-seq operator time_stamp
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `<=`: less than or equals
  - `=`: equals
  - `>=`: greater than or equals

- **string**
  A unique name that you specify to match with the ‘seq’ field in RTP-Info header of the RTSP message.
  `string` must be an alpha and/or numeric string of 0 through 65535 characters in Normal Play Time (NPT) time format.

**Usage**

Use this command to specify a rule definition to analyze user traffic matching the sequence ‘seq’ field in the RTP-Info header of the RTSP response for a PLAY request.

**Example**

The following command creates an RTSP rule definition for analyzing user traffic using an RTP-seq of 2348:

```
rtsp rtp-seq = 2348
```
rtsp rtp-time

This command defines a rule definition to analyze and charge user traffic based on ‘time’ field in the RTP-Info header of the RTSP message.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] rtsp rtp-time operator time_stamp

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:
- !: does not equal
- <=: less than or equals
- =: equals
- >>: greater than or equals

string
A unique name that you specify to match with the ‘time’ field in RTP-Info header of the RTSP message. string must be an alpha and/or numeric string of 1 through 2147483647 characters in Normal Play Time (NPT) time format.

Usage
Use this command to specify a rule definition to analyze user traffic matching the ‘time’ field in the RTP-Info header of the RTSP response for a PLAY request.

Example
The following command creates an RTSP rule definition for analyzing user traffic using an RTP-Time-stamp of 19970123T153600Z:

rtsp rtp-time = 19970123T153600Z
rtsp rtp-uri

This command defines a rule definition to analyze and charge user traffic based on the uniform resource identifier (URI) field in the RTP-Info header of the RTSP message.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] rtsp rtp-uri [ case-sensitive ] operator string

no
Removes the specified rule definition.

case-sensitive
Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
- !=: does not equal
- !contains: does not contain
- !ends-with: does not end with
- !starts-with: does not start with
- =: equals
- contains: contains
- ends-with: ends with
- starts-with: starts with

string
A unique name that you specify to match with the URI in RTP-Info header of the RTSP message.
string must be an alpha and/or numeric string of 1 through 127 characters in length. string allows punctuation characters and it does not include the “host” portion.

Usage
Use this command to specify a rule definition to analyze user traffic matching the “URI” field in the RTP-Info header of the RTSP response for a PLAY request.

Example
The following command creates an RTSP rule definition for analyzing user traffic using an RTP-URI string of rtsp://www.foo.com in RTP-info header of RTSP packet:

```
rtsp rtp-uri = rtsp://www.foo.com
```
rtsp session-id

This command defines a rule definition to analyze and charge user traffic based on the RTSP session ID.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] rtsp session-id [ case-sensitive ] operator session_id

no
Removes the specified rule definition.

case-sensitive
Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
  • ! =: does not equal
  • ! contains: does not contain
  • ! ends-with: does not end with
  • ! starts-with: does not start with
  • =: equals
  • contains: contains
  • ends-with: ends with
  • starts-with: starts with

session_id
An unique session Id for the RTSP user.
session_id must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage
Use this command to specify a rule definition to analyze user traffic based on an RTSP session ID.

Example
The following command creates an RTSP rule definition for analyzing user traffic using an RTSP session ID of 0123abc100:
\texttt{rtsp session-id} = 0123abc100
rtsp session-length

This command defines a rule definition to analyze and charge user traffic based on the RTSP session length.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] rtsp session-length operator session_length

- no
Removes the specified rule definition.

- operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

  - !=: does not equal
  - <=: less than or equals
  - ==: equals
  - >=: greater than or equals

- session_length
Specifies the RTSP session length, in bytes, for this rule definition.
session_length must be an integer from 1 through 40000000.

Usage
Use this command to specify a rule definition to analyze, compare, or match the total length of RTSP session. The session-length is calculated by adding together the IP payloads (i.e., starting after the IP header) of all relevant packets.

Example
The following command creates an RTSP rule definition for analyzing user traffic using an RTSP session length of 3000 bytes:

```
rtsp session-length = 3000
```
rtsp state

This command defines a rule definition to analyze and charge user traffic based on RTSP state.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] rtsp state operator state

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:

- !=: does not equal
- ==: equals

state
Specifies the RTSP state for this rule definition. state must be one of the following:

- end
- init
- open
- play
- ready
- record

Usage
Use this command to specify a rule definition to analyze user traffic based on an RTSP state.

Example
The following command creates an RTSP rule definition for analyzing user traffic using an RTSP in state of init:

rtsp state = init
rtsp uri

This command defines a rule definition to analyze and charge user traffic based on the uniform resource identifier (URI) in RTSP message.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] rtsp uri [ case-sensitive ] operator string
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!`: does not equal
  - `!=contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **string**
  A unique name that you specify to match with the URI in RTSP header.
  `string` must be an alpha and/or numeric string of 1 through 127 characters in length. `string` allows punctuation characters and it does not include the “host” portion.

**Usage**
Use this command to specify a rule definition to analyze user traffic based on a URI in RTSP header.

**Example**
The following command creates an RTSP rule definition for analyzing user traffic using an RTSP URI string of
rtsp://www..example.com:554/twister/audiotrack:

```
rtsp uri = rtsp://www.example.com:554/twister/audiotrack
```
rtsp uri sub-part

This command defines a rule definition to analyze and charge user traffic by parsing sub-parts of the URI in an RTSP request message.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] rtsp uri sub-part { { absolute-path | host | query } [ case-sensitive ]
operator string | port { port_operator port_value | { range | !range
} range_front | range_to } }
```

- **no**
Removes the specified rule definition.

- **absolute-path**
Specifies the absolute path matching criteria to RTSP URI in an RTSP request message.

- **host**
Specifies the host name matching criteria to RTSP URI in an RTSP request message.

- **query**
Specifies the query string matching criteria to RTSP URI in an RTSP request message.

- **case-sensitive**
Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
Specifies how to logically match the information in the analyzed field.

  - operator must be one of the following:
    - `!=` does not equal
    - `!contains`: does not contain
    - `!ends-with`: does not end with
    - `!starts-with`: does not start with
    - `=`: equals
    - `contains`: contains
    - `ends-with`: ends with
    - `starts-with`: starts with
string
A unique absolute path/host name or query string that you specify to match with the URI in RTSP header. string must be an alpha and/or numeric string of 1 through 127 characters in length. string allows punctuation characters and it does not include the “host” portion.

port
Specifies the port related matching for RTSP URI in an RTSP request message.

port_operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:
- !=: does not equal
- <=: less than or equals
- ==: equals
- >=: greater than or equals

port_value
Specifies the RTSP port number used for matching with port rule in RTSP flow. port_value must be an integer from 0 through 65535.

{ range | !range } range_from to range_to
Enables or disables the range criteria for RTSP flow ports.
range: Enables the range criteria for RTSP flow ports.
!range: Disables the range criteria for RTSP flow ports.
range_from: Specifies the start of range of RTSP flow ports and value must be an integer from 0 through 65535 but less than or equal to range_to.
range_to: Specifies the end of range of RTSP flow ports and value must be an integer from 0 through 65535 but more than or equal to range_from.

Usage
Use this command to specify a rule definition to analyze user traffic based on a URI sub parts like host, absolute path, port, and query in RTSP request message.

Example
The following command creates an RTSP URI sub part rule definition to analyze user traffic using an RTSP URI port number between 1023 and 1068:

    rtsp uri sub-part port range 1023 to 1068
rtsp user-agent

This command defines a rule definition to analyze and charge user traffic matching ‘user-agent’ field in RTSP header.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] rtsp user-agent [ case-sensitive ] operator user_agent

- no
  Removes the specified rule definition.

- case-sensitive
  Default: Disabled
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- operator
  Specifies how to logically match the information in the analyzed field.
  operator must be one of the following:
  • !=: does not equal
  • !contains: does not contain
  • !ends-with: does not end with
  • !starts-with: does not start with
  • :=: equals
  • contains: contains
  • ends-with: ends with
  • starts-with: starts with

- user_agent
  Specifies the user agent in RTSP header for this rule definition.
  user_agent must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage
Use this command to specify a rule definition to analyze user agent field in RTSP header.

Example
The following command creates a rule definition for analyzing user traffic using content as test in “user-agent” field of RTSP header:
rtsp user-agent = test
**rule-application**

This command specifies the application rule for the rule definition.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
rule-application { charging | post-processing | routing }

no rule-application
```

- **no**
  Removes the previous rule application configuration.

- **routing**
  Default: Disabled
  Specifies that this rule definition only be used for routing purposes.
  Up to 256 rule definitions can be defined for routing in an Active Charging Service.

- **post-processing**

  **Important:** The `post-processing` keyword is only available in StarOS 8.3 and later.

  Specifies that this rule definition only be used for post-processing purposes. This enables processing of packets even if the rule matching for them has been disabled.

- **charging**
  Default: Enabled
  Specifies that this rule definition only be used for charging purposes.
  Up to 2048 rule definitions can be defined for charging application in an Active Charging Service.

**Usage**

Use this command to assign a rule application to a rule definition.
If, when configuring a ruledef, the rule-application is not specified, by default the system configures the ruledef as a charging ruledef.

**Example**
The following command assigns a rule application of charging to the current rule definition:

```plaintext
rule-application charging
```
The following commands define rules for analyzing traffic based on Session Description Protocol (SDP):
**sdp any-match**

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for SDP.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] sdp any-match operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `! =`: does not equal
  - `= =`: equals

- **condition**
  Specifies the condition for this rule definition.
  `condition` must be one of the following:
  - `FALSE`
  - `TRUE`

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the SDP any match status.

**Example**
The following command defines an any match rule definition for analyzing SDP user traffic as `TRUE`:

```
sdp any-match = TRUE
```
sdp connection-ip-address

This command defines a rule definition to analyze and charge user traffic based on SDP connection IP address.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] sdp connection-ip-address operator ip_address

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:
- !=: does not equal
- ==: equals

ip_address
The connection IP address expressed in IPv4 dotted decimal notation.

Usage
Use this command to specify a rule definition to analyze user traffic based on the SDP connection-ip-address.

Example
The following command defines a rule definition for analyzing sdp user traffic using an SDP connection-ip-address of 1.1.1.1:

sdp connection-ip-address = 1.1.1.1
sdp media-audio-port

This command defines a rule definition to analyze and charge user traffic based on SDP media-audio-port.

**Product**  
All

**Privilege**  
Security Administrator, Administrator

**Syntax**

```
[ no ] sdp media-audio-port operator port
```

- **no**  
  Removes the specified rule definition.

- **operator**  
  Specifies how to logically match the information in the analyzed field.  
  **operator** must be one of the following:
  - 
    - !: does not equal
  - =: equals

- **port**  
  Specifies the port number for this rule definition.  
  **port** must be an integer from 0 through 65535.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on an SDP media-audio-port.

**Example**

The following command creates an SDP rule definition for analyzing user traffic using SDP media audio port 10:

```
sdp media-audio-port = 10
```
Ruledef Configuration Mode Commands

sdp media-video-port

This command defines a rule definition to analyze and charge user traffic based on SDP media-video-port.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] sdp media-video-port operator port

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
- !=: does not equal
- ==: equals

port
Specifies the port number for this rule definition.
port must be an integer from 0 through 65535.

Usage
Use this command to specify a rule definition to analyze user traffic based on an SDP media-video-port.

Example
The following command creates an SDP rule definition for analyzing user traffic using SDP media video port 10:

sdp media-video-port = 10
**sdp uplink**

This command defines a rule definition to analyze and charge user traffic based on SDP uplink.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] sdp uplink operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!=`: does not equal
  - `==`: equals

- **condition**
  Specifies the condition for this rule definition. `condition` must be one of the following:
  - `FALSE`: is not uplink
  - `TRUE`: is uplink

**Usage**

Use this command to specify a rule definition to analyze user traffic based on whether the SDP traffic is uplink or not uplink.

**Example**

The following command defines a rule definition for analyzing SDP user traffic using an SDP uplink status is not equal to `FALSE`:

```
sdp uplink != FALSE
```
The following commands define rules for analyzing traffic based on Secure-HTTP:
secure-http any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for Secure HTTP.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
[ no ] secure-http any-match operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `! =`: does not equal
  - `= =`: equals

- **condition**
  Specifies the condition for this rule definition.
  `condition` must be one of the following:
  - `FALSE`
  - `TRUE`

Usage
Use this command to specify a rule definition to analyze user traffic based on the HTTP any match status.

Example
The following command creates an HTTPS rule definition for analyzing user traffic using an HTTPS any match status of `FALSE`:

```
secure-http any-match = FALSE
```
secure-http uplink

This command defines a rule definition to analyze and charge user traffic based on Secure-HTTP uplink.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] secure-http uplink operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `==`: equals

- **condition**
  Specifies the condition for this rule definition.
  `condition` must be one of the following:
  - `FALSE`: is not uplink
  - `TRUE`: is uplink

**Usage**
Use this command to specify a rule definition to analyze user traffic based on whether the HTTPS traffic is uplink or not uplink.

**Example**
The following command defines a rule definition for analyzing HTTPS user traffic using an HTTPS uplink status is not equal to `FALSE`:

```
secure-http uplink ! = FALSE
```
The following commands define rules for analyzing traffic based on Session Initiation Protocol (SIP):
sip any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for SIP.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] sip any-match operator condition

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  *operator must be one of the following:*
  - • !=: does not equal
  - • ==: equals

- **condition**
  Specifies the condition for this rule definition.
  *condition must be one of the following:*
  - • FALSE
  - • TRUE

Usage

Use this command to specify a rule definition to analyze user traffic based on the SIP any match status.

Example

The following command defines an any match rule definition for analyzing SIP user traffic:

```
sip any-match = TRUE
```
**sip call-id**

This command defines a rule definition to analyze and charge user traffic based on the SIP call ID.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] sip call-id [ case-sensitive ] operator call-id
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **call-id**
  `call-id` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

**Usage**
Use this command to specify a SIP call ID rule definition to analyze user traffic based on a SIP call ID.

**Example**
The following command creates a rule definition for analyzing user traffic using a SIP call ID of `test`:

```
sip call-id = test
```
sip call-id
**sip content length**

This command defines a rule definition to analyze and charge user traffic based on the SIP content length.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] sip content length operator content_length
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
    - `!=`: does not equal
    - `<=`: less than or equals
    - `==`: equals
    - `>=`: greater than or equals

- **content_length**
  Specifies the SIP content length for this rule definition. `content_length` must be an integer from 0 through 65535.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a SIP content length.

**Example**

The following command creates a SIP rule definition for analyzing user traffic using a SIP content length of **10000**:

```
sip content length = 10000
```
sip content type

This command defines a rule definition to analyze and charge user traffic based on the SIP content type.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] sip content type [ case-sensitive ] operator string
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **string**
  Specifies content type is used in this rule definition.
  `string` must be an alpha and/or numeric string of 1 through 127 characters in length.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a SIP content type.

**Example**

The following command creates a SIP rule definition for analyzing user traffic using a SIP content type as `download_string`. 

```
```

```
sip content type = download_string
```
sip from

This command defines a rule definition to analyze and charge user traffic based on the SIP from.

Product  
All

Privilege  
Security Administrator, Administrator

Syntax

[ no ] sip from [ case-sensitive ] operator string

no

Removes the specified rule definition.

case-sensitive

Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator

Specifies how to logically match the information in the analyzed field. operator must be one of the following:

- !: does not equal
- !=: contains: does not contain
- !=ends-with: does not end with
- !=starts-with: does not start with
- =: equals
- contains: contains
- ends-with: ends with
- starts-with: starts with

string

Specifies the string for this rule definition. string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a SIP from value.

Example

The following command creates a SIP rule definition for analyzing user traffic containing a SIP from value of test1:

```
sip from contains test1
## sip previous-state

This command defines a rule definition to analyze and charge user traffic based on the SIP previous state.

### Product
All

### Privilege
Security Administrator, Administrator

### Syntax

```
[ no ] sip previous-state operator previous_state
```

<table>
<thead>
<tr>
<th><strong>no</strong></th>
<th>Removes the specified rule definition.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>

</tr>
<tr>
<td><code>response-ok</code></td>
<td></td>
</tr>
</tbody>
</table>

### Usage

Use this command to specify a rule definition to analyze user traffic based on a SIP previous state.

### Example

The following command creates a SIP rule definition for analyzing user traffic using a SIP previous state of `request-sent`:

```
sip previous-state = request-sent
```
**sip reply code**

This command defines a rule definition to analyze and charge user traffic based on the SIP reply code.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] sip reply code operator return_code
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!`: does not equal
  - `<`: less than
  - `<=`: less than or equals
  - `=`: equals
  - `>=`: greater than or equals

- **return_code**
  Specifies the SIP return code for this rule definition. `return_code` must be an integer from 100 through 699.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a SIP reply code.

**Example**

The following command creates a SIP rule definition for analyzing user traffic using a SIP reply code of 150:

```
sip reply code = 150
```
sip request method

This command defines a rule definition to analyze and charge user traffic based on the SIP request method.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] sip request method operator method

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
• !=: does not equal
• ==: equals

method
Specifies the SIP method for this rule definition.
method must be one of the following:
• ack
• bye
• cancel
• invite
• options
• register

Usage
Use this command to specify a rule definition to analyze user traffic based on SIP method.

Example
The following command defines a rule definition for analyzing SIP user traffic using SIP request method bye:

    sip request method = bye
sip request packet

This command defines a rule definition to analyze and charge user traffic based on the SIP request packet.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] sip request packet operator condition

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:
- \( = \): equals
- \( \neq \): not equals

condition
The type of SIP packet is request. condition must be one of the following:
- \( \text{FALSE} \): is a response
- \( \text{TRUE} \): is a request

Usage
Use this command to specify a rule definition to analyze user traffic based on the SIP request packet.

Example
The following command defines a rule definition for analyzing SIP user traffic using a SIP request packet is equals to request:

sip request packet = TRUE
**sip state**

This command defines a rule definition to analyze and charge user traffic based on the SIP state.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] sip state operator state
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!=`: does not equal
  - `==`: equals

- **state**
  Specifies the sip state for this rule definition. `state` must be one of the following:
  - `ack-received`
  - `provisional-response`
  - `request-sent`
  - `response-fail`
  - `response-ok`

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a SIP state.

**Example**

The following command creates a SIP rule definition for analyzing user traffic using a SIP state of `request-sent`:

```
sip state = request-sent
```
This command defines a rule definition to analyze and charge user traffic based on the “to” field of SIP.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] sip to [ case-sensitive ] operator sip_to_field
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `!=contains`: does not contain
  - `!=ends-with`: does not end with
  - `!=starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **sip_to_field**
  Specifies the SIP to value for this rule definition.
  `sip_to_field` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

**Usage**
Use this command to specify a rule definition to analyze user traffic based on a SIP to value.

**Example**
The following command creates a SIP rule definition for analyzing user traffic containing a SIP to value of `test1`:
sip to contains test1
sip uri

This command defines a rule definition to analyze and charge user traffic based on the SIP URI.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```plaintext
[ no ] sip uri [ sub-part { headers | host | parameters | port | userinfo } ] [ case-sensitive ] operator string
```

**no**
Removes the specified rule definition.

**sub-part { headers | host | parameters | port | userinfo }**
This is an optional keyword that defines what sub-part of a SIP URI to check.
- **headers**: Apply the rule to SIP URI header field.
- **host**: Apply the rule the SIP URI host field.
- **parameters**: Apply the rule to the SIP URI parameters field.
- **port**: Apply the rule to the SIP URI port field.
- **userinfo**: Apply the rule to the SIP URI userinfo field.

**case-sensitive**
Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

**operator**
Specifies how to logically match the information in the analyzed field. **operator** must be one of the following:
- `!=`: does not equal
- `!contains`: does not contain
- `!ends-with`: does not end with
- `!starts-with`: does not start with
- `=`: equals
- `contains`: contains
- `ends-with`: ends with
- `starts-with`: starts with

The string for sub-part keyword **port** must be an integer and requires different operators. Use the following operators with the **port** keyword:
- `!=`: does not equal
- `<=`: is less than
Ruledef Configuration Mode Commands

### sip uri

- `•=`: equals
- `•>:=` : is greater than

**string**

A unique name that you specify for a SIP URI.

`string` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

The string for sub-part keyword `port` must be an integer from 0 through 65535.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a SIP URI.

**Example**

The following command creates a SIP rule definition for analyzing user traffic using a SIP URI string:

```
sip uri = sip:192.168.1.51:5060
```

```
sip uri = sip:nnnnn@host:5060;user=phone
```
smtp

The following defines common syntax block options. These options appear in similar commands and are detailed here for easy reference.
smtp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for SMTP.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] smtp any-match [ operator ] [ condition ]
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  *operator* must be one of the following:
  - `! =`: does not equal
  - `=`: equals

- **condition**
  Specifies the condition for this rule definition.
  *condition* must be one of the following:
  - `FALSE`
  - `TRUE`

**Usage**

Use this command to specify an any match rule definition on analyzing user traffic based on the SMTP analyzed status.

**Example**

The following command defines an any match rule definition for analyzing SMTP user traffic:

```
smtp any-match = TRUE
```
smtp command arguments

This command defines a rule definition to analyze and charge user traffic based on the SMTP command arguments.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
[ no ] smtp command arguments [ case-sensitive ] operator argument
```

- **no**
  
  Removes the specified rule definition.

- **case-sensitive**
  
  Default: Disabled.
  
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  
  Specifies how to logically match the information in the analyzed field.
  
  *operator* must be one of the following:
  
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **argument**
  
  A unique value that you specify to use for the command argument.
  
  *argument* must be an alpha and/or numeric string of 1 through 63 characters in length, and can contain punctuation characters.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on an SMTP command argument.

**Example**

The following command defines a rule definition for analyzing SMTP user traffic using a command argument of `test`: 
smtp command arguments = test
smtp command id

This command defines a rule definition to analyze and charge user traffic based on the SMTP command ID.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] smtp command id operator command_id
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `<=`: less than or equals
  - `==`: equals
  - `=>`: greater than or equals

- **command_id**
  A unique value that you specify to use for the command argument.
  `command_id` must be an integer from 0 through 10.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on an SMTP command ID.

**Example**

The following command defines a rule definition for analyzing POP3 user traffic using a command ID of 8:

```
smtp command id = 8
```
smtp command name

This command defines a rule definition to analyze and charge user traffic based on the SMTP command name.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
[ no ] smtp command name operator command_name
```

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
- `!=`: does not equal
- `==`: equals

command_name
command_name must be one of the following:
- `bdat`
- `data`
- `ehlo`
- `expn`
- `helo`
- `mail-from`
- `noop`
- `quit`
- `rcpt-to`
- `rset`
- `vrfy`

Usage
Use this command to specify a rule definition to analyze user traffic based on an SMTP command name.

Example
The following command defines a rule definition for analyzing SMTP user traffic using a command name of `data`:
smtp command name = data
smtp mail-size

This command defines a rule definition to analyze and charge user traffic based on the SMTP mail size.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
[ no ] smtp mail-size \{ operator mail_size \} \{ \{ range | !range \} \}
```

**no**
Removes the specified rule definition.

**operator**
Specifies how to logically match the information in the analyzed field. 
**operator** must be one of the following:
- `!=`: does not equal
- `<=`: less than or equals
- `==`: equals
- `>=`: greater than or equals

**mail_size**
Specifies the mail size, in bytes, for this rule definition.
**mail_size** must be an integer from 1 through 40000000.

**{ range | !range } range_from to range_to**
Enables or disables the range criteria.
**range**: Enables the range criteria.
**!range**: Disables the range criteria.
**range_from**: Specifies the start of range, and must be an integer from 1 through 40000000.
**range_to**: Specifies the end range. **range_to** must be an integer from 1 through 40000000, and must be greater than **range_from**

Usage
Use this command to specify a rule definition to analyze user traffic based on SMTP mail size.

Example
The following command defines a rule definition for analyzing SMTP user traffic using a mail size of 40000:

```
smtp mail-size = 40000
```
smtp pdu-length

This command defines a rule definition to analyze and charge user traffic based on the SMTP protocol data unit (PDU) length.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```plaintext
[ no ] smtp pdu-length \{ operator pdu_length | \{ range | !range \} range_from to range_to \}
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!`: does not equal
  - `<<=`: less than or equals
  - `=`: equals
  - `><=`: greater than or equals

- **pdu_length**
  Specifies the SMTP PDU length, in bytes, for this rule definition. `pdu_length` must be an integer from 1 through 65535.

- **\{ range | !range \} range_from to range_to**
  Enables or disables the range criteria.
  - `range`: Enables the range criteria.
  - `!range`: Disables the range criteria.
  - `range_from`: Specifies the start of range, and must be an integer from 1 through 65535.
  - `range_to`: Specifies the end range. `range_to` must be an integer from 1 through 65535, and must be greater than `range_from`

Usage

Use this command to specify a rule definition to analyze user traffic based on an SMTP packet length.

Example

The following command defines a rule definition for analyzing SMTP user traffic using a PDU length of 1600 bytes:

```plaintext
smtp pdu-length = 1600
```
smtp pdu-length
smtp previous-state

This command defines a rule definition to analyze and charge user traffic based on the SMTP previous state.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] smtp previous-state operator pre_state

---

no
Removes the specified rule definition.

---

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
- !=: does not equal
- =: equals

---

pre_state
Specifies the previous state for this rule definition.
pre_state must be one of the following:
- close: closed state
- init: initialized state
- response-error: reply error state
- response-ok: response ok state
- waiting-for-response: waiting for response state

Usage
Use this command to specify a rule definition to analyze user traffic based on an SMTP previous state.

Example
The following command creates an SMTP rule definition for analyzing user traffic using an SMTP previous state of closed:

```
smtp previous-state = closed
```
smtp recipient

This command defines a rule definition to analyze and charge user traffic based on the SMTP recipient.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
[ no ] smtp recipient [ case-sensitive ] operator argument
```

- **no**
  
  Removes the specified rule definition.

- **case-sensitive**
  
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **argument**
  
  A unique value that you specify to use for the response argument.
  `argument` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a recipient rule definition.

**Example**

The following command defines a rule definition for analyzing SMTP user traffic using a recipient of `test`:
smtp recipient = test
smtp reply arguments

This command defines a rule definition to analyze and charge user traffic based on the SMTP reply argument.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] smtp reply arguments[ case-sensitive ]operator argument

- no
  Removes the specified rule definition.

- case-sensitive
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- operator
  Specifies how to logically match the information in the analyzed field.
  operator must be one of the following:
  - !=: does not equal
  - !contains: does not contain
  - !ends-with: does not end with
  - !starts-with: does not start with
  - =: equals
  - contains: contains
  - ends-with: ends with
  - starts-with: starts with

- argument
  Specifies the string for this rule definition.
  argument must be an alpha and/or numeric string of 1 through 63 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an SMTP reply argument.

Example

The following command creates an SMTP reply argument rule definition for analyzing user traffic using a reply argument of test:
smtp reply arguments = test
smtp reply id

This command defines a rule definition to analyze and charge user traffic based on the SMTP reply ID.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] smtp reply id operator reply_id

---

no

Removes the specified rule definition.

---

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- !: does not equal
- := equals

---

reply_id

Specifies the reply ID for this rule definition.
reply_id must be one of the following:

- 0: +NO reply
- 1: +OK reply
- 2: -ERR reply

---

Usage

Use this command to specify a rule definition to analyze user traffic based on an SMTP reply ID.

Example

The following command defines a rule definition for analyzing SMTP user traffic using a reply ID of 2:

```
smtp reply id = 2
```
**smtp reply status**

This command defines a rule definition to analyze and charge user traffic based on the SMTP reply status.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] smtp reply status operator reply_status
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `==`: equals

- **reply_status**
  Specifies the response ID for this rule definition.
  `reply_status` must be one of the following:
  - `+OK`: response OK
  - `-ERR`: response error

**Usage**

Use this command to specify a rule definition to analyze user traffic based on an SMTP reply status.

**Example**

The following command defines a rule definition for analyzing SMTP user traffic using a reply status of `+OK`:

```plaintext
smtp reply status = +OK
```
smtp sender

This command defines a rule definition to analyze and charge user traffic based on the SMTP sender.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] smtp sender [ case-sensitive ] operator sender
```

**no**
Removes the specified rule definition.

**case-sensitive**
Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

**operator**
Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:
- `!=`: does not equal
- `!contains`: does not contain
- `!ends-with`: does not end with
- `!starts-with`: does not start with
- `=`: equals
- `contains`: contains
- `ends-with`: ends with
- `starts-with`: starts with

**sender**
Specifies the session length used for this rule definition.
`sentry` must be an alpha/or numeric string of 1 through 127 characters in length.

**Usage**
Use this command to specify a rule definition to analyze user traffic based on the SMTP session length.

**Example**
The following command creates an SMTP rule definition for analyzing user traffic using an SMTP sender of `test`:

```
smtp sender = test
```
smtp session-length

This command defines a rule definition to analyze and charge user traffic based on the SMTP session-length.

Product
All

Privilege
Security Administrator, Administrator

Syntax

\[
\text{[ no ] smtp session-length } \text{ operator } \text{ sess.length } \text{ range | !range range_from to range_to}
\]

- `no` Removes the specified rule definition.
- `operator` Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!=`: does not equal
  - `<=`: less than or equals
  - `=`: equals
  - `>=`: greater than or equals
- `sess.length` Specifies the session length for this rule definition. `sess.length` must be an integer from 1 through 40000000.
- `{ range | !range } range_from to range_to` Enables or disables the range criteria.
  - `range`: Enables the range criteria.
  - `!range`: Disables the range criteria.
  - `range_from`: Specifies the start of range, and must be an integer from 1 through 40000000.
  - `range_to`: Specifies the end range. `range_to` must be an integer from 1 through 40000000, and must be greater than `range_from`

Usage
Use this command to specify a rule definition to analyze user traffic based on the SMTP session length.

Example
The following command creates an SMTP rule definition for analyzing user traffic using an SMTP session length of 4000000:

```
smtp session-length = 4000000
```
smtp state

This command defines a rule definition to analyze and charge user traffic using SMTP state.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] smtp state operator state
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!=`: does not equal
  - `==`: equals

- **state**
  Specifies the SMTP state for this rule definition. `state` must be one of the following:
  - `close`: closed state
  - `init`: initialized state
  - `response-error`: response of error state
  - `response-ok`: response of ok state
  - `waiting-for-response`: waiting for response state

**Usage**

Use this command to specify a rule definition to analyze user traffic based on SMTP state.

**Example**

The following command creates an SMTP rule definition for analyzing user traffic using an SMTP state of `close`:

```
smtp state = close
```
tcp

The following commands define rules for analyzing traffic based on Transmission Control Protocol (TCP):
tcp analyzed out-of-order

This command specifies counting/charging of all TCP out-of-order packets that are received and buffered at ACSMgr/SessMgr due to non receipt of earlier packet(s) in sequence.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] tcp analyzed out-of-order operator condition

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
- !=: does not equal
- ==: equals

condition
Specifies the condition for this rule definition.
condition must be one of the following:
- FALSE: not analyzed
- TRUE: analyzed

Usage
This command is used to set the status flag to ‘analyzed’ or ‘not analyzed’ for all TCP packets received at the ACSMgr/SessMgr prior to their earlier packets.
When a packet reaches ACSMgr/SessMgr prior to earlier packet(s), particular packet with subsequent packets are buffered at ACSMgr/SessMgr as TCP out-of-order packets and ACSMgr/SessMgr waits for missing packet(s) till time-out duration expires. If the packet(s) with the missing sequence number(s) arrives within time-out duration, all buffered packets with correct sequence will be presented to upper layers (HTTP etc.) for analysis; otherwise buffered TCP out-of-order packets will be sent to charging with analysis done flag at TCP/IP layer only.
If this command is enabled the TCP out-of-order packets marked and sent to TCP analyzer as analyzed for charging action otherwise discarded.

Example
The following command sets to analyze TCP out-of-order packets:

tcp analyzed out-of-order = TRUE
tcp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for TCP.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] tcp any-match operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  - `!`: does not equal
  - `=`: equals

- **condition**
  Specifies the condition for this rule definition.
  - `FALSE`: not analyzed
  - `TRUE`: analyzed

**Usage**
Use this command to specify a rule definition to analyze user traffic based on the tcp any match status.

**Example**
The following command defines an any match rule definition for analyzing TCP user traffic:

```
tcp any-match = TRUE
```
tcp connection-initiator

This command defines a rule definition to analyze and charge user traffic based on the TCP connection initiator.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] tcp connection-initiator operator subscriber

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. "operator" must be one of the following:

- !=: does not equal
- =: equals

subscriber
Specifies that the connection is being initiated by the subscriber.

Usage
Use this command to specify a rule definition to analyze user traffic based on the TCP connection initiator and to allow the operator to differentiate between connection initiated by subscriber or the subscriber is acting as a TCS (Transaction Control Server) server.

Example
The following command creates TCP rule definition for analyzing user traffic using an TCP connection initiator as subscriber:

tcp connection-initiator = subscriber
tcp downlink

This command defines a rule definition to analyze and charge user traffic matching the direction of TCP packets to downlink (to subscriber).

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] tcp downlink operator condition

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
</table>
| Removes the specified rule definition.

<table>
<thead>
<tr>
<th>operator</th>
</tr>
</thead>
</table>
| Specifies how to logically match the information in the analyzed field.
| operator must be one of the following:
| • ! =: does not equal
| • =: equals

<table>
<thead>
<tr>
<th>condition</th>
</tr>
</thead>
</table>
| Specifies the condition for this rule definition.
| condition must be one of the following:
| • FALSE
| • TRUE

Usage
Use this command to specify a rule definition to analyze user traffic based on the TCP packet direction as downlink.

Example
The following command creates TCP rule definition for analyzing user traffic using an TCP packet direction to downlink (to subscriber):

```
tcp downlink = TRUE
```
**tcp dst-port**

This command defines a rule definition to analyze and charge user traffic based on destination TCP port.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] tcp dst-port { operator port_number | { !range | range } { start_range to end_range | port-map port_map } }
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the port number.
  *operator must be one of the following:*
  *!=:* Does not equal
  *<=:* Less than or equals
  *=:* Equals
  *>=:* Greater than or equals

- **port_number**
  Specifies the port number to match.
  *port_number must be an integer from 1 through 65535.*

- **range | !range**
  Specifies the range criteria:
  *!range: Not in the range
  *range: In the range

- **start_range to end_range**
  Specifies the starting and ending port numbers for the range of destination TCP ports.
  *start_range must be an integer from 1 through 65535.*
  *end_range must be an integer from 1 through 65535, and must be greater than start_range*

- **port-map port_map**
  Specifies the port map for the port range.
  *port_map must be a string of 1 through 63 characters in length.*

**Usage**
Use this command to specify a rule definition to analyze user traffic based on destination TCP port.

Example
The following command creates a TCP rule definition for analyzing user traffic matching destination port for TCP as 10:

```
tcp dst-port = 10
```
tcp duplicate

This command defines a rule definition to analyze and charge user traffic using duplicate TCP packet.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] tcp duplicate operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `==`: equals

- **condition**
  Specifies the condition for this rule definition.
  `condition` must be one of the following:
  - `FALSE`: not duplicated/retransmitted
  - `TRUE`: duplicated/retransmitted

**Usage**

Use this command to specify a duplicate rule definition for analyzing user traffic.

**Example**
The following command defines a duplicate rule definition with a value of `TRUE`:

```
tcp duplicate = TRUE
```
**tcp either-port**

This command defines a rule definition to analyze and charge user traffic using either (destination or source) TCP port.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
[ no ] tcp either-port { operator port_number | { !range | range } { start_range to end_range | port-map port_map } }
```

- **no**
  - Removes the specified rule definition.

- **operator**
  - Specifies how to logically match the port number.
  - **operator** must be one of the following:
    - `!=`: Does not equal
    - `<=`: Less than or equals
    - `==`: Equals
    - `>=`: Greater than or equals

- **port_number**
  - Specifies the port number to match.
  - **port_number** must be an integer from 1 through 65535.

- **range | !range**
  - Specifies the range criteria:
    - `!range`: Not in the range
    - `range`: In the range

- **start_range to end_range**
  - Specifies the starting and ending port numbers for the port range.
  - **start_range** must be an integer from 1 through 65535.
  - **end_range** must be an integer from 1 through 65535, and must be greater than **start_range**.

- **port-map port_map**
  - Specifies the port-map for the port range.
  - **port_map** must be a string of 1 through 63 characters in length.

**Usage**

---

**Cisco ASR 5000 Series Command Line Interface Reference**

4762
Use this command to specify a rule definition to analyze user traffic based on either TCP port.

**Example**
The following command creates a TCP rule definition for analyzing user traffic matching destination or source port for TCP as 10:

```
tcp either-port = 10
```
tcp error

This command defines a rule definition to identify any erroneous TCP packets.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

\[
\begin{array}{l}
\text{[ no ] tcp error operator condition} \\
\end{array}
\]

- **no**
  - Removes the specified rule definition.

- **operator**
  - Specifies how to logically match the information in the analyzed field.
  - `operator` must be one of the following:
    - `!=`: does not equal
    - `==`: equals

- **condition**
  - Specifies the condition for this rule definition.
  - `condition` must be one of the following:
    - `FALSE`
    - `TRUE`

**Usage**

Use this command to specify a rule definition to identify any erroneous TCP packets.

**Example**

The following command creates a TCP rule definition for identifying an erroneous TCP packet:

```plaintext
tcp error = TRUE
```
tcp flag

This command defines a rule definition to analyze and charge user traffic based on the TCP flag.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```markdown
[ no ] tcp flag operator value
```

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removes the specified rule definition.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>operator</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies how to logically match the information in the analyzed field.</td>
</tr>
<tr>
<td>operator must be one of the following:</td>
</tr>
<tr>
<td>• !contains: does not contain</td>
</tr>
<tr>
<td>• contains: contains</td>
</tr>
<tr>
<td>• !=: does not equal</td>
</tr>
<tr>
<td>• =: equals</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>The value of the specified field.</td>
</tr>
<tr>
<td>value must be one of the following:</td>
</tr>
<tr>
<td>• ack: TCP FLAG ACK</td>
</tr>
<tr>
<td>• fin: TCP FLAG FIN</td>
</tr>
<tr>
<td>• push: TCP FLAG PUSH</td>
</tr>
<tr>
<td>• reset: TCP FLAG RESET</td>
</tr>
<tr>
<td>• syn: TCP FLAG SYN</td>
</tr>
</tbody>
</table>

Usage

Use this command to specify a flag rule definition for analyzing user traffic.

Example

The following command defines a flag rule definition with a value of reset:

```bash
tcp flag = reset
```
tcp initial-handshake-lost

This command defines a rule definition to identify a TCP flow where the initial handshake was not seen.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] tcp initial-handshake-lost operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!=`: does not equal
  - `=`: equals

- **condition**
  Specifies the condition for this rule definition. `condition` must be one of the following:
  - `FALSE`
  - `TRUE`

**Usage**
Use this command to specify a rule definition to identify a TCP flow where the initial handshake was not seen.

**Example**
The following command creates a TCP rule definition for identifying a TCP flow where the initial handshake was not seen:

```
tcp initial-handshake-lost = TRUE
```
tcp payload

This command defines a rule definition to analyze and charge user traffic based on Hex/ASCII string content in payload protocol-signature field of TCP payload.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] tcp payload starts-with { hex-signature hex_string | string-signature string }

no
Removes the specified rule definition.

hex-signature hex_string
Specifies hexadecimal protocol signature in payload field. 
hex_string must be a dash-delimited list of hex data of size smaller than 32.

string-signature string
Specifies protocol signature in payload field. 
string must be a string of 1 through 32 characters in length.

Usage
Use this command to define a rule definition to analyze user traffic based on a match for Hex/ASCII string content in payload protocol-signature field.

Example
The following command creates a TCP rule definition to identify user traffic using TCP protocol signature as tcp1:

tcp payload starts-with string-signature tcp1
tcp payload-length

This command defines a rule definition to analyze and charge user traffic based on the TCP payload length.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] tcp payload-length operator payload_length

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. 
operator must be one of the following:

- !=: does not equal
- <=: less than or equals
- ==: equals
- >=: greater than or equals

payload_length
Specifies the tcp payload length for this rule definition. 
payload_length must be an integer from 0 through 40000000.

Usage
Use this command to specify a rule definition to analyze user traffic based on a TCP payload length.

Example
The following command creates a TCP rule definition for analyzing user traffic using a TCP payload length of 10000:

```
tcp payload-length = 10000
```
tcp previous-state

This command defines a rule definition to analyze and charge user traffic using previous state of TCP packet.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] tcp previous-state operator previous_state

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:
• !=: does not equal
• ==: equals

previous_state
Specifies the TCP previous state for this rule definition. previous_state must be one of the following:
• close
• close-wait
• closing
• established
• fin-wait1
• fin-wait2
• last-ack
• listen
• syn-received
• syn-sent
• time-wait

Usage
Use this command to specify a rule definition to analyze user traffic based on a TCP previous state.

Example
The following command creates a TCP rule definition for analyzing user traffic using a TCP previous state of time-wait:
tcp previous-state = time-wait
tcp session-length

This command defines a rule definition to analyze and charge user traffic using TCP session length.

Product
All

Privilege
Security Administrator, Administrator

Syntax

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
• !=: does not equal
• <=: less than or equals
• ==: equals
• >=: greater than or equals

sess_length
Specifies the TCP session length, in bytes, for this rule definition.
sess_length must be an integer from 0 through 4000000000.

Usage
Use this command to specify a rule definition to analyze user traffic based on the TCP session length.

Example
The following command creates a TCP rule definition for analyzing user traffic using a TCP session length of 2000 bytes:

tcp session-length = 2000
**tcp src-port**

This command defines a rule definition to analyze and charge user traffic based on source TCP port.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
[ no ] tcp src-port { operator port_number | !range | range } { start_range to end_range | port-map port_map } }
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the port number.
  `operator` must be one of the following:
  - `!`: does not equal
  - `<`: Less than or equals
  - `=`: equals
  - `>`: greater than or equals

- **port_number**
  Specifies the port number to match.
  `port_number` must be an integer from 1 through 65535.

- **range | !range**
  Specifies the range criteria:
  - `!range`: Not in the range
  - `range`: In the range

- **start_range to end_range**
  Specifies the starting and ending port numbers for the port range.
  `start_range` must be an integer from 1 through 65535.
  `end_range` must be an integer from 1 through 65535, and must be greater than `start_range`.

- **port-map port_map**
  Specifies the port map for the port range.
  `port_map` must be a string of 1 through 63 characters in length.

**Usage**
Use this command to specify a rule definition to analyze user traffic based on source TCP port.

**Example**

The following command creates a TCP rule definition for analyzing user traffic matching source port for TCP as 10:

```
tcp src-port = 10
```
tcp state

This command defines a rule definition to analyze and charge user traffic using current state of TCP packet.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] tcp state operator state
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `==`: equals

- **state**
  Specifies the TCP state for this rule definition.
  `state` must be one of the following:
  - `close`
  - `close-wait`
  - `closing`
  - `established`
  - `fin-wait1`
  - `fin-wait2`
  - `last-ack`
  - `listen`
  - `syn-received`
  - `syn-sent`
  - `time-wait`

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a TCP state.

**Example**

The following command creates a TCP rule definition for analyzing user traffic using a TCP state of `close`:
tcp state = close
tcp uplink

This command defines a rule definition to analyze and charge user traffic matching the direction of TCP packets to uplink (from subscriber).

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] tcp uplink operator condition

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removes the specified rule definition.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>operator</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies how to logically match the information in the analyzed field.</td>
</tr>
<tr>
<td>operator must be one of the following:</td>
</tr>
<tr>
<td>• ! =: does not equal</td>
</tr>
<tr>
<td>• =: equals</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the condition for this rule definition.</td>
</tr>
<tr>
<td>condition must be one of the following:</td>
</tr>
<tr>
<td>• FALSE</td>
</tr>
<tr>
<td>• TRUE</td>
</tr>
</tbody>
</table>

Usage
Use this command to specify a rule definition to analyze user traffic based on the TCP packet direction as uplink.

Example
The following command creates TCP rule definition for analyzing user traffic using an TCP packet direction to uplink (from subscriber):

tcp uplink = TRUE
udp

The following commands define rules for analyzing traffic based on User Datagram Protocol (UDP):

```
udp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for UDP.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] udp any-match operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. 
  `operator` must be one of the following:
  - `!=`: does not equal
  - `=`: equals

- **condition**
  Specifies the condition for this rule definition. 
  `condition` must be one of the following:
  - `FALSE`
  - `TRUE`

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the UDP analyzed status.

**Example**

The following command defines an any match rule definition for analyzing UDP user traffic:

```
udp any-match = TRUE
```
udp downlink

This command defines a rule definition to analyze and charge user traffic based on the UDP downlink.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] udp downlink operator condition

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field. 
operator must be one of the following:

• =: equals

condition

Specifies the condition for this rule definition.
condition must be one of the following: 

• FALSE
• TRUE

Usage

Use this command to specify a rule definition to analyze user traffic based on a UDP downlink condition.

Example

The following command creates a UDP rule definition for analyzing user traffic using UDP downlink condition TRUE

udp downlink = TRUE
udp dst-port

This command defines a rule definition to analyze and charge user traffic based on destination UDP port.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```plaintext
{ [ no ] udp dst-port { operator port_number | { !range | range } { start_range to end_range | port-map port_map } }
```

no
Removes the specified rule definition.

operator
Specifies how to logically match the port number.
operator must be one of the following:
- • !=: Does not equal
- • <=: Less than or equals
- • =: Equals
- • =>: Greater than or equals

port_number
Specifies the port number to match.
port_number must be an integer from 1 through 65535.

!range | range
Specifies the range criteria.
- • !range: Not in the range
- • range: In the range

start_range to end_range
Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535, and must be greater than start_range.

port-map port_map
Specifies the port map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage
Use this command to specify a rule definition to analyze user traffic based on destination UDP port.

Example
The following command creates a UDP rule definition for analyzing user traffic matching destination port for UDP as 10:

```
udp dst-port = 10
```
udp either-port

This command defines a rule definition to analyze and charge user traffic using either (destination or source) UDP port.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] udp either-port { operator port_number | { !range | range } { start_range to end_range | port-map port_map } }

no
Removes the specified rule definition.

operator
Specifies how to logically match the port number.
operator must be one of the following:
• !: Does not equal
• <: Less than or equals
• =: Equals
• =>: Greater than or equals

port_number
Specifies the port number to match.
port_number must be an integer from 1 through 65535.

!range | range
Specifies the range criteria.
• !: Not in the range
• : In the range

start_range to end_range
Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535, and must be greater than start_range.

port-map port_map
Specifies the port map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage
Use this command to specify a rule definition to analyze user traffic based on either UDP port.

**Example**
The following command creates a UDP rule definition for analyzing user traffic matching destination or source port for UDP as 10:

```
udp either-port = 10
```
udp payload

This command defines rule to analyze and charge user traffic based on the match for Hex/ASCII string content in payload protocol-signature field in UDP payload.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] udp payload starts-with { hex-signature hex_string | string-signature string }

- no
  Removes the specified rule definition.

- hex-signature hex_string
  Specifies hexadecimal protocol signature in payload field. 
  hex_string must be a dash-delimited list of hex data of size smaller than 32.

- string-signature string
  Specifies protocol signature in payload field.
  string must be a string of 1 through 32 characters in length.

Usage
Use this command to specify a rule definition to analyze user traffic based on a match for Hex/ASCII string content in payload protocol-signature field.

Example
The following command creates a UDP rule definition for analyzing user traffic using a UDP protocol signature as udp1:

    udp payload starts-with string-signature udp1
udp src-port

This command defines a rule definition to analyze and charge user traffic based on source UDP port.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] udp src-port { operator port_number | { !range | range } { start_range to end_range | port-map port_map } }
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the port number.
  `operator` must be one of the following:
  - `!=`: Does not equal
  - `<=`: Less than or equals
  - `==`: Equals
  - `>=`: Greater than or equals

- **port_number**
  Specifies the port number to match.
  `port_number` must be an integer from 1 through 65535.

- **!range | range**
  Specifies the range criteria.
  - `!range`: Not in the range
  - `range`: In the range

- **start_range to end_range**
  Specifies the starting and ending port numbers for the port range.
  `start_range` must be an integer from 1 through 65535.
  `end_range` must be an integer from 1 through 65535, and must be greater than `start_range`.

- **port-map port_map**
  Specifies the port map for the port range.
  `port_map` must be a string of 1 through 63 characters in length.

**Usage**
Use this command to specify a rule definition to analyze user traffic based on source UDP port.

Example
The following command creates a UDP rule definition for analyzing user traffic matching source port for UDP as 10:

```
udp src-port = 10
```
udp uplink

This command defines a rule definition to analyze and charge user traffic based on the UDP uplink.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] udp uplink operator condition

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
• =: equals

condition
Specifies the condition for this rule definition.
condition must be one of the following:
• FALSE
• TRUE

Usage
Use this command to specify a rule definition to analyze user traffic based on a UDP uplink condition.

Example
The following command creates a UDP rule definition for analyzing user traffic using UDP uplink condition TRUE:

udp uplink = TRUE
wsp

The following commands define rules for analyzing traffic based on Wireless Session Protocol (WSP):
wsp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for WSP.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] wsp any-match operator condition

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. 
  `operator` must be one of the following:
  - `!=`: does not equal
  - `=`: equals

- **condition**
  Specifies the condition for this rule definition. 
  `condition` must be one of the following:
  - **FALSE**
  - **TRUE**

Usage

Use this command to specify an any match WSP rule definition on analyzing user traffic.

Example
The following command defines an any match rule definition for analyzing WSP user traffic:

```
  wsp any-match = TRUE
```
**wsp content type**

This command defines a rule definition to analyze and charge user traffic based on the WSP content type.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
[ no ] wsp content type [ case-sensitive ] operator content_type
```

- **no**
  - Removes the specified rule definition.

- **case-sensitive**
  - Default: Disabled.
  - This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  - Specifies how to logically match the information in the analyzed field.
  - **operator** must be one of the following:
    - `!=`: does not equal
    - `!contains`: does not contain
    - `!ends-with`: does not end with
    - `!starts-with`: does not start with
    - `=`: equals
    - `contains`: contains
    - `ends-with`: ends with
    - `starts-with`: starts with

- **content_type**
  - **content_type** must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a WSP content type.

**Example**

The following command creates a SIP rule definition for analyzing user traffic using a WSP content of `test`:

```
wsp content type = test
```
wsp downlink

This command defines a rule definition to analyze and charge user traffic using WSP downlink.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] wsp downlink operator condition

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
- !: does not equal
- =: equals

condition
Indicates the downlink (from the Mobile Node direction) status.
condition must be one of the following:
- FALSE
- TRUE

Usage
Use this command to specify a rule definition to analyze user traffic based on a WSP downlink condition.

Example
The following command defines a rule definition for analyzing WSP user traffic based on the WSP downlink condition of TRUE:

wsp downlink = TRUE
**wsp first-request-packet**

This command defines a rule definition to analyze and charge user traffic based on the WSP first-request-packet.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] wsp first-request-packet operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!=`: does not equal
  - `=`: equals

- **condition**
  Specifies the condition for this rule definition. `condition` must be one of the following:
  - `FALSE`
  - `TRUE`

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the WSP first request packet.

**Example**

The following command creates an WSP rule definition for analyzing user traffic testing for the first-request-packet equals **TRUE**:

```
wsp first-request-packet = TRUE
```
wsp host

This command defines a rule definition to analyze and charge user traffic using WSP host.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] wsp host [ case-sensitive ] operator host_name

- no
  Removes the specified rule definition.

- case-sensitive
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- operator
  Specifies how to logically match the information in the analyzed field.
  operator must be one of the following:
  - !=: does not equal
  - !contains: does not contain
  - !ends-with: does not end with
  - !starts-with: does not start with
  - =: equals
  - contains: contains
  - ends-with: ends with
  - starts-with: starts with

- host_name
  A unique name that you specify for the WSP host.
  host_name must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WSP host name.

Example

The following command creates a WSP rule definition for analyzing user traffic containing a WSP host of host1:
wsp host contains host1
wsp pdu-length

This command defines a rule definition to analyze and charge user traffic based on the WSP Protocol Data Unit (PDU) length.

Product
All

Privilege
Security Administrator, Administrator

Syntax

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- ! =: does not equal
- < =: less than or equals
- = =: equals
- >=: greater than or equals

pdu_length
Specifies the WSP PDU length, in bytes, for this rule definition.
pdu_length must be an integer from 1 through 65535.

