Security Administrator, Administrator

Syntax

file [ charging-service-name { include | omit } ] [ compression { gzip | none } ] [ current-prefix string ] [ delete-timeout seconds ] [ directory dir_name ] [ edr-format-name ] [ exclude-checksum-record ] [ field-separator { hyphen | omit | underscore } ] [ file-sequence-number rulebase-seq-num ] [ headers ] [ name file_name ] [ reset-indicator ] [ rotation { num-records | number | time-segments | volume-bytes } ] [ sequence-number { length length | omit | padded | padded-sixth-length | unpadded } ] [ storage-limit limit ] [ single-edr-format ] [ time-stamp { expanded-format | rotated-format | unix-format } ] [ trailing-text string ] [ trap-on-file-delete ] [ xor-final-record ] +

default file [ charging-service-name ] [ compression ] [ current-prefix ] [ delete-timeout ] [ directory ] [ edr-format-name ] [ field-separator ] [ file-sequence-number ] [ headers ] [ name ] [ reset-indicator ] [ rotation { num-records | time | volume } ] [ sequence-number ] [ storage-limit ] [ time-stamp ] [ trailing-text ] +

default
Sets the default configuration.

charging-service-name { include | omit }
Specifies the inclusion/exclusion of charging service name in the file name.
  •include: Sets this command to include the charging service name in EDR file name.
  •omit: Sets this command to exclude the charging service name in EDR file name.

compression { gzip | none }
Specifies compression of EDR files.
  •gzip: Enables GNU zip compression of the EDR file at approximately 10:1 ratio.
  •none: Disables Gzip compression.

current-prefix string
Default: curr
Specifies a string to add to the beginning of the EDR file that is currently being used to store EDR records.
string must be an alpha and/or numeric string of 1 through 31 characters in length.

delete-timeout seconds
Default: Disabled
Specifies a time period, in seconds, when completed EDR files are deleted. By default, files are never deleted. *seconds* must be an integer from 3600 through 3153600.

**directory dir_name**
Default: /records/edr
Specifies a subdirectory in the default directory in which to store EDR files. *dir_name* must be an alpha and/or numeric string of 1 through 191 characters in length.

**edr-format-name**
Specifies creation of separate files for EDRs that have different formats. The EDR format name will be included in the file name.

**exclude-checksum-record**
Default: Disabled, inserts checksum record into the EDR file header.
When entered, this keyword excludes the final record containing #CHECKSUM followed by the 32-bit Cyclic redundancy check (CRC) of all preceding records from the EDR file.

**field-separator [ hyphen | omit | underscore ]**
Specifies the field inclusion/exclusion type of separators between two fields of EDR file name.
- **hyphen**: Specifies the field separator as ‘-’ (hyphen) symbol between two fields.
- **omit**: Removes or omits the field separator between two fields.
- **underscore**: Specifies the field separator as ‘_’ (underscore) symbol between two fields.

**file-sequence-number rulebase-seq-num**
Specifies that the file name sequence numbers be unique per rulebase and EDR format name combination.

**headers**
Includes a file header summarizing the record layout.

**name file_name**
Default: edr
Specifies a string to be used as the base file name for EDR files. *file_name* must be an alpha and/or numeric string of 1 through 31 characters in length. The file name format is as follows:
base_rulebase_format_sequnenum_timestamp
- **base**: Specifies type of record in file or contains the operator-specified string. Default: edr
- **rulebase**: Specifies the name of the Rulebase. EDRs from different Rulebases go into different EDR files.
- **format**: Specifies the name of the EDR format if single-edr-format is specified else the format field (and the trailing underscore) is omitted from the filename.
- **sequencenum**: This is a 5-digit sequence number to detect the missing file sequence. It is unique among all EDR files on the system.
- **timestamp**: Contains a timestamp based on file creation time in UTC time in MMDDYYYYHHMMSS format.
EDR files that have not been closed have a string added to the beginning of their filenames.
Filename for an EDR file in CSV format that contains information for rule base named rulebase1 and an EDR schema named edr_schema1 appears as follows:

```plaintext
edr_rulebase1_edr_schema1_00005_01302006143409
```

If the file name is not configured it will create files for EDRs/UDRs/FDRs (xDRs) with following template with limits to 256 characters:

```plaintext
basename_ChargSvcName_timestamp_SeqNumResetIndicator_FileSeqNumber
```

- **basename**: A global-based configurable text string that is unique per system that uniquely identifies the global location of the system running ECS
- **ChargSvcName**: A system context-based configurable text string that uniquely identifies a specific context-based charging service
- **timestamp**: Date and time at the instance of file creation. Date and time in the form of “MMDDYYHHmmSS” where HH is a 24-hour value from 00-23
- **SeqNumResetIndicator**: A one byte counter used to discern the potential for duplicated FileSeqNumber with a range of 0 to 255 which is incremented by a value of 1 for the following conditions:
  - Failure of an ECS software process on an individual PSC
  - Failure of the system such that a second system takes over. (For example: a backup or standby system put in place according to Interchassis Session Recovery.)
  - File Sequence Number (FileSeqNumber) rollover from 999999999 to 0
- **FileSeqNumber**: Unique file sequence number for the file with 9 digit integer having range from 000000000 to 999999999. It is unique on each system.

File name for a closed xDR file in CSV format that contains information for ECS system `xyz_city1` and charging service name `prepaid2` with timestamp `12311969190000`, and file sequence number counter reset indicator to `002` for file sequence number `034939002` appears as follows:

```plaintext
xyz_city1_preapaid2_12311969190000_002_034939002
```

File name for a running xDR file, not closed, in CSV format that contains information for the same parameters for file sequence number `034939003` prefixed with `curr_` and appears as follows:

```plaintext
curr_xyz_city1_preapaid2_12311969190000_002_034939002
```

### reset-indicator

Specifies inclusion of the reset indicator counter value from 0 through 255 in EDR file name, and is incremented (by one) whenever any of the following conditions occur:

- an ACSMgr process fails.
- a peer chassis has taken over in compliance with our Interchassis Session Recovery feature.
- the sequence number, see `sequence-number` keyword, has rolled over to zero.

### rotation 

```plaintext
rotation { num-records number | time seconds | volume bytes }
```

Defaults:

- **num-records**: 1024
- **time**: 3600 seconds
- **volume**: 102400 bytes

Specifies when to close an EDR file and create a new one.

- **num-records**: Specifies the number of records that should be added to the file. When the number of records in the file reaches the specified value, the file is complete. `number` must be an integer 100 through 10240.
- **time**: Specifies the period of time to wait before closing the EDR file and creating a new one. `seconds` must be an integer from 30 through 86400.
volume bytes: Specifies the maximum size of the EDR file before closing it and creating a new one. bytes must be an integer from 51200 to 62914560. (Note, a higher setting may improve the compression ratio when the compression keyword is set to gzip.)

sequence-number { length length | omit | padded | padded-six-length | unpadded }
Default: padded
Specifies including/excluding sequence number in the file name.
- **length length**: Includes the sequence number with the specified length. length must be the file sequence number length with preceding zeroes in the file name, and must be an integer from 1 through 9.
- **omit**: Excludes the sequence number from the file name.
- **padded**: Includes the padded sequence number with preceding zeros in the file name. This is the default setting.
- **padded-six-length**: Includes the padded sequence number with six preceding zeros in the file name.
- **unpadded**: Includes the unpadded sequence number in the file name.

**Important**: The length configuration is applicable in both EDR and UDR modules. When applied in both modules without the `file udr-seq-num` configuration, the minimum among the two values will come into effect for both the modules. With the `file udr-seq-num` config, each module will use its own value of length.

single-edr-format
Default: Disabled
Creates separate files for EDRs having different formats.

storage-limit limit
Default: 33554432
Specifies deleting files when the specified amount of space, in bytes, is used up for EDR/UDR file storage on the PSC’s RAM.
On an ASR 5000 chassis, limit must be an integer from 10485760 through 536870912.

**Important**: On an ASR 5000 chassis the total storage limit is 536870912 bytes (512 MB). This limit is for both UDR and EDR files combined.

time-stamp { expanded-format | rotated-format | unix-format }
Specifies the timestamp of when the file was created be included in the file name.
- **expanded-format**: Specifies the UTC MMDDYYYYHHMMSS format.
- **rotated-format**: Specifies the time stamp format to YYYYYMDDHHMMSS format.
- **unix-format**: Specifies the UNIX format of x.y, where x is the number of seconds since 1/1/1970 and y is the fractional portion of the current second that has elapsed.

trailing-text string
Specifies the inclusion of arbitrary text string in the file name.
**file**

`string` must be an alpha and/or numeric string of 1 through 30 characters in length.

**trap-on-file-delete**
Default: Disabled
This keyword instructs the system to send an SNMP notification (trap) when an EDR/UDR file is deleted due to lack of space.

**xor-final-record**
Default: Disabled
Specifies inserting an xor checksum (in place of the CRC checksum) into the EDR file header if the `exclude-checksum-record` is left at its default setting.

More than one of the previous keywords can be entered within a single command.

**Usage**
Use this command to configure EDR file characteristics.

**Example**
The following command sets the prefix of the current active EDR file to `Current`:

```
file current-prefix Current
```

The following command sets the base file name to `EDRfile`

```
file name EDRfile
```
Chapter 86

eGTP Service Configuration Mode Commands

The eGTP Service Configuration Mode is used to create and manage eGTP interface types and associated parameters.
associate

Configures an association with a GTP-U service where parameters are applied to the GTP-U data flow.

Product
P-GW

Privilege
Administrator

Syntax

associate gtpu-service name

no associate gtpu-service

no
Removes the association to the configured GTP-U service from this service.

gtpu-service name
Associates a GTP-U service with this eGTP service. name must be from 1 to 63 alpha and/or numeric characters.

Usage
Use this command to associate a GTP-U service with this eGTP service.

Example
The following command associates this eGTP service with a GTP-U service named gtpu3:

associate gtpu-service gtpu3
end

Exits the current mode and returns to the Exec Mode.

Product
All

Privilege
Administrator

Syntax

```bash
end
```

Usage
Change the mode back to the Exec mode.
exit

Exits the current mode and returns to the previous mode.

**Product**
All

**Privilege**
Administrator

**Syntax**

```
exit
```

**Usage**
Return to the previous mode.
gtpc

Configure the GPRS Tunneling Protocol Control (GTP-C) plane settings for this service.

Product
MME, P-GW, S-GW

Privilege
Administrator

Syntax

```
gtpc { bind { ipv4-address ipv4_address [ ipv6-address ipv6_address ] | ipv6-address ipv6_address [ ipv4-address ipv4_address ] } | echo-interval seconds | ip qos-dscp { forwarding_type } | max-retransmissions num | retransmission-timeout seconds }

no gtpc { bind { ipv4-address ipv4_address [ ipv6-address ipv6_address ] | ipv6-address ipv6_address [ ipv4-address ipv4_address ] } } | echo-interval }

default gtpc { echo-interval | ip qos-dscp | max-retransmissions | retransmission-timeout }
```

**no**
Disables or removes the configured GTP-C setting.

**default**
Resets the specified parameter to its default value.

**bind { ipv4-address ipv4_address [ ipv6-address ipv6_address ] | ipv6-address ipv6_address [ ipv4-address ipv4_address ] }**
Binds the service to an interface with an IPv4 address, IPv6 address or both.

**ipv4-address ipv4_address [ ipv6-address ipv6_address ]**: Binds this service to the IPv4 address of a configured interface. Optionally, bind the service to a configured interface with an IPv6 address. *ipv4_address* must be entered as a standard IPv4 address in dotted decimal notation.

**ipv6-address ipv6_address [ ipv4-address ipv4_address ]**: Binds this service to the IPv6 address of a configured interface. Optionally, bind the service to a configured interface with an IPv4 address. *ipv6_address* must be entered as a standard IPv6 address in colon-separated notation.

**echo-interval seconds**
Default: 60
Configures the duration between the sending of echo messages. *seconds* must be an integer value from 60 to 3600.

**ip qos-dscp { forwarding_type }**
Default: af11
Specifies the IP QoS DSCP per-hop behavior to be marked on the outer header of signalling packets originating from the LTE component. This is a standards-based feature (RFC 2597). The following forwarding types are supported:

- **af11**: Designates the use of Assured Forwarding 11 per-hop behavior
- **af12**: Designates the use of Assured Forwarding 12 per-hop behavior
- **af13**: Designates the use of Assured Forwarding 13 per-hop behavior
- **af21**: Designates the use of Assured Forwarding 21 per-hop behavior
- **af22**: Designates the use of Assured Forwarding 22 per-hop behavior
- **af23**: Designates the use of Assured Forwarding 23 per-hop behavior
- **af31**: Designates the use of Assured Forwarding 31 per-hop behavior
- **af32**: Designates the use of Assured Forwarding 32 per-hop behavior
- **af33**: Designates the use of Assured Forwarding 33 per-hop behavior
- **af41**: Designates the use of Assured Forwarding 41 per-hop behavior
- **af42**: Designates the use of Assured Forwarding 42 per-hop behavior
- **af43**: Designates the use of Assured Forwarding 43 per-hop behavior
- **be**: Designates the use of Best Effort forwarding per-hop behavior
- **ef**: Designates the use of Expedited Forwarding per-hop behavior typically dedicated to low-loss, low-latency traffic.

The assured forwarding behavior groups are listed in the table below.

<table>
<thead>
<tr>
<th>Class 1</th>
<th>Class 2</th>
<th>Class 3</th>
<th>Class 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low Drop</td>
<td>AF11</td>
<td>AF21</td>
<td>AF31</td>
</tr>
<tr>
<td>Medium Drop</td>
<td>AF12</td>
<td>AF22</td>
<td>AF32</td>
</tr>
<tr>
<td>High Drop</td>
<td>AF13</td>
<td>AF23</td>
<td>AF33</td>
</tr>
</tbody>
</table>

Traffic marked with a higher class is given priority during congestion periods. If congestion occurs to traffic with the same class, the packets with the higher AF value are dropped first.

**max-retransmissions num**

Default: 4

Configures the maximum number of retries for packets. *num* must be an integer from 0 through 15.

**retransmission-timeout seconds**

Default: 5

Configures the control packet (echo message) retransmission timeout in GTP, in seconds. *seconds* must be an integer value from 1 through 20.

**Usage**

Use this command to configure GTP-C settings for the current service. This interface assumes the characteristics of an S11 reference point on the S-GW or MME.

**Example**

The following command binds the service to a GTP-C interface with an IP address of 112.334.556.778:

```
gtpc bind address 112.334.556.778
```
**interface-type**

Configures the interface type used by this service.

**Product**
MME, P-GW, S-GW

**Privilege**
Administrator

**Syntax**

```
interface-type { interface-mme | interface-pgw-ingress | interface-sgsn | interface-sgw-egress | interface-sgw-ingress }
```

- **interface-mme**: Specifies that the interface has the characteristics of an eGTP MME S11 reference point to/from an S-GW.
- **interface-pgw-ingress**: Specifies that the interface has the characteristics of an eGTP P-GW S5/S8 reference point from an S-GW. The interface assumes the characteristics of either a GTP-C (control Plane) or GTP-U (user plane) reference point.
- **interface-sgsn**: Specifies that the interface has the characteristics of an eGTP S-GW S4 reference point to/from an SGSN.
- **interface-sgw-egress**: Specifies that the interface has the characteristics of an eGTP S-GW S5/S8 reference point to an eGTP P-GW. The interface assumes the characteristics of either a GTP-C (control Plane) or GTP-U (user plane) reference point.
- **interface-sgw-ingress**: Specifies that the interface has the characteristics of:
  - an eGTP-C S-GW S11 reference point from the MME.
  - an eGTP-U S-GW S1-U reference point from the eNodeB.

**Usage**

Use this command to specify the type of interface this service uses. By configuring this command, the interface takes on the characteristics of the selected type.

**Example**

The following command configures the interface bound to this service to maintain the characteristics of an eGTP-C S-GW S11 reference point from an MME:

```
interface-type interface-sgw-ingress
```
validation-mode

Configures the type of validation to be performed on messages received by this service.

Product
P-GW

Privilege
Administrator

Syntax

validation-mode { custom1 | standard }

default validation-mode

default

Returns the command to the default setting of standard.

{ custom1 | standard }

custom1: Specifies that the message should be validated based on a vendor-specific set of mandatory elements.
standard: Specifies that the message should be validated based on the set of mandatory elements as defined in 3GPP 29.274.

Usage

Use this command to specify the type of validation performed on messages received by this service. The information elements contained in messages have mandatory elements and conditional elements. The standard set of elements, as defined by 3GPP 29.274 is checked if this command is set to “standard”. The custom1 setting is for a vendor-specific set of mandatory elements.

Example

The flowering command sets the validation mode for incoming messages to standard:

validation-mode standard
Chapter 87
Ethernet Interface Configuration Mode Commands

The Ethernet Interface Configuration Mode is used to create and manage the IP interfaces for addresses, address resolution options, etc.

![Diagram of Ethernet Interface Configuration Mode]

- **Exec Mode**
  - `configure`
  - **Global Configuration Mode**
    - `context name`
    - **Context Configuration Mode**
      - `Interface name broadcast`
      - **Ethernet Interface Configuration Mode**
crypto-map

Applies the specified IPSec crypto-map to this interface.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax

crypto-map map_name [ secondary-address sec_ip_addr ]

no

Deletes the application of the crypto map on this interface.

map_name

Specifies the name of the crypto map being applied. The name can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

secondary-address sec_ip_addr

Applies the crypto map to the secondary address for this interface that is specified by sec_ip_addr. sec_ip_addr must be specified using the standard IPv4/IPv6 notation.

Usage
In order for ISAKMP and/or manual crypto maps to work, they must be applied to a specific interface using this command. Dynamic crypto maps should not be applied to interfaces. The crypto map must be configured in the same context as the interface.

Example
To apply the IPSEC crypto map named cmap1 to this interface, use the following command:

crypto-map cmap1
description

Configures the description text for the current interface.

Product
All

Privilege
Security Administrator, Administrator

Syntax

description text

no description

no
Clears the description for the interface.

text
Specifies the descriptive text to use. text must be 0 to 79 alpha and/or numeric characters with no spaces or a quoted string of printable characters

Usage
Set the description to provide useful information on the interface’s primary function, services, end users, etc. Any information useful may be provided.

Example

description sampleInterfaceDescriptiveText
end

Exits the interface configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

end

Usage
Change the mode back to the Exec mode.
exit

Exits the interface configuration mode and returns to the context configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Return to the context configuration mode.
**ip**

Configures the IP options for the current interface.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
ip { access-group acl_name { in | out } [ priority-value ] | address ip_address ip_mask [ secondary | srp-activate ] | arp { arpa | timeout seconds } }
```

```
no ip { access-group acl_name { in | out } | address ip_address | arp { arpa | timeout } }
```

**no**

Disables and/or restores the option to the system default.

```
access-group acl_name { in | out } [ priority-value ]
```

*acl_name* specifies the access control list to be added/removed from the group. The ACL rules must be configured in the same context as the interface.

In Release 8.1 and later, *acl_name* must be an alpha and/or numeric string of 1 through 47 characters in length.

In Release 8.0 and earlier, *acl_name* must be an alpha and/or numeric string of 1 through 79 characters in length.

The direction must also be specified as either inbound or outbound using the keywords *in* and *out*, respectively.

*priority-value*: Default: 0. If more than one ACL is applied, *priority-value* specifies the priority in which they will be compared against the packet. If not specified, the priority is set to 0. *priority-value* must be an integer from 0 through 4294967295. If access groups in the list have the same priority, the last one entered is used first.

**Important**: Up to 8 ACLs can be applied to a group provided that the number of rules configured within the ACL(s) does not exceed the 128 rule limit for the interface.

```
address ip_address ip_mask [ secondary | srp-activate ]
```

Configures the IP address for the interface specifying the networking mask as well. *ip_address* and *ip_mask* must be specified using the standard IPv4/IPv6 notation.

The *secondary* keyword is used to configure a secondary IP address on the interface. This is referred to as multi-homing of the interface.

The *srp-activate* Activates the IP address for Interchassis Session Redundancy.
Ethernet Interface Configuration Mode Commands

## ARP Configuration

### Command Syntax

```
arp { arpa | timeout seconds }
```

### Important

These keywords have been replaced by the `arp` command in the Global Configuration Mode. For backwards compatibility, however, these keywords are accepted as valid.

### Usage

Create and manage the IP interfaces for the associated context.

### Example

The following command configures the access group for the current context:

```
ip access-group sampleAccessGroup
```

The following command sets the address resolution protocol timeout.

```
ip arp timeout 1800
```

The following commands remove the associated IP address and disable ARP for the interface, respectively.

```
no ip address 1.2.3.
no ip arp arpa
```
**ip mtu**

Configures the Maximum Transmission Unit (MTU) for this IP interface.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```bash
ip mtu mtu-size

no ip mtu mtu-size
```

**Usage**

On ASR 5000 we support IP MTU with a normal interface and point-to-point interface (for OLC port). The maximum MTU size allowed with an OLC port is 1600, the maximum MTU size allowed with an Ethernet port is 2048. The default MTU size is 1500.

**Example**
The following command sets the MTU value to the default.

```
ip mtu 1500
```
ip ospf authentication-key

This command configures the password for the authentication with neighboring routers.

**Product**
PDSN, HA, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ip ospf authentication-key [ encrypted ] password auth_key
no ip ospf authentication-key
```

- **no**
  Deletes the authentication key.

- **encrypted**
  Use this keyword if you are pasting a previously encrypted authentication key into the CLI command.

- **password auth_key**
  The password to use for authentication. `authentication_key` is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication password. This variable is entered in clear text format.

**Usage**

Use this command to set the authentication key used when authenticating with neighboring routers.

**Example**

To set the authentication key to 123abc, use the following command:

```
ip ospf authentication-key password 123abc
```

Use the following command to delete the authentication key:

```
no ip ospf authentication-key
```
ip ospf authentication-type

This command configures the OSPF authentication method to be used with OSPF neighbors over the logical interface.

**Product**

PDSN, HA, GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
ip ospf authentication-type { message-digest | null | text }
no ip ospf authentication-type { message-digest | null | text }
```

- **no**
  - Disable this function.

- **message-digest**
  - Set the OSPF authentication type to use the message digest (MD) authentication method.

- **null**
  - Set the OSPF authentication type to use no authentication, thus disabling either MD or clear text methods.

- **text**
  - Set the OSPF authentication type to use the clear text authentication method.

**Usage**

Use this command to set the type of authentication to use when authenticating with neighboring routers.

**Example**

To set the authentication type to use clear text, enter the following command;

```
ip ospf authentication-type text
```
**ip ospf cost**

This command configures the cost associated with sending a packet over the logical interface.

**Product**
PDSN, HA, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ip ospf cost value
no ip ospf cost
```

- **no**
  - Disable this function.

- **value**
  - Default: 10
  - The cost to assign to OSPF packets. This must be an integer from 1 through 65535.

**Usage**
Use this command to set the cost associated with routes from the interface.

**Example**
Use the following command to set the cost to 20;

```
ip ospf cost 20
```

Use the following command to disable the cost setting;

```
no ip ospf cost
```
ip ospf intervals

This command configures the interval or delay type, and the interval or delay time in seconds, for OSPF communications.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

ip ospf { dead-interval value | hello-interval value | retransmit-interval value | transmit-delay value }

no ip ospf { dead-interval | hello-interval | retransmit-interval | transmit-delay }

no
Deletes the value set and returns the value to its default.

dead-interval value
Default: 40
The interval, in seconds, that the router should wait, during which time no packets are received and after the router considers a neighboring router to be off-line. value must be an integer from 1 through 65535.

hello-interval value
Default: 10
The interval, in seconds between sending hello packets. value must be an integer from 1 through 65535.

retransmit-interval value
Default: 5
The interval, in seconds, between LSA (Link State Advertisement) retransmissions. value must be an integer from 1 through 65535.

transmit-delay value
Default: 1
The interval, in seconds, that the router should wait before transmitting a packet. value must be an integer from 1 through 65535.

Usage
Use this command to set the intervals or delays for OSPF communications.

Example
To set the dead-interval to 100, use the following command;
ip ospf dead-interval 100
To delete the setting for the dead-interval and reset the dead-interval value to its default of 40, use the following command:

    no ip ospf dead-interval
ip ospf message-digest-key

This command enables the use of MD5-based OSPF authentication.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
ip ospf message-digest-key key_id md5 [ encrypted ] password authentication_key
no ip ospf message-digest-key key_id
```

- **no**
  Deletes the key.

- **message-digest-key key_id**
  Specifies the key identifier number. key_id must be an integer from 1 through 255.

- **encrypted**
  Use this if you are pasting a previously encrypted authentication key into the CLI command.

- **password authentication_key**
  The password to use for authentication. authentication_key is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication password. This variable is entered in clear text format.

Usage
Use this command to create an authentication key that uses MD5-based OSPF authentication.

Example
To create a key with the ID of 25 and a password of 123abc, use the following command;

```
   ip ospf message-digest-key 25 md5 password 123abc
```

To delete the same key, enter the following command;

```
   no ip ospf message-digest-key 25
```
ip ospf network

Configures the OSPF network type.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

ip ospf network { broadcast | non-broadcast | point-to-multipoint | point-to-point }

no ip ospf network

no
Disable this function.

broadcast
Sets the network type to broadcast.

non-broadcast
Sets the network type to non-broadcast multi access (NBMA).

point-to-multipoint
Sets the network type to point-to-multipoint.

point-to-point
Sets the network type to point-to-point.

Usage
Use this command to specify the OSPF network type.

Example
To set the OSPF network type to broadcast, enter the following command;

ip ospf network broadcast

To disable the OSPF network type, enter the following command;

no ip ospf network
ip ospf priority

This command designates the OSPF router priority.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator

Syntax

ip ospf priority
no ip ospf priority

Usage
Use this command to set the OSPF router priority.

Example
To set the priority to 25, enter the following command:

    ip ospf priority 25

To disable the priority, enter the following command:

    no ip ospf priority
ipv6 access-group

Specifies the name of the ACL group to assign the interface to. You can filter for either inbound or outbound traffic.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax

[no] ipv6 access-group group name { in | out } { priority-value }

**no**
Removes a previously configured access group association.

**group_name**
Specifies the name of the access group. group_name must be an alpha and/or numeric string of 1 to 79 characters.

**in**
Applies the filter to the inbound traffic.
Specify a priority_value for the access group from 0 to 4294967295. The lower values indicate a higher priority.

**out**
Applies the filter to the outbound traffic.
Specify a priority-value for the access group from 0 to 4294967295. The lower values indicate a higher priority.

**priority-value**
Default: 0
Specifies the priority of the access group. 0 is the highest priority. If priority-value is not specified the priority is set to 0. priority-value must be a value from 0 to 4294967295.
If access groups in the list have the same priority, the last one entered is used first.

Usage
Use this command to specify the ACL group to assign the interface to. Specify an ACL group name with this command.

**Important:** Up to 8 ACLs can be applied to a group provided that the number of rules configured within the ACL(s) does not exceed the 128 rule limit for the interface.

Example
Use the following command to associate the group_1 access group with the current IPv6 profile for inbound access:

```
ipv6 access-group group_1 in
```
ipv6 address

Specifies the address and subnet mask.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax

```
ipv6 address ip_address

ip_address
Specifies an individual host IP address to add to this host pool.
ip_address is the IP address in colon separated notation.
```

Usage

Configures the IPv6 address and subnet mask for a specific interface.
ipv6 router advertisement

Enables or disables the system to send IPv6 router advertisements.

**Product**

PDSN, HA

**Privilege**

Security Administrator, Administrator

**Syntax**

`[no] ipv6 router advertisement`

**Usage**

Enables sending of router advertisements on the interface. All of the pool prefixes in the context (belonging to the interface) will be advertised in the router advertisement.

The router-lifetime in the advertisement is sent as 0 to indicate to the receiver that the sender cannot be a default-router. For all the prefixes (pools), the valid and preferred lifetime are sent as default. The router-advertisement is sent every 600 seconds.

If the pool-prefix is deleted, then an router-advertisement is sent for that particular prefix with the valid and preferred time set to 0.
**policy-forward**

Configure the system for redirecting the HA packets to new HA during existing HA upgradation.

**Product**

PDSN, HA

**Privilege**

Security Administrator, Administrator

**Syntax**

```
policy-forward { icmp unreachable next-hop ip address /unconnected-address next-system ip address }
```

```
no policy-forward unconnected-address
```

<table>
<thead>
<tr>
<th>no policy-forward unconnected-address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deletes the policy forwarding configuration for unconnected address for the current interface.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>icmp unreachable next-hop ip address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies routing of Internet Control Message Protocol (icmp) unreachable is required in overlapping pool configuration. <code>ip address</code> must be an IP address expressed in IPv4/IPv6 notation.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>unconnected-address next-system ip address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies address of next system HA to handle processing during HA upgrade. <code>ip address</code> must be an IP address expressed in IPv4/IPv6 notation.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to set the redirecting policy for IP packets from existing HA to new HA during upgradation. To configure this command both keyword will be in separate interface.

**Important:** It is a customer specific command.

To configure existing HA system for redirecting the HA packets to new HA during existing HA upgrade enter the following command:

```
policy-forward unconnected-address next-system ip address policy-forward icmp unreachable next-hop ip address
```
pool-share-protocol

Configure the primary or secondary system for the IP pool sharing protocol and enter IPSP configuration mode.

**Product**
PDSN, HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
pool-share-protocol { primary address | secondary address } [mode { active | inactive | check-config }]
no pool-share-protocol
```

**no pool-share-protocol**

Deletes the IP pool sharing protocol information from the current interface.

**primary address**

On the secondary system, define the IP address of an interface on the primary system that has identical IP pools configured for use with the IP pool sharing protocol. `address` must be an IP address expressed in IP v4 dotted decimal notation.

**secondary address**

On the primary system, define the IP address of an interface on the secondary system that has identical IP pools configured for use with the IP pool sharing protocol. `address` must be an IP address expressed in IP v4 dotted decimal notation.

**mode { active | inactive | check-config }**

This is an optional command to manage the mode for IP pool sharing protocol for primary or secondary HA. 

- **active**: Activates the IP pool sharing protocol mode.
- **inactive**: Inactivates the IP pool sharing protocol mode.
- **check-config**: Verify the IP pool sharing protocol configuration.

**Usage**

Use this command to set the IP address of the primary or secondary system for use with the IP pool sharing protocol and enter ipsp configuration mode. This command must be configured for an interface in each context that has IP pools configured. Refer to the System Administration and Configuration Guide for information on configuring and using the IP pool sharing protocol.

**Important:** Both the primary and secondary systems must be in the same subnet.

**Important:** For information on configuring and using IPSP refer to the System Administration and Configuration Guide.
**Important:** To reserve free addresses on primary HA for this command use reserved-free-percentage command in *IPSP Configuration Mode Commands* of this guide.

**Example**
To configure a secondary system with an IP address of 192.168.100.10 for use with the IP pool sharing protocol, enter the following command:

```
pool-share-protocol secondary 192.168.100.10
```

To inactivate a secondary system with an IP address of 192.168.100.10 for use with the IP pool sharing protocol, enter the following command:

```
pool-share-protocol secondary 192.168.100.10 mode inactive
```
port-switch-on-L3-fail

This command causes the line card port to which the current interface is bound to switch over to the port on the redundant line card when connectivity to the specified IP address is lost.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
port-switch-on-L3-fail address { ip_address | ipv6_address } [ minimum-switchover-period switch_time ] [ interval int_time ] [ timeout time_out ] [ num-retry number ]
```

```
no port-switch-on-L3-fail
```

```
no
Disable port switchover on failure.
```

```
ip_address
The IP address to monitor for connectivity. ip_address must be in either ipv4 format or IPv6 format
```

```
minimum-switchover-period switch_time
Default: 120 seconds
After a switchover occurs, another switchover cannot occur until the amount of time specified has elapsed.
switch_time must be an integer in the range from 1 to 3600.
```

```
interval int_time
Default: 60 seconds
This specifies how often, in seconds, monitoring packets are sent to the IP address being monitored.
int_time must be an integer in the range from 1 to 3600.
```

```
timeout time_out
Default: 3 seconds
This specifies how long to wait without a reply before resending monitoring packets to the IP address being monitored. time_out must be an integer in the range from 1 to 10.
```

```
um-retry number
Default: 5
This value specifies how many times to retry sending monitor packets to the IP address being monitored before performing the switchover operation. number must be an integer in the range from 1 to 100.
```

Usage
Use this command to monitor a destination in your network to test for L3 connectivity. The destination being monitored should be reachable from both the active and standby line cards.

Example
The following command enables port switchover on connectivity failure to the IP address 192.168.10.100 using default values:

```
port-switch-on-L3-fail address 192.168.10.100
```

The following command disables port switchover on connectivity failure:

```
no port-switch-on-L3-fail
```
**vlan-map**

This command sets a single next-hop IP address so that multiple vlans can use a single next-hop gateway. `vlan-map` is associated with a specific interface.

**Product**
PDSN, HA, SGSN

**Privilege**
Security Administrator, Administrator

```
vlan-map next-hop ip_address
```

**next-hop**
`ip_address`

This keyword defines an IP address for the next-hop gateway.

`ip_address`: Can be either an IPv4 or IPv6 address in standard format.

**Usage**
Use `vlan-map` to combine multiple vlan links to go through a single IP address. This feature is used in conjunction with next-hop forwarding and overlapping IP pools.
After configuring the `vlan-map`, move to the Port Ethernet configuration mode to attach the `vlan-map` to a specific vlan.

**Example**
The following command sets an IPv4 for a next-hop gateway.

```
vlan-map next-hop 123.123.123.1
```
Chapter 88
Ethernet Port Configuration Mode Commands

The Ethernet Port Configuration Mode is used to create and manage Ethernet ports and their bindings between contexts.
bind interface

Configures an association (binds) between a virtual IP interface or an SS7 or Frame Relay link to a specific context.

Product
All

Privilege
Security Administrator, Administrator

Syntax

bind interface interface_name context_name

no bind interface interface_name context_name

Usage

Bind an interface to a context to allow the context to provide service.

Example

bind interface sampleVirtual sampleContext
no bind interface sampleVirtual sampleContext
**default**

Restores the port’s default speed and communication mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```bash
default { medium | preferred slot | threshold { value } }
```

<table>
<thead>
<tr>
<th>medium</th>
<th>Restores the default values for the medium options as follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td>- SPIO and fast ethernet line cards: auto</td>
<td></td>
</tr>
<tr>
<td>- Gigabit ethernet line card: auto</td>
<td></td>
</tr>
</tbody>
</table>

| preferred slot | Sets the port for non-revertive operation for port redundancy auto-recovery; requiring an administrative user to manually issue a port switch to command to return service to the original port. |

<table>
<thead>
<tr>
<th>threshold { value }</th>
<th>Restores the specified port-level threshold parameter to its default value(s). The possible values are:</th>
</tr>
</thead>
<tbody>
<tr>
<td>- <strong>high-activity</strong>: High port activity threshold settings</td>
<td></td>
</tr>
<tr>
<td>- <strong>monitoring</strong>: Threshold monitoring configuration settings</td>
<td></td>
</tr>
<tr>
<td>- <strong>rx-utilization</strong>: Receive port utilization threshold settings</td>
<td></td>
</tr>
<tr>
<td>- <strong>tx-utilization</strong>: Transmit port utilization threshold settings</td>
<td></td>
</tr>
</tbody>
</table>

**Usage**

Restores port-level parameters to their default values.

**Example**

default medium
description

Sets the port descriptive text.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
description text

no description

no

Clears the description for the port.

text

Specifies the descriptive text to use. text must be 1 to 79 alpha and/or numeric characters with no spaces or a quoted string using printable characters.
```

**Usage**

Set the description to provide useful information on the port’s primary function, services, end users, etc. Any information useful may be provided.

**Example**

description samplePortDescriptiveText
description "This is a sample description"
end

Exits the port configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

end

Usage
Change the mode back to the Exec mode.
exit

Exits the port configuration mode and returns to the global configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Return to the global configuration mode.
flow-control

Enables and disables flow control on the Quad Gig-E linecard (QGLC).

Product
PDSN, SGSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

[ no ] flow-control

no flow-control
Disables flow control on the specified port

Usage
Flow control is enabled by default on the QGLC and can be disabled using the no command on a per-port basis. This command does not work on Fast Ethernet or Gigabit Ethernet line cards (FELC, GELC) which do not support flow control.
**Ingress-mode**

Labels this port as an ingress port.

**Product**

IPSG

**Privilege**

Security Administrator, Administrator

**Syntax**

```
[ no ] ingress-mode
```

```
no
Disables ingress port tag.
```

**Usage**

Use this command to label this port in order for the session manager to recognize the interface from which IP data packets are being received. This command should be used in single context configurations. In single context configurations, the ingress port can only be identified if labeled.
link aggregation

Used to aggregate ports on a Quad Gig-E line card (QGLC) and set LACP parameters.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```plaintext
[ no ] link aggregation { master | member | group N } [ lacp { active | passive } ] [ rate { auto | slow | fast } ]
```

default link-aggregation lacp

no
This command deletes the Ethernet port from any group it might be in. If the port was the Master of a group, the whole group would be deleted.

master
This command creates the Master port for the aggregated group.
group N is an integer between 1..1023.

member
This command makes the port a member of the aggregated group.
group N is an integer between 1..1023.

lacp { active | passive }
Configures the Link Aggregation Control Protocol.
active mode sends out LACP packets periodically.
passive mode only responds to LACP packets received.

rate { auto | fast | slow }
Configures the rate at which the LACP sends packet and timeout events.
auto = the rate is controlled by the peer
fast = 1sec
slow = 30sec

default
Configures LACP default settings. Defaults are active and slow.

Usage
Configure from one to four ports on a QGLC to be in an aggregation group on the chassis to link to an aggregation group on a remote switch. Very large files can be downloaded across all ports in a group, which makes for a faster download when compared to serial downloads over a single link.
Example
The following example configures the port to be the Master for Group 2:

```
link aggregation master group 2
```
media

Configures the port interface type.

Product
All

Privilege
Security Administrator, Administrator

Syntax
media { rj45 | sfp }

rj45 | sfp
rj45: sets the physical interface to RJ-45 connectors.
sfp: sets the physical interface connection to SFP gigabit.

Usage
Set the media option when the physical cabling interface is changed.

Example
The following command sets the physical interface to RJ-45 and SFP, respectively:
media rj45
media sfp
**medium**

Configures the port speed and communication mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
medium { auto | speed { 10 | 100 | 1000 } duplex { full | half } }
```

- **auto** | **speed** { 10 | 100 | 1000 } **duplex** { full | half }

  Default: auto
  Optionally sets the speed of the interface and the communication mode.
  - auto: configures the interface to auto negotiate the interface speed.
  - speed { 10 | 100 | 1000 }: specifies the speed to use at all times.
  - duplex { full | half }: sets the communication mode of the interface to either full or half duplex.

---

**Important:** Ethernet networking rules dictate that if a device whose interface is configured to auto-negotiate is communicating with a device that is manually configured to support full duplex, the first device will negotiate to the manually configured speed of the second device but will only communicate in half duplex mode.

---

**Usage**

Set the medium options when the physical interface changes.

**Example**

The following configures the port’s speed and communication mode to be auto negotiated.

```
medium auto
```

The following command configures the port’s interface speed to gigabit with full duplex communication.

```
medium speed 1000 duplex full
```
preferred slot

Assigns revertive or non-revertive control to port redundancy auto-recovery.

Default: non-revertive operation

Product

PDSN, FA, HA, SGSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

preferred slot slot#

no preferred slot slot#

Usage

This command enables or disables revertive port redundancy, wherein after a port failover, when the original port is restored to service (i.e. link up) the system will return service to that port automatically.

Disabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue a port switch to command to return service to the original port.

This command must be issued on a per port basis, allowing you to configure specific ports to be used on individual LCs or SPIO cards. For example, ports 1 through 4 could be configured as “preferred” on the LC in slot 17 while ports 5 through 8 are “preferred” on the LC in slot 33. In this scenario, both LCs would be in an Active operational state while still providing LC and port redundancy for the other.

Important: This command is not supported on all platforms.

Example

preferred slot 17
shutdown

Terminates all processes supporting the port or blocks the shutting down of the port. Conversely, the port is enabled with the use of the `no` keyword.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
shutdown
no shutdown
```

```
no
Enables the port. When omitted the card is shutdown (removed from service).
```

Usage
Shut down a port prior to re-cabling and/or other maintenance activities.
This command is necessary to bring a port into service by enabling it via the `no` keyword.

Example

```
shutdown
no shutdown
```

**snmp trap link-status**

Enables/disables the generation of an SNMP trap for link status changes.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
snmp trap link-status
no snmp trap link-status
```

**Usage**

Enable link status change traps when a monitoring facility can use the information or if there are troubleshooting activities are in progress.

**Example**

```
snmp trap link-status
no snmp trap link-status
```
srp virtual-mac-address

Configures the SRP virtual MAC address for the port.

Product
All

Privilege
Security Administrator, Administrator

Syntax

srp virtual-mac-address MAC_Address

no srp virtual-mac-address

Usage
The SRP virtual MAC address is applied to the port when the chassis is in SRP ACTIVE state. The default is no srp virtual-mac-address.

Important: This command is not supported on all platforms.

Example

srp virtual-mac-address MAC_Address

no srp virtual-mac-address
threshold high-activity

Configures thresholds for high port activity for the port.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
threshold high-activity high_thresh [ clear low_thresh ]
```

**high_thresh**
Default: 50
The high threshold high port activity percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
`high_thresh` can be configured to any integer value between 0 and 100.

**clear**
Allows the configuration of the low threshold.

**low_thresh**
Default: 50
The low threshold high port activity percentage that maintains a previously generated alarm condition. If the activity percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
`low_thresh` can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

High port activity thresholds generate alerts or alarms based on the utilization percentage of each configured port during the specified polling interval. This threshold is configured on a per-port basis. Alerts or alarms are triggered for high port activity based on the following rules:

- **Enter condition:** Actual percent utilization of a port ≥ High Threshold
- **Clear condition:** Actual percent utilization of a port < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the `threshold monitoring` command in this chapter to enable thresholding for this value.

Example
The following command configures a high port utilization threshold percent of 70 and a low threshold of 50 for an
system using the Alarm thresholding model:

```
threshold high-activity 70 clear 50
```
threshold monitoring

Enables thresholding for port-level values.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] threshold monitoring
```

- **no**
  Disables threshold monitoring for port-level values. This is the default setting.

**Usage**

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e., high-activity) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps:** SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the starentMIB(8164).starentTraps(2) section of the SNMP MIB Reference.

  The generation of specific traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs:** The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of WARNING.

  “Outstanding” alarms are reported to through the system’s alarm subsystem and are viewable through the system’s CLI.

The following table indicates the reporting mechanisms supported by each of the above models.

<table>
<thead>
<tr>
<th>Model</th>
<th>SNMP Traps</th>
<th>Logs</th>
<th>Alarm System</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alert</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>Alarm</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

This command enables thresholding for port-level values. Refer to the `threshold high-activity`, `threshold rx-utilization`, and `threshold tx-utilization` commands in this chapter for
information on configuring these values. In addition refer to the `threshold poll` command in the Global Configuration Mode Commands chapter of this reference for information on configuring the polling interval over which these values are monitored.
threshold rx-utilization

Configures thresholds for receive port utilization.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
threshold rx-utilization high_thresh [ clear low_thresh ]
```

**high_thresh**
Default: 80
The high threshold receive port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
The percentage can be configured to any integer value between 0 and 100.

**clear**
Allows the configuration of the low threshold.

```
low_thresh
Default: 80
The low threshold receive port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
The percentage can be configured to any integer value between 0 and 100.
```

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**
Receive port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data received during the specified polling interval. This threshold is configured on a per-port basis.

**Important:** Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive or transmit utilization threshold be configured.

Alerts or alarms are triggered for receive port utilization based on the following rules:
- **Enter condition:** Actual percent utilization of a port for received data ≥ High Threshold
- **Clear condition:** Actual percent utilization of a port for received data < Low Threshold
If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the `threshold monitoring` command in this chapter to enable thresholding for this value.

**Example**

The following command configures a receive port high utilization threshold percent of 70 and a low threshold of 50 for a system using the Alarm thresholding model:

```
threshold rx-utilization 70 clear 50
```
threshold tx-utilization

Configures thresholds for transmit port utilization.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
threshold tx-utilization high_thresh [ clear low_thresh ]
```

**high_thresh**
Default: 80
The high threshold transmit port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
The percentage can be configured to any integer value between 0 and 100.

**clear**
Allows the configuration of the low threshold.

**low_thresh**
Default: 80
The low threshold transmit port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
The percentage can be configured to any integer value between 0 and 100.

**Important**: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**
Transmit port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data transmitted during the specified polling interval. This threshold is configured on a per-port basis.

**Important**: Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive or transmit utilization threshold be configured.

Alerts or alarms are triggered for transmit port utilization based on the following rules:
- **Enter condition**: Actual percent utilization of a port for transmit data \( \geq \) High Threshold
- **Clear condition**: Actual percent utilization of a port for transmit data \( < \) Low Threshold
If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval. Refer to the `threshold poll` command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the `threshold monitoring` command in this chapter to enable thresholding for this value.

Example
The following command configures a transmit port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold tx-utilization 70 clear 50
```
**vlan**

Creates/deletes a VLAN tag and enters VLAN configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
vlan tag [ inline-process ] [ subscriber-vlan ] [ -noconfirm ]
```

```
novlan tag
```

- **tag**
  - A tag that you specify to identify the VLAN. The tag must be unique and not used by any other VLANs on any other ports in the system. `tag` must be an integer from 1 through 4095.

- **inline-process**
  - Do not use this keyword. This is a restricted keyword. It sets this VLAN for special processing for packets received from an external inline server.

- **subscriber-vlan**
  - Designates the VLAN type as a subscriber VLAN. This keyword must be specified if the VLAN is to be associated with specific subscribers. Refer to the `ip vlan` command in the Subscriber Configuration Mode chapter of this reference for additional information on Subscriber-VLAN associations.

**Important**: To maintain optimal performance, this keyword should not be specified for VLANs that are not to be associated with subscribers.

- **-noconfirm**
  - Indicates that the command is to execute without any additional prompt and confirmation from the user.

**Usage**

Virtual LANs (VLANs) provide greater flexibility in the configuration and use of contexts and services. They are configured as “tags” on a per-port basis and allow more complex configurations to be implemented. The VLAN tag allows a single physical port to be bound to multiple logical interfaces that can be configured in different contexts. Therefore, each Ethernet port can be viewed as containing many logical ports when VLAN tags are employed.
**Important:** VLANs are supported in conjunction with ports on the Ethernet 10/100 and 1000 line cards and on the four-port Quad Gig-E Line Card (QGLC). (VLAN tagging is not supported for SPIO ports.) The system supports the configuration of VLANs as follows:

**Important:** Ethernet 1000 Line Card/QGLC: 1024 VLANs per card. QGLC supports 511 VLANs per port.

**Important:** Ethernet 10/100 Line Card: Maximum of 256 VLANs per port and a maximum of 1016 VLANs per Line Card. (VLANs on all the ports of a single 10/100 Line Card can not add up to more than 1016.)

**Important:** In order to change the type (using/removing the `subscriber-vlan` keyword) for VLANs that are already configured, the VLAN must first be deleted and then reconfigured as desired.

---

**Example**

The following example creates a VLAN and assign it the tag of 100:

```
  vlan 100
```
This section includes the commands `aaa test` through `crypto-group`.

The Exec Mode is the initial entry point into the command line interface system. Exec mode commands are useful in troubleshooting and basic system monitoring.
aaa test

This command tests AAA functionality between the system and a remote server.

Product
PDSN, HA, GGSN, SGSN, ASN-GW

Privilege
Security Administrator, Administrator, Operator

Syntax

```
aaa test { accounting username user_name | authenticate user_name password | session user_name password }
```

- **accounting username user_name**
  Tests RADIUS or GTPP accounting functionality for the specified user.
  `user_name` is the name of a user configured on the RADIUS or CFG server.

  **Important:** GTPP is used only in conjunction with the GGSN or SGSN product.

- **authenticate user_name password**
  Tests RADIUS authentication functionality for the specified user.
  `user_name` is the name of a user configured on the RADIUS server. `password` is the user’s password.

- **session user_name password**
  Tests both RADIUS authentication and RADIUS or GTPP accounting functionality for the specified user.
  `user_name` is the name of a user configured on the RADIUS server. `password` is the user’s password.

  **Important:** GTPP is used only in conjunction with the GGSN or SGSN product.

Usage
This command is used to test RADIUS-based authentication and RADIUS or GTPP accounting. This command may be useful for diagnosing problems with subscribers and access to the system and/or billing data.

Example
The following command verifies accounting for a user called user1:

```
aaa test accounting username user1
```

The following tests authentication for a user called user1 with a password of abc123:

```
aaa test authenticate user1 abc123
```
The following command will test both accounting and authentication for the user called user1 with a password of abc123:

```
   aaa test session user1 abc123
```
**active-charging service**

This command creates an active charging service.

**Product**
ECS

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```plaintext
active-charging service ecs_service_name [ -noconfirm ]
```

- `ecs_service_name`
  Specifies the active charging service name.

- `service_name`
  Must be an alpha and/or numeric string of 1 through 15 characters in length.

If the named service does not exist, it is created, and the CLI mode changes to the Active Charging Service Configuration mode wherein the service can be configured.

If the named service already exists, the CLI mode changes to the Active Charging Service Configuration mode wherein the service can be reconfigured.

- `-noconfirm`
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

**Usage**

Use this command to create an active charging service on the system. This command can be used directly in Exec-mode after issuing the `require active-charging` command in the Global Configuration mode. This command allows an operator (rather than security administrators and administrators) to configure the Enhanced charging service functionality only.

**Important:** Operator needs the special CLI privilege for Enhanced charging service functionality to be able to use this CLI command.

**Example**

The following command creates an active charging service named `test`:

```plaintext
active-charging service test
```
alarm

This command is used to disable the internal audible alarm on the system management card.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

alarm cutoff

Usage
Alarm cutoff disables the audible alarm. The alarm may be enabled following this command if an event within the system results in the audible alarm being enabled.

Example
alarm cutoff
autoconfirm

This command disables or enables confirmation for certain commands. This command affects the current CLI session only.

**Important:** Use the `autoconfirm` command in the Global Configuration Mode to change the behavior for all future CLI sessions.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
autoconfirm
no autoconfirm
```

**Usage**
When `autoconfirm` is enabled, certain commands ask you to answer yes or no to confirm that you want to execute the command. When `autoconfirm` is disabled, the confirmation questions never appear. Disabling `autoconfirm` is active for the current session only.

By default `autoconfirm` is enabled.

**Example**
The following command enables command confirmation:

```
autoconfirm
```

The following command disables command confirmation for the duration of the current CLI session:

```
no autoconfirm
```
bulkstats force

This command is used to manage the system statistics for collection and delivery to the configured server.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

bulkstats force { gather | transfer }

| gather |
|-----------------
| Immediately collects the system statistics.

| transfer |
|-----------------
| Immediately send the currently collected statistics to the configured server.

Usage

When the current system statistics are desired immediately as opposed to the normal scheduled collection and delivery intervals issue this command.
Troubleshooting the system may require the review of statistics at times when the scheduled delivery is not timely.

Example

The following causes the chassis to immediately collect system statistics. This would be in anticipation of a transfer command.

bulkstats force gather

The following command causes the chassis to immediately send all collected statistics to the configured server.

bulkstats force transfer
card halt

This command halts a card. A card reboot must be issued to bring the card back into service after it is halted.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

```
card haltslot_num [ -force ] [ -noconfirm ]
```

- **slot_num**
  Indicates the slot number of the card of interest.

- **-force**
  Over-rides any warnings to force the card to be halted.

- **-noconfirm**
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Halt a card to stop the card for maintenance or emergency situations.

⚠️ **Caution:** Caution should be taken in using this command as halting a card which has no redundancy card available may cause a service interruption and loss of active sessions.

⚠️ **Caution:** The `-force` and `-noconfirm` options should only be used concurrently by experienced users as this will cause an immediate halt regardless of warnings and no confirmation from the user.

ℹ️ **Important:** This command is not supported on all platforms.

Example

The following command temporarily stops the card in slot 1.

```
card halt 1
```

The following commands force the card to halt and indicate no confirmation is to take place, respectively.

```
card halt 17 -force -noconfirm
```
card lc switch

This is the command for managing the line cards and their active/standby status.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

```
card lc switch to target_slot [ -noconfirm ]
```

- `switch to target_slot`
  Indicates the card which is to become the active card specified as `target_slot`.

- `-noconfirm`
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Line card switch overs change the active/standby status of a line card. This is useful when there is a maintenance activity on the active card which requires removing the card from service.

⚠️ **Caution:** Caution should be taken in using this command. Depending on the amount of bandwidth/traffic being switched, some subscribers may experience service interruptions.

ℹ️ **Important:** This command is not supported on all platforms.

Example

The following command switches the active/standby status of the line cards where one of the cards is in slot 17. This command only executes after the user provides confirmation of the request.

```
card lc switch to 17
```

The following switches the active/standby status of the line cards where one of the cards is in slot 17. This command executes immediately with no additional user confirmation.

```
card lc switch to 17 -noconfirm
```
card lc upgrade

This command upgrades the programmables on the line card.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
card lc upgrade slot_number
```

Upgrades programmables on the specified card. Must be followed by a slot number of card to upgrade.

⚠️ **Caution:** This command should only be used if instructed by or working with Technical Support.

**Usage**
This command upgrades the linear flash on the line card.

⚠️ **Important:** This command is not supported on all platforms.

**Example**
The following command initiates a lc upgrade:

```
card lc upgrade
```
card psc

This command moves processes from the source PSC to the destination PSC or disables the PSC from accepting any new calls.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
card psc { migratefrom src_slot to dst_slot | busy-out } [ -noconfirm ]
```

```
no card psc busy-out
```

- **no card psc busy-out**
  Disable busy-out. The PSC is re-enabled to accept new calls.

- **migrate from src_slot to dst_slot**
  This keyword moves processes from the specified source PSC to the specified destination PSC. The command prompt is returned once the command is initiated. The card migration is completed in background.

  *src_slot* indicates the source slot number of the card whose processes will be migrated from.

  *dst_slot* indicates the destination slot number of the card processes will be migrated to.

- **busy-out**
  When busy-out is enabled on a PSC, the PSC stops receiving new calls but continues to process calls it currently has until they are completed. The command prompt is returned once the command is initiated. The busy-out procedure is completed in background.

- **-noconfirm**
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

**Usage**

Migrating a packet accelerator card changes the active/standby status of a packet accelerator card. This results in the active sessions/processes being moved to the newly active PSC. This is useful when there is a maintenance activity on the active card which requires removing the card from service.

The destination slot specified must contain a packet accelerator card which is in the standby state for the command to complete successfully.

⚠️ **Caution**: Caution should be taken in using this command. Depending on the number of active sessions being migrated, some subscribers may experience service interruptions.

Using busy-out to refuse new calls on a PSC allows you to take a card out of service without any interruptions to the end user. An individual system can be taken completely out of service gracefully by
enabling busy-out on all PSCs and waiting for current calls to complete. The `show card` info command shows if busy-out is enabled.

**Important:** When a PSC fails, is migrated, or is restarted for any reason busy-out is reset to disabled, the default behavior.

**Important:** This command is not supported on all platforms.

**Example**
The following command migrates the active processes from the PSC card in slot 12 to the card in slot 14. This command only executes after the user provides confirmation of the request.

```plaintext
card psc migrate from 12 to 14
```

The following command sets the PSC in slot 1 to stop accepting new calls:

```plaintext
card psc busy-out 1
```
card psc upgrade

This command upgrades the programmables on the PSC card.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
card psc upgradeslot_number
```

- `upgrade`
  Upgrades programmables on the specified card. Must be followed by a slot number of card to upgrade.

⚠️ **Caution:** This command should only be used if instructed by or working with Technical Support.

Usage
You can only initiate an upgrade if:
- there is no migration occurring
- the card is active or standby
- there is no online upgrade in progress

⚠️ **Important:** The following operations are not allowed while a card is upgrading:
- change pac edc requirement
- change card [no] shutdown
- change card active
- change card redundancy
- card halt
- card reboot
- start an online upgrade

⚠️ **Important:** Level unlock operations are ignored while a card is upgrading.

⚠️ **Important:** This command is not supported on all platforms.

Example
The following command initiates a PSC upgrade:

```
card psc upgrade
```
card reboot

This performs a reset of the target card. Rebooting a packet processing or line card will result in the card downloading the image from the system management card.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

```
card reboot target_slot [ -force ] [ -noconfirm ]
```

- **target_slot**
  Indicates the slot number of the card which is the target of the reboot.

- **-force**
  Indicates the reboot is to take place ignoring any state or usage warnings that might be generated.

- **-noconfirm**
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage
A reboot is used to reset the card and receive a new download. This may be useful when a card is not responding or when it is necessary to cause the card to reload its image and restart.

**Important:** Caution should be taken in using this command as rebooting a card which has no redundancy card available may cause a service interruption and loss of active sessions.

**Caution:** The **-force** and **-noconfirm** options should only be used concurrently by experienced users as this will cause an immediate reboot regardless of warnings and no confirmation from the user.

**Important:** This command is not supported on all platforms.

Example
The following will cause the card in slot \( \theta \) to reboot without any confirmation from the user. The card will not reboot if there are any warnings generated.

```
card reboot \( \theta \) -noconfirm
```

The following command will cause the card in slot \( \theta \) to reboot regardless of any warnings. The user must provide confirmation prior to this command executing.
card reboot 8 -force

The following command will cause the card in slot 8 to reboot regardless of any warnings with no additional user confirmation.

card reboot 8 -force -noconfirm
card restart

This performs a soft-reset of the target card causing all application processes to restart.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

```
card restart target_slot [ -force ] [ -noconfirm ]
```

- `target_slot`
  Indicates the slot number of the card which is the target of the restart.

- `-force`
  Indicates the restart is to take place ignoring any state or usage warnings that might be generated.

- `-noconfirm`
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Restarting a card may be useful when a card is not performing as expected (performance drop, increased response delays, etc.). A restart may be preferred to a reboot as the card becomes available in less time than a reboot.

When this command is issued for an active card, the user is prompted for confirmation unless the `-force` and/or `-noconfirm` keywords are used. Because the reboot of standby or redundant cards is non-service impacting, the reboot proceeds immediately after the command execution without user confirmation.

**Important:** Caution should be taken in using this command as restarting a card which has no redundant card available may cause a service interruption and loss of active sessions.

**Important:** This command is not supported on all platforms.

**Caution:** The `-force` and `-noconfirm` options should only be used concurrently by experienced users as this will cause an immediate restart regardless of warnings and no confirmation from the user.

Example

The following will cause the card in slot 8 to restart without any confirmation from the user. The card will not reboot if there are any warnings generated.

```
card restart 8 -noconfirm
```
The following command will cause the card in slot 8 to restart regardless of any warnings. The user must provide confirmation prior to this command executing.

```
card restart 8 -force
```

The following command will cause the card in slot 8 to restart regardless of any warnings with no additional user confirmation.

```
card restart 8 -force -noconfirm
```
card smc

This is command is for managing the switch processor cards and their active/standby status and synchronizing the filesystem between the active device and the standby device.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

cardsmc { switchover | synchronize filesystem [ /flash | /hd | /pcmcia1 | all ] [ checkonly ] [ reverse ] } [ -noconfirm ]

- noconfirm
Executes the command without any additional prompt and confirmation from the user.

switchover
Switches control from the active SMC to the defined standby SMC.

synchronize filesystem [ /flash | /hd | /pcmcia1 | all ] [ checkonly ] [ reverse ]

/flash: Synchronizes only the filesystem on the standby SMC’s /flash device.
/hd: Synchronizes only the filesystem on the standby SMC’s hard drive.
/pcmcia1: Synchronizes only the filesystem on the standby SMC’s /pcmcia1 device.
all: Synchronizes file systems on all available matching local devices (/flash, /pcmcia1).
checkonly: Displays a list of files that could be synchronized, without executing any synchronization actions.
reverse: When used, the specified operation is performed from the standby SMC to the active SMC.

Usage
The switch over of an SMC changes the active/standby status of an SMC card. This is useful when there is a maintenance activity on the active card which requires removing the card from service. Each SMC contains independent local devices, namely a CompactFlash (/flash) and a PCMCIA card slot (/pcmcia1). Either of these devices may contain system files such as binary software images, configuration text files, boot system files, and others used to control and manage the system. This command allows the files contained on the active (currently managed) SMC to be synchronized, or mirrored, on the like local device(s) contained on the standby SMC.

Important: Only filesystems on matching local devices are synchronized. For example, if the active SMC contains two local devices (/flash and /pcmcia1) and the standby SMC contains only one local device (/flash), then synchronization only occurs on the matching local device (i.e. /flash).

Important: This command is not supported on all platforms.
Example
The following command switches the active/standby status of the switch processor cards. This command only executes after the user provides confirmation of the request:

```
card smc switchover
```

The following command switches the active/standby status of the SMCs and executes immediately with no additional user confirmation:

```
card smc switchover -noconfirm
```

The following command synchronizes the filesystems on all available matching local devices (/flash, /pcmcia1):

```
card smc synchronize filesystem all
```

The following command checks to see what files could be synchronized but no synchronization is performed:

```
card smc synchronize filesystem checkonly
```
card smc upgrade

This command updates the programmables on the SMC.

Product

All

Privilege

Security Administrator, Administrator

Syntax

card smc upgrade slot_number

upgrade

Upgrades programmables on the specified card. Must be followed by a slot number of card to upgrade.

⚠️ Caution: This command should only be used if instructed by or working with Technical Support.

Usage

You can only initiate an upgrade if:

- there is no migration occurring
- the card is active or standby
- there is no online upgrade in progress

❗️ Important: The following operations are not allowed while a card is upgrading: change pac edc requirement (config) change card [no] shutdown (config) change card active (config) change card redundancy (config) card halt (exec) card reboot (exec) start an online upgrade

❗️ Important: Level unlock operations are ignored while a card is upgrading.

❗️ Important: This command is not supported on all platforms.

Example

The following command initiates a PSC upgrade:

    card psc upgrade

⚠️ Caution: This command should only be used if instructed by or working with Technical Support.
card spio

This is the command for managing the switch processor I/O cards and their active/standby status.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

card spio switch toslot# [ -noconfirm ]

slot#
The slot number of the SPIO card that you want to switch to be the active card. The currently active SPIO card is put in standby mode and the SPIO card in the specified slot number is made active.

-noconfirm
Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage
Switch over changes the active/standby status of a SPIO card. This is useful when there is a maintenance activity on the active card which requires removing the card from service.

Important: This command is not supported on all platforms.

Example
The following command switches the active/standby status of the switch processor I/O cards. This command only executes after the user provides confirmation of the request.

    card spio switch

The following switches the active/standby status of the switch processor I/O cards. This command executes immediately with no additional user confirmation.

    card lc switch -noconfirm
**cdr-push**

This command initiates manual push of CDR files to L-ESS.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
cdr-push { all | local-filename file_name }
```

- **all**
  Specifies to push all CDR files to the configured URL.

- **local-filename file_name**
  Specifies to push the specified file to the configured URL.
  `file_name` must be the absolute path of local file name to push, and must be a string of 1 through 1023 characters in length.

**Usage**

Use this command to manually push CDR files to the configured L-ESS.
For information on configuring the L-ESS, see the `cdr` command in the EDR Module Configuration Mode Commands/UDR Module Configuration Mode Commands chapters.
On ASR 5000 chassis, run this command only from the local context. If you are in any other context, you will see this failure message: “Failure: Manual PUSH of CDRs supported only in the local context”

**Example**
The following command pushes all CDR files to the URL:

```
cdr-push all
```
clear

The following commands clear a variety of items including statistics, conditions, alarms, sessions, and files:
**clear aaa**

This command is used to clear all AAA statistics in the current context.

**Product**
PDSN, GGSN, ASN-GW

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
clear aaa local counters
```

**Usage**
Clearing the AAA statistics which may be useful when monitoring the statistics manually. Clearing resets the counters to zero.

The keyword `local` is not intended to imply the local context defined for all systems. Rather, the keyword `local` indicates the statistics within the current context are to be cleared.

**Example**
The following command zeroes out all the AAA statistics in the current context.

```
clear aaa local counters
```
clear active-charging analyzer statistics

This command is used to clear protocol analyzer statistics.

**Product**
ECS

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
clear active-charging analyzer statistics [ name protocol_name ] [ | { grep grep_options | more } ]
```

- `name protocol_name`
  
  Clears statistics for the specified protocol analyzer.
  
  If this keyword is not specified all statistics are cleared.
  
  `protocol_name` must be one of the following:
  
  - `dns`
  - `file-transfer`
  - `ftp`
  - `http`
  - `icmp`
  - `icmpv6`
  - `imap`
  - `ip`
  - `ipv6`
  - `mms`
  - `p2p [ application ]`: Peer-to-peer analyzer. The supported applications are:
    
    - `actsync`
    - `aimini`
    - `applejuice`
    - `ares`
    - `battlefld`
    - `bittorrent`
    - `ddlink`
    - `directconnect`
    - `edonkey`
    - `fasttrack`
    - `feidian`
    - `filetopia`

grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

**Usage**

Use this command to clear active charging analyzers.

**Example**

The following command clears active charging service analyzer information for analyzer named tcp:
clear active-charging analyzer statistics name tcp
clear active-charging charging-action statistics

This command is used to clear charging action statistics.

Product
ECS

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear active-charging charging-action statistics [ name<string> ] [ | {
grep grep_options | more } ]
```

- **name string**
  Clears detailed information for specific protocol analyzer.
  `<string>` must be the name of an existing charging action.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage
Use this command to clear active charging action statistics.

Example
The following command clears active charging action statistics information for charging action named `pre-paid`:

```
clear active-charging charging-action statistics name pre-paid
```
clear active-charging content-filtering category statistics

This command is used to clear category-based content filtering statistics for the specified rulebase.

**Product**
CF

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
clear active-charging content-filtering category statistics [ rulebase name=rulebase_name| all ] [ | { grep|grep_options| more } ]
```

- `all`:
  Clears the statistics of each and every configured rulebase.

- `rulebase_name`:
  `rulebase_name` must be the name of an existing rulebase, and must be an alpha and/or numeric string of 1 through 15 characters in length.

- `grep grep_options | more`:
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

**Usage**
Use this command to category-based content filtering statistics.

**Example**
The following command clears category-based content filtering statistics information for Rulebase named `cf_rule1`:

```
clear active-charging content-filtering category statistics rulebase name cf_rule1
```
clear active-charging credit-control statistics

This command clears credit control statistics.

Product
ECS

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear active-charging credit-control statistics [ group group_name]
```

**group group_name**
Clears statistics for the specified credit control group. *group_name* must be the name of a credit control group, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage
Use this command to clear credit control statistics.

Example
The following command clears statistics information for credit control:

```
clear active-charging credit-control statistics
```
clear active-charging edr-format statistics

Clears the statistics for the specified EDR format.

Product
ECS

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear active-charging edr-format statistics [ name edr_format ]
```

- `name edr_format`
  Specifies name of the EDR format for which you want to clear the statistics.
  `edr_format` must be the name of a configured EDR format, and must be an alpha and/or numeric string of 1 through 63 characters in length.

**Important:** If an EDR format name is not specified statistics for all EDR formats are cleared.

Usage
Use this command to clear the accumulated statistics for the specified EDR format.

Example
The following command clears the statistics for all EDR formats:

```
clear active-charging edr-format statistics
```
clear active-charging edr-udr-file statistics

This command is used to clear EDR/UDR file related statistics.

Product
ECS

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear active-charging edr-udr-file statistics
```

Usage

Use this command to clear EDR and UDR file statistics.

Example

The following command clears statistical information for EDR and UDR files:

```
clear active-charging edr-udr-file statistics
```
clear active-charging firewall statistics

This command clears Active Charging Stateful Firewall statistics.

**Product**
FW

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```plaintext
clear active-charging firewall statistics [ callid call_id | domain-name domain_name | nat-realm nat_realm | protocol { icmp | ip | other | tcp | udp } | username user_name | [ acsmgr instance instance_id ] [ grep|grep_options | more ] ]
```

---

**acsmgr instance instance_id**

Specifies an ACS Manager instance ID.
`instance_id` must be an integer from 1 through 65535.

---

**callid call_id**

Specifies a Call Identification number.
`call_id` must be an eight-digit HEX number.

---

**domain-name domain_name**

Specifies a domain name for the statistics.
`domain_name` must be a string of 1 through 127 characters in length.

---

**nat-realm nat_realm**

Specifies a NAT realm name for the statistics.
`nat_realm` must be a string of 1 through 31 characters in length.

---

**protocol { icmp | ip | other | tcp | udp }**

Specifies protocol for the stats.
- **icmp**: ICMP protocol
- **ip**: IP protocol
- **other**: Protocols other than TCP, UDP, and ICMP
- **tcp**: TCP protocol
- **udp**: UDP protocol

---

**username user_name**

Specifies a user name for the statistics.
`user_name` must be a string of 1 through 127 characters in length.
Clear Active-Charging Stateful Firewall Statistics

```
   clear active-charging firewall statistics
```

Usage

Use this command to clear Active Charging Stateful Firewall statistics.

Example

The following command clears all Stateful Firewall statistics:

```
   clear active-charging firewall statistics
```
clear active-charging firewall track-list

This command clears the list of servers being tracked for involvement in any Denial-of-Service (DOS) attacks.

**Product**
FW

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```plaintext
clear active-charging firewall track-list attacking-servers
```

**Usage**
Use this command to clear the list of servers being tracked for involvement in any DOS attacks.

**Example**
The following command clears the list of servers being tracked for involvement in any DOS attacks:
```
clear active-charging firewall track-list attacking-servers
```
clear active-charging fw-and-nat policy statistics

This command clears statistics for all or a specific firewall-and-NAT policy.

**Product**
FW, NAT

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
clear active-charging fw-and-nat policy statistics { all | name policy_name } [ | { grep grep_options | more } ]
```

- **all**
  Displays information for all firewall-and-NAT policies configured.

- **name policy_name**
  Displays information for the specified firewall-and-NAT policy. `policy_name` must be the name of a firewall-and-NAT policy, and must be an alpha and/or numeric string of 1 through 63 characters in length.

- **grep grep_options | more**
  Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

**Usage**
Use this command to clear statistics for all or a specific firewall-and-NAT policy.

**Example**
The following command clears statistics for the firewall-and-NAT policy named `test123`:

```
clear active-charging fw-and-nat policy statistics name test123
```
clear active-charging group-of-ruledefs statistics

This command clears statistical information related to Active Charging Service group of ruledefs.

Product
ECS

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear active-charging group-of-ruledefs statistics [ name group_of_ruledefs ] [ | { grep grep_options | more } ]
```

```
name group_of_ruledefs
```
Specifies name of the group of ruledefs for which statistics must be cleared. `group_of_ruledefs` must be the name of an existing group of ruledefs, and must be a string of 1 through 63 characters in length.

```
grep grep_options | more
```
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage
Use this command to clear statistical information related to all or specified Active Charging Service group of ruledefs.

Example
The following command clears statistical information related to the group of ruledefs named `ruledef_group12`:

```
clear active-charging group-of-ruledefs statistics name ruledef_group12
```
clear active-charging nat statistics

This command clears NAT realm statistics.

**Product**
NAT

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
clear active-charging nat statistics [ nat-realm nat_realm ] [ | { grep grep_options | more } ]
```

- **clear active-charging nat statistics**
  This command when issued in the local context clears statistics for all NAT realms in all contexts. When issued in a specific context, this command clears statistics for all NAT realms in that context.

- **clear active-charging nat statistics nat-realm nat_realm**
  This command when issued in the local context clears statistics for the specified NAT realm in all contexts. When issued in a specific context, this command clears statistics for the specified NAT realm in that context.

- **nat-realm nat_realm**
  Specifies the NAT realm’s name.
  `nat_realm` must be an alpha and/or numeric string of 1 through 31 characters in length.

- **grep grep_options | more**
  Specifies that the command’s output be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section in the Command Line Interface Reference.

**Usage**
Use this command to clear NAT realm statistics.

**Example**
The following command when issued in the local context, clears NAT realm statistics for NAT realms named `test135` in all contexts:

```
clear active-charging nat statistics nat-realm test135
```
clear active-charging rulebase statistics

This command clears ACS rulebase statistics.

Product
ECS

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear active-charging rulebase statistics [ name rulebase_name ] [ | { grep grep_options | more } ]
```

- `rulebase_name`
  Clears statistics for specified ACS rulebase.
  `-rulebase_name` must be the name of an existing rulebase, and must be an alpha and/or numeric string of 1 through 15 characters in length.

- `grep grep_options | more`
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  - For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage
Use this command to clear ACS rulebase statistics.

Example
The following command clears statistics for the ACS rulebase named `postpaid`:

```
clear active-charging rulebase statistics name postpaid
```
clear active-charging ruledef statistics

This command clears ACS rule definition statistics.

Product
ECS

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear active-charging ruledef statistics [ charging | firewall | name
ruledef_name ] [ | { grep grep_options | more } ]
```

- **charging**
  Clears statistics for all Charging rule definitions configured.

- **firewall**
  Clears statistics for all Firewall rule definitions configured.

- **name ruledef_name**
  Clears statistics for the specified active charging service rule definition.
  `ruledef_name` must be the name of an existing rule definition, and must be an alpha and/or numeric string of 1 through 63 characters in length.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to clear ACS ruledef statistics.

Example

The following command clears all ruledef statistics:

```
clear active-charging ruledef statistics
```
clear active-charging subsystem

This command is used to clear all Active Charging service information.

**Product**

ECS

**Privilege**

Security Administrator, Administrator, Operator

**Syntax**

```
clear active-charging subsystem
```

**Usage**

Use this command to clear all Active Charging subsystem information.

**Example**

The following command clears all Active Charging service information:

```
clear active-charging subsystem
```
clear active-charging url-blacklisting statistics

This command clears URL Blacklisting feature related statistics.

Product
CF

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear active-charging url-blacklisting statistics [ rulebase name rulebase_name ] [ [ | { grep grep_options | more } ] ]
```

```
rulebase name rulebase_name
Cleans URL Blacklisting information for the specified rulebase.
rulebase_name must be the name of a rulebase, and must be a string of 1 through 63 characters in length.
```

```
grep grep_options | more
Specifies that the output of the command must be piped (sent) to the command specified. A command to send
the output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the
Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.
```

Usage
Use this command to clear URL Blacklisting feature related statistics, optionally for a specific rulebase.

Example
The following command clears URL Blacklisting feature related statistics for rulebase12:

```
clear active-charging url-blacklisting statistics rulebase name rulebase12
```

clear administrator

This command ends the session of an administrative user specified by either user name or session ID.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
clear administrator { name user_name | session id id_num }
```

- **name user_name**
  Identifies the user name of the administrative user.

- **session id id_num**
  Identifies the ID number of the administrative user session as displayed in the `show administrators session id` command output.

Usage
This command is used to terminate command line interface sessions for other administrative users.

Example
The following command ends the session of the administrative user identified as user1:

```
clear administrator name user1
```

The following command ends the session of the administrative user with the session ID of 3:

```
clear administrator session id 3
```
clear alarm

Clears outstanding alarm conditions

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear alarm { all | chassis | idnum | port slot/port | slot slot }
```

- **all**
  Clear all outstanding alarms

- **chassis**
  Clears chassis-wide and fan tray alarms

- **id num**
  Clears a specific alarm by its internal alarm ID. `num` is the internal alarm identification number.

- **port slot/port**
  Clears alarms for the specified port. `slot/port` is the port to clear alarms for. `slot` is the slot that the card is installed in and `port` is the port on that card.

- **slot slot**
  Clears alarms for the specified slot. `slot` is the slot to clear alarms for.

Usage

Use this command to clear outstanding alarm conditions.

Example

To clear all outstanding alarms, use the following command:

```
clear alarm all
```

To clear all alarms for slot 7, enter the following command:

```
clear alarm slot 7
```
clear asngw-service

This command clears the service session statistics of an ASN GW service specified by either service name or trusted peer address.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
clear asngw-service statistics [name svc_name] peer-address ip_address
```

- **name svc_name**
  Identifies the name of the ASN GW service to clear all service statistics.

- **peer-address ip_address**
  Identifies the IP address of the ASN GW peer to clear all service statistics.

Usage
This command is used to terminate command line interface sessions for ASN GW services.

Example
The following command clears the service session statistics of ASN GW service named as asngw-service:

```
clear asngw-service statistics name asn_svc1
```
clear asnpc-service

This command clears the service session statistics of an ASN paging controller service specified by either ASN PC service name or trusted paging controller peer address.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```plaintext
clear asnpc-service statistics [name svc_name | peer-address ip_address]
```

- **name svc_name**
  Identifies the name of the ASN PC service to clear all service session statistics.

- **peer-address ip_address**
  Identifies the IP address of the ASN PC peer to clear all service statistics.

Usage

This command is used to terminate command line interface sessions for ASN PC services.

Example

The following command clears the service session statistics of ASN PC service named as asnp_svc1:

```plaintext
clear asnpc-service statistics name asnp_svc1
```
clear apn statistics

Deletes all previously gathered statistics for either a specific APN or all APNs configured with the given context.

Product
GGSN

Privilege
Security Administrator, Administrator, Operator

Syntax

clear apn statistics [ name=apn_name ]

name apn_name

Specifies the name of a specific APN configured in the context for which to clear statistics.

apn_name is the name of the APN and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage
Statistics for a single APN can be cleared using the name keyword. Statistics for all APNs in the context can be deleted by entering the command with no keywords.

If this command is executed from within the local context with no keywords, statistics will be cleared for every APN configured on the system regardless of context. In addition, if the name keyword is used when executing from within the local context, statistics for all APNs configured with the specified name will be cleared regardless of context.

Example
The following command clears statistics for an apn called isp1:

clear apn statistics isp1
clear bcmcs statistics

Clears BCMCS statistics.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear bcmcs statistics [ pdsn-service service_name ]
```

<table>
<thead>
<tr>
<th>pdsn-service service_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Defines a specific PDSN service for which to clear BCMCS-specific statistics. This value must be a string consisting of up to 63 characters.</td>
</tr>
</tbody>
</table>

Usage

Use this command to clear accumulated BCMCS statistics. You may specify an individual PDSN or peer to selectively clear statistics.

Example

```
clear bcmcs statistics
clear bcmcs statistics pdsn-service service_name
```
clear blacklisted-gtpu-bind-address

Clears the GTP-U loopback address blacklisted by a specific RNC as defined for a specific IuPS Service configuration.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

clear blacklisted-gtpu-bind-address ip_address rnc-id rnc-id mcc mcc_num mnc mnc_num iups-service name

**ip_address**

Specifies the IP loopback address that has been blacklisted. This loopback address was originally defined with the **associate-gtpu-bind-address** command in the Radio-Network-Controller configuration mode of the IuPS Service.

*ip_address* must be specified using the standard IPv4 dotted decimal notation.

Usage

This command enables this loopback address to be used for future RAB-assignment requests.

Example

clear blacklisted-gtpu-bind-address 1.1.1.1 rnc-id 2 mcc 123 mnc 321 iups-service iups1
clear bssap+ statistics

Clears/deletes the statistics for Base Station System Application Part plus in a Gs service sessions.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
clear bssap+ statistics [ gs-service gs_svc_name ] [ vlr { name vlr_name | isdn-number E164_ISDN_Num } ]
```

- **gs-service gs_svc_name**
  Specifies the name of a specific Gs service to clear the BSSAP+ information.
  `gs_svc_name` is the name of a configured Gs service for which BSSAP+ is applied and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

- **vlr { name vlr_name | isdn-number E164_ISDN_Num }**
  Specifies the name of the VLR or SS7 address in E.164 ISDN format to clear the BSSAP+ information.
  `vlr_name` is name of the VLR must be an alpha and/or numeric string of 1 to 63 characters.
  `E164_VLR_num` is an ISDN number for VLR per E.164 number plan and must be an numerical string of 1 to 15 digits.

**Usage**
Use this command to delete or clear the statistics of BSSAP+ application on a system.

**Example**
The following command clears the information about BSSAP+ in a Gs service named `gssvc1`.

```
clear bssap+ statistics gs-service gssvc1
```
clear bulkstats

Clears counters and accumulated bulk statistics related information.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```plaintext
clear bulkstats { counters | data }
```

- **counters**
  Clears the counters maintained by the system’s “bulkstats” facility.

- **data**
  Clears any accumulated data that has not been transferred. This includes any “completed” files that haven't been successfully transferred.

**Usage**

Once bulk statistics collection is enabled, the system stores the information until the specified transfer criteria is met or until a manual transfer is initiated. The system maintains counters for the “bulkstats” software facility. (Refer to the **data** keyword for the **show bulkstats** command for information on viewing the counters.)

This command can be used to delete bulk statistics information that has been collected but not transferred and/or to clear the counters that have been maintained.

**Example**
The following command clears bulk statistics-related counters:

```plaintext
clear bulkstats counters
```
clear config

This command replaces the active configuration source file with an empty configuration where possible.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
clear config [ -noconfirm ]
```

- **-noconfirm**
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

**Usage**
Clear the current configuration when a complete over write is desired or if it is necessary to start from an empty configuration.

**Important:** Clearing the configuration will cause the active configuration source file to be empty and of no use in configuring the system to an active state providing service.

**Important:** It is suggested that this command only be performed on configurations which have been backed up for easy restoration.

**Example**
The following command clears the active configuration after the user provides confirmation of the request.

```
clear config
```

The following command clears the active configuration source file immediately with no user confirmation.

```
clear config -noconfirm
```
clear congestion-control statistics

Clears the congestion control statistics for all instances of the specified manager type.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
clearcongestion-controlstatistics { allmgr | asngwmgm | asnpcmgr | hamgr | gtpcmgr | 12tpmgr | imsimgr }
```

- **allmgr**
  Clears the statistics for all A11 Manager instances.

- **asngwmgm**
  Clears the statistics for all ASN GW Manager instances

- **asnpcmgr**
  Clears the statistics for all ASN PC-LR Manager instances

- **hamgr**
  Clears the statistics for all HA Manager instances.

- **gtpcmgr**
  Clears the statistics for all GTPC Manager instances.

- **12tpmgr**
  Clears the statistics for all L2TP Manager instances.

- **imsimgr**
  Clears the statistics for all IMSI Manager instances.

**Usage**

Use this command to statistics for all instances of the specified manager.

**Important:** When this command is issued in any context other than the local context, only instances of the specified manager for the current context have the statistics cleared. When the current context is the local context, all instances of the specified manager type in all contexts have the statistics cleared.

**Example**
Clear the statistics for all instances of the A11 manger, by entering the following command:

```
clear congestion-control statistics allmgr
```
clear content-filtering category statistics

This command clears the Category-based Content Filtering application statistics.

Product
CF

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear content-filtering category statistics [ facility srdbmgr instance:<instance_value>]
```

```
facility srdbmgr instance:<instance_value>
```
Cleans logged events for the specified SRDB Manager instance.

- `instance_value` must be an integer from 1 through 8.
- In StarOS 9.0 and later, `instance_value` must be an integer from 1 through 10000.

Usage
Use this command to clear all Category-based Content Filtering application statistics, or statistics for a specific SRDB Manager instance.

Example
The following command clears all Category-based Content Filtering application statistics:

```
clear content-filtering category statistics
```
clear crash

The clear crash command removes a specific crash file or all crash files.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear crash [ list | number crash_num ]
```

<table>
<thead>
<tr>
<th>list</th>
<th>number crash_num</th>
</tr>
</thead>
<tbody>
<tr>
<td>list: removes all crash files.</td>
<td></td>
</tr>
<tr>
<td>number crash_num removes only the crash file specified as crash_num which must be within the range of 1 through 30.</td>
<td></td>
</tr>
</tbody>
</table>

Usage

CLeft crashes for general maintenance activities in cleaning out old, unused, or files which are of no importance.

Example

The following will remove all crash files.

```
clear crash list
```

The following command will remove only crash file 27.

```
clear crash number 27
```
clear credit-control statistics

This command is used to clear credit control statistics.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear credit-control statistics cc-service cc_service_name
```

```
cc-service cc_service_name
Specifies the credit control service name.
cc_service_name must be an existing Credit Control service, and must be an alpha and/or numeric string of 1 through 63 characters in length.
```

Usage
Use this command to clear active credit control statistics.

Example
The following command clears the configured credit control statistics for a service named service1:

```
clear credit-control statistics cc-service service1
```
clear crypto

The clear crypto command clears crypto associations or crypto statistics.

Product

PDSN, HA, GGSN, PDG/TTG, PDIF, SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear crypto { isakmp [ tag map_name | peer peer_ip ] | security-association { counters tag map_name [ tx | rx ] | tag map_name | peer peer_ip } | statistics { ikev2 | ipsec-3gpp-cscf } [ service-ip-address ip-address | service-name name ] }
```

- **isakmp [ tag map_name | peer peer_ip ]**
  - When no keywords are specified, this command clears all of the ISAKMP security associations for the current context.
  - **tag map_name**: Clears the ISAKMP SAs for the specified crypto map. `map_name` is the name of an existing crypto map.
  - **peer peer_ip**: Deletes the ISAKMP SAs for the specified peer. `peer_ip` must be entered in standard IPv4 notation.

- **security-association { counters tag map_name [ tx | rx ] | tag map_name | peer peer_ip }**
  - **counters tag map_name [ tx | rx ]**: Resets the counters for the specified crypto map. `map_name` is the name of an existing crypto map. `tx` specifies that only the transmit SA counters are reset. `rx` specifies that only the receive SA counters are reset. If neither `tx` or `rx` are specified, both transmit and receive SA counters are reset.
  - **tag map_name**: Tears down a Security Association (SA) for the specified crypto map. `map_name` is the name of an existing crypto map.
  - **peer peer_ip**: Clears the SAs for all tunnels who have the peer at the specified IP address. `peer_ip` must be entered in standard IPv4 notation.

⚠️ **Caution**: Modification(s) to an existing crypto map and/or ISAKMP policy configuration will not take effect until the related security association has been cleared.

- **statistics { ikev2 | ipsec-3gpp-cscf } [ service-ip-address ip-address | service-name name ]**
  - **ikev2**: Clears global IKEv2 statistics for the current context.
  - **ipsec-3gpp-cscf**: Clears global CSCF IPSec statistics for the current context.
  - **service-ip-address ip-address**: Clears statistics for the specified service-ip address. `service-name name`: Clears statistics for the specified service name.

Usage

Clear SAs and apply changes to the crypto map or clear the crypto statistics for this context.
Example
The following clears all IKEv2 crypto statistics for the current context:

    clear crypto statistics ikev2
clear cscf service

Resets statistics counters for a specific CSCF service, all CSCF services, or for all services within a specified context (VPN).

Product
SCM

Privilege
Security Administrator, Administrator, Operator

Syntax

clear cscf service

Syntax: clear cscf service { diameter { location-info | policy-control } statistics [ service-name service_name | vpn-name name ] | li-packet-cable statistics [ service-name service_name ] | performance-counters name service_name | statistics name service_name { all | calls | ip-security | message | package-name { message-summary | presence | reg | winfo } | registrations | sigcomp | tcp | vpn-name name } }

diameter { location-info | policy-control } statistics [ service-name service_name | vpn-name name ]
Clears Diameter (DPECA) statistics on the CSCF Rx interface with the configuration information.
service-name service_name: Specifies the name of a CSCF service for which the statistics will be reset.
vpn-name name: Must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

li-packet-cable statistics [ service-name service_name ]
Clears Lawful Intercept statistics.
service-name service_name: Clears Lawful Intercept statistics for a specific CSCF service configured on this system. service_name must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

performance-counters name service_name
Clears all CSCF performance counters for a specific CSCF service configured on this system.
name service_name: Must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

statistics name service_name { all | calls | ip-security | message | package-name { message-summary | presence | reg | winfo } | registrations | sigcomp | tcp | vpn-name name }
Clears service statistics for a specific CSCF service configured on this system. service_name must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.
all: Clears all CSCF service statistics.
calls: Clears statistics related to CSCF calls.
ip-security: Clears statistics related to CSCF IPSec.
message: Clears statistics for the SIP method MESSAGE.
package-name: Clears statistics for the associated event package.
clear cscf service

- presence: Clears statistics for the “presence” event package.
- reg: Clears statistics for the “reg” event package.
- winfo: Clears statistics for the “watcher-info” event package.
- registrations: Clears statistics related to CSCF registrations, re-registrations, and de-registrations.
- sigcomp: Clears statistics related to CSCF sigcomp.
- tcp: Displays session statistics related to CSCF TCP.
- vpn-name name: Clears statistics for a specific CSCF service configured in a specific context on this system. name must be an existing context and be from 1 to 79 alpha and/or numeric characters.

**Important:** This keyword must be followed by another statistics-related keyword.

**Usage**

Use this command to reset statistics counters for CSCF services. This command will reset the counters in the output of the `show cscf service statistics` command.

**Important:** This command will not clear current registered users and current CSCF sessions.

**Example**

The following command resets all statistics for a service named `cscf1`:

```
clear cscf service statistics name cscf1 all
```
clear cscf sessions

Clears statistics for CSCF sessions on this system.

Product
SCM

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear cscf sessions { counters { calls | subscription } service service_name | service service_name { all | aor aor | session-id id } }
```

**counters { calls | subscription } service service_name**
Clears counters for all CSCF sessions matching the filter criteria.
calls: Counters associated with calls in CSCF service.
subscription: Counters associated with subscriptions in CSCF service.

**service service_name { all | aor aor | session-id id }**
Clears session information for all CSCF sessions matching the filter criteria.
service service_name: Session statistics on specific CSCF service. service_name must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

- **all**: Specifies that session statistics are to be cleared for all sessions on this service.
- **aor aor**: Specifies that session statistics are to be cleared for sessions at this specific AoR. aor must be an existing AoR and be from 1 to 79 alpha and/or numeric characters.
- **session-id id**: Specifies that session statistics are to be cleared for sessions with this ID. id must be an existing session ID and be from 1 to 63 alpha and/or numeric characters.

Usage
Use this command to clear session information for CSCF sessions.

Example
The following command resets all session statistics for a service named cscf1:

```
clear cscf sessions service cscf1 all
```
clear cscf sip

Resets SIP statistics counters for a specific CSCF service, all CSCF services, or for all services within a specified context (VPN) or interface.

**Product**

SCM

**Privilege**

Security Administrator, Administrator, Operator

**Syntax**

```
clear cscf sip statistics [ name service_name [ interface { domain_name domain_name | ip address ip_address } | vpn-name name ]
```

- **name service_name**
  Specifies the name of a CSCF service for which the SIP statistics will be reset. `service_name` must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

- **interface { domain_name domain_name | ip address ip_address }**
  SIP statistics will be reset in this interface.
  - domain name `domain_name`: Specifies the domain associated with the CSCF service. `domain_name` must be an existing domain and be from 1 to 64 alpha and/or numeric characters.
  - ip address `ip_address`: Specifies the destination or source ip address associated with the CSCF service.

- **vpn-name name**
  Specifies the name of a context in which all SIP statistics for all services will be reset. `name` must be an existing context and be from 1 to 79 alpha and/or numeric characters.

**Usage**

Use this command to reset SIP counters found in the output of the `show cscf sip` command.

**Example**

The following command resets the SIP statistics for a service named `cscf1`:

```
clear cscf sip statistics name cscf1
```
clear cscf subscription

Clears all subscriptions for a named service or for individual subscribers within the service.

Product
SCM

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear cscf subscription service service_name { all | from-aor subscriber_aor to-aor resource_aor }
```

```

service service_name
Specifies the name of a CSCF service for which the subscription(s) will be cleared. service_name must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

all | from-aor subscriber_aor to-aor resource_aor
all: Removes all CSCF subscriptions for the specified service.
from-aor subscriber_aor: Removes all CSCF subscriptions for a specified subscriber in a specified service.
subscribed-to resource_aor: Removes all CSCF subscriptions for a specified subscriber in a specified service with a specified subscribed-to resource AoR.

Usage
Use this command to clear subscriptions to enforce policies. This command initiates a SUBSCRIBE request with Expires as 0 in the corresponding subscription dialog.

Example
The following command clear all subscriptions for a CSCF service named cscf1:

```
clear cscf subscription service cscf1 all
```
clear diameter aaa-statistics

This command clears Diameter AAA statistics.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear diameter aaa-statistics [ all | [ group aaa_group ] server diameter_server ] [ | { grep grep_options | more } ]
```

<table>
<thead>
<tr>
<th>all</th>
</tr>
</thead>
</table>
| Clears all Diameter server statistics.

<table>
<thead>
<tr>
<th>group aaa_group</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clears Diameter server statistics for the specified AAA group.</td>
</tr>
<tr>
<td><code>aaa_group</code> must be the name of a AAA group, and must be a string of 1 through 64 characters in length.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>server diameter_server</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clears Diameter server statistics for the specified Diameter server.</td>
</tr>
<tr>
<td><code>diameter_server</code> must be the name of a Diameter server, and must be a string of 1 through 64 characters in length.</td>
</tr>
</tbody>
</table>

| | { grep grep_options | more } |
|-----------------------------|
| Indicates the output of the command is to be piped (sent) to the command specified. |
| A command to send output to must be specified. |
| For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference. |

Usage

Use this command to clear Diameter AAA statistics.

Example

The following command clears Diameter server statistics for the specified AAA group:

```
clear diameter aaa-statistics group <aaa_group>
```
clear diameter statistics

This command clears Diameter statistics.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

clear diameter statistics [ [ proxy ] endpoint endpoint_name [ peer-host host_id [ peer-realm realm_id ] ] ] [ | { grep grep_options | more } ]

endpoint endpoint_name
Clears endpoint related statistics.
endpoint_name must be the name of an endpoint, and must be a string of 1 through 63 characters in length.

proxy
Clears proxy related statistics.

peer-host host_id
Clears statistics for the specified Diameter peer host ID.
host_id must be the Diameter peer host ID, and must be a string 1 through 255 characters in length.

peer-realm realm_id
Clears statistics for the specified Diameter peer realm.
realm_id must be the Diameter peer realm ID, and must be a string 1 through 127 characters in length.

| { grep grep_options | more }
Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage
Use this command to clear Diameter statistics.

Example
The following command clears all Diameter statistics for the specified endpoint:

clear diameter statistics endpoint <endpoint_name>
clear dhcp statistics

Deletes all previously gathered statistics for either a specific DHCP server or all DHCP servers configured within the given context.

Product
GGSN, ASN-GW

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear dhcp statistics [ dhcp-service svc_name | server ip_address]
```

```
dhcp-service svc_name
```

The name of a specific DHCP service for which to clear statistics. **svc_name** is the name of the DHCP service and can be from 1 to 63 alpha and/or numeric characters in length and is case sensitive.

```
server ip_address
```

Specifies the IP address of a specific DHCP server configured in the context for which to clear statistics. **ip_address** must be entered in dotted decimal notation.

Usage
Statistics for a single server can be cleared using the **server** keyword. Statistics for all DHCP servers in the context can be deleted by entering the command with no keywords. This command can be executed from any context configured on the system. If this command is executed from within the local context with no keywords, statistics will be cleared for every DHCP server configured on the system regardless of context. In addition, if the server keyword is used when executing from within the local context, statistics for all DHCP servers configured with the specified name will be cleared regardless of context.

Example
The following command clears statistics for all configured DHCP servers within the context:

```
clear dhcp statistics
```
clear dns-client

Clears DNS cache and/or statistics for a specified DNS client.

Product
SCM

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear dns-client name { cache [ query-name name | query-type { A | SRV } ] | statistics }
```

dns-client name
Defines the name of the DNS client whose cache and/or statistics are being cleared. `name` must be an existing DNS client and be from 1 to 255 alpha and/or numeric characters in length.

```
cache [ query-name name | query-type { A | SRV } ]
```
Specifies that the cache for the defined DNS client is to be cleared.
query-name `name`: Filters DNS results based on the domain name. `name` must be from 1 to 255 characters in length. `name` is the domain name used to perform the DNS query. `name` is different from the actual domain name which is resolved. For example, to resolve the SIP server for `service.com`, the query name is `_sip._udp.service.com` and the query type is `SRV`.
query-type:
• `A`: Filters DNS results based on domain IP address records (A records).
• `SRV`: Filters DNS results based on service host records (SRV records).

```
statistics
```
Specifies that statistics for the defined DNS client are to be cleared.

Usage
Use this command to clear DNS cache and/or statistics for a specified DNS client.

Example
The following command clears statistics for a DNS client named `domain1.com`

```
clear dns-client domain1.com statistics
```
clear egtpc

Clears enhanced GPRS Tunneling Protocol control plane statistics and counters found in show command outputs and bulk statistics associated with all eGTP-C-related services or those defined by the parameters in this command.

Product
MME, P-GW, S-GW

Privilege
Operator

Syntax

```
clear egtpc statistics [ egtp-service name | interface-type { interface-mme | interface-pgw-ingress | interface-sgw-egress | interface-sgw-ingress } | mme-address ip_address | pgw-address ip_address | sgw-address ip_address ]
```

<table>
<thead>
<tr>
<th>egtp-service name</th>
</tr>
</thead>
</table>
| Clears all statistics and counters associated with a specific eGTP service name. *name* must be an existing eGTP service name and be from 1 to 63 alpha and/or numeric characters.

| interface-type { interface-mme | interface-pgw-ingress | interface-sgw-egress | interface-sgw-ingress } |
|---------------------------|
| interface-mme: Clears statistics and counters derived from all MME interface types associated with this system.
| interface-pgw-ingress: Clears statistics and counters derived from all P-GW ingress interface types associated with this system.
| interface-sgw-egress: Clears statistics and counters derived from all S-GW egress interface types associated with this system.
| interface-sgw-ingress: Clears statistics and counters derived from all S-GW ingress interface types associated with this system.

<table>
<thead>
<tr>
<th>mme-address ip_address</th>
</tr>
</thead>
</table>
| Clears all statistics and counters derived from a specific MME IP address. *ip_address* must be an existing MME IP address and be specified in dotted decimal notation (for IPv4) or colon-separated notation (for IPv6).

<table>
<thead>
<tr>
<th>pgw-address ip_address</th>
</tr>
</thead>
</table>
| Clears all statistics and counters derived from a specific P-GW IP address. *ip_address* must be an existing P-GW IP address and be specified in dotted decimal notation (for IPv4) or colon-separated notation (for IPv6).

<table>
<thead>
<tr>
<th>sgw-address ip_address</th>
</tr>
</thead>
</table>
| Clears all statistics and counters derived from a specific S-GW IP address. *ip_address* must be an existing S-GW IP address and be specified in dotted decimal notation (for IPv4) or colon-separated notation (for IPv6).
**Usage**

Use this command to clear running statistics and counters found in show command and bulk statistics outputs for all eGTP-C-related services or for specific interfaces, services, or IP addresses as specified by parameters in this command.

**Example**

The following command clears eGTP-C statistics and counter associated with all P-GW ingress interfaces configured on this system:

```
clear egtpc statistics interface-type interface-pgw-ingress
```

The following command clears eGTP-C statistics and counter associated with all MME interfaces configured on this system:

```
clear egtpc statistics interface-type interface-mme
```
clear firewall flows

This command is obsolete.
clear firewall ruledef

This command is obsolete.
clear firewall statistics

This command is obsolete.
clear gmm-sm statistics

Deletes all previously gathered GMM-SM statistics within the given context based on the specified criteria.

Product
GGSN

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear gmm-sm statistics [ gmm-only | sm-only ] [ gprs-service srvc_name [ nsei
nsei_id | routing-area mcc mcc_id mnc mnc_id lac lac_id rac rac_id ] ] | [ sgsn-
service srvc_name [ rnc mcc mcc_id mnc mnc_id rnc-id rnc_id | routing area mcc
mcc_id mnc mnc_id lac lac_id rac rac_id ] ]
```

**gmm-only**
Enter this keyword to display only GPRS mobility management (GMM) information for other specified keyword parameters for the current context.

**sm-only**
Enter this keyword to display only session management (SM) information for other specified keyword parameters for the current context.

**gprs-service srvc_name**
Enter this keyword to display the statistics for the specified GPRS service. The display request can be narrowed by adding additional keywords. 

*srvc_name* must be an alphanumeric string of 1 to 63 alphanumeric characters.

**nsei**
Enter this keyword to display the GMM/SM session statistics for the identified network service entity (NSEI).

**sgsn-service srvc_name**
Enter this keyword to display the statistics for the specified SGSN service. The display request can be narrowed by adding additional keywords. 

*srvc_name* must be an alphanumeric string of 1 to 63 alphanumeric characters.

**rnc**
Enter this keyword to fine-tune the display of the GMM/SM session statistics just for the specified (rnc-id) radio network controller (RNC).

**rnc-id rnc_id**
Enter this keyword to identify the specific RNC.

*rnc_id* must be an integer from 0 through 4095.
clear gmm-sm statistics

**Routing Area Commands (A-C)**

Clear GMM/SM statistics

```
Routing-area mcc mcc_id mnc mnc_id lac lac_id rac rac_id
```

Enter the `routing-area` keyword to fine-tune the display of the GMM/SM session statistics for a specified routing area (RA) identified by the MCC, MNC, LAC and RAC.

**MCC mcc_id**

Enter this keyword to specify the mobile country code (MCC) as part of the identification of the RNC or RA. `mcc_id` must be an integer from 100 through 999.

**MNC mnc_id**

Enter this keyword to specify the mobile network code (MNC) as part of the identification of the RNC or RA. `mnc_id` must be an integer from 00 through 999.

**LAC lac_id**

Enter this keyword to specify the location area code (LAC) as part of the identification of the RNC or RA. `lac_id` must be an integer from 1 through 65535.

**RAC rac_id**

Enter this keyword to specify the routing area code (RAC) as part of the identification of the RNC or RA. `rac_id` must be an integer from 1 through 255.

**Usage**

Use this command to delete statistics for the GMM/SM session configurations for SGSN services.

**Example**

The following command deletes GMM/SM statistics for a specific routing area defined for the GPRS service:

```
clear gmm-sm statistics gprs-service gprs1 routing-area mcc 123 mnc 131 lac 24 rac 11
```

The following command clears all collected information for GMM/SM statistics:

```
clear gmm-sm statistics verbose
```
clear gtpc statistics

Deletes all previously gathered GTPC (GTPv0, GTPv1-C, GTPv1-U) statistics within the given context based on the specified criteria.

**Product**  
GGSN

**Privilege**  
Security Administrator, Administrator, Operator

**Syntax**  

```
clear gtpc statistics [ apn apn_name] [ custom1 ] [ ggsn-service ggsn_name] [ sgsn-address sgsn_address]
```

**apn apn_name**  
Specifies the name of an APN configured in the context for which to delete GTPC statistics.  
`apn_name` can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

**custom1**  
Clears the statistics of GTP-C messages for preservation mode and free of charge service.  
This keyword is customer-specific license enabled and used for Preservation-Mode and Free-of-Charge Service which are enabled under customer-specific license. For more information on this support, contact your local representative.

**ggsn-service ggsn_name**  
Specifies the name of a GGSN service configured in the context for which to delete GTPC statistics.  
`ggsn_name` can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

**sgsn-address sgsn_address**  
Specifies the IP address of an SGSN for which to delete GTPC statistics.  
`sgsn_address` must be expressed in dotted decimal notation.

**Usage**  
GT-C statistics can be cleared for a single APN, GGSN service, or SGSN. All GTPC statistics in the context can be deleted by entering the command with no keywords.  
This command can be executed from any context configured on the system.  
If this command is executed from within the local context with no keywords, all GTPC statistics will be cleared regardless of context.  
GTPP statistics are not affected by this command.

**Example**  
The following command clears all GTPC statistics within the context:

```
clear gtpc statistics
```
clear gtpc statistics
clear gtppp statistics

Deletes all previously gathered GTPP statistics within the given context based for either single or all charging gateway functions (CGFs).

Product
GGSN

Privilege
Security Administrator, Administrator, Operator

Syntax

clear gtppp statistics [ cgf-address ip-address]

cgf-address cgf_address
Deletes statistics for a particular CGF. cgf_address is the IP address of the CGF for which statistics are to be deleted. It must be expressed in dotted decimal notation

Usage
Statistics for a single CGF can be cleared using the cgf-address keyword. Statistics for all CGFs in the context can be deleted by entering the command with no keywords.
This command can be executed from any context configured on the system.
If this command is executed from within the local context with no keywords, statistics will be cleared for every CGF configured on the system regardless of context. In addition, if the cgf-address keyword is used when executing from within the local context, statistics for all CGFs configured with the specified name will be cleared regardless of context.

Example
The following command deletes all GTPP statistics for a CGF with an IP address of 192.168.1.42:

clear gtppp statistics cgf-address 192.168.1.42
clear gtpp storage-server local file statistics

This command clears AAAproxy GTPP group level statistics for CDRs stored on the local SMC hard disk.

Product
GGSN, SGSN

Privilege
Security Administrator, Administrator, Operator

Syntax

clear gtpp storage-server local file statistics [ group name name ]

Usage
If executed from the local context, this command clears statistics for all GTPP groups configured on the system. If executed from the context within which the storage servers (SMC hard disk) is configured, statistics are deleted for only that context.
clear gtpp storage-server statistics

Clears statistics for configured GTPP storage servers (GSS).

Product
GGSN

Privilege
Security Administrator, Administrator, Operator

Syntax

`clear gtpp storage-server statistics`

Usage
If executed from the local context, this command clears statistics for all GTPP storage servers configured on the system. If executed from the context within which the servers are configured, statistics are deleted for only those servers.
clear gtpu statistics

Clears enhanced GPRS Tunneling Protocol user plane statistics and counters found in show command outputs and bulk statistics associated with all GTP-U-related services or those defined by the parameters in this command.

Product
P-GW, S-GW

Privilege
Operator

Syntax
clear gtpu statistics [ gtpu-service name | peer-address ip_address ]

gtpu-service name
Clears all statistics and counters associated with a specific GTP-U service name. name must be an existing GTP-U service name and be from 1 to 63 alpha and/or numeric characters.

peer-address ip_address
Clears all statistics and counters derived from a specific peer IP address. ip_address must be an existing peer IPv4 or IPv6 address and be specified in dotted decimal notation (for IPv4) or colon-separated notation (for IPv6).

Usage
Use this command to clear running statistics and counters found in show command and bulk statistics outputs for all GTP-U-related services or for specific services or IP addresses as specified by parameters in this command.

Example
The following command clears GTP-U statistics and counter associated with a GTP-U service name gtpu-12 configured on this system:

```
clear gtpu statistics gtpu-service gtpu-12
```
clear hd-storage-policy

Clears statistic information for HD storage policies configured on the system.

Product
HSGW, P-GW, S-GW

Privilege
Operator

Syntax

```
clear hd-storage-policy statistics { all | name name }
```

```
statistics { all | name name }
```

- **all**: Specifies that ACR statistic information for all HD storage policies configured on the system is to be cleared.
- **name name**: Specifies that ACR statistic information for an HD storage policy with the specified name is to be cleared.

Usage
Use this command to clear statistics for HD storage policies configured on the system.

Example
The following command clears statistics for an HD storage policy named `pgwsgw`:

```
clear hd-storage-policy statistics name pgwsgw
```
clear hsgw-service

Clears statistic information for HSGW services configured on the system.

**Product**

HSGW

**Privilege**

Operator

**Syntax**

```
clear hsgw-service statistics { all | name name }
```

- **statistics { all | name name }**
  - **all**: Specifies that HSGW service statistic information for all HSGW services configured on the system is to be cleared.
  - **name name**: Specifies that HSGW service statistic information for an HSGW service with the specified name is to be cleared.

**Usage**

Use this command to clear statistics for HSGW services configured on the system.

**Example**

The following command clears statistics for an HSGW service named `hsgw3`:

```
clear hsgw-service statistics name hsgw3
```
clear ims-authorization

This command clears statistics for all or for a specified IMS Authorization Service.

Product
GGSN, SCM

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear ims-authorization { policy-control statistics [ ims-auth-service service_name ] | service statistics [ name service_name ] } [ | { grep grep_options | more } ]
```

- **ims-auth-service service_name**
  
  Clears statistics for the specified IMSA service. *service_name* must be the name of an IMSA service, and must be a string of 1 through 64 characters in length.

- **grep grep_options | more**
  
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  
  For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to clear IMSA Service statistics.

Example

The following command clears IMSA policy-control statistics for an IMSA service named *test_service*:

```
clear ims-authorization policy-control statistics ims-auth-service test_service
```
clear ip access-group statistics

This command clears all interface ACL statistics and the context level ACL statistics that have been configured in the current context. Be aware that updating an access list also causes all ip access-groups utilizing the list to be cleared.

**Product**

PDSN, GGSN, ASN-GW

**Privilege**

Security Administrator, Administrator

**Syntax**

```
clear ip access-group statistics
```

**Usage**

Use this command to clear all interface ACL statistics and the context level ACL statistics that have been configured in the current context.

The following command clears the ACL statistics:

```
clear ip access-group statistics
```
clear ip arp

Clears the address resolution protocol cache for a given IP address.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
clear ip arp ip_address
```

Specifies the IP address for which to clear the ARP cache. `ip_address` must be specified using the standard IPv4 dotted decimal notation.

Usage
Clear the ARP cache when network changes have occurred for the case where the cached data may cause undue overhead in routing of packets.

Example
The following command clears the ARP cache for the IP address 1.2.3.4:

```
clear ip arp 1.2.3.4
```
clear ip bgp peer

Resets BGP connections for all peers or for specified peers in the current context.

Product
HA

Privilege
Security Administrator, Administrator

Syntax
```
clear ip bgp peer {ip_address| all | as as_num} [in | out | soft | vpnv4 ]
```

**ip_address**
The IP address of the neighbor for which BGP connections should be reset. *ip_address* is an IPv4 address in dotted-decimal notation.

**all**
Reset BGP connections for all peers.

**as as_num**
Reset BGP connections for all peers in the specified AS. *as_num* must be an integer from 1 through 65535.

**in**
Soft reconfigure inbound updates.

**out**
Soft reconfigure outbound updates.

**soft**
Soft reconfigure inbound and outbound updates.

**vpnv4**
Clears bgp sessions with the vpnv4 address family.

Usage
Use this command to BGP information for the current context.

Example
The following command resets BGP connections for all neighbors:
```
clear ip bgp peer all
```
clear ip localhosts

This command removes the host specified from the current context’s local host list for IP address mappings.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
clear ip localhosts [ host_name ]
```

*host_name*
Specifies the name of the host to be removed. Value must be a string from 1 to 1023 characters. When omitted, all local host name mappings will be removed.

**Usage**
Clear a host name when it is no longer valid for the current context to access. The host name specified will be unrecognized by the current context once the command is performed.

**Example**

```plaintext
clear ip localhosts
clear ip localhosts 1.2.3.4
clear ip localhosts remoteABC
```
clear ip ospf process

Clears OSPF database information for the current context and re-establishes neighbor adjacency.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
clear ip ospf process
```

**Usage**
Use this command to clear the OSPF database information for the current context and re-establishes neighbor adjacency.

**Example**
The following command clears the OSPF database information for the current context and re-establishes neighbor adjacency:

```
clear ip ospf process
```
clear ipv6 neighbors

Clears an ipv6 address from the neighbor cache.

**Product**
PDIF

**Privilege**
Administrator, Security Administrator

**Syntax**

```
clear ipv6 neighbors ipaddress
```

**Usage**
Clears a specific address from the neighbor cache.

**Example**

Use the following example to clear 3ffe:ffff:101::230:6eff:fe04:d9aa/48:

```
```
clear l2tp

Clears all or specific L2TP statistics or clears and disconnects all or specified sessions or tunnels.

Product
PDSN, GGSN, LNS

Privilege
Security Administrator, Administrator, Operator

Syntax

```
statistics [ lac-service service_name | lns-service service_name | peer-address ip_address ]
```

With no optional keywords specified, this command clears all L2TP statistics for the current context.

- **lac-service service_name**: Clears all L2TP statistics for the specified LAC service in the current context.
- **lns-service service_name**: Clears all L2TP statistics for the specified LNS service in the current context.
- **peer-address ip_address**: Clears all L2TP statistics for the destination (peer LNS) at the specified IP address. The IP address is specified using the standard IPv4 dotted decimal notation.

```
tunnels { all [ clear-sa ] | callid call_id | lac-service service_name [ clear-sa ] | peer-address ip_address [ clear-sa ] }
```

- **all**: Clears all tunnels in the current context.
- **lac-service service_name**: Clears all tunnels in the current context that belong to the specified LAC service and closes the tunnels.
- **lns-service service_name**: Clears all tunnels in the current context that belong to the specified LNS service and closes the tunnels.
- **peer-address ip_address**: Clears all tunnels in the current context whose destination (peer LNS) is the system at the specified IP address. The IP address is specified using the standard IPv4 dotted decimal notation.
- **callid call_id**: Uses the unique identifier that specifies a particular tunnel in the system to clear that tunnel and disconnect it. The output of the command `show l2tp tunnels` contains a field labeled Callid Hint which lists the call id information to use with this command. This is an 8-Byte Hexadecimal number.
- **clear-sa**: If any security associations have been established they are cleared.

Usage
Clear L2TP all or specific L2TP statistics or clear sessions in a tunnel and disconnect the tunnel.

Example
To clear all L2TP statistics for the current context, use the following command:
```
clear l2tp statistics
```

To clear all L2TP statistics for the LAC service named lac1, use the following command:
```
clear l2tp statistics lac-service lac1
```
Use the following command to clear L2TP statistics for the LNS peer at the IP address 10.10.10.100:

```
clear l2tp statistics peer-address 10.10.10.100
```

The following command clears and closes all tunnels in the current context:

```
clear l2tp tunnels all
```

The following command clears and closes all tunnels for the LAC service named lac2:

```
clear l2tp tunnels lac-service lac2
```

The following command clears and closes all tunnels the peer at the IP address 10.10.10.110:

```
clear l2tp tunnels peer-address 10.10.10.110
```
clear lawful-intercept

Clears information pertaining to lawful interception capability.

**Product**
PDSN, HA, LNS, GGSN, ASN-GW

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```plaintext
clear lawful-intercept statistics
```

**Usage**
Use this command to clear statistics pertaining to Lawful Intercept functionality.

**Important:** You must log in to the system through a Secure Shell (SSH) using a system account that has administrator privileges to use this command. For details on using the Lawful Intercept capability of the system, refer to System Administration and Configuration Guide.

**Example**
The following clears all statistics for the Lawful Intercept functionality.

```
clear lawful-intercept statistics
```
clear lma-service statistics

Clears Local Mobility Anchor statistics and counters found in show command outputs and bulk statistics associated with all LMA services or a specific service defined by the parameter in this command.

**Product**
P-GW

**Privilege**
Operator

**Syntax**

```
clear lma-service statistics [ name servie_name ]
```

- **name servie_name**
  Clears statistics and counters for a specific LMA service name. `name` must be an existing LMA service name and be from 1 to 63 alpha and/or numeric characters.

**Usage**

Use this command to clear statistics and counters in show command outputs and bulk statistics for all LMA services or for a specific LMA service.

**Example**

The following command clears statistics and counters for an LMA service named `lma3`:

```
clear lma-service statistics name lma3
```
clear local-user

Clears information pertaining to local-user administrative accounts.

Product

All

Privilege

Security Administrator

Syntax

```
clear local-user { database [ -noconfirm ] | statistics | username name lockout }
```

**database [ -noconfirm ]**

Clears the local-user database. This command deletes all information for all local-user accounts.

⚠️ **Caution:** Use this command only in the event of security concerns or to address concerns of the local-user account database integrity.

**statistics**

Clears statistics pertaining to local-user accounts.

**username name lockout**

Removes lockouts associated with specific local-user accounts.

*name* is the name of the local-user account and can consist of from 3 to 16 alpha and/or numeric characters and is case sensitive.

Usage

This command can be used to remove local-user account lockouts, reset local-user-related statistics to 0, or to delete the local-user database.

Example

The following command removes the lockout placed on a local-user account named *SecureAdmin*.

```
clear local-user username SecureAdmin lockout
```
clear mag-service statistics

Clears Mobile Access Gateway statistics and counters found in show command outputs and bulk statistics associated with all MAG services or a specific service defined by the parameter in this command.

Product
HSGW, S-GW

Privilege
Operator

Syntax

```plaintext
clear mag-service statistics [ name servie_name ]
```

**name servie_name**
Clears statistics and counters for a specific MAG service name. *name* must be an existing MAG service name and be from 1 to 63 alpha and/or numeric characters.

Usage
Use this command to clears statistics and counters in show command outputs and bulk statistics for all MAG services or for a specific MAG service.

Example
The following command clears statistics and counters for a MAG service named *mag1*

```plaintext
clear mag-service statistics name mag1
```
clear maximum-temperatures

Clears information pertaining to component maximum temperatures.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

clear maximum-temperatures

Usage
Reset the timestamp to the current time and clear previous maximum temperatures for all temperature monitored components. This may be useful when preparing to study system performance, monitor usage, or trouble shoot the administrative interfaces.

Example
The following command resets the maximum temperature statistics for all monitored chassis components.

clear maximum-temperatures
clear mipfa statistics

This command clears the statistics for the mobile IP foreign agent. The statistics for a specific foreign agent service may be cleared by explicit command.

Product
PDSN, GGSN, ASN-GW

Privilege
Security Administrator, Administrator, Operator

Syntax

clear mipfa statistics [ fa-service name | peer-address ip_address ]

fa-service name | peer-address ip_address

fa-service name: Indicates the statistics for a specific service are to be cleared where the service is as specified by name. “Total sessions” counters for all peers associated with the service are also reset. name must be an existing FA service name.

peer-address ip_address: Indicates the statistics for the specific IP address, ip_address, are to be cleared. “Total sessions” counter for the specified peer is also reset. The IP address is specified using the standard IPv4 dotted decimal notation.

Usage
Clear all statistics for the MIP foreign agent or for a specific service. This may be useful in monitoring performance and troubleshooting as the statistics may be cleared at a well known time and then collected and transferred for review.

Example
The following clears all statistics for the mobile IP foreign agent.

    clear mipfa statistics

The following command clears the statistics for the example service only.

    clear mipfa statistics fa-service sampleService peer-address 1.2.3.4
clear mipha statistics

This command clears the statistics for the mobile IP home agent. The statistics for a home agent service may be cleared by explicit command.

**Product**
HA

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
clear mipha statistics [ ha-service name | peer-address ip_address ]
```

- **ha-service name | peer-address ip_address**
  - indicates the statistics for a specific service are to be cleared where the service is specified by name. “Total sessions” counters for all peers associated with the service are also reset. name must be an existing HA service name.
  - indicates the statistics for the specific IP address, are to be cleared. “Total sessions” counter for the specified peer is also reset. The IP address is specified using the standard IPv4 dotted decimal notation.

**Usage**
Clear all statistics for the MIP home agent or for a specific service. This may be useful in monitoring performance and troubleshooting as the statistics may be cleared at a well known time and then collected and transferred for review.

**Example**
The following clears all statistics for the mobile IP foreign agent.

```
clear mipha statistics
```

The following command clears the statistics for the example service only.

```
clear mipha statistics ha-service sampleService
```
```
clear mipha statistics peer-address 1.2.3.4
```
clear mme-service db statistics

This command clears the MME database statistics for MME sessions for all or specific session instances on this system.

**Product**
MME

**Privilege**
Inspector

**Syntax**

```
clear mme-service db statistics [instance smgr_instance]
```

*instance smgr_instance*

This keyword specifies that MME database statistics are to be removed for a specific instance of session manager running for MME service. *smgr_instance* must be specified as an instance ID in the range 0 through 4294967295. If instance is not specified database statistics of all instances will be removed.

**Usage**

Use this command to clear/remove database statistics for all or a particular instance of session manager for MME services on this system.

**Example**

The following command removes/clears the database statistics of all instances of the MME service on a system:

```
clear mme-service db statistics
```

clear mme-service db record

This command clears the MME database records all instances of session manager running for MME service filtered with IMSI or GUTI as criteria.

**Product**
MME

**Privilege**
Inspector

**Syntax**

```
clear mme-service db record {imsi imsi_identifier | callid call_id | guti plmn plmn_id group-id mme_grp_id code mme_code m-tmsi mtmsi_value} [ | { grep grep_options | more } ]
```

**imsi imsi_identifier**
This keyword specifies the filter criteria as International Mobile Subscriber Identity (IMSI)
`imsi_identifier` to clear the database records of a session instance.
`imsi_identifier` is a 15 character IMSI field which identifies the subscriber’s home country and carrier. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘‘). For example; ‘$’.

**callid call_id**
This keyword specifies the filter criteria as call id `call_id` to clear the database records of a session instance.
`call_id` must be specified as an 8-byte hexadecimal number.

**guti plmn plmn_id group-id mme_grp_id code mme_code m-tmsi mtmsi_value**
This set of keyword specifies the filter criteria as Globally Unique Temporary Identifier (GUTI) to clear the database records for MME service.
The GUTI is constructed from the GUMMEI and the M-TMSI where GUMMEI is constructed from PLMN (MMC and MNC) `plmn_id` and MME Identifier is constructed from an MME Group ID (MMEGI) `mme_grp_id` and an MME Code (MMEC) `mme_code`.
Within the MME, the mobile is identified by the M-TMSI `mtmsi_value`.

**Usage**
Use this command to clear/remove database records for all or a particular instance of session manager for MME services on this system with IMSI or GUTI as filter criteria.

**Example**
The following command clears the summary database records of a session instance for subscriber having IMSI as 123455432112345 in the MME service:

```
clear mme-service db record imsi 123455432112345
```
clear mme-service statistics

This command clears the service statistics of an MME service specified by various criteria.

Product
MME

Privilege
Security Administrator, Administrator

Syntax

```
clear mme-service statistics [emm-only [mme-service mme_svc_name| peer-id peer_identifier]] | esm-only [mme-service mme_svc_name| peer-id peer_identifier] | slap [mme-service mme_svc_name| peer-id peer_identifier] | sctp [mme-service mme_svc_name]
```

- **emm-only**
  This keyword sets the filter criteria as MME service name or peer MME identifier to clear all EPS mobility management (EMM) related statistics.

- **esm-only**
  This keyword sets the filter criteria as MME service name or peer MME identifier to clear all EPS session management (ESM) related statistics.

- **slap**
  This keyword sets the filter criteria as MME service name of peer MME identifier to clear all S1-AP statistics.

- **sctp**
  This keyword sets the filter criteria as MME service name of peer MME identifier to clear all SCTP statistics.

- **mme-service mme_svc_name**
  This keyword sets the filter criteria as MME service name to clear all service statistics.

- **peer-id peer_identifier**
  This keyword sets the filter criteria as identifier of MME peer to clear all service statistics.

Usage

This command is used to clear the statistical information of an MME service based on various filter criteria.

Example

The following command clears the service session statistics of all MME service on a system:

```
clear mme-service statistics
```
clear mme-service statistics
clear mme-service statistics

This command clears the service statistics of an MME service specified by various criteria.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Syntax**

```
clear mme-service statistics [emm-only [mme-service mme_svc_name| peer-id peer_identifier]] | esm-only [mme-service mme_svc_name| peer-id peer_identifier] | slap [mme-service mme_svc_name| peer-id peer_identifier] | sctp [mme-service mme_svc_name]
```

- **emm-only**
  This keyword sets the filter criteria as MME service name or peer MME identifier to clear all EPS mobility management (EMM) related statistics.

- **esm-only**
  This keyword sets the filter criteria as MME service name or peer MME identifier to clear all EPS session management (ESM) related statistics.

- **slap**
  This keyword sets the filter criteria as MME service name of peer MME identifier to clear all S1-AP statistics.

- **sctp**
  This keyword sets the filter criteria as MME service name of peer MME identifier to clear all SCTP statistics.

- **mme-service mme_svc_name**
  This keyword sets the filter criteria as MME service name to clear all service statistics.

- **peer-id peer_identifier**
  This keyword sets the filter criteria as identifier of MME peer to clear all service statistics.

**Usage**

This command is used to clear the statistical information of an MME service based on various filter criteria.

**Example**

The following command clears the service session statistics of all MME service on a system:

```
clear mme-service statistics
```
clear mme-service statistics
clear multicast-sessions

Disconnects broadcast-multicast sessions based on specified criteria.

Product
PDSN, GGSN

Privilege
Security Administrator Operator

Syntax

clear multicast-sessions [ -noconfirm ] [ keywords ] [ verbose ]

-noconfirm
Indicates that the command is to execute without any additional prompt and confirmation from the user.

all
Disconnects all multicast sessions.

callid call_id
Clears the call specified by call_id. The call ID must be specified as an 8-digit hexadecimal number.

card-num psc_num
The slot number of the packet processing by which the multicast session is processed. psc_num is a slot number from 1 through 7 or 10 through 16.

flowid id
Clears calls for a specific BCMCS flow, defined by id. The flow ID must be a hexadecimal number.

flowid-type [ flow | program ]
Clears multicast sessions according to the type of flow.
flow: Clears all multicast sessions for the flow ID type "flow".
program: Clears all multicast sessions for the flow ID type "program".

mcast-address ipv4_address
Clears multicast sessions for a specific multicast address. Must be followed by the IP address of an interface, using dotted decimal notation.

pcf ipv4_address
Clears multicast sessions connected via the packet control function defined by ipv4_address. The address must be specified using the standard IPv4 dotted decimal notation.

pdsn_service name
Clears multicast sessions connected to the packet data service name. The packet data service must have been previously configured.
verbose
Indicates the output should provide as much information as possible. If this option is not specified then the output is the standard level which is the concise mode.

Usage
Clear multicast sessions to aid in troubleshooting the system when no additional subscribers may connect or when a specific service or remote address may be having connection problems. This command may also be useful when preparing for maintenance activities such that connects may be cleared to perform any necessary procedures.
The keywords are filters that modify or filter the criteria for deciding which sessions to clear and are described below. Multiple keywords can be entered on a command line.
When multiple keywords are specified, the multicast sessions deleted must meet the specifications of all of the keywords.

Example
The following command clears the broadcast-multicast sessions having multicast address 1.2.3.4:

clear multicast-sessions mcast-address 1.2.3.4

The following command clears the broadcast-multicast session(s) having call id 00004e22:

clear multicast-sessions callid 00004e22
clear orbem statistics

Clears the CORBA element manager interface related statistics.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
clear orbem statistics
```

**Usage**

Clear the statistics to reset them to zero for the object request broker element manager interface. This may be useful when preparing to study system performance, monitor usage, or troubleshoot the administrative interfaces.

**Example**

The following command resets the statistics for the ORB element manager.

```
clear orbem
```
clear pdg-service statistics

Deletes all previously gathered statistics for a specific PDG service or all PDG services configured within a context.

Product
PDG/TTG

Privilege
Security Administrator, Administrator, Operator

Syntax

clear pdg-service statistics [ name service_name ]

name service_name

Specifies the name of a specific PDG service configured in the context for which to clear statistics. service_name is the name of the PDG service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

Usage Statistics for a single PDG service can be cleared using the name keyword. Statistics for all PDG services in the context can be deleted by entering the command with no keywords.

If this command is executed from within the local context with no keywords, statistics will be cleared for every PDG service configured on the system regardless of context. In addition, if the name keyword is used when executing from within the local context, statistics for all PDG services configured with the specified name will be cleared regardless of context.

Example

Example(s) The following command clears statistics for a PDG service named pdg1:

  clear pdg-service statistics pdg1
clear pgw-service

Clears PDN Gateway statistics and counters found in show command outputs and bulk statistics associated with all P-GW services or a specific service defined by the parameter in this command.

Product
P-GW

Privilege
Operator

Syntax

```
clear pgw-service statistics { all | name service_name }
```

- **all**
  Clears statistics and counters for all P-GW services on the system.

- **name service_name**
  Clears statistics and counters for a specific P-GW service name. *name* must be an existing P-GW service name and be from 1 to 63 alpha and/or numeric characters.

Usage
Use this command to clear statistics and counters in show command outputs and bulk statistics for all P-GW services or for a specific P-GW service.

Example
The following command clears statistics and counters for an P-GW service named *pgw5*:

```
clear lma-service statistics name pgw5
```
clear port

Clears port related statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear port { datalink counters { all | slot/port } | npu counters { all | slot/port [ untagged | vlantag_id ] } }
```

datalink

Clear the data link port statistics.

npu

Clear statistics for the network processing unit port.

all

Clear counters for all datalink or NPU ports.

slot/port

Clear the statistics for the specified slot and port number.

untagged

Clear NPU statistics for all ports that do not have a VLAN tag.

vlan tag_id

Clear NPU statistics for the port that has the specified VLAN tag ID. `tag_id` must be a previously configured VLAN tag id.

Usage

Manually clear the statistics for a specified port. This is useful when preparing to trouble shoot or monitor the system.

Example

The following command clears the data link related statistics for port 1 in slot 17.

```
clear port datalink counters 17/1
```

The following command clears the network processing unit related statistics for port 1 in slot 17.

```
clear port npu counters 17/1
```
clear port
clear ppp statistics

Clears point-to-point protocol related statistics. All PPP statistics may be cleared or just those for a specific packet data service may be cleared.

**Product**

PDSN, GGSN

**Privilege**

Security Administrator, Administrator, Operator

**Syntax**

```
clear ppp statistics [ggsn-service ggsn_name | lns-service lns_name | pcf-address [pcf_ip_addr | all] | pdsn-service pdsn_name ]
```

- **ggsn-service ggsn_name**
  Display statistics only for the time the session is connected to the specified ggsn_name.

- **lns-service lns_name**
  Display statistics only for the time the session is connected to the specified lns_name.

- **pcf-address [pcf_ip_addr | all]**
  Display statistics only for the time the session is connected to the specified PCF (Packet Control Function) or for all PCFs. pcf_ip_addr must be specified using the standard IPv4 dotted decimal notation.

- **pdns-service pdsn_name**
  Specifies the service as pdsn_name which is to have only its statistics cleared.

**Usage**

Allows you to manually reset PPP statistics when it is desired to have counts begin again from a specific point in time.

**Example**

The following clears the statistics for all PPP counters and services.

```
clear ppp statistics
```

The following clears only the point-to-point protocol statistics for the service named sampleService.

```
clear ppp statistics pdsn-service sampleService
```
clear prepaid 3gpp2 statistics

This command clears all of the statistics counters for 3GPP2 Pre-paid accounting. Statistics may be cleared for all services or for an individual service.

**Product**
PDSN, GGSN

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
clear prepaid 3gpp2 statistics { all | {ggsn-service | ha-service | lns-service | pdsn-service} {all | name service_name} }
```

- **all**
  This keyword clears prepaid statistics for all services.

- **ggsn-service**
  Clear statistics for GGSN service(s).

- **ha-service**
  Clear statistics for HA service(s).

- **lns-service**
  Clear statistics for LNS service(s).

- **pdsn-service**
  Clear statistics for PDSN service(s).

```
{ all | name service_name }
```

- **all**: Clear statistics for all services of the specified type.
- **name service_name**: Clear statistics for the service named *service_name* of the specified service type.

**Usage**

Use this command to clear Pre-paid statistics for a particular named service or for all services.

**Example**

To clear statistics for a PDSN service name PDSN1, enter the following command:

```
clear prepaid 3gpp2 statistics pdsn-service name PDSN1
```
clear prepaid wimax

This command clears all of the statistics counters for WiMAX prepaid accounting. Statistics may be cleared for all services or for an individual service.

Product
ASN GW

Privilege
Operator

Syntax

```
clear prepaid wimax statistics { all | asngw-service { all | nameservice_name } | ha-service { all | nameservice_name } }
```

- **all**
  This keyword clears prepaid statistics for all services.

- **asngw-service**
  Clears prepaid statistics for ASN GW service(s).

- **ha-service**
  Clears prepaid accounting statistics for HA service(s).

```
{ all | name service_name }
```

- **all**: Clears statistics for all services of the specified type.
- **name service_name**: Clears statistics for the service named `service_name` of the specified service type.

Usage

Use this command to clear prepaid WiMAX accounting statistics for named service or for all services.

Example

The following command clears prepaid WiMAX accounting statistics for an ASN GW service name `asn1`:

```
clear prepaid wimax statistics asngw-service name asn1
```
clear qos npu stats

Clears information pertaining to NPU QoS priority queue bandwidth allocation and sharing.

Product
GGSN

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear qos npu stats inter-subscriber traffic slot slot_num
```

```
inter-subscriber traffic slot slot_num
```

Clears inter-subscriber traffic statistics for the application or line card installed in the specified slot. `slot_num` indicates the number of the chassis slot in which the card is installed and can be configured to any integer value from 1 through 48.

Usage
Allows you to manually reset statistics pertaining to NPU QoS priority queue bandwidth allocation.

Example
The following command clears statistics for a card installed in chassis slot 4:

```
clear qos npu stats inter-subscriber traffic slot 4
```
clear radius accounting archive

This command clears archived RADIUS accounting messages associated with a AAA group, or all the archived RADIUS accounting messages in the context in which the command is executed depending on the option chosen. The scope of the command is limited to the context in which it is executed including for local context.

---

**Important:** This command is only available in StarOS 8.3 and later. For more information, please contact your local service representative.

---

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
clear radius accounting archive { all | radius group group_name } [ -noconfirm ]
```

- `all`
  Cuts all archived RADIUS accounting messages in the context.

- `radius group group_name`
  Cuts all archived RADIUS accounting messages for the specified group.
  `group_name` must be the name of a RADIUS group, and must be a string of 0 through 64 characters in length.

- `-noconfirm`
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

**Usage**

Use this command to clear the archived RADIUS accounting messages associated with a AAA group, or all the archived RADIUS accounting messages in the context in which the command is executed.

**Example**

Use the following command to clear all archived RADIUS accounting messages for the group named `test12`.

```
clear radius accounting archive radius group test12
```
clear radius counters

Clears statistics for RADIUS servers and server group. The statistics for all RADIUS servers or server group may be cleared or only a specified server.

Product
PDSN, GGSN, ASN-GW

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear radius counters { all | radius group group_name| server ip_address [ port number ] }
```

- `all`: Clears statistics for all servers.
- `server ip_address [ port number ]`: Clears statistics only for the server specified by `ip_address`. Optionally specify the port which is to have its RADIUS statistics cleared, where port number must be an integer from 0 through 65535. `ip_address` must be specified using the standard IPv4 dotted decimal notation.
- `radius group group_name`: Clears all configured authentication / accounting servers in the specified RADIUS group. `group_name` must be name of server group configured in specific context for authentication/accounting, and must be a string of 1 through 63 characters in length.

Usage
Clear the statistics to reset them to zero prior to logging or monitoring the system for troubleshooting, performance measurements, etc.

Example
The following command clears the statistics for all RADIUS servers.

```
clear radius counters all
```

The following command resets the statistics only for the server 1.2.3.4.

```
clear radius counters server 1.2.3.4
```

The following command resets the statistics only for the server group named `star1`.

```
clear radius counters radius group star1
```
clear rohc statistics

This command clears statistics and counters collected since the last reload or clear command was issued for ROHC IP header compression.

Product
PDSN

Privilege
Administrator, Config-administrator, Operator, Inspector

Syntax

```
clear rohc statistics [ pdsn-service pdsnsvc_name ]
```

**pdsn-service pdsnsvc_name**
Clear ROHC statistics and counters for the specified PDSN service.

Usage
Use this command to clear ROHC statistics for all services or for a specific PDSN.

Example
The following command clears ROHC statistics and counters for the PDSN service named pdsn1:

```
clear rohc statistics pdsn-service pdsn1
```
clear rp service-option

Clears the R-P interface service option statistics.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator

Syntax

clear rp service-option statistics [ number option_num | psdn-service psdn_name ]

- number option_num | psdn-service psdn_name
  Default: clear the statistics for all service options and all packet data services.
  number option_num specifies the R-P service option number for which the statistics are to be cleared.
  option_num must be a value in the range 0 through 1000.
  psdn-service psdn_name specifies the service as psdn_name which is to have only its statistics cleared.

Usage
Clear the R-P service option statistics prior to monitoring the system for benchmarking or for detecting areas of further research.

Example
The following resets the service option statistics for service option 23 and packet data service sampleService, respectively.

clear rp service-option statistics number 23 clear rp service-option statistics psdn-service sampleService
clear rp statistics

Clears the R-P interface statistics. The statistics for a specific packet data server or peer node may be cleared if specified.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator

Syntax

clear rp statistics [ pdsn-service name | peer-address [ peer_address | all ] ]

default: clear all R-P associated statistics.

pdns-service name: specifies the packet data service specified by name is to have its statistics reset.

peer-address [ peer_address | all ]: specifies that statistics for the specified peer, or all peers, are to be cleared. ip_address must be specified using the standard IPv4 dotted decimal notation.

Usage
Clear the statistics to prepare for monitoring the system.

Example
The following command resets all the associated statistics for the R-P interfaces.

clear rp statistics

The following clears the statistics for the packet data service sampleService.

clear rp statistics pdsn-service sampleService

The following command resets the statistics associated with peer node with IP address 1.2.3.4.

clear rp statistics peer-address 1.2.3.4
clear session disconnect-reasons

Clears the session disconnect reason statistics for all sessions on the system.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear session disconnect-reasons
```

Usage

Sets the counters for session disconnect reasons to zero (0) in preparation for a monitoring or troubleshooting session.

Example

```
clear session disconnect-reasons
```
clear session setuptime

Clears the session setup time statistics for PCFs or SGSNs. If no keyword is specified the summary statistics displayed by the `show session setuptime` command are cleared.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
clearsessionsetuptime { pcf { pcf_addr | all } | sgsn { sgsn_addr | all } }
```

- **pcf { pcf_addr | all }**
  - `pcf_addr`: Clear the setup time counters for the PCF at the specified IP address. `pcf_addr` must be an IP v4 address expressed in dotted decimal notation.
  - `all`: Clear the setup time counters for all PCFs.

- **sgsn { sgsn_addr | all }**
  - `sgsn_addr`: Clear the setup time counters for the SGSN at the specified IP address. `sgsn_addr` must be an IP v4 address expressed in dotted decimal notation.
  - `all`: Clear the setup time counters for all SGSNs.

**Usage**
Sets the counters for session disconnect reasons to zero (0) in preparation for a monitoring or troubleshooting session.

**Example**
To clear the statistics for the PCF at IP address 192.168.100.10, enter the following command:

```
clear session setuptime pcf 192.168.100.10
```
clear session subsystem

Clears all session subsystem statistics for the current context.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

clear session subsystem

Usage
Clear the statistics in preparation for a troubleshooting or monitoring session so that the counters are at a well known values.

Example

clear session subsystem
clear sgtpu statistics

Clears all SGTPU statistics for the current context.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator

Syntax

```plaintext
clear sgtpu statistics [ ggsn-address ipv4_address | iups-service iups_srvc_name |
| rnc-address ipv4_address | sgtp-service sgtp_srvc_name |gprs-service
|gprs_srvc_name nsei nse_id ]
```

Usage
Clear the statistics in preparation for a troubleshooting or monitoring session so that the counters.

Example

```plaintext
clear sgtpu statistics gprs-service SGSN1Gprs1 nsei 2445
```
clear sgw-service statistics

Clears Serving Gateway statistics and counters found in show command outputs and bulk statistics associated with all S-GW services or a specific service defined by the parameter in this command.

Product
S-GW

Privilege
Operator

Syntax

```
clear sgw-service statistics { all | name service_name }
```

**all**
Clears statistics and counters for all S-GW services configured on the system.

**name service_name**
Clears statistics and counters for a specific S-GW service name. `service_name` must be an existing S-GW service name and be from 1 to 63 alpha and/or numeric characters.

Usage
Use this command to clears statistics and counters in show command outputs and bulk statistics for all S-GW services or for a specific S-GW service.

Example
The following command clears statistics and counters for an S-GW service named `sgw3`:

```
clear sgw-service statistics name sgw3
```
clear snmp trap

Clears all SNMP event trap notifications from the buffer.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear snmp trap { history | statistics }
```

- **history**
  Clears all SNMP historical trap information from system buffer.

- **statistics**
  Clears all SNMP event trap information from system buffer.

Usage

Use this command to empty the buffer of all SNMP trap notifications.

Example

Following command clears the all historical SNMP traps from the system buffer:

```
clear snmp trap history
```
clear srp checkpoint statistics

Clears the SRP checkpoint interface statistics.

**Product**
HA, GGSN PDIF

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
clear srp checkpoint statistics
```

**Usage**
Clears the srp checkpoint statistics to prepare for srp monitoring.

**Example**
The following command resets all the associated statistics for srp checkpoint.

```
clear srp checkpoint statistics
```
clear srp statistics

Clears the SRP statistics.

Product
HA, GGSN PDIF

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear srp statistics
```

Usage
Clears the srp statistics to prepare for srp monitoring.

Example
The following command resets all the associated statistics for srp.

```
clear srp statistics
```
clear subscribers

Dis_connections subscribers based on specified criteria.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

```
clear subscribers [ keywords ] [ verbose ] [ -noconfirm ]
```

The keywords are filters that modify or filter the criteria for deciding which subscriber sessions to clear and are described below. Multiple keywords can be entered on a command line. When multiple keywords are specified, the subscriber sessions deleted must meet the specifications of all of the keywords.

For example, if you enter the following command:

```
clear subscribers ip-pool pool1 card-num 1
```

Only subscriber sessions that were assigned an IP address from the IP pool named `pool1` and are also being processed by the processing card in slot 1 are cleared. All other subscriber sessions that do not meet these criteria remain and are not cleared.

- `-noconfirm`
Indicates that the command is to execute without any additional prompt and confirmation from the user.

**Important**: The Operator privilege does not have access to this keyword.

- `active`
Only disconnects subscribers who currently have active sessions.

- `all`
Dis_connections all subscribers.

**Important**: The Operator privilege does not have access to this keyword.

- `apn name`
Clears all PDP contexts accessing a specific access point name (APN).

`apn_name` is the name of the APN and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

- `asn-peer-address ip_address`
Clears information for subscribers on an ASN GW trusted peer.

`ip_address` is the IPv4 address of the ASN GW peer server in dotted decimal notation.
### Exec Mode Commands (A-C)

**clear subscribers**
Clears counters for subscribers accessing the ASN GW service.

**asn-gw-service service_name**
Clears counters for subscribers accessing the ASN GW service.

**asn-pc-service service_name**
Clears counters for subscribers accessing the ASN PC service.

**callid id**
Clears the call specified by call_id. The call ID must be specified as a 4-byte hexadecimal number.

**card-num card_num**
The slot number of the processing card by which the subscriber session is processed. card_num is a slot number from 1 through 7 or 10 through 16.

**ccoa-only**
This option clears the subscribers that registered a MIP co-located COA directly with the HA. This option is only valid when MIP HA session license is enabled.

**configured-idle-timeout [ < | > | greater-than | less-than ] value**
Disconnects subscribers whose idle timeout matches the specified criteria. A value of 0 (zero) indicates that the subscribers idle timeout is disabled.

**connected-time [ < | > | greater-than | less-than ] value**
Disconnects subscribers who have been connected for the specified length of time.

**cscf-service service_name**
Clears all subscribers from the specified CSCF service.

**css-delivery-sequence name**

---

**Important:** This is a restricted keyword. In StarOS 9.0 and later, this keyword is obsoleted.
clear subscribers

**css-service** *name*

**Important:** This is a restricted keyword. In StarOS 9.0 and later, this keyword is obsoleted.

**dhcp-server** *address*
Clears all PDP contexts that currently possess an IP address assigned from a specific DHCP server. *dhcp_address* is the IP address of the DHCP server expressed in dotted decimal notation.

**dormant**
Only disconnect subscriber sessions that are dormant (not transmitting or receiving data).

**fa** *address*
Disconnects all subscribers connected to the foreign agent specified by *fa_address*. The address must be specified using the standard IPv4 dotted decimal notation.

**fa-service** *name*
Disconnects all subscribers connected to the foreign agent specified by *fa_name*. The foreign agent name must have been previously defined.

**firewall** { not-required | required }
Clears all subscriber information for the specified subscribers:
- **not-required:** Subscribers for whom firewall processing is not-required.
- **required:** Subscribers for whom firewall processing is required.

**firewall-policy** *fw_policy_name*
This keyword is obsolete.

**ggsn-service** *name*
Clears all PDP contexts accessing a specific GGSN service.
*ggsn_name* is the name of the APN and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

**gsm-traffic-class** { background | conversational | interactive { priority } | streaming }
Subscribers whose traffic matches the specified 3GPP traffic class.
- **background:** 3GPP QoS background class.
- **conversational:** 3GPP QoS conversational class.
- **interactive:** 3GPP QoS interactive class. Must be followed by a traffic priority. priority can be configured to any integer value from 1 to 3.
- **streaming:** 3GPP QoS streaming class.

**gtp-version**
Displays the specific GTP version number. Must be followed by one of the supported GTP versions (0 or 1). The following filter keywords are valid with this command:
active-charging-service, apn, asngw-service, asnp-service, asn-peer-address, bearer-establishment, callid, card-num, coaa-only, configured-idle-timeout, connected-time, csclf-service, dhcp-server, fa, fa-service, firewall, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, ha, ha-ipsec-service, ha-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, network-requested, network-type, pcf, pdg-service, pdif-service., pdsn-service, plmn-type, rulebase, rx-data, session-time-left, sgsn-address, sgsn-service, tx-data, username, grep, more

```ha address```
Disconnects all subscribers connected to the home agent specified by `ha_address`. The address must be specified using the standard IPv4 dotted decimal notation.

```ha-ipsec-only```
Disconnects all MIP HA sessions with IPsec tunnels.

```ha-service name```
Disconnects all subscribers connected to the home agent specified by `ha_name`. The home agent name must have been previously defined.

```hsgw-service name```
Disconnects subscribers using this HRPD Serving Gateway (HSGW) service configured on this system. `name` must be an existing HSGW service and be from 1 to 63 alpha and/or numeric characters.

```idle-time [ < | > | greater-than | less-than ] value```
Disconnects subscribers whose idle time matches the specified length of time.

- `<`: Filters output so that only information less than the specified value is cleared.
- `>`: Filters output so that only information greater than the specified value is cleared.
- `greater-than`: Filters output so that only information greater than the specified value is cleared.
- `less-than`: Filters output so that only information less than the specified value is cleared.

`value`: If no other filtering options are specified only output matching `value` is cleared. If `value` is not specified all data is cleared. `value` must be an integer from 0 through 4294967295.

```ims-auth-service name```
Disconnects subscribers using this IMS Authorization Service configured on this system. `name` must be an existing IMS Authorization Service and be from 1 to 63 alpha and/or numeric characters.

```imsi id```
Disconnects the subscriber with the specified id. The IMSI (International Mobile Subscriber Identity) ID is a 50-bit field which identifies the subscriber’s home country and carrier. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘ '). For example; ‘$’.

```ip-alloc-method {aaa-assigned | dhcp [ relay-agent | proxy-client ] | dynamic-pool | 12tp-lns-assigned | mip-ha-assigned | ms-provided-static | not-ms-provided-static | static pool }```
Displays the specific IP Allocation Method. Must be followed by one of the IP Allocation Methods:

- `aaa-assigned`: Selects subscribers whose IP Addresses were assigned by AAA.
### Exec Mode Commands (A-C)

- **clear subscribers**
  -Disconnects all subscribers connected to the specified **ip_address**. The address must be specified using the standard IPv4 dotted decimal notation.

- **ip-pool name**
  -Disconnects all subscribers assigned addresses from the IP address pool **pool_name**. **pool_name** must be the name of an existing IP pool or IP pool group.

- **ipv6-address address**
  -Clears all subscribers connected to the specified IPv6 **address**.

- **ipv6-prefix prefix**
  -Clears subscribers from a specific IPv6 address prefix.

- **lac address**
  -Disconnects all calls to the peer LAC (L2TP access concentrator) specified by **address**. The address must be specified using the standard IPv4 dotted decimal notation.

- **lac-service name**
  -Disconnects all calls for this LAC service. **name** is a string of 1 to 63 characters.

- **lma-service name**
  -Disconnects subscribers using this LMA service configured on this system. **name** must be an existing LMA service and be from 1 to 63 alpha and/or numeric characters.

- **lns address**
  -Disconnects calls to the peer LNS (L2TP network server) specified by **address**. The address must be specified using the standard IPv4 dotted decimal notation.
clear subscribers

**lns-service name**
Disconnects calls associated with the LNS service named *name*. *name* is a string of 1 to 63 characters.

**long-duration-time-left [ < | > | greater-than | less-than ] value**
Disconnects subscriber sessions whose time left for the maximum duration of their session matches the length of time specified.
- `<`: Filters output so that only information less than the specified value is cleared.
- `>`: Filters output so that only information greater than the specified value is cleared.
- `greater-than`: Filters output so that only information greater than the specified value is cleared.
- `less-than`: Filters output so that only information less than the specified value is cleared.
- `value`: If no other filtering options are specified only output matching `value` is cleared. If `value` is not specified all data is cleared. `value` must be an integer from 0 through 4294967295.

**mag-service name**
Disconnects subscribers using this Mobile Access Gateway (MAG) service configured on this system. *name* must be an existing MAG service and be from 1 to 63 alpha and/or numeric characters.

**mip-udp-tunnel-only**
This option clears the subscribers that negotiated MIP-UDP tunneling with the HA. This option is only valid when MIP NAT Traversal license is enabled.

**mme-address ipv4_addr**
Disconnects subscribers using this peer Mobility Management Entity (MME). *ipv4_addr* must be an existing peer MME IPv4 address and be specified in dotted decimal notation.

**mme-only**
Disconnects all MME subscriber sessions on the system.

**mme-service name**
Disconnects subscribers using this MME service configured on this system. *name* must be an existing MME service and be from 1 to 63 alpha and/or numeric characters.

**msid id**
Disconnects the mobile user identified by *ms_id*. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘’). For example; ‘$’.

In case of **enforce imsi-min equivalence** is enabled on the chassis and MIN or IMSI numbers supplied, this filter will clear subscribers with a corresponding MSID (MIN or IMSI) whose lower 10 digits matches to lower 10 digits of the supplied MSID.

**clear subscribers msid 111110123456789 or**
**clear subscribers msid 0123456789**
will clear any subscriber with a MSID that match the lower 10 digits of MSID supplied, i.e. 0123456789.

**msisdn msisdn**
Clears information for the mobile user identified by Mobile Subscriber ISDN Number (MSISDN). *msisdn* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.
clear subscribers

```
exec { not-required | required [ nat-ip nat_ip_address | nat-realm nat_realm ] }
```

Clears all subscriber information for the specified subscribers:

- **not-required**: Subscribers for whom NAT processing is not required.
- **required**: Subscribers for whom NAT processing is required.

**Important**: The **nat-ip** keyword is only available in StarOS 8.3 and later.

- **nat-ip nat_ip_address**: Subscribers for whom NAT processing is enabled and are using the specified NAT IP address. `nat_ip_address` specifies the NAT IP address and must be a standard IPv4 address.
- **nat-realm nat_realm**: Subscribers for whom NAT processing is enabled and are using the specified NAT realm. `nat_realm` specifies the NAT realm name and must be a string from 1 through 63 characters in length.

**network-requested**

Disconnect subscriber sessions that were initiated by the GGSN network requested create PDP context procedure.

```
network-type { gre | ipv4 | ipv6 | ipip | l2tp | mobile-ip | proxy-mobile-ip }
```

Disconnects subscriber sessions based on the network type. The following network types can be selected:

- **gre**: Generic Routing Encapsulation (GRE) per RFC 2784
- **ipv4**: Internet Protocol version 4 (IPv4)
- **ipv6**: Internet Protocol version 6 (IPv6)
- **ipip**: IP-in-IP encapsulation per RFC 2003
- **l2tp**: Layer 2 Tunneling Protocol encryption per RFC 2661
- **mobile-ip**: Mobile IP
- **proxy-mobile-ip**: Proxy Mobile IP

```
exec { < | > | less-than | greater-than } ipv4_address [ [ < | > | less-than | greater-than ] ipv4_address ]
```

Displays information for subscribers connected via the packet control function with a specific or range of IP address `ipv4_address`. The address must be specified using the standard IPv4 dotted decimal notation.

- `<`: Filters output so that only information less than the specified IPv4 address value is displayed.
- `>`: Filters output so that only information greater than the specified IPv4 address value is displayed.
- `less-than`: Filters output so that only information less than the specified IPv4 address value is displayed.
- `greater-than`: Filters output so that only information greater than the specified IPv4 address value is displayed.

**Note**: It is possible to define a limited range of IP addresses by using the less-than and greater-than options to define minimum and maximum values.

```
pdsn-service name
```

Disconnect all subscribers connected to the packet data service `pdsn_name`. The packet data service must have been previously configured.
clear subscribers

**pdg-service service_name**

Disconnects subscriber sessions that are using the PDG service.

*service_name* must be an existing service and be from 1 to 63 alpha and/or numeric characters.

**pdif-service service_name**

Clears counters for subscribers accessing the Packet Data Interworking Function (PDIF) service.

*service_name* must be an existing service and be from 1 to 63 alpha and/or numeric characters.

**pgw-only { all | imsi id ebi id | pgw-service name | sgw-address ipv4_addr }**

- **all**: Disconnects all subscribers for all P-GW services on this system.
- **imsi id ebi id**: Disconnects subscribers based on their International Mobile Subscriber Identification (IMSI). *id* must be the 3 digit MCC (Mobile Country Code), follow by the 2 or 3 digits of the MNC (Mobile Network Code) and the MSIN (Mobile Subscriber Identification Number). *id* should not exceed 15 digits. Example: 123-45-678910234 must be entered as 12345678910234
- The EBI (EPS Bearer Identity) *id* must be a valid EBI and be an integer value from 5 to 15.
- **pgw-service name**: Disconnects all subscribers using this P-GW service. *name* must be an existing P-GW service and be from 1 to 63 alpha and/or numeric characters.
- **sgw-address ipv4_addr**: Disconnects all subscribers using this S-GW IP address. *ipv4_addr* must be an existing IPv4 address and be specified in dotted-decimal notation.

**plmn-type { home | roaming | visiting }**

For GGSN, disconnect subscribers whose subscriber type matches the specified type.

**qci { number }**

Disconnects subscribers based on their QCI identity. *number* must be an integer value from 0 to 9.

**rx-data [ < | > | greater-than | less-than ] value**

Disconnects subscribers who have received the specified number of bytes of data.

- `<`: Filters output so that only information less than the specified value is cleared.
- `>`: Filters output so that only information greater than the specified value is cleared.
- **greater-than**: Filters output so that only information greater than the specified value is cleared.
- **less-than**: Filters output so that only information less than the specified value is cleared.

*value*: If no other filtering options are specified only output matching *value* is cleared. If *value* is not specified all data is cleared. *value* must be an integer from 0 through 18446744073709551615.

**s5proto { gtp | pmip }**

Disconnects subscribers based on their S5 interface protocol type.

- **gtp**: Indicates that the GTP protocol is used on the S5 interface for the subscribers being disconnected.
- **pmip**: Indicates that the PMIP protocol is used on the S5 interface for the subscribers being disconnected.

**session-time-left [ < | > | greater-than | less-than ] value**

The amount of time left for the subscriber session.

- `<`: Filters output so that only information less than the specified value is cleared.
- `>`: Filters output so that only information greater than the specified value is cleared.
- **greater-than**: Filters output so that only information greater than the specified value is cleared.
- **less-than**: Filters output so that only information less than the specified value is cleared.
value: If no other filtering options are specified only output matching value is cleared. If value is not specified all data is cleared. value must be an integer from 0 through 4294967295.

sgsn-address address
Clears all PDP contexts currently being facilitated by a specific SGSN.
address is the IP address of the SGSN expressed in dotted decimal notation.

sgsn-service name
Clears all PDP contexts associated with SGSN. This keyword can be used with filtering keywords that are part of the clear subscriber command set.
Using this keyword can trigger a network-initiated service request (paging) procedure.
name is the identity of a specific SGSN-service configuration. The name consists of 1 to 63 alphanumeric characters.

sgw-only
Disconnects all S-GW subscriber sessions on the system.

sgw-service name
Disconnects subscribers using this Serving Gateway (S-GW) service configured on this system. name must be an existing S-GW service and be from 1 to 63 alpha and/or numeric characters.

tx-data [ < | > | greater-than | less-than ] value
Disconnects subscribers who have transmitted the specified number of bytes of data.
<: Filters output so that only information less than the specified value is cleared.
>: Filters output so that only information greater than the specified value is cleared.
greater-than: Filters output so that only information greater than the specified value is cleared.
less-than: Filters output so that only information less than the specified value is cleared.
value: If no other filtering options are specified only output matching value is cleared. If value is not specified all data is cleared. value must be an integer from 0 through 18446744073709551615.

username name
Disconnect the subscriber with the specified username
name is the username of the subscriber to be cleared. name must be a sequence of characters and/or wildcard characters (‘$’ and ‘*’) from 1 to 127 characters in length. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as wildcard enclose them in single quotes (‘‘). For example; ‘$’.

verbose
Indicates the output should provide as much information as possible. If this option is not specified then the output is the standard level which is the concise mode.

grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.
Usage
Clear subscribers sessions to aid in troubleshooting the system when no additional subscribers may connect or when a specific service or remote address may be having connection problems. This command may also be useful when preparing for maintenance activities such that connects may be cleared to perform any necessary procedures.

Example
The following examples illustrate the basic command usage as well as the redirection of the command output. Not all options are exemplified as all options follow the same basic constructs.
The following are basic subscriber clearing examples.

```
clear subscribers username user1
```
```
clear subscribers ha sampleService
```
```
clear subscribers ip-pool poolName verbose
```

The following command disconnects users connected to the foreign agent with IP address 1.2.3.4.
```
clear subscribers fa 1.2.3.4
```

The following redirects the output of the command to the more command for paging of the output to allow easier viewing of all output by the user. This example highlights the use of the verbose option as well.
```
clear subscribers all verbose | more
```
clear super-charger

Deletes the subscriber’s backed-up subscription data.

Product
SGSN

Privilege
Administrator, Security Administrator

Syntax

```
clear super-charger { imsi | all }
```

**imsi**
Defines a specific subscriber’s international mobile subscriber identity (IMSI) number.

- **imsi**: up to 15 digits. This number includes the MCC (mobile country code), the MNC (mobile network code) and the MSIN (mobile station identification number).

**all**
Instructs the SGSN to delete subscription data for all super charger subscribers.

Usage
Use this command to clear (delete) the subscription data records for one or all subscribers with super charger subscription configuration.

Example
The following command deletes the backed up records for the subscriber identified by the IMSI 90121882144672.

```
clear super-charger imsi 90121882144672
```
cli

This command specifies command line interface (CLI) session behavior

Product
All

Privilege
Security Administrator, Administrator, Operator, inspector

Syntax

cli { history | stop-on-first-error }

no cli { history | stop-on-first-error }

no
Disables the specified keyword functionality.

history
Default: Enabled
Enables command line history for the current command line session.

stop-on-first-error
Default: Disabled
When this is enabled, when a configuration file is loaded, on the first syntax error the system stops loading the configuration file.

Usage
This command controls CLI settings pertaining to the maintenance of a per-session command history and syntax error monitoring during configuration file loading.
By default, the system maintains a list of commands executed during each CLI session. This list is referred to as a history.
In addition, the system can be configured to stop loading a configuration if a syntax error is detected. By default, the system identifies the error but continues to process the configuration file.

Example
The following command disables the keeping of a CLI history for the current session:

no cli history
**clock set**

Sets the system time.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
clock set date_time
```

*date_time*

Specifies the date and time to set the system clock. Specified as YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss. Where YYYY is a 4-digit year, MM is a 2-digit month in the range 01 through 12, DD is a 2-digit day in the range 01 through 31, HH is a 2-digit hour in the range 00 through 23, mm is a 2-digit minute in the range 00 through 59, and ss is a 2-digit second in the range 00 through 59.

**Usage**

Set the clock to adjust the system clock for such things as timing drift, day-light savings adjustment, etc. New settings are immediately applied to all CPUs in the system.

**Important:** This command should only be used if there is no NTP server enabled for any context. If NTP is running on the system, this command returns a failure.

**Example**
The following commands set the system clock where one sets the exact second as well.

```
clock set 2003:08:23:02:30
```

```
clock set 2003:08:23:02:30:30
```
configure

Sets the mode to the global configure mode. May also be used to set the mode to the configure mode and pre-load the configuration referred to by the options.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
configure [ url [ verbose ] ]
```

- **url**
  Specifies the location of a configuration file to pre-load. url may refer to a local or a remote file. url must be entered using one of the following formats:
    - ASR 5000:
      - `[ file: ]{ /flash | /pcmcia | /hd } [ /directory ]/file_name`
      - `tftp://[ host[ :port# ] ] [ /directory ]/file_name`
      - `[ http: | ftp: | sftp: ]///[ username [ :password ] @ ] [ host ] [ :port# ] [ /directory ]/file_name`

**Important:** Use of the SMC hard drive is not supported in this release.

- **directory** is the directory name.
- **filename** is the actual file of interest.
- **username** is the user to be authenticated.
- **password** is the password to use for authentication.
- **host** is the IP address or host name of the server.
- **port#** is the logical port number that the communication protocol is to use.

- **verbose**
  Displays each the line number and actual line content from the configuration as it is processed.

Usage
If no URL is specified, executing this command causes the CLI to enter the Global Configuration Mode. If a URL is specified, executing this command loads the specified configuration file.

Example
The following simply changes the mode to the command line interface global configuration mode.

```
configure
```
The following command loads a configuration file from the node `sampleNode` given the path specified and a local file, respectively.

```
configure ftp://sampleNode/pub/glob.cfg
configure /pcmcia/pub/glob.cfg verbose
```
context

Sets the current context to the context specified.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

context name

name

Specifies the context of interest. Must be a previously defined context.

Usage
Change the current context when it is desired to configure and/or manage a specific context.

Example
The following sets the current context to the sampleContext context.

context sampleContext
**copy**

Copies files from one location to another. Allows files to be copied to/from locally as well as from one remote location to another.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
copy from_url to_url [ passive ] [ -noconfirm ]
```

**from_url**

Specifies the source of the copy. `url` may refer to a local or a remote file. `url` must be entered using one of the following formats:

- **ASR 5000:**
  - `[file: ]{/flash|/pcmcia1|/hd}[ /directory ]/file_name`
  - `tftp://{ host[ :port# ]}{ /directory ]/file_name`
  - `{ http: | ftp: | sftp: }///{ username[ :password ]@ }{ host }[ :port# ]{ /directory ]/file_name`

**Important:** Use of the SMC hard drive is not supported in this release.

- `directory` is the directory name.
- `filename` is the actual file of interest.
- `username` is the user to be authenticated.
- `password` is the password to use for authentication.
- `host` is the IP address or host name of the server.
- `port#` is the logical port number that the communication protocol is to use.

**to_url**

Specifies the destination of the copy. `url` may refer to a local or a remote file. `url` must be entered using one of the following formats:

- **ASR 5000:**
  - `[ file: ]{/flash | /pcmcia1 | /hd}[ /directory ] /file_name`
  - `tftp://{ host[ :port# ] }{ /directory ] /file_name`
  - `{ ftp: | sftp: } / / { username [ :password ] @ } { host }[ :port# ]{ /directory ] /file_name`

**Important:** Use of the SMC hard drive is not supported in this release.

- `directory` is the directory name.
- `filename` is the actual file of interest.
username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.

passive
Indicates the file copy is to use the passive mode.

-noconfirm
Indicates that the command is to execute without any additional prompt and confirmation from the user.

Important: Use of the -noconfirm option allows the over writing of an existing file if the destination file already exists.

Usage
Copy configuration files, log files, etc., to provide backups of data through the network.

Example
The following copies files from the local /flash/pub directory to remote node remoteABC's /pcmcia2/pub directory with and without confirmation respectively.

    copy http://remoteABC/pub/june.cfg /flash/pub/june.cfg
    copy tftp://remoteABC/pub/june.cfg /pcmcia2/pub/june.cfg -noconfirm

The following copies files from remote node remoteABC to remote node remote123.

    copy ftp://remoteABC/pub/may.cfg ftp://remote123/pub/may.cfg
crash copy

Copies individual crash files (one-at-a-time) and optionally the core dump file from the stored crash records on the chassis to a user-specified location.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
    crash copy number number url to_url [ core ]
```

**number number**

The identification number of the crash record. *number* must be an integer representing a valid record number selected from a range of 1 to 120. To determine the numeric identity of a specific crash file, use the `show crash list` command in Exec mode.

**url to_url**

Specifies the destination of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ASR 5000:
  ```
  • tftp://[ host[ :port# ] ] [ /directory ] /
  • [ ftp: | sftp: ]://[ username [ :password ] @ ] { host } [ :port# ] [ /directory ] /
  ```

**Important:** Use of the SMC hard drive is not supported in this release.

*directory*: the name of the target directory.
*username*: the username to be authenticated to provide access to targeted server.
*password*: the username’s password to be authenticated.
*host*: the IP address or host name of the targeted server.
*port#*: the number of the target server’s logical port used for the selected communication protocol.

**Important:** Do not specify a target filename as this will prevent the file from writing to the target server. The system generates and provides a timestamp-based filename that appears at the destination when the copy command completes.

**core**

Including this keyword as part of the command instructs the system to copy the core dump to the targeted storage server. The core cannot be copied alone; it must be part of a `crash copy` action included when copying a crash file.
Usage

Copy crash files of core dump to another location for backup or analysis.

Example

The following uses `ftp` to copy stored record number 5 and the core dump from the crash record list to a targeted remote node directory called `crasharchive` through port 22 of the targeted server `remoteABC` with access through user `homeboy` whose password is `secret.7.word`.

```
crash copy number 5 url ftp://homeboy:secret.7.word@remoteABC:22/crasharchive/core
```
crypto-group

Allows the manual switchover of redundant IPSec tunnels belonging to a specific crypto group.

**Product**
PDSN, GGSN

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

crypto-group name group_name activate { primary | secondary }

group_name

*group_name* is the name of the crypto group to which the tunnels to be switched are associated.

**activate { primary | secondary }**

Allows you to specify which tunnel to activate (i.e. to facilitate user traffic):

*• primary*: Switch traffic to the primary tunnel in the group.

*• secondary*: Switch traffic to the secondary tunnel in the group.

**Usage**

This command is used in conjunction with the Redundant IPSec Tunnel Fail-over feature. Use this command to manually switch traffic to a specific tunnel in a crypto group if the automatic switchover options have been disabled. Refer to the *switchover* command in the Crypto Group configuration mode for more information.

**Example**

The following command manually switches user traffic to the secondary tunnel in the crypto group called *group1*:

crypto-group group1 activate secondary
Chapter 90
Exec Modes Commands (D-S)

This chapter contains the commands in the Exec Mode from debug to sgsn offload.
The following commands send information to the logging facility for review:

**debug ip**

Enables/disables the debug options for IP debugging. If logging is enabled, results are sent to the logging system.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
debug ip { arp | interface | route }
no debug ip { arp | interface | route }
```

- **no**
  Indicates the IP debugging is to be disabled for the IP interfaces/function specified.

- **arp | interface name | route**
  Specifies which IP interfaces/function to debug.
  - **arp**: indicates debug is to be enabled for the address resolution protocol.
  - **interface**: indicates debug is to be enabled for the IP interfaces.
  - **route**: indicates debug is to be enabled for the route selection and updates.

**Usage**
The debug IP command is valuable when troubleshooting network problems between nodes. The debugging is stopped by using the `no` keyword.

⚠️ **Caution:** Issuing this command could negatively impact system performance depending on system configuration and/or loading.

**Example**
The following commands enable/disable debugging for ARP.

```
debug ip arpnof debug ip arn
```

The following enables/disables debugging for IP interfaces.

```
debug ip interface
no debug ip interface
```

The following enables/disables debugging for routing.

```
debug ip routenof debug ip route
```
debug ip bgp

This command enables BGP debug flags. If logging is enabled, results are sent to the logging system.

Product
HA

Privilege
Security Administrator, Administrator, Operator

Syntax

dbg ip bgp {all | event | filters | fsm | keepalives | updates { inbound | outbound } }

no debug ip bgp { all | event | filters | fsm | keepalives | updates { inbound | outbound } }

Usage
Use this command to enable or disable BGP debug flags.

Example
The following command disables all BGP debug flags enabled by any of the debug ip bgp commands:

```plaintext
no debug ip bgp all
```

The following command enables all BGP debug flags:

```plaintext
d-debug ip bgp all
```
**debug ip ospf all**

This command enables all OSPF debug flags. If logging is enabled, results are sent to the logging system.

**Product**

PDSN, HA, GGSN

**Privilege**

Security Administrator, Administrator, Operator

**Syntax**

```
debug ip ospf all
no debug ip ospf all
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Disable all OSPF debug flags.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to enable or disable all OSPF debug flags.

**Example**

The following command disables all OSPF debug flags enabled by any of the `debug ip ospf` commands:

```
no debug ip ospf all
```

The following command enables all OSPF debug flags:

```
ddebug ip ospf all
```
**debug ip ospf event**

This command enables debugging of OSPF protocol events. If logging is enabled, results are sent to the logging system. If no keywords are specified, all events are enabled for debugging.

**Product**
PDSN, HA, GGSN

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
debug ip ospf event [ abr | asbr | vl | lsa | os | router ]
```

```
no debug ip ospf event [ abr | asbr | vl | lsa | os | router ]
```

**Usage**
Use this command to output debug information for OSPF events.

**Example**
To enable all event debug information, enter the following command;

```
diag ip ospf event
```
To disable all event debug information, enter the following command:

```
no debug ip ospf event
```
**debug ip ospf ism**

This command enables OSPF Interface State Machine (ISM) troubleshooting, based on ISM information type. If no keywords are specified all ISM information types are enabled. If logging is enabled, results are sent to the logging system.

**Product**

PDSN, HA, GGSN

**Privilege**

Security Administrator, Administrator, Operator

**Syntax**

```
debug ip ospf ism [ events | status | timers ]
no debug ip ospf ism [ events | status | timers ]
```

- **events**
  Enable debugging ISM event information.

- **status**
  Enable debugging ISM status information.

- **timers**
  Enable debugging ISM timer information.

**Usage**

Use this command to output ISM debug information.

**Example**

To enable all ISM debug information, enter the following command:

```
debug ip ospf ism
```

To disable all ISM debug information, enter the following command:

```
no debug ip ospf ism
```
debug ip ospf lsa

This command enables troubleshooting on OSPF Link State Advertisements (LSAs), based on the specific LSA option. If no keywords are specified, all options are enabled. If logging is enabled, results are sent to the logging system.

**Product**
PDSN, HA, GGSN

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```plaintext
debugip ospf lsa [ flooding | generate | install | refresh | maxage | refresh ]
no debugip ospf lsa [ flooding | generate | install | refresh | maxage | refresh ]
```

---

**no**
Disables the specified LSA debug information. If no keyword is specified, all LSA debug information is disabled.

---

**flooding**
Enable LSA flooding information.

---

**generate**
Enable LSA generation information.

---

**install**
Enable LSA install information.

---

**maxage**
Enable LSA maxage information in seconds. The maxage is equal to 3600 seconds.

---

**refresh**
Enable LSA refresh information.

---

**Usage**

Use this command to output debug information for LSAs.

---

**Example**

To enable all LSA debug information, enter the following command;

```plaintext
debug ip ospf lsa
```

To disable all LSA debug information, enter the following command;

```plaintext
no debug ip ospf lsa
```
no debug ip ospf lsa
debug ip ospf nsm

This command enables troubleshooting OSPF Neighbor State Machines (NSMs), based on the specific NSM information type. If no keyword is specified, all NSM information types are enabled. If logging is enabled, results are sent to the logging system.

**Product**
PDSN, HA, GGSN

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
debug ip ospf nsm [ status | events | timers ]
nodebug ip ospf nsm [ status | events | timers ]
```

- **no**
  Disables the debugging the specified NSM information type. If no keyword is specified, all information types are disabled.

- **events**
  Enables debugging NSM event information.

- **status**
  Enables debugging NSM status information.

- **timers**
  Enables debugging NSM timer information.

**Usage**
Use this command to output debug information for OSPF NSMs.

**Example**
To enable all NSM debug information, enter the following command;

```
debug ip ospf nsm
```

To disable all NSM debug information, enter the following command;

```
no debug ip ospf nsm
```
**debug ip ospf packet**

This command enables troubleshooting of specific OSPF packet information. If logging is enabled, results are sent to the logging system.

**Product**

PDSN, HA, GGSN

**Privilege**

Security Administrator, Administrator, Operator

**Syntax**

```
debug ip ospf packet { all | dd | hello | ls-ack | ls-request | ls-update } [ send | recv ] [ detail ]
```

```
nodebug ip ospf packet { all | dd | hello | ls-ack | ls-request | ls-update } [ send | recv ] [ detail ]
```

---

**no**

Disable debugging of the specified packet information.

---

**all**

Enable debugging all OSPF packet information.

---

**dd**

Enable debugging database descriptions.

---

**hello**

Enable debugging hello packets.

---

**ls-ack**

Enable debugging link state acknowledgements.

---

**ls-request**

Enable debugging link state requests.

---

**ls-update**

Enable debugging link state updates.

---

**send**

Enable debugging only on sent packets.

---

**recv**

Enable debugging only on received packets.
**debug ip ospf packet**

---

**detail**

Enable detailed information in the debug output.

---

**Usage**

Use this command to output specific OSPF packet information.

---

**Example**

To enable all packet debug information, enter the following command:

```
debug ip ospf packet all
```

To disable all route debug information, enter the following command:

```
no debug ip ospf packet all
```
**debug ip ospf route**

This command sets the route calculation method to use in debugging OSPF routes. If no route calculation method is specified, all methods are enabled. If logging is enabled, results are sent to the logging system.

**Product**
PDSN, HA, GGSN

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
debugipospfroute [ ase | ia | install | spf ]
nodebugipospfroute [ ase | ia | install | spf ]
```

- **no**
  Disables debugging of route information. If no keyword is specified all information types are disabled.

- **ase**
  Enables debugging information on external route calculations.

- **ia**
  Enables debugging information on Inter-Area route calculations.

- **install**
  Enables debugging information on route installation.

- **spf**
  Enables debugging information on SPF route calculations.

**Usage**

Use this command to output debug information for OSPF routes.

**Example**

To enable all route debug information, enter the following command;

```
d debug ip ospf route
```

To disable all route debug information, enter the following command;

```
no debug ip ospf route
```
**debug ip ospf router**

This command sets the debug option for OSPF router information. If no keyword is specified, all router information is enabled. If logging is enabled, results are sent to the logging system.

**Product**

PDSN, HA, GGSN

**Privilege**

Security Administrator, Administrator, Operator

**Syntax**

```
debug ip ospf router [ interface | redistribute ]
```

```
no debug ip ospf router [ interface | redistribute ]
```

- **no**
  - Disables the specified router debug information. If no keyword is specified, all router information is disabled.

- **interface**
  - Enables router interface information.

- **redistribute**
  - Enables router redistribute information.

**Usage**

Use this command to output debug information for the OSPF router.

**Example**

To enable all router debug information, enter the following command:

```
debug ip ospf router
```

To disable all router debug information, enter the following command:

```
no debug ip ospf router
```
default terminal

Restores the system default value for the terminal options.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

default terminal { length | width }

length | width
length: reset the terminal length to the system default.
width: restores the system default terminal width.

Usage
Restore the default terminal settings when the current paging and display wraps inappropriately or pages to soon.

Example
The following sets the default length then width in two commands.

default terminal length

default terminal width
delete

Removes the specified file(s) permanently from the local.

Product
All

Privilege
Security Administrator, Administrator

Syntax

dele**te** filepath [ -noconfirm ]

filepath
Specifies the location of the file to delete. The path must be formatted according to the following format:

| Specifies the source of the copy. url may refer to a local or a remote file. url must be entered using one of the following formats: |
| ASR 5000: |
| ![Important](image) Use of the SMC hard drive is not supported in this release. |
| directory is the directory name |
| filename is the actual file of interest |

-`-noconfirm`
Indicates that the command is to execute without any additional prompt and confirmation from the user.

**Important**: Use of the `-noconfirm` option should be done with extra care to ensure the file is specified accurately as there is no method of recovering a file that has been deleted.

Usage
Deleting files is a maintenance activity which may be part of periodic routine procedures to reduce system space utilization.

Example
The following removes files from the local `flash/pub` directory.

`delete /flash/pub/june03.cfg`
**dhcp force**

Tests the lease-renewal for DHCP-assigned IP addresses for a particular subscriber.

**Product**

GGSN, ASN-GW

**Privilege**

Security Administrator, Administrator, Operator

**Syntax**

```
dhcp force lease-renewal { callid id | imsi imsi [ nsap nsapi ] | msid msid }
```

- **callid id**
  
  Clears the call specified by `call_id`. The call ID must be specified as a 4-byte hexadecimal number.

- **imsi msid**
  
  Disconnects the subscriber with the specified msid. The IMSI (International Mobile Subscriber Identity) ID is a 50-bit field which identifies the subscriber’s home country and carrier. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘‘). For example; ‘$’.

- **nsapi nsapi**
  
  A specific Network Service Access Point Identifier (NSAPI). `nsapi` is an integer value from 5 to 15.

- **msid id**
  
  Disconnects the mobile user identified by `ms_id`. `ms_id` must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘‘). For example; ‘$’.

**Usage**

Use this command tests a forced IP address lease renewal for a specific subscriber.

**Example**

The following command tests DHCP lease renewal for a subscriber with an MSID of 1234567:

```
dhcp force lease-renewal msid 1234567
```
**dhcp test**

Tests DHCP functions for a particular DHCP service.

**Product**
GGSN, ASN-GW

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
dhcp test dhcp-service svc_name [ all | server ip_address ]
```

- `dhcp-service svc_name`
  The name of the DHCP service. It can be from 1 to 63 alpha and/or numeric characters in length and is case sensitive.

- `all`
  Tests DHCP functionality for all servers.

- `server ip_address`
  Tests DHCP functionality for the server.
  `ip_address` is the IP address of the DHCP server in dotted-decimal notation.

**Usage**

Once DHCP functionality is configured on the system, this command can be used to verify that it is configured properly and that it can successfully communicate with the DHCP server. Executing this command causes the system to request and allocate an IP address and then release it. If a specific DHCP server is not specified, then each server configured in the service is tested.

**Example**

The following command tests the system's ability to get an IP address from all servers a DHCP service called DHCP-Gi is configured to communicate with:

```
dhcp test dhcp-service DHCP-Gi all
```

The following displays a sample of this command's output showing a successful DHCP test.

```
DHCP test status for service <DHCP-Gi>: Server address: 192.168.16.2 Status: 
Tested Lease address: 192.168.16.144 Lease Duration: 600 secs.
```

**diameter disable endpoint**

This command disables a diameter peer without removing the peer’s configuration.

**Product**

PDIF, SCM

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
diameter disable endpoint endpoint_name peer peer_id
```

- **endpoint endpoint_name**
  Specifies the endpoint in which the peer is configured.  
  `endpoint_name` must be the endpoint name, and must be a string of 1 through 63 characters in length.

- **peer peer_id**
  Specifies the peer to be disabled.  
  `peer_id` must be the diameter peer host name, and must be a string of 1 through 63 characters in length.

**Usage**

Use this command to administratively disable a diameter peer without removing the peer configuration. This command will tear down all connections on the specified peer (by sending a DPR if the configuration demands the same at peer level configuration). The peer will remain in disabled state until it is enabled again. Also see the `diameter enable endpoint` command.

**Example**

This command disables the diameter peer `peer12`:

```plaintext
diameter disable endpoint endpoint1 peer peer12
```
diameter enable endpoint

This command enables a diameter peer that is disabled.

Product
PDIF, SCM

Privilege
Security Administrator, Administrator

Syntax

diameter enable endpoint endpoint_name peer peer_id

endpoint endpoint_name
Specifies the endpoint in which the peer is configured.
endpoint_name must be the endpoint name, and must be a string of 1 through 63 characters in length.

peer peer_id
Specifies the peer to be enabled.
peer_id must be the diameter peer host name, and must be a string of 1 through 63 characters in length.

Usage
Use this command to administratively enable a diameter peer. Also see the diameter disable endpoint command.

Example
This command enables the diameter peer peer12:

diameter enable endpoint endpoint1 peer peer12
diameter reset connection

This command resets individual TCP/SCTP connections.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
diameter reset connection { endpoint endpoint_name peer peer_id }
```

- **endpoint endpoint_name**
  Resets connection to the specified endpoint.
  *endpoint_name* must be the endpoint name, and must be an alpha and/or numeric string of 1 through 63 characters in length.

- **peer peer_id**
  Resets connection to the specified peer.
  *peer_id* must be the Diameter peer host name, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to reset the TCP/SCTP connections for the specified endpoint/peer. With this command, the connection will be closed temporarily after DPR/DPA. If there is any traffic to be sent to the particular peer, then the connection will be re-established.

This command overrides the endpoint configured in any other configuration mode.

This command is applicable only when the specified peer is enabled.

Example

This command resets connection to the specified endpoint:

```
diameter reset connection endpoint <endpoint_name>
```
diameter reset route failure

This command resets the failed route status of Diameter destination-host combination via peer to AVAILABLE status.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
diameter reset route failure [ endpoint endpoint_name ] [ host host_name ] [ peer peer_id ]
```

**endpoint endpoint_name**
Resets paths to the specified endpoint.
endpoint_name must be a string of 1 through 63 characters in length.

**host host_name**
Resets the FAILED status of all Diameter destination-host combination routes via peer for every Diameter client within the chassis having a specific host name to AVAILABLE.
host_name must be the Diameter host name, and must be a string of 1 through 63 characters in length.

**peer peer_id**
Resets the FAILED status of all Diameter destination-host combination routes via a peer having specific peer-id for every Diameter client within the chassis to AVAILABLE.
peer_id must be the Diameter peer host name, and must be a string of 1 through 63 characters in length.

Usage
Use this command to reset the FAILED status of all Diameter destination-host combination routes via peer for every Diameter client within the chassis to AVAILABLE status.
This command also resets the failure counts used to determine the AVAILABLE/FAILED status of destination-host combination.
When executed from local context, this command matches all contexts. If an optional keyword is not supplied, a wildcard is used for the value.
The status of every matching combination of destination-host via peer for every matching Diameter client within the chassis will be reset to AVAILABLE. The failure counts that are used to determine AVAILABLE/FAILED status will also be reset.
Also see the route-entry and route-failure CLI commands in the Diameter Endpoint Configuration Mode.
Default value: N/A

Example
The following command resets the FAILED status of all Diameter destination-host combination routes via peer for every Diameter client within the chassis for specified endpoint name to AVAILABLE.
diameter reset route failure endpoint endpoint_name
directory

Lists the files in a specified location.

Product
All

Privilege
Security Administrator, Administrator

Syntax

directory filepath [ -size ] [ -reverse ] [ -time ]

filepath
Specifies the directory path to list the contained files. The path must be formatted according to the following format:
Specifies the source of the copy. url may refer to a local or a remote file. url must be entered using one of the following formats:
• ASR 5000:
  * [ file: ] { /flash | /pcmcia1 | /hd } [ /directory ] /file_name

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name
filename is the actual file of interest

-size
Indicates the size of each file should be displayed in the output.

-reverse
Indicates the order of files listed should be in descending order (z-aZ-A9-0). Default is to sort in ascending order (0-9A-Za-z).

-time
Indicates the last modification timestamp of each file should be displayed in the output.

Usage
Lists such things as log and crash files from multiple nodes within the network.
The optional arguments may be specified individually or in any combination.

Example
The following command will list the files in the local /flash/pub directory sorted in reverse order.

directory /flash/pub -reverse
disable

Prevents the system from making requests of a selected RADIUS server.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
disable radius [ accounting | charging [ accounting ] ] server address [ port num ] [ group name ]
```

**accounting | charging | charging accounting**

Specifies the type of RADIUS server to disable.

**server address**

Identifies the RADIUS server by IP address.

`address` is specified using the standard IPv4 or IPv6 dotted decimal notation.

**port num**

Default: 1812 (authentication) 1813 (accounting)

Specifies the port number of the RADIUS server being disabled.

`num` must be the configured port number of the RADIUS server being disabled and be 0 to 65535 numeric characters in length.

**group name**

Default: default

Specifies the RADIUS group to which the server belongs. Use this option in the event that the RADIUS server belongs to multiple groups and you only want to disable the server within the specific group.

`name` must be the name of a configured RADIUS Server group and be 1 to 63 characters in length.

**Usage**

Use this command to gracefully stop the system from making requests of a specific RADIUS server.

**Example**
The following command disables a RADIUS accounting server with an IP address of 1.2.3.4, the default accounting server port number, and that resides in the “Group5” server group:

```
disable radius accounting server 1.2.3.4 group Group5
```
**dns-client**

This command performs DNS query on the basis of specified DNS client name, DNS query domain name, and type of query criteria.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

dns-client  dns_client_name  [  query-type  {  A  |  AAAA  |  NAPTR  |  SRV  }  ]  query-name

**Example**
The following command displays statistics for a DNS client named test_dns with query type for IP address as A and query name as domain1.com

dns-client  test_dns  query-type  A  query-name  domain1.com
dns-client
enable

Allows the system to start making requests of a selected RADIUS server.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
enable radius [ accounting | charging | [ accounting ] ] server address [ port num ] [ group name ]
```

<table>
<thead>
<tr>
<th>accounting</th>
<th>charging</th>
<th>charging accounting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the type of RADIUS server to enable.</td>
<td></td>
<td></td>

</tr>
</tbody>
</table>

| num must be the configured port number of the RADIUS server being enabled and must be 0 to 65535 numeric characters in length. |

<table>
<thead>
<tr>
<th>group name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: default</td>
</tr>
<tr>
<td>Specifies the RADIUS group to which the server belongs. Use this option in the event that the RADIUS server belongs to multiple groups and you only want to disable the server within the specific group.</td>
</tr>
</tbody>
</table>

| name must be the name of a configured RADIUS Server group and be 1 to 63 characters in length. |

Usage
Use this command to allow the system to start making requests of a specific RADIUS server.

Example
The following command enables a RADIUS accounting server with an IP address of 1.2.3.4, the default accounting server port number, and that resides in the “Group5” server group:

```
enable radius accounting server 1.2.3.4 group Group5
```
exit

Exits the current CLI session.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

exit

Usage
Use this command to close the current CLI session.
filesystem format

Used to format the PCMCIA card or the Compact Flash on the SMC.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ASR 5000:

filesystem format { /flash | /pcmcia1 | /hd } [ othersmc ]
```

{ /flash | /pcmcia1 | /pcmcia2} or { /flash | /pcmcia1 | /hd }

Format the file system on the specified device.

**Important:** Use of the SMC hard drive is not supported in this release.

```
[ othersmc ]
```

Format the file system on the standby SMC.

**Usage**
Clear all directories and files from the PCMCIA card(s) and/or the Compact Flash and re-establish the file system.

**Example**
The following command formats the PCMCIA card located in slot 1 on the SMC:

```
filesystem format /pcmcia1
```
filesystem repair

Used to repair the file system on a PCMCIA card or the Compact Flash on the SMC.

Product
All

Privilege
Security Administrator, Administrator

Syntax
ASR 5000:

```
filesystem repair {/flash | /pcmcia1 | /pcmcia2 | /hd} [checkonly] [othersmc]
```

Repair the file system on the specified device.

**Important:** Use of the SMC hard drive is not supported in this release.

```
[ checkonly ]
Check, but do not repair, the file system.

[ othersmc ]
Repair the file system on the standby SMC.
```

Usage
Repair the file system on a PCMCIA card or the Compact Flash.

Example
The following command repairs the file system on the PCMCIA card located in slot 1 on the SMC:

```
filesystem format /pcmcia1
```
**gtpc test echo**

Tests the ability of a GGSN service to exchange GTP-C echo request messages with the specified SGSN(s).

**Product**
GGSN

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
  gtpc test echo src-address gn_address { all | sgsn-address ip_address }
```

- **src-address** `gn_address`
  Specifies the IP address of a Gn interface configured on the system.
  `gn_address` must be expressed in dotted decimal notation.

- **all**
  Specifies that GTP-C echo requests will be sent to all SGSNs that currently have sessions with the GGSN service.

- **sgsn-address** `ip_address`
  Specifies that GTP-C echo requests will be sent to a specific SGSN.
  `ip_address` is the address of the SGSN to send the requests to and must be expressed in dotted decimal notation.

**Usage**

This command tests the GGSN’s ability to exchange GPRS Tunneling Protocol control plane (GTP-C) packets with the specified SGSNs which can be useful troubleshooting and/or monitoring. This command must be executed from within the context in which the GGSN service is configured. Refer also to the `gtpu test` command.

**Example**

The following command issues GTP-C echo packets from a GGSN service bound to address 192.168.157.32 to an SGSN with an address of 192.168.157.2:

```
  gtpc test echo src-address 192.168.157.32 sgsn-address 192.168.157.2
```

The following displays a sample of this command’s output.

```
GTPC test echo-------------------SGSN: 192.168.157.2 Tx/Rx: 1/1 RTT(ms): 1 (COMPLETE) Recovery: 202 (0xCA)
```
gtpc test echo
gtppp interim now

Check points current GTPP accounting messages and identifies which types of interim CDRs are to be generated and sent to the external charging/storage servers (e.g., a CFG or a GSS). The impact of this command is immediate.

**Product**

GGSN, SGSN

**Privilege**

Security Administrator, Administrator, Operator

**Syntax**

```
gtppp interim now (active-charging egcdr|apnapn_name| calldcall_id|cdr-types ( gcdr | mcdr | scdr | dhcp-serverip_address|gprs-servicesvc_name| ggsn-servicesvc_name| imsiimsi[ ip-addresssub_address[ username| username] now | nsapsnsapi[ ip-addresssub-address[ username| username] ] | ip-addresssub_address[ username| username] ] | ip-poolpool_name|mccmcc_number|mncmnc_number|msisdnmsisdn_num|sgsn-addressip_address|sgsn-servicesvc_name|username|username]+
```

</tr>
</tbody>
</table>
**ggsn-service svc_name**

This keyword is specific to the GGSN.
Initiates GTPP interim accounting for all PDP contexts currently being facilitated by the specified GGSN service.
*svc_name* can be from 1 to 63, case sensitive, alphanumeric characters.

**gprs-service svc_name**

This keyword is specific to the SGSN.
Initiates GTPP interim accounting for all PDP contexts currently being facilitated by the specified GPRS service.
This keyword is specific to the SGSN.
*svc_name* can be from 1 to 63, case sensitive, alphanumeric characters. Must be an already defined GPRS service name.

**imsi insi [ ip-address sub_address [ username name ] ] nsapi nsapi [ ip-address sub-address [ username name ] username name ]**

Initiates GTPP interim accounting for a specific International Mobile Subscriber Identity (IMSI) number. The request could be further filtered using any of the following keywords:

- **ip-address**: Interim accounting will be performed for the address specified by *sub_address*. The command can be further filtered by specifying a specific username (*name*) with that address.
- **nsapi**: Interim accounting will be performed for a specific Network Service Access Point Identifier (NSAPI). *nsapi* is an integer value from 5 to 15. The command can be further filtered by specifying a specific ip address (*sub_address*) and/or a username (*name*) with that address, or just a specific username.

**ip-address sub_address [ username name ]**

Initiates GTPP interim accounting for the address specified.
*sub_address* is the IP address of the subscriber and must be expressed in dotted decimal notation.
The command can be further filtered by specifying *username* with that address.
*name* is the subscriber’s name and can be a sequence of characters and/or wildcard characters ('$' and '*') from 1 to 127 characters in length. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as wildcard enclose them in single quotes (‘‘). For example: ‘$’.

**ip-pool pool_name**

This keyword is applicable to the GGSN only.
Initiates GTPP interim accounting for all PDP contexts that were allocated IP addresses from the specified pool.
*pool_name* can be from 1 to 31 alpha and/or numeric characters and is case sensitive.

**mcc mcc_number mnc mnc_number**

*mcc_number* Specifies the mobile country code (MCC) portion of the PLMN’s identifier and can be configured to any 3-digit integer value between 100 and 999.
*mnc_number* Specifies the mobile network code (MNC) portion of the PLMN’s identifier and can be configured to any 2 or 3 digit integer value between 00 and 999.
**msisdn msisdn_num**

This keyword configures the SGSN to include the Mobile Subscribers Integrated Services Digital Network identifier in generated CDRs (M-CDRs and/or the S-CDRs).

This keyword is applicable for SGSN only.

*msisdn_number* - Must be followed by a valid MSISDN number, consisting of 1 to 15 digits.

**sgsn-address ip_address**

This keyword is specific to the GGSN.

Initiates GTPP interim accounting for all PDP contexts currently being facilitated by the specified SGSN.

*ip_address* is the IP address of the SGSN and must be expressed in dotted decimal notation.

**sgsn-service svc_name**

Initiates GTPP interim accounting for all PDP contexts currently being facilitated by the specified SGSN service.

This keyword is specific to the SGSN.

*svc_name* can be from 1 to 63, case sensitive, alphanumeric characters. Must be an already defined SGSN service name.

**username name**

Initiates GTPP interim accounting for all PDP contexts for the subscriber specified.

*name* is the subscriber’s name and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

+ 

More than one of the above keywords can be entered within a single command.

**Usage**

This command causes GTPP accounting CDRs to immediately be generated for all active sessions that are in the current context. If executed within the local context, CDRs will be generated for all active sessions regardless of context.

The sending of the CDRs is paced so as not to overload the accounting server.

**Example**

The following command causes CDRs to immediately be generated:

```
gtp p interim now
```
gtpp interim now active-charging egcdr

Check points current GTPP accounting messages for active charging immediately.

Product
GGSN

Privilege
Security Administrator, Administrator, Operator

Syntax

```
gtpp interim now active-charging egcdr [ callid call_id | imsi imsi | msid msid | rulebase rbase_name | session-id sess_id | username name ]
```

- **callid call_id**
  Initiates GTPP interim accounting for a session with the specific call ID. `call_id` must be an 8-digit hexadecimal number.

- **imsi imsi**
  Initiates GTPP interim accounting for a specific International Mobile Subscriber Identity (IMSI) number. `imsi` must be a sequence of hexadecimal digits and wildcard characters - \$ matches a single character and \* matches multiple characters.

- **msid msid**
  Initiates GTPP interim accounting for a specific Mobile Station Identifier (MSID) number. `msid` must be a sequence of up to 24 digits and wildcard characters - \$ matches a single character and \* matches multiple characters.

- **rulebase rbase_name**
  Initiates GTPP interim accounting for sessions that use the named active charging rulebase. `rbase_name` must be an alpha and/or numeric string of from 1 through 24 characters.

- **session-id sess_id**
  Initiates GTPP interim accounting for a specific active charging session. `sess_id` must be the name of a current active charging session.

- **username name**
  Initiates GTPP interim accounting for all PDP contexts for the subscriber specified. `name` is the subscriber’s name and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

Usage

This command causes GTPP accounting eG-CDRs to immediately be generated for active charging sessions that meet the specified criteria.
The sending of the CDRs is paced so as not to overload the accounting server.
Example
The following command causes eG-CDRs to immediately be generated for active charging sessions using the rulebase named rulebase1:

```
gtpp interim now active-charging egcdr rulebase rulebase1
```
gtpp storage-server commit

Causes the GTPP storage server to save all buffered packets to the hard drive.

Product
GGSN

Privilege
Security Administrator, Administrator, Operator

Syntax

```
gtpp storage-server commit now
```

Usage

Upon execution, this command is relayed by the system to the GTPP Storage Server (GSS) causing the GSS to save all buffered packets to the hard drive. It also causes the GSS to delete all CDRs that have been acknowledged by the CGF. The deleted CDRs are saved in a separate file.

Note that this command must be executed from within the context in which the GSS is configured.

Refer to the `gtpp storage-server` command in the Context Configuration Mode for more information.
**gtpp test**

Tests the system’s ability to communicate with configured CGF(s).

**Product**

GGSN

**Privilege**

Operator, Config-Administrator, Administrator

**Syntax**

```
gtpp test [ accounting { all | cfg-server cfg_address } ] | [ storage-server { address ip-addr port udp-port } ]
```

*all*

Tests all CGFs configured within the given context.

*cfg-server
cfg_address*

Tests a specific CGF configured within the given context.

*ip_address* is the IP address of the CGF expressed in dotted decimal notation.

*storage-server [address ip-address port udp-port]*

Test the connectivity and provide round trip time for the echo request sent to GTPP Storage-Server configured in the requested context.

*ip_address* is the IP address of the GSS expressed in dotted decimal notation and *udp-port* is the port defined for GTPP Storage Server.

**Usage**

This command is used to verify the configuration of and test the system’s ability to communicate with one or all configured GSS/CGFs for monitoring or troubleshooting purposes. When executed, this command causes the system to send GTPP echo packets to the specified GSS/CGF(s). The command’s response will display whether the GSS/CGF is active or unreachable.

**Example**

The following command tests communication with a CGF having an IP address of 192.168.1.5:

```
gtpp test accounting cfg-server 192.168.1.5
```

The following command tests communication with a GSS configured in requested context

```
gtpp test storage-server
```

The following command verify communication with a GSS, having IP address 192.156.12.10 and port 50000, without configuring it in a context

```
gtpp test storage-server address 192.156.12.10 port 50000
```
gtpu test echo

Tests the ability of a GGSN service to exchange GTP-U echo request messages with the specified SGSN(s).

Product
GGSN

Privilege
Operator, Config-Administrator, Administrator

Syntax

gtpu test echo src-address gn_address { all | sgsn-address ip_address }

src-address gn_address
Specifies the IP address of a Gn interface configured on the system. 
gn_address must be expressed in dotted decimal notation.

Important: The IP address of the system’s Gn interface must be bound to a configured GGSN service prior to executing this command.

all
Specifies that GTP-U echo requests will be sent to all SGSNs that currently have sessions with the GGSN service.

sgsn-address ip_address
Specifies that GTP-U echo requests will be sent to a specific SGSN. 
ip_address is the address of the SGSN to send the requests to and must be expressed in dotted decimal notation.

Usage
This command tests the GGSN’s ability to exchange GPRS Tunneling Protocol user plane (GTP-U) packets with the specified SGSNs which can be useful troubleshooting and/or monitoring. 
This command must be executed from within the context in which the GGSN service is configured. 
Refer also to the gtpc test command.

Example
The following command issues GTP-U echo packets from a GGSN service bound to address 192.168.157.43 to an SGSN with an address of 192.168.1.52:

gtpu test echo src-address 192.168.157.43 sgsn-address 192.168.157.2

The following displays a sample of this command’s output.

GTPU test echo--------------SGSN: 192.168.157.2 Tx/Rx: 1/1 RTT(ms): 24 (COMPLETE)
gp filter test echo
gtpv0 test echo

Tests the ability of a GGSN service to exchange GTPv0 echo request messages with the specified SGSN(s).

Product
GGSN

Privilege
Security Administrator, Administrator, Operator

Syntax

```
gtpv0 test echo src-address gn_address { all | sgsn-address ip_address }
```

- **src-address gn_address**
  Specifies the IP address of a Gn interface configured on the system.
  `gn_address` must be expressed in dotted decimal notation.

- **all**
  Specifies that GTPv0 echo requests will be sent to all SGSNs that currently have sessions with the GGSN service.

- **sgsn-address ip_address**
  Specifies that GTPv0 echo requests will be sent to a specific SGSN.
  `ip_address` is the address of the SGSN to send the requests to and must be expressed in dotted decimal notation.

Usage

This command tests the GGSN’s ability to exchange GPRS Tunneling Protocol version 0 (GTPv0) packets with the specified SGSNs which can be useful troubleshooting and/or monitoring.

This command must be executed from within the context in which the GGSN service is configured.

Refer also to the gtpc test and gtpu test commands.

Example

The following command issues GTPv0 echo packets from a GGSN service bound to address 192.168.1.33 to an SGSN with an address of 192.168.1.42:

```
gtpv0 test echo src-address 192.168.1.33 sgsn-address 192.168.1.42
```

The following displays a sample of this command’s output.

```
GTPv0 test echo------------------SGSN: 192.168.157.2 Tx/Rx: 1/1 RTT(ms): 14
{COMPLETE) Recovery: 210 (0xD2)
```
gtpv0 test echo
**hd raid**

Performs the RAID management operations on the ASR 5000 hard drive.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
hd raid { check | { create { local1 | remotel } [ -force ] [ -noconfirm ] } | { overwrite { local1 | remotel } [ -force ] [ -noconfirm ] } | { select { local1 | remotel } [ -force ] [ -noconfirm ] } | { insert { local1 | remotel } [ -force ] [ -noconfirm ] } | { remove { local1 | remotel } [ -force ] [ -noconfirm ] }
```

**check**

Starts a background check on RAID disks unless the RAID is running in degraded mode. 

*noconfirm*: instructs system not to display “are you sure” prompts. 

*force*: instructs the system to enforce the action and override warnings.

**create local1 | remotel**

Overwrites the specified disk to create a new RAID that could run in degraded mode on the specified drive:

*local*: specifies the RAID is to be established on the primary SMC. 
*remote*: specifies the RAID is to be established on the backup SMC. 

*noconfirm*: instructs system not to display “are you sure” prompts. 

*force*: instructs the system to enforce the action and override warnings.

**overwrite local1 | remotel**

Overwrites the specified disk and adds it to the current running RAID to construct a fully mirrored array. 

*local*: specifies the primary SMC is to be added to the current RAID. 
*remote*: specifies the backup SMC is to be added to the current RAID. 

*noconfirm*: instructs system not to display “are you sure” prompts. 

*force*: instructs the system to enforce the action and override warnings.

**select local1 | remotel**

Selects the specified disk to assemble a RAID when two unrelated RAID disks are present in the system. The resulting RAID runs in degraded mode. 

*local*: specifies the primary SMC is to assemble the RAID. 
*remote*: specifies the backup SMC is to assemble the RAID. 

*noconfirm*: instructs system not to display “are you sure” prompts. 

*force*: instructs the system to enforce the action and override warnings.

**insert local1 | remotel**

Inserts the specified disk to the running RAID causing it to recover from degraded mode. 

*local*: specifies the primary SMC is to be inserted into the RAID. 
*remote*: specifies the backup SMC is to be inserted into the RAID.
-noconfirm: instructs system not to display “are you sure” prompts. -force: instructs the system to enforce the action and override warnings.

remove local1 | remote1
Removes the specified disk from the running RAID causing it to run in degraded mode or to fail.
local1: specifies the primary SMC is to be removed from the RAID. remote1: specifies the backup SMC is to be removed from the RAID.
-noconfirm: instructs system not to display “are you sure” prompts. -force: instructs the system to enforce the action and override warnings.

Usage
All commands need confirmation unless the -noconfirm is included in the command. If the result will bring down a running RAID, you have to force the command using -force.
RAID commands are needed to intervene in the following situations:
- the hard disk controller task can not determine the correct operation,
- administrator action is required by policy
- the administrator wants to wipe out an unused disk.

In an automated system, the policies created with this CLI address the possibility of a manually partitioned disk, a disk resulting from a different version of software, a partially constructed disk, or the case of two unrelated disks in the system.
To reduce administrator intervention, a set of policies can be configured to set the default action using the commands in the HD RAID configuration mode. These hd raid commands are described in the HD RAID Configuration Mode chapter of the Command Line Interface Reference.

Example
The following instructs the system to setup a RAID on the primary SMC hard drive.

```
hd raid create local1 -force
```
host

Used to resolve the IP address or logical host name information via DNS query.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

```
host { host_name | host_ip_address }
```

- `host_name | host_ip_address`
  - Specifies host for which IP information is to be displayed.
  - `host_name`: specifies the logical host name for which the IP address is to be displayed (via DNS lookup).
  - `host_ip_address`: specifies the IP address for which the associated logical host name(s) are to be displayed (via reverse DNS lookup).

Usage

Verify DNS information which affects connections and packet routing.

Example

The following will resolve the host information for `remoteABC` and `1.2.3.4`.

```
host remoteABCHost 1.2.3.4
```
interface sent gratuitous-arp

Use this command to configure the system to allow the manual generation of G-ARPs in case of a failure during inter-node online upgrade. If the chassis is not active, an error message displays.

Product
All

Privilege
Security Administrator, Administrator, Operator, or Inspector with li-administrator permissions

Syntax

```
interface name send gratuitous-arp ip-address
```

Usage
This command generates a G-ARP for the IP-ADDR specified and sends it out for the interface.

Example
The following generate a G-ARP for IP address 192.168.100.10.

```
interface interface_1 send gratuitous-arp 192.168.100.10
```
lawful-intercept

This command provisions/de-provisions the lawful interception of data for the specified subscriber session.

Product
PDSN, HA, LNS, GGSN, PDIF, SGSN, ASN-GW

Privilege
Security Administrator, or Administrator, Operator, or Inspector with li-administrator permissions

Syntax

```
lawful-intercept { [ imei imei_value ] [ imsi imsi_value ] [ ip-addr intercept_ip_addr ] [ msid ms_id ] [ msisdn msisdn_value ] [ username subscriber_name ] + } [ active-only ] [ allow-multiple-match ] [ calltype call_type ] [ intercept-id li_id ] [ li-context ctxt_name ] [ content-delivery { none | udp-unack-format-1 dest-addr df_ip_address dest-port df_port_no } event-delivery { none | udp-unack-format-1 | udp-ack-format-1 dest-addr df_ip_address dest-port df_port_no } ]
```

```
no lawful-intercept [ all ] { [ imei imei_value ] [ imsi imsi_value ] [ ip-addr intercept_ip_addr ] [ msid ms_id ] [ msisdn msisdn_value ] [ username subscriber_name ] + } [ calltype call_type ] [ content-delivery { none | udp-unack-format-1 dest-addr df_ip_address dest-port df_port_no } event-delivery { none | udp-ack-format | udp-unack-format } dest-addr ip_address dest-port port_no
```

- **no**
  De-provisions a previously configured lawful-intercept.

- **all**
  De-provisions all previously configured lawful-intercept warrant information. This Keyword is used to clear all warrant information in a single command `no lawful-intercept all`.

- **imei imei_value**
  Specifies the unique International Mobile Equipment Identifier (IMEI) which identifies the targeted device being used for a subscriber session to be intercepted.
  `imei_value` consists of 1 to 16 digits.

- **imsi imsi_value**
  Specifies the international mobile subscriber identity (IMSI) of the subscriber session to be intercepted.
  `imsi_value` is an integer value from 1 to 15 characters.

- **ip-addr intercept_ip_addr**
  Specifies the IP address assigned for the subscriber session or to the mobile station to be targeted for interception.
  `intercept_ip_addr` must be an IPv4/IPv6 address in desired notation.
**msid ms_id**
Specifies the mobile station identification (MSID) number, assigned by the home service provider, to be intercepted. 
*ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

**msisdn msisdn_value**
Specifies the unique mobile subscriber ISDN (telephone) number. 
*msisdn_value* consists of 1 to 15 digits.

**username subscriber_name**
Specifies the previously configured NAI username of the subscriber to be intercepted. 
*subscriber_name* is an alphanumeric string of 1 to 127 characters. 
Use of this keyword is not supported by the SGSN during LI provisioning or de-provisioning.

+ 
Indicates that multiple keywords can be specified in a single command entry. When the “+” appears in the syntax, any of the keywords that appear prior to the “+” can be entered in any order. 
This functionality is not supported by the SGSN during LI provisioning or de-provisioning.

**active-only**
Dictates that the interception applies only to calls currently in progress and not those that have not started. 
Use of this keyword is not supported by the SGSN during LI provisioning or de-provisioning.

**allow-multiple-match**
When used, interception is provided for up to 10 subscribers matching the specified criteria. This feature is disabled by default. 
Use of this keyword is not supported by the SGSN during LI provisioning.

**calltype call_type**
The type of call for the specified subscriber session. *call_type* must be one of the following:

- *asングw*
- *ммe*
- *pgw*
- *sgw*
- *gгssн*
- *pdif*
- *pdsn*
- *sgsn*
- *cссf*
- *ha*
- *lns*

Note that specifying call type is not mandatory while provisioning on SGSN and GGSN targets for any type of event and content delivery format.
content-delivery
Specifies the format in which the intercepted data content comprised of GTPU messages CC information is to be delivered to the DF.

event-delivery
Specifies the format in which intercepted control messages (such as attach/detach or RAU messages) IRI event messages are to be delivered to the DF.

intercept-id li_id
This is an arbitrary identification number, assigned by the provisioner, to identify this intercept definition. li_id must be an integer from 1 to 4294967295.

li-context ctxt_name
Identifies the destination context for intercepted packets. This keyword is mandatory if provisioning is done in a different context. ctxt_name must be an alpha/numeric string of 1 to 79 characters that specifies the name of an existing context.

none
Indicates that the intercepted data, specified as either delivery-type (content or event), is not to be sent to the DF. Entering none automatically activates the active-only provisioning method.

udp-unack-format-1
Dictates that the specified information type (content or event) is to be delivered using the udp-unack-format-1 which does not support acknowledgement messages for delivered information.

udp-ack-format-1
Dictates that the event information type is to be delivered using the udp-ack-format-1 which supports acknowledgement messages for delivered information.

dest-addr df_ip_address
The IP address of the DF to which the system sends intercepted data. df_ip_address must be an IPv4/IPv6 address in desired notation.

dest-port df_port_no
The port of the DF to which the system sends intercepted data. df_port_no can be any integer value from 1 to 65535.

Usage
Use this command to initiate a lawful Intercept of data for a subscriber. This command is not available to system accounts that do not have li-administrator privileges.
**Important:** You must log in to the system through a Secure Shell (SSH) using a system account that has administrator privileges to use this command. For details on using the Lawful Intercept capability of the system, refer to the System Administration and Configuration Guide.

**Example**

To lawfully intercept data from a subscriber session with an MSID of 0000100048, assign an intercept ID of 102, set the destination address to 192.168.100.10 and the destination port to 100, enter the following command:

```
lawful-intercept msid 0000100048 intercept-id 102 content-delivery udp-unack-format-1 dest-addr 192.168.100.10 dest-port 100 event-delivery none
```
lawful-intercept packet-cable

This command provisions/de-provisions the LI Call Content interception for PDSN or CSCF session.

Product
PDSN, SCM

Privilege
Security Administrator, or Administrator, Operator, or Inspector with li-administrator permissions

Syntax

lawful-intercept packet-cable {content-delivery {df-setup content id df_cont_id calltype {cscf | pdsn } dest-addr df_ip_address dest-port df_port_no li-context li_ctxt_name | intercept-request content id intercept_cont_id calltype {cscf | pdsn } filter-spec src-ip-addr src_ip_address} | event-delivery username subscriber_name intercept id intercept_id)

no lawful-intercept packet-cable {content-delivery content id df_cont_id calltype {cscf | pdsn } | event-delivery username subscriber_name calltype {cscf | pdsn}}

no
De-provisions a previously configured lawful-intercept.

**df-setup content id df_cont_id**
Specifies the DF setup and content identifier for subscriber to be intercepted.
df_cont_id must be an integer from 1 to 4294967295.

**intercept-request content id intercept_cont_id**
This is an arbitrary identification number, assigned by the provisioner, to identify this intercept definition.
intercept_cont_id must be an integer from 1 to 4294967295.

**calltype {cscf | pdsn}**
The type of call for the specified subscriber session.
pdsn: specifies the CDMA 2000 networks subscriber session.
cscf: specifies the SCM/IMS networks subscriber session.

**content-delivery**
Specifies the format in which the intercepted data content is to be delivered to the DF.

**event-delivery**
Specifies the format in which intercepted control messages IRI event messages are to be delivered to the DF.

**username subscriber_name**
Specifies the previously configured NAI username of the subscriber to be intercepted.
subscriber_name is an alphanumeric string of 1 to 127 characters.
**li-context li_ctx_name**

Identifies the destination context for intercepted packets. This keyword is mandatory if provisioning is done in a different context. `li_ctx_name` must be an alpha/numeric string of 1 to 79 characters that specifies the name of an existing context.

**dest-addr df_ip_address**

The IP address of the DF to which the system sends intercepted data. `df_ip_address` must be an IPv4/IPv6 address in desired notation.

**dest-port df_port_no**

The port of the DF to which the system sends intercepted data. `df_port_no` can be any integer value from 1 to 65535.

**filter-spec src-ip-addr src_ip_address**

The IP address of the source filter from which the system retrieves intercepted data. `src_ip_address` must be an IPv4/IPv6 address in desired notation.

**Usage**

Use this command to initiate a packet-cable lawful Intercept for a PDSN or CSCF subscriber. This command is not available to system accounts that do not have li-administrator privileges.

**Important:** You must log in to the system through a Secure Shell (SSH) using a system account that has li-administrator privileges to use this command. For details on using the Lawful Intercept capability of the system, refer to the System Administration and Configuration Guide.

**Example**

Following command enables the LI Call Content interception for CSCF with DF setup having content id 10203 with destination address 1.2.3.4, port 2300 and LI context `li_cscf1`:

```
lawful-intercept packet-cable content-delivery df-setup content id 10203
calltype cscf dest-addr 1.2.3.4 dest-port 2300 li-context li_cscf1
```
lawful-intercept ssdf

This command is used to configure and provision the SSDF generic interface for LI Call Content interception during CSCF session in IMS network.

**Product**
SCM

**Privilege**
Security Administrator, or Administrator, Operator, or Inspector with li-administrator permissions

**Syntax**

```
lawful-intercept ssdf dest-addr df_ip_address dest-port df_port_no serial-number sr_num version vr_num [li-context li_ctxt_name]

[no] lawful-intercept ssdf [li-context li_ctxt_name] dest-addr df_ip_address dest-port df_port_no
```

- **no**
  De-provisions a previously configured lawful-intercept.

- **dest-addr df_ip_address**
  The IP address of the DF to which the system sends intercepted data. `df_ip_address` must be an IPv4/IPv6 address in desired notation.

- **dest-port df_port_no**
  The port of the DF to which the system sends intercepted data. `df_port_no` can be any integer value from 1 to 65535.

- **li-context li_ctxt_name**
  Identifies the destination context for intercepted packets. This keyword is mandatory if provisioning is done in a different context. `li_ctxt_name` must be an alpha/numeric string of 1 to 79 characters that specifies the name of an existing context.

- **serial-number sr_num**
  Identifies the Serial Number of the Access Function (AF) for validation which is to be provisioned on SSDF interface. `sr_num` must be an ASCII string of 1 to 79 characters that represents the serial number of the access function equipment.

- **version sr_num**
  Identifies the software version of the software running on the Access Function (AF) for validation which is to be provisioned on SSDF interface. `sr_num` must be an ASCII string of 1 to 79 characters that represents the software version running on the access function equipment.
Usage

Use this command to configure/provision the SSDF generic interface for lawful Intercept on a CSCF function. This command is not available to system accounts that do not have li-administrator privileges.

Important: You must log in to the system through a Secure Shell (SSH) using a system account that has li-administrator privileges to use this command. For details on using the Lawful Intercept capability of the system, refer to the System Administration and Configuration Guide.

Example

Following command configures the SSDF interface with AF number 10203 software version 2 with destination address 1.2.3.4, port 2300 and LI context li_cscfl:

```
    lawful-intercept ssdf dest-address 1.2.3.4 dest-port 2300 serial-number 10203 version 2 li-context li_cscfl
```
logging active

Enables/disables logging for active internal log files.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```plaintext
logging active [ copy runtime filters ] [ event-verbosity event_level] [ pdu-data format ] [ pdu-verbosity pdu_level ]
```

```plaintext
no logging active
```

**no**
Indicates the internal logging is to be disabled.

**copy runtime filters**
When this command is issued, it makes a copy of the runtime filters and makes that copy the filters for the current logging session.