Usage
Use this command to specify a rule definition to analyze user traffic based on a WSP PDU length (header + payload) in bytes.

Example
The following command creates a WSP rule definition for analyzing user traffic using an WSP PDU length of 10000 bytes:

\[ \text{wsp pdu-length} = 10000 \]
wsp pdu-type

This command defines a rule definition to analyze and charge user traffic using WSP Protocol Data Unit (PDU) type.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] wsp pdu-type operator pdu_type

---

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- !=: does not equal

- ==: equals

---

pdu_type

Specifies the WSP PDU type used for this rule definition.
pdu_type must be one of the following:

- confirmed push
- connect-reply
- connect-request
- data-fragment
- delete
- disconnect
- get
- head
- options
- post
- push
- put
- redirect
- reply
- resume
- suspend
- trace
**Usage**

Use this command to specify a rule definition to analyze user traffic based on a WSP PDU type value.

**Example**

The following command creates a WSP rule definition for analyzing user traffic containing a WSP PDU type resume:

```
wsp pdu-type resume
```
wsp previous-state

This command defines a rule definition to analyze and charge user traffic using WSP previous state.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] wsp previous-state operator previous_state
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!:=` does not equal
  - `:=` equals

- **previous_state**
  Specifies the previous state for this rule definition.
  `previous_state` must be one of the following:
  - `init`
  - `response-error`
  - `response-ok`
  - `waiting-for-response`

**Usage**
Use this command to specify a rule definition to analyze user traffic based on a WSP previous state.

**Example**
The following command creates a WSP rule definition for analyzing user traffic using a WSP previous state of `response-ok`:

```plaintext
wsp previous-state = response-ok
```
**wsp reply code**

This command defines a rule definition to analyze and charge user traffic based on the WSP reply code.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
no
```

Removes the specified rule definition.

```plaintext
operator
```

Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:

- `!=`: does not equal
- `<=`: less than or equals
- `=`: equals
- `>=`: greater than or equals

```plaintext
return_code
```

Specifies the WSP return code for this rule definition. `return_code` must be an integer from 0 through 101.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a WSP reply code.

**Example**
The following command creates a WSP rule definition for analyzing user traffic using a WSP reply code of 50:

```
wsp reply code = 50
```
**wsp session-length**

This command defines a rule definition to analyze and charge user traffic using WSP session length.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
- !: does not equal
- <=: less than equals
- =: equals
- >=: greater than equals

sess_length

Specifies the WSP session length, in bytes, for this rule definition.
sess_length must be an integer from 1 through 65535.
```

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the WSP session length.

**Example**
The following command creates a WSP rule definition for analyzing user traffic using a WSP session length of 2000 bytes:

```plaintext
wsp session-length = 2000
```
**wsp session-management**

This command defines a rule definition to analyze and charge user traffic based on WSP session management information.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
[ no ] wsp session-management { previous-state | state } operator state
```

- **no**
  - Removes the specified rule definition.

- **previous-state**
  - Specifies WSP previous state information.

- **state**
  - Specifies WSP current state information.

- **operator**
  - Specifies how to logically match the information in the analyzed field. operator must be one of the following:
    - `!=`: does not equal
    - `=`: equals

- **state**
  - Specifies the WSP state.
  - For `previous-state`, state must be one of the following:
    - `connected`
    - `connecting`
    - `init`
    - `resuming`
    - `suspended`
  - For `state`, state must be one of the following:
    - `close`
    - `connected`
    - `connecting`
    - `init`
    - `resuming`
### Usage

Use this command to specify a rule definition to analyze user traffic based on WSP session management information.

### Example

The following command creates a WSP rule definition for analyzing user traffic based on WSP session-management current state of `connecting`:

```
wsp session-management state = connecting
```
wsp state

This command defines a rule definition to analyze and charge user traffic using WSP state.

Product
All

Privilege
Security Administrator, Administrator

Syntax

\[ \text{[ no ] \ wsp \ state} \ \text{operator} \ \text{state} \]

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  \text{operator} must be one of the following:
  - \text{!=}: does not equal
  - \text{==}: equals

- **state**
  Specifies the WSP state for this rule definition.
  \text{state} must be one of the following:
  - \text{close}
  - \text{response-error}
  - \text{response-ok}
  - \text{waiting-for-response}

Usage
Use this command to specify a rule definition to analyze user traffic based on a WSP state.

Example
The following command creates a WSP rule definition for analyzing user traffic using a WSP state of \text{connecting}.

\[ \text{wsp \ state} = \text{connecting} \]
**wsp tid**

This command defines a rule definition to analyze and charge user traffic using WSP Transaction Identifier (TID).

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] wsp tid operator tid_value
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `==`: equals

- **tid_value**
  Specifies the transaction identifier for this rule definition.
  `tid_value` must be an integer from 0 through 255.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a WSP tid.

**Example**

The following command creates a rule definition for analyzing user traffic using a WSP TID value of 22:

```plaintext
wsp tid = 22
```
wsp total-length

This command defines a rule definition to analyze and charge user traffic using WSP total packet length.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] wsp total-length operator total_length
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!`: does not equal
  - `<`: less than equals
  - `=`: equals
  - `>=`: greater than equals

- **total_length**
  Specifies the total length of the WSP packet including payload for this rule definition.
  `total_length` must be an integer from 1 through 65535.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the WSP total length.

**Example**
The following command creates a WSP rule definition for analyzing user traffic using an WSP total length of 2000 bytes:

```plaintext
wsp total-length = 2000
```
wsp transfer-encoding

This command defines a rule definition to analyze and charge user traffic using WSP transfer-encoding.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] wsp transfer-encoding [ case-sensitive ] operator string
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  **operator** must be one of the following:
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **string**
  `string` must be of 1 through 127 characters in length.

**Usage**
Use this command to specify a rule definition to analyze user traffic based on WSP transfer-encoding.

**Example**
The following command creates a WSP rule definition for analyzing user traffic containing a WSP transfer encoding that contains the number 7:

```
wsp transfer-encoding contains 7
```
wsp uplink

This command defines a rule definition to analyze and charge user traffic using WSP uplink.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] wsp uplink operator condition

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
  • !=: does not equal
  • ==: equals

condition
Indicates the uplink (to the Mobile Node direction) status.
condition must be one of the following:
  • FALSE
  • TRUE

Usage
Use this command to specify a rule definition to analyze user traffic based on the WSP uplink status.

Example
The following command creates a rule definition for analyzing user traffic using a WSP uplink value of TRUE

wsp uplink = TRUE
**wsp url**

This command defines a rule definition to analyze and charge user traffic using WSP URL.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] wsp url [ case-sensitive ]operator url
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **url**
  `url` must be an alpha and/or numeric string of 1 through 127 characters in length.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the WSP URL.

**Example**

The following command creates a rule definition for analyzing user traffic using a WSP URL of `wsp://wiki.tcl.tk`

```
wsp url = wsp://wiki.tcl.tk
```
**wsp user-agent**

This command defines a rule definition to analyze and charge user traffic using WSP user agent.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] wsp user-agent [ case sensitive ] operator user_agent
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **user_agent**
  Specifies the WSP user agent for this rule definition.
  `user_agent` must be an alpha and/or numeric string of 1 through 127 characters in length.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the WSP user agent.

**Example**

The following command creates a rule definition for analyzing user traffic containing a WSP user agent of `test`:

```
wsp user-agent contains test
```
wsp x-header

This command defines a rule definition to analyze and charge user traffic based on WSP extension-headers (x-headers).

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] wsp x-header name [ case-sensitive ] operator string
```

- **no**
  Removes the specified rule definition.

- **name**
  A unique value that you specify to use for the x-header.
  *name* must be an alpha and/or numeric string of 1 through 31 characters in length.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  *operator* must be one of the following:
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **string**
  Specifies the value of the extension header.
  *string* must be an alpha and/or numeric string of 1 through 127 characters in length.

**Usage**
Use this CLI to configure any x-header field in WSP and parse it. The extension-header mechanism allows additional header fields to be defined without changing the protocol. The extension-header can be any header fields that are not specified in RFC/standard.

Example
The following command creates a rule definition for analyzing user traffic containing WSP extension-header of test_field and value of test_string

```
wsp x-header test_field = test_string
```
wtp

The following commands define rules for analyzing traffic based on Wireless Transaction Protocol (WTP):
wtp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for WTP.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] wtp any-match operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. 
  `operator` must be one of the following:
  - `!=`: does not equal
  - `=`: equals

- **condition**
  Specifies the condition for this rule definition.
  `condition` must be one of the following:
  - `FALSE`
  - `TRUE`

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the WTP any match status.

**Example**

The following command defines an any match rule definition for analyzing WTP user traffic:

```
wtp any-match = TRUE
```
wtp downlink

This command defines a rule definition to analyze and charge user traffic using WTP downlink.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] wtp downlink operator condition

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
- !=: does not equal
- ==: equals

condition
Indicates the downlink (from the Mobile Node direction) status.
condition must be one of the following:
- FALSE
- TRUE

Usage
Use this command to specify a rule definition to analyze user traffic based on a WTP downlink condition.

Example
The following command defines a rule definition for analyzing WTP user traffic based on the WTP downlink condition of TRUE:

wtp downlink = TRUE
**wtp gtr**

This command defines a rule definition to analyze and charge user traffic based on the WTP Group Transmission Flag (GTR).

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] wtp gtr operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. 
  `operator` must be one of the following:
  - `!=`: does not equal
  - `=`: equals

- **condition**
  `condition` must be one of the following:
  - `FALSE`
  - `TRUE`

**Usage**
Use this command to specify a rule definition to analyze user traffic based on a WTP GTR condition.

**Example**
The following command defines a rule definition for analyzing WTP user traffic based on the WTP GTR condition of `TRUE`:

```
  wtp gtr = TRUE
```
wtp pdu-length

This command defines a rule definition to analyze and charge user traffic using WTP Protocol Data Unit (PDU) length.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```bash
[ no ] wtp pdu-type operator pdu_length
```

*no*
Removes the specified rule definition.

*operator*
Specifies how to logically match the information in the analyzed field.
*operator* must be one of the following:
- `!=`: does not equal
- `==`: equals

*pdu_length*
Specifies the WTP PDU length, in bytes, for this rule definition.
*pdu_length* must be an integer from 1 through 65535.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on WTP PDU length (header + payload) in bytes.

**Example**

The following command creates a WTP rule definition for analyzing user traffic using an WTP PDU length of 9647 bytes:

```bash
ftp pdu-length = 9647
```
**wtp pdu-type**

This command defines a rule definition to analyze and charge user traffic based on the WTP Protocol data Unit (PDU) type.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] wtp pdu-type operator pdu_type
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  - operator must be one of the following:
    - `!=': does not equal
    - `=': equals

- **pdu_type**
  Specifies the WTP PDU type used for this rule definition.
  - pdu_type must be one of the following:
    - `abort`
    - `ack`
    - `invoke`
    - `negative-ack`
    - `result`
    - `segment invoke`
    - `segment result`

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a WTP PDU type value.

**Example**

The following command creates a WTP rule definition for analyzing user traffic containing a WTP PDU type `result`:

```
wtp pdu-type result
```
**wtp previous-state**

This command defines a rule definition to analyze and charge user traffic using WTP previous state.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] wtp previous-state operator previous_state
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!=`: does not equal
  - `=`: equals

- **previous_state**
  Specifies the WTP previous state for this rule definition. `previous_state` must be one of the following:
  - `ack-sent`
  - `init`
  - `invoke-sent`
  - `rcvd`
  - `result-rcvd`

**Usage**
Use this command to specify a rule definition to analyze user traffic based on a WTP previous state.

**Example**
The following command creates a WTP rule definition for analyzing user traffic using a WTP previous state of `ack_sent`:

```
  wtp previous-state = ack-sent
```
wtp rid

This command defines a rule definition to analyze and charge user traffic based on the WTP Re-transmission Indicator (RID) flag.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] wtp rid operator condition

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:

- ! =: does not equal
- =: equals

condition
condition must be one of the following:

- FALSE
- TRUE

Usage
Use this command to specify a rule definition to analyze user traffic based on a WTP RID.

Example
The following command creates a rule definition for analyzing user traffic containing a WTP RID condition of TRUE:

wtp rid = TRUE
**wtp state**

This command defines a rule definition to analyze and charge user traffic using WTP state.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] wtp state operator state
```

- `no`
  Removes the specified rule definition.

- `operator`
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!=`: does not equal
  - `=`: equals

- `state`
  Specifies the WTP state for this rule definition. `state` must be one of the following:
  - `ack-sent`
  - `close`
  - `init`
  - `invoke-sent`
  - `rcvd`
  - `result-rcvd`

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a WTP state.

**Example**
The following command creates a WTP rule definition for analyzing user traffic using a WTP state of `close`:

```
wtp state = close
```
**wtp tid**

This command defines a rule definition to analyze and charge user traffic based on the WTP Transaction Identifier (tid).

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] wtp tid [ operator ] tid_value
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `=`: equals

- **tid_value**
  Specifies the transaction identifier for this rule definition.
  `tid_value` must be an integer from 0 through 65535.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a WTP TID.

**Example**

The following command creates a rule definition for analyzing user traffic containing a WTP TID value of 22:

```
wtp tid = 22
```
wtp transaction class

This command defines a rule definition to analyze and charge user traffic based on the WTP Transaction Class (TCL) state.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] wtp transaction class operator transaction_class
```

<table>
<thead>
<tr>
<th><strong>no</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Removes the specified rule definition.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>operator</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies how to logically match the information in the analyzed field. <code>operator</code> must be one of the following:</td>
</tr>
<tr>
<td>• ≠: does not equal</td>
</tr>
<tr>
<td>• =: equals</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>transaction_class</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the WTP TCL for this rule definition. <code>transaction_class</code> must be an integer from 0 through 2.</td>
</tr>
</tbody>
</table>

**Usage**
Use this command to specify a rule definition to analyze user traffic based on a WTP transaction class.

**Example**
The following command creates a WTP rule definition for analyzing user traffic using a WTP transaction class of 2:

```
wtp transaction class = 2
```
**wtp ttr**

This command defines a rule definition to analyze and charge user traffic based on the WTP Trailer Transmission flag (TTR).

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] wtp ttr operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!=`: does not equal
  - `==`: equals

- **condition**
  `condition` must be one of the following:
  - `FALSE`
  - `TRUE`

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a WTP TTR condition.

**Example**

The following command defines a rule definition for analyzing WTP user traffic based on the WTP TTR condition of `TRUE`:

```
wtp ttr = TRUE
```
wtp uplink

This command defines a rule definition to analyze and charge user traffic using WTP uplink.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] wtp uplink operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `==`: equals

- **condition**
  Indicates the uplink (to the Mobile Node direction) status.
  `condition` must be one of the following:
  - `FALSE`
  - `TRUE`

**Usage**
Use this command to specify a rule definition to analyze user traffic based on the WTP uplink status.

**Example**
The following command creates a rule definition for analyzing user traffic using a WTP uplink value of `TRUE`:

```
wtp uplink = TRUE
```
WWW

The following commands define rules for analyzing traffic based on World Wide Web (WWW):
www any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for WWW.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] www any-match operator condition

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
- ! =: does not equal
- =: equals

condition
Specifies the condition for this rule definition.
condition must be one of the following:
- FALSE
- TRUE

Usage
Use this command to specify a rule definition to analyze user traffic based on the WWW any match status.

Example
The following command defines an any match rule definition for analyzing WWW user traffic:

www any-match = TRUE
**www content type**

This command defines a rule definition to analyze and charge user traffic based on the WWW content type.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] www content type [ case-sensitive ] operator content_type
```

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:
  - `!=`: does not equal
  - `!contains`: does not contain
  - `!ends-with`: does not end with
  - `!starts-with`: does not start with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

- **content_type**
  `content_type` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

**Usage**

Use this command to specify a rule definition to analyze user traffic based on a WWW content type.

**Example**

The following command creates a SIP rule definition for analyzing user traffic using a WWW content of `test`:

```
www content type = test
```
www downlink

This command defines a rule definition to analyze and charge user traffic based on the WWW downlink conditions.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] www downlink operator condition

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
• !=: does not equal
• ==: equals

condition
Indicates the downlink (from the Mobile Node direction) status.
condition must be one of the following:
• FALSE
• TRUE

Usage
Use this command to specify a rule definition to analyze user traffic based on a WWW downlink condition.

Example
The following command defines a rule definition for analyzing WWW user traffic based on the WWW downlink condition of TRUE.

www downlink = TRUE
**WWW first-request-packet**

This command defines a rule definition to analyze and charge user traffic based on the Wide Web (WWW) first-request-packet.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] www first-request-packet operator condition
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  *operator* must be one of the following:
  - `!=`: does not equal
  - `==`: equals

- **condition**
  Specifies the condition for this rule definition.
  *condition* must be one of the following:
  - `FALSE`
  - `TRUE`

**Usage**

Use this command to specify a rule definition to analyze user traffic based on the WWW first request packet.

**Example**

The following command creates an WW rule definition for analyzing user traffic testing for the first-request-packet equals *TRUE*:

```plaintext
www first-request-packet = TRUE
```
www header-length

This command defines a rule definition to analyze and charge user traffic based on the WWW packet header length.

Product
All

Privilege
Security Administrator, Administrator

Syntax

\[
\text{[ } \text{no } \text{]} \text{ www header-length } \text{operator header_length}
\]

- \text{no}
  - Removes the specified rule definition.

- \text{operator}
  - Specifies how to logically match the information in the analyzed field.
    - \text{! =}: does not equal
    - \text{< =}: less than or equals
    - \text{=} : equals
    - \text{> =}: greater than or equals

- \text{header_length}
  - Specifies the WWW packet header length, in bytes, for this rule definition.
    - \text{header_length} must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WWW packet header length.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an WWW packet header length of 10000:

\[
\text{www header-length } = 10000
\]
www host

This command defines a rule definition to analyze and charge user traffic based on the WWW host.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] www host [ case-sensitive ] operator host_name

- **no**
  Removes the specified rule definition.

- **case-sensitive**
  Default: Disabled.
  This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  *operator* must be one of the following:
  - !=: does not equal
  - !contains: does not contain
  - !ends-with: does not end with
  - !starts-with: does not start with
  - =: equals
  - contains: contains
  - ends-with: ends with
  - starts-with: starts with

- **host_name**
  A unique name that you specify for the WWW host.
  *host_name* must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WWW host name.

Example

The following command creates a WWW rule definition for analyzing user traffic using a WWW host of *host1*:

```
www host = host1
www payload-length

This command defines a rule definition to analyze and charge user traffic based on the WWW payload length.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] www payload-length operator payload_length

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:
• !: does not equal
• <=: less than or equals
• =: equals
• >=: greater than or equals

payload_length
Specifies the WWW payload length for this rule definition. payload_length must be an integer from 1 through 4000000000.

Usage
Use this command to specify a rule definition to analyze user traffic based on a WWW payload length.

Example
The following command creates a WWW rule definition for analyzing user traffic using a WWW payload length of 10000:

www payload-length = 10000
**www pdu-length**

This command defines a rule definition to analyze and charge user traffic based on the WWW Protocol Data Unit (PDU) length.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] www pdu-length operator pdu_length
```

---

**no**
Removes the specified rule definition.

---

**operator**
Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:

- `!=`: does not equal
- `<=`: less than or equals
- `==`: equals
- `>=`: greater than or equals

---

**pdu_length**
Specifies the WWW PDU length, in bytes, for this rule definition.

`pdu_length` must be an integer from 0 through 65535.

---

**Usage**
Use this command to specify a rule definition to analyze user traffic based on WWW PDU length (header + payload) in bytes.

---

**Example**
The following command creates an FTP rule definition for analyzing user traffic using a WWW PDU length of 9767 bytes:

```
www pdu-length = 9767
```
www previous-state

This command defines a rule definition to analyze and charge user traffic based on the previous state of WWW.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] www previous-state operator previous_state

no
Removes the specified rule definition.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:
  • !=: does not equal
  • ==: equals

previous_state
Specifies the WWW previous state for this rule definition. previous_state must be one of the following:
  • init
  • response-error
  • response-ok
  • waiting-for-response

Usage
Use this command to specify a rule definition to analyze user traffic based on a WWW previous state.

Example
The following command creates a WWW rule definition for analyzing user traffic using a WWW previous state of init:

www previous-state = init
### www reply code

This command defines a rule definition to analyze and charge user traffic based on the WWW reply code arguments.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
(no) www reply code operator response_code
```

- **no**
  Removes the specified rule definition.

- **operator**
  Specifies how to logically match the information in the analyzed field.
  `operator` must be one of the following:
  - `!=`: does not equal
  - `<=`: less than or equals
  - `=`: equals
  - `>=`: greater than or equals

- **response_code**
  A unique value that you specify to use for the response.
  `response` must be an integer from 100 through 599.

**Usage**
Use this command to specify a rule definition to analyze WWW user traffic based on a reply code rule definition.

**Example**
The following command defines a rule definition for analyzing WWW user traffic using a reply code of 110:

```
www reply code = 110
```
www state

This command defines a rule definition to analyze and charge user traffic based on the current state of WWW.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] www state operator state

- no
  Removes the specified rule definition.

- operator
  Specifies how to logically match the information in the analyzed field. 
  operator must be one of the following:
  - !=: does not equal
  - ==: equals

- state
  Specifies the WWW state for this rule definition. 
  state must be one of the following:
  - close
  - response-error
  - response-ok
  - waiting-for-response

Usage
Use this command to specify a rule definition to analyze user traffic based on a WWW state.

Example
The following command creates a WWW rule definition for analyzing user traffic using a WWW state of close:

www state = close
www transfer-encoding

This command defines a rule definition to analyze and charge user traffic based on the WWW transfer encoding.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] www transfer-encoding [ case-sensitive ] operator string

no
Removes the specified rule definition.

case-sensitive
Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
• !=: does not equal
• !contains: does not contain
• !ends-with: does not end with
• !starts-with: does not start with
• =: equals
• contains: contains
• ends-with: ends with
• starts-with: starts with

string
A unique name that you specify for WWW transfer encoding.
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage
Use this command to specify a rule definition to analyze user traffic based on a WWW transfer encoding string.

Example
The following command creates an HTTP rule definition for analyzing user traffic using a WWW transfer encoding string of *user1*:

```
www transfer-encoding = user1
```
www url

This command defines a rule definition to analyze and charge user traffic based on the WWW URL.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] www url [ case-sensitive ] operator url

no
Removes the specified rule definition.

case-sensitive
Default: Disabled.
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

operator
Specifies how to logically match the information in the analyzed field. operator must be one of the following:

- !=: does not equal
- !contains: does not contain
- !ends-with: does not end with
- !starts-with: does not start with
- =: equals
- contains: contains
- ends-with: ends with
- starts-with: starts with

url
url must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage
Use this command to specify a rule definition to analyze user traffic based on the WWW URL.

Example
The following command creates a rule definition for analyzing user traffic using the WWW URL www.abc.com

www url = www.abc.com
Chapter 183
SCCP Network Configuration Mode Commands

The SCCP Network Configuration Mode is used to configure properties for Signaling Connection Control Part (SCCP) services for SS7.

Signaling Connection Control Part (SCCP) is a routing protocol in the SS7 protocol suite in layer 4, which provides end-to-end routing for TCAP messages to their proper database.

```
Exec Mode
  configure
  Global Configuration Mode
    sccp-network
      id_number
    SCCP Network Configuration Mode
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
associate

Associates an SS7 routing domain with the SCCP network.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
associate ss7-routing-domain rd_id

no associate

no

Removes the association with the SS7 routing domain from the system configuration.

rd_id

This number identifies an already defined SS7 routing domain.

rd_id: enter an integer from 1 through 12.
```

Usage

Use this command to associate SS7 routing domain configurations with SCCP network configurations.

Example

The following command associates the SCCP network with SS7 routing domain 2:

```
associate ss7-routing-domain 2
```
**description**

This command defines a string that describes the SCCP network. The description is used for operator reference.

**Product**
SGSN, HNB-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
description string
```

```
no description
```

<table>
<thead>
<tr>
<th>string</th>
</tr>
</thead>
<tbody>
<tr>
<td>This is a string to describe the SCCP network.</td>
</tr>
</tbody>
</table>
| *string* must be an alphanumeric string from 1 through 127 characters in length. If there are spaces in the string the string must be enclosed in double-quotes. For example; “This is a Description”.

```
no
```

Removes the description from the system configuration.

**Usage**

Use this command to configure a description of this SCCP service for operator reference.

**Example**

The following command sets the description to “This is the SCCP Service Number 1”:

```
description "This is the SCCP Service Number 1."
```
destination

This command configures the SCCP network destination information. Use this command multiple times to set all of the destination information required.

Product
SGSN, HNB-GW

Privilege
Security Administrator, Administrator

Syntax

```
destination dpc point_code { name route_name | next-hop | ssn subsys_num | version sccp_ver }
```

```
no destination dpc_code [ name route_name | ssn subsys_num | version sccp_ver ]
```

no
Deletes the specified destination information from the SCCP network configuration.

dpc point_code
Specifies the SCCP destination point code.
point_code: Must be in SS7 point code dotted-decimal ###.###.### format or decimal ####### format.

name route_name
The name of the SCCP destination route.
route_name: enter an alphanumeric string from 1 through 64 characters in length.

next-hop
Associates the next destination defined in the SS7 routing domain.

ssn subsys_num
The destination subsystem number.
subsys_num: enter an integer from 1 through 255.

version sccp_ver
sccp_ver: enter one of the following to select the SCCP variant:
  • ANS188
  • ANS192
  • ANS196
  • BELL05
  • GSM0806
  • ITU88
  • ITU92
**ITU96**

**Usage**
Use this command to configure the destination information for the SCCP network.

**Example**
The following commands set the name of the destination route to default_route, the subsystem number to 1, and the variant version to ITU96, all with a destination point code of 1:

```bash
destination dpc 1 name default_route
destination dpc 1 ssn 1
destination dpc version ITU96
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
end
```

**Usage**

Return to the Exec mode.
exit

Exits the current configuration mode and returns to the global configuration mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

`exit`

---

**Usage**

Return to the global configuration mode.
global-title-translation

This command associates a GTT address-map with this SCCP network.

Product
SGSN, HNB-GW

Privilege
Security Administrator, Administrator

Syntax

```
global-title-translation address-map instance instance
no global-title-translation address-map instance instance
```

```
no
Deletes the GTT address-map instance associated with this SCCP network.

instance
This value uniquely identifies a specific previously defined instance of a GTT address-map.
instance: enter an integer from 1 to 4096.
```

Usage
Use this command to link a GTT address-map, configured with the GTT Address Map configuration mode, to a specific SCCP network configuration.

Example

```
global-title-translation address-map instance gtt-map1
```
hop-count

This command specifies the hop count for this SCCP network.

Product
SGSN, HNB-GW

Privilege
Security Administrator, Administrator

Syntax

hop-count hop_cnt

default hop-count

default

Resets the hop-count value to the system default of 5.

hop_cnt

The hop count to assign to this SCCP network.

hop_cnt: enter an integer from 1 to 5.

Usage

Use this command to define the hop count for this SCCP network.

Example

The following command sets the hop count to 3:

hop-count 3
self-point-code

This command specifies the SS7 point code for this SCCP service.

Product
SGSN, HNB-GW

Privilege
Security Administrator, Administrator

Syntax

self-point-code point_code

no self-point-code

point_code
Defines the point code to assign to this SCCP network service.

point_code: value entered must adhere to the point code variant selected when the SCCP network instance was defined:

- ITU Range 0.0.1 to 7.255.7
- ANSI Range 0.0.1 to 255.255.255
- TTC Range 0.0.1 to 15.31.255
- a string of 1 to 11 combined digits ad period.

Usage
Use this command to assign the self point code to use for this SCCP service.

Example
The following command sets an ITU-based point code for this SCCP service:

    self-pointcode 4.121.5

The following command removes the configured self-point code:

    no self-pointcode
timeout

This command configures the timeout parameters for this SCCP network.

Product
SGSN, HNB-GW

Privilege
Security Administrator, Administrator

Syntax

timeout { attack-timer | congestion-timer | conn-est-timer | crd-timer | decay-timer | iar-timer | ias-timer | interval-timer | reassembly-timer | release-timer | repeat-release-timer | reset-timer | sst-timer } *

default timeout

go timeout timer

attack-timer time
Defines the time before the attack timer expires.
time: enter an integer between 1 and 10.

congestion-timer time
Defines the time before the congestion timer expires.
time: enter an integer between 1 and 10.

conn-est-timer time
Defines the time before the connection timer expires.
time: enter an integer between 6 and 12.

crd-timer time
Defines the time before the coordinated-state-change timer expires.
time: enter an integer between 60 and 120.

decay-timer time
Defines the time before the decay timer expires.
time: enter an integer between 1 and 10.

iar-timer time
Defines the time before the inactivity–receive timer expires.
time: enter an integer between 60 and 120.

ias-timer time
Defines the time before the inactivity–send timer expires.
time: enter an integer between 30 and 60.
timeout

interval-timer time
Defines the time before the interval timer expires.
\textit{time}: enter an integer between 6 and 12

reassembly-timer time
Defines the time before the reassembly-timer expires.
\textit{time}: enter an integer between 10 and 20

release-timer time
Defines the time before the release-assembly timer expires.
\textit{time}: enter an integer between 1 and 2

repeat-release-timer time
Defines the time before repeat-release timer expires.
\textit{time}: enter an integer between 1 and 2

reset-timer time
Defines the amount of time before the reset timer expires.
\textit{time}: enter an integer between 1 and 2

sst-timer time
Defines the amount of time before the subsystem status test timer expires.
\textit{time}: enter an integer between 5 and 1200

default
Resets the timeout parameter to the system default.

no
Deletes the specified timer configuration.

Usage
Use this command to assign timeout timers and timeout values for this SCCP service.

Example

\texttt{timeout reset-timer 75}
Chapter 184
Service Redundancy Protocol Configuration Mode Commands

The Service Redundancy Protocol Mode is used to configure properties for Interchassis Session Recovery services.

![Diagram]

```
Exec Mode

configure

Global Configuration Mode

context name

Context Configuration Mode

server redundancy-protocol

Srvc. Redundancy Protocol Config Mode
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
bind address

Binds the service to the IP address of the local chassis.

Product
HA, GGSN,

Privilege
Security Administrator, Administrator

Syntax

bind address {IPv4 _address | IPv6_address}

no bind address

no
Removes the IP bind address.

IPv4 _address | IPv6_address
The system IP address.

Usage
Defines the IP address of the local chassis defined as part of the Interchassis Session Recovery configuration.

Example

bind address 1.1.1.1
chassis-mode

Defines the chassis’s operational mode - primary or backup - for Interchassis Session Recovery.

Product
HA, GGSN,

Privilege
Security Administrator, Administrator

Syntax

chassis-mode { primary | backup }

default chassis-mode

  default
  Resets the chassis mode to the default setting of backup.

  primary
  Configures the system as the primary chassis operating in active state.

  backup
  Configures the system as the backup chassis operating in standby state.

Usage
Sets the chassis mode (primary or backup) for the system within the framework of Interchassis Session Recovery.

Example

chassis-mode primary
checkpoint session duration

Configures check pointing for Interchassis Session Recovery.

Product
HA, GGSN,

Privilege
Security Administrator, Administrator

Syntax

checkpoint session duration duration

default checkpoint session duration

default
Resets the checkpoint session duration to the default setting of 60 seconds.

duration
The amount of time (in seconds) that a call must be active before it is check pointed. duration must be an integer from 1 through 65535.

Usage
Sets the amount of time the chassis waits before check pointing an existing call session.

Example

checkpoint session duration 6500
configuration-interval

Defines the configuration validation interval.

**Product**
HA, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
configuration-interval interval
```

default configuration-interval

---

**default**

Resets the configuration interval to the default setting of 3600 seconds.

---

**interval**

The amount of time (number of seconds) between one configuration validation and the next configuration validation. interval must be an integer from 1 through 65535.

---

**Usage**

This configures the interval between configuration validations of the primary and backup chassis.

---

**Example**

```
configuration-interval 34
```
**dead-interval**

The timeout interval before a peer is determined to be down.

**Product**

HA, GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
dead-interval interval

default dead-interval
```

**default**

Resets the dead interval to the default setting of 30 seconds.

**interval**

The amount of time (in seconds) for the dead interval. interval must be an integer from 1 through 65535.

**Usage**

This command specifies the amount of time that one chassis waits to receive a communication from a peer before the listening chassis determines that the peer chassis is down.

**Example**

```
dead-interval 65
```
delay-interval

Configure the delay time, for starting the dead timer, after configuration files are loaded.

Product
HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
delay-interval interval

default delay-interval
```

```
default
   Sets / Restores default value assigned for specified parameter.

interval
   The amount of time (in seconds) for the delay interval. interval must be an integer from 1 through 65535.
```

Usage
This configures interval for starting the dead timer, after configuration files are loaded.

Example
```
delay interval 65
```
end

Exits the service recovery mode and returns to the Exec mode.

**Product**
HA, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Return to the Exec mode.
exit

Exits the current configuration mode and returns to the Context Configuration mode.

Product
HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Return to the context configuration mode.
hello-interval

Defines the lapse time between sending the hello message.

Product
HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
hello-interval interval
default hello-interval
```

**default**
Resets the hello interval to the default setting of 10 seconds.

**interval**
The lapse time (in seconds) between sending the hello message. interval must be an integer from 1 through 65535.

Usage
This command configures the hello interval - the amount of time that lapses between the sending of each hello message. Each chassis sends the other chassis a hello message at the expiration of every hello interval.

Example

```
hello-interval 35
```
monitor authentication probe

Enables the monitoring of the connection between the primary chassis and a specified RADIUS server.

Product
HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
[ no ] monitor authentication probe context context_name { IPv4_address | IPv6_address } port port_number
```

- **no**
  Turns off the monitoring.

- **context context_name**
  Identifies the context being used.

- **IPv4 _address | IPv6_address**
  Defines the IP address of the RADIUS server to be monitored.

- **port port_number**
  Identifies a specific port for the authentication probe. port_number must be the port for the AAA server.

Usage
This command initiates monitoring of the connection between the primary chassis and the specified AAA server through the use of authentication probe packets. If the connection drops, the standby chassis becomes active.

Example

```
monitor authentication probe context test1 1.1.1.1 port 1025
```
monitor bgp

Enables monitoring of the connection between the specified BGP peer and the primary chassis.

**Product**
HA, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] monitor BGP context context_name IPv4_address
```

- **no**
  Disables monitoring.

- **context context_name**
  Identifies the context being used.

- **IPv4_address | IPv6_address**
  Defines the IP address of the BGP peer to be monitored.

**Usage**

This command initiates monitoring of the connection between the primary chassis and the specified BGP peer through the use of authentication probe packets. If the connection drops, the standby chassis becomes active.

**Example**

```
monitor bgp context test 125.2.1.56
```
peer-ip-address

Specifies the IP address for the peer chassis.

**Product**

HA, GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
peer-ip-address { IPv4_address | IPv6_address }

no peer-ip-address
```

**Usage**

This command is used to identify the peer chassis in the Interchassis Session Recovery configuration. From the primary’s perspective, the peer is the backup and from the backup’s perspective, the peer is the primary.

**Example**

```plaintext
peer-ip-address 1.1.1.1
```
priority

Sets the initial Interchassis Session Recovery priority of each peer chassis.

**Important:** `priority` takes affect only during simultaneous initializing of all chassis in an Interchassis Session Recovery configuration, and only if a misconfiguration has both chassis in the same mode (both Primary or both Backup).

**Product**
HA, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
priority priority_value
default priority
```

<table>
<thead>
<tr>
<th><strong>default</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Resets the priority to the default setting of 125.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>priority_value</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>The priority for the HA. <code>priority_value</code> must be an integer from 1 through 255.</td>
</tr>
</tbody>
</table>

**Usage**

This command determines which chassis transitions to the Active state when all chassis have the same mode configuration. `priority` acts as a tie breaker for the state determination only when all chassis initialize simultaneously. The chassis with the higher priority (higher number) becomes Active while the chassis with the lower priority (lower number) becomes Standby.

Once chassis become operational (after initialization), if there is an event requiring a chassis change of state, then each chassis returns to its previous state (Active or Standby) after both chassis recover.

**Example**

`priority 5`
route-modifier

Sets the route modifier for the peer chassis.

Product
HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

route-modifier threshold threshold_value

default route-modifier

---

default

Resets the route modifier to the default setting of 16.

threshold_value

The value that causes the route-modifier counter to be reset to the initial value. threshold_value must be an integer from 2 through 32.

---

Usage

This command is used to determine when the route modifier should be reset to its initial value to avoid rollover.

---

Example

route-modifier threshold 10
Chapter 185
SGSN APN Policy Configuration Mode Commands

The SGSN APN Policy configuration mode provides the commands to configure the access point name (APN) parameters specific to a particular SGSN operator policy.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
address-resolution-mode

Identify the address resolution mode for this SGSN APN policy.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

address-resolution-mode { fallback-for-dns | local }

default address-resolution-mode

default
Resets the configuration to the default value; i.e. fallback-for-dns.

fallback-for-dns
Default: Enabled
This keyword instructs the system to first attempt DNS resolution. If this fails, then the system is to use locally configured addresses, if available.

local
Default: Disabled
This keyword instructs the system not to use DNS query and to only use locally configured addresses.

Usage
Use this command to specify the DNS query or local address resolution for this SGSN APN policy.

Example
The following command sets the address resolution mode to attempt the DNS resolution first and if failed attempt to use available local address:

address-resolution-mode fallback-for-dns
CC

This command provides the configurables to define the charging characteristics for this SGSN APN policy.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

cc { local-value-for-scdrs behavior bit_value profile index_bit | prefer { hlr-value-for-scdrs | local-value-for-scdrs } }

remove cc { local-value-for-scdrs | prefer }

remove

Removes the charging characteristics configuration for this APN policy.

local-value-for-scdrs behavior bit_value profile index_bit

Defaults: bit_value = 0x0; index_bit = 8

This keyword sets the SGSN APN policy to configure the value of the behavior bits and profile index for the charging characteristics for S-CDRs locally, when the HLR does not provide values for this. If the HLR provides the charging characteristics with behavior bits and profile index and operator want to ignore it, then specify prefer local-value-for-scdrs keyword with this command.

bit_value: Must be a hexadecimal value between 0x0 and 0xFFF.

index_bit: Must be an integer value from 1 to 15.

Some of the index values are predefined according to 3GPP standard:

- 1 for hot billing
- 2 for flat billing
- 4 for prepaid billing
- 8 for normal billing

prefer { hlr-value-for-scdrs | local-value-for-scdrs } 

Default: hlr-value-for-scdrs

Specifies preference for using charging characteristics settings received from HLR or set by SGSN locally.

- hlr-value-for-scdrs: Sets the operator policy to use charging characteristics settings received from HLR for S-CDRs. This is the default preference.

- local-value-for-scdrs: Sets the operator policy to use charging characteristics settings from SGSN only for S-CDRs.

Usage

Use this command to set the APN policy behavior in operator policy to use charging characteristic for S-CDRs either from HLR or locally from SGSN.

The charging characteristics parameters are configurable from SGSN Operator Policy Configuration mode too. For generation of M-CDRs the parameters configured in SGSN Operator Policy Configuration mode will
prevail but for generation of S-CDRs the parameters configured in this SGSN APN Policy Configuration mode will prevail.

**Example**
The following command configures the APN policy not to use charging characteristics setting received from HLR for S-CDR generation.

```
cisco cc prefer hlr-value-for-scdrs
```
**direct-tunnel**

This command defines the permission for direct tunnel establishment by GGSNs resolved by this APN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
direct-tunnel not-permitted-by-ggsn
remove direct-tunnel
```

- **remove**
  Removes the configured policy of not to permit direct tunnel by GGSNs resolved by this APN.

- **not-permitted-by-ggsn**
  Default: Disabled.
  Specifies that a direct tunnel is not permitted by the GGSN resolved by this APN.

**Usage**
Use this command to enable/disable the permission for establishment of direct tunnels between RNC and GGSN.

**Example**
The following command configures the SGSN not to permit the direct tunnel with the GGSN which is resolved by this APN policy:

```
direct-tunnel not-permitted-by-ggsn
```
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
end
```

**Usage**
Return to the Exec mode.
exit

Exits the current configuration mode and returns to the previous configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Return to the previous configuration mode.
**gateway-address**

Configures the address of the gateway GPRS support node (GGSN) with priority to activate the GGSN. It also provides the load balancing through weight for specific GGSN address in this APN policy.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
gateway-address ip_address { priority priority | weight weight }
no gateway-address ip_address
```

**no**
Removes the preconfigured/defined GGSN address from this APN policy.

**ip_address**
Specifies the IP address for the GGSN in standard IPv4 or IPv6 notation.

**priority priority**
Specify the priority for the configured GGSN address for SGSN address selection. If one GGSN fails to respond, the next priority level GGSN is selected.

`priority` is an integer from 1 to 100 to assign a priority to the GGSN IP address. Note that the lower the integer, the higher the priority so that 1 is the highest priority.

**weight weight**
Specifies the weight (importance) assigned to a GGSN for load balancing.

`weight` is an integer from 1 to 100 to give a weight to the GGSN IP address. If a weight is assigned to an address for that APN, then load balancing (of primary CPC requests) depends on the weight value.

For example:

```
GGSN1 172.16.130.1 weight 30 and GGSN2 172.16.130.3 weight 70
```

With this configuration, 30% of the activation requests for this APN will go to GGSN1 and 70% of the requests will go to GGSN2. Also note, the sum of the weights does not need to be 100. The calculation of weight percentiles is carried out proportionally; so the following configuration will also yield the same 30% - 70% results:

```
GGSN1 172.16.130.1 weight 6 and GGSN2 172.16.130.3 weight 14
```

**Usage**

Use this command to provide a priority and load balancing in GGSN selection through APN policy. Note that keyword priority and weight can not be used simultaneously in one APN policy. A maximum of 16 GGSN address can be configured with this command in an APN policy.
Example

gateway-address 123.123.123.1 priority 2
gtp

This command enables (by adding a configuration statement) or disables (by removing the configuration statement) the GTPC private extension. This command is available in releases 9.0 and higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```plaintext
gtp private-extension loss-of-radio-coverage send-to-ggsn [ send-to-peer-sgsn ]
remove gtp private-extension loss-of-radio-coverage send-to-ggsn [ send-to-peer-sgsn ]
```

remove

Including this keyword, as part of the command, disables the inclusion of the GTPC private extension, thereby disabling the Overcharging Protection feature.

private-extension

This keyword is required as part of the `gtp` command to instruct the SGSN to set a proprietary GTPC private extension in the LORC Intimation IEs, in the event of loss of radio coverage (LORC). These private extension are only understood by a GGSN with an Overcharging Protection license.

loss-of-radio-coverage send-to-ggsn

This keyword set is required as part of the `gtp` command to instruct the SGSN to forward the private extension ‘flag’ to the GGSN in the event of loss of radio coverage (LORC).

send-to-peer-sgsn

This optional keyword instructs the SGSN to also forward the LORC private extension to the peer SGSN.

Usage

`gtp private-extension` is one of the two commands required to enable the Overcharging Protection feature. The second command sets the RANAP cause code in the Iu Release to enable the SGSN detect the LORC state of the MS/UE. This second command is configured in the IuPS service and is explained in the IuPS Service Configuration Mode chapter.

When there is a loss of coverage and the Overcharging Protection feature is enabled with the `gtp private-extension` command, then the SGSN includes the proprietary private extension in the GTP LORC Intimation IE messages. This LORC IE is also included in UPCQ, DPCQ, and SGSN Context Response GTP messages.

Refer to the SGSN Overview chapter of the SGSN Administration Guide for functional information regarding the Overcharging Protection feature.
Example
Use the following command to have the SGSN send the GGSN the GTPC private extension in the LORC Intimation IE:

```
gtp private-extension loss-of-radio-coverage send-to-ggsn
```
**ip**

Use this command to define the IP parameters for this APN policy.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
ip { qos-dscp { { downlink | uplink } { background | conversational | interactive | streaming } + } | source-violation { deactivate [ all-pdp | exclude-from accounting | linked-pdp | tolerance-limit ] | discard [ exclude-from-accounting ] | ignore }

default ip { qos-dscp [ downlink | uplink ] | source-violation }no qos-dscp { { downlink | uplink } { background | conversational | interactive | streaming } + }
```

---

**Important**: All parameters not specifically configured will be included in the configuration with default values.

**default**

Resets the configuration to the default values.

**qos-dscp**

Configures the diffserv code point marking to be used for sending packets of a particular 3GPP QoS class. Defaults are **downlink** with:

- conversational - ef;
- streaming - af11;
- interactive 1 - ef;
- interactive 2 - af21;
- interactive 3 - af21;
- background - be

**downlink | uplink**

Configures the packets for either downlink or uplink direction. **downlink** and **uplink** configuration must include one or more of the following:

- **background** - Configures the DSCP marking to be used for packets of sessions subscribed to 3GPP background class. Must be followed by a DSCP marking

- **conversational** - Configures the DSCP marking to be used for packets of sessions subscribed to 3GPP conversational class. Must be followed by a DSCP marking

- **interactive** - Configures the DSCP marking to be used for packets of sessions subscribed to different traffic priorities in the 3GPP interactive class. Must be followed by a traffic handling priority: 1, 2, or 3.
• **streaming** - Configures the DSCP marking to be used for packets of sessions subscribed to 3GPP streaming class. Must be followed by a DSCP marking

---

### DSCP marking options

Downlink and uplink configuration options must include a DSCP marking, supported options include:

- **af11** - Designates use of Assured Forwarding 11 PHB
- **af12** - Designates use of Assured Forwarding 12 PHB
- **af13** - Designates use of Assured Forwarding 13 PHB
- **af21** - Designates use of Assured Forwarding 21 PHB
- **af22** - Designates use of Assured Forwarding 22 PHB
- **af23** - Designates use of Assured Forwarding 23 PHB
- **af31** - Designates use of Assured Forwarding 31 PHB
- **af32** - Designates use of Assured Forwarding 32 PHB
- **af33** - Designates use of Assured Forwarding 33 PHB
- **af41** - Designates use of Assured Forwarding 41 PHB
- **af42** - Designates use of Assured Forwarding 42 PHB
- **af43** - Designates use of Assured Forwarding 43 PHB
- **be** - Designates use of Best Effort forwarding PHB
- **ef** - Designates use of Expedited Forwarding PHB

---

### source-violation

Configures settings related to IP source-violation detection with one of the following criteria:

- **deactivate** - Deactivate the PDP context with one of the following conditions:
  - **all-pdp** - Deactivates all PDP context of the MS/UE. Default is to deactivate errant PDP contexts.
  - **exclude-from-accounting** - Excludes packets having an invalid source IP address from the statistics used in the accounting records.
  - **linked-pdp** - Deactivates all associated pdp contexts (primary and secondary). Default is to deactivate errant pdp context.
  - **tolerance-limit** - Configures maximum number of allowed ip source violations before the session is deactivated.
  - **discard** - Discards errant packets, can include the following option:
  - **exclude-from-accounting** - Excludes packets having an invalid source IP address from the statistics used in the accounting records.
  - **ignore** - Ignore checking of packets for MS/UE IP source violation.

---

### Usage

This command is used to configure a range of IP functions to be associated with the APN policy; such as:

- SGSN action to detection of IP source violations,
- DSCP marking for downlink and uplink configuration per traffic class,
- QoS class diffserv code.
Example
Use the following command so the SGSN does not check incoming packets for IP source violation information.

```
ip source-violation ignore
```
pdp-data-inactivity

Configures APN policy regarding PDP data inactivity.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
pdp-data-inactivity { action { deactivate [ all-pdp | linked-pdp ] | detach-when { all-pdp-inactive | any-pdp-inactive } } | timeout minutes minutes }

default pdp-data-inactivity { action | timeout }

no pdp-data-inactivity
```

default
Resets the APN policy configuration to the default values for PDP data-inactivity.

no
Disables the PDP data-inactivity configuration defined for the APN policy.

action
Defines the action to be taken if PDP data-inactivity occurs:
- **deactivate** - defines which PDP context should be deactivated:
  - **all-pdp** - deactivates all PDP contexts.
  - **linked-pdp** - deactivates only linked PDP contexts.
- **detach-when** - defines the condition that warrants a detach:
  - **all-pdp-inactive** - detach when all PDP contexts are inactive.
  - **any-pdp-inactive** - detach when any PDP context is inactive.

timeout minutes minutes

minutes: Must be an integer from 1 to 1440. Note that even though the timeout is set for minutes, the configuration displays in seconds.

Usage
Use this command to define how the SGSN will handle a situation where the PDP is not fully active. Repeat the command, as needed, to configure more than one keyword-controlled function.

Example

---

Cisco ASR 5000 Series Command Line Interface Reference

OL-22948-01

4889
Use the following command to have the SGSN deactivate all PDP contexts associated with the APN when it detects the PDP is inactive:

```
pdp-data-inactivity action deactivate all-pdp
```

Use the following command to have the SGSN wait 2 minutes after detecting PDP data inactivity:

```
pdp-data-inactivity timeout 2
```
qos class

This command configures Quality of Service (QoS) parameters for traffic class configured for this APN policy.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

qos class { background | conversational | interactive | streaming } [qualif_option ]

default qos class { background | conversational | interactive | streaming } [qualif_option ]

default
Sets the APN policy to default QoS parameters for the specified traffic class.

class
Defines the class of service for this APN policy. Configuration must include one of the following class options:

• background - selects background class of service and can include one of the qualifying options.
• conversational - selects conversational class of service and can include one of the qualifying options.
• interactive - selects interactive class of service and can include a qualifying option.
• streaming - selects streaming class of service and can include a qualifying option.

qualif_option
Qualifying options include:

• gbr-down - guaranteed bit rate downlink; Enter an integer from the range 1 to 256000 kbps.
• gbr-up - guaranteed bit rate uplink in kbps. Enter an integer from 1 to 256000 kbps.
• mbr-down - maximum bit rate downlink. Enter an integer from the range 1 to 256000 kbps.
• mbr-up - maximum bit rate uplink in kbps. Enter an integer from 1 to 256000 kbps.
• min-transfer-delay - minimum transfer delay in milliseconds. Enter an integer from 80 to 4000.
• residual-bit-error-rate - 
  ● background residual-bit-error-rate range is from 4*10^-4 to 6*10^-8. Enter one of the following integers, where:
    • 4: represents 4*10^-3
    • 7: represents 10^-5
    • 9: represents 6*10^-8
• Conversational residual-bit-error-rate range is from $5 \times 10^{-2}$ to $10^{-6}$. Enter one of the following integers, where:
  • 1: represents $5 \times 10^{-2}$
  • 2: represents $10^{-2}$
  • 3: represents $5 \times 10^{-3}$
  • 5: represents $10^{-3}$
  • 6: represents $10^{-4}$
  • 7: represents $10^{-5}$
  • 8: represents $10^{-6}$

• Interactive residual-bit-error-rate range is from $4 \times 10^{-4}$ to $6 \times 10^{-8}$. Enter one of the following integers, where:
  • 4: represents $4 \times 10^{-3}$
  • 7: represents $10^{-5}$
  • 9: represents $6 \times 10^{-8}$

• Streaming residual-bit-error-rate range is from $5 \times 10^{-2}$ to $10^{-6}$. Enter one of the following integers, where:
  • 1: represents $5 \times 10^{-2}$
  • 2: represents $10^{-2}$
  • 3: represents $5 \times 10^{-3}$
  • 5: represents $10^{-3}$
  • 6: represents $10^{-4}$
  • 7: represents $10^{-5}$
  • 8: represents $10^{-6}$

• sdu - signalling data unit, must include one of the following options:

  • delivery-order: Enter one of the two following options:
    • no: without delivery order
    • yes: with delivery order

  • erroneous: Enter one of the two following options:
    • no: erroneous SDUs will not be delivered
    • no-detect: erroneous SDUs are not detected (‘-‘)
    • yes: erroneous SDUs will be delivered

  • error-ratio: the SDU error-ratio range is from $10^{-3}$ to $10^{-6}$. Enter an integer from 1 to 6, where:
    • 3: represents $10^{-3}$
    • 4: represents $10^{-4}$
    • 6: represents $10^{-6}$
max-size: defines the maximum number of octets (size) of the SDU. Enter an integer from 10 to 1502.

Usage
Use this command to define the qualifying options for each QoS class parameter defined for this APN policy. Repeat the command as often as needed with different keywords to define all required QoS criteria.

Example
Use the following command to define a background QoS class qualified with mbr-down.