**event-verbosity event_level**
Specifies the level of verboseness to use in logging of events as one of:
- **min** - displays minimal information about the event. Information includes event name, facility, event ID, severity level, date, and time.
- **concise** - displays detailed information about the event, but does not provide the event source within the system.
- **full** - displays detailed information about event, including source information, identifying where within the system the event was generated.

**pdu-data format**
Specifies output format for packet data units when logged as one of:
- **none** - output is in raw format (unformatted).
- **hex** - output being displayed in hexadecimal format.
- **hex-ascii** - output being displayed in hexadecimal and ASCII similar to a main-frame dump.

**pdu-verbosity pdu_level**
Specifies the level of verboseness to use in logging of packet data units as a value from 1 to 5 where 5 is the most detailed.

**Usage**
Adjust the active logging levels when excessive log file sizes are being generated or, conversely, not enough information is being sent to the active log files for adequate troubleshooting support. The no keyword is used to disable internal logging.

**Important:** A maximum of 50,000 events may be stored in each log. Enabling more events for logging may cause the log to be filled in a much shorter time period. This may reduce the effectiveness of the log data as a shorter time period of event data may make troubleshooting more difficult.

**Important:** Once a log has reached the 50,000 event limit the oldest events will be discarded as new log entries are created.

**Example**
The following sets the active logging for events to the maximum.

```plaintext
logging active event-verbosity full
```

The following command sets the active logging for packet data units to level 3 and sets the output format to the main-frame style hex-ascii.

```plaintext
logging active pdu-data hex-ascii pdu-verbosity 3
```

The following disables internal logging.

```plaintext
no logging active
```
logging filter

Sets the logging filtering options for all or individual facilities.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
logging filter active facility facility level severity_level [ critical-info | no-critical-info ]
```

- **active**
  Indicates only active processes are to have logging options set.

- **facility**
  Specifies the facility to modify the filtering of logged information for as one of:

  - **a10**: A10 interface facility
  - **a11**: A11 interface facility
  - **a11mgr**: A11 Manager facility
  - **aaa-client**: AAA client facility
  - **aaamgr**: AAA manager logging facility
  - **aaaproxy**: AAA Proxy facility
  - **acl-log**: Access Control List logging facility
  - **acsctrl**: Active Charging Service (ACS) Controller facility
  - **acsmgr**: Active Charging Service (ACS) Manager facility
  - **alarmctrl**: Alarm Controller facility
  - **all**: All facilities
  - **asf**: Voice Application Server Framework logging facility
  - **asfprt**: ASF Protocol Task (SIP) logging facility
  - **asngwmgr**: ASN Gateway Manager facility
  - **asnlrmgr**: ASN Paging/Location-Registry Manager facility
  - **bgp**: Border Gateway Protocol (BGP) facility
  - **cli**: CLI logging facility
  - **cscf**: IMS/MMD CSCF
  - **cscfmgr**: SIP CSCF Manager facility
  - **csp**: Card Slot Port controller facility
  - **css**: Content Service Selection (CSS) facility
  - **css-sig**: Content Service Selection (CSS) RADIUS Signaling facility

logging filter

- **sitmain**: System Initialization Task main logging facility
- **snmp**: SNMP logging facility
- **srdb**: Static Rating Database
- **srp**: Service Redundancy Protocol (SRP) logging facility
- **ssh-ipsecc**: SSH IP Security logging facility  
  - **stat**: Statistics logging facility
- **system**: System logging facility
- **tacacsplus**: TACACS+ Protocol logging facility
- **threshold**: threshold logging facility
- **ttg**: TTG logging facility
- **udr**: User detail record facility (used with the Charging Service)
- **user-data**: User data logging facility
- **user-l3tunnel**: User layer-3 tunnel logging facility
- **vpn**: Virtual Private Network logging facility
- **wimax-data**: WiMAX DATA
- **wimax-r6**: WiMAX R6

**level severity_level**

Specifies the level of information to be logged from the following list which is ordered from highest to lowest:

- **critical**: display critical events
- **error**: display error events and all events with a higher severity level
- **warning**: display warning events and all events with a higher severity level
- **unusual**: display unusual events and all events with a higher severity level
- **info**: display info events and all events with a higher severity level
- **trace**: display trace events and all events with a higher severity level
- **debug**: display all events

**critical-info | no-critical-info**

Default: critical-info enabled.

- **critical-info**: specifies that events with a category attribute of critical information are to be displayed. Examples of these types of events can be seen at bootup when system processes and tasks are being initiated.
- **no-critical-info**: specifies that events with a category attribute of critical information are not to be displayed.

**Usage**

Apply filters for logged data to collect only that data which is of interest.
**Important:** A maximum of 50,000 events may be stored in each log. Enabling more events for logging may cause the log to be filled in a much shorter time period. This may reduce the effectiveness of the log data as a shorter time period of event data may make troubleshooting more difficult.

**Important:** Once a log has reached the 50,000 event limit the oldest events will be discarded as new log entries are created.

**Caution:** Issuing this command could negatively impact system performance depending on the amount of system activity at the time of execution and/or the type of facility(ies) being logged.

**Example**
The following are selected examples used to illustrate the various options. Not all facilities will be explicitly shown as each follows the same syntax for options.
The following sets the level to log only warning information for all facilities.

```
logging filter active facility all level warning
```

The following enables the logging of critical information for the SNMP facility while setting the level to error.

```
logging filter active facility snmp level error critical-info
```
logging trace

Enables/disables the logging of trace information for specific calls, mobiles, or network addresses.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

logging trace { callid call_id | ipaddr ip_address | msid ms_id | username user_name }

no logging trace { callid call_id | ipaddr ip_address | msid ms_id | username user_name }

no
Indicates the logging of trace information is to be disabled.

callid call_id | ipaddr ip_address | msid ms_id | username user_name

callid call_id: specifies the exact call instance ID which is to have trace data logged. call_id is specified as a 4-byte hexadecimal number.
ipaddr ip_address: specifies the IP address for which trace information is to be logged. ip_address must be specified using the standard IPv4 dotted decimal notation.
msid ms_id: specifies the mobile subscriber ID for which trace information is to be logged. ms_id must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.
username user_name: specifies a user who is to have trace information logged. user_name must refer to a previously configured user.

Usage

A trace log is useful in troubleshooting subscriber problems as well as for system verification by using a test subscriber. The no keyword is used to stop the logging of trace information.

Important: A maximum of 50,000 events may be stored in each log. Enabling more events for logging may cause the log to be filled in a much shorter time period. This may reduce the effectiveness of the log data as a shorter time period of event data may make troubleshooting more difficult.

Important: Once a log has reached the 50,000 event limit the oldest events will be discarded as new log entries are created.

Caution: Issuing this command could negatively impact system performance depending on the number of subscribers connected and the amount of data being passed.
**Example**
The following commands enables/disables trace information for user user1.

```
logging trace username user1
no logging trace username user1
```

The following commands will enable/disable trace information logging for the user assigned IP address 1.2.3.4.

```
logging trace ipaddr 1.2.3.4
no logging trace ipaddr 1.2.3.4
```

The following enables/disables logging of trace information for call ID FE80A12.

```
logging trace callid fe80a12
no logging trace callid fe80a12
```
logs checkpoint

Performs check pointing operations on log data. Check pointing identifies logged data as previously viewed or marked. Check pointing results in log information since the last check point being displayed only, i.e., check pointed log data is not available for viewing.

Individual logs may have up to 50,000 events in the active log. Check pointing the logs will then result in at most 50,000 events being in the inactive log files. This gives a maximum of 100,000 events in total which are available for each facility logged.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
logs checkpoint
```

**Usage**
Check point log data to a set the log contents to a well know point prior to special activities taking place. This command may also be a part of periodic regular maintenance to manage log data. The check pointing of logs moves the current log data to the inactive logs. Only the most recently check pointed data is retained in the inactive logs. A subsequent check pointing of the logs will result in the prior check pointed inactive log data being cleared and replaced with the newly check pointed data. The check pointing of log data moves the active log data to be retained as the inactive log data. This results in the active log data, if displayed, having no data earlier than the point in time when the check pointing occurred.

**Important:** Check pointing of logs should be done periodically to avoid the logs becoming full. Logs which have 50,000 events logged will discard the oldest events first when new events are to be logged.

**Example**

```
logs checkpoint
```
mkdir

Creates a new directory in the local file system or in remote locations as specified.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```bash
mkdir filepath
```

`filepath`
Specifies the directory path to create. The path must be formatted as follows:
Specifies the source of the copy. `url` may refer to a local or a remote file. `url` must be entered using one of the following formats:
- ASR 5000:

  ```bash
  [file:][/flash|/pcmcia|/hd][/directory]/file_name
  ```

**Important:** Use of the SMC hard drive is not supported in this release.

`directory` is the directory name
`filename` is the actual file of interest

Usage
Create new directories as part of periodic maintenance activities to better organize stored files.

Example
The following creates the directory `/flash/pub` in the local flash storage.

```bash
mkdir /flash/pub
```
monitor protocol

Enters the system’s protocol monitoring utility.

**Product**

All

**Privilege**

Security Administrator, Administrator, Operator

**Syntax**

```plaintext
monitor protocol
```

**Usage**

Useful for troubleshooting, this command provides a tool for monitoring protocol transactions between the system and other network nodes including the mobile station(s).

The following protocols can be monitored:

- SNMP
- RADIUS Authentication
- RADIUS Accounting
- A11 (R-P Interface) (PDSN only)
- Mobile IPv4
- A11MGR
- PPP
- A10 (PDSN only)
- User L3 (User Layer 3 protocols)
- L2TP
- L2TPMGR
- L2TP Data
- GTPC
- GTPCMGR
- GTPU
- GTPP
- DHCP (GGSN only)
- CDR
- DHCPV6
- RADIUS COA
- MIP Tunnel
- L3 Tunnel (Layer 3 Tunnel Protocols)
- CSS Data
- CSS Signaling

- EC Diameter (Diameter Enhanced Charging)
- SIP
- IPSec IKE Inter-Node
- IPSec IKE Subscriber
- IPSG RADIUS Signal
- ROHC (Robust Header Compression) (PDSN only)
- WiMAX R6
- WiMAX Data
- SRP
- BCMCS SERV AUTH
- RSVP
- Mobile IPv6
- ASNGWMGR
- ASNPCMGR
- STUN
- SCTP
- M3UA
- SCCP
- TCAP
- MAP
- RANAP
- GMM
- GPRS-NS
- BSSGP
- CAP
- SSCOP
- SSCFNNI
- MTP3
- LLC
- SNDCP
- BSSAP+
- SMS
- PHS-Control
- PHS-Data
DNS Client
HNBP: Enabling this option will display the HNB Application Part (HNBP) protocol packets.
RUA: Enabling this option will display the RANAP User Adaptation (RUA) protocol packets.
MTP2
EGTPC
App Specific Diameter
PHS-EAPOL
ICAP
Micro-Tunnel
ALCAP
SSL
S1-AP
NAS

Once the protocol has been selected, the utility monitors and displays every relative protocol message transaction. Protocol monitoring is performed on a context-by-context-basis. Therefore, the messages displayed are only those that are transmitted/received within the system context from which the utility was executed.

**Caution:** Protocol monitoring can be intrusive to subscriber sessions and could impact system performance. Therefore, it should only be used as a troubleshooting tool.

**Example**
The following command opens the protocol monitoring utility:

`monitor protocol`

The following displays a sample of this command's output with verbosity level 2 for GTPC:

```plaintext
*** Verbosity Level ( 2) ***INBOUND>>>> 04:39:58:808 Eventid:47000(3)GTPC Rx PDU, from 192.168.35.3:2123 to 192.168.35.1:2123 (190)TEID: 0x00000000, Message type: GTP_CREATE_PDP_CTX_REQ_MSG (0x10)INFORMATION ELEMENTS FOLLOW: IMSI: 40427000000001ROUTING AREA IDENTITY (RAI) FOLLOWS: MCC: 333 MNC: 444 LAC:0 RAC:0ROUTING AREA IDENTITY (RAI) ENDS: Recovery: 0x01 (1) Selection Mode: 0x1 (MS provided APN, subscription not verified (Sent by MS)) Tunnel ID Data I: 0x000000400 Tunnel ID Control I: 0x000000400 NSAPI: 0x05 (5) Charging Characteristics: 0x0800 (Normal) End User Address: Organisation=IETF, PDP Type=IPv4, Address=10.0.0.1 Access Point Name: starent.comPROTOCOL CONFIG. ```
The following displays a sample of this command's output with verbosity level 3 for the Session Initiation Protocol (SIP):

**monitor subscriber**

Enables the system’s subscriber monitoring utility.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
monitor subscriber [ asn-peer-address bs_peer_address | callid call_id | imsi imsi_value | ipaddr ip_address | ipv6addr ipv6_address | ipsg-peer-address ipsg_peer_address | msid ms_id | msisdn msisdn | next-call | pcf pcf_address | pdif-peer-address pdif_peer_address | peer-fa peer_fa_address | peer-lac lac_peer_address | sgsn-address sgsn_address | type { 1xrtt | asngw | asnpc | closedrp | evdorev0 | evdoreva | interrogating-cscf | ggsn [ Next-Call By APN ] | ha | ipsg | lns | mme | pdif | proxy-cscf | rfc3261-proxy | serving-cscf | next-call | type bcmcs { next-call | next-service-request } | username user_name | Next-Call By APN ]
```

**asn-peer-address bs_peer_address**
Specifies the peer ASN Base Station IP address. Must be followed by IPv4 address in dotted decimal notation.

**callid call_id**
Specifies the call identification number assigned to the subscriber session by the system to be monitored. 
*call_id* is specified as a 4-byte hexadecimal number.

**imsi imsi_value**
Specifies the International Mobile Subscriber Identity (IMSI) of the subscriber session to be monitored. 
*imsi_value* is an integer value from 1 to 15 characters.

**ipaddr ip_address**
Specifies the IP address of the subscriber session to be monitored. 
*ip_address* must be specified using dotted decimal notation.

**ipv6addr ipv6_address**
Specifies the IPv6 address of the subscriber session to be monitored. 
*ipv6_address* must be an IPv6 IP address entered using colon (:) separated notation.

**ipsg-peer-address ipsg_peer_address**
Specifies the peer IPSG IP address. Must be followed by IPv4 address in dotted decimal notation.

**msid ms_id**
Specifies the mobile subscriber identification number to be monitored.
ms_id\text{m}ust be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

\text{msisdn} \text{msisdn}

Specifies the Mobile Subscriber ISDN number to be monitored.
\text{msisdn} must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

\text{next-call}

Specifies that the system will monitor the next incoming subscriber session.

\text{pcf} \text{pcf\_address}

Specifies the PCF IP address. Must be followed by IPv4 address in dotted decimal notation.

\text{pdif-peer-address} \text{pdif\_peer\_address}

Specifies the peer PDIF IP address. Must be followed by IPv4 address in dotted decimal notation.

\text{peer-fa} \text{peer\_fa\_address}

Specifies the peer FA IP address. Must be followed by IPv4 address in dotted decimal notation.

\text{peer-lac} \text{lac\_peer\_address}

Specifies the peer LAC IP address. Must be followed by IPv4 address in dotted decimal notation.

\text{sgsn-address} \text{sgsn\_address}

Specifies the SGSN IP address. Must be followed by IPv4 address in dotted decimal notation.

\text{type} \{ \text{1xrtt} | \text{asngw} | \text{asnpo} | \text{evdorev0} | \text{evdoreva} | \text{interrogating-cscf} | \text{ggsn} [ \text{Next-Call By APN} ] | \text{ha} | \text{ipsg} | \text{lns} | \text{mme} | \text{openrp} | | \text{pdif} | | \text{proxy-cscf} | \text{rfc3261-proxy} | \text{serving-cscf} \} \text{next-call}

Allows monitoring for specific subscriber types established in the system when next call occurs.

- \text{1xrtt}: Displays logs for cdma2000 1xRTT call session subscriber
- \text{asngw}: Displays logs for ASN GW call session subscriber
- \text{asnpo}: Displays logs for ASN PC/LR call session subscriber
- \text{evdorev0}: Displays logs for cdma2000 EVDO Rev0 call session subscriber
- \text{evdoreva}: Displays logs for cdma2000 EVDO RevA call session subscriber
- \text{interrogating-cscf}: Displays logs for Interrogating CSCF subscriber
- \text{ggsn}: Displays logs for UMTS GGSN call session subscriber
- \text{Next-Call By APN}: Display logs for next call on APN basis, where APN name can be any of Gi or Gn
- \text{apn}.
- \text{ha}: Displays logs for Home Agent call session subscriber
- \text{ipsg}: Displays logs for IPSG call session subscriber
- \text{lns}: Displays logs for LNS call session subscriber
- \text{mme}: Displays logs for MME session subscribers.
- \text{openrp}: Displays logs for OpenRP subscriber
• **pdif**: Displays logs for PDIF call session subscriber
• **proxy-cscf**: Displays logs for Proxy CSCF subscriber
• **rfc3261-proxy-cscf**: Displays logs for non-ims-proxy (RFC-3261 proxy) subscriber
• **serving-cscf**: Displays logs for Serving CSCF subscriber

```plaintext
type bcmcs {next-call / next-service-request}
```
Specifies the type of BCMCS call for the subscriber.

```plaintext
username user_name
```
Specifies the username of the subscriber to be monitored. `user_name` refers to a previously configured user.

**Usage**
The monitor subscriber utility provides a useful tool for monitoring information about and the activity of either a single subscriber or all subscribers with active sessions within a given context. The following items can be monitored:

- Control events
- Data events
- Event ID information
- Inbound events
- Outbound events
- Protocols (identical to those monitored by `command` command)

Once the criteria has been selected, the utility will monitor and display every relative piece of information on the subscriber(s).

**Important:** Option Y for performing multi-call traces is only supported for use with the GGSN. This option is available when monitoring is performed using the “Next-Call” option. It allows you to monitor up to 11 primary PDP contexts for a single subscriber.

Subscriber monitoring is performed on a context-by-context-basis. Therefore, the information displayed will be only that which is collected within the system context from which the utility was executed.

**Caution:** Subscriber monitoring can be intrusive to subscriber sessions and could impact system performance. Therefore, it should only be used as a troubleshooting tool.

**Example**
The following command enables monitoring for user `user1`.

```plaintext
monitor subscriber username user1
```

The following command will enable monitoring for the user assigned IP address `1.2.3.4`.

```plaintext
monitor subscriber ip-address 1.2.3.4
```
The following enables monitoring for call ID FE80AA12.

```
monitor subscriber callid fe80aa12
```
newcall policy

Configures new call policies for busy-out conditions.

**Product**

PDSN, GGSN, MME, HA, LNS, P-CSCF, ASN GW, ASN PC/LR

**Privilege**

Security Administrator, Administrator, Operator

**Syntax**

```
newcall policy {asngw-service asnpc-service} {all | name service_name} reject
newcall policy cscc-service { all | nameservice_name } { 
redirect target_ip_address [ weight weight_num ] [ target_ipaddress2 [ weight weight_num ] ... target_ip_address16 [ weight weight_num ] | reject }
newcall policy { fa-service | lns-service | mipv6ha-service } { all | name service_name } reject
newcall policy { ha-service | pdns-service} { all | name service_name } { 
redirect target_ip_address [ weight weight_num ] [ target_ipaddress2 [ weight weight_num ] ... target_ip_address16 [ weight weight_num ] | reject }
newcall policy ggsn-service { apn_name apn_name | all | name ggsn-service-name } reject
no newcall policy { fa-service | ggsn-service | ha-service | mipv6ha-service | pdns-service| lns-service } { all | name service_name }
newcall policy mme-service {all | nameservice_name } reject
nonewcallpolicy { ha-service | pdns-service } { all | nameservice_name }
redirect target_ip_address [ weight weight_num ] [ target_ip_address2 [ weight weight_num ] ... target_ip_address16 [ weight weight_num ] }
no newcall policy ggsn-service { apn_name apn_name | all | name ggsn-service-name } reject
no newcall policy { asngw-service | asnpc-service } { all | name service_name }
no newcall policy mme-service { all | name service_name}
```

**no**

Disables the new call policy for all or specified service of a service type.

```
newcall policy { asngw-service | asnpc-service } { all | name service_name } reject
```

Creates a new call policy to reject the calls based on the specified ASN GW or ASN PC/LR service name or all services of this type.

**asngw-service**: Specifies the type of service as ASN GW for which new call policy is configured.
Exec Modes Commands (D-S)

newcall policy { cscf-service | fa-service | lns-service | mipv6ha-service } { all | name service_name } reject

Creates a new call policy that rejects calls based on the specified access point name.

no newcall policy { cscf-service | fa-service | ggsn-service | ha-service | mipv6ha-service | pdsn-service } { all | name service_name }

Removes a previously configured new call policy for the specified service.

no newcall policy { ha-service | pdsn-service } { all | name service_name } redirect target_ip_address [ weight weight_num ] [ target_ip_address2 [ weight weight_num ] ... target_ip_address16 [ weight weight_num ] }

Deletes up to 16 IP addresses from the redirect policy. The IP addresses must be expressed in IP v4 dotted decimal notation.

cscf-service | fa-service | ggsn-service | ha-service | lns-service | mipv6ha-service | pdsn-service }

Specifies the type of service for which to configure a new call policy. The following services are supported:

- **cscf-service**: A Call/Session Control Function service
- **fa-service**: A Foreign Agent service
- **ggsn-service**: A Gateway GPRS Support Node service
- **ha-service**: A Home Agent service
- **lns-service**: An L2TP Network Server service
- **mipv6ha-service**: A Mobile IPv6 Home Agent service
- **pdsn-service**: A Packet Data Serving Node service

{ all | name service_name }

Specifies a filter for the new call policy. Whether the new call policy will be applied to all configured services or a specific one.

- **all**: Specifies that the new call policy will be applied to all instances of the selected service type.
- **name service_name**: Specifies the name of a specific instance of the selected service type. service_name can be between 1 and 63 alpha and/or numeric characters and is case sensitive.

redirect target_ip_address [ weight weight_num ] [ target_ip_address2 [ weight weight_num ] ... target_ip_address16 [ weight weight_num ] }

Configures the busy-out action. When a redirect policy is invoked, the service rejects new sessions and provides the IP address of an alternate destination. This command can be issued multiple times.

address: The IP address of an alternate destination expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you
try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.

**weight weight_num** When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. **weight_num** must be an integer from 1 through 10.

Depending on the type of service that the policy is applied to, the following reason codes are reported as part of the reply:

- **ha service**: 88H (Registration Denied - unknown home agent address)
- **pdsn service**: 88H (Registration Denied - unknown PDSN address)

**Important**: The redirect option is not supported for use with FA and GGSN services.

```
newcall policy mme-service) {all | name service_name} reject
```

Creates a new call policy to reject the calls based on the specified MME service name or all MME services on the system.

- **name service_name**: Specifies the name of the MME service for which new call policy is configured.
- **service_name**: is name of a configured MME service.
- **reject**: Specifies that the policy rejects new incoming calls. Depending on the type of service that the policy is applied to, the reason codes are reported as part of the reply to indicate the rejection. For MME service rejection code is 81H (Registration Denied - administratively prohibited).

**reject**

Specifies that the policy rejects new incoming calls. Depending on the type of service that the policy is applied to, the following reason codes are reported as part of the reply to indicate the rejection:

- **asngw service**: 81H (Registration Denied - administratively prohibited)
- **fa service**: 41H (administratively prohibited)

**Important**: When the newcall policy is set to reject for the FA service, the Busy Bit is set in the Agent Advertisement. Any further RRQs will be rejected with this code value.

- **ggsn service**: C7H (Rejected - no resources available)
- **ha service**: 81H (Registration Denied - administratively prohibited)
- **mipv6ha-service**: 81H (Registration Denied - administratively prohibited)
- **mme service**: 81H (Registration Denied - administratively prohibited)
- **pdsn service**: 81H (Registration Denied - administratively prohibited)

**Usage**

This command is used to busy-out specific system services prior to planned maintenance or for troubleshooting.

**Example**

The following command creates a new call policy to re-direct all new calls for all PDSN services to a device having an IP address of 192.168.1.23:
newcall policy psdn-service all redirect 192.168.1.23

The following command creates a new call policy to reject all new calls for a GGSN service called ggsn1:

newcall policy ggsn-service name ggsn1 reject

The following command creates a new call policy to reject all new calls for an MME service called MME1:

newcall policy mme-service name MME1 reject
password change

Provides a mechanism for local-user administrative users to change their passwords.

Product
All

Privilege
All local-user administrative levels except as noted below

Syntax

```
password change [ local-user name ]
```

- **local-user name**
  Specifies the name of the local-user administrative user for which to change the password.
  name can be from 3 to 16 alpha and/or numeric characters in length and is case sensitive.

**Important:** This keyword is only available to local-users with an authorization level of security-administrator.

Usage
This command provides a mechanism for local-user administrative users to change their passwords. In addition, it also provides a mechanism for security-administrator local-users to change the password for other local-user accounts.

If the local-user keyword is not entered, the system prompts the user for their current password and for the new password. New passwords take effect at the next login. Users that have had their password changed by a security-administrator are prompted to change their passwords at their next login.

New passwords must meet the criteria dictated by the local-user password command options in the Global Configuration Mode.

**Important:** The system does not allow the changing of passwords unless the time limit specified by the local-user passwordmin-change-interval has been reached.

Example
The following command, executed by a security-administrator, resets the password for a local-user name operator12:

```
password change local-user operator12
```
ping

Verifies ability to communicate with a remote node in the network by passing data packets between and measuring the response.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Important: Inspector privileges are granted for all variables except count. To initiate a ping count, you must have a minimum privilege level of Operator.

Syntax

```
ping host_ip_address [ broadcast ] [ count num_packets ] [ pattern packet_pattern ] [ size octet_count ] [ src { src_host_name | src_host_ip_address } ] [ | { grep grep_options | more } ]
```

**host_ip_address**
Identifies the remote node to which the ability to communicate with is to be verified.

**broadcast**
Sends ping packets to broadcast addresses.

**count num_packets**
Default: 5
Specifies the number of packets to send to the remote host for verification. num_packets must be within the range 1 through 10000.

**pattern packet_pattern**
Default: each octet of the packet is encoded with the octet number of the packet.
Specifies a pattern to use to fill the internet control message protocol packets with. packet_pattern must be specified in hexadecimal format with a value in the range hexadecimal 0x0000 through 0xFFFF. packet_pattern must begin with a ‘0x’ followed by up to 4 hexadecimal digits.

**size octet_count**
Default: 56
Specifies the number of bytes each IP datagram. octet_count must be a value in the range 40 through 18432.

**src { src_host_name | src_host_ip_address }**
Default: originating system’s IP address
Specifies an IP address to use in the packets as the source node.
ping

src_host_name: specifies the source node using the node’s logical host name which must be resolved via DNS lookup.
src_host_ip_address: specifies the source node using the node’s assigned IP address specified using the standard IPv4 dotted decimal notation.

```bash
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in *Command Line Interface Reference*.

**Usage**
This command is useful in verifying network routing and if a remote node is able to respond at the IP layer.

**Example**
The following command is the most basic and will report the results of trying to communication with remote node remoteABC.

```bash
ping remoteABC
```

The following will verify communication with the remote node 1.2.3.4 using 1000 packets.

```bash
ping 1.2.3.4 count 1000
```

The following verifies communication with remote node remoteABC while making it appears as though the source is remote node with IP address 1.2.3.4.

```bash
ping remoteABC src 1.2.3.4
```

**Important**: It is important to note that the responses from the remote host to the ping packets will be rerouted to the host specified as the source.
ping6

Ping options for IPv6 addresses

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
ping6 { hostname | ipv6 address } [ count num ] [ flood ] [ pattern val ] [ size val ] [ src val ] [ interface string ]
```

**hostname**
Name of the host to be pinged.

**ipv6 address**
IPv6 address of host to be pinged.

**count num**
Sets the number of ping packets to be sent. num must be an integer between 1 - 10,000.

**flood**
Configures ping6 to send packets as quickly as possible, or 100 per second, whichever is faster.

**pattern val**
Specifies hex pattern to fill ICMP packets. val is in the range 0x0 - 0xffff

**size val**
Size of ICMP datagram in bytes. val is an integer from 40 - 18432. Default is 56.

**src val**
Specifies the source IP address.

**interface string**
Specifies the originating source interface name.

Usage

Ping command for IPv6. Note that the command is just “ping6, and not “pingv6.”

Example
Use this command to ping the IPv6 address
2001:0db8:85a3:0000:0000:8a2e:0370:7334 ping6
2001:0db8:85a3:0000:0000:8a2e:0370:7334
port

Performs a manual switchover to an available redundant/standby line card or SPIO port.
Default: none.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

```
port switch to slot#/port#
```

<table>
<thead>
<tr>
<th>slot#</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identifies the physical chassis slot where the line card or SPIO card is installed.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>port#</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identifies the physical port on the line card or SPIO to automatically switch to.</td>
</tr>
</tbody>
</table>

Usage
This command is used to specify the redundant port on a Line Card (LC). When port redundancy is enabled, if an external network device or cable failure occurs that causes a link down failure on the port, then the redundant port is used.

Important: This command is not supported on all platforms.

Example
```
port switch to 17/1
```
ppp echo-test

Verifies the point-to-point link by sending link control protocol packets to the targeted users. This command will not

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator, Operator

Syntax

```
ppp echo-test { callid call_id | imsi imsi_id | ipaddr ip_address | msid ms_id | username user_name } [ num_packets ] [ | ( grep grep_options | more ) ]
```

callid call_id
Specifies the exact call instance ID which is to have its PPP link verified. call_id is specified as a 4-byte hexadecimal number.

imsi imsi_id
Specifies the International Mobile Subscriber Identifier (IMSI) which is to have its PPP link verified.

ipaddr ip_address
Specifies the IP address which is to have its PPP link verified. ip_address must be specified using the standard IPv4 dotted decimal notation.

msid ms_id
Specifies the mobile subscriber ID which is to have its PPP link verified. ms_id must be from 7 to 16 digits specified as an MIN, or RMI.

username user_name
Specifies a user which is to have its PPP link verified. user_name must refer to a previously configured user.

num_packets
Default 1
Specifies the number of test packets to generate. num_packets must be a value in the range from 1 through 1000000.

grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in Command Line Interface Reference.

Usage
Use the echo test to verify the point-to-point protocol communications.

⚠️ **Caution:** Issuing this command could negatively impact system performance depending on the number of subscribers using the same name and/or if the number of packets used in the test is large.

---

**Example**

The following command tests the PPP link to user `user1`.

```
ppp echo-test username user1
```

The following command tests the PPP link to the user assigned IP address `1.2.3.4`.

```
ppp echo-test ipaddr 1.2.3.4
```

The following tests the PPP link associated with call ID `FE80AA12`.

```
ppp echo-test callid fe80aa12
```
radius interim

Check points current RADIUS accounting messages immediately

Product
PDSN, GGSN, ASN-GW

Privilege
Security Administrator, Administrator, Operator

Syntax
radius interim accounting now

Usage
The interim command may be part of a regiment of periodic activities to maintain the chassis. This command may also be useful in preparation for system monitoring or troubleshooting to set the list of messages to be displayed at a well known time.
radius test

Verifies the RADIUS servers functions for accounting and authentication.

Product
PDSN, GGSN, ASN-GW

Privilege
Security Administrator, Administrator, Operator

Syntax

```
radius test { accounting | authentication |
probeauthenticationserverip_addriport_no [ username username | password ]
} { all | [ on ] | off } | radius group group_name user_name |
server server_name port server_port } user_name password
```

`accounting`
Test accounting server functionality.

`authentication`
Test authentication server functionality.

`all | radius group group_name user_name | server server_name port server_port`

`all`: indicates all configured servers are to be tested.

`server server_name port server_port`: indicates only the server specified as `server_name` and `server_port` is to be tested. The server must have been previously configured.

`radius group group_name user_name`: tests all configured authentication servers in a specific RADIUS group for specific user. Must be followed by the RADIUS group name and user name.

`group_name` will be a string of size 1 to 63 character and specifies the name of server group configured in specific context for authentication/accounting.

`on/off`
Allows the user to turn radius test accounting on or off.

`user_name`
Specifies the RADIUS user who is to be verified. The user must have been previously configured.

`password`
Specifies the RADIUS user who is to have authentication verified. `password` is only applicable when the `authentication` keyword is specified.

Usage
Test the RADIUS accounting for troubleshooting the system for specific users or to verify all the system RADIUS accounting functions.
Example
The following verifies all RADIUS servers.

```
radius test accounting all
radius test authentication all
```

The following verifies the RADIUS accounting and authentication for user `user1` for the `sampleServer`.

```
radius test accounting server sampleServer port 5000 user1
radius test authentication server sampleServer port 5000 user1 dummyPwd
```

The following commands will verify the RADIUS accounting and authentication for RADIUS server group `star1` for the current context:

```
radius test accounting server sampleServer port 5000 user1
radius test authentication server sampleServer port 5000 user1 dummyPwd
radius test authentication all
```

The following verifies the RADIUS authentication server group `star1` for user `user1`.

```
radius test authentication radius group star1 user1
```

The following displays a sample of the output:

```
Authentication from authentication server 192.168.65.1, port 1812
Authentication Success: Access-Accept received
Round-trip time for response was 29.8 ms
```

The following activates radius test authentication:

```
radius test accounting on group abc server 134.141.12.1 port 1111.
```
reload

Invokes a full system reboot.

Product
All

Privilege
Security Administrator, Administrator

Syntax

reload [ -noconfirm ]

-noconfirm
Execute the command without any additional prompts or confirmation from the user.

Usage
The system performs a hardware reset and reloads the highest priority boot image and configuration file specified in the boot.sys file. Refer to the boot system priority command in the Global Configuration Mode for additional information on configuring boot images, configuration files and priorities.

Important: To avoid the abrupt termination of subscriber sessions, it is recommended that a new call policy be configured and executed prior to invoking the reload command. This sets busy-out conditions for the system and allows active sessions to terminate gracefully. Refer to the newcall command in the Exec Mode for additional information.

Caution: Issuing this command causes the system to become unavailable for session processing until the reboot process is complete.

Example
The following command performs a hardware reset on the system:

   reload
rename

Changes the name of an existing local file.

Product
All

Privilege
Security Administrator, Administrator

Syntax

rename from_filepath to_filepath [ -noconfirm ]

- from_filepath
  Specifies the path to the file/directory to be renamed. The path must be formatted according to the following format:
  - Specifies the source of the copy. url may refer to a local or a remote file. url must be entered using one of the following formats:
    - ASR 5000:
      - [file:][/flash|/pcmcia|/hd][/directory]/file_name

- Important: Use of the SMC hard drive is not supported in this release.

  directory is the directory name
  filename is the actual file of interest

- to_filepath
  Specifies the new name of file/directory. The path must be formatted according to the following formats:
  - Specifies the source of the copy. url may refer to a local or a remote file. url must be entered using one of the following formats:
    - ASR 5000:
      - [file:][/flash|/pcmcia|/hd][/directory]/file_name

- Important: Use of the SMC hard drive is not supported in this release.

  directory is the directory name
  filename is the actual file of interest

- -noconfirm
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

- Important: Extreme caution should be taken when using the -noconfirm option. The paths to the source and the destination should be verified prior to performing the command.
Usage
Rename files as part of regular system maintenance in conjunction with the delete command.

Example
The following renames the directory /pub in the local PCMCIA1 device.

    rename /pcmcia1/pub /pcmcia1/pub_old
reveal disabled commands

Enables the input of commands for features that do not have license keys installed. The output of the command `show cli` indicates when this is enabled. This command affects the current CLI session only. This is disabled by default.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
reveal disabled commands

no reveal disabled commands
```

**Usage**

When this is enabled and a disabled command is entered, a message is displayed that informs you that the required feature is not enabled and also lists the name of the feature that you need to support the command. When this is disabled and a disabled command is entered, the CLI does not acknowledge the existence of the command and displays a message that the keyword is unrecognized.

**Example**

Set the CLI to accept disabled commands and display the required feature for the current CLI session with the following command:

```
reveal disabled commands
```

Set the CLI to reject disabled commands and return an error message for the current CLI session:

```
no reveal disabled commands
```
rlogin

Attempts to connect to a remote host.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax
```
rlogin { host_name | host_ip_address } [ user user_name ]
```

- `host_name | host_ip_address`
  Identifies the remote node to attempt to connect to.
  - `host_name`: specifies the remote node using the node’s logical host name which must be resolved via DNS lookup.
  - `host_ip_address`: specifies the remote node using the node’s assigned IP address specified using the standard IPv4 dotted decimal notation.

- `user user_name`
  Specifies a user name to attempt to connect as. `user_name` must be from to 1023 alpha and/or numeric characters.

Usage
Connect to remote network elements using rlogin.

**Important:** *rlogin* is not a secure method of connecting to a remote host. *ssh* should be used whenever possible for security reasons.

Example
The following connects to remote host `remoteABC` as user `user1`.

```
rlogin remoteABC user user1
```

The following connects to remote host `1.2.3.4` without any default user.

```
rlogin 1.2.3.4
```
rmdir

Removes (deletes) a local directory.

Product
All

Privilege
Security Administrator, Administrator

Syntax

rmdir path [ force ]

path
Specifies the directory path to remove. The must be formatted according to the following formats:
Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:
directory is the directory name
directory is the actual file of interest

force
Over-rides any warnings to force deletion of the directory and any files contained therein.

Important: Use of the *force* keyword should be done with care to ensure the directory is specified accurately as there is no method to recover a directory which has been removed.

Usage
Remove old directories as part of regular maintenance.

Example
The following removes the local directory `/pcmcia1/pub`

    rmdir /pcmcia1/pub
rotate-hd-file

This command rotates the current temp file manually.

Product
SGW, PGW, HSGW

Privilege
Security Administrator, Administrator

Syntax

```
rotate-hd-file [ name policy_name ]

[ name policy_name ]

Specifies the hd-storage policy name. policy_name must be an existing HD Storage Policy name and must be an alpha and/or numeric string of 0 through 63 characters in length.
```

Usage
Use this command to manually rotate the Diameter HD stored files.

Example
The following command rotates Diameter files in the HD storage drive for files stored using the HD storage policy named CDR1:

```
rotate-hd-file diameter name CDR1
```
save configuration

Saves the current contexts configuration to a local or remote location.

Product
All

Privilege
Security Administrator, Administrator

Syntax

save configuration url [ -redundant ] [ -noconfirm ] [ showsecrets ] [ verbose ]

url
Default: saves to the location of the active configuration currently loaded.
Specifies the location to store the configuration file(s). url may refer to a local or a remote file. url must be entered using one of the following formats:
Specifies the source of the copy. url may refer to a local or a remote file. url must be entered using one of the following formats:

- \[file:\] [/flash|/pcmcia1|/hd] [/directory] /file_name
- [ ftp: | sftp: ] // [username[ :password@] ] [host] [ :port# ] [ /directory] /file_name

directory is the directory name.
filename is the actual file of interest.

**Important:** Configuration files should be named with a .cfg extension.

username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.

**Important:** hostname can only be used if the networkconfig parameter is configured for DHCP and the DHCP server returns a valid nameserver.

port# is the logical port number that the communication protocol is to use.

**-redundant**
This keyword directs the system to save the CLI configuration file to the local device, defined by the url variable, and then automatically copy that same file to the like device on the standby processing card, if available.

**Important:** This keyword will only work for local devices that are located on both the active and standby processing cards. For example, if you save the file to the /pcmcia1 device on the active processing card, that same type
of device (card in Slot 1 of the standby processing card) must be available. Otherwise, a failure message is displayed. If saving the file to an external network (non-local) device, the system disregards this keyword.

**Important:** This keyword does not synchronize the local file system. If you have added, modified, or deleted other files or directories to or from a local device for the active processing card, then you must synchronize the local file system on both SMC cards.

- **noconfirm**
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

**Important:** Caution should be exercised when using the **noconfirm** option as this may cause the accidental over-write of data if the URL refers to an existing file.

- **showsecrets**
  This keyword causes the CLI configuration file to be saved with all passwords in plain text, rather than their default encrypted format.

- **verbose**
  Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

**Usage**
Backup the current configuration as part of periodic maintenance activities in case of emergencies.

**Important:** The saving of a configuration does not save the boot options as configured via the global configuration mode **boot** commands.

**Example**
The following saves the configuration data to the local file `/flash/pub/juneconfig.cfg` with no confirmation from the user:

```
save configuration /flash/pub/juneconfig.cfg -noconfirm
```

The following saves the configuration data to remote hoist `remoteABCas /pub/juneconfig.cfg`:

```
save configuration tftp://remoteABC/pub/juneconfig.cfg
```
save logs

Saves the current log file to a local or remote location.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```bash
save logs { url } [ active ] [ inactive ] [ callid call_id ] [ event-verbosity evt_verboseness ] [ facility facility ] [ level severity_level ] [ pdu-data pdu_format ] [ pdu-verbosity pdu_verboseness ] [ since from_date_time [ until to_date_time ] ] [ | { grep grep_options | more } ]
```

- **url**
  Specifies the location to store the log file(s). `url` may refer to a local or a remote file. `url` must be entered using one of the following formats:
  - Specifies the source of the copy. `url` may refer to a local or a remote file. `url` must be entered using one of the following formats:

```
directory
filename
username
password
host
```

- **Important:** Use of the SMC hard drive is not supported in this release.

```
directory is the directory name.
filename is the actual file of interest.
username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
```

```
Important: hostname can only be used if the networkconfig parameter is configured for DHCP and the DHCP server returns a valid nameserver.
```

- **port#** is the logical port number that the communication protocol is to use.

- **active**
  Indicates output is to display data from active logs.

- **inactive**
  Indicates output is to display data from inactive logs.

- **callid call_id**
  Specifies a call ID for which log information is to be displayed. `call_id` must be specified as a 4-byte hexadecimal number.
**event-verbosity evt_verbosity**

Specifies the level of verboseness to use in displaying of event data as one of:

- `min` - displays minimal information about the event. Information includes event name, facility, event ID, severity level, date, and time.
- `concise` - displays detailed information about the event, but does not provide the event source within the system.
- `full` - displays detailed information about event, including source information, identifying where within the system the event was generated.

**facility facility**

Specifies the facility to modify the filtering of logged information for as one of:

- `a10`: A10 interface facility
- `a11`: A11 interface facility
- `a11mgr`: A11 Manager facility
- `aaa-client`: AAA client facility
- `aaamgr`: AAA manager logging facility
- `aaaproxy`: AAA Proxy facility
- `acl-log`: Access Control List logging facility
- `acsctrl`: Active Charging Service (ACS) Controller facility
- `acsmgr`: Active Charging Service (ACS) Manager facility
- `alarmctrl`: Alarm Controller facility
- `all`: All facilities
- `asf`: Voice Application Server Framework logging facility
- `asfprt`: ASF Protocol Task (SIP) logging facility
- `asngwmgr`: ASN Gateway Manager facility
- `asnpemgr`: ASN Paging/Location-Registry Manager facility
- `bgp`: Border Gateway Protocol (BGP) facility
- `cli`: CLI logging facility
- `cscf`: IMS/MMD CSCF
- `cscfmg`: SIP CSCF Manager facility
- `csp`: Card Slot Port controller facility
- `css`: Content Service Selection (CSS) facility
- `css-sig`: Content Service Selection (CSS) RADIUS Signaling facility
- `dcardctrl`: IPSEC Daughtercard Controller logging facility (not used at this time)
- `dcardmgr`: IPSEC Daughtercard Manager logging facility (Not used at this time)
- `dhcp`: DHCP facility (GGSN product only)
- `dhost`: Distributed Host logging facility
- `diameter`: Diameter endpoint logging facility
- `diameter-acct`: Diameter Accounting
• **diameter-auth**: Diameter Authentication
• **diameter-ecs**: ECS Diameter signaling facility
• **diameter-svc**: Diameter Service
• **diamproxy**: DiamProxy logging facility
• **dpath**: IPSEC Data Path facility
• **drvctrl**: Driver Controller facility
• **evlog**: Event log facility
• **famgr**: Foreign Agent manager logging facility
• **firewall**: Firewall logging facility
• **gss-gcdr**: GTPP Storage Server GCDR facility
• **gtpc**: GTP-C protocol logging facility (GGSN product only)
• **gtpcmgr**: GTP-C protocol Manager logging facility (GGSN product only)
• **gtpp**: GTP-PRIME protocol logging facility (GGSN product only)
• **gtpu**: GTP-U protocol logging facility (GGSN product only)
• **h248p**: H.248 Protocol logging facility
• **hamgr**: Home Agent manager logging facility
• **hat**: High Availability Task (HAT) process facility
• **ims-authorizatn**: IMS Authorization Service facility
• **ip-arp**: IP Address Resolution Protocol facility
• **ip-interface**: IP interface facility
• **ip-route**: IP route facility
• **ipsec**: IP Security logging facility
• **ipsgmgr**: IP Services Gateway facility
• **ipsp**: IP Pool Sharing Protocol logging facility
• **l2tp-control**: L2TP control logging facility
• **l2tp-data**: L2TP data logging facility
• **l2tpdemux**: L2TP Demux Manager logging facility
• **l2tpmgr**: L2TP Manager logging facility
• **li**: Lawful intercept facility (Logs are visible only to system accounts with li-administrator privileges.)
• **mme-app**: MME application facility
• **mme-hss**: MME HSS Service facility
• **mme-misc**: MME miscellaneous logging facility
• **mmedemux**: MME Demux Manager logging facility
• **mmemgr**: MME Manager logging facility
• **mmgr**: SGSN/SS7 Master Manager logging facility
• **mobile-ip**: Mobile IP processes
• **mobile-ip-data**: Mobile IP data facility
- **multicast-proxy**: Multicast Proxy logging facility
- **netwstrg**: Network Storage facility
- **npuctrl**: Network Processor Unit Control facility
- **npumgr**: Network Processor Unit Manager facility
- **nsctrl**: Charging Service Controller facility (supported in conjunction with ECSv1)
- **nsmgr**: Charging Service Manager facility
- **nsproc**: Charging Service process facility
- **orbs**: Object Request Broker System logging facility
- **ospf**: OSPF logging facility
- **ppp**: PPP link and packet facilities
- **radius acct**: RADIUS accounting logging facility
- **radius auth**: RADIUS authentication logging facility
- **radius coa**: RADIUS change of authorization and radius disconnect
- **rct**: Recovery Control Task logging facility
- **rdt**: Redirect Task logging facility
- **resmgr**: Resource Manager logging facility
- **rip**: RIP logging facility (RIP is not supported at this time.)
- **rohc**: RObust Header Compression facility
- **rsvp**: Reservation Protocol logging facility
- **sct**: Shared Configuration Task logging facility
- **sessctrl**: Session Controller logging facility
- **sessmgr**: Session Manager logging facility
- **sft**: Switch Fabric Task logging facility
- **sipcdprt**: Sip Call Distributor facility
- **sitmain**: System Initialization Task main logging facility
- **snmp**: SNMP logging facility
- **srdb**: Static Rating Database
- **srp**: Service Redundancy Protocol (SRP) logging facility
- **ssh ipsec**: SSH IP Security logging facility
- **stat**: Statistics logging facility
- **system**: System logging facility
- **tacacsplus**: TACACS+ Protocol logging facility
- **threshold**: threshold logging facility
- **udr**: User detail record facility (used with the Charging Service)
- **user-data**: User data logging facility
- **user-l3tunnel**: User layer-3 tunnel logging facility
- **vpn**: Virtual Private Network logging facility
- `wimax-data`: WiMAX DATA
- `wimax-r6`: WiMAX R6

### level severity_level
Specifies the level of information to be logged, severity_level, from the following list which is ordered from highest to lowest:
- `critical`: display critical events
- `error`: display error events and all events with a higher severity level
- `warning`: display warning events and all events with a higher severity level
- `unusual`: display unusual events and all events with a higher severity level
- `info`: display info events and all events with a higher severity level
- `trace`: display trace events and all events with a higher severity level
- `debug`: display all events

### pdu-data pdu_format
Specifies output format for the display of packet data units as one of:
- `none`: output is in raw format (unformatted).
- `hex`: output being displayed in hexadecimal format.
- `hex-ascii`: output being displayed in hexadecimal and ASCII similar to a main-frame dump.

### pdu-verbosity pdu_verboseness
Specifies the level of verboseness to use in displaying of packet data units as a value from 1 to 5 where 5 is the most detailed.

### since from_date_time [ until to_date_time ]
Default: no limit.
since from_date_time: indicates only the log information which has been collected more recently than from_date_time is to be displayed.
until to_date_time: indicates no log information more recent than to_date_time is to be displayed. until defaults to current time when omitted.
from_date_time and to_date_time must be formatted as YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss. Where YYYY is a 4-digit year, MM is a 2-digit month in the range 01 through 12, DD is a 2-digit day in the range 01 through 31, HH is a 2-digit hour in the range 00 through 23, mm is a 2-digit minute in the range 00 through 59, and ss is a 2 digit second in the range 00 through 59.
to_date_time must be a time which is more recent than from_date_time.
The use of the until keyword allows for a time range of log information while only using the since keyword will display all information up to the current time.

### grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in Command Line Interface Reference.
Usage
Backup the current log file as part of periodic maintenance activities.

Example
The following saves the log to the local file /flash/pub/junelogs.logs with no confirmation from the user:

```bash
save logs /flash/pub/junelogs.logs -noconfirm
```

The following saves the configuration data to remote host remoteABC as /pub/junelogs.logs:

```bash
save logs tftp://remoteABC/pub/junelogs.logs
```
session trace subscriber

This command enable disables the subscriber session trace functionality based on a specified subscriber device or ID on one or all instance of session on a specified EPS network elements.

**Product**
MME, P-GW, S-GW

**Privilege**
Operator

**Syntax**

```
session trace subscriber network-element {mme | pgw | sgw} {imei id} {imsi id} {interface {all | interface}} trace-ref id collection-entity ip_address
```

```
no session trace subscriber [network-element {mme | pgw | sgw}] [trace-ref id]
```

**no**
Disables the entire session trace or for a specific network element and/or trace reference.

**network-element { mme | pgw | sgw }**

Identifies the network element that, in turn, identifies the interfaces where the session trace is to occur. Specific interfaces can be specified using the interface keyword described below.

- **mme**: Specifies that the session trace is to occur on one or all interfaces on the MME.
- **pgw**: Specifies that the session trace is to occur on one or all interfaces on the P-GW.
- **sgw**: Specifies that the session trace is to occur on one or all interfaces on the S-GW.

**imei id**

Specifies the International Mobile Equipment Identification number of the subscribers UE. *id* must be the 8 digit TAC (Type Allocation Code) and 6 digit serial number. Only the first 14 digits of the IMEI/IMEISV are used to find the equipment ID.

**imsi id**

Specifies the International Mobile Subscriber Identification (IMSI). *id* must be the 3 digit MCC (Mobile Country Code), 2 or 3 digit MNC (Mobile Network Code), and the MSIN (Mobile Subscriber Identification Number). The total should not exceed 15 digits.

**interface { all | interface }**

Specifies the interfaces where the session trace application will collect data.

- **all**: Specifies that all interfaces associated with the selected network element
- **interface**: Specifies the interface type where the session trace application will collect trace data. The following interfaces are applicable for the network element type:
  - **MME**:
    - **s1mme**: Specifies that the interface where the trace will be performed is the S1-MME interface between the MME and the eNodeB.
    - **s3**: Specifies that the interface where the trace will be performed is the S3 interface between the MME and an SGSN.
• **s6a**: Specifies that the interface where the trace will be performed is the S6a interface between the MME and the HSS.

• **s10**: Specifies that the interface where the trace will be performed is the S10 interface between the MME and another MME.

• **s11**: Specifies that the interface where the trace will be performed is the S11 interface between the MME and the S-GW.

• **P-GW:**

  • **gx**: Specifies that the interface where the trace will be performed is the Gx interface between the P-GW and the PCRF.

  • **s2a**: Specifies that the interface where the trace will be performed is the S2a interface between the P-GW and the HSGW.

  • **s2b**: Specifies that the interface where the trace will be performed is the S2b interface between the P-GW and an ePDG.

  • **s2c**: Specifies that the interface where the trace will be performed is the S2c interface between the P-GW and a trusted, non-3GPP access device.

  • **s5**: Specifies that the interface where the trace will be performed is the S5 interface between the P-GW and the S-GW.

  • **s6b**: Specifies that the interface where the trace will be performed is the S6b interface between the P-GW and the 3GPP AAA server.

  • **s8b**: Specifies that the interface where the trace will be performed is the S8b interface between the P-GW and the S-GW.

  • **sgi**: Specifies that the interface where the trace will be performed is the SGi interface between the P-GW and the PDN.

• **S-GW:**

  • **gxc**: Specifies that the interface where the trace will be performed is the Gxc interface between the S-GW and the PCRF.

  • **s11**: Specifies that the interface where the trace will be performed is the S11 interface between the S-GW and the MME.

  • **s4**: Specifies that the interface where the trace will be performed is the S4 interface between the S-GW and an SGSN.

  • **s5**: Specifies that the interface where the trace will be performed is the S5 interface between the S-GW and the P-GW.

  • **s8b**: Specifies that the interface where the trace will be performed is the S8b interface between the S-GW and the P-GW.

---

**trace-ref** *id*

Specifies the trace reference for the trace being initiated. *id* must be the MCC (3 digits), followed by the MNC (3 digits), then the trace ID number (3 byte octet string).

**collection-entity** *ip_address*

Specifies the IP address of the collection entity where session trace data is pushed. *ip_address* must be a valid IPv4 address and is specified in dotted decimal notation.
Usage

Use this command to initiate a session trace for a specified subscriber device or ID on one or all interfaces on a specified network element.

Important: Session trace configuration is performed in the Global Configuration Mode using the `session trace` command. Refer to the Global Configuration Mode Commands chapter in this reference for more information.

Example

The following command initiates a session trace on a P-GW S5 interface for a subscriber with an IMSI of 322233123456789 and sets the trace reference as 322233987654 and the collection entity IP address as 1.2.3.4:

```
session trace subscriber network-element pgw imsi 322233123456789
interface s5 trace-ref 322233987654 collection-entity 1.2.3.4
```

The following command initiates a session trace on an MME S6a interface for a subscriber with an IMSI of 322233123456789 and sets the trace reference as 322233987654 and the collection entity IP address as 1.2.3.4:

```
session trace subscriber network-element mme imsi 322233123456789
interface s6a trace-ref 322233987654 collection-entity 1.2.3.4
```
setup

Enters the system setup wizard which guides the user through a series of questions regarding the system basic configuration options such as initial context-level administrative users, host name, etc.

Product
All

Privilege
Security Administrator, Administrator

Syntax

setup

Usage
The setup wizard provides a user friendly interface for initial system configuration.

⚠️ Important: If the configuration script generated by the setup wizard is applied when an existing configuration is in use the options which are common to both are updated and all remaining options are left unchanged.

Example

setup
sgsn imsigr

Enters commands to manage the SGSN IMSIMgr audits.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sgsn imsigr { add-record imsi sessmgr instance sessmgr# | audit-with sessmgr { all | instance sessmgr# } | remove-record imsi }
```

**add-record imsi**

Adds a record for an IMSI to the IMSI manager’s audit table and associates a specific Session Manager (SessMgr) with the IMSIMgr for the IMSI audit.

- **imsi** - enter up to 15 digits. An IMSI consists of the 3-digit MCC (mobile country code) + the 2- or 3-digit MNC (mobile network code) + the MSIN (mobile station identification number) for the remaining 10 or 9 digits (depending on the length of the MNC).

**sessmgr instance sessmgr#**

Identifies a specific Session Manager (SessMgr) to associate with the IMSIMgr for the IMSI audit.

- **sessmgr#** - enter up to 4 digits, 0 to 4095.

**audit-with sessmgr { all | instance sessmgr# }**

Initiate an IMSI audit with a specific Session Manager (SessMgr) or with all SessMgs.

- **sessmgr#** - enter up to 4 digits, 0 to 4095.

**remove-record**

Delete a specific IMSI from the IMSI audit table.

- **imsi** - enter up to 15 digits. An IMSI consists of the 3-digit MCC (mobile country code) + the 2- or 3-digit MNC (mobile network code) + the MSIN (mobile station identification number) for the remaining 10 or 9 digits (depending on the length of the MNC).

**Usage**

Use this command to manage the IMSIMgr’s audit functions. Associate one or multiple SessMgs with the IMSIMgr for the audits.

**Example**

```
sgsn imsigr audit-with sessmgr instance 245
```
sgsn offload

This command configures the offloading procedure and actually starts and stops the offloading of subscribers which is part of the SGSN’s Gb flex load redistribution functionality.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
sgsn offload gprs-service srcv_name { activating | connecting } [ nri-value | stop | t3312-timeout seconds]
```

**srcv_name**
A unique string of 1 to 63 alphanumeric characters that identifies a specific GPRS service.

**activating**
Instructs the SGSN to offload any subscribers sending an ‘activate request’ message.

**connecting**
Instructs the SGSN to offload any subscribers sending either an ‘attach request’ or a ‘RAU request’ message.

**nri-value**
Instructs the SGSN to check the P-TMSI and use the SGSN matching the configured NRI value to offload subscribers

**stop**
Instructs the SGSN to stop offloading subscribers from the pool area.

**t3312-timeout**
Configures the timer for sending period RAUs to the MS. Default is 4 seconds.

*seconds*: Must be an integer from 2 to 60.

Usage
Use this command to configured the offloading of subscribers which is a part of the SGSN’s load redistribution operation. This command can be used anytime an SGSN is to be taken out of service.

Example
The following command instructs the SGSN to notify all MS to detach and reattach.

```
sgsn offload gprs-service srcv_name activating nri-value nri_value
```
shutdown

Terminates all processes within the chassis.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
shutdown [ -noconfirm ]
```

- **-noconfirm**
  Execute the command without any additional prompts or confirmation from the user.

Usage

The system performs a hardware reset and reloads the highest priority boot image and configuration file specified in the boot.sys file. Refer to the `boot system priority` command in the Global Configuration Mode for additional information on configuring boot images, configuration files and priorities.

**Important:** To avoid the abrupt termination of subscriber sessions, it is recommended that a new call policy be configured and executed prior to invoking the `shutdown` command. This sets busy-out conditions for the system and allows active sessions to terminate gracefully. Refer to the `newcall` command in the Exec Mode for additional information.

**Caution:** Issuing this command causes the system to become unavailable for session processing until the reboot process is complete.

Example

The following command performs a hardware reset on the system:

```
shutdown
```
sleep

Pauses the CLI interface.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
sleep seconds
```

`seconds`

Specifies the number of seconds to pause. The number of seconds must be a value in the range from 1 through 3600.

Usage
Sleep is a command delay which is only useful when creating command line interface scripts such as predefined configuration files/scripts.

Example
The following will cause the CLI to pause for 30 seconds.

```
sleep 30
```
**srp initiate-switchover**

This command changes the device status on the primary and backup HA or GGSN systems configured for Interchassis Session Recovery support.

**Product**
HA, GGSN PDIF

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
srp initiate-switchover [ post-processing-timeout | reset-route-modifier | timeout seconds ] [ -noconfirm ]
```

- **post-processing-timeout**
  Specifies the timeout value in seconds to initiate the post-switchover process. The value must be an integer from 0 through 3600.

- **reset-route-modifier**
  During a switchover, reset the route-modifier to the initial value.

- **timeout seconds**
  Default: 300
  Specifies the number of seconds before a forced switchover occurs. seconds must be a value in the range from 0 through 65535.

- **-noconfirm**
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

**Usage**

This command executes a forced switchover from active to inactive. The command must be executed on the active system and switches the active system to the inactive state and the inactive system to an active state.

**Example**

The following initiates a switchover in 30 seconds.

```
srp initiate-switchover timeout 30
```
srp reset-auth-probe-fail

This command resets the auth probe monitor failure information.

**Product**
HA, GGSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**
```
srp reset-auth-probe-fail
```

**Usage**
This command resets the auth probe monitor failure information to 0.
srp terminate-post-process

This command forcibly terminates the post-switchover of primary and backup HA or GGSN systems configured for Interchassis Session Recovery (ICSR) support.

Product
HA, GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax
srp terminate-post-process [ -noconfirm ]

-noconfirm
Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage
Use this command to force the termination of post-switchover process.

Example
srp terminate-post-process
srp validate-configuration

Initiates a configuration validation check from the ACTIVE chassis.

**Product**
- HA, GGSN PDIF

**Privilege**
- Security Administrator, Administrator

**Syntax**

```
srp validate-configuration
```

**Usage**

Validates the configuration for an active chassis.
**ssh**

Connects to a remote host using a secure interface.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```plaintext
ssh { host_name | host_ip_address } [ port port_num ] [ user user_name ]
```

- **host_name / host_ip_address**
  Identifies the remote node to attempt to connect to.
  *host_name*: specifies the remote node using the node’s logical host name which must be resolved via DNS lookup.
  *host_ip_address*: specifies the remote node using the node’s assigned IP address specified using the standard IPv4 dotted decimal notation.

- **port port_num**
  Specifies a specific port to connect to where *port_num* must be a value in the range 1025 through 10000.

- **user user_name**
  Specifies a user name to attempt to connect as.

**Usage**

SSH connects to a remote network element using a secure interface.

**Example**

The following connects to remote host `remoteABC` as user `user1`.

```plaintext
ssh remoteABC user user1
```

The following connects to remote host `1.2.3.4` without any default user.

```plaintext
ssh 1.2.3.4
```

The following connects to remote host `1.2.3.4` via port `2047` without any default user.

```plaintext
ssh 1.2.3.4 port 2047
```
start crypto security-association

Initiates IKE negotiations.

**Product**

PDSN, HA, GGSN

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
start crypto security-association cryptomap
```

`cryptomap`

This is the name of the crypto map policy to use when starting the IKE negotiations. `cryptomap` must be the name of an existing crypto map entered as an alpha and/or numeric string of from 1 to 127 characters.

**Usage**

Use this command to start IKE negotiations for IPSEC.

**Example**

The following command starts the IKE negotiations using the parameters set in the crypto map named `cryptomap1`:

```
start crypto security-association cryptomap1
```
Chapter 91
Exec Mode (T-Z)

This section includes the commands `telnet` through `upgrade url-blacklisting database`. 
**telnet**

Connects to a remote host using the terminal-remote host protocol.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
telnet { host_name | host_ip_address } [ port port_num ]
```

- `host_name | host_ip_address`
  
  Identifies the remote node to attempt to connect to.
  
  - `host_name`: specifies the remote node using the node’s logical host name which must be resolved via DNS lookup.
  
  - `host_ip_address`: specifies the remote node using the node’s assigned IP address specified using the standard IPv4 dotted decimal notation.

- `port port_num`
  
  Specifies a specific port to connect to where `port_num` must be a value in the range 1025 through 10000.

**Usage**

Telnet to a remote node for maintenance activities and/or troubleshooting when unable to do so directly.

**Important**: `telnet` is not a secure method of connecting between two hosts. `ssh` should be used whenever possible for security reasons.

**Example**

The following connects to remote host `remoteABC`.

```
telnet remoteABC
```

The following connects to remote host `1.2.3.4` port `2047`.

```
telnet 1.2.3.4 port 2047
```
terminal

Sets the number of rows or columns for output.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
terminal { length lines | width characters }
```

- `length lines`: sets the terminal length in number of `lines` (rows) of text from 5 to 4294967295 lines or the special value of 0 (zero). The value 0 sets the terminal length to infinity.
- `width characters`: sets the terminal width in number of `characters` from 5 to 512 characters.

Usage

Set the length to 0 (infinite) when collecting the output of a command line interface session which is part of a scripted interface.

Example

The following sets the length then width in two commands.

```
terminal length 66
terminal width 160
```

The following command sets the number of rows of the terminal to infinity.

```
terminal length 0
```
test alarm

Tests the alarm capabilities of the chassis.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
test alarm { audible | central-office { critical | major | minor } }
```

- **audible | central-office { critical | major | minor }**
  - **audible**: indicates that the internal alarm on the system management card is to be tested for 10 seconds. The alarm status is returned to its prior state, i.e., if the audible alarm was enabled prior to the test, the alarm will again be enabled following the test.
  - **central-office { critical | major | minor }**: indicates the central office alarms are to be tested for the specified CO alarm.

Usage

Test the alarm capabilities of the chassis as periodic maintenance to verify the hardware for generation of the internal audible alarms is functional.

Example

```
test alarm audible
test alarm central-office critical
test alarm central-office major
test alarm central-office minor
```
timestamps

Enables/disables the generation of a timestamp in response to each command entered. The timestamp does not appear in any logs as it is a CLI output only. This command affects the current CLI session only. Use the `timestamps` command in the Global Configuration Mode to change the behavior for all future CLI sessions.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
timestamps

no timestamps
```

```
no

Disables generation of timestamp output for each command entered. When omitted, the output of a timestamp for each entered command is enabled.
```

Usage
Enable timestamps when logging a CLI session on a remote terminal such that each command will have a line of text indicating the time when the command was entered.
traceroute

Collects information on the route data will take to a specified host.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Important: Inspector privileges are granted for all variables except count and port. To initiate a traceroute count or to target a specific port for a traceroute, you must have a minimum privilege level of Operator.

Syntax

```
traceroute { host_name | host_ip_address } [ count packets ] [ df ] [ maxttl max_ttl ] [ minttl min_ttl ] [ portport_num ] [ sizersoctet_count ] [ src { src_host_name | src_host_ip_address } ] [ timeoutseconds ] [ | { grep grep_options | more } ]
```

**host_name | host_ip_address**
Identifies the remote node to trace the route to.
*host_name*: specifies the remote node using the node’s logical host name which must be resolved via DNS lookup.
*host_ip_address*: specifies the remote node using the node’s assigned IP address specified using the standard IPv4 dotted decimal notation.

**count packets**
Default: 3
Specifies the number of UDP probe packets to send.

**df**
Indicates the packets for the tracing of the route should not be fragmented. If a packet would require fragmenting then it is dropped and the result is the ICMP response “Unreachable, Needs Fragmentation” is received.

**maxttl max_ttl**
Default: 30
Specifies the maximum time to live, in seconds, for the route tracing packets. *max_ttl* must be specified as a value in the range of 1 through 255. It is an error if *max_ttl* is less than *min_ttl* whether *min_ttl* is specified or defaulted.
The time to live (TTL) is the number of hops through the network, i.e., it is not a measure of time.

**minttl min_ttl**
Default: 1
Specifies the minimum time to live, in seconds, for the route tracing packets. \texttt{min\_ttl} must be specified as a value in the range of 1 through 255. It is an error if \texttt{min\_ttl} is greater than \texttt{max\_ttl} whether \texttt{max\_ttl} is specified or defaulted. The time to live (TTL) is the number of hops through the network, i.e., it is not a measure of time.

\begin{verbatim}
port port_num
\end{verbatim}

Default: 33434
Specifies a specific port to connect to where \texttt{port\_num} must be a value in the range 1 through 65535.

\begin{verbatim}
size octet_count
\end{verbatim}

Default: 40
Specifies the number of bytes each packet. \texttt{octet\_count} must be a value in the range 40 through 32768.

\begin{verbatim}
src \{ src\_host\_name | src\_host\_ip\_address \}
\end{verbatim}

Default: originating system’s IP address
Specifies an IP address to use in the packets as the source node.
\texttt{src\_host\_name}: specifies the remote node using the node’s logical host name which must be resolved via DNS lookup.
\texttt{src\_host\_ip\_address}: specifies the remote node using the node’s assigned IP address specified using the standard IPv4 dotted decimal notation.

\begin{verbatim}
timeout seconds
\end{verbatim}

Default: 5
Specifies the maximum time to wait for a response from each route tracing packet. \texttt{seconds} must be a value in the range 2 through 100.

\begin{verbatim}
grep grep\_options | more
\end{verbatim}

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of \texttt{grep} and \texttt{more}, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series-series Command Line Interface Reference.

### Usage

Trace an IP route when troubleshooting network problems where certain nodes are having significant packet delays or packet loss. This can also be used to identify bottlenecks in the routing of data within the network.

### Example

The following traces the route to remote host \texttt{remoteABC} and sends the output to the more command.

\begin{verbatim}
traceroute remoteABC | more
\end{verbatim}

The following command traces the route to remote host 1.2.3.4’s port 2047 waiting a maximum of 2 seconds for responses.

\begin{verbatim}
traceroute 1.2.3.4 port 2047 timeout 2
\end{verbatim}
traceroute
**update active-charging**

This command updates specified active charging option(s) for the matching sessions.

**Product**
ACS, FW, NAT

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
update active-charging { switch-to-fw-and-nat-policy fw_nat_policy | switch-to-rulebase rulebase } { all | callid call_id | fw-and-nat-policy fw_nat_policy | imsi imsi | ip-address ipv4_address | msid msid | rulebase rulebase | username user_name } [ -noconfirm ] [ | { grep grep_options | more } ]
```

---

**switch-to-fw-and-nat-policy**
Switch to the specified Firewall-and-NAT policy.
`fw_nat_policy` must be a string of 1 through 63 characters in length.

---

**switch-to-rulebase**
Switch to the specified rulebase.
`rulebase` must be a string from 1 through 63 characters in length.

---

**all**
Updates rulebase for all subscribers.

---

**callid call_id**
Specific Call identification number.
`call_id` must be an eight-digit HEX number.

---

**fw-and-nat-policy fw_nat_policy**
Specific Firewall-and-NAT policy.
`fw_nat_policy` must be a string from 1 through 63 characters in length.

---

**imsi imsi**
Specific International Mobile Subscriber Identification (IMSI).
`imsi` must be 3 digits of MCC (Mobile Country Code), 2 or 3 digits of MNC (Mobile Network Code), and the rest with MSIN (Mobile Subscriber Identification Number). The total should not exceed 15 digits. For example, 123-45-678910234 can be entered as 12345678910234.

---

**ip-address ipv4_address**
Specific IPv4 IP address.
`ipv4_address` must be IPv4 address in dotted decimal notation.
**update active-charging**

**msid msid**
Updates rulebase for a specific MSID.  
*msid* must be a string of 1 through 24 characters in length.

**rulebase rulebase**
Updates rulebase for sessions matching the specified rulebase.  
*rulebase* must be a string from 1 through 63 characters in length.

**username user_name**
Updates rulebase for a specific user.  
*user_name* must be a sequence of characters and/or wildcard characters ("\$" and "\*") - string of 1 through 127 characters in length.

**-noconfirm**
Specifies that the command is to execute without any additional prompt and confirmation from the user.

```
| \{ grep grep_options | more \}
```
Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.  
For details on the usage of *grep* and *more*, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

**Usage**
Use this command to change specified active charging option(s) for the matching sessions.

**Example**
The following command changes the rulebase for sessions using the rulebase named *standard* to use the rulebase named *super*:

```
update active-charging switch-to-rulebase super rulebase standard
```
**update cscf**

This command will cause a NOTIFY to be triggered from S-CSCF with contact event as “shortened” and indicating the expiry timer value for each contact as “reauthentication-time” provided from CLI. The subscriber is supposed to send a fresh REGISTER message within “reauthentication-time”, which will be challenged by S-CSCF in order to accomplish reauthentication. If reauthentication does not occur/fails, the subscriber will be cleared after “reauthentication-time”.

**Product**
SCM (S-CSCF)

**Privilege**
Administrator

**Syntax**

```
update cscf subscriber { all | username user_name } cscf-service service_name
reauthentication-time seconds [ verbose ]
```

- **subscriber { all | username user_name }**
  Updates cscf subscriber data.
  all: Updates data for all subscribers within a specified S-CSCF service.
  username **user_name**: Name of specific user within current context. can be between 1 and 127 alpha and/or numeric characters and is case sensitive.

- **cscf-service service_name**
  Specific configured S-CSCF service. **service_name** can be between 1 and 63 alpha and/or numeric characters and is case sensitive.

- **reauthentication-time seconds**
  Specify the time within which subscriber is expected to reauthenticate. **seconds** must be an integer from 1 to 86400 seconds.

- **verbose**
  Show detailed information.

**Usage**
This command is only applicable for an S-CSCF service.

**Important:** reauthentication-time should be greater than the current expiry time of the contact so that S-CSCF will initiate the NOTIFY message.

**Example**
The following command sets the reauthentication time for all CSCF subscribers in the **scsf1** S-CSCF service to **500** seconds:

```
update cscf subscriber all cscf-service scsf1 reauthentication-time 500
```
update firewall policy

This command is obsolete.
update ip

When you update an IP Access list, this command forces the new version of the access list to be applied to any subscriber sessions that are currently using that list.

Product
PDSN, GGSN, ASN-GW

Privilege
Security Administrator, Administrator

Syntax

update ip access-list list_name subscribers [ command_keyword ] [ filter_keywords ] [ | { grep grep_options | more } ]

list_name
This is the name of the IP Access list that you want to apply to the subscriber.

[ command_keyword ] [ filter_keywords ]
These are the same command keywords and filter keywords available for the show subscribers command.

grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage
Use this command to force existing subscriber sessions that are already using a specific IP Access list to have that IP Access list reapplied. This is useful when you edit an IP Access list and want to make sure that even existing subscriber sessions have the new changes applied.

Example
To apply the IP Access list named ACLlist1 to all existing subscribers that are already using that IP Access list, enter the following command:

update ip access-list ACLlist1 subscribers all
update qos policy map

Updates QoS profile information based on specific subscriber policy maps.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
update qos policy-map map_name use-granted-profile-id id1 [ id2 ] [ id3 ]
subscribers [ command_keyword ] [ filter_keywords ] [ -noconfirm ] [ verbose ] [ match-requested-profile-id ] [ | { grep grep_options | more } ]
```

- **map_name**
  Specifies the name of the policy map. `map_name` can be from 1 to 15 alpha and/or numeric characters in length.

- **use-granted-profile-id id1 [ id2 ] [ id3 ]**
  Specifies the profile IDs to update. Up to 3 different profile IDs can be specified. Each profile ID is specified as a hexadecimal value from 0x0 and 0xFFFF.

- **subscribers [ command_keyword ] [ filter_keywords ]**
  These are the same command keywords and filter keywords available for the `show subscribers` command.

- **[ -noconfirm ]**
  Updates matching subscribers without prompting for confirmation.

- **[ verbose ]**
  Displays details for the profile updates.

- **[ match-requested-profile-id ]**
  Causes the system to send session-updates only with profile-ids matching the profile-ids in the requested list.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

**Usage**

Use this command to update subscriber session profile IDs based on the specified criteria.
Example
The following command updates profile IDs 0x3E and 0x4C for all subscriber sessions and sends session-updates with the IDs:

```
update qos policy-map test use-granted-profile-id 0x3E 0x4C subscribers all match-requested-profile-id
```
**update qos tft**

Updates the subscribers TFT associated with the flow ID and direction.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
update qos tft flow-id flow-id flow-dir {forward | reverse} use-granted-profile-id id1[id2] [id3] subscribers [ command_keyword ] [ filter_keywords ][-noconfirm ] [ verbose ] [ match-requested-profile-id ] [ | { grep|grep_options | more }
```

- **flow-id**
  
  When `flow-id` is specified, the session update will be sent only when the flow ID matches the flow-id and flow-direction. The `flow-id` must be specified as a value in the range of 1 through 255.

- **flow-dir {forward | reverse}**
  
  The direction of the tft flow.

- **subscribers [ command_keyword ] [ filter_keywords ]**
  
  These are the same command keywords and filter keywords available for the `show subscribers` command.

**Usage**

Supports QoS updates based on subscriber TFTs.

**Example**

```
update qos tft flow-id 0 flow-dir reverse use-granted-profile-id 0x0 subscribers all -noconfirm
```
**upgrade**

This command installs major software releases to the system.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
upgrade { online | patch } image_url config_url [ -noconfirm ]
```

<table>
<thead>
<tr>
<th><strong>Keyword</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>online</strong></td>
<td>Perform a software upgrade from one release version to another. The online upgrade is only available for software release 3.5 and higher.</td>
</tr>
<tr>
<td><strong>patch</strong></td>
<td>Install an interim, or patch, software release.</td>
</tr>
</tbody>
</table>

**Important:** Software Patch Upgrades are not supported in this release.

**image_url**

Specifies the location of an image file to use for system startup. The URL may refer to a local or a remote file. The URL must be formatted according to one of the following formats:

- ASR 5000:
  
  ```
  *[file: ]{/flash|/pcmcia1|/hd}/{directory}\/file_name
  *[ http: | tftp: ]\//{ host[ :port# ]}{ /directory }/file_name
  ```

  - `directory` is the directory name.
  - `filename` is the actual file of interest.
  - `host` is the IP address or host name of the server.
  - `port#` is the logical port number that the communication protocol is to use.

**Important:** A file intended for use on an ASR 5000 uses the convention `xxxxx.ASR5000.bin`, where `xxxxx` is the software build information.

**Important:** When using the TFTP, it is advisable to use a server that supports large blocks, per RFC 2348. This can be implemented by using the “block size option” to ensure that the TFTP service does not restrict the file size of the transfer to 32MB.

**config config_path**

Specifies the location of a configuration file to use for system startup. This must be formatted according to the following format:

- ASR 5000:
upgrade

*file: */flash|/pcmcia|/hd|[/path]/filename

Where path is the directory structure to the file of interest, and filename is the name of the configuration file. This file typically has a .cfg extension.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

**Usage**

Use the upgrade online command to perform a software upgrade when upgrading from one software release version to another, providing that both versions support this feature. For example, you can use this method to upgrade from release version 3.5 (any build number) to version 4.0 (any build number), but you cannot use this method to upgrade from release version 3.0 to version 3.5 since version 3.0 does not support the feature.

**Important:** Software Patch Upgrades are not supported in this release.

**Important:** This command is not supported on all platforms.

**Example**

The following command performs a major software release upgrade from an older version to a newer version. In this example the new software image file is in a subdirectory on a tftp server, and the configuration file is in a subdirectory on the local flash.tftp://host[/path]/filename

    upgrade online tftp://imageserver/images/image.bin config
    /flash/configurations/localconfig.cfg
upgrade content-filtering

This command upgrades the Static Rating Database (SRDB) for Category-based Content Filtering application.

Product
CF

Privilege
Security Administrator, Administrator

Syntax

```
upgrade content-filtering category { database | rater-pkg }
```

- **upgrade content-filtering category database**
  This command triggers upgrade of the Category-based Content Filtering Static Rating Database (SRDB).

- **upgrade content-filtering category rater-pkg**
  This command triggers manual upgrade of the Dynamic Content-Filtering Rater Package (rater.pkg file). The rater.pkg file contains the models and feature counters that are used to return the dynamic content rating. The upgrade will trigger distribution of the rater.pkg to all the SRDBs.

Usage

Use this command to load the Static Rating Database (SRDB) in to memory for Category-based Content Filtering application, and/or to load the rater.pkg file.

If the default directory of /cf does not exist on the flash, it will create the same. It also locates the recent full database and loads it into memory. This command also clears the old and excess incremental databases.

**Important:** This command is not supported on all platforms.

Example

The following command upgrades the SRDB for the Category-based Content Filtering application:

```
upgrade content-filtering category database
```
upgrade url-blacklisting database

This command upgrade the URL Blacklisting database.

Product
CF

Privilege
Security Administrator, Administrator

Syntax

```
upgrade url-blacklisting database [ -noconfirm ]
```

- `noconfirm`
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to upgrade and load URL Blacklisting database whenever required.

Example

```
upgrade url-blacklisting database
```
Chapter 92
Exec Mode Show Commands (A-C)

This section includes the commands `show` through `show css service`.
The following commands provide outputs for a variety of parameters and statistics:
show aaa

Use this command to view AAA statistics for the current context.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show aaa { group { all | name aaa_group } | local counters } [ | { grep grep_options | more } ]

group { all | name aaa_group }
Displays AAA group configuration parameters.
all: If the exec context is local, all the default AAA groups, and the AAA groups configured in all the contexts are displayed. If the exec context is not local, only the context specific AAA groups are displayed.
name aaa_group: Displays AAA group configuration of the specified group. aaa_group must be the name of an existing AAA group, and must be a string of 0 to 64 characters in length.

local counters
Displays information for current context.

grep grep_options | more
Specifies that output of this command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
This command is used to view accounting and authentication statistics for the current context.

Example
The following command displays AAA statistics for the current context:

show aaa local counters

The following command displays AAA statistics for the AAA group aaa_group1:

show aaa group name aaa_group1

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show active-charging analyzer statistics

This command displays statistic information for protocol analyzers.

Product
ECS

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show active-charging analyzer statistics [ name protocol [ verbose ] ] [ | {
grep grep_options | more } ]

name protocol
Displays detailed information for the specified protocol analyzer.
protocol must be an available analyzer name, and must be one of the following:
• dns
• file-transfer
• ftp
• http
• icmp
• icmpv6
• imap
• ip
• ipv6
• mms
• p2p
• pop3
• pptp
• rtcp
• rtp
• rtp
• sdp
• secure-http
• sip
• smtp
• tcp
• tftp
• udp
"wsp
"wtp

verbose
Indicates the output should provide as much information as possible. If this option is not specified then the output is the standard level which is the concise mode.

grep grep_options | more
Specifies that output of this command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter.

Usage
Use this command to display statistic information for active charging protocol analyzers.

Example
The following command displays detailed statistic information for all P2P protocol analyzers:

    show active-charging analyzer statistics name p2p verbose

The following command displays detailed statistic information for all TCP protocol analyzers:

    show active-charging analyzer statistics name tcp verbose

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show active-charging bandwidth-policy

This command displays information on bandwidth policies configured in a service.

Product
ECS

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging bandwidth-policy { all | name bandwidth_policy } [ | { grep grep_options | more } ]
```

- **all**
  Displays information for all bandwidth policies configured in the service.

- **name**
  Displays detailed information for the specified bandwidth policy.
  `bandwidth_policy` must be a bandwidth policy name, and must be a string from 1 through 63 characters in length.

- **grep grep_options | more**
  Specifies that output of this command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
Use this command to view information on bandwidth policies configured in a service.

Example
The following command displays detailed information for the bandwidth policy named `standard`

```
show active-charging bandwidth-policy name standard
```
show active-charging charging-action

This command displays information for charging actions configured in the active charging service.

Product
ECS

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging charging-action { { all | name action_name } [ service name ecs_service_name ] } | statistics [ name action_name ] } [ | { grep grep_options | more } ]
```

- **all**
  Displays information for each configured charging action.

- **name action_name**
  Displays detailed information for specific charging action.
  `action_name` must be a string of 1 through 63 characters in length.

- **statistics**
  Displays statistical information for all configured charging action.

- **service name acs_service**
  Displays information for all or specified charging action(s) in the specified Active Charging Service.
  `acs_service` must be the name of an ACS and must be a string of 1 through 15 characters in length.

- **grep grep_options | more**
  Specifies that output of this command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to display information for charging actions configured in a service.

Example

The following command displays a detailed information for all charging actions:

```
show active-charging charging-action all
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show active-charging charging-action
show active-charging content-filtering category policy-id

This command displays Content Filtering category policy definitions.

**Important**: This command is not available on StarOS 8.0 and earlier.

**Product**
CF

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show active-charging content-filtering category policy-id { all | id policy_id } [ | { grep grep_options | more } ]
```

- **all**
  Displays definitions of all Content Filtering category policies.

- **id policy_id**
  Displays definitions of a specific Content Filtering category policy. 
  `policy_id` must be a CF policy ID, and must be an integer from 1 through 4294967295.

- **grep grep_options | more**
  Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**

Use this command to view Content-Filtering category definitions for a specific/all Policy IDs.

**Example**

The following command displays Content Filtering category definitions for policy ID 3:

```
show active-charging content-filtering category policy-id id 3
```

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show active-charging content-filtering category statistics

This command displays category-based content filtering statistics.

Product
CF

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging content-filtering category statistics [ rulebase { name rulebase_name | all } ] [ verbose ] [ | { grep grep_options | more } ]
```

- **rulebase { name rulebase_name | all }**
  - Displays category-based content filtering statistics, optionally for a specific or all rulebase.
  - `rulebase_name` must be the name of an existing rulebase, and must be an alpha and/or numeric string of 1 through 63 characters in length.
  - `all`: Displays category-based content filtering statistics for each configured rulebase in the active charging service separately.

- **verbose**
  - Specifies that the output should provide as much information as possible. If this option is not specified then the output is the standard level, which is the concise mode.

- **grep grep_options | more**
  - Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
  - For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view category-based content filtering statistics for a specific rulebase, or cumulative statistics for all rulebases in an active charging service.

Example

The following command displays category-based content filtering statistics for the rulebase named `consumer`:

```
show active-charging content-filtering category statistics rulebase name consumer
```

The following command displays cumulative category-based content filtering statistics for all rulebases in verbose mode:

```
show active-charging content-filtering category statistics verbose
```
Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show active-charging content-filtering server-group

This command displays information for Content Filtering Server Group (CFSG) configured in the service.

**Product**
CF

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show active-charging content-filtering server-group [ statistics [ verbose ] ] [ name cfsg_name ] [ | { grep grep_options | more } ]
```

- **name cfsg_name**
  Displays detailed information for the specified Content Filtering Server Group.
  `cfsg_name` specifies the name of the configured Content Filtering Server Group, and must be an alpha and/or numeric string of 1 through 63 characters in length.

- **statistics**
  Displays statistical information for all configured Content Filtering Server Groups.

- **verbose**
  Specifies that the output provide as much information as possible. If this option is not specified then the output is at the standard level, which is the concise mode.

- **grep grep_options | more**
  Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

**Usage**

Use this command to display information for Content Filtering Server Group configured in a service.

**Example**

The following command displays information for the CFSG named `test12`:

```
show active-charging content-filtering server-group name test12
```

The following command displays detailed information for all CFSG:

```
show active-charging content-filtering server-group statistics verbose
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show active-charging credit-control

This command displays statistics for Diameter/RADIUS prepaid credit control service in the Active Charging Service.

Product
ECS

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging credit-control { statistics [ all | group group_name ] | session-states [ rulebase rulebase_name ] [ content-id content_id ] } [ | { grep grep_options | more } ]
```

```
statistics [ all | group group_name ]
```

Displays prepaid credit control statistics.
- `all`: Displays all available statistics.
- `group group_name`: Displays statistics for the specified credit control group. `group_name` must be the name of a credit control group, and must be an alpha and/or numeric string of 1 through 63 characters in length.

```
session-states [ rulebase rulebase_name ] [ content-id content_id ]
```

Displays prepaid CCA session status based on rulebase and/or content ID.
- `rulebase rulebase_name`: Displays the CCA session state counts for the specified rulebase.
  - `rulebase_name`: must be the name of a rulebase configured for credit control service, and must be an alpha and/or numeric string of 1 through 63 characters in length.
- `content-id content_id`: Displays CCA session state counts for the specified content ID.
  - `content_id`: must be the content ID of a credit control service, and must be an integer from 1 through 65535.

```
grep grep_options | more
```

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
- `grep`: For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view statistics for Diameter/RADIUS prepaid credit control service in an Active Charging Service.

Example

The following command shows active charging statistics of configured Diameter or RADIUS Credit control Application:

```
show active-charging credit-control statistics
```
Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show active-charging edr-format

This command displays information about EDR formats configured in an Active Charging Service.

Product
ECS

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging edr-format [ statistics ] [ all | name edr_format_name] [ | { grep grep_options | more } ]
```

- **all**
  Displays information for all EDR formats.

- **statistics**
  Displays statistics for all or the specified EDR format.
  If neither **all** nor **name** is specified, summarized statistics over all EDR formats is displayed.

- **name edr_format_name**
  Displays information for the specified EDR format.
  *edr_format_name* must be the name of an existing EDR format, and must be an alpha and/or numeric string of 1 through 63 characters in length.

- **grep grep_options | more**
  Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
  For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage
Use this command to display information for EDR format(s) in an active charging service.

Example
The following command displays all configured EDR formats in a active charging service.

```
show active-charging edr-format all
```

⚠️ **Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show active-charging edr-udr-file

This command displays CDR flow control information. This command also displays the EDR and UDR file related information.

Product
ECS

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging edr-udr-file { flow-control-counters [ verbose ] | statistics } [ | { grep grep_options | more } ]
```

```
flow-control-counters [ verbose ]
Displays the counters for dropped EDR/UDR records. These counters are for when CDRMOD uses flow control to stop ACSMgs/SessMgs from sending the records.
verbose displays detailed information.
```

```
statistics
Displays EDR and UDR file statistics.
```

```
grep grep_options | more
Specifies that output of this command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.
```

Usage
Use this command to view CDR flow control information.

Example
The following command displays EDR and UDR files statistics:

```
show active-charging edr-udr-file statistics
```

The following command displays CDR flow control information:

```
show active-charging edr-udr-file flow-control-counters
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show active-charging file-space-usage

This command displays the file space used by CDR/EDR files.

Product
ECS

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging file-space-usage [ | { grep grep_options | more } ]
```

**grep grep_options | more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to view CDR/EDR file space usage information. The context in which this command is used is not relevant.
show active-charging firewall statistics

This command displays Active Charging Stateful Firewall statistics.

Product
- FW

Privilege
- Security Administrator, Administrator, Operator, Inspector

Syntax

show active-charging firewall statistics [ callid call_id | domain-name domain_name | nat-realm nat_realm | protocol { icmp | ip | other | tcp | udp } | username user_name ] [ acsmgr instance instance_id ] [ verbose ] [ | { grep grep_options | more } ]

- **acsmgr instance instance_id**
  Specifies an ACS/Sess Manager instance ID.
  - *instance_id* must be an integer from 1 through 65535.

- **callid call_id**
  Specifies a Call Identification number.
  - *call_id* must be an eight-digit HEX number.

- **domain-name domain_name**
  Specifies a domain name for the statistics.
  - *domain_name* must be a string of 1 through 127 characters in length.

- **nat-realm nat_realm**
  Specifies a NAT realm name for the statistics.
  - *nat_realm* must be a string of 1 through 31 characters in length.

- **protocol { icmp | ip | other | tcp | udp }**
  Specifies a protocol for the statistics:
  - **icmp**: ICMP protocol
  - **ip**: IP protocol
  - **other**: Protocols other than TCP, UDP, and ICMP
  - **tcp**: TCP protocol
  - **udp**: UDP protocol

- **username user_name**
  Specifies user name for the statistics.
  - *user_name* must be a string of 1 through 127 characters in length.
**verbose**
Specifies that the output should provide as much information as possible. If this option is not specified then the output is the standard level, which is the concise mode.

**grep grep_options | more**
Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

**Usage**
Use this command to view Active Charging Stateful Firewall statistics. If you are in the local context, statistics for all contexts are displayed. Otherwise, only statistics of your current context are displayed.

**Example**
The following command displays Active Charging Stateful Firewall statistics:

```
show active-charging firewall statistics
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show active-charging firewall track-list

This command displays the list of servers being tracked for involvement in any Denial-of-Service (DOS) attacks.

**Product**
FW

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```bash
show active-charging firewall track-list attacking-servers [ | { grep grep_options | more } ]
```

- `grep grep_options | more`

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**

Use this command to view details of servers being tracked for involvement in any DOS attack.

**Example**

The following command displays the list of servers being tracked for involvement in any DOS attacks:

```bash
show active-charging firewall track-list attacking-servers
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show active-charging flows

This command displays information for active charging flows.

Product
ECS

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show active-charging flows { all | [ connected-time [ < | > | greater-than | less-than ] seconds ] [ flow-id flow_id ] [ full ] [ idle-time [ < | > | greater-than | less-than ] seconds ] [ ip-address [ server | subscriber ] [ < | > | IPv4 | greater-than | less-than ] address ] [ nat { not-required | required [ nat-ip nat_ip_address ] } ] [ port-number [ server | subscriber ] [ < | > | IPv4 | greater-than | less-than ] number ] [ rx-bytes [ < | > | greater-than | less-than ] number ] [ rx-packets [ < | > | greater-than | less-than ] number ] [ session-id session_id ] [ summary ] [ trans,proto { icmp | tcp | udp } ] [ tx-bytes [ < | > | greater-than | less-than ] number ] [ tx-packets [ < | > | greater-than | less-than ] number ] [ type flow_type ] } [ | { grep grep_options | more } ]

all
Displays information for all active charging flows.

connected-time [ < | > | greater-than | less-than ] seconds
Displays information for flows filtered by connected time period.
  •< seconds: Displays flows that have been connected less than the specified number of seconds.
  •>> seconds: Displays flows that have been connected more than the specified number of seconds.
  •greater-than seconds: Displays flows that have been connected more than the specified number of seconds.
  •less-than seconds: Displays flows that have been connected less than the specified number of seconds.

seconds must be an integer from 0 through 4294967295.

flow-id flow_id
Displays information for specified active charging flow ID.

full
Displays all available information for the specified flows.

idle-time [ < | > | greater-than | less-than ] seconds
Displays information for flows filtered by idle time period.
  •< seconds: Displays flows that have been idle less than the specified number of seconds.
  •>> seconds: Displays flows that have been idle more than the specified number of seconds.
show active-charge flows

• **greater-than seconds**: Displays flows that have been idle more than the specified number of seconds.
• **less-than seconds**: Displays flows that have been idle less than the specified number of seconds.

*seconds* must be an integer from 0 through 4294967295.

```plaintext
ip-address [ server | subscriber ][ < | > | IPv4 | greater-than | less-than ] address
```

Displays information for flows filtered by IPv4 IP address.

• **server**: Specifies the ip address for a specific server.
• **subscriber**: Specifies subscriber details for this *ip-address*. *address* is an IPv4 IP address in the *x.x.x.x* format.
• **< address**: Specifies an IPv4 IP address that is lesser than *address*.
• **> address**: Specifies an IPv4 IP address that is greater than *address*.
• **greater-than address**: Specifies an IPv4 IP address that is greater than *address*.
• **less-than address**: Specifies an IPv4 IP address that is lesser than *address*.

*address* must be an IPv4 address in decimal notation.

```plaintext
nat { not-required | required [ nat-ip nat_ip_address [ nat-port nat_port ] ] }
```

**Important**: The **nat** keyword and options are only available in StarOS 8.3 and later releases.

Displays information for flows filtered by Network Address Translation (NAT) required or not required setting.

• **not-required**: Sessions with NAT processing not required.
• **required**: Sessions with NAT processing required.
• **nat-ip nat_ip_address**: Sessions using specified NAT IP address. *nat_ip_address* must be an IPv4 address in dotted decimal format.
• **nat-port nat_port**: Sessions using specified NAT IP address and NAT port number. *nat_port* must be an integer from 0 through 65535.

```plaintext
port-number [ server | subscriber ][ < | > | IPv4 | greater-than | less-than ] number
```

Displays information on flows filtered by port number.

• **server**: Specifies the port-number for a specific server.
• **subscriber**: Specifies subscriber details for this *port-number*. *number* must be an integer from 0 through 65535.
• **< number**: Specifies a port number that is less than the specified *port-number*.
• **> number**: Specifies a port number that is greater than the specified *port-number*.
• **greater-than number**: Specifies a port number that is greater than the specified *port-number*.
• **less-than number**: Specifies a port number that is less than the specified *port-number*.
**rx-bytes [ < | > | greater-than | less-than ] number**

Displays information on flows filtered by the number of bytes received in the flow.
- `< number`: Specifies the number of bytes that is less than the specified `rx-bytes`.
- `> number`: Specifies number of bytes that is greater than the specified `rx-bytes`.
- `greater-than number`: Specifies number of bytes that is greater than the specified `rx-bytes`.
- `less-than number`: Specifies number of bytes that is less than the specified `rx-bytes`.

`number` must be an integer from 0 through 18446744073709551615.

**rx-packets [ < | > | greater-than | less-than ] number**

Displays information on flows filtered by the number of packets received in the flow.
- `greater-than number`: Specifies the number of packets that is greater than the specified `rx-packets`.
- `less-than number`: Specifies the number of packets that is less than the specified `rx-packets`.

`number` must be an integer from 0 through 18446744073709551615.

**session-id session_id**

Displays detailed information for specific active charging session ID.

**summary**

Displays summary information for defined sessions, based on defined parameters.

**trans-proto { icmp | tcp | udp }**

Displays information on flows filtered by the transport protocol.
- `icmp`: ICMP protocol type flow
- `tcp`: TCP protocol type flow
- `udp`: User Datagram Protocol (UDP) flows

**tx-bytes [ < | > | greater-than | less-than ] number**

Displays information on flows filtered by the number of bytes received in the flow.
- `< number`: Specifies the number of bytes that is less than the specified `tx-bytes`.
- `> number`: Specifies number of bytes that is greater than the specified `tx-bytes`.
- `greater-than number`: Specifies number of bytes that is greater than the specified `tx-bytes`.
- `less-than number`: Specifies number of bytes that is less than the specified `tx-bytes`.

`number` must be an integer from 0 through 18446744073709551615.

**tx-packets [ < | > | greater-than | less-than ] number**

Displays information on flows filtered by the number of packets received in the flow.
- `greater-than number`: Specifies the number of packets that is greater than the specified `tx-packets`.
- `less-than number`: Specifies the number of packets that is less than the specified `tx-packets`.

`number` must be an integer from 0 through 18446744073709551615.
**type flow_type**

Displays information on flows filtered by flow type of application protocol.

*flow_type* must be one of the following:

- `dns`
- `ftp`
- `http`
- `icmp`
- `icmpv6`
- `imap`
- `ip`
- `ipv6`
- `mms`
- `p2p`: P2P protocol type flows including one or more of the following applications:
  - `actsync`
  - `aimini`
  - `applejuice`
  - `ares`
  - `battlefd`
  - `bittorrent`
  - `ddlink`
  - `directconnect`
  - `edonkey`
  - `fasttrack`
  - `feidian`
  - `filetopia`
  - `freenet`
  - `fring`
  - `gadu_gadu`
  - `gnutella`
  - `gtalk`
  - `halflife2`
  - `hamachivpn`
  - `iax`
  - `imesh`
  - `iptv`
  - `iskoot`
  - `irc`

**grep grep_options | more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of `grep` and `more`, refer to the `Regulating a Command’s Output` section of the `Command Line Interface Overview` chapter.

**Usage**

Use this command to display charging flow type information.

**Example**

The following command displays a detailed flow information for a session ID of `test`:

```
show active-charging flows session-id test
```

The following command displays a detailed flow information for a P2P type session:

```
show active-charging flows full type p2p
```

The following command displays a detailed information for a P2P type flow:

```
show active-charging flows type p2p
```

**Important:** Output descriptions for commands are available in the `Statistics and Counters Reference`.
show active-charging fw-and-nat policy

This command displays Firewall-and-NAT Policy information.

Important: This command is only available in StarOS 8.1, and in StarOS 9.0 and later. For more information on this command please contact your local service representative.

Product
ECS, FW, NAT

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging fw-and-nat policy { { { all | name fw_nat_policy } [ service name acs_service ] } | { statistics { all | name fw_nat_policy } } } [ | { grep grep_options | more } ]
```

- **all**
  Displays information for all Firewall-and-NAT policies configured, optionally all in a specified service.

- **name fw_nat_policy**
  Displays detailed information for the specified Firewall-and-NAT policy.
  
  `fw_nat_policy` specifies the Firewall-and-NAT policy name, and must be an alpha and/or numeric string of 1 through 63 characters in length.

- **service name acs_service**
  Displays information for all or the specified Firewall-and-NAT policy in the specified Active Charging Service.
  
  `acs_service` must be the name of an Active Charging Service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

- **statistics**
  Displays statistics for the all/specified Firewall-and-NAT policy.

- **grep grep_options | more**
  Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
  
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to view Firewall-and-NAT Policy information.
Example
The following command displays detailed information for the Firewall-and-NAT policy named `standard`:

```
show active-charging fw-and-nat policy name standard
```
show active-charging group-of-prefixed-urls

This command displays information on group of prefixed URLs configured in a service.

**Product**
ECS

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show active-charging group-of-prefixed-urls { all | name prefixed_url_group } [ service name acs_service ] [ | { grep grep_options | more } ]
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>all</strong></td>
<td>Displays information for all group of prefixed URLs configured in a service.</td>
</tr>
<tr>
<td><strong>name prefixed_url_group</strong></td>
<td>Displays detailed information for the specified group of prefixed URLs. prefixed_url_group must be the name of a group of prefixed URLs, and must be a string of 1 through 63 characters in length.</td>
</tr>
<tr>
<td><strong>service name acs_service</strong></td>
<td>Displays information for all or the specified group of prefixed URLs within the specified Active Charging Service. acs_service must be a string of 1 through 15 characters in length.</td>
</tr>
<tr>
<td>**grep grep_options</td>
<td>more**</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to view information on group of prefixed URLs configured in an Active Charging Service.

**Example**
The following command displays for the group of prefixed URLs named **test123**:

```
show active-charging group-of-prefixed-urls name test123
```
show active-charging group-of-ruledefs

This command displays information on group of ruledefs configured in a service.

Product
ECS

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging group-of-ruledefs { { all | name group_of_ruledefs } [ service name acs_service ] | statistics name group_of_ruledefs } [ | { grep grep_options| more } ]
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>all</strong></td>
<td>Displays information for all groups of ruledefs configured, optionally all in a specified service.</td>
</tr>
<tr>
<td><strong>name group_of_ruledefs</strong></td>
<td>Displays detailed information for the specified group of ruledefs. <code>group_of_ruledefs</code> must be the name of a group of ruledefs, and must be a string of 1 through 63 characters in length.</td>
</tr>
<tr>
<td><strong>service name acs_service</strong></td>
<td>Displays information for all or the specified group of ruledefs within the specified Active Charging Service. <code>acs_service</code> must be the name of an Active Charging Service, and must be a string of 1 through 15 characters in length.</td>
</tr>
<tr>
<td><strong>statistics name group_of_ruledefs</strong></td>
<td>Displays statistics for the specified group of ruledefs. <code>group_of_ruledefs</code> must be the name of a group of ruledefs, and must be a string of 1 through 63 characters in length.</td>
</tr>
<tr>
<td>**grep grep_options</td>
<td>more**</td>
</tr>
</tbody>
</table>

Usage
Use this command to view information on group of ruledefs configured in a service.

Example
The following command displays information on all groups of ruledefs configured:

```
show active-charging group-of-ruledefs all
```
show active-charging group-of-ruledefs
show active-charging nat statistics

This command displays NAT realm statistics.

Product
NAT

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show active-charging nat statistics [ nat-realm nat_realm [ summary ] ] [ | {
grep grep_options | more } ]

Usage
Use this command to view NAT realm statistics.

Example

This command when issued in the local context displays statistics for all NAT realms in all contexts. When issued in a specific context, this command displays statistics for all NAT realms in that context.

show active-charging nat statistics nat-realm nat_realm

This command when issued in the local context displays statistics for the specified NAT realm in all contexts. When issued in a specific context, this command displays statistics for the specified NAT realm in that context.

nat-realm nat_realm

Specifies the NAT realm’s / NAT realm group’s name.
nat_realm must be an alpha and/or numeric string of 1 through 31 characters in length.

summary

When the nat_realm specified is a “pool group” and the summary option is used, summary statistics of all pools in the pool group is displayed.
When the nat_realm specified is a pool and the summary option is NOT used, all available statistics for the specified pool is displayed.
When the nat_realm specified is a “pool group” and the summary option is NOT used, all available statistics of each pool in the specified “pool group” is displayed.

grep grep_options | more

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.
The following command when issued in the local context, displays NAT realm statistics for NAT realms named *test135* in all contexts:

```
show active-charging nat statistics nat-realm test135
```
show active-charging p2p-dynamic-rules

This command displays P2P Dynamic signature file information.

Product
P2P

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging p2p-dynamic-rules [ verbose ] [ acsmgr instance instance_id ] [ | { grep grep_options | more } ]
```

```
acsMgr instance instance_id

Specifies an ACS Manager instance ID.
instance_id must be an integer from 1 through 65535.
```

```
verbose

Displays P2P Dynamic rule statistics in detail.
```

```
grep grep_options | more

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.
```

Usage

Use this command to view P2P Dynamic signature file statistics/information.

Example

The following command displays P2P Dynamic rule information:

```
show active-charging p2p-dynamic-rules
```
show active-charging packet-filter

This command displays information on packet filters configured in a service.

**Product**
ECS

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show active-charging packet-filter { all | name packet_filter } [ service name acs_service ] [ | { grep grep_options | more } ]
```

- **all**
  Displays information for all packet filters configured, optionally all configured in a service.

- **name packet_filter**
  Displays detailed information for the specified packet filter.
  `packet_filter` must be a packet filter’s name, and must be a string of 1 through 63 characters in length.

- **service name acs_service**
  Displays information for all or the specified packet filter within the specified Active Charging Service.
  `acs_service` must be the Active Charging Service’s name, and must be a string of 1 through 15 characters in length.

- **grep grep_options | more**
  Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
  For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**

Use this command to view information on packet filters configured in a service.

**Example**

The following command displays information for the packet filter `filter12`:

```
show active-charging packet-filter name filter12
```
show active-charging rulebase

This command shows information for rulebases configured in a system or service.

Product
ECS

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging rulebase { { all | name rulebase_name } [ service name acs_service ] } | statistics [ name rulebase_name ] } [ | { grep grep_options | more } ]
```

- **all**
  Displays details of all rulebases configured in the system.

- **name rulebase_name**
  Displays details of the specified rulebase.
  `rulebase_name` must be string of 1 through 63 characters in length.

- **service name acs_service**
  Displays details of all or the specified rulebase configured within the specified Active Charging Service.
  `acs_service` must be a string of 1 through 15 characters in length.

- **statistics**
  Displays statistical information for all or the a specific rulebase.

- **grep grep_options | more**
  Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to view various statistics for a specific charging rulebase.

Example

The following command displays active charging rulebase statistics.

```
show active-charging rulebase statistics
```

The following command displays configurations and statistics for a Rulebase named `rulebase_1`.

```
show active-charging rulebase name rulebase_1
```
**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show active-charging ruledef

This command displays information for rule definitions (ruledefs) configured in the ACS service.

Product
ECS

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging ruledef { all | charging | firewall | name ruledef_name | post-processing | routing | statistics [ all { charging | firewall [ wide ] | post-processing } | name ruledef_name [ wide ] ] ] [ | { grep grep_options | more } ]
```

all
Displays information for all ruledefs configured in the ACS service.

charging
Displays information for all Charging ruledefs configured in the ACS service.

firewall
Displays information for all Firewall ruledefs configured in the ACS service.

name ruledef_name
Displays detailed information for the specified ruledef. ruledef_name must be the name of an existing ruledef, and must be a string of 1 through 63 characters in length.

post-processing

**Important:** This keyword is only available in StarOS 8.3 and later.

Displays information for all post-processing ruledefs configured in the ACS service.

routing
Displays information for all Routing ruledefs configured in the ACS service.

service svc_name
This keyword is obsolete.

statistics [ all { charging | firewall [ wide ] | post-processing } | name ruledef_name [ wide ] ]
Displays statistical information for all/specified ruledefs configured in the ACS service. If none of the optional arguments are supplied, statistics totaled for all ruledefs will be displayed.
show active-charging ruledef

**all**: Displays statistics for all ruledefs of the specified type configured in the ACS service.
**charging**: Displays statistics for all Charging ruledefs configured in the service.
**firewall**: Displays statistics for all Firewall ruledefs configured in the service.
**post-processing**: Displays statistics for all Post-processing ruledefs configured in the service.

---

**Important**: The post-processing keyword is only available in StarOS 8.3 and later.

**name ruledef_name**: Displays statistics for the specified ruledef. *ruledef_name* must be the name of an existing ruledef, and must be a string of 1 through 63 characters in length.
**wide**: Displays all available information in a single wide line.

---

**grep grep_options | more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

---

**Usage**

Use this command to view information for ruledefs configured in the ACS service.

---

**Example**
The following command displays active charging ruledef statistics.

```
show active-charging ruledef statistics
```

---

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show active-charging service

This command displays Active Charging Service details.

**Product**

ECS

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show active-charging service { all | name acs_service } [ | { grep grep_options | more } ]
```

- **all**
  Displays information for all configured Active Charging Service.

- **name acs_service**
  Displays detailed information for the specified Active Charging Service.
  `acs_service` must be a string of 1 through 15 characters in length.

- **grep grep_options | more**
  Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**

Use this command to view Active Charging Service details.

**Example**

The following command displays details for the Active Charging Service named `test1`.

```
show active-charging service name test1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show active-charging sessions

This command displays statistics for Active Charging Service sessions.

Product
ECS

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show active-charging sessions [ full [ wide ] | summary | display-dynamic-charging-rules | dynamic-charging ] { [ all ] | [ filter_keyword ] + } [ | { grep grep_options | more } ]

- **full [ wide ]**
  Displays all available information for the specified session. Optionally all available information can be displayed in a single wide line.

- **summary**
  Displays summary information for defined sessions based on defined parameters.

- **display-dynamic-charging-rules**
  Displays information for the dynamic-charging rules configured per session under Gx/Ty interface support.

- **dynamic-charging**
  Displays information for dynamic charging sessions.

- **filter_keyword**
  The following keywords are filters that modify or filter the output of the Command Keywords. Not all filters are available for all command keywords. Multiple filter keywords can be entered on a command line. When multiple filter keywords are specified, the output conforms to all of the filter keywords specifications. For example, if you enter the following command:

  ```
  show active-charging sessions full active-charging-service acs_1
  ```

  Counters for active charging sessions active in active charging service `acs_1` with full details is displayed. Information for all other services is not displayed.

- **acsmgr instance instance**
  Displays session information for a specific ACS/Sess Manager instance.

- **active-charging-service acs_service**
  Displays session information for the specified Active Charging Service.

- **all**
  Displays session information for all active charging sessions.

username
Displays session information for a specific user name.

dynamic-charging
Displays the all sessions having received at least one Gx message from Session Manager/IMS Authorization.

grep grep_options | more
Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to display the configuration information for an active charging session.

Example
The following command displays full information of an active charging session.

    show active-charging sessions full all

The following command displays an active charging session summary.

    show active-charging sessions summary

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show active-charging subsystem

This command shows service and configuration counters for the active charging service.

Product
ECS

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging subsystem { all | facility acsmgr { all | instance instance_value } } [ rulebase name rulebase_name ] | [ | { grep grep_options | more } ]
```

- **all**
  Displays active charging service subsystem information.

- **facility acsmgr { all | instance instance_value }**
  Displays logged events for all active charging managers or for a specific instance. `instance_value` must be an integer from 1 through 65535.

- **rulebase name rulebase_name**
  Displays rulebase statistics for a specific rulebase configured in a system.

- **grep grep_options | more**
  Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to display information for active charging service manager.

Example

The following command displays active charging service subsystem information.

```
show active-charging subsystem all
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show active-charging timedef

This command displays the details of timeslots configured in specified time definition(s).

**Important:** This command is only available in StarOS 8.1 and in StarOS 9.0 and later.

**Product**
ECS

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```plaintext
show active-charging timedef { all | name timedef_name } [ service name acs_service ] [ | { grep grep_options | more } ]
```

- **all**
  Displays information for all timedefs configured in the service.

- **name timedef_name**
  Displays detailed information for the specified timedef.
  `timedef_name` must be the name of a timedef, and must be an alpha and/or numeric string of 1 through 63 characters in length.

- **service name acs_service**
  Displays information for all or a specific timedef configured within the specified Active Charging Service.
  `acs_service` must be the Active Charging Service name, and must be an alpha and/or numeric string of 1 through 15 characters in length.

- **grep grep_options | more**
  Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

**Usage**

Use this command to view details of timeslots configured in specified timedef(s) that have been configured for the Time-of-Day Activation/Deactivation of Rules feature.

**Example**
The following command displays timeslot details of all timedefs configured in the Active Charging Service:

```plaintext
show active-charging timedef all
```
show active-charging timedef
show active-charging udr-format

This command displays information about UDR formats configured in an Active Charging Service.

Product
ECS

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging udr-format { all | name udr_format_name } [ | { grep grep_options | more } ]
```

- `all`
  Displays information for all UDR formats.

- `name udr_format_name`
  Displays information for the specified UDR format.
  `udr_format_name` must be the name of an existing UDR format, and must be an alpha and/or numeric string of 1 through 63 characters in length.

- `grep grep_options | more`
  Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
  For details on the usage of `grep` and `more`, refer to the `Regulating a Command's Output` section of the `Command Line Interface Overview` chapter in the `Command Line Interface Reference`.

Usage
Use this command to display information for UDR format(s) in an active charging service.

Example
The following command displays all configured UDR formats in a active charging service.

```
show active-charging udr-format all
```

**Important**: Output descriptions for commands are available in the `Statistics and Counters Reference`.
show active-charging url-blacklisting statistics

This command displays URL Blacklisting statistics.

**Product**
CF

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show active-charging url-blacklisting statistics [ rulebase { all | name rulebase_name } ] [ verbose ] [ | { grep grep_options | more } ]
```

- **rulebase { all | name rulebase_name }**
  Displays information on URL Blacklisting configured in a rulebase.
  - **all**: Displays URL Blacklisting statistics for all rulebases.
  - **name rulebase_name**: Displays URL Blacklisting statistics for the specified rulebase. `rulebase_name` must be a rulebase name, and must be an alpha and/or numeric string of 1 through 63 characters in length.

- **verbose**
  Displays detailed URL Blacklisting statistics.

- **grep grep_options | more**
  Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
  For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

**Usage**

Use this command to view URL Blacklisting hits and misses statistics.

**Example**

The following command displays cumulative URL Blacklisting statistics:

```
show active-charging url-blacklisting statistics
```

The following command displays URL Blacklisting statistics for the rulebase `rulebase_1`:

```
show active-charging url-blacklisting statistics rulebase name rulebase_1
```

**Important**: Output descriptions for commands are available in the Statistics and Counters Reference.
show active-charging xheader-format

This command displays x-header format configurations.

Important: This is a customer-specific command. Please contact your local sales representative for more information.

Product
ECS

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax
show active-charging xheader-format { all | name xheader_format } [ | { grep grep_options | more } ]

all
Displays information for all x-header formats configured.

ame xheader_format
Displays information for the specified x-header format.
xheader_format must be an x-header format’s name, and must be a string of 1 through 63 characters in length.

grep grep_options | more
Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
Use this command to view details of x-header formats configured in a service.

Example
The following command displays information for the x-header format named test12:

show active-charging xheader-format test12
show administrators

Displays information regarding all CLI users currently connected to the system.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show administrators [ session id ] [ | { grep grep_options | more } ]
```

- **session id**
  Indicates the output is to contain additional information about the CLI user session including the assigned session ID.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

This command displays a list of administrative users that have command line interface sessions active.

Example

```
show administrators
show administrators session id
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show alarm

Displays alarm information.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
showalarm { all | audible | central-office | facility | outstanding [ all | chassis | port slot/port | slot slot ] [ verbose ] | statistics } [ | { grep grep_options | more } ]
```

- **all**
  Displays the state of all alarms in one screen.

- **audible**
  Displays the state of the internal audible alarm buzzer on the SMC.

- **central-office**
  Displays the state of the CO Alarm relays on the SPIO.

- **facility**
  Displays the state of the facility (audible and CO) alarms.

- **outstanding [ all | chassis | port slot/port | slot slot ] [ verbose ]**
  Displays information on currently outstanding alarms.
  - **all**: Displays all alarm information.
  - **chassis**: Displays chassis/power/fan alarms.
  - **port slot/port**: Shows the alarm information for the specified port.
  - **slot slot**: Shows the alarm information for the card in the specified slot.
  - **verbose**: Displays more verbose output, including the internal alarm ID

- **statistics**
  Displays basic statistics on the alarming subsystem, including the current number of outstanding alarms of different severities and a cumulative total of alarms generated.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of **grep** and **more**, refer to the Regulating a Command Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.
**Usage**

View alarms to verify system status or to periodically check the general health of the system.

**Important:** This command is not supported on all platforms.

**Example**

The following command displays all alarms that are currently outstanding:

```
show alarm outstanding all
```

The following command displays more detailed information on all alarms that are currently outstanding:

```
show alarm outstanding all verbose
```

The following command displays alarm statistics:

```
show alarm statistics
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show apn

Displays configuration information for either a specific or all configured APNs.

Product
GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show apn { all | name apn_name } [ | { grep grep_options | more } ]
```

```
all
Displays information on all APNs configured on the system.
```

```
name apn_name
Displays information for a specific APN.
apn_name is the name of the APN and can be from 1 to 62 alpha and/or numeric characters and is case sensitive.
```

```
grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of grep and more options, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.
```

Usage
This command is used to verify the configuration of one or all APNs for monitoring or troubleshooting purposes. The output is a concise listing of APN parameter settings.
If this command is executed from within the local context with the all keyword, information for all APNs configured on the system will be displayed.

Example
The following command displays configuration information for all APNs:

```
show apn all
```

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show apn counter ip-allocation

This command displays the IP allocation method information/statistics counters on per apn basis for all currently active calls.

Product
GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show apn counter ip-allocation [all | name apn_name] [{grep grep_options | more}]

all
Displays statistics for all APNs.

name apn_name
Displays statistics for a specific APN. apn_name is the name of the preconfigured APN and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

{grep grep_options | more}
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
This command is used to display the IP allocation counters on per apn basis for all currently active calls. Output of this command gives the user clear idea of how many sessions in each apn are using a particular type of ip-allocation method.
If this command is issued from within the local context, the statistics displayed will be cumulative for all APNs configured on the system regardless of context. If no APN name is specified and the command is executed from a context with multiple APNs configured, the output will be cumulative for all APNs in the context.

Example
The following command displays statistics for all APN on a system:

show apn counter ip-allocation all

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show apn statistics

Displays APN statistics for either a specific or all configured APNs.

Product
GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show apn statistics [ all | name apn_name ] [ | { grep grep_options | more } ]
```

- **all**
  Displays statistics for all APNs.

- **name apn_name**
  Displays statistics for a specific APN.
  *apn_name* is the name of the APN and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of *grep* and *more*, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

This command is used to view statistics for one or all APNs within a context for monitoring or troubleshooting purposes.
If this command is issued from within the local context, the statistics displayed will be cumulative for all APNs configured on the system regardless of context. If no APN name is specified and the command is executed from a context with multiple APNs configured, the output will be cumulative for all APNs in the context.

Example

The following command displays statistics for an APN called isp2:

```
show apn statistics name isp2
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*.
show asngw-service

This command displays information about selected Access Service Network Gateway (ASN GW) calls/services.

Product
ASN GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show asngw-service { all | name service_name | session | statistics } [ bs-status [ address ip_addr | filter { all | icmp-monitored | no-calls | summary | up } ] [ ] [ grep grep_options | more ] ]

---

all
Displays information for all configured ASN GW services.

name service_name
Displays information only for the specified ASN GW service.
 service_name must be the name of an existing ASN GW service in the current context. The service name must be an alpha and/or numeric string of 1 through 63 characters in length.

session
Displays information about configured ASNGW sessions. See the show asngw-service session command

statistics
Total of collected information for specific protocol since last restart or clear command.

bs-status { address ip_addr | filter { all | icmp-monitored | no-calls | summary | up } }
Displays the ASN BS status based on IP address and various filters.
 address ip_addr specifies the IP address of ASN base station whose status is requested. ip_addr must be an IPv4 or IPv6 IP address of ASN BS.
 filter { all | icmp-monitored | no-calls | summary | up }: Filters the requested BS’s staus on the basis of following criteria:
  • all: Displays the status of all ASN BS.
  • icmp-monitored: Displays the status of ASN BS which are monitored through ICMP ping messages.
  • no-calls: Displays the status of ASN BS which has no active calls.
  • summary: Displays the summary of status of requested ASN BSs.
  • up: Displays the status of ASN BSs which are in active state.
show asngw-service

| { grep grep_options | more }

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to view information for selected configured ASN GW services.

Example

The following command displays available information for all active ASN GW services.

```
show asngw-service all
```

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show asngw-service session

This command displays statistics for specific Access Service Network Gateway sessions.

Product
ASN GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax
show asngw-service session [ all | anchor-only [ full ] | callid call_id | counters | full | ip-address ipv4_address | msid msid_number | non-anchor-only [ full ] | peer-address ipv4_address | summary | username user_name ] [ | { grep grep_options | more } ]

**all**
Displays all related information for all active ASN GW service sessions.

**anchor-only**
Displays all available information for all active ASN GW service sessions on an anchor ASN GW only.

**callid call_id**
Displays available information for the specific call identification number. call_id must be an eight-digit HEX number.

**full**
Displays all available information for the associated display or filter keyword.

**ip-address ipv4_address**
IP address of the subscriber. ipv4_address must be an IPv4 address, in dotted decimal notation.

**msid msid_number**
Displays available information for the specific mobile station identification number. msid_number must be an MSID number.

**non-anchor-only**
Displays all available information for all active ASN GW service sessions on a non-anchor ASN GW only.

**peer-address ipv4_address**
Address of specific IP peer. ipv4_address must be an IPv4 address, in dotted decimal notation.

**summary**
Displays summary of available information for associated display or filter keyword (previous keyword).
**username user_name**

Name of specific user within current context. Displays available information for the specific user name. user_name must be followed by an user name. The user name can an alpha and/or numeric string of 1 through 127 characters in length.

```
| { grep grep_options | more }
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**

Use this command to view configuration information for an ASN GW session.

**Example**

The following command displays all available ASN GW sessions.

```
show asngw-service session all
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show asngw-service session counters

This command displays statistics for specific Access Service Network Gateway sessions.

**Product**
ASN GW

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**
```
show asngw-service session counters [ [ function-type { auth-relay | context-transfer | data-path | handoff | im-operation | ms-state-change | paging | qos } ] | [ anchor-only | callid call_id | ip-address ipv4_address | msid msid_number |
   non-anchor-only | peer-address ipv4_address | username user_name ] | [ r4-only | r6-only | verbose ] ] [ | ( grep grep_options | more ) ]
```

**anchor-only**
Displays all available information for all active anchor sessions in an ASN GW service.

**callid call_id**
Displays available information for the specific call identification number. 
*call_id* must be an eight-digit HEX number.

**function-type { auth-relay | context-transfer | data-path | handoff | im-operation | ms-state-change | paging | qos }**
Displays the counters for specific type of functions in an ASN GW session.

- **auth-relay**: Displays information about authentication relay messages.
- **context-transfer**: Displays information about context-transfer messages.
- **data-path**: Displays information about data-path registration messages.
- **handoff**: Displays information about hand-off messages.
- **im-operation**: Displays information about idle mode state operation messages.
- **ms-state-change**: Displays information about MS state change messages.
- **paging**: Displays information about paging messages.
- **qos**: Displays information about RR messages.

**ip-address ipv4_address**
IP address of the subscriber.
*ipv4_address* must be an IPv4 address, in dotted decimal notation.

**msid msid_number**
Displays available information for the specific mobile station identification number.
*msid_number* must be an MSID number.

**non-anchor-only**
Displays all available information for all active non-anchor sessions in an ASN GW service.
**show asngw-service session counters**

*peer-address ipv4_address*
Address of specific IP peer.
*ipv4_address* must be an IPv4 address, in dotted decimal notation.

*rx-only*
Displays all available counters for R6 interface in an ASN GW session.

*rx-only*
Displays all available counters for R4 interface in an ASN GW session.

*username user_name*
Displays available session information for the specific WiMAX user in ASN GW service session.
*user_name* must be followed by an user name.
The user name can an alpha and/or numeric string of 1 through 127 characters in length.

*verbose*
Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

```
| { grep grep_options | more }
```
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of *grep* and *more*, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**
Use this command to view the counters of an ASN GW session.

**Example**
The following command displays the counters for data path type function.

```
show asngw-service session counters function-type data-path
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 

show asngw-service statistics

Displays statistics for all ASN GW sessions.

Product
ASN GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show asngw-service statistics { [ function-type ( auth-relay | context-transfer | data-path | handoff | im-operations | ms-state-change | paging | qos | r4-only | r6-only ) ] | name service_name | r4-only | r6-only | verbose | peer-address ipv4_address [ verbose ] } [ | { grep grep_options | more } ]

function-type
Displays information about selected function type on R4 or R6 interface.

function-type ( auth-relay | context-transfer | data-path | handoff | im-operations | ms-state-change | paging | qos | r4-only | r6-only )
Displays the counters for specific type of functions in an ASN GW session.
auth-relay: Displays information about authentication relay messages.
context-transfer: Displays information about context-transfer messages.
data-path: Displays information about data-path registration messages.
handoff: Displays information about hand-off messages.
im-operations: Displays information about idle mode state operation messages.
ms-state-change: Displays information about MS state change messages.
paging: Displays information about paging messages.
qos: Displays information about RR messages.
r4-only: Displays information about selected function on R4 interface.
r6-only: Displays information about selected function on R6 interface.

name service_name
Displays specific service.
service_name must be a service name.
The service name can be one to 63 alpha and/or numeric characters long.

r4-only
Displays statistics of R4 interface in ASN GW services.

r6-only
Displays statistics of R6 interface in ASN GW services.

peer-address ipv4_address
Address of specific IP Peer.
ipv4_address must be an IPv4 address, in dotted decimal notation.
**show asngw-service statistics**

**verbose**
Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

```
| { grep grep_options | more }
```
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

**Usage**
Use this command to display ASN GW statistics.

**Example**
The following command displays information about selected MS-State-Change function.

```
show asngw-service statistics function-type ms-state-change
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show asnpc-service

This command displays information about selected Access Service Network Paging Controller and Location Registry (ASN PC/LR) services.

Product
ASN GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show asnpc-service { all | id | name service_name | session | statistics } [ | { grep grep_options | more } ]
```

**all**
Displays information for all configured ASN PC services.

**paging-group**
Displays all the configured paging-groups and associated paging nodes, and the offset count. For a specific paging group, enter the paging group id number.

**name service_name**
Displays information only for the specified ASN PC service. `service_name` must be the name of an existing ASN PC service in the current context. The service name must be an alpha and/or numeric string of 1 through 63 characters in length.

**session**
Displays information about configured ASN PC sessions.

**statistics**
Total of collected information for specific protocol since last restart or clear command.

```
| { grep grep_options | more }
```
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
Use this command to view information for selected configured ASN PC services.

Example
The following command displays available information for all active ASN PC services.
show asnpc-service

show asnpc-service all

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show asnpc-service session

This command displays statistics for specific ASN PC service sessions.

Product
ASN GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show asnpc-service session [ all | callid call_id | counters | full | msid msid_number | peer-address ipv4_address | summary ] [ | { grep grep_options | more } ]
```

**all**
Displays all related information for all active ASN PC service sessions.

**callid call_id**
Displays available information for the specific call identification number.
*call_id* must be an eight-digit HEX number.

**full**
Displays all available information for the associated display or filter keyword.

**msid msid_number**
Displays available information for the specific mobile station identification number.
*msid_number* must be an MSID number.

**peer-address ipv4_address**
Address of specific peer.
*ipv4_address* must be an IPv4 address, in dotted decimal notation.

**summary**
Displays summary of available information for associated display or filter keyword (previous keyword).

**| { grep grep_options | more }**
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of *grep* and *more*, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage
Use this command to view configuration information for an ASN PC session.
Example
The following command displays all available ASN PC session counters in verbose mode.

```
show asnpc-service session all
```

The following command displays full ASN PC session counters in verbose mode.

```
show asnpc-service session full
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show asnpc-service session counters

This command displays session counters for ASN PC service sessions.

Product
ASN GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show asngw-service session counters [ all | callid call_id | msid msid_number | peer-address ipv4_address | verbose ] [ | { grep grep_options | more } ]

all
Displays all available counters for all ASN PC service sessions.

callid call_id
Displays available information for the specific call identification number.
call_id must be an eight-digit HEX number.

msid msid_number
Displays available information for the specific mobile station identification number.
msid_number must be an MSID number.

peer-address ipv4_address
Address of specific IP peer.
ipv4_address must be an IPv4 address, in dotted decimal notation.

verbose
Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

| { grep grep_options | more }
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
Use this command to view the counters of an ASN PC session.

Example
The following command displays the counters for ASN PC service sessions in verbose mode.
show asnpc-service session counters verbose

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show asnpc-service session counters verbose

This command displays session counters for ASN PC service sessions in complete detail.

Product
ASN GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show asnpc-service session counters verbose [ function-type { context-transfer | im-operations | ms-state-change | paging } ] [ all | callid call_id | msid msid_number | peer-address ipv4_address ] ] [ | { grep grep_options | more } ]
```

- **all**
  Displays all available counters for all ASN PC service sessions in verbose mode.

- **callid call_id**
  Displays available information for the specific call identification number in verbose mode. 
  *call_id* must be an eight-digit HEX number.

- **function-type { context-transfer | im-operations | ms-state-change | paging }**
  Displays the counters for specific type of functions in an ASN GW session.
  - **context-transfer**: Displays information about context-transfer messages.
  - **im-operations**: Displays information about idle mode state operation messages.
  - **ms-state-change**: Displays information about MS state change messages.
  - **paging**: Displays information about paging messages.

- **msid msid_number**
  Displays available information for the specific mobile station identification number in verbose mode. 
  *msid_number* must be an MSID number.

- **peer-address ipv4_address**
  Address of specific IP peer. 
  *ipv4_address* must be an IPv4 address, in dotted decimal notation.

- **r4-only**
  Displays statistics of R4 interface in ASN PC services in verbose mode.

- **r6-only**
  Displays statistics of R6 interface in ASN PC services in verbose mode.
show asnpc-service session counters verbose

Usage

Use this command to view the counters of an ASN PC session in verbose mode.

Example

The following command displays the counters for data path type function.

```
show asnpc-service session counters verbose
```

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*.
show asnpc-service statistics

Displays statistics for all ASN PC service sessions.

Product
ASN GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show asngw-service statistics [ name service_name | peer-address ipv4_address | verbose ] [ | { grep grep_options | more } ]

name service_name
Displays specific service.
service_name must be a service name.
The service name can be one to 63 alpha and/or numeric characters long.

peer-address ipv4_address
Address of specific IP Peer.
ipv4_address must be an IPv4 address, in dotted decimal notation.

verbose
Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

| { grep grep_options | more }
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
Use this command to display ASN PC statistics.

Example
The following command displays information about ASN PC service in verbose mode.

show asnpc-service statistics verbose

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show asnpc-service statistics verbose

Displays statistics for all ASN PC service in verbose mode.

**Product**
ASN GW

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show asnpc-service statistics verbose [ function-type { context-transfer | im-operations | ms-state-change | paging } ] | all | r4-only | r6-only ] [ | { grep grep_options | more } ]
```

- **function-type**: Displays the statistics for specific type of functions in an ASN PC service in verbose mode.
  - `context-transfer`: Displays information about context-transfer messages.
  - `im-operations`: Displays information about idle mode state operation messages.
  - `ms-state-change`: Displays information about MS state change messages.
  - `paging`: Displays information about paging messages.

- **all**: Displays statistics of all ASN PC services in verbose mode.

- **r4-only**: Displays statistics of R4 interface in ASN PC services.

- **r6-only**: Displays statistics of R6 interface in ASN PC services.

| { grep grep_options | more } |

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**

Use this command to display ASN PC service statistics in verbose mode.

**Example**
The following command displays information about selected MS-State-Change function.

```
show asnpc-service statistics verbose function-type ms-state-change
```
show asnp-service statistics verbose

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show banner

Displays the configured banner message for the current context.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show banner { all | charging-service | motd | lawful-intercept | pre-login } [ | { grep grep_options | more } ]
```

- **all**
  Displays all banners configured for a service in a system including enhanced charging service.

- **charging-service**
  Displays banner message configured for a enhanced charging service in current context.

- **motd**
  Display the banner message that is configured for the current context.

- **lawful-intercept**
  Display the banner message that is configured for users that have Lawful Intercept privileges.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**

Show the configured banner to verify the message of the day contents for possible change

**Example**

```
show banner
```

---

*Cisco ASR 5000 Series Command Line Interface Reference*
show bcmcs counters

Displays BCMCS-specific counters and statistics.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show bcmcs counters { all | callid call_id | flow-id flow_id }
```

- **all**
  Displays BCMCS-specific counters and statistics for all multicast sessions.

- **callid call_id**
  Displays BCMCS-specific counters and statistics for a specific call ID.

- **flow-id flow_id**
  Displays BCMCS-specific counters and statistics for a specific BCMCS flow, defined by a flow ID.

Usage

Use this command to view BCMCS-specific statistics. You may narrow the results of the command output by specifying a specific call ID or flow ID.

Example

```
show bcmcs counters all
```

⚠️ **Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show bcmcs statistics

Displays BCMCS-specific statistics for the current PDSN-service.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show bcmcs statistics [ pdsn-service service_name]
```

**Usage**

Shows several sets of BCMCS-specific statistics, and may be configured to show statistics only for a certain PDSN service.

**Example**

```
show bcmcs statistics pdsn-service service_name
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show boot

Displays information on the current boot image in use.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show boot [ initial-config| { grep grep_options | more } ]
```

**initial-config**
Identifies the OS image, configuration file, and boot priority used during the initial start up of the system.

**grep grep_options | more**
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
Show the boot information in preparing for maintenance activities by verifying current boot data. The boot image in use may not be the same as the boot image stored on the SMC due to upgrades and pending reboots. `show boot initial-config` displays the actual boot image and configuration file loaded during boot. This may or may not be the highest priority image and makes this command useful when comparing the loaded image to the priority list.

**Important:** This command is not supported on all platforms.

Example
The following command displays the boot system configuration priority list:

```
show boot
```

The following command displays the initial configuration after a system boot:

```
show boot initial-config
```
show bssap+ statistics

Displays statistics for base station system application part plus in a Gs service sessions.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show bssap+ statistics [ gs-service gs_svc_name ] [ vlr { name vlr_name | isdn-number E164_ISDN_Num } ] [ verbose ] [ | { grep grep_options | more } ]
```

**gs-service gs_svc_name**
Specifies the name of a specific Gs service to filter the BSSAP+ information.

*gs_svc_name* is the name of a configured Gs service for which BSSAP+ is applied and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

**vlr { name vlr_name | isdn-number E164_ISDN_Num }**
Specifies the name of the VLR or SS7 address in E.164 ISDN format to filter the BSSAP+ information.

*vlr_name* is name of the VLR must be an alpha and/or numeric string of 1 to 63 characters.

*E164_VLR_num* is an ISDN number for VLR per E.164 number plan and must be an numerical string of 1 to 15 digits.

**verbose**
Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

| {grep grep_options | more}

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of *grep* and *more*, refer to the *Regulating a Command’s Output* section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

**Usage**
Use this command to display the statistics of BSSAP+ application on a system.

**Example**
The following command displays information about BSSAP+ in a Gs service named *gssvc1*.

```
show bssap+ statistics gs-service gssvc1
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show bssap+ statistics
show bulkstats

Displays the information on bulk statistics.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show bulkstats [ [ data ] | [ schemas ] | [ variables [ apn | asngw | asnpc | bcmcs | card | closedrp | common | context | csfc | ecs | egtpc | fa | gprs | gtpc | gtpp | ha | ippool | ipsg | lac | lma | mag | mipv6ha | nat-realm | mme | pdif | pgw | phsgw | phspc | port | ppp | radius | rp | sccp | sgsn | sgtp | sgw | ss7link | ss7rd | system | vpn ] | obsolete ] ] [ | { grep grep_options | more }
```

data
Displays collected bulk statistical data.

schema
Displays the configuration of the statistics to be collected on a per-schema basis.

```
[ variables [ apn | asngw | asnpc | bcmcs | card | closedrp | common | context | csfc | ecs | egtpc | fa | gprs | gtpc | gtpp | ha | ippool | ipsg | lac | lma | mag | mipv6ha | nat-realm | mme | pdif | pgw | phsgw | phspc | port | ppp | radius | rp | sccp | sgsn | sgtp | sgw | ss7link | ss7rd | system | vpn ] | obsolete ]
```
Displays all valid bulkstat schema statistics, or only the statistics for the specified schema.
If the obsolete keyword is used, obsolete (but still available) schema variables are displayed. An asterisk (*) is displayed next to schema variables that have been obsoleted.
For information on available schemas, refer to the Bulk Statistics Configuration Mode Commands chapter.

grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For information on usage of grep and more, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
This command is used to display information on bulk statistics supported by the system.
The variable keyword can be used to list statistics supported by the system either for all schemas, or for an individual schema.
The schema keyword can be used to display the configuration of bulkstatistic settings including the schema.
The data keyword can be used to display bulkstatistic data collected up to that point.
Example
The following command displays the bulk statistics data:

```
show bulkstats data
```

The following command displays the bulk statistics schema configuration:

```
show bulkstats data schemas
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show card

Displays card information based upon the filtering options specified.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show card [ diag [ card_num ] | hardware [ card_num ] | info [ card_num ] | mappings | table [ all ] ] [ | { grep grep_options | more } ]
```

diag [ card_num ] | hardware [ card_num ] | info [ card_num ] | mappings | table [ all ]

Specifies what card information is to be displayed.

- `diag [ card_num ]`: indicates diagnostic information is to be displayed for all cards or the card specified by `card_num`. `card_num` must be a value in the range 1 through 48.
- `hardware [ card_num ]`: indicates information on the installed hardware is to be displayed for all cards or the card specified by `card_num`. `card_num` must be a value in the range 1 through 48.
- `info [ card_num ]`: indicates detailed information is to be displayed for all cards or the card specified by `card_num`. `card_num` must be a value in the range 1 to 48.
- `mappings`: indicates the front installed to rear installed card mapping is to be displayed.
- `table [ all ]`: indicates information for each card in front and RCC slots is to be displayed. The `all` keyword indicates all 48 slots are to be displayed.

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

View the card information to verify card installations for front and rear as well as for checking basic or detailed card information.

Example

The following command displays the diagnostic information for a card in slot 8:

```
show card diag 8
```

The following command displays the detailed information for a card in slot 8:

```
show card info 8
```

The following command displays the card mappings for the chassis:
show card mappings

The following command displays the card table:

show card mappings

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show cli

Displays current CLI users and associated session information.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax
show cli {session | history} [ | { grep grep_options | more } ]

- **session**
  Displays information about the current CLI session.

- **history**
  Displays CLI command history for this CLI session.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage
Show current command line interface sessions when there is some unexpected output from a chassis and a check of current CLI users may reveal other activities in progress.

Example
show cli
show clock

Displays the current system data and time.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show clock [ universal ] [ | { grep grep_options | more } ]
```

- **universal**
  Displays the date and time in universal coordinated time (UTC).

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
Check the current time of a chassis to compare with network wide time or for logging purposes if network accounting and/or event records appear to have inconsistent timestamps.

**Important:** This command is not supported on all platforms.

Example
The following displays the system time in local time and UTC, respectively.

```
show clock
show clock universal
```
show configuration

Displays current configuration information for the card, context, port, or target configuration file as specified.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

show configuration [ card card_num | context name [ radius group [ all | name group]] | port slot/port | srp | [ showsecrets ] | [ url url | [ verbose ] ] { grep grep_options | more }]

card card_num | context name [radius group [all|name group]] | port slot/port

Specifies the type of configuration information to be displayed.

card card_num specifies a specific card for which configuration information is to be displayed.

card_num must be a value in the range 1 through 48.

context name specifies a specific context for which configuration information is to be displayed.

radius group[all|name group]: specifies a specific or all RADIUS server group/s configured in a specific context for which configuration information is to be displayed.

port slot/port: specifies a specific port for which configuration information is to be displayed.

srp

Shows the Service Redundancy Protocol configuration.

showsecrets

Show encrypted/unencrypted secret keys saved in the configuration. If this keyword is not specified, secret keys are not displayed.

url url

Default: configuration which is currently in use.

This keyword is not available to users with Operator level permissions. Specifies the location of the configuration data to use for information display. The url may refer to a local or a remote file. url must be entered using one of the following formats:

- ASR 5000:

  * [file:][/flash][/pcmcia1][/hd][/directory]/file_name
  * tftp://[host[:port]]/[directory]/file_name
  * [ http: | ftp: | sftp: ]//[/username[ :password]@]{host}[:port][/directory]/file_name

directory is the directory name.

filename is the actual file of interest.
**show configuration**

**Important:** Configuration files should be named with a .cfg extension.

- `username` is the user to be authenticated.
- `password` is the password to use for authentication.
- `host` is the IP address or host name of the server.
- `port#` is the logical port number that the communication protocol is to use.

**verbose**

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

**grep grep_options | more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**

View the current configuration to review recent changes.

**Important:** This command is not supported on all platforms.

**Example**

The following command displays the local in use port configuration information for port 24/1 in verbose mode.

```
show configuration port 24/1 verbose
```

The following command displays the card configuration for card 17 on host `remoteABC` stored in the configuration file in `/pub/config.cfg`.

```
show configuration card 17
```

The following command displays the configuration of all RADIUS server groups configured in context `local`

```
show configuration context local radius group all
```

The following command shows the configuration for a context named PDIF.

```
show configuration context pdif
```
show configuration errors

Displays current configuration errors and warning information for the target configuration file as specified for a service.

Product
All

Privilege
Security Administrator, Administrator, Operator

Syntax

```
show configuration errors [ section { aaa-config | active-charging | apn |
asngw-service | asnpc-service | closed-rp-service | csclf-service | diameter |
fa-service | ggsn-service | gprs-service | gs-service | ha-service | hsgw-service |
imsh-service | imsue-service | ipms | ipsg-service | iups-service | lac-
service | lns-service | map-service | mme-service | pdif-service | pdns-service |
phsgw-service | policy-grp-config | sccp-network | sgsn-op-policy | sgsn-service |
sgtp-service | subscriber-config } } [ verbose ] [ | ( grep grep_options |
more ) ]
```

Specifies the services and section to display and validate configuration.

`aaa-config`: Displays configuration errors/warnings for the AAA service(s) configured on the system.

`active-charging`: Displays configuration errors/warnings for the Enhanced Charging Service(s) and the Personal Stateful Firewall service(s) configured on the system.

`apn`: Displays configuration errors/warnings for the APN configuration(s) on the system.

`asngw-service`: Displays configuration errors/warnings for the Access Service Network Gateway (ASN-GW) Service configured in a specific context for which configuration errors/warnings is to be displayed.

`asnpc-service`: Displays configuration errors/warnings for the Access Service Network Controller and Location Registry (ASN PC-LR) Service(s) configured on the system.

`closed-rp-service`: Displays configuration errors/warnings for the closed RP service(s) configured on the system.

`csclf-service`: Displays configuration errors/warnings for the Call Session Control Function (CSCF) service(s) configured on the system.

`diameter`: Displays configuration errors/warnings for the Diameter configuration(s) on the system.

`fa-service`: Displays configuration errors/warnings for the Foreign Agent (FA) service(s) configured on the system.

`ggsn-service`: Displays configuration errors/warnings for the GGSN service(s) configured on the system.

`gprs-service`: Displays configuration errors/warnings for the GPRS service(s) configured on the system.

`gs-service`: Displays configuration errors/warnings for the GS service(s) configured on the system.

`ha-service`: Displays configuration errors/warnings for the Home Agent (HA) service(s) configured on the system.

`hsgw-service`: Displays configuration errors/warnings for the HSGW service(s) configured on the system.
**imssh-service**: Displays configuration errors/warnings for the IMS Sh (IMSSh) service(s) configured on the system.

**imsue-service**: Displays configuration errors/warnings for the IMS UE service(s) configured on the system.

**ipms**: Displays configuration errors/warnings for the IPMS service(s) configured on the system.

**ipsg-service**: Displays configuration errors/warnings for the IP Security Gateway (IPSG) service(s) configured on the system.

**iups-service**: Displays configuration errors/warnings for the IuPS service(s) configured on the system.

**lac-service**: Displays configuration errors/warnings for the Layer 2 Tunneling Protocol (L2TP) Access Concentrator (LAC) service(s) configured on the system.

**lns-service**: Displays configuration errors/warnings for the L2TP Network Server (LNS) service(s) configured on the system.

**map-service**: Displays configuration errors/warnings for the MAP service(s) configured on the system.

**mme-service**: Specifies the configuration errors for MME service configured in a specific context for which configuration errors/warnings is to be displayed.

**pdif-service**: Displays configuration errors/warnings for the PDIF service(s) configured on the system.

**pdsn-service**: Displays configuration errors/warnings for the PDSN service(s) configured on the system.

**phsgw-service**: Displays configuration errors/warnings for the PHS Gateway service(s) configured on the system.

**policy-grp-config**: Displays configuration errors/warnings for the Policy Group configuration(s) on the system.

**sccp-network**: Displays configuration errors/warnings for the SCCP network configuration(s) on the system.

**sgsn-op-policy**: Displays configuration errors/warnings for the SGSN operator policy configuration(s) on the system.

**sgsn-service**: Displays configuration errors/warnings for the SGSN service(s) configured on the system.

**sgtp-service**: Displays configuration errors/warnings for the SGTP service(s) configured on the system.

**subscriber-config**: Displays configuration errors/warnings for the subscriber configuration(s) on the system.

**verbose**

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

**grep grep_options | more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For more information on the usage of **grep** and **more**, refer *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**

Use this command to view the current configuration errors and warning to review recent changes.

**Example**

The following command displays configuration errors and warnings for all services configured in a context/system:

```
show configuration errors verbose | more
```
The following command displays configuration errors and warnings for Enhanced Charging service and Personal Stateful Firewall service configured in a context:

```bash
d show configuration errors section active-charging verbose
```
show congestion-control

Displays information pertaining to congestion control functionality on the system

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show congestion-control { configuration | statistics { allmgr | asngwmgmgr | asnpcmgr | egtpinmgr | gtpcmgr | hamgr | l2tpmgr } [ all | instance task_instance ] } [ | { grep grep_options | more } ]

configuration

Displays congestion control configuration information including threshold parameters and policy settings for the configured services.

statistics

Displays congestion control statistics for one of the following services:

- allmgr: Specifies that statistics are displayed for PDSN services.
- asngwmgmgr: Specifies that statistics are displayed for ASN GW services.
- asnpcmgr: Specifies that statistics are displayed for ASN PC-LR services.
- egtpinmgr: Specifies that statistics are displayed for EGTP ingress demuxmgr.
- gtpcmgr: Specifies that statistics are displayed for GGSN services.
- hamgr: Specifies that statistics are displayed for HA services.
- l2tpmgr: Specifies that statistics are displayed for L2TP managers.
- all: Select this keyword to display statistics based on the current state of all instances of the specified task.
- instance task_instance: Specifies that statistics are to be displayed for a specific software task instance. task_instance can be configured to any integer value from 1 to 128.

Important: The inst column of the show task table command output can be used to determine the instance of a particular task.

grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

This command displays congestion control configuration information or statistics for a particular service type. When the all keyword is used, the system compares the current state of all instances of the specified task. The state is based on whether or not any congestion control thresholds have been exceeded. If one or more
instances are experiencing congestion, the state is displayed as “Applied”, and the various thresholds that have been crossed are indicated.

Example
The following command displays congestion control statistics for a PDSN service using an `allmgr` task with an instance of 2:

```
show congestion-control statistics allmgr instance 2
```

The following command displays congestion control statistics for an ASN GW service using an `asngwmgr` task with an instance of 2:

```
show congestion-control statistics asngwmgr instance 2
```

The following command displays congestion control statistics for an ASN PC-LR service using an `asnpcmgr` task with an instance of 2:

```
show congestion-control statistics asnpcmgr instance 2
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show content-filtering category database

This command displays details of the specified category based content filtering database for content filtering application configured in a system/service.

Product
CF

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax
show content-filtering category database [ active | all | facility srdbmgr { all | instance instance_value } | url url_string] [ verbose ] [ | ( grep grep_options | more ) ]

active
Displays the information about all active databases, for example databases in memory. This is the default setting for category database information.

all
Displays the information about all active databases, for example, databases in memory and all saved databases on a system.

facility
Displays logged events for a specific facility.

srdbmgr { all | instance instance_value }
Displays logged events for all static rating database managers or for all or for a specific instance.

• all: Displays the logged events for all SRDB Manager instances.

• instance instance_value: Displays events logged for a specific SRDB Manager instance.

instance_value must be an integer from 1 through 8.

url url_string
Displays the information of the specific database located at the given URL. url_string specifies the name/location of category database to retrieve information, and must be an alpha and/or numeric string of 1 through 512 characters in length.

verbose
This option enables the detailed mode for additional information display for specific database.

grep grep_options | more
Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.
show content-filtering category database

Usage
Use this command to display information of database for category based content filtering application in a service.

Example
The following command displays a detailed information for all active databases in memory.

```
show content-filtering category database active all
```

The following command displays the CF database status of all running SRDB manager.

```
show content-filtering category database facility srdbmgr all
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show content-filtering category policy-id

This command displays Content Filtering category policy definitions.

**Important:** In StarOS 8.1 and later this command is replaced by the `show active-charging content-filtering category policy-id` command.

**Product**
CF

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```plaintext
show content-filtering category policy-id { all | id cf_policy_id } [ | { grep grep_options | more } ]
```

- **all**
  Displays definitions of all Content Filtering category policies.

- **id cf_policy_id**
  Displays definitions of a specific Content Filtering category policy.
  *cf_policy_id* must be a preconfigured category policy ID, and must be an integer from 1 through 4294967295.

- **grep grep_options | more**
  Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**

Use this command to view Content-Filtering Category definitions for a specific/all Policy IDs.

**Example**

The following command displays Content Filtering category definitions for policy ID 3:

```plaintext
show content-filtering category policy-id id 3
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show content-filtering category statistics

This command displays statistics for the Category-based Content Filtering application configured in a system/service.

Product
CF

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax
show content-filtering category statistics [ facility srdbmgr { all | instance instance_value } volume { all | number } [ | { grep grep_options | more } ]

facility
Displays logged events for a specific facility.

srdbmgr { all | instance instance_value }
Displays logged events for all Static Rating Database Manager instances or for specified instance.
  • all: Displays events logged for all SRDB Manager instances.
  • instance instance_value: Displays events logged for a specific SRDB Manager instance.
    instance_value must be an integer from 1 through 8.

grep grep_options | more
Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
Use this command to view the statistics of Category Based Content Filtering application in a service. This command’s output also indicates capability of the system to perform Content Filtering and Dynamic Content Filtering if configured.

Important: Content filtering cannot be performed if less than two PSCs are activated. Dynamic Content Filtering cannot be performed if less than three PSCs are activated.

Example
The following command displays the detailed statistics of configured category based content filtering application:

show content-filtering category statistics

The following command displays the detailed statistics of configured category based content filtering application based on running SRDB Manager instance1.
show content-filtering category statistics facility srdbmgr instance instance1

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show content-filtering category url

This command displays the information about the categories of the database at the specific URL configured for category based content filtering application in a system/service.

Product
CF

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show content-filtering category url url_string [ policy-id cf_policy_id ] rulebase rulebase_name [ verbose ] [ | { grep grep_options | more } ]
```

**url url_string**
Displays the category information of the specific URL.
url_string specifies the URL, and must be an alpha and/or numeric string of 1 through 512 characters in length.

**policy-id cf_policy_id**
This option displays the category information of specific URL configured with specific content filtering category policy identifier in active charging configuration mode for category based content filtering. cf_policy_id must be a preconfigured category policy id in Active Charging Configuration Mode.

**rulebase rulebase_name**
This option displays the category information of specific URL configured in Active Charging Configuration mode for category based content filtering in specific Rulebase. rulebase_name must be the name of an existing rulebase, and must be an alpha and/or numeric string of 1 through 15 characters in length.

**verbose**
This option enables the detailed mode for additional information display for specific database.

**grep grep_options | more**
Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
Use this command to display information of a database URL for category based content filtering application in a service.

Example
The following command displays a detailed information for all active databases in memory.

```
show content-filtering category url verbose /cf_server/cf/optcmd.bin
verbose
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show content-filtering server-group

This command displays information for content Filtering Server Group (CFSG) configured in the service.

Product
CF

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show content-filtering server-group [ name cfsg_name | statistics ] | [ | { grep grep_options | more } ]

name cfsg_name
Displays detailed information for the specified Content Filtering Server Group.

statistics
Displays statistical information for all configured Content Filtering Server Groups.

grep grep_options | more
Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
Use this command to display information for Content Filtering Server Group configured in a service.

Example
The following command displays a detailed information for all charging actions:

show content-filtering server-group statistics

The following command displays a details of a specific charging action:

show content-filtering server-group name sahre

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show context

Displays information on currently configured contexts.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show context [ all | name context_name ] [ | { grep grep_options | more } ]
```

```
all | name context_name
```

**all**: display information for all currently configured contexts.

**name context_name**: display information for the context specified as context_name only.

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View configured contexts when the context of interest needs to be looked up. This may be useful in verifying configuration or in troubleshooting the system.

Example

The following command displays information for the configured context named *sampleContext*:

```
show context name sampleContext
```

The following command displays information for all contexts:

```
show context all
```

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show cpu

Displays information on system CPUs.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```bash
show cpu { info [ card card_num [ cpu cpu_num ] ] [ graphs ] [ verbose ] | table } [ grep grep_options | more ]
```

- **info [ card card_num [ cpu cpu_num ] ] [ graphs ] [ verbose ]**
  Specifies information for an entire card or a specific CPU is to be displayed.
  - `card` specifies the card to display associated information. `card_num` must be a value in the range 1 through 48 and must refer to an installed card.
  - `cpu` optionally selects a specific CPU on the card of interest to display specific information. `cpu_num` must be a value in the range 0 through 3 and must refer to an installed CPU.
  - `graphs`: in addition to textual CPU information display CPU utilization information in graphs.
  - `verbose`: output is to display all information available.

- **table**
  Display, in tabular format, all cards and CPUs.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

View CPU statistics to aid in diagnosing service problems for the case of overload conditions.

- **Important:** This command is not supported on all platforms.

Example

The following command displays the CPU information in tabular format for all CPUs on all installed cards:

```bash
show cpu table
```

The following command displays CPU information for card 8 in verbose mode:

```bash
show cpu info card 8 verbose
```
The following command displays information for CPU 0 on card 1:

```
show cpu info card 1 cpu 0
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
**show crash**

Displays summary of crashes or information on a specific crash.

**Product**

All

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show crash { list | number crash_num } [ | { grep grep_options | more } ]
```

**list | number crash_num**

*list:* indicates a list of recent crash data is to be displayed.

*number crash_num* indicates the information for the crash specified by `crash_num` is to be displayed. The crash number must be an existing crash which would be displayed using the `list` keyword.

**grep grep_options | more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**

View the crash list to determine frequency of crashes or if crashes occur at some specific time of day. This may also be used to view information on a specific crash to aid in troubleshooting.

**Example**

The following displays the list of recent crashes.

```
show crash list
```

The following command will display the crash information for crash number 11.

```
show crash number 11
```
show credit-control sessions

This command displays credit control sessions information.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show credit-control session [ all | callid | full | mdn | nai | summary ] [ | { grep grep_options | more } ]

session [ all | callid | full | mdn | nai | summary ]
Displays the credit control session status based on the following keywords:
all: Displays all available information for Credit Control sessions
callid: Displays the Credit Control SessionCall ID
full: Displays all available information for the associated display or the filter keyword
mdn: Displays the Credit Control MDN
nai: Displays the Credit Control NI
summary: Displays the summary of Credit Control session information

grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
Please refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference for details on the usage of grep and more.

Usage
Use this command to show active credit control application for service sessions.

Example
The following command shows the configured Credit control application sessions:

show credit-control sessions
show credit-control statistics

This command displays credit control statistics.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show credit-control statistics cc-service name
```

**cc-service**
Specifies the credit control service name.
*name* must be an existing Credit Control service, and must be an alpha and/or numeric string of 1 through 63 characters in length.

**Usage**
Use this command to show active credit control statistics.

**Example**
The following command shows the configured credit control statistics for a service named *service1*:

```
show credit-control statistics cc-service service1
```
show crypto group

Displays information pertaining to configured crypto groups.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show crypto group [ name group_name| summary ]
```

- **name group_name**
  Displays information for a specific crypto group.
  - `group_name` is the name of the group for which to display information.

- **summary**
  Displays state and statistical information for configured crypto groups in this context.

Usage
Use this command to display information and statistics pertaining to one or all configured crypto groups within the current context.

If the `summary` keyword is not used, detailed information is displayed.

The following command displays detailed information for a crypto group called `group1`:

```
show crypto group name group1
```
show crypto ikev1

Displays pre-shared key information for peer security gateways configured within the context.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show crypto ikev1 { keys | policy [preference] | security-associations [ summary ] }

keys
Specifies the IKE pre-shared key information based on the peer security gateway.

policy [ preference ]
Specifies the IKE policy priority for which configuration information will be displayed. The priority can be configured to any integer value from 1 to 100. If no preference is specified, information will be displayed for all configured policies.

security-associations [ summary ]
Specifies that established IPSec SA information should be displayed.

Usage
Use this command to:

- Display pre-shared key information. This information can be used to verify configuration and/or for troubleshooting.
- Verify the configuration of IKE policies within the context.
- Display established IPSec SA information. This information can be used for troubleshooting.

Example
The following command lists the pre-shared keys received from peer security gateways as part of the Diffie-Hellman exchange:

```
show crypto ikev1 keys
```

The following command displays information for an IKE policy with a preference of 1:

```
show crypto ikev1 policy 1
```

The following command displays the currently established SAs:

```
show crypto ikev1 security-associations summary
```
show crypto ikev2-ikesa security-associations summary

Summary view of ikev2-ikesa SAs

Product
PDIF

Privilege
Administrator, Security Administrator

Syntax

show crypto ikev2-ikesa security-associations summary

Usage
Shows a summary of the SAs configured for a crypto template. It shows the total configured SA lifetime in seconds and the number of seconds left on the timer.

Example
Use this command to create the SA summary:

    show crypto ikev2-ikesa security-associations summary

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show crypto ipsec

Displays IPSec security associations (SAs) configured within or facilitated by the context and can optionally display
statistics for them.

Product
PDSN, GGSN, PDIF, SCM

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show crypto ipsec security-associations map-type { ipsec-3gpp-cscf-subscriber | ipsec-dynamic | ipsec-ikev1 | ipsec-12tp | ipsec-manual | ipsec-mobile-ip } | summary [ distribution | ipsecmgr ipsec_mgr_id | map-type map_type ] | tag map_name
```

```
map-type { ipsec-dynamic | ipsec-ikev1 | ipsec-12tp | ipsec-manual | ipsec-mobile-ip }
```

Specifies that information for all crypto maps of a specific type configured within the context will be
displayed. The following types can be specified:
  • ipsec-3gpp-cscf-subscriber: P-CSCF Subscriber IPSec Tunnel
  • ipsec-dynamic: Dynamic IPSec Tunnel
  • ipsec-ikev1: IKEv1 IPSec Tunnel
  • ipsec-ikev2-subscriber: IKEv2 Subscriber Tunnel
  • ipsec-12tp: L2TP IPSec Tunnel
  • ipsec-manual: Manual (Static) IPSec Tunnel
  • ipsec-mobile-ip: Mobile IP IPSec Tunnel

```
summary [ distribution | ipsecmgr ipsec_mgr_id | map-type map_type | template-map map_name ]
```

Specifies that only security association summary information should be displayed.

distribution - Show IPSec Manager SA distribution information.
ipsecmgr ipsec_mgr_id - Show summary SA information for the specified IPSec manager instance ID.
  must be an integer from 1 through 200.
map-type map_type - Show summary SA information for the specified type of crypto map. The following
types can be specified:
  • ipsec-3gpp-cscf-subscriber: P-CSCF Subscriber IPSec Tunnel
  • ipsec-dynamic: Dynamic IPSec Tunnel
  • ipsec-ikev1: IKEv1 IPSec Tunnel
  • ipsec-12tp: L2TP IPSec Tunnel
  • ipsec-manual: Manual (Static) IPSec Tunnel
  • ipsec-mobile-ip: Mobile IP IPSec Tunnel
tag map_name

Specifies that SAs should be displayed for the specified crypto map.

*map_name* is the name of the crypto map configured in the context and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

### Usage

Use this command to display IPSec SA information and statistics. This information can be used for performance monitoring and/or troubleshooting.

The displayed information categorizes control signal and data statistics. Data statistics are further categorized according to the encapsulation method, either GRE or IP-in-IP.

### Example

The following command displays summary SA statistics for all IPSec managers.

```
show crypto ipsec security-associations summary
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show crypto ipsec transform-set

Displays IPsec transform set configuration information.

Product
PDG/TTG
PDIF

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax
show crypto ipsec transform-set [ transform_name ]

transform_name
Specifies the name of a particular IPsec transform set for which to display information.
transform_name is the name of the IPsec transform set and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

Usage
Use this command to verify the configuration of IPsec transform sets within the context.
If no keyword is specified, information will be displayed for all IPsec transform sets configured within the context.

Important: This command is used in PDIF Release 8.3 only.

Example
The following command displays information for an IPsec transform set named test1:

show crypto ipsec transform-set test1
show crypto isakmp keys

Displays pre-shared key information for peer security gateways configured within the context.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show crypto isakmp keys

Usage
Use this command to display pre-shared key information based on the peer security gateway. This information can be used to verify configuration and/or for troubleshooting.

Example
The following command lists the pre-shared keys received from peer security gateways as part of the Diffie-Hellman exchange:

show crypto isakmp keys

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
**show crypto isakmp policy**

Displays ISAKMP policy configuration information.

**Product**

PDSN, GGSN

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show crypto isakmp policy [ preference ]
```

*preference*

Specifies the ISAKMP policy priority for which configuration information will be displayed. The priority can be configured to any integer value from 1 to 100.

**Usage**

Use this command to verify the configuration of ISAKMP policies within the context. If no *preference* is specified, information will be displayed for all configured policies.

**Example**

The following command displays information for an ISAKMP policy with a preference of 1:

```
show crypto isakmp policy 1
```
show crypto isakmp security-associations

Displays currently established IKE security associations (SAs) facilitated by the context.

**Product**
PDSN, GGSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show crypto isakmp security-associations [ cookies ]

cookies
Specifies that cookies should be displayed.
```

**Usage**

Use this command to display established IPSec SA information. This information can be used for troubleshooting.

**Example**
The following command displays the currently established SAs:

```
show crypto isakmp security-associations
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show crypto managers

Shows statistics per IPSec Manager.

Product
PDSN, GGSN, PDIF, SCM

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show crypto managers [ context context_id | crypto-map map_name | instance instance_num | summary [ distribution | ike-stats | ipsec-3gpp-cscf-stats | ikev2-stats [ demux-stats ] | ipsec-sa-stats | npu-stats ] ]

context context_id
Show IPSec manager statistics for the context with the specified context identifier number. must be an integer from 1 through 64.

crypto-map map_name
Show IPSec Managers for a specific crypto map. map_name must be the name of an existing crypto map.

instance instance_num
Show statistics for the specified IPSec manager instance. instance_num must be an integer from 1 through 284.

summary [ distribution | ike-stats | ipsec-3gpp-cscf-stats | ikev2-stats [ demux-stats ] | ipsec-sa-stats | npu-stats ]
Shows stats per service ip address for each manager.

distribution - Shows a summary list of IPsec manager distribution.
ike-stats - Shows a summary list of IPsec IKE statistics for each IPsec manager.
ipsec-3gpp-cscf-stats - Displays CSCF IPSec Statistics on each IPsec Manager.
ikev2-stats - Displays IKEv2 Statistics on each IPsec Manager.
*demux-stats - Displays session demux statistics on each IPsec Manager.
ipsec-sa-stats - Shows a summary list of IPsec Security Association statistics for each IPsec Manager.
npu-stats - Displays NPU statistics on each IPsec Manager.

Usage
Use this command to view statistics relating to IPSec managers.

Example
The following command displays summary information for all IPsec managers:

show crypto managers summary
Important: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show crypto map

Displays crypto map configuration information.

Product
PDIF, PDSN, GGSN, SCM

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax
```
show crypto map [ map-type [ ipsec-3gpp-cscf-subscriber | ipsec-dynamic | ipsec-ikev1 | ipsec-ikev2-subscriber | ipsec-l2tp | ipsec-manual | ipsec-mobile-ip ] |
tag map_name | summary ]
```

**map-type [ ipsec-3gpp-cscf-subscriber | ipsec-dynamic | ipsec-ikev1 | ipsec-ikev2-subscriber | ipsec-l2tp | ipsec-manual | ipsec-mobile-ip ]**

Specifies that information for all crypto maps of a specific type configured within the context will be displayed. The following types can be specified:
- **ipsec-3gpp-cscf-subscriber**: P-CSCF subscriber IPSec Tunnel
- **ipsec-dynamic**: Dynamic IPSec Tunnel
- **ipsec-ikev1**: IKEv1 IPSec Tunnel
- **ipsec-ikev2-subscriber**: IKEv2 Subscriber Tunnel
- **ipsec-l2tp**: L2TP IPSec Tunnel
- **ipsec-manual**: Manual (Static) IPSec Tunnel
- **ipsec-mobile-ip**: Mobile IP IPSec Tunnel

**tag map_name**

Specifies the name of a crypto map for which to display configuration information. *map_name* is the name of the crypto map configured in the context and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

**summary**

Displays summary information for all crypto maps configured in the context.

Usage

Use this command to verify the configuration of crypto maps within the context.
If no keyword is specified, information will be displayed for all maps configured within the context regardless of type.

Example

The following command displays configuration information for a dynamic crypto map named *test_map3*:

```
show crypto map tag test_map3
```
Exec Mode Show Commands (A-C)

show crypto map
show crypto statistics

Displays IPSec statistics.

Product
PDSN, GGSN, PDG/TTG, PDIF, SCM

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show crypto statistics ikev1 | ikev2 [service-ip-address ip-address ] [ service-name name ] | ipsec-3gpp-cscf [ service-ip-address ip-address ] [ service-name name ]
```

---

**ikev1**
Displays global ikev1 statistics for this context.

```
ikev2 [ service-ip-address ip-address ] [ service-name name ]
```
Displays global ikev2 statistics for this context.

- **service-ip-address ip-address**: Specified PDIF service ip address.
- **service-name name**: Specified PDIF service name.

```
ipsec-3gpp-cscf [ service-ip-address ip-address ] [ service-name name ]
```
Displays global CSCF IPSec SA statistics for this context.

- **service-ip-address ip-address**: Specified CSCF service ip address.
- **service-name name**: Specified CSCF service name.

---

**Usage**
Use this command to display statistics for IPSec tunnels facilitated by the context. This information can be used for performance monitoring and/or troubleshooting.

---

**Example**
The following command displays cumulative IPSec statistics for the current context:

```
show crypto statistics
```

---

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show crypto transform-set

Displays transform set configuration information.

**Product**
PDIF, PDSN, GGSN, SCM

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show crypto transform-set [ transform_name ]
```

*transform_name*

Specifies the name of a particular transform set for which to display information. *transform_name* is the name of the transform set and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

**Usage**
Use this command to verify the configuration of transform sets within the context. If no keyword is specified, information will be displayed for all transform sets configured within the context.

**Important:** This command is used in PDIF Release 8.1. In PDIF Release 8.3, the syntax of this command is changed to `show crypto ipsec transform-set`.

**Example**
The following command displays information for a transform set named test1:

```
show crypto transform-set test1
```
show cscf nat

Displays the mapping created for each of the media streams present in an established dialog.

Product
SCM (P-CSCF, A-BG)

Privilege
Security Administrator, Administrator

Syntax

```
show cscf nat media mapping { all | aor aor } [ | { grep grep_options | more } ]
```

**media mapping { all | aor aor }**

*all*: Displays the UE/Network origins and destinations, including their IP addresses/port numbers and associated contexts.

*aor aor*: Displays information for a specific AoR. *aor* must be an existing AoR and be from 1 to 79 alpha and/or numeric characters.

**grep grep_options | more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Refer to Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference for details on the usage of `grep` and `more`.

Usage

Use this command to display the status of configured Network Address Translation (NAT) support.

Example

The following command displays the status of the mapping created for each of the media streams present on this system:

```
show cscf nat media mapping all
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show cscf peer-servers

Displays name, IP address, and status of configured peer servers visible to the system.

**Product**
SCM

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
show cscf peer-servers { all | full | name service_name [ server-name server_name ] } [ | { grep grep_options | more } ]
```

- **all | full**: Displays the peer server list names and the servers within those lists including their IP addresses/port numbers and domain names.
- **name service_name [ server-name server_name ]**: Displays the same information as the full keyword output, but for a specific peer server list or specific server.
- **service_name/server_name**: Must be an existing peer server list or server and be from 1 through 80 alpha and/or numeric characters.
- **grep grep_options | more**: Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Refer to Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference for details on the usage of `grep` and `more`.

**Usage**

Use this command to display the status of configured peer servers.

**Example**

The following command displays the status of a peer server named `icscf3` that is a member of peer server list `cscf-main`:

```
show cscf peer-servers name cscf-main server-name icscf3
```

The following command displays the status of all peer servers in configured peer server groups in this context:

```
show cscf peer-servers full
```

**Important**: Output descriptions for commands are available in the Statistics and Counters Reference.
show cscf service

Displays configuration and/or statistic information for CSCF services on this system.

**Product**

SCM

**Privilege**

Security Administrator, Administrator, Operator

**Syntax**

```
show cscf service { all [ counters ] | diameter [ location-info statistics service-name service_name [ vpn-name name ] | policy-control statistics service-name service_name [ vpn-name name ] ] | grey-list name name | li-packet-cable statistics service-name service_name | performance-counters name service_name | statistics name service_name [ all | calls | ip-security | message | package-name { message-summary | presence | reg | winfo } | registrations | sigcomp | tcp ] | subscription name service_name } [ | ( grep grep_options | more ) ]
```

**all [ counters ]**

Displays configuration information for all CSCF services configured on this system.

**counters:** Displays statistics with the configuration information for all CSCF services configured on the system.

**diameter [ location-info statistics service-name service_name [ vpn-name name ] | policy-control statistics service-name service_name [ vpn-name name ] ]**

**location-info:** Displays Diameter statistics on the E2 interface with the location information.

**policy-control:** Displays Diameter (DPECA) statistics on the CSCF Rx interface with the configuration information.

**service-name service_name:** Specifies the name of a CSCF service for which the statistics will be displayed. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

**vpn-name name:** Specifies the name of a context in which all statistics for all services will be displayed. *name* must be an existing context and be from 1 to 79 alpha and/or numeric characters.

**grey-list name name**

Displays the list of run-time grey-listed users and their remaining barred period for the specified CSCF service.

**name** must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

**li-packet-cable statistics service-name service_name**

Displays Lawful Intercept statistics for a specific CSCF service configured on this system. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.
performance-counters name service_name
Displays performance counters specified in 3GPP TS 32.409 for a specific CSCF service configured on this system. service_name must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

statistics name service_name [ all | calls | ip-security | message | package-name { message-summary | presence | reg | winfo } | registrations | sigcomp | tcp | vpn-name name ]
Displays service statistics for a specific CSCF service configured on this system. service_name must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.
all: Displays all CSCF service statistics.
calls: Displays session statistics related to CSCF calls.
ip-security: Displays session statistics related to CSCF IPsec.
message: Displays session statistics for the SIP method MESSAGE.
package-name: Displays session statistics for the associated event package.
  • message-summary: Displays session statistics for the “message-summary” event package.
  • presence: Displays session statistics for the “presence” event package.
  • reg: Displays session statistics for the “reg” event package.
  • winfo: Displays session statistics for the “watcher-info” event package.
registrations: Displays session statistics related to CSCF registrations, re-registrations, and de-registrations.
sigcomp: Displays session statistics related to CSCF sigcomp.
tcp: Displays session statistics related to CSCF TCP.

Important: This keyword must be followed by another statistics-related keyword.

subscription name service_name
Displays service level subscription information for a specific service. service_name must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
Use this command to display configuration information and/or statistics for any or all CSCF services on this system.

Example
The following command displays service statistics for the CSCF service named cscf1:

  show cscf service statistics name cscf1
**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show cscf sessions

Displays statistics for CSCF sessions on this system.

Product
SCM

Privilege
Security Administrator, Administrator, Operator

Syntax

show cscf sessions { counters { calls { duration | first-response-time | invite-processing-time | post-answer-delay | post-dial-delay | service service_name | session-release-delay | session-setup-delay } service service_name | subscription { duration | service service_name | setup-time } service service_name } | duration | full [ callleg-id id | from-aor aor | service service_name | session-id id | to-aor aor ] [ media-type type ] | summary [ from-aor aor | service service_name | session-id id | to-aor aor ] } [ | { grep grep_options | more } ]

counters { calls { duration | first-response-time | invite-processing-time | post-answer-delay | post-dial-delay | service service_name | session-release-delay | session-setup-delay } service service_name | subscription { duration | service service_name | setup-time } service service_name }

Important: This keyword may be used alone with the counters keyword or following any other counters-specific keyword.

• duration: Displays the call duration time.
• first-response-time: Displays the time interval for the first response received for INVITE.
• invite-processing-time: Displays the INVITE message processing time in CSCF.
• post-answer-delay: Displays the time interval for post answer delay.
• post-dial-delay: Displays the time interval for the ringing or success response for INVITE.
• service service_name: Displays specific service. service_name must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

Important: This keyword may be used alone with the counters keyword or following any other counters-specific keyword.

• session-release-delay: Displays the time interval for releasing the call.
• session-setup-delay: Displays the time interval for session setup.

subscription: Counters associated with subscriptions in CSCF service.
• duration: Displays the SIP Subscription duration time.
• service service_name: Displays specific service. service_name must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.
**show cscf sessions**

***Important:** This keyword may be used alone with the `subscription` keyword or following any other subscription-specific keyword.

- **setup-time:** Displays the SIP Subscription setup time.

**duration**

Displays the call duration for all CSCF sessions.

```
full [callleg-id id | from-aor aor | service service_name | session-id id | to-aor aor] [ media-type type ]
```

Displays all the session information for the active CSCF sessions matching the filter criteria.

- **callleg-id id:** Specifies a call leg from which session statistics are to be displayed. `id` must be an existing call-leg ID and be from 1 to 63 alpha and/or numeric characters.
- **from-aor aor:** Specifies that session statistics are to be displayed for sessions originating from this specific AoR. `aor` must be an existing AoR and be from 1 to 79 alpha and/or numeric characters.
- **service service_name:** Specifies that session statistics are to be displayed for sessions using this CSCF service. `service_name` must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.
- **session-id id:** Specifies that session statistics are to be displayed for sessions with this ID. `id` must be an existing session ID and be from 1 to 63 alpha and/or numeric characters.
- **to-aor aor:** Specifies that session statistics are to be displayed for sessions sent to this specific AoR. `aor` must be an existing AoR and be from 1 to 79 alpha and/or numeric characters.
- **media-type type:** Displays information about specific media type, if any. `type` must be an existing media type and be from 1 to 9 alpha and/or numeric characters.

```
summary [ from-aor aor | service service_name | session-id id | to-aor aor ]
```

Displays session summary information for sessions matching the filter criteria.

- **from-aor aor:** Specifies that session statistics are to be displayed for sessions originating from this specific AoR. `aor` must be an existing AoR and be from 1 to 79 alpha and/or numeric characters.
- **service service_name:** Specifies that session statistics are to be displayed for sessions using this CSCF service. `service_name` must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.
- **session-id id:** Specifies that session statistics are to be displayed for sessions with this ID. `id` must be an existing session ID and be from 1 to 63 alpha and/or numeric characters.
- **to-aor aor:** Specifies that session statistics are to be displayed for sessions sent to this specific AoR. `aor` must be an existing AoR and be from 1 to 79 alpha and/or numeric characters.

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Refer to **Regulating a Command’s Output** section of the **Command Line Interface Overview** chapter in the **Command Line Interface Reference** for details on the usage of `grep` and `more`.

**Usage**

Use this command to display session information for any or all CSCF sessions.
Example
The following command displays the output for CSCF session duration:

```
show cscf sessions duration
```

⚠️ **Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
**show cscf sip**

Displays SIP statistics for a specific CSCF service configured on this system.

**Product**

SCM

**Privilege**

Security Administrator, Administrator, Operator

**Syntax**

```
show cscf sip statistics name service_name [ interface { domain { list | name domain_name } | ip { address ip_address | list } } | vpn-name name ] [ | { grep grep_options | more } ]
```

**show cscf sip statistics name service_name**

Specifies the name of the CSCF service. `service_name` must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

```
[ interface { domain { list | name domain_name } | ip { address ip_address | list } }
```

SIP statistics will be displayed for this interface.

**domain list:** Displays list of interfaces associated with the CSCF service.

**domain name domain_name:** Specifies the domain associated with the CSCF service. `domain_name` must be an existing domain and be from 1 to 64 alpha and/or numeric characters.

**ip address ip_address:** Specifies the destination or source ip address associated with the CSCF service.

**ip list:** Displays list of interfaces associated with the CSCF service.

**vpn-name name**

Specifies the name of the context in which the service is configured. `name` must be an existing context and be from 1 to 79 alpha and/or numeric characters.

**grep grep_options | more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. Refer to *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference* for details on the usage of `grep` and `more`.

**Usage**

Use this command to display SIP statistics for a specific CSCF service.

**Important:** This command displays counters for SIP statistics for a specified CSCF service. Counters are incriminated when SIP messages are sent (Tx) or received (Rx). SIP Request, Response, and Error counters are maintained at various levels in the SIP stack. These values are dependent on the packet flow. For example, if packets are dropped at an initial stage of parsing and error detection, the counters may not increment. All 2xx Response counters for
individual requests are maintain outside the SIP layer and will not track re-transmissions and erroneous packets that are dropped. All other counters do keep track of re-transmissions.

Example
The following command displays SIP statistics for the CSCF service named cscf1:

```
show cscf sip statistics name cscf1
```

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show cscf tcp

Displays TCP connection information for a specific CSCF service configured on this system.

**Product**
SCM

**Privilege**
Security Administrator, Administrator, Operator

**Syntax**

```
show cscf tcp connections service service_name [ facility { cscfmg | sessmgr } ] [ full ] [ remote-ip ip_address ] [ remote-port port_number ] [ | { grep grep_options | more } ]
```

- **connections service service_name**
  - Specifies the name of the CSCF service.
  - Must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

- **facility { cscfmg | sessmgr }**
  - Facility type for which connection details have to be retrieved.
  - **cscfg**: Facility type cscfmg.
  - **sessmgr**: Facility type sessmgr.

- **full**
  - Displays detailed information related to each connection.

- **remote-ip ip_address**
  -Remote IP address to match the connection. `ip_address` is expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

- **remote-port port_number**
  - Remote port to match the connection.

- **grep grep_options | more**
  - Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  - Refer to **Regulating a Command’s Output** section of the **Command Line Interface Overview** chapter in the **Command Line Interface Reference** for details on the usage of **grep** and **more**.

**Usage**

Use this command to display TCP connection information for a specific CSCF service.

**Important:** More than one optional keyword may be used per command.
Example
The following command displays TCP connections for the CSCF service named *cscf1*:

```
show cscf tcp connections service cscf1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show css delivery-sequence

This is a restricted command. In StarOS 9.0 and later, this command is obsoleted.
show css server

This is a restricted command. In StarOS 9.0 and later, this command is obsoleted.
show css service

This is a restricted command. In StarOS 9.0 and later, this command is obsoleted.
Chapter 93
Exec Mode Show Commands (D-G)

This section includes the commands `show dhcp` through `show gtpu-service`.
show dhcp

Displays counter information pertaining to DHCP functionality based on specific criteria.

Product
GGSN, ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show dhcp [ counters | full | summary ] [ all | apn apn_name | callid id | chaddr mac_address | dhcp-service svc_name | imsi imsi | user-address address | msid msid | server server_address | username name ]
```

counters
Displays DHCP counter information.

full
Displays all available information pertaining to the criteria specified.

summary
Displays a summary of the DHCP statistics.

all
Displays counter information for each active PDP context.

apn apn_name
Displays information based on a specific APN name.
apn_name is the name of the APN and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

callid id
Displays information for a specific call identification number.
id must be specified as a 4-byte hexadecimal number.

chaddr mac_address
Displays information for a specific mobile node.
mac_address must be MAC address of mobile node.

dhcp-service svc_name
Displays information for a specific DHCP service.
svc_name is the name of the DHCP service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.
**imsi imsi**
Displays information for a specific International Mobile Subscriber Identity (IMSI).
*imsi* is an integer value from 1 to 15 characters.

**user-address address**
Displays information for a specific DHCP-assigned user IP address.
*address* is the IP address expressed in dotted-decimal notation.

**msid msid**
Displays information for a specific Mobile Subscriber Identity (MSID).
*msid* must be from 1 to 15 digits.

**server server_address**
Displays information for a specific DHCP server.
*server_address* is the IP address of the server expressed in dotted-decimal notation.

**username name**
Displays information for a specific subscriber.
*name* can be from 1 to 127 alpha and/or numeric characters (including wildcards (‘$’ and ‘*’)) and is case sensitive.

**Usage**
Counters pertaining to DHCP functionality can be displayed as cumulative values or for specific APNs, PDP contexts, servers, or DHCP services.

**Example**
The following command displays DHCP counter information for a DHCP service called DHCP-Gi:

```
show dhcp dhcp-service DHCP-Gi
```

The following command displays DHCP counter information for a DHCP Call Id 01ca11a2:

```
show dhcp call-id 01ca11a2
```

The following command displays DHCP information for the specified mobile node:

```
show dhcp chaddr 00:05:47:00:37:44
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show dhcp statistics

Displays DHCP statistics for the specified servers.

Product
GGSN, ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show dhcp statistics [ dhcp-service svc_name | server ip_address ]
```

- **dhcp-service svc_name**
  Displays statistics for a specific DHCP service.
  `svc_name` is the name of the desired DHCP service and can be from 1 to 63 alpha and/or numeric characters in length and is case sensitive.

- **server ip_address**
  Displays statistics for a specific DHCP server.
  `ip_address` is the IP address of the desired server and must be entered in dotted decimal notation.

Usage
Statistics for a single DHCP service or DHCP server can be viewed using the `dhcp-service` or `server` keywords respectively.
Cumulative statistics for all DHCP services and servers within a context can be viewed by executing the command with no keywords from within the context in which they’re configured.
If this command is issued from within the local context, the statistics displayed will be cumulative for all dhcp servers configured on the system regardless of context.

Example
The following command allows you to view statistics for all configured DHCP servers within the context:

```
show dhcp statistics
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show dhcp-service

Displays configuration information for either a specific, or for all DHCP servers configured.

Product
GGSN, ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show dhcp-service { all | name svc_name }
```

- **all**
  Displays information for all configured DHCP services.

- **name svc_name**
  Displays information for a specific DHCP service.
  `svc_name` is the name of the service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage
This command is used to verify the configuration of one or all DHCP services for monitoring or troubleshooting purposes. The output is a concise listing of DHCP service parameter settings. If this command is executed from within the local context with the all keyword, information for all DHCP services configured on the system will be displayed.

Example
The following command displays configuration information for a DHCP service called dhcp1:

```
show dhcp-service name dhcp1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show dhcp status

Displays configuration information for either a specific, or for all DHCP service and servers configured.

Product
GGSN, ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show dhcp status [ dhcp-service svc_name ] [ server ip_addr ]
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Displays information for all configured DHCP services.</td>
</tr>
<tr>
<td>dhcp-service svc_name</td>
<td>Displays information for a specific DHCP service. svc_name is the name of the service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.</td>
</tr>
<tr>
<td>server ip_address</td>
<td>Displays status for a specific DHCP server. ip_address is the IP address of the desired server and must be entered in dotted decimal notation.</td>
</tr>
</tbody>
</table>

Usage
This command is used to show/verify the status or configuration of one or all DHCP services along with count of cumulative leased addresses and addresses leased at that time for monitoring or troubleshooting purposes. The output is a concise listing of DHCP service parameter settings.
If this command is executed from within the local context with the all keyword, information for all DHCP services configured on the system will be displayed.

Example
The following command displays status of a DHCP service called ggsn_dhcp1:

```
show dhcp status dhcp-service ggsn_dhcp1
```

State shown in display is consolidated across session managers, i.e. for each session manager, DHCP server have a timestamp value associated with its state.
For a DHCP server, its timestamp value is compared for each session manager and the state associated with the latest value is shown.

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show diameter aaa-statistics

This command displays Diameter AAA statistics.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show diameter aaa-statistics [ all | group group_name [ server server_name ] | server server_name ] [ | { grep grep_options | more } ]
```

- **all**
  Displays all available Diameter server statistics.

- **group group_name [ server server_name ]**
  Displays all Diameter server statistics within the specified AAA group.
  
  - *group_name* must be the name of a AAA group, and must be a string of 1 through 64 characters in length.
  
  - *server_name* must be the name of a Diameter server, and must be a string of 1 through 64 characters in length.

- **server server_name**
  Displays Diameter server statistics for the specified server.
  
  - *server_name* must be the name of the Diameter server, and must be a string of 1 through 64 characters in length.

  | { grep grep_options | more } |
  |
  Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output must be specified.

  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

**Usage**

Use this command to view Diameter AAA statistics.

**Example**

The following command displays all available Diameter server statistics:

```
show diameter aaa-statistics all
```
show diameter accounting servers aaa-group

This command displays Diameter accounting server information for a AAA group.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show diameter accounting servers [ aaa-group group_name ] [ | { grep grep_options | more } ]
```

<table>
<thead>
<tr>
<th>group_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_name must be the name of a AAA group, and must be a string of 0 through 64 characters in length.</td>
</tr>
</tbody>
</table>

|  | { grep grep_options | more } |
|-----------------|-------------------|
| Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified. |
| For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference. |

**Usage**

Use this command to view Diameter accounting server information for a AAA group.

**Example**
The following command displays Diameter accounting server information for a AAA group named `group12`:

```
show diameter accounting servers aaa-group group12
```
show diameter authentication servers aaa-group

This command displays Diameter Authentication server information for a specified AAA group.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show diameter authentication servers [ aaa-group group_name ]
```

*group_name*

*group_name* must be the name of a AAA group, and must be a string of 0 through 64 characters in length.

**Usage**

Use this command to view Diameter authentication server information for a AAA group.

**Example**
The following command displays Diameter authentication server information for a AAA group named *group12*:

```
show diameter authentication servers aaa-group group12
```
show diameter endpoint

This command has been deprecated, and is replaced by the `show diameter endpoints` command.
show diameter endpoints

This command displays the status of Diameter client endpoint(s).

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show diameter endpoints { all | endpoint endpoint_name } [ | { grep grep_options | more } ]
```

- **all**
  Displays status of all Diameter client endpoints.

- **endpoint endpoint_name**
  Displays status of the specified Diameter client endpoint. 
  `endpoint_name` must be the name of a Diameter endpoint, and must be a string of 1 through 63 characters in length.

- **| { grep grep_options | more }**
  Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to view the status of Diameter client endpoints.
If you are in the local context, then all contexts are searched for the specified endpoint(s). Specify `all` to see all endpoints; otherwise, just the named endpoint will be displayed. If no argument is provided, a summary of all endpoints is displayed.
Default value: N/A

Example
The following command displays status of all Diameter client endpoints.

```
show diameter endpoints all
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show diameter message-queue

This command displays Diameter message queue statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show diameter message-queue counters { inbound | outbound } [ endpoint endpoint_name [ peer-host peer_id [ peer-realm realm_id ] ] | session-id session_id ] [ | { grep grep_options | more } ]

counters { inbound | outbound }
Specifies the message counters:
  inbound: Specifies Diameter inbound messages
  outbound: Specifies Diameter outbound messages

endpoint endpoint_name
Specifies the Diameter endpoint.
endpoint_name must be a string of 1 through 63 characters in length.

peer-host peer_id
Specifies the Diameter peer host.
peer_id must be a string of 1 through 63 characters in length.

peer-realm realm_id
Specifies the Diameter peer realm.
realm_id must be a string of 1 through 127 characters in length.

session-id session_id
Specifies the session ID.
session_id must be a string of 1 through 127 characters in length.

| { grep grep_options | more }
Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to view the count of the messages in the Diameter message queue for specific counter type, session ID, or endpoint, peer host, and peer realm.
Example
The following command displays message queue statistics for outbound messages specific to the Diameter endpoint named `asr5k.testnetwork.com`:

```
show diameter message-queue counters outbound endpoint asr5k.testnetwork.com
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show diameter peers

This command displays Diameter peer information.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show diameter peers [ full | summary ] [ all | [ endpoint endpoint_name ] [ peer-host peer_id ] [ peer-realm realm_id ]+ ] [ | { grep grep_options | more } ]

| full
| Displays full details of all or specified Diameter peers.

| summary
| Displays summary details of all or specified Diameter peer(s).

| all
| Displays details of all Diameter peers.

| endpoint endpoint_name
| Displays details of the specified Diameter endpoint.
endpoint_name must be the origin endpoint value, and must be a string of 1 through 255 characters in length.

| peer-host peer_id
| Displays details of the specified Diameter peer host.
peer_id must be the peer host value, and must be a string of 1 through 63 characters in length.

| peer-realm realm_id
| Displays details of the specified Diameter peer realm.
realm_id must be the Diameter peer realm ID, and must be a string of 1 through 127 characters in length.

| | { grep grep_options | more }
| Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
Use this command to view the details of Diameter peers.
If you are in the local context, then all contexts are searched for the specified peer(s). This is similar to the `show subscribers` CLI command and supports multiple filter options specified at the same time.

If filter options are specified (e.g., `all,endpoint`, etc.), the default is for one line of output to be displayed per peer. Use `full` to get detailed information per peer, or `summary` to get summarized information about all matching peers.

If no filter options are specified, a summary output for all peers is displayed. Use the `full` option to get detailed information about every peer.

Default value: N/A

**Example**
The following command details of the Diameter endpoint named `endpoint12`:

```
show diameter peers endpoint endpoint12
```

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show diameter route status

This command displays Diameter route health status information.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show diameter route status [ endpoint endpoint_name | full [ endpoint endpoint_name ] ] [ host host_name | peer peer_id ] [ | { grep grep_options | more } ]
```

---

**full**
Displays information of which Diameter clients are using which peer/host combinations.

---

**endpoint endpoint_name**
Displays detailed information of the specified Diameter client endpoint.
*endpoint_name* must be the name of a Diameter endpoint, and must be a string of 1 through 63 characters in length.

---

**host host_name**
Displays information for the specified Diameter host.
*host_name* must be the name of a Diameter host, and must be a string of 1 through 63 characters in length.

---

**peer peer_id**
Displays information for the specified Diameter peer.
*peer_id* must be the name of a Diameter peer host, and must be a string of 1 through 63 characters in length.

---

```
| { grep grep_options | more }
```
Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of *grep* and *more*, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

---

**Usage**
Use this command to view the Diameter route health status.
The route status displays status of peer/host combinations. Refer to the *route-failure* CLI command in Diameter Endpoint Configuration mode. When no options are specified, the display will give one line per peer/host combination, indicating how many Diameter clients are using each combination, and for how many clients the combination is available or failed. Specify *full* to see which Diameter clients are using which peer/host combinations. Specify *host* or *peer* to see just combinations with the named host or peer. Specify *endpoint* to see detailed information about the named Diameter client.
Default value: N/A

Example
The following command displays route health status details of the Diameter client endpoint named `endpoint12`:

```
show diameter route status endpoint endpoint12
```
show diameter route table

This command displays the Diameter routing table.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show diameter route table [ wide ] [ endpoint endpoint_name ] [ | { grep grep_options | more } ]

wide
Displays the route table information in wide-format.

endpoint endpoint_name
Displays the Diameter routing table for the specified endpoint.

endpoint_name must be the name of a Diameter endpoint, and must be a string of 1 through 63 characters in length.

| { grep grep_options | more }

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
Use this command to view the status of Diameter client endpoints.
If you are in the local context, then the route information used by Diameter endpoints in all chassis contexts will be used in the display.
The route table displays all static and dynamic routes. Refer to the route-entry CLI command in Diameter Endpoint Configuration Mode.
Default value: N/A

Example
The following command displays status of the Diameter client endpoint named endpoint12.

    show diameter route table endpoint endpoint12
show diameter statistics

This command displays Diameter peer statistics.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show diameter statistics [ [ proxy ] endpoint endpoint_name [ peer-host peer_id [ peer-realm realm_id ] ] ] [ | { grep grep_options | more } ]
```

<table>
<thead>
<tr>
<th>endpoint endpoint_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays statistics for the specified Diameter endpoint.</td>
</tr>
<tr>
<td><code>endpoint_name</code> must be the name of a Diameter endpoint, and must be an alpha and/or numeric string of 1 through 63 characters in length.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>peer-host peer_id</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays statistics for the specified Diameter host peer.</td>
</tr>
<tr>
<td><code>peer_id</code> must be an alpha and/or numeric string of 1 through 255 characters in length.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>peer-realm realm_id</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays statistics for the specified Diameter peer realm.</td>
</tr>
<tr>
<td><code>realm_id</code> must be an alpha and/or numeric string of 1 through 127 characters in length.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>proxy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays proxy related statistics.</td>
</tr>
</tbody>
</table>

| | { grep grep_options | more } |
|-------------------|
| Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified. |
| For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference. |

Usage

Use this command to view Diameter statistics for the specified endpoint or proxy.

Example

The following command displays Diameter peer statistics for the endpoint named `endpoint12`:

```
show diameter statistics endpoint endpoint12
```
show dns-client

Displays DNS cache and/or statistics for a specified DNS client.

Product
P-CSCF, SIP Proxy, SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show dns-client { cache client name [ query-name name | query-type { A | SRV } ] | statistics client name } [ | { grep grep_options | more } ]

**cache client name [ query-name name | query-type { A | SRV } ]**

Specifies that the cache for the defined DNS client is to be displayed.

**name**: Defines the name of the DNS client whose cache is to be displayed. **name** must be an existing DNS client and be from 1 to 255 alpha and/or numeric characters in length.

**query-name name**: Filters DNS results based on the domain name. **name** must be from 1 to 255 characters in length. **name** is the domain name used to perform the DNS query. **name** is different from the actual domain name which is resolved. For example, to resolve the SIP server for service.com, the query name is _sip._udp.service.com and the query type is SRV.

**query-type**: Filters DNS results based on domain IP address records (A records).

- **A**: Filters DNS results based on domain IP address records (A records).
- **SRV**: Filters DNS results based on service host records (SRV records).

**statistics client name**

Specifies that statistics for the defined DNS client are to be cleared.

**name**: Defines the name of the DNS client whose statistics are to be displayed. **name** must be an existing DNS client and be from 1 to 255 alpha and/or numeric characters in length.

| { grep grep_options | more } |

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 5000 Series Command Line Interface Reference.

Usage

Use this command to display DNS cache and/or statistics for a specified DNS client.

Example

The following command displays statistics for a DNS client named domain1.com

```
show dns-client statistics client domain1.com
```
**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show dynamic-policy statistics

Displays policy control and charging (PCC) statistics from the interface communicating with the PCRF (Gx(x)).

**Product**

HSGW, PDSN, S-GW

**Privilege**

Inspector

**Syntax**

```
show dynamic-policy statistics { hsgw-service name | pdsn-service name | sgw-service name }
```

- **hsgw-service name**
  
  Displays policy control and charging statistics from the Gxa interface communicating with the PCRF. *name* must be an existing HSGW service name and be from 1 to 63 alpha and/or numeric characters.

- **pdsn-service name**
  
  Displays policy control and charging statistics from the Gx interface communicating with the PCRF. *name* must be an existing PDSN service name and be from 1 to 63 alpha and/or numeric characters.

- **sgw-service name**
  
  Displays policy control and charging statistics from the Gxc interface communicating with the PCRF. *name* must be an existing S-GW service name and be from 1 to 63 alpha and/or numeric characters.

**Usage**

Use this command to display PCC statistics for the specified service and its Gx interface communicating with the PCRF.

**Example**

The following command displays PCC statistics for a PDSN service named *cdma4*:

```
show dynamic-policy statistics pdsn-service cdma4
```
show egtpc peers

Displays information about eGTP-C peers.

Product
MME, P-GW, S-GW

Privilege
Inspector

Syntax

show egtpc peers [ address ip_address | egtp-service name [ address ip_address ] | interface { mme [ address ip_address ] | pgw-ingress [ address ip_address ] | sgw-egress [ address ip_address ] | sgw-ingress [ address ip_address ] } ] [ | { grep grep_options | more } ]

address ip_address

Displays information about a specific eGTP-C peer based on the IP address of the peer. ip_address must be an existing eGTP-C peer and be expressed in IPv4 dotted decimal notation.

egtp-service name [ address ip_address ]

Displays information about eGTP-C peers associated with a specific service. name must be an existing egtp-service and be from 1 to 63 alpha and/or numeric characters.

address ip_address: Additionally, the results can be filtered based on the IP address associated with the service. ip_address must be an existing eGTP-C peer and be expressed in IPv4 dotted decimal notation.

interface { mme [ address ip_address ] | pgw-ingress [ address ip_address ] | sgw-egress [ address ip_address ] | sgw-ingress [ address ip_address ] }

Displays information about eGTP-C peers associated with the service interface configured on this system.

mme [ address ip_address]: Displays information about eGTP-C MME peers associated with the service interface configured on this system. Additionally, the results can be filtered based on the IP address associated with the MME peer. ip_address must be an existing MME peer and be expressed in IPv4 dotted decimal notation.

pgw-ingress [ address ip_address ]: Displays information about eGTP-C P-GW ingress peers associated with the service interface configured on this system. Additionally, the results can be filtered based on the IP address associated with the P-GW ingress peer. ip_address must be an existing P-GW ingress peer and be expressed in IPv4 dotted decimal notation.

sgw-egress [ address ip_address ]: Displays information about eGTP-C S-GW egress peers associated with the service interface configured on this system. Additionally, the results can be filtered based on the IP address associated with the S-GW egress peer. ip_address must be an existing S-GW egress peer and be expressed in IPv4 dotted decimal notation.

sgw-ingress [ address ip_address ]: Displays information about eGTP-C S-GW ingress peers associated with the service interface configured on this system. Additionally, the results can be filtered based on the IP address associated with the S-GW ingress peer. ip_address must be an existing S-GW ingress peer and be expressed in IPv4 dotted decimal notation.
show egtpc peers

| { grep grep_options | more }

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. For details on using the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display information about eGTP-C peers associated with the service interface configured on this system. The output contains the following information about the peer:

- Status of the peer
- Echo status
- Restart counter status
- Peer restart counter knowledge
- Service ID
- Peer IP address
- Current sessions
- Maximum sessions

Important: The primary command, show egtpc peers, when entered without additional keywords, displays information for all peers associated with the service operating on this system.

Example

The following command returns an output for an eGTP-C S-GW egress peers associated with the service interface configured on this system with an IP address of 1.2.3.4:

```
show egtpc peers interface sgw-egress address 1.2.3.4
```

The following command returns an output for an eGTP-C MME peer associated with the service interface configured on this system with an IP address of 1.2.3.4:

```
show egtpc peers interface mme address 1.2.3.4
```
show egtp-service

Displays configuration information for evolved GPRS Tunneling Protocol (eGTP) services on this system.

Product
MME, P-GW, S-GW

Privilege
Inspector

Syntax

```show egtp-service { all | name service_name } [ | { grep grep_options | more } ]```

- `all`
  Displays configuration information for all eGTP services configured on this system.

- `name service_name`
  Displays configuration information for a specific eGTP service configured on this system. `service_name` must be an existing eGTP service, and be from 1 to 63 alpha and/or numeric characters in length.

- `| { grep grep_options | more }`
  Indicates the output of the command is to be piped (sent) to the command specified.
  A command to send output to must be specified.
  For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section of Chapter 1 of the Command Line Interface Reference Guide.

Usage
Use this command to view configuration information for eGTP services on this system.

Example
The following command displays service statistics for the eGTP service named `egtp1`:

```show egtp-service name egtp1```
**show egtpc sessions**

Displays eGTP-C session information.

**Product**

MME, P-GW, S-GW

**Privilege**

Inspector

**Syntax**

```
show egtpc sessions [ egtp-service name | interface { mme | pgw-ingress | sgw-egress | sgw-ingress } ] [ | { grep grep_options | more } ]
```

- **egtp-service name**
  
  Displays information about eGTP-C sessions associated with a specific service. *name* must be an existing egtp-service and be from 1 to 63 alpha and/or numeric characters.

- **interface { mme | pgw-ingress | sgw-egress | sgw-ingress }**
  
  Displays information about eGTP-C sessions associated with the service interface configured on this system.
  
  - mme: Displays information about eGTP-C sessions associated with the MME interface configured on this system.
  
  - pgw-ingress: Displays information about eGTP-C sessions associated with the P-GW ingress interface configured on this system.
  
  - sgw-egress: Displays information about eGTP-C sessions associated with the S-GW egress interface configured on this system.
  
  - sgw-ingress: Displays information about eGTP-C sessions associated with the S-GW ingress interface configured on this system.

- **| { grep grep_options | more }**
  
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. For details on using the *grep* and *more* commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**

Use this command to display session information for a specific eGTP service or for sessions associated with an interface type configured on this system.

**Example**

The following command displays eGTP-C session information for sessions associated with all P-GW ingress interfaces configured on this system:

```
show egtpc sessions interface pgw-ingress
```

The following command displays eGTP-C session information for sessions associated with all MME interfaces configured on this system:
show egtpc sessions
show egtpc statistics

Displays evolved GPRS Tunneling Protocol Control (eGTP-C) plane statistics for a specific service name or interface type.

Product
MME, P-GW, S-GW

Privilege
Inspector

Syntax
show egtpc statistics [ egtp-service name | interface { mme | pgw-ingress | sgw-egress | sgw-ingress } | mme-address ip_address | pgw-address ip_address | sgw-address ip_address ] [ verbose ] [ | { grep grep_options | more } ]

egtp-service name
Displays statistics for a specific eGTP service configured on this system. service_name must be an existing eGTP service, and be from 1 to 63 alpha and/or numeric characters in length.

interface { mme | pgw-ingress | sgw-egress | sgw-ingress }
mme: Displays eGTP-C statistics for all MME interfaces.
pgw-ingress: Displays eGTP-C statistics for all eGTP P-GW ingress interfaces.
sgw-egress: Displays eGTP-C statistics for all eGTP S-GW egress interfaces.
sgw-ingress: Displays eGTP-C statistics for all eGTP S-GW ingress interfaces.

mme-address ip_address
Displays eGTP-C statistics for a specific MME IP address. ip_address must be an existing MME IP address and be expressed in dotted decimal notation.

pgw-address ip_address
Displays eGTP-C statistics for a specific P-GW IP address. ip_address must be an existing MME IP address and be expressed in dotted decimal notation.

sgw-address ip_address
Displays eGTP-C statistics for a specific S-GW IP address. ip_address must be an existing MME IP address and be expressed in dotted decimal notation.

verbose
Displays the maximum amount of detail available for this command's output. If this option is not specified, the output is truncated to a more concise level.

| { grep grep_options | more }

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on using the `grep` and `more` commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**

Use this command to display evolved GPRS Tunneling Protocol Control (eGTPC) plane statistics for a specific service name or interface type.

**Example**

The following command displays eGTPC statistics for interfaces configured as S-GW ingress interfaces:

```
show egtpc statistics interface sgw-ingess
```

The following command displays eGTP-C session information for sessions associated with all MME interfaces configured on this system:

```
show egtpc sessions interface mme
```
show external-inline-servers

This command is obsolete.
show fa-service

Displays information on configured foreign agent services.

Product
PDSN, GGSN, ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show fa-service { all | name fa_name } [ | { grep grep_options | more } ]

all | name fa_name

all: indicates information on all foreign agent services is to be displayed.
name fa_name: indicates only the information for the FA service specified as fa_name is to be displayed.

grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 5000 Series Platforms Command Line Interface Reference.

Usage
Display foreign agent service configuration information.

Example
The following commands display information on the FA service sampleService and all services, respectively.

show fa-service name sampleService
show fa-service all

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show fans

Displays the current control status, speed, and temperature for the upper and lower fans.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show fans [ | { grep grep_options | more } ]

- grep grep_options | more
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

View the fan information to verify system hardware status as necessary.

Example

The following command displays information regarding the cooling fans in the system:

  show fans

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show file

Displays the contents of the file specified. The contents are paginated as if it were normal ASCII output.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show file url [ | { grep grep_options | more } ]
```

- **url**
  Specifies the location of a file to display. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:
  - ASR 5000:
    - `[file:]|[/flash|/pcmcial|/hd]|[/directory]//file_name`
    - `tftp://host[:port]|[/directory]//file_name`
    - `[http: | ftp: | sftp: ]/[/username[:password]]@host[:port]|[/directory]//file_name`

  **Important**: Use of the SMC hard drive is not supported in this release.

- **directory** is the directory name.
- **filename** is the actual file of interest.
- **username** is the user to be authenticated.
- **password** is the password to use for authentication.
- **host** is the IP address or host name of the server.
- **port#** is the logical port number that the communication protocol is to use.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Display the contents of files to view such information as log data, trace information, etc.

Example
The following will display the contents of the local file `/pub/log.txt`.

```
show file //pcmcial//pub//log.txt
```
The following command will display the contents of the file `/pub/log.txt` on remote host `remoteABC`.

```
show file ftp://remoteABC/pub/log.txt
```
show firewall flows

This command is obsolete.
show firewall ruledef

This command is obsolete.
show firewall statistics

This command is obsolete.
show freeze-ptmsi imsi

Displays the P-TMSI (packet-temporary mobile subscriber identify) corresponding to the IMSI (international mobile subscriber identity) that has entered a frozen state after the purge timeout timer expires.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show freeze-ptmsi imsi imsi_num
```

- **imsi imsi_num**
  Specifies the IMSI that has been frozen. The first three digits are the MCC (mobile country code). The next two or three digits are the MNC (mobile network code). The remaining digits are the MSIN (mobile station identification number).
  - `imsi_num` Enter a sequence of up to 15 digits.

**Usage**
This command enables the operator to know whether a frozen IMSI has an associated P-TMSI.

**Example**
The following command displays the P-TMSI corresponding to a frozen IMSI:

```
show freeze-ptmsi imsi 262090426000194
```
show ggsn-service

Displays configuration information for GGSN services on the system.

Product
GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show ggsn-service { all | name ggsn_svc_name} [ | { grep grep_options | more }]

all
Displays information for all GGSN services configured with the given context.

name ggsn_svc_name
Specifies the name of a specific GGSN service for which to display information.
ggsn_svc_name is the name of a configured GGSN service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For more information on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Reference.