```
qos class background mbr-down 5600
```
**qos prefer-as-cap**

This command specifies operational preferences for QoS parameters, specifically QoS bit rates.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
quos prefer-as-cap { both-hlr-and-local | hlr-subscription | local }
remove qos prefer-as-cap
```

**Important:** Command and keyword names have changed. `prefer` has become `prefer-as-cap` and `hlr` has become `hlr-subscription`. These changes will not impact configuration generated with earlier releases as the keywords are aliases for the previous names.

**remove**

Removes previous configuration changes and resets the default.

**both-hlr-and-local**

This keyword instructs the SGSN to use, as the capping value during session establishment, the lower of either the locally configured QoS bit rate or the HLR subscription.

**hlr-subscription**

Default. Instructs the SGSN to take QoS bit rates from the HLR configuration and use HLR rate as the capping value for session establishment.

**local**

Instructs the SGSN to take QoS bit rate from the local configuration and use it for session establishment.

**Usage**

Use this command to instruct the SGSN to take QoS configuration as the bit rate for session establishment.

**Example**

Following command specifies use of the bit rate in subscription at the HLR:

```
qos prefer-as-cap hlr-subscription hlr
```

Instruct the SGSN to cap the bit rate with the lower rate of the two configurations, HLR or local:
qos prefer-as-cap both-hlr-and-local
qos rate-limit direction

Configure the parameters and actions governing the subscriber traffic flow if it violates or exceeds configured peak or committed data rates.

This command can be entered multiple times to specify different combinations of traffic direction and class. If this command is not configured at all, the GGSN does not perform traffic policing or QoS negotiation with the SGSN (i.e. it accepts all of the SGSN-provided values for the PDP context).

Additional information on the QoS traffic policing functionality is located in the System Enhanced Feature Configuration Guide.

Important: This command should be used in conjunction with the max-contexts command to limit the maximum possible bandwidth consumption by the APN.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
qos rate-limit direction { downlink | uplink } [ [ burst-size { auto-readjust [ duration seconds ] | bytes } ] [ class { background | conversational | interactive traffic_priority } ] ] | exceed-action { drop | lower-ip-precedence | transmit } ] [ violate-action { drop | lower-ip-precedence | transmit } ] ] +
```

```
remove qos rate-limit direction { downlink | uplink } [ class { background | conversational | interactive traffic_priority | streaming } ]
```

```
remove

Disables the QoS data rate limit configuration for the APN policy.
```

Important: If no Qos Profile is configured, the system’s default behavior is to use the information provided by the SGSN.

```
downlink | uplink
```

Apply the limits and actions configured with the other keywords to the selected link:

```
downlink - This is the direction from GGSN to MS. (from Gn to Iu/Gb).
uplink - This is the direction from MS to GGSN (from Iu/Gb to Gn).
```

```
burst-size [ bytes | auto-readjust [ duration seconds ] ]
```

Default: See the table of class default values in the Usage section below.

The peak burst size allowed. System measurements for this value exclude the GTP and outer packet headers.

Supported options include:

- **bytes**: Must be an integer from 1 through 6000000.
**Important:** It is recommended that the minimum value of this parameter be configured to the greater of the following two values: (1) 3 times greater than packet MTU for the subscriber connection, or (2) 3 seconds worth of token accumulation within the “bucket” for the configured peak-data-rate. In addition, if the committed-data-rate parameter is specified, the burst-size is applied to both the committed and peak rates.

- **auto-readjust:** This keyword enables dynamic burst-size calculation, for traffic policing, at the time PDP Activation/Modification is negotiated using QoS maximum bit-rates and guaranteed bit-rates.

- **duration seconds:** Must be an integer from 1 to 30. This keyword sets the number of seconds that the dynamic burst-size calculation will last. This allows the traffic to be throttled at the negotiated rates.

```plaintext
class { background | conversational | interactive traffic_priority | streaming }
```

Apply the specified limits and actions to PDP contexts of the specified UMTS traffic class. The following classes are supported:

- **background:** Specifies the QOS for traffic patterns in which the data transfer is not time-critical (for example email exchange). This traffic pattern should be the lowest QOS.

- **conversational:** Specifies the QOS for traffic patterns in which there is a constant flow of packets in each direction, upstream and downstream. This traffic pattern should be the highest QOS.

- **interactive traffic_priority:** Specifies the QOS for traffic patterns in which there is an intermittent flow of packets in each direction, upstream and downstream. This traffic pattern should be a higher QOS than the background pattern, but not as high as that for the streaming pattern. traffic_priority is the 3GPP traffic handling priority and can be an integer 1, 2 or 3.

- **streaming:** Specifies the QOS for traffic patterns in which there is a constant flow of data in one direction, either upstream or downstream. This traffic pattern should be a higher QOS than the interactive pattern, but not as high as that for the conversational pattern.

**Important:** If this keyword is omitted, the same values are used for all classes.

```plaintext
exceed-action { drop | lower-ip-precedence | transmit }
```

Default: See the table of class default values in the Usage section below.
The action to take on the packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:

- **drop:** Drop the packet

- **lower-ip-precedence:** Transmit the packet after lowering the ip-precedence

- **transmit:** Transmit the packet

```plaintext
violate-action { drop | lower-ip-precedence | transmit }
```

Default: See the table of class default values in the Usage section below.
The action to take on the packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:

- **drop:** Drop the packet

- **lower-ip-precedence:** Transmit the packet after lowering the IP precedence
### transmit

Transmit the packet

+ This symbol indicates that the keywords can be entered multiple times within a single command.

#### Usage

This command configures the APN’s quality of service (QoS) data rate shaping through traffic policing. Configured actions prevent subscriber flow exceeding or violating configured peak or committed data rate limits.

**Important:** If either `exceed action` or `violate action` is set to “lower-ip-precedence”, this command may override the configuration of the `ip qos-dscp` command in the GGSN service configuration mode for packets from the GGSN to the SGSN. In addition, the GGSN service `ip qos-dscp` command configuration can override this APN setting for packets from the GGSN to the Internet.

Important: If a subscribed traffic class is received, the system changes the class to background and sets the following parameters: The uplink and downlink guaranteed data rates are set to 0. If the received uplink or downlink data rates are 0 and traffic policing is disabled, the default of 64 kbps is used. When enabled, the APN configured values are used. If the configured value for downlink max data rate is larger than can fit in an R4 QoS profile, the default of 64 kbps is used. If either the received uplink or downlink max data rates is non-zero, traffic policing is employed if enabled for the “Background” class. The received values are used for responses when traffic policing is disabled.

Example

The following command lowers the IP precedence when the committed-data-rate and the peak-data-rate are violated in uplink direction:

```
qos rate-limit direction uplink violate-action lower-ip-precedence
```

The following command buffers the excess user packets when the subscriber traffic violates the configured peak or committed data-rate bps in uplink direction. Once the peak/committed data rate for that subscriber goes below the configured limit it transmit them. It also transmits them if buffer memory is full:

```
qos rate-limit direction uplink violate-action shape transmit-when-buffer-full
```
ranap allocation-retention-priority-ie

This command configures the allocation/retention priority (ARP) IE for this APN policy.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
ranap allocation-retention-priority-ie subscription-priority priority class [ { background | conversational | interactive | streaming } [ not-pre-emptable | priority | queuing-not-allowed | shall-not-trigger-pre-emptable ] ]
```

**Important:** All parameters not specifically configured will be included in the configuration with default values.

```
[ default | remove | no ] ranap allocation-retention-priority-ie [ subscription-priority priority class [ background | conversational | interactive | streaming ] ]
```

default
Resets the configuration to the default values.

no
Disables the specified configuration

remove
Removes the specified configuration.

```
subscription-priority priority
```

This keyword sets the subscription priority. The lowest number means the highest priority.

`priority` must be an integer from 1 to 3.

```
class
```

Configure allocation retention priority for specific QoS traffic classes. Include one or more of the following class options:

- **background** - background class of service
- **conversational** - conversational class of service
- **interactive** - interactive class of service
- **streaming** - streaming class of service

Default values will be included in the configuration for any class configuration not specified.

```
qualifying options
```

For each of the class options, the configuration must include one or more of the following qualifying options:
• **not-pre-emptable**
• **priority** - smallest number is the highest priority. Value must be an integer from 1 to 15
• **queuing-disallowed**
• **shall-not-trigger-pre-emptable**

When entering more than one option, we recommend that you do it in the order in which they are listed.

+ This symbol indicates that the keywords can be entered multiple times within a single command.

---

### Usage

Use this command to configure values for the allocation/retention priority (ARP) IE in the radio access bearer (RAB) assignment request message for RANAP that occurs during RAB setup.

This command can be used multiple times to define multiple priorities, with different combinations of **subscription-priority** and **class**.

If the HLR returns a matching value for the subscribed ARP for the desired traffic class, then the SGSN includes the configured qualifying options for the ARP IE in the RANAP message.

If there is no matching configuration, the SGSN includes the following default values for the traffic class (tc) within the ARP IE:

- **Default values for tc=background:**
  - priority-level = (subscribed-value * 3) + 3
  - pre-emption-capability = may-trigger-pre-emption
  - pre-emption-vulnerability = pre-emptable
  - queuing-allowed = yes

- **Default values for tc=interactive:**
  - priority-level = (subscribed-value * 3) + 3
  - pre-emption-capability = may-trigger-pre-emption
  - pre-emption-vulnerability = pre-emptable
  - queuing-allowed = yes

- **Default values for tc=conversational:**
  - priority-level = (subscribed-value * 3) + 2
  - pre-emption-capability = may-trigger-pre-emption
  - pre-emption-vulnerability = pre-emptable
  - queuing-allowed = yes

- **Default values for tc=streaming:**
  - priority-level = (subscribed-value * 3) + 1
  - pre-emption-capability = may-trigger-pre-emption
  - pre-emption-vulnerability = pre-emptable
  - queuing-allowed = yes
Example
The following series of commands define the highest priority for conversational traffic class with priority level 1-10 (Subscribed priority 0-3), PCI of shall-not-trigger-pre-emption, PVI of not-pre-emptable with queuing-not-allowed:

```
ranap allocation-retention-priority-ie subscription-priority 0 priority class conversational not-pre-emptable priority 1 shall-not-trigger-pre-emptable
ranap allocation-retention-priority-ie subscription-priority 1 priority class conversational not-pre-emptable priority 4 shall-not-trigger-pre-emptable
ranap allocation-retention-priority-ie subscription-priority 2 priority class conversational not-pre-emptable priority 7 shall-not-trigger-pre-emptable
ranap allocation-retention-priority-ie subscription-priority 3 priority class conversational not-pre-emptable priority 10 shall-not-trigger-pre-emptable
```
restrict access-type

This command configures the activation restrictions of PDP context on the basis of the access type and QoS class.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
restrict access-type { { gprs | umts } [ qos-class { background | conversational | interactive | streaming } ] } 
no restrict access-type { gprs | umts } [ qos-class ]
default restrict access-type { gprs | umts }
```

**Usage**
Use this command to configure the restriction rules in an APN policy for activation of PDP context on the basis of the access type. It also provides the facility to restrict type of traffic QoS class.
Example
The following command configures the APN policy to restrict all traffic from a GPRS network service having a QoS class of interactive:

```
restrict access-type grps qos-class interactive
```
Chapter 186
SGSN ASP Configuration Mode Commands

The ASP (application server process) Configuration Mode defines the M3UA end-point parameters for a specific SS7 routing domain instance. The ASP instance is generated originally with the SS7 routing domain configuration mode commands.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.
end-point

This command defines or deletes the IP address and/or port number to be associated with the local SCTP end-point for this ASP. At least one address needs to be configured before the end-point can be activated.

When using the `bind` keyword, this command also activates the end-point once the address has been defined. Once bound, it cannot be reconfigured until it is unbound with the `no end-point bind` command.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
end-point { address ip_address context context_id | bind | port port_number }

no end-point { address ip_address context context_id | bind }
```

**address ip_address context context_id:**
Specifies the IP address and the context associated with the address for this end-point.
- `ip_address`: must be defined using the standard IPv4 dotted decimal notation or the colon notation of IPv6.
- `context context_id`: a string of 1 to 79 alphanumeric characters to identify the specific context associated with the end-point address.

**bind**
Activates (binds) the end-point.

**Important:** Only use `bind` after you have configured other parameters.

**port port_number**
Identifies the M3UA’s SCTP port associated with this end-point.
- `port_number`: must be an integer from 1 to 65535. Default is 2905.

**no**
Removes the end-point configuration or deactivates the end-point.

**Caution:** Entering this command will terminate all current subscriber sessions for associated peers.

**Usage**
Use this command to manage the ASP end-point. Once the ASP end-point is bound the end-point configuration can not be changed until it is unbound.

**Example**
Activate the end-point with the following command:
end-point bind

Deactivate or unbind the end-point with the following command:

    no end-point bind

Set the end-point port to default for ASP 1 with the following command:

    default asp instance 1 end-point port
**exit**

Exits the current mode and returns to the previous mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Returns to the previous mode.
Chapter 187
SGSN Operator Policy Configuration Mode Commands

The SGSN Operator Policy configuration mode enables the operator to specify a single policy with rules governing the services, facilities, and privileges available to one, multiple, or all subscribers. These policies can override standard behaviors and provide mechanisms for an operator to get around the limitations of other infrastructure elements such as DNS servers and HLRs. By configuring an operator policy, the operator fine-tunes any desired restrictions or limitations needed to control call handling per subscriber or for a group of callers within a defined IMSI range.

**Important:** To create and use an operator policy, you must first define the IMSI range using the `mcc` command. This does not apply to the default operator policy.

The system supports up to 1000 operator policies, including the single operator policy named `default`. This default operator policy must be configured by the user to define limitations to be applied to any IMSIs that are not covered by any other defined operator policy.

Upon accessing this mode, your prompt should look similar to the following:

```
[local]asn5000(config-sgsn-op-policy-<pol_name>)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
accounting context

This command defines the name of the accounting context and optionally associates a GTPP group with this SGSN operator policy.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

accounting context  ctxt_name [ gtpp group  grp_name ]
remove accounting context

remove
Removes the accounting configuration from this SGSN operator policy configuration.

context  ctxt_name
Use this keyword to identify the accounting context.
ctxt_name: Enter a string of 1 to 79 alphanumeric characters.

gtpp group  grp_name
This keyword set identifies the GTPP group, where the GTPP related parameters have been configured in the GTPP Group configuration mode, to associate with this SGSN operator policy.
grp_name: Enter a string of 1 to 63 alphanumeric characters to identify the GTPP group created with the gtpp group command in the Context configuration mode.

Usage
This command can be used to associate a predefined GTPP server group - including all its associated configuration - with a specific operator policy. The GTPP group would have been defined with the gtpp group command in the Context Configuration Mode chapter of the CLI Reference Guide. If the GTPP group is not specified, then a default GTPP group in the accounting context will be used. If this command is not specified, use the name of the accounting context configured in the SGSN service configuration mode (for 3G) or the GPRS service configuration mode (for 2G), either will automatically use a “default” GTPP group generated in that accounting context. If the accounting context is specified in the GPRS service or SGSN service and in an SGSN operator policy, then priority is given to the accounting context of the operator policy.

Example
For this SGSN operator policy, the following command identifies an accounting context called acctng1 and associates a GTPP server group named roamers with defined charging gateway accounting functionality.
accounting context acctng1 gtpp group roamers
**allocate-ptmsi-signature**

This command enables the allocation of a P-TMSI signature.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
allocate-ptmsi-signature
no allocate-ptmsi-signature
default allocate-ptmsi-signature
```

- **no**
  Disables the allocation of the P-TMSI signature.

- **default**
  Resets the configuration value to the default: allocates the P-TMSI signature.

**Usage**
Enable the allocation of the P-TMSI signature.

**Example**
```
allocate-ptmsi-signature
```
apn

This command creates and associates an SGSN access point name (APN) configuration instance with the SGSN operator policy.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

apn { network-identifier apn_net_id| operator-identifier apn_op_id} +
no { network-identifier apn_net_id | operator-identifier apn_op_id }

default apn

---

no
Disables the specified APN policy.

---

default
Creates a default SGSN APN policy with default values for all parameters.

---

network-identifier apn_net_id

apn_net_id: Enter a string of 1 to 62 alphanumeric characters, including dots (.) and dashes (-), to define the GT-address network identifier. For releases 8.0 the maximum number of characters is 63; for releases 8.1 and higher, the maximum number of characters is 62.

---

operator-identifier apn_op_id

apn_op_id: Enter a string of 1 to 18 alphanumeric characters including dots (.). The entry must be in the following format, where # represents a digit: : MNC###.MCC###.GPRS.

---

Usage
Use this command, to create an SGSN APN policy configuration or to access the SGSN APN configuration mode to update/modify the policy. Either of the two keywords can be used to identify the specific APN policy configuration.

---

Example
For this SGSN operator policy, create an APN configuration for network cust1-net:

    apn network-identifier cust1-net
**apn-restriction**

**Description**  With this command, this SGSN operator policy instructs the system to apply APN restrictions at the SGSN-level.

**Product**  SGSN

**Privilege**  Security Administrator, Administrator

**Syntax**

```plaintext
apn-restriction update-policy deactivate restriction

default apn-restriction
```

- **default**
  - Creates a default APN restriction configuration.

- **restriction**
  - Select one of the two restrictions:
    - `least-restrictive`: applies a lower APN restriction value.
    - `most-restrictive`: applies a higher APN restriction value.

**Usage**

Configures the level of restrictions.

**Example**

Apply the lowest level of APN restrictions.

```plaintext
apn-restriction update-policy deactivate least-restrictive
```
apn-selection-default

This command enables/disables and configures the Default APN feature for use when the normal APN selection process fails. This command is available in releases 8.1 and higher.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

apn-selection-default network-identifier apn_net_id [ require-subscription-apn network-identifier apn_net_id ]

no apn-selection-default

no
Delete the configuration statement and disable the Default APN feature.

network-identifier apn_net_id

The network identifier will be used as the default APN name.
apn_net_id: Enter a string of 1 to 62 alphanumeric characters, including dots (.) and dashes (-), to define the GT-address network identifier. For releases 8.0 the maximum number of characters is 63; for releases 8.1 and higher, the maximum number of characters is 62.

require-subscription-apn network-identifier apn_net_id

If defined, this APN name must also be included in the subscription data for the Default APN feature to function.
apn_net_id: Enter a string of 1 to 62 alphanumeric characters, including dots (.) and dashes (-), to define the GT-address network identifier. For releases 8.0 the maximum number of characters is 63; for releases 8.1 and higher, the maximum number of characters is 62.

Usage

The default APN will be used in error situations when the SGSN cannot select a valid APN via the normal APN selection process.
Within an operator policy, a default APN can be configured for the SGSN to:
- override a requested APN when the HLR does not have the requested APN in the subscription profile.
- provide a viable APN if APN selection fails because there was no "requested APN" and wildcard subscription was not an option.
In either of these instances, the SGSN can provide the default APN as an alternate behavior to ensure that PDP context activation is successful.
attach

This command defines attach-related configuration for this SGSN operator policy.

**Important:** Before using this command, ensure that the appropriate LAC information has been defined with the `location-area-list` command.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] attach allow access-type { gprs | umts } location-area-list list_id
[ no ] attach restrict access-type { gprs | umts } { all | location-area-list instance list_id }
[ no ] attach access-type { gprs | umts } { all | location-area-list list_id } failure-code

default attach { access-type { gprs | umts } { all failure-code | location-area-list instance list_id } }
```

- **no**
  Deletes the specified attach configuration that was previously defined with this command for this operator policy.

- **default**
  Restores the default values for the operator policy for the specified parameter.

- **allow**
  Allow re-enables attaches in the configuration after an `attach restrict` command has been used.

- **restrict**
  Restrict attaches (do not accept calls) of specified `access-type` and from specified location areas (defined using either the `all` or `location-area-list` keywords).

- **access-type**
  Defines the type of access to be allowed or restricted.
  - `gprs`
  - `umts`
  If this keyword is not included, then both access types are allowed by default.
all

Instructs the SGSN to apply the command action to all location areas.

`location-area-list instance list_id`

This keyword identifies a location area list already created with the `location-area-list` command. The location area list consists of one or more LACs, location area codes, where the MS is when placing the call. Using this keyword with either the `allow` or `restrict` keywords enables you to configure with more granularity.

`list_id` must be an integer between 1 and 5.

`failure-code`

Specify a GMM failure cause code to identify the reason an attach did not occur. This GMM cause code will be sent in the reject message to the MS.

`fail-code` must be an integer from 2 to 111. Default is 14. Refer to the GMM failure cause codes listed below (information has been taken from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

- 2 - IMSI unknown in HLR
- 3 - Illegal MS
- 6 - Illegal ME
- 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived by the network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 - MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable
- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented
SGSN Operator Policy Configuration Mode Commands

attach

- 100 - Conditional IE error
- 101 - Message not compatible with the protocol state
- 111 - Protocol error, unspecified

Usage

Once the IMSI of an incoming call is known and matched with a specific operator policy, according to the filter definition of the mcc command, then that specific operator policy is selected to determine how the incoming call is handled.

By default, all attaches are allowed. If no access limitations are needed, then do not use the attach command.

Important: Before using this command, ensure that the appropriate LAC information has been defined with the location-area-list command.

Use this command to define this operator policy’s attach configuration.
Use this command to fine-tune the attach configuration specifying which calls/subscribers can attach and which calls are restricted from attaching.
Attachment restrictions can be based on any one or combination of the options, such as location area code or access type. It is even possible to restrict all attaches.
The command can be repeated using different keyword values to further fine-tune the attachment configuration.

Example

For calls under this operator policy, the following command restricts the attaches of all subscribers using the GPRS access type.

   attach restrict access-type gprs all

Use the next command to reverse the previous attach restrict command:

   attach allow access-type gprs all

Or, change the attach restriction to only restrict attaches of GPRS subscribers from specified LACs included in location area list #2 and include failure-code 45 as the reject cause. This configuration requires two CLI commands:

   attach restrict access-type gprs location-area-list instance 2
   attach access-type gprs location-area-list instance 2 failure-code 45

In the case of a dual-access SGSN, it is possible to also add a second definition to restrict attaches of UMTS subscribers within the LACs included in location area list #3.

   attach restrict access-type UMTS location-area-list instance 3

Change the configuration to allow attaches for GPRS access for all previously restricted LACs - note that GPRS attaches would still be limited.

   no attach restrict access-type gprs all
Restrict (deny) all GPRS attach requests (coming from any location area) and assign a single failure code for the reject messages. This is a two command process:

```plaintext
attach restrict access-type gprs all
attach access-type grps all failure-code 22
```

Remove the restrictions defined above - so that the access type is reset to the default (both types) and the failure code returns to the default value (14).

```plaintext
default attach access-type gprs all failure-code
```
authenticate

Product
This command enables/disables authentication for procedures like attach and service request.

SGSN

Privilege
Security Administrator, Administrator

Syntax
authenticate { activate | all-events | attach [ access-type | attach-type |
frequency | inter-rat ] | detach | rau | service-request }

no authenticate { activate | attach | detach | rau | service-request }

default authenticate { activate | attach | detach | rau | service-request }

no
Disables and removes the defined authentication configuration for this SGSN operator policy.

default
Resets all parameters to default values for the authentication process configured for this SGSN operator policy.

activate
This command enables/disables authentication for activate requests and allows one or more of the following options to the configuration:

• access-type type : Select one of the two options:
  • gprs
  • umts
• first - Enables/disables authentication for first activate.

• frequency frequency - Defines 1-in-N selective authentication of subscriber events - where an event is an Attach Request, RAU, Service Request, Activate-Primary-PDP-Context Request, or Detach Request. If the frequency is set for 12, then the SGSN skips authentication for the first 11 events and authenticates on the 12th event.

  frequency must be an integer from 1 to 16.

• primary - Enables/disables authentication for every primary activate request.

all-events
Specifies that procedures - attaches, service requests, RAUs, detaches, and activations - will be authenticated. This can be fine-tuned by adding either or both of the following parameters:

• access-type type must be one of the two:
  • gprs
SGSN Operator Policy Configuration Mode Commands

authenticate

Cisco ASR 5000 Series Command Line Interface Reference

OL-22948-01

SGSN Operator Policy Configuration Mode Commands

• umts

• frequency frequency - Defines 1-in-N selective authentication of subscriber events - where an event is an Attach Request, RAU, Service Request, Activate-Primary-PDP-Context Request, or Detach Request. If the frequency is set for 12, then the SGSN skips authentication for the first 11 events and authenticates on the 12th event.

frequency must be an integer from 1 to 16.

attach

This keyword configures the Attach authentication parameters. It enables/disables authentication for an Attach with a local P-TMSI or Attaches with an IMSI will be authenticated to acquire the CK (cipher key) and the IK (integrity key).

• access-type type : Must be one of the following options:
  • gprs
  • umts

• attach-type type : Must be one of the following options:
  • combined : Authenticates combined GPRS/IMSI Attaches.
  • gprs-only : Authenticates GRPS Attaches only.

• frequency frequency - Defines 1-in-N selective authentication of subscriber events - where an event is an Attach Request, RAU, Service Request, Activate-Primary-PDP-Context Request, or Detach Request. If the frequency is set for 12, then the SGSN skips authentication for the first 11 events and authenticates on the 12th event.

frequency must be an integer from 1 to 16.

• inter-rat: Enables authentication for Inter-RAT Attaches.

detach

This keyword enables/disables and configures the access-type authentication for detach.

access-type type : must be one of the two:
  • gprs
  • umts

rau

This keyword enables/disables and configures authentication for routing area updates (RAUs).

• access-type type : Must be one of the two options:
  • gprs
  • umts

• frequency frequency - Defines 1-in-N selective authentication of subscriber events - where an event is an Attach Request, RAU, Service Request, Activate-Primary-PDP-Context Request, or Detach Request. If the frequency is set for 12, then the SGSN skips authentication for the first 11 events and authenticates on the 12th event.

frequency must be an integer from 1 to 16.

• periodicity duration : Defines the length of time (number of minutes) that authentication can be skipped.

duration : Must be an integer from 1 to 10800.
authenticate

• **update-type**: Defines the type of RAU Request. Select one of the following:
  - combined-update {access-type|with inter-rat-local-ptmsi}
  - imsi-combined-update {access-type|with inter-rat-local-ptmsi}
  - periodic {access-type|frequency|periodicity}
  - ra-update {access-type|with inter-rat-local-ptmsi}

`service-request`

This keyword enables/disables authentication for service request.

  • **frequency** `frequency` - Defines 1-in-N selective authentication of subscriber events - where an event is an attach request, RAU, service request, activate-primary-PDP-context request, or detach request. If the frequency is set for 12, then the SGN skips authentication for the first 11 events and authenticates on the 12th event. `frequency` must be an integer from 1 to 16.

  • **periodicity** `duration` - Defines the length of time (number of minutes) that authentication can be skipped.
    - `duration` - Must be an integer from 1 to 10800.

  • **service-type**: Defines the service request type. Options include:
    - data
    - signalling
    - paging response

**Usage**

Use this command with the **frequency** keyword to determine the support for selective execution of the re-authentication and/or P-TMSI reallocation procedure in case of a 3G service request.

**Example**

Configure authentication to occur after every 10th event for GPRS access.

```
authenticate all-events frequency 9 access-type gprs
```

Disable authentication for Inter-RAT Attaches, use:

```
default authenticate attach inter-rat
```

Enable authentication for Inter-RAT RAU of the combined IMSI type:

```
authenticate rau update-type imsi-combined-update with inter-rat-local-ptmsi
```
CC

**Description** This command defines the charging characteristics to be applied for CDR generation through SGSN operator policy.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
cc { behavior-bit no-records bit_value | local-value behavior bit_value profile index_bit | prefer { hlr-value | local-value } }
```

```plaintext
no cc behavior-bit no-records
```

```plaintext
remove cc { behavior-bit no-records | local-value | prefer }
```

**no**
Disables the charging characteristics configuration of behavior bit from this SGSN operator policy.

**remove**
Removes the configured charging characteristics from this operator policy.

**behavior-bit no-records**

`bit_value`

Default: Disabled
Specify that which behavior bit in charging characteristic is used to no accounting records will be generated.
no-records to indicate which behavior bit in charging characteristics, means that no accounting records should be generated.
If we use a charging characteristics with the no-records bit set, then we won’t generate any accounting records, regardless of what may be configured elsewhere. Use “no” to indicate that there is no such bit.

`bit_value` must be an integer value from 1 through 12.

**local-value behavior**

`bit_value profile index_bit`

Default: bit_value = 0x0
index_bit = 8
This keyword sets the SGSN operator policy to configure the value of the behavior bits and profile index for the charging characteristics when the HLR does not provide value for this.
If the HLR provides the charging characteristics with behavior bits and profile index and operator want to ignore it, then specify **prefer local-value** keyword with this command.
`bit_value` must be a hexadecimal value between 0x0 and 0xFFF.
`index_bit` must be an integer value from 1 through 15.
Some of the index values are predefined according to 3GPP standard:

- **1** for hot billing
- **2** for flat billing
- **4** for prepaid billing
prefer

Default: hlr-value

Specifies preference for using charging characteristics settings received from HLR or set by SGSN locally.

- **hlr-value**: Sets the operator policy to use charging characteristics settings received from HLR. This is the default preference.

- **local-value**: Sets the operator policy to use charging characteristics settings from SGSN only. If no charging characteristics received from HLR then local value will be applicable.

Usage

Use this command to set the SGSN operator policy behavior to use charging characteristic either from HLR or locally from SGSN.

These charging characteristics parameters are configurable from SGSN APN Policy Configuration mode too. For generation of M-CDRs the parameters configured in this mode of SGSN Operator Policy Configuration mode will prevail but for generation of S-CDRs the parameters configured in SGSN APN Policy Configuration mode will prevail.

The first four bits of charging characteristics (use keyword profile) is for the charging trigger profile index and is used to select different charging trigger profiles.

The 12 behavior bits (with keyword local-value behavior) can to enable or disable the CDR generation.

Example

The following command configures the SGSN operator policy not to use records for charging characteristics and to set behavior bit to 2:

```
cc behavior-bit no-records 2
```
charging context

**Description** This command has been deprecated in favor of the `accounting-context` command for configuration of charging per SGSN operator policy.
description

Set to a relevant descriptive string.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

description  description

no description

--------------------
description
Enter an alphanumeric string of 1 to 100 alphanumeric characters. The string may include spaces, punctuation, and case-sensitive letters if the string is enclosed in double quotes (" ").

--------------------
no
Removes the description configuration from this SGSN operator policy.

Usage
Define information that identifies this particularly SGSN operator policy.

Example

description  "sgsn1 operator policy carrier1"
direct-tunnel

This command allows direct tunneling if the direct tunneling is supported by destination node.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
direct-tunnel attempt-when-permitted
remove direct-tunnel
```

**Usage**
Use this command to enable the direct-tunnel feature at the operator policy level. To ensure that direct tunnel is supported, check the settings of the `direct-tunnel` commands in the SGSN APN policy configuration mode and the Radio Network Controller (release 8.0) or RNC (releases 8.1 or higher) configuration mode. Direct tunneling must be enabled at these two point to allow direct tunneling for the MS/UE.

**Example**
The following command sets the SGSN operator policy to attempt to setup a direct tunnel if permitted at the destination node:

```
direct-tunnel attempt-when-permitted
```
**dns-ggsn**

Define the context to be used to do DNS lookup.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
dns-ggsn context ctxt_name

no dns-ggsn context ctxt_name
```

- **no**
  - Removes the dns-ggsn configuration from this SGSN operator policy.

- **ctxt_name**
  - Enter an alphanumeric string of 1 to 64 alphanumeric characters.

**Usage**

Use this command to define the context to be used to do DNS lookup to find the GGSN address.

**Example**

```plaintext
dns-ggsn context sgsn1
```
**dns-sgsn**

Identify the context to be used to do DNS to find the SGSN Address

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] dns-sgsn context ctxt_name
```

- **no**
  Removes the dns-sgsn configuration from this SGSN operator policy.

- **ctxt_name**
  Enter an alphanumeric string of 1 to 64 alphanumeric characters.

**Usage**
Use this command to configure the context ID for the SGSN address that will be used to do the DNS lookup.

**Example**

```
dns-sgsn context sgsn1
```
encryption-algorithm-umts

Defines the order of preference for the encryption algorithm. This feature is specific to a 3G configuration.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

`encryption-algorithm-umts type`

[ default | no ] encryption-algorithm-umts

default
Resets the encryption-algorithm definition with default values.

no
Disables the encryption-algorithm definition.

type
Enter your first choice, first. After entering the first choice, you are prompted to indicate another type as a second priority choice.

- `uea0` - No encryption algorithm
- `uea1` - uea1 Algorithm
- `uea2` - uea2 Algorithm

Usage
Use this command to determine which UMTS encryption algorithm is to be used first.

Example

`encryption-algorithm-umts uea1 then-uea2`
end

Exits the configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

end
equivalent-plmn

Configures the definition for an equivalent PLMNID and the preferred radio access technology (RAT). This command can be entered multiple times.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
equivalent-plmn radio_access_technology {2G | 3g | any} plmnid mcc_number mnc_number priority priority
no equivalent-plmn radio_access_technology {2G | 3g | any} plmnid mcc_number mnc_number
```

Enter one of the following options:
- **2G**: 2nd generation
- **3G**: 3rd generation
- **any**: Any RAT

```
plmnid mcc_number mnc_number
```

- **mcc**: Specifies the mobile country code (MCC) portion of the PLMN’s ID. The number can be any integer between 100 and 999.
- **mnc**: Specifies the mobile network code (MNC) portion of the PLMN’s ID. The number can be any integer between 00 and 999.

```
priority priority
```

Select an integer between 1 and 15 with the highest priority assigned to the integer of the lower numeric value.

Usage

Use the priority option to define the preferred equivalent PLMN to be used.

Example

```
equivalent-plmn radio_access_technology any plmnid mcc 121 mnc 767 priority 2
```
exit

Exits the configuration mode and returns to the previous configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit
gmm information-in-messages

This command provides the configuration to include the information in messages for the GPRS mobility management (GMM) parameters.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

gmm information-in-messages access-type { { gprs | umts } [ network-name { full-text name | short-text name } ] [ send-after { attach | rau } ] }  
[ default | no ] gmm { information-in-messages access-type { gprs | umts } }

no
Disables the GMM configuration from this SGSN operator policy.

default
Sets up a GMM configuration with system default values.

access-type

Must select one of the following options:
  • gprs - General Packet Radio Service network
  • umts - Universal Mobile Telecommunications System network

After selecting the access-type, an additional parameter can be configured:
  • network-name: identifies the network name in either short text or full text.
  • send-after: configures the information in message to send after attachment or Routing Area Update (RAU).

network-name { full-text name | short-text name }

This keyword provides the option to add the network name to the message. The network name will in full text or short text. Possible options are:
  • full-text name: Indicate the network name in full text
  • short-text name: Indicate the network name in short text

send-after { attach | rau }

This keyword configures the information in message to send after attachment or RAU message. Possible options are:
  • attach: Information sent after attachment
  • rau: Information sent after routing area update
Usage

Use this command to configure identifying information about the network that will be included in GMM messages.

Example

default gmm information-in-messages access-type gprs
gmm retrieve-equipment-identity

This command configures the International Mobile Equipment Identity (IMEI) or software version (SV) retrieval and validation procedure for SGSN operator policy.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```bash
gmm retrieve-equipment-identity { imei | imeisv [ unciphered ] [ then-imei ] } [ verify-equipment-identity [ deny-greylisted ] ]

[ no | default ] gmm retrieve-equipment-identity
```

no
Disables the equipment identity retrieval procedure configured for this SGSN operator policy.

default
Sets the default action of equipment identity retrieval (EIR) procedure configuration from this SGSN operator policy:

- **retrieve-equipment-identity**: Default action is disabled - no retrieval of IMEI/IMEI-SV
- **verify-equipment-identity**: Default action is disabled - no verification with Equipment Identity Register (EIR)

**equipment-identity-type**
Default: disabled
Indicates the type of equipment identity to be configured for operator policy. The possible values are:

- **imei**: International Mobile Equipment Identity
- **imeisv**: International Mobile Equipment Identity - Software Version

**imei**
Indicates the equipment identity retrieval type to International Mobile equipment Identity (IMEI). IMEI is a unique 15 digit number consists of TAC (technical approval code), FAC (Final Assembly Code), SNR (Serial Number), and a check digit.

**imeisv** [ unciphered ] [ then-imei ]
Indicates the equipment identity retrieval type to IMEI with software version (SV). IMEI with SV becomes a unique 16 digit number consists of TAC (technical approval code), FAC (Final Assembly Code), SNR (Serial Number), and 2 digit software version number.

- **unciphered**: This optional keyword enables the unciphered retrieval of IMEI-SV. If this option is enabled the retrieval procedure will get IMEISV (if auth is still pending, get as part of Authentication and Ciphering Response otherwise, via explicit Identification Request after Security Mode Complete).
\*\*\* then-imei: \* This optional keyword enables the retrieval of software version number before the IMEI. If this option is enabled, the equipment identity retrieval procedure will get IMEISV on secured link (after Security mode procedure via explicit Gmm Identification Request), and if MS is not having IMEISV (responded with NO Identity), SGSN will try to get IMEI.

If no other keyword is provided, imeisv will get IMEISV on secured link (after Security mode procedure via explicit Gmm Identification Request).

\*\*\* verify-equipment-identity [ deny-greylisted ]

Default: disabled
This keyword enables the equipment identity validation and validates the equipment identity against EIR.
- \*\*\* deny-greylisted: This keyword finetunes the configuration and enables the restriction to the user having mobile equipment with an IMEI in the EIR’s grey list.

**Usage**

Use this command to enable and configure the procedures for mobile equipment identity retrieval and validation from the EIR identified in the MAP Service configuration mode.

**Example**

The following command enables the SGSN to send ‘check IMEI’ messages to the EIR:

```
gmm retrieve-equipment-identity imei verify-equipment-identity
```
gs-service

This command associates the context of a Gs service interface with an SGSN operator policy.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
gs-service gs_svc_name context ctx_name
no gs-service svc_name
```

- **no**
  Removes/disassociates the named Gs service from an SGSN operator policy.

- **gs_svc_name**
  Specifies the name of a specific Gs service for which to display information.
  *gs_svc_name* is the name of a configured Gs service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

- **context ctx_name**
  Specifies the specific context name where Gs service is configured. If this keyword is omitted, the named Gs service must be exist in the same context as the GPRS/SGSN service.
  *ctx_name* is name of the configured context of Gs service. This can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

**Usage**

Use this command to associate a specific Gs service interface with this GPRS service instance.

**Important:** A Gs service can be used with multiple SGSN and/or GPRS service.

**Example**

Following command associates a Gs service instance named *stargsl*, which is configured in context named *star_ctx*, with an SGSN operator policy:

```
gs-service stargsl context star_ctx
```
**gtp send**

This command configures which information elements (IE) this operator policy sends in GTP messages. These IEs are required by the GGSN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
gtp send { imeisv | ms-timezone | rat | uli }
remove gtp send { imeisv | ms-timezone | rat | uli }
no gtp send
```

---

**remove**
Removes the specified GTP send definition from the system configuration.

**no**
Disables the specified GTP send configuration.

---

**imeisv**
Instructs the SGSN to include the IMEI (international mobile equipment identity (and software version) of the mobile when sending GTP messages of the type “Create PDP Context Request”.

---

**ms-timezone**
Instructs the SGSN to include this IE in GTP messages of the type “Create PDP Request” and “Update PDP Context Request”. This IE specifies the offset between universal time and local time, where the MS currently resides, in steps of 15 minutes. This IE is sent by default.

---

**rat**
The RAT IE specifies which radio access technology (RAT) is being used by the MS (GERAN, UTRAN, or GAN). Including this keyword instructs the SGSN to include this IE when sending GTP messages of the type “Create PDP Request” and “Update PDP Context Request”. This IE is sent by default.

---

**uli**
The ULI IE specifies the CGI (MCC, MNC, etc.) and SAI of the MS where it is registered. Including this keyword instructs the SGSN to include the IE when sending GTP messages of the type “Create PDP Request” and “Update PDP Context Request”. This IE is not sent by default.
Usage

Use this command to define a preferred set of information to include when GTP messages are sent. Repeat this command multiple times to enable or disable multiple options. This instruction will be implemented when the specific operator policy is applied.

Example

Following command series instructs the SGSN to send ULI and RAT in the GTP messages.

```
gtp send ul
gtp send rat
```
gtpu fast-path

This command enables/disables the network processing unit (NPU) Fast Path support for NPU processing of GTP-U packets of user sessions at the NPU.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```bash
[ remove ] gtpu fast-path
```

- **remove**
  Removes the NPU fast path functionality from an operator policy.

**Usage**

Use this command to enable/disable the NPU processed fast-path feature for processing of GTP-U data packets received from GGSN/RNC. This feature enhances the GTP-U packet processing by adding the ability to fully process and forward the packets through the NPU itself.

**Important:** When enabled/disabled, fast-path processing will be applicable only to new subscriber who establishes a PDP context after issuing this command (enabling GTP-U fast path). No existing subscriber session will be affected by this command.

**Example**

Following command enables the NPU fast path processing for all new subscribers’ session established with this operator policy:

```
gtpu fast-path
```
**integrity-algorithm-umts**

This command configures the order of preference for the Integrity Algorithm used for 3G.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
integrity-algorithm-umts type then_type
```

default integrity-algorithm-umts

default

Creates a configuration defining an order of preference based on system defaults.

```
type
```

Enter one or more of the following options in the order of preference:

- **uia1** - uia1 Algorithm
- **uia2** - uia2 Algorithm

**Usage**
Use this command to determine which integrity algorithm is preferred 3G. This command is configured in tandem with the algorithm type for `encryption-algorithm-umts` command.

**Example**

```
default integrity-algorithm-umts
```
location-area-list

Define the location area list to allow or restrict services in the specified location areas identified by location area code (LAC).

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

location-area-list instance instance area-code area_code [ area_code * ]

no location-area-list instance instance [ area-code area_code ]

no
If the area-code keyword is included in the command, then only the specified area code is removed from the identified list. If the area-code keyword is not included with the command then the entire list of LACs is removed from this operator policy.

instance instance
Specifies an identification for the specific location area list.
instance must be an integer between 1 and 5.

area-code area_code *
This keyword defines the location area codes (LACs) to be used by this operator policy as a determining factor in the handling of incoming calls. Multiple LACs can be defined in a single location-area-list.
area_code must be an integer between 1 and 65535.
* If desired, enter multiple LACs separated by a single blank space.

Usage
Use the command multiple times to configure multiple LAC lists or to modify the list.

Example
The following command creates a location area list for a single area code:

location-area-list instance 1 area-code 514

This command creates a second location area list for with multiple area codes - all separated by a single blank space:

location-area-list instance 2 area-code 514 62552 32 1513

The next command corrects an area code mistake (327 not 32) made in the previous configuration:

location-area-list instance 1 area-code 514 62552 327 1513
location-area-list

Cisco ASR 5000 Series Command Line Interface Reference

OL-22948-01
map

Use this command to configure the optional extensions to MAP messages.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

[ remove ] map message update-gprs-location [ imeisv | private-extension access-type ]

- remove
  IMEI-SV is not included in the GLU request -- this is the default behavior.

- update-gprs-location
  Includes an GLU message. This keyword-set is required.

- imeisv
  Default: disabled
  Specifies the International Mobile equipment Identity-Software Version (IMEI-SV) information to include in GPRS Location Update (GLU) request message. SGSN will include IMEI-SV if available in message.

- private-extension access-type
  Include specific access-type private extension in the message.

Usage
This command configures optional extensions to MAP messages. The HLR should ignore these extensions if not supported by the HLR.

Example

map message update-gprs-location private-extension access-type
map-service

This command identifies a MAP service to associate with the operator policy and the context in which the service is configured.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax
map-service context ctxt_name service map_svc_name
no map-service context

no
Disables use of MAP service with this operator policy.

ctxt_name
Enter an alphanumeric string of 1 to 64 alphanumeric characters.

map_svc_name
Enter an alphanumeric string of 1 to 64 alphanumeric characters.

Usage
Use this command to enable or disable MAP service with this operator policy.

Example
no map-service context
max-attached-subscribers

Defines the maximum number of subscribers allowed to attach at one time.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

max-attached-subscribers number

default max-attached-subscribers

default
Creates a configuration based on a system default.

number
Enter an integer from 1 to 4294967295.

Usage
Use this command to limit the number of simultaneous subscriber sessions.

Example

max-attached-subscribers 1231231234
mcc

This command defines a range of IMSI (the international mobile subscriber identity) numbers upon which an operator policy is based. Specifically, this command identifies: the mobile country code (MCC), and the mobile network code (MNC).

Optionally, the command can define, either or both, the mobile subscriber international number (MSIN - the last portion of the IMSI) and the public land mobile network ID (PLMNID).

⚠️ **Important:** This command is mandatory if an operator policy is to be used. However, you do not need to complete this command if you are using the default operator policy.

### Product
SGSN

### Privilege
Security Administrator, Administrator

### Syntax
```
mcc mcc_num mnc mnc_num [ msin first start_num last stop_num | plmnid id ] +
```

- **mcc**
  - Defines the mobile country code (MCC) of an IMSI.
  - **mcc_num**: Enter a 3-digit number from 100 to 999. 000 to 099 are reserved.

- **mnc**
  - Defines the mobile network code (MNC) of an IMSI.
  - **mnc_num**: Enter a 2 or 3-digit number from 00 to 999.

- **msin**
  - MSIN (mobile subscriber international number) portion of the IMSI.
  - **first start_num**: Defines first MSIN prefix number in a range
  - **last stop_num**: Defines the last or final MSIN prefix number in a range.

- **plmnid**
  - PLMN-ID consists of the MCC (mobile country code) plus the MNC (mobile network code) to identify the public land mobile network (PLMN) for a specific operator. This keyword associates a specific PLMN with this specific SGSN operator policy.

+  
  - This symbol indicates that command can be repeated to create repeated definitions.

### Usage
An IMSI = maximum of 15 digits. An IMSI consists of the MCC (3 digits) + the MNC (2 or 3 digits) + the MSIN (the remaining 10 or 9 digits depending on the length of the MNC).
MCC and MNC are the minimum amount of information required to identify a unique operator policy with IMSI filtering. The MCC and MNC combine uniquely to identify the country and the network operator, for example: Cingular Wireless in the United States = mcc 311 mnc 180

To improve the granularity of call handling, an operator policy with additional IMSI filtering parameters can be defined, to include filtering based on the MSIN, by defining a MSIN range - first (or start-of-range) MSIN and last (or end-of-range) MSIN. The range numbers do not include the maximum allowed for the MSIN but should include a sufficient number to enable the operator policy to filter effectively.

For the most efficient IMSI filter, the operator policy should include all of the above parameters and the PLMN ID which defines the current location of the MS -- this parameter is particularly useful for highlighting which calls are roaming.

And if none of the operator policies contain useful filtering information, then the default operator policy will be applied as the information in this command is never defined for the default operator policy.

The following table will illustrate how these filtering parameters determine which operator policy will govern a call:

<table>
<thead>
<tr>
<th>Operator Policy ID</th>
<th>MCC</th>
<th>MNC</th>
<th>MSINfirst</th>
<th>MSINlast</th>
<th>PLMN ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpPol-1</td>
<td>123</td>
<td>45</td>
<td>67890</td>
<td>67898</td>
<td></td>
</tr>
<tr>
<td>OpPol-2</td>
<td>123</td>
<td>45</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>OpPol-3</td>
<td>123</td>
<td>45</td>
<td>67890</td>
<td>67898</td>
<td>23232</td>
</tr>
<tr>
<td>OpPol-4</td>
<td>123</td>
<td>45</td>
<td></td>
<td></td>
<td>23232</td>
</tr>
<tr>
<td>OpPol-5</td>
<td>123</td>
<td>45</td>
<td>6789012</td>
<td>6789019</td>
<td></td>
</tr>
<tr>
<td>OpPol-6</td>
<td>123</td>
<td>45</td>
<td>6789012</td>
<td>6789019</td>
<td>23232</td>
</tr>
<tr>
<td>default</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The filtering selects which operator policy will be used to determine how a call is handled - the operator policy that best matches the IMSI. So, a call with IMSI 123456789012345 PLMNID 23232 is best matched with OpPol-6.

In most cases, the operator policy with the most information defined will be used as a combination of PLMNID and IMSI provides the best match. But OpPol-6 won’t always be the best match. Using the table above:

OpPol-1 is the best match for IMSI 123456789011111.
OpPol-2 is the best match for IMSI 123456789099999
OpPol-5 is the best match for IMSI 123456789012345 if the PLMNID is 12344

Example
The following defines an operator policy with country code 310, mobile network code of 33, and PLMN ID of 42244.

```
mcc 310 mnc 33 plmnid 42244
```
network-initiated-pdp-activation

This command configures the Operator Policy to support activation of network-initiated PDP contexts and defines any desired activation restrictions.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
network-initiated-pdp-activation { allow | primary | restrict | secondary } +

allow
Allows either or both primary and secondary network-initiated PDP context activation.

primary
Specifies that only network-initiated primary PDP context activation is to be allowed.

restrict
Restricts network-initiated PDP context activation to either primary or secondary PDP contexts.

secondary
Specifies that only network-initiated secondary PDP context activation is to be allowed.
```

Usage

Use this command to define activation restrictions for network-initiated PDP contexts.

Example

```
etwork-initiated-pdp-activation allow
```
nri

This command specifies the network resource identifier (NRI) stored in bit 17 to bit 23 of Packet-temporary mobile subscriber identity (P-TMSI) to be retrieved by SGSN operator policy.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
nri length length [ value value ]
no nri [value ]
```

**no**
Removes the configured NRI value and location in P-TMSI for retrieval by this SGSN operator policy.

**length length**
Specifies the length of bits to be used in the P-TMSI to retrieve NRI information. This starts from bit 23 of the P-TMSI.

*length* must be an integer from 1 to 6.

**value value**
Specifies the value of the NRI to be retrieved from the P-TMSI. This value should not exceed the maximum possible value for the specified length.

*value* must be an integer from 0 to 63.

Usage
Use this command to retrieve the NRI stored in bit 17 to bit 23 of the packet-temporary mobile subscriber identity (P-TMSI).

Example
The following command specifies the length of NRI information to 5 bit and length of the NRI information to 23:

```
nri length 5 value 23
```
pdp-activate access-type

This command configures the PDP context activation option based on operator’s policy for type of access technology.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
pdp-activate access-type { grps | umts } { all | location-area-list instance instance } failure-code failure_code
```

```
default pdp-activate access-type { grps | umts } { all | location-area-list instance instance } failure-code code
```

default
 Resets the configuration to system default values for PDP context activation request.

access-type { grps | umts }
Specifies the access technology type for PDP context activation.
- **grps**: Enables access type as GPRS.
- **umts**: Enables access type as UMTS.

all
Default: allow
Configures the system to allow to create all PDP context activation request from MS.

location-area-list instance instance
Specifies the location area instance to create PDP context.
`instance` must be an integer from 1 through 5. The value must be an already defined instance of a LAC list created with the `location-area-list` command.

failure-code code
Default: 8
Specifies the failure code for PDP context activation.
`code` must be an integer from 8 through 112.

Usage
Use this command to configure this policy to allow GPRS/UMTS access through PDP context activation request from MS.

Example

```
Following command configures the system to create the PDP context for request from MS for GPRS access type with location area list instance 2 and failure-code 45.

```
pdp-activate access-type gprs location-area-list 2 failure-code 45
```
pdp-activate allow

This command configures the system to allow the PDP context activation based on operator’s policy for type of access technology.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

[ no ] pdp-activate allow access-type { gprs | umts } location-area-list instance instance

no
Removes the configured permission to create PDP context on request of PDP context activation from MS for an access type.

access-type { gprs | umts }
Specifies the access technology type for PDP context activation.
- gprs: Enables access type as GPRS.
- umts: Enables access type as UMTS.

location-area-list instance instance
Specifies the location area instance to create PDP context.
instance must be an integer from 1 through 5. The value must be an already defined instance of a LAC list created with the location-area-list command.

Usage
Use this command to configure this policy to allow GPRS/UMTS access through PDP context activation request from MS.

Example
Following command configures the system to allow the PDP context activation for GPRS access type with location area list instance 2.

pdp-activate allow access-type gprs location-area-list instance 2
### pdp-activate restrict

This command configures the system to restrict the PDP context activation based on operator’s policy for type of access technology.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] pdp-activate restrict { access-type { gprs | umts } { all | location-area-list instance instance } | secondary-activation }
```

- **no**
  - Removes the configured restriction on PDP context activation through this command.