Usage
This command is used to verify the configuration of one or all GGSN services for monitoring or troubleshooting purposes. The output is a concise listing of GGSN service parameter settings.
If this command is executed from within the local context with the all keyword, information for all GGSN services configured on the system will be displayed.

Example
The following command displays configuration information for a GGSN service called ggsn1:

show ggsn-service name ggsn1
show ggsn-service sgsn-table

This new command is the only way to list all SGSNs by IP address and show the current number of subscribers to each SGSN.

Product
GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show ggsn-service sgsn-table

Usage
While there are existing commands to show SGSN subscriber information, this new command is the only way to list all SGSNs by IP address and show the current number of subscribers to each SGSN.

Example
The following command will bring up a table showing the current active/inactive status, IP address, reboots/restarts and SGSN users.

show ggsn-service sgsn-table

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show global-title-translation

Displays configuration information for the global title translation (GTT).

Product
SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show global-title-translation { address-map name | association name }

address-map name
Displays GTT database. name must be a unique identification comprised of 1 to 63 alphanumeric characters.

association name
Displays GTT association list. name must be a unique identification comprised of 1 to 63 alphanumeric characters.

Usage
This command displays the configuration for the GTT.

Example
The following command displays the address map called gtt-ad1.

show global-title-translation address-map gtt-ad1
show gmm-sm statistics

This command displays statistics for the GPRS Mobility Management and Session Management (GMM/SM) configuration of the system’s SGSN service. GMM/SM supports mobility to allow the SGSN to know the location of a Mobile Station (MS) at any time and to activate, modify and deactivate the PDP sessions required by the MS for user data transfer.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show gmm-sm statistics [ gmm-only | sm-only ] [ gprs-service srvc_name | nsei nse_id | routing-area mcc mcc_id mnc mnc_id lac lac_id rac rac_id ] [ sgsn-service srvc_name | rnc mcc mcc_id mnc mnc_id rnc-id rnc_id | routing area mcc mcc_id mnc mnc_id lac lac_id rac rac_id ] [ verbose ] [ grep grep_options | more ]

gmm-only
Enter this keyword to display only GPRS mobility management (GMM) information for other specified keyword parameters for the current context.

sm-only
Enter this keyword to display only session management (SM) information for other specified keyword parameters for the current context.

gprs-service srvc_name
Enter this keyword to display the statistics for the specified GPRS service. The display request can be narrowed by adding additional keywords.
srvc_name must be an alphanumeric string of 1 to 63 alphanumeric characters.

nsei
Enter this keyword to display the GMM/SM session statistics for the identified network service entity (NSEI).

sgsn-service srvc_name
Enter this keyword to display the statistics for the specified SGSN service. The display request can be narrowed by adding additional keywords.
srvc_name must be an alphanumeric string of 1 to 63 alphanumeric characters.

rnc
Enter this keyword to fine-tune the display of the GMM/SM session statistics just for the specified (rnc-id) radio network controller (RNC).

rnc-id rnc_id
Enter this keyword to identify the specific RNC.
rnc_id must be an integer from 0 through 4095.

**routing-area mcc mcc_id mnc mnc_id lac lac_id rac rac_id**

Enter the **routing-area** keyword to fine-tune the display of the GMM/SM session statistics for a specified routing area (RA) identified by the MCC, MNC, LAC and RAC.

**mcc mcc_id**

Enter this keyword to specify the mobile country code (MCC) as part of the identification of the RNC or RA. **mcc_id** must be an integer from 100 through 999.

**mnc mnc_id**

Enter this keyword to specify the mobile network code (MNC) as part of the identification of the RNC or RA. **mnc_id** must be an integer from 00 through 999.

**lac lac_id**

Enter this keyword to specify the location area code (LAC) as part of the identification of the RNC or RA. **lac_id** must be an integer from 1 through 65535.

**rac rac_id**

Enter this keyword to specify the routing area code (RAC) as part of the identification of the RNC or RA. **rac_id** must be an integer from 1 through 255.

**verbose**

This keyword displays all possible statistics for specified command or keyword.

**grep grep_options | more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For more information on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Reference.

**Usage**

Use this command to display usage statistics for the GMM/SM session configurations for SGSN services, including a BSC’s attaches, activations, and throughput.

**Example**

The following command displays GMM/SM statistics for a specific routing area defined for the GPRS service:

```bash
show gmm-sm statistics gprs-service gprs1 routing-area mcc 123 mcc 131 lac 24 rac 11
```

The following command displays all possible information for GMM/SM statistics:

```bash
show gmm-sm statistics verbose
```
show gnm-sm statistics

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show gprs-service

Displays the statistics of GPRS service(s) configured in a given context on the system.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show gprs-service { all | name gprs_srvc_name } [ | { grep grep_options | more }]
```

- **all**
  Displays information for all GPRS services configured with the given context.

- **name gprs_srvc_name**
  Specifies the name of a specific GPRS service for which information is to be displayed.
  `gprs_srvc_name` is the name of a configured GPRS service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For more information on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Reference.

Usage

This command is used to verify the configuration of one or all GPRS services for monitoring or troubleshooting purposes. The output is a concise listing of GPRS service parameter settings.

If this command is executed from within the local context with the all keyword, information for all GPRS services configured on the system will be displayed.

Example

The following command displays configuration information for all GPRS services configured in this context:

```
show gprs-service all
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show gs-service

Displays configuration information and statistics for Gs service configured on system.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show gs-service { all | name svc_name } [ | { grep grep_options | more }]
```

- `all`
  Displays information for all Gs services configured with in the given context.

- `name svc_name`
  Specifies the name of a specific Gs service for which to display information.
  `svc_name` is the name of a configured Gs service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

- `grep grep_options | more`
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For more information on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Reference.

Usage

This command is used to verify the configuration of one or all Gs services for monitoring or troubleshooting purposes.
If this command is executed from within the local context with the all keyword, information for all Gs services configured on the system will be displayed.

Example

The following command displays configuration information for all Gs services configured on a system:

```
show gs-service all
```

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show gtpc

Displays GTPv0, GTPv1-C, GTPv1-U information with filtering options.

Product
GGSN, SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show gtpc [ full | counters | summary ] { all | apn apn_name | imsi imsi_value [ nsap nsapi_value ] | callid callid | sgsn-address ip_address | ggsn-service ggsn_name | user-address ip_address | username username }

[ full | counters | summary ]

Specifies the level of information to be displayed. The following levels can be used:

• **full**: Indicates detailed information is to be displayed.

• **counters**: Indicates the output is to include the statistic counters.

• **summary**: Indicates only summary information is to be displayed.

{ all | apn apn_name | imsi imsi_value [ nsap nsapi_value ] | callid callid | sgsn-address ip_address | ggsn-service ggsn_name | user-address ip_address | username username }

Specifies the filter criteria used when displaying GTP information. The following filters can be used:

• **all**: Specifies that all available information is to be displayed.

• **apn apn_name**: Specifies that GTP information for a particular APN will be displayed. **apn_name** can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

• **imsi imsi_value [ nsap nsapi_value ]**: Specifies that GTP information will be displayed for a particular International Mobile Subscriber Identity (IMSI). **imsi_value** is an integer value from 1 to 15 characters. Optionally, the IMSI could be further filtered by specifying a particular PDP context using the Network Service Access Point Identifier (NSAPI). **nsapi_value** is an integer value from 5 to 15.

• **callid callid**: Specifies that GTP information will be displayed for a particular call identification number. **callid** must be specified as a 4-byte hexadecimal number.

• **sgsn-address ip_address**: Specifies that GTP information for a particular SGSN will be displayed. **ip_address** is the address of the SGSN in dotted decimal notation.

• **ggsn-service ggsn_name**: Specifies that GTP information for a particular GGSN service will be displayed. **ggsn_name** can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

• **user-address ip_address**: Specifies that GTP information for a particular user address will be displayed. **ip_address** is the address of the user’s PDP context in dotted decimal notation.

• **username username**: Specifies that GTP information for a particular username will be displayed. **username** can be from 1 to 127 alpha and/or numeric characters (including wildcards (‘$’ and ‘*’)) and is case sensitive.
Usage

This command displays statistics for every GTP message type based on the filter criteria. This information is useful for system monitoring or troubleshooting.

Example

The following command displays GTPC counters for a GGSN service named ggsn1:

```
show gtpc counters ggsn-service ggsn1
```

The following command displays GTPC full information:

```
show gtpc full
```

The following command displays GTPC summary information for a specific call identification number of 05f62f34:

```
show gtpc summary callid 05f62f34
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show gtpc statistics

Display GTPv0, GTPv1-C, GTPv1-U statistics with filtering options.

Product
GGSN, SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show gtpc statistics [ apn-name apn_name ] [ custom1 custom2 ] [ sgsn-address address ] [ ggsn-service svc_name ] [ verbose ]
```

- **apn-name apn_name**
  Specifies that GTP statistics for a particular APN will be displayed.
  *apn_name* can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

- **custom1**
  Displays the statistics of GTP-C messages for preservation mode and free of charge service.
  This keyword is customer-specific license enabled and used for Preservation-Mode and Free-of-Charge Service which are enabled under customer-specific license. For more information on this support, contact your local representative.

- **custom2**
  Displays the statistics of GTP-C messages for overcharging protection on loss of radio coverage for a GGSN service.
  This keyword is feature-specific license enabled and used for subscriber overcharging protection on loss of radio coverage at the GGSN service. For more information on this support, contact your local representative.

- **sgsn-address address**
  Specifies that GTP statistics for a particular SGSN will be displayed.
  *address* is the address of the SGSN in dotted decimal notation.

- **ggsn-service svc_name**
  Specifies that GTP statistics for a particular GGSN service will be displayed.
  *ggsn_name* can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

- **verbose**
  Specifies that detailed statistics will be displayed.

Usage

The information displayed by this command consists of session statistics such as the number of currently active sessions categorized by PDP context type, and statistics for every GTP message type. The statistics are cumulative.
If the verbose keyword is used, additional information will be displayed such as statistics for every type of error code.

**Example**
The following command displays verbose GTP statistics:

```
show gtpc statistics verbose
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show gtpp accounting

Displays information on the GPRS Tunneling Protocol Prime (GTPP).

**Product**
GGSN, SGSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show gtpp accounting servers
```

**Usage**
This command is used to view the status of GTPP accounting servers configured within a context for monitoring or troubleshooting purposes.
If this command is issued from within the local context, a information for all GTPP accounting servers configured on the system is displayed regardless of context.

**Example**
The following command displays the status of and information on configured GTPP accounting servers:

```
show gtpp accounting servers
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show gtpp counters

Displays GTPP counters for configured charging gateway functions (CGFs) within the given context.

Product
GGSN, SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show gtpp counters { all | cgf-address cgf_address }
```

- **all**
  Displays counters for all CGFs configured within the context.

- **cgf-address cgf_address**
  Displays counters for a specific CGF.
  `cgf_address` is the IP address of the CGF expressed in dotted decimal notation.

Usage
Counters for a single CGF can be viewed using the `cgf-address` keyword. Counters for all CGFs in the context can be viewed by entering the command with the `all` keyword.
If this command is issued from within the local context and no CGF-address is specified, the counters displayed will be cumulative for all CGFs configured on the system regardless of context.

Example
The following command displays counters for all CGF:
```
show gtpp counters all
```

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show gtpp group

Displays information pertaining to the configured GTTP storage server group.

**Product**

GGSN, SGSN

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show gtpp group [name gtpp_group_name| all] [ | { grep grep_options| more }]  
```

- **name** gtpp_group_name
  
  Displays information and CDR statistics of the GTTP server group named `gtpp_group_name`. `gtpp_group_name` is name of the configured/default GTTP storage server group.

- **all**
  
  Displays statistics of all configured GTTP storage server group including default group.

- **grep grep_options | more**
  
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  
  For more information on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Reference.

**Usage**

Use this command to display the CDR statistics on the basis of GTTP server groups. It shows the information for all or specific GTTP server group configured in the context from which this command is issued.

**Example**

The following command displays the status of the GTTP server group backup server configured in a context called `GTTP_Group1`:

```
show gtpp group name GTTP_Group1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
**show gtp statistics**

Displays GTPP statistics for configured CGFs within the context.

**Product**
GGSN, SGSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show gtpp statistics [ cgf-address cgf_address ]
```

- **cgf-address cgf_address**
  Specifies the IP address of a specific CGF for which to display statistics and is express in dotted decimal notation.

**Usage**
Statistics for a single CGF can be viewed by specifying its IP address. Statistics for all CGFs in the context can be viewed by not specifying an IP address. If this command is issued from within the local context, the statistics displayed will be cumulative for all CGFs configured on the system regardless of context.

**Example**
The following command displays statistics for a CGF with an IP address of 192.168.1.14:

```
show gtpp statistics cgf-address 192.168.1.14
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show gtpp storage-server

Displays information pertaining to the configured GTPP storage server.

Product
GGSN, SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show gtpp storage-server [ counters { all | group name } | group name ]
local file { counters { all | group name } | statistics [ group name ] } |
status { verbose } | streaming { counters { all | group name } | statistics [ group name ] } ]
| { grep grep_options | more } |

---

counters
Displays counters for the external GTPP storage server.

---

group name name
Displays GTPP backup server information for the specified group.

---

local file
Displays statistics and counters for the local storage-server. This is the hard disk if hard disk support has been enabled with the gtpp storage-server mode command in the GTPP Group Configuration Mode.

---

statistics
Displays statistics for the GTPP storage server.

---

status { verbose }
Displays status of the GTPP storage server. verbose enables the detailed view.

---

streaming
Displays the status of CDRs backup on HDD while ‘streaming’ mode is enabled.

---

grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

---

Usage
Executing this command with no keywords displays status information for the GTPP backup server configured in the context from which this command is issued.
Example

The following command displays the GTPP CDR file statistics stored on the local SMC hard disk.

```
show gtpp storage-server local file counters all
```

The following command displays the status of the GTPP backup server configured in a context called ggsn1:

```
show gtpp storage-server
```

The following command displays statistics for the GTPP backup server configured in a context called ggsn1:

```
show gtpp storage-server statistics
```

The following command displays gtpp storage server counters:

```
show gtpp storage-server counters
```

The following command displays gtpp storage server status:

```
show gtpp storage-server status
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show gtpu statistics

Displays GPRS Tunneling Protocol user plane (GTP-U) statistics and counters on this system.

Product
P-GW, S-GW

Privilege
Inspector

Syntax

```
show gtpu statistics [ gtpumgr-instance number ] [ gtpu-service name | peer-address ip_address ]
```

- **gtpumgr-instance number**
  Displays configuration information for a specific GTP-U manager instance.
  *number* must be an existing instance and be an integer value from 1 to 4294967295.

- **gtpu-service name**
  Displays GTP-U statistics and counters for a specific GTP-U service configured on this system.
  *name* must be an existing GTP-U service, and be from 1 to 63 alpha and/or numeric characters in length.

- **peer-address ip_address**
  Displays GTP-U statistics and counters for a specific peer IP address.
  *ip_address* must be an existing peer IPv4 or IPv6 address and be specified in dotted decimal notation (for IPv4) or colon-separated notation (for IPv6).

  | { grep grep_options | more }

  Indicates the output of the command is to be piped (sent) to the command specified.
  A command to send output to must be specified.
  For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section of Chapter 1 of the Command Line Interface Reference Guide.

Usage

Use this command to view statistics and counters for GTP-U traffic on this system.

Example

The following command displays statistics for the GTP-U service named *egtp1*:

```
show egtpu statistics gtpu-service egtp1
```
show gtpu-service

Displays configuration information for GPRS Tunneling Protocol user plane (GTP-U) services on this system.

Product
P-GW, S-GW

Privilege
Inspector

Syntax

show gtpu-service { all | name service_name } [ | { grep grep_options | more } ]

all
Displays configuration information for all GTP-U services configured on this system.

name service_name
Displays configuration information for a specific GTP-U service configured on this system.

service_name must be an existing GTP-U service, and be from 1 to 63 alpha and/or numeric characters in length.

| { grep grep_options | more }
Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section of Chapter 1 of the Command Line Interface Reference Guide.

Usage
Use this command to view configuration information for GTP-U services on this system.

Example
The following command displays service statistics for the GTP-U service named egtpl:

show egtpl-service name egtpl
Chapter 94
Exec Modes Show Commands (H-L)

This section includes the commands `show ha-service` through `show logs`.
show ha-service

Displays information on configured home agent services.

Product
HA

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ha-service { all | name ha_name } [ | { grep grep_options | more } ]
```

- **all | name ha_name**
  - `all`: indicates information on all home agent services is to be displayed.
  - `name ha_name`: indicates only the information for the HA service specified as `ha_name` is to be displayed.

- **grep grep_options | more**
  - Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  - For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage
Display home agent service configuration information.

Example
The following commands displays information on the HA service `sampleService` and all services, respectively.

```
show ha-service name sampleService show ha-service all
```
show hardware

Displays information on the system hardware.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show hardware ( card [ card_num ] | inventory | version [ board | diags | fans ] ) [ | { grep grep_options | more } ]
```

- **card [ card_num ]**
  - Provide the hardware information for all cards or the card specified by `card_num`. `card_num` must be a value in the range 1 through 48 and must refer to an installed card.

- **inventory**
  - Display the hardware information for all slots in tabular format.

- **version [ board | diags | fans ]**
  - Display the CPU information for all application cards and fan controller version for the upper and lower fan trays.
    - **board**: Only include the CPLD and FPGA version information.
    - **diags**: Only include the CFE diagnostics version information.
    - **fans**: Show the fan controller versions for the upper and lower fan trays.

- **grep grep_options | more**
  - Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  - For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Show the hardware information to verify part lists and hardware component versions with reserve stock.

Example

The following displays the hardware information for a card installed in slot 1.

```
show hardware card 1
```

The following command displays the hardware inventory for the entire chassis.

```
show hardware inventory
```
The following command results in the display of the CPU version for all application cards displaying only the CPLD and FPGA information.

```
show hardware version board
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show hd raid

Shows the output of the RAID established on the ASR 5000 SMCs.

Product
All

Privilege
Security Administrator, Administrator, Administrator, Operator

Syntax

show hd raid [ verbose ]

Example

show hd raid verbose

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show hd-storage-policy

Displays ACR counter and statistic information.

Product
HSGW, P-GW, S-GW

Privilege
Inspector

Syntax

show hd-storage-policy { all | counters [ all ] [ name name ] [ verbose ] | name name | statistics [ all ] [ name name ] [ verbose ] }

- **all**
  Specifies that ACR information for all HD storage policies configured on the system is to be displayed.

- **counters [ all ] [ name name ] [ verbose ]**
  Specifies that ACR counter information for HD storage policies configured on the system is to be displayed.

- **name name**
  Specifies that ACR information for an HD storage policy with the specified name is to be displayed.

- **statistics [ all ] [ name name ] [ verbose ]**
  Specifies that ACR statistic information for HD storage policies configured on the system is to be displayed.

- **verbose**
  Displays HD storage statistics based on instance.

Usage

Use this command to display ACR counter and statistic information.

Example

The following command displays ACR statistic information for an HD storage policy named pgwsgw:

```
show hd-storage-policy statistics name pgwsgw
```
show hnbgw counters

This command displays the session counter information for Home-NodeB Gateway (HNB-GW) services and HNBs connected on this system.

**Product**
HNB-GW

**Privilege**
Inspector

**Syntax**

```
show hnbgw counters [hnbgw-service service_name | hnbid hnb_identifier] [ | { grep grep_options | more }]  
```

- **hnbgw-service service_name**
  - This keyword is used to filter the counter display based on the HNB-GW service name `service_name` configured and running on this system.
  - `service_name` must be an existing HNB-GW service, and be from 1 to 63 alpha and/or numeric characters in length.

- **hnbid hnb_identifier**
  - This keyword is used to filter the counter display based on Home-NodeB `hnb_identifier` which is connected to this system with HNB-GW service and in active or dormant state.
  - `hnb_identifier` must be an identifier for HNB from 1 to 255 alpha and/or numeric characters in length.

- `| { grep grep_options | more }
  - Indicates the output of the command is to be piped (sent) to the command specified.
  - A command to send output to must be specified.
  - For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section in Command Line Interface Overview chapter of the Command Line Interface Reference.

**Usage**

Use this command to view the session counter information for HNB-GW services configured and HNBs connected on this system.

**Example**

The following command displays the counters for the HNB-GW service named `hnbgw1`:

```
show hnbgw counter hnbgw-service hnbgw1
```
show hnbgw statistics hnbgw-service

This command displays the session statistics for Home-NodeB Gateway (HNB-GW) services configured and running on this system.

**Product**
HNB-GW

**Privilege**
Inspector

**Syntax**

```
show hnbgw statistics hnbgw-service service_name [hnbap-only | ranap-only | rua-only | sccp-only | sctp-only] [ verbose] [ grep grep_options | more ]
```

**hnbgw-service service_name**

This keyword is used to filter the session statistics display based on the HNB-GW service name `service_name` configured and running on this system. `service_name` must be an existing HNB-GW service, and be from 1 to 63 alpha and/or numeric characters in length.

**hnbap-only**

This keyword is used to filter the session statistics display limited to Home NodeB Application Part (HNBAP) traffic only for selected HNB-GW service which is configured and running on this system.

**ranap-only**

This keyword is used to filter the session statistics display limited to Radio Access Network Application Protocol (RANAP) traffic only for selected HNB-GW service which is configured and running on this system.

**rua-only**

This keyword is used to filter the session statistics display limited to RANAP User Adaptation (RUA) traffic only for selected HNB-GW service which is configured and running on this system.

**sccp-only**

This keyword is used to filter the session statistics display limited to Signaling Connection Control Part (SCCP) traffic only for selected HNB-GW service which is configured and running on this system.

**sctp-only**

This keyword is used to filter the session statistics display limited to Stream Control Transmission Protocol (SCTP) traffic only for selected HNB-GW service which is configured and running on this system.

**verbose**

This keyword is used to display the detailed statistics for all sessions on HNB-GW services or for selected filter and named HNB-GW service which is configured and running on this system.
Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section in Command Line Interface Overview chapter of the Command Line Interface Reference.

Usage
Use this command to view the session statistics for overall session or in selected part of user session for HNB-GW services configured and running on this system.

Example
The following command displays the session statistics for HNBAP part of session details for the HNB-GW service named `hnbwl`:

```
show hnbgw statistics hnbgw-service hnbwl hnbap-only
```

The following command displays the session statistics for RANAP part of session with maximum details for the HNB-GW service named `hnbwl`:

```
show hnbgw statistics hnbgw-service hnbwl ranap-only verbose
```
show hnbgw statistics hnbid

This command displays the session statistics for Home-NodeB (HNB) connected to an HNB-GW service on this system.

| Product | HNB-GW |
| Privilege | Inspector |

Syntax

```
show hnbgw statistics hnbid hnb_identifier[hnbp-only | ranap-only | rua-only] [ verbose] [ | { grep grep_options | more } ]
```

```
hnbid hnb_identifier
```

This keyword is used to filter the session statistics display based on Home-NodeB `hnb_identifier` which is connected to this system through an HNB-GW service. `hnb_identifier` must be an identifier for HNB from 1 to 255 alpha and/or numeric characters in length.

```
hnbap-only
```

This keyword is used to filter the session statistics display limited to Home NodeB Application Part (HNBAP) traffic only for selected HNB which is connected to this system through HNB-GW service.

```
rana-only
```

This keyword is used to filter the session statistics display limited to Radio Access Network Application Protocol (RANAP) traffic only for selected HNB which is connected to this system through HNB-GW service.

```
rua-only
```

This keyword is used to filter the session statistics display limited to RANAP User Adaptation (RUA) traffic only for selected HNB which is connected to this system through HNB-GW service.

```
verbose
```

This keyword is used to display the detailed statistics for all HNB sessions or for selected filter and HNB which is connected to this system through HNB-GW service.

```
| { grep grep_options | more }
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of the `grep` and `more` commands, refer to the `Regulating a Command’s Output` section in `Command Line Interface Overview` chapter of the `Command Line Interface Reference`.

Usage

Use this command to view the session statistics for overall session or in selected part of user session for selected HNB which is connected to this system through HNB-GW service.
Example
The following command displays the session statistics for HNBAP part of session details for the HNB having
hnbl12234 as identifier on this system:

    show hnbgw statistics hnbid hnb112234 hnbap-only

The following command displays the detailed session statistics for RANAP part of session details for the HNB having
hnbl12234 as identifier on this system:

    show hnbgw statistics hnbid hnb112234 ranap-only verbose
show hnbgw-service

This command displays the configuration details for configured HNB-GW service(s) on this system.

Product
HNB-GW

Privilege
Inspector

Syntax

show hnbgw-service {all | hnbgw-service service_name}

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>This keyword is used to display the configuration and other default parameters for all HNB-GW service configured on this system.</td>
</tr>
<tr>
<td>hnbgw-service service_name</td>
<td>This keyword displays the configuration and default parameters for specific HNB-GW service name service_name which is configured and running on this system. Service_name must be an existing HNB-GW service, and be from 1 to 63 alpha and/or numeric characters in length.</td>
</tr>
</tbody>
</table>

Usage

Use this command to view the configuration and service parameters set for all or any specific HNB-GW service(s) on this system.

Example

The following command displays the configured and default parameters for all HNB-GW services configured on this system:

```
show hnbgw-service all
```
show hsgw-service

Displays configuration information for HRPD Serving Gateway (HSGW) services on this system.

**Product**
HSGW

**Privilege**
Inspector

**Syntax**

```
show hsgw-service { all | name service_name } [ | { grep grep_options | more } ]
```

| all |
| Displays configuration information for all HSGW services configured on this system.

| name service_name |
| Displays configuration information for a specific HSGW service configured on this system. service_name must be an existing HSGW service, and be from 1 to 63 alpha and/or numeric characters in length.

| [ | { grep grep_options | more } |
| Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command’s Output section of Chapter 1 of the Command Line Interface Reference Guide.

**Usage**

Use this command to view configuration information for HSGW services on this system.

**Example**

The following command displays service statistics for the HSGW service named **hsgw1**:

```
show hsgw-service name hsgw1
```
show ims-authorization policy-control

Displays information and statistics specific to the policy control in IP Multimedia Subsystem (IMS) authorization service.

**Product**
SCM, GGSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show ims-authorization policy-control statistics [ service ims_auth_svc_name ]
server { ip-address ip_address [ port port_value ] | name server_name } ] [ ] {
grep grep_options | more } ]
```

**statistics**
Displays the total collected statistics of all policy control parameters of IMS authorization service sessions since the last system restart or clear command.

**service ims_auth_svc_name**
Displays the total collected statistics of all IMS authorization sessions processed by a specific IMS authorization service since the last system restart or clear command. `ims_auth_svc_name` must be an existing IMS authorization service name.

**server { ip-address ip_address [ port port_value ] | name server_name }**
Displays the server-level message statistics and the server IP address. Specify the PCRF server IP address or server name.

**grep grep_options | more**
Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified. For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

**Usage**
Use this command to display information and statistics about policy control configuration in existing IMS authorization services.

**Example**
The following command displays the existing IMS authorization service name `ims_auth_gxl` on the system:

```
show ims-authorization policy-control statistics service ims_auth_gxl
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show ims-authorization policy-control
show ims-authorization policy-gate

Displays information of installed Policy Gates for specific subscriber in IP Multimedia Subsystem (IMS) authorization service.

Product
SCM, GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ims-authorization policy-gate { { status [ summary | full ] [ { imsi imsi_value [ nsapi nsapi_value ] | callid call_id [ { ims-auth-service ims_auth_svc } [ rulename rule_name ] ] | { counters [ all | { imsi imsi_value [ nsapi nsapi_value ] | { rulename rule_name } | { callid call_id } ] } [ grep grep_options | more ] } ] ]

status [ summary | full ]
This option displays the status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based on the specified criteria.
summary: limits the display to a summary on status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based.
full: displays the full information on status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based.

counters all
This option displays the counters/statistics of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based on the specified criteria.
all displays the all counters of the installed gates and their flow definitions along with the run-time status in an IMS authorization service based.

imsi imsi_value [ nsapi nsapi_value ]
This option displays all of the counters/status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based on the specified International Mobile Subscriber Identity (IMSI) named imsi_value.
nsapi nsapi_value specifies Network Service Access Point Identifier (NSAPI) named nsapi_value to limit the display to a single PDP context of the subscriber.

callid call_id
This option displays all of the counters/status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based on the specified call identifier named call_id.

ims-auth-service ims_auth_svc
This option displays status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service named ims_auth_svc.
```
show ims-authorization policy-gate

**rulename** rule_name

This option displays all of the counters/status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based on the specific dynamic charging rule named rule_name.

**grep grep_options | more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. Please refer to the Regulating a Command’s Output section of the Command Line Interface Reference for details on the usage of grep and more.

**Usage**

Use this command to display information/statistics/counters about all of the installed policy gates and their flow definitions along with the run-time status with specified criteria and filters in existing IMS authorization services.

**Example**

The following command displays the full status of the installed policy gates in an existing IMS authorization service on the system:

```
show ims-authorization policy-gate status full
```

The following command displays all counters of the installed policy gates in an existing IMS authorization service on the system:

```
show ims-authorization policy-gate counters all
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show ims-authorization servers

Displays information and statistics specific to the authorization servers used for IP Multimedia Subsystem (IMS) authorization service.

Product
SCM, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
show ims-authorization servers [ ims-auth-service ims_auth_svc_name [ | { grep grep_options | more } ] ]
```

```
server [ ims-auth-service ims_auth_svc_name ]
```
Displays the information and statistics of all authorization servers configured for IMS authorization service in a system.
ims-auth-service ims_auth_svc_name: Displays the configured authorization servers for IMS authorization for an IMS authorization service named ms_auth_svc_name.

```
grep grep_options | more
```
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
Please refer to the Regulating a Command’s Output section of the Command Line Interface Reference for details on the usage of `grep` and `more`.

Usage
Use this command to display information and statistics about IMS authorization servers configured on a system or IMS authorization service.

Example
The following command displays the information and statistics of the authorization servers in IMS authorization service named `ims_auth_gxl`:

```
show ims-authorization servers ims-auth-service ims_auth_gxl
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show ims-authorization service

Displays information, configuration, and statistics of all/specific IP Multimedia Subsytem (IMS) authorization service.

Product
SCM, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
show ims-authorization service { { all [ verbose ] | name ims_auth_svc_name | summary } } | { statistics [ all | name ims_auth_svc_name ] [ verbose ] } [ | { grep grep_options | more } ]
```

**all [ verbose ]**
Displays information and configuration of all configured IMS authorization services with a single line of information for each IMS authorization service.
verbose: Displays all information and configuration data of every IMS authorization services configured on system.

**name ims_auth_svc_name**
Displays the information, statistics, and configuration data of an IMS authorization service named ims_auth_svc_name.

**summary**
Displays summarized information and configuration data of all IMS authorization services configured in a system.

**statistics [ all | name ims_auth_svc_name ] [ verbose ]**
Displays the IMS Authorization service statistics including following information:
- Initial authorization procedures
- Re-authorization procedures initiated by us
- Re-authorization procedures initiated by servers
- Various failure statistics

If no criteria specified summarized statistics of all IMS Authorization services are displayed
- **all**: displays individual statistics for every IMS authorization service configured on system.
- **name ims_auth_svc_name**: Displays the statistics of the IMS authorization service named ims_auth_svc_name
- **verbose**: displays the detailed statistics of a configured IMS authorization service.

**grep grep_options | more**
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
show ims-authorization service

Please refer to the Regulating a Command’s Output section of the Command Line Interface Reference for details on the usage of `grep` and `more`.

Usage

Use this command to display the IMS Authorization service status, counters and configuration. The status includes the state of a server table switchover. Statistics option is used for various processes and procedure status.

Example

The following command displays the information and configuration data of the IMS authorization service named `ims_auth_gxl`:

```
show ims-authorization service name ims_auth_gxl
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show ims-authorization sessions

Displays information, configuration, and statistics of sessions active in IP Multimedia Subsystem (IMS) authorization service.

Product
SCM, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
show ims-authorization session [ full | summary ] | [ all ] | [ ims-auth-service ims_auth_svc_name | imsi imsi_value [ nsapi nsapi_value ] | apn apn_name | ip-address ip_address | callid call_id ] [ | { grep grep_options } more ]
```

**full**
Displays complete information and configuration data of all sessions in IMS authorization services configured in a system.

**summary**
Displays summarized information and configuration data of all sessions in IMS authorization services configured in a system.

**all**
Displays information and configuration of all sessions running in IMS authorization services with a single line of information for each IMS authorization session.

**ims-auth-service ims_auth_svc_name**
Displays the information, statistics, and configuration data of sessions in an IMS authorization service named ms_auth_svc_name.

**imsi imsi_value [ nsapi nsapi_value ]**
This option displays all of the counters/status of the running services in an IMS authorization service based on the specified International Mobile Subscriber Identity (IMSI) named imsi_value. The option **nsapi nsapi_value** specifies Network Service Access Point Identifier (NSAPI) named nsapi_value to limit the display to a single PDP context of the subscriber.

**apn apn_name**
This option displays all of the counters/status of the running services in IMS authorization service based on the access point name (APN) named apn_name.

**ip-address ip_address**
This option displays all of the counters/status of the running services in IMS authorization service based on the host IP address having IP address value as ip_address.
show ims-authorization sessions

**callid call_id**
This option displays all of the counters/status of the running services in IMS authorization service based on the specified call identifier named `call_id`.

**summary**
Displays summarized information and configuration data of all IMS authorization services configured in a system.

**grep grep_options | more**
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. Please refer to the Regulating a Command’s Output section of the Command Line Interface Reference for details on the usage of `grep` and `more`.

**Usage**
Use this command to display the sessions running under IMS Authorization service on a system with different filter criteria.

**Example**
The following command displays the information and statistical data of a session in IMS authorization service:

```bash
show ims-authorization sessions full
```

**Important**: Output descriptions for commands are available in the Statistics and Counters Reference.
show ip

Displays information for the IP-based interfaces’ access group and access list information along with address resolve protocol information for the current context.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ip { access-group [ statistics] | access-list [ list_name ] | arp [ arp_ip_address ] | [summary] | statistics ] | localhost [ host_name ] | prefix-list [ detail [list_name ] | namelist_name | summary [list_name ] ] | rip | route [route_ip_address [route_gw_address ] ] | static-routes [route_ip_address [ sroute_gw_address ] | vrf vrf-name] [ | { grep | grep_options | more }]
```

<table>
<thead>
<tr>
<th>access-group [ statistics ]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays all configured access groups in the current context along with the priority values.</td>
</tr>
<tr>
<td>statistics: Displays all configured access groups along with packet and byte counters for each ACL rule hit for the current context. In addition, it shows the priority values.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>access-list [ list_name ]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indicates the output is to display the information for all access control lists or the list specified as list_name.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>arp [ arp_ip_address ]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays the address resolution protocol table or the ARP information associated with the IP address specified as $(arp_ip_address). $(arp_ip_address) must be specified using the standard IPv4 dotted decimal notation.</td>
</tr>
</tbody>
</table>

**Important:** When the VPN Manager restarts, it removes all interfaces from the kernel and thus the kernel removes all ARP entries. When this happens, the NPU still holds all of the ARP entries so that there is no traffic disruption. When this happens, from a user point of view, `show ip arp` is broken since this command gathers information from the Kernel and not the NPU.

<table>
<thead>
<tr>
<th>localhost [ host_name ]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays all the local host information or only for the host specified as host_name.</td>
</tr>
</tbody>
</table>

| prefix-list [ detail [list_name ] | name list_name | summary [list_name ] ] |
|---------------------------|
| This keyword list information on configured IP prefix lists. With no keyword supplied, a list of all prefix lists and their entries is displayed. |
| detail [list_name]: Lists detailed information for all prefix lists and their entries. If a list name is specified only the details for the specified prefix list are displayed. list_name must be a string of from 1 through 79 alpha and/or numeric characters. |
**show ip**

**name list_name**: Lists the entries for a specified prefix list. *list_name* must be a string of from 1 through 79 alpha and/or numeric characters.

**summary [ list_name ]**: Lists summary information for all prefix lists and their entries. If a list name is specified only the summary for the specified prefix list are displayed. *list_name* must be a string of from 1 through 79 alpha and/or numeric characters.

---

**rip**

Displays general RIP routing process information. (RIP is not supported at this time.)

**route [ route_ip_address [ route_gw_address ] ]**

Indicates the route information to the address specified by *route_ip_address* is to be displayed. The route gateway address may be specified as needed to identify the route. *route_ip_address* and *route_gw_address* must be specified using the standard IPv4 dotted decimal notation.

**static-route sroute_ip_address [ sroute_gw_address ]**

Displays the static route information for the address specified by *sroute_ip_address* is to be displayed. The static route gateway address may also be specified to identify the route. *sroute_ip_address* and *sroute_gw_address* must be specified using the standard IPv4 dotted decimal notation.

**vrf vrf_name**

Displays the routing information of the VRF. *vrf_name* is a name used to identify a VRF.

**grep grep_options | more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of *grep* and *more*, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

---

**Usage**

Show the IP information to verify and/or troubleshooting communication difficulties between to a remote host/node.

**Example**

The following command displays the ACL for the list named *sampleACL*.

```bash
show ip access-list sampleACL
```

The following command will output the static route information to remote host 1.2.3.4.

```bash
show ip static-route 1.2.3.4
```
show ip as-path-access-list

Displays the contents of a BGP router AS path access list in the current context.

**Product**
HA

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show ip as-path-access-list list_name
```

- **list_name**
  The name of an existing AS path access list configured in the current context. must be an alpha and or numeric string from 1 through 79 characters in length.

**Usage**
Use this command to display the configured entries for the specified BGP router AS path access list in the current context.

**Example**
The following command displays the contents of an AS path access list named ASlist1:

```
show ip as-path-access-list ASlist1
```
show ip bgp

Displays BGP information for the current context.

Product

HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ip bgp [ip_address/mask] debugging | filter-list list_name | neighbors [ip_address] | route-map map_name| vpn4 { all [network | neighbors | summary ] | vrf vrf-name [ network ] | route-distinguisher [ network | neighbors | summary ] } [ | { grep grep_options | more } ]
```

**ip_address/mask**

Specify the IP address and netmask bits for the network for which information should be displayed. *ip_address* is an IPv4 address in dotted-decimal notation and *mask* is the number of subnet bits, representing a subnet mask in shorthand. These must be entered in the dotted-decimal notation/subnet bits format (1.1.1.1/24).

**debugging**

Display debug flags that are enabled.

**filter-list list_name**

Display routes that match the specified filter list.

**neighbors [ip_address]**

Display information for all neighbors or a specified neighbor. *ip_address* is an IPv4 address in dotted-decimal notation.

**route-map map_name**

Display routes that match the specified route-map.

**vpn4 { all [network | neighbors | summary ] | vrf vrf-name [ network ] | route-distinguisher [ network | neighbors | summary ] }**

Display all VPNv4 routing data, routing data for a VRF, or a route-distinguisher.

- **all**: displays all VPN routing information. If this is specified, the information displayed is gathered from all the VRF's known to BGP and displayed. It could contain the list of neighbors, the list of networks, or a particular network.
- **network**: displays the network for which information in the BGP routing table.
- **neighbors**: shows neighbor information for the all the vrf with the matching RD value.
- **summary**: shows summary information of neighbors for all the vrf with the matching RD value.
**vrf vrf name**: name used to identify a VRF. Information is only gathered from the corresponding VRF. If there is no such VRF, an error is reported.

**network**: displays the network for which information in the BGP routing table.

**route-distinguisher**: If specified along with the RD value, the information displayed is gathered from the corresponding VRF whose RD value is the same as the specified value. If there is no VRF associated with such an RD, an error is reported.

**network**: displays the network for which information in the BGP routing table.

**neighbors**: shows neighbor information for all the vrf's including the default vrf or for the VRF with a matching RD value.

**summary**: shows summary information of neighbors for all the vrf's including the default vrf or for the VRF with a matching RD value.

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of `grep` and `more`, refer to the `Regulating a Command’s Output` section of the `Command Line Interface Overview` chapter in the `Command Line Interface Reference`.

**Usage**

Use this command display to BGP information for the current context.

**Example**

The following command displays information for all BGP neighbors:

```
show ip bgp neighbors
```
show ip interface

This command displays the statistical and configuration information for the IP-based interfaces including VRF table for specific context.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show ip interface [vrf vrf-name] [ name intfc_name [statistics] [tunnel [gre-keepalive ] ] [summary] [ | (grep grep_options | more ) ]
```

- **vrf vrf-name**
  Displays the routing information of the VRF. `vrf_name` is a name used to identify a VRF.

- **name intfc_name**
  Indicates the name of the interface for which information has to be displayed. If no interface name is specified then information for all IP interfaces is displayed.
  `intfc_name` is name of the configured IP interface.

- **tunnel [ gre-keepalive ]**
  This keyword will filter the IP interface information for tunnel type of interfaces.
  It is applicable for GRE/IP-in-IP type of tunnel interfaces only.
  `gre-keepalive`: This optional keyword displays the GRE keepalive information for GRE tunnel configured with this IP interface.

- **statistics**
  Displays the session statistics of all ingress and egress packets processed through this IP interface.

- **summary**
  Displays summarized information about requested IP interface/s.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**

Use this command to display the summarized of detailed configuration and statistical information for configured IP interface. This information can be used to verify and/or troubleshooting communication difficulties between to a remote host/node.
Example
The following command displays the interface information, including statistics, for the IP interface `sampleInterface`.

```
show ip interface sampleInterface statistics
```

The following command displays the GRE keepalive information for an IP interface named `IP_grel`.

```
show ip interface IP_grel tunnel gre-keepalive
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show ip ospf

This command displays OSPF routing information.

**Product**

PDSN, HA, GGSN

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show ip ospf [ border-routers | database [ verbose ] [ ls-id ip_addr ] [ adv-router ip_addr ] [ ls-type { router | network | summary | asbr-summary | external | nssa [integer] } ] [ debugging | interface | neighbor [ details ] | route | virtual-links ]
```

- `border-routers`
  Displays all known area border routers (ABRs) and Autonomous System border routers (ASBRs) for OSPF.

- `database [ verbose ] [ ls-id ip_addr ] [ adv-router ip_addr ] [ ls-type { router | network | summary | asbr-summary | external | nssa [integer] } ]`
  Displays a summary of the database information for OSPF.

  - `verbose`: Display detailed OSPF database information.
  - `ls-id ip_addr`: Display OSPF database information for the LSAs with the specified LSID.
  - `adv-router ip_addr`: Display OSPF database information for the advertising router with the specified LSID.
  - `ls-type { router | network | summary | asbr-summary | external | nssa [integer] }`: Display OSPF database information for the specified LSA type.

- `debugging`
  Lists which debugging parameters are enabled.

- `interface`
  Displays interface information for OSPF.

- `neighbor [ details ]`
  Displays summary information about all known OSPF neighbors.

  - `details`: Displays detailed information about all known OSPF neighbors.

- `route [ summary ]`
  Displays the OSPF routing table.

  - `summary`: Displays the number of intra-area, inter-area, external-1 and external-2 routes.

- `virtual-links`
  Displays the OSPF virtual links.
show ip ospf

Usage
Use this command to display OSPF information.

Example
To display general OSPF information, enter the following command;

    show ip ospf
show ip policy-forward

Displays information for IP packet redirecting policy for HA.

**Product**

All

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show ip policy-forward
```

**Usage**

Use this command to see all the settings for IP packet redirection configuration from existing HA to new HA during upgrade.

**Important:** It is a customer specific command.

**Example**

The following command displays forward policy configuration for an HA:

```
show ip policy-forward
```
show ip pool

This command displays statistics specific to IP pools.

Product
PDSN, GGSN, HA, ASN-GW, A-BG

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show ip pool [ address {pool-name pool_name | group-name group_name} {used | free | hold | release} [limit limit]] | group-name group_name | groups | hold-timer {imsi imsi | msid msid | username username [imsi imsi | msid msid] } | overlap | pool-name pool_name | private | public | resource | static | summary | verbose | wide ]

address {pool-name pool_name | group-name group_name} {used | free | hold | release} [limit limit]
Displays IP pool addresses for the specified IP pool or pool group that are currently in the specified state.

pool-name pool_name: Show IP addresses from the IP pool with the specified name. pool_name must be the name of an existing IP pool.

group-name group_name: Show IP addresses from the IP pool group with the specified name. group_name must be the name of an existing IP pool group.

used: Display the IP addresses that are in a used state.
free: Display the IP addresses that are in a free state.
hold: Display the IP addresses that are in a hold state.
release: Display the IP addresses that are in a release state.
limit limit: The maximum number of address to display. limit must be an integer from 1 through 524287.

group-name group_name
Show information about the IP pool group with the specified name. group_name must be the name of an existing IP pool group.

groups
List information about all IP pool groups.

hold-timer {imsi imsi | msid msid | username username [imsi imsi | msid msid]}
Displays hold timer address information for the specified IMSI, MSID, or username.

imsi imsi: The IMSI for which to display hold-timer information. imsi must be a valid IMSI (International Mobile Subscriber Identity) ID which is a 15 character field that identifies the subscriber’s home country and carrier.

msid msid: The MSID for which to display hold-timer information. msid must be a mobile subscriber ID from 7 through 16 digits.

username username: The username for which to display hold-timer information. username must be an alpha and or numeric string of from 1 through 127 characters.
**Important:** Active users cannot be displayed. If an active ID or username is entered, the following error message appears: Failure: No address matching the specified information was found! Please confirm that the options used match the network architecture/deployment, i.e. IMSI/MSID only, Username only, or IMSI/MSID plus Username. Please note that this command does not apply for addresses in the used state.

**overlap**
List information on overlapping IP pools

**pool-name pool_name**
Show information about the specified IP pool. *pool_name* must be the name of an existing IP pool.

**private**
Show information about IP pools marked private.

**public**
Show information about IP pools marked public.

**resource**
Show information about resource IP pools.

**static**
Show information about static IP pools.

**summary**
Show a summary of all IP pool information.

**verbose**
Show detailed information about all IP pools.

**wide**
Show detailed information formatted to more than 80 columns.

**grep grep_options | more**
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**
Use this command to display statistics pertaining to IP Pools in the current context.

**Example**
The following command displays IP address information for an IP Pool named *pool1*:
show ip pool address pool-name pool

To display a summary list for all IP pools in the current context, enter the following command:

show ip pool summary

The following command displays IP pool information for all IP pools configured in the current context:

show ip pool verbose

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show ip ipsp

Displays the names of IP pools that are enabled for the IP pool sharing protocol (IPSP) and lists the disposition of addresses in the pools.

Product
PDSN, HA, ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
showipipsp [ summary ]
```

<table>
<thead>
<tr>
<th>summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only show the disposition of the addresses in the participating IP pools. Do not show the names of the participating IP pools.</td>
</tr>
</tbody>
</table>

Usage
Use this command to list the names of IP pools that are participating in the IPSP and list the disposition of IP addresses in those pools.

Important: For information on configuring and using IPSP refer to the System Administration and Configuration Guide.

Example
To list information on all IPSP participating pools and address disposition, enter the following command:

```
show ip ipsp
```
show ipms status

Displays the status of IPMS client service with information related to system and call events. It also displays the status of IPMS servers configured.

Product
IPMS

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax
show ipms status [summary | all | server address ip_address]

---

summary
Displays the summary of all configured IPMS client and IPMS servers.

all
Displays information for all configured IPMS client and IPMS servers.

server address ip_address
Displays status for a specific IPMS server.
ip_address is the IP address of the desired IPMS server and must be entered in IPv4 dotted decimal notation.

---

Usage
This command is used to show/verify the status or configuration of one or all IPMS server along with system and call event information.

Example
The following command displays status of an IPMS server with IP address 1.2.3.4:

show ipms status server address 1.2.3.4
**show ipsg**

Displays information and statistics specific to the IP Services Gateway service.

**Product**

IPSG

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Syntax**

```bash
show ipsg { service { all [ counters ] | name name } | sessions { all | callid num | counters { criteria } | full { criteria } | ip-address address | msid num | peer-address address | summary { criteria } | username name } | statistics [ name name | peer-address address ] } [ | { grep grep_options| more } ]
```

- **service { all [ counters ] | name name }**
  - Displays information about the configured IPSG service.
  - `all [ counters ]`: Displays information about all of the configured IPSG services on the system.
  - `name name`: Displays information about a specific IPSG service on the system. `name` must be an existing IPSG service name.

- **sessions { all | callid num | counters { criteria } | full { criteria } | ip-address address | msid num | peer-address address | summary { criteria } | username name }**
  - `all`: Displays session information including call ID, NAI, and home address for all current IPSG sessions. This is the default behavior for the `sessions` keyword.
  - `callid num`: Displays session information for a current IPSG session based on the call ID. `num` must be an existing IPSG service session call ID.
  - `counters { criteria }`: Displays session counters for sessions matching the criteria. (See `criteria` below.)
  - `full { criteria }`: Displays all available session information for sessions matching the criteria. (See `criteria` below.)
  - `ip-address address`: Displays session information for a current IPSG session based on the MSID. `num` must be an existing IPSG service session MSID.
  - `msid num`: Displays session information for a current IPSG session based on the IP address of the device sending the RADIUS accounting messages. `address` must be an existing IPSG service session IP address for the device sending the RADIUS accounting messages.
  - `peer-address address`: Displays session information for a current IPSG session based on the IP address of the subscriber. `address` must be an existing IPSG service session subscriber IP address.
  - `summary { criteria }`: Displays a summary of available session information for sessions matching the criteria. (See `criteria` below.)
  - `username name`: Displays session information for a specific IPSG session based on the username of the subscriber. `name` must be an existing IPSG service session subscriber username.

- **statistics [ name name | peer-address address ]**
  - `name name`: Displays session information for all existing IPSG service sessions.
  - `peer-address address`: Displays session information for a specific IPSG session based on the call ID. `num` must be an existing IPSG service session call ID.

- **counters { criteria }**

- **full { criteria }**

- **ip-address address**

- **msid num**

- **peer-address address**

- **summary { criteria }**

- **username name**

- **callid num**

- **all**

- **counters { criteria }**

- **full { criteria }**

- **ip-address address**

- **msid num**

- **peer-address address**

- **summary { criteria }**

- **username name**
show ipsg

**msid num**: Displays session information for a specific IPSG session based on the MSID. _num_ must be an existing IPSG service session MSID.

**peer-address address**: Displays session information for a current IPSG session based on the IP address of the device sending the RADIUS accounting messages. _address_ must be an existing IPSG service session IP address for the device sending the RADIUS accounting messages.

**username name**: Displays session information for a specific IPSG session based on the username of the subscriber. _name_ must be an existing IPSG service session subscriber username.

**statistics [ name name | peer-address address ]**: Displays the total collected statistics of all IPSG sessions since the last system restart or clear command.

- **name name**: Displays the total collected statistics of all IPSG sessions processed by a specific service since the last system restart or clear command. _name_ must be an existing IPSG service name.
- **peer-address address**: Displays the total collected statistics of all IPSG sessions associated with a specific IP address of the device responsible for sending the RADIUS accounting messages. Displayed statistics are from the last system restart or clear command.

**grep grep_options | more**: Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

**Usage**

Use this command to display information and statistics about existing IPSG services.

**Example**

The following command displays the existing IPSG services on the system:

```
show ipsg service all
```

The following command displays all the existing IPSG service sessions on the system:

```
show ipsg session all
```

The following command displays the cumulative IPSG session statistics on the system:

```
show ipsg statistics
```

The following command displays the cumulative IPSG session statistics on the system for an IPSG service named _ipsgl_

```
show ipsg statistics name ipsgl
```

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show ipv6

Displays the statistics for each rule in an IPv6 access control group.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show ipv6 access-group

show ipv6 { access-group [ statistics] | access-list [ list_name ] | interface [ summary | name interface_name [ statistics ] | neighbors | route route_ip_address }
```

**access-group [ statistics ]**
Displays all configured access groups in the current context along with the priority values.

*statistics:* Displays all configured access groups along with packet and byte counters for each IPv6 ACL rule hit for the current context. In addition, it shows the priority values.

**access-list [ list_name ]**
Indicates the output is to display the information for all access control lists or the list specified as `list_name`.

**interface [ summary | name interface_name [ statistics ]**
This command displays information about IPv6 interfaces. If no interface name is specified then information for IPv6 interfaces is displayed.

*summary:* Displays a summary of the interface information.

*name interface_name:* Displays information for the IPv6 interface specified. Must be followed by an `interface_name`.

*statistics:* Includes the number on inbound and outbound IP packets statistics that were registered by the kernel in the information displayed.

**neighbors**
Displays the neighbor discovery table for this context.

**route route_ip_address**
Indicates the route information to the address specified by `route_ip_address` is to be displayed. The route gateway address may be specified as needed to identify the route. `route_ip_address` using colon (`:`) separated notation.

**Usage**
Show the IPv6 information to verify and/or troubleshoot communication difficulties between to a remote host/node.
Example
The following command displays the ACL for the list named sampleACL.

    show ipv6 access-list samplev6ACL

The following command displays the interface information, including statistics, for the IPv6 interface samplev6Interface.

    show ipv6 interface samplev6Interface statistics

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show ipv6 pool

Displays information for ipv6 pools.

Product
PDSN, GGSN, ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ipv6 pools [ name ipv6 pool name|group-name name| { grep grep_options | more } ]
```

**name ipv6 name**
Displays information for a specified ipv6 pool.

**group-name name**
Displays information for a specified IPv6 pools group.

`name` is the name of the group of IPv6 pool and must be a string having 1 to 79 alpha and/or numeric characters.

**grep grep_options | more**
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
Use this command to see all the ipv6 pools.

Example
The following command displays ipv6 pool information:

```
show ipv6 pools
```
show iups-service

This command displays information for Iu-PS services in the current context.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show iups-service { all | name srvc_name }{ rnc { all | mcc mcc_num mnc mnc_num | rnc_id } }

| all |
| Show information for all IuPS services. |

| name srvc_name |
| srvc_name: must be a string of 1 to 63 alphanumeric characters that identifies a specific existing IuPS service. |

| rnc all |
| Displays information for all configured RNCs. |

| rnc mcc mcc_num mnc mnc_num |
| Displays information for a specific RNC. |
| •mcc_num: The Mobile Country Code (MCC) of the RNC. Must be a 3 digit integer from 200 through 999. |
| •mnc_num: The Mobile Network Code (MNC) of the RNC. Must be a 2 or 3 digit integer from 00 through 999. |

| rnc rnc_id |
| rnc_id: The identification number of the RNC configuration instance. Must be an integer from 0 to 4095. |

Usage
Use this command to display information for a specific Iu-PS service or for all Iu-PS services configured within the context. It is also possible, but not required, to fine-tune the display to only provide information for a specific RNC.
Iu-PS services control the interface between the SGSN and the RNCs in the UMTS Radio Access Network (UTRAN). Iu-PS services include the control plane and the data plane between these nodes.

Example
The following command displays information for a single Iu-PS service named iups-svc-1:

show iups-service name iups-svc-1
The next command displays information for all Iu-PS services configured in the current context:

`show iups-service all`

This command displays information for a specific RNC for a specific Iu-PS services:

`show iups-service name iups-svc-1 rnc 123`

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show l2tp sessions

Displays information for L2TP tunnels.

Product
LNS, PDSN, GGSN, HA

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
full
Shows all available information for the specified sessions.

summary
Shows a summary of available information for the specified sessions.

counters
Shows counters for the specified L2TP sessions.

all
Shows all current sessions.

callid id
Show session information for the specified call id. The output of the command `show l2tp tunnels` contains a field labeled Callid Hint which lists the call id information to use with this command. This is an 8-Byte Hexadecimal number.

username name
Shows session information for the specified subscriber. `username` has a string length of 1 to 127 characters. Wildcard characters $ and * are allowed.

msid ms_id
Shows session information for the mobile user identified by `ms_id`. `ms_id` must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed.

lac-service service_name
Shows all L2TP sessions in the specified LAC service.

lns-service service_name
Shows all L2TP sessions in the specified LNS service.

peer-address [ operator ] peer_address
Shows all L2TP sessions to the destination (peer LNS) at the specified IP address. The `peer_address` must be specified using the standard IPv4 dotted decimal notation.
```
In conjunction with `sessions` keyword, indicates a range of peers is to be displayed.

`peer-address [operator] peer_address` must be specified using the standard IPv4 dotted decimal notation.

`operator` implies how to logically specify a range of peer-address and it must be one of the following:

- `<`: IP address less than to specified `peer_address`
- `>=`: IP address less than or equal to specified `peer_address`
- `>=`: IP address less than to specified `peer_address`
- `less-than`: IP address less than to specified `peer_address`

### Usage

Use this command to show information for sessions in the current context.

> **Important:** If this command is executed from within the local context, cumulative session information is displayed for all contexts.

### Example

The following command displays cumulative statistics for all sessions processed within the current context:

```
show l2tp sessions
```

The following command displays all information pertaining to the L2TP session of a subscriber named `isp1vpuser1`:

```
show l2tp session full username isp1vpuser1
```

> **Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show l2tp statistics

Displays statistics for all L2TP tunnels and sessions.

Product
LNS, PDSN, GGSN, HA

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

lac-service service_name
Shows L2TP statistics for all tunnels and sessions in the specified LAC service.

lns-service service_name
Shows L2TP statistics for all tunnels and sessions in the specified LNS service.

peer-address peer_address
Shows L2TP statistics for all tunnels and sessions to the destination (peer LNS) at the specified IP address. The peer_address must be specified using the standard IPv4 dotted decimal notation.

Usage
Use this command to display statistics for L2TP services.

Example
The following command displays statistics for a specific LAC service named vpn1:

show l2tp statistics lac-service service_name

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show l2tp tunnels

Displays information for L2TP tunnels.

Product
LNS, PDSN, GGSN, HA

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>full</td>
<td>Shows all available information for the specified tunnels.</td>
</tr>
<tr>
<td>summary</td>
<td>Shows a summary of available information for the specified tunnels.</td>
</tr>
<tr>
<td>counters</td>
<td>Shows counters for the specified L2TP tunnels.</td>
</tr>
<tr>
<td>all</td>
<td>Shows all current tunnels.</td>
</tr>
<tr>
<td>callid id</td>
<td>Show tunnel information for the specified call id. The output of the command <code>show l2tp tunnels</code> contains a field labeled Callid Hint which lists the call id information to use with this command. This is an 8-Byte Hexadecimal number.</td>
</tr>
<tr>
<td>username name</td>
<td>Shows tunnel information for the specified subscriber. <code>username</code> has a string length of 1 to 127 characters. Wildcard characters $ and * are allowed.</td>
</tr>
<tr>
<td>msid ms_id</td>
<td>Shows tunnel information for the mobile user identified by <code>ms_id</code>. <code>ms_id</code> must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed.</td>
</tr>
<tr>
<td>lac-service service_name</td>
<td>Shows all L2TP tunnels in the specified LAC service.</td>
</tr>
<tr>
<td>lns-service service_name</td>
<td>Shows all L2TP tunnels in the specified LNS service.</td>
</tr>
<tr>
<td>peer-address [ operator ] peer_address</td>
<td>Shows all L2TP tunnels to the destination (peer LNS) at the specified IP address. The <code>peer_address</code> must be specified using the standard IPv4 dotted decimal notation.</td>
</tr>
</tbody>
</table>
In conjunction with `tunnels` keyword, indicates a range of peers is to be displayed. `peer-address [ operator ] peer_address` must be specified using the standard IPv4 dotted decimal notation.

`operator` implies how to logically specify a range of peer-address and it must be one of the following:

- `<`: IP address less than to specified `peer_address`
- `>`: IP address less than to specified `peer_address`
- `greater-than`: IP address less than to specified `peer_address`
- `less-than`: IP address less than to specified `peer_address`

**Usage**

Use this command to show information for tunnels in the current context.

**Example**

The following command displays all of the tunnels currently being facilitated by LAC services within the current context:

```
show l2tp tunnels all
```

The following command displays information pertaining to the L2TP tunnel(s) established for a LAC-service named `vpn1`:

```
show l2tp tunnels full lac-service vpn1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show lawful-intercept

Displays information on sessions that are currently being lawfully intercepted.

Product
PDSN, HA, GGSN, ASN-GW

Privilege
Security Administrator, Administrator, Operator, or Inspector that have l-administrator privileges.

Syntax

```
show lawful-intercept [ full ] [ all ] [ imsi imsi_value ] [ intercept-idli_id ] [ ip-addr intercept_ip_addr ] [ msid ms_id ] [ username subscriber_name ] [ statistics ]
```

<table>
<thead>
<tr>
<th><strong>full</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Display full detailed information.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>all</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Display information for all lawful intercepts.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>imsi imsi_value</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the International Mobile Subscriber Identity (IMSI) of the intercepted subscriber session.</td>
</tr>
<tr>
<td><em>imsi_value</em> is an integer value from 1 to 15 characters.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>ipaddr intercept_ip_addr</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the IP address of the intercepted subscriber session.</td>
</tr>
<tr>
<td><em>intercept_ip_addr</em> must be specified using dotted decimal notation.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>msid ms_id</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the mobile subscriber identification number of the intercepted subscriber session.</td>
</tr>
<tr>
<td><em>ms_id</em> must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>username subscriber_name</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the username of the intercepted subscriber.</td>
</tr>
<tr>
<td><em>subscriber_name</em> refers to a previously configured user.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>statistics</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Display summary statistical information for all Lawful Intercept sessions.</td>
</tr>
</tbody>
</table>

Usage
Use this command to display lawful intercept statistics.
Important: You must log in to the system through a Secure Shell (SSH) using a system account that has administrator privileges to use this command. For details on using the Lawful Intercept capability of the system, refer to System Administration and Configuration Guide.

Example
To show detailed information for a lawfully intercepted session with the MSID 0000100048, enter the following command

```
show lawful-intercept full msid 0000100048
```
show lac-service

Displays the information for all LAC services or for a particular LAC service.

Product
PDSN, HA, GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show lac-service { all | nameservice_name } [ | { grep grep_options | more } ]

- **all**
  Display information for all LAC services.

- **name service_name**
  Display information only for the LAC service specified by `service_name`.
  `service_name` is up to a 60 character name given to the service when it was originally configured.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage
Use this command to list information for LAC services configured on this system.

Example
The following commands display information for all LAC services and the LAC service named `lac1`, respectively.

```
show lac-service all
show lac-service name lac1
```
show leds

Displays the current status of the LEDs for a specific card or all cards.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show leds { all | card_num } [ | { grep grep_options | more } ]
```

- `all` | `card_num`
  - `all`: indicates the LED status for all cards is to be displayed.
  - `card_num` indicates the LED status for the card specified by `card_num` is to be displayed.

- `grep grep_options | more`
  - Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  - For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
Display the status of the LEDs as a part of an automated periodic script which checks the LEDs of the chassis.

Important: This command is not supported on all platforms.

Example
The following commands display the LED status for all cards and only card 0, respectively.

```
show leds all
```

Important: Refer to the descriptions for Card LEDs and System LEDs in `show card info` command in the Counters and Statistics Reference for information on the LED color codes.
show license information

Displays the installed license information as well as maximum number of sessions.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show licenseinformation { key_name | full } | { key } [ | { grep | grep_options } | more ]
```

- **key_name / full**
  - `key_name`: the output displays the information for the key specified as `key_name`.
  - `full`: the output displays the full features and quantities without any hardware limits in place.

- **key:**
  - indicates the output is to display the installed keys in encrypted format.

- **grep grep_options | more**
  - Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  - For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Show the license information to verify the proper keys have been installed. This command is also helpful in troubleshooting user system access due to the maximum number of sessions being reached.

Example

The following displays the encrypted installed key and the information for `sampleKey` respectively.

```
show license information
```
show linecard table

Displays information on the rear-installed interface cards.

**Product**

All

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Syntax**

```markdown
show linecard table [ | { grep grep_options | more } ]
```

<table>
<thead>
<tr>
<th><strong>table</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays information on all linecard slots in tabular format.</td>
</tr>
</tbody>
</table>

| **grep grep_options | more** |
|---------------------|
| Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. For details on the usage of `grep` and `more`, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*. |

**Usage**

Show the line card information to verify hardware inventories and installed components.

**Important:** This command is not supported on all platforms.

**Example**

```bash
show linecard table
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show lma-service

Displays statistic and counter information for Local Mobility Anchor (LMA) services on this system.

Product
P-GW

Privilege
Inspector

Syntax

show lma-service all

show lma-service name service_name

show lma-service session [ all | callid id | counters | full | ipv6-address { <address | >address | address | greater-than address [ less-than address ] | less-than address [ greater-than address ] } | summary | username name ]

show lma-service statistics [ lma-service name ] [ [ | { grep grep_options | more } ]]

all
Displays information about all configured LMA services on this system.

name service_name
Displays configuration information for a specific LMA service configured on this system.

session [ all | callid id | counters | full | ipv6-address { <address | >address | address | greater-than address [ less-than address ] | less-than address [ greater-than address ] } | summary | username name ]

Displays session information filtered by the following parameters:

- all: Displays all active LMA sessions using LMA services on the system.
- callid id: Displays available session information for the specific call identification number. id must be an eight-digit HEX number.
- counters: Displays session counters for active LMA sessions using LMA services on the system. This keyword can also be filtered by the following:
  - all
  - callid
  - ipv6-address
  - username

Refer to the keyword descriptions in this command for information regarding these filters.

full: Displays additional session information for active LMA sessions using LMA services on the system. This keyword includes the information in the output of the ‘all’ keyword plus additional information. This keyword can also be filtered by the following:

- all
show lma-service

- `callid`
- `ipv6-address`
- `username`

Refer to the keyword descriptions in this command for information regarding these filters.

**ipv6-address:**
- `<address` and `less-than address`: Displays summary information for a group of IPv6 addresses that are less than the specified IPv6 address using one of these keywords. A range can be specified by including an address with the `greater-than` option. `address` must be specified in colon separated notation.
- `>address` and `greater-than address`: Displays summary information for a group of IPv6 addresses that are greater than the specified IPv6 address using one of these keywords. A range can be specified by including an address with the `less-than` option. `address` must be specified in colon separated notation.
- `address`: Displays summary information for a specific IPv6 address using an LMA service on this system. `address` must be specified in colon separated notation.

**summary** Displays the number of LMA sessions currently active for LMA services configured on the system.

**username name**: Displays available session information for a specific user in a service session. `name` must be followed by an existing user name and must be from 1 to 127 alpha and/or numeric characters.

**statistics [ lma-service name ]**

`lma-service name`: Displays LMA service statistics for a specific LMA service. `name` must be an existing LMA service and be from 1 to 63 alpha and/or numeric characters.

| { grep grep_options | more }

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section of Chapter 1 of the Command Line Interface Reference Guide.

**Usage**

Use this command to view configuration information for LMA services on this system.

**Example**

The following command displays service statistics for the LMA service named `lma1`:

```
show lma-service name lma1
```
show lns-service

Displays the information for all LNS services or for a particular LNS service.

Product
PDSN, HA, GGSN, LNS

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show lns-service { all | nameservice_name } [ | { grep grep_options | more } ]
```

- **all**
  Display information for all LNS services.

- **name service_name**
  Display information only for the LNS service specified by `service_name`.
  `service_name` is up to a 60 character name given to the service when it was originally configured.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the `Regulating a Command’s Output` section of the `Command Line Interface Overview` chapter in the `Command Line Interface Reference`.

Usage

Use this command to list information for LNS services configured on this system.

Example

The following commands display information for all LNS services and the LNS service named lns1, respectively.

```
show lns-service all
show lns-service name lns1
```
show local-user

Displays information pertaining to local-user accounts.

Product
All

Privilege
Security Administrator

Syntax

```
show local-user [ [ username name ] [ inactive filter ] [ verbose | wide ] ]
statistics [ verbose ]
```

**username name**
Specifies the name of a specific local-user administrative account for which to display information. name can be from 3 to 16 alpha and/or numeric characters in length and is case sensitive.

**inactive filter**
Specifies a filter for displaying inactive local-user accounts. filter can be one of the following:

- `< days`: Displays accounts that have been inactive less than the specified number of days.
- `>` days`: Displays accounts that have been inactive more than the specified number of days.
- `greater-than days`: Displays accounts that have been inactive more than the specified number of days.
- `less-than days`: Displays accounts that have been inactive less than the specified number of days.

days can be configured to any integer value from 1 to 365.

**[ verbose | wide ]**
Default: wide
Specifies how the information is to be displayed as one of the following options:

- `verbose` : The data is displayed in list format. Additional information is provided beyond what is displayed when the wide option is used.
- `wide` : The data is displayed in tabular format.

**statistics [ verbose ]**
Displays local-user statistics.
Using the `verbose` keyword displays additional statistics.

Usage

Use this command to display information and statistics on local-user administrative accounts.

Example

The following command displays detailed information on local-user administrative accounts that have been inactive for more than 10 days:
show local-user

**show local-user inactive greater-than 10 verbose**

The following command displays detailed information for a local-user account named Test:

**show local-user username Test verbose**

The following command displays detailed local-user account statistics:

**show local-user statistics verbose**

---

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*.
show logging

Displays the defined logging filters for the current context.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show logging [ active | verbose ] [ | { grep grep_options | more } ]

active | verbose
Default: all facilities are shown in concise form.
active: indicates only the active CLI logging filter information is to be displayed.
verbose: indicates the output should provide as much information as possible.

grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send
output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the
Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
View log filters to trouble shoot disk utilization issues.

Example
show logging
show logging active
show logging verbose
show logging active verbose
**show logs**

Displays active and inactive logs filtered by the options specified.

**Product**
- All

**Privilege**
- Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show logs [ active ] [ inactive ] [ callid call_id ] [ event-verbosistyevt_verboseness] [ facility facility ] [ level severity_level ] [ pdu-data pdu_format ] [ pdu-verbosisty pdu_verboseness ] [ procler facility ] [ since from_date_time [ until to_date_time ] ] [ | { grep grep_options | more } ]
```

**active**
Indicates output is to display data from active logs.

**inactive**
Indicates output is to display data from inactive logs.

**callid call_id**
Specifies a call ID for which log information is to be displayed. `call_id` must be specified as a 4-byte hexadecimal number.

**event-verbosisty evt_verboseness**
Specifies the level of verbosity to use in displaying of event data as one of:
- **min** - displays minimal information about the event. Information includes event name, facility, event ID, severity level, date, and time.
- **concise** - displays detailed information about the event, but does not provide the event source within the system.
- **full** - displays detailed information about event, including source information, identifying where within the system the event was generated.

**facility facility**
Specifies the facility to modify the filtering of logged information for as one of:
- **a10**: A10 interface facility
- **a11**: A11 interface facility
- **a1mgr**: A11 Manager facility
- **aaa-client**: AAA client facility
- **aaamgr**: AAA manager logging facility
- **aaaproxy**: AAA Proxy facility
- **acl-log**: Access Control List logging facility
- **acsctrl**: Active Charging Service (ACS) Controller facility
- **acsmgr**: Active Charging Service (ACS) Manager facility
- **alarmctrl**: Alarm Controller facility
- **all**: All facilities
- **asf**: Voice Application Server Framework logging facility
- **asfprt**: ASF Protocol Task (SIP) logging facility
- **asngwmgr**: ASN Gateway Manager facility
- **asnpemgr**: ASN Paging Controller/Location-Registry Manager facility
- **bgp**: Border Gateway Protocol (BGP) facility
- **cli**: CLI logging facility
- **cscf**: IMS/MMD CSCF
- **cscfmgr**: SIP CSCF Manager facility
- **csp**: Card Slot Port controller facility
- **css**: Content Service Selection (CSS) facility
- **css-sig**: Content Service Selection (CSS) RADIUS Signaling facility
- **dcardctrl**: IPSEC Daughtercard Controller logging facility (not used at this time)
- **dcardmgr**: IPSEC Daughtercard Manager logging facility (Not used at this time)
- **dhcp**: DHCP facility (GGSN product only)
- **dhost**: Distributed Host logging facility
- **diameter**: Diameter endpoint logging facility
- **diameter-acct**: Diameter Accounting
- **diameter-auth**: Diameter Authentication
- **diameter-ecs**: ECS Diameter signaling facility
- **diameter-svc**: Diameter Service
- **diamproxy**: DiamProxy logging facility
- **dpath**: IPSEC Data Path facility
- **drvctrl**: Driver Controller facility
- **egtpc**: eGTP-C logging facility
- **egtpmgr**: eGTP manager logging facility
- **evlog**: Event log facility
- **famgr**: Foreign Agent manager logging facility
- **firewall**: Firewall logging facility
- **gss-gcdr**: GTPP Storage Server GCDR facility
- **gtpc**: GTP-C protocol logging facility (GGSN product only)
- **gtpcemgr**: GTP-C protocol Manager logging facility (GGSN product only)
- **gtp**: GTP-PRIME protocol logging facility (GGSN product only)
- **gtpu**: GTP-U protocol logging facility (GGSN product only)
• **h248prt**: H.248 Protocol logging facility
• **hamgr**: Home Agent manager logging facility
• **hat**: High Availability Task (HAT) process facility
• **ims-authoriztn**: IMS Authorization Service facility
• **ip-arp**: IP Address Resolution Protocol facility
• **ip-interface**: IP interface facility
• **ip-route**: IP route facility
• **ipsec**: IP Security logging facility
• **ipsgmgr**: IP Services Gateway facility
• **ips**: IP Pool Sharing Protocol logging facility
• **l2tp-control**: L2TP control logging facility
• **l2tp-data**: L2TP data logging facility
• **l2tpdemux**: L2TP Demux Manager logging facility
• **l2tpmgr**: L2TP Manager logging facility
• **li**: Lawful intercept facility (Logs are visible only to system accounts with li-administrator privileges.)
• **magmgr**: Mobile Access Gateway manager logging facility
• **mme-app**: Mobility Management Entity Application logging facility
• **mmedemux**: Mobility Management Entity Demux Manager logging facility
• **mme-hss**: Mobility Management Entity logging facility
• **mme-misc**: Mobility Management Entity Miscellaneous logging facility
• **mobile-ip**: Mobile IP processes
• **mobile-ip-data**: Mobile IP data facility
• **mobile-ipv6**: Mobile IPv6 logging facility
• **multicast-proxy**: Multicast Proxy logging facility
• **nas**: Network Access Signaling logging facility
• **netwstrg**: Network Storage facility
• **npctrl**: Network Processor Unit Control facility
• **npumgr**: Network Processor Unit Manager facility
• **nctrl**: Charging Service Controller facility (supported in conjunction with ECSv1)
• **nsmgr**: Charging Service Manager facility
• **nsproc**: Charging Service process facility
• **orbs**: Object Request Broker System logging facility
• **ospf**: OSPF logging facility
• **pgw**: PDN Gateway logging facility
• **ppp**: PPP link and packet facilities
• **radius-acct**: RADIUS accounting logging facility
• **radius-auth**: RADIUS authentication logging facility
show logs

- radius-coa: RADIUS change of authorization and radius disconnect
- rct: Recovery Control Task logging facility
- rdt: Redirect Task logging facility
- resmgr: Resource Manager logging facility
- rip: RIP logging facility (RIP is not supported at this time.)
- rohc: RObust Header Compression facility
- rsvp: Reservation Protocol logging facility
- sct: Shared Configuration Task logging facility
- sessctrl: Session Controller logging facility
- sessmgr: Session Manager logging facility
- st: Switch Fabric Task logging facility
- sgpw: Serving Gateway logging facility
- sipcdprt: Sip Call Distributor facility
- sitmain: System Initialization Task main logging facility
- snmp: SNMP logging facility
- srdb: Static Rating Database
- srp: Service Redundancy Protocol (SRP) logging facility
- ssh-ipsec: SSH IP Security logging facility
- stat: Statistics logging facility
- system: System logging facility
- tacacplus: TACACS+ Protocol logging facility
- threshold: threshold logging facility
- udr: User detail record facility (used with the Charging Service)
- user-data: User data logging facility
- user-l3tunnel: User layer-3 tunnel logging facility
- vpn: Virtual Private Network logging facility
- wimax-data: WiMAX DATA
- wimax-r6: WiMAX R6

```
level severity_level
```

`level severity_level` specifies the level of information to be logged, `severity_level`, from the following list which is ordered from highest to lowest:

- critical - display critical events
- error - display error events and all events with a higher severity level
- warning - display warning events and all events with a higher severity level
- unusual - display unusual events and all events with a higher severity level
- info - display info events and all events with a higher severity level
- trace - display trace events and all events with a higher severity level
show logs

- debug - display all events

**pdu-data pdu_format**
Specifies output format for the display of packet data units as one of:
- none - output is in raw format (unformatted).
- hex - output being displayed in hexadecimal format.
- hex-ascii - output being displayed in hexadecimal and ASCII similar to a main-frame dump.

**pdu-verbosity pduverbosity**
Specifies the level of verboseness to use in displaying of packet data units as a value from 1 to 5 where 5 is the most detailed.

**proclet facility**
Shows the logs from a specific proclet facility. The available facilities are the same as those listed earlier.

**since from_date_time [ until to_date_time ]**
Default: no limit.
**since from_date_time:** indicates only the log information which has been collected more recently than **from_date_time** is to be displayed.
**until to_date_time:** indicates no log information more recent than **to_date_time** is to be displayed. **until** defaults to current time when omitted.
**from_date_time** and **to_date_time** must be formatted as YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss. Where YYYY is a 4-digit year, MM is a 2-digit month in the range 01 through 12, DD is a 2-digit day in the range 01 through 31, HH is a 2-digit hour in the range 00 through 23, mm is a 2-digit minute in the range 00 through 59, and ss is a 2-dig second in the range 00 through 59.
**to_date_time** must be a time which is more recent than **from_date_time**.
The use of the **until** keyword allows for a time range of log information while only using the **since** keyword will display all information up to the current time.

**grep grep_options | more**
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

**Usage**
View log files for general maintenance or troubleshooting system issues.

**Example**
The following commands display log information for the **allmgr** facility starting with February 20th, 2003 at midnight where both are equivalent.

**show logs facility allmgr since 2003:02:20:00:00**

**show logs facility allmgr since 2003:02:20:00:00:00**

The following command displays the log information for call ID **FE881D32** only in active logs.
show logs active callid FE881D32
Chapter 95
Exec Mode Show Commands (M-P)

This section includes the commands `show m3ua statistics` through `show profile-id-qci-mapping`. 
show mag-service

Displays statistic and counter information for Mobile Access Gateway (MAG) services on this system.

Product
HSGW, S-GW

Privilege
Inspector

Syntax

```
show mag-service { all | name service_name | session [ all | callid id | counters | full | msid id | summary | username name ] | statistics [ name service_name ] } [ | { grep grep_options | more } ]
```

**all**
Displays information for all configured MAG services on this system.

**name service_name**
Displays configuration information for a specific MAG service configured on this system.

_service_name_ must be an existing MAG service, and be from 1 to 63 alpha and/or numeric characters in length.

**session [ all | callid id | counters | full | msid id | summary | username name ]**

_all:_ Displays all active MAG sessions using MAG services on the system.

_callid id:_ Displays available session information for the specific call identification number. _id_ must be an eight-digit HEX number.

_counters:_ Displays counters for all MAG services on the system. This keyword can also be filtered by the following:

- _all_
- _callid_
- _msid_
- _username_

Refer to the keyword descriptions in this command for information regarding these filters.

_full:_ Displays additional session information for all active MAG sessions using MAG services on the system. This keyword includes the information in the output of the ‘all’ keyword plus additional information. This keyword can also be filtered by the following:

- _all_
- _callid_
- _msid_
- _username_

Refer to the keyword descriptions in this command for information regarding these filters.

_msid id:_ Displays available information for a specific mobile station identification number or group of numbers based on wildcard entry. _id_ must be a valid MSID number and can be a sequence of characters.
and/or wildcard characters ('$' and/or '*'). The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as wildcard enclose them in single quotes (''). For example: ‘$’.

**summary** Displays the number of MAG sessions currently active for MAG services configured on the system.

**username name** Displays available session information for a specific user in a service session. *name* must be followed by an existing user name and must be from 1 to 127 alpha and/or numeric characters.

**statistics [ name service_name ]**

- **name service_name** Displays MAG service statistics for a specific MAG service. *service_name* must be an existing MAG service and be from 1 to 63 alpha and/or numeric characters.

| { grep grep_options | more } |

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. For details on the usage of the *grep* and *more* commands, refer to the Regulating a Command’s Output section of Chapter 1 of the Command Line Interface Reference Guide.

**Usage**

Use this command to view configuration information for MAG services on this system.

**Example**

The following command displays service statistics for the MAG service named *mag1*:

```
show mag-service name mag1
```
show map-service

Displays information configured for the Mobile Application Part (MAP) services, including MAP service features and operational configuration. Also includes some related configuration information for the HLR and EIR configuration parameters.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show map-service [ all | name srvc_name ]

name srvc_name

srvc_name: must be a string of 1 to 63 alphanumeric characters that identifies a specific existing MAP service.

Usage
Use this command to display all MAP service or the statistics for a particular MAP service.

Example
The following command displays configuration information for the MAP service named map-svc-1:

    show map-service name map-svc-1

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show map statistics

Displays Mobile Application Part (MAP) statistics.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show map statistics [ name svc_name ]
```

- `name svc_name`
  - `svc_name`: must be a string of 1 to 63 alphanumeric characters that identifies a specific existing MAP service.

Usage

Use this command to display all MAP statistics or the statistics for a particular MAP service.

Example

The following command displays statistics for the MAP service named `map-svc-1`:

```
show map statistics name map-svc-1
```

The following command displays combined statistics for all MAP services in the current context:

```
show map statistics
```

`Important:` Output descriptions for commands are available in the *Statistics and Counters Reference.*
show maximum-temperatures

Shows the maximum temperature reached by each card since the last temperature timestamp reset.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```plaintext
show maximum-temperatures [ verbose] [ | { grep grep_options | more } ]
```

| grep grep_options | more |
---|---|
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

| verbose |
---|
Indicates that the output is to contain detailed information.

Usage
Verify the maximum temperature reached by components in the chassis since the indicated timestamp.

**Important:** This command is not supported on all platforms.

Example

```plaintext
show maximum-temperatures
show maximum-temperatures verbose
```
show mbms bearer-service

Displays configuration information for bearer service configured for multimedia broadcast and multicast facility on this system.

**Product**
GGSN, SGSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show mbms bearer-service [ all | apn apn_name mcast-addr ip_address | service-type { broadcast | multicast } | full | instance instance_id | summary ] + | | { grep grep_options | more } ]
```

- **all**
  Displays information on all bearer services configured on the system.

- **apn apn_name mcast-addr ip_address**
  Displays bearer service information of MBMS for a specific APN `apn_name` bind to given BM-SC (Broadcast Multicast - Service Center) server address `ip_address`.
  `apn_name` is the name of the APN and can be from 1 to 62 alpha and/or numeric characters and is case sensitive.
  `ip_address` is the IP address of the BM-SC server in IPv4 dotted decimal notation bind to the APN.

- **service-type { broadcast | multicast }**
  Displays information for a specific type of service for MBMS.
  broadcast: Specifies the MBMS service type as broadcast only.
  multicast: Specifies the MBMS service type as multicast only.

- **full**
  Displays full information for specific or all instances of bearer service in MBMS feature on system.

- **instance instance_id**
  Displays session information filtered for specific instances of bearer service in MBMS feature on system.
  `instance_id` is the indicator for bearer service running for MBMS session and it must be an integer from 1 through 64.

- **summary**
  Displays summary information for specific or all instances of bearer service in MBMS feature on system.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more` options, refer to the Regulating a Command’s Output section of the Command Line Interface Reference.
show mbms bearer-service

Usage

Use this command to verify the configuration of one or all bearer services and active instances of bearer services under MBMS feature. It is also useful for monitoring or troubleshooting purposes. If this command is executed from within the local context with the all keyword, information for all bearer service instances running under MBMS feature configured on the system will be displayed.

Example

The following command displays configuration information for all bearer service instances running on system:

    show mbms bearer-service full all

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show mipfa

Displays the foreign agent information for the mobile IP calls specified.

Product
PDSN, GGSN, ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show mipfa { [ [ counters | full | summary ] { all | callid call_id | msid ms_id | peer-address [ operator ] peer_address | reverse-tunnel { on | off } ] | username user_name } | statistics [ fa-service fa_name | peer-address [ peer_address | greater-than peer_address | less-than peer_address | > peer_address | < peer_address ] ] | peers fa-service service_name [ current-sessions { { > | greater-than } sessions | < sessions } | { < | less-than } sessions | > sessions ] | sessions ] | peer-address address ] ) } [ [ grep grep_options | more ] ]
```

counters | full | summary

Default: concise output.
counters: indicates the output is to include the statistic counters.
full: indicates detailed information is to be displayed.
summary: indicates only summary information is to be displayed.
These options are not available in conjunction with the statistics keyword.

all | callid call_id | msid ms_id | peer-address peer_ip_address | reverse-tunnel { on | off } | username user_name

all: indicates all available information is to be displayed.
callid call_id: indicates the information only for calls with Id call_id are to be displayed.
msid ms_id: must be specified as a 4-byte hexadecimal number.
peer-address peer_ip_address: specifies a mobile subscriber ID only for which information is to be displayed. ms_id must be from 7 to 16 digits specified as an IMSI, MIN, or RMI and /or characters $ and * for wildcard filter.
reverse-tunnel { on | off }: will show any subscriber with a MSID that match the upper 8 digits of MSID supplied, i.e. 01234567 and any 2 digits at remaining 2 places.
username user_name: specifies a user only for which MIP call information is to been displayed where the user is specified as user_name.
user_name: must be a sequence of character and /or wildcard characters $ and * for wildcard matching with a string length of 1 to 127 characters.
show mipfa

```
statistics [ fa-service fa_name | peer-address [ peer_address | greater-than peer_address | less-than peer_address | > peer_address | < peer_address ]
```

Indicates the statistics information is to be displayed for foreign agent service specified as `fa_name` or for the peer specified by the address `peer_address`.

- **fa-service `fa_name`**: indicates the statistic information for the peer specified is to be displayed. `fa_name` must be from 1 to 63 alpha and/or numeric characters.
- **peer-address `peer_address`**: indicates the statistic information for the peer specified is to be displayed. `peer_address` must be specified using the standard IPv4 dotted decimal notation.
- **greater-than `peer_address`**: Specifies the range of IPv4 addresses greater than `peer_address`.
- **less-than `peer_address`**: Specifies the range of IPv4 addresses less than `peer_address`.

```
peer-address [ operator ] peer_address
```

In conjunction with `mipfa [ summary ] peer-address` keyword, indicates a range of peers is to be displayed.

- **peer-address [ operator ] peer_address**: must be specified using the standard IPv4 dotted decimal notation.
- **operator**: implies how to logically specify a range of peer-address and it must be one of the following:
  - `<`: IP address less than to specified `peer_address`
  - `>`: IP address less than to specified `peer_address`
  - `greater-than`: IP address less than to specified `peer_address`
  - `less-than`: IP address less than to specified `peer_address`

```
peers fa-service service_name [ current-sessions { ( > | greater-than ) sessions [ < sessions ] | ( < | less-than ) sessions [ > sessions ] } | sessions ] [ peer-address address ]
```

Displays peer servers for the specified FA service.

- **fa-service `service_name`**: Specifies the name of the FA service from which the associated peer servers are to be displayed. `service_name` must be an existing FA service and be from 1 to 63 alpha and/or numeric characters in length.
- **current-sessions**: Displays only peer servers with current sessions meeting the following criteria:
  - `>` or `greater-than sessions`: Displays only peer servers currently running sessions higher than the value entered in this parameter. `sessions` must be an integer from 1 to 3000000. **Note**: the keyword “greater-than” and the “>” symbol are interchangeable in this instance of the command.
  - `< sessions`: Displays only peer servers that are currently running sessions higher than the `greater-than` parameter but less than the value entered in this parameter. `sessions` must be an integer from 1 to 3000000.
  - `less-than sessions`: Displays only peer servers currently running sessions lower than the value entered in this parameter. `sessions` must be an integer from 1 to 3000000. **Note**: the keyword “less-than” and the “<” symbol are interchangeable in this instance of the command.
  - `>` or `sessions`: Displays only peer servers that are currently running sessions lower than the `less-than` parameter but more than the value entered in this parameter. `sessions` must be an integer from 1 to 3000000.
  - `sessions`: Displays only peer servers currently running sessions that are equal to the value entered in this parameter. `sessions` must be an integer from 1 to 3000000.
peer-address address: Displays only peer servers matching the IP address entered in this parameter. 
address must be specified using IPv4 dotted decimal notation and can be followed by the netmask of the address.

```
grep grep_options | more
```
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

**Usage**
View MIP foreign agent information to support troubleshooting subscriber issues by viewing call information and filtering on the subscriber information using various methods.

**Example**
The following displays the call information for all mobile IP FA calls and statistics for `fal`, respectively.

```
show mipfa all
```
The following command displays the statistics for the foreign agent service `fal`.

```
show mipfa statistics fa-service fal
```
The following commands displays call information for user `user0@aaa` in full detail and in summary.

```
show mipfa full username user0@aaa
show mipfa summary username user1
```
The following displays MIP FA call information for calls from mobile subscriber `4412345678` and peer address `1.2.3.4`, respectively.

```
show mipfa msid 4412345678
show mipfa peer-address 1.2.3.4
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show mipha

Displays the home agent information for the mobile IP calls specified.

Product
HA

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show mipha [ [ counters | full | summary ] { all | callid call_id | imsi imsi_num | ip-address ip_addr | msid msid_num | peer-address [ operator ] peer_address | reverse-tunnel { on | off } | username user_name } | statistics [ ha-service ha_name | peer-address peer_address ] ] ] | peers ha-service service_name [ current-sessions { { > | greater-than } sessions { < sessions } | { < | less-than } sessions [ > sessions ] | sessions ] } ] [ { grep grep_options | more } ]
```

counters | full | summary
Default: concise output.
counters: indicates the output is to include the statistic counters.
full: indicates detailed information is to be displayed.
summary: indicates only summary information is to be displayed.
These options are not available in conjunction with the statistics keyword.

```
msid msid_num
```
Displays the subscriber with supplied MSID on HA.

msid/msid_num specifies a mobile subscriber ID only for which information is to be displayed. ms_id must be from 7 to 16 digits hexadecimal digit specified as an IMSI, MIN, or RMI and /or characters $ and * for wildcard filter.

In case of enforce imsi-min equivalence is enabled on the chasis and MIN or IMSI numbers supplied, this keyword/ filter will show subscribers with a corresponding MSID (MIN or IMSI) whose lower 10 digits matches to lower 10 digits of the supplied MSID.

```
show mipha msid ABCD0123456789 or
show mipha msid 0123456789
```
will show any subscriber with a MSID that match the lower 10 digits of MSID supplied, i.e. 0123456789.

```
show mipha msid 01234567$E
```
will show any subscriber with a MSID that match the upper 8 digits of MSID supplied, i.e. 01234567 and any 2 digits at remaining 2 places.

```
all | callid call_id | imsi imsi_num | ip-address ip_addr | msid msid_num | peer-address [ operator ] peer_address | reverse-tunnel { on | off } | username user_name
```

all: indicates all available information is to be displayed.
callid call_id: indicates the information only for calls with Id call_id are to be displayed.
call_id must be specified as a 4-byte hexadecimal number.
**imsi imsi_num** Specifies an international mobile subscriber ID only for which information is to be displayed. The IMSI (International Mobile Subscriber Identity) ID is a 15 character field which identifies the subscriber’s home country and carrier.

**ip-address ip_addr**: Show statistics for a call that has the specified IP address assigned. *ip_addr* must be an IPv4 address specified in decimal notation.

**msid msid_num** Specifies a mobile subscriber ID only for which information is to be displayed. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

**peer-address peer_address**: indicates the statistic information for the peer specified is to be displayed. *peer_address* must be specified using the standard IPv4 dotted decimal notation.

**reverse-tunnel { on | off }**: specifies either the on or off reverse IP tunnels information is to be displayed.

**username user_name**: specifies a user only for which MIP call information is to be displayed where the user is specified as *user_name*. *user_name* must be a sequence of character and/or wildcard characters $ and * for wildcard matching with a string length of 1 to 127 characters.

**peer-address [ operator ] peer_address**

In conjunction with **mipha [ summary ] peer-address** keyword, indicates a range of peers is to be displayed. *peer_address* must be specified using the standard IPv4 dotted decimal notation.

*operator* implies how to logically specify a range of peer-address and it must be one of the following:

- `<`: IP address less than to specified *peer_address*
- `>`: IP address less than to specified *peer_address*
- `*:` IP address less than to specified *peer_address*
- `less-than`: IP address less than to specified *peer_address*

**statistics [ ha-service ha_name | peer-address peer_address ]**

Indicates the statistics information is to be displayed for home agent service specified as *ha_name* or for the peer specified by the address *peer_address*.

*ha-service ha_name*: indicates the statistic information for the peer specified is to be displayed. *ha_name* must be from 1 to 63 alpha and/or numeric characters.

*peer-address peer_address*: indicates the statistic information for the peer specified is to be displayed. *peer-address peer_address* must be specified using the standard IPv4 dotted decimal notation.

**peers ha-service service_name [ current-sessions { { > | greater-than } sessions [ < sessions ] | { < | less-than } sessions [ > sessions ] | sessions ] } ] [ peer-address address ]**

Displays peer servers for the specified HA service.

*ha-service service_name*: Specifies the name of the HA service from which the associated peer servers are to be displayed. *service_name* must be an existing HA service and be from 1 to 63 alpha and/or numeric characters in length.

*current-sessions*: Displays only peer servers with current sessions meeting the following criteria:

- `>`: greater-than *sessions*: Displays only peer servers currently running sessions higher than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000. **Note**: the keyword “greater-than” and the “>” symbol are interchangeable in this instance of the command.
show mipha

- `< sessions`: Displays only peer servers that are currently running sessions higher than the `greater-than` parameter but less than the value entered in this parameter. `sessions` must be an integer from 1 to 3000000.
- `< | less-than sessions`: Displays only peer servers currently running sessions lower than the value entered in this parameter. `sessions` must be an integer from 1 to 3000000. **Note**: the keyword “`less-than`” and the “`<`” symbol are interchangeable in this instance of the command.
- `> sessions`: Displays only peer servers that are currently running sessions lower than the `less-than` parameter but more than the value entered in this parameter. `sessions` must be an integer from 1 to 3000000.
- `sessions`: Displays only peer servers currently running sessions that are equal to the value entered in this parameter. `sessions` must be an integer from 1 to 3000000.

peer-address `address`: Displays only peer servers matching the IP address entered in this parameter. `address` must be specified using IPv4 dotted decimal notation and can be followed by the netmask of the address.

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

## Usage
View MIP home agent information to support troubleshooting subscriber issues by viewing call information and filtering on the subscriber information using various methods.

## Example
The following displays the call information for all mobile IP HA calls and statistics for `halt`, respectively.

```
show mipha all
show mipha statistics ha-service halt
```

The following commands displays call information for user `ispluser1` in full detail and in summary.

```
show mipha full username ispluser1
show mipha summary username user1
```

The following displays MIP HA call information for calls from mobile subscribers with reverse tunneling `off` and peer address `1.2.3.4`, respectively.

```
show mipha reverse-tunnel off
show mipha peer-address 1.2.3.4
```

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show mipv6ha

Displays MIPv6 Home Agent-based information about selected Mobile IP calls.

**Product**
PDSN, HA

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show mipv6ha [ all | callid callid | counters filter | full filter | ipv6-address ip_addr | statistics mipv6ha-service mipv6ha-service_name | summary filter | username user_name ]
```

- **all**
  Displays all information for mipv6ha calls.

- **callid call_id**
  Specifies the Call Identification number.
  *call_id* must be an eight-digit HEX number.

- **counters [ all | callid | ipv6-address | username ]**
  Displays the counters associated with the HA-based MIPv6 service. The following filters are available:
  - *all*
  - *callid:
  - *ipv6-address*
  - *username*

- **full [ all | callid | ipv6-address | username ]**
  Displays all available information for the associated display or filter keyword.
  The following filters are available:
  - *all*
  - *callid:
  - *ipv6-address*
  - *username*

- **ipv6-address ip_addr**
  Displays information for subscribers connected via the packet control function with a specific or range of IP address *ipv6_address*. The address must be specified using the IPv6 colon notation.
  - *<:* Filters output so that only information less than the specified IPv6 address value is displayed.
  - *>:* Filters output so that only information greater than the specified IPv6 address value is displayed.
  - *less-than:* Filters output so that only information less than the specified IPv6 address value is displayed.
show mipv6ha

• greater-than: Filters output so that only information greater than the specified IPv6 address value is displayed.

statistics [ mipv6ha-service mipv6ha-service_name ]
Total of collected information for specific protocol since last restart or clear command.
This can be filtered according to a specified mipv6ha-service.

summary [ all | callid | ipv6-address | username ]
Displays summary information for defined sessions, based on defined parameters.
The following filters are available:
  • all
  • callid:
  • ipv6-address
  • username

username user_name
Displays session information for a specific username.

Usage
View MIPv6 home agent information to support troubleshooting subscriber issues by viewing call information and filtering on the subscriber information using various methods.

Example
The following displays the call information for all mobile IP HA calls and statistics for ha1, respectively.

  show mipv6ha all
The following command displays call information for user mipv6hauser1 in full detail and in summary.

  show mipv6ha full username mipv6hauser1

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show mme-hss service

Displays configuration and setup information of MME-HSS service(s) running on a peer or local system.

Product
MME

Privilege
Inspector

Syntax

show mme-hss service { all | name svc_name } [verbose] [{grep grep_options | more}]

| all |
| Displays configuration/setup information for all MME-HSS services configured on this system.

| name service_name |
| Displays configuration/setup information for a specific MME-HSS service configured on this system. service_name must be an existing MME-HSS service, and be from 1 to 63 alpha and/or numeric characters in length.

| verbose |
| This keyword displays the comprehensive information of specific or set of arguments. |

| { grep grep_options | more } |
| Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. |

For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section in CLI Overview chapter of the Command Line Interface Reference.

Usage
Use this command to view configuration/setup information for MME-HSS services on this system. This command also displays the configured actions for failure handling on various types of messages.

Example
The following command displays service statistics for all MME-HSS services configured on the system:

show mme-hss service all

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show mme-hss session

Displays session information of MME-HSS service(s) running on a peer or local system.

**Product**
MME

**Privilege**
Inspector

**Syntax**

```
show mme-hss session [summary | full] [all | call-id call_identifier | mdn mdn_string | nai nai_string] [verbose] [{grep grep_options | more}]
```

**summary**
This keyword displays the summarized output of this command.

**full**
This keyword displays detailed output of this command.

**all**
This keyword displays information of all MME-HSS sessions running on this system.

**call-id call_identifier**
Displays summarized or detailed statistics of MME-HSS sessions running and filtered on the basis of the call identifier with an MME-HSS service configured on this system.
`call_identifier` must an existing call identity in eight character Hex digit format running on an MME service on system.

**mdn mdn_string**
Displays summarized or detailed statistics of MME-HSS sessions running and filtered on the basis of mobile directory Number (MDN) with an MME-HSS service configured on this system.
`mdn_string` must be an alpha and/or numeric string of 1 to100 characters in length.

**nai nai_string**
Displays summarized or detailed statistics of MME-HSS sessions running and filtered on the basis of Network Access Identifier (NAI) with an MME service configured on this system.
`nai_string` must be an alpha and/or numeric string of 1 to128 characters in length.

**verbose**
This keyword displays the comprehensive information of specific or set of arguments.

```
| {grep grep_options | more}
```

This argument searches the output of the root command and selects the lines matching one or more patterns/options. The types of patterns are controlled by the options specified with `grep_options`. 
For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section in CLI Overview chapter of the Command Line Interface Reference.

### Usage

Use this command to view detailed or summarized session statistics of MME-HSS sessions running on MME-HSS services on a system. This command also provides the various filter criteria to display the session statistics.

### Example

The following command displays information of all MME-HSS sessions of MME-HSS services running on a system:

```
show mme-hss session all
```

> **Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*.

The following command displays summarized session information of all MME-HSS sessions running on a system:

```
show mme-hss session summary all
```

> **Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*.
show mme-service

Displays configuration information for Mobility Management Entity (MME) services on this system.

**Product**
MME

**Privilege**
Inspector

**Syntax**

```
show mme-service { all | name svc_name } [verbose] [ | { grep grep_options | more }]
```

- **all**
  Displays configuration information for all MME services configured on this system.

- **name service_name**
  Displays configuration information for a specific MME service configured on this system.
  `service_name` must be an existing MME service, and be from 1 to 63 alpha and/or numeric characters in length.

- **verbose**
  This keyword displays the comprehensive information of specific or set of arguments.

  ```
  | { grep grep_options | more }
  ```

  Indicates the output of the command is to be piped (sent) to the command specified.
  A command to send output to must be specified.
  For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section in CLI Overview chapter of the Command Line Interface Reference.

**Usage**

Use this command to view configuration information for MME services on this system.

**Example**

The following command displays service statistics for the MME service named `mme1`:

```
show mme-service name mme1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show mme-service db statistics

This command displays the MME database statistics for MME sessions for all or specific session instances on this system.

Product
MME

Privilege
Inspector

Syntax

show mme-service db statistics [instance smgr_instance] [verbose] [grep grep_options | more]

instance smgr_instance
This keyword specifies that MME database statistics are to be displayed for a specific instance of session manager running for MME service. smgr_instance must be specified as an instance ID in the range 0 through 4294967295. If instance is not specified summary statistics are displayed.

verbose
This keyword displays the comprehensive information of specific or set of arguments.

| grep grep_options | more
This argument searches the output of the root command and selects the lines matching one or more patterns/options. The types of patterns are controlled by the options specified with grep_options. For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section in CLI Overview chapter of the Command Line Interface Reference.

Usage

Use this command to view database statistics for all or a particular instance of session manager for MME services on this system.

Example

The following command displays the summary database statistics for the MME service on a system:
show mme-service db statistics

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show mme-service db record

This command displays the MME database records of MME sessions grouped in session instances on this system filtered with IMSI or GUTI as criteria.

Product
MME

Privilege
Inspector

Syntax

```
show mme-service db record \{all | imsi imsi_identifier | callid call_id | guti plmn plmn_id group-id mme_grp_id code mme_code m-tmsi mtmsi_value\} [verbose] \{|grep grep_options | more\}
```

all
This keyword specifies the criteria to display all database records of a session instance used for MME service.

imsi imsi_identifier
This keyword specifies the filter criteria as International Mobile Subscriber Identity (IMSI) imsi_identifier to display the database records of a session instance. imsi_identifier is a 15 character IMSI field which identifies the subscriber’s home country and carrier. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘‘). For example; ‘$’.

callid call_id
This keyword specifies the filter criteria as call id call_id to display the database records of a session instance. call_id must be specified as an 8-byte hexadecimal number.

guti plmn plmn_id group-id mme_grp_id code mme_code m-tmsi mtmsi_value
This set of keyword specifies the filter criteria as Globally Unique Temporary Identifier (GUTI) to display the database records for an MME service. The GUTI is constructed from the GUMMEI and the M-TMSI where GUMMEI is constructed from PLMN (MMC and MNC) plmn_id and MME Identifier is constructed from an MME Group ID (MMEGI) mme_grp_id and an MME Code (MMEC) mme_code. Within the MME, the mobile is identified by the M-TMSI mtmsi_value. A GUTI has; 1) unique identity for MME which allocated the GUTI; and 2) the unique identity of the UE within the MME that allocated the GUTI. Within the MME, the mobile is identified by the M-TMSI. The Globally Unique MME Identifier (GUMMEI) is constructed from public land mobile network id (PLMN) which constructed with MCC and MNC. The MME Identifier (MMEI) is constructed from an MME Group ID (MMEGI) and an MME Code (MMEC). In other words, The GUTI is constructed from the GUMMEI and the M-TMSI.

verbose
This keyword displays the comprehensive information of specific or set of arguments.
show mme-service db record

| {grep grep_options | more}

This argument searches the output of the root command and selects the lines matching one or more patterns/options. The types of patterns are controlled by the options specified with grep_options. For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section in CLI Overview chapter of the Command Line Interface Reference.

Usage

Use this command to view database records for all or a particular instance of session manager for MME services on this system with IMSI or GUTI as a filter criteria.

Example

The following command displays the summary database records of a session instance for subscriber having IMSI as 123455432112345 in the MME service:

show mme-service db record imsi 123455432112345

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show mme-service enodeb-association

Displays configuration information of associated eNodeB with an MME services on system.

Product
MME

Privilege
Inspector

Syntax

show mme-service enodeb-association [summary | full ] [all | mme-service-name mme_svc_name | peer-address peer_ip_address | peer-id peer_identifier] [verbose] [{grep grep_options | more }]

summary
This keyword displays the summarized output of this command.

full
This keyword displays detailed output of this command.

all
This keyword displays information of all eNodeBs associated with MME services on this system.

mme-service-name mme_svc_name
Displays summarized or detailed configuration information of eNodeBs associated with specific MME service mme_svc_name configured on this system.
mme_svc_name must be an existing MME service on system.

peer-address peer_ip_address
Displays summarized or detailed configuration information of eNodeBs associated with specific MME peer address peer_ip_address configured with an MME service on this system.
peer_ip_address must be a configured peer MME IP address in IPv4/IPv6 notation with an existing MME service on system.

peer-id peer_identifier
Displays summarized or detailed configuration information of eNodeBs associated with specific MME peer id peer_identifier configured with an MME service on this system.
peer_identifier must be a configured peer MME Id between 1 through 4294967295 with an existing MME service on system.

verbose
This keyword displays the comprehensive information of specific or set of arguments.
show mme-service enodeb-association

Usage

Use this command to view configuration information of eNodeBs associated with an MME services on this system.