- **access-type { gprs | umts }**
  - Specifies the access technology type to restrict PDP context activation.
    - *gprs*: Enables access type as GPRS.
    - *umts*: Enables access type as UMTS.

- **all**
  - Default: allow
  - Configures the system to restrict all PDP context activation request from MS.

- **location-area-list instance instance**
  - Specifies the location area instance to restrict PDP context activation.
    - *list_id* must be an integer from 1 through 5. The value must be an already defined instance of a LAC list created with the `location-area-list` command.

- **secondary-activation**
  - Specifies the type of PDP context to restrict for secondary activation. This keyword restricts the system to create the secondary PDP context on receiving the PDP Context Activation Request from the MS.

**Usage**

Use this command to configure this policy to restrict GPRS/UMTS access through PDP context activation request from MS.

**Example**

Following command configures the system to restrict the PDP context activation for request from MS to access GPRS service with location area list instance 2.

```plaintext
pdp-activate restrict access-type gprs location-area-list instance 2
```
pdp-activate restrict
ptmsi-reallocate

Define P-TMSI reallocation for attach or RAU or service requests.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

ptmsi-reallocate { attach | frequency frequency | interval minutes | routing-area-update | service-request } access-type { gprs | umts }

[ no | default ] ptmsi-reallocate { attach | frequency | interval | routing-area-update | service-request } access-type { gprs | umts }

---

access-type
One of the following options must be used to identify the access-type extension.

- **gprs** - General Packet Radio Service
- **umts** - Universal Mobile Telecommunications System

---

no
Disables the definition in the configuration.

---

default
Resets the configuration with system defaults.

---

attach
Enables/disables P-TMSI reallocation for attach with local P-TMSI. IMSI or inter-SGSN attach will always be reallocated.

---

frequency frequency
Enter an integer from 1 to 50 to define how many times a particular message can be skipped.

---

interval minutes
Enter an integer between 60 and 1440 to define the time interval (in minutes) for skipping the service/RAU/attach request message procedure.

---

routing-area-update
Enables/disables P-TMSI -reallocation for RAU (routing area update) with local P-TMSI. Inter-SGSN RAU will always be reallocated.

---

service-request
Enables/disables P-TMSI reallocation for service request.
Usage

Use this command to enable the various parameters that will determine the operation of P-TMSI reallocation.

Example

no ptmsi-reallocate attach access-type gprs
rau-inter

Define acceptable procedure for inter-SGSN routing area updates.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

rau-inter { access-type | allow access-type | restrict access-type } { [ all ]
failure-code fail_code | location-area-list instance instance } }

no rau-inter { allow access-type | restrict access-type } { [ all ] failure-code
fail_code | location-area-list instance instance } }

default rau-inter { allow access-type | restrict access-type } { [ all ]
failure-code fail_code | location-area-list instance instance } }

no
Including ‘no’ as part of the command structure disables the values already configured for parameters specified in the command.

default
Resets the configuration of specified parameters to system default values.

allow access-type
Including this keyword-set with one of the following options, configures the SGSN to allow MS/UE with the identified access-type extension to be part of the intra-RAU procedure.

• gprs - General Packet Radio Service
• umts - Universal Mobile Telecommunications System

restrict access-type
Including this keyword-set with one of the following options, configures the SGSN to restrict MS/UE with the identified access-type extension from the inter-RAU procedure.

• gprs - General Packet Radio Service
• umts - Universal Mobile Telecommunications System

location-area-list instance instance
list_id must be an integer between 1 and 5. The value must be an already defined instance of a LAC list created with the location-area-list command.

[ all ] failure-code fail-code
Specify a GMM failure cause code to identify the reason an inter SGSN RAU does not occur. This GMM cause code will be sent in the reject message to the MS.
all - adding this option to the keyword determines that the failure cause code will be applicable to all location areas.

`fail-code` must be an integer from 2 to 111. Refer to the GMM failure cause codes listed below (information has been taken from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

- 2 - IMSI unknown in HLR
- 3 - Illegal MS
- 6 - Illegal ME
- 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived by the network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 - MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable
- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented
- 100 - Conditional IE error
- 101 - Message not compatible with the protocol state
- 111 - Protocol error, unspecified

**Usage**

Use this command to configure the restrictions and function of the inter-RAU procedure.

**Example**
default rau-inter allow access-type gprs location-area-list instance 1
rau-intra

Define acceptable procedure for intra-SGSN Routing Area Updates

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

rau-intra { access-type | allow access-type | restrict access-type } { [ all ] failure-code fail_code | location-area-list instance instance } }  

no rau-intra { allow access-type | restrict access-type } { [ all ] failure-code fail_code | location-area-list instance instance } }  

default rau-intra { allow access-type | restrict access-type } { [ all ] failure-code fail_code | location-area-list instance instance } }  

no
Including ‘no’ as part of the command structure disables the values already configured for parameters specified in the command.

default
Resets the configuration of specified parameters to system default values.

allow access-type
Including this keyword-set with one of the following options, configures the SGSN to allow MS/UE with the identified access-type extension to be part of the intra-RAU procedure.

- **gprs** - General Packet Radio Service
- **umts** - Universal Mobile Telecommunications System

restrict access-type
Including this keyword-set with one of the following options, configures the SGSN to restrict MS/UE with the identified access-type extension from the intra-RAU procedure.

- **gprs** - General Packet Radio Service
- **umts** - Universal Mobile Telecommunications System

location-area-list instance instance
list_id must be an integer between 1 and 5. The value must be an already defined instance of a LAC list created with the location-area-list command.

[ all ] failure-code fail-code
Specify a GMM failure cause code to identify the reason an inter SGSN RAU does not occur. This GMM cause code will be sent in the reject message to the MS.
all - adding this option to the keyword determines that the failure cause code will be applicable to all location areas.

\textit{fail-code} must be an integer from 2 to 111. Refer to the GMM failure cause codes listed below (information has been taken from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

\begin{itemize}
  \item 2 - IMSI unknown in HLR
  \item 3 - Illegal MS
  \item 6 - Illegal ME
  \item 7 - GPRS services not allowed
  \item 8 - GPRS services and non-GPRS services not allowed
  \item 9 - MSID cannot be derived by the network
  \item 10 - Implicitly detached
  \item 11 - PLMN not allowed
  \item 12 - Location Area not allowed
  \item 13 - Roaming not allowed in this location area
  \item 14 - GPRS services not allowed in this PLMN
  \item 15 - No Suitable Cells In Location Area
  \item 16 - MSC temporarily not reachable
  \item 17 - Network failure
  \item 20 - MAC failure
  \item 21 - Synch failure
  \item 22 - Congestion
  \item 23 - GSM authentication unacceptable
  \item 40 - No PDP context activated
  \item 48 to 63 - retry upon entry into a new cell
  \item 95 - Semantically incorrect message
  \item 96 - Invalid mandatory information
  \item 97 - Message type non-existent or not implemented
  \item 98 - Message type not compatible with state
  \item 99 - Information element non-existent or not implemented
  \item 100 - Conditional IE error
  \item 101 - Message not compatible with the protocol state
  \item 111 - Protocol error, unspecified
\end{itemize}

\textbf{Usage}

Use this command to configure the restrictions and function of the intra-RAU procedure.

\textbf{Example}
default rau-intra allow access-type gprs location-area-list instance 1
re-authenticate

Enable or disable the re-authentication feature. This command is available in releases 8.1 and higher.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
re-authenticate [ access-type { gprs | umts } ]
```

**remove re-authenticate**

---

**remove**

Including this keyword with the command disables the feature. The feature is disabled by default.

**access-type**

Defines the type of access to be allowed or restricted.

* **gprs**
* **umts**

If this keyword is not included, then both access types are allowed by default.

---

**Usage**

Use this command to enable or disable the re-authentication feature, which instructs the SGSN to retry authentication with another RAND in situations where failure of the first authentication has occurred. To address the introduction of new SIM cards, for security reasons a systematic "last chance" authentication retry with a fresh Authentication Vector is needed, particularly in cases where there is an SRES mismatch at authentication.

---

**Example**

```
re-authenticate
```
**reuse-authentication-triplets**

Creates an Operator Policy configuration entry to enable or disable the reuse of authentication triplets in the event of a failure.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no | remove ] reuse-authentication-triplets no-limit
```

- **no**
  This keyword disables the SGSN Operator Policy from reusing triplets.

- **remove**
  This keyword causes the reuse configuration to be deleted from the Operator Policy configuration. This is the default behavior. Triplets are reused.

- **no-limit**
  This keyword enables the SGSN Operator Policy to reuse triplets as needed.

**Usage**

Use this command to enable reuse of authentication triplets.

**Example**

```
reuse-authentication-triplets no limit
```
sgsn-address

Use this command to define the SGSN addresses for the static SGSN address table for peer SGSNs.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sgsn-address rac rac-id lac lac_id [ nri nri ] prefer { fallback-for-dns address { ipv4 ip_address | ipv6 ip_address } | local address { ipv4 ip_address | ipv6 ip_address } }
```

```
o sgsn-address { ipv4 ip_address | ipv6 ip_address } rac rac_id lac lac_id
```

---

**no**
Disables the SGSN address configuration for the designated IP address.

---

**rac rac_id**

*rac_id* identifies foreign RAC of the peer SGSN address to be configured in the static peer SGSN address table.

*rac_id* must be an integer from 1 to 255.

---

**lac lac_id**

*lac_id* identifies foreign LAC of the peer SGSN address to be configured in the static peer SGSN address table.

*lac_id* must be an integer from 1 to 65535.

---

**nri nri**

*nri* identifies the network resource identifier stored in PTMSI (bit 17 to bit 23).

*nri* must be an integer from 0 to 63.

---

**prefer**

Indicate the preferred source of the address to be used.

*fallback-for-dns* - instructs the SGSN to do a DNS query to get the address.

*local* - instructs the system to use the local address present in the configuration.

---

**address ip_address**

- *ipv4* - enter a valid address in IPv4 standard notation.
- *ipv6* - enter a valid address in IPv6 standard notation.
sgsn-number

Define the SGSN’s E.164 number to be used for interactions via the MAP protocol.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sgsn-number E164_number
no sgsn-number
```

- **no**
  Disables the use of this configuration definition.

- **E164_number**
  Enter a string of 1 to 16 digits to identify the SGSN’s E.164 identification.
sgtp-service

Identifies the SGTP service configuration to be used for this operator policy.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sgtp-service context  ctxt_name  service  sgtp_service_name

no  sgtp-service context
```

**Example**

```
sgtp-service context  ctxt_name  service  sgtp_service_name
```
sms-mo

This command configures the operator policy dictating how mobile-originated SMS messages are handled.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
[ remove ]sms-mo { { access-type { gprs | umts } { all-location-areas | location-area-list } | allow access-type { gprs | umts } | restrict access-type { gprs | umts } }

remove
Deletes the specified configuration.

access-type type
Access by SMS will be limited to SMS coming from this network type:
  *gprs
  *umts

allow
Allow either GPRS or UMTS type access for SMS.

restrict
Restrict either GPRS or UMTS type access for SMS.

location-area-list instance instance
instance must be an integer between 1 and 5. The value must identify an already defined LAC list created with the location-area-list command.

failure-code code
code: Must be an integer from 2 to 111.
```

Usage
Configure filtering for SMS-MO messaging.

Example

```
sms-mo access-type gprs all-location-areas failure-code code
```
**sms-mt**

This command configures the operator policy dictating how mobile-terminated SMS messages are handled.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ remove ]sms-mt { { access-type { gprs | umts } { all-location-areas | location-area-list } | allow access-type { gprs | umts } | restrict access-type { gprs | umts } }
```

- **remove**
  Deletes the specified configuration.

- **access-type type**
  Access by SMS will be limited to SMS coming from this network type:
  - *gprs
  - *umts

- **allow**
  Allow either GPRS or UMTS type access for SMS.

- **restrict**
  Restrict either GPRS or UMTS type access for SMS.

- **location-area-list instance instance**
  *instance* must be an integer between 1 and 5. The value must identify an already defined LAC list created with the `location-area-list` command.

- **failure-code code**
  *code*: Must be an integer from 2 to 111.

**Usage**
Configure filtering for SMS-MT messaging.

**Example**

```
sms-mt access-type gprs all-location-areas failure-code code
```
srns-inter

Inter-SRNS (Serving Radio Network Subsystem) relocation.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

\[ \text{srns-inter} \ ( \text{all failure-code} \ | \ \text{allow location-area-list instance instance} \ | \ \text{location-area-list instance instance failure-code code} \ | \ \text{restrict location-area-list instance instance} \) \]

\[ \text{no srns-inter} \ ( \text{allow location-area-list instance instance} \ | \ \text{restrict location-area-list instance instance} \) \]

\[ \text{default srns-inter} \ ( \text{all} \ | \ \text{location-area-list-instance instance instance} \) \]

\[ \text{no} \]
Deletes the inter-SRNS relocation configuration.

\[ \text{default} \]
Resets the configuration to default values.

\[ \text{all failure-code code} \]
Define the failure code that will apply to all inter-SRNS relocations.
\[ \text{code} \]: Must be an integer from 2 to 111.

\[ \text{allow location-area-list instance instance} \]
Identify the location area list Id (LAC Id) that will allow services in the defined location area.

\[ \text{location-area-list instance instance} \]
\[ \text{instance} \]: Must be an integer between 1 and 5 that identifies the previously defined location area list created with the \text{location-area-list} command.

\[ \text{restrict location-area-list instance instance} \]
Identify the location area list Id (LAC Id) that indicates the location areas where services will be restricted.

Usage
This command defines the operational parameters for inter-SRNS relocation.

Example
Use the following command to allow services in areas listed in LAC list #3:
\[ \text{srns-inter allow location-area-list instance 3} \]
srns-intra

Intra-SRNS (Serving Radio Network Subsystem) relocation.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

srns-intra { all failure-code | allow location-area-list instance instance | location-area-list instance instance failure-code code | restrict location-area-list instance instance }

no srns-intra { allowlocation-area-list instance instance | restrictlocation-area-list instance instance }

default srns-intra { all | location-area-list-instance instance }

no

Deletes the intra-SRNS relocation configuration.

default

Resets the configuration to default values.

---

**all failure-code code**
Define the failure code that will apply to all intra-SRNS relocations.

*code*: Must be an integer from 2 to 111.

**allow location-area-list instance instance**
Identify the location area list Id (LAC Id) that will allow services in the defined location area.

**location-area-list instance instance**

*instance*: Must be an integer between 1 and 5 that identifies the previously defined location area list created with the `location-area-list` command.

**restrict location-area-list instance instance**
Identify the location area list Id (LAC Id) that indicates the location areas where services will be restricted.

Usage

This command defines the operational parameters for intra-SRNS relocation.

Example

Use the following command to restrict service in areas listed in the LAC list 1:

```
srns-intra restrict location-area-list instance 1
```
subscriber-control-inactivity

This command defines the time for the subscriber-control inactivity timer. The system seeks to detect inactivity where no PDP context is activated and then starts the timer.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

subscriber-control-inactivity timeout minutes time

( no | default ) subscriber-control-inactivity

no
Deletes the timer configuration.

default
Resets the timer configuration to the default value of 7 days (10080 minutes).

time
This timer is measured in minutes.
time: Enter an integer from 1 to 20160 (two weeks).

Usage
Use this command to configure the timeout timer. After this timer times out the subscriber is detached from the SGSN.

Example

subscriber-control-inactivity timeout minutes 360
**super-charger**

This command enables/disables the SGSN to work with a super-charged network.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
super-charger

remove super-charger
```

**Usage**

By enabling the super charger functionality for 2G or 3G connections controlled by an operator policy, the SGSN changes the hand-off and location update procedures to reduce signalling traffic management.

**Example**

Enable the feature with the following command:

```plaintext
super-charger
```
wildcard-apn

Define the APN to be used in case a wildcard APN is included in the subscriber record.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
wildcard-apn pdp-type pdp-type apn-network-identifier apn_net_id
no wildcard-apn pdp-type pdp-type
```

- **no**
  - Removes the wildcard-apn definition from the configuration.

- **pdp-type pdp-type**
  - `pdp-type` can be one of the following options:
    - `ipv4` - for an ipv4 context
    - `ipv6` - for an ipv6 context
    - `ppp` - for a PPP context

- **apn-network-identifier apn_net_id**
  - `apn_net_id`: Must be one of the APN network Ids defined with the `apn` command in this SGSN operator policy configuration mode.
  - `apn_net_id`: Enter a string of 1 to 62 alphanumeric characters, including dots (.) and dashes (-), to define the network identifier. For releases 8.0 the maximum number of characters is 63; for releases 8.1 and higher, the maximum number of characters is 62.

**Usage**

This command is used to define a wildcard APN with the type of PDP context and the APN’s network ID. This wildcard APN would be used when an APN is not identified.

**Example**

Use this command to create an APN wildcard:

```plaintext
wildcard-apn -pdp-type ipv4 apn-network-identifier homern1
```
zone-code

Create a zone code and define one or more LAC Ids to specify service.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

zone-code zc_id lac lac_id

[ no ]

no
Removes either a specific LAC Id from the zone-code definition or if lac_id is not included in the command then the entire zone-code definition is removed from configuration.

zc_id
Must be an integer from 1 to 65535.

lac_id
This keyword identifies a location area-code list previously defined with the location-area-list command of this SGSN operator policy configuration mode.
lac_id must be an integer from 1 to 65535.

Usage
Repeat this command to include multiple LAC Ids in the service definition.

Example

zone-code 1 lac 4132zone-code 1 lac 1234zone-code 1 lac 64321
Chapter 188
SGSN Pool Area Configuration Mode Commands

The Pool Area configuration mode configures the parameters used to setup the VLRs to use with a pool area in a Gs service.

```
Exec Mode

configure

Global Configuration Mode

context name

Context Configuration Mode

gs-service name

Gs Service Configuration Mode

pool-area name

Pool Area Configuration Mode
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Return to the Exec mode.
exit

Exits the current configuration mode and returns to the previous configuration mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Return to the previous configuration mode.
hash-value

This command configures the load distribution for the VLRs that service this pool area.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
hash-value { hash_value | range start_value to end_value | non-configured-values
} use-vlr vlr_name

no hash-value { hash_value | range start_value to end_value | non-configured-values }
```

**no**
Removes the configured Gs procedures from this Gs service.

**hash_value**
Specifies the specific hash value for VLR(s).
```
hash_value must be an integer value from 0 through 999.
```

**range start_value to end_value**
Specifies the range of hash values for a VLR.
```
start_value specifies the start value for range of hash and is an integer value from 0 through 999.
start_value must be lower than end_value.
end_value specifies the end value for range of hash and is an integer value from 0 through 999.
end_value must be higher than start_value.
```

**non-configured-values**
This keyword assign all non-configured hash values to use the named VLR.

**use-vlr vlr_name**
Specifies the name of the VLR to be associated with this pool area.
```
vlr_name is the name of VLR and must be an alpha and/or numeric string of 1 to 63 characters.
```

**Usage**
Use this command to command configures the load distribution for the VLRs that service this pool area as defined in TS 23.236.
The algorithm for selection of VLR from a pool area is based on the hash value computed on the IMSI digits. The SGSN derives a hash value (V) using procedure as defined in TS 23.236. Every hash value from the range 0 to 999 corresponds to a single MSC/VLR node. Typically many hash values may point to the same MSC/VLR node.
This command can be entered multiple times for different hash value.
Example
Following command configure the all non configured hash values to use VLR named \texttt{starvlrl} in this pool area:

\texttt{hash-value non-configured-values use-vlr starvlrl}
lac

This command defines a set of location area code (LAC) values for a pool area.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
lac lac_id +
no lac lac_id
```

More than one `lac_id`, separated by a space, can be entered within a single command.

```
no
Removes the configured LAC value from this pool area configuration.
```

```
lac lac_id
```

Specifies the subscribers’ location area code (LAC) to be associated with this pool area and a specific VLR. This LAC is obtained from the radio area indicator (RAI).

`lac_id`: Must be an integer from 1 through 65535.

```
+  
```

More than one `lac_id`, separated by a space, can be entered within a single command.

**Usage**

Use this command to specify a set of LACs to use for a pool area.

This command can be entered multiple times, subject to a limit of 32 LAC definitions (total for non-pool-area and pool-area configuration) per Gs service.

**Important:** LAC values across multiple pool areas and non-pool-areas must be unique within the Gs service.

**Example**

The following command configures LACs 101, 301, and 222 for the pool area.

```
lac 101 301 222
```
Chapter 189
SGSN PSP Configuration Mode Commands

The Peer-Server Process (PSP) configuration mode provides the commands to create, configure, bind, and manage a specific PSP instance for a SS7 Routing Domain.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
associate

Defines an association between the PSP instance and an application server process (ASP) instance.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
associate asp instance asp_num
```

```
no associate
```

```
no
```

Removes the association between the PSP and the ASP from the routing domain configuration.

**Important:** Using this command will probably result in the termination of all current subscriber sessions active through the peer-server.

```
asp_num
```

Identifies a specific ASP configuration. Up to four ASP instances can be configured for a single SS7 routing domain.

*asp_num* must be an integer from 1 through 4.

**Usage**
Create an association between a specific peer-server process (PSP) and a specific application server process (ASP) instance. The M3UA end-point of the ASP must be configured prior to configuring the PSP-ASP association. Use the commands defined in the ASP Configuration Mode chapter of the Command Line Interface Reference.

**Example**

```
associate asp instance 2
```
**end**

Exits the configuration mode and returns to the Exec mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Change the mode back to the Exec mode.
end-point

This command defines or deletes the IP address to be associated with the local SCTP end-point for the application server process (ASP).

Product  
SGSN

Privilege  
Security Administrator, Administrator

Syntax

```plaintext
end-point [ address ip_address | port port_number ]
no end-point [ address ip_address ]
```

- **port port_number**
  - Identifies the M3UA’s SCTP port associated with this end-point.
  - `port_number`: must be an integer from 1 to 65535.
  - Removes the end-point configuration.

- **no**
  - Removes the ASP end-point association from the PSP configuration.

**Important**: This command can not be used as long as the PSP and the ASP are associated.

Usage

Use this command to manage the ASP end-point. At least one address needs to be configured for the ASP before the end-point can be associated with the PSP.

Example

Set the end-point to IP address 192.168.1.1 with the following command:

```plaintext
end-point address 192.168.1.1
```
exchange-mode

Configures the exchange-mode for the peer-server process.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```bash
exchange-mode [ double-ended | single-ended ]
```

**Usage**
Use this command to toggle the exchange modes for the peer-server process. The default (initial configuration) mode is double-ended.

**Example**

```bash
exchange-mode double-ended
```
exit

Exits the configuration mode and returns to the Global configuration mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the Global configuration mode.
**psp-mode**

Configures the peer-server process (PSP) operational mode as either client or server mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
psp-mode { client | server }
```

- **client**
The PSP operates as a client.

- **server**
The PSP operates as a server.

**Usage**
Instruct the peer-server process to operate in either client or server mode.

**Example**

```
psp-mode server
```
**routing-context**

Configures the behavior of the routing context in M3UA messages.

---

**Important:** This keyword function is only available in releases 8.1 and higher.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
routing-context { discard-inbound | process-inbound { insert-outbound | suppress-outbound }

default routing-context
```

---

**default**

Include this keyword with the command, to reset the configuration to the system default for routing-context which is a combination of process-inbound and insert-outbound.

---

**discard-inbound**

Sets the routing context received in M3UA messages to be discarded.

---

**process-inbound**

Sets the routing context received in M3UA messages to be processed.

---

**insert-outbound**

Sets the routing context so that it is added in the M3UA messages.

---

**suppress-outbound**

Sets the routing context so that it is suppressed in the M3UA messages.

---

**Usage**

In PSP (singled-ended) configuration mode, the settings for both the local routing context (the SGSN's routing context) and the peer routing context (the RNC's routing context) should be the same. If the routing contexts created at the SGSN and on the peer are different then this can cause the M3UA link to fail. Routing context is an optional parameter when an M3UA association has only one associated peer-server.

---

**Example**

```
 routing-context discard-inbound insert-outbound
```
sctp-alpha

This stream control transmission protocol (SCTP) retransmission time out (RTO) parameter defines a retransmission timeout value.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

sctp-alpha value

default sctp-alpha

value
Defines a percentage (%) that represents the RTO portion of the RTT calculation. This percentage value must be an integer between 0 and 65535.

default
Resets the sctp-alpha to the default value of 5%.

Usage
sctp-alpha is used in conjunction with other commands, such as the sctp-beta command, to determine the round-trip time (RTT) calculations. The Alpha parameter is used to manage load balancing within the SS7 environment for multi-homed peers.

Example

sctp-alpha 256
**sctp-beta**

This stream control transmission protocol (SCTP) retransmission time out (RTO) parameter defines a retransmission timeout value.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sctp-beta value
```

```
default sctp-beta
```

value

Defines a percentage (%) that represents the RTO portion of the RTT calculation. This percentage value must be an integer between 0 and 65535.

```
default
```

Resets the `sctp-beta` to the default value of 10%.

**Usage**

Use this command in conjunction with other commands, such as the `sctp-alpha` command, to determine the round-trip time (RTT) calculations. The Beta parameter is used to manage load balancing within the SS7 environment for multi-homed peers.

**Example**

```
sctp-beta 512
```
sctp-checksum-type

This command selects the type of checksum algorithm to be used.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
sctp-checksum-type { adler32 | crc32 }
default sctp-checksum-type
```

---

**adler32**
Selects the Adler-32 type of algorithm as a faster checksum function.

---

**crc32**
Selects the CRC-32, a slower but more reliable 32-bit cyclic redundancy check.

---

**default**
Resets the `sctp-checksum-type` to the default of CRC-32.

---

**Usage**
Use this command to set which type of checksum algorithm the SGSN is to use to validate SCTP packets.

**Example**

```
sctp-checksum-type crc32
```
**sctp-cookie-life**

This command sets the valid life for the SCTP cookie.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
sctp-cookie-life value
```

**default sctp-cookie-life**

```
value
Sets the cookie life value in increments of 100 milliseconds. The range is 50 to 1200.
```

```
default
Resets the sctp-cookie-life value to the default, 600 (= 60 seconds).
```

**Usage**

Use this command to set the SCTP cookie life.

**Example**

```
sctp-cookie-life 60
```
**sctp-max-assoc-retx**

This command sets the maximum number of datagram retransmissions to be associated with this peer server configuration.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sctp-max-assoc-retx value
```

```
default sctp-max-assoc-retx
```

- **value**
  Defines the maximum number of datagram retransmissions for an association. The value must be an integer between 0 and 255.

- **default**
  Resets the default for `sctp-max-assoc-retx` to 10.

**Usage**

Use this command to configure the maximum number of datagram retransmissions for an association. The endpoint will be declared unreachable after `sctp-max-assoc-retx` number of consecutive retransmissions to an endpoint on any transport address.

**Example**

```
sctp-max-assoc-retx 3
```
**sctp-max-init-retx**

This command sets the maximum number of retries to send the INIT datagram.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
sctp-max-init-retx value

default sctp-max-init-retx

value
Sets the maximum number of retries. This value must be an integer between 0 and 255.

default
Resets the default for `sctp-max-init-retx` to 5.
```

**Usage**

Use this command to set the maximum number retries the SCTP layer should make to send the INIT datagram to the peer to open an association.

**Example**

```plaintext
sctp-max-init-retx 3
```
**sctp-max-mtu size**

This command sets the number of bytes that comprise the maximum MTU size.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sctp-max-mtu-size value

default sctp-max-mtu-size
```

- **value**
  Sets the maximum number of bytes for the SCTP MTU size. This value must be an integer between 508 and 65535.

- **default**
  Resets the default for `sctp-max-mtu-size` to 1500.

**Usage**
Use this command to configure the size of the MTU.

**Example**

```
sctp-max-mtu-size 1024
```
**sctp-max-out-strms**

This command sets the maximum number of outgoing streams through the PSP going towards the peer server.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sctp-max-out-strms max#_out_streams
default sctp-max-out-strms
```

**default**

Resets the SGSN’s `sctp-max-out-strms` value to the default of 16.

**max#_out_streams**

The value must be an integer between 1 and 65535. The value should match the peer node’s (STP/SG/RNC/HLR) number of in-bound streams.

**Usage**

Use this command to balance the stream throughput from the PSP to the peer server. The value for this command is used to validate the incoming packets in the SCTP layer.

**Example**

```
sctp-max-out-strms 3500
```
sctp-max-path-retx

This command sets the maximum number of datagram retransmissions for this path.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
sctp-max-path-retx value
```

```
default sctp-max-path-retx
```

```
value
Sets the maximum number of datagram retransmission to a destination transport address. This value must be an integer from 0 to 255.
```

```
default
Resets the sctp-max-path-retx default to 5.
```

Usage
Use this command to set the maximum number of datagram retransmissions to a destination transport address. The destination transport address will be declared unreachable after the SGSN exhausts the sctp-max-path-retx number of consecutive retransmissions to a destination transport address.

Example

```
sctp-max-path-retx 10
```
**sctp-rto-initial**

This command sets the initial retransmission timeout for the SCTP.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sctp-rto-initial value

default sctp-rto-initial
```

- **value**
  Sets the timeout in increments of 100 milliseconds. The value must be an integer between 10 and 1200.

- **default**
  Resets the system to the sctp-rto-initial default of 30 (3 seconds).

**Usage**
Use this command to define the initial retransmission timer.

**Example**
```
sctp-rto-initial 240
```
sctp-rto-max

This command sets the maximum retransmission timeout value for the SCTP.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sctp-rto-max value

default sctp-rto-max
```

```
default
Resets the system to the sctp-rto-max default of 600 (60 seconds).
```

```
value
Set the maximum retransmission timeout value in increments of 100 milliseconds and the value must be an integer between 5 and 1200.
```

**Usage**

Use this command to configure the maximum time for retransmissions.

**Example**

The following sets the timeout for 45 seconds:

```
sctp-rto-max 450
```
**sctp-rto-min**

This command sets the minimum retransmission timeout (RTO) value for the SCTP.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sctp-rto-min value
```

```
default sctp-rto-min
```

**default**

Resets the *sctp-rto-min* to the default of 10 (1 second).

**value**

Sets the minimum retransmission timeout in increments of 100 milliseconds. The value must be an integer from 1 to 50.

**Usage**

Use this command to set the minimum time for retransmission before timeout.

**Example**

The following sets the timeout for 2 seconds:

```
sctp-rto-min 20
```
**sctp-sack-frequency**

This command sets the frequency of transmission of SCTP selective acknowledgements (SACK).

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sctp-sack-frequency value
```

```
default sack-frequency
```

<table>
<thead>
<tr>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sets the maximum number of datagrams to be received prior to sending a SACK to the peer. The value must be an integer between 1 and 5.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resets the <code>sctp-sack-frequency</code> default value of 2.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to set the maximum number of datagrams to be received before a SACK must be sent to the peer. The `sctp-sack-frequency` is used in conjunction with the `sctp-sack-period` to control the generation of SACK, depending on which one occurs first.

**Example**

```
sctp-sack-frequency 3
```
**sctp-sack-period**

This command sets the delay before sending an SCTP selective acknowledgement (SACK).

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sctp-sack-period value
```

```
default sack-period
```

---

**value**

Sets the maximum time, in increments of 100 milliseconds, before the system must send a SACK to the peer. The value must be an integer from 0 to 5.

---

**default**

Resets the system to the `sctp-sack-period` default value, 2 (=200 milliseconds).

---

**Usage**

Use this command to set the time the SCTP waits to send a SACK.

**Example**

```
sctp-sack-period 120
```
sctp-suppress-alarm

This command enables/disables the suppression of alarms for SCTP path failure between two peer endpoints.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

[ no ]sctp-suppress-alarm path-failure self-end-point-address
orig_ipv4_address peer-end-point-address peer_ipv4_address

no
Disables the pre-configured alarm suppression for SCTP path failure.

path-failure
This keyword specifies that the alarm suppression is for SCTP path failure between two peer nodes.

self-end-point-address orig_ipv4_address
This keyword specifies the IP address of the originating endpoint.
orig_ipv4_address is the IP address of originating endpoint in IPv4 dotted decimal notation.

peer-end-point-address peer_ipv4_address
This keyword specifies the IP address of the peer endpoint.
peer_ipv4_address is the IP address of peer endpoint in IPv4 dotted decimal notation.

Usage
Use this command to configure the path failure alarm suppression. This command ignores the alarms generated on SCTP path failure.

Example
The following command suppresses the path failure alarms occurred in SCTP path between originating peer address 1.2.3.4 and peer endpoint 6.7.8.9:

sctp-suppress-alarm path-failure self-end-point-address 1.2.3.4 peer-end-point-address 6.7.8.9
timeout

This command sets the times for various timeout timers.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
timeout { m3ua-periodic-dest-audit dest_timeout | sctp-bundle bundle_time | sctp-heart-beat hrt_bt_timeout }

default timeout sctp-heart-beat
```

default
Resets the system to the default values.

```
m3ua-periodic-dest-audit dest_timeout
```
Sets the period (in increments of seconds) between the DAUD messages while auditing a destination state.

*dest_timeout*: Must be an integer from 1 to 65535. Default is 2.

```
sctp-bundle
```
Sets the SCTP bundle timeout value in increments of 100 milliseconds, with a range of 1 to 65535. By default, SCTP bundling is disabled.

```
sctp-heart-beat hrt_bt_timeout
```
Sets the number of seconds in the SCTP heart-beat timer

*hrt_bt_timeout*: This value is an integer between 1 and 300. Default is 30.

Usage
Use this command to configure timers. Repeat the command with each of the keywords to set values for each.

Example

```
timeout m3ua-periodic-dest-audit 120
```
Chapter 190
SGSN Service Configuration Mode Commands

The SGSN Service configuration mode is used within the global configuration mode to specify the 3G operations of the SGSN and the available SGSN services for a specific context.

SGSN Service works with MAP Service, SGTP Service, GTPP Group, and IuPS Service. All five of these services must be configured to enable a 3G SGSN to communicate with other elements within a UMTS network.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
accounting

This command defines the accounting context name and enables/disables specific types of CDR generation for the accounting in the SGSN service.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
accounting { cdr-types { mcdr | scdr | sms { mo-cdr | mt-cdr } } + | context cntx_name }
```

default accounting cdr-types

no accounting { cdr-types | context }

---

default

Returns the system to default settings for the selected type of CDR.

---

no

Removes the pre-configured type of CDR generation for accounting from the SGSN service.

---

```
cdr-types { mcdr | scdr | sms { mo-cdr | mt-cdr } } +
```

Default: enabled

Defines the types of CDRs to be generated within the specified SGSN service for accounting:

- **mcdr**: Enables generation of M-CDRs.
- **scdr**: Enables generation of S-CDRs.
- **sms**: Enables generation of SMS-type CDRs based on one of the following:
  - **mo-cdr**: SMS CDRs originates from the mobile.
  - **mt-cdr**: SMS CDRs terminates at the mobile.

---

```
+ 
```

Specifies that the specified keywords with in the group can be entered multiple times with a single command.

---

```
context cntx_name
```

Specifies an accounting context to be associated with the SGSN service.

*cntx_name*: Define a string of 1 to 79 alphanumeric characters.

---

Usage

Use this command to define the type of CDRs to generate for SGSN service. By default all type of CDRs are generated. Note that change of this configuration will be applied to new call and/or to new PDP contexts only.
By default, generation of the S-CDR, M-CDR, SMS-MT-CDR, and SMS MO-CDR types is enabled.

Example
The following command configures the system to generate CDRs of M-CDR type for accounting in the current SGSN service:

```
accounting cdr-types mcdr
```
cc profile

Configures the charging characteristic (CC) profile with the triggers for generating various types of CDR as defined with the accounting command.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

cc profile profile_bits [ buckets number | interval time | tariff time1 mins hours [ time2 mins hours ] [ time3 mins hours ] [ time4 mins hours ] | volume { downlink down_vol uplink up_vol | total total_vol } ] +

[ no | default ] cc profile profile_bits [ buckets | interval | tariff | volume ]

no
Removes a previously configured CC profile.

default
Returns the specified CC profile to the original default system settings.

profile_bits
Defines the value of the profile bits for the SGSN service.
index can be configured to any integer value from 0 to 15. Some of the values have been predefined according to 3GPP standard:

1 for hot billing
2 for flat billing
4 for prepaid billing
8 for normal billing

buckets number
Specifies the number of statistics container changes in the CDR due to QoS changes or tariff times that can occur before an accounting record (CDR) is closed
Default: 4
number: Must be integer from 1 to 4.

interval time
Specifies the normal time duration (in seconds) that must elapse before closing an accounting record (CDR) provided that any or all of the following conditions occur:
time: Enter any integer from 60 to 4000000.
```
tariff time1 mins hours [ time2 mins hours time3 mins hours time4 mins hours ]
```

Specifies the time-of-day (based on a 24-hour clock) to close the current statistics container in the CDR, but not necessarily the CDR itself. One tariff time must be defined and up to four tariff times can be specified.

**Important:** The system assumes that the billing system uses the day/date to determine if the statistics container represents an actual tariff period.

- **mins:** The minutes of the hour. Enter an integer from 0 to 59.
- **hours:** The hour of the day. Enter an integer from 0 to 23.

```
volume { downlink down_vol uplink up_vol | total total_vol }
```

Specifies the downlink, uplink, and total volumes octet counts that must be met for the closure of the CDR.

- **down_vol:** Enter any integer from 100000 to 1345294336.
- **up_vol:** Enter any integer from 100000 to 40000000.
- **total_vol:** Enter any integer from 100000 to 40000000.

**Usage**

Charging characteristics consist of a profile index and behavior settings. This command configures the profile index for the SGSN’s charging characteristics. The SGSN supports up to 16 profile indexes.

**Example**

The following command configures a profile index of 10 with tariff times of 7:00 AM and 7:30 PM:

```
cc profile 10 tariff time1 07 time2 30 19 time3 07 time4 30 19
```
check-imei-timeout-action

This command configures the action to be taken if a Check-IMEI fails due to a timeout. This command is available in releases 8.1 and higher.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

check-imei-timeout-action [ continue | reject ]

default check-imei-timeout-action

default
Rejects the Attach or ISRAU procedure if a Check-IMEI timeout occurs.

continue
Instructs the SGSN to continue the Attach or ISRAU procedure if a Check-IMEI timeout occurs because the EIR is not reachable. This functionality matches standard call flow.

reject
Instructs the SGSN to reject the Attach or ISRAU procedure if a Check-IMEI timeout occurs.

Usage
Use this command only if the Gf interface (EIR) is available in the network. This command controls the SGSN reaction if the Check-IMEI procedure fails due to a timeout.

The continue option allows the SGSN to go forward with the MS Attach or RAU, if the first Check-IMEI fails to reach the EIR due to a timeout. Any subsequent activity (such as a RAU or Service Request would force another Check-IMEI towards the EIR. If this subsequent MAP Check-IMEI should fail, then the same policy of continuing the procedure would apply.

Example

check-imei-timeout-action continue
core-network

This command specifies the numeric ID for a core network to identify which CN is to be used by the SGSN service.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

core-network id cn_id

no core-network id

no
Removes the currently configured core network ID from the current SGSN configuration.

id cn_id
This number identifies the core network to connect the SGSN service.

cn_id: Must be an integer from 0 through 65535.

Usage
Use this command to set a global ID to identify this SGSN in the core network.

Example
The following command sets the core network ID for the current SGSN service to 127:

core-network id 127
disable/enable super-charger

This command has been deprecated and replaced by the `super-charger` command. For the commands to configure the SuperCharger feature are explained the *SGSN Operator Policy Configuration Mode* chapter.

**Product**

SSGN
**dns israu-mcc-mnc-encoding**

Configures either decimal or hexadecimal format for the MCC and MNC values in the DNS query which is sent during the ISRAU.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
dns israu-mcc-mnc-encoding { decimal | hexadecimal }
default dns israu-mcc-mnc-encoding
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>decimal</td>
<td>Default. Instructs the SGSN to send the MCC and MNC in decimal format in the DNS query.</td>
</tr>
<tr>
<td>hexadecimal</td>
<td>Instructs the SGSN to send the MCC and MNC in hexadecimal format in the DNS query.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to determine the type of encoding for the MCC and MNC to be included in the DNS query sent during the inter-SGSN RAU (ISRAU). The choice must match the format of the DNS server. For example:

In decimal, the MNC/MCC in a DNS query would appear like:

```
rac0017.lac42e3.mnc310.mcc722.gprs
```

In hexadecimal, the MNC/MCC in a DNS query would appear like:

```
rac0017.lac42e3.mnc0136.mcc02d2.gprs
```

**Example**

Use hexadecimal values for the MCC/MNC in the DNS query.

```
dns israu-mcc-mnc-encoding hexadecimal
```
end

Exits the current configuration mode and returns to the Exec mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax
```end```

Usage
Return to the Exec mode.
exit

Exits the current configuration mode and returns to the global configuration mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Return to the context configuration mode.
gmm

This command defines the GPRS mobility management parameters for the SGSN service.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
gmm { T3302-timeout t3302_dur | T3312-timeout t3312_dur | T3313-timeout initial t3313_init [ decrease t3313_decrement | increase t3313_increment ] | T3322-timeout t3322_dur | T3350-timeout t3350_dur | T3360-timeout t3360_dur | T3370-timeout t3370_dur | implicit-detach-timeout impli_detach_dur | max-auth-retransmission auth_retrans | max-identity-retransmission id_retrans | max-page-retransmission page_retrans | max-ptmsi-reloc-retransmission ptmsi_reloc_retrans | mobile-reachable-timeout ms_reach_dur | perform-identity-on-auth-failure | purge-timeout purge_dur | trau-timeout trau_dur }

no gmm { implicit-detach-timeout | max-auth-retransmission | max-identity-retransmission | perform-identity-on-auth-failure }
```

default
Sets the default value for the specified parameter.

T3302-timeout t3302_dur
Default: 10
Specifies the retransmission timer value to guard the GPRS attach or RAU procedure on MS side. t3302_dur is the waiting duration in minutes before retransmitting the specific message and must be an integer from 1 through 186.

T3312-timeout t3312_dur
Default: 54
Specifies the retransmission timer value to guard the RAU procedure initiation on network side. t3312_dur is the waiting duration in minutes before retransmitting the specific message and must be an integer from 1 through 186.

T3313-timeout initial t3313_init [ decrease t3313_decrement | increase t3313_increment ]
Default: 5
Specifies the retransmission timer value to guard the for paging request procedure initiation on network side.
initial \texttt{t3313\_init} is the initial waiting duration in seconds before retransmitting the specific message. \texttt{t3313\_init} must be an integer from 1 through 60.

decrease \texttt{t3313\_decrement}. specifies the decrement of the initial timer value in seconds. \texttt{t3313\_decrement} must be an integer from 1 through 5.

increase \texttt{t3313\_increment}. specifies the increment of the initial timer value in seconds. \texttt{t3313\_decrement} must be an integer from 1 through 5.

\begin{verbatim}
T3322-timeout t3322_dur
Default: 6
Specifies the retransmission timer value to guard the GPRS detach request procedure on network side. \texttt{t3322dur} is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.
\end{verbatim}

\begin{verbatim}
T3350-timeout t3350_dur
Default: 6
Specifies the retransmission timer value to guard the GPRS attach accept/RAU accept/realloc request procedure sent with P-TMSI and/or TMSI on network side. \texttt{t3350dur} is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.
\end{verbatim}

\begin{verbatim}
T3360-timeout t3360_dur
Default: 6
Specifies the retransmission timer value to guard the authentication and cipher request procedure on network side. \texttt{t3360dur} is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.
\end{verbatim}

\begin{verbatim}
T3370-timeout t3370_dur
Default: 6
Specifies the retransmission timer value to guard the identity request procedure on network side. \texttt{t3370dur} is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.
\end{verbatim}

\begin{verbatim}
implicit_detach_timeout impli_detach_dur
Default: 3600
Specifies the retransmission timer value to guard the implicit detach procedure on network side. \texttt{impli\_detach\_dur} is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 3600.
\end{verbatim}

\begin{verbatim}
max-auth-retransmission auth_retrans
Default: 4
Specifies the maximum retransmission of authentication requests allowed. \texttt{auth_retrans} is the number of retries before declaring the authentication failure and must be an integer from 1 through 10.
\end{verbatim}

\begin{verbatim}
max-identity-retransmission id_retrans
Default: 4
Specifies the maximum retransmission of identity requests allowed.
\end{verbatim}
**id_retrans** is the number of retries before declaring the identity failure and must be an integer from 1 through 10.

**max-page-retransmission page_retrans**
Default: 5
Specifies the maximum retransmission of page requests allowed.
**id_retrans** is the number of retries before declaring the paging request failure and must be an integer from 1 through 5.

**max-ptmsi-reloc-retransmission ptmsi_reloc_retrans**
Default: 5
Specifies the maximum retransmission for P-TMSI relocation procedure allowed.
**id_retrans** is the number of retries before declaring the P-TMSI relocation procedure failure and must be an integer from 1 through 5.

**mobile-reachable-timeout ms_reach_dur**
Default: 58
Specifies the retransmission timer value to guard the mobile reachability procedure on network side.
**impli_detach_dur** is the waiting duration in minutes before retransmitting the specific message and must be an integer from 1 through 1440.

**perform-identity-on-auth-failure**
Default: Enabled
Configures the SGSN service to perform an identity check to ascertain the IMSI after an authentication failure on a PTMSI-based message.

**purge-timeout purge_dur**
Default: 10080 (7 days)
Specifies the timer value to guard the detach of MM context procedure on network side.
**impli_detach_dur** is the waiting duration in minutes before retransmitting the specific message and must be an integer from 1 through 20160.
Define the purge timer to hold detached mm-contexts. Default is 10080 mins (7 days).

**trau-timeout trau_dur**
This timer is available in releases 9.0 and higher.
Default: 30
Specifies the number of seconds the “old” 3G SGSN waits to purge the MS’s data. This timer is started by the “old” SGSN after completion of the inter-SGSN RAU.
**trau_dur**: Must be an integer from 5 to 60.

**Usage**
Repeat this command as needed to configure multiple parameters for GPRS mobility management in a UMTS network. This command provides the configuration of timers for mobility procedures and retries for different messages. GMM layer is defined in the 3GPP TS 24.008 (Release 7).

**Example**
Following command configures the timer to wait for 5 mins before retransmitting the message for GPRS attach or RAU procedure on MS side with maximum number of retries as 6 for authentication:

```
gmm T3302-timeout 5 max-auth-retransmission 6
```
gs-service

This command associates a previously defined Gs service interface to MSC/VLR along with its associated context with an SGSN service.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

`gs-service gs_svc_name context ctx_name`

`no gs-service gs_svc_name`

- `gs_svc_name`
  Specifies the name of a specific Gs service for which to display information. `svc_name` is the name of a configured Gs service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

- `context ctx_name`
  Specifies the specific context name where Gs service is configured. If this keyword is omitted, the named Gs service must be exist in the same context as the SGSN service. `ctx_name` is name of the configured context of Gs service. This can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

Use this command to associate a specific Gs service interface with this SGSN service instance.

**Important**: A single Gs service can be used with multiple SGSN and/or GPRS service.

Example

Following command associates a Gs service instance named `stargsl`, which is configured in context named `star_ctx`, with an SGSN service:

```
gs-service stargsl context star_ctx
```
lac

This command defines the location area code (LAC in hexadecimal format.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

    lac  hex

    no  lac

    no
    Erases the lac configuration statement.

    hex
    Enter a hexadecimal number between 0x0 and 0xFFFF
max-pdp-contexts

Configures the maximum number of PDP contexts for a MS (mobile station) that will be supported on this SGSN service.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

max-pdp-contexts per-ms number

default max-pdp-contexts per-ms

default
Resets the maximum number of PDP contexts per mobile station to the default of 11 for the Gs service configuration

per-ms number
Default: 11
Defines the combined total number of primary and secondary PDP contexts for the SGSN service. number can be an integer from 2 to 11.

Usage
The following example defines 5 as the maximum number of primary and secondary PDP contexts that this SGSN will support for any connected MS.

Example

max-pdp-contexts per-ms 5
mobile-application-part

This command identifies an already defined MAP service (Mobile Application Part service) to associate with the SGSN service. Although the MAP service does not need to be defined in the same context as the SGSN service, there is a one-to-one relationship between a MAP service and an SGSN service.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

mobile-application-part service map_svc [ context ctx_name ]

no mobile-application-part service

no
Remove the MAP service association from the SGSN service configuration.

service map_svc
Specifies the name of the MAP service to be associated with this SGSN service.
map_svc must be the name of a MAP service previously configured on the system.

context ctx_name
Specifies the name of the context where the MAP service is configured. If the MAP service is not configured in the current context, then the context where it is configured must be specified to enable the SGSN to reach the MAP service.
If this keyword is not specified, the current context is used.
ctx_name: Must be the name of the context where the specified MAP service is configured.

Usage

Use this command to identify the MAP service configuration to be used by the SGSN service configuration. Also use this command to specify the context in which the MAP service configuration was created.
If the MAP service is not identified or if the correct context is not identified, then the SGSN service will not START.

Example

The following command specifies a MAP service named map1 that is configured in the same context as the current SGSN service:

mobile-application-part service map1
network-sharing cs-ps-coordination

Enables/disables the SGSN service to perform a CS-PS coordination check.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

network-sharing cs-ps-coordination

default network-sharing cs-ps-coordination

no network-sharing cs-ps-coordination

default
Including this keyword resets the SGSN service to allow the check to be performed.

no
Disables this feature for the SGSN service.

Usage
Use this command to facilitate the network sharing functionality. With this command, the SGSN can be instructed to perform a check to determine if CS-PS coordination is needed.

3GPP TS 25.231 section 4.2.5 describes the functionality of the SGSN to handle CS-PS (circuit-switching/packet-switching) coordination for attached networks not having a Gs-interface. In compliance with the standard, the SGSN rejects an Attach in a MOCN configuration with cause 'CS-PS coordination required', after learning the IMSI, to facilitate the RNC choosing the same operator for both CS and PS domains.

Example
Use the following syntax to disable the CS-PS coordination check:

no network-sharing cs-ps-coordination
nri length

This command defines the Network Resource Identifier (NRI) of the SGSN that is stored in the P-TMSI (bits 23 to 18).

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
nri length  nri_length  {  nri-value  nri_value  |  null-nri-value  null_nri_value  
non-broadcast  mcc  mcc  mnc  mnc  lac  lac_id  rac  rac_id  [  nri-value  nri_value  ]  
no  nri
```

- **no**
  Removes the configured NRI value and location in P-TMSI for retrieval by this SGSN operator policy.
  
  **nri length  nri_length**
  Specifies the number of bits to be used in the P-TMSI, bits 23 to 18, to define the network resource identifier (NRI). The NRI length configuration also sets the maximum size of the pool. If not configured, the NRI length will be of zero length.
  
  **nri_length**: Must be an integer from 1 to 6 to identify the number of bits.

- **null-nri-value  null_nri_value**
  This keyword is only available in releases 8.1 and higher. Configures the null NRI value which must be unique across the pool areas. This keyword is used for the offloading procedure for SGSN pooling (enabled with the `sgsn offloading` command, see the Exec Mode chapter).
  
  **null_nri_value**: 0 (zero) indicates the keyword is not to be used and 1 to 63 are used to identify the SGSN to be used for the offloading procedure for SGSN pooling. There is no default value for this parameter.

- **non-broadcast  mcc  mcc  mnc  mnc  lac  lac_id  rac  rac_id**
  This keyword set is only available in releases 8.1 and higher.
  
  Defines the non-broadcast LAC/RAC to be used in combination with the null-NRI for the offloading procedure. Including the MCC and MNC to specify the PLMN because the Iu-Flex feature supports multiple IuPS Services.
  
  **mcc**: identifies the mobile country code, the first part of the PLMN ID. Must be an integer between 100 and 999.
  
  **mnc**: identifies the mobile network code portion of the PLMN ID. Must be a 2- or 3-digit integer between 01 and 999.
  
  **lac_id**: defines a location area code associated with an RNC. Must be an integer between 1 and 65535.
  
  **rac_id**: defines the remote area code to be associated with an RNC. Must be an integer between 1 and 255.
nri-value nri_value

Specifies the MS-assigned value of the NRI to retrieve from the P-TMSI. This value must not exceed the maximum possible value specified by the NRI length. The NRI value must be unique across the pool or across all overlapping pools.

nri_value must be an integer from 1 to 63 to identify a specific SGSN in a pool. Use of 0 (zero) value is not recommended.

Multiple NRI values can be identified by providing multiple nri-values separated by a blank space for example: nri length 6 nri-value 29 43 61

Usage

Use this command to identify the SGSN identified with the NRI in the MS generated P-TMSI. This command adds or removes the Iu Flex configuration for this SGSN service. When using Iu Flex, all keywords must be defined. The command can be repeated to specify different values for any of the keyword parameters. If more than one NRI is configured, the SGSN service will round-robin between the available NRIs when new subscribers (re)connect.

Use this command to retrieve the NRI (identity of an SGSN) stored in in bits 23 to 18 of the packet temporary mobile subscriber identity (P-TMSI). If more than one NRI value is configured, the SGSN service will round-robin between the available NRIs when new subscribers (re)connect.

When using MOCN mode for network sharing without SGSN pooling, the NRI length and the NRI value should both be used.

Example

The following command specifies the the NRI length as 5 bits, identifies SGSN 23 with LAC 222 and RAC 12 for offloading procedure with NRIs 6 and 41:

```
nri length 5 null-nri-value 34 non-broadcast lac 222 rac 12 nri-value 6
```

**override-lac-li**

This command defines the override location area code (LAC) needed for the function of the lawful intercept feature.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
override-lac-li hex

no override-lac-li
```

- **no**
  Erases the override location area code for this GGSN service from the configuration.

- **hex**
  Enter a hexadecimal number between 0x0 and 0xFFFF
override-rac-li

This command defines the override routing area code needed for the lawful intercept function.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

override-rac-li hex

no override-rac-li

no
Erases the override routing area code for this GGSN service from the configuration.

hex
Enter a hexadecimal number between 0x0 and 0xFFFF
**rac**

This command defines the override routing area code needed for the lawful intercept function.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
rac hex
no rac
```

---

**no**
Erases the routing area code configuration statement.

---

**hex**
Enter a hexadecimal number between 0x0 and 0xFFFF
**ran-protocol**

This command specifies the IuPS service for the SGSN service to use for communication with the RAN.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
ran-protocol iups-service iups_svc [ context ctx_name ]
```

```
no ran-protocol iups-service
```

- **no**
  
  Removes the IuPS service information from the SGSN service configuration.

- **iups-service iups_svc**
  
  Specifies the name of an IuPS service already configured on the system.
  
  `iups_svc`: Enter an alphanumeric string of 1 to 63 characters.

- **ctx_name**
  
  `ctx_name`: Enter the name of the IuPS context, an alphanumeric string of 1 to 63 characters.

**Usage**

Use this command to configure the IuPS service context that the current SGSN service will use to communicate with the RAN. Up to 8 definitions can be defined for a single SGSN service to allow for multiple PLMNs support.

**Example**

The following command configures the SGSN service to use an IuPS service named `iups1` that has been configured in the same context as the SGSN service:

```
ran-protocol iups-service iups1
```
sgsn-number

This command defines the E.164 number that identifies this particular SGSN service context.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
sgsn-number  E.164_number

no sgsn-number
```

```
no
Removes the SGSN number configuration from the SGSN service configuration.

E.164_number
Enter a maximum of 15 digits to define this ‘phone’ number associated with this SGSN service context.
```

Usage
To delete the sgsn-number associated with this SGSN service context, enter:

Example

```
no sgsn-number
```
sgtp-service

This command creates an instance of an SGTP service.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
sgtp-service sgtp_srvc_name
no sgtp-service
```

Usage

```
sgtp_srvc_name
Enter the name of an SGTP service that will be used by this SGSN service
sgtp_srvc_name: Enter a string of 1 to 63 alphanumeric characters.
```

Example

```
sgtp-service sgtp1
```
**sm**

This command configures session management parameters for this SGSN service. This command can be repeated multiple times to configure each parameter individually.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sm { T3385-timeout time | T3386-timeout time | T3395-timeout time | max-actv-retransmission number | max-deactv-retransmission number | max-modf-retransmission number | rab-ass-timeout time | session-inactivity | rns-ctxt-rsp-timeout }
```

```
default sm timer
```

**default**

Resets the selected timer to the system default value.

**T3385-timeout**

Retransmission timer for network-initiated Activate Request. Default is 8 sec

**T3386-timeout**

Retransmission timer for network-initiated Modify Request. Default is 8 sec

**T3395-timeout**

Retransmission timer for network-initiated Deactivate Request. Default is 8 sec

**max-actv-retransmission**

Configures maximum retries for activate PDP ctxt request. Default is 4

**max-deactv-retransmission**

Configures maximum retries for deactivate PDP ctxt request. Default is 4

**max-modf-retransmission**

Configures maximum retries for modify PDP ctxt request. Default is 4

**Usage**

Repeat the command to configure multiple session management parameters for the SGSN service.

**Example**
sm T3385-timeout 5
Chapter 191
SGTP Service Configuration Mode Commands

The SGSN GPRS Tunneling Protocol (SGTP) Service configuration mode provides the configuration of GTP-C and GTP-U related parameters for the SGSN.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**end**

Exits the configuration mode and returns to the Exec mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Change the mode back to the Exec mode.
exit

Exits the configuration mode and returns to the Global configuration mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Return to the Global configuration mode.
gtpc

Configure the GPRS Tunneling Protocol Control (GTP-C) settings for the SGTP service.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
gtpc { bind address ip_address | dns-sgsn context ctxt_name | echo-interval seconds | guard-interval seconds | ignore response-port-validation | max-retransmissions num | retransmission-timeout seconds | send { common flags | rab-context } }

no gtpc { bind address ip_address | dns-sgsn context ctxt_name | echo-interval seconds | send { common flags | rab-context } }

default gtpc { echo-interval | guard-interval | ignore response-port-validation | max-retransmissions | retransmission-timeout | send { common flags | rab-context } }
```

---

**no**

Disables the configured GTPC setting.

---

**default**

Resets the specified parameter to its default value.

---

**bind address ip_address**

Binds SGTP service to the IP address of the interface. Enter a standard dotted-quad IPv4 address. The bind address for the `gtpc` and `gtpu` commands should be the same.

---

**dns-sgsn context ctxt_name**

Enter a string of 1 to 79 alphanumeric characters to identify the context name.

---

**echo-interval seconds**

Default: 60

*seconds* must be an integer from 0 through 3600. Configures the duration between echos.

---

**guard-interval seconds**

Default: 100

Configures the interval (in seconds) for which the SGTP maintains responses sent to SGSN. This optimizes the handling of retransmitted messages. This value should be configured to be greater than the SGSN's configuration for max-retries multiple by retry-interval.

*seconds*: Must be an integer from 10 to 3600.
**ignore response-port-validation**

This keyword is available in releases 8.1 and higher.
Default: disabled. To reset the default for this parameter, you must enter the following command:

```
no gtpc ignore response-port-validation
```

This keyword instructs the SGSN to ignore the response port validation.
For the SGSN to process incoming GTP responses to an incorrect port,
- this keyword must be entered, and
- the same `bind address` must be configured for GTPC and GTPU in the SGTP service.

**max-retransmissions num**

Default: 4
Configures the maximum number of retries for packets.
`num`: Must be an integer from 0 to 15.

**retransmission-timeout seconds**

Default: 5
Configures the control packet retransmission timeout in GTP, in seconds.
`seconds`: Must be an integer value from 1 through 20.

**send { common-flags | rab-context }**

- `common-flags`: This option configures the SGTP service to include or exclude the common flags IE during an Inter-SGSN RAU. When selected, the default is to send the common flags IE.
- `rab-context`: This option configures the SGTP service to include/exclude the radio access bearer (RAB) context IE in SGSN ‘context response’ message during Inter-SGSN Routing Area Update procedure. Default is to send the RAB context IE.

**Usage**

Use this command to configure GTP-C settings for the current SGTP service.

**Example**

Following command excludes the radio access bearer (RAB) context IE in the SGSN Context Response message during the inter-SGSN RAU procedure:

```
no gtpc send rab-context
```
gtpu

This command configures the GPRS Tunneling Protocol user data plane parameters (GTP-U) for this SGTP service.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
gtpu { bind address ip_address | echo-interval | max-retransmissions | retransmission-timeout } +
```

```
no gtpu { bind | echo-interval }
```

```
default gtpu { echo-interval | max-retransmissions | retransmission-timeout }
```

**no**
Removes the configuration for the specified parameter from the current SGTP service configuration.

**default**
Resets the specified GTP-U parameter to its factory default.

**bind address ip_address**
Defines the GTP-U Gn interface IP address that binds to this SGTP service. The gtpu and the gtpc commands should be configured with the same bind address.

**echo-interval seconds**
Default: 60
Configures the echo interval.

```
seconds: Must be an integer from 60 through 3600.
```

**max-retransmissions num**
Default: 4
Configures the maximum number of retries for packets.

```
um: Must be an integer from 0 through 15.
```

**retransmission-timeout seconds**
Default: 5
Configures the retransmission timeout of packets, in seconds.

```
seconds: Must be an integer from 1 through 20.
```

**Usage**
Use this command to configure the GTP-U settings for the SGTP service.
Example

gtpu echo-interval 5
path-failure

This command specifies the method for determining if path failure has occurred.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
path-failure detection-policy gtp type
no path-failure detection-policy

no
  Deletes the path-failure definition from the configuration.

detection-policy gtp type
  Default: echo (for both GTPC and GTPU)
  Specifies the policy to be used, value options include:
  * `echo` - When set to `echo`, path failure is detected when the retries of echo messages time out.
  * `non-echo` - When set to `non-echo`, path failure is detected when the retries of non-echo messages time out.
```

**Usage**

Use this command to define the policy to detect gtp path failure.

**Example**

```
path-failure detection-policy gtp echo
```
pool

This command enables the default SGSN functionality for (flex) pooling and enables inclusion of the configured pool hop-counter count in new SGSN context/identify request messages.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

pool { default-sgsn | hop-counter count }

default pool hop-counter

no pool { default-sgsn | hop-counter }

default
Removes the SGSN pool hop-counter IE from the GTP Identity/context requests.

no
Disables the default SGSN pooling functionality or removes the SGSN pool hop-counter IE from the GTP Identity/context requests.

default-sgsn
Enables default SGSN pooling functionality for this SGSN.

hop-counter count
Default: 4
Enables and configures the SGSN pool hop-counter to set the number of hops and to include the configured count in the new SGSN Context Requests or the new SGSN Identify Requests.
If default-sgsn is enabled, then any messages relayed will have the default value of 4 for the counter if the message does not include this hop-counter ID.

count : Must be an integer from 1 to 255.

Usage
Use this command to enable the default flex functionality without exposing the pool (flex) structure. This functionality provides a means for SGSNs outside of the pool to reach a pooled SGSN on the basis of its NRI. Once the pooling has been enabled. Repeat the command using the hop-counter keyword to enable inclusion of the hop-counter IE in SGSN context/identify request messages and to configure the count for the pooling hop-counter. If the SGSN is behaving as the ‘default SGSN’, this SGSN will forward (relay) requests with the hop-count included to the target SGSN.

Example
Enable the default pooling functionality which allows an outside SGSN to reach a pooled SGSN:
pool default-sgsn

Set the hop-count to be included in messages to 25:

pool hop-count 25
Chapter 192
S-GW Service Configuration Mode Commands

The S-GW (Serving Gateway) Service Configuration Mode is used to create and manage the relationship between an eGTP service used for either ingress or egress control plane and user data plane network traffic.
accounting context

Configures the GTPP accounting context and group selection for S-GW service.

Product
S-GW

Privilege
Administrator

Syntax

accounting context name [ gtpp group name ]

no accounting context

Usage

Use this command to specify the accounting context and/or GTPP accounting group the S-GW service will use to perform GTPP accounting.

Example

The following command specifies a GTPP accounting context named acct-2 and a GTPP accounting group named gtpp-grp-3 as the context and group the S-GW service will use:

    accounting context acct-2 gtpp group gtpp-grp-3
**associate**

Associates the S-GW service with QoS and policy control and charging configurations.

**Product**  
S-GW

**Privilege**  
Administrator

**Syntax**

```bash
associate { accounting-policy name | egress_proto { gtp | gtp-pmip | pmip } [ egress-context name [ egtp-service name ] [ mag-service name ] ] | ims-auth-service name | ingress egtp-service name | qci-qos-mapping name }

no associate { accounting-policy name | egress_proto [ egress-context [ egtp-service ] [ mag-service ] ] | ims-auth-service name | ingress egtp-service | qci-qos-mapping name | }
```

**no**  
Removes the specified association from the S-GW service.

**accounting-policy name**

Associates the S-GW service with an accounting policy configured in the same context. `name` must be an existing accounting policy and be from 1 to 63 alpha and/or numeric characters.

Accounting policies are configured through the `policy accounting` command in the Context Configuration Mode.

**egress_proto { gtp | gtp-pmip | pmip } [ egress-context name [ egtp-service name ] [ mag-service name ] ]**

Associates and configures the egress protocol for this S-GW service.

- `gtp`: Specifies that GTP is to be used for the S-GW service egress.
- `gtp-pmip`: Specifies that either GTP or PMIP is to be used for the S-GW service egress.
- `pmip`: Specifies that PMIP is to be used for the S-GW service egress.

**egress-context name**: Specifies that the context in this keyword is to be used for the S-GW service egress. `name` must be an existing context on this system and be from 1 to 63 alpha and/or numeric characters.

**egtp-service name**: Specifies that the service in this keyword is to be used for the S-GW service egress. `name` must be an existing eGTP service on this system and be from 1 to 63 alpha and/or numeric characters.

**mag-service name**: Specifies that the service in this keyword is to be used for the S-GW service egress. `name` must be an existing MAG service on this system and be from 1 to 63 alpha and/or numeric characters.

**ims-auth-service name**

Associates the S-GW service with an IMS authorization service configured in the same context. `name` must be an existing IMS auth service and be from 1 to 63 alpha and/or numeric characters.

IMS authorization services are configured through the `ims-auth-service` command in the Context Configuration Mode.
### ingress egtp-service name
Associates and configures the eGTP service ingress for this S-GW service. name must be an existing eGTP service on this system and be from 1 to 63 alpha and/or numeric characters.

### qci-qos-mapping name
Associates the S-GW service with QCI to QoS mapping parameters. name must be an existing QCI-QoS mapping configuration and be from 1 to 63 alpha and/or numeric characters. QCI-QoS mapping is configured through the **qci-qos-mapping** command in the Global Configuration Mode.

### Usage
Use this command to select a pre-configured QoS mapping and/or policy control and charging configuration to be used by the S-GW service.

### Example
The following command associates the S-GW service with an IMS authorization service named *ims-23*:

```
associate ims-auth-service ims-23
```
egtp-service

Configures an eGTP service to use as either an ingress (S1-U) or egress (S5/S8) service for the S-GW.

**Product**
S-GW

**Privilege**
Administrator

**Syntax**

```
egtp-service { egress { context name | service name } | ingress service name }
no egtp-service { egress { context | service } | ingress service }
```

**no**
Removes the selected EGTP service from this service.

```
egtp-service { context name | service name }
```

Specifies the egtp-service to be used as the egress eGTP service on a GTP based S5/S8 interface.

- **context name**: Specifies the name of the context where the eGTP service resides. *name* must be from 1 to 63 alpha and/or numeric characters and be an existing context name where an eGTP service resides.

- **Caution**: context name is not supported in this release.

```
service name
```

Specifies the name of the egress eGTP service. *name* must be from 1 to 63 alpha and/or numeric characters and be an existing eGTP service name.

```
ingress service name
```

Specifies the egtp-service to be used as the ingress eGTP service on the S11 interface. *name* must be from 1 to 63 alpha and/or numeric characters and be an existing eGTP service name.

**Usage**

Use this command to configure the eGTP service to use with this S-GW service. The eGTP service must be existing and be configured with the appropriate parameters supporting the intended service type.

**Example**
The following command configures the S-GW service to use an eGTP service named *slu-egtp* as it’s ingress service:

```
egtp-service ingress service slu-egtp
```
end

Exits the current mode and returns to the Exec Mode.

**Product**
- All

**Privilege**
- Security Administrator, Administrator

**Syntax**

```plaintext
end
```

**Usage**

Change the mode back to the Exec mode.
exit

Exits the current mode and returns to the previous mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
```exit```

Usage
Return to the previous mode.
gtpu-error-ind

Configures the actions to be taken upon receiving a GTP-U error indication from an eNodeB or P-GW.

**Product**
S-GW

**Privilege**
Administrator

**Syntax**

```plaintext
  gtpu-error-ind { s1u { local-purge | page-ue [ custom1-behavior ] } | s5u { local-purge | signal-peer } }

  default gtpu-error-ind { s1u | s5u }
```

**default**

Rests the command to the default action for the specified interface. For S1-U, **page-ue** is the default action. For S5-U, **local-purge** is the default action.

**s1u { local-purge | page-ue [ custom1-behavior ] }**

Specifies the action to take when a GTP-U error indication is received from an eNodeB over the S1-U interface.

- **local-purge**: The S-GW clears the affected bearer (or PDN if error-ind is received on default bearer) locally without informing peer.
- **page-ue [ custom1-behavior ]**: The S-GW moves the complete UE state to S1-Idle and starts paging for this UE. If the custom1-behavior option is specified, the S-GW will guard the paging attempt with a timer of 60 seconds. Within this time the bearer must have the eNodeB TEID refreshed by an MME. Otherwise, the S-GW will clear the affected bearer with signaling. This is the default action for GTP-U error indication messages received on the S1-U interface.

**s5u { local-purge | signal-peer }**

Specifies the action to take when a GTP-U error indication is received from a P-GW over the S5-U interface.

- **local-purge**: The S-GW clears the affected bearer (or PDN if error-ind is received on a default bearer) locally without informing the peer. This is the default action for GTP-U error indication messages received on the S5-U interface.
- **signal-peer**: The S-GW initiates control signalling towards the peer MME and P-GW. When signalling:
  - For a bearer deletion, the S-GW sends a Delete-Bearer-Command message to the P-GW and a Delete-Bearer-Request (with EBI) message to the MME.
  - For PDN deletion, the S-GW sends a Delete-Session-Request message to the P-GW and a Delete-Bearer-Request (with LBI) message to the MME.
  - The S-GW will not wait for Delete replies from the peer. The request will be sent only once and local resources will be reset.

**Usage**

Use this command to specify the action to taken upon receiving a GTP-U error indication from either an eNodeB across an S1-U interface or from a P-GW across an S5-U interface.
Example
The following command sets the action to take upon receipt of a GTP-U error indication from the eNodeB to clear affected bearer:

```
gtpu-error-ind slu local-purge
```
mag-service

Identifies the Mobile Access Gateway (MAG) egress service through which calls are to be routed for this S-GW service.

**Product**
S-GW

**Privilege**
Administrator

**Syntax**

```
mag-service egress service name
no mag-service egress service
```

**no**
Removes the configured MAG egress service from this service.

```
no egress service name
```

Specifies the MAG service name to be used as the egress MAG service on a PMIP based S5/S8 interface. *name* must be an existing MAG service and be from 1 to 63 alpha and/or numeric characters.

**Usage**
Use this command to specify the name of the MAG service where calls are to be routed.

**Example**
The following command specifies that an existing MAG service named *mag3* is to be used to route call through for this S-GW service:

```
mag-service egress service mag3
```
path-failure

Configures the action to take upon the occurrence of a path failure between the S-GW and the MME, P-GW, or eNodeB.

Product
S-GW

Privilege
Administrator

Syntax

    path-failure { s11 | s1u | s5 | s5u } { local-purge | signal-peer }

    default path-failure { s11 | s1u | s5 | s5u }

    default
    Returns the command to the default setting of “local purge” for the selected interface.

{ s11 | s1u | s5 | s5u }

Specifies the interface to which the action will be applied.

s11: Indicates that the path failure action is to be applied to the S11 interface between the S-GW and the MME.

s1u: Indicates that the path failure action is to be applied to the S1-U interface between the S-GW and the eNodeB.

s5: Indicates that the path failure action is to be applied to the S5 interface between the S-GW and the P-GW.

s5u: Indicates that the path failure action is to be applied to the S5-U interface between the S-GW and the P-GW.

{ local-purge | signal-peer }

Specifies the action to apply to the selected interface.

local-purge: The S-GW clears the affected bearer (or PDN if path failure is received on a default bearer) locally without informing the peer. This is the default action for all interfaces.

signal-peer: The S-GW initiates control signalling towards the peer MME and P-GW. When signalling:

- For a bearer deletion, the S-GW sends a Delete-Bearer-Command message to the P-GW and a Delete-Bearer-Request (with EBI) message to the MME.

- For PDN deletion, the S-GW sends a Delete-Session-Request message to the P-GW and a Delete-Bearer-Request (with LBI) message to the MME.

- The S-GW will not wait for Delete replies from the peer. The request will be sent only once and local resources will be reset.

Usage

Use this command to specify the type of action to take when a path failure occurs on one of the supported interfaces.

Example
The following command sets the path failure action for the S5 interface to “signal peer”:

```
path-failure s5 signal-peer
```
Chapter 193
SMS Service Configuration Mode Commands

The SMS (short message service) Service configuration mode is used to configure properties of the SMS Service component. The SGSN uses the SMS Service component to communicate via the Gd interface with a gateway message service controller (GMSC) to send short text messages (up to 140 octets in length) to a mobile (SMS-MT) and/or receive messages from a mobile (SMS-MO).

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
cp-data

Enables the SGSN to send and/or receive cp-data (text messages).

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

cp-data max-retransmission retries_num

default cp-data max-retransmissions

<table>
<thead>
<tr>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use this command to configure the number of times the SGSN will attempt to retransmit a message.</td>
</tr>
</tbody>
</table>

Example

cp-data max-retransmission 2
mo-message-forwarding-destination

This command defines the SGSN’s handling policy for MO (mobile originating) message.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

[ default ] mo-message-forwarding-destination { gmsc-selected-from-imsi | smsc-supplied-by-subscriber }

---

default

Resets the SMS service configuration to the default message forwarding technique.

---

gmsc-selected-from-imsi

Entering this keyword enables SMS-MO messages to be forwarded on the basis of their IMSI prefix.

---

smsc-supplied-by-subscriber

Entering this keyword enables SMS-MO messages to be forwarded on the basis of the SMSC (SMS controller) address provided by the subscriber.

---

Usage

Use this command to define how the mobile originated SMS are to be routed.

---

Example

mo-message-forwarding-destination gmsc-selected-from-imsi
smsc-routing

This command configures the routing to the SMSC.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[ no ] smsc-routing { { any | imsi-starts-with | msisdn-starts-with } { isdn isdn_number | mobile-global-title mgt_number | point-code pt_code } }

any
Configures routing according to any IMSI prefix.

imsi-starts-with IMSI_prefix
Defines the IMSI prefix. Enter a string of up to 15 integers.

msisdn-starts-with msisdn_prefix
Defines the MSISDN prefix. Enter a string of up to 15 integers.

isdn isdn_number
Defines the ISDN E.164 number of the SMSC.

mobile-global-title mgt_number
Defines the mobile global title for conversion

point-code pt_code
Defines the point code for the SMSC. Enter a string of up to 11 digits in SS7 dotted decimal or decimal format

Usage

Use this command to define routing to the SMSC based on any point code.

Example

smsc-routing any point-code 1.222.1
timeout

This command defines the SMS service timers.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
timeout { tc1n-timer | tr1n-timer time | tr2n timer time }

default timeout { tc1n-timer | tr1n-timer | tr2n timer }
```

**default**
Resets the configuration to the default value for the specified timer.

**tc1n-timer time**
Configures the TC1N timer in seconds.
*time*: Must an integer from 1 to 255. The default is 5 seconds.

**tr1n-timer time**
Configures the TR1N timer in seconds.
*time*: Must an integer from 1 to 255. The default is 30 seconds.

**tr2n-timer time**
Configures the TR2N timer in seconds.
*time*: Must an integer from 1 to 255. The default is 30 seconds.

Usage
Use this command to set SMS service timers. The command can be repeated to set all of the timers, one-at-a-time.

Example
```
tr1n-timer 25
```
Chapter 194
SS7 Routing Domain Configuration Mode Commands

The SS7 Routing Domain configuration mode is used to configure Signaling System 7 (SS7) parameters. For convenience in configuration management, all SS7 parameters have been collected into a proprietary grouping called an SS7 routing domains.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
asp

This command creates or removes an M3UA Application Server Process (ASP) instance and enters the ASP configuration mode. See the SGSN ASP Configuration Mode chapter in the Command Line Interface Reference for command details.

Product
SGSN, HNB-GW

Privilege
Security Administrator, Administrator

Syntax

```plaintext
asp instance asp_inst
no asp instance asp_inst
default asp instance asp_inst end-point port
```

- **no**
  Deletes the ASP instance for the SS7 routing domain configuration.

- **default**
  Sets the ASP instance parameters to the end-point port value of 2905.

- **instance asp_inst**
  Identifies a specific ASP configuration. Up to four ASP instances can be configured for a single SS7 routing domain.
  *asp_inst*: Must be an integer from 1 through 4.

Usage

Use this command to create an ASP instance or enter the ASP configuration mode.

Example

The following command enters the ASP configuration mode for a specific ASP.

```plaintext
asp instance 1
```
description

This command defines an alphanumeric string that describes the current SS7 routing domain. This is used for operator reference only.

Product
SGSN, HNB-GW

Privilege
Security Administrator, Administrator

Syntax

description string
no description

no
Removes the description string from the current SS7 routing domain configuration.

string
Specifies the alphanumeric string that is stored. Strings with spaces must be enclosed in double-quotes (see the example below).
string: Must be from 1 to 255 alphanumeric characters.

Usage
Use this command to set a description for reference by operators.

Example
The following command sets the description to identify a routing domain for messages transmitted within a national boundary.

description "National Service Routing Domain"
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
SGSN, HNB-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```bash
exit
```

**Usage**

Return to the Exec mode from any configuration mode.
exit

Exits the current configuration mode and returns to the context configuration mode.

**Product**
SGSN, HNB-GW

**Privilege**
Security Administrator, Administrator

**Syntax**
```
exit
```

**Usage**
Return to the previous configuration mode.
inbound-asp-identifier validate

This command enables validation of ASP identifiers inbound to the SGSN via routes defined with this SS7 routing domain.

**Important:** This command is only available in releases 8.1 and higher.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
inbound-asp-identifier validate
```

[ default | no ] inbound-asp-identifier validate

**Usage**
The standard is to validate the ASP Id. However, in some circumstances it is necessary to skip such validation. For example, if the same ASP Id is assigned to more than one RNC (peer-server).

**Example**
Use the following command to skip validation of inbound ASP Ids:

```
no inbound-asp-identifier validate
```

Use either of the following commands to enable validation if it has been disabled:

```
default inbound-asp-identifier validate
inbound-asp-identifier validate
```
linkset

This command creates an instance of an MTP3 linkset and enters the linkset configuration mode. See the Linkset Configuration Mode chapter in Command Line Interface Reference for the commands to configure the linkset.

Product
SGSN, HNB-GW

Privilege
Security Administrator, Administrator

Syntax

```
linkset id id
no linkset id id

no
Removes the identified linkset definition from the system configuration.

id
This value uniquely identifies a linkset for the specific SS7 routing domain.
$id$: Must be an integer of 1 to 49.
```

Usage

This command creates instances of linkset configurations and provides access to the linkset configuration mode.

Example

Use the following command to create the 12th linkset:

```
linkset id 12
```
MTU-size

This command has been deprecated.
**peer-server**

This command creates a peer-server instance to setup a SIGTRAN peer for sending and receiving M3UA traffic. Completing the command automatically enters the peer-server configuration mode. To define 1 or more (up to 145) peer servers, use the commands documented in the *Peer-Server Configuration Mode* chapter in this reference.

**Product**
SGSN, HNB-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
peer-server id srvr_id
no peer-server id srvr_id
```

- **no**
  Removes the identified peer-server definition from the system configuration.

- **srvr_id**
  srvr_id uniquely identifies a peer-server. The id must be an integer from 1 to 49.

**Usage**

Use the following command to create a definition for peer-server 2 and enter the configuration mode to configure the communication parameters for peer-server 12.

**Example**

```
peer-server id 12
```
route

This command configures SS7 routes for the current SS7 routing domain.

Product
SGSN, HNB-GW

Privilege
Security Administrator, Administrator

Syntax

```plaintext
route destination-point-code dp_code { linkset id id [ priority pri_value ] | peer-server-id srvr_id }

no route destination-point-code dp_code { linkset id id | peer-server-id srvr_id }
```

**no**
Removes the SS7 route from the current SS7 routing domain configuration.

**destination-point-code dp_code**
Specifies the SS7 destination point code for this route.
Reminder: the point-code structure must match the variant defined for the SS7 routing domain when the SS7RD was configured in the global configuration mode.

**linkset id id**
This keyword identifies a linkset instance, created and configured with the `linkset` command.
This keyword identifies a linkset instance, created and configured with the `linkset` command.
`id`: Must be an integer from 1 to 49.

**peer-server-id srvr_id**
This keyword identifies a peer-server configuration instance, created and configured with the `peer-server` command.
`srvr_id` must be an integer from 1 to 49.

**Usage**
This command associates the previously configured linksets and peer servers and the destination point codes with a specified SS7 route.

**Example**
Define a route setting an ITU-type destination point-code address for the linkset Id 12:

```plaintext
route destination-point-code 6.211.6 linkset id 12
```
**routing-context**

Identifies the routing context for this SS7 routing domain.

**Product**
SGSN, HNB-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
routing-context value
```

```
default routing-context
```

```
default
```

Resets the local routing context value to the index (instance ID) for this SS7 routing domain.

```
value
```

An integer that uniquely identifies the routing context for this SS7 routing domain.

**value:** Must be integers from 1 to 65535 (for releases 8.0) or 1 to 4294967295 (for releases 8.1 and higher).

**Usage**

Use this command to set the routing context IDs for a specific SS7 routing domain configuration.

**Example**

```
routing-context 2355
```
ssf

This command sets the network indicator in the subservice field for SS7 message signal units (MSUs).

Product
SGSN, HNB-GW

Privilege
Security Administrator, Administrator

Syntax

```
ssf ( international | national | reserved | spare )
```

- **international**
The network indicator identifies the message as international with a point code structure that does not match the national point code structure.

- **national**
The network indicator identifies the messages as having a national point code structure.

- **reserved**
Provides an alternate network indicator for national messages.

- **spare**
Provides an alternate network indicator for international messages.

Usage

In SS7 signaling, the Message Transfer Part (MTP) Level 2 message signal units (MSUs) contain a service information octet (SIO). The SIO field in an MSU contains a 4-bit subservice field (SSF) followed by a 4-bit service indicator. The indicator carried in the message’s routing information typically identifies the structure of the point code as a message from within a nation or as a message coming from outside the nation - international. As well, the 4-bit SSF determines the point code structure of the messages transmitted from the SGSN.

Example

For messages being transmitted within a country, set the indicator to national with the following command.

```
ssf national
```
Chapter 195
SSH Configuration Mode Commands

The Secure Shell Configuration Mode is used to manage the SSH server options for the current context.
end

Exits the SSH server configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Administrator, Config-administrator

**Syntax**

```
end
```

**Usage**
Change the mode back to the Exec mode.
**exit**

Exits the secure shell server configuration mode and returns to the context configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Return to the context configuration mode.
listen

This command configures the SSH server in the current context to only listen for connections from the interface with the specified IP address. The default behavior is to listen on all interfaces.

Product
All

Privilege
Security Administrator, Administrator

Syntax

\texttt{\textbf{listen} \textit{ip\_address}}

\textit{no \textbf{listen}}

\textit{no}

Disable listening for a specific interface address and enable listening on all interfaces.

Usage
Use this command to configure the SSH server for the current context to only listen for connections from the interface with the specified IP address. Only one IP address may be set for listening.

Example
The following command specifies that the Server should only listen for connections in the interface with the IP address of 192.168.0.10:

\texttt{listen 192.168.0.10}
**max servers**

Configures the maximum number of SSH servers that can be started within any 60 second interval. If this limit is reached, the system waits two minutes before trying to start any more servers.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
max servers number
```

*number*

Default: 40

Specifies the maximum number of servers that can be spawned in any 60 second interval. number must be a value in the range from 1 to 100.

**Usage**

Set the number of servers to tune the system response as a heavily loaded system may need more servers to support the incoming requests.

The converse would be true as well in that a system can benefit by reducing the number of servers such that telnet services do not cause excessive system impact to other services.

**Example**

```
max servers 50
```
subsystem

Configures the system to perform file transfers using secure ftp (sftp) over ssh v2. Administrator users must be configured with the ftp attribute privilege to issue this command.

Product
All

Privilege
Security Administrator, Administrator

Syntax

subsystem { cli | sftp }
no subsystem { cli | sftp }

no
Disables either the sftp ssh file transfer method or disables access to the CLI over ssh.

cli
Default: Enabled
Configures the SSH system for the current context to allow access to the CLI.

sftp
Default: Disabled
Enables the SSH system for the current context to perform file transfers using secure ftp (sftp) over ssh v2.

Usage
Use this command to enable or disable file transfers using secure ftp over an ssh v2 tunnel. Also use this command to enable or disable access to the CLI over an SSH connection.

Example
The following command enables SFTP for the current context:

    subsystem sftp

The following command disables access to the CLI through an SSH session for the current context:

    no subsystem cli
Chapter 196
Subscriber Configuration Mode Commands

The Subscriber Configuration Mode is used to create local subscribers as well as to set default subscriber options for the current context.

```
Exec Mode
  configure
    Global Configuration Mode
      context name
        Context Configuration Mode
          subscriber
            { default | name name }
              Subscriber Configuration Mode
```
aaa group

Configures a AAA server group for AAA functionality at the subscriber level.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] aaa group group_name

default aaa group

group_name
The AAA group to configure for authentication and/or accounting for the specific subscriber. 
group_name must be a string of length between one to 63 characters.

no
Disables the specified AAA group for the specific subscriber.

default
Sets/restores default AAA group specified at the context level or default subscriber profile.

Usage
Instead of having a single list of servers per context, this feature configures multiple server groups within a context and applies individual server group for subscribers in that context. Each server group consists of a list of AAA servers for each AAA function (accounting, authentication, charging, etc.).

Example
The following command applies the AAA server group star1 to a subscriber within the specific context:

    aaa group star1

The following command disables the AAA group for the specific subscriber:

    no aaa group group_name
access-link ip-fragmentation

Configures IP fragmentation processing over the Access-link (\, GTP etc).

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
access-link ip-fragmentation { normal | df-ignore | df-fragment-and-icmp-notify }
```

**df-ignore**

Default: Enabled
Ignore the DF bit setting. Fragment and forward the packet over the access link.

**df-fragment-and-icmp-notify**

Default: Disabled
Partially ignore the DF bit. Fragment and forward the packet, but also return an ICMP error message to the source of the packet. The number of ICMP errors sent like this is rate-limited to 1 ICMP error packet per second per session.

**normal**

Default: Disabled
Normal processing. Drop the packet and send an ICMP unreachable message to the source of packet. This is the default behavior.

**Usage**

If the IP packet to be forwarded is larger than the access-link MTU and if the DF (Don't Fragment) bit is set for the packet, then the fragmentation behavior configured by this command is applied. Use this command to fragment packets even if they are larger than the access-link MTU.

**Example**

Set fragmentation so that the DF bit is ignored and the packet is forwarded anyway by entering the following command: `access-link ip-fragmentation df-ignore`
# accounting-mode

This command sets the accounting mode for the current local subscriber configuration.

## Product
PDSN, HA, ASN GW, S-GW

## Privilege
Administrator

## Syntax

```
accounting-mode { flow-based | gtp [ radius-diameter ] | none | radius-diameter [ gtp ] | rf-style }
```

```
default accounting-mode
```

---

### default
Sets the type of accounting to be performed for the current local subscriber to the default setting.

Default: radius-diameter

### flow-based
Diameter flow-based accounting is enabled for the current local subscriber.

### gtp [ radius-diameter ]
GTPP CDR RADIUS accounting is enabled for the current local subscriber. The `radius-diameter` keyword is available if both GTPP RADIUS and RADIUS-Diameter accounting are to be used.

### none
Accounting is disabled for the current local subscriber and no charging records will be generated.

### radius-diameter [ gtp ]
RADIUS-Diameter accounting is enabled for the current local subscriber. The `gtp` keyword is available if both GTPP RADIUS and RADIUS-Diameter accounting are to be used.

### rf-style
Diameter Rf interface accounting is enabled for the current local subscriber.

## Usage
This command specifies which protocol, if any, will be used to provide accounting for PDP contexts accessing the APN profile.

Use this command to enable or disable RADIUS/Diameter accounting for any subscribers that use the current local subscriber configuration.

If the `gtp` option is used, then GTTP RADIUS is used as configured in the Context Configuration mode or the AAA Server Group Configuration mode and GTTP charging records will be enabled.

If the `radius-diameter` option is used, either the RADIUS or the Diameter protocol is used as configured in the Context Configuration mode or the AAA Server Group Configuration mode.
RADIUS accounting can also be enabled and disabled at the context level with the `aaa accounting` command in the Context Configuration Mode. If RADIUS accounting is enabled at the context level, the `accounting-mode` command can be used to disable RADIUS accounting for individual local subscriber configurations.

If the accounting mode is set to `rf-style`, then BM will generate accounting records corresponding to AIMS RF.

**Example**

To disable accounting for the current subscriber, enter the following command:

```
accounting-mode none
```
active-charging bandwidth-policy

This command configures the bandwidth policy to be used for the subscriber.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

```
active-charging bandwidth-policy bandwidth_policy

{ default | no } active-charging bandwidth-policy
```

- **default**
  Specifies that the default bandwidth policy configured in the rulebase be used for this subscriber.

- **no**
  Disables bandwidth control for this subscriber.

- **bandwidth_policy**
  Specifies the bandwidth policy name.
  *bandwidth_policy* must be an alpha and/or numeric string from 1 through 63 characters in length.

Usage

Use this command to configure bandwidth policy to be used for subscribers.

Example

The following command configures a bandwidth policy named *standard* for the subscriber:

```
active-charging bandwidth-policy standard
```
active-charging rulebase

This command specifies the name of the rulebase to be used for this subscriber.

Product  
ECS

Privilege  
Security Administrator, Administrator

Syntax

active-charging rulebase rulebase_name

no active-charging rulebase

no

Removes the previously specified rulebase for the subscriber.

rulebase_name

Name of the specific active charging service rulebase.

rulebase_name must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

This command specifies the name of the rulebase for specific subscriber (reals).

If the specified rulebase does not exist in the Active Charging service, the call will be rejected.

Example

Following command specifies the active charging rulebase rule1 for specified subscriber.

active-charging rulebase rule1
always-on

Once the idle timeout limit is reached, keep the current subscriber session connected as long as the subscriber is reachable.

⚠️ **Caution:** When always-on is enabled, the subscriber must have an idle time-out period configured (default is 0, no time-out). Failure to configure an idle time-out results in a subscriber session that is indefinite in length.

Two timers and a counter are associated with this feature. Refer to the `timeout` command in this chapter and the `ppp echo-retransmit-timeout msec` and `ppp echo-max-retransmissions num_retries` commands.

Default: Disabled.

**Product**
PDSN, ASN GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```markdown
always-on
no always-on

no
```

Disables `always-on`. The user is disconnected after the idle time expires.

**Usage**

If this parameter is enabled for a subscriber, when the idle time-out limit is reached the subscribers IP/PPP session remains connected as long as the subscriber is reachable. This is true even if the airlink between the mobile device and the RN (Radio Node) is moved from active to dormant (inactive) status. When the idle timeout limit is reached, the PDSN determines availability using LCP keepalive messages. A response to these messages indicates that the “always-on” status should be maintained. Failure to respond to a predetermined number of LCP keepalive messages causes the PDSN to tear-down (disconnect) the subscriber session.

**Example**

Enable always on for the current subscriber by entering the following command:

```markdown
always-on
```
asn-pdfid

This command configures the identifiers for packet data flow, service data flow, and service profile in an ASN-GW service.

Product
ASN-GW

Privilege
Security Administrator, Administrator

Syntax

[ no ] asn-pdfid pdf_id asn-service-profile-id svc_profile_id asn-sdfid sdf_id

no
Removes/disables the configured identifiers for this subscriber in ASN-GW service.

asn-pdfid pdf_id
Specifies the an unique ASN Packet Data Flow identifier for this subscriber.
pdf_id must be an integer between 1 and 65535.

asn-service-profile-id svc_profile_id
Specifies an unique ASN Service Profile Identifier for this subscriber.
svc_profile_id is a preconfigured Service Profile Identifier configured in the Context Configuration Mode.

asn-sdfid sdf_id
Specifies the an unique ASN Service Data Flow identifier for this subscriber.
sdf_id must be an integer between 1 and 65535.

Usage
Use this command to configure subscriber profile for QoS parameters in an ASN-GW service.
A maximum of 4 QoS profiles can be configured for a subscriber.

Example
The following command configures the QoS profile for a subscriber as PDF id 1, Service Profile id 3, and Service Data Flow id 2:

asn-pdfid 1 asn-service-profile-id 3 asn-sdfid 2
asn-policy

This command configures the identifiers for packet data flow, service data flow, and service profile in an ASN GW service.

Product
ASN GW

Privilege
Security Administrator, Administrator

Syntax

asn-policy {classifiers downlink {strict | loose} | idle-mode {allow | disallow}}

[no | default] asn-policy idle-mode

[default] asn-policy classifiers downlink

no
Removes/disables the configured policy for this subscriber in ASN GW service.

default
Sets the ASN policy to default for this subscriber.
For downlink traffic classifier default policy is “loos” and for idle mode policy the default action is to allow idle mode operation in an ASN GW service.

idle-mode
Sets the idle mode policy for this subscriber in an ASN GW service.

allow
Default: enabled
Enables the policy for this subscriber to allow idle mode operation in an ASN GW service.

disallow
Default: disabled
Enable the policy for this subscriber to disallow idle mode operation in an ASN GW service.

classifiers downlink
Sets the classifier policy for all service flows coming from HA to FA for this subscriber’s matching classifier.

strict
Default: disabled
This option discards all the service flows coming from HA to FA and any other packets not matching to any of the classifiers set for this subscriber.
**loose**

Default: enabled

This option allows all the service flows coming from HA to FA and any other packet does not matching to any of the classifiers set for this subscriber and sent to the BS/MS over downlink flow.

**Usage**

Use this command to configure subscriber policy to allow/disallow the idle mode operation or the downlink traffic flow for a subscriber in an ASN GW service.

This command allows MS to transition to idle mode with an ASN GW.

**Example**

The following command configures the policy to allow the idle mode for an MS with an ASN GW:

```plaintext
default asn-policy idle-mode
```
authorized-flow-profile-id

When a profile ID is requested by the Mobile Node (MN), this command sets the value that is authorized by the AGW.

Product

PDSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

authorized-flow-profile-id profile_id direction { bidirectional | forward | reverse }

no authorized-flow-profile-id profile_id

---

no

Remove the existing profile ID setting specified by profile_id. profile_id must be an integer from 0 through 65535.

---

profile_id

The profile ID number that is authorized for the current subscriber. profile_id must be an integer from 0 through 65535.

---

direction { bidirectional | forward | reverse }

This specifies in which data direction the profile ID should be applied.
- bidirectional: This profile ID pertains to both the forward and reverse directions.
- forward: This profile ID pertains to data going to the MN.
- reverse: This profile ID pertains to data coming from the MN.

Usage

Use this command to set the profile ID that the AGW will authorize for a subscriber.

---

Example

Set the profile ID for both directions to 3 for the current subscriber by entering the following command

authorized-flow-profile-id 3 direction bidirectional
content-filtering category

This command enables/disables the specified preconfigured Category Policy Identifier for policy based Content Filtering support to the subscriber.

Product
All

Privilege
Security Administrator, Administrator

Syntax

content-filtering category policy-id cf_policy_id
no content-filtering category policy-id

no
Disables the configured category policy identifier for Content Filtering support to the subscriber. This is the default setting.

category policy-id cf_policy_id
This command applies the content filtering category policy ID, configured in Active Charging Configuration mode, to this subscriber. 

`cf_policy_id` must be a preconfigured category policy id in Active Charging Configuration Mode.
In case category policy identifier `cf_policy_id` used here is not configured in Active Charging Configuration Mode, all packets will be passed regardless of the categories determined for such packets.

**Important:** Category Policy Id configured through this mode overrides the Category Policy id configured through `content-filtering category policy-id` command in Rulebase Configuration Mode of Active Charging Service Configuration mode.

Usage

Use this command to enter the Content Filtering Policy Configuration mode and to enable or disable the Content Filtering Category Policy ID for a Subscriber.

**Important:** If Content Filtering Category Policy ID is not specified here the similar command in Rulebase Configuration Mode of Active Charging Configuration Mode determines the policy.

Up to 64 different policy identifier can be defined in a Content Filtering support service.

Example

Following command enters the Content filtering Policy Configuration mode and enables the Category Policy Id 101 for Content Filtering support.

```
content-filtering category policy-id 101
```
**cscf core-service**

CSCF/A-BG core service that maps to the current domain.

**Product**
SCM (CSCF, A-BG)

**Privilege**
Security Administrator, Administrator

**Syntax**

```
cscf core-service name name
no cscf core-service
```

**cscf core-service name name**

Specifies the name of the CSCF/A-BG core service. _name_ must be from 1 to 63 alpha and/or numeric characters.

**no cscf core-service**

Removes the CSCF/A-BG core service from the domain.

**Usage**

Use this command to map a CSCF/A-BG core service to the current domain.

**Example**

The following command creates a CSCF core service named _cs1_:

```
cscf core-service name cs1
```

The following command removes the CSCF core service from this domain:

```
no cscf core-service
```
cscf county-name

Assigns a Last Routing Option (LRO) profile county name to the subscriber for finding the correct Public Safety Answering Point (PSAP) during emergency calls.

Product

SCM (S-CSCF)

Privilege

Security Administrator, Administrator

Syntax

[ no ] cscf county-name name

cscf county-name name

Specifies the LRO profile county name of the subscriber.

name must be an existing LRO profile county name and be from 1 to 127 alpha and/or numeric characters.

no

Removes the LRO profile county name from the subscriber.

Usage

Use this command to assign an LRO profile county name to the subscriber.

Example

The following command assigns county name norfolk to the subscriber:

    cscf county-name norfolk

The following command removes county name norfolk from the subscriber:

    no cscf county-name norfolk
**cscf nat-applicable**

Indicates if NAT (Network Address Translation) processing is required for this domain.

**Product**
SCM (CSCF/A-SBC)

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] cscf nat-applicable
```

```
no
Disables NAT processing for this domain.
```

**Usage**
Use this command to indicate whether NAT processing is required for this domain.

**Example**
The following command indicates NAT processing is required for this domain:

```
cscf nat-applicable
```

The following command disables NAT processing for this domain:

```
no cscf nat-applicable
```
cscf private-user-id

Assigns a private user identity to the subscriber.

**Product**
SCM (P-CSCF, S-CSCF, SIP Proxy)

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] cscf private-user-id user_id
```

- **no**
  Removed the private user identity of the subscriber.

- **cscf private-user-id user_id**
  Specifies the private user identity of the subscriber.
  *user_id* must be from 1 to 127 alpha and/or numeric characters.

**Usage**

Use this command to assign a private user identity to the subscriber.

**Example**

The following command assigns a private user identity named *user007* to the subscriber:

```
cscf private-user-id user007
```

The following command removes private user identity named *user007* from the subscriber:

```
no cscf private-user-id user007
```
cscf session-template

Assigns a CSCF session template to the subscriber profile.

Product
SCM (P-CSCF, S-CSCF, SIP Proxy)

Privilege
Security Administrator, Administrator

Syntax

```
cscf session-template name name
no cscf session-template
```

- `cscf session-template name name`
  Specifies the name of the CSCF session template.
  `name` must be an existing CSCF session template name and be from 1 to 79 alpha and/or numeric characters.

- `no cscf session-template`
  Removes the assignment of a session template to the subscriber profile.

Usage
Use this command to bind a CSCF session template to a subscriber profile.

Example
The following command assigns a CSCF session template named `template4` to the subscriber profile:
```
cscf session-template name template4
```

The following command removes the assignment of a session template to the subscriber profile:
```
no cscf session-template
```
data-tunneling ignore df-bit

This command controls the handling of the DF (Don't Fragment) bit present in the user IPv4/IPv6 packet for GRE, IP-in-IP tunneling used for the MIP data path. If this feature is enabled, and fragmentation is required for the tunneled user IPv4/IPv6 packet, then the DF bit is ignored and the packet is fragmented. Also the DF bit is not copied to the outer header. Default is enabled.

Product
PDSN, HA, FA, ASN GW

Privilege
Security Administrator, Administrator

Syntax

data-tunneling ignore df-bit
no data-tunneling ignore df-bit

Usage
Use this command to configure a user so that during Mobile IP tunneling the DF bit is not ignored and packets are not fragmented.

Example
To disable fragmentation of a subscriber's packets over a MIP tunnel even when the DF bit is present, enter the following command:

no data-tunneling ignore df-bit
dcca origin host

Important: This command has been deprecated, and is replaced by the dcca origin endpoint command.
dcca origin endpoint

**Important:** This command is obsolete. To configure the Diameter Credit Control Origin Endpoint, in the Credit Control Configuration mode, use the `diameter origin endpoint` command.
dcca peer-select

Specifies the Diameter credit control primary and secondary peer for credit control.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

```
dcca peer-select peer host_name [ realm realm_name] [ secondary-peer host_name [ realm realm_name] ]
no dcca peer-select
```

no
Removes the previously configured Diameter credit control peer selection.

```
peer host_name
```
A unique name that you specify for the peer.
peer_name must be an alpha and/or numeric string of from 1 through 127 characters. peer_name allows punctuation marks.

```
secondary-peer host_name
```
Specifies a back-up host that is used for fail-over processing. When the route-table does not find an AVAILABLE route the secondary host performs a fail-over processing.

```
realm realm_name
```
The realm_name must be an alpha and/or numeric string of 1 through 127 characters in length. The realm may typically be a company or service name. realm_name allows punctuation characters.

Usage
Use this command to select a Diameter credit control peer and realm.

⚠️ WARNING: This configuration completely overrides all instances of diameter peer-select that have been configured with in the Credit Control Configuration Mode for an Active Charging service.

Example
The following command selects a Diameter credit control peer named test and a realm of companyx:

```
dcca peer-select peer test realm companyx
```
default

Restores the default value for the option specified for the current subscriber.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
default {access-link ip-fragmentation|accounting-mode|data-tunneling
ignore df-bit|idle-timeout-activity dormant-downlink-data|inter-pdsn-handoff|ip {
alloc-method|allowed-dscp|header-compression|hide-service-address|
multicast discard|gqs-dscp|source-validation|loadbalance-tunnel-peers|
long-duration-action|mobile-ip|home-agent|mn-aaa-removal-indication|mn-
ha-hash-algorithm|reverse-tunnel|security-level|send {dns-address|
terminal-verification | } | permission | ppp | always-on-vse-packet|data-
compression {mode|protocols} | keepalive | min-compression-size | mtu } | radius
accounting interim interval-timeout | timeout {absolute|idle} }
```

**access-link ip-fragmentation**
Sets the method for fragmenting packets over the MN access link to its default of normal. Drop the packet and send ICMP unreachable to the source of packet.

**accounting-mode**
Enables Radius accounting for the current local subscriber configuration.

**data-tunneling ignore df-bit**
Sets this option to the default behavior, which is to send an *ICMP unreachable - need to frag* message back to the sender and drop the packet, in the case that fragmentation is required but the DF bit is set.

**idle-timeout-activity dormant-downlink-data**
Sets this option to the default behavior. When downlink data packets are transmitted to the Mobile node and the session is in dormant mode the session idle timer is reset.

**inter-pdsn-handoff**
During a handoff from one PDSN to another, if the Mobile requests an IP address of 0.0.0.0 or a mismatched IP address the PDSN will not disconnect the session immediately. The PDSN tries to assign the proposed address of the session in the IPCP configuration NAK.