Example

The following command displays detailed service statistics of associated eNodeBs with MME service named mme1:

```
show mme-service enodeb-association full mme-service-name mme1
```

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show mme-service session

Displays session information of MME service(s) running on a peer or local system.

**Product**
MME

**Privilege**
Inspector

**Syntax**

```
show mme-service session [summary | full | counters] [all | s1-peer s1_peer_ip_address | s11-peer s11_peer_ip_address | call-id call_identifier | pdn-address pdn_ip_address] [verbose] [{grep grep_options | more}]
```

**summary**
This keyword displays the summarized output of this command.

**full**
This keyword displays detailed output of this command.

**counters**
This keyword displays all counters related events and messages for an MME session running on a system.

**all**
This keyword displays information of all MME sessions running on this system.

**s1-peer s1_peer_ip_address**
Displays summarized or detailed configuration information of MME session running and filtered on the basis of IP address of a peer connected through S1 interface with an MME service configured on this system. `s1_peer_ip_address` must be a configured IP address of a peer on S1 interface in IPv4/IPv6 notation with an existing MME service on system.

**s11-peer s11_peer_ip_address**
Displays summarized or detailed configuration information of MME session running and filtered on the basis of IP address of a peer connected through S11 interface with an MME service configured on this system. `s11_peer_ip_address` must be a configured IP address of a peer on S11 interface in IPv4/IPv6 notation with an existing MME service on system.

**call-id call_identifier**
Displays summarized or detailed configuration information of MME session running and filtered on the basis of the identifier of MME calls with an MME service configured on this system. `call_identifier` must an existing call identity in eight character Hex digit format running on an MME service on system.
**pdn-address pdn_ip_address**
Displays summarized or detailed configuration information of MME session running and filtered on the basis of IP address of connected PDN(s) with an MME service configured on this system.

*s11_peer_ip_address* must be a configured IP address of a peer on S11 interface in IPv4/IPv6 notation with an existing MME service on system.

**verbose**
This keyword displays the comprehensive information of specific or set of arguments.

| {grep grep_options | more} |
This argument searches the output of the root command and selects the lines matching one or more patterns/options. The types of patterns are controlled by the options specified with *grep_options*.
For details on the usage of the *grep* and *more* commands, refer to the Regulating a Command’s Output section in CLI Overview chapter of the Command Line Interface Reference.

**Usage**
Use this command to view session information of MME session in an MME services on this system.

**Example**
The following command displays detailed session statistics of an MME service running on a system:

```bash
show mme-service session full
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*.

The following command displays detailed session counters of an MME service running on a system:

```
show mme-service session counters
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 

```
show mme-service statistics

This command displays the service statistics of an MME service specified by various criteria.

Product
All

Privilege
Security Administrator, Administrator

Syntax

show mme-service statistics [sctp [mme-service mme_svc_name] | slap [mme-service mme_svc_name peer-id peer_identifier] | [emm-only | esm-only] [mme-service mme_svc_name peer-id peer_identifier] [verbose] [] | {grep grep_options | more}]

emm-only
This keyword sets the filter criteria as MME service name or peer MME identifier to display all EPS mobility management (EMM) related statistics.

esm-only
This keyword sets the filter criteria as MME service name or peer MME identifier to display all EPS session management (ESM) related statistics.

slap
This keyword sets the filter criteria as MME service name of peer MME identifier to display all S1-AP statistics.

sctp
This keyword sets the filter criteria as MME service name of peer MME identifier to display all SCTP statistics.

mme-service mme_svc_name
This keyword sets the filter criteria as MME service name to display all type of statistics of an MME service; i.e. EMM, ESM, SCTP, S1-AP, and SCTP.

peer-id peer_identifier
This keyword sets the filter criteria as identifier of MME peer to display all service statistics of an MME service; i.e. EMM, ESM, SCTP, S1-AP, and SCTP.

verbose
This keyword displays the comprehensive information of specific or set of arguments.

| { grep grep_options | more }
Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section in CLI Overview chapter of the Command Line Interface Reference.

**Usage**

This command is used to display the statistical information of an MME service based on various filter criteria as local MME service or peer MME related to EMM, ESM, SCTP, S1-AP, and SCTP.

**Example**

The following command displays the service session statistics of all MME service on a system related to all; i.e. EMM, ESM, SCTP, S1-AP, and SCTP:

```
show mme-service statistics
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*.

The following command displays the service session statistics of all MME services on a system related to S1-AP:

```
show mme-service statistics s1ap
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*.

The following command displays the service session statistics of all MME services on a system related to EMM only:

```
show mme-service statistics emm-only
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show multicast-sessions

Shows information for multicast sessions defined by the specified keywords. Keywords described under Command Keywords below are base commands that display distinctive different types of data. Keywords described under Filter Keywords are filters that modify or filter the output of the base commands. Not all filter keywords are available for all command keywords commands. Each command keyword lists the filter keywords that it accepts.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show multicast-sessions [command_keyword] [filter_keywords] [ grep grep_options | more ]
```

command_keyword
The following keywords are base commands that each have a distinct display output. Only one Command Keyword can entered on the command line.

```
default
```

Displays internal call troubleshooting information for multicast sessions defined by the specified keywords.

```
callid id
```
Displays subscriber information for the call specified by id. The call ID must be specified as an 8-byte hexadecimal number.

```
flowid id
```
Displays information for a specific BCMCS flow, defined by id. The flow ID must be a hexadecimal number.

```
full
```
Displays all available multicast session information. The following filter keywords are valid for this command:

active, all, callid, card-num, dormant, flowid, flowid-type, mcast-address, pcf, pdsn-service, grep, more

```
summary
```
Only displays a summary of multicast session information. The following commands are valid for this command:

active, all, callid, card-num, dormant, flowid, flowid-type, mcast-address, pcf, pdsn-service, grep, more

filter_keywords
The following keywords are filters that modify or filter the output of the Command Keywords. Not all filters are available for all Command Keywords. Multiple Filter Keywords can be entered on a command line. When multiple Filter Keywords are specified, the output conforms to all of the Filter Keywords specifications.

```
active
```
Only display information for multicast sessions that are currently active.
show multicast-sessions

**all**
If no keywords are specified before **all**, information for all multicast sessions is displayed. If keywords are specified before **all**, all information is displayed with no further options being allowed.

**callid id**
Displays multicast session information for the call specified by **id**. The call must be specified as an 8-byte hexadecimal number.

**card-num card_num**
The slot number of the processing card by which the subscriber session is processed. **card_num** is a slot number from 1 through 7 or 10 through 16.

**dormant**
Shows information for subscriber sessions that are dormant (not transmitting or receiving data).

**flowid id**
Displays information for a specific BCMCS flow, defined by **id**. The flow ID must be a hexadecimal number.

**flowid-type [ flow | program ]**
Displays information for multicast sessions according to the type of flow.

**flow**: Shows all multicast sessions for the flow ID type “**flow**”.

**program**: Shows all multicast sessions for the flow ID type “program”.

**mcast-address ipv4_address**
Show multicast sessions for a specific multicast address. Must be followed by the IP address of an interface, using dotted decimal notation.

**pcf ipv4_address**
Displays information for multicast sessions connected via the packet control function, defined by **ipv4_address**. The address must be specified using the standard IPv4 dotted decimal notation.

**pdsn-service svc_name**
Displays information for multicast session connected to the packet data service **svc_name**. The packet data service must have been previously configured.

**grep grep_options | more**
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Please refer to the Regulating a Command’s Output of Command Line Interface Reference for details on the usage of **grep** and **more**.

**Usage**
Use this command to view information about multicast sessions.
The output of this command may be considered for part of a periodic system auditing program by verifying active and dormant sessions.

Example
The following command displays the all broadcast-multicast sessions active in a context/system:

```
show multicast-sessions all
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show network-requested-pdp-context

Displays information for the specified network-requested PDP context.

Product
GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show network-requested-pdp-context imsi imsi_value
```

```
imsi imsi_value

Specifies that information will be displayed for a particular International Mobile Subscriber Identity (IMSI). imsi_value is an integer value from 1 to 15 characters.
```

Usage

Use this command to display information pertaining to network-requested PDP contexts.

Example

The following command displays network-requested PDP context information for a subscriber with an IMSI of 123456789:

```
show network-requested-pdp-context imsi 123456789
```
show network-service-entity

Displays information regarding the network service entities (NSEs) in the network.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show network-service-entity { consolidated-status | fr-config [ peer-nsei nsei] | ip-config [ nsvl { all | instance value } ] }
```

- **consolidated-status**
  Displays NSVC status information for all network service entities in the network. This keyword is particularly useful for troubleshooting.

- **fr-config [ peer-nsei nsei]**
  Displays network service configurations for NSEs using Frame Relay configurations. peer-nsei nsei including this optional keyword limits the display to a specific peer NSE identified with an integer of 0 to 65535.

- **ip-config [ nsvl { all | instance value } ]**
  Displays network service configurations for NSEs using IP configurations. Including the nsvl keyword limits the display to all or a single (instance 0 to 3) network service virtual link.

Usage
Use this command to display NSE information pertaining to the NSVCs of the NSEs in the networks or NSEs configured for Frame Relay or IP.

Example
The following command displays the status of all the NSVCs for all the NSEs in the network.

```
show network-service-entity consolidated-status
```
show nw-reachability server

Show the configuration for the network reachability servers for the current context.

Product
HA

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show nw-reachability server { all | name server_name }
```

- **all**
  Show configuration information for all network reachability servers in the current context.

- **name server_name**
  Show configuration information for the network reachability server with the specified name.
  *server_name* is the name of a previously configured reachability server and must be a string from 1 through 15 characters in length.

Usage
Use this command to display configuration information on network reachability servers configured in the current context.

Example
The following command displays information on all network reachability servers in the current context:

```
show nw-reachability server all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show ntp

Displays the network timing protocol associations and status.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ntp { associations | status } [ address ip_address ] [ | { grep grep_options | more } ]
```

**associations**
- `associations`: displays the current NTP server associations and related statistics.

**status**
- `status`: displays the client permeates configured and the synchronization status.

**address ip_address**
- `address ip_address`: the IP address of a specific NTP server/client in the current context.
  - `ip_address` must be specified using the standard IPv4 dotted decimal notation.

**grep grep_options | more**
- Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  - For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

View network timing protocol information to troubleshooting system clock issues by displaying the associations and status of the local NTP client.

Example

The following displays the NTP associations and status, respectively.

```
show ntp associations
show ntp status
```

**Important**: Output descriptions for commands are available in the Statistics and Counters Reference.
show orbem

Displays the ORB element manager information and statistics for the current context.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show orbem { client { id client_name | table } | event-notif-service filters | session { id session_name | table } | status } [ | ( grep grep_options | more ) ]

**client { id client_name | table }
Indicates client information is to be displayed. The keyword table is used to output to the display information on all configured clients. The keyword id is used to specify a specific client for which information is to be displayed specified as client_name.
client_name must refer to an existing client which is found using the table keyword option.

**event-notif-service filters
Displays information pertaining to filters configured for the ORB Notification Service.

**session { id session_name | table }
Indicates session information is to be displayed. The keyword table is used to output to the display information on all configured clients. The keyword id is used to specify a specific session for which information is to be displayed specified as session_name.
session_name must refer to an existing session which is found using the table keyword option.

**status
Indicates the ORB element manage server status information is to be displayed.

**grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

**Usage
Display current sessions when ORBEM system response may appear sluggish. This command is also useful in periodic verification of the server status.

**Example
The following commands will display the information for all clients.
show orbem client table
The following commands display the information for the clientName and sessionID, respectively:

show orbem client id clientId
show orbem session id sessionId

The following command displays the ORBEM server status:

show orbem status

The following command displays the information for all sessions:

show orbem session table

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show patch-progress

This command displays the status of the on-going software patch installation.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show patch-progress
```

**Usage**
Use this command to show the status of an on-going software patch installation.

> **Important:** Software Patch Upgrades are not supported in this release.
show pdg-service

Displays configuration information about PDIF services configured on the system.

Product
PDG/TTG

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```plaintext
show pdg-service { all | name service_name }
```

- **all**
  Displays information for all configured PDG services.

- **name service_name**
  Displays information for the specified PDG service only.
  `service_name` must be the name of an existing PDG service in the current context and from 1 to 63 alpha and/or numeric characters.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to display information for PDG services.

Example

The following command displays available information for all active PDG services:

```plaintext
show pdg-service all
```
show pdg-service statistics

Displays statistics for the PDG/TTG since the last restart or clear command. The output includes the number of each type of protocol message. For example, the output includes the various types of EAP messages.

Product
PDG/TTG

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show pdg-service statistics [ name service_name | peer-address ipv4_address ]

name service_name
Displays statistics for the specified PDG service.

service_name must from 1 to 63 alpha and/or numeric characters.

peer-address ipv4_address
Displays statistics for a specific subscriber with the specified WLAN IPv4 address.

ipv4_address must be entered in standard IPv4 dotted decimal notation.

grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage
Use this command to display PDG service statistics.

Example
The following command displays statistics for all active PDG services:

show pdg-service statistics
**show pdif-service**

Displays configuration information about PDIF services configured on the system.

**Product**
PDIF

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show pdif service { all [ counters ] | name name [ counters ] | statistics [ name name | peer-address address ] } [ | { grep | grep_options | more } ]
```

- **all [ counters ]**
  Displays configuration information and statistic counters for all PDIF services in the system.

- **name name [ counters ]**
  Displays configuration information and statistic counters for a specified PDIF service in the system. `name` must be from 1 to 63 alpha and/or numeric characters and an existing PDIF service.

- **statistics [ name name | peer-address address ]**
  `name name`: Displays service statistics for a specific PDIF service. `name` must be from 1 to 63 alpha and/or numeric characters and an existing PDIF service.
  `peer-address address`: Displays service statistics for a specific peer server. `address` must be specified in IP v4 dotted decimal notation.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

**Usage**
Use this command to display configuration information and statistics about PDIF services on the system.

**Example**
The following example displays configuration information about a PDIF service named `pdif23`:

```
show pdif service name pdif23
```

**Important**: Output descriptions for commands are available in the Statistics and Counters Reference.
show pdsn-service

Displays information on configured packet data services for the current context.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show pdsn-service ( all | name pdsn_name ) [ pcf-status [ address ip_address ] | filter [ all | icmp-monitored | no-calls | summary | up ] ] [ | { grep grep_options | more } ]
```

- `all | name pdsn_name`: displays information for all configured packet data services. `name pdsn_name`: indicates information only for the PDSN service specified is displayed. `pdsn_name` must be the name of an existing PDSN service in the current context and must be from 1 to 79 alpha and/or numeric characters.

- `pcf-status | address ip_address | filter [ all | icmp-monitored | no-calls | summary | up ]`: provides information on configured packet data services. `address ip_address`: only list information for the PCF with the specified IP address. `ip_address` must be specified in IP v4 dotted decimal notation. `filter`: Filter the output so only the specified information is displayed. If filter is specified with no keywords summary information for all PCFs is displayed.
  - `all`: Show information for all the PCFs
  - `icmp-monitored`: Show information only for PCFs which are ICMP monitored
  - `no-calls`: Show information only for PCFs which have no active sessions
  - `summary`: Show only a summary of the status of the PCFs
  - `up`: Show information only for PCFs which are alive

- `grep grep_options | more`: Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage
Show the PDSN service information for standard system monitoring or troubleshooting.

Example
The following will display the information for the sampleService and for all configured services, respectively.
show pdn-service

show pdn-service all
show pdn-service name sampleService
show pgw-service

Displays configuration information for PDN Gateway (P-GW) services on this system.

Product
P-GW

Privilege
Inspector

Syntax

```
show pgw-service { all | name service_name | statistics { all | name service_name } } [ | { grep grep_options | more } ]
```

`all`
Displays configuration information for all P-GW services configured on this system.

`name service_name`
Displays configuration information for a specific P-GW service configured on this system. `service_name` must be an existing P-GW service, and be from 1 to 63 alpha and/or numeric characters in length.

`statistics { all | name service_name }`
Displays P-GW service statistics.
`all`: Displays statistics for all P-GW services on the system.
`name service_name`: Displays statistics for a specific P-GW service. `name` must be an existing P-GW service and be from 1 to 63 alpha and/or numeric characters.

`| { grep grep_options | more }`
Indicates the output of the command is to be piped (sent) to the command specified. A command to send the output to must be specified. For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section of Chapter 1 of the Command Line Interface Reference Guide.

Usage
Use this command to view configuration information for P-GW services on this system.

Example
The following command displays service statistics for the P-GW service named `pgw1`:

```
show pgw-service name pgw
```
show port

Displays information such as statistics and information on configured ports.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show port { datalink counters [ slot/port ] | info { slot/port } [ vlan vlan_id ] | npu counters [ slot/port [ tagged | untagged | vlan tag_id ] ] | table | utilization table } [ | { grep grep_options | more } ]

datalink counters slot/port

Display the information for all data links or only the one specified by slot/port. slot/port must refer to a previously configured port.

info { slot/port } [ vlan vlan_id ]

Display detailed information for all ports within the chassis or only the one specified by slot/port. slot/port must refer to a previously configured port.

vlan vlan_id: Display detailed information about all VLANs in the port/slot. If the optional vlan_id is not specified, it will show port information for all VLANs in slot/port.

npu counters [ slot/port [ tagged | untagged | vlan tag_id ] ] | bound | unbound

Display the information for network processing unit ports. The information for all ports is output or only the one specified by slot/port. slot/port must refer to a previously configured port.

tagged: Display stats for all tagged packets.
untagged: Display statistics for all untagged packets.
vlan tag_id: Display NPU counters for a specified VLAN. tag_id must be the VLAN tag ID of a previously configured VLAN.
bound: Displays individual and cumulative npu port counters for the bound ports within the current context. If the command is invoked the local context all of the bound ports for all contexts and cumulative counter values for all contexts is displayed.
unbound: Displays individual and cumulative npu port counters for all unbound ports within system.

table

Display information on all physical ports on rear-installed interface cards.

utilization table

Show average port utilization in Mbps. The output is a table that lists the current utilization average, a 5 minute average, and a 15 minute average, for all enabled ports.
show port

**grep** *grep_options | more*

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

### Usage

Display port information for troubleshooting of network communications by viewing statistics and configuration information for physical ports.

### Example

The following displays detailed information for port 1 in slot 17:

```
show port info 17/1
```

The following displays information for the data link port 33/1:

```
show port datalink counters 33/1
```

```
show port npu counters 33/1
```

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show power

Displays information about installed cards with power supplied.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show power [ all | chassis | card_num ] [ | { grep grep_options | more } ]
```

- **all | chassis | card_num**
  - Default: chassis
  - **all**: indicates power information for all cards is to be displayed.
  - **chassis**: indicates the chassis power source(s) are to be displayed.
  - **card_num**: specifies a specific card for which power information is to be displayed. Card number must be a value in the range 1 through 48.

- **grep grep_options | more**
  - Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  - For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage
View power source information to quickly check the power for all cards within a chassis.

**Important:** On some platforms, only **show power** is supported with no other keywords or variables.

Example
The following displays power supply status for the chassis.

```
show power
```

The following command displays the power status for all slots

```
show power all
```
**show ppp**

Displays the point-to-point protocol information, detailed or summarized, for one or all connections by the use of filtering options.

**Product**

PDSN, GGSN

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show ppp { [ counters | full | summary ] { all | callid call_id | imsi id | msid ms_id | username user_name } | statistics [ pcf-address [ pcf_ip_addr | all ] | pdn-service pdn_name ] } [ | { grep grep_options | more } ]
```

- **counters | full | summary**
  
  Provides an optional modifier to the output for the level and type of information.
  
  - **counters**: indicates the point-to-point protocol statistics are to be displayed.
  
  - **full**: indicates all available information is to be displayed.
  
  - **summary**: indicates only a summary of available information is to be displayed.

- **all | callid call_id | imsi imsi_id | msid ms_id | username user_name**

  - **all**: indicates all available information is to be displayed.
  
  - **callid call_id**: indicates the PPP information only for the call specified by `call_id` is to be displayed. `call_id` must be specified as a 4-byte hexadecimal number.
  
  - **imsi id**: specifies that PPP information only for the subscriber with the specified id be displayed. The IMSI (International Mobile Subscriber Identity) `id` is a 15 character field which identifies the subscriber’s home country and carrier.
  
  - **msid ms_id**: specifies a mobile subscriber ID only for which information is to be displayed. `ms_id` must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.
  
  - **username user_name**: specifies a user only for which PPP information is to be displayed where the user is specified as `username`.

- **statistics [ pcf-address [ pcf_ip_addr | all ] | pdn-service pdn_name ]**

  Statistics for all packet data services is displayed.
  
  - **pcf-address [ pcf_ip_addr | all ]**: Display statistics only for the time the session is connected to the specified PCF (Packet Control Function) or for all PCFs. `pcf_ip_addr` must be specified using the standard IPv4 dotted decimal notation.
  
  - **pdn-service pdn_name**: Display statistics only for the service specified by `pdn_name`. `pdn_name` must be from 1 to 63 alpha and/or numeric characters.

- **grep grep_options | more**

  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.
**Usage**

View the Point-to-Point Protocol information to support troubleshooting subscriber connections by viewing information for point-to-point connections for a specific subscriber.

**Example**

The following displays the PPP summary for all connections.

```
show ppp summary all
```

The following outputs the point-to-point detailed information for the user `user1`.

```
show ppp full username user1
```

The following command displays the standard information for the call with ID `FF0E11CD`.

```
show ppp callid ff0e11cd
```

The following command displays the PPP statistics for `pdsn1`.

```
show ppp statistics pdsn-service pdsn1
```

The following command provides summarized information for the PPP statistics.

```
show ppp
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show prepaid 3gpp2

This command displays prepaid accounting information for all services or only the service specified.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
all
This keyword displays prepaid statistics for all services.

ggsn-service
Display statistics for GGSN service(s).

ha-service
Display statistics for HA service(s).

lns-service
Display statistics for LNS service(s).

pdsn-service
Display statistics for PDSN service(s).

{ all | name service_name }
all: Display statistics for all services of the specified type.
name service_name: Display statistics for the service named service_name of the specified service type.

per-service-summary
Displays prepaid statistics per service summary for all services.

grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage
Displays Pre-paid statistics for a particular named service or for all services.
Example
To display statistics for a PDSN service name PDSN1, enter the following command:

```
show prepaid 3gpp2 statistics pdsn-service name PDSN1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show prepaid wimax

This command displays prepaid WiMAX accounting information for all services or only the service specified.

Product
ASN GW

Privilege
Inspector

Syntax

show prepaid wimax [ statistics { all | asngw-service { all | nameservice_name } | ha-service { all | nameservice_name } | per-service-summary } [ grepgrep_options | more ] ]

all
This keyword displays prepaid statistics for all services.

asngw-service
Displays prepaid statistics for ASN GW service(s).

ha-service
Displays prepaid accounting statistics for HA service(s).

{ all | nameservice_name }
all: Display statistics for all services of the specified type.
name service_name: Display statistics for the service named service_name of the specified service type.

per-service-summary
Displays prepaid statistics per service summary for all services.

grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage
Use this command to display prepaid WiMAX accounting statistics for named service or for all services.

Example
The following command displays prepaid WiMAX accounting statistics for an ASN GW service name asn1:

show prepaid wimax statistics asngw-service name asn1
show prepaid wimax

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show profile-id-qci-mapping

Displays QCI-RAN mapping tables configured on this system.

Product
HSGW

Privilege
Inspector

Syntax

show profile-id-qci-mapping table { all | name name } [ | { grep grep_options | more }]

- **all**
  Displays information for all QCI-RAN mapping tables configured on this system.

- **name name**
  Displays information for a QCI-RAN mapping tables configured for a specific QCI-RAN table on this system.
  *name* must be an existing QCI-RAN table, and be from 1 to 63 alpha and/or numeric characters in length.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of *grep* and *more*, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage
Use this command to display the contents of a specific QCI-RAN mapping table or all mapping tables configured on this system.

Example
The following command displays the contents of a QCI-RAN mapping table named *table1*:

```bash
show profile-id-qci-mapping table name table1
```
Chapter 96
Exec Mode Show Commands (Q-S)

This section includes the commands qci-qos-mapping through show system uptime.
show qci-qos-mapping

Displays QCI-QoS mapping tables configured on this system.

**Product**
HSGW, P-GW, S-GW

**Privilege**
Inspector

**Syntax**

```
show qci-qos-mapping table { all | name table_name } [ | { grep grep_options | more } ]
```

- **all**
  Displays information for all QCI-QoS mapping tables configured on this system.

- **name table_name**
  Displays information for a QCI-QoS mapping tables configured for a specific QCI-QoS table on this system. `table_name` must be an existing QCI-QoS table, and be from 1 to 63 alpha and/or numeric characters in length.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output must be specified.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the Command Line Interface Reference.

**Usage**

Use this command to display the contents of a specific QCI-QoS mapping table or all mapping tables configured on this system.

**Example**

The following command displays the contents of a QCI-QoS mapping table named `table1`:

```
show qci-qos-mapping table name table1
```
show qos npu inter-subscriber traffic

Displays configuration information pertaining to NPU QoS priority queue bandwidth allocation and sharing.

Product
GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show inter-subscriber traffic { bandwidth | bandwidth-sharing }
```

- **bandwidth**
  Displays NPU QoS priority queue bandwidth allocation configuration information.

- **bandwidth-sharing**
  Displays NPU QoS priority queue bandwidth sharing configuration information.

Usage

Use this command to verify configuration information and for troubleshooting.
When the bandwidth keyword is used, the output is a table showing the configuration status, the priority queue, and the bandwidth allocation per DSCP.
When the bandwidth-sharing keyword is used, the output of is a table displaying the bandwidth sharing configuration per processing card slot/CP number.
For additional information on the NPU QoS functionality, refer to the System Administration and Configuration Guide.

**Important:** This functionality is not supported for use with the PDSN at this time.
show qos npu stats

Displays NPU Qos statistics per priority queue for a particular processing card:

Product
GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show qos npu stats inter-subscriber traffic slot slot_num
```

```
slot slot_num
```

Specifies the chassis slot number in which the processing card for which to display statistics is installed. `slot_num` is an integer from 1 to 48 that represents the slot in which a processing card is installed. Processing cards can be installed in slots 1 through 8, and/or 10 through 16.

Usage

This command displays packet and byte counts per NPU QoS priority queue on a per-processing card basis. For additional information on the NPU QoS functionality, refer to the System Administration and Configuration Guide.

**Important:** This functionality is not supported for use with the PDSN at this time.

Example

The following command displays NPU QoS priority queue statistics for a processing card installed in chassis slot number 4:

```
show qos npu stats inter-subscriber traffic slot 4
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show radius

Displays and statistic information for accounting and/or authentication.

Product
PDSN, HA, GGSN, ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show radius { accounting servers | authentication servers } [ detail ] [ admin-status { enabled | disabled } | [ | { grep grep_options | more } ] [ radius group group_name{ detail } | [ | { grep grep_options | more } ] ] ]
```

- **accounting servers**
  Lists information for configured accounting servers and their current state.

- **authentication servers**
  Lists information for configured authentication servers and their current state.

- **[ detail ]**
  Displays historical state information for configured servers of the specified type

- **admin-status { enabled | disabled }**
  Displays information for accounting and/or authentication servers with an administrative status of “enabled” or “disabled”.

- **radius group group_name**
  Displays the authentication/authorization RADIUS server group information for server group `group_name` with in current context.
  `group_name` will be a string of size 1 to 63 character and specifies the name of server group configured in specific context for authentication/accounting.

- **grep grep_options | more**
  Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Display the RADIUS server information as part of periodic monitoring of the health of the system.

Example

The following displays the information on configured accounting servers:
**show radius accounting server**

The following command displays detailed information for RADIUS accounting servers:

```
show radius accounting servers detail
```

The following command displays detailed information for RADIUS server group `star1` used for authentication:

```
show radius authentication servers radius group star1 detail
```

The following command displays detailed information for RADIUS server group `star1` used for accounting:

```
show radius accounting servers radius group star1 detail
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show radius charging servers

This command displays the RADIUS authentication and accounting servers or server group that are configured for use by charging services.

Product
PDSN, HA, GGSN, ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax
show radius charging servers [ radius group group_name ] [ | { grep grep_options | more } ]

radius group group_name all
Displays all RADIUS counter information for the specified server group configured for use by charging services.
group_name specifies the name of server group configured in specific context for authentication/accounting, and must be a string of 1 through 63 characters in length.

grep grep_options | more
Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
Use this command to display information about RADIUS servers or server group configured for use by Charging Services.

Example
The following command displays RADIUS servers configured for Charging Services:

show radius charging servers

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show radius client

Displays information about the RADIUS client configured on the system.

Product
PDSN, HA, GGSN, ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show radius client status [ | { grep grep_options | more } ]

status
Displays a status summary for the RADIUS client.

| { grep grep_options | more } |
Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
The configuration of the RADIUS protocol on the system enables RADIUS client functionality.
This command is used to view information pertaining to the status of the client.

Example
The following command displays detailed information pertaining to the system’s RADIUS client:

show radius client status

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show radius counters

Displays RADIUS server and statistic information for accounting and/or authentication.

Product
PDSN, HA, GGSN, ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show radius counters { all | radius group group_name [all] | server ip_address [port number] | summary [ all-contexts [ verbose ] ] } [ | { grep grep_options | more } ]
```

counters { all | server ip_address [ port number ] }

counters { all | server ip_address [port number] }: indicates the statistics for either all servers or the server specified by ip_address is to be displayed. The statistics for a specific port of the server may also be specified as number. ip_address must be specified using the standard IPv4 dotted decimal notation. number must be a value from 0 through 65535.

radius group group_name all

Displays all RADIUS counter information for the specified server group within current context. group_name specifies name of the server group configured in specific context for authentication/accounting, and must be a string of 1 through 63 characters in length.

summary [ all-contexts [verbose]]

Displays a summary of RADIUS statistics for all the RADIUS servers configured in specific context. all-contexts: Specifies that a summary of RADIUS statistics for all RADIUS servers configured in all contexts should be displayed. If verbose is also specified the information is displayed in more detail.

grep grep_options | more

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Display the RADIUS server information as part of periodic monitoring of the health of the system.

Example

The following command displays detailed information pertaining to the RADIUS server group star1 with in current context:

```
show radius counters radius group star1 all
```
The following displays the statistics for the server with IP address 1.2.3.4, then just port 7777, followed by all services.

```
show radius counters server 1.2.3.4
show radius counters server 1.2.3.4 port 7777
show radius counters all
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show resources

Displays the resource information by CPU or session.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```plaintext
show resources { cpu | session } [ | { grep grep_options | more } ]
```

cpu | session
--- | ---
cpu: indicates the resource information is to be displayed by CPU.
session: indicates the resource information is to be displayed by session.

grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

View resource utilization as part of troubleshooting systems which appear sluggish or are having excessive connection timeouts or other connection issues.

Example

The following display the resource information by CPU and session, respectively.

```plaintext
show resources cpu
show resources session
```

`Important:` Output descriptions for commands are available in the Statistics and Counters Reference.
**show rohc counters**

This command displays ROHC counters for all active calls.

**Product**

PDSN, HSGW

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show rohc counters [ all | callid call_id | imsi imsi_num | ip-address ip_addr | msid msid_num | username user_name ] [ | { grep grep_options | more } ]
```

- **all**
  
  Indicates all information is to be displayed.

- **callid call_id**
  
  `call_id` indicates the information only for calls with ID `call_id` are to be displayed. `call_id` must be specified as a 4-byte hexadecimal number.

- **imsi imsi_num**
  
  `imsi_num` specifies an international mobile subscriber ID only for which information is to be displayed. The IMSI (International Mobile Subscriber Identity) ID is a 15 character field which identifies the subscriber’s home country and carrier.

- **ip-address ip_addr**
  
  `ip_addr` specifies a mobile subscriber IP address only for which information is to be displayed. `ip_addr` must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

- **msid msid_num**
  
  `msid_num` specifies a mobile subscriber ID only for which information is to be displayed. `msid_num` must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

- **username user_name**
  
  `user_name` specifies a user only for which R-P information is to be displayed where the user is specified as `user_name`.

- **grep grep_options | more**
  
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output must be specified.
  
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

**Usage**

---

Cisco ASR 5000 Series Command Line Interface Reference

2478

OL-22948-01
Use this command to display ROHC counters for all active calls.

Example
The following command displays ROHC counters for all active calls:

    show rohc counters all
show rohc statistics

This command displays statistics and counters for ROHC IP header compression.

**Product**
PDSN, HSGW

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show rohc statistics [ psdn-service pdsnsvc_name | hsgw-service hsgwsvc_name ] [ ( grep grep_options | more ) ]
```

- **psdn-service pdsnsvc_name**
  Display ROHC statistics and counters for the specified PDSN service.

- **hsgw-service hsgwsvc_name**
  Display ROHC statistics and counters for the specified HSGW service.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**

Use this command to display ROHC statistics for all services or for a specific PDSN or HSGW.

**Example**

The following command displays ROHC statistics for the PDSN service named psdn1:

```
show rohc statistics psdn-service psdn1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
**show route-map**

This command displays entries for all route maps for the current context.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show route-map [ name route-map name | { grep grep_options | more } ]
```

- **name route-map name**
  Displays information for a specified route-map. The name is a string of 1 to 79 characters.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**

Use this command to see the rules configured in all route-maps for the current context.

**Example**

The following command displays the route-map information;

```
show route-map
```

Refer to the match and set command descriptions in Route-map Configuration Mode Commands for explanations of the various entries listed.
show rp

Displays the R-P interface statistics using the filtering options specified.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show rp [ counters | full | summary ] { all | callid call_id | msid ms_id | peer-address peer_ip_address | username user_name } [ | { grep grep_options | more } ]

counters | full | summary
Provides an optional modifier to the output for the level and type of information. counters: indicates the R-P protocol statistics are to be displayed. full: indicates all available information is to be displayed. summary: indicates only a summary of available information is to be displayed. These options are not available in conjunction with the keywords statistics or service-option statistics.

all | callid call_id | msid ms_id | peer-address peer_ip_address | username user_name

all: indicates all R-P information is to be displayed. callid call_id: indicates the information only for calls with Id call_id are to be displayed. call_id must be specified as a 4-byte hexadecimal number. msid ms_id: specifies a mobile subscriber ID only for which information is to be displayed. ms_id must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. peer-address peer_ip_address: specifies the peer IP address, of the PCF, for which R-P information is to be displayed. peer_ip_address must be specified using the standard IPv4 dotted decimal notation. username user_name: specifies a user only for which R-P information is to be displayed where the user is specified as user_name.

grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
View the R-P interface statistics for the current context.

Example
The following displays the summary for all connections.
show rp summary all
The following outputs the R-P interface detailed information for the user user1.

show rp full username ispluser1
The following command displays the standard information for the call with ID FF0E11CD

show rp callid ff0e11cd
The following displays the statistics summary for the R-P facility.

show rp

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show rp service-option

Displays the R-P service option statistics using the filtering options specified.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show rp service-option statistics number svc_option_num | pdsn-service pdsn_name ] [ | { grep grep_options | more } ]
```

- `number svc_option_num | pdsn-service pdsn_name`
  Default: display statistics for all service options numbers and associated packet data services.
  - `number svc_option_num` specifies the service option number for which collected statistics are to be displayed.
  - `pdn-service pdsn_name`: specifies the packet data service for which the collected statistics are to be displayed.

- `grep grep_options | more`
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
View the R-P service option statistics for the current context.

Example
The following displays the statistics for all service options.

```
show rp service-option statistics
```

The following displays the statistics for service option 5.

```
show rp service-option statistics number 5
```

The following command displays the statistics for all service options in collected for the packet data service `sampleService`.

```
show rp service-option statistics pdsn-service sampleService
```
show rp statistics

Displays the R-P protocol statistics using the filtering options specified.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show rp statistics [ pdsn-service pdsn_name | peer-address [peer_address | all]] [ | grep grep_options | more ] [ verbose ]

pdsn-service pdsn_name | peer-address peer_address

Default: all R-P protocol statistics are to be displayed.

pdsn-service pdsn_name: indicates the statistic information for the service specified is to be displayed. pdsn_name must be from 1 to 63 alpha and/or numeric characters.

peer-address [ peer_address | all]: indicates the statistic information for the peer specified or all peers is to be displayed. peer_address must be specified using the standard IPv4 dotted decimal notation.

grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

verbose

Displays more detailed statistics.

Usage

View the R-P statistics for the current context.

Example

The following displays all collected R-P statistics.

show rp statistics

The following displays the R-P statistics associated with the peer address 1.2.3.4.

show rp statistics peer-address 1.2.3.4

The following command displays the R-P statistics for the packet data service PCFnet.

show rp statistics pdsn-service PCFnet
show rp statistics

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show rsvp counters

Displays the rsvp counters using the filtering options specified.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show rsvp counters [ all | callid call_id | msid ms_id | username user_name ]
```

- **all**: indicates all rsvp information is to be displayed.
- **callid call_id**: indicates the information only for calls with Id `call_id` are to be displayed.
- **msid ms_id**: specifies a mobile subscriber ID only for which information is to be displayed. `ms_id` must be specified as a 4-byte hexadecimal number.
- **username user_name**: specifies a user only for which rsvp information is to be displayed where the user is specified as `user_name`.

**Usage**

View the rsvp counters for the current context.

**Example**

The following displays all collected rsvp counters.

```
show rsvp counters all
```
show rsvp statistics

Displays the rsvp statistics using the filtering options specified.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show rsvpcounters [ pdsn-service service | sessmgr instance instance ]
```

```
pdsn-service service | sessmgr instance instance

pdsn-service service: indicates the statistic information for the service specified is to be displayed. pdsn_name must be from 1 to 63 alpha and/or numeric characters.

sessmgr instance instance: indicates the session manager instances.
```

Usage
View the rsvp statistics for the current context.

Example
The following displays collected rsvp statistics for a sampleService.

```
show rsvp statistics pdsn-service sampleService
```
show sccp-network

This command displays SS7 Signaling Connection Control Part (SCCP) network configuration and status information.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show sccp-network { ntwk_index | all } [ status [ all | dpc ] ]
```

- **ntwk_index**
  Display configuration and status information for the SSCP network configuration with the specified network index.
  `ntwk_index` must be an integer from 1 through 12.

- **all**
  Display all available configuration and status information for all SSCP networks.

- **status all**
  Display all status information for specified SCCP networks.

- **status dpc**
  Display status information for the device in the SCCP network identified by the destination point-code.

**Usage**
Use this command to display global SCCP statistics or to display SCCP statistics for a specified service or network.

**Example**
The following command displays global SCCP statistics:

```
show sccp-network all
```

The following command displays information for an SCCP network configuration with the network index of 1:

```
show sccp-network 1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show sccp statistics

This command displays SS7 Signaling Connection Control Part (SCCP) statistics for services that use the SCCP protocol.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show sccp statistics [ iups-service iups_srvc_name | map-service map_srvc_name | sccp-network ntwk_index ]
```

### iups-service iups_srvc_name
Display SCCP protocol statistics for the specified IU-PS service in the current context. `iups_name` must be the name of a configured IU-PS service and must be an alphanumeric string of from 1 through 63 characters.

### map-service map_srvc_name
Display SCCP protocol statistics for the specified MAP service in the current context. `map_srvc_name` must be the name of a configured MAP service and must be an alphanumeric string of from 1 through 63 characters.

### sccp-network ntwk_index
Display SCCP protocol statistics for the SSCP network configuration with the specified network index. `ntwk_index` must be an integer from 1 through 12.

**Usage**
Use this command to display global SCCP statistics or to display SCCP statistics for a specified service or network.

**Example**
The following command displays global SCCP statistics:

```
show sccp statistics
```

The following command displays SCCP statistics for the IuPS service named `iups-serv1`:

```
show sccp statistics iups-service iups-serv1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show session counters historical

Displays historical information for session-related counters based on data collected in bulk statistics.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show session counters historical { all | arrived | callops | connected | disconnected | failed | handoff | rejected | renewal } [ all-intervals | recent-intervals ] [ cumulative | incremental ] [ graph | table ]

---

all
Displays data for all counters either as a single, wide table or as multiple graphs.

arrived
Displays only data for “total calls arrived” counters. This is based on the “sess-ttlarrived” statistic in the system schema.

callops
Displays data for all call operations. This is a calculated value based on the following formula:
(arrived + rejected + disconnected + failed + handoffs + renewals)

connected
Displays only data for “total calls connected” counters. This is based on the “sess-ttlconnected” statistic in the system schema.

disconnected
Displays only data for “total calls disconnected” counters. This is based on the “sess-ttldisconnect” statistic in the system schema.

failed
Displays only data for “total calls failed” counters. This is based on the “sess-ttlfailed” statistic in the system schema.

handoff
Displays only data for “total handoffs” counters. This is based on the “sess-ttlhandoff” statistic in the system schema.

rejected
Displays only data for “total calls rejected” counters. This is based on the “sess-ttlrejected” statistic in the system schema.
### show session counters historical

**renewal**
Displays only data for “total renewal” counters. This is based on the “sess-ttlrenewal” statistic in the system schema.

**all-intervals**
Displays all available historical information from all samples. This filter is used by default.

**recent-intervals**
Displays historical information for only recent samples.

**cumulative**
Displays total data for all samples up to and including the last one. In this view, values increase over time.

**incremental**
Displays data changes for each specific sample. The data for each sample is the amount of change since the previous sample. This filter is used by default.

**graph**
Displays data in graphical form.

**table**
Displays data in tabular form. This is the default view.

### Usage
This command provides the ability to track key session-related statistic information over time. This information can be used as part of system performance monitoring and capacity planning.

**Important:** The information provided in the output of this command requires that bulk statistics functionality be enabled on the system. Refer to the System Administration and Configuration Guide for more information on configuring/enabling bulk statistics support.

The output of this command displays historical data collected at various sample intervals. The interval length is 15 minutes and is not user-configurable. Up to 192 samples (2 days worth of data) are maintained.

**Important:** Data collection is “best-effort” over these intervals. Data is preserved on system management card switchovers. As with all counters, certain session failures can cause inaccuracies with counters, including counters which appear to go backwards.

Each sample is identified by a timestamp that displays the approximate time the data was gathered. It is in the format YYYY:MM:DD:HH:MM:SS.

Data acquired during the sample may be marked with an “S” appended to the end of the timestamp or to the counter value. The “S” indicates that the data is suspect (potentially bad). Occurrences of this result from events like changes to the real time clock, which can cause an interval to be an atypical length. Instances of suspect data should be rare. Additionally, there may be occasions in which a sample may be marked as
“invalid”. “invalid” identifies bad data, a situation that could result from the polling hasn't run long enough, or because of an unexpected error retrieving data. Since baseline values must be obtained prior to collecting interval samples, the first interval of data will not be available until up to 2x the interval period.

**Example**
The following command displays cumulative total calls arrived information for the most recent intervals and displays the output in graphical format:

```
show session counters historical arrived recent-intervals cumulative graph
```

The following command displays historical data for all counters for all intervals and displays the output in tabular format:

```
show session counters historical all
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show session counters pcf-summary

Displays the PCF summary which include the number of calls, call types, and Tx/Rx packets/octet statistics.

**Product**

PDSN

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show session counters pcf-summary [ call-types | data | wfl [ pcf pcf_address ] [ | { grep grep_options | more } | ] ]
```

- **call-types**
  Displays the number of calls and the types of calls.

- **data**
  Displays the number of successful calls and Tx/Rx packets/octet statistics.

- **pcf pcf_address**
  Displays the given PCF summary for a particular address.

- **wfl**
  Displays the PCF summary in a single very wide line.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. Please refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference* for details on the usage of `grep` and `more`.

**Usage**

Use this command to display a summary of all PCFs.

**Example**

```
show session counters pcf-summary
```
show session disconnect-reasons

Displays a list of the reasons for call disconnects and the number of calls disconnected for each reason.

Product
All

Privilege
Security Administrator, Administrator, Inspector, Operator

Syntax

show session disconnect-reasons [ gprs-only | sgsn-only | mme-only | verbose ] [ [ grep [ grep_options ] | more ] ]

- **gprs-only**
  Only supported on the SGSN.
  This keyword limits the display to session disconnect reasons for the SGSN’s 2G MM and PDP context disconnects.

- **sgsn-only**
  Only supported on the SGSN.
  This keyword limits the display to session disconnect reasons for the SGSN’s 3G MM and PDP context disconnects.

- **mme-only**
  This keyword filters to the list of the session disconnect reasons for MME call disconnects.

- **verbose**
  List all disconnect reasons even if the values are zero (0).

- **grep [ grep_options ] | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to display a list of the reasons why calls were disconnected.

Example

To view session disconnect statistics, enter the following command:

```
show session disconnect-reasons
```

To view a list of the disconnect reasons with verbose output, enter the following command:
show session disconnect-reasons verbose

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show session duration

Displays session duration information for the current context filtered by the options specified.

**Product**
All

**Privilege**
Security Administrator, Administrator, Inspector, Operator

**Syntax**

```
show session duration [ session_filter ] [ | { grep grep_options | more } ]
```

**session_filter**

Indicates name of the sessions/services/AGWs whose session duration information is to be filtered and displayed. This consist of following:

- **asn-peer-address ip_address**: Indicates that only the session information for the ASN GW peer whose IP address is specified by `ip_address` is to be displayed. `ip_address` must be specified using the standard IPv4 dotted decimal notation.

- **asnsgw-service service_name**: Indicates that only the session information for the ASN GW service whose name is specified by `service_name` is to be displayed.

- **asnpc-peer-address ip_address**: Indicates that only the session information for the ASN PC peer whose IP address is specified by `ip_address` is to be displayed. `ip_address` must be specified using the standard IPv4 dotted decimal notation.

- **asnpc-service service_name**: Indicates that only the session information for the ASN PC service whose name is specified by `service_name` is to be displayed.

- **apn apn_name**: Indicates that only session information for the specified APN will be displayed. `apn_name` specifies the name of a configured APN that can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

- **cscf-service service_name**: Indicates that only session information for the specified CSCF service will be displayed. `service_name` must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

**Important**: CSCF SIP calls under progress only. Registrations will not be considered a call.

- **dhcp-server dhcp_address**: Indicates that only session information for the specified DHCP server will be displayed. `dhcp_address` is the name of the DHCP server and must be expressed in dotted decimal notation.

- **fa fa_address**: indicates only the session information for the foreign agent whose IP address is specified by `fa_address` is to be displayed. `fa_address` must be specified using the standard IPv4 dotted decimal notation.

- **fa-service fa_name**: indicates only the session information for the foreign agent service specified by `fa_name` is to have information displayed.

- **ggsn-service ggsn_name**: Indicates that only session information for the specified GGSN service will be displayed. `ggsn_name` specifies the name of a configured GGSN service that can be from 1 to 63 alpha and/or numeric characters and is case sensitive.
• **gprs-only**: Limits the display to the session information for the SGSN’s 2G MM and PDP contexts.

• **ha ha_address**: indicates only the session information for the home agent whose IP address is specified by ha_address is to be displayed. ha_address must be specified using the standard IPv4 dotted decimal notation.

• **ha-service ha_name**: indicates only the session information for the home agent service specified by ha_name is to be displayed.

• **hsgw-service service_name**: indicates only the session information for the HSGW service specified by the service_name is to be displayed. service_name must be an existing HSGW service and be from 1 to 63 alpha and/or numeric characters.

• **lma-service service_name**: indicates only the session information for the LMA service specified by the service_name is to be displayed. service_name must be an existing LMA service and be from 1 to 63 alpha and/or numeric characters.

• **mme-service service_name**: indicates only the session information for the MME service specified by the service_name is to be displayed. service_name must be an existing MME service and be from 1 to 63 alpha and/or numeric characters.

• **mag-service service_name**: indicates only the session information for the MAG service specified by the service_name is to be displayed. service_name must be an existing MAG service and be from 1 to 63 alpha and/or numeric characters.

• **pcf pcf_address**: indicates only the session information for the packet control function with IP address pcf_address is to be displayed. pcf_address must be specified using the standard IPv4 dotted decimal notation.

• **pdsn-service pdsn_name**: indicates only the session information for the packet data service specified by pdsn_name is to have information displayed.

---

**Important**: If no PCF address or PDSN service is specified the session information for all sessions is displayed.

• **sgsn-address sgsn-address**: Indicates that only session information for the specified SGSN will be displayed. sgsn_address is the IP address of the SGSN and must be expressed in dotted decimal notation.

• **sgsn-only**: Limits the display to the session information for the SGSN’s 3G MM and PDP contexts.

• **sgw-service service_name**: indicates only the session information for the S-GW service specified by the service_name is to be displayed. service_name must be an existing S-GW service and be from 1 to 63 alpha and/or numeric characters.

---

```bash
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the **Regulating a Command’s Output** section of the **Command Line Interface Overview** chapter in the **Command Line Interface Reference**.

---

**Usage**

View the session information to troubleshooting subscriber problems and for general monitoring for orphaned sessions.
Example
The following commands display the duration information for the session connected to the packet control function with address 1.2.3.4, packet data service sampleService, and for all sessions, respectively.

```
show session duration pcf 1.2.3.4
show session duration pdsn-service sampleService
show session duration
```

The following is a sample of the output.

```
In-Progress Call Duration Statistics <1min 3 <2min 44 <5min 126 <15min 32 <1hr 3 <4hr 1 <12hr 0 <24hr 0 >24hr 0
```

The column on the left lists various time intervals ranging from less than (<) 1 minute to greater than (>) 24 hours. The column on the right categorizes the number subscriber sessions that are currently in progress into the appropriate time interval.
show session progress

Displays session progress information for the current context filtered by the options specified.

**Product**
All

**Privilege**
Security Administrator, Administrator, Inspector, Operator

**Syntax**

```
show session progress [ asn-peer-address ip_address | asngw-service service_name | asnpc-service service_name | asnpc-peer-address ip_address | apn apn_name | csfc-service service_name | dhcp-server dhcp_address | fa fa-address | fa-service fa_name | ggsn-service ggsn_name | ha ha_address | ha-service ha_address | hsgw-service service_name | lma-service service_name | mag-service service_name | mme-address mme_address | pcf { pcf_address | all } | pdsn-service pdsn_name | pgw-address ip_address | sgsn-address sgsn_address | sgw-service service_name ] [ | | { grepgrep_options | more } ]
```

**progress**: indicates session progress information is to be displayed.

- **asn-peer-address ip_address**: Indicates that only the session information for the ASN GW peer whose IP address specified by *ip_address* is to be displayed. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

- **asngw-service service_name**: Indicates that only the session information for the ASN GW service whose name is specified by *service_name* is to be displayed.

- **asnpc-service service_name**: Indicates that only the session information for the ASN PC service whose name is specified by *service_name* is to be displayed.

- **asnpc-peer-address ip_address**: Indicates that only the session information for the ASN PC peer whose IP address specified by *ip_address* is to be displayed. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

- **apn apn_name**: Indicates that only session information for the specified APN will be displayed. *apn_name* specifies the name of a configured APN that can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

- **csfc-service service_name**: Indicates that only session information for the specified CSCF service will be displayed. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

***Important***: CSCF SIP calls under progress only. Registrations will not be considered a call.
Exec Mode Show Commands (Q-S)

**show session progress**

- **dhcp-server dhcp_address**: Indicates that only session information for the specified DHCP server will be displayed. *dhcp_address* is the name of the DHCP server and must be expressed in dotted decimal notation.

- **fa fa_address**: indicates only the session information for the foreign agent whose IP address is specified by *fa_address* is to be displayed. *fa_address* must be specified using the standard IPv4 dotted decimal notation.

- **fa-service fa_name**: indicates only the session information for the foreign agent service specified by *fa_name* is to have information displayed.

- **ggsn-service ggsn_name**: Indicates that only session information for the specified GGSN service will be displayed. *ggsn_name* specifies the name of a configured GGSN service that can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

- **ha ha_address**: indicates only the session information for the home agent whose IP address is specified by *ha_address* is to be displayed. *ha_address* must be specified using the standard IPv4 dotted decimal notation.

- **ha-service ha_name**: indicates only the session information for the home agent service specified by *ha_name* is to have information displayed.

- **hsgw-service service_name**: Indicates only the session progress information for the HSGW service specified by the *service_name* is to be displayed. *service_name* must be an existing HSGW service and be from 1 to 63 alpha and/or numeric characters.

- **lma-service service_name**: Indicates only the session progress information for the LMA service specified by the *service_name* is to be displayed. *service_name* must be an existing LMA service and be from 1 to 63 alpha and/or numeric characters.

- **mag-service service_name**: Indicates only the session progress information for the MAG service specified by the *service_name* is to be displayed. *service_name* must be an existing MAG service and be from 1 to 63 alpha and/or numeric characters.

- **mme-address mme_address**: indicates only the session information for the foreign agent whose IP address is specified by *mme_address* is to be displayed. *mme_address* must be specified using the standard IPv4 dotted decimal notation.

- **pcf pcf_address**: Indicates only the session information for the packet control function with IP address *pcf_address* is to be displayed. *pcf_address* must be specified using the standard IPv4 dotted decimal notation.

- **pcf all**: indicates the session information for the packet control function for all pcf addresses.

- **pdsn-service pdsn_name**: indicates only the session information for the packet data service specified by *pdsn_name* is to have information displayed.

---

**Important:** If no PCF address or PDSN service is specified the session information for all sessions is displayed.

- **pgw-address ip_address**: Indicates only session progress information for the P-GW with an IP address specified by *ip_address* is to be displayed. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

- **sgsn-address sgsn-address**: Indicates that only session information for the specified SGSN will be displayed. *sgsn-address* is the IP address of the SGSN and must be expressed in dotted decimal notation.
show session progress

**sgw-service service_name**: Indicates only the session progress information for the S-GW service specified by the **service_name** is to be displayed. **service_name** must be an existing S-GW service and be from 1 to 63 alpha and/or numeric characters.

grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**
View the session information to troubleshooting subscriber problems and for general monitoring for orphaned sessions.

**Example**
The following commands display the status information for the session connected to the packet control function with address 1.2.3.4, packet data service **sampleService**, and for all sessions, respectively.

```bash
show session progress pcf 1.2.3.4
show session progress pdsn-service sampleService
show session progress
```

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show session recovery status

Displays session recovery status information for the current context filtered by the options specified.

Product
All

Privilege
Security Administrator, Administrator, Inspector, Operator

Syntax

```
show session recovery status [verbose] [ | { grep grep_options | more } ]
```

---

recovery status
Displays the current status of the system’s ability to recover from a hardware or software fault that requires the recovery of home agent-based Mobile IP session(s).

verbose
Includes per-CPU Session Recovery status.

grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

---

Usage
View the session information for troubleshooting subscriber problems and for general monitoring for orphaned sessions.

---

Example
To display the session recovery status information, enter the following command:

```
show session recovery status
```

Adding the optional verbose keyword to this command provides more details.

```
show session recovery status verbose
```

---

`Important:` Output descriptions for commands are available in the Statistics and Counters Reference.
show session setuptime

Displays session setup time information for all sessions or sessions associated with the specified AGW/node.

Product
All

Privilege
Operator

Syntax

```
show session setuptime [ mme-only | pcf pcf_address | gprs-only | sgsn-address sgsn-only ] [ | { grep grep_options | more } ]
```

Displays the call setup times aggregated into basic ranges of time.
- **mme-only**: Filters and displays the call setup information for MME calls only.
- **pcf pcf_address**: displays call setup data for the packet control function whose IPv address is specified as `pcf_address.pcf_address` must be specified using the standard IPv4 dotted decimal notation. The call setup times for all PCFs is displayed when no specified PCF is specified.
- **gprs-only**: Displays 2G call setup data for the for the SGSN for the MM and PDP contexts.
- **sgsn-address sgsn_address**: Displays call setup times for the specified SGSN.
  - `sgsn_address` is the IP address of the SGSN and must be expressed in dotted decimal notation. This keyword is used by the GGSN.
- **sgsn-only**: Displays 3G call setup data for the for the SGSN for the MM and PDP contexts.

```
| grep grep_options | more |
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Usage

View the session information to troubleshooting subscriber problems and for general monitoring for orphaned sessions.

When no keywords are specified, the information shown is cumulative for all sessions that have been facilitated by the system.

Example

The following command shows setup time statistics for all sessions from the PCF at IP address 192.168.10.3:

```
show session setuptime pcf 192.168.10.3
```
show session subsystem

Displays session information for system subsystems. If no keywords are specified, information for all subsystems is displayed.

Product
All

Privilege
Security Administrator, Administrator, Inspector, Operator

Syntax

show sessionsubsystem [ full | facility facility [ all | instanceid ] ] [ verbose ] [ | { grep grep_options | more }]

[ full | facility facility [ all | instance id ] ]

• full: Indicates that a full statistics summary of all subsystems is to be displayed.
• facility facility: Specifies the facility for which subsystem statistics is to be displayed where facility is specified as one of:
  • a11mgr: A11 Manager
  • aaamgr: Accounting and Authentication Manager
  • aaaprox: AAA Proxy Manager
  • asngwmgr: ASN Gateway Manager
  • asnpcmgr: ASN Paging/Location-Registry Manager
  • cscfmgr: SIP CSCF Manager
  • dgmbmgr: Diameter Gmb Application Manager
  • diamsproxy: Diameter Proxy Application Manager
  • egtpegmgr: EGTP Egress Demux Manager
  • egtpinmgr: EGTP Ingress Demux Manager
  • famgr: Foreign Agent Manager
  • gtpumgr: GTPUMGR Demux Manager
  • gtpcmgr: GTPC Manager
  • hambmgr: Home Agent Manager
  • hnbmgr: HNBGW HNB Manager
  • imsimgr: SGSN IMSI Manager
  • ipsgmgr: IP Services Gateway Manager
  • l2tudemux: L2TP Demux Manager
  • l2tpmgr: L2TP Manager
  • linkmgr: SGSN/SS7 Master Manager
  • magmgr: Mobile Access Gateway Manager
Exec Mode Show Commands (Q-S)

show session subsystem

- `megadiammgr`: Mega Diameter Manager
- `mmedemux`: MME Demux Manager logging facility
- `mmemgr`: MME Manager logging facility
- `mmgr`: SGSN/SS7 Master Manager
- `phsgwmgr`: PHS Gateway Manager
- `phspcmgr`: PHS Paging Controller Manager
- `sessmgr`: Session Manager
- `sgtpcmgr`: SGSN GTPC Manager

- `all` | `instance id` the keyword `all` indicates all instances of the specified facility are to be displayed whereas the keyword `instance` specifies a specific instance for which information is to be displayed where `id` must be specified as an instance ID in the range 0 through 4294967295. If `all` or `instance` is not specified summary statistics are displayed.

verbose
Displays everything the show session subsystem command output displays with the exception that the Setup Time statistics are reported in 100 ms increments from <100 ms up to 9600 ms.

`grep grep_options | more`
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. Please refer to the Regulating the Command Output section in the Command Line Interface Reference for details on the usage of `grep` and `more`.

Usage
View the session information to troubleshooting subscriber problems and for general monitoring for orphaned sessions.
If this command is entered with no keywords, the information displayed is cumulative for all sessions facilitated by the system.

Example
The following commands display the statistics information summarized for all sessions, then for the `fgmgr` facility (all sessions), and finally only for the session with ID 127589 for the `hamgr` subsystem.

```
  show session subsystem full
  show session subsystem facility allmgr all
  show session subsystem facility aaamgr all
  show session subsystem facility asngwmgmt all
  show session subsystem facility fngmgr all
  show session subsystem facility hamgr all
  show session subsystem facility sessmgr all
```
show session subsystem facility aaaproxy all

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
**show session trace**

Displays status and statistics for the session trace application.

**Product**
MME, P-GW, S-GW

**Privilege**
Inspector

**Syntax**

```
show session trace { statistics | subscriber network-element { mme | pgw | sgw } trace-ref value | tce-address ip_address tce-index num | tce-summary | trace-summary } [ | { grep grep_options | more } ]
```

- **statistics**
  Displays summary statistics of the session trace subsystem.

- **subscriber network-element { mme | pgw | sgw } trace-ref value**
  Displays status and statistics of a specified session trace using the network element type and the trace reference. `value` must be a valid trace reference 12 characters in length.

- **tce-address ip_address tce-index num**
  Displays status and statistics of a specified Trace Collection Entity (TCE) connection. `ip_address` must be a valid existing collection entity IPv4 address and is specified in dotted decimal notation.

- **tce-summary**
  Displays a summary of all active TCE connections.

- **trace-summary**
  Displays a summary of all active session traces.

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. Please refer to the Regulating the Command Output section in this reference for details on the usage of `grep` and `more`.

**Usage**
Use this command to display status and statistics for the session trace application.

**Example**
The following command displays status and statistics for a subscriber session trace on a P-GW with a trace reference of 32223398765:
show session trace subscriber network-element pgw trace-ref 32223398765

The following command displays status and statistics for a subscriber session trace on an MME with a trace reference of 32221234567:

```
show session trace subscriber network-element pgw trace-ref 32223398765
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show sgsn-operator-policy

Displays configuration information for the SGSN features bundled into the SGSN Operator Policy and includes operational configuration for features such as GPRS Attach, GPRS RAU Inter, and PTMSI-Realloc Service Request (Signalling).

Product
SGSN

Privilege
Security Administrator, Administrator, Inspector, Operator

Syntax

```
show sgsn-operator-policy ( all | full | name op-pol-name ) +
```

- **all**
  Displays information for all configured SGSN operator policies.

- **full**
  Display all details of the configuration for the specified SGSN Operator Policy.

- **name op-pol-name**
  Identifies a specific operator policy. `op-pol-name` must be a combination of 1 to 64 alphanumeric characters.

Usage
This command can be used to display all of the operator policies that have been configured or all of the configuration information for a specific operator policy.

Example
The following command displays information for all configured SGSN operator policies:

```
show sgsn-operator-policy all
```
show sgsn-service

This command displays information about the configured SGSN services in the current context.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator, Inspector, Operator

**Syntax**

```bash
show sgsn-service { all | name svc_name }
```

- `all`
  Displays information for all SGSN services in the current context.

- `name svc_name`
  Displays information for the specified SGSN service in the current context. `svc_name` must be the name of a configured SGSN service and must be an alphanumeric string from 1 to 63 characters in length.

**Usage**

Use this command to display information for SGSN services.

**Example**

The following command displays information for all SGSN services in the current context:

```bash
show sgsn-service all
```

The following command displays information for an SGSN service in the current context that is named sgsn1:

```bash
show sgsn-service name sgsn1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show sgsn sessmgr

This command displays session manager (SMGR) statistics specific to the SGSN service.

Product
SGSN

Privilege
Security Administrator, Administrator, Inspector, Operator

Syntax

show sgsn sessmgr { all | instance }

---

**all memory statistics**
Displays all SMGR statistics specific to the system’s SGSN service.

---

**instance smgr_inst memory statistics**
Displays the statistics for a specific session manager instance of the SGSN service. 
*smgr_inst* must be an integer between 1 and 10000000.

---

Usage
Use this command to display information for SGSN services.

---

Example
The following command displays GPTP-U statistics for the traffic between an SGSN and a connected RNC.

```
show sgtpu statistics rnc-address 123.1.2.3
```
show sgtp-service

This command displays information about the configured SGTP services in the current context, including GTP-C and GTP-U operational configuration.

**Product**
SGSN
PDG/TTG

**Privilege**
Security Administrator, Administrator, Inspector, Operator

**Syntax**

```
show sgtp-service { all | ggsn-table | sgsn-table | name svc_name }
```

- **all**
  Displays configuration information for all of the SGTP services defined for the current context.

- **ggsn-table**
  Displays GGSN information configured for the SGTP service in the current context.

- **sgsn-table**
  Displays SGSN information configured for the SGTP service in the current context.

- **name svc_name**
  Displays information for the specified SGTP service in the current context. *svc_name* must be the name of a configured SGTP service and must be an alphanumeric string from 1 to 63 characters in length.

**Usage**

Use this command to display information for SGSN services.

**Example**
The following command displays information for all SGTP services in the current context:

```
show sgtp-service all
```

The following command displays the GGSN information in SGTP services in the current context:

```
show sgtp-service ggsn-table
```

The following command displays the SGSN information in SGTP services in the current context:

```
show sgtp-service sgsn-table
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show sgtp-service
show sgtpc statistics

This command displays all statistics, for SGTPC interface parameters, collected since the last restart or last use of a clear command.

Product
SGSN
PDG/TTG

Privilege
Security Administrator, Administrator, Inspector, Operator

Syntax

```
show sgtpc statistics [ all | gsn-address ipv4_address | sgtp-service sgtp_svc_name ] [ verbose ]
```

**all**
Displays configuration information for all of the SGTP services defined for the current context.

**gsn-address ipv4_address**
`ipv4_address` Displays statistics for a specific SGSN identified by the SGSN’s IPv4 address. specified in dotted decimal notation.
Note this must be an existing and active interface.

**sgtp-service sgtp_svc_name**
Displays statistics for the specified SGTP service in the current context.
`sgtp_svc_name` must be the name of a previously configured and active SGTP service and must be an alphanumeric string from 1 to 63 characters in length.

**verbose**
Causes the system to display a more detailed level of statistics.

Usage
Use this command to display information for SGSN services.

Example
The following command displays statistics for the SGTP service named `sgtp1`:

```
show sgtpc statistics sgtp-service sgtp1
```

**Important:** Output descriptions for commands are available in the `Statistics and Counters Reference`.
show sgtpu statistics

This command displays all transmission and reception statistics, for pre-defined and active GTP-U interfaces, collected since the last restart or last use of a clear command.

Product
SGSN
PDG/TTG

Privilege
Security Administrator, Administrator, Inspector, Operator

Syntax

show sgtpu statistics [ ggsn-address ipv4_address | iups-service iups_srvc_name | rnc-address ipv4_address | sgtp-service sgtp_srvc_name | gprs-service gprs_srvc_name nsei nse_id ]

  ggsn-address ipv4_address
  ipv4_address Displays statistics for a specific GGSN identified by the GGSN’s IPv4 address. specified in dotted decimal notation.

  iups-service iups_srvc_name
  Displays statistics for the specified IuPS service in the current context.
  iups_srvc_name must be the name of a previously configured and active IuPS service and must be an alphanumeric string from 1 to 63 characters in length.

  rnc-address ipv4_address
  ipv4_address Displays statistics for a specific RNC identified by the RNC’s IPv4 address. specified in dotted decimal notation.

  sgtp-service sgtp_srvc_name
  Displays statistics for the specified SGTP service in the current context.
  sgtp_srvc_name must be the name of a previously configured and active SGTP service and must be an alphanumeric string from 1 to 63 characters in length.

  gprs-service gprs_srvc_name nsei nse_id
  Displays the statistics for a specific NSEI-based GTPU statistics associated with the specified GPRS service in the current context.
  gprs_srvc_name must be the name of a previously configured and active GPRS service and must be an alphanumeric string from 1 to 63 characters in length.
  nsei nse_id must be an integer from 0 to 65535.

Usage

Use this command to display information for SGSN services.
Example
The following command displays GPTP-U statistics for the traffic between an SGSN and a connected RNC.

```
show sgtpu statistics rnc-address 123.1.2.3
```
**show sgw-service**

Displays configuration information and/or service statistics for Serving Gateway (S-GW) services on this system.

**Product**
S-GW

**Privilege**
Inspector

**Syntax**

```
show sgw-service { all | name service_name } statistics { all | name service_name } [ | { grep grep_options | more } ]
```

- **all**
  Displays configuration information for all S-GW services configured on this system.

- **name service_name**
  Displays configuration information for a specific S-GW service configured on this system. `service_name` must be an existing S-GW service, and be from 1 to 63 alpha and/or numeric characters in length.

- **statistics { all | name service_name }**
  Displays statistics for all S-GW services on this system or for a specified service. `service_name` must be an existing S-GW service and be from 1 to 63 alpha and/or numerics characters.

  | { grep grep_options | more }
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

  For details on the usage of the `grep` and `more` commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**

Use this command to view configuration information and/or service statistics for S-GW services on this system.

**Example**

The following command displays service statistics for the S-GW service named `sgw1`:

```
show sgw-service statistics name sgw1
```
show snmp

Displays information on the Simple Network Management Protocol servers and interfaces.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

show snmp { accesses | communities | contexts | notifies | server | transports | trap [ history | statistics ] | views } [ | { grep grep_options | more } ]

accesses
Displays SNMP server usage statistics.

communities
Displays SNMP community strings.

contexts
Displays SNMP information per context.

notifies
Displays SNMP event trap and notification statistics.

server
Displays SNMP server configuration information.

transports
Displays trap destination configuration information.

trap [ history | statistics {verbose}{wide}]

history: displays SNMP event trap history. trap history shows up to 5000 time-stamped trap records stored in a buffer. The buffer may be cleared by entering the clear snmp history command.
statistics: displays SNMP event trap and notification statistics.
verbose: displays rows for every defined trap, even if never generated.
wide: shows trap statistics data in excess of 80 columns.

views
Displays SNMP views.

grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

### Usage

Display SNMP information as part of system verification and troubleshooting.

### Example

The following commands display the usage statistics, community string information, event trap and notification data, server information, and trap destination configuration, respectively.

```
show snmp communities
show snmp transport
show snmp server
show snmp accesses
show snmp notifies
show snmp trap history
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show srp

Displays the Service Redundancy Protocol information.

Product
HA, PDSN GGSN PDIF

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show srp { call-loss statistics | checkpoint statistics [ verbose ] | info | statistics } | [ grep grep_options | more ]
```

- **call-loss statistics**
  Displays history of lost calls during switchover.

- **checkpoint statistics [ verbose ]**
  Displays checkpointing statistics on session redundancy data (session managers, current call recovery records, etc.).
  - **verbose**: Displays cumulative information for all session managers in tabular output.

- **info**
  Displays Service Redundancy Protocol information (context, chassis state, peer, connection state, etc.).

- **statistics**
  Displays Service Redundancy Protocol statistics (hello messages sent, configuration validation, resource messages, switchovers, etc.).

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of `grep` and `more`, refer to the `Regulating a Command's Output` section of the `Command Line Interface Overview` chapter in the `Command Line Reference`.

Usage
The output of this command may be considered as part of a periodic system auditing program by verifying the Service Redundancy Protocol performance. For more information, refer to the Interchassis Session Recovery chapter of the Administration and Configuration Guide and the Service Redundancy Protocol Configuration Mode chapter of the Command Line Reference.

Example
The following command shows Service Redundancy Protocol information:
show srp call-loss statistics
show srp info
show srp checkpoint statistics
show srp statistics

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show srp monitor

Displays the Service Redundancy Protocol monitor information.

Product
HA, GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show srp monitor [ all | authentication-probe | bgp | [ grep grep_options | more ] ]
```

<table>
<thead>
<tr>
<th>all</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays monitor information for all types (authentication-probe and bgp).</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>authentication-probe</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays authentication probe monitor information.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>bgp</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays BGP monitor statistics.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>grep grep_options</th>
<th>more</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. For details on the usage of <code>grep</code> and <code>more</code>, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.</td>
<td></td>
</tr>
</tbody>
</table>

Usage
The output of this command may be considered as part of a periodic system auditing program by verifying the Service Redundancy Protocol performance. For more information, refer to the Interchassis Session Recovery chapter of the Administration and Configuration Guide and the Service Redundancy Protocol Configuration Mode chapter of the Command Line Reference.

Example
The following command shows Service Redundancy Protocol monitor information:

```
show srp monitor
```
show ss7-routing-domain

This command displays the configuration information for the defined SS7 routing domains. As SS7 routing domains conglomerate a large number of operational parameters, this command enables you to narrow your displays to specific protocol parameters on a specific link.

Product
SGSN

Privilege
Security Administrator, Administrator, Inspector, Operator

Syntax

```
show ss7-routing-domain { all | ss7rd_id { m3ua | mtp2 | mtp3 | qsaal | routes [ adjacent ] } | sctp asp { all | instance asp_id } | ssf } }

show ss7-routing-domain ss7rd_id m3ua { statistics { gen | peer-server { all | id peer-server_id peer-server-process { all | instance psp_instance } } } | status { address-translation-table | destination-point-code { all | ss7_dpc } | gen | peer-server peer-server_id [ peer-server-process instance psp_id | verbose ] } }

show ss7-routing-domain 1 ssf { statistics linkset { all | id linkset_id link { all | id link_id } } | status linkset { all | id linkset_id link { all | id link_id [ verbose ] } } }
```

```
ss7-routing-domain { all | ss7rd_id }
```

Specifies whether the display will output information for all SS7 routing domains or only for a specifically identified SS7 routing domain.

`ss7rd_id` must be an integer value from 1 through 12.

```
m3ua
```

Provides access to statistics or status information for the SS7 MTP3 User Adaptation Layer (M3UA) the specified SS7 routing domain.

```
mtp2
```

Provides access to statistics or status information the SS7 Message Transfer Part-2 (MTP2) for the specified SS7 routing domain.

```
mtp3
```

Provides access to statistics or status information the SS7 Message Transfer Part-3 (MTP3) for the specified SS7 routing domain.

```
qsaal
```

Provides access to statistics or status information for the Service Specific Connection-Oriented Protocol (SSCOP) sub-layer of the Quasi Signaling Application Adaptation Layer (QSAAL) for the specified SS7 routing domain.
**routes [ adjacent ]**

Displays the destination point code (DPC) routing table.
adjacent - If this keyword is used with the routes keyword, then it provides access to the statistics and status information for configured adjacent point codes.

**sctp asp [ all | instance asp_id ]**

Provides access to the status or statistics of Stream Control Transmission Protocol (SCTP) application server processes (ASP) in the specified SS7 routing domain for all or a specified SCTP ASP instance.
- **all**: This keyword displays the information for all SCTP application server process instances for specific SS7 routing domain.
- **instance asp_id**: Specified the specific SCTP application server process instance where
  \[ instance_id \] must be an integer value from 1 through 4.

**sscf**

Provides access to the statistics or status information for the Service Specific Coordination Function (SSCF (q.2140)) for the specified SS7 routing domain.

**peer-server [ all | id peer-server_id ]**

This keyword filters the information for the specific protocol in SS7 routing domain for all or specific peer server id.
- **all**: This keyword displays the information for all peer servers for specific protocol.
- **id peer-server_id**: Specified the specific linkset identifier where \( peer-server_id \)must be an integer value from 1 through 49.

**peer-server-process [ all | instance instance_id ]**

This keyword filters the information for the specific protocol in SS7 routing domain for all or specific instance of peer-server process.
- **all**: This keyword displays the information for all peer server process instances for specific protocol.
- **instance instance_id**: Specified the specific peer server process instance where
  \[ instance_id \] must be an integer value from 1 through 4.

**destination-point-code [ all | dest_point_code ]**

This keyword filters the information for the specific protocol in SS7 routing domain for all or specific destination point code.
- **all**: This keyword displays the information for all destination point codes in SS7 routing domain.
- **dest_point_code**: Specified the specific destination point code in SS7 routing domain.

**gen**

This keyword displays the general information for the specific protocol for the specified SS7 routing domain.

**verbose**

This keyword enables the display of maximum information for a protocol statistics/status.
```
linkset [ all | id linkset_id ]
This keyword filters the information for the specific protocol in SS7 routing domain for all or specific link set.
- **all**: This keyword displays the information for all linksets for specific protocol.
- **id linkset_id**: Specified the specific linkset identifier where linkset_id must be an integer value from 1 through 49.

link [ all | id link_id ]
This keyword filters the information for the specific protocol in SS7 routing domain for all or specific link set.
- **all**: This keyword displays the information for all links for specific protocol.
- **id link_id**: Specified the specific linkset identifier where link_id must be an integer value from 1 through 16.

Usage
Use this command to display the SS7 routing domain and different layer protocol information for SGSN service.

Example
Following command displays the information/statistics of all SCTP application server processes of peer server id 17 and peer server process instance 1 in SS7 routing domain 12:

```
show ss7-routing-domain 12 sctp asp all status peer-server id 17 peer-server-process instance 1
```

> **Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show ssh key

Displays the secure shell public key information.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ssh key [ type { v1-rsa | v2-rsa | v2-dsa } ] [ | { grep grep_options | more } ]
```

| type { v1-rsa | v2-rsa | v2-dsa } |
|-----------------------------|
| Specifies the type of SSH key information to display. If type is not specified, information for all types is displayed. |
| v1-rsa: SSH v1 RSA host key only |
| v2-rsa: SSH v2 DSA host key only |
| v2-dsa: SSH v2 RSA host key only |

`grep grep_options | more`

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of `grep` and `more`, refer to the `Regulating a Command’s Output` section of the `Command Line Interface Overview` chapter in the `Command Line Interface Reference`.

Usage
Show the secure shell key information for all types to verify installed keys.

Example
The following command shows information for all SSH V1 and SSH V2 keys:

```
show ssh key
```

The following command shows information for only SSH V2 RSA host keys:

```
show ssh key type v2-rsa
```
show subscribers

Shows information for subscriber sessions defined by the specified keywords. Keywords described under Command Keywords below are base commands that display distinctive type of data. Keywords described under Filter Keywords are filters that modify or filter the output of the base commands. Not all filter keywords are available for all command keywords commands. Each command keyword lists the filter keywords that it accepts.

Product
All

Privilege
Security Administrator, Administrator, Inspector, Operator

Syntax

```
show subscribers [ command_keyword ] [ filter_keywords ] [ | { grep grep_options | more } ]
```

Command Keywords

The following keywords are base commands that each have a distinct display output. Only one Command Keyword can entered on the command line.

```
aaa-configuration
```

Shows AAA configuration information for subscriber sessions defined by the specified filter keywords. The following filter keywords are valid with this command:

- `active`, `all`, `apn`, `callid`, `card-num`, `configured-idle-timeout`, `connected-time`, `dhcp-server`, `dormant`, `fa`, `fa-service`, `ggsn-service`, `ha`, `ha-service`, `idle-time`, `imsi`, `ip-address`, `ip-pool`, `lac`, `lac-service`, `lns`, `lns-service`, `long-duration-time-left`, `msid`, `network-requested`, `network-type`, `pcf`, `pdsn-service`, `plmn-type`, `rx-data`, `session-time-left`, `sgsn-address`, `sgsn-service`, `tx-data`, `username`, `verbose`, `grep`, `more`

```
access-flows { accounting | dynamic | pre-provisioned | static }
```

Shows the ip-flows for the subscribers defined by the specified filter keywords.

- `accounting`: Use this keyword to display the accounting type of access flows for a subscriber.
- `dynamic`: Use this keyword to display the dynamic type of access flows for a subscriber.
- `pre-provisioned`: Use this keyword to display the pre-provisioned type of access flows for a WiMAX subscriber.
- `static`: Use this keyword to display the static type of access flows for a subscriber.

The following filter keywords are valid with this command:

- `active`, `active-charging-service`, `all`, `asngw-service`, `asnp-service`, `asnp-peer-address`, `apn`, `callid`, `card-num`, `ccoa-only`, `configured-idle-timeout`, `connected-time`, `dhcp-server`, `dormant`, `fa`, `fa-service`, `flow-type`, `ggsn-service`, `gsm-traffic-class`, `ha`, `ha-ipsec-only`, `ha-service`, `idle-time`, `imsi`, `ip-address`, `ip-pool`, `ipv6-address`, `ipv6-prefix`, `13-tunnel-local-address`, `13-tunnel-remote-address`, `lac`, `lac-service`, `lns`, `lns-service`, `long-duration-time-left`, `mip-udp-tunnel-only`, `msid`, `msiddn`, `network-requested`, `network-type`, `pcf`, `pdsn-service`, `plmn-type`, `rulebase`, `rx-data`,...
Exec Mode Show Commands (Q-S)

show subscribers

Display subscribers link activity percentage. When no Filter Keywords are specified, the output is a summary of all subscriber activity. When Filter Keywords are specified, the link activity percentage is displayed as graphs in which one is displayed using a high sampling rate, a 10 second interval between samples, and a low sampling rate, a 15 minute interval between samples.

The following filter keywords are valid with this command:

active, all, asngw-service, asnpc-service, asn-peer-address, apn, callid, card-num, configured-idle-timeout, connected-time, dhcp-server, dormant, fa, fa-service, ggsn-service, ha, ha-service, idle-time, imsi, ip-address, ip-pool, lac, lac-service, lns, lns-service, long-duration-time-left, msid, network-requested, pcf, pdns-service, plmn-type, rx-data, session-time-left, sgsn-address, sgsn-service, tx-data, username, grep, more

asn-peer-address ip_address

Displays information for subscribers on an ASN GW trusted peer.

ip_address is the IPv4 address of the ASN GW peer server in dotted decimal notation.

The following filter keywords are valid with this command:

all, counters all, asngw-service, full, summary, grep, more

asngw-service service_name

Displays counters for subscribers accessing the ASN GW service.

service_name must be an existing service and be from 1 to 63 alpha and/or numeric characters in length.

The following filter keywords are valid with this command:

all, counters all, full, summary, grep, more

asnpc-service service_name

Displays counters for subscribers accessing the ASN Paging Controller and Location Registry service.

service_name must be an existing ASN PC service and be from 1 to 63 alpha and/or numeric characters in length.

The following filter keywords are valid with this command:

all, counters all, full, summary, grep, more

bearer-establishment { direct-tunnel | normal | pending }  

Selects Bearer Establishment type defined by the specified filter keywords.

direct-tunnel: Select subscribers having direct tunnel established with the RNC.
normal: Select subscribers having bearer established with SGSN.
pending: Select subscribers for whom bearer is not fully established.

configuration

Display current configuration for all subscribers or a specified subscriber. The following filter keywords are valid with this command:
**show subscribers**

**counters**
Show the counters associated with the subscriber. The following filter keywords are valid with this command:
active, all, asngw-service, asnpc-service, asn-peer-address, apn, callid, card-num, configured-idle-timeout, connected-time, dhcp-server, dormant, fa, fa-service, ggsn-service, ha, ha-service, idle-time, imsi, ip-address, ip-pool, lac, lac-service, lns, lns-service, long-duration-time-left, msid, network-requested, network-type, pcf, pdsn-service, plmn-type, rx-data, session-time-left, sgsn-address, sgsn-service, tx-data, username, grep, more

**cscf-only**
Displays information for CSCF subscribers only.
The following filter keywords are valid with this command:

```
aaa-configuration, access-flows, active, activity, all, bearer-establishment, callid, card-num, configured-idle-timeout, connected-time, counters, cscf-service, data-rate, dormant, fa, full, gtp-version, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, network-type, policy, rx-data, session-time-left, smgr-instance, subscription, summary, tft, tx-data, username, wfl
```

**cscf-service service_name**
Displays information for subscribers accessing the specified CSCF service.
`service_name` must be an existing service and be from 1 to 63 alpha and/or numeric characters in length.
The following filter keywords are valid with this command:

```
bearer-establishment, callid, card-num, configured-idle-timeout, connected-time, cscf-service, fa, gtp-version, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, network-type, rx-data, session-time-left, smgr-instance, subscription, tx-data, username
```

**css-delivery-sequence**

**Important:** This is a restricted keyword. In StarOS 9.0 and later, this keyword is obsoleted.

**css-service csssvc_name**

**Important:** This is a restricted keyword. In StarOS 9.0 and later, this keyword is obsoleted.

**data-rate [ summary | full ] [ verbose | graph { high | low } ] [ high | low ]**
Indicates how to display subscriber throughput data.
**Important:** This keyword is best used for individual subscriber output.

**summary** Combine statistics for the matching subscriber and show a summary in text form.

**full** Display a separate output for each matching subscriber separately in tabular form.

**verbose** Display cumulative information for all matching subscribers in tabular output.

**graph** \{**high** | **low** \}: Display the throughput data as a graph using either a high sampling rate of every 30 seconds or a low sampling rate of every 15 minutes. The graph contains data points over the last 24 hours, if available. The command displays a graph each for the transmit and receive peak, average, and sustained throughput for a total of six graphs.

**high** Display the raw data collected for the throughput analysis using a high sampling rate (smaller interval). The data displayed uses a sampling interval of 30 seconds and includes the data collected over the last 24 hours, if available.

**low** Display the raw data collected for the throughput analysis using a low sampling rate (larger interval). The data displayed uses a sampling interval of 15 minutes and includes the data collected over the last 24 hours, if available.

The following filter keywords are valid with this command:

- active, all, asngw-service, asnpc-service, asn-peer-address, apn, callid, card-num, configured-idle-timeout, connected-time, dhcp-server, dormant, fa, fa-service, ggsn-service, ha, ha-service, hsgw-only, hsgw-service, idle-time, imsi, ip-address, ip-pool, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mme-address, mme-service, msid, network-requested, pcf, pdsn-service, plmn-type, rx-data, session-time-left, sgsn-address, sgsn-service, tx-data, username, grep, more

**debug-info** \{**callid** id | **msid** id | **username** name \}

Displays internal call troubleshooting information for subscriber sessions defined by the specified keywords.

**callid** id: Displays subscriber information for the call specified by **id**. The call ID must be specified as an 8-byte hexadecimal number.

**msid** id: Displays information for the mobile user identified by **id**. The **id** must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (’). For example: ‘$’.

**username** name: Displays information for connections for the subscriber identified by **name**. The user must have been previously configured. **name** must be a sequence of characters and/or wildcard characters (‘$’ and ‘*’) from 1 to 127 characters in length. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as wildcard enclose them in single quotes (’). For example; ‘$’.

**full**

Shows all available subscriber information. The following filter keywords are valid with this command:

- active, all, asngw-service, asnpc-service, asn-peer-address, apn, callid, card-num, configured-idle-timeout, connected-time, dhcp-server, dormant, fa, fa-service, ggsn-service, ha, ha-service, idle-time, imsi, ip-address, ip-pool, lac, lac-service, lns, lns-service, long-duration-time-left, msid, network-requested, network-type, pcf, pdsn-service, plmn-type, rx-data, session-time-left, sgsn-address, sgsn-service, tx-data, username, grep, more

**ggsn-only**

Displays only GGSN-specific subscriber context information.
**gprs-only**

Displays only 2G SGSN subscribers/contexts. The following filter keywords are valid with this command:

aaa-configuration, active, active-charging-service, activity, all, apn, callid, card-num, configured-idle-timeout, connected-time, counters, data-rate, full, ggsn-address, gprs-service, gsm-traffic-class, idle-time, imsi, msid, msisdn, partial, plmn-type, rx-data, session-time-left, summary, tx-data, grep, and more.

**gtp-version { 0 | 1 }**

Displays the specific GTP version number. Must be followed by one of the supported GTP versions (0 or 1). The following filter keywords are valid with this command:

active-charging-service, apn, bearer-establishment, callid, dhcp-server, fa, fa-service, ggsn-service, gprs-service, gsm-traffic-class, msid, msisdn, plmn-type, ggsn-address, gprs-service, smgr-instance, tx-data, username, grep, more.

**hsgw-only**

Displays HSGW subscriber session information.

The following filters/keywords are valid with this command:

```
    all, full, summary
```

hsgw-service **svc_name**

Displays subscriber information based on the HSGW service name. **svc_name** must be an existing HSGW service and be from 1 to 63 alpha and/or numeric characters.

**hsgw-service svc_name**

Displays subscriber information based on the HSGW service name. **svc_name** must be an existing HSGW service and be from 1 to 63 alpha and/or numeric characters.

**ip-alloc-method { aaa-assigned | dhcp [ relay-agent | proxy-client ] | dynamic-pool | l2tp-1ns-assigned | mip-ha-assigned | ms-provided-static | not-ms-provided-static | static pool }**

Displays the specific IP Allocation Method. Must be followed by one of the IP Allocation Methods:

- **aaa-assigned**: Selects subscribers whose IP Addresses were assigned by AAA.
- **dhcp**: Selects subscribers whose IP Addresses were assigned by DHCP.
  - **relay-agent**: Selects subscribers whose IP Addresses were assigned by the DHCP Relay Agent
  - **proxy-client**: Selects subscribers whose IP Addresses were assigned by the DHCP Proxy Client
- **dynamic-pool**: Selects subscribers whose IP Addresses were assigned from a dynamic IP address pool.
- **l2tp-1ns-assigned**: Selects subscribers whose IP Addresses were assigned by the Layer 2 Tunneling Protocol Network Server.
- **mip-ha-assigned**: Selects subscribers whose IP Addresses were assigned by the Mobile IP Home Agent.
- **ms-provided-static**: Selects subscribers whose IP Addresses were provided by the Mobile Station.
- **not-ms-provided-static**: Selects subscribers whose IP Addresses were not provided by the Mobile Station.
- **static-pool**: Selects subscribers whose IP Addresses were assigned from a static IP address pool.

**ipsg-only**

Displays IPSG subscriber session information.
show subscribers

**lma-service** *svc_name*
Displays subscriber information based on the LMA service name. *svc_name* must be an existing LMA service and be from 1 to 63 alpha and/or numeric characters.

**mag-service** *svc_name*
Displays subscriber information based on the MAG service name. *svc_name* must be an existing MAG service and be from 1 to 63 alpha and/or numeric characters.

**mme-address**
Displays subscriber information based on the MME IP address. *ip_address* must be an existing MME IP address and be entered in IPv4 dotted decimal notation.

**mme-only**
Displays MME subscriber session information.
The following filter keywords are valid with this command:

```
all, full, summary
```

**pdg-only**
Displays a summary of PDG subscriber statistics.

**pdg-service** *name*
Displays statistics for users associated with a specific PDG service name.

**pdif-only**
Displays a summary of PDIF subscriber statistics.

**pdif-service** *name*
Displays connection statistics for users associated with a specific pdif-service name.

**pgw-only**
Displays P-GW subscriber session information.
The following filters/keywords are valid with this command:
**show subscribers**

```
all, full, summary

pgw-service svc_name: Displays subscriber information based on the P-GW service name. svc_name must be an existing P-GW service and be from 1 to 63 alpha and/or numeric characters.
sgw-address ip_address: Displays subscriber information based on the S-GW IP address. ip_address must be an existing S-GW IP address and be entered in IPv4 dotted decimal notation.
```

```
qci number
Displays subscriber session information based on the QCI value assigned to the subscriber. number must be an integer value from 0 to 9.
```

```
slu-state { active | idle | idle-active }
Displays session information based on the subscriber’s S1-U state. The S1-U interface is the interface from the eNodeB to the S-GW.
active: Displays session information for subscribers with an S1-U state set to active.
idle: Displays session information for subscribers with an S1-U state set to idle.
idle-active: Displays session information for subscribers with an S1-U state set to idle-active.
```

```
s5,proto { gtp | pmip }
Displays subscriber session information based on the S5 interface protocol used. Choose either GPRS Tunneling Protocol (GTP) or Proxy Mobile IP (PMIP).
```

```
sgsn-only
Displays only 3G SGSN-specific subscriber context information. The following filters are valid with this command:
aaa-configuration, active, active-charging-service, activity, all, apn, callid, card-num, configured-idle-timeout, connected-time, counters, data-rate, full, ggsn-address, gsm-traffic-class, idle-time, imsi, msid, msisdn, partial qos [requested | netogitated ], plmn-type, rnc, rx-data, session-time-left, summary, tx-data, grep, and more.
```

```
sgw-only
Displays S-GW subscriber session information.
The following filters/keywords are valid with this command:

```
all, full, summary

sgw-service svc_name: Displays subscriber information based on the S-GW service name. svc_name must be an existing S-GW service and be from 1 to 63 alpha and/or numeric characters.
pgw-address ip_address: Displays subscriber information based on the P-GW IP address. ip_address must be an existing P-GW IP address and be entered in IPv4 dotted decimal notation.
```

```
sgw-service svc_name
Displays subscriber information based on the S-GW service name. svc_name must be an existing S-GW service and be from 1 to 63 alpha and/or numeric characters.
```

```
subscription { aor address | callid id | full }
Displays subscription information for defined subscribers, based on defined parameters.
aor address: Clear session(s) by Address of Record.
callid id: Specific Call Identification Number.
```
full: Displays all available information.

summary
Only display a summary of the subscriber information. The following filter keywords are valid with this command:
active, activity, all, asngw-service, asnpc-service, asn-peer-address, apn, callid, card-num, configured-idle-timeout, connected-time, dhcp-server, dormant, enodeb-address, fa, fa-service, ggsn-service, ha, ha-service, idle-time, imsi ip-address, ip-pool, lac, lac-service, lns, lns-service, long-duration-time-left, msid, network-requested pcf, pdsn-service, plmn-type, rx-data, session-time-left, sgsn-address, tx-data, username, grep, more

tft
Displays the current Traffic Flow Template (TFT) associated with the subscriber session.

tx-data
Bytes transmitted by the subscriber.

wf1
Displays subscriber information in wide format number 1. Wide format number 1 includes the following information for each listed subscriber session:
• Access Type
• Access Technology
• Call State
• Link Status
• Network Type
• Call ID
• MSID
• Username
• IP Address
• Time-Idle
• Access Peer Address
• Service Address
• Network Peer Address
• Connect Time

filter_keywords
The following keywords are filters that modify or filter the output of the Command Keywords. Not all filters are available for all Command Keywords. Multiple Filter Keywords can be entered on a command line. When multiple Filter Keywords are specified, the output conforms to all of the Filter Keywords specifications.
For example; if you enter the following command:
show subscribers counters ip-pool pool1 card-num 1
show subscribers

Counters for all subscriber sessions that were assigned an IP address from the IP pool named pool1 and also are being processed by the processing card in slot 1 is displayed. Information for all other subscribers is not displayed.

**active**
Only display information for those subscribers who currently have active sessions.

**active-charging-service acs_service**
Displays information for subscribers under active charging service processing. 
*acs_service* must be a string of 1 through 15 characters in length.

**all**
If no keywords are specified before *all*, information for all subscribers is displayed. If keywords are specified before *all*, all information is displayed with no further options being allowed.

**apn name**
Displays subscribers currently facilitated by the Access Point Name (APN) template called *name* configured on the system. This command is for GGSN only.

**asngw-only**
Displays counters for subscribers accessing the ASN GW service only.

**asnpnc-only**
Displays counters for subscribers accessing the ASN Paging Controller and Location Registry service only.

**callid id**
Displays subscriber information for the call specified by *id*. The call ID must be specified as an 8-byte hexadecimal number.

**card-num card_num**
The slot number of the processing card by which the subscriber session is processed. *card_num* is a slot number from 1 through 7 or 10 through 16.

**cocoa-only**
Displays the subscribers that registered a MIP colocated COA directly with the HA. This option is only valid when MIPHA session license is enabled.

**configured-idle-timeout [ < | > | greater-than | less-than ] value**
Shows the idle timeout that is configured for the specified subscriber. A value of 0 (zero) indicates that the subscribers idle timeout is disabled.
*<*: Filters output so that only information less than the specified value is displayed.
*>: Filters output so that only information greater than the specified value is displayed.
*greater-than*: Filters output so that only information greater than the specified value is displayed.
*less-than*: Filters output so that only information less than the specified value is displayed.
*value*: Used in conjunction with <, >, greater-than, less-than. If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.
**connected-time** [ < | > | greater-than | less-than ] value

Shows how long the subscriber has been connected. <: Filters output so that only information less than the specified value is displayed. 
>: Filters output so that only information greater than the specified value is displayed. 
greater-than: Filters output so that only information greater than the specified value is displayed. 
less-than: Filters output so that only information less than the specified value is displayed. 
value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching value is displayed. If value is not specified all data is displayed. value must be an integer from 0 through 4294967295.

**cscf-only**
Displays information for CSCF subscribers only.

**cscf-service service_name**
Displays information for subscribers accessing the specified CSCF service. 
*service_name* must be an existing service and be from 1 to 63 alpha and/or numeric characters in length.

**dhcp-server address**
Displays subscribers currently accessing the system that have been provided an IP address by the DHCP server specified by *address*. This command is for GGSN only.

**dormant**
Shows information for subscriber sessions that are dormant (not transmitting or receiving data).

**enodeb-address IPv4_address**
Displays information for EPS subscribers connected to the eNodeB specified by *IPv4_address*. The address must be specified using the standard IPv4 dotted decimal notation.

**fa address**
Displays information for subscribers connected to the foreign agent specified by *address*. The address must be specified using the standard IPv4 dotted decimal notation.

**fa-only**
Only display FA-specific context information.

**fa-service name**
Displays information for subscribers connected to the foreign agent service specified by *name*. The foreign agent service name must have been previously defined.

**firewall { not-required | required }**
Displays information for the specified subscribers: 
not-required: Subscribers for whom firewall processing is not required. 
required: Subscribers for whom firewall processing is required.
**firewall-policy fw_policy_name**
This keyword is obsolete.

**fw-and-nat policy fw_nat_policy**

**Important:** This option is customer-specific and is only available in StarOS 8.1.

Displays information for subscribers using the specified Firewall-and-NAT policy.

*fw_nat_policy* specifies the Firewall-and-NAT policy name, and must be an alpha and/or numeric string of 1 through 15 characters in length.

**ggsn-address ip_address**
Displays information for subscribers connected to the GGSN with specific IP address specified by *ip_address*. The GGSN IP address *ip_address* must have been previously defined.

*ip_address:* must use dotted decimal notation.
This keyword is for SGSN only.

**ggsn-preservation-mode**
Displays information for subscribers connected to the GGSN service with preservation mode enabled. This filter keyword is for GGSN only.

**ggsn-service name**
Displays information for subscribers connected to the GGSN service specified by *name*. The GGSN service *name* must have been previously defined. This keyword is for GGSN only.

**gsm-traffic-class { background | conversational | interactive | streaming }**
Displays information for subscriber traffic that matches the specified 3GPP traffic class.

- **background:** 3GPP QoS background class.
- **conversational:** 3GPP QoS conversational class.
- **interactive:** 3GPP QoS interactive class. Must be followed by a traffic priority.
- **streaming:** 3GPP QoS streaming class.

**ha address**
Displays information for subscribers connected to the home agent specified by *address*. The address must be specified using the standard IPv4 dotted decimal notation.

**ha-ipsec-only**
Only display information for subscriber sessions that are using IP-Security.

**ha-only**
Only display HA-specific context information.
ha-service name
Displays information for subscribers connected to the home agent service specified by name. The home agent service name must have been previously defined.

idle-time [ < | > | greater-than | less-than ] value
Displays how long the subscriber session has been idle or display subscriber sessions that meet the idle time criteria specified.
<: Filters output so that only information less than the specified value is displayed.
>: Filters output so that only information greater than the specified value is displayed.
greater-than: Filters output so that only information greater than the specified value is displayed.
less-than: Filters output so that only information less than the specified value is displayed.
value: Used in conjunction with <, >, greater-than, less-than. If no other filtering options are specified only output matching value is displayed. If value is not specified all data is displayed. value must be an integer from 0 through 4294967295.

ims-auth-service service_name
Displays information for subscribers with specified IMS Authorization Service. service_name must have been previously defined.

imsi id
Shows the subscriber with the specified id. The IMSI (International Mobile Subscriber Identity) ID is a 15 character field which identifies the subscriber’s home country and carrier. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (’). For example; ‘$’.

ip-address [ < | > | greater-than | less-than ] address
Displays information for subscribers connected to the specified address.
<: Filters output so that only information for subscribers with an IP address lower than the specified address is displayed.
>: Filters output so that only information for subscribers with an IP address higher than the specified address is displayed.
greater-than: Filters output so that only information for subscribers with an IP address higher than the specified address is displayed.
less-than: Filters output so that only information for subscribers with an IP address lower than the specified address is displayed.
address: The address must be specified using the standard IPv4 dotted decimal notation. Used in conjunction with <, >, greater-than, less-than. If the ip address is specified without a qualifier then only subscribers with the specified IP address have their information displayed.

ip-pool name
Displays information for subscribers assigned addresses from the IP address pool name. name must be the name of an existing IP pool or IP pool group. IP pool name will be either ipv4 or ipv6 according to call line setup for specified pool name.

ipv6-address address
Displays information for subscribers connected to the specified address.
**ipv6-prefix prefix**
Displays information for subscribers connected to the specified address and `prefix`.

**lac address**
Displays information for calls to the peer LAC (L2TP access concentrator) specified by `address`.

**lac-only**
Show L2TP LAC specific information only.

**lac-service name [ local-tunnel-id id | remote-tunnel-id id ]**
Displays information for calls associated with the LAC service named `name`. This is a string of 1 to 63 characters.
- `local-tunnel-id id`: Specifies a specific local tunnel from which to clear calls. `id` must be in the range of 1 to 65535.
- `remote-tunnel-id id`: Specifies a specific remote tunnel from which to clear calls. `id` must be in the range of 1 to 65535.

**13-tunnel-local-addr ip_address**
Specific layer 3 tunneling interface specified by `ip_address`. The address must be specified using the standard IPv4 dotted decimal notation.

**13-tunnel-remote-addr ip_address**
Specific layer 3 tunneling peer specified by `ip_address`. The address must be specified using the standard IPv4 dotted decimal notation.

**lns address**
Displays information for calls to the peer LNS (L2TP network server) specified by `address`.

**lns-only**
Show L2TP LNS specific information only.

**lns-service name [ local-tunnel-id id | remote-tunnel-id id ]**
Displays information for calls associated with the LNS service named `name`. This is a string of 1 to 63 characters.
- `local-tunnel-id id`: Specifies a specific local tunnel from which to clear calls. `id` must be in the range of 1 to 65535.
- `remote-tunnel-id id`: Specifies a specific remote tunnel from which to clear calls. `id` must be in the range of 1 to 65535.

**long-duration-time-left [ < | > | greater-than | less-than ] value**
Shows how much time is left for the maximum duration of a specified subscriber session.
- `<`: Filters output so that only information less than the specified value is displayed.
- `>`: Filters output so that only information greater than the specified value is displayed.
- `greater-than`: Filters output so that only information greater than the specified value is displayed.
- `less-than`: Filters output so that only information less than the specified value is displayed.
value: Used in conjunction with <, >, greater-than, less-than. If no other filtering options are specified only output matching value is displayed. If value is not specified all data is displayed. value must be an integer from 0 through 4294967295.

mip-udp-tunnel-only
Displays the subscribers that negotiated MIP-UDP tunneling with the HA. This option is only valid when MIP NAT Traversal license is enabled.

mipv6ha-only
Shows MIPV6HA-specific context information for the session.

mipv6ha-service service_name
Displays specific configured MIPV6 Home Agent service. service_name must have been previously defined.

msid id
Displays information for the mobile user identified by id. id must be from 7 to 16 hexadecimal digits specified as an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘’). For example: ‘$’.

In case of enforce imsi-min equivalence is enabled on the chasis and MIN or IMSI numbers supplied, this filter will show subscribers with a corresponding MSID (MIN or IMSI) whose lower 10 digits matches to lower 10 digits of the supplied MSID.

show subscribers msid ABCD0123456789 or
show subscribers msid 0123456789
will show any subscriber with a MSID that match the lower 10 digits of MSID supplid, i.e. 0123456789.

msisdn msisdn
Displays information for the mobile user identified by the Mobile Subscriber ISDN Number (MSISDN). msisdn must be 7 to 16 digits; specified as an IMSI, MIN, or RMI.

nat { not-required | required [ nat-ip nat_ip_address | nat.realm nat.realm ] }
Displays information for the specified subscribers.
not-required: Subscribers for whom Network Address Translation (NAT) processing is not required.
required: Subscribers for whom NAT processing is required.

Important: The nat-ip keyword is only available in StarOS 8.3 and later.

nat-ip nat_ip_address: Subscribers for whom NAT processing is enabled and are using the specified NAT IP address. nat_ip_address specifies the NAT IP address and must be a standard IPv4 address.
nat.realm nat.realm: Subscribers for whom NAT processing is enabled and are using the specified NAT realm. nat.realm specifies the NAT realm name and must be a string from 1 through 63 characters in length.
show subscribers

network-requested
Display information for currently active subscribers whose sessions were initiated by the GGSN network requested create PDP context procedure.

network-type { gre | ipip | ipsec | ipv4 | ipv6 | l2tp | mobile-ip | proxy-mobile-ip }
Displays network type information for the subscriber session. The following network types can be selected:
* gre: Generic Routing Encapsulation (GRE) per RFC 2784
* ipip: IP-in-IP encapsulation per RFC 2003
* ipsec: IPSec
* ipv4: Internet Protocol version 4 (IPv4)
* ipv6: Internet Protocol version 6 (IPv6)
* l2tp: Layer 2 Tunneling Protocol encryption per RFC 2661
* mobile-ip: Mobile IP
* proxy-mobile-ip: Proxy Mobile IP

nsapi nsap_id
Displays session information for the mobile user identified by network service access point identifier (NSAPI) between MS and SGSN. NSAPI is also used as part of the Tunnel Identifier between GPRS Support Nodes (GSNs). The user identity IMSI and the application identifier (NSAPI) are integrated into the Tunnel Identifier (GTPv0) (TID) or Tunnel Endpoint Identifier (GTPv1) (TEID) that uniquely identifies the subscriber’s sublink between the GSNs (SGSN and GGSN). The NSAPI is an integer value within the PDP context header.
nsap_id must be an integer value from 5 through 15.

partial qos { negotiated | requested }
This filter is specific to the SGSN.
Is limits the display of information to requested or negotiated QoS information for the subscriber.
This filter can be used in combination with further defining filters: active, active-charging-service, all, apn, callid, card-num, configured-idle-timeout, connected-time, ggsn-address, gprs-service, gsm-traffic-class, idle-time, imsi, msid, misisd, negotiated, plmn-type, requested, rx-data, session-time-left, tx-data

pcf [ < | > | less-than | greater-than ] ipv4_address [ [ < | > | less-than | greater-than ] ipv4_address ]
Displays information for subscribers connected via the packet control function with a specific or range of IP address ipv4_address. The address must be specified using the standard IPv4 dotted decimal notation.
* <: Filters output so that only information less than the specified IPv4 address value is displayed.
* >: Filters output so that only information greater than the specified IPv4 address value is displayed.
* less-than: Filters output so that only information less than the specified IPv4 address value is displayed.
* greater-than: Filters output so that only information greater than the specified IPv4 address value is displayed.

Note: It is possible to define a limited range of IP addresses by using the less-than and greater-than options to define minimum and maximum values.
show subscribers

**pdsn-only**
Show PDSN specific information only.

**pdsn-service name**
Displays information for subscribers connected to the packet data service *name*. The packet data service must have been previously configured.

**plmn-type**
Displays subscriber type (HOME, VISITING, or ROAMING). This keyword is for the GGSN or the SGSN only.

**policy**
Displays the current policies associated with the subscriber session.

**rnc id rnc_id mcc mcc_num mnc mnc_num**
Displays information for subscribers connected to the SGSN via a specific RNC (radio network controller) identified by the RNC ID, the MCC (mobile country code), and the MNC (mobile network code). This keyword is for SGSN only.

**rx-data [< | > | greater-than | less-than ] value**
The number of bytes received by the specified subscriber.
- `<`: Filters output so that only information less than the specified value is displayed.
- `>`: Filters output so that only information greater than the specified value is displayed.
- `greater-than`: Filters output so that only information greater than the specified value is displayed.
- `less-than`: Filters output so that only information less than the specified value is displayed.

**session-time-left [< | > | greater-than | less-than ] value**
How much session time is left for the specified subscriber.
- `<`: Filters output so that only information less than the specified value is displayed.
- `>`: Filters output so that only information greater than the specified value is displayed.
- `greater-than`: Filters output so that only information greater than the specified value is displayed.
- `less-than`: Filters output so that only information less than the specified value is displayed.

**smgr-instance number**
Specific sessmgr instance. *number* must be in the range of 1 to 4294967295.

**sgsn-address address**
Shows information for subscribers whose PDP contexts are currently being facilitated by the SGSN specified by address. This command is for GGSN only.
shows subscribers

sgsn-service srvc_name
Shows subscriber information for a specified 3G SGSN service.
srvc_name must be a string of 1 to 63 alphanumeric characters that identifies a configured SGSN service. This command is for SGSN only.

tx-data [ < | > | greater-than | less-than ] value
The number of bytes transmitted by the specified subscriber.
<: Filters output so that only information less than the specified value is displayed.
>: Filters output so that only information greater than the specified value is displayed.
greater-than: Filters output so that only information greater than the specified value is displayed.
less-than: Filters output so that only information less than the specified value is displayed.
value: Used in conjunction with <, >, greater-than, less-than. If no other filtering options are specified only output matching value is displayed. If value is not specified all data is displayed. value must be an integer from 0 through 18446744073709551615.

username name
Displays information for connections for the subscriber identified by name. The user must have been previously configured. name must be a sequence of characters and/or wildcard characters ('$' and '*') from 1 to 127 characters in length. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

verbose
Display detailed information.

grep grep_options | more
Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
Use this command to view information about subscriber sessions.
The output of this command may be considered for part of a periodic system auditing program by verifying active and dormant subscribers.
The Command Keywords may be used standalone to display detailed information or you may use one or more of the various Filter Keywords to reduce the amount of information displayed.

⚠️ Caution: Executing this command may negatively impact performance if multiple instances are executed while the system is under heavy load and simultaneously facilitating multiple CLI sessions.

Example
The following command displays information for all subscriber sessions:

show subscribers all
The following command displays information for all ggsn-only subscriber sessions:

```
show subscribers ggsn-only all
```

The following command displays information for all subscriber sessions in wide format 1:

```
show subscribers w1 all
show subscribers aaa-configuration
show subscribers counters username ispluser1
```

The following command displays information for subscriber in GGSN service:

```
show subscribers ggsn-only all
show subscribers ggsn-only full
```

The following command displays information for all subscriber with SGSN session having partial QoS requests:

```
show subscribers sgsn-only partial qos requested
```

The following command displays information for all subscriber with MME session connected to MME service having IP address as 1.1.1.1:

```
show subscribers mme-only mme-address 1.1.1.1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show super-charger

Lists subscribers with valid super charger configuration.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show super-charger { imsi imsi | all }
```

- **imsi**
  Defines a specific subscriber’s international mobile subscriber identity (IMSI) number.
  **imsi** - up to 15 digits This number includes the MCC (mobile country code), the MNC (mobile network code) and the MSIN (mobile station identification number),

- **all**
  Instructs the SGSN to display super charger subscription information for all subscribers.

Usage
Use this command to determine if a single subscriber, identified by the IMSI, has a super charger configuration. Also, this command can display the list of all subscribers with a super charger configuration. If a subscriber has super charger as part of the configuration, then subscriber data is backed up (using the IMSI Manager) after the subscriber detaches and the purge timer expires.

Example
The following command displays the super charger configuration information for the subscriber identified by the IMSI 90121882144672.