```
ip { | allowed-dscp | header-compression | hide-service-address |
multicast discard | gqs-dscp | source-validation | user-datagram-tos copy }
```

**allowed-dscp**: resets the allowed DSCP parameters to the system defaults: class none, max-class be.

**hide-service-address**: specifies the default setting for hide the ip-address of the service from the subscriber. Default is Disabled
multicast discard: configures the default multicast settings which is to discard PDUs
qos-dscp: sets the quality of service setting to the system default.
source-validation: Specifies the default IP source validation. Default is Enabled.
user-datagram-tos copy: Disable copying of the IP TOS octet value to all tunnel encapsulation IP headers.

loadbalance-tunnel-peers
Sets the tunnel load balancing algorithm to the system default.

long-duration-action
Sets the action that is taken when the long duration timer expires to the default: detection.

mobile-ip { home-agent | mn-aaa-removal-indication | mn-ha-hash-algorithm | reverse-tunnel | security-level | send { dns-address | terminal-verification } }
allow-aaa-address-assignment: Disables the FA from accepting a home address assigned by an AAA server.
home-agent: Sets home agent IP address to its default of 0.0.0.0.
match-aaa-assigned-address: Disables the FA validating the home address in the RRQ against the one assigned by AAA server.
mn-aaa-removal-indication: Sets this parameter to its default of disabled.
mn-ha-hash-algorithm: Sets the encryption algorithm to the default of hmac-md5.
reverse-tunnel: Sets this parameter to its default of enabled.
security-level: Sets this parameter to its default of none.
send dns-address: Disables the HA from sending the DNS address NVSE in the RRP.
send terminal-verification: Disables the FA from sending the terminal verification NVSE in the RRQ.

permission
Restores the subscriber’s service usage defaults.

ppp { always-on-vse-packet | data-compression { mode | protocols } | ip-header-compression negotiation | keepalive | min-compression-size | mtu }
Sets the point-to-point protocol option defaults.
always-on-vse-packet: Re-enables the PDSN to send special 3GPP2 VSE PPP packets to the Mobile Node with a max inactivity timer value for always on sessions. This configuration is applicable only for PDSN sessions.
data-compression { mode | protocols }: restores the default value for either the data compression mode or compression protocols as follows:
  ● mode stateless
  ● all protocols enabled
ip-header-compression negotiation: sets the IP header compression negotiation to the system default: force.
keepalive: sets the subscriber’s PPP keep alive option to the system default: 30 seconds.
min-compression-size: restores the PPP minimum packet size for compression: 128 octets.
mtu: sets the maximum message transfer unit packet size to the system default: 1500 octets.
**radius accounting interim interval-timeout**
Disables the RADIUS accounting interim interval for the current subscriber.

**timeout [ absolute | idle | long-duration ]**
When a keyword is entered, this command resets the specified timeout to the system default: 0. When no keyword is specified, all timeouts are reset to the system defaults: 0.

**Usage**
Reset subscriber data to the system defaults. This is useful in setting the subscriber back to the basic values to possibly aid in trouble shooting or tuning a subscriber’s access and options.

**Example**
default ipqos-dscp
default permission
default data-compression mode
**dns**

Configures the domain name servers for the current subscriber.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] dns { primary | secondary } ip_address
```

- **no**
  Indicates the IP address is to be removed as either a primary or secondary domain name server.

- **primary | secondary**
  - **primary**: Indicates the primary domain name server for the subscriber is to be updated.
  - **secondary**: Indicates the secondary domain name server for the subscriber is to be updated.

- **ip_address**
  Specifies the IP address of the domain name server.

**Usage**
Set the subscriber DNS server lists as not all users will have the same set of servers.

**Example**

dns primary 1.2.3.4
no dns primary 1.2.3.4
dns secondary 1.2.5.6
no dns secondary 1.2.5.6
This command specifies the lifetime for a master session key (MSK) for extensible authentication protocol (EAP) authentication.

**Product**
ASN GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[default] eap msk-lifetime dur
```

<table>
<thead>
<tr>
<th>Context</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Sets the lifetime duration to default value of 3600 seconds for master session key.</td>
</tr>
</tbody>
</table>

```
msk-lifetime dur
```

Specifies the lifetime duration on Master session key (MSK) in seconds for a WiMAX subscriber EAP authentication.

`dur` is the lifetime value in seconds and must be an integer from 60 through 65535.

**Usage**
This command is used to set the lifetime for MSK in EAP authentication for WiMAX subscriber.

**Example**
The following command sets the lifetime for MSK key to 4800 seconds for a WiMAX subscriber through EAP authentication:

```
eap msk-lifetime 4800
```
encrypted password

Designates use of password encryption.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
encrypted password password
```

*password*

*password* is the encrypted password and must be an alpha and/or numeric string of from 1 to 63 characters.

Usage

This command is normally used only inside configuration files.

Example

The following command sets an encrypted password of *qsf12d4*:

```
encrypted password qsf12d4
```
end

Exits the subscriber configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Change the mode back to the Exec mode.
exit

Exits the subscriber configuration mode and returns to the context configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Return to the context configuration mode.
external-inline-server

This is a restricted command.
**firewall policy**

*Important:* This command is only available in StarOS 8.0. In StarOS 8.1 and later, this configuration is available in the Rulebase Configuration Mode.

This command enables/disables Stateful Firewall support for the subscriber.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
firewall policy firewall-required
{ default | no } firewall policy
```

- **no**
  Disables Stateful Firewall support for this subscriber.

- **default**
  Configures the default setting for Stateful Firewall support.
  Default: Disabled

- **firewall-required**
  Enables Stateful Firewall support for this subscriber.

**Usage**

Use this command to enable or disable Stateful Firewall support for this subscriber.

*Important:* Unless Stateful Firewall support for this subscriber is enabled using this command, firewall processing for this subscriber is disabled.

*Important:* If firewall is enabled, and the rulebase has no firewall configuration, Stateful Firewall will cause all packets to be discarded.

**Example**

The following command enables Stateful Firewall support for this subscriber:

```
firewall policy firewall-required
```

The following command disables Stateful Firewall support for this subscriber:
no firewall policy
fw-and-nat policy

**Important:** This command is customer-specific and is only available in StarOS 8.1. This command must be used to configure the Policy-based Firewall-and-NAT feature.

This command configures the Firewall-and-NAT policy for the subscriber.

**Product**

FW, NAT

**Privilege**

Security Administrator, Administrator

**Syntax**

```
fw-and-nat policy fw_nat_policy
{ default | no } fw-and-nat policy
```

- **default**
  
  Specifies that the default Firewall-and-NAT policy configured in the rulebase be used for the subscriber.

- **no**
  
  Disables Firewall and NAT processing for the subscriber.

- **fw_nat_policy**
  
  Specifies the Firewall-and-NAT policy for the subscriber. `fw_nat_policy` must be an alpha and/or numeric string of 1 through 63 characters in length. Note that this policy will override the default `Firewall-and-NAT policy` configured in the ACS rulebase.

**Usage**

Use this command to configure the Firewall-and-NAT policy for subscribers. Note that the policy configured in the subscriber mode will override the default policy configured in the ACS rulebase. If a policy is not configured in the subscriber mode, the default policy configured in the ACS rulebase will be applied.

**Example**

The following command configures a Firewall-and-NAT policy named `standard` for the subscriber:

```
fw-and-nat policy standard
```
idle-timeout-activity

Defines whether downlink (towards Mobile Node) data packets transmitted when the session is dormant is treated as activity for the idle-timer (inactivity timer).

By default, downlink data transmitted over a dormant session restarts the idle-timer for that session (it is treated as activity for the session).

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

[ no ] idle-timeout-activity dormant-downlink-data

no

Dormant mode downlink data is not treated as activity for the session idle-timer. The session idle timer is not reset.

Usage
Use this command to disable or re-enable restarting the session idle timer when downlink data packets are transmitted to the Mobile Node when the session is in dormant mode.

Example
Use the following command to disable restarting the session idle timer when downlink data packets are transmitted to the Mobile Node when the session is in dormant mode:

idle-timeout-activity dormant-downlink-data

Use the following command to re-enable restarting the session idle timer when downlink data packets are transmitted to the Mobile Node when the session is in dormant mode:

no idle-timeout-activity dormant-downlink-data
**ims application-manager**

Specifies the application manager for the subscriber.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] ims application-manager { domain-name domain-name | ipv4-address ipv4-address }
```

- **no**
  Disables the IMS application manager for this subscriber.

- **domain-name domain-name**
  Specifies the domain name of the application manager.
  `domain-name` must be from 1 to 63 alpha and/or numeric characters.

- **ipv4-address ipv4-address**
  Specifies the IPv4/IPv6 address of the application manager.

**Usage**
The ims application manager address is returned by HA to MN in DHCP Ack when it receives the DHCP inform from an AIMS subscriber.

**Example**

```
ims application-manager domain-name domain23
ims application-manager ipv4-address 192.168.23.1
```
**ims-auth-service**

It applies an IMS authorization service to a subscriber in a network access service (PDSN or GGSN service) for Gx/Ty interface support and functionality.

**Product**

PDSN, GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
[default|no]ims-auth-service auth_svc_name
```

**default**

Sets / Restores default state of IMS authorization service, disabled or as specified at the context or network access service level or in subscriber template.

**no**

Disables the applied IMS authorization service for specific subscriber.

**auth_svc_name**

Specifies the name of IMS authorization service name that is used for Ty interface support for specific subscriber. `auth_svc_name` must be from 1 to 63 alpha and/or numeric characters preconfigured within the same context of this subscriber.

**Usage**

This feature provides the IMS authorization service configuration for Gx/Ty interface in IMS service node.

**Example**

Following command applies a previously configured IMS authorization service named `ims_interface1` to a subscriber within the specific context.

```
ims-auth-service ims_interface1
```
inter-pdsn-handoff

Configure the system to enforce the MN’s use of its assigned IP address during IPCP negotiations resulting from inter-PDSN handoffs.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

[ no ] inter-pdsn-handoff require ip-address

no
Disables the rejecting of sessions when the MN uses a non-allocated IP address during IPCP re-negotiations.

Usage
This command is used to configure the system to reject sessions that are re-negotiating IPCP after an inter-PDSN handoff if the IP address they propose does not match the one initially provided by the PDSN. The session would be rejected even if the proposed address was 0.0.0.0. If this parameter is disabled, the PDSN will attempt to re-assign the IP address initially provided.

Example
To set the PDSN to not allow a mismatched IP address during a PDSN to PDSN handoff of a MIP call, use the following command:

    inter-pdsn-handoff require ip-address

To set the PDSN so that it will not disconnect the session immediately, if the Mobile requests an IP address of 0.0.0.0 or a mismatched IP address after inter-pdsn handoff, use the following command:

    no inter-pdsn-handoff require ip-address
ip access-group

Configures IP access group for the current subscriber.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] ip access-group group_name [ in | out ]

no
Indicates the access group specified is to be cleared from the subscribers configuration.

group_name
Specifies the name of the IPv4/IPv6 access group. acl_group_name is a configured ACL group and must be an alpha and/or numeric string of 1 to 79 characters.

in | out
Default: both (in and out)
Specifies the access-group as either inbound or outbound by the keywords in and out, respectively. If neither of these key words is specified, the command associates the group_name access group with the current subscriber for both inbound and outbound access.

Usage
Set the subscriber access group to manage the access control for subscribers as a logical group.

Example
The following command associates the sampleGroup access group with the current subscriber for both inbound and outbound access:

ip access-group sampleGroup

The following removes the outbound access group flag for sampleGroup:

no ip access-group sampleGroup out
ip address

Configures a static IP address for use by the subscriber.

Product
PDSN, GGSN, HA, ASN GW

Privilege
Security Administrator, Administrator

Syntax

[ no ] ip address ip_address netmask

no
Removes a previously configured IP address assignment.

ip_address
The IP address assigned to the subscriber.

netmask
The subnet mask that corresponds to the assigned IP address.

Usage
Use this command to assign a static IP address to the subscriber. This address will be used each time the subscriber establishes data sessions.

Example
The following command configures a static IP address of 192.168.1.15 with a subnet mask of 255.255.255.0 to the subscriber:

ip address 192.168.1.15 255.255.255.0
ip address pool

Configures IP address pool properties for the subscriber.

Product
PDSN, GGSN, HA, ASN GW

Privilege
Security Administrator, Administrator

Syntax

[ no ] ip addresspool name pool_name

no
Removes a previously configured static address.

name pool_name
Specifies the IP address pool or IP address pool group from which the subscriber's IP address is assigned. pool_name must be the name of an existing IP pool or IP pool group and from 1 to 31 alpha and/or numeric characters.

Usage
Use this command to specify the name of an IP address pool configured on the system from which IP addresses are to be dynamically assigned to sessions from this subscriber. This command can be issued multiple times to specify multiple address pools for the subscriber. If multiple pools are specified, addresses are assigned for subscriber sessions from the pools based on the order in which the pools were configured. If an address can not be provided from the first-specified pool for whatever reason, the system attempts to assign an address from the second-specified pool, and so on. This operation is independent of the priorities configured for the pools. For example, if pool1 was specified for the subscriber first, and pool2 second, the system always attempts to assign addresses from pool1. If an address can not be assigned from pool1 (i.e. all addresses are in use), the system then attempts to assign an address from pool2.

Example
The following command configures the subscriber to receive IP addresses from an IP address pool named public1:

ip addresspool name public1
ip address secondary-pool

Configures secondary IP address pool properties for the subscriber to provide multiple IP host configuration behind one WiMAX CPE.

Product
ASN GW

Privilege
Security Administrator, Administrator

Syntax

```
ip address secondary-pool name aux_pool_name

no ip address secondary-pool name aux_pool_name
```

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removes a previously configured auxiliary pool named \texttt{aux_pool_name} for multiple host support in ASN GW service.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>name aux_pool_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the secondary/auxiliary IP address pool or IP address pool group from which the IP address is assigned to host behind a WiMAX CPE having primary IP address. \texttt{pool_name} must be the name of an existing IP pool or IP pool group and from 1 to 31 alpha and/or numeric characters.</td>
</tr>
</tbody>
</table>

Usage

Use this command to specify the name of an IP address pool configured on the system from which IP addresses are to be dynamically assigned to host behind a WiMAX CPE for multiple host session support. This command designates the IP address to secondary hosts from locally configured secondary IP address pool. To enable multiple host support behind a WiMAX CPE and configure maximum number of supported hosts use \texttt{secondary-ip-host} command in ASN Gateway Service Configuration mode.

Example

The following command configures the subscriber to receive IP addresses from a secondary IP address pool named \texttt{auxiliary} for secondary hosts behind the WiMAX CPE:

```
ip address secondary-pool name auxiliary
```
**ip allowed-dscp**

This command sets the Quality of Service (QoS) Differentiated Services (DiffServ) marking that a subscriber session is allowed. This is disabled by default.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
ip allowed-dscp class classmax-class maxclass [rt-marking marking]
no ip allowed-dscp class
```

**no ip allowed-dscp class**

Resets the parameters to the defaults: class none, max-class be. This indicates that all packets are let through without any dscp checking

**class class**

This parameter specifies the Differentiated Services Codepoint (DSCP) class that the subscriber session may mark its packets with. If the subscriber sessions packets request a code point class higher than the code point class specified, the PDSN service re-marks the packets with the QOS-DSCP value specified by the `ip qos-dscp` command.

Default: none

*class* must be one of the following:
- a: packets with AF DSCPs are allowed
- e: packets with EF DSCPs are allowed
- o: packets for experimental or local use are allowed
- ao: packets with AF and EF DSCPs are allowed
- eo: packets with AF DSCPs or packets for experimental or local use are allowed
- ace: packets with EF DSCPs or packets for experimental or local use are allowed
- none: only the be and sc1 through sc7 codepoints are allowed

**max-class maxclass**

This parameter specifies the maximum code point that a subscriber session may mark its packets with. If the subscriber sessions packets request a code point higher than the code point specified, the PDSN service re-marks the packets with the QOS-DSCP value specified by the lower of the max-class and the `ip qos-dscp` command.

Default: none

*maxclass* must be one of the following:
- be, af12, af11, af22: are allowed. If a subscriber session marks its packets with anything after af22 in this list, the PDSN service re-marks the packets with the QOS-DSCP value specified by the lower of the maxclass and the `ip qos-dscp` command.
- only be, sc1 through sc7 codepoints are allowed. For example; if class is set to none and you set max-class be, only the be codepoints are allowed.

**Default:**

*maxclass* must be one of the following:
be: best effort forwarding
af13: assured Forwarding 13
af12: assured Forwarding 12
af11: assured Forwarding 11
af23: assured Forwarding 23
af22: assured Forwarding 22
af21: assured Forwarding 21
af31: assured Forwarding 31
af32: assured Forwarding 32
af33: assured Forwarding 33
af41: assured Forwarding 41
af42: assured Forwarding 42
af43: assured Forwarding 43
ef: expedited forwarding
sc1: selector class 1
sc2: selector class 2
sc3: selector class 3
sc4: selector class 4
sc5: selector class 5
sc6: selector class 6
sc7: selector class 7

**rt-marking**

This parameter is used for Mobile IP (MIP) reverse tunnels. When a MIP sessions packets do not have a DSCP marking, the Foreign Agent (FA) marks the packets with the value specified by **rt-marking**.

If the MIP sessions packets have a DSCP marking, the marking is subjected to the conformance rules for the values of class and max-class, then the final DSCP marking is copied from the inner IP header to the outer IP header.

Default: be

**marking** must be one of the following:
be: best effort forwarding
af11: assured Forwarding 11
af12: assured Forwarding 12
af13: assured Forwarding 13
af21: assured Forwarding 21
af22: assured Forwarding 22
af23: assured Forwarding 23
af31: assured Forwarding 31
af32: assured Forwarding 32
af33: assured Forwarding 33
af41: assured Forwarding 41
af42: assured Forwarding 42
af43: assured Forwarding 43
ef: expedited forwarding
sc1: selector class 1
sc2: selector class 2
sc3: selector class 3
sc4: selector class 4
sc5: selector class 5
sc6: selector class 6
**sc7**: selector class 7

**Usage**

Use this command to configure Quality of Service (QoS) for a subscriber session to allow a Differentiated Services (DiffServ) Code Point (DSCP) marker in the header of each IP packet that prompts network routers to apply differentiated grades of service to various packet streams.

This command uses `class` and type of marker (`rt-marking` for reverse tunnels) for configuration with `max-class` maximum code point that a subscriber session may mark its packets with.

**Example**

The following command will allow o packets for experimental or local use with best effort forwarding be:

```
ip allowed-dscp class o max-class be
```
ip context-name

Configures context to assign the subscriber to upon authentication. The context assigned to is considered the destination context which provides the configuration options for the services the subscriber is allowed to access.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] ip context-name name

no
Removes the current assigned context from the subscriber’s data.

name
Specifies the name of the context to assign the subscriber to once authenticated. name must be from 1 to 79 alpha and/or numeric characters.

Usage
Set the subscriber IP context to a common context when all subscribers from one or more contexts will use the same egress context.

Example

ip context-name sampleName
no ip context-name sampleName
**ip header-compression**

Configures the IP packet header compression options for the current subscriber. Although this command configures IP header compression algorithms, the IPCP negotiations determine when the header compression algorithm is applied.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ip header-compression { rohc [ any [ mode { optimistic | reliable | unidirectional } ] | cid-mode { { large | small } [ marked-flows-only | max-cid | max-hdr value | mrru value ] } | marked flows-only | max-hdr value | mrru value | downlink | uplink ] | vj }+ [ default | no ] ip header-compression
```

default
Restores this command’s default setting to the Van Jacobsen (VJ) header compression algorithm.

no
Disables all IP header compression.

```
rohc [ any [ mode { optimistic | reliable | unidirectional } ] | cid-mode { { large | small } [ marked-flows-only | max-cid | max-hdr value | mrru value ] } } | marked flows-only | max-hdr value | mrru value | downlink | uplink ]
```

Specifies that the Robust Header Compression (ROHC) algorithms is used for data.

**Important:** ROHC is only supported for use with the PDSN.

**any**: Apply ROHC header compression in both the uplink and downlink directions.

**mode { optimistic | reliable | unidirectional }**:

- **optimistic**: Sets the ROHC mode to Bidirectional Optimistic mode (O-mode). In this mode packets are sent in both directions. A feedback channel is used to send error recovery requests and (optionally) acknowledgments of significant context updates from decompressor to compressor. Periodic refreshes are not used in the Bidirectional Optimistic mode.

- **reliable**: Sets the ROHC mode to Bidirectional Reliable mode (R-mode). This mode applies an intensive usage of a feedback channel and a strict logic at both the compressor and the decompressor that prevents loss of context synchronization between the compressor and the decompressor. Feedback is sent to acknowledge all context updates, including updates of the sequence number field.

- **unidirectional**: Sets the ROHC mode to Unidirectional mode (U-mode). With this mode packets are sent in one direction only, from the compressor to the decompressor. This mode therefore makes ROHC usable over links where a return path from the decompressor to the compressor is unavailable or undesirable.
CID-MODE { { LARGE | SMALL } [ MARKED-FLOWS-ONLY | DM | MAX-HDR value | MRRU value ] } Specifies the ROHC packet type to be used.

* LARGE | SMALL [ MARKED-FLOWS-ONLY | MAX-CID | MAX-HDR value | MRRU value ] Defines the ROHC packet type as large or small and optionally sets the following parameters for the packet type selected:

**MARKED-FLOWS-ONLY** Specifies that ROHC is to be applied only to marked flows.

**MAX-CID integer** Default: 0 The highest context ID number to be used by the compressor.

*integer* must be an integer from 0 through 15 when small packet size is selected and must be an integer from 0 through 31 when large packet size is selected.

**MAX-HDR value** Specifies the maximum header size to use. Default: 168. *value* must be an integer from 0 through 65535.

**MRRU value** Specifies the maximum reconstructed reception unit to use. Default: 65535. *value* must be an integer from 0 through 65535.

MARKED-FLOWS-ONLY: Specifies that ROHC is to be applied only to marked flows.

MAX-HDR value: Specifies the maximum header size to use. Default: 168. *value* must be an integer from 0 through 65535.

MRRU value: Specifies the maximum reconstructed reception unit to use. Default: 65535. *value* must be an integer from 0 through 65535.

downlink: Apply the ROHC algorithm only in the downlink direction.

uplink: Apply the ROHC algorithm only in the uplink direction.

**Important:** When ROHC is enabled for downlink or uplink only the operational mode is Unidirectional.

**VJ**

Specifies that the VJ algorithm is used for header compression.

+ Either one or both of the keywords may be entered in a single command.

If both VJ and ROHC are specified, VJ must be specified first.

**Important:** If both VJ and ROHC header compression are specified, the optimum header compression algorithm for the type of data being transferred is used for data in the downlink direction.

**Usage**

Header compression can be used to provide a higher level of security in IP traffic enhance bandwidth usage and lower bit errors.

By default the header compression algorithm is set to VJ.

**Example**

The following command disables all IP packet header compression:

no ip header-compression

The following command sets IP header compression to default VJ algorithm:

default ip header-compression

The following command also sets the IP header compression to the VJ algorithm:

ip header-compression vj
The following command enables the Internet Protocol Control Protocol (IPCP) to determine which protocol is the optimum algorithm for data in the downlink direction and use either VJ or ROHC as needed:

```
ip header-compression vj rohc
```

The following command enables ROHC for the downlink direction only:

```
ip header-compression rohc downlink
```

The following command enables ROHC in any direction using Bidirectional Optimistic mode:

```
ip header-compression rohc any mode Optimistic
```
**ip hide-service-address**

Hide the IP address of the service from the subscriber.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] ip hide-service-address
```

- **no**
  Disable this command's function. This is the default behavior.

**Usage**

Use this command to prevent subscribers from using traceroute to discover the network addresses that are in the public domain and configured on services. This prevent users from pinging such addresses.

**Example**

To prevent subscribers from discovering IP addresses, enter the following command:
ip local-address

Configures the local-side IP address of the subscriber's point-to-point connection.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
ip local-address ip_address
no ip local-address
```

**Usage**
This parameter specifies the IP address on the system that the MS uses as the remote-end of the PPP connection. If no local address is configured, the system uses an "unnumbered" scheme for local-side addresses.

**Example**
The following command configures a local address of 192.168.1.23 for the MS:

```plaintext
local-address 192.168.1.23
```
ip multicast discard

Configures the IP multicast discard packet behavior.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

[ no ] ip multicast discard

no

Removes a previously configured IP multicast discard.

Usage
This command specifies if IP multicast discard is enabled or disabled.

Example
The following command enables IP multicast discard for an APN:

ip multicast discard
**ip qos-dscp**

Configures quality of service options for the current subscriber using the differentiated services code point method. This is disabled by default.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ip qos-dscp option
no ip qos-dscp
```

`no`
Sets the quality of service option to its default value.

`option`
Default: be
Specifies the subscriber’s per hop quality of service setting as one of:
- `af11` (assured Forwarding 11)
- `af12` (assured Forwarding 12)
- `af13` (assured Forwarding 13)
- `af21` (assured Forwarding 21)
- `af22` (assured Forwarding 22)
- `af23` (assured Forwarding 23)
- `af31` (assured Forwarding 31)
- `af32` (assured Forwarding 32)
- `af33` (assured Forwarding 33)
- `af41` (assured Forwarding 41)
- `af42` (assured Forwarding 42)
- `af43` (assured Forwarding 43)
- `be` (best effort forwarding)
- `ef` (expedited forwarding)

**Usage**
Set the quality of service for a subscriber based upon the service level agreements.

**Example**

```
ip qos-dscp ef
no ip qos-dscp
```
Subscriber Configuration Mode Commands

ip qos-dscp
ip route

Configures the static route to use to reach the subscriber’s network.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] ip route ip_address ip_mask [ gateway_address ]

no
Removes the configured route information from the subscriber data.

ip_address
Specifies the target IP address for which the route information applies.

ip_mask
Specifies the networking mask for the route.
1 bits in the ip_mask indicate that bit position in the ip_address must also have a value of 1.
0 bits in the ip_mask indicate that bit position in the ip_address does not need to match, i.e., the bit can be either a 0 or a 1.
For example, if the IP address and mask were specified as 172.168.10.0 and 255.255.255.224, respectively, the network mask will be 172.168.0.0 (obtained by logically ANDing the IP address with the IP mask).

gateway_address
Default: assigned remote IP address will be used as the gateway address.
Specifies the IP address of the next hop gateway for the route.

Usage
The static routes are also known as framed IP routes for subscribers. Static routes are typically applicable for subscribers connecting via other networks or when the mobile device acts as a gateway to a network on the far side of the device.
For example, if the mobile device is assigned IP address 1.2.3.4 and it acts as a gateway for the network 10.2.3.0 (with a network mask of 255.255.255.0) a static route would be configured with the ip_address being 10.2.3.0, ip_mask being 255.255.255.0, and gateway_address being 1.2.3.4.

Example

no ip route 1.2.3.4 1.2.3.0 0
no ip route 1.2.3.4 1.2.3.0 0 1.2.255.254
**ip source-validation**

Enables/disables packet source validation for the current subscriber. Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session. If an incorrect source address is received from the mobile node, the system attempts to renegotiate the PPP session. The parameters for IP source validation can be set by the `ip source-violation` command.

**Syntax**

```
[ no ] ip source-validation
```

- `no`
  - Disables source validation.

**Usage**

Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

**Example**

The following command enables IP source validation:

```
ip source-validation
```

The following command disables IP source validation:

```
no ip source-validation
```
ip user-datagram-tos copy

This CLI controls copying of IP TOS octet value from IPv4/IPv6 datagrams to the IP header in tunnel encapsulation. This is disabled by default.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax

```
ip user-datagram-tos copy [access-link-tunnel | both | data-tunnel]
no ip user-datagram-tos copy
```

- **no**
  Disable copying of the IP TOS octet value to all tunnel encapsulation IP headers.

- **access-link-tunnel**
  Copy the IP TOS octet value to the tunnel encapsulation IP header on the access side (RP) tunnel.

- **both**
  Use both access-link-tunnel and data-tunnel.

- **data-tunnel**
  Copy the IP TOS octet value to the tunnel encapsulation IP header on the MIP data tunnel or L3 tunnel (IP-in-IP, GRE).

Usage
Use this command to enable the copying of the IP TOS octet value to the tunnel encapsulation IP header. This functionality will enable PCF to detect special TOS marking in the outer IP header of A11 packets and to identify certain packets as QChat control messages. The BSC/PCF must give higher priority to QChat control messages.

Example
Enable copying of the IP TOS octet value to the tunnel encapsulation IP header for the access side tunnel by entering the following command;

```
ip user-datagram-tos copy access-link-tunnel
```

Disable copying of the IP TOS octet value to all tunnel encapsulation IP headers by entering the following command;

```
no ip user-datagram-tos copy
```
ip vlan

Configures subscriber-to-Virtual LAN (VLAN) associations.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax

ip vlan

Syntax

ip vlan vlan-id
[ default | no ] ip vlan

default
Resets the vlan ID to the default setting.

no
Disables the vlan ID for the subscriber.

vlan-id
Is the vlan ID that is associated with the IP address for that session. vlan-id is an integer between 1 and 4094.

Usage
This command configures the subscriber vlan ID which is used with the assigned address for the subscriber session to receive packets. If the IP pool from which the address is assigned is configured with a vlan ID, then this subscriber configured vlan ID overrides it.

Subscriber traffic can be routed to specific VLANs based on the configuration of their user profile. Using this functionality provides a mechanism for routing all traffic from a subscriber over the specified VLAN. All packets destined for the subscriber must also be sent using only IP addresses valid on the VLAN or they will be dropped.

Example
Set the vlan ID to the default setting by entering the following command;

default ip vlan
**ipv6 access-group**

Configures the IPv6 access group for a subscriber.

**Product**

PDSN, GGSN, ASN GW

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
ipv6 access-group name [ in | out ]
```

**in**

Defines the access group as inbound.

**out**

Defines the access group as outbound.

**Usage**

Used to create an access group for a subscriber.

**Example**

The following command provides an example of an IPv6 access group with the name *list_1*:

```
ipv6 access-group list_1
```
ipv6 address

Configures a static IP address for use by the subscriber.

Product
PDSN, GGSN, ASN GW

Privilege
Security Administrator, Administrator

Syntax

```
[ no ] ipv6 address { prefix address | prefix-pool name }
```

no
 Deletes a previously configured ipv6 address.

prefix
 Specifies a static IPv6 address.

prefix-pool
 Specifies an IPv6 prefix pool name.

Usage
Use this command to assign a static IPv6 address to the subscriber. This address will be used each time the subscriber establishes data sessions.

Example
The following command configures a static IP address of 1:1:1:1:1:1:1:1 with a length of 24 to the subscriber:

```
ipv6 address 1:1:1:1:1:1:1:1/24
```
ipv6 dns

Configures the IPv6 Domain Name Service (DNS) servers.

**Product**
PDSN, GGSN, ASN GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] ipv6 dns { primary | secondary } {ipv6_dns_address}
```

- **no**
  Deletes a previously configured DNS server.

- **primary**
  Configures the primary DNS server for the subscriber.

- **secondary**
  Configures the secondary DNS server for the subscriber. Only one secondary DNS server can be configured.

- **ipv6_dns_address**
  Configures the IP address of the DNS server.

**Usage**

DNS servers are configured on a per subscriber basis. This allows each subscriber to use specific servers.

**Example**

The following command provides an example of setting the primary IPv6 DNS server:

```
ipv6 dns primary 1::1::1::1::1::1
```
### `ipv6 dns-proxy`

Configures the domain name server proxy for the current subscriber.

**Product**

PDSN, GGSN, ASN GW

**Privilege**

Security Administrator, Administrator

**Syntax**

```
[ default | no ] ipv6 dns-proxy
```

- **default**
  
  Disables the IPv6 DNs proxy functionality for a subscriber.

- **no**
  
  Removes the pre-enabled functionality of IPv6 DNS proxy for subscriber.

- **dns-proxy**
  
  Enables IPv6 DNS proxy functionality for a subscriber. If the functionality enabled, PDSN will act as a proxy DNS server.
  
  Default: disabled.

**Usage**

Used to enable/disable IPv6 DNS proxy for the subscriber. When enabled, the PDSN acts as a proxy DNS server for DNS IPv6 queries coming from the mobile station to the PDSN’s local PPP link address.

**Example**

The following command provides an example of disabling an IPv6 DNS proxy for the subscriber:

```
no ipv6 dns-proxy
```
ipv6 egress-address-filtering

Configures the egress address filtering for the subscriber.

Product
PDSN, GGSN, ASN GW

Privilege
Security Administrator, Administrator

Syntax

[ no ] ipv6 egress-address-filtering

no
Disables IPv6 egress address filtering.

ipv6 egress-address-filtering
Enables IPv6 egress address filtering.

Usage
Used to filter packets that arrive from the internet to a particular site.

Example
The following command provides an example disabling egress address filtering:
no ipv6 egress-address-filtering
ipv6 initial-router-advt

Creates an IPv6 initial router advertisement interval for the subscriber.

**Product**
PDSN, GGSN, ASN GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ipv6 initial-router-advt { interval value | num-advts value }  
default ipv6 initial-router-advt { interval | num-advts }
```

- **default**
  Resets interval or num-advts to their default setting.

- **interval value**
  Default: 3000ms
  The time interval the initial IPv6 router advertisement is sent to the mobile node in milliseconds.
  value is an integer between 100 and 16000 milliseconds.

- **num-advts value**
  Default: 3
  The number of initial IPv6 router advertisements sent to the mobile node.
  value is an integer between 1 to 16.

**Usage**
This command is used to set the advertisement interval and the number of advertisements. Using a smaller advertisement interval increases the likelihood of router being discovered more quickly when it first becomes available.

**Example**
The following command specifies the initial ipv6 router interval to be 2000ms:

```
ipv6 initial-router-advt interval 2000
```
ipv6 interface-id

Provides an IPv6 interface ID for the subscriber.

Product
PDSN, GGSN, ASN GW

Privilege
Security Administrator, Administrator

Syntax
ipv6 interface-id ifid
[ default | no ] ipv6 interface-id

default
No interface id set for IPv6CP negotiation to subscriber.

no
Deletes a previously configured ipv6 interface id.

interface-id ifid
It is a interface ID assigned to the Mobile during IPv6CP negotiation.
ifid is a 64 bit unsigned integer.

Usage
Used to provide a IPv6 ifid for the subscriber when using 6to4 routing.

Example
The following command provides an example of assigning an IPv6 interface ID of 00-00-00-05-47-00-37-44 to the subscriber:
ipv6 interface-id 00-00-00-05-47-00-37-44
ipv6 minimum-link-mtu

Configures the IPv6 minimum-link-MTU value.

Product
PDSN, GGSN, ASN GW

Privilege
Security Administrator, Administrator

Syntax

ipv6 minimum-link-mtu value
default ipv6 minimum-link-mtu

default
Resets minimum link MTU to their default setting.
Default: 1280

value
Default: 1280
value is an integer between 100 and 2000 MTUs.

Usage
Used to override the IPv6 minimum link MTU values recommended by the standard.

Example
The following command provides an example of assigning an IPv6 minimum link MTU to 1580 to the subscriber:

ipv6 minimum-link-mtu 1580
ipv6 secondary-address

Configures additional IPv6 4-bit prefixes to the subscriber session.

Product
PDSN, GGSN, ASN GW

Privilege
Security Administrator, Administrator

Syntax
[ no ] ipv6 secondary-address { prefix ipv6_address_prefix | prefix-pool pool_name }

no
Deletes a previously configured ipv6 secondary address.

ipv6_address_prefix
The IPv6 secondary address and must be specified using colon notation.

pool_name
The name given to the secondary address prefix pool (a string size from 1 to 31 characters).

Usage
An IPv6 prefix pool name may be configured for a dynamic prefix, while the prefix is static. This command may be executed multiple times to configure multiple prefixes.

Example
The following command provides an example of assigning an IPv6 secondary address prefix-pool name of eastcoast to the subscriber:
ipv6 secondary-address prefix-pool eastcoast
I2tp send accounting-correlation-info

This command enables the L2TP LAC to send accounting correlation information (Correlation-Id, NAS-IP-Address and NAS-ID) in L2TP control message (ICRQ) during session setup to LNS.

**Product**
PDSN, LNS, LAC

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[no | default] i2tp send accounting-correlation-info
```

- **no**
  Disables the command and sets the setting to default mode for this subscriber.

- **default**
  Sets the setting to default mode of disable.

**Usage**

Use this command to enable the L2TP LAC to send accounting correlation information (Correlation-Id, NAS-IP-Address and NAS-ID) in L2TP control message (ICRQ) during session setup to LNS for this subscriber. LNS can be configured to include this information in ECS billing records, so that billing servers can easily correlate accounting records from PDSN/LAC and LNS. By default, this mode is disabled.

**Example**

Following command disables the inclusion of accounting correlation information in control messages during session setup to LNS for a subscriber:

```
default i2tp send accounting-correlation-info
```
13-to-l2-tunnel address-policy

Configure the subscriber address allocation/validation policy, when subscriber L3 (IPV4) sessions are tunneled using an L2 tunneling protocol (e.g. L2TP).

**Product**
HA, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
13-to-l2-tunnel address-policy { alloc-only | alloc-validate | no-alloc-validate }
```

default 13-to-l2-tunnel address-policy

- **default**
  Restores the default value for l3-to-l2-tunnel address-policy.

- **alloc-only**
  Only allocate an address in the case of dynamic address assignment. Do not validate static addresses.

- **alloc-validate**
  Locally allocate and validate subscriber addresses.

- **no-alloc-validate**
  Do not allocate or validate subscriber addresses locally in the system for the current subscribers sessions. Pass the address between the remote tunnel terminator and the Mobile Node. This is the default behavior.

**Usage**
Use this command to configure the L3 to L2 tunnel address policy for MIP HA sessions tunneled from the system using L2TP tunnels or for GGSN IP Context sessions tunneled using L2TP to a remote LNS. Also refer to the `resource` keyword of the context configuration mode `ip pool` command.

**Example**
To set the L3 to L2 tunnel address policy so that the current subscriber must have IP addresses allocated and validated locally on the system, enter the following command:

```
13-to-l2-tunnel address-policy alloc-validate
```
loadbalance-tunnel-peers

Configures the load balancing of traffic bound for L2TP tunnels configured on the system for the selected subscriber.

Product
L2TP

Privilege
Security Administrator, Administrator

Syntax
```
loadbalance-tunnel-peers { balanced | prioritized | random }
```

- **balanced**
  Enables the equal use of all configured tunnel peers (LNSs) for the selected subscriber.

- **prioritized**
  Enables the use of all configured tunnel peers (LNSs) for the selected subscriber based on the preference number assigned to the peer address.

- **random**
  Default: Enabled
  Enables the random use of all configured tunnel peers (LNSs) for the selected subscriber.

Usage
Use to manage traffic loads on LAC ports and their respective L2TP Network Servers.

Example
Use the following command to randomly use all configured tunnel peers (LNSs):
```
loadbalance-tunnel-peers random
```
long-duration-action

This command specifies what action is taken when the long duration timer expires.

**Product**

All

**Privilege**

Administrator

**Syntax**

```plaintext
long-duration-action { detection | disconnection [ dormant-only ] [ suppress-notification ] }
```

**detection**

Default: Enabled

Detects long duration sessions and sends SNMP TRAP and CORBA notification. This is the default behavior. Use this command to detect a session exceeding the limit set by the long duration timer.

**disconnection [ dormant-only ] [ suppress-notification ]**

Default: Disabled

Detects a long duration session and disconnects the session after sending SNMP TRAP and CORBA notification.

**suppress-notification**

Suppress the SNMP TRAP and CORBA notification after detecting and disconnecting a long duration session. Default: Disabled

**dormant-only**

Disconnects the dormant sessions after long duration timer and inactivity time with idle time-out duration expires. If the long duration timeout is fired and the call is not dormant, the call is disconnected when the call later moves to dormancy.

**Important:** For HA calls, the inactivity-time is considered as gauge for dormancy.

It sends the SNMP TRAP and CORBA notification after disconnecting a long duration session. Default: Disabled

**Usage**

Use this command to determine what action is taken when a session exceeds the limit set by the long duration timer.

**Example**

Use the following command to enable disconnecting sessions that exceed the long duration timer:

```plaintext
long-duration-action disconnection
```

Use the following command to disconnect the session that exceed the long duration timer without sending SNMP TRAP and CORBA notification:
long-duration-action disconnection suppress-notification

Use the following command to disconnect the session that is in dormant and exceed the long duration timer and send SNMP TRAP and CORBA notification:

    long-duration-action disconnection dormant-only

Note that in case of HA calls, the inactivity-time is considered as gauge for dormancy.
mobile-ip

Enables/disables the subscriber for mobile IP services and access.

Product
HA, FA

Privilege
Security Administrator, Administrator

Syntax

[no] mobile-ip { allow-aaa-address-assignment | dns-address source-priority { aaa | home-agent } | gratuitous-arp aggressive | home-agent ip_address[alternate] | match-aaa-assigned-address | mn-aaa-removal-indication | mn-ha-hash-algorithm { hmac-md5 | md5 | rfc2002-md5 } | mn-ha-shared-keykey | mn-ha-spi spi_num | reverse-tunnel | security-level { ipsec | none } | send { accounting-correlation-info | dns-address | imsi | terminal-verification } }

no
Disables the mobile IP option specified.

allow-aaa-address-assignment
Default: Disabled.
Enables the FA to accept a home address assigned by an AAA server. This should only be configured on the FA side.

dns-address source-priority { aaa | home-agent }
Sets the priority behavior on the FA to use either the DNS IP address information from the HA or the AAA server to include in the the RRP to the MN.
When the no keyword is used in conjunction with the dns-address keyword, information received from both the home-agent and the AAA server is sent if available.
DNS IP address information from the HA comes from the DNS NVSE in the RRP.
DNS IP address information from the AAA server is in the access accept message.
home-agent: If the DNS address is received from the home-agent only that information is sent to the MN. Otherwise the DNS address received from the AAA server is sent.
aaa: If the DNS address is received from the AAA server only that information is sent to MN. Otherwise the DNS address received from the home-agent is sent.
gratuitous-arp aggressive
Default: Disabled.
When enabled, this mode will cause the HA to send out gratuitous ARP messages for all Mobile IP (MIP) registration renewals and handoffs.
To disable this mode, use the no form of this command.

Important: This mode will only work for IP addresses that have been assigned from a static IP address pool.
Subnetwork Configuration Mode Commands

**home-agent ip_address [alternate]**

Specifies the IP address of the mobile IP user’s home agent. *ip_address* must be an IPv4/IPv6 address.

*alternate* - Specifies the secondary, or alternate, Home Agent to use when Proxy Mobile IP HA Failover is enabled.

**match-aaa-assigned-address**

Default: Disabled.

Enables the FA to validate the home address in the RRQ against the one assigned by AAA server. This should only be configured on the FA side.

**mn-aaa-removal-indication**

Default: Disabled.

When enabled, the MN-FA challenge and MN-AAA Authentication extensions are removed when relaying a Registration Request (RRQ) to the Home Agent (HA)

**mn-ha-hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }**

Specifies the encryption algorithm to use.

Default: **hmac-md5**

**hmac-md5**: Use HMAC-MD5 hash algorithm, as defined in RFC-2002bis. This is the default algorithm.

**md5**: Use the MD-5 hash algorithm.

**rfc2002-md5**: Use the MD-5 hash algorithm variant as defined in RFC-2002.

**mn-ha-shared-key key**

This is used to verify the MN-HA Authentication for a local subscriber in the current context. A string or a Hexadecimal number beginning with "0x" up to 127 bytes

**mn-ha-spi spi_num**

Specifies the SPI number. *spi_num* must be an integer from 256 through 4294967295.

**reverse-tunnel**

Default: enabled.

Enables the mobile IP user’s for reverse IP tunnels. The **no** keyword is used to disable this option.

**security-level { ipsec | none }**

Default: none

The security-level option configures the security level needed for the subscriber’s traffic.

**ipsec**: both MIP control and data traffic are secured with IPSEC

**none**: none of the traffic is secured

**Important**: This keyword corresponds to the 3GPP2-Security-Level RADIUS attribute. This attribute indicates the type of security that the home network mandates on the visited network.

**Important**: For this attribute, integer value: 3 : Enables IPSec for tunnels and registration messages 4 : Disables IPSec
send { accounting-correlation-info | dns-address | imsi | terminal-verification }

**accounting-correlation-info**: Configures whether the FA sends the correlation info to the NVSE in the RRQ. Default is disabled.

**dns-address**: Enables the HA to send the DNS address NVSE in the RRP. Default is disabled. This should only be enabled on the HA side.

**imsi**: Configures sending the IMSI NVSE in the RRQ. Default is sending IMSI in custom-1 format.

**terminal-verification**: Enables the FA to send the terminal verification NVSE in the RRQ. Default is disabled. This should only be enabled on the FA side.

**Important**: send dns-address is a proprietary feature developed for a specific purpose and requires the MN to be able to renegotiate IPCP for DNS addresses and reregister MIP if necessary. Since this feature needs the MN to support certain PPP/MIP behavior, and not all MNs may support that particular behavior, send dns-address should be enabled only after careful consideration.

**Usage**

Use as subscriber service contracts change.

**Example**

```
mobile-ip home-agent 1.2.3.4
no mobile-ip reverse-tunnel
```
mobile-ip ha

Accommodates two MIP HA options in subscriber mode.

Product
PDSN, HA, ASN GW

Privilege
Security Administrator, Administrator

Syntax

\[
\text{no mobile-ip ha } \{ \text{assignment-table } name \mid \text{ignore-unknown-ha-addr-error} \}
\]

\text{no}
Disables the mobile IP HA option specified.

\text{assignment-table } name
The name of an existing MIP HA Assignment table.
\text{name} must be a string of alphanumeric characters from 1 through 63 characters in length.

\text{ignore-unknown-ha-addr-error}
Default is disabled.
Enables or disables the HA to accept or reject the RRQ from a particular subscriber.

Usage
Use this command to assign a MIP HA Assignment table to the current subscriber.
Use this command to disable or enable the HA to accept or reject the RRQ from a particular subscriber when the HA address in the incoming MIP RRQ is not the same as the HA service address. The feature is off by default which causes the RRQ to be rejected with the error code UNKNOWN_HOME_AGENT.

Example
The following command assigns the MIP HA Assignment table named \text{Atable1} to the current subscriber:
\text{mobile-ip ha assignment-table Atable1}
The following command sets ignore-unknown-ha-addr-error to its default disabled state:
\text{no mobile-ip ha ignore-unknown-ha-addr-error}.
mobile-ip reg-lifetime-override

This command overrides the mobile IP registration lifetime from HA with value configured for subscriber.

**Product**

PDSN, HA, ASN-GW

**Privilege**

Security Administrator, Administrator

**Syntax**

```
mobile-ip reg-lifetime-override [dur | infinite ]
```

`dur`

Default: 100 secs.
This the configurable value in seconds.
`dur` must be an integer from 1 through 65534.

`infinite`

Sets the mobile IP registration lifetime override value to infinite for a particular subscriber.

`default`

Sets the value of mobile IP registration lifetime override option to 100 seconds.

`no`

Disables the mobile IP registration lifetime override option specified.

**Usage**

Use this command to configure MIP registration-lifetime per realm/domain. This value overrides the default lifetime configured under HA service.

**Example**

The following command overrides the mobile IP registration lifetime value from HA service and assigns the MIP registration lifetime to 100 seconds for the current subscriber:

```
default mobile-ip reg-lifetime-override
```
mobile-ip send accounting-correlation-info

Enables the sending call correlation information NVSE’s to the HA in MIP RRQ.

Product
PDSN, HA, ECS

Privilege
Security Administrator, Administrator

Syntax

[ default | no ] mobile-ip send accounting-correlation-info

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disables the support for sending call correlation information NCSE’s to the HA in MIP RRQ.</td>
</tr>
<tr>
<td>This is the default mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removes the configured support for sending call correlation information.</td>
</tr>
</tbody>
</table>

Usage
Use this command to support PDSN-Correlation-ID VSE and send the call correlation information.

Example
The following command enables sending call correlation information NVSE’s to the HA in MIP RRQ

```bash
mobile-ip send accounting-correlation-info
```
mobile-ipv6

Configures Mobile IPv6 related parameters for a subscriber.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```
[ default | no ] mobile-ipv6 { home-address ipv6_address / home-agent ipv6_address / home-link-prefix ipv6_address | tunnel mtu value }
```

- **default**
  Disables the support for sending call correlation information NCSE’s to the HA in MIP RRQ. This is the default mode.

- **no**
  Removes the configured support for sending call correlation information.

- **home-address ipv6_address**
  Specifies the home address for the subscriber. `ipv6_address` must be a an IPv6 address in colon notation.

- **home-agent ipv6_address**
  Specifies the IPv6 address of the mobile IP user’s home agent. `ipv6_address` must be a an IPv6 address in colon notation.

- **home-link-prefix ipv6_address**
  Specifies the IPv6 address of the mobile IP user’s home link. `ipv6_address` must be a an IPv6 address in colon notation.

- **tunnel mtu value**
  Configures the tunnel MTU for the IPv6 tunnel between the HA and the mobile node. `value` must be an integer between 1024 and 2000. The default is 1500.

Usage

This command sets the mobile-ipv6 parameters for a subscriber. Use this command to set the home-address, home-agent, and home-link prefix.

Example
Use the following command to set the tunnel value to 1800:

```
mobile-ipv6 tunnel mtu 1800
```
nai-construction-domain

After authentication, the domain name set by this command replaces the NAI constructed domain for subscriber.

Product
All

Privilege
Security Administrator, Administrator

Syntax

nai-construction-domain domain_name
no nai-construction-domain

domain_name
Defines the domain name to use to replace the NAI constructed domain name. This must be a string of 1 to 79 characters.

no
Deletes the defined domain name.

Usage
Define or delete a domain name to use to replace the NAI constructed domain name after authentication.

Example
To set the domain name to private1 use the following command:

nai-construction-domain private1

To delete the previously configured domain name, use the following command:

no nai-construction-domain
**nbns**

Configures and Enables use of NetBios Name Service for the subscriber.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
nbns { primary IPv4-address | secondary IPv4-address }
no nbns { primary [IPv4-address] | secondary [IPv4-address] }
```

**primary**
Designates primary NBNS server. Must be followed with IPv4 address in dotted-decimal notation.

**secondary**
Designates secondary/failover NBNS server. Must be followed with IPv4 address in dotted-decimal notation.

**IPv4-address**
Specifies the IPv4 address used for this service.

**no**
Removes/disables use of a previously configured NetBios Name Service.

**Usage**
This command specifies NBNS parameters. The NBNS option is present for both pdp type IP and pdp type PPP for GGSN.
The system can be configured to use of NetBios Name Service for the APN.

**Example**
The following command configures the subscriber’s NetBios Name Service to primary IP 192.168.1.15:
```
nbns primary 192.168.1.15
```
nexthop-forwarding-address

Configures the next hop forwarding address for the subscriber.

**Product**

PDSN, GGSN, ASN GW

**Privilege**

Security Administrator, Administrator

**Syntax**

```
nexthop-forwarding-address ip_address
no nexthop-forwarding-address
```

- **ip_address**
  - Configures the IP address of the nexthop forwarding address.

- **no**
  - Disables this function. This is the default setting.

**Usage**

Use this command to configure the next hop forwarding address for the subscriber.

**Example**

The following command configures the next hop forwarding address to 1.1.1.1 using IPv4:

```
nexthop-forwarding-address 1.1.1.1
```
npu qos

Configures an NPU QoS priority queue for packets from the subscriber.

Product
PDSN, GGSN, ASN GW

Privilege
Security Administrator, Administrator

Syntax
npu qos traffic priority { best-effort | bronze | derive-from-packet-dscp | gold | silver }

best-effort
Assigns the best-effort queue priority. This is the lowest priority.

bronze
Assigns the bronze queue priority. This is the third-highest priority.

derive-from-packet-dscp
Default: Enabled
Specifies that the priority is to be determined from the DS field in the packet's TOS octet.

gold
Assigns the gold queue priority. This is the highest priority.

silver
Assigns the silver queue priority. This is the second-highest priority.

Usage
This command is used in conjunction with the Network Processing Unit (NPU) Quality of Service (QoS) functionality.

The system can be configured to determine the priority of a subscriber packet either based on the configuration of the subscriber, or from the differentiated service (DS) field in the packet's TOS octet (representing the differentiated service code point (DSCP) value).

Refer to the System Administration and Configuration Guide for additional information on NPU QoS functionality.

Important: This functionality is not supported for use with the PDSN at this time.

Example
The following command configures the subscriber’s priority queue to be gold:

npu qos traffic priority gold
nw-reachability-server

Bind the name of a configured network reachability server to the current subscriber and enable network reachability detection.

Product
HA

Privilege
Security Administrator, Administrator

Syntax
```
nw-reachability server server_name
no nw-reachability server
```

server_name
The name of a network reachability server that has been defined in the current context. This is a string of from 1 through 16 characters.

no nw-reachability server
Delete the name of the network reachability server from the current subscriber's configuration and disable network reachability failure detection for the current subscriber.

Usage
Use this command to define the network reachability server for the current subscriber and enable network reachability failure detection for the current subscriber. If a network reachability server is defined in an IP pool, that setting takes precedence over this command.

Important: Refer to the HA configuration mode command `policy nw-reachability-fail` to configure the action that should be taken when network reachability fails.

Important: Refer to the context configuration mode command `nw-reachability server` to configure network reachability servers.

Important: Refer to the `nw-reachability server server_name` keyword of the `ip pool` command in the context configuration mode chapter to bind the network reachability server to an IP pool.

Example
To bind a network reachability server named `InternetDevice` to the current subscriber, enter the following command:

```
nw-reachability server InternetDevice
```
outbound

Configures the subscriber host password for use in authentication of PPP sessions.

Product  
All

Privilege  
Security Administrator, Administrator

Syntax

```
outbound [encrypted] password pwd
no outbound password
```

```
[ encrypted ] password pwd
```

Specifies the password to use for point-to-point protocol session host authentication. The `encrypted` keyword indicates the password specified uses encryption. The password specified as `pwd` must be from 1 to 63 alpha and/or numeric characters without encryption and must be from 1 to 127 alpha and/or numeric characters when encryption has been indicated. The `encrypted` keyword is intended only for use by the chassis while saving configuration scripts. The system displays the `encrypted` keyword in the configuration file as a flag that the variable following the `password` keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

```
no outbound password
```

Used to clear the outbound password configuration from the subscriber data.

Usage

Set the outbound (egress) password for increased security.

Example

```
outbound password secretPwd
outbound encrypted password scrambledPwd
no outbound password
```
overload-disconnect

Sets the threshold parameter for overload disconnect.

Product
ASN GW, HA, PDIF, PDSN, PHS GWPDG/TTG

Privilege
Security Administrator, Administrator

Syntax
overload-disconnect [ threshold { inactivity-time inactivity_time_threshold | connect-time connect_time_threshold } ]

[ default | no ] overload-disconnect [ threshold { inactivity-time | threshold connect-time } ]

threshold inactivity-time inactivity_time_threshold
Sets the inactivity time threshold in seconds. This value must be from 0 to 4294967295. The default value of zero disables this feature. If inactivity-time for the subscriber’s session is greater than inactivity_time_threshold, the session becomes a candidate for disconnection.

threshold connect-time connect_time_threshold
Sets the connection time threshold in seconds. This value must be from 0 to 4294967295. A value of zero disables this feature. If connect-time for the subscriber’s session is greater than connect_time_threshold, the session becomes a candidate for disconnection.

default
This command enables the default condition for this subscriber.

no
Disables the overload disconnect feature for this subscriber. This is the default condition for PDIF.

Usage
Set a subscriber’s overload disconnect threshold in seconds, based on either inactivity or connection time. When this threshold is exceeded during a session, the subscriber’s session becomes a candidate for disconnection. To set overload-disconnect policies for the entire chassis, see congestion-control overload-disconnect in Global Configuration Mode Commands.

Example
overload-disconnect threshold inactivity-time inactivity_time_thresholdDefault
overload disconnect threshold connect-timeno overload-disconnect threshold connect-timeno overload disconnect
password

Configures the subscribers password for the current context.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ encrypted ] password p\w d
no password
```

**encrypted**

Indicates the password provided is encrypted. The `encrypted` keyword is intended only for use by the chassis while saving configuration scripts. The system displays the `encrypted` keyword in the configuration file as a flag that the variable following the `password` keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

**pwd**

Specifies the users password for authentication. `pwd` must be from 1 to 63 alpha and/or numeric characters or from 1 to 127 characters if the `encrypted` keyword was specified. A “null” password is allowed and is entered as consecutive quotes ("""). See Example(s) for correct syntax.

**Important:** Subscribers configured with a null password will be authenticated using PAP and CHAP (MD5) only. Subscribers configured without a password (`no password`) will only be able to access services if the service is configured to allow no authentication.

**no**

Used to clear the subscriber password configuration from the subscriber data.

**Important:** Subscribers with no password will only be able to access services if the service is configured to allow no authentication.

**Usage**

Password management is critical to system security and all precautions should be taken to ensure passwords are not shared or to easily deciphered.

**Example**

```
password secretPwd password "no password
```
pdif mobile-ip

Configures PDIF subscriber call setup parameters.

Product
PDIF

Privilege
Security Administrator, Administrator

Syntax

[ default | no ] pdif mobile-ip { release-tia | required | simple-ip-fallback }

[ default | no ]
Disables the option specified.

release-tia
Specifies that after subscriber call setup is complete, the tunnel inner address (TIA) is released. If SLimple IP is enabled, the TIA becomes the principal communications tunnel and the restriction that it is only to be used to set up a Mobile-IP call is lifted. This parameter is disabled by default.

required
Specifies that Mobile IP is required for this subscriber whenever a call is set up. This parameter is disabled by default.

simple-ip-fallback
Specifies that Simple IP should be used when Mobile IP could not be established. This parameter is disabled by default.

Usage
Use this command to configure specific behavior for the PDIF subscriber during call setup.

Example
The following command enables the system to fall back to Simple IP when Mobile IP fails for this subscriber during call setup:

    pdif mobile-ip simple-ip-fallback
permission

Enables/disables the ability to access wireless data services for the current subscriber.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax

[ no ] permission { ha-mobile-ip | pdsn-mobile-ip | pdsn-simple-ip }

no
Disables the usage of the specified service.

ha-mobile-ip | pdsn-mobile-ip | pdsn-simple-ip
ha-mobile-ip: enable/disable the home agent support for mobile IP service.
pdsn-mobile-ip: enable/disable the packet data and foreign agent support for mobile IP service.
pdsn-simple-ip: enable/disable the packet data support for simple IP service.

Usage
This is necessary per the services the subscriber is allowed to access in the current context.

Example

permission pdsn-mobile-ip
no permission ha-mobile-ip
**policy ipv6 tunnel**

Tunnel MTU for IPv6 Tunnel between HA and Mobile Node.

**Product**
PDSN, HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
policy ipv6 tunnel mtu exceed { fragment | notify-sender }
```

- `mtu exceed {fragment | notify-sender}`
  - `fragment`: Adjust Tunnel MTU and Fragment Packets
  - `notify-sender`: Send a ICMPv6 Packet Too Big the original sender

**Usage**

Use this command to configure Tunnel MTU for IPv6 Tunnel between HA and Mobile Node.

**Example**

```plaintext
policy ipv6 tunnel mtu exceed fragment
```
policy-group

This command assigns/removes a flow-based traffic policy group to a subscriber.

**Product**
PDSN, HA, ASN GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] policy-group policy_group_name direction { in | out }
```

- **no**
  - Removes assigned policy group from a subscriber configuration.

- **policy_group_name**
  - Specifies the traffic policy group name for a subscriber session flow pre-configured within a destination context.
  - `policy_group_name` consist of from 1 to 15 alpha and/or numeric characters in length and is case sensitive.

- **direction { in | out }**
  - Specifies the direction of flow in which the traffic policies need to be applied.
    - `in`: specifies the incoming traffic
    - `out`: specifies the outgoing traffic

**Usage**

Use this command to assign traffic policy group to a subscriber for traffic policing.

**Example**

```
policy-group traffic_policy_group1 direction in
```
ppp

Configures the point-to-point protocol options for the current subscriber.

**Product**

PDSN, GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
ppp { accept-peer-ipv6-ffid | always-on-vse-packet | data-compression { mode { normal | stateless } | protocols { protocols[protocols] } | ip-header-compression negotiation { detect | force | vj compress-slot-id { both | none | receive | transmit } } } | ipv4 { disable | enable | passive } | ipv6 { disable | enable | passive } | keepalive seconds | min-compression-size min_octets | mtu max_octets | remote-renegotiation disconnect { always | nai-prefix-msid-mismatch } }
```

```
default ppp { accept-peer-ipv6-ffid | always-on-vse-packet | data-compression { mode | protocols } | ip-header-compression negotiation { vj compress-slot-id } | ipv4 | ipv6 | keepalive | min-compression-size | mtu | remote-renegotiation disconnect }
```

```
no ppp { accept-peer-ipv6-ffid | always-on-vse-packet | data-compression protocols | ipv4 | ipv6 | keepalive | mtu | remote-renegotiation disconnect }
```

---

**default**

Restores the default value for the option specified.

**no**

Resets the option specified to its default.

### always-on-vse-packet

Default: Enabled

If the always-on feature is enabled for a session, this keyword enables the PDSN to send special 3GPP2 VSE PPP packets to the Mobile Node with a max inactivity timer value. This configuration is applicable only for PDSN sessions.

### accept-ipv6-peer-ffid

Default: None

This is used to configure a 6to4 tunnel. It controls the behavior of IPv6CP negotiation for Interface ID. If enabled, PDSN will accept a valid interface-id proposed by the peer.

### data-compression { mode { normal | stateless } | protocols { protocols [ protocols ] } }

Default: all protocols enabled.

Specifies the subscriber’s mode of data compression or the compression protocol to use.

**mode**: sets the mode of compression where *modes* must be one of:
Subscriber Configuration Mode Commands

- normal (packets are compressed using the packet history for automatic adjustment for best compression)
- stateless (each packet compressed individually)

protocols: sets the compression protocol where protocols must be one of:
- deflate (DEFLATE algorithm)
- mppc (Microsoft PPP algorithm)
- stac (STAC algorithm)

ip-header-compression negotiation { detect | force | vj compress-slot-id { both | none | receive | transmit } }

Default: force

PPP IP compression Van Jacobson (VJ) negotiation scheme. This command is applicable only if IP header compression is enabled for the subscriber.

detect: The local side does not include the VJ Compression option in its IPCP configuration request unless the peer sends an IPCP NAK including a VJ compression option. If the peer requests the VJ compression option in its IPCP request the local side will ACK/NAK.

force: The IP header compression negotiation in IPCP happens normally. The local side requests the VJ compression option in its IPCP configure request. If the peer side requests VJ compression in its IPCP request, the local side will ACK/NAK the option.

vj compress-slot-id { both | none | receive | transmit }:

- both: If the client proposes VJ slotid compression, accept it and propose slotid compression for downlink and uplink.
- none: If the client proposes VJ slotid compression, NAK the offer, do not propose slotid compression for downlink.
- receive: (Default) If the client proposes VJ slotid compression in the uplink direction accept the configuration.
- transmit: Propose VJ slotid compression for uplink.

ipv4 { disable | enable | passive }

Default: enable

Controls IPCP negotiation during PPP negotiation.

disable: The PDSN does not negotiate IPCP with the mobile.

enable: The PDSN negotiates IPCP with the mobile.

passive: The PDSN initiates IPCP only when the mobile sends an IPCP request.

ipv6 { disable | enable | passive }

Default: enable

Controls IPv6CP negotiation during PPP negotiation.

disable: The PDSN does not negotiate IPCP with the mobile.

enable: The PDSN negotiates IPCP with the mobile.

passive: The PDSN initiates IPCP only when the mobile sends an IPCP request.

keepalive seconds

Default: 30

Specifies the frequency of sending the Link Control Protocol keep alive messages. seconds must be either 0 or in the range from 5 to 14400.
The special value 0 disables the keep alive messages entirely.

**min-compression-size** `min_octets`
Default: 128
Specifies the smallest packet to which compression may be applied. `min_octets` must be a value in the range from 0 to 2000.

**mtu** `max_octets`
Default: 1500
Specifies the maximum size in octets the message transfer unit packets can reach. `max_octets` must be a value in the range from 100 to 2000.

**remote-renegotiation disconnect** `{ always | nai-prefix-msid-mismatch }`
Default: Disabled
Terminates the already established PPP sessions if they are renegotiated by the remote side by sending LCP Conf-req/nak/ack. The following termination conditions are available:

- **always**: The session is automatically disconnected.
- **nai-prefix-msid-mismatch**: The session is disconnected only if the MSID of the session does not match NAI-Prefix (prefix before “@” for the NAI). The configuration of the renegotiated (new) NAI is used for the matching process.

**Usage**
Adjust packet sizes and compression to improve bandwidth utilization. Each network may have unique characteristics such that determining the best packet size and compression options may require system monitoring over an extended period of time.

**Example**

```
ppp data-compression protocols mode statelesppp mtu 500no ppp data-compression protocolsno ppp keepalive
```
prepaid 3gpp2

Enables 3GPP2 compliant prepaid billing support for a subscriber to be configured by 3GPP2 attributes sent from a RADIUS server. If not enabled, prepaid attributes received from the RADIUS server are ignored.

Product
HA, PDSN

Privilege
Security Administrator, Administrator

Syntax

```
prepaid3gpp2 { accounting [ no-final-access-request ] | duration-quota final-duration-algorithm { current-time | last-airlink-activity-time | last-user-layer3-activity-time } | preference { duration | volume } }
```

```
default prepaid 3gpp2 { duration-quota final-duration-algorithm | preference }
```

```
no prepaid3gpp2accounting
```

```
default prepaid 3gpp2 { duration-quota final-duration-algorithm | preference }
```

Sets the 3GPP2 Pre-paid settings to the default values.

- **duration-quota final-duration-algorithm:** Reset the end of billing duration quota algorithm to the default of current-time.
- **preference:** Reset the preference to duration, If both duration and volume attributes are present.

```
no prepaid 3gpp2 accounting
```

Disables 3GPP2 prepaid accounting. All 3GPP2 Prepaid attributes received from a RADIUS server are ignored.

```
accounting [ no-final-access-request ]
```

Default: Disabled
Enabled 3GPP2 prepaid accounting behavior.

Sets the low-watermark for remaining byte credits. `percentage` is a percentage of the subscriber sessions total credits. When the low-watermark is reached a new RADIUS access-request is sent to the RADIUS server to retrieve more credits. `percentage` must be an integer from 1 to 99.

```
no-final-access-request
```

Disables 3GPP2 prepaid accounting. By default, this option is disabled.

```
duration-quota final-duration-algorithm { current-time | last-airlink-activity-time | last-user-layer3-activity-time }
```

Define what behavior specifies the end of the billing duration for duration-based quota usage accounting. The default behavior is the duration quota algorithm set to current-time.
Default: current-time

```
current-time
```

Selects the duration quota as the difference between the session termination timestamp and the session setup timestamp.

```
last-airlink-activity-time
```

Selects the duration quota as the difference between the last-user-activity timestamp (G17) and the session setup timestamp.
last-user-layer3-activity-time: Selects the duration quota as the difference between the timestamp of the last layer-3 packet sent to or received from the user and the session setup timestamp.

preference { duration | volume }
If both duration and volume RADIUS attributes are present this keyword specifies which attribute has precedence.
Default: duration
duration: The duration attribute takes precedence.
volume: The volume attribute takes precedence

Usage
Use this command to enable prepaid support for a default user or for the default user of a domain alias.

Example
The following command enables 3GPP2 prepaid support for the default user:
prepaid 3gpp2 accounting
prepaid custom

Enables custom prepaid billing support for a subscriber to be configured by attributes sent from a RADIUS server. If not enabled, prepaid attributes received from the RADIUS server are ignored. The keywords are to set prepaid values that are used if the corresponding RADIUS attribute is not present. If the RADIUS attribute is present it takes precedence over these values.

Product
HA, PDSN

Privilege
Security Administrator, Administrator

Syntax

```plaintext
prepaidcustom { accounting | byte-count compressed | low-
watermarkpercentage | renewalintervalseconds } | preference { duration |
volume }

defaultprepaidcustom { byte-count | low-watermark }

noprepaidcustom { accounting | byte-count compressed | low-watermark | renewal }
```

```plaintext
default prepaid custom { byte-count | low-watermark }

Resets custom prepaid settings to the default values.

byte-count: Reset to the default of basing the prepaid byte credits on the flow of uncompressed traffic.

low-watermark: Disable sending an access request to retrieve more credits when a low watermark is reached.
```

```plaintext
no prepaid custom { accounting | byte-count compressed | low-watermark | renewal}
```

byte-count compressed: The prepaid byte credits are based on the flow of uncompressed traffic. This is the default.

low-watermark: Disables the low watermark feature. An access-request isn’t sent to the RADIUS server until the credits granted for the subscriber session are depleted.

renewal: Disables time-based renewals for prepaid accounting.

accounting

Default: Disabled
Enabled custom prepaid accounting behavior.

byte-count compressed

Default: uncompressed.
When compression is used, the prepaid byte credits are based on the flow of compressed traffic. The default is to base the prepaid byte credits on the flow of uncompressed traffic.

low-watermark percent percentage

Default: Disabled.
Sets the low-watermark for remaining byte credits. *percentage* is a percentage of the subscriber sessions total credits. When the low-watermark is reached a new RADIUS access-request is sent to the RADIUS server to retrieve more credits. *percentage* must be an integer from 1 to 99.

**renewal interval seconds**

Default: The time in seconds to wait before sending a new RADIUS access-request to the RADIUS server to retrieve more credits. *seconds* must be an integer from 60 through 65535.

**preference { duration | volume }**

If both duration and volume RADIUS attributes are present this keyword specifies which attribute has precedence.

Default: duration

**duration:** The duration attribute takes precedence.

**volume:** The volume attribute takes precedence

**Usage**

Use this command to enable prepaid support for a default user or for the default user of a domain alias.

**Example**

The following command enables custom prepaid support for the default user:

```
prepaid custom accounting
```
prepaid unclassify

This command provides customer specific functionality.
prepaid voice-push

This command provides customer specific functionality.
**prepaid wimax**

Enables WiMAX prepaid accounting for this subscriber. This feature is disabled by default.

**Product**
ASN GW

**Privilege**
Administrator

**Syntax**

```
[ no ] prepaid wimax accounting
```

- **no**
  
  Disables WiMAX prepaid accounting for this subscriber.

**Usage**

Use this command to enable WiMAX prepaid accounting for this subscriber.
proxy-dns intercept list-name

Identifies a proxy DNS intercept rules list for the selected subscriber.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

[ no ] proxy-dns intercept list-name name

no
Remove the intercept list from the subscriber’s profile.

proxy-dns intercept list-name name
Specifies a name of a proxy DNS intercept list used for the selected subscriber.
name is the name of the intercept list and must be a string from 1 to 63 characters in length.

Usage
Use this command to identify a proxy DNS rules list for the selected subscriber. For a more detailed explanation of the HA Proxy DNS Intercept feature, see the proxy-dns intercept-list command in the Context Configuration Mode Commands chapter.
proxy-mip

Configures support for Proxy Mobile IP for the subscriber.

Product
PDSN, GGSN, ASN GW, PDIF

Privilege
Security Administrator, Administrator

Syntax

[ no ] proxy-mip required

no
Disables support for Proxy Mobile IP.

required
Enables support for Proxy Mobile IP.

Usage
When enabled through the session license and feature use key, the system supports Proxy Mobile IP to provide a mobility solution for subscribers with mobile nodes (MNs) capable of supporting only Simple IP. For subscriber sessions using Proxy Mobile IP, R-P and PPP sessions get established as they would for a Simple IP session. However, the AGW/FA performs Mobile IP operations with an HA (identified by information stored in the subscriber’s profile) on behalf of the MN while the MN performs only Simple IP processes.

Example
The following command enables proxy mobile IP for the current subscriber:

proxy-mip required
qos rate-limit

Configure the action on subscriber traffic flow that violates or exceeds the peak/committed data rate under traffic policing functionality. When configured, the PDG/TTG performs traffic policing for the subscriber session. If the GGSN changes the QoS via an Update PDP Context Request, the PDG/TTG uses the new QoS values for traffic policing.

Product
PDG/TTG

Privilege
Security Administrator, Administrator

Syntax
```
qos rate-limit direction { downlink | uplink } [ class { background | conversational | interactive traffic_priority | streaming } ]
[ exceed-action { drop | lower-ip-precedence | transmit } ][ violate-action { drop | lower-ip-precedence | transmit } ]
noqosrate-limitdirection{ downlink | uplink } { class { background | conversational | interactive traffic_priority | streaming } }
```

no
Disables the QoS data rate limit configuration for the APN.

downlink
Apply the specified limits and actions to the downlink (to the data coming from the GGSN over the Gn’ interface).

uplink
Apply the specified limits and actions to the uplink (to the data coming from the UE over the IPSec tunnel).

class { background | conversational | interactive traffic_priority | streaming }
Apply the specified limits and actions to the PDP contexts of the specified UMTS traffic class. The following classes are supported:

- **background**: Specifies the QoS for traffic patterns in which the data transfer is not time-critical (for example, e-mail exchanges). This traffic pattern should be the lowest QoS.

- **conversational**: Specifies the QoS for traffic patterns in which there is a constant flow of packets in each direction, upstream and downstream. This traffic pattern should be the highest QoS.

- **interactive traffic_priority**: Specifies the QoS for traffic patterns in which there is an intermittent flow of packets in each direction, upstream and downstream. This traffic pattern should be a higher QoS than the background pattern, but not as high as that for the streaming pattern. The traffic_priorityis the 3GPP traffic handling priority and can be the integers 1, 2, or 3.

- **streaming**: Specifies the QoS for traffic patterns in which there is a constant flow of data in one direction, either upstream or downstream. This traffic pattern should be a higher QoS than the interactive pattern, but not as high as that for the conversational pattern.
Important: If this keyword is omitted, the same values are used for all classes.

```
exceed-action { drop | lower-ip-precedence | transmit }
```

Default: See Usage section for this command

The action to take on the packets that exceed the committed-data-rate but do not violate the peak-data-rate.

The following actions are supported:

- **drop**: Drop the packet.
- **lower-ip-precedence**: Transmit the packet after lowering the ip-precedence.
- **transmit**: Transmit the packet.

```
vio late-action { drop | lower-ip-precedence | transmit }
```

Default: See Usage section for this command

The action to take on the packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:

- **drop**: Drop the packet.
- **lower-ip-precedence**: Transmit the packet after lowering the IP precedence.
- **transmit**: Transmit the packet.

**Usage**

This command configures the APN’s quality of service (QoS) data rate shaping through traffic policing. This command enables the actions on subscriber flow exceeding or violating peak/committed data rate allowed. The shaping function also provides an enhanced function to buffer the exceeded user packets in a buffer memory and sends them to the subscriber when subscriber traffic goes below the committed or peak data rate limit.

Important: The user packet buffer function in traffic shaping is not applicable for real-time traffic.

Important: If the exceed/violate action is set to “lower-ip-precedence”, this command may override the configuration of the `ip qos-dscp` command in the GGSN service configuration mode for packets from the GGSN to the PDG/TTG. In addition, the GGSN service `ip qos-dscp` command configuration can override the APN setting for packets from the GGSN to the Internet. Therefore, it is recommended that command not be used in conjunction with this action.

The command can be entered multiple times to specify different combinations of direction and class. If this command is not configured at all, the GGSN does not perform traffic policing or QoS negotiation with the PDG/TTG (i.e., it accepts all of the PDG/TTG-provided values for the PDP context.

Important: This command should be used in conjunction with the max-contexts command to limit the maximum possible bandwidth consumption by the APN.

Additional information on the QoS traffic shaping and policing functionality is located in the *System Enhanced Feature Configuration Guide*.

Default values:

The following table displays the default values for each of the traffic classes:
<table>
<thead>
<tr>
<th>Class: Conversational</th>

**Example**
The following command lowers the IP precedence when the committed-data-rate and the peak-data-rate are violated in uplink direction:

```
qos rate-limit direction uplink violate-action lower-ip-precedence
```
**qos traffic-policing**

Enables and configures traffic policing through the bandwidth limits and action for the subscriber traffic if it exceeds/violates the peak or committed data rate. Uplink and downlink limits are configured separately.

**Product**
PDSN, HA, GGSN, ASN GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
qos traffic-policing {downlink|uplink} [burst-size bytes] [committed-data-rate bps] [exceed-action {drop|lower-ip-precedence|transmit}] [peak-data-rate bps] [violate-action {drop|lower-ip-precedence|transmit}]
```

```
no qos traffic-policing {downlink|uplink}
```

**downlink**

Apply the specified limits and actions to the downlink (data to the subscriber).

**uplink**

Apply the specified limits and actions to the uplink (data from the subscriber).

**burst-size bytes**

Default: 3000
The peak burst size allowed, in bytes.

*important*: It is recommended that this parameter be configured to at least the greater of the following two values: 1) 3 times greater than packet MTU for the subscriber connection, OR 2) 3 seconds worth of token accumulation within the “bucket” for the configured peak-data-rate.

**committed-data-rate bps**

Default: 144000
The committed data rate (guaranteed-data-rate) in bps (bits per second).

*important*: It is recommended that this parameter be configured to at least the greater of the following two values: 1) 3 times greater than packet MTU for the subscriber connection, OR 2) 3 seconds worth of token accumulation within the “bucket” for the configured peak-data-rate.

**exceed-action { drop | lower-ip-precedence | transmit }**

Default: lower-ip-precedence
The action to take on the packets that exceed the committed-data-rate but do not violate the peak-data-rate.

The following actions are supported:

- **drop**: Drop the packet
- **lower-ip-precedence**: Transmit the packet after lowering the ip-precedence
- **transmit**: Transmit the packet
peak-data-rate \textit{bps}

Default: 256000
Specifies the peak data-rate for the subscriber, in bps (bits per second).
\textit{bps} must be an integer from 0 through 4294967295.

\textbf{violate-action} \{ \textit{drop} | \textit{lower-ip-precedence} | \textit{transmit} \}

Default: \textit{drop}
The action to take on the packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:
\textit{drop}: Drop the packet
\textit{lower-ip-precedence}: Transmit the packet after lowering the IP precedence
\textit{transmit}: Transmit the packet

\textbf{no}
Disable traffic policing for the specified direction for the current subscriber.

\textbf{Usage}
Use this command to limit the bandwidth a subscriber uses in the uplink and downlink directions.

\begin{itemize}
    \item \textbf{Important:} If the exceed/violate action is set to “lower-ip-precedence”, the TOS value for the outer packet becomes “best effort” for packets that exceed/violate the traffic limits regardless of what the \texttt{ip user-datagram-tos copy} command is configured to. In addition, the “lower-ip-precedence” option may also override the configuration of the \texttt{ip qos-dscp} command. Therefore, it is recommended that command not be used when specifying this option.
\end{itemize}

Details on the QoS traffic policing functionality is located in the System Enhanced Feature Configuration Guide.

\textbf{Example}
The following command sets an uplink peak data rate of 128000 bps and lowers the IP precedence when the committed-data-rate and the peak-data-rate are exceeded:
\texttt{qos traffic-policy direction uplink peak-data-rate 128000 violate-action lower-ip-precedence}
The following command sets a downlink peak data rate of 256000 bps and drops packets when the committed-data-rate and the peak-data-rate are exceeded:
\texttt{qos traffic-policy direction downlink peak-data-rate 256000 violate-action drop}
**qos traffic-shape**

Enables and configures traffic shaping functionality to provide the traffic shaping by means of buffering the data packets during congestion or when subscriber exceeds the configured peak or committed data rate limit. It buffers the data packets instead of discarding instantaneous burst and deliver it to subscriber when traffic flow is below the peak or committed data rate. Uplink and downlink traffic shaping are configured separately.

---

**Important:** This feature is NOT supported for real-time traffic.

**Product:**

PDSN, HA, GGSN, ASN GW

**Privilege:**

Security Administrator, Administrator

**Syntax**

```
qos traffic-shape direction { downlink | uplink } [ burst-size bytes ] [ committed-data-rate bps ] [ exceed-action { drop | lower-ip-precedence | transmit } ] [ peak-data-rate bps ] [ violate-action { drop | lower-ip-precedence | transmit } ] +
no qos traffic-shape direction { downlink | uplink }
```

**downlink**

Apply the specified limits and actions to the downlink (data to the subscriber).

**uplink**

Apply the specified limits and actions to the uplink (data from the subscriber).

**burst-size bytes**

Default: 3000

The peak burst size allowed, in bytes.

*bytes* must be an integer from 0 through 4294967295.

---

**Important:** It is recommended that this parameter be configured to at least the greater of the following two values: 1) 3 times greater than packet MTU for the subscriber connection, OR 2) 3 seconds worth of token accumulation within the “bucket” for the configured peak-data-rate.

**committed-data-rate bps**

Default: 144000

The committed data rate (guaranteed-data-rate) in bps (bits per second).

*bps* must be an integer from 0 through 4294967295.

**exceed-action { drop | lower-ip-precedence | transmit }**

Default: lower-ip-precedence
The action to take on the packets that exceed the committed-data-rate but do not violate the peak-data-rate.
The following actions are supported:

- **drop**: Drop the packet
- **lower-ip-precedence**: Transmit the packet after lowering the ip-precedence
- **transmit**: Transmit the packet

---

### peak-data-rate bps

Default: 256000

Specifies the peak data-rate for the subscriber, in bps (bits per second).

- **bps** must be an integer from 0 through 4294967295.

---

### violate-action { drop | lower-ip-precedence | buffer [transmit-when-buffer-full] | transmit }

Default: See Usage section for this command

The action to take on the packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:

- **drop**: Drop the packet
- **lower-ip-precedence**: Transmit the packet after lowering the IP precedence
- **buffer [transmit-when-buffer-full]**: Enables the traffic shaping and provides the buffering of user packets when subscriber traffic violates the allowed peak/committed data rate. The **[transmit-when-buffer-full]** keyword allows the packet to be transmitted when buffer memory is full.
- **transmit**: Transmit the packet

---

+ More than one of the above keywords can be entered within a single command.

---

### no

Disable traffic policing for the specified direction for the current subscriber.

---

### Usage

Use this command to provide the traffic shaping function to a subscriber in the uplink and downlink directions. This feature is providing a traffic flow control different to QoS traffic policing. When a subscriber violates or exceeds the peak data rate instead of dropping the packets, as in QoS traffic policing, this feature provides the buffering facility of subscriber data packets and it sends the buffered data when the traffic flow is low or not in congestion state.

---

**Important:** If the exceed/violate action is set to “lower-ip-precedence”, the TOS value for the outer packet becomes “best effort” for packets that exceed/violate the traffic limits regardless of what the **ip user-dgram-tos copy** command is configured to. In addition, the “lower-ip-precedence” option may also override the configuration of the **ip qos-dscp** command. Therefore, it is recommended that command not be used when specifying this option.

---

Details on the QoS traffic policing functionality is located in the System Enhanced Feature Configuration Guide.

---

### Example
The following command sets an uplink peak data rate of 128000 bps and lowers the IP precedence when the committed-data-rate and the peak-data-rate are exceeded:

```
qos traffic-shape direction uplink peak-data-rate 128000 violate-action lower-ip-precedence
```

The following command buffers the excess user packets when the subscriber traffic violates the configured peak-data-rate 256000 bps in downlink direction. Once the peak/committed data rate for that subscriber goes below the configured limit it transmit them. It also transmits them if buffer memory is full:

```
qos traffic-shape direction downlink peak-data-rate 256000 violate-action buffer transmit-when-buffer-full
```
radius accounting

Sets the RADIUS accounting parameters for the subscriber or domain. This command takes precedence over the similar context configuration command. This command is disabled by default.

Product
All

Privilege
Administrator

Syntax

radius accounting { interim { interval-timeout timeout } | ip remote-address list-id list_id | mode { session-based | access-flow-based { none | auxiliary-flows | all-flows | main-a10-only } } | start { normal | suppress } | stop { normal | suppress } }

no radius accounting { ip remote-address list-id list_id | interim { interval-timeout } }

| interim { interval-timeout timeout | normal | suppress } |
| interval-timeout timeout: Indicates the time (in seconds) between updates to session counters (log file on RADIUS or AAA event log) during the session. timeout must be an integer from 50 to 4000000.

Caution: Interim interval settings received from the RADIUS server take precedence over this setting on the system. While the low limit of this setting on the system is a minimum of 50 seconds, the low limit setting on the RADIUS server can be as little as 1 second. To avoid increasing network traffic unnecessarily and potentially reducing network and system performance, do not set this parameter to a value less than 50 on the RADIUS server.

| normal: If RADIUS accounting is enabled, send this Acct-Status-Type message when required by normal operation |
| suppress: If RADIUS accounting is enabled, suppress the sending of this Acct-Status-Type message. |

ip remote-address list-id list_id

Specifies the identification number of the IP address list to use for the subscriber for remote address-based accounting.

list_id: Specify the RADIUS accounting remote IP address list identifier for remote-address accounting for the subscriber. list_id must be an integer from 1 through 65535.

This command is used as part of the Remote Address-based accounting feature and associates the subscriber with a list of remote addresses. Remote address accounting data is collected each time the subscriber communicates with any of the addresses specified in the list.

Remote address lists are configured using the list keyword in the radius accounting ip remote-address command in the Context Configuration mode.

mode { session-based | access-flow-based { none | auxiliary-flows | all-flows | main-a10-only } }

Default: session-based

Specifies if the radius accounting mode is either session-based or access-flow-based.
**session-based**: configures session-based RADIUS accounting behavior for the subscriber - which means a single radius accounting message generated for the subscriber session not separate accounting messages for individual A10 connections or flows.

**access-flow-based**: configures access-flow-based RADIUS accounting behavior for the subscriber. This offers flexibility by generating separate accounting messages for flows and A10 sessions.

- **all-flows**: Generates separate RADIUS accounting messages per access flow. Separate accounting messages are not generated for data path connections. (For example, separate messages are not sent for the main A10 or auxiliary connections.).

- **auxiliary-flows**: Generates RADIUS accounting records for the main data path connection and for access-flows for all auxiliary data connections. (For example, separate RADIUS accounting messages are generated for the main A10 session and for access-flows within auxiliary A10 connections. The main A10 session accounting does not include octets or other accounting information from the auxiliary flows.)

- **main-a10-only**: Configures access-flow-based single accounting messages (for example only single start/interim/stop) are generated for the main A-10 flows only.

- **none**: Separate RADIUS accounting messages are generated for all data path connections (for example, PDSN main or auxiliary A10 connections) but not for individual access-flows. This is essentially A10 connection-based accounting.

```
start { normal | suppress }
```

**normal**: If RADIUS accounting is enabled, send this Acct-Status-Type message when required by normal operation

**suppress**: If RADIUS accounting is enabled, suppress the sending of this Acct-Status-Type message.

```
stop { normal | suppress }
```

**normal**: If RADIUS accounting is enabled, send this Acct-Status-Type message when required by normal operation

**suppress**: If RADIUS accounting is enabled, suppress the sending of this Acct-Status-Type message.

```
o
```

**no**

Sets the accounting message start normal for main A-10 flows only.

### Usage

Use this command to allow a per-domain setting for the RADIUS accounting.

### Example

Set the accounting interim interval to one minute (60 seconds) for all sessions that use the current subscriber configuration:

```
radius accounting interim interval-timeout 60
```

Do not send RADIUS interim accounting messages:

```
radius accounting interim suppress
```

Sets the accounting message start normal for main A-10 flows only.
radius accounting mode main-a10-only start normal
radius group

It applies a RADIUS server group at the subscriber level for AAA functionality.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```bash
radius group group_name
```

**group_name**

Specifies the name of the server group that is used for authentication and/or accounting for the specific subscriber.

*group_name* must be a string of size 1 to 63 characters. It must be the same as configured earlier within the same context of subscriber.

```bash
default
```

Sets / Restores default RADIUS server group specified at the context level or default subscriber profile.

```bash
no
```

Disables the applied RADIUS group for specific subscriber.

**Usage**

This feature provides the RADIUS configurables under radius group node. Instead of having a single list of servers per context, this feature configures multiple server groups within a context and applies individual RADIUS server group for a subscriber in that context. Each server group consists of a list of AAA servers. In case no RADIUS group is applied for the said subscriber or default subscriber profile, then the default server group available at context level is applicable for accounting and authentication of specific subscriber.

**Example**

Following command applies a previously configured RADIUS server group named *star1* to a subscriber within the specific context:

```bash
radius group star1
```

Following command disables the applied RADIUS server group for the specific subscriber.

```bash
no radius group
```
radius returned-framed-ip-address

Sets the policy whether or not to reject a call when the RADIUS server supplies 255.255.255.255 as the framed IP address and the MS does not supply an address.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

radius returned-framed-ip-address 255.255.255.255-policy {accept-call-when-ms-ip-not-supplied | reject-call-when-ms-ip-not-supplied}

default radius returned-framed-ip-address 255.255.255.255-policy

accept-call-when-ms-ip-not-supplied
Accept calls when the RADIUS server does not supply a framed IP address and the MS does not supply and address.

reject-call-when-ms-ip-not-supplied
Reject calls when the RADIUS server does not supply a framed IP address and the MS does not supply and address.

default
Set the policy to its default of rejecting calls when the RADIUS server does not supply a framed IP address and the MS does not supply and address.

Usage
Use this command to set the behavior for the current subscriber when the RADIUS server supplies 255.255.255.255 as the framed IP address and the MS does not supply an address.

Example
Use the following command to set the subscriber profile to reject calls when the RADIUS server does not supply a framed IP address and the MS does not supply and address:

radius returned-framed-ip-address 255.255.255.255-policy reject-call-when-ms-ip-not-supplied
**rohc-profile-name**

Identifies the RoHC profile configuration to be applied to bearer sessions belonging to this subscriber.

**Product**

HSGW,PDSN

**Privilege**

Administrator

**Syntax**

```
rohc-profile-name name
```

`name`

Specifies the name of the RoHC profile this subscriber will use to apply header compression and decompression parameters to bearer session data. `name` must be an existing RoHC profile and be from 1 to 63 alpha and/or numeric characters.

**Usage**

Use this command to specify a RoHC configuration profile to be applied to bearer sessions belonging to this subscriber. RoHC profiles are configured through the Global Configuration Mode using the `rohc-profile` command.

**Example**

The following command specifies that the RoHC profile named `rohc-cfg1` is to be applied to all bearer sessions belonging to this subscriber:

```
rohc-profile-name rohc-cfg1
```
secondary ip pool

This command specifies a secondary IP pool to be used as backup pool for NAT.

Important: This command is license dependent, requiring the 600-00-7871 NAT Bypass license. Please contact your local sales representative for more information.

Product
NAT

Privilege
Security Administrator, Administrator

Syntax

```
secondary ip pool pool_name
no secondary ip pool
```

no
Removes the previous secondary IP pool configuration.

```
pool_name
```
Specifies the secondary IP pool name.
`pool_name` must be an alpha and/or numeric string of 1 through 31 characters in length.

Usage
Use this command to configure a secondary IP pool for NAT subscribers, which is not overwritten by the RADIUS supplied list. The secondary pool configured will be appended to the RADIUS supplied IP pool list / subscriber template provided IP pool list whichever is applicable during call setup.

Example
The following command configures a secondary IP pool named `test123`:

```
secondary ip pool test123
```
simultaneous

Enables/disables the simultaneous use of both Mobile and Simple IP services.

Product
PDSN, FA, HA, ASN-GW

Privilege
Security Administrator, Administrator

Syntax

```plaintext
[ no ] simultaneous simple-and-mobile-ip
```

```plaintext
no
```

Disables the simultaneous use.

Usage
Subscribers with mobile devices supporting mobile and simple IP services concurrently require this option to be set.

Example

```plaintext
no simultaneous simple-and-mobile-ip
simultaneous simple-and-mobile-ip
```
timeout

Configures the subscriber session timeouts.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
timeout { absolute | idle } seconds
no timeout [ absolute | idle ]
```

**absolute**
Default: 0
The absolute maximum time a session may exist in any state (active or dormant).

**idle**
Default: 0
The maximum duration of the session, in seconds, before the system automatically terminates the session due to inactivity.

**seconds**
Specifies the maximum amount of time, in seconds, before the specified timeout action is activated. **seconds** must be a value in the range from 0 through 4294967295.
The special value 0 disables the timeout specified.

**no**
Indicates the timeout specified is to be returned to its default behavior. If no specific timeout is specified then all are set to their default behavior.

Usage

Reduce the idle timeout to free session resources faster for use by new requests.

Example

```
timeout absolute 1800
no timeout
```
timeout idle-time

This command configures the idle timeout configuration timer for subscriber session.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
timeout idle-time idle_timeout
no timeout idle-time
```

- **idle_timeout**
  
  Default: 0
  
  Designates the maximum duration of the session, in seconds, after the expiry of which the system disconnects the subscriber.
  
  *idle_timeout* must be a value in the range from 0 through 4294967295.
  
  The special value 0 disables the timeout specified.

- **no**
  
  Indicates the timeout specified is to be returned to its default behavior. If no specific timeout is specified then all are set to their default behavior.

**Usage**

Use this command to set the idle time after which the call has to be disconnected.

**Example**

Following command sets the idle timeout duration to 450 seconds.

```
timeout idle-timeout 450
```
timeout long-duration

Configures the long duration timeout and optionally the inactivity duration of HA subscriber session.

Product
All

Privilege
Security Administrator, Administrator

Syntax

timeout-long-duration ldt_timeout [ inactivity-time inact_timeout]

[ no | default ]timeoutlong-duration

no
Indicates the timeout specified is to be returned to its default behavior. If no specific timeout is specified then all are set to their default behavior.

long-duration ldt_timeout
Default: 0
Designates the maximum duration of the session, in seconds, before the system automatically reports/terminates the session.
ldt_timeout must be a value in the range from 0 through 4294967295.
The special value 0 disables the timer.

inactivity-time inact_timeout
Specifies the maximum amount of time, in seconds, before the specified session is marked as dormant.
inact_timeout must be a value in the range from 0 through 4294967295.
The special value 0 disables the inactivity time specified.

Usage
Use this command to set the long duration timeout period and inactivity timer for subscriber sessions. Reduce the idle timeout to free session resources faster for use by new requests. Refer to the long-duration-action detection and long-duration-action disconnection section for more information.

Example
Following command sets the long duration timeout duration to 300 seconds and inactivity timer for subscriber session to 45 seconds.
timeout long-duration 300 inactivity-time 45
tunnel address-policy

This command specifies the policy for address allocation and validation for all tunneled calls (IP-IP, IP-GRE) except L2TP calls. This means that GGSN IP address validation could be disabled for specified incoming calls.

For GGSN systems, this command can also be specified in the APN Configuration mode (tunnel address-policy) which would mean the system defers to the old 13-to-12-tunnel address policy command for calls coming through L2TP tunnels.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

tunnel address-policy { alloc-only | alloc-validate | no-alloc-validate }

default tunnel address-policy

---

alloc-only
IP addresses are allocated locally and no validation is done.

alloc-validate
Default.
The VPN Manager allocates and validates all incoming IP addresses from a static pool of IP addresses.

no-alloc-validate
No IP address assignment or validation is done for calls coming in via L3 tunnels. Incoming static IP addresses are passed. This allows for the greatest flexibility.

default
Resets the tunnel address-policy to alloc-validate.

---

Usage
This command supports scalable solutions for Corporate APN deployment as many corporations handle their own IP address assignment. In some cases this is done to relieve the customer or the mobile operators from the necessity of reconfiguring the range of IP addresses for the IP pools at the GGSN.

Example
Use the following command to reset the IP address validation policy to validate against a static pool of address:

default tunnel address-policy

Use the following command to disable all IP address validation for calls coming through tunnels:

tunnel address-policy no-alloc-validate
Subscriber Configuration Mode Commands

Cisco ASR 5000 Series Command Line Interface Reference
tunnel gre

Configures Generic Routing Encapsulation (GRE) tunnel parameters for the current subscriber.

Product
PDSN, GGSN, ASN-GW

Privilege
Security Administrator, Administrator

Syntax

**tunnel gre peer-address peer_address**
**local-address local_addr**

**no tunnel gre peer-address peer_address**

**peer-address peer_address**
Specifies the IP address of the external gateway terminating the GRE tunnel.

**local-address local_addr**
Specifies the IP address of the interface in the destination context originating the GRE tunnel.

**no**
Disables GRE tunneling for the current subscriber.

Usage
Subscriber IP payloads are encapsulated with IP/GRE headers and tunneled by the AGW to an external gateway.

Example
The following command configures the system to encapsulate subscriber traffic using GRE and tunnel it from a local address of 192.168.1.100 to a gateway with an IP address of 192.168.1.225:

```
tunnel gre peer-address 192.168.1.225 local-address 192.168.1.100
```
tunnel ipip

Configures IP-in-IP tunnelling parameters for the current subscriber.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
tunnel ipip peer-address peer_address local-address local_addr
no tunnel ipip
```

**peer-address peer_address**
Specifies the IP address of the external gateway terminating the IP-in-IP tunnel.

**local-address local_addr**
Specifies the IP address of the interface in the destination context originating the IP-in-IP tunnel.

**no**
Disables IP-in-IP tunneling for the current subscriber.

**Usage**
Subscriber IP payloads are encapsulated with IP-in-IP headers and tunneled by the GGSN or PDSN to an external gateway.

**Example**
The following command configures the system to encapsulate subscriber traffic using IP-in-IP and tunnel it from a local address of 192.168.1.100 to a gateway with an IP address of 192.168.1.225:

```
tunnel ipip peer-address 192.168.1.225
local-address 192.168.1.100
```
tunnel ipsec

This command configures sessions for the current subscriber to use an IPSEC tunnel based on the IP pool corresponding to the subscribers assigned ip address.

**Product**
PDSN, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
tunnel ipsec use-policy-matching-ip-pooler-address
no tunnel ipsec [ use-policy-matching-ip-pooler-address ]
```

- **no**
  Disables the use of the IPSEC policy that matches the IP pool that the assigned IP address relates to.

**Usage**

Use this command to set the current subscribers sessions to use an IPSEC policy that is assigned to the IP pool that the subscribers assigned IP address relates to.

**Example**
The following command enables the use of the policy that matches the IP pool address:
```
tunnel ipsec use-policy-matching-ip-pooler-address
```
tunnel l2tp

Configures the L2TP tunnel for the subscriber.

Product
L2TP

Privilege
Security Administrator, Administrator

Syntax

```
tunnel l2tp [ peer-address ip_address [ [ encrypted ] [ secret secret ] ] [ preference number ] [ tunnel-context context ] [ local-address ip_address ] [ crypto-map map_name [ [ encrypted ] isakmp-secret secret ] ] ]
```

```
no tunnel l2tp [ peer-address ip_address ]
```

**peer-address ip_address**

A peer L2TP Network Server (LNS) associated with this LAC (L2TP Access Concentrator). ip_address must be an IP address in IPv4/IPv6 format.

```
[ [ encrypted ] secret secret ]
```

The shared key (secret) between the L2TP Network Server (LNS) associated with this LAC (L2TP Access Concentrator). secret must be between 1 and 63 alpha and/or numeric characters and is case sensitive. **encrypted**: The encrypted shared key between the L2TP Network Server (LNS) associated with this LAC (L2TP Access Concentrator). secret must be between 1 and 128 alpha and/or numeric characters and is case sensitive. The encrypted keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the secret keyword is the encrypted version of the plain text secret. Only the encrypted secret is saved as part of the configuration file.

**preference number**

Default: 1

The order in which a group of tunnels configured for this subscriber will be tried. number must be an integer between 1 and 65535.

**tunnel-context context**

The name of the context containing ports through which this subscriber’s data traffic is to be communicated between this LAC and the LNS. context must be between 1 and 79 alpha and/or numeric characters.

**local-address ip_address**

A LAC service bind address which is given as a hint used to select a particular LAC service. ip_address must be an IP address in IPv4/IPv6 format.
crypto-map map_name { [encrypted] isakmp-secret secret }

map_name is the name of a crypto map that has been configured in the current context. map_name must be a string from 1 to 127 alphanumeric characters.

isakmp-secret secret: The pre-shared key for IKE. secret must be a string from 1 to 127 alphanumeric characters.

encrypted isakmp-secret secret: The pre-shared key for IKE. Encryption must be used when sending the key. secret must be a string from 1 to 127 alphanumeric characters.

no

Disables tunneling for the current subscriber. When peer-address is included, the tunneling for that specific L2TP Network Server (LNS) is disabled but tunneling to other configured LNSs is still enabled.

Usage

Use this command to configure specific L2TP tunneling parameters for the current subscriber.

Example

To specify L2tp tunneling to the LNS peer at the IP address 198.162.10.100 with a shared secret of bigco and preference of 1, enter the following command:

tunnel l2tp peer-address 198.162.10.100 secret bigco preference 1
Chapter 197
Telnet Configuration Mode Commands

The Telnet Configuration Mode is used to manage the Telnet server options for the current context.
end

Exits the telnet server configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Change the mode back to the Exec mode.
exit

Exits the telnet server configuration mode and returns to the context configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Return to the context configuration mode.
**max servers**

Configures the maximum number of telnet servers that can be started within any 60 second interval. If this limit is reached, the system waits two minutes before trying to start any more servers.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
max servers count
```

count

Default: 40

Specifies the maximum number of servers that can be spawned in any 60 second interval. count must be a value in the range from 1 to 100.

**Usage**

Set the number of servers to tune the system response as a heavily loaded system may need more servers to support the incoming requests.

The converse would be true as well in that a system can benefit by reducing the number of servers such that telnet services do not cause excessive system impact to other services.

**Example**

```
max servers 50
```
Chapter 198
TFTP Configuration Mode Commands

The TFTP configuration mode is used to manage the TFTP servers for the current context.

```
Exec Mode
  configure
    Global Configuration Mode
      context name
        Context Configuration Mode
          server tftpd
            TFTP Configuration Mode
```
end

Exits the TFTP server configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Change the mode back to the Exec mode.
exit

Exits the TFTP server configuration mode and returns to the context configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

`exit`

**Usage**

Return to the context configuration mode.
max servers

Configures the maximum number of TFTP servers that can be started within any 60 second interval. If this limit is reached, the system waits two minutes before trying to start any more servers.

Product
All

Privilege
Security Administrator, Administrator

Syntax

max servers count

count

Default: 40

Specifies the maximum number of servers that can be spawned in any 60 second interval. count must be a value in the range from 1 to 100.

Usage

Set the number of servers to tune the system response as a heavily loaded system may need more servers to support the incoming requests.

The converse would be true as well in that a system can benefit by reducing the number of servers such that TFTP services do not cause excessive system impact to other services.

Example

max servers 50
Chapter 199
Timedef Configuration Mode Commands

The Timedef Configuration Mode enables configuring the Time-of-Day Activation/Deactivation feature.

**Important:** This configuration mode is only available in StarOS 8.1 and StarOS 9.0 and later releases.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

This command returns the CLI prompt to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

end

Usage
Use this command to change to the Exec mode.
exit

This command exits the current configuration mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.
**start**

This command configures timeslots in the current timedef.

---

**Important**: This command is only available in StarOS 8.1 and StarOS 9.0 and later releases.

**Important**: A maximum of 24 timeslots can be specified within a timedef.

---

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] start day { friday | monday | saturday | sunday | thursday | tuesday | wednesday } time hh mm ss end day { friday | monday | saturday | sunday | thursday | tuesday | wednesday } time hh mm ss

[ no ] start time hh mm ss end time hh mm ss
```

---

**no**

Removes the specified timeslot.

---

**start day**

Specifies a timeslot with a start day and time, and an end day and time.

**start day**: Specifies the start day and start time.

**end day**: Specifies the end day and end time.

**time**

`hh mm ss`: Specifies the start/end time:

- `hh`: Specifies the start/end hour, and must be an integer from 0 through 23.
- `mm`: Specifies the start/end minute, and must be an integer from 0 through 59.
- `ss`: Specifies the start/end second, and must be an integer from 0 through 59.

---

**start time**

Specifies a timeslot with a start time and an end time to be applicable for all days of the week.

In specifying the start/end time:

- `hh`: Specifies the start/end hour, and must be an integer from 0 through 23.
- `mm`: Specifies the start/end minute, and must be an integer from 0 through 59.
- `ss`: Specifies the start/end second, and must be an integer from 0 through 59.

---

**Usage**

"Cisco ASR 5000 Series Command Line Interface Reference"
Use this command to create timeslots in a timedef during which rules have to be active. Timedefs enable activation/deactivation of ruledefs/groups-of-ruledefs such that they are available for rule matching only when they are active.

When a packet is received, and a ruledef/group-of-ruledefs is eligible for rule matching, if a timedef is associated with the ruledef/group-of-ruledefs, before rule matching, the packet-arrival time is compared with the timeslots configured in the timedef. If the packet arrived in any of the timeslots configured in the associated timedef, rule matching is undertaken, else the next ruledef/group-of-ruledefs is considered.

**Important:** The time considered for timedef matching is the system’s local time.

This release does not support configuring a timeslot for a specific date.

If, in a timeslot, only the time is specified, that timeslot will be applicable for all days.

If for a timeslot, “start time” > “end time”, that rule will span the midnight. I.e. that rule is considered to be active from the current day till the next day.

If for a timeslot, “start day” > “end day”, that rule will span over the current week till the end day in the next week.

In the following cases a rule will be active all the time:

- a timedef is not configured in an action priority
- a timedef is configured in an action priority, but the named timedef is not defined
- a timedef is defined but with no timeslots

**Example**

The following example specifies a timeslot that starts on Tuesday at 09:00:00 and ends on Friday 21:30:00:

```
start day tuesday time 9 0 0 end day friday time 21 30 0
```

The following example specifies a timeslot that starts at 15:00:00 and ends at 17:00:00 on all days of the week:

```
start time 15 0 0 end time 17 0 0
```

The following example specifies a timeslot that starts on Friday at 22:00:00 and ends on Tuesday at 08:00:00. This timeslot spans the complete week until the end day, i.e. up to Tuesday.