```
show super-charger imsi 90121882144672
```
show support details

This command outputs a comprehensive list of system information that is useful for troubleshooting purposes. In most cases, the output of this command is requested by the technical support team.

Product
All

Privilege
All

Syntax

```
show support details [ to file url]
```

to file url

Specifies the location where a tar file with the support detail information should be created. url may refer to a local or a remote file. url must be entered using one of the following formats:

- ASR 5000:
  ```
  ![file:]{/flash|/pcmcia|/hd}[/{directory}]/{file_name}
  ![tftp:]{host[:port]}[/{directory}]/{file_name}
  ![ftp: | sftp: ]/{username}:{password}@{host}:{port}]
  ![directory]/{file_name}
  ```

- filename is the directory name.
- username is the user to be authenticated.
- password is the password to use for authentication.
- host is the IP address or host name of the server.
- port# is the logical port number that the communication protocol is to use.

If the filename is not specified with a .tar extension, it is automatically appended to the filename when the file is created and a message is generated.

The content of the tar file is as follows:

- **support_summary** - An ASCII text file that contains the support detail information.
- **information.minicores.tar** - A tar file that contains any minicore files found on the system. Minicore files contain memory core dumps that are captured during some events. These core dumps provide specific memory locations and other information about the event. This information is useful to the technical support team in identifying specifically where an event occurred and its probable cause.

Usage

Use this command to obtain extensive system information for use in troubleshooting. This command does the work of over 30 separate commands, which saves time and ensures that all of the information needed is collected and displayed in the same order every time. The output of the following commands is included:

- show version verbose
- show config
- show context
- show ip pool
- show ip interface
- show ip route
- show boot
- show boot initial-config
- show system uptime
- show license information
- show card hardware
- show card info
- show card diag
- show card table all
- show port table all
- show port info
- show port npu counters
- show port datalink counters
- show fans
- show hardware version fans
- show power chassis
- show alarm audible
- show alarm central-office
- show alarm outstanding
- show alarm statistics
- show asngw-service statistics
- show asnpe-service statistics
- show content-filtering category database
- show cpu table
- show cpu info verbose
- show resources
- show task table
- show task resources
- show task resources max
- show crash list
- show snmp trap history
- show logs level error
- show logs level error inactive
- show ppp statistics
- show session disconnect-reasons
- show apn statistics all
• show pdsn-service all
• show ha-service all
• show dhcp-service all
• show ggsn-service all
• show lac-service all
• show lns-service all
• mme-hss-service
• mme-service
• show session progress
• show rp statistics
• show mipfa statistics
• show mipha statistics
• show srp info
• show srp checkpoint statistics
• show srp checkpoint statistics verbose
• show gtpc statistics verbose
• show gtp accounting servers
• show gtpp statistics verbose
• show gtpp storage-server
• show session recovery status verbose
• show clock all
• show radius counters all
• show ntp associations all
• show charging-service all (if the Enhanced Charging Service license is installed)
• show qos npu inter-subscriber traffic bandwidth-sharing
• timestamps
• no timestamps

In addition to the information provided by the above commands, the show support details command includes information that is not otherwise accessible to users but that is helpful in the swift resolution of issues.

Example
The following command displays the system information on your console.

    show support details

The following command displays the information on your console and also writes it to the local device (pcmcia1 in this case) and includes the mini core dumps, using the filename r-p_problem.tar.

    show support details to file /pcmcia1/r-p_problem.tar
The following command displays the information on your console and also writes it to an FTP server (named host), placing the file in the dir directory and includes the mini core dumps, using the filename re_problem.tar.

```
show support details to file ftp://host/dir/re_problem.tar
```
show system uptime

Shows the system the amount of time the system has been operational since the down time (maintenance or otherwise).

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show system uptime [ | { grep grep_options | more } ]
```

| **uptime** |
| Indicates only the system up time is to be displayed. |

| **grep grep_options | more** |
| Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified. For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference. |

**Usage**
Display the system up time to check for the possibility of anomalous behavior related to longer up times.

**Example**
The following commands display the system basic information and up time only, respectively.

```
show system uptime
```
Chapter 97
Exec Mode Show Commands (T-Z)

This section includes the commands `show task` through `show version`
show task

Displays information about system tasks.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show task { info | resources | table } [ card card_num ] [ facility facility { all | instance id } ] [ process process_name { all | max } ] [ grep grep_options ]
```

- **{ info | resources | table }**
  Specifies type of information to be displayed and scope of tasks to include in output.
  - `info`: Display detailed task information.
  - `resources`: Display resource allocation and usage information for all tasks.
  - `table`: Display identification information in tabular format for all tasks.

- **card card_num**
  Default: all powered on cards.
  Specifies a single card for which task information is to be displayed where `card_num` must be from 1 to 48.

- **facility facility { all | instance id }**
  Default: all facilities.
  Specifies the list of facilities for which task information may be displayed. A specific instance of the facility may be displayed as specified by `id` or all instances may be displayed. The value of `id` must be in the range of 0 through 100000. `facility` must be one of:
  - `allmgr`: A11 Interface Manager facility
  - `aaamgr`: AAA Manager Facility
  - `aaaproxy`: AAA Proxy manager Facility
  - `acscctrl`: Active Charging Service (ACS) Controller Facility
  - `acsmgr`: Active Charging Service (ACS) Manager Facility
  - `asngwmg`: ASN Gateway Manager
  - `asnpcrm`: ASN Paging/Location-Registry (ASN-PC) Manager
  - `bgp`: Border Gateway Protocol (BGP) Facility
  - `bulkstat`: Bulk Statistics Manager Facility
  - `cdrmod`: Charging Detail Record Module
  - `cli`: Command Line Interface Facility
  - `cscfmg`: SIP CSCF Manager
  - `csctrl`: Card Slot Port controller Facility
• **cssctrl**: Content Service Steering Controller  
• **dcardctrl**: IPSEC Daughtercard Controller Logging Facility  
• **dcardmgr**: IPSEC Daughtercard Manager Logging Facility  
• **dhmgr**: Distributed Host Manager  
• **drvctrl**: Driver Controller Facility  
• **egtpemgr**: EGTP Egress Demux Manager  
• **egtpinmgr**: EGTP Ingress Demux Manager  
• **evlogd**: Event Log Daemon Facility  
• **famgr**: Foreign Agent Manager Facility  
• **gtpcmr**: GTP-C Protocol Logging facility (GGSN product only)  
• **h248pmt**: H.248 Protocol Task  
• **hamgr**: Home Agent Manager Facility  
• **hatcpu**: High Availability Task CPU Facility  
• **hatsystem**: High Availability Task Facility  
• **ipsecctrl**: IP Security Controller Facility  
• **ipsecemgr**: IP Security Manager Facility  
• **ipsmgmr**: IP Services Gateway Facility  
• **l2pdemux**: L2TP Demultiplexor (LNS) Facility  
• **l2pemgr**: L2TP Manager Facility  
• **magmgr**: Mobile Access Gateway Manager  
• **megadiammgr**: MegaDiameter Manager  
• **mmedemux**: MME Demux Manager logging facility  
• **mmemgr**: MME Manager logging facility  
• **mmgr**: SGSN/SS7 Master Manager  
• **mttest**: Migration Performance Test on Packet Accelerator Card  
• **netwstrg**: Network Storage Manager  
• **npuctrl**: Network Processor Unit control Facility  
• **npumgr**: Network Processor Unit Manager Facility  
• **nputst**: Network Processor Unit Tester  
• **nsctrl**: Charging Service Controller  
• **nsmgr**: Charging Service Process Manager  
• **orbs**: Object Request Broker Notification Server Facility  
• **orbs**: Object Request Broker System Facility  
• **ospf**: Open Shortest Path First Facility  
• **rct**: Recovery Control Task Facility  
• **rdt**: Redirect Task Facility  
• **rip**: Routing Information Protocol Facility
show task

- **rmctrl**: Resource Manager Controller Facility
- **rmmgr**: Resource Manager Facility
- **sct**: Shared Configuration Task Facility
- **sessctrl**: Session Controller Facility
- **sessmgr**: Session Manager Facility
- **sft**: Switch Fabric Monitoring Task
- **sipcdprt**: Sip Call Distributor Task
- **sitmain**: System Initialization Task Main Facility
- **sitparent**: Card based system initialization facility that applies to Packet Accelerator Cards and Switch Processor Cards

**Important**: **sitparent** replaces the facilities **sitpac**, **sitspc** and **sittac**.

- **snmp**: SNMP Protocol Facility
- **srdb**: Static Rating Database
- **threshold**: Threshold Server Facility
- **vpncntl**: Virtual Private Network Controller Facility
- **vpnmgr**: VPN Manager Facility
- **zebos**: ZEBOS™ OSPF Message Facility

**all**: Display information for all instances of the specified facility.
**instance id**: Display information for the specified instance of the specified facility only. id must be an integer from 0 through 10000000.

**process process_name all**

Display information for all instances of the specified process. must be one of the following process names:
- **ftpd**: File Transfer Protocol Daemon
- **inetd**: Internet Super-server Daemon
- **nsproc**: NetSpira Packet Processor
- **ntpd**: Network Time Protocol Daemon
- **orbsnd**: Object Request Broker Notification Server
- **ping**: Ping
- **pvmd-wrapper**: NetSpira Messenger Daemon
- **pvmgs**: NetSpira Messenger Daemon
- **rlogin**: Remote Login
- **sftp-server**: Secure File Transfer Protocol Server
- **sitreap**: System Initialization Task Cleanup Process
- **sn_resolve**: DNS Resolver Process
- **ssh**: Secure Shell
- **sshd**: Secure Shell Daemon
Exec Mode Show Commands (T-Z)

**show task**

- **telnet**: Telnet
- **telnetd**: Telnet Daemon
- **tftpd**: Trivial File Transfer Protocol Daemon
- **traceroute**: Traceroute

### max

Default: current usage levels are displayed.
Displayed the maximum usage levels for tasks as opposed to the current usage levels.
The keyword **max** is valid only in conjunction with the **resources** keyword.

### grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

### Usage

Display task information as part of system troubleshooting unexpected behavior.

### Important: This command is not supported on all platforms.

### Example

The following commands provide some examples of the combinations of options that may be used to display task information.

```plaintext
show task info facility hatspc all
show task info facility hatspc instance 456
show task resources facility zebos all
show task table facility ospf
show task table card 8 facility cli all
show task resources facility rip all max
```
**show temperature**

Displays the current temperature on all installed application and line cards. Also displays the temperature of upper and lower fan trays. Temperature readings are acquired from sensors located on these components.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show temperature [ verbose] [ | { grep grep_options | more } ]
```

- **grep grep_options | more**
  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
  For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

- **verbose**
  Indicates that the output is to contain detailed information.

**Usage**

Verify current temperature of components in chassis.

**Example**

```
show temperature
show temperature verbose
```
show terminal

Displays the current terminal settings for number of lines in length and number of characters in width.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show terminal [ | { grep grep_options | more } ]
```

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Verify current terminal settings in case the output displayed appears to have line breaks/wraps in unexpected places.

Example

```
show terminal
```
show threshold

Displays thresholding information for the system.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show threshold [ default ]
```

[ default ]
Used to display the system’s thresholding default values.

**Usage**
Use this command to display information on threshold value configuration and activity.

**Example**
The following command displays configuration information pertaining to threshold values configured on the system:

```
show threshold
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show timing

Displays the information configured to define a transmit timing source other than the system clock. The display includes related information (such as port status, timing source priority, timing alarms, etc.) for all of the ports configured for either BITS or line timing.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show timing
```

**Usage**

Use this command to determine which line cards are recovering receive timing clocks.

**Important:** This command is not supported on all platforms.

**Example**

The following command displays timing configuration and status information for the timing-configured ports.

```
show timing
```
show upgrade

Displays the status of an on-going on-line software upgrade.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Syntax**

```
show upgrade
```

**Usage**
Use this command to show the status of an on-going on-line software upgrade.

**Important:** This command is not supported on all platforms.
show url-blacklisting database

This command displays URL Blacklisting static database configurations.

Product
CF

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show url-blacklisting database [ all | url url | facility acsmgr { all | instance instance } ] [ | { grep grep_options | more } ]
```

- **all**
  Displays configurations of all URL Blacklisting databases present in the default or override directory.

- **facility acsmgr { all | instance instance }**
  Displays configurations of URL Blacklisting database configuration per facility/ACSMgr instance.
  - **all**: Displays URL Blacklisting database configuration of all ACSMgrs.
  - **instance instance**: Displays URL Blacklisting database configuration of the specified instance.
    - `instance` must be instance number of the database, and must be an integer from 1 through 1000000.

- **url url**
  Displays configurations of the URL Blacklisting database specified in the URL.
  - `url` must be the database's URL, and must be a string of 1 through 512 characters in length.

- **grep grep_options | more**
  Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to view configurations associated with in-memory and on-flash Blacklisting database. The `show url-blacklisting database` command displays the active database that is loaded, and is the one set by either the default or override CLI commands.

Example

The following command displays configurations of all the databases present in default or override directory, indicating one as ACTIVE and rest as NOT LOADED:

```
show url-blacklisting database all
```

The following command displays configurations of the `/flash/bl/optblk.bin` database:
The following command displays database configuration for the ACSMgr instance 1:

```
show url-blacklisting database facility acsmgr instance 1
```
show version

Displays the version information for the current system image or for a remote image.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show version [ url ] [ all | verbose ] [ | { grep | grep_options | more } ]
```

- **url**
  Specifies the location of a configuration file to display version information for. The `url` may refer to a local or a remote file. `url` must be entered using one of the following formats:
  - **ASR 5000:**
    - `{ file: }[/flash|/pcmcia|/hd ][/directory]/file_name`
    - `tftp://host[:port#][/directory]/file_name`
    - `http: | ftp: | sftp: ]//username[:password]@host[:port#][/directory]/file_name`

  - `directory` is the directory name.
  - `filename` is the actual file of interest.
  - `username` is the user to be authenticated.
  - `password` is the password to use for authentication.
  - `host` is the IP address or host name of the server.
  - `port#` is the logical port number that the communication protocol is to use.

- **all | verbose**
  - `all`: indicates all image information is to be displayed.
  - `verbose`: indicates the output is to contain detailed information.

  The `verbose` keyword may not be used in conjunction with a URL specification.

- **grep | grep_options | more**

  Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Display the version information to verify the image versions loaded in preparation for maintenance, upgrades, etc.

**Important:** This command is not supported on all platforms.
Example
The following commands display the version information with the basic level of output and the detailed level, respectively.

    show version
    show version verbose
Chapter 98
FA Service Configuration Mode Commands

The Foreign Agent Service Configuration Mode is used to create and manage the Foreign Agent (FA) services associated with the current context.

```
Exec Mode
configure
Global Configuration Mode
context name
Context Configuration Mode
fa-service name
FA Service Configuration Mode
```
advertise

Configures agent advertisement parameters within the FA service.

**Product**
PDSN, GGSN, ASN GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
advertise {adv-delay seconds | adv-lifetime time | adv-interval { seconds | msec num } | num-adv-sent number | prefix-length-extn | reg-lifetime reg_time}
```

```
noadvertise {prefix-length-extn | reg-lifetime}
```

[default] advertise adv-delay

```
no advertise prefix-length-extn
```

Disables prefix-length-extn

```
no advertise reg-lifetime
```

Specifies that there is no limit to the registration lifetime that the FA service will allow in any Registration Request message from the mobile node.

```
default advertise adv-delay
```

Sets the initial delay for the unsolicited advertisement to default value of 1000 ms.

```
advertise adv-delay seconds
```

Default: 1000
This command sets the initial delay for the unsolicited advertisement.

`seconds` is the advertisement delay in milliseconds and must be an integer from 10 through 5000.

**Important:** This command is available for WiMAX CMIP calls only.

```
adv-lifetime time
```

Default: 9000
Specifies the FA agent advertisement lifetime.
The agent advertisement lifetime is the amount of time that an FA agent advertisement remains valid in the absence of further advertisements.
time is measured in seconds and can be configured to any integer value between 1 and 65535.

```
adv-interval { seconds | msec num }
```

Default: 5 seconds
Specifies the amount of time between agent advertisements.
seconds is the time in seconds and can be any integer value from 1 through 1800.
**msec num** Configures agent advertisement interval in milliseconds. can be any integer from 100 through 1800000.

**num-adv-sent number**
Default: 5
Specifies the number of unanswered agent advertisements that the FA service sends upon PPP establishment before it will reject the session. number can be any integer value between 1 and 65535.

**prefix-length-extn**
Default: Disabled
When this is enabled, the FA includes the FA-service address in the Router Address field of the Agent Advertisement and appends a Prefix Length Extension in Agent Advertisements with a prefix length of 32.

**reg-lifetime reg_time**
Default: 600
Specifies the longest registration lifetime that the FA service will allow in any Registration Request message from the mobile node. reg_time is measured in seconds and can be configured to any integer value between 1 and 65534.

**Usage**
Use to tailor FA advertisements to meet your network needs and/or conditions.

**Example**
The following command configures the FA advertisement interval at 10 seconds, the advertise lifetime to 20000 seconds, and the maximum number of unanswered advertisements that will be sent to 3.

```
advertise adv-interval 10 adv-lifetime 20000 num-adv-sent 3
```
authentication aaa

This configuration enables/disables the authentication parameters for the FA service to override dynamic keys from AAA with static keys to support MIP registration with HA which do not support dynamic keys.

Product
FA, ASN-GW

Privilege
Security Administrator, Administrator

Syntax

[ no | default ] authentication aaa-distributed-mip-keys override

no
Disable the override of dynamic keys from AAA.

default
By default the override behavior is disabled and system uses dynamic keys from AAA after successful EAP authentication. When no EAP authentication happens system uses static keys by default.

Usage
Specify how the system will perform authentication of registration request messages. By default dynamic MN-HA and FA-HA keys from AAA after successful EAP authentication used by PMIP client in WiMAX calls for MIP registration with HA. This configuration in FA service overrides the dynamic keys from AAA with static keys to support MIP registration with HA which do not support dynamic keys.

Example
The following command configures the FA service to override use of AAA MIP keys and force the use of statically configured FA-HA SPI/key for WiMAX calls.

    authentication aaa-distributed-mip-keys override
authentication mn-aaa

Specifies how the system handles authentication for mobile node re-registrations.

**Product**
PDSN, ASN GW, GGS

**Privilege**
Security Administrator, Administrator

**Syntax**

```
```

---

**always**
Specifies that the FA service performs authentication each time a mobile node registers. This is the default setting.

**ignore-after-handoff**
MN-AAA authentication is not done at the FA, for a handoff Access Gateway (AGW).

**init-reg**
MN-AAA and MN-FAC extensions are required only in initialization RRQ.

**init-reg-except-handoff**
MN-AAA and MN-FAC extensions are not required in initialization RRQ after inter-Access Gateway (AGW) handoff.

**renew-and-dereg-noauth**
Specifies that the FA service does not perform authentication for mobile node re-registration or deregistration authorization requests. Initial registration is handled normally.

**renew-reg-noauth**
Specifies that the FA service does not perform authentication for mobile node re-registrations. Initial registration and de-registration are handled normally.

**optimize-retries**
Optimizes the number of Authentication retries sent to the AAA server. When an authentication request is pending for a MIP call at the AGW, if a retry RRQ is received from the mobile node, the AGW discards the old RRQ and keeps the most recent RRQ. Subsequently when the authentication succeeds, the AGW forwards the most recent RRQ to the HA. If the authentication fails, the AGW replies to the MN using the most recent RRQ.

**Usage**
Use this command to determine how the FA service handles mobile node re-registrations. The system is shipped from the factory with the mobile AAA authentication set to always.

**Example**

The following command configures the FA service to perform mobile node authentication for every re-registration:

```
authentication mn-aaa always
```

The following command specifies that the FA service does not perform authentication for mobile node re-registrations:

```
authentication mn-aaa renew-reg-noauth
```
authentication mn-ha

Configures whether the FA service looks for MN-HA auth extension in the RRP.

Product
PDSN, ASN GW, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
authentication mn-ha { allow-noauth | always }
```

---

**allow-noauth**

Allows a reply that does not contain the auth extension.

---

**always**

A reply should always contain the auth extension to be accepted.
This is the default setting.

---

Usage
Use this command to determine whether or not the FA service requires the MN-HA auth extension in the RRP.
The system is shipped from the factory with this set to always.

---

Example
The following command configures the FA service to require a reply to contain the authentication extension to be accepted:

```
authentication mn-ha always
```
bind

Binds the FA service to a logical IP interface serving as the Pi interface and specifies the maximum number of subscribers that can access this service over the interface.

Product
PDSN, ASN GW, GGSN PDIF

Privilege
Security Administrator, Administrator

Syntax

\[ \text{bind address address [ max-subscribers count ]} \]
\[ \text{no bind address} \]

\[ address \]
Specifies the IP address (address) of the interface configured as the Pi interface. address is specified in dotted decimal notation.

\[ \text{max-subscribers max#} \]
Default: 500000
Specifies the maximum number of subscribers that can access this service on this interface.
\[ \text{count} \]
can be configured to any integer value between 0 and 500000.

Important: The maximum number of subscribers supported is dependant on the license key installed and the number of active PACs/PSCs installed in the system. A fully loaded system with 13 active PACs/PSCs can support 500,000 total subscribers. Refer to the license key command for additional information.

Usage
Associate or tie the FA service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an Pi interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.
This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.
When configuring the max-subscribers option, be sure to consider the following:
- The total number of interfaces you will configure for use as Pi interfaces
- The maximum number of subscriber sessions that all of these interfaces may handle during peak busy hours
- The average bandwidth for each of the sessions
- The type of physical port (10/100Base-T or 1000Base-Tx) that these interfaces will be bound to
Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.
Use the no bind address command to delete a previously configured binding.
Example
The following command would bind the logical IP interface with the address of 192.168.3.1 to the FA service and specifies that a maximum of 600 simultaneous subscriber sessions can be facilitated by the interface/service at any given time.

    bind address 192.168.3.1 max-subscribers 600

The following command disables a binding that was previously configured:

    no bind address
challenge-window

Defines the number of recently sent challenge values that are considered valid by the FA.

**Product**
PDSN, ASN GW, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
challenge-window number
```

- **number**
  - Default: 2
  - The number of recently sent challenge values that are considered valid. `number` must be an integer from 1 through 5.

**Usage**

Use this command to set the number of recently sent challenge values that are considered valid by the FA.

**Example**

Set the challenge window to 3:

```
challenge-window 3
```
**default**

Restores default values assigned for specified parameter.

**Product**
PDSN, ASN GW, GGSN PDIF

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
```

<table>

</table>
revocation [ enable | max-retransmission | retransmission-timeout | trigger internal-failure ]

Sets the MIP Registration Revocation settings to their default values. When no optional keywords are specified all revocation settings are set to their defaults.

- **enable**: Disables MIP Registration Revocation on the FA.
- **max-retransmission**: Sets the maximum number of retransmissions to 3.
- **retransmission-timeout**: Sets the retransmission timeout to 3 seconds.
- **trigger internal-failure**: Disables the FA from sending revocation messages when a session experiences an internal failure.

**Usage**

After the system has been modified from its default values, this command is used to set/restore specific parameters to their default values.

**Example**

The following command is used to return the ip local-port parameter to it’s default value:

```
default ip local-port
```
default subscriber

Specifies the name of a subscriber profile configured within the same context as the FA service from which to base the handling of all other subscriber sessions handled by the FA service.

Product
PDSN, ASN GW, GGSN PDIF

Privilege
Security Administrator, Administrator

Syntax

```plaintext
default subscriber profile_name

no default subscriber profile_name
```

profile_name
Specifies the name of the configured subscriber profile. `profile_name` can be between 1 and 63 alpha and/or number characters and is case sensitive.

Usage
Each subscriber profile specifies “rules” such as permissions, PPP settings, and timeout values.
By default, the FA service will use the information configured for the subscriber named default within the same context. This command allows for multiple FA services within the same context to apply different “rules” to sessions they process. Each set of rules can be configured under a different subscriber name which is pointed to by this command.
Use the `no default subscriber profile_name` command to delete the configured default subscriber.

Example
To configure the FA service to apply the rules configured for a subscriber named user1 to every other subscriber session it processes, enter the following command:

```
default subscriber user1
```
**dynamic-ha-assignment**

This command configures various dynamic HA assignment parameters.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ default | no ] dynamic-ha-assignment [ aaa-override mn-supplied-ha-addr | allow-failover ]
```

- **default**
  Feature is disabled by default.

- **no**
  Removes the feature and returns it to the default setting of disabled.

- **aaa-override mn-supplied-ha-addr**
  Enables the system to override the mobile node supplied HA IP address with the AAA provided HA address.

- **allow-failover**
  Enables/disables a failover retry for dynamic HA assignment from the AAA server.

**Usage**

Use this command to override the mobile node supplied HA IP address with the AAA supplied HA address. Use this command to enable or disable the failover feature that allows the system to receive and use a newer HA address from the AAA server in cases where the original HA address is not responding. A AAA server may assign different HA addresses each time a retransmitted MIP RRQ is authenticated during the MIP session setup. When this configuration is enabled, if the FA gets a new HA address from AAA during setup, it discards the previous HA address and start using the new address. This allows the FA session to connect to an available HA during setup.

**Example**

The following command enables the failover feature that allows the system to receive and use a newer HA address from the AAA server:

```
dynamic-ha-assignment allow-failover
```
**dynamic-mip-key-update**

When enabled, the FA service processes MIP Key_Update_Request from the AAA server and allows dynamic MIP key updates (DMUs).

Default: Disabled

**Product**
PDSN, ASN GW, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
dynamic-mip-key-update
no dynamic-mip-key-update
```

**Example**
To enable DMU and allow dynamic updates of MIP keys, enter the following command:

```
dynamic-mip-key-update
```
encapsulation allow gre

Enables or disables the use of generic routing encapsulation (GRE) when establishing a MIP session. When enabled, if requested by a Mobile Node (MN), the FA requests the HA to use GRE encapsulation when establishing the MIP session. When disabled, the FA does not set the GRE bit in Agent Advertisements to the MN.

Default: GRE is enabled.

Product
PDSN, ASN GW, GGSN

Privilege
Security Administrator, Administrator

Syntax

encapsulation allow gre
no encapsulation allow gre

Usage
Use to disable or re-enable the use of GRE encapsulation for MIP sessions.

Example
To disable GRE encapsulation for MIP sessions, enter the following command;

no encapsulation allow gre

To re-enable GRE encapsulation for MIP sessions, enter the following command;

encapsulation allow gre
end

Exits the FA service configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Change the mode back to the Exec mode.
exit

Exits the FA service configuration mode and returns to the context configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Return to the context configuration mode.
fa-ha-spi

Configures the security parameter index (SPI) between the FA service and the HA.

Product
PDSN, ASN GW, GGSN PDIF

Privilege
Security Administrator, Administrator

Syntax

fa-ha-spi remote-address { ha_ip_address | ip_addr_mask_combo } spi-number
number { encrypted secret enc_secret | secret secret } [ description string | hash-algorithm { hmac-md5 | md5 | rfc2002-md5 } | monitor-ha | replay-protection { timestamp | nonce } | timestamp-tolerance tolerance ]

no fa-ha-spi remote-address { ha_ip_address | ip_addr_mask_combo } spi-number
number

remote-address { ha_ip_address | ip_addr_mask_combo }  

ha_ip_address: Specifies the IP address of the HA in IP v4 dotted decimal notation.
ip_addr_mask_combo: Specifies the IP address network mask bits. ip_addr_mask_combo must be specified using the form ‘IP Address/Mask Bits’ where the IP address is specified using the standard IPv4 dotted decimal notation and the mask bits are a numeric value which is the number of bits in the subnet mask.

spi-number number

Specifies the SPI (number) which indicates a security context between the FA and the HA in accordance with RFC 2002.

number can be configured to any integer value between 256 and 4294967295.

encrypted secret enc_secret | secret secret

Configures the shared-secret between the FA service and the HA. The secret can be either encrypted or non-encrypted.

• encrypted secret enc_secret: Specifies the encrypted shared key (enc_secret) between the FA service and the HA. enc_secret must be between 1 and 254 alpha and/or numeric characters and is case sensitive.

Important: The encrypted keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the secret keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

• secret secret: Specifies the shared key (secret) between the FA service and the HA. secret must be between 1 and 127 alpha and/or numeric characters and is case sensitive.
**description** string

This is a description for the SPI. string must be an alpha and or numeric string of from 1 through 31 characters.

**hash-algorithm** { hmac-md5 | md5 | rfc2002-md5 }

Default: hmac-md5

Specifies the hash-algorithm used between the FA service and the HA.
- **hmac-md5**: Configures the hash-algorithm to implement HMAC-MD5 per RFC 2002bis.
- **md5**: Configures the hash-algorithm to implement MD5 per RFC 1321.
- **rfc2002-md5**: Configures the hash-algorithm to implement keyed-MD5 per RFC 2002.

**monitor-ha**

Default: disabled

Enables the HA monitor feature for this HA address.

To set the behavior of the HA monitor feature, refer to the **ha-monitor** command in this chapter. To disable this command (if enabled) for this HA address, re-enter the entire **fa-ha-spi** command without the **monitor-ha** keyword.

**replay-protection** { timestamp | nonce }

Default: timestamp

Specifies the replay-protection scheme that should be implemented by the FA service for this SPI.
- **nonce**: Configures replay protection to be implemented using NONCE per RFC 2002.
- **timestamp**: Configures replay protection to be implemented using timestamps per RFC 2002.

**Important**: This keyword should only be used in conjunction with Proxy Mobile IP support.

**timestamp-tolerance** tolerance

Default: 60

Specifies the allowable difference (tolerance) in timestamps that is acceptable. If the difference is exceeded, then the session will be rejected. If this is set to 0, then time stamp tolerance checking is disabled at the receiving end.

**tolerance** is measured in seconds and can be configured to any integer value between 0 and 65535.

**Important**: This keyword should only be used in conjunction with Proxy Mobile IP support.

More than one of the above keywords can be entered within a single command.

**Usage**

An SPI is a security mechanism configured and shared by the FA service and the HA. Please refer to RFC 2002 for additional information.

Though it is possible for FAs and HAs to communicate without SPIs being configured, the use of them is recommended for security purposes. It is also recommended that a “default” SPI with a remote address of 0.0.0.0/0 be configured on both the HA and FA to prevent hackers from spoofing addresses.
**Important:** The SPI configuration on the HA must match the SPI configuration for the FA service on the system in order for the two devices to communicate properly.

A maximum of 2048 SPIs can be configured per FA service. Use the `no` version of this command to delete a previously configured SPI.

**Example**
The following command configures the FA service to use an SPI of 512 when communicating with an HA with the IP address 192.168.0.2. The key that would be shared between the HA and the FA service is q397F65. When communicating with this HA, the FA service will also be configured to use the rfc2002-md5 hash-algorithm.

```plaintext
fa-ha-spi remote-address 192.168.0.2 spi-number 512 secret q397F65 hash-algorithm rfc2002-md5
```

The following command deletes the configured SPI of 400 for an HA with an IP address of 172.100.3.200:

```plaintext
no fa-ha-spi remote-address 172.100.3.200 spi-number 400
```
gre

Configures Generic Routing Encapsulation (GRE) parameters.

Product
PDSN, ASN GW, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
gre { checksum | checksum-verify | reorder-timeout timeout | sequence-mode { none | reorder } | sequence-numbers }

no gre { checksum | checksum-verify | sequence-numbers }
```

no
Disables the specified functionality.

checksum
Default: disabled
Enables the introduction of the checksum field in outgoing GRE packets.

checksum-verify
Default: disabled
Enables verification of the GRE checksum (if present) in incoming GRE packets.

reorder-timeout timeout
Default: 100
Configures maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets. `timeout` must be an integer from 0 through 5000.

sequence-mode { none | reorder }
Default: none
Configures how incoming out-of-sequence GRE packets should be handled.
none: Disables reordering of incoming out-of-sequence GRE packets.
reorder: Enables reordering of incoming out-of-sequence GRE packets.

sequence-numbers
Default: Disabled.
Enables insertion or removal of GRE sequence numbers in GRE packets.

Usage

Use this command to configure how the FA service handles GRE packets.
Example
To set maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets to 500 milliseconds, enter the following command:

```
gre reorder-timeout 500
```

To enable the reordering of incoming out of sequence GRE packets, enter the following command:

```
gre sequence-mode reorder
```
ha-monitor

Configures the behavior of the HA monitor feature.

**Product**
PDSN, ASN GW, FA, HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ default ] ha-monitor [ interval sec | max-inactivity-time sec | num-retry num ]
[ no ] ha-monitor
```

**default**
Restores the system default setting(s) for the command/keyword(s). This command is disabled by default.

**no**
Disables the HA monitoring feature for this FA service.

**interval sec**
Default: 30
Configures the time interval before the next monitoring request message is sent to the HA.
`sec` must be a numeric value between 1 and 36000.

**max-inactivity-time sec**
Default: 60
Specifies the maximum amount of time the system will wait without receiving MIP control traffic from a HA before the HA monitoring mechanism is triggered.
`sec` must be a numeric value between 30 and 600.

**num-retry num**
Default: 5
Configures the number of time the system will attempt to send HA monitor requests before determining the HA is down and a trap is initiated.
`num` must be a numeric value between 0 and 10.

**Usage**
Use this command to set parameters for the HA monitor feature. This feature allows the AGW/FA to monitor HAs with which it has MIP sessions. The monitoring feature is triggered when the AGW/FA does not receive any MIP traffic from a HA for a configured amount of time (**max-inactivity-time**). The AGW/FA starts sending special MIP RRQ monitor messages and waits for RRP monitor message responses from the HA. The RRQ monitor messages are addressed to the HA service address. The source address of the monitor-request messages is the FA service's IP address.
The actions taken during monitoring are comprised of the following:
If no monitor response is received during the interval time (interval), the AGW retransmits the monitor message a configured number of times (num-retry).

If no response is received after retransmitting for the number configured in num-retry, the HA is considered down. The AGW/FA sends a trap (HAUnreachable) to the management station. Monitoring of this HA is stopped until a MIP control message is received from the particular HA and when the AGW/FA sends a trap (HAreachable) to the management station and starts monitoring the HA again.

When an HA receives the RRQ from an FA, it verifies the message and identifies it as a monitor message based on a special reserved NAI (in the message) and a Monitor HA CVSE in the RRQ. The HA responds with an RRP with Reply code 0x00 (accepted) and includes the Monitor HA CVSE. When the FA receives the RRP from the HA, it updates the activity for the peer HA to maintain the “up” state.

**Important:** This command only sets the behavior of the HA monitor feature. To enable the HA monitor feature for each HA address, refer to the fa-ha-spi command in this chapter. Up to 256 HAs can be monitored per system.

**Example**

The following commands set the HA monitor message interval to 45 seconds, the HA inactivity time to 60 seconds, and the number of HA monitor retries to 6:

```shell
ha-monitor interval 45
ha-monitor max-inactivity-time 60
ha-monitor num-retry 6
```
idle-timeout-mode

Controls whether Mobile IP data and control packets or only Mobile IP data resets the session idle timer.

**Product**
PDSN, ASN GW, GGSN PDIF

**Privilege**
Security Administrator, Administrator

**Syntax**

idle-timeout-mode {aggressive | normal}

- **aggressive**
  Only Mobile IP data resets the session idle timer.

- **normal**
  Both Mobile IP data and control packets reset the session idle timer.

**Usage**

Use this command to control how the session idle timer is reset.

**Example**
The following command specifies that only Mobile IP data can reset the session idle timer:

```
idle-timeout-mode aggressive
```
ignore-mip-key-data

When this is enabled, if DMU is not enabled and the MN sends a MIP-Key-Data CVSE, the FA ignores the MIP-Key-Data extension and the call is continued like a regular MIP call.

**Product**
PDSN, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ignore-mip-key-data
no ignore-mip-key-data
```

```
no
```

Disable ignoring of MIP key data.

**Usage**

When DMU is not enabled, use this command to ignore MIP key data sent by the MN and allow the call to continue normally.

**Example**
To enable the FA to ignore MIP key data sent by the MN, enter the following command:

```
ignore-mip-key-data
```
ignore-stale-challenge

Enables the system to accept RRQs with previously used challenges. This feature is disabled by default.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

ignore-stale-challenge
no ignore-stale-challenge

Usage
Use this command to allow the FA to accept stale challenges regardless of the ID field or if other RRQs are pending.

Example
To enable this functionality in the FA service, enter the following command;

    ignore-stale-challenge

To disable this functionality, enter the following command;

    no ignore-stale-challenge
ip local-port

Configures the local User Datagram Protocol (UDP) port for the Pi interfaces’ IP socket on which to listen for Mobile IP Registration messages.

**Product**

PDSN, ASN GW, GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
ip local-port port#
```

*port#*

Specifies the UDP port number.

*port#* can be any integer value between 1 and 65535.

**Usage**

Specify the UDP port that should be used for communications between the FA service and the HA.

The system is shipped from the factory with the local port set to 434.

**Example**

The following command specifies a UDP port of 3950 for the FA service to use to communicate with the HA on the Pi interface:

```
ip local-port 3950
```
**isakmp**

Configures support for IPSec within the FA-service.

**Product**

PDSN, ASN GW, GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
isakmp {peer-ha ha_address {crypto map map_name [ [ encrypted ] secret secret ]} |
          default { crypto map map_name [ [ encrypted ] secret secret ]}}
```

```plaintext
no isakmp { peer-ha peer_ip_address | default }
```

**no**

Deletes the reference to the crypto map for the specified HA or deletes the reference for the default crypto map.

```plaintext
peer-ha ha_address { crypto map map_name [ [ encrypted ] secret preshared_secret ] }
```

Configures a crypto map for a peer HA.

- **ha_address**: The IP address of the HA with which the FA service will establish an IPSec SA. The address must be expressed in dotted decimal format.

- **crypto map map_name**: The name of a crypto map configured in the same context that defines the IPSec tunnel properties. `map_name` is the name of the crypto map and can be from 1 to 127 alpha and/or numeric characters.

- **encrypted**: This keyword is intended only for use by the system while saving configuration scripts. The system displays the `encrypted` keyword in the configuration file as a flag that the variable following the `secret` keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

- **secret secret**: The pre-shared secret that will be used during the IKE negotiation. `preshared_secret` is the secret and can be from 1 to 127 alpha and/or numeric characters.

```plaintext
default { crypto map map_name [ [ encrypted ] secret secret ] }
```

Specifies the default crypto map to use when there is no matching crypto map configured for an HA address.

- **crypto map map_name**: The name of a crypto map configured in the same context that defines the IPSec tunnel properties. `map_name` is the name of the crypto map and can be from 1 to 127 alpha and/or numeric characters.

- **encrypted**: This keyword is intended only for use by the system while saving configuration scripts. The system displays the `encrypted` keyword in the configuration file as a flag that the variable following the `secret` keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

- **secret secret**: The pre-shared secret that will be used during the IKE negotiation. `preshared_secret` is the secret and can be from 1 to 127 alpha and/or numeric characters.
Usage

Use this command to configure the FA-service’s per-HA IPSec parameters. These dictate how the FA service is to establish an IPSec SA with the specified HA.

**Important:** For maximum security, it is recommended that the above command be executed for every possible HA that the FA service communicates with.

A default crypto map can also be configured using the default keyword. The default crypto map is used in the event that the AAA server returns an HA address that is not configured as an isakmp peer-ha.

**Important:** For maximum security, the default crypto map should be configured in addition to peer-ha crypto maps instead of being used to provide IPSec SAs to all HAs.

Note that once an IPSec tunnel is established between the FA and HA for a particular subscriber, all new Mobile IP sessions using the same FA and HA are passed over the tunnel regardless of whether or not IPSec is supported for the new subscriber sessions. Data for existing Mobile IP sessions is unaffected.

Example

The following command creates a reference for an HA with the IP address 1.2.3.4 to a crypto map named map1:

```
isakmp peer-ha 1.2.3.4 crypto map map1
```

The following command deletes the crypto map reference for the HA with the IP address 1.2.3.4.

```
no isakmp peer-ha 1.2.3.4
```
limit-reg-lifetime

Enable the current default behavior of limiting the MIP lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts. When disabled, this command allows a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts.

Product
PDSN, ASN GW, GGSN PDIF

Privilege
Security Administrator, Administrator

Syntax

[no | default] limit-reg-lifetime

- **no**
  Allows a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts.

- **default**
  Enable the default behavior of limiting the MIP lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts.

Usage
Use the no keyword with this command to allow a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts.
Use the base command or the keyword to reset the FA service to the default behavior of limiting the MIP lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts.

Example
Configure the FA service to allow a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts by entering the following command:

```
no limit-reg-lifetime
```

Configure the FA service to the default behavior of limiting the MIP lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts by entering either of the following commands:

```
default limit-reg-lifetime
```
max-challenge-len

For mobile subscribers, the FA generates a random number and sends it to the mobile node as part of the mobile authentication extension (Mobile-Foreign Authentication extension) as described in RFC 3012. This command sets the maximum length of the FA challenge in bytes.

**Product**
PDSN, ASN GW, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
max-challenge-len length
```

*length*

Default: 16
The maximum length, in bytes, of the FA challenge. This value must be an integer in from 4 to 32.

**Usage**
Change the maximum allowed length of the randomly generated FA challenge its default of 16.

**Example**
Use the following command to change the maximum length of the FA challenge to 18 bytes:

```
max-challenge-len 18
```
mn-aaa-removal-indication

Enables the FA to remove the MN-FAC and MN-AAA extensions from RRQs. This is disabled by default.

**Product**
PDSN, ASN GW, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```markdown
mn-aaa-removal-indication
no mn-aaa-removal-indication
```

**Usage**
Enable this feature if there is no need to authenticate the subscriber at HA using MN-AAA extension.

**Example**
The following command enables the FA service to remove MN-FAC and MN-AAA extensions from RRQs:

```
mn-aaa-removal-indication
```
multiple-reg

Specifies the number of simultaneous Mobile IP sessions that will be supported for over a single PPP session.

**Product**
PDSN, ASN GW, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
multiple-reg number
```

- `number`: number can be configured to any integer value between 1 and 3.

**Usage**

Use to support multiple registrations per subscriber.
The system is shipped from the factory with the multiple simultaneous MIP sessions set to 1.

**Important:** The system will only support multiple Mobile IP sessions per subscriber if the subscriber’s mobile node has a static IP address. The system will only allow a single Mobile IP session for mobile nodes that receive a dynamically assigned IP address. In addition, because only a single Mobile IP or proxy-Mobile IP session is supported for IP PDP contexts, this parameter must remain at its default configuration.

**Example**
The following command configures the number of supported simultaneous registrations for subscribers using this FA service to 3.

```
multiple-reg 3
```
optimize tunnel-reassembly

Configures FA to HA optimization for tunnel reassembly.

**Product**

PDSN, ASN GW, GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
optimize tunnel-reassembly
no optimize tunnel-reassembly
```

**Usage**

Enabling this functionality fragments large packets prior to encapsulation for easier processing. Tunnel reassembly optimization is disabled by default.

**Important:** Cisco Systems strongly recommends that you do not use this command without first consulting Cisco Systems Technical Support. This command applies to very specific scenarios where packet reassembly is not supported at the far end of the tunnel. There are cases where the destination network may either discard the data, or be unable to reassemble the packets.

**Important:** This functionality works best when the FA service is communicating with an HA service running in a system. However, an FA service running in the system communicating with an HA from a different manufacturer will operate correctly even if this parameter is enabled.

Use the no version of this command to disable tunnel optimization if it was previously enabled.

**Example**

The following command enables tunnel reassembly optimization:

```plaintext
optimize tunnel-reassembly
```
private-address allow-no-reverse-tunnel

This command enables the FA to allow calls with private addresses and no reverse tunneling.

Product
PDSN, ASN GW, GGSN

Privilege
Security Administrator, Administrator

Syntax

```
private-address allow-no-reverse-tunnel
no private-address allow-no-reverse-tunnel
```

Usage

Use this command to let the FA allow sessions with private addresses that do not have the reverse tunnel bit set.

Example

To enable sessions with private addresses and no reverse tunneling, enter the following command:

```
private-address allow-no-reverse-tunnel
```
proxy-mip

Configures parameters pertaining to Proxy Mobile IP support.

Product
PDSN, ASN GW, GGSN PDIF

Privilege
Security Administrator, Administrator

Syntax

```
proxy-mip { allow | ha-failover [ max-attempts max_attempts | num-attempts-before-switching num_attempts | timeout seconds ] | max-retransmissions number | renew-percent-time renew-time | retransmission-timeout time }

no proxy-mip { allow | ha-failover }

default proxy-mip { allow | ha-failover | max-retransmissions | renew-percent-time | retransmission-timeout }
```

no
Disables FA service support for Proxy Mobile IP or HA failover for Proxy Mobile IP.

default
Restores the specified option to the default setting as described below.

allow
Default: Disabled
Enables FA service support for Proxy Mobile IP.

ha-failover [max-attempts max_attempts | num-attempts-before-switching num_attempts | timeout seconds ]
Default: Disabled
Enables HA failover for the Proxy Mobile IP feature.

- `max-attempts max_attempts` - Configures the maximum number of retransmissions of Proxy MIP control messages. `max_attempts` must be an integer from 1 through 10. Default is 4

- `num-attempts-before-switching num_attempts` - Configures the total number of RRQ attempts (including retransmissions) before failing over to the alternate HA. `num_attempts` must be an integer from 1 through 5. Default is 2.

- `timeout seconds` - Configures the retransmission timeout, in seconds, of Proxy MIP control messages when failover happens. `seconds` must be an integer from 1 through 50. Default is 2

max-retransmissions number
Default: 5
Configures the maximum number re-try attempts that the FA service is allowed to make when sending Proxy Mobile IP Registration Requests to the HA.
number is the maximum number of retries and can be configured to any integer value from 1 to 4294967295.

**renew-percent-time renew-time**

Default: 75

Configures the amount of time that must pass prior to the FA sending a Proxy Mobile IP Registration Renewal Request.

renew-time is entered as a percentage of the advertisement registration lifetime configured for the FA service. (Refer to the advertise command in this chapter). The time can be configured to any integer value from 1 to 100.

The following equation can be used to calculate renew-time:

\[
\text{renew-time} = \left( \frac{\text{duration}}{\text{lifetime}} \right) \times 100
\]

duration = The desired amount of time that can pass prior to the FA sending a Proxy Mobile IP Registration Renewal Request

lifetime = The advertisement registration lifetime configured for the FA service.

duration £ lifetime

Default: 3

Configure the maximum amount of time allowed by the FA for a response from the HA before re-sending a Proxy Mobile IP Registration Request message.

time is measured in seconds and can be configured to any integer value from 1 to 100.

**Usage**

The proxy-mip command and its keywords configure the FA services support for Proxy Mobile Mobile IP. When enabled though the session license and feature use key, the system supports Proxy Mobile IP to provide a mobility solution for subscribers with mobile nodes (MNs) capable of supporting only Simple IP.

In addition to the parameters configured via this command, the HA-FA SPI(s) must also be modified to support Proxy Mobile IP. Refer to the fa-ha-spi command for more information.

**Example**

The following command configures the FA service to wait up to 5 seconds for an HA to respond prior to re-sending an a Mobile IP Registration Request message:

```
proxy-mip retransmission-timeout 5
```

If the advertisement registration lifetime configured for the FA service is 900 seconds and you want the system to send a Proxy Mobile IP Registration Renewal Request message after 500 seconds, then the following command must be executed:

```
proxy-mip renew-percent-time 50
```

Note that \( 50 = \frac{450}{900} \times 100 \).
reg-timeout

Configures the FA registration reply timeout.

**Product**

PDSN, ASN GW, GGSN PDIF

**Privilege**

Security Administrator, Administrator

**Syntax**

```
reg-timeout time
```

*time*

Default: 45
time is measured in seconds and can be configured to any integer between 1 and 65535.

**Usage**

Configure the amount of time that the FA service will wait for a Registration Reply from an HA before the call is rejected with a reply code of 78H (registration Timeout).

**Example**

The following command configures a registration timeout of 10.

```
reg-timeout 10
```
reverse-tunnel

Enables the use of reverse tunneling for a Mobile IP sessions when requested by the mobile node.

**Product**
PDSN, ASN GW, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

reverse-tunnel

no reverse-tunnel

---

**Usage**
Reverse tunneling involves tunneling datagrams originated by the mobile node to the HA via the FA service. When an MN arrives at a foreign network, it listens for agent advertisements and selects an FA that supports reverse tunnels. The MN requests this service when it registers through the selected FA. At this time, the MN may also specify a delivery technique such as Direct or the Encapsulating Delivery Style.

The advantages of using reverse-tunneling:

- All datagrams from the mobile node seem to originate from its home network
- The FA can keep track of the HA that the mobile node is registered to and tunnel all datagrams from the mobile node to its HA

Use the **no** option of this command to disable reverse tunneling. If reverse tunneling is disabled, and the mobile node does not request it, then triangular routing is used.

The system is shipped from the factory with the reverse tunnel enabled.

---

**Important:** If reverse tunneling is disabled on the system and a mobile node requests it, the call will be rejected with a reply code of 74H (reverse-tunneling unavailable).

---

**Example**
The following command disables reverse-tunneling support for the FA service:

```
no reverse-tunnel
```
revocation

Enables the MIP revocation feature and configures revocation parameters.

Product
PDSN, ASN GW, GGSN PDIF

Privilege
Security Administrator, Administrator

Syntax

```
revocation { enable | max-retransmission number | negotiate-i-bit |
retransmission-timeout secs | trigger internal-failure }
```

```
no revocation enable | trigger internal-failure | negotiate-i-bit
```

```
no revocation { enable | negotiate-i-bit | trigger internal-failure }
```

Completely disables registration revocation on the FA.
Disables sending revocation messages to the HA when a session is affected by an internal task failure.

enable

Enables the MIP registration revocation feature on the FA. When enabled, if revocation is negotiated with an HA, and a MIP binding is terminated, the FA can send a Revocation message to the HA. This feature is disabled by default.

max-retransmission number

Default: 3
The maximum number of retransmissions of a Revocation message before the revocation fails. `number` must be an integer from 0 through 10.

negotiate-i-bit

Default: disabled
Enables the FA to negotiate the i-bit via PRQ/RRP messages and processes the i-bit revocation messages.

retransmission-timeout secs

Default: 3
The number of seconds to wait for a Revocation Acknowledgement from the HA before retransmitting the Revocation message. `secs` must be an integer from 1 through 10.

trigger internal-failure

Default: disabled
Enable sending a revocation message to the HA for all sessions that are affected by an internal task failure.

Usage
Use this command to enable or disable the MIP revocation feature on the FA or to change settings for this feature. Both the HA and the FA must have Registration Revocation enabled and FA/HA authorization must be in use for Registration Revocation to be negotiated successfully.

**Example**

The following command enables Registration Revocation on the FA:

```
revocation enable
```

The following command sets the maximum number of retries for a Revocation message to 6:

```
revocation max-retransmission 6
```

The following command sets the timeout between retransmissions to 10:

```
revocation retransmission-timeout 10
```
threshold reg-reply-error

Set an alarm or alert based on the number of registration reply errors per FA service.

Product
PDSN, ASN GW, GGSN

Privilege
Security Administrator, Administrator

Syntax

threshold reg-reply-error high_thresh [ clear low_thresh ]

no threshold reg-reply-error

no
Delete the alert or alarm.

high_thresh
Default: 0
The high threshold number of registration reply errors that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: You must enter a value between 1 and 100000 to trigger an alert/alarm.

clear low_thresh
Default: 0
The low threshold number of registration reply errors that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Important: You must enter a value between 1 and 100000 to trigger an alert/alarm.

Usage
Use this command to set an alert or an alarm when the number of registration reply errors is equal to or greater than a specified number of calls per second. Alerts or alarms are triggered for the number of registration reply errors on the following rules:

- **Enter condition**: Actual number of registration reply errors > High Threshold
- **Clear condition**: Actual number of registration reply errors ≤ Low Threshold

Example
The following command configures a registration reply error threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:

```bash
threshold reg-reply-error 1000 clear 500
```
Chapter 99
Firewall-and-NAT Policy Configuration Mode Commands

The Firewall-and-NAT Policy Configuration Mode enables configuring Firewall-and-NAT policies.

**Important:** This configuration mode is only available in StarOS 8.1 and in StarOS 9.0 and later. This configuration mode must be used to configure Policy-based Stateful Firewall and NAT features.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
access-rule

This command creates and configures an access rule.

Product
FW, NAT

Privilege
Security Administrator, Administrator

Syntax

access-rule { no-ruledef-matches { downlink | uplink } action { deny [ charging-action charging_action ] | permit [ bypass-nat | nat-realm nat_realm ] } | priority priority { [ dynamic-only | static-and-dynamic ] access-ruledef ruledef_name { deny [ charging-action charging_action ] | permit [ [ bypass-nat | nat-realm nat_realm ] trigger open-port { port_number | range start_port to end_port } direction { both | reverse | same } ] } } }]

default access-rule no-ruledef-matches { downlink | uplink } action

no access-rule priority priority

default
Configures the default setting.
Default: uplink direction: permit; downlink direction: deny

no
Removes the access rule specified by the priority.

no-ruledef-matches
Configures action on packets with no ruledef match.

downlink
Specifies to act on downlink packets with no ruledef match.

uplink
Specifies to act on uplink packets with no ruledef match.

action
Specifies action to take on downlink/uplink packets with no ruledef match.

deny
Specifies to deny packets.

permit
Specifies to permit packets and allow the creation of data flows.
**charging-action charging_action**

Specifies the charging action. Optionally, for deny action a charging action can be configured. If a packet matches the deny rule, action is taken as configured in the charging action. If a charging action is specified, the content-ID and billing-action configured in the charging action are used. Also, the flow may be terminated (instead of just discarding the packet), if so configured in the specified charging action. `charging_action` must be an alpha and/or numeric string of 1 through 63 characters in length.

**bypass-nat**

Specifies to bypass NAT.

**nat-realm nat_realm**

Specifies the NAT realm to be used to perform NAT on subscriber packets matching the access ruledef. If the NAT realm is not specified, NAT will be bypassed. That is, NAT will not be performed on subscriber packets that are matching a ruledef with no NAT realm name configured in it. `nat_realm` must be an alpha and/or numeric string of 1 through 31 characters in length.

**priority priority**

Specifies priority of an access ruledef in the Firewall-and-NAT policy. `priority` must be an integer from 1 through 65535, and must be unique for each access ruledef in the Firewall-and-NAT policy.

```markdown
[ dynamic-only | static-and-dynamic ] access-ruledef ruledef_name
```

Specifies the access ruledef name. Optionally, the ruledef type can also be specified.

- **dynamic-only**: Dynamic Ruledef—Predefined ruledef that can be enabled/disabled by the policy server, and is disabled by default.
- **static-and-dynamic**: Static and Dynamic Ruledef—Predefined ruledef that can be enabled/disabled by the policy server, and is enabled by default.
- **access-ruledef ruledef_name**: Specifies the access ruledef name. `ruledef_name` must be an alpha and/or numeric string of 1 through 63 characters in length.

**trigger open-port { port_number | range start_port to end_port }**

**direction { both | reverse | same }**

Optionally a port trigger can be specified to be used for this rule to limit the range of auxiliary data connections (a single or range of port numbers) for protocols having control and data connections (like FTP). The trigger port will be the destination port of an association which matches a rule.

- **port_number**: Specifies the auxiliary port number to open for traffic, and must be an integer from 1 through 65535.
- **range start_port to end_port**: Specifies the range of port numbers to open for subscriber traffic.
  - **start_port** must be an integer from 1 through 65535.
  - **end_port** must be an integer from 1 through 65535, and must be greater than `start_port`.
- **direction { both | reverse | same }**: Specifies the direction from which the auxiliary connection is initiated. This direction can be same as the direction of control connection, or the reverse of the control connection direction, or in both directions.
Firewall-and-NAT Policy Configuration Mode Commands

access-rule

- **both**: Provides the trigger to open port for traffic in either direction of the control connection.
- **reverse**: Provides the trigger to open port for traffic in the reverse direction of the control connection (from where the connection is initiated).
- **same**: Provides the trigger to open port for traffic in the same direction of the control connection (from where the connection is initiated).

Usage

Use this command to add access ruledefs to the Firewall-and-NAT policy and configure the priority and actions for rule matching.

The policy specifies the rules to be applied on calls. The ruledefs in the policy have priorities, based on which priority matching is done.

For Stateful Firewall, the port trigger configuration is optional, and can be configured only if a rule action is permit. When a rule is matched and the rule action is permit, if the trigger is configured, the appropriate check is made. The trigger port will be the destination port of an association that matches the rule. Multiple triggers can be defined for the same port number to permit multiple auxiliary ports for subscriber traffic. When a rule is matched and if the rule action is deny, the action taken depends on what is configured in the specified charging action. If the flow exists, flow statistics are updated and action is taken as configured in the charging action:

- If the billing action is configured as EDR enabled, EDR is generated.
- If the content ID is configured, UDR information is updated.
- If the flow action is configured as “terminate-flow”, the flow is terminated instead of just discarding the packet.

If the billing action, content ID, and flow action are not configured, no action is taken on the dropped packets. Allowing/dropping of packets is determined in the following sequence:

- Check is done to see if the packet matches any pinholes. If yes, no rule matching is done and the packet is allowed.
- Access ruledef matching is done. If a rule matches, the packet is allowed or dropped as per the `access-rule priority` configuration.
- If no access ruledef matches, the packet is allowed or dropped as per the `access-rule no-ruledef-matches` configuration.

For a packet dropped due to access ruledef match or no match (first packet of a flow), the charging action applied is the one configured in the `access-rule priority` or the `access-rule no-ruledef-matches` command respectively.

For action on packets dropped due to any error condition after data session is created, the charging action must be configured in the `flow any-error charging-action` command in the Rulebase Configuration Mode.

The GGSN can dynamically activate/deactivate dynamic ruledefs for a subscriber based on the rule name received from a policy server. At rule match, if a rule in the policy is a dynamic rule, and if the rule is enabled for the particular subscriber, rule matching is done for the rule. If the rule is disabled for the particular subscriber, rule matching is not done for the rule.

Example

For Stateful Firewall, the following command assigns a priority of 10 to the access ruledef `test_rule`, adds it to the policy, and permits port trigger to be used for the rule to open ports in the range of 1000 to 2000 in either direction of the control connection:
access-rule priority 1 access-ruledef test_rule permit trigger open-port range 1000 to 2000 direction both
end

This command returns the CLI prompt to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to change to the Exec mode.
exit

This command exits the current configuration mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
**firewall dos-protection**

This command configures Stateful Firewall protection for subscribers from Denial-of-Service (DoS) attacks.

![Important] In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the Rulebase Configuration Mode.

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] firewall dos-protection { all | flooding { icmp | tcp-syn | udp } | ftp-bounce | ip-unaligned-timestamp | mime-flood | port-scan | source-router | tcp-window-containment | teardrop | winnuke }
```

**default firewall dos-protection**

- **no**
  Disables Stateful Firewall protection for subscribers against the specified DoS attack(s).

- **default**
  Disables Stateful Firewall protection for subscribers against all DoS attacks.

- **all**
  Enables Stateful Firewall protection for subscribers against all DoS attacks supported by the Stateful Firewall service.

- **flooding { icmp | tcp-syn | udp }**
  Enables protection against the specified flooding attack:

  - **icmp**
    Enables protection against ICMP Flood attack

  - **tcp-syn**
    Enables protection against TCP Syn Flood attack

  - **udp**
    Enables protection against UDP Flood attack

- **ftp-bounce**
  Enables protection against FTP Bounce attacks.

- **ip-unaligned-timestamp**
  Enables protection against IP Unaligned Timestamp attacks.
Enables protection against HTTP Multiple Internet Mail Extension (MIME) header flooding attacks.

Enables protection against Port Scan attacks.

Enables protection against TCP sequence number out-of-range attacks.

Enables protection against IP Source Route IP Option attacks.

Enables protection against Teardrop attacks.

Enables protection against WIN-NUKE attacks.

Use this command to enable Stateful Firewall protection from different types of DoS attacks. This command can be used multiple times for different DoS attacks.

Important: DoS attacks are detected only in the downlink direction.

The following command enables protection from all supported DoS attacks:

```
firwall dos-protection all
```
firewall flooding

This command configures Stateful Firewall protection from Packet Flooding attacks.

**Important:** In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the Rulebase Configuration Mode.

**Product:**
FW

**Privilege:**
Security Administrator, Administrator

**Syntax:**

```
firewall flooding { protocol { icmp | tcp-syn | udp } packet limit packets } | sampling-interval interval }

default firewall flooding { protocol { icmp | tcp-syn | udp } packet limit } | sampling-interval }

default
Configures the default setting for the specified configuration.

protocol { icmp | tcp-syn | udp }
Specifies the transport protocol:
- icmp: Configuration for ICMP protocol.
- tcp-syn: Configuration for TCP-SYN packet limit.
- udp: Configuration for UDP protocol.

packet limit packets
Specifies the maximum number of specified packets a subscriber can receive during a sampling interval. packets must be an integer from 1 through 4294967295. Default: 1000 packets per sampling interval for all protocols.

sampling-interval interval
Specifies the flooding sampling interval, in seconds. interval must be an integer from 1 through 60. Default: 1 second
The maximum sampling-interval configurable is 60 seconds.

**Usage**

Use this command to configure the maximum number of ICMP, TCP-SYN, / UDP packets allowed to prevent the packet flooding attacks to the host.
Example
The following command ensures a subscriber will not receive more than 1000 ICMP packets per sampling interval:

```
firewall flooding protocol icmp packet limit 1000
```

The following command ensures a subscriber will not receive more than 1000 UDP packets per sampling interval on different 5-tuples. That is, if an attacker is sending lot of UDP packets on different ports or using different spoofed IPs, those packets will be limited to 1000 packets per sampling interval. This way only “suspected” malicious packets are limited and not “legitimate” packets.

```
firewall flooding protocol udp packet limit 1000
```

The following command ensures a subscriber will not receive more than 1000 TCP-Syn packets per sampling interval.

```
firewall flooding protocol tcp-syn packet limit 1000
```

The following command specifies a flooding sampling interval of 1 second:

```
firewall flooding sampling-interval 1
```
**firewall icmp-checksum-error**

This command configures Stateful Firewall action on packets with ICMP Checksum errors.

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
firewall icmp-checksum-error { drop | permit }
```

**default firewall icmp-checksum-error**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Configures the default setting. Default: drop</td>
</tr>
<tr>
<td>drop</td>
<td>Specifies to drop packets with ICMP Checksum errors.</td>
</tr>
<tr>
<td>permit</td>
<td>Specifies to permit packets with ICMP Checksum errors.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to configure Stateful Firewall action on packets with ICMP Checksum errors. This CLI also applies to ICMP packets with Inner IP Checksum error.

For NAT-only calls, packets with ICMP errors are dropped, and other packets are allowed.

**Example**

The following command configures Stateful Firewall to drop packets with ICMP Checksum errors:

```
firewall icmp-checksum-error drop
```
**firewall icmp-destination-unreachable-message-threshold**

This command configures a threshold on the number of ICMP error messages sent by the subscriber for a particular data flow.

---

**Important:** In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the Rulebase Configuration Mode.

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
firewall icmp-destination-unreachable-message-threshold messages then-block-server

{ default | no } firewall icmp-destination-unreachable-message-threshold
```

- **default**
  - Configures the default setting.
  - Default: No limit

- **no**
  - Removes the previous configuration.

- **messages**
  - Specifies the threshold on the number of ICMP error messages sent by the subscriber for a particular data flow. `messages` must be an integer from 1 through 100.

**Usage**

Use this command to configure a threshold on the number of ICMP error messages sent by the subscriber for a particular data flow. After the threshold is reached, it is assumed that the server is not reacting properly to the error messages, and further downlink traffic to the subscriber on the unwanted flow is blocked. Some servers that run QChat ignore the ICMP error messages (Destination Port Unreachable and Host Unreachable) from the mobiles. So the mobiles continue to receive unwanted UDP traffic from the QChat servers, and their batteries get exhausted quickly.

**Example**

The following command configures a threshold of 10 ICMP error messages:

```plaintext
firewall icmp-destination-unreachable-message-threshold 10 then-block-server
```
**firewall icmp-fsm**

This command enables/disables Stateful Firewall’s ICMP Finite State Machine (FSM).

**Product**

FW

**Privilege**

Security Administrator, Administrator

**Syntax**

```
[ default | no ] firewall icmp-fsm
```

- **default**
  - Configures the default setting.
  - Default: Enabled. Same as `firewall icmp-fsm`

- **no**
  - Disables Stateful Firewall ICMP FSM checks.

**Usage**

Use this command to enable/disable Stateful Firewall ICMP FSM checks. When Stateful Firewall and ICMP FSM are enabled, ICMP reply messages for which there is no saved ICMP request message are discarded. ICMP error messages (i.e., messages containing an embedded message) for which there is no saved flow for the embedded message are discarded.

**Example**

The following command disables Stateful Firewall’s ICMP FSM checks:

```
no firewall icmp-fsm
```
**firewall ip-reassembly-failure**

This command configures Stateful Firewall action on packets involved in IP Reassembly Failure scenarios.

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
fir iewall ip-reassembly-failure { drop | permit }
default fireplace l ip-reassembly-failure
```

- **default**
  - Configures the default setting.
  - Default: `permit`

- **drop**
  - Specifies to drop packets involved in IP reassembly failure scenarios.

- **permit**
  - Specifies to permit packets involved in IP reassembly failure scenarios.

**Usage**
Use this command to configure Stateful Firewall action on packets involved in IP reassembly failure scenarios such as missing fragments, overlapping offset, etc.
For NAT-only calls, packets involved in IP reassembly failure scenarios are dropped.

**Example**
The following command specifies to drop packets involved in IP reassembly failure scenarios:
```
fir iewall ip-reassembly-failure drop
```
firewall malformed-packets

This command configures Stateful Firewall action on malformed packets.

Product
FW

Privilege
Security Administrator, Administrator

Syntax

firewall malformed-packets { drop | permit }

default firewall malformed-packets

default
Configures the default setting.
Default: permit

drop
Specifies to drop malformed packets.

permit
Specifies to permit malformed packets.

Usage
Use this command to configure Stateful Firewall action on malformed packets. For NAT-only calls, malformed packets are always permitted.

Example
The following command specifies Stateful Firewall to drop malformed packets:

firewall malformed-packets drop
firewall max-ip-packet-size

This command configures the maximum IP packet size (after IP reassembly) allowed over Stateful Firewall.

**Important:** In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the Rulebase Configuration Mode.

**Syntax**

```
firewall max-ip-packet-size packet_size protocol { icmp | non-icmp }
```

```
default firewall max-ip-packet-size protocol { icmp | non-icmp }
```

**Syntax**

```
default
```

Configures the default setting.
Default: 65535 bytes (for both ICMP and non-ICMP)

```
packet_size
```

Specifies the maximum packet size allowed.
```
packet_size must be an integer from 30000 through 65535.
```

```
protocol { icmp | non-icmp }
```

Specifies the transport protocol:
```
•icmp: Configuration for ICMP protocol.
```
```
•non-icmp: Configuration for protocols other than ICMP.
```

**Usage**

Use this command to configure the maximum IP packet size allowed for ICMP and non-ICMP packets to prevent packet flooding attacks to the host. Packets exceeding the configured size will be dropped for “Jolt” and “Ping-Of-Death” attacks.

**Example**

The following command allows a maximum packet size of 60000 for ICMP protocol:

```
firewall max-ip-packet-size 60000 protocol icmp
```
**firewall mime-flood**

This command configures Stateful Firewall protection from MIME Flood attacks.

⚠️ **Important:** In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the Rulebase Configuration Mode.

**Product**

FW

**Privilege**

Security Administrator, Administrator

**Syntax**

```bash
firewall mime-flood { http-headers-limit max_limit | max-http-header-field-size max_size }
default firewall mime-flood { http-headers-limit | max-http-header-field-size }
```

**default**

Configures the default setting for the specified parameter.

**http-headers-limit max_limit**

Specifies the maximum number of headers allowed in an HTTP packet. If the number of HTTP headers in a page received is more than the specified limit, the request will be denied.

- `max_limit` must be an integer from 1 through 256.
- Default: 16

**max-http-header-field-size max_size**

Specifies the maximum header field size allowed in the HTTP header, in bytes. If the size of HTTP header in the received page is more than the specified number of bytes, the request will be denied.

- `max_size` must be an integer from 1 through 8192.
- Default: 4096 bytes

**Usage**

Use this command to configure the maximum number of headers allowed in an HTTP packet, and the maximum header field size allowed in the HTTP header to prevent MIME flooding attacks. This command is only effective if Stateful Firewall DoS protection for MIME flood attacks has been enabled using the `firewall dos-protection mime-flood` command, and the `route` command has been configured to send HTTP packets to the HTTP analyzer.

**Example**

The following command sets the maximum number of headers allowed in an HTTP packet to 100:
The following command sets the maximum header field size allowed in the HTTP header to 1000 bytes:

```
firewall mime-flood max-http-header-field-size 1000
```
**firewall policy**

This command enables/disables Stateful Firewall support in a Firewall-and-NAT policy.

**Important:** In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the Rulebase Configuration Mode.

---

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
firewall policy firewall-required

no firewall policy
```

**Usage**
Use this command to enable/disable Stateful Firewall support for all subscribers using a Firewall-and-NAT policy.

**Example**
The following command enables Stateful Firewall support in a Firewall-and-NAT policy:

```plaintext
firewall policy firewall-required
```

The following command disables Stateful Firewall support in a Firewall-and-NAT policy:

```plaintext
no firewall policy
```
**firewall tcp-checksum-error**

This command configures Stateful Firewall action on packets with TCP Checksum error.

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
firewall tcp-checksum-error { drop | permit }
```

```
default firewall tcp-checksum-error
```

**Usage**

Use this command to configure Stateful Firewall action on packets with TCP Checksum error. For NAT-only calls, packets with TCP Checksum errors are permitted.

**Example**

The following command specifies Stateful Firewall to drop packets with TCP Checksum errors:

```
firewall tcp-checksum-error drop
```
firewall tcp-first-packet-non-syn

This command configures Stateful Firewall action on TCP flows starting with a non-SYN packet.

Product
FW

Privilege
Security Administrator, Administrator

Syntax

```
firewall tcp-first-packet-non-syn { drop | reset }
```

default firewall tcp-first-packet-non-syn

```
default
Configures the default setting.
Default: `drop`
```

```
drop
Specifies to drop the non-SYN packet.
```

```
reset
Specifies to send reset.
```

Usage

Use this command to configure Stateful Firewall action on TCP flows starting with a non-SYN packet.

Example

For flows starting with a non-SYN packet, the following command specifies Stateful Firewall to drop the non-SYN packet:

```
firewall tcp-first-packet-non-syn drop
```
**firewall tcp-fsm**

This command enables/disables Stateful Firewall’s TCP Finite State Machine (FSM).

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
firewall tcp-fsm [ first-packet-non-syn { drop | permit | send-reset } ] [ default | no ]
```

- **default**
  Configures the default setting.
  Default: `firewall tcp-fsm first-packet-non-syn drop`

- **no**
  Disables Stateful Firewall’s TCP FSM.

- **first-packet-non-syn { drop | permit | send-reset }**
  Specifies Stateful Firewall action on TCP flows starting with a non-SYN packet:
  - **drop**: Specifies to drop the packet.
  - **permit**: Specifies to permit the packet.
  - **send-reset**: Specifies to drop the packet and send TCP RST.
  Default: `drop`

**Usage**
Use this command to enable/disable Stateful Firewall’s TCP FSM checks. When Stateful Firewall and TCP FSM are enabled, state of the TCP session is checked to decide whether to forward TCP packets.

**Example**
The following command enables TCP FSM, and configures action to take on TCP flows starting with a non-SYN packet to drop the packet:

`firewall tcp-fsm first-packet-non-syn drop`
**firewall tcp-idle-timeout-action**

This command configures action on TCP idle timeout expiry.

**Product**
FW, NAT

**Privilege**
Security Administrator, Administrator

**Syntax**

```
firewall tcp-idle-timeout-action { drop | reset }
{ default | no } firewall tcp-idle-timeout-action
```

---

**default**
Configures the default setting.
Default: `reset`

---

**no**
Configures the TCP idle timeout expiry action to reset.

---

**drop | reset**
Specifies the action to take on TCP idle timeout expiry.
- **drop**: Drops the session.
- **reset**: Sends TCP RST. When configured to reset, the session is dropped, and the system can avoid packets arriving for the idle flow from getting dropped.

**Usage**
Use this command to configure action to take on TCP idle timeout expiry.

**Example**
The following command configures action to take on TCP idle timeout expiry to drop:

```
firewall tcp-idle-timeout-action drop
```
firewall tcp-options-error

This command configures Stateful Firewall action on packets with TCP Option errors.

Product
FW

Privileges
Security Administrator, Administrator

Syntax

```
firewall tcp-options-error { drop | permit }

default firewall tcp-options-error
```

- **default**
  
  Configures the default setting.
  
  Default: `permit`

- **drop**
  
  Specifies to drop packets with TCP Option errors.

- **permit**
  
  Specifies to permit packets with TCP Option errors.

Usage

Use this command to configure Stateful Firewall action on packets with TCP Option errors.

Example

The following command configures Stateful Firewall to drop packets with TCP Option errors:

```
firweall tcp-options-error drop
```
**firewall tcp-reset-message-threshold**

This command configures a threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. After this threshold is reached, further downlink traffic to the subscriber on the unwanted flow is blocked.

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
firewall tcp-reset-message-threshold messages then-block-server
	default | no firewall tcp-reset-message-threshold
```

- **default**
  Configures the default setting.
  Default: Disabled

- **no**
  Disables the configuration.

- **messages**
  Specifies the threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. `messages` must be an integer from 1 through 100.

**Usage**

Use this command to configure a threshold on the number of TCP reset messages (TCP RST+ACK) sent by the subscriber for a particular data flow. After the threshold is reached, assuming the server is not reacting properly to the reset messages further downlink traffic to the subscriber on the unwanted flow is blocked. This configuration enables QCHAT noise suppression for TCP.

**Example**

The following command sets the threshold on the number of TCP reset messages to 10:

```
firewall tcp-reset-message-threshold 10 then-block-server
```
firewall tcp-syn-flood-intercept

This command configures TCP SYN intercept parameters for protection against TCP SYN flooding attacks.

**Important:** In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the Rulebase Configuration Mode.

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
firewall tcp-syn-flood-intercept { mode { none | watch [ aggressive ] } | watch-timeout intercept_watch_timeout }
```

default firewall tcp-syn-flood-intercept { mode | watch-timeout }

default
Confignes the default settings for SYN Flood DoS protection.

```
mode { none | watch [ aggressive ] }
```

Specifies the TCP SYN flood intercept mode:

- **none**: Disables the TCP SYN Flood Intercept feature.
- **watch**: Configures TCP SYN flood intercept feature in watch mode. The Stateful Firewall passively watches to see if TCP connections become established within a configurable interval. If connections are not established within the timeout period, the Stateful Firewall clears the half-open connections by sending RST to TCP client and server. The default watch-timeout for connection establishment is 30 seconds.

- **aggressive**: Configures TCP SYN flood Intercept or Watch feature for aggressive behavior. Each new connection request causes the oldest incomplete connection to be deleted. When operating in watch mode, the watch timeout is reduced by half. If the watch-timeout is 30 seconds, under aggressive conditions it becomes 15 seconds. When operating in intercept mode, the retransmit timeout is reduced by half (i.e. if the timeout is 60 seconds, it is reduced to 30 seconds). Thus the amount of time waiting for connections to be established is reduced by half (i.e. it is reduced to 150 seconds from 300 seconds under aggressive conditions).

Default: **none**

```
watch-timeout intercept_watch_timeout
```

Specifies the TCP intercept watch timeout, in seconds.

*intercept_watch_timeout* must be an integer from 5 through 30.

Default: 30
Usage
This TCP intercept functionality provides protection against TCP SYN Flooding attacks. This command enables and configures TCP intercept parameters to prevent TCP SYN flooding attacks by intercepting and validating TCP connection requests for DoS protection mechanism configured with the `dos-protection` command.

The system captures TCP SYN requests and responds with TCP SYN-ACKs. If a connection initiator completes the handshake with a TCP ACK, the TCP connection request is considered as valid by system and system forwards the initial TCP SYN to the valid target which triggers the target to send a TCP SYN-ACK. Now system intercepts with TCP SYN-ACK and sends the TCP ACK to complete the TCP handshake. Any TCP packet received before the handshake completion will be discarded.

Example
The following command sets the intercept watch timeout setting to 15 seconds:

```
firewall tcp-syn-flood-intercept watch-timeout 15
```
**firewall tcp-syn-with-ecn-cwr**

This command configures Stateful Firewall action on TCP SYN packets with either ECN or CWR flag set.

**Product**
FW

**Privileges**
Security Administrator, Administrator

**Syntax**

```plaintext
firewall tcp-syn-with-ecn-cwr { drop | permit }
default firewall tcp-syn-with-ecn-cwr
```

- **default**
  Configures the default setting.
  Default: `permit`

- **drop**
  Specifies to drop TCP SYN packets with either ECN or CWR flag set.

- **permit**
  Specifies to permit TCP SYN packets with either ECN or CWR flag set.

**Usage**
Use this command to configure Stateful Firewall action on receiving a TCP SYN packet with either ECN or CWR flag set.

**Example**
The following command configures Stateful Firewall to drop TCP SYN packets with ECN / CWR flag set:

```plaintext
firewall tcp-syn-with-ecn-cwr drop
```
**firewall udp-checksum-error**

This command configures Stateful Firewall action on packets with UDP Checksum error.

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
fir**** firewall udp-checksum-error { drop | permit }
default firewall udp-checksum-error
```

- **default**
  Configures the default setting.
  Default: **drop**

- **drop**
  Specifies to drop packets with UDP Checksum error.

- **permit**
  Specifies to permit packets with UDP Checksum error.

**Usage**
Use this command to configure Stateful Firewall action on packets with UDP Checksum error.
For NAT-only calls, packets with UDP Checksum error are permitted.

**Example**
The following command specifies to drop packets with UDP Checksum error:

```
fir**** firewall udp-checksum-error drop
```
**firewall validate-ip-options**

This command enables / disables the Stateful Firewall validation of IP options for errors.

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ default | no ] firewall validate-ip-options
```

- **default**
  Configures the default setting.
  Default: Disabled. Same as `no firewall validate-ip-options`

- **no**
  Disables validation of IP options.

**Usage**

Use this command to enable / disable Stateful Firewall validation of IP options. When enabled, Stateful Firewall will drop packets with IP option errors. For NAT calls, validation of IP Options is disabled.

**Example**
The following command enables validation of IP options:

```
firewall validate-ip-options
```
**nat binding-record**

This command configures the generation of NAT Binding Records.

**Product**
NAT

**Privilege**
Security Administrator, Administrator

**Syntax**

```
nat binding-record edr-format edr_format [ port-chunk-allocation ] [ port-chunk-release ]

{ default | no } nat binding-record
```

- **default**
  Configures the default setting.
  Default: `port-chunk-release`

- **no**
  Disables generating NAT Binding Records.

- **edr-format edr_format**
  Specifies the EDR format name.
  `edr_format` must be an alpha and/or numeric string of 1 through 63 characters in length.

- **port-chunk-allocation**
  Specifies generating NAT Binding Records when a port-chunk is allocated.

- **port-chunk-release**
  Specifies generating NAT Binding Record when a port-chunk is released.

**Usage**
Use this command to configure the generation of NAT Binding Records.

**Example**
The following command configures an EDR format named `test123` and specifies generating NAT Binding Records when a port chunk is allocated:

```
nat binding-record edr-format test123 port-chunk-allocation
```
nat policy

This command enables/disables Network Address Translation (NAT) support in a Firewall-and-NAT policy.

**Important:** In StarOS 8.3, this configuration is available in the Rulebase Configuration Mode.

**Product**
NAT

**Privilege**
Security Administrator, Administrator

**Syntax**

```
nat policy nat-required [ default-nat-realm nat_realm_name ]

no nat policy
```

- **no**
  - Disables NAT support in the Firewall-and-NAT policy.

- **nat-required**
  - Enables NAT support in the Firewall-and-NAT policy.

- **default-nat-realm nat_realm_name**
  - Specifies the default NAT realm for the Firewall-and-NAT policy.
    - `nat_realm_name` must be the name of an existing NAT realm, and must be an alpha and/or numeric string of 1 through 31 characters in length.

**Usage**

Use this command to enable/disable NAT support for all subscribers using a Firewall-and-NAT policy. In StarOS 8.1, to enable NAT support for a subscriber, Stateful Firewall must also be enabled for that subscriber. See the `firewall policy` CLI command.

Once NAT is enabled for a subscriber, the NAT IP address to be used is chosen from the NAT realms specified in the rules. See the `access-rule` CLI command.

You can enable/disable NAT at any time, however the changed NAT status will not be applied to active calls. The new NAT status will only be applied to new calls.

**Example**

The following command enables NAT support in a Firewall-and-NAT policy:

```
nat policy nat-required
```

The following command disables NAT support in a Firewall-and-NAT policy:

```
no nat policy
```
nat private-ip-flow-timeout

This command configures the Private IP NPU flow timeout setting.

Product
NAT

Privilege
Security Administrator, Administrator

Syntax

nat private-ip-flow-timeout timeout
{ default | no } nat private-ip-flow-timeout

**default**
Configures the default setting.
Default: 180 seconds

**no**
Disables the Private IP NPU flow timeout configuration.
When disabled, the flow is installed at call setup and will be removed only when the subscriber disconnects.

**timeout**
Specifies the Private IP NPU flow timeout period in seconds.
*timeout* must be an integer from 180 through 86400.

Usage
Use this command to configure the Private IP NPU flow timeout setting.
For NAT-enabled calls, by default, the downlink private IP NPU flow will not be installed at call setup for a subscriber session. The flow will only be installed on demand. When there is no traffic on the private flow, the private IP flow will be removed after the configurable timeout period.

Example
The following command configures the Private IP NPU flow timeout setting to 36000 seconds:

```
nat private-ip-flow-timeout 36000
```
nat suppress-aaa-update

This command suppresses sending NAT Bind Update (NBU) to the AAA server when PPP disconnect happens.

Important: This command is customer-specific. For more information please contact your local service representative.

Product
NAT

Privilege
Security Administrator, Administrator

Syntax

nat suppress-aaa-update call-termination

default nat suppress-aaa-update

default
Configure the default setting.
Default: No suppression of AAA updates.

Usage
Use this command to suppress sending of NBU to the AAA server when PPP disconnect happens, as these NBUs would be cleared at the AAA after receiving the accounting-stop. This enables to minimize the number of messages between the chassis and AAA server. When not configured, NBU are sent to the AAA server whenever a port chunk is allocated, de-allocated, or the call is cleared (PPP disconnect).

Example
The following command suppresses the sending of NBU to the AAA server:

    nat suppress-aaa-update call-termination
Chapter 100
Firewall Ruledef Configuration Mode Commands

The Firewall Ruledef Configuration Mode is used to configure and manage Access/Stateful Firewall rule definitions.

![Diagram]

- Exec Mode
  - active-charging
    - service name
  - ACS Configuration Mode
    - firewall ruledef
      - name
  - ACS Firewall Ruledef Configuration Mode
bearer 3gpp apn

This command configures an access/firewall ruledef to analyze user traffic based on APN bearer.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

[ no ] bearer 3gpp apn [ case-sensitive ] operator value

no
Removes previously configured bearer ruledef.

case-sensitive
This keyword makes the rule case sensitive.
By default, ruledefs are not case sensitive.
Default: Disabled

operator
Specifies how to logically match the APN name.
operator must be one of the following:
• !=: Does not equal
• !contains: Does not contain
• !ends-with: Does not end with
• !starts-with: Does not start with
• =: Equals
• contains: Contains
• ends-with: Ends with
• starts-with: Starts with

value
The APN name to match in bearer flow.
value must be an alpha and/or numeric string of 1 through 62 characters in length, and can include punctuation characters.

Usage
Use this command to specify an access/firewall ruledef to analyze user traffic based on APN name.

Example
The following command creates an access/firewall ruledef for analyzing user traffic for an APN named apn12:
bearer 3gpp apn = apn12
**bearer 3gpp imsi**

This command configures an access/firewall ruledef to analyze user traffic based on International Mobile Station Identification (IMSI) number in bearer flow.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] bearer 3gpp imsi { operator msid | { !range | range } imsi-pool imsi_pool }
```

- **no**
  Removes previously configured bearer ruledef.

- **operator**
  Specifies how to logically match the MSID.
  `operator` must be one of the following:
  - !=: Does not equal
  - ==: Equals

- **msid**
  Specifies the Mobile Station Identifier.

- `{ !range | range } imsi-pool imsi_pool`
  `{ !range | range }`: Specifies the range criteria:
    - !=range: Not in the range of
    - range: In the range of
  `imsi-pool imsi_pool`: Specifies the IMSI pool name. `imsi_pool` must be a string of 1 through 63 characters in length.

**Usage**
Use this command to specify an access/firewall ruledef to analyze user traffic based on IMSI number of mobile station.

**Example**
The following command creates an access/firewall ruledef to analyze user traffic for the IMSI number 9198838330912:

```
bearer 3gpp imsi = 9198838330912
```
bearer username

This command configures an access/firewall ruledef to analyze user traffic based on user name of the bearer flow.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] bearer username [ case-sensitive ] operator value
```

- **no**
  Removes previously configured bearer ruledef.

- **case-sensitive**
  This keyword makes the rule case sensitive.
  By default, ruledefs are not case sensitive.
  Default: Disabled

- **operator**
  Specifies how to logically match the MSID.
  `operator` must be one of the following:
  - `!=`: Does not equal
  - `!contains`: Does not contain
  - `!ends-with`: Does not end with
  - `!starts-with`: Does not start with
  - `=`: Equals
  - `contains`: Contains
  - `ends-with`: Ends with
  - `starts-with`: Starts with

- **value**
  Specifies the user name.
  `value` must be an alpha and/or numeric string of 1 through 127 characters in length.

**Usage**

Use this command to specify a access/firewall ruledef to analyze user traffic based on user name of the bearer flow.

**Example**

The following command creates an access/firewall ruledef for analyzing user traffic for the user name `user12`:
bearer username = user12
create-log-record

This command enables/disables Firewall ruledef logging.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] create-log-record

  no
  Disables Firewall ruledef logging.

Usage
Use this command to enable/disable Firewall ruledef logging.

Example
The following command enables Firewall ruledef logging:

  create-log-record

The following command disables Firewall ruledef logging:

  no create-log-record
end

This command exits the current configuration mode, and returns to the Executive mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to change to the Executive mode.
exit

This command exits the current configuration mode, and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
**icmp any-match**

This command configures an access/firewall ruledef to match any ICMP traffic for the user.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
[ no ] icmp any-match  operator  condition
```

- **no**
  
  Removes previously configured ICMP any-match ruledef.

- **operator**
  
  Specifies how to logically match the analyzed state.
  
  `operator` must be one of the following:
  
  - `!=`: Does not equal
  - `==`: Equals

- **condition**
  
  Specifies the condition to be matched for the user traffic.
  
  `condition` must be one of the following:
  
  - `FALSE`: Specified condition is FALSE.
  - `TRUE`: Specified condition is TRUE.

**Usage**

Use this command to specify an access/firewall ruledef to match any ICMP traffic of the user.

**Example**

The following command creates an access/firewall ruledef to match any non-ICMP traffic of the user:

```
icmp any-match = FALSE
```
**icmp code**

This command configures an access/firewall ruledef to analyze user traffic based on ICMP code.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] icmp code operator code
```

- **no**
  Removes previously configured ICMP code ruledef.

- **operator**
  Specifies how to logically match the ICMP code.
  *operator* must be one of the following:
  - `!=`: does not equal
  - `<=`: less than or equals
  - `=`: equals
  - `>=`: greater than or equals

- **code**
  Specifies the ICMP code.
  *code* must be an integer from 0 through 255.

**Usage**

Use this command to define an access/firewall ruledef to analyze user traffic based on the ICMP code.

**Example**

The following command creates an access/firewall ruledef for analyzing user traffic using the ICMP code as 23:

```
icmp code = 23
```
icmp type

This command configures an access/firewall ruledef to analyze user traffic based on ICMP type.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] icmp type operator type
```

- **no**
  Removes previously configured ICMP type ruledef.

- **operator**
  Specifies how to logically match the ICMP type.
  `operator` must be one of the following:
  - `!=`: Does not equal
  - `<=`: Less than or equals
  - `=`: Equals
  - `=>`: Greater than or equals

- **type**
  Specifies the ICMP type.
  `type` must be an integer from 0 through 255.
  For example, 0 for ECHO Reply, 3 for Dest. Unreachable, and 5 for Redirect.

**Usage**

Use this command to define an access/firewall ruledef to analyze user traffic based on the ICMP type.

**Example**

The following command creates an access/firewall ruledef for analyzing user traffic using an ICMP type as 123:

```
icmp type = 123
```
ip any-match

This command configures an access/firewall ruledef to match any IP traffic for the user.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] ip any-match operator condition

no
Removes previously configured IP any-match ruledef.

operator
Specifies how to logically match the analyzed state. operator must be one of the following:
  • !=: Does not equal
  • ==: Equals

condition
Specifies the condition to be matched for the user traffic. condition must be one of the following:
  • FALSE: Specified condition is FALSE.
  • TRUE: Specified condition is TRUE.

Usage

Use this command to specify an access/firewall ruledef to match any IP traffic of the user.

Example

The following command creates an access/firewall ruledef to match any non-IP traffic of the user:

    ip any-match = FALSE
ip downlink

This command configures an access/firewall ruledef to analyze user traffic based on IP packet flow in downlink direction (to subscriber).

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] ip downlink operator condition

no
Removes previously configured IP ruledef.

operator
Specifies how to logically match the packet flow direction.
operator must be one of the following:
  • !=: Does not equal
  • ==: Equals

condition
Specifies the condition to match.
condition must be one of the following:
  • TRUE: Analyzed
  • FALSE: Not analyzed

Usage
Use this command to define an access/firewall ruledef to analyze user traffic based on the IP packet flow direction as downlink.

Example
The following command creates firewall ruledef for analyzing user traffic using an IP packet direction to downlink (to subscriber):

    ip downlink = TRUE
**ip dst-address**

This command configures an access/firewall ruledef to analyze user traffic based on IP destination address.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] ip dst-address { operator { ip_address | ip_address/mask } | { !range | range } host-pool host_pool }
```

- **no**
  Removes previously configured IP destination address ruledef.

- **operator { ip_address | ip_address/mask }**
  **operator** specifies how to logically match the IP destination address. **operator** must be one of the following:
  - `!=`: does not equal
  - `<=`: less than or equals
  - `==`: equals
  - `>=`: greater than or equals

  **ip_address**: Specifies the IP address of destination node for outgoing traffic in IPv4 or IPv6 standard notation. **ip_address** must be the IP address in dotted decimal notation for IPv4, or in colon notation for IPv6.

  **ip_address/mask**: Specifies the IP address of destination node for outgoing traffic in IPv4 or IPv6 standard notation with subnet mask bit. **ip_address/mask** must be the IP address in dotted decimal notation for IPv4, or in colon notation for IPv6 with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

- **{ !range | range } host-pool host_pool**
  **{ !range | range }**: Specifies the range criteria:
    - `!range`: Not in the range of
    - `range`: In the range of

  **host-pool host_pool**: Specifies the host pool name. **host_pool** must be a string of 1 through 63 characters in length.

**Usage**

Use this command to specify an access/firewall ruledef to analyze user traffic based on the IP destination address.

**Example**
The following command creates IP ruledef for analyzing user traffic using an IP destination address of 1.1.1.1:

```
ip dst-address = 1.1.1.1
```
ip protocol

This command configures an access/firewall ruledef to analyze user traffic based on the protocol being transported by IP packets.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```bash
[ no ] ip protocol { { operator { protocol | protocol_assignment } } } | { operatorprotocol_assignment } }
```

- **no**
  Removes previously configured IP protocol address ruledef.

- **operator { protocol | protocol_assignment }**
  - **operator**: Specifies how to logically match the IP protocol. **operator** must be one of the following:
    - `! =`: Does not equal
    - `= =`: Equals
  - **protocol**: Specifies the protocol by name. **protocol** must be one of the following:
    - `ah`
    - `esp`
    - `gre`
    - `icmp`
    - `tcp`
    - `udp`
  - **protocol_assignment**: Specifies the protocol by assignment number. **protocol_assignment** must be an integer from 0 through 255 (e.g., 1 for ICMP, 6 for TCP, and 17 for UDP).

- **operator protocol_assignment**
  - **operator**: Specifies how to logically match the IP protocol. **operator** must be one of the following:
    - `<`: less than
    - `<=`: less than or equals
    - `> =`: greater than or equals
  - **protocol_assignment**: Specifies the protocol by assignment number. **protocol_assignment** must be an integer from 0 through 255 (e.g., 1 for ICMP, 6 for TCP, and 17 for UDP).

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on the IP protocol.
Example
The following command creates IP ruledef for analyzing user traffic using a protocol assignment of 1:

```
ip protocol = 1
```
ip src-address

This command configures an access/firewall ruledef to analyze user traffic based on IP source address.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] ip src-address { operator { ip_address | ip_address/mask } | { !range | range } host-pool host_pool }

no
Removes previously configured IP destination address ruledef.

operator { ip_address | ip_address/mask }
operator: Specifies how to logically match the IP source address. operator must be one of the following:
• !: does not equal
• <=: less than or equals
• =: equals
• =>: greater than or equals

ip_address: Specifies the IP address of source node for incoming traffic in IPv4 or IPv6 standard notation. ip_address must be the IP address in dotted decimal notation for IPv4, or in colon notation for IPv6.

ip_address/mask: Specifies the IP address of source node for incoming traffic in IPv4 or IPv6 standard notation with subnet mask bit. ip_address/mask must be the IP address in dotted decimal notation for IPv4, or in colon notation for IPv6 with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

{ !range | range } host-pool host_pool

!range | range: Specifies the range criteria:
• !range: Not in the range of
• range: In the range of

host-pool host_pool: Specifies the host pool name. host_pool must be a string of 1 through 63 characters in length.

Usage
Use this command to specify an access/firewall ruledef to analyze user traffic based on the IP source address.

Example
The following command creates IP ruledef for analyzing user traffic using an IP source address of 1.1.1.1:

OL-22948-01
Cisco ASR 5000 Series Command Line Interface Reference
ip src-address = 1.1.1.1
ip uplink

This command configures an access/firewall ruledef to analyze user traffic based on IP packet flow in uplink direction (from subscriber).

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
[ no ] ip uplink operator condition
```

- **no**
  Removes previously configured IP uplink match ruledef.

- **operator**
  Specifies how to logically match the IP packet flow direction. `operator` must be one of the following:
  - `!=`: Does not equal
  - `=`: Equals

- **condition**
  Specifies the condition to match. `condition` must be one of the following:
  - `true`: Not analyzed
  - `false`: Analyzed

Usage
Use this command to define an access/firewall ruledef to analyze user traffic based on the IP packet flow direction as uplink.

Example
The following command creates firewall ruledef for analyzing user traffic using an IP packet direction to uplink (from subscriber):

```
ip uplink = TRUE
```
tcp any-match

This command configures an access/firewall ruledef to match any TCP traffic for the user.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] tcp any-match operator condition

no
Removes previously configured TCP any-match ruledef.

operator
Specifies how to logically match the analyzed state. operator must be one of the following:
- • ! =: does not equal
- • =: equals

condition
Specifies the condition to be matched for the user traffic. condition must be one of the following:
- • FALSE: Specified condition is FALSE.
- • TRUE: Specified condition is TRUE.

Usage
Use this command to specify an access/firewall ruledef to match any TCP traffic of the user.

Example
The following command creates an access/firewall ruledef to match any non-TCP traffic of the user:

tcp any-match = FALSE
tcp dst-port

This command configures an access/firewall ruledef to analyze user traffic based on destination TCP port.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] tcp dst-port { operator port_number | { !range | range } { start_range to end_range | port-map port_map } }

no
Removes the previously configured destination TCP port ruledef.

operator
Specifies how to logically match the port number.
operator must be one of the following:

• !=: Does not equal
• <=: Less than or equals
• =: Equals
• >=: Greater than or equals

port_number
Specifies the port number to match.
port_number must be an integer from 1 to 65535.

range | !range
Specifies the range criteria:

• !range: Not in the range
• range: In the range

start_range to end_range
Specifies the starting and ending port numbers for the range of destination TCP ports.
start_range must be an integer from 1 through 65535.
enrange must be an integer from 1 through 65535, and must be greater than start_range

port-map port_map
Specifies name of the port-map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage
Use this command to specify an access/firewall ruledef to analyze user traffic based on destination TCP port.

**Example**
The following command creates an access/firewall ruledef for analyzing user traffic matching destination port for TCP as 10:

```
tcp dst-port = 10
```
### tcp either-port

This command configures an access/firewall ruledef to analyze user traffic based on either (destination or source) TCP ports.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] tcp either-port { operator port_number | ( !range | range ) { start_range
to end_range | port-map port_map } }
```

---

**no**

Removes previously configured TCP either-port (destination or source) ruledef.

---

**operator**

Specifies how to logically match the port number.

- `!=`: Does not equal
- `<=`: Less than or equals
- `=`: Equals
- `>=`: Greater than or equals

---

**port_number**

Specifies the port number to match.

- `port_number` must be an integer from 1 through 65535.

---

**range | !range**

Specifies the range criteria:

- `!range`: Not in the range
- `range`: In the range

---

**start_range to end_range**

Specifies the starting and ending port numbers for the port range.

- `start_range` must be an integer from 1 through 65535.
- `end_range` must be an integer from 1 through 65535, and must be greater than `start_range`.

---

**port-map port_map**

Specifies name of the port-map for the port range.

- `port_map` must be a string of 1 through 63 characters in length.
Usage
Use this command to specify an access/firewall ruledef to analyze user traffic based on either TCP port.

Example
The following command creates an access/firewall ruledef for analyzing user traffic matching destination or source port for TCP as 10:

```
tcp either-port = 10
```
tcp src-port

This command configures an access/firewall ruledef to analyze user traffic based on source TCP port.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] tcp src-port { operator port_number | { !range | range } { start_range to end_range | port-map port_map } }
```

- **no**
  Removes previously configured source TCP port ruledef.

- **operator**
  Specifies how to logically match the port number.
  `operator` must be one of the following:
  - `!=`: Does not equal
  - `<=`: Less than or equals
  - `=`: Equals
  - `>=`: Greater than or equals

- **port_number**
  Specifies the port number to match.
  `port_number` must be an integer from 1 to 65535.

- **range | !range**
  Specifies the range criteria:
  - `!range`: Not in the range
  - `range`: In the range

- **start_range to end_range**
  Specifies the starting and ending port numbers for the port range.
  `start_range` must be an integer from 1 through 65535.
  `end_range` must be an integer from 1 through 65535, and must be greater than `start_range`.

- **port-map port_map**
  Specifies name of the port-map for the port range.
  `port_map` must be a string of 1 through 63 characters in length.

**Usage**
Use this command to specify an access/firewall ruledef to analyze user traffic based on source TCP port.

Example
The following command creates an access/firewall ruledef for analyzing user traffic matching source port for TCP as 10:

```
tcp src-port = 10
```
udp any-match

This command configures an access/firewall ruledef to match any UDP traffic for the user.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] udp any-match operator condition

no
Removes previously configured UDP any-match ruledef.

operator
Specifies how to logically match the analyzed state.
operator must be one of the following:
  * =: does not equal
  * =: equals

condition
Specifies the condition to be matched for the user traffic.
condition must be one of the following:
  * FALSE: Specified condition is FALSE.
  * TRUE: Specified condition is TRUE.

Usage
Use this command to specify an access/firewall ruledef to match any UDP traffic of the user.

Example
The following command creates an access/firewall ruledef to match any UDP traffic of the user:

    udp any-match = TRUE
udp dst-port

This command configures an access/firewall ruledef to analyze user traffic based on destination UDP port.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```plaintext
[ no ] udp dst-port { operator port_number | { !range | range } { start_range to end_range | port-map port_map } }
```

- **no**
  Removes previously configured destination UDP ports ruledef.

- **operator**
  Specifies how to logically match the port number.
  *operator* must be one of the following:
  - `!=`: Does not equal
  - `<=`: Less than or equals
  - `=`: Equals
  - `>=`: Greater than or equals

- **port_number**
  Specifies the port number to match.
  *port_number* must be an integer from 1 through 65535.