```
start day friday time 22 0 0 end day tuesday time 8 0 0
```

The following example specifies a timeslot that starts at 16:00:00 and ends at 09:00:00 on all days of the week. Also, as start time > end time, this timeslot spans the midnight too. I.e., from 16:00:00 to 23:59:59 and from 00:00:00 to 09:00:00.

```
start time 16 0 0 end time 9 0 0
```
Policy-Group is used to form a set of configured Policy-Maps for Traffic Policy feature. It applies multiple policies for a subscriber session flow within a destination context.

```
Exec Mode
    configure
    Global Configuration Mode
        context name
        Context Configuration Mode
        policy-group name name
        Traffic Policy Group Configuration Mode
```
end

Exits the context configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Change the mode back to the Exec mode.
**exit**

Exits the context configuration mode and returns to the global configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Return to the global configuration mode.
policy

This command assigns the traffic policies, pre-configured in Policy-Map configuration mode, to a Policy Group for flow-based traffic policing to a subscriber session flow.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax

```
[ no ] policy policy_map_name precedence value direction [ in | out ]
```

- **no**
  - Disables/removes configured policy for traffic policing.

- **direction [ in | out ]**
  - Specifies the direction in which the policies need to be applied.

- **policy_map_name**
  - Specifies the name of Policy-Map configured within a context to this policy group. A maximum of 16 policies can be assigned in a policy group.

- **precedence value**
  - Specifies the precedence of traffic policies to resolve. 
    - **value** is an integer in the range from 1 through 16. If a session flow matches multiple policies this keyword resolves them.

Usage
- Use this command to form a policy-group with a set of pre-configured Policy-Maps.

Example
- The following commands assigns the traffic policy policymap1 with precedence 2.
  
  ```
  policy policymap1 precedence 2
  ```
Chapter 201
Traffic Policy-Map Configuration Mode Commands

Policy-Map is used to configure a flow-based traffic policy for Traffic Policy feature within a destination context. It designates the flow treatment based on the classification rules configured in Class-Map mode for a subscriber session flow.
3gpp2 data-over-signaling

This command configures 3GPP2 related flow treatment policy for the flow-based traffic policing to subscriber session.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax

[ no ] 3gpp2 data-over-signaling marking

no
Disables configured 3GPP2 related flow treatment policy.

marking
Indicates 3GPP2 related traffic flow for data over signaling channel.

Usage
Use this command to mark traffic flows for 3GPP2 related policy.

Example
3gpp2 data-over-signaling marking
access-control

This command configures the access control action for traffic flow matching with Class-Map rules.

**Product**
PDSN, HA, ASN GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
access-control { allow | discard }
```

- **allow**
  This option allows the packets, if policy matches with the criteria defined in Class-Map assigned to the specific traffic policy.

- **discard**
  This option discards the packets, if policy matches with the criteria defined in Class-Map assigned to the specific traffic policy.

**Usage**

Configures the action or treatment for traffic flows matching with criteria specified in assigned Class-Map.

**Example**
The following command allows the packets or traffic flow on matching with criteria specified in assigned Class-Map for specific traffic policy.

```
access-control allow
```
accounting suppress

This command suppresses accounting action on traffic flow matching the policy map.

Product
PDSN, HA, ASN GW

Privilege
Security Administrator, Administrator

Syntax

[ no ] accounting suppress

no
Removes the suppression of accounting for traffic flow matching this policy map.

Usage
Use this command to suppress accounting action on traffic flow matching this policy map. Policy maps configured for accounting suppression are used to implement the QChat Billing Suppression feature to selectively start and terminate accounting sessions based on the categorization of traffic as being interesting or non-interesting. See the accounting trigger command.

Example
The following command configures suppression of accounting on traffic flows matching this policy map:

accounting suppress
accounting trigger

This command configures an accounting trigger policy map to selectively start and terminate accounting sessions based on the categorization of traffic as being interesting or non-interesting to support the QCHAT Billing Suppression feature.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

[ no | default ] accounting trigger { inactivity-timeout | interesting-traffic | intra-service-handoff }

default
Sets / Restores default value assigned for specified parameter.

no
Disables previously configured triggers.

inactivity-timeout
Generates an accounting stop message if there has been no data activity on the session for the interim accounting timeout interval.
Default: disabled

interesting-traffic
Generates an accounting start message upon arrival of interesting traffic.
Default: disabled

intra-service-handoff
Generates accounting start and stop messages during intra service handoffs within the same service.
Default: enabled
If this is disabled, the messages are suppressed during the handoffs. The current accounting session continues and no stop or start messages are generated during the intra service handoff.

Usage

Use this command to configure an accounting trigger policy map (ATPM) to selectively start and terminate accounting sessions based on the categorization of traffic as being interesting or non-interesting to support the QChat Billing Suppression feature.
Interesting traffic is identified as traffic that does not match any of the other Accounting Policy Maps (APMs) configured for accounting suppression. See the `accounting suppress` command.
An ATPM is similar to an APM, but without the class map rules. The ATPM is configured as of type accounting using the `type accounting` command.
In the ATPM, the trigger to start accounting for interesting traffic is configured using the `accounting trigger interesting-traffic` command. Accounting Start is triggered on arrival of interesting traffic, or change in airlink parameters conveyed through active-start airlink record. If an active-start record was included in the initial connection setup, Accounting Start is not triggered. But if the active-start comes separately and is the first one for the session, it is treated as airlink change and an Accounting Start is sent. Optionally, timeout can be triggered when there is no data traffic for the interim accounting timeout interval using the `accounting trigger inactivity-timeout stop` command. On timeout, the accounting session is terminated and an Accounting Stop message is sent. A new accounting session is created if interesting traffic resumes.

The ATPM should have the lowest precedence among the APMs. As the airlink events are generated on the ingress side, the ATPM must be included in a policy group that is applied to the ingress direction in the subscriber profile. The configuration is applicable only for standard trigger policy and session based accounting mode.

**Example**
The following command sets the trigger to generate accounting start message upon arrival of interesting traffic:

```
accounting trigger interesting-traffic
```
class-map

This command assigns a traffic classification rule (Class-Map) to the policy map.

**Product**
PDSN, HA, ASN GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
    class-map name
```

`name`

Specifies the name of the class map assigned for this policy map. The class map should be one that was configured in the Class Map Configuration Mode.

`name` must be the name of a class map, and must be a string of 1 through 15 characters in length.

**Usage**
Use this command to assigns a class map to the policy map for traffic policing. The class map is configured in the Class Map Configuration Mode.

**Example**
The following command assigns the class map classification1 to the current policy map:

```
class classification1
```
end

This command exits the current mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to change to the Exec mode.
exit

This command exits the current mode and returns to the parent mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent mode.
flow-tp-trigger

This command specifies that the traffic volume will be calculated based on the traffic on the flow.

Product
PDSN, HA, ASN GW

Privilege
Security Administrator, Administrator

Syntax

flow-tp-trigger volume

no flow-tp-trigger volume

    volume
    Specifies the volume threshold to trigger traffic policing.
    volume is the value in bytes, and must be an integer from 1 through 4294967295.

Usage
This command is available if you have purchased and installed the Intelligent Traffic Control License on your system. Use this command to calculate the traffic volume based on the traffic on the flow.

Example

flow-tp-trigger 500
ip header-compression

Enables the system to mark IP flows for RObust Header Compression.

**Product**
PDSN, HA, ASN GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] ip header-compression rohc flow-marking
```

- **no**
  Disables the setting.

- **rohc flow-marking**
  Marks the IP flow for SO67 and PPP ROHC.

**Usage**

Use this command to mark IP flows for SO67 and PPP ROHC.

**Example**

```
ip header-compression rohc flow-marking
```
qos encaps-header

Enables and configures Quality of Service (QoS) policy to use Differentiated Service Code Point (DSCP) marking in IP header field for the flow-based traffic policing to subscriber session flow.

**Product**
PDSN, HA, ASN GW

**Privilege**
Security Administrator, Administrator

**Syntax**
```
qos encaps-header dscp-marking ( dscp_code | copy-from-user-datagram | ignore-pcf-signaled-dscp | user-datagram )
```

- **dscp_code**
  Specifies the DSCP code value marked in IP header of packet/flow to determine the QoS for traffic policing. The value must be expressed as a hexadecimal value from 0x00 through 0x3F.

- **copy-from-user-datagram**
  Specifies to use DSCP code value from user datagram (UDP header) to determine the QoS for traffic policing.

- **ignore-pcf-signaled-dscp**
  Specifies to override the highest priority DSCP value signaled by the PCF.

- **user-datagram**
  Specifies to use the DSCP value copied from the user datagram.

**Usage**
Use this command to apply the QoS policy based on DSCP code value encapsulated in IP packet header or User datagram packet to subscriber session flow for flow-based traffic policing.

**Important**: Details on the QoS traffic policing functionality is located in the System Administration and Configuration Guide.

**Example**
The following command sets QoS policy with DSCP code value to 0x0C for Class 1, silver (AF12):
```
qos encaps-header dscp-marking 0x0C
```
qos traffic-police

Enables and configures Quality of Service (QoS) policy for the flow-based traffic policing to subscriber session flow on per-flow basis.

**Product**
PDSN, HA, ASN GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
qos traffic-police committed bps peak bps burst-size bytes exceed-action { drop | lower-ip-precedence | allow } violate-action { drop | lower-ip-precedence | allow }

burst-size bytes
Default: 3000
The peak burst size allowed, in bytes.
bytes must be an integer from 0 through 4294967295.
```

**Important:** It is recommended that this parameter be configured to at least the greater of the following two values: 1) 3 times greater than packet MTU for the subscriber connection, OR 2) 3 seconds worth of token accumulation within the “bucket” for the configured peak-data-rate.

```plaintext
committed bps
Default: 144000
The committed data rate (guaranteed-data-rate) in bps (bits per second).
bps must be an integer from 0 through 4294967295.
```

```plaintext
exceed-action { drop | lower-ip-precedence | allow }
Default: lower-ip-precedence
The action to take on the packets that exceed the committed-data-rate but do not violate the peak-data-rate.
The following actions are supported:
drop: Drop the packet
lower-ip-precedence: Transmit the packet after lowering the ip-precedence
allow: Transmit the packet
```

```plaintext
peak bps
Default: 256000
Specifies the peak data-rate for the subscriber, in bps (bits per second).
bps must be an integer from 0 through 4294967295.
```

```plaintext
violate-action { drop | lower-ip-precedence | allow }
Default: drop
The action to take on the packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:
drop: Drop the packet
```
**qsos traffic-policy**

**lower-ip-precedence**: Transmit the packet after lowering the IP precedence

**allow**: Transmit the packet

---

**Usage**

Use this command to apply the QoS policy to subscriber session flow for flow-based traffic policing.

---

**Important**: Details on the QoS traffic policing functionality are located in the System Administration.

---

**Example**

The following command sets committed data rate of 102400 bps with peak data rate of 128000 bps and burst size 2048 bytes. This lowers the IP precedence when the committed-data-rate exceeded and drops the packets when peak-data-rate are violated:

```
qos traffic-policy committed 102400 peak-data-rate 128000 burst-size 2048 exceed-action lower-ip-precedence violate-action drop
```
**qos user-datagram dscp-marking**

Enables and configures Quality of Service (QoS) policy related to differentiated service code point (DSCP) marking in user datagram of subscriber session flow on per-flow basis.

**Product**
PDSN, HA, ASN GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
qos user-datagram dscp-marking dscp_code
```

*dscp_code*

Specifies the DSCP code value marked in IP header of packet/flow to determine the QoS for traffic policing. The value must be expressed as a hexadecimal value from 0x00 through 0x3F.

**Usage**

Use this command to apply the QoS policy to subscriber session flow by DSCP marking in user datagram.

**Example**
The following command sets DSCP marking for user datagram as 0x01 for QoS to subscriber session flow:

```
qos user-datagram dscp-marking 0x01
```
**sess-tp-trigger**

This command configures the trigger traffic control based on traffic volume on a session.

**Product**
PDSN, HA, ASN GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sess-tp-trigger volume
```

```
no sess-tp-trigger volume
```

*volume*

Specifies the traffic volume threshold to trigger traffic control. *volume* is a value in bytes from 1 to 4294967295.

**Usage**

This command is available if you have purchased and installed the Intelligent Traffic Control License on your system. Use this command to configure the trigger traffic control based on traffic volume on a session.

**Example**

```
sess-tp-trigger 500
```
**type**

This command specifies the type of traffic policy within specific Policy-Map.

**Product**
PDSN, HA, ASN GW

**Privilege**
Administrator

**Syntax**

```
type { accounting | dynamic ( three-gpp2 rev-A profile-id { any | id profile_id | range low_value to high_value } flow-id { any | id flow_id | range low_value to high_value } | pre-provisioned wimax asn-service-profile-id { any | id service_id } asn-pdfid { any | id pdf_id } | static | template }
```

**accounting**
Specifies the type of traffic policing as accounting for this specific policy map. This configuration is used for enabling/disabling the accounting of different flows matching with conditions within this Policy-Map.

**dynamic**
Identifies the type of policy map as dynamic.

**three-gpp2 rev-A**
Configures dynamic policy map type for CDMA2000-3GPP2 RevA service.

**profile-id { any | id profile_id | range low_hex to high_hex }**
Specifies the profile id matching in this policy map.

- **any** allows any profile identifier matching with in this policy map.
- **id profile_id** allows specific profile identifier matching with in this policy map. `profile_id` must be either a value in hexadecimal format from 0x0 to 0xFFFF or an integer from 0 to 65535.
- **range low_value to high_value** identifies a range in which a profile identifier must fall within to be considered a match. `low_value` and `high_value` must be either a value in hexadecimal format from 0x0 to 0xFFFF or an integer from 0 to 65535.

**flow-id { any | id flow_id | range low_hex to high_hex }**
Specifies the flow id matching in this policy map.

- **any** allows any flow identifier matching with in this policy map.
- **id flow_id** allows specific flow identifier matching with in this policy map. `flow_id` must be either a value in hexadecimal format from 0x0 to 0xFFFF or an integer from 0 to 65535.
- **range low_value to high_value** identifies a range in which a flow identifier must fall within to be considered a match. `low_value` and `high_value` must be either a value in hexadecimal format from 0x0 to 0xFFFF or an integer from 0 to 65535.

**pre-provisioned**
Identifies the type of policy map as pre-provisioned.
Traffic Policy-Map Configuration Mode Commands

⚠️

Cisco ASR 5000 Series Command Line Interface Reference

Traffic Policy

- Map Configuration

- Mode Commands

vic

Configures WiMAX service policy map in an ASN-GW service.

asn-service-profile { any | id service_id }

- Specifies the ASN Service profile identifier to match with in this policy map.
- `any`: Allows any ASN Service Profile Identifier matching within this policy map.
- `id service_id`: Allows specific Service Profile matching to a specified identifier. `service_id` must be an integer from 1 to 65535 and must match a service ID that was configured in the Subscriber Configuration Mode.

asn-pdfid { any | id pdf_id }

- Specifies the ASN Packet Data Flow Identifier to match with in this policy map.
- `any`: Allows any ASN Packet Data Flow Identifier matching within this policy map.
- `id pdf_id`: Allows specific Packet Data Flow matching to a specified identifier. `pdf_id` must be an integer from 1 to 255 and must match a PDF ID that was configured in the Subscriber Configuration Mode.

static

- Specifies the type of traffic policing as static for this specific Policy Map. In this type of policy, the traffic flow classification and flow treatment is pre-defined with classification rules through Class-Map configuration.
- This is the detailed type of policy map.

template

- Specifies the type of traffic policy to as a template to all subscribers associated with this policy map.

Usage

- Specifies the type of traffic policy within the specific Policy-Map.

Example

- The following commands configures the traffic policy for this Policy-Map as static:
  - `type static`
- The following commands configures the traffic policy for this Policy-Map as pre-provisioned for WiMAX service requiring a match of any service profile and PDF id of 3:
  - `type pre-provisioned wimax asn-service-profile any asn-pdfid id 3`
Chapter 202
Tunnel Interface Configuration Mode Commands

The Tunnel Interface Configuration Mode is used to create and manage the IP interfaces for various type of tunnels and its parameters like addresses, address resolution options, etc.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
description

Configures the description text for the current interface.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

description <text>

no description

- **no**
  
  Clears the description for the interface.

- **text**
  
  Specifies the descriptive text to use. *text* must be 0 to 79 alpha and/or numeric characters with no spaces or a quoted string of printable characters. The interface description is case sensitive.

**Usage**

Set the description to provide useful information on the interface’s primary function, services, end users, etc. Any information useful may be provided.

**Example**

Following command sets the description about this interface:

```bash
description sampleInterfaceDescriptiveText
```
end

Exits the interface configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Change the mode back to the Exec mode.
exit

Exits the Interface Configuration Mode and returns to the Context Configuration Mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Return to the context configuration mode.
ip address

This command configures the IPv4 address for the specific tunnel interface.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
ip address [ip_address/ip_mask | ip_address ip_mask]
```

```
o ip address ip_address
```

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removes the configured IPv4 address bound to a tunnel interface.</td>
</tr>
</tbody>
</table>

```
[ip_address/ip_mask | ip_address ip_mask]
```

| Specifies a destination IP address or group of addresses that will use this route. |

```
ip_address/ip_mask: Specifies a combined IP address subnet mask bits to indicate what IP addresses are included in the route. ip_address/ip_mask must be specified using the form ‘IP Address/Mask Bits’ where the IP address is specified using the standard IPv4 dotted decimal notation and the mask bits are a numeric value which is the number of bits in the subnet mask. |
```

```
ip_address ip_mask: Specifies an IP address and the networking (subnet) mask pair which is used to identify the set of IP addresses to which the route applies. ip_address must be specified using the standard IPv4 dotted decimal notation. ip_mask must be specified using the standard IPv4 dotted decimal notation as network mask for subnets. The mask as specified by ip_mask or resulting from ip_address/ip_mask is used to determine the network for packet routing. 0’s in the resulting mask indicate the corresponding bit in the IP address is not significant in determining the network for packet routing. 1’s in the resulting mask indicate the corresponding bit in the IP address is significant in determining the network. |
```

Usage

Use this command to bind the IPv4 address to a tunnel interface. This address does not affect the encapsulation of packets going out on the tunnel interface.

Example

The following command will assign the 1.2.3.4 as IPv4 address to this tunnel interface:

```
ip address 1.2.3.4
```
**ipv6 address**

This command configures the IPv6 address for the specific tunnel interface.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
ipv6 address ipv6_address/ipv6_mask
no ipv6 address ipv6_address
```

**no**

Removes the configured IPv6 address bound to a tunnel interface.

```
ipv6_address/ipv6_mask
```

Specifies a destination IP address or group of addresses that will use this route. `ipv6_address/ipv6_mask`: Specifies a combined IP address subnet mask bits to indicate what IP addresses to which the route applies. `ipv6_address/ipv6_mask` must be specified using the form ‘IP Address/Mask Bits’ where the IP address is specified using the standard IPv4 dotted decimal notation and the mask bits are a numeric value which is the number of bits in the subnet mask.

**Usage**

Use this command to bind the IPv6 address to a tunnel interface. This address does not affect the encapsulation of packets going out on the tunnel interface.

**Example**

The following command will assign the `1001::2:010:1234` as IPv4 address to this tunnel interface:

```
ipv6 address 1001::2:010:1234
```
tunnel-mode

This command configures the tunnel mode type for specific tunnel interface. It also creates the specific tunnel configuration mode if required.

Product
All

Privilege
Security Administrator, Administrator

Syntax

tunnel-mode {gre | ipv6ip}
default tunnel-mode

default
Sets the default tunnel mode for this interface. By default tunnel mode is set to IPv6-to-IPv4 type.

gre
Default: Disabled
This keyword sets the tunnel interface mode to GRE type and creates the GRE tunnel Configuration mode if required.

ipv6ip
Default: Enabled
This keyword sets the tunnel interface mode to IPv6-to-IPv4 type and creates the IPv6-to-IPv4 Tunnel Configuration mode, if required.

Usage
Use this command to set the tunnel mode type of GRE or IPv6-to-IPv4 for tunneling interface.

Example
The following command sets the tunnel mode to GRE for specific interface:

    tunnel-mode gre
Chapter 203
UDR Format Configuration Mode Commands

The UDR Configuration Mode enables configuring User Detail Record (UDR) formats. UDR file formats are represented in Comma Separated Value (CSV).

<table>
<thead>
<tr>
<th>Exec Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>active-charging service name</td>
</tr>
<tr>
<td>ACS Configuration Mode</td>
</tr>
<tr>
<td>udr-format name</td>
</tr>
<tr>
<td>UDR Format Configuration Mode</td>
</tr>
</tbody>
</table>

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
attribute

This command specifies the order of fields in the UDR.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
```

```
o attribute attribute [ priority priority ]
```

- **no**
  - Removes the specified attribute configuration.

- **attribute**
  - Specifies the attribute.
  - `attribute` must be one of the following:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diameter-session-id</td>
<td>Unique Diameter session identifier.</td>
</tr>
<tr>
<td></td>
<td><strong>Important:</strong> This attribute is customer specific, and is only available in Release 8.3 and later releases.</td>
</tr>
<tr>
<td>radius-called-station-id</td>
<td>Called Station ID of the mobile handling the flow.</td>
</tr>
<tr>
<td>radius-calling-station-id</td>
<td>Calling Station ID of the mobile handling the flow.</td>
</tr>
<tr>
<td>radius-fa-nas-identifier</td>
<td>RADIUS NAS identifier of Foreign Agent (FA).</td>
</tr>
<tr>
<td>radius-fa-nas-ip-address</td>
<td>RADIUS IP address of Foreign Agent (FA).</td>
</tr>
<tr>
<td>radius-nas-identifier</td>
<td>RADIUS NAS identifier.</td>
</tr>
<tr>
<td>radius-nas-ip-address</td>
<td>RADIUS NAS IP address.</td>
</tr>
<tr>
<td>radius-user-name</td>
<td>User name associated with the flow.</td>
</tr>
<tr>
<td>sn-3gpp2-bsid</td>
<td>This option is obsolete. To configure this attribute see the <code>rule-variable</code> command.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>sn-3gpp2-carrier-id</td>
<td>This option is obsolete. To configure this attribute see the <code>rule-variable</code> command.</td>
</tr>
<tr>
<td>sn-3gpp2-esn</td>
<td>This option is obsolete. To configure this attribute see the <code>rule-variable</code> command.</td>
</tr>
<tr>
<td>sn-3gpp2-meid</td>
<td>This option is obsolete. To configure this attribute see the <code>rule-variable</code> command.</td>
</tr>
<tr>
<td>sn-3gpp2-service-option</td>
<td>This option is obsolete. To configure this attribute see the <code>rule-variable</code> command.</td>
</tr>
<tr>
<td>sn-acct-beginning-session</td>
<td>Session beginning information. Important: This attribute is customer specific, and is only available in Release 8.3 and later releases.</td>
</tr>
<tr>
<td>sn-acct-session-continue</td>
<td>Session continue information. Important: This attribute is customer specific, and is only available in Release 8.3 and later releases.</td>
</tr>
<tr>
<td>sn-acct-session-id</td>
<td>Indicator for the accounting session Identifier.</td>
</tr>
<tr>
<td>sn-acct-session-time</td>
<td>Duration from acct-status-type:start to acct-status-type:stop. Important: This attribute is customer specific, and is only available in Release 8.3 and later releases.</td>
</tr>
<tr>
<td>sn-acct-status-type</td>
<td>Accounting status identifier. Important: This attribute is customer specific, and is only available in Release 8.3 and later releases.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>sn-charging-type</td>
<td>Charging type:</td>
</tr>
<tr>
<td></td>
<td>- offline</td>
</tr>
<tr>
<td></td>
<td>- online</td>
</tr>
<tr>
<td></td>
<td><strong>Important</strong>: This attribute is customer specific, and is only available in Release 8.3 and later releases.</td>
</tr>
<tr>
<td>sn-closure-reason</td>
<td>Includes reason for the termination of the flow/UDR:</td>
</tr>
<tr>
<td></td>
<td>- 0: normal, i.e., subscriber session ended</td>
</tr>
<tr>
<td></td>
<td>- 1: handoff control processing specified</td>
</tr>
<tr>
<td></td>
<td>- 2: subscriber session terminated</td>
</tr>
<tr>
<td></td>
<td>- 3: flow timeout</td>
</tr>
<tr>
<td>sn-content-id</td>
<td>Unique identifier for the content-id.</td>
</tr>
<tr>
<td>sn-content-label</td>
<td>Identifier for text label for content-id.</td>
</tr>
<tr>
<td>sn-content-vol</td>
<td>Identifier for content volume.</td>
</tr>
<tr>
<td>sn-correlation-id</td>
<td>RADIUS correlation identifier.</td>
</tr>
<tr>
<td>sn-duration</td>
<td>Duration between the last and first packet for the record.</td>
</tr>
<tr>
<td>sn-end-time [ format ]</td>
<td>Timestamp for last packet of flow in UTC.</td>
</tr>
<tr>
<td></td>
<td>[ format ]</td>
</tr>
<tr>
<td>sn-fa-correlation-id</td>
<td>RADIUS Correlation Identifier of the Foreign Agent (FA).</td>
</tr>
<tr>
<td>sn-fa-ip-address</td>
<td>FA IP address.</td>
</tr>
<tr>
<td>sn-filler-blank</td>
<td>Keeps attributes place blank and generates an empty UDR field.</td>
</tr>
<tr>
<td>sn-filler-zero</td>
<td>Fills ‘0’ for this attribute place in the EDR/UDR.</td>
</tr>
<tr>
<td>sn-format-name</td>
<td>Indicates the name of the UDR/EDR format used.</td>
</tr>
<tr>
<td>sn-group-id</td>
<td>Indicates the sequence group identifier for the records.</td>
</tr>
<tr>
<td>sn-ha-ip-address</td>
<td>Home Agent IP address.</td>
</tr>
<tr>
<td></td>
<td><strong>Important</strong>: This attribute is customer specific, and is only available in 8.3 and later releases.</td>
</tr>
<tr>
<td>sn-local-seq-no</td>
<td>Unique local sequence number of UDR identifier per ACSMgr and linearly increasing in UDR file.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>sn-ocs-ip-address</td>
<td>Online Charging Server's IP address.</td>
</tr>
<tr>
<td></td>
<td><strong>Important:</strong> This attribute is customer specific, and is only available in</td>
</tr>
<tr>
<td></td>
<td>Release 8.3 and later releases.</td>
</tr>
<tr>
<td>sn-rulebase</td>
<td>Indicates the name of the ACS rulebase used.</td>
</tr>
<tr>
<td>sn-sequence-no</td>
<td>Unique sequence number (per <code>sn-sequence-group</code> and <code>radius-nas-ip-address</code>)</td>
</tr>
<tr>
<td></td>
<td>of UDR identifier and linearly increasing in UDR file.</td>
</tr>
<tr>
<td>sn-served-bsa-addr</td>
<td>Indicator for address of Base Station Area being served.</td>
</tr>
<tr>
<td>sn-service-name</td>
<td>Indicator for ACS service name.</td>
</tr>
<tr>
<td>sn-st16-ip-addr</td>
<td>IP address of the chassis handling this flow.</td>
</tr>
<tr>
<td></td>
<td><strong>Important:</strong> This attribute is interchangeable with <code>radius-nas-ip-address</code> for other systems.</td>
</tr>
<tr>
<td>sn-start-time [ format ]</td>
<td>Timestamp for first packet of flow in UTC.</td>
</tr>
<tr>
<td>sn-stream-number</td>
<td>Unique UDR billing record identifier.</td>
</tr>
<tr>
<td></td>
<td><strong>Important:</strong> This attribute is customer specific, and is only available in</td>
</tr>
<tr>
<td></td>
<td>Release 8.3 and later releases.</td>
</tr>
<tr>
<td>sn-subscriber-id</td>
<td>Indicator for subscriber ID.</td>
</tr>
<tr>
<td>sn-subscriber-nat-flow-ip</td>
<td>NAT IP address(es) of NAT-enabled subscriber.</td>
</tr>
<tr>
<td>sn-timestamp</td>
<td>Timestamp when the UDR is actually generated.</td>
</tr>
<tr>
<td></td>
<td><strong>Important:</strong> This attribute is customer specific, and is only available in</td>
</tr>
<tr>
<td></td>
<td>Release 8.3 and later releases.</td>
</tr>
</tbody>
</table>

Specifies the timestamp format.

**localtime**

Specifies the local time. By default, timestamps are displayed in GMT.

```plaintext
{ bytes | pkts } { downlink | uplink }
```

Specifies bytes/packets sent/received from/by mobile.

**priority priority**

Specifies the position priority of the value within the UDR. Lower numbered priorities (across all attribute, event-label, and rule-variable) occur first.

*priority* must be an integer from 1 through 65535. Up to 50 position priorities (across all attribute, event-label, and rule-variable) can be configured.

**Usage**

Use this command to set the attributes and priority for UDR file format.

A particular field in UDR format can be entered multiple times at different priorities. While removing the UDR field using the `no attribute` command either you can remove all occurrences of a particular field by specifying the field name or a single occurrence by additionally specifying the optional *priority* keyword.

**Example**

```plaintext
attribute radius-user-name priority 12
```
end

This command returns the CLI prompt to the Exec mode.

Product
- All

Privilege
- Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to change to the Exec mode.
event-label

This command configures an optional event ID to use in generated billing records.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
event-label label priority priority
no event-label
```

- **no**
  Removes the previously configured event label for UDR attribute.

- **label**
  Specifies event label for attribute to be used for UDR format.
  *label* must be an alpha and/or numeric string of 1 through 63 characters in length.

- **priority priority**
  Specifies the CSV position of event ID in UDR.
  *priority* must be an integer from 1 through 65535.

**Usage**

Use this command to set the event ID and its position in UDR file format.

**Example**

```
event-label radius_csv1 priority 23
```
exit

This command exits the UDR Format Configuration Mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
exit
```

Usage
Use this command to return to the parent configuration mode.
rule-variable

This command specifies the order of fields in the UDR.

Product
All

Privilege
Security Administrator, Administrator

Syntax

rule-variable protocol rule priority priority

no rule-variable [ priority priority ] protocol rule

removes the rule-variable protocol configuration.

protocol rule

Specifies the rule variable for UDR format.

protocol must be one of the following with specified rule:

• bearer 3gpp2: Bearer-related configuration:

  • always-on
  • bsid
  • carrier-id
  • esn
  • ip-qos
  • ip-technology
  • meid
  • release-indicator
  • serv-MDN
  • service-option
  • session-begin
  • session-continue

**Important:** For more information on protocol-based rules see the Ruledef Configuration Mode Commands chapter.

priority priority

Specifies the CSV position of the value in the UDR.

priority must be an integer from 1 through 65535.
Usage
Use this command to set the rule variables priority for UDR file format.
A particular field in UDR format can be entered multiple times at different priorities. While removing the
UDR field using the `no rule-variable` command either you can remove all occurrences of a particular
field by specifying the field name or a single occurrence by additionally specifying the optional priority
keyword.

Example
```
rule-variable bearer 3gpp2 bsid priority 36
```
Chapter 204
UDR Module Configuration Mode Commands

To access the UDR Module Configuration Mode, in the Context Configuration Mode, enter the udr-module active-charging-service command.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
cdr

This command configures the EDR/UDR file parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```plaintext
cdr [ push-interval value ] [ push-trigger space-usage-percent trigger_percentage ] [ remove-file-after-transfer ] [ transfer-mode { pull | push primary { encrypted-url enc_url | url url } [ via local-context ] [ secondary { encrypted-secondary-url enc_sec_url | url sec_url } ] } ] + | use-harddisk ]
```

```plaintext
no cdr [ remove-file-after-transfer | use-harddisk ] +
```

```plaintext
default cdr [ push-interval | push-trigger space-usage-percent | remove-file-
after-transfer | transfer-mode [ push via ] | use-harddisk ] +
```

```plaintext
no
```

Disables the configured CDR storage and CDR file processing in this mode:

- **remove-file-after-transfer**: Retains a copy of the file even after it has been pushed or pulled to another server.
- **use-harddisk**: Disables data storage on the SMC harddisk.

**Important**: `use-harddisk` keyword is available only on the ASR 5000 chassis.

**Important**: `use-harddisk` keyword is only available on ASR 5000 chassis.

```plaintext
push-interval value
```

Default: 300

Specifies the transfer interval, in seconds, to push EDR and UDR files to an external file server.
value must be an integer from 60 through 3600.

push-trigger space-usage-percent trigger_percentage

Default: 80%
Specifies the EDR/UDR disk space utilization percentage, upon reaching which an automatic push is triggered and files are transferred to the configured external server. trigger_percentage specifies the EDR/UDR disk utilization percentage for triggering push, and must be an integer from 10 through 80.

remove-file-after-transfer

Default: Disabled
Specifies that the system must delete EDR/UDR files after they are transferred to the external file server.

transfer-mode { pull | push primary [ encrypted-url enc_url | url url ] [ via local-context ] [ secondary [ encrypted-secondary-url enc_sec_url | secondary-url sec_url ] ] }

Specifies the EDR/UDR file transfer mode.
- pull: Specifies that the L-ESS is to pull the CDR files.
- push: Specifies that the system is to push CDR files to the configured L-ESS.
- primary encrypted-url enc_url: Specifies the primary URL location in encrypted format to which the system pushes the CDR files. enc_url must be the location name in an encrypted format, and must be an alpha and/or numeric string of 1 through 1024 characters in length.
- primary url url: Specifies the primary URL location to which the system pushes the CDR files. url must be an alpha and/or numeric string of 1 through 1024 characters in the //user:password@host:[port]/directory format.
- via local-context: Configuration to select LC/SPIO for transfer of CDRs. The system pushes the UDR files via SPIO in the local context.
- encrypted-secondary-url enc_sec_url: Specifies the secondary URL location in encrypted format to which the system pushes the CDR files when the primary location is unreachable or fails. enc_sec_url must be the location name in an encrypted format, and must be an alpha and/or numeric string of 1 through 1024 characters in length.
- secondary-url sec_url: Specifies the secondary URL location to which the system pushes the CDR files when the primary location is unreachable or fails. sec_url must be an alpha and/or numeric string of 1 through 1024 characters in //user:password@host:[port]/directory format.

use-harddisk

Default: Disabled
Specifies that on ASR 5000 chassis the hard disk on the SMC be used to store EDR/UDR files. On configuring to use the hard disk for EDR/UDR storage, EDR/UDR files are transferred from RAMFS on the PSC to the hard disk on the SMC.

Important: use-harddisk keyword is available only on the ASR 5000 chassis.

+ Indicates that more than one of the previous keywords can be entered within a single command.
Usage

Use this command to configure how charging data records (CDR) are moved and stored.

On the ASR 5000 chassis, run this command only from the local context. Running in any other context would fail and deliver an error message.

The **use-harddisk** keyword is only available on the ASR 5000 system. This command can be run only in a context where CDRMOD is running. Configuring in any other context will result in failure with the message “Failure: Please Check if CDRMOD is running in this context or not.”

This config can be applied either in the EDR/UDR module, but will be applicable both to the EDR and UDR modules. Configuring in one of the modules prevents the configuration to be done in the other module.

If PUSH transfer mode is selected, the L-ESS server URL to which the CDR files need to be transferred must be specified. The configuration allows a primary and a secondary server to be configured. Configuring the secondary server is optional. Whenever a file transfer to the primary server fails for four consecutive times, the files will be transferred to the secondary server. The transfer will switch back to the original primary server when:

- Four consecutive transfer failures to the secondary server occur
- After switching from the primary server, 30 minutes elapses

When changing **transfer-mode** from pull to push, disable the PULL from L-ESS and then change the transfer mode to push. Make sure that the push server URL configured is accessible from the local context. Also, make sure that the base directory that is mentioned contains udr directory created within it.

When changing **transfer-mode** from push to pull, after changing, enable PULL on the L-ESS. Any of the ongoing PUSH activity will continue till all the scheduled file transfers are completed. If there is no PUSH activity going on at the time of this configuration change, all the PUSH related configuration is nullified immediately.

Example

The following command configures the system to retain a copy of the data file after it has been transferred to the storage location:

```
no cdr remove-file-after-transfer
```
end

This command returns the CLI prompt to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Use this command to change to the Exec mode.
exit

This command exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
file

This command sets UDR file parameters.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
default file [ charging-service-name ] [ compression ] [ current-prefix ] [ delete-timeout ] [ directory ] [ field-separator ] [ file-sequence-number ] [ headers ] [ name ] [ reset-indicator ] [ rotation { num-records | time | volume } ] [ sequence-number ] [ storage-limit ] [ time-stamp ] [ trailing-text ] [ udr-seq-num ]
```

---

**default**
Using default file will reset some but not all keyword parameters to their default values. To ensure that the default is reset for a specific parameter, include the keyword in the default file syntax.

---

**charging-service-name { include | omit }**
Configures the inclusion and exclusion of charging service name in the file name.
Default: include
- **include**: Sets this command to include the Charging service name in UDR file name.
- **omit**: Sets this command to exclude or omit the Charging service name from UDR file name.

---

**compression { gzip | none }**
Configures the compression of the UDR file.
Default: none
- **gzip**: Enables GNU zip compression of the UDR file at approximately 10:1 ratio.
- **none**: Disables Gzip compression.

---

**current-prefix string**
Default: curr
Specifies a string to add to the beginning of the UDR file that is currently being used to store UDR records.
*string* must be an alpha and/or numeric string of 1 through 31 characters in length.

---

**delete-timeout seconds**
Default: Disabled
Specifies a time period, in seconds, when completed UDR files are deleted. By default, files are never deleted. *seconds* must be an integer from 3600 through 31536000.

---

**directory dir_name**
Default: /records/udr
Specifications a subdirectory in the default directory in which to store UDR files. `dir_name` must be an alpha and/or numeric string of 1 through 191 characters in length.

**exclude-checksum-record**

Default: Disabled, inserts checksum record into the UDR file header. When entered, this keyword excludes the final record containing `#CHECKSUM` followed by the 32-bit cyclic redundancy check (CRC) of all preceding records from the UDR file.

**field-separator { hyphen | omit | underscore }**

Specifies the field separators between two fields of UDR file name. Default: underscore

- **hyphen**: specifies the field separator as `-' (hyphen) symbol between two fields.
- **omit**: removes or omits the field separator between two fields.
- **underscore**: specifies the field separator as `_' (underscore) symbol between two fields.

**file-sequence-number rulebase-seq-num**

Generates unique file sequence numbers for different rulebase-formatname combinations.

**headers**

Includes a file header summarizing the record layout.

**name file_name**

Default: udr

Specifies a string to use as the base file name for UDR files. `file_name` must be an alpha and/or numeric string of 1 through 31 characters in length. The file name format is as follows:

```
base_rulebase_format_sequencenum_timestamp
```

- **base**: Specifies type of record in file or contains the operator-specified string. Default is `udr`.
- **rulebase**: Specifies the name of the Rulebase. UDRs from different Rulebases go into different UDR files.
- **format**: Specifies the name of the UDR format if `single-udr-format` is specified else the format field (and the trailing underscore) is omitted from the file name.
- **sequencenum**: This is a 5-digit sequence number to detect the missing file sequence. It is unique among all UDR files on the system.
- **timestamp**: Contains a timestamp based on file creation time in UTC time in MMDDYYYYHHMMSS format.

UDR files that have not been closed have a string added to the beginning of their file names. File name for a UDR file in CSV format that contains information for rule base named rulebase1 and a UDR schema named udr_schema1 appears as follows:

```
udr_rulebase1_udr_schema1_00005_01302006143409
```

If file name is not configured it creates files for EDRs/UDRs/FDRs (xDRs) having following name template with limits to 256 characters:

```
basename_ChargSvcName__timestamp_SeqNumResetIndicator_FileSeqNumber
```

- **basename**: A global-based configurable text string that is unique per system that uniquely identifies the global location of the system running ECS.
ChargSvcName: A system context-based configurable text string that uniquely identifies a specific context-based charging service.

timestamp: Date and time at the instance of file creation. Date and time in the form of “MMDDYYHHmmSS” where HH is a 24-hour value from 00-23.

SeqNumResetIndicator: A one byte counter used to discern the potential for duplicated FileSeqNumber with a range of 0 through 255 which is incremented by a value of 1 for the following conditions:

Failure of an ECS software process on an individual PSC

Failure of the system such that a second system takes over (for example, a standby or backup chassis put in place according to Inter-chassis Session Recovery)

File Sequence Number (FileSeqNumber) rollover from 999999999 to 0

FileSeqNumber: unique file sequence number for the file with 9 digit integer having range from 000000000 to 999999999. It is unique on each chassis system.

File name for a closed xDR file in CSV format that contains information for ECS system xyz_city1 and charging service name prepaid2 with timestamp 12311969190000, and file sequence number counter reset indicator to 002 for file sequence number 034939002 appears as follows:

xyz_city1_preapaid2_12311969190000_002_034939002

File name for a running xDR file in CSV format that contains information for the same parameters for file sequence number 034939003 prefixed with curr_ and appears as follows:

curr_xyz_city1_preapaid2_12311969190000_002_034939002

reset-indicator

This option includes the reset indicator counter value from 0 to 255 in UDR file name and is incremented (by one) whenever any of the following conditions occur:

- An ACSMgr process fails
- A peer chassis has taken over in compliance with our Inter-chassis Session Recovery feature
- The sequence number-keyword has rolled over to zero

rotation { num-records records | time seconds | volume bytes }

Defaults:
num-records: 1024

time: 3600 seconds

volume: 102400 bytes

Specifies when to close a UDR file and create a new one.

num-records records: Specifies the number of records that should be added to the file. When the number of records in the file reaches the specified value, the file is complete. records must be an integer from 100 through 10240.

time seconds: Specifies the period of time to wait before closing the UDR file and creating a new one. seconds must be an integer from 30 through 86400.

volume bytes: Specifies the maximum size of the UDR file before closing it and creating a new one. bytes must be an integer from 51200 through 62914560. Note: Higher sets may provide the best compression ratio when the compression keyword is set to gzip.

sequence-number { length length | omit | padded | padded-six-length | unpadded }

Default: padded

Specifies including/excluding sequence number in the file name.
**length** *length*: Includes the sequence number with the specified length. *length* must be the file sequence number length with preceding zeroes in the file name, and must be an integer from 1 through 9.

**Important**: The **length** configuration is applicable in both EDR and UDR modules. When applied in both modules without the **file udr-seq-num** configuration, the minimum among the two values will come into effect for both the modules. With the **file udr-seq-num** config, each module will use its own value of length.

- **omit**: Excludes the sequence number from the file name.
- **padded**: Includes the padded sequence number with preceding zeros in the file name. This is the default setting.
- **padded-six-length**: Includes the padded sequence number with six preceding zeros in the file name.
- **unpadded**: Includes the unpadded sequence number in the file name.

**storage-limit** *limit*

Default: 33554432

Specifies deleting files when the specified amount of space, in bytes, is used up for UDR/EDR file storage on the PSCs RAM.

On ASR 5000 chassis, *limit* is an integer from 10485760 through 536870912.

**Important**: On ASR 5000 chassis, the total storage limit is 536870912 bytes (512 MB). This limit is for both UDR and EDR files combined.

**time-stamp** { expanded-format | rotated-format | unix-format }

Specifies the timestamp of when the file was created be included in the file name.

- **expanded-format**: Specifies the UTC MMDDYYYYHHMMSS format.
- **rotated-format**: Specifies the YYYYMMDDHHMMSS format.
- **unix-format**: Specifies the UNIX format of \( x.y \), where \( x \) is the number of seconds since 1/1/1970 and \( y \) is the fractional portion of the current second that has elapsed.

**trailing-text** *string*

Specifies the inclusion of arbitrary text string in the file name. *string* must be an alpha and/or numeric string of 1 through 30 characters in length.

**trap-on-file-delete**

Default: Disabled

This keyword instructs the system to send an SNMP notification (trap) when an EDR/UDR file is deleted due to lack of space.

**udr-seq-num**

Default: Disabled

Specifies that the file sequence numbers that are part of the UDR file names be independently generated. If disabled, a single set of sequence numbers are shared by both EDR files and UDRs.
file

xor-final-record
Default: Disabled
Specifies inserting an xor checksum (in place of the CRC checksum) into the UDR file header if the exclude-checksum-record keyword is left at its default setting.

More than one of the previous keywords can be entered within a single command.

Usage
Use this command to configure UDR file characteristics.

Example
The following command sets the prefix of the current active UDR file to current:

    file current-prefix current

The following command sets the base file name to UDRfile

    file name UDRfile
The VLAN Configuration Mode is used to create and manage Virtual LANs and their bindings between contexts.
**bind interface**

Configures a virtual interface to context association for the current VLAN.

**Product**
PDSN, HA, SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
bind interface interface_name context_name
no bind interface interface_name context_name
```

`no`
Indicates the binding between the virtual interface specified and the context specified is to be unbound for the current VLAN.

`interface_name`
Specifies the name of the virtual interface to be bound to the context. `interface_name` must be from 1 to 79 alpha and/or numeric characters.

`context_name`
Specifies the name of the context to be bound to the virtual interface. `context_name` must refer to a previously configured context.

**Usage**
Bind a virtual interface and context to allow the VLAN to provide service.

**Example**

```
bind interface sampleVirtual sampleContext
no bind interface sampleVirtual sampleContext
```
end

Exits the port configuration mode and returns to the Exec mode.

**Product**
PDSN, HA

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Change the mode back to the Exec mode.
exit

Exits the VLAN configuration mode and returns to the port configuration mode.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Return to the port configuration mode.
**ingress-mode**

This command toggles between enabling and disabling the port ingress mode.

**Product**
PDSN, HA, SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
-ingress-mode
```

**Usage**
Use this command to enable or disable the ingress mode for the port.

**Example**

```
ingress-mode
```
shutdown

Disables/enables traffic over the current VLAN.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax

```
shutdown
no shutdown
```

```
no
```

Enables the VLAN. When omitted the VLAN is shutdown.

Usage
Shut down a VLAN.
This command is necessary to bring a VLAN into service by enabling it via the `no` keyword.

Example
To disable a VLAN from sending or receiving network traffic use the following command:
```
shutdown
```
To enable a VLAN use the following command:
```
no shutdown
```
**vlan-map**

This command sets a single next-hop IP address so that multiple vlans can use a single next-hop gateway. `vlan-map` is associated with a specific interface.

**Product**
PDSN, HA, SGSN

**Privilege**
Security Administrator, Administrator

`vlan-map next-hop ip_address`

**Usage**
Use `vlan-map` to combine multiple vlan links to go through a single IP address. This feature is used in conjunction with nexthop forwarding and overlapping IP pools. After configuring the `vlan-map`, move to the Port Ethernet configuration mode to attach the `vlan-map` to a specific vlan.

**Example**
The following command sets an IPv4 for a next-hop gateway.

```
vlan-map next-hop 123.123.123.1
```
Chapter 206
x-header Format Configuration Mode Commands

The x-header Format Configuration Mode is used to create and configure extension-header (x-header) formats.

**Important:** This feature is license dependent. Please contact your local sales representative for more information.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

This command returns the CLI prompt to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to change to the Exec mode.
exit

This command exits the current configuration mode and returns the CLI prompt to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to change to the parent configuration mode.
**insert**

This command configures the x-header fields to be inserted in HTTP/WSP GET and POST request packets.

---

**Important:** This command is license dependent. Please contact your local sales representative for more information.

---

**Product**

ECS

**Privilege**

Security Administrator, Administrator

**Syntax**

In StarOS 8.0:

```
insert xheader_field_name { string-constant xheader_field_value | variable { bearer { 3gpp charging-id | ggsn-address | imsi | radius-calling-station-id | sgsn-address | sn-rulebase | subscriber-ip-address } | http { host | url } }
```

```
no insert xheader_field_name
```

In StarOS 8.1, StarOS 9.0 and later releases:

```
insert xheader_field_name { string-constant xheader_field_value | variable { bearer { 3gpp | apn | charging-characteristics | charging-id | imei | imsi | rat-type | sgsn-address | acr | customer-id | ggsn-address | mdn | radius-calling-station-id | session-id | sn-rulebase | subscriber-ip-address | username } [ encrypt ] | http { host | url } }
```

```
no insert xheader_field_name
```

---

**no**

Removes the specified x-header field configuration.

---

**xheader_field_name**

Specifies the x-header field name to be inserted in the packets.

- `xheader_field_name` must be an alpha and/or numeric string of 1 through 31 characters in length.
- Up to 10 fields can be inserted in each x-header format.

---

**string-constant xheader_field_value**

Specifies constant string value for x-header field to be inserted in the packets.

- `xheader_field_value` must be the x-header field value, and must be an alpha and/or numeric string of 1 through 63 characters in length.

---

**variable**

Specifies name of the x-header field whose value must be inserted in the packets.
bearer { 3gpp { apn | charging-characteristics | charging-id | imei | imsi | rat-type | sgsn-address } | acr | customer-id | ggsn-address | mdn | radius-calling-station-id | session-id | sn-rulebase | subscriber-ip-address | username } [ encrypt ]

Specifies value of x-header field to be inserted:

- **3gpp**: 3GPP service
  - **apn**: APN of the bearer flow. This field is deprecated from under `bearer apn` and has been added within `bearer 3gpp apn`
  - **charging-characteristics**: Charging characteristics of the bearer flow
  - **charging-id**: Charging ID of the bearer flow
  - **imei**: IMEI or IMEISV (depending on the case) associated with the bearer flow
  - **imsi**: Specific Mobile Station Identification number.
  - **rat-type**: This field is deprecated from under `bearer rat-type` and has been added within `bearer 3gpp rat-type`
  - **sgsn-address**: SGSN associated with the bearer flow
  - **acr**: Anonymous Customer Reference. Only MSISDN part of this is encrypted, if encrypt flag is set.
  - **customer-id**: Customer ID of the bearer
  - **ggsn-address**: GGSN IP address field
  - **imsi**: This field is deprecated from within `bearer imsi` and has been moved within `bearer 3gpp imsi`
  - **mdn**: MDN of the bearer flow
  - **radius-calling-station-id**: Calling Station ID of the mobile handling the flow
  - **session-id**: Accounting session ID of the bearer flow
  - **sn-rulebase**: Name of the ECS rulebase
  - **sgsn-address**: This field is deprecated from under `bearer sgsn-address` and has been moved within `bearer 3gpp sgsn-address`
  - **subscriber-ip-address**: Subscriber IP address
  - **username**: User name of the bearer flow

**encrypt**: Specifies encryption of x-header field configuration. This option must only be configured in the case of x-header encryption feature.

http { host | url }

Specifies value of the x-header field to be inserted:

- **host**: Host
- **url**: Uniform Resource Locator

**Usage**

Use this command to configure the x-header fields to be inserted in HTTP/WSP GET and POST request packets. The x-headers would be inserted at the end of HTTP/WSP header. This CLI command may be used up to 10 times. There is no control over the order of the fields that are to be inserted. Any of the indicated
ruledef variables may be inserted using the variable option, or a static string may be inserted using the string-constant option. Operators may insert x-headers in some HTTP/WSP packets, for which some rules will be configured. The charging-action associated with these rules will contain the list of x-headers to be inserted in the packets.

Example
The following command configures an x-header field named test12 with a constant string value of testing to be inserted in HTTP/WSP GET and POST request packets:

```
insert test12 string-constant testing
```