- **!range | range**
  Specifies the range criteria.
  - `!range`: Not in the range
  - `range`: In the range

- **start_range to end_range**
  Specifies the starting and ending port numbers for the port range.
  *start_range* must be an integer from 1 through 65535.
  *end_range* must be an integer from 1 through 65535, and must be greater than *start_range*.

- **port-map port_map**
  Specifies name of the port-map for the port range.
  *port_map* must be a string of 1 through 63 characters in length.

Usage
Use this command to specify an access/firewall ruledef to analyze user traffic based on destination UDP port.

Example
The following command creates an access/firewall ruledef for analyzing user traffic matching destination port for UDP as 10:

```
udp dst-port = 10
```
udp either-port

This command configures an access/firewall ruledef to analyze user traffic based on either (destination or source) UDP port.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] udp either-port { operator port_number | { !range | range } { start_range to end_range | port-map port_map } } }  

no
Removes previously configured either-port (destination or source) UDP ruledef.

operator
Specifies how to logically match the port number.
operator must be one of the following:

• !=: Does not equal
• <=: Less than or equals
• =: Equals
• >=: Greater than or equals

port_number
Specifies the port number to match.
port_number must be an integer from 1 through 65535.

!range | range
Specifies the range criteria.

• !range: Not in the range
• range: In the range

start_range to end_range
Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535, and must be greater than start_range.

port-map port_map
Specifies name of the port-map for the port range.
port_map must be a string of 1 through 63 characters in length.
Usage
Use this command to specify an access/firewall ruledef to analyze user traffic based on either UDP port.

Example
The following command creates an access/firewall ruledef for analyzing user traffic matching destination or source port for UDP as 10:

```
udp either-port = 10
```
udp src-port

This command configures an access/firewall ruledef to analyze user traffic based on source UDP port.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```plaintext
[ no ] udp src-port { operator port_number | { !range | range } { start_range to end_range } | port-map port_map } }
```

- **no**
  Removes previously configured source UDP port ruledef.

- **operator**
  Specifies how to logically match the port number.
  - `!`: Not equal
  - `<`: Less than or equals
  - `=`: Equals
  - `>`: Greater than or equals

- **port_number**
  Specifies the port number to match.
  - `port_number` must be an integer from 1 through 65535.

- **!range | range**
  Specifies the range criteria.
  - `!range`: Not in the range
  - `range`: In the range

- **start_range to end_range**
  Specifies the starting and ending port numbers for the port range.
  - `start_range` must be an integer from 1 through 65535.
  - `end_range` must be an integer from 1 through 65535, and must be greater than `start_range`.

- **port-map port_map**
  Specifies name of the port-map for the port range.
  - `port_map` must be a string of 1 through 63 characters in length.

Usage
Use this command to specify an access/firewall ruledef to analyze user traffic based on source UDP port.

**Example**
The following command creates an access/firewall ruledef for analyzing user traffic matching source port for UDP as 10:

```plaintext
udp src-port = 10
```
Chapter 101
FTP Configuration Mode Commands

The FTP Configuration Mode is used to manage the FTP server options for the current context.

- Exec Mode
  - configure
    - Global Configuration Mode
      - context name
        - Context Configuration Mode
          - server ftpd
            - FTP Configuration Mode
end

Exits the FTP server configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
end
```

Usage
Change the mode back to the Exec mode.
exit

Exits the FTP server configuration mode and returns to the context configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
exit
```

**Usage**
Return to the context configuration mode.
max servers

Configures the maximum number of FTP servers that can be started within any 60 second interval. If this limit is reached, the system waits two minutes before trying to start any more servers.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
max servers count
```

```
count
Default: 40
Specifies the maximum number of servers that can be spawned in any 60 second interval. count must be a value in the range from 1 to 100.
```

Usage
Set the number of servers to tune the system response as a heavily loaded system may need more servers to support the incoming requests.
The converse would be true as well in that a system can benefit by reducing the number of servers such that FTP services do not cause excessive system impact to other services.

Example
```
max servers 50
```
timeout

Configures the client idle timeout before an FTP session is automatically closed.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
timeout seconds
```

- `seconds`
  - Default: 900
  - Specifies the number of seconds of inactivity before an FTP session is automatically closed. `seconds` must be in the range from 10 through 86400.

**Usage**
Adjust the session timeout to fine tune the system. FTP session resources can be released sooner to support additional requests by adjusting the timeout to a smaller value.

**Example**
```
timeout 300
```
Chapter 102
GGSN Service Configuration Mode Commands

The Gateway GPRS Support Node (GGSN) Configuration Mode is used to create and manage GGSN services within the current context.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
accounting

Configures the name of the context configured on the system that processes accounting for PDP contexts handled by this GGSN service.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
accounting context context_name
no accounting context
```

**no**
Removes a previously configured accounting context.

**context_name**
Specifies the name of the context to be used for accounting. The name must be between 1 and 79 alpha and/or numeric characters and is case sensitive.

**Usage**
By default, the system attempts to use the same context as the one in which the GGSN service is configured for accounting purposes. This command can be used to either change the system’s default behavior, or allow GPRS Tunneling Protocol Prime (GTPP) accounting to a charging gateway (CG).

By default when GTPP accounting is used, accounting records will be sent to the accounting servers configured in whichever context the GGSN service is configured. This command may be used to override that default.

**Example**
The following command configures the GGSN service’s accounting context to be plmn1:

```plaintext
accounting context plmn1
```
**authorize-with-hss**

This command enables/disables subscriber session authorization with HSS over S6b Diameter interface. This feature is required to support the interworking of GGSN with P-GW and HA.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[default] authorize-with-hss
```

**Usage**
Use this command to enable/disable the authorization support for subscriber over S6b interface which is used between GGSN and the 3GPP AAA to exchange the information related to charging, P-CSCF discovery, etc. By use of this feature allows the GGSN service to interact with HSS over S6b interface through Diameter configuration which is already configured on the system.

**Important:** Diameter configuration must be available before enabling this command. For more information of Diameter interface configuration, refer Diameter Endpoint Configuration Mode Commands chapter.

**Important:** This command is a license-enabled feature.

**Example**
The following command enables the subscriber authorization with HSS over S6b Diameter interface to provide session interoperability between GGSN and PGW and HA in this GGSN service:

```
authorize-with-hss
```
bind

Binds the GGSN service to a logical IP interface serving as the Gn interface. Specifies the maximum number of subscribers that can access this service over the interface.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
bind address address [max-total-pdp-contexts max_total | max-ppp-pdp-contexts max_ppp]
```

```
no bind address address
```

**no**
Removes a previously configured binding for the GGSN service.

**address**
Specifies the IP address (address) of the interface configured as the Gn interface. address is specified in dotted decimal notation.

**max-total-pdp-contexts max_total**
Default: 1,500,000
Specifies the maximum number of PDP contexts (both IP and PPP) that can access this service on this interface.

**max-ppp-pdp-contexts max_ppp**
Default: 750,000
Specifies the maximum number of PPP PDP contexts that can access this service on this interface.

**Important:** The maximum number of subscriber contexts supported is dependant on the session capacity license installed and the number of active PACs/PSCs installed in the system. A fully loaded ASR 5000 with 13 active PSCs can support 4,000,000 total IP and PPP PDP contexts. Note that each PPP PDP context is treated as two IP PDP contexts. Refer to the license key command for additional information.

**Important:** The maximum number of subscriber contexts supported is dependant on the session capacity license installed and the number of active PACs installed in the system. A fully loaded ST16 system with 13 active PACs can support 1,500,000 PPP PDP contexts. Refer to the license key command for additional information.

**Important:** The maximum number of subscriber contexts supported is dependant on the session capacity license installed and the number of active processing cards installed in the system. A fully loaded ASR 5000 with 13 active PACs can support 1,500,000 PPP PDP contexts. Refer to the license key command for additional information.
processing cards can support 2,500,000 total PPP PDP contexts. Refer to the license key command for additional information.

Usage

Used to associate or tie the GGSN service to a specific logical IP address. The logical IP address or interface takes on the characteristics of a Gn interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.

This command also sets a “soft” limit as to the number of simultaneous subscriber contexts that can be facilitated by the service/interface at any given time. Soft limits are based on measurements gathered at regular short intervals (several times per minute) as opposed to measurements taken in real-time. Therefore the sampled measurement may not match the actual number of PDP contexts currently being processed. Every PDP context request received is compared against the result of the last sample. If the sample is less than the soft limit configured, the request will be processed. If it is more, the request will be rejected.

When configuring the max-total-pdp-contexts or max-ppp-pdp-contexts options, be sure to consider the following:

- Each PPP PDP context is treated as two IP PDP contexts due to the additional CPU and memory resources required
- The total number of interfaces that you configure for use as Gn interfaces
- The maximum number of subscriber PDP contexts that all of the interfaces may handle during peak busy hours
- The average bandwidth for each of the PDP contexts
- The type of physical port (10/100Base-T or 1000Base-Tx) to which these interfaces are bound

Taking these factors into account and distributing your subscriber contexts across all available interfaces allows you to configure your interfaces to optimally handle PDP contexts without degraded performance.

Example

The following command would bind the logical IP interface with the address of 192.168.3.1 to the GGSN service and specifies that a maximum of 600 simultaneous subscriber sessions can be facilitated by the interface/service at any given time:

```
bind address 192.168.3.1 max-subscribers 600
```

The following command disables a binding that was previously configured:

```
no bind address
```
cc behavior

Configures the 3GPP behavior bits associated with the GGSN’s charging characteristics (CC).

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

cc behavior no-records nr_value }

no-records nr_value
Default: 0 (disabled)
Specifies the behavior bit upon which the GGSN ceases sending accounting records to a server.
nr_value can be configured to any integer value between 1 and 12 corresponding to the 12 behavior bits B1 through B12.

Usage
3GPP standards after 3GPP R98 included 12 behavior bits as part of GGSN charging characteristics. Like the charging characteristics profile index, the behavior bits are sent by the SGSN to the GGSN in the Create PDP Context request message.
This command configures the behavior bits for each of the conditions described.

Example

The following command configures a behavior bit of 10 for no-records:

cc behavior no-records 10
**cc profile**

Configures the charging characteristic (CC) profile index properties.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
cce profile index [bucket number | interval time [downlink down_octets uplink up_octets | total total_octets ] | prepaid {prohibited | use-rulebase-configuration } | server address context | sgsns num_changes | tariff time1 mins hours [time2 mins hours [time3 mins hours [time4 mins hours [time5 mins hours [time6 mins hours ]]]] | volume {downlink vol_down_octets uplink vol_up_octets | total total_octets } ]
```

```
no cc profile index {bucket | interval | prepaid | server address | sgsns | tariff | volume }
```

```
default cc profile index [bucket | interval | prepaid | server address | sgsns | tariff | volume]
```

---

**no**

Removes a previously configured profile index.

**default**

Returns the specified cc profile to the original default system settings.

**index**

Configures a profile index for the parameter to be specified. index can be configured to any integer value from 0 to 15.

---

**Important:** 3GPP standards suggest that profile index values of 1, 2, 4, and 8 be used for hot billing, flat rate billing, prepaid billing and normal billing, respectively. A single charging characteristics profile can contain multiple behavior settings.

```
buckets number
```

Default: 4

Specifies the number of statistics container changes due to QoS changes or tariff time that can occur before an accounting record should be closed.

*number* can be configured to any integer value from 1 through 4.
interval time [downlink down_octets uplink up_octets | total total_octets ]

Specifies the normal time duration that must elapse before closing an accounting record provided that any or all of the following conditions occur:

- Downlink traffic volume is reached within the time interval
- Uplink traffic volume is reached within the time interval
- Total traffic volume (up and downlink) is reached within the time interval

time is measured in seconds and can be configured to any integer value from 60 to 40,000,000.
down_octets is the downlink traffic volume measured in octets and can be configured to any integer value from 0 to 1,000,000.
up_octets is the uplink traffic volume measured in octets and can be configured to any integer value from 0 to 1,000,000.
total_octets is the total traffic volume measured in octets and can be configured to any integer value from 0 to 1,000,000.

prepaid {prohibited | use-rulebase-configuration }

This command enables or disables prepaid for the specified profile index.
Default: N/A
prohibited: Disable prepaid for the specified profile index.
use-rulebase-configuration: Use the prepaid configuration in the rulebase.

sgsns num_changes

Default: 4
Specifies the number of SGSN changes (i.e., inter-SGSN switchovers) resulting in a new RAI (Routing Area Identity) that can occur before closing an accounting record.
um_changes can be configured to any integer value from 1 to 15.

tariff time1 mins hours time2 mins hours time3 mins hours time4 mins hours time5 mins hours time6 mins hours

Specifies time-of-day time values to close the current statistics container (but not necessarily the accounting record). Six different tariff times may be specified. If less than six times are required, the same time can be specified multiple times.

Important: The system assumes that the billing system uses the day/date to determine if the statistics container represents an actual tariff period.

For each of the different tariff times, the following parameters must be configured:
- mins: The minutes of the hour, an integer value from 0 to 59.
- hours: The hour of the day, an integer value from 0 to 23.

volume {downlink vol_down_octets uplink vol_up_octets | total total_octets }

Specifies the downlink, uplink, and total volumes that must be met before closing an accounting record.
vol_down_octets is measured in octets and can be configured to any integer value from 100,000 to 4,000,000,000.
vol_up_octets is measured in octets and can be configured to any integer value from 100,000 to 4,000,000,000.
**total_octets** is the total traffic volume (up and downlink) measured in octets and can be configured to any integer value from 100,000 to 4,000,000,000.

**Usage**

Charging characteristics consist of a profile index and behavior settings. This command configures profile indexes for the GGSN’s charging characteristics. The GGSN supports up to 16 profile indexes. This command works in conjunction with the cc-sgsn command located in the APN configuration mode that dictates which CCs should be used for subscriber PDP contexts.

**Example**

The following command configures a profile index of 10 for tariff times of 7:00 AM and 7:30 PM:

```
cc profile 10 tariff time1 0 7 time2 30 19 time3 0 7 time4 30 19
```
**default**

Sets/restores the default value assigned for the specified parameter.

**Product**

GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
default {cc {behavior | profile index } | echo-interval | gtpu echo-interval | gtpu reorder {context | sequence-numbers | timeout } | guard-interval | ip {local-port gtpc-v1 | qos-dscp } | max-retransmissions | plmn {unlisted-sgsn } | setup-timeout | timeout }
```

```
cc {behavior | profile index }
```

Restores the GGSN’s charging characteristics parameters to the following default settings:
- **behavior**: Restores all behavior parameters to their default values of 0 (disabled).
- **profile**: For the specified index, the following defaults are applied:
  - buckets: 4
  - interval: Disabled
  - volume: Disabled
  - sgsns: 4
  - tariff-time: Disabled

```
echo-interval
```

Restores the GTP echo-interval parameter to its default setting of 60.

```
gtpu echo-interval
```

Restores the GTPU echo-interval parameter to its default setting of 60.

```
gtpu reorder {context | sequence-numbers | timeout }
```

Restores the gtpu reordering parameters to the following default settings:
- gtpu reorder context: Disabled
- gtpu reorder sequence-numbers: Disabled
- gtpu reorder timeout: 100 milliseconds

```
gtpu udp-checksum insert
```

Restores the GGSN gtpu udp-checksum parameter to its default setting of enabled.

```
guard-interval
```

Restores the GGSN guard-interval parameter to its default setting of 100.
ip {local-port gtpc-v1 | qos-dscp }
Restores the GGSN ip parameters to the following default setting:
- **local-port gtpc-v1**: 2123
- **qos-dscp**: conversational ef streaming af11 interactive af21 background be

max-retransmissions
Restores the GGSN max-retransmissions parameter to its default setting of 4.

plmn {unlisted-sgsn }
Restores the GGSN plmn unlisted-ggsn parameter to its default setting of reject.

setup-timeout
Restores the GGSN setup-timeout parameter to its default setting of 60.

timeout
Restores the GGSN timeout parameter to its default setting of 5.

Usage
After the system has been modified from its default values, this command is used to set/restore specific parameters to their default values.

Example
The following command restores the GGSN service’s guard interval parameter to its default setting:

default guard-interval
dns-client

This command defines the context name where a DNS client is configured. This command will associates an existing DNS client configuration with GGSN to perform DNS query for P-CSCF, if P-CSCF query request in AAA message is received from Diameter node.

Product
All

Privilege
Security Administrator, Administrator

Syntax

dns-client context dns_ctxt_name

[no] dns-client context

no
Removes the association of DNS context which was configured to perform DSN query in this GGSN service.

dns_ctxt_name
Specifies the name of the context in which a DNS client configuration is present. Typically this should be the same where this GGSN service is configured.
dns_ctxt_name is a context name and must be alpha and/or numeric string of 1 through 79 characters.

Usage
Use this command to associate a DNS client configuration to perform DNS query used for the resolution of P-CSCF query received in AAA message from Diameter peer, on the basis of DNS client parameters configured in a context.
A DNS client configuration must be present in the same context as GGSN service before enabling this command to perform DNS query for P-CSCF.

Important: This command is a license-enabled feature.

Example
The following command associates a DNS client configuration to perform DNS query for P-CSCF with this GGSN service which is configured in same context as GGSN service:

default dns-client context
**echo-interval**

Configures the rate at which GPRS Tunneling Protocol (GTP) v1-C Echo packets are sent from the GGSN service to the SGSN.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
echo-interval time_interval
no echo-interval
```

- **time_interval**
  
  Default: 60
  
  Specifies the frequency at which the GGSN service sends GTPv1-C Echo packets to the SGSN(s) it is configured to communicate with.
  
  `time_interval` is measured in seconds and can be configured to any integer value between 60 and 3600.

**Usage**

Use this command to adjust the rate at which the GGSN sends these packets. GTPv1-C Echo packets are used to detect whether SGSNs that the GGSN service is communicating with, has become unresponsive or has rebooted.

The system initiates this protocol for each of the following scenarios:

- Upon system boot
- Upon the configuration of a new SGSN on the system using the `sgsn address` command as described in this chapter
- Upon the execution of the path failure detection policy as described in the `path-failure` command of this chapter

The echo-interval command is used in conjunction with the `max-retransmissions` and `retransmission-timeout` commands as described in this chapter.

In addition to receiving an echo response for this echo protocol, if GGSN receives a Node Alive Request message or a Echo Request message from a presumed dead SGSN, it will immediately assume the SGSN is active again.

If the GGSN discovers that an SGSN has become unresponsive, it will terminate all PDP contexts that had been established with the SGSN.

**Example**

The following command configures the GGSN service to send GTP Echo packets every 120 seconds:
echo-interval 120
end

Exits the GGSN service configuration mode and returns to the Administrator-Exec mode prompt.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Change the mode back to the Administrator-Exec mode.
exit

Exits the GGSN service configuration mode and returns to the context configuration mode.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Returns to the context configuration mode.
fqdn

This command defines Fully Qualified Domain Name (FQDN) which would be used for authorization over S6b interface between GGSN and 3GPP AAA/HSS.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[no | default] fqdn host host_name realm realm_id

no
Removes configured FQDN host name and realm id from GGSN service.

default
Sets the system to default mode for this command and configure the host and realm id value to NULL.

host host_name
Specifies the name of the host to be used for authorization over S6b interface with 3GPP AAA server/HSS from GGSN service. host_name is a unique name that need to be configured for the authorization over S6b interface from this GGSN service. host_name must be an alpha and/or numeric string of from 1 through 127 characters. host_name allows punctuation marks.

realm realm_id
Specifies the realm as FQDN to be used for authorization over S6b interface with 3GPP AAA server/HSS from GGSN service. The realm may typically be a company or service name. realm_id is a unique identifier that need to be configured for the authorization over S6b interface from this GGSN service and must be an alpha and/or numeric string of from 1 through 127 characters. It allows punctuation marks. host_name

Usage
Use this command to define host and realm as FQDN for 3GPP AAA server/HSS which would be used for authorization over S6b interface with GGSN. The realm specified as FQDN may typically be a company or service name.
By default the FQDN host and realm will be NULL

Important: This command is a license-enabled feature.

Example
The following configures the `hss1` as host name and `xyz.com` as realm for FQDN to support authorization over S6b from this GGSN service:

```
fqdn host hss1 realm xyz.com
```
gtpc nsapi-in-create-pdp-response

This command configures the exclusion/inclusion of optional information element (IE) Network Service Access Point Identifier (NSAPI) in “Create PDP Context Response” messages in GTP-C.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

[default | no] gtpc nsapi-in-create-pdp-response

default
Sets the default mode for GTP-C messages; i.e. to not to include NSAPI IE in “Create PDP Context Response” messages.

no
Removes the preconfigured mode for GTP-C messages; in other words sets the mode for GTP-C message to not to include NSAPI IE in “Create PDP Context Response” messages. By default it is disabled.

Usage
Use this command to configure the mode for the GTP-C messages to exclude or include the NSAPI IE in “Create PDP Context Response” message received from SGSN.

Example
The following command configures the GGSN service to include the optional IE of NSAPI in “Create PDP Context Response” message:

gtpc nsapi-in-create-pdp-response
**gtpc private-extension**

This command configures the customer specific private extension in GTP-C messages.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
gtpc private-extension {{focs | odb} access-list acl_name in disconnect-on-violation } | ggsn-preservation-mode | insk | loss-of-radio-coverage | none}
default gtpc private-extension

no gtpc private-extension [focs | insk | preservation-mode | loss-of-radio-coverage]
```

**default**
Sets the default mode for GTP-C messages. By default it is disabled.

**no**
Disables the configured private extensions for GTP-C messages.

```
{focs | odb} access-list acl_name in disconnect-on-violation
```

These keywords configures the Free-Of-Charge-Service and Operator Determined Barring for all packet oriented services as defined by operators.

**focs**: This keyword enables/disables Free of Charging Services for the subscriber who has no credit, and also takes the access-list `acl_name` to be applied for FOCS.

**odb**: This keyword enables/disables “all packet oriented service barred” for the subscriber, and also takes the access-list `acl_name` to be applied for ODB.

`acl_name` is the name of configured access control list for this service.

**Important**: These are the customer-specific keywords and need customer-specific license to use them.

```
insk
```

This keyword is for the Intelligent-Network-Service-Key defined by vendors. This private extension can be present in Create PDP Context request messages.

A radius dictionary can be configured to send that value in accounting messages.

**Important**: This is a customer specific-keyword and needs customer-specific license to use this feature.
gtpc private-extension

**ggsn-preservation-mode**

This keyword is the customer specific option and used to indicate the presence of such a private extension in Update PDP Context requests. It indicates whether the subscriber is active or has become idle, and RAN resources might have been released. It also indicates the "type" of desired preservation mode behavior. System support two different types of behavior. When **ggsn-preservation-mode** is configured, different generation of accounting records occur based on the "type" of mode. To enable the different generation of accounting records, the trigger for preservation mode must be configured for RADIUS or GTPP command for that accounting protocol. If that trigger is not configured, there will be no change in the generation of accounting records.

**Important:** This is a customer-specific keyword and needs customer-specific license to use this feature.

**loss-of-radio-coverage**

These keywords enables the protection for overcharging to a subscriber due to loss of radio coverage (LORC) in a GGSN service. It also enables the system to understand the private extension in GTP-C message for LORC in Update PDP Context message from SGSN.

**Important:** This is a license enabled keyword and need feature-specific license to use it.

**none**

Removes the private extensions from record which are from GTP-C messages received from the SGSN.

**Usage**

Use this command to configure the private extensions to record from the GTP-C messages received from SGSN. It also configures the customer specific features; i.e. preservation mode for GGSN service. Overcharging protection for LORC is a solution which provides the ability to configure mobile carriers to maximize their network solutions and balancing the requirements to accurately bill their customer.

Consider scenario where a mobile is streaming or downloading very large files from external sources and the mobile goes out of radio coverage. If this download is happening on Background/Interactive traffic class then the GGSN is unaware of such loss of connectivity as SGSN does not perform the Update PDP Context procedure to set QoS to 0kbps (this is done when traffic class is either Streaming or Conversational only). The GGSN continues to forward the downlink packets to SGSN. In the loss of radio coverage, the SGSN will do paging request and find out that the mobile is not responding; SGSN will then drops the packets. In such cases, the G-CDR will have increased counts but S-CDR will not. This means that when operators charge the subscribers based on G-CDR the subscribers may be overcharged. This feature is implemented to avoid the overcharging in such cases.

This implementation is based on Cisco-specific private extension to GTP messages and/or any co-relation of G-CDRs and S-CDRs. It also does not modify any RANAP messages.

**Important:** This is a license enabled command and needs feature-specific license/s to use this command.

**Important:** Some of the keywords a customer-specific feature and need customer-specific license/s to use them.

**Example**
The following command configures the GGSN service to record the private extension for intelligent network service key as defined by operator:

```
gtpc private-extension insk
```
**gtpc ran-procedure-ready-delay**

This command configures the GGSN to enable the RAN Procedure Ready feature for the particular GGSN service and specify the timeout period for RAN procedure timer in GGSN which is started on arrival of every secondary Create PDP Context request.

**Product**

GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
gtpc ran-procedure-ready-delay [timeout dur]
```

- **default**
  
  Sets the default mode of RAN Procedure Ready feature for the particular GGSN service. By default it is disabled.

- **no**
  
  This keyword is used to disable RAN Procedure Ready feature for the particular GGSN service. By default it is disabled.

- **timeout dur**

  Default: 10
  
  Specifies the timeout duration in seconds for RAN procedure timer in GGSN which is started on arrival of every secondary “Create PDP Context Request” message.
  
  This is an optional keyword. If no timeout period is specified then default value of 10 seconds will be assigned to timeout period.
  
  *dur* must be an integer between 1 through 40.

**Usage**

Use this command to enable the RAN Procedure Ready feature for the particular GGSN service and to specify the timeout period for RAN procedure timer in GGSN which is started on arrival of every secondary “Create PDP Context Request” message.

Once a “Create PDP Context Request” is received by GGSN from SGSN, a timer will be started at GGSN and GGSN will wait till the Radio Access Bearer setup is completed and “Update PDP Context Request” is sent by SGSN. If any downlink data is received before arrival of “Update PDP Context Request” or before timer expire, that downlink packets will be queued or buffered. Currently buffer limit of sub-system is 1024 packets.

To support this feature each sub-session uses a common flag ‘ran procedure ready state’, whenever a “Create PDP Context Request” is received for secondary PDP context and sub-session is allocated, this flag will be set to TRUE by default. This common flag is checked while sending downlink traffic, if this flag is FALSE then GGSN permit flow of downlink data but, if it is TRUE, GGSN will queue the downlink packets.

In case if the buffer becomes full (total buffer limit is of 1024 packets) then, all the newly coming packets will be dropped.
If “Update PDP Context Request” is received by GGSN with RAN Procedure flag set or if timer expires the 'ran-procedure ready state' flag in sub-session will be reset and hence GGSN will start sending queued packets in ‘first-in first-out’ manner and buffering will be disabled for further downlink traffic.

This feature supports following scenarios when RAB setup timer starts at the GGSN:

- If GGSN receives the “Update PDP Context Request” before timer expires, with RAN Procedure Ready bit TRUE (1), then GGSN will stop the timer, send all the queued/buffered packets in ‘first-in first-out’ manner and change the ‘ran procedure ready state’ to FALSE and disables buffering of further downlink data.

- If GGSN receives the “Update PDP Context Request” before timer expires, with RAN Procedure Ready bit FALSE (0), then GGSN will process the “Update PDP Context Request” as usual, but will not disable the buffering of downlink data and wait for other “Update PDP Context Request” to come with RAN procedure ready flag set or wait for timer to expire.

- If GGSN do not receive the “Update PDP Context Request” with RAN Procedure Ready bit TRUE (1) before timer expire, the timer will be fired and GGSN starts sending all the queued packet and will change the ‘ran procedure ready state’ to FALSE and disables buffering of further downlink data (assuming that the corresponding SGSN does not support this feature).

- If timer has expired and GGSN received an “Update PDP Context Request” for secondary PDP context with or without RAN Procedure Ready bit set, the UPC will be processed as usual without making any changes for buffering the packets.

**Important**: This feature make no effect on Enhanced Charging Service or DPI as the buffering of downlink data is done before sending it to ACSMgr.

**Important**: During SGSN handoff scenario all packets will be processed in a normal way and the downlink packets buffered till the timer expires.

**Example**
The following command configures the GGSN service to enable the RAN Procedure Ready feature and specify the timeout period as 20 seconds for RAN procedure timer in GGSN:

```
gtpc ran-procedure-ready-delay timeout 20
```
gtpu echo-interval

Configures the rate at which GPRS Tunneling Protocol (GTP) v1-U Echo packets are sent from the GGSN service to the SGSN.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

```
gtpu echo-interval time_interval
no gtpu echo-interval
```

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disables the sending of GTPv1-U Echo packets.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>time_interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 60</td>
</tr>
<tr>
<td>Specifies the frequency at which the GGSN service sends GTPv1-C Echo packets to the SGSN(s) it is configured to communicate with.</td>
</tr>
<tr>
<td>time_interval is measured in seconds and can be configured to any integer value between 60 and 3600.</td>
</tr>
</tbody>
</table>

Usage
GTPv1-C Echo packets are used to detect whether SGSNs that the GGSN service is communicating with, has become unresponsive or has rebooted. Use this command to adjust the rate at which the GGSN sends these packets.
If the GGSN discovers that an SGSN has become unresponsive, it will terminate all PDP contexts that had been established with the SGSN.

Example
The following command configures the GGSN service to send GTPv1-U Echo packets every 120 seconds:

```
gtpu echo-interval 120
```
**gtpu reorder**

Configures packet data reordering for the GGSN service.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
gtpu reorder {context {ppp } | sequence-numbers {ipv4 | ppp | ipv4-ppp | ppp-ipv4 } | timeout time }

no gtpu reorder {context | sequence-numbers {ipv4 | ppp | ipv4-ppp | ppp-ipv4 } }
```

**no**
Disables the re-ordering of GTPU packets.

**context {ppp }**
Default: Disabled
Enables the GGSN service to re-order PPP data packets based on the sequence numbers inserted by the SGSN.

**sequence-numbers {ipv4 | ppp | ipv4-ppp | ppp-ipv4 }**
Default: Disabled
Enables the GGSN service to insert sequence numbers into the data packets that it sends to the SGSN.
The insertion of sequence numbers can be controlled for specific PDP context types. The following PDP context types can be specified:

- **ipv4**: Enables re-ordering for IP PDP context types
- **ppp**: Enables re-ordering for PPP PDP context types
- **ipv4-ppp**: Enables re-ordering for both IP and PDP context types
- **ppp-ipv4**: The same as ipv4-ppp, enables re-ordering for both IP and PDP context types

**Important**: If packet re-ordering is enabled using the `gtpu reorder context` command, sequence numbers are automatically be added regardless of this command.

**timeout time**
Default: 100 milliseconds
If re-ordering is enabled, this option specifies the amount of time that the GGSN should wait prior to sending re-sequenced data packets stored in queue.

- time is measured in milliseconds and can be configured to any integer value between 0 and 5000. A timeout of “0” indicates that only packets arriving in sequence are processed and the accepted sequence number is updated for each in-sequence packet. Packets are not queued. Packets arriving with seq number less than the accepted sequence number are discarded.
Usage
Use this command to control data packet re-ordering between the GGSN and SGSN. If re-ordering is enabled for the GGSN service, the GGSN informs the SGSN to also reorder the data packets from the GGSN. The GGSN informs the SGSN in the create PDP context response. The GGSN and SGSN optionally insert sequence numbers into the data packets that they send.

Example
The following command specifies that the GGSN service re-sequences data packets received from the SGSN for PPP PDP context types:

    gtpu reorder context ppp

The following command specifies that the GGSN service inserts sequence numbers for both IP and PPP PDP context types into data packets it is sending to the SGSN for PPP PDP context types:

    gtpu reorder sequence-numbers ppp-ipv4
gtpu udp-checksum insert

This command enables/disables the insertion of UDP checksum in outgoing UDP data packets. By default checksum insertion is enabled.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[no | default] gtpu udp-checksum insert
```

- **no**
  Disables insertion of UDP checksum in outgoing UDP data packets.

- **default**
  Enables the insertion of UDP checksum in outgoing UDP data packets.

**Usage**

Use this command to enable or disable the system to insert UDP checksum in outgoing UDP data packets.

**Example**

The following command specifies that the GGSN service will insert the UDP checksum into outgoing UDP data packets:

```
gtpu udp-checksum insert
```
guard-interval

Configures the time period after which a redundant PDP context request received from an SGSN is treated as a new request rather than a re-send of a previous request.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

```
guard-interval guard_time
no guard-interval
```

**no**
Disables the guard-interval function for the GGSN service.

**guard_time**
Default: 100
Specifies the amount of time that must pass before a GGSN service treats a redundant PDP context request as a new request instead of a re-send of a previous request.

*guard_time* is measured in seconds and can be configured to any integer value between 10 and 3600.

Usage
The guard interval is used to protect against replay attacks. Without a guard interval configured, information from a valid PDP context request could be used to gain un-authorized network access.

If the GGSN service receives a PDP context request in which the International Mobile Subscriber Identity (IMSI), the Network Service Access Point Identifier (NSAPI), the end user IP address, and the GTP sequence number are identical to those received in a previous request, the GGSN treats the new request as a re-send of the original. Therefore, information from a valid PDP context request could be collected and re-sent at a later time by an un-authorized user to gain network access.

Configuring a guard interval limits the amount of time that the information contained within a PDP context request remains valid.

Example
The following command configures the GGSN service with a guard interval of 60 seconds:

```
guard-interval 60
```
**ip local-port**

Configures the local User Datagram Protocol (UDP) port for the Gn interfaces’ GTPC socket for GTPv1.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ip local-port gtpc-v1 port#
```

**gtpc-v1 port#**

Default: 2123

Specifies the UDP port number for GTPv1 GTPC sockets.

`port#` can be configured to any integer value between 1 and 65535.

**Usage**

By default, the GGSN service attempts to use GTPv1 when communicating with SGSNs. This parameter configures the UDP port over which the GTP control (GTPC) sockets are sent. If an SGSN only supports GTPv0, the GGSN service automatically switches to GTPv0 when communicating with this SGSN. In the scenario, the GGSN service communicates with the SGSN on UDP port 3386 and does not have a GTPC socket.

**Important:** The UDP port setting on the SGSN must match the local-port setting for the GGSN service on the system in order for the two devices to communicate.

**Example**
The following command configures the GGSN service to use UDP port 2500 for exchanging GTPC sockets with SGSNs when using GTPv1:

```
ip local port 2500
```
ip qos-dscp

Configures the quality of service (QOS) differentiated service code point (DSCP) used when sending data packets over the Gn interface.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

\[
\text{ip qos-dscp \{\{allocation-retention-priority | background | conversational | interactive traffic_priority | streaming \} \{ dscp\}\}+}
\]

\[
\text{no ip qos-dscp \{allocation-retention-priority | background | conversational | interactive traffic_priority | streaming\} +}
\]

\textbf{allocation-retention-priority}

Specifies the DSCP for interactive class if the allocation priority is present in the QOS profile. \textit{allocation-retention-priority} can be the integers 1, 2, or 3. DSCP values use the following matrix to map based on traffic handling priority and Alloc/Retention priority if the allocation priority is present in the QOS profile. The following table shows the DSCP value matrix for \textit{allocation-retention-priority}.

\begin{table}
\centering
\begin{tabular}{|c|c|c|c|}
\hline
\textbf{Allocation Priority} & 1 & 2 & 3 \\
\hline
\textbf{Traffic Handling Priority} & ef & ef & ef \\
\hline
1 & af21 & af21 & af21 \\
\hline
2 & af21 & af21 & af21 \\
\hline
3 & af21 & af21 & af21 \\
\hline
\end{tabular}
\end{table}

\textbf{background}

Specifies the QOS for traffic patterns in which the data transfer is not time-critical (for example email exchange). This traffic pattern requires the lowest QOS.

\textbf{conversational}

Specifies the QOS for traffic patterns in which there is an constant flow of packets in each direction, upstream and downstream. This traffic pattern requires the highest QOS.
**interactive**

Specifies the QOS for traffic patterns in which there is an intermittent flow of packets in each direction, upstream and downstream. This traffic pattern requires a higher QOS than the background pattern, but not as high as that for the streaming pattern.

*traffic_priority* is the 3GPP traffic handling priority and can be the integers 1, 2 or 3.

**streaming**

Specifies the QOS for traffic patterns in which there is a constant flow of data in one direction, either upstream or downstream. This traffic pattern requires a higher QOS than the interactive pattern, but not as high as that for the conversational pattern.

**dscp**

Default:

- background: be
- interactive:
- Traffic Priority 1: ef
- Traffic Priority 1: af21
- Traffic Priority 1: af21
- streaming: af11
- conversational: ef

Specifies the DSCP for the specified traffic pattern. *dscp* can be configured to any one of the following:

- **af11**: Assured Forwarding 11 per-hop-behavior (PHB)
- **af12**: Assured Forwarding 12 PHB
- **af13**: Assured Forwarding 13 PHB
- **af21**: Assured Forwarding 21 PHB
- **af22**: Assured Forwarding 22 PHB
- **af23**: Assured Forwarding 23 PHB
- **af31**: Assured Forwarding 31 PHB
- **af32**: Assured Forwarding 32 PHB
- **af33**: Assured Forwarding 33 PHB
- **af41**: Assured Forwarding 41 PHB
- **af42**: Assured Forwarding 42 PHB
- **af43**: Assured Forwarding 43 PHB
- **be**: Best effort forwarding PHB
- **ef**: Expedited forwarding PHB

More than one of the above keywords can be entered within a single command.

**Usage**

DSCP levels can be assigned to specific traffic patterns in order to ensure that data packets are delivered according to the precedence with which they’re tagged. The diffserv markings are applied to the outer IP header of every GTP data packet. The diffserv marking of the inner IP header is not modified.
The four traffic patterns have the following order of precedence: background (lowest), interactive, streaming, and conversational (highest). Data packets falling under the category of each of the traffic patterns are tagged with a DSCP that further indicate their precedence as shown in the following tables:

**Table 22. Class structure for assured forwarding (af) levels**

<table>
<thead>
<tr>
<th>Drop Precedence</th>
<th>Class 1</th>
<th>Class 2</th>
<th>Class 3</th>
<th>Class 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low</td>
<td>af11</td>
<td>af21</td>
<td>af31</td>
<td>af41</td>
</tr>
<tr>
<td>Medium</td>
<td>af12</td>
<td>af22</td>
<td>af32</td>
<td>af41</td>
</tr>
<tr>
<td>High</td>
<td>af13</td>
<td>af23</td>
<td>af33</td>
<td>af43</td>
</tr>
</tbody>
</table>

**Table 23. DSCP Precedence**

<table>
<thead>
<tr>
<th>Precedence (low to high)</th>
<th>DSCP</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Best Effort (be)</td>
</tr>
<tr>

<tr>
<td>3</td>
<td>Class 3</td>
</tr>
<tr>
<td>4</td>
<td>Class 4</td>
</tr>
<tr>
<td>5</td>
<td>Express Forwarding (ef)</td>
</tr>
</tbody>
</table>

The DSCP level can be configured for multiple traffic patterns within a single instance of this command. The no ip qos command can be issued to remove a QOS setting and return it to it’s default setting.

**Example**

The following command configures the DSCP level for the streaming traffic pattern to be ef:

```
ip qos streaming ef
```

The following command configures the DSCP levels for the conversational, streaming, interactive and background traffic patterns to be ef, ef, af22, and af41, respectively:

```
ip qos-dscp conversational ef streaming ef interactive af22 background af41
```
max-retransmissions

Configures the maximum number of times that GTP control packets are retransmitted to an SGSN before it marks it unreachable.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax
max-retransmissions max_number

max_number
Default: 4
Indicates the maximum number of times that GTP control packets are retransmitted.
max_number can be configured to any integer value between 0 and 15.

Usage
This command is used in conjunction with the timeout command to control the retransmission of GTP control packets when no response is received from an SGSN. It is equivalent to the N3-REQUESTS parameter discussed in 3GPP TS 29.060.
If no response is received from the SGSN prior to the expiration of the timeout value, the GTP control packets are re-sent by the GGSN. This process occurs as many times as allowed by the configuration of this command.
If the max-retransmissions value is exceeded, the GGSN records a “Path Failure” for that SGSN and releases all PDP contexts associated with it.

Example
The following command configures the maximum number of retransmissions to 8:

max-retransmissions 8
mbms policy

This command enables/disables the MBMS user service support for Multicast and/or Broadcast mode. It also specifies the policy for MBMS user service mode.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
mbms policy multicast broadcast
[no | default] mbms policy
```

- **no**
  Removes/disables the configured MBMS support for Multicast and/or Broadcast mode in this GGSN service.

- **default**
  Restores the default mode of MBMS support in this GGSN service.

- **multicast broadcast**
  Enables the MBMS support and configures the policy for multicast and broadcast of user service.

**Usage**
Use this command to enable/disable the MBMS user service support for Multicast and/or Broadcast mode. It also specifies the policy for MBMS user service mode.

**Example**
The following command enables the MBMS support in this GGSN service:

```plaintext
mbms policy multicast broadcast
```
**newcall**

This command enables/disables the new call related behavior of GGSN service when duplicate sessions with same IP address request is received. This feature is required to support the interworking with P-GW and HA.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[default] newcall duplicate-subscriber-requested-address {accept | reject}
```

**default**

Restores the default mode for new call session with same address request received in this GGSN service. It sets the new call related behavior to reject call with duplicate address request.

**accept**

Sets the system to “accept” the another session using same IP address for new call. New session will be accepted and old session will be torn down.

Default: Disbaled

**reject**

Reject new call with duplicate address request. This is the default behavior.

Default: Enabled

**Usage**

Use this command to enable/disable to support the new connection where UE is not able to gracefully disconnect from the Enterprise PDN before it attempts to reconnect via another access method. The Enterprise xGW (GGSN) shall be able to tear down the old session in order to accept the new connection with the same IP address assignment.

By use of this feature GGSN will allow accepting request for static subscriber address, even if address is already used by another session. If this feature is not enabled, then new request with same IP address for another session will be rejected.

**Important:** This command is a license-enabled feature.

**Example**

The following command allows the GGSN to accept the duplicate call session request with same IP address:

```
newcall duplicate-subscriber-requested-address accept
```
path-failure

Determines the GTP path-failure behavior on echo/non-echo messages.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

path-failure detection-policy gtp {echo [non-echo] | non-echo [echo] }

[no | default] path-failure detection-policy

| no |
| No defined detection policy means path-failures are not detected. |

| default |
| Use the default command to set the path-failure detection-policy to gtp in echo mode. |

| detection-policy gtp {echo [non-echo] | non-echo [echo] } |
| Detection-policy is the policy to be used when path-failure is in the default active state. GTP messages are either gtp(u) (user) or gtp(c) (control) type, and the gtp keyword takes either echo or non-echo as message type. |
| echo: gtp(u) or gtp(c) message. |
| non-echo: a message type other than gtp(u) or gtp(c). |

Usage

Under current circumstances, a GGSN shuts down the GTP tunnel if the associated SGSN does not respond to multiple retries of an echo or non-echo message from the GGSN. In this way, a single call failure could be responsible for the loss of all active calls in the tunnel.
This is also an issue when echo is disabled, or when there is very little traffic on the SGSN and the GGSN is configured with large echo intervals.
This behavior adversely impacts the user experience because the customer has to reconnect every time this happens with their SGSN.

Example

The following example detects path failures when the SGSN fails to respond to multiple echo message retries:

```
path-failure detection-policy gtp echo
```

The following example turns off path-failure detection. On timeout of gtp(c) message retries, the particular context will be purged:

```
no path-failure detection-policy
```
plmn id

Configures the GGSN’s public land mobile network (PLMN) identifiers. Up to five PLMN IDs can be configured for each GGSN service.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

plmn id mcc mcc_number mnc mnc_number [primary]
o plmn id mcc mcc_number mnc mnc_number

no
Removes a previously configured PLMN identifier for the GGSN service.

mcc mcc_number
Specifies the mobile country code (MCC) portion of the PLMN’s identifier. 
mcc_number is the PLMN MCC identifier and can be configured to any integer value between 100 and 999.

mnc mnc_number
Specifies the mobile network code (MNC) portion of the PLMN’s identifier. 
mnc_number is the PLMN MNC identifier and can be configured to any 2 or 3 digit integer value between 00 and 999.

primary
When multiple PLMN IDs are configured the primary keyword can be used to designate one of the PLMN IDs to be used for the AAA attribute (3GPP-GGSN-MCC-MNC).

Usage
The PLMN identifier is used to aid the GGSN service in the determination of whether or not a mobile station is visiting, roaming, or home. Multiple GGSN services can be configured with the same PLMN identifier. Up to five PLMN IDs can be configured for each GGSN Service.

Example
The following command configures the PLMN identifier with an MCC of 462 and MNC of 2:

plmn id mcc 462 mnc 02
plmn unlisted-sgsn

Configures the GGSN’s policy for handling communications from SGSNs that it is not configured to communicate with.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

**default**

 Resets configured parameters to their default settings.

**foreign**

 Default: Disabled
 Specifies that the GGSN service accepts messages from SGSNs that are not configured within the service using the sgsn command.
 This keyword also dictates that unlisted SGSNs are treated as if they belong to a foreign PLMN. Therefore PDP contexts originating from them are treated as visiting or roaming.

**disable-gtpc-echo**

 Default: Send GTPC Echo messages to unlisted SGSNs.
 When this keyword is specified, GTPC echo messages are not sent to unlisted SGSNs.

**reject-foreign-subscriber**

 Default: Disabled
 Specifies that incoming calls from foreign subscribers are rejected.

**home**

 Default: Disabled
 Specifies that the GGSN service accepts messages from SGSNs that are not configured within the service using the sgsn command.
 This keyword also dictates that unlisted SGSNs are treated as if they belong to the GGSN service’s home PLMN.

**reject**

 Default: Enabled
 Specifies that the GGSN service rejects messages from SGSNs that are not configured within the service using the sgsn command.
 When the GGSN service rejects the message(s), it returns a cause code of No Resources 199 (C7H, No resources available).
GGSN Service Configuration Mode Commands

Usage
This command works in conjunction with the sgsn command that configures the GGSN service to communicate with specific SGSNs. Any messages received from SGSNs not configured in that list are subject to the rules dictated by the unlisted-sgsn policy.

Example
The following command configures the GGSN service to accept messages from unlisted SGSNs and treat the SGSN as if it is on the GGSN’s home network:

```
plmn unlisted-sgsn accept home
```
**policy**

Specifies the reject code to be used in the "Create PDP Context" response message when a RADIUS server timeouts.

**Product**

GGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
policy {accounting-server-timeout use-reject-code {system-failure | no-resources } | authentication-server-timeout use-reject-code {system-failure | user-authentication-failure } }

default policy {authentication-server-timeout | accounting-server-timeout }
```

**default**

Restores the specified parameter to its default setting.

```
accounting-server-timeout use-reject-code {system-failure | no-resources }
```

Default: **no-resources**

Specifies the reject code used by the GGSN if communication with an accounting server times out. The possible reject codes are:

- system-failure (204 (CCH))
- no-resources (199 (C7H))

```
authentication-server-timeout use-reject-code {system-failure | user-authentication-failure }
```

Default: user-authentication-failure

Specifies the reject code used by the GGSN if communication with an authentication server times out. The possible reject codes are:

- system-failure (204 (CCH))
- user-authentication-failure (209 (D1H))

**Usage**

This command is used to configure the cause code used by the GGSN if communication with either a RADIUS authentication or accounting server times out. When this parameter is used in conjunction with Radius accounting servers, the response is only set if a flag is configured in the APN Delay GTP Response, only after getting a response to the Accounting Start.

**Example**

The following command configures the GGSN response to a RADIUS authentication server timeout to be system-failure:
policy authentication-server-timeout use-reject-code system-failure
retransmission-timeout

Configures the timeout period in between retransmissions of GTP control packets. This timeout configuration is not applicable on Echo Request retransmission.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax
retransmission-timeout retransmit_time

retransmit_time
Default: 5
Specifies the amount of time that must pass without an SGSN response before the GGSN service retransmits GTP control packets. 
retransmit_time is measured in seconds and can be configured to any integer value between 1 and 20.

Usage
This command is used in conjunction with the `max-retransmissions` command to control the retransmission of GTP control packets when no response is received from an SGSN.
If no response is received from the SGSN prior to the expiration of the timeout value, the GTP control packets are re-sent by the GGSN. This process occurs as many times as allowed by the configuration of the max-retransmissions command.
If the max-retransmissions value is exceeded within the retransmission-timeout period, the GGSN records a “Path Failure” for that SGSN and releases all PDP contexts associated with it.

Important: This retransmission timeout configuration is not applicable for Echo Requests message retransmission. Echo are sent/retransmitted every echo interval, which can be configured separately.

Example
The following command configures a timeout value of 20 seconds:

```
retransmission-timeout 20
```
**setup-timeout**

Configures the maximum amount of time the GGSN service allows for the setting up of PDP contexts.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
setup-timeout setup_time
```

- `setup_time`
  - Default: 60
  - Specifies the maximum amount of time the GGSN service allows for the setting up of PDP contexts.
  - `setup_time` is measured in seconds and can be configured to any integer value between 1 and 6000.

**Usage**

Use this command to limit the amount of time allowed for setting up PDP contexts. If the PDP context is not set up within the configured time frame, the GGSN service rejects the PDP context with a cause code of 199 (C7H, No resources available).

**Example**

The following command allows a maximum of 120 seconds for the setting up of PDP contexts:

```
setup-timeout 120
```
**sgsn address**

Configures the SGSNs that this GGSN service is allowed to communicate with.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
sgsn address {{ip_address [subnetmask netmask ]} | ip_address/netmask} [plmn-
foreign [reject-foreign-subscriber] | mcc mcc_code mnc mnc_code [reject-foreign-
subscriber]] [rat-type {GAN | GERAN | HSPA | UTRAN | WLAN }] [description

description] [disable-gtpc-echo]

no sgn (address ip_address [subnetmask netmask ] )
```

---

**no**
Removes a specific SGSN from the list or all configured SGSNs.

**address**
Configures the IP address of the SGSN.
`ip_address` must be expressed in dotted decimal notation.

**subnetmask**
Configures the subnet mask of the SGSN.
`netmask` must be expressed in dotted decimal notation.

**disable-gtpc-echo**
Default: Send GTPC Echo messages to unlisted SGSNs.
When this keyword is specified, GTPC echo messages are not sent to unlisted SGSNs.

**plmn-foreign**
Indicates whether or not the SGSN belongs to a foreign public land mobile network (PLMN).

**reject-foreign-subscriber**
Default: Disabled
Specifies that incoming calls from foreign subscribers are rejected.

**mcc mcc_code**
Specifies the mobile country code (MCC) portion of the PLMN’s identifier.
`mcc_code` is the PLMN MCC identifier and can be configured to any integer value between 100 and 999.

**mnc mnc_code**
Specifies the mobile network code (MNC) portion of the PLMN’s identifier.
mnc_code is the PLMN MNC identifier and can be configured to any 2 or 3 digit integer value between 00 and 999.

rat-type {GAN | GERAN | HSPA | UTRAN | WLAN }

This keyword configures the type of radio access technology.
GAN: Specifies the Generic Access Network type of RAT.
GERAN: Specifies the GSM EDGE Radio Access Network type of RAT.
HSPA: Specifies the High Speed Packet Access type of RAT.
UTRAN: Specifies the UMTS Terrestrial Radio Access Network type of RAT.
WLAN: Specifies the Wireless Local Access Network type of RAT.

description description

Add description field to the SGSN entry in GGSN service.
description is a string of 1 to 63 alpha and/or numeric characters.

Usage

Use this command to configure a list of SGSNs that the GGSN service is to communicate with. This command can be entered multiple times to configure multiple SGSNs.

Important: The GGSN only communicates with the SGSNs configured using this command unless a plmn-policy is enabled to allow communication with unconfigured SGSNs. PLMN policies are configured using the plmn unlisted-sgsn command.

Example

The following command configures the GGSN to communicate with an SGSN on a foreign PLMN with an IP address of 192.168.1.100 and subnet mask of 255.255.255.0:

sgn address 192.168.1.100 subnetmask 255.255.255.0 plmn-foreign
sgsn define-multiple-address-group

This keyword defines an SGSN Multiple Address Group and enters SGSN Multiple Address Group Configuration mode. Whenever there is a change in the control address in a GTPC UPC message, it is treated as an inter-SGSN handoff because an SGSN is usually identified uniquely by a single IP-address. This command supports a multiple address group feature which allows you to specify a set of addresses that specify a single SGSN. When a UPC handoff is received from any address in the group, it is treated as an intra-SGSN handoff.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

[no] sgsn define-multiple-address-group grp_name

-no
Removes a specific SGSN Multiple Address Group from the list GGSN service configuration.

-grp_name
Specifies the name of an SGSN multiple address group to create or configure. must be an alphanumeric string from 1 through 63 characters in length.

Usage
Use this command to create or configure an SGSN Multiple Address Group that the GGSN service is to communicate with. This command can be entered multiple times to configure multiple SGSN Multiple Address Groups.

Example
The following command creates an SGSN Multiple Address Group named sgsngrp1 enters SGSN Multiple Address Group Configuration mode:

sgsn define-multiple-address-group sgsngrp1
sgsn multiple-address-group

Configures the SGSN multiple address groups that this GGSN service is allowed to communicate with.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

sgsn multiple-address-group grp_name [disable-gtpc-echo] [mcc mcc_code mnc mnc_code [reject-foreign-subscriber]] [plmn-foreign [reject-foreign-subscriber] [rat-type {GAN | GERAN | HSPA | UTRAN | WLAN }]] [description description ]

no sgsn multiple-address-group grp_name

no
Removes a specific SGSN multiple address group from the list of configured SGSN multiple address groups.

 grp_name
Specifies the name of a configured SGSN multiple address group to use.

disable-gtpc-echo
Default: Send GTPC Echo messages to unlisted SGSNs.
When this keyword is specified, GTPC echo messages are not sent to unlisted SGSNs.

plmn-foreign
Indicates whether or not the SGSN multiple address group belongs to a foreign public land mobile network (PLMN).

reject-foreign-subscriber
Default: Disabled
Specifies that incoming calls from foreign subscribers are rejected.

mcc mcc_code
Specifies the mobile country code (MCC) portion of the PLMN’s identifier.
mcc_code is the PLMN MCC identifier and can be configured to any integer value between 100 and 999.

mnc mnc_code
Specifies the mobile network code (MNC) portion of the PLMN’s identifier.
mnc_code is the PLMN MNC identifier and can be configured to any 2 or 3 digit integer value between 00 and 999.

rat-type {GAN | GERAN | HSPA | UTRAN | WLAN }
This keyword configures the type of radio access technology.
**GGSN Service Configuration Mode Commands**

**sgsn multiple-address-group**

**GAN:** Specifies the Generic Access Network type of RAT.

**GERAN:** Specifies the GSM EDGE Radio Access Network type of RAT.

**HSPA:** Specifies the High Speed Packet Access type of RAT.

**UTRAN:** Specifies the UMTS Terrestrial Radio Access Network type of RAT.

**WLAN:** Specifies the Wireless Local Access Network type of RAT.

**description description**

Add a description field to the SGSN multiple address group entry in the GGSN service configuration. *description* must be a string of 1 through 63 alphanumeric characters.

**Usage**

Use this command to configure a list of SGSN multiple address groups that the GGSN service is to communicate with. This command can be entered multiple times to configure multiple SGSN multiple address groups.

**Important:** The GGSN only communicates with the SGSN multiple address groups configured using this command unless a plmn-policy is enabled to allow communication with unconfigured SGSNs. PLMN policies are configured using the `plmn unlisted-sgsn` command.

**Example**

The following command configures the GGSN to communicate with an SGSN with multiple address that is defined by an SGSN multiple address group named `sgsngrp1` that is on a foreign PLMN:

```plaintext
sgsn multiple-address-group sgsngrp1 plmn-foreign
```
Chapter 103
Global Configuration Mode Commands

The Global Configuration Mode is used to set basic system wide options.

Exec Mode
  configure
  Global Configuration Mode
aaa accounting-overload-protection

This command configures Overload Protection Policy for accounting requests.

Product
All

Privilege
Security Administrator, Administrator

Syntax

aaa accounting-overload-protection prioritize-gtpp

{ default | no } aaa accounting-overload-protection

---

default
Configures the default setting.
Default: no priority assigned

---

no
Disables the Overload Protection configuration.

---

prioritize-gtpp
Specifies to give higher priority to GTPP requests among the other outstanding requests. So while purging the lower priority requests will be selected first.

Usage
Use this command to configure Overload Protection Policy for accounting requests.

Example
The following command prioritizes GTPP requests among the other outstanding requests:

    aaa accounting-overload-protection prioritize-gtpp
aaa default-domain

Configure global accounting and authentication default domain for subscriber and context-level administrative user sessions.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
aaa default-domain { administrator | subscriber } domain_name
no aaa default-domain { administrator | subscriber } [ domain_name ]
```

**no**
Removes all or only the specified configured domain.

**administrator | subscriber**

- **administrator**: Configures the default domain for context-level administrative users.
- **subscriber**: Configures the default domain for subscribers.

**domain_name**
Specifies the context which is to be set as the default. *domain_name* must be from 1 to 79 alpha and/or numeric characters with no spaces.

Usage

This command configures the default domain which is used when accounting and authentication services are required for context-level administrative user and subscriber sessions whose user name does not include a domain.

Example

The following commands configure the default domains for context-level administrative users and subscribers, respectively:

```
aaa default-domain administrator sampleAdministratorDomain
aaa default-domain subscriber sampleSubscriberDomain
```

The following command removes the sampleSubscriberDomain domain:

```
no aaa default-domain subscriber sampleSubscriberDomain
```
aaa domain-matching ignore-case

This command disables case sensitivity when performing domain matching. When this command is enabled, the system disregard case when matching domains.

Product
All

Privilege
Security Administrator, Administrator

Syntax
[ no ] aaa domain-matching ignore-case

default aaa domain-matching

default
Configures ignore-case as the domain matching method.

no
Specifies that the system consider case when domain matching.

Usage
Use this command to configure the system to ignore case when matching domains.

Example
The following command configures the system to ignore case when matching domains:

aaa domain-matching ignore-case
aaa domain-matching imsi-prefix

This command enables domain lookup for session based on the IMSI prefix length. Default: Disabled

**Important:** This command is only available in Release 8.3 and later.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
aaa domain-matching imsi-prefix prefix-length prefix_length

no aaa domain-matching imsi-prefix
```

**Usage**

Use this command to configure the IMSI-prefix method of domain matching. This command enables domain lookup for the session based on the IMSI prefix length. If there is a domain configured with the matching IMSI prefix, the associated configuration is used. This feature does not support partial matches.

**Example**
The following command configures the IMSI prefix method for domain matching setting the prefix length to 10.

```plaintext
aaa domain-matching imsi-prefix prefix-length 10
```
aaa large-configuration

This command enables/disables the system to accept a large number of RADIUS configurations to be defined and
stored.

**Important:** For this command to take affect, after entering the command the configuration must be saved and
reloaded.

When aaa large-configuration is disabled, the following restrictions are in place:

- Only one (1) NAS IP address can be defined per context with the `radius attribute` command.
- The RADIUS attribute `nas-ip-address` can only be configured if the RADIUS group is `default`.
- Only 320 RADIUS servers can be configured system-wide.
- Only 64 RADIUS groups can be configured system-wide.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
aaa large-configuration
no aaa large-configuration
```

**Usage**

When aaa large-configuration is enabled, the system provides the ability to configure multiple NAS IP
addresses in a single context to used with different radius groups. As well, the command allows support for
up to 1600 RADIUS server configurations and for a PDSN a maximum of 400 or for a GGSN a maximum of
800 RADIUS server group configurations system-wide.

**Example**

To enable the definition of a large number of RADIUS configurations, enter the following commands in the following
order:

In APN Configuration mode, use the `aaa group` command and enter:

```
default aaa group
```

In Global Configuration mode, enter

```
aaa large-configuration
```
In Exec mode, use the `save configuration` command and then the `reload` command.
aaa last-resort

Configure global accounting and authentication last resort domain for subscriber and context-level administrative user sessions.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```plaintext
aaa last-resort context { administrator | subscriber } context_name
no aaa last-resort context { administrator | subscriber } [ context_name ]
no
Removes all or only the specified previously configured authentication last resort domain name.

administrator | subscriber
administrator: Configures the last resort domain for context-level administrative.
subscriber: Configures the last resort domain for the subscribers.

context_name
Specifies the context which is to be set as the last resort. context_name must be from 1 to 79 alpha and/or numeric characters with no spaces.

Usage
Set the last resort context which is used when there is no applicable default domain (context) and there is no domain provided with the subscriber’s or context-level administrative user’s name for use in the AAA functions.

Example
The following commands configure the last resort domains for context-level administrative user and subscribers, respectively:

aaa last-resort administrator sampleAdministratorDomain
aaa last-resort subscriber sampleSubscriberDomain

The following command removes the previously configured domain called sampleAdministratorDomain:

no aaa last-resort administrator sampleAdministratorDomain```
aaa username-format

Configure global accounting and authentication user name formats for AAA functions. Up to six formats may be configured.

Product
All

Privilege
Security Administrator, Administrator

Syntax

aaa username-format { domain | username } separator

no aaa username-format { domain | username } separator

no
Removing the specified user name format from the configuration.

domain | username
Default: username @
domain: indicates the left side of the string from the separator character is a domain name and the right side is the user name.
username: indicates the left side of the string from the separator character is a user name and the right side is the domain name.

Important: The user name string is always searched from right to left for the first occurrence of the separator character.

separator
Specifies the character to use for delimiting the domain from the user name for global AAA functions as one of: @, %, -, \, #, or /. Note: to specify a slash (\) as the separator it is necessary to enter a double slash (\\) on the command line.

Usage
Define the formats for user name delimiting if certain domains or groups of users are to be authenticated based upon their user name versus domain name.

Example

aaa username-format domain @

aaa username-format username @

no aaa username-format username @
aaa username-format
active-charging service

This command creates/selects an Active Charging Service.

**Product**
ECS

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
active-charging service ecs_service_name [ -noconfirm ]

no active-charging service ecs_service_name
```

**no**
Removes the specified Active Charging Service.

**ecs_service_name**
Creates/selects the specified Active Charging Service, and changes to the Active Charging Service Configuration Mode.

*ecs_service_name* must be an alpha and/or numeric string of 1 through 15 characters in length.

**-noconfirm**
Indicates that the command is to execute without any additional prompt and confirmation from the user.

**Usage**
Use this command to create/select an active charging service on the system.

Use this command after enabling Enhanced Charging Service using the `require active-charging` command. This command allows administrative users to configure the Enhanced Charging Service functionality.

**Example**
The following command creates an active charging service named *test*:

```
active-charging service test
```
alarm

Enables/disables alarming options for the switch processor card internal alarms and the central-office external alarms. To verify the state of the alarms, refer to the `show alarm` command.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
alarm { audible | central-office }
no alarm { audible | central-office }
```

**Usage**
Disables the option specified.

- `audible`: indicates the internal audible alarm on the switch processor cards are to be enabled.
- `central-office`: indicates the central office alarms are to be enabled.

**Example**
The following commands enable the SMC internal alarm and disable the central office alarms, respectively.

```plaintext
alarm audible
no alarm central-office
```
arp

Configures a system-wide time interval for performing Address Resolution Protocol (ARP) refresh.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
arp base-reachable-time time

default arp base-reachable-time
```

```
default
Restores the parameter to its default setting.

time
Default: 30
Specifies the ARP refresh interval (in seconds). The range is 30 to 86400 seconds.
```

Usage
Use this command to configure a system-wide ARP refresh interval. Once a neighbor is found, the entry is considered valid for at least a random value between the time/2 and the time*1.5.

Example
The following command configures an ARP refresh interval of 1 hour:

```
arp base-reachable-time 3600
```
autoconfirm

This command disables or enables confirmation for certain commands. This command affects all future CLI sessions.

---

**Important:** To change the behavior for the current CLI session only, use the `autoconfirm` command in the Exec Mode.

<table>
<thead>
<tr>
<th>Product</th>
<th>All</th>
</tr>
</thead>
<tbody>
<tr>
<td>Privilege</td>
<td>Security Administrator, Administrator, Operator</td>
</tr>
</tbody>
</table>

**Syntax**

```
autoconfirm

no autoconfirm
```

**Usage**

When autoconfirm is enabled, certain commands ask you to answer yes or no to confirm that you want to execute the command. When autoconfirm is disabled the confirmation questions never appear. Disabling autoconfirm disables command confirmation for all future CLI sessions. By default `autoconfirm` is enabled.

**Example**

The following command enables command confirmation for all future CLI sessions;

```
autoconfirm
```

The following command disables command confirmation for all future CLI sessions;

```
no autoconfirm
```
autoless

This command is obsolete. It is included in the CLI for backward compatibility with older configuration files. When executed, this command issues a warning and performs no function.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
autoless

no autoless
```
banner

Configures the CLI banner which is displayed upon the initialization of a CLI session.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
banner { charging-service | lawful-intercept | motd | pre-login } string
no banner { charging-service | lawful-intercept | motd | pre-login }
```

**no**
Removes the banner message by setting it to be string of zero length.

### charging-service

Specifies the Enhanced Charging Service banner message. That banner is displayed upon the initialization of an SSH CLI session with ECS-admin privileges (whenever anyone with the CLI privilege bit for ECS logs in).

### lawful-intercept

Configures the CLI banner message of the day which is displayed upon the initialization of an SSH CLI session with li-admin privileges.

### motd

Configures the CLI banner message of the day which is displayed upon the initialization of any CLI session.

### pre-login

Configures the CLI banner displayed before a CLI user logs in.

**Important:** This banner is displayed only for serial port and telnet log ins. It is not supported in ssh and, therefore, will not be displayed before ssh log ins.

### string

Specifies the banner or message to be displayed at session initialization. `string` may be from 0 to 2048 characters and must be enclosed in double quotation marks if the banner or message is to include spaces.

**Usage**

Set the message of the day banner when an important system wide message is needed. For example, in preparation for removing a chassis from service, set the banner 1 or more days in advance to notify administrative users of the pending maintenance.
Example

banner motd "Have a nice day."

banner motd No_News_Today

no banner motd
**boot**

The commands in this section set system boot time parameters.
boot delay

Configures the delay period, in seconds, before attempting to boot the system from a software image file residing on an external network server.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
boot delay time

no boot delay
```

- **no**
  Deletes the setting for the boot delay. The boot process executes immediately.

- **time**
  Specifies the amount of time (in seconds) to delay prior to requesting the software image from the external network server. The range is 1 to 300 seconds.

Usage
Useful when booting from the network when connection delays may cause timeouts. Such as when the Spanning Tree Protocol is used on network equipment.

**Important:** The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

Example
The following sets the boot delay to 10 seconds:

```
boot delay 10
```
boot interface

Configures the Switch Processor I/O card network interfaces for obtaining a system software image during the system boot process.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
boot interface { spio-eth1 | spio-eth2 } [ medium { auto | speed medium_speed duplex medium_duplex } [ media medium_media ] ]
```

```
o boot interface
```

no

Removes the boot interface configuration from the boot.sys file. Only files from the local file system can be loaded.

```
spio-eth1 | spio-eth2
```

Specifies the network interface to be configured where spio-eth1 is the primary interface on the SPIO (slot 24 interface 1 or slot 25 interface 1) and spio-eth2 is the secondary interface on the SPIO (slot 24 interface 2 or slot 25 interface 2). The interfaces refer to either the RJ-45 interfaces for speeds of 10, 100, or 1000 megabit per second (Mbps) or the SFP interface for the optical gigabit (1000 Mbps) interface.

```
medium { auto | speed medium_speed duplex medium_duplex }
```

Default: auto

**auto:** configures the interface to auto-negotiate the interface speed and duplex.

**speed medium_speed duplex medium_duplex:** specifies the speed to use at all times where medium_speed must be one of:

- 10
- 100
- 1000

The keyword **duplex** is used to set the communication mode of the interface where medium_duplex must be one of:

- full
- half

```
media medium_media
```

Default: rj45

Optionally sets the physical interface where medium_media must be either rj45 or sfp.
Modify the boot interface settings to ensure the system is able to obtain a software image from an external network server.

**Important:** The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

**Example**
The following configures the primary interface to auto-negotiate the speed.

```plaintext
boot interface spio-eth1 medium auto
```

The following command configures the secondary interface to a fixed gigabit speed at full duplex using RJ45 connectors for the physical interface.

```plaintext
boot interface spio-eth2 medium speed 1000 duplex full media rj45
```

The following restores the defaults for the boot interface.

```plaintext
no boot interface
```
**boot nameserver**

Configures the IP address of the DNS (Domain Name Service) server to use when looking up hostnames in URLs for network booting.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
boot nameserver ip_address
no boot nameserver
```

**ip_address**
IPv4 address of the DNS server the system uses to lookup hostnames in URLs for a software image from the network during the system boot process.

**no**
Removes the network boot nameserver information from the boot.sys file.

**Usage**
Use this command to identify the DNS server to use to lookup hostnames in a software image URL.

**Important:** The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

**Example**
The following configures the system to communicate with a DNS nameserver with the IP address of 1.2.3.4:

```
boot nameserver 1.2.3.4
```

## boot networkconfig

Configures the networking parameters for the Switch Processor I/O card network interfaces to use when obtaining a software image from an external network server during the system boot process.

### Product

All

### Privilege

Security Administrator, Administrator

### Syntax

```plaintext
bootnetworkconfig { dhcp | { dhcp-static-fallback | static } ipaddress spio24 ip_address [ spio25 ip_address ] netmask ip_mask [ gateway gw_address ] } }

no boot networkconfig
```

- **no**
  
  Removes the network configuration information from the boot.sys file.

- **dhcp**

  Indicates that a Dynamic Host Control Protocol (DHCP) server is used for communicating with the external network server.

- **dhcp-static-fallback | static**

  - **dhcp-static-fallback**: provides static IP address fallback network option when a DHCP server is unavailable.
  - **static**: specifies a fixed network IP address for the external network server that hosts the software image.

- **spio24 ip_address [ spio25 ip_address ] netmask ip_mask [ gateway gw_address ]**

  - **spio24 ip_address [ spio25 ip_address ]**: the IP address to use for the SPIO in slot 24 and optionally the SPIO in slot 25 for network booting. `ip_address` must be specified using the standard IPv4 dotted-decimal notation.
  - **netmask ip_mask**: the network mask to use in conjunction with the IP address(es) specified for network booting. `ip_mask` must be specified using the standard IPv4 dotted-decimal notation.
  - **gateway gw_address**: the IP address of a network gateway to use in conjunction with the IP address(es) specified for network booting. `gw_address` must be specified using the standard IPv4 dotted-decimal notation.

- **Important:** If `gw_address` is not specified, then the network server must be on the same LAN as the system. Since both SPIOS must be in the same network, the netmask and gateway settings are shared.

### Usage
Configure the network parameters for the ports on the SPIO cards to use to communicate with an external network server that hosts software images.

**Important:** The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

**Important:** When configuring static addresses both SPIOs must have different IP addresses. Neither address can be the same as the local context IP address.

**Example**
The following configures the system to communicate with the external network server via DHCP with a fallback to IP address 1.2.3.4, respectively.

```
boot networkconfig dhcp-static-fallback ip address spio24 192.168.100.10 netmask 255.255.255.0
```

The following command configures the system to communicate with an external network server using the fixed (static) IP address 1.2.3.4 with a network mask of 255.255.255.0.

```
boot networkconfig static ip address spio24 192.168.100.10 netmask 255.255.255.0
```

The following restores the system default for the network boot configuration options.

```
no boot networkconfig
```
**boot system priority**

Specifies the priority of a boot stack entry to use when the system first initializes or restarts. Up to 10 boot system priorities (entries in the boot.sys file located on the /flash device in the SMC) can be configured.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
boot system priority number image_image_url config config_path
no boot system priority number
```

- `no` Remove a boot stack entry at the priority specified from the boot stack when it is no longer used.

- `priority number`
  Specifies the priority for the file group (consisting of an image (.bin) and its corresponding configuration (.cfg) file) specified in the boot stack. The value must be in the range from 1 through 100 where a priority of 1 is the highest. Up to 10 boot system priorities (boot stack entries) can be configured.

**Important**: When performing a software upgrade it is important that the new file group have the highest priority (lowest value) configured.

**Important**: It is suggested that an “N-1” priority numbering methodology, where “N” is the first priority in the current boot stack be employed to ensure that higher priority numbers remain open.

- `image image_url`
  Specifies the location of a image file to use for system startup. The URL may refer to a local or a remote file. The URL must be formatted according to one of the following formats:
  - ASR 5000:
    - `[file:][/flash[/pcmcia[/hd]][/directory]/filename`
  - `[http:|tftp://host[:port][/directory]/filename`

**Important**: Use of the SMC hard drive is not supported in this release.

- `directory` is the directory name.
- `filename` is the actual file of interest.
- `host` is the IP address or host name of the server.
- `port#` is the logical port number that the communication protocol is to use.
**Important:** A file intended for use on an ASR 5000 uses the convention xxxxx.asr5000.bin, where xxxxx is the software build information.

**Important:** When using the TFTP, it is advisable to use a server that supports large blocks, per RFC 2348. This can be implemented by using the “block size option” to ensure that the TFTP service does not restrict the file size of the transfer to 32MB.

```
config config_path
```

Specifies the location of a configuration file to use for system startup. This must be formatted according to the following format:

- ASR 5000:
  ```
  [{file:}|/flash|/pcmcia1|/pcmcia2]{/path}/filename
  ```

- Important: Use of the SMC hard drive is not supported in this release.

Where `path` is the directory structure to the file of interest, and `filename` is the name of the configuration file. This file typically has a `.cfg` extension.

**Usage**

This command is useful in prioritizing boot stack entries in the boot.sys file, typically located on the /flash device of the Active SMC, for automatic recovery in case of a failure of a primary boot file group.

**Important:** The configuration file must reside on the SMC’s local filesystem, stored on one of its local devices (/flash, /pcmcia1, /pcmcia2, /hd). Attempts to load the configuration file from an external network server will result in a failure to load that image and configuration file group, causing the system to load the image and configuration file group with the next highest priority in the boot stack.

**Important:** Configuration changes do not take effect until the system is reloaded.

**Important:** The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

**Example**

The following commands set up two locations to obtain a boot file group from.

```
boot system priority 1 image tftp://remoteABC/pub/2003jan.bin config
/flasb/pub/data/2003feb.cfg
```

```
boot system priority 2 image /flash/pub/data/2002jun.bin config
/pcmcia1/pub/data/2003feb.cfg
```

The following removes the current priority 1 boot entry from the boot.sys file.
no boot system priority 1
bulkstats

Enables the collection of bulk statistics by the system and/or enters the bulk statistic configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

bulkstats { collection | historical | mode }

no bulkstatscollection

no
Disables the collection of bulk statistics.

collection
Enables the statistics collection process. Collects a period snapshot of data, i.e. “here is what the value is right now”.

historical collection
Enables the system to collect historical bulk statistics. If enabled, the system keeps track of some things which require the storing of more data, such as “the highest value that’s been seen over the last 24 hours”.

mode
Enters the bulk statistics configuration mode. The resulting command-line prompt will look similar to:

[<context-name>]asr5000(config-bulkstats)#

Usage

The Bulk Statistics Configuration Code consists of commands for configuring bulk statistic properties, such as the period of collection. Bulk Statistics configuration mode commands are defined in the “Bulk Statistics Configuration Mode Commands” chapter.
The system can be configured to collect bulk statistics and send them to a collection server (called a receiver). Bulk statistics are statistics that are collected in a group or schema, for example, system stats, port stats, radius stats.
Once bulk statistics receiver, schema, and collection properties are configured, this bulkstats command is used to enable or disable the collection of the data.
To collect a sample that will provide an average, for example, an average of CPU counters, the “historical” features must be enabled with the bulkstats historical collection command.
Since bulk statistics are collected at regular, user-defined intervals, the bulkstats force command in the Exec Mode can be used to manually initiate the collection of statistics at any time.
Example

bulkstats collection
bulkstats mode
no bulkstats collection
ca-certificate

Configures and selects an X.509 CA root certificate to enable a security gateway to perform certificate-based peer (client) authentication. The system supports a maximum of 16 certificates and 16 CA root certificates. A maximum of four CA root certificates can be bound to a crypto template.

Product Privilege

Administrator, Security Administrator, Operator

Syntax

[ no ] ca-certificate name name pem { data pemdata | url url }

no
Removes the named CA certificate.

name
Names the CA certificate.

pem data pemdata | url
The PEM-formatted data can be specified (data pemdata) or the information can be read from a file via url url). When read via a file, note that show configuration will not contain the url reference, but will instead output the data via data pemdata such that the configuration file is self-contained.

Usage

In addition to the X.509 certificate-based gateway authentication method and the PSK (Pre-Shared Key) and EAP-AKA (Extensible Authentication Protocol - Authentication and Key Agreement) peer (client) authentication methods, the FNG supports X.509 certificate-based peer authentication.

The FNG checks the network policy on whether a FAP is authorized to provide service. If the network policy states that all FAPs that pass device authentication are authorized to provide service, no further authorization check may be required. If the network policy requires that each FAP be individually authorized for service (in the case where the FEID is associated with a valid subscription), the FNG sends a RADIUS Access-Request message to the AAA server. If the AAA server sends a RADIUS Access-Accept message, the FNG proceeds with device authentication. Otherwise, the FNG terminates the IPSec tunnel setup by sending an IKEv2 Notification message indicating authentication failure.

The operator/administrator is responsible for configuring the certificates through the CLI. The FNG will generate an SNMP notification when the certificate is within 30 days of expiration, and then once a day.

Example

Use the following command to remove a certificate named fap1:

no ca-certificate data fap1
card

Enters the card configuration mode for the card specified.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
card number
```

`number`
Specifies the number of the card for which the card configuration mode is to be entered. `number` must be a value in the range 1 through 48.

Usage
Enter the configuration mode for a specific card when changes are required.

**Important:** This command is not supported on all platforms.

Example

```
card 8
```
card-standby-priority

Configures the redundancy priorities for the Packet Services Cards (PSC or PSC2) by specifying the slot number search order for a standby card when needed. Not available for the XT2 platform.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
    card-standby-priority slot_num [ slot_num ] [ slot_num ] ...
```

*slot_num*
Specifies the slot of the card for the order of the standby cards. *slot_num* must be in the range from 1 through 16 excluding slots 8 and 9. *slot_num* may be repeated as many times as necessary to indicate the complete search order.

**Usage**
Set the standby order of the redundant cards when multiple standby cards are available. Questionable hardware should be placed lower in the priority list.

**Important:** This command replaces the `psc-standby-priority` command.

**Important:** This command is not supported on all platforms.

**Example**
The following command configures the redundancy priority to use the standby cards in slots 16, 14, and 12 in that order:

```
    card-standby-priority 16 14 12
```
**cdr-multi-mode**

This command enables multiple instances of CDRMOD.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ default ] cdr-multi-mode
```

- `default`
  Configures the default setting.

**Usage**

Use this command to enable multiple instances of CDRMOD.
certificate

Configures and selects an X.509 Trusted Author certificate.

Product

ECS
PDG/TTG
PDIF

Privilege

Administrator, Security Administrator, Operator

Syntax

[ no ] certificate name name pem { data pemdata | url url }

no
Removes the named certificate.

name
Names the certificate.

data pemdata | url
The PEM-formatted data can be specified (data pemdata) or the information can be read from a file via url. When read via a file, note that show configuration will not contain the URL reference, but will instead output the data via data pemdata, such that the configuration file is self-contained.

Usage

A certificate authority or certification authority (CA) is an entity which issues digital certificates for use by other parties. It is an example of a trusted third party. CAs are characteristic of many public key infrastructure (PKI) schemes.
If CERT information is configured, PDIF will include the CERT payload in the first IKE_AUTH Response during the first authentication. PDIF stores its own certificate for use in the first AUTH calculation. MS will not have its own certificate from CA. Still it will be capable of accepting a certificate from PDIF and verify AUTH.
The operator/administrator is responsible for configuring the certificates through the CLI. PDIF will generate an SNMP notification when the certificate is within 30 days of expiration, and then once a day.

Example

Use the following command to remove a certificate named box1:

no certificate data box1
cli

Configures global CLI parameters.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
cli { access { monitor-protocol | monitor-subscriber } { administrator | operator } | login-failure-delay number | max-sessions number | operator clear-subscriber-one-only | trap config-mode }

no cli { max-sessions | login-failure-delay number | operator clear-subscriber-one-only | trap config-mode }

default cli { access { monitor-protocol | monitor-subscriber } | max-sessions | login-failure-delay number | operator clear-subscriber-one-only | trap config-mode }
```

no

Removes the limit on the number of allowed simultaneous CLI sessions on the system, or removes the limit of how many subscribers an Operator can clear.

default

Resets the keywords to their default values.

access { monitor-protocol | monitor-subscriber } { operator | administrator }

Sets access privileges on the `monitor-template` and `monitor-queue` commands: `monitor-protocol`: Selects privileges for the `monitor-template` command. `monitor-subscriber`: Selects privileges for the `monitor-template` command. `operator`: Sets the privileges for the selected command to allow use by users with operator privileges. `administrator`: Restricts use of the selected command to administrators only.

login-failure-delay number

This is the time to wait before a login failure is returned and another login may be attempted. Default is five seconds.

max-sessions number

Sets the number of allowed simultaneous CLI sessions on the system. If this value is set to a number below the current number of open CLI sessions, the open sessions will continue until closed. `number` must be from 2 through 100.
Caution: Use caution when setting this command. Limiting simultaneous CLI sessions prevents authorized users from accessing the system if the maximum number allowed has been reached. The system already limits CLI sessions based on available resources. Additional limitation could have adverse effects.

**operator clear-subscriber-one-only**
Restricts Operator to clearing only one subscriber session at a time.

**trap config-mode**
Enables sending an SNMP notification (trap) when a CLI user enters the configuration mode.

Usage
Control the number of simultaneous CLI sessions on the system at any given time.

**Important:** The maximum number of multiple CLI session support is based on the amount of available memory. The Resource Manager, however, reserves enough resources so that a minimum of 15 CLI sessions are assured for ASR 5000s. One of the CLI sessions is reserved for use exclusively by a CLI session on an SPIO console interface. Additional CLI sessions beyond the pre-reserved set are permitted if sufficient SMC resources are available. If the Resource Manager is unable to reserve resources for a CLI session beyond those that are pre-reserved, administrative users are prompted as to whether or not the system should attempt to create the new CLI session even without reserved resources.

Example
The following command sets the number of allowed simultaneous CLI sessions to 5.

`cli max-sessions 5`

The following command sets the command `monitor protocol` to administrator-only

`cli access monitor-protocol administrator`
clock

Configures system clock timezone and what local time zone to use.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
clock timezone tz [ local ]
no clock timezone
```

**no**
Resets the system timezone to the system default UTC.

**tz**
Specifies the system time zone to use as one of:

- `america-buenos-aires` (GMT-3:00; Buenos Aires)
- `america-caracas` (GMT-4:00; Caracas)
- `america-guatemala` (GMT-6:00; Guatemala, Guatemala)
- `america-la_paz` (GMT-4:00; La Paz)
- `america-lima` (GMT-5:00; Lima, Peru)
- `america-puerto-rico` (GMT-4:00; Puerto Rico)
- `america-sao-paulo` (GMT-3:00; Brazil)
- `america-tijuana` (GMT-8:00; Tijuana)
- `asia-baghdad` (GMT+3:00; Baghdad, Russia Zone 2, Kuwait, Nairobi, Riyadh, Moscow, Tehran)
- `asia-bangkok` (GMT+7:00; Bangkok)
- `asia-calcutta` (GMT+5:30; Calcutta, Mumbai, New Delhi)
- `asia-dhaka` (GMT+6:00; Dhaka)
- `asia-hong-kong` (GMT+8:00; Hong_Kong)
- `asia-irkutsk` (GMT+9:30; Irkutsk)
- `asia-kabul` (GMT+4:30; Kabul)
- `asia-karachi` (GMT+5:00; Karachi)
- `asia-kathmandu` (GMT+5:45; Kathmandu)
- `asia-magadan` (GMT+11:00; Magadan)
- `asia-muscat` (GMT+4:00; Abu Dhabi, UAE, Muscat, Tblisi, Volgograd, Kabul)
- `asia-rangoon` (GMT+6:30; Rangoon)
- `asia-seoul` (GMT+9:00; Seoul)
- asia-tehran (GMT+3:30; Tehran)
- asia-tokyo (GMT+9:00; Tokyo, Russia Zone 8)
- atlantic-azores (GMT-2:00; Azores)
- atlantic-cape-verde (GMT-1:00; Cape Verde Islands)
- australia-perth (GMT+8:00) Perth
- australia-darwin (GMT+9:30) Northern Territory - Alice Springs, Darwin, Uluru
- australia-adelaide (GMT+9:30) Southern Territory - Adelaide
- australia-melbourne (GMT+10:00) Victoria - Ballarat, Melbourne
- australia-sydney (GMT+10:00) New South Wales - Newcastle, Sydney, Wollongong
- australia-hobart (GMT+10:00) Tasmania - Hobart, Launceston
- australia-brisbane (GMT+10:00) Queensland - Brisbane, Cairns, Toowoomba, Townsville
- australia-lordhowe (GMT+10:30) Lord Howe Island
- canada-newfoundland (GMT-3:30; Newfoundland)
- canada-saskatchewan (GMT-6:00; Saskatchewan)
- europe-central (GMT+1:00; Paris, Berlin, Amsterdam, Brussels, Vienna, Madrid, Rome, Bern, Stockholm, Oslo)
- europe-dublin (GMT+0:00) Dublin, Ireland
- europe-eastern (GMT+2:00; Russia Zone 1, Athens, Helsinki, Istanbul, Jerusalem, Harare)
- newzealand-auckland (GMT +12:00; Auckland, Wellington)
- newzealand-chatham (GMT +12:45; Chatham)
- nuku (GMT-13:00; Nuku'alofa)
- pacific-fiji (GMT+12:00; Wellington, Fiji, Marshall Islands)
- pacific-guam (GMT+10:00; Brisbane, Cairns, Sydney, Guam)
- pacific-kwajalein (GMT-12:00; Kwajalein)
- pacific-norfolk - (GMT+11:30) Norfolk Island
- pacific-samoa (GMT-11:00; Samoa)
- us-alaska (GMT-9:00; Alaska)
- us-arizona (GMT-7:00; Arizona)
- us-central (GMT-6:00; Chicago, Mexico City, Saint Louis)
- us-eastern (GMT-5:00; Bogota, Lima, New York City)
- us-hawaii (GMT-10:00; Hawaii)
- us-indiana (GMT-6:00; Indiana)
- us-mountain (GMT-7:00; Cheyenne, Denver, Las Vegas)
- us-pacific (GMT-8:00) San Francisco, LA, Seattle
- utc (GMT; Universal Time Coordinated: London, Dublin, Edinburgh, Lisbon, Reykjavik, Casablanca)
**local**

Indicates the timezone specified by \( tz \) is to be considered the local time zone for local time display and conversion.

---

**Usage**

Clock and timezone management is necessary for proper accounting records. The chassis may be set to display a different local time than that of the system clock which allows accounting records to use the system time but to display the proper local time for users.

---

**Example**

```
clock timezone utc

clock timezone us-indiana local

no clock timezone
```
congestion-control

Enables/disables congestion control support on the system.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
congestion-control policy
default congestion-control
no congestion-control
```

- **default**
  Sets the congestion control to its default value.

- **no**
  Disables congestion-control functionality. This is the default setting.

**Usage**

Congestion control on the system is used to monitor the system for conditions that could potentially degrade performance when the system is under heavy load. Typically, these conditions are temporary (i.e., high CPU or memory utilization) and are quickly resolved. However, continuous or large numbers of these conditions within a specific time interval may impact the system’s ability to service subscriber sessions. The purpose of congestion control is to aid in the identification of such conditions and invoke policies for addressing the situation.

Congestion control operation is based on the configuration of the following:

- **Congestion condition thresholds:** Thresholds dictate the conditions for which congestion control is to be enabled and establish limits for defining the state of the system (congested or clear). These thresholds function in a similar fashion to the operation thresholds that can be configured for the system (as described in later in this chapter). The primary difference is that when these thresholds are reached, not only is an SNMP trap generated (starCongestion), but a service congestion policy is invoked as well.

A threshold tolerance is configured to dictate the percentage under the configured threshold that must be reached in order for the condition to be considered “cleared”. An SNMP trap (starCongestionClear) is then triggered.

- **Service congestion policies:** Congestion policies are configurable for each service (PDSN, GGSN, or HA). These policies dictate how services respond should the system detect that a congestion condition threshold has been crossed.

Because congestion control functionality on the system is disabled by default, this command should be executed once congestion-control thresholds and policies have been configured. (Refer to the `congestion-control policy` and `congestion-control threshold` commands for more information.)
congestion-control overload-disconnect

This command enables and disables the policy for disconnecting passive calls (chassis-wide) during an overload situation. It also configures and fine-tunes the overload-disconnect congestion control policy for an entire chassis.

To verify the congestion-control configuration use `show congestion-control configuration` from the Exec mode.

To set overload-disconnect policies for individual subscribers., see `overload-disconnect` in Subscriber Configuration Mode Commands.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
congestion-control overload-disconnect [ iterations-per-stage integer | percent percentage_value| threshold { license-utilization percentage_value | max-sessions-per-service-utilization percentage_value | tolerance number } ]

default congestion-control overload-disconnect [ iterations-per-stage | percent | threshold { license-utilization | max-sessions-per-service-utilization | tolerance } ]

no congestion-control overload-disconnect
```

- `iterations-per-stage integer`:
  An integer between 2 and 8. This value defines the number of calls to be disconnected during the defined number of seconds. The default value for this keyword is 8.

- `percent percentage_value`:
  An integer between 1 and 100 specifies the percentage of calls to be disconnected, in stages, during an overload situation. The default value is 5.

- `threshold`:
  - `license-utilization`: An integer value between 1 and 100 that specifies the license-utilization percentage threshold for overload situations. If candidates are available, passive calls are disconnected when this threshold is exceeded. The default value is 80.
  - `max-sessions-per-service-utilization`: An integer value between 1 and 100 that specifies a percentage of the maximum sessions per service. If candidates are available, passive calls are disconnected when this threshold is exceeded. The default value is 80.
  - `tolerance`: An integer between 1 and 25 that specifies the percentage of calls the system disconnects below the values set for the other two thresholds. In either case, a Clear Traps message is sent after the number of calls goes below the corresponding threshold value. The tolerance default value is 10.

- `default`:
  When ‘default’ and one of the keywords is added to the command, then the policy remains in its current state and the value for the specified keyword is reset to its default value.
When ‘default’ and the command are entered without keywords, then the overload-disconnect policy for congestion control is disabled.

```
no congestion-control overload-disconnect
```
Disables the overload-disconnect policy for congestion control.

**Usage**
Use this command to set the policy for call disconnects when the chassis experiences call overload.

**Example**
The following command sets an overload-disconnect policy for the chassis in which 5 calls would be disconnected very 5 seconds during an overload situation.

```
congestion-control overload-disconnect interactions-per-stage 5
```
Both of the following commands disable the overload-disconnect policy without changing the policy configuration.

```
default congestion-control overload-disconnect
```
or

```
no congestion-control overload-disconnect
```
To instruct the system to stop call disconnects when the number of calls goes down 85% of the total allowed calls for that service, enter both of the following commands to set the max-sessions-per-service-utilization value to 90% and the tolerance value to 5%:

```
congestion-control overload-disconnect threshold max-sessions-per-service-utilization 90
congestion-control overload-disconnect threshold tolerance 5
```
congestion-control policy

Configures congestion control policies.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
default congestion-control policy {asngw-service | asnpc-service | ggsn-service | ha-service | lns-service | mipv6ha-service | pdsn-service pdg-service | pdif-service | sgsn-service}
```

### default congestion-control policy service
Sets the congestion policy action for the selected service to its default value.

### asngw-service
Sets the congestion policy action for the ASN GW service.

### asnpc-service
Sets the congestion policy action for the ASN PC-LR service.

### cscf-service
Sets the congestion policy action for the CSCF service.

### ggsn-service
Sets the congestion policy action for the GGSN service.

### ha-service
Sets the congestion policy action for the HA service.

### lma-service
Sets the congestion control policy action for the LMA service

### lns-service
Sets the congestion policy action for the LNS service.

### mipv6ha-service
Sets the congestion policy action for the MIPv6-HA service.

### mme-service
Sets the congestion control policy for action to take when subscriber sessions exceeds the defined threshold limit.
For MME type of session/calls redirect action is not supported.

**pdg-service**
Sets the congestion policy action for the PDG service.

**pdif-service**
Sets the congestion policy action for the PDIF service.

**pdsn-service**
Sets the congestion policy action for the PDSN service.

**sgsn-service**
Sets the congestion policy action for the SGSN service.

**action { drop | none | redirect | reject }**
Defines what policy action is taken:

- **drop**: Specifies that the system is to drop incoming packets containing new session requests. (PDSN, GGSN, ASN GW, LMA, MME, and ASN PC and HA only)
- **none**: Specifies that the system is take no action. This is the default for PDIF-service.
- **redirect**: Specifies that the system is to redirect new session requests to an alternate device. (PDSN and HA only)

**Important**: If this option is used, the IP address of the alternate device must be configured using the policy overload redirect command that is part of the service configuration. Note that this option can not be used in conjunction with GGSN and MME services.

- **reject**: Specifies that the system processes new session request messages and responds with a reject message. (For PDSN and HA, the reply code is 130, “insufficient resources”. For the GGSN, the reply code is 199, “no resources available”.)

**Usage**
Congestion policies can be configured for each service. When congestion control functionality is enabled, these policies dictate how services respond should the system detect that a congestion condition threshold has been crossed.

**Example**
The following command configures a congestion control policy of reject for PDSN services:

```
congestion-control policy pdsn-service action reject
```

The following command configures a congestion control policy of reject for MME services:

```
congestion-control policy mme-service action reject
```
congestion-control threshold

Configures the congestion control threshold values that are to be monitored.

Product
All

Privilege
Security Administrator, Administrator

Syntax

congestion-control threshold { license-utilization percent | max-sessions-per-service-utilization percent | message-queue-utilization percent | message-queue-wait-time time | port-rx-utilization percent | port-specific { slot/port | all } [ tx-utilization percent ] [ rx-utilization percent ] | port-tx-utilization percent | service-control-cpu-utilization percent | system-cpu-utilization percent | system-memory-utilization percent | tolerance percent }

no congestion-control threshold port-specific { slot/port | all }

no congestion-control threshold port-specific { slot/port | all } [ rx-utilization percent ] [ tx-utilization percent ]

no congestion-control threshold { message-queue-utilization | message-queue-wait-time | port-rx-utilization percent | port-tx-utilization percent | service-control-cpu-utilization | system-cpu-utilization | system-memory-utilization }

default congestion-control threshold keyword
Sets the threshold keyword to its default value.

no congestion-control threshold port-specific { slot/port | all }
This command disables port specific threshold monitoring on the specified port or on all ports.

slot/port: Specifies the port for which port specific threshold monitoring is being configured. The slot and port must refer to an installed card and port.

all: Set port specific threshold monitoring for all ports on all cards.

license-utilization percent
Default: 100
The percent utilization of licensed session capacity as measured in 10 second intervals.

percent can be configured to any integer value from 0 to 100.

max-sessions-per-service-utilization percent
Default: 80
The percent utilization of the maximum sessions allowed per service as measured in real-time. This threshold is based on the maximum number of sessions or PDP contexts configured for the a particular service. (Refer to the bind command for the PDSN, GGSN, SGSN, or HA services.) percent can be configured to any integer value from 0 to 100.

**message-queue-utilization** *percent*

Default: 80
The percent utilization of the Demux Manager software task’s message queue as measured in 10 second intervals. The queue is capable of storing a maximum of 10000 messages. percent can be configured to any integer value from 0 to 100.

**message-queue-wait-time** *time*

Default: 5
The maximum time (in seconds) messages can be held in queue as measured by packet time stamps. time is measured in seconds and can be configured to any integer value from 1 to 30.

*Important:* In the event that this threshold is crossed, an SNMP trap is not triggered. In addition, the service congestion policy invocation resulting from the crossing of this threshold is enforced only for the packet that triggered the action.

**[no]** **port-rx-utilization** *percent*

Default: 80
The average percent utilization of port resources for all ports by received data as measured in 5 minute intervals. percent can be configured to any integer value from 0 to 100.

**[no]** **port-specific** *(slot/port | all)* **[rx-utilization** *percent]* [**tx-utilization** *percent]*

Default: Disabled
Sets port-specific thresholds. If you set port-specific thresholds, when any individual port-specific threshold is reached, congestion control is applied system-wide. *slot/port*: Specifies the port for which port-specific threshold monitoring is being configured. The slot and port must refer to an installed card and port. *all*: Set port specific threshold monitoring for all ports on all cards. *rx-utilization* *percent*: Default 80%. The average percent utilization of port resources for the specified port by received data as measured in 5 minute intervals. percent must an integer from 0 through 100. *tx-utilization* *percent*: Default 80%. The average percent utilization of port resources for the specified port by transmitted data as measured in 5 minute intervals. percent must be an integer from 0 through 100.

**[no]** **port-tx-utilization** *percent*

Default: 80
The average percent utilization of port resources for all ports by transmitted data as measured in 5 minute intervals. percent can be configured to any integer value from 0 to 100.
Global Configuration Mode Commands

congestion-control threshold

Default: 80
The average percent utilization of CPUs on which a Demux Manager software task instance is running as measured in 10 second intervals.
percent can be configured to any integer value from 0 to 100.

Cisco ASR 5000 Series Command Line Interface Reference

OL-22948-01

system-cpu-utilization percent

Default: 80
The average percent utilization for all PSC/PSC2 CPUs available to the system as measured in 10 second intervals.
percent can be configured to any integer value from 0 to 100.
This threshold setting can be disabled with no congestion-control threshold system-cpu-utilization command. In case later you want to enable the same threshold setting congestion-control threshold system-cpu-utilization command will enable the CPU utilization threshold to preconfigured level.

system-memory-utilization percent

Default: 80
The average percent utilization of all CPU memory available to the system as measured in 10 second intervals.
percent can be configured to any integer value from 0 to 100.

tolerance percent

Default: 10
The percentage under a configured threshold that dictates the point at which the condition is cleared.
percent is an integer value from 0 to 100.

Usage

Thresholds dictate the conditions for which congestion control is to be enabled and establish limits for defining the state of the system (congested or clear). These thresholds function in a similar fashion to the operation thresholds that can be configured for the system (as described in later in this chapter). The primary difference is that when these thresholds are reached, not only is an SNMP trap generated (starCongestion), but a service congestion policy is invoked as well.
The tolerance parameter establishes the threshold at which the condition is cleared. An SNMP trap (starCongestionClear) is generated for the clear condition, as well.

Example

The following command configures a system CPU utilization threshold of 75%.
congestion-control threshold system-cpu-utilization 75
This setting will remain in configuration unless you specify another threshold value in place of 75. This threshold setting can be disabled with no congestion-control threshold system-cpu-utilization command but can not be removed from configuration. Later if you want to enable the previously configured threshold value of 75 percent you only need to enter congestion-control threshold system-cpu-utilization command without specifying any threshold value and it will enable the CPU utilization threshold to preconfigured level of 75 percent.
For example, no congestion-control threshold system-cpu-utilization will disable the configured threshold setting and congestion-control threshold system-cpu-utilization will again enable the threshold setting of 75%.
The following command configures a threshold tolerance of 5%:

```
congestion-control threshold tolerance 5
```

In the above examples, the starCongestion trap gets triggered if the system CPU utilization goes above 75% and the starCongestionClear trap gets triggered if it reaches or goes below 70%.
content-filtering category database directory

This command configures the base directory to be used for storing all content-rating databases that are required for Category-based Content Filtering application.

**Product**
CF

**Privilege**
Security Administrator, Administrator

**Syntax**

```
content-filtering category database directory path directory_path
```

```
default content-filtering category database directory path
```

**default**
Specifies the default base directory and directory path for Category-based Content Filtering application.

**directory_path**
Default: /pcmcia1/cf
Specifies the base directory and its path to store all of the full or incremental content rating databases for the Category-based Content Filtering application.

directory_path must be an alpha and/or numeric string of 1 through 255 characters in length.

**Usage**
Use this command to specify the directory and its path to download all full or incremental category-rating databases to be used for the Category-based Content Filtering application.
Merging of incremental database can be done as part of the database upgrade process preformed with upgrade content-filtering category database command in the Executive Mode.

**Example**
The following command configures the /flash/cf_temp/DB as base directory to download all full and incremental content-rating databases for content filtering application.

```
content-filtering category database directory path /flash/cf_temp/DB
```
content-filtering category database max-versions

This command configures the number of full content-rating databases to maintain/archive in the base directory for category-based content filtering application.

**Product**
CF

**Privilege**
Security Administrator, Administrator

**Syntax**

```
content-filtering category database max-versions num_archive

default content-filtering category database max-versions
```

- **default**
  Sets the default number of full databases for specified directory path/location.

- **num_archive**
  Default: 2
  Specifies the maximum number of database to be archived or maintained in the specific location.
  num_archive must be an integer between 1 and 3.

**Usage**
Use this command to set the number of full content-rating database to be maintained in the specified directory path with the base file name specified using the `content-filtering database override file` command. Note that the specified directory path is the location specified using the `content-filtering category database directory path` command.

**Example**
The following command configures the system to maintain 3 full content-rating databases for category-based content filtering application.

```
content-filtering category database max-versions 3
```
content-filtering category database override

This command specifies the name of a file to be used by the category-rating database load process for category-based content filtering application.

Product
CF

Privilege
Security Administrator, Administrator

Syntax

content-filtering category database override file file_name.extension

default content-filtering category database override file

default
Sets the default content rating database file name; i.e. optcmd.bin.

file file_name.extension
Specifies the header of the file in the database directory path location to determine the newest full database. file_name must be an alpha and/or numeric string of up to 10 characters with an extension of 3 character after a period (.) as extension.

Usage
Use this command to configure the category-rating database file name to determine the newest version of full database. A process called “LOAD_DATABASE” invokes during the system startup or the database upgrade process by upgrade content-filtering category database command in Executive Mode. This process examines the header of each of the files in the database folder specified by content-filtering category directory path command in this mode. Note that by default system examines the header of those files only which begins with the string “OPTCMDB” and having extension “.bin”.

Example
The following command configures the system to examine the header of files that begins with CF_sta.DB only for content filtering application.

content-filtering category database override file CF_sta.DB
context

Enters the context configuration mode or is used to add or remove a specified context.

Product
All

Privilege
Security Administrator, Administrator

Syntax

context name[ -noconfirm ]

no context name

no
Removes the specified context from the configuration.

name
Specifies the name of a context to enter, add, or remove. When creating a new context, the context name must be unique, it may not be the same as any existing context or any domain specified within any context.

Important: When creating a new context, the context name specified must not conflict with the name of any existing context or domain names.

-noconfirm
Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage
Configure contexts or remove obsolete contexts.

Important: A maximum of 64 contexts may be created.

Example

context sampleContext

no context sampleContext
crash enable

Enables/disables the copying of crash data to a specified location.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
crash enable [ encrypted ] url crash_url [ filename-pattern pattern ] [ restrict mbyte ]
```

```
no crash enable
```

no

Removes the specified context from the configuration.

**Important:** System crash information is generated and stored in the crash list even when the `no` keyword is specified. The information maintained in the crash lists is minimal crash information when the `no` keyword has been specified.

**encrypted**

The URL specified is in an encrypted format for security reasons.

**filename-pattern pattern**

The `filename-pattern` is a string containing any or all of the following variables:
- `%hostname%` - The system hostname.
- `%ip%` - A SPIO IP address
- `%cpu%` - CPU number
- `%card%` - Card number
- `%time%` - POSIX timestamp in hexadecimal notation
- `%filename%` - Alias for `crash-%card%-%cpu%-%time-core%`
- `%%` - A single % sign

If no pattern is specified the result is the same as the pattern `filename`. Use '/' characters in the filename pattern part to store crashes in per-system subdirectories.

**url crash_url**

Specifies the location to store crash files. `crash_url` may refer to a local or a remote file. `crash_url` must be entered using one of the following formats:
- `{file://[/flash]/pcmcia1[/pcmcia2][/directory]}/`
- `{tftp://[host[:port]]/[directory]}/`
- `{ftp://sftp://[username[:password]@] [host][:port]/[directory]}/`
Global Configuration Mode Commands

- ASR 5000:
  - file://flash/pcmcia1/hd[/directory]/
  - tftp://host[:port]//directory/ 

**Important:** Use of the SMC hard drive is not supported in this release.

directory is the directory name.
filename is the actual file of interest.
username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.

restrict mbyte

Default: 128
Specifies a maximum amount of memory to use for storing crash files where mbyte is in megabytes and must be in the range from 1 through 128 megabytes.
The restrict keyword is only applicable to local URLs.

Usage
Enable crashes if there are systems that are not stable and the crash information will be useful for troubleshooting. The remote storage of the crash file reduces the memory utilized on the chassis.

Example

```
  crash enable ftp://remoteABC/pub/crash.dmp
  crash enable /flash/pub/data/crash.dmp restrict 64
  no crash enable
```
cs-network

This command creates/removes an HNB-CS network configuration instance for Femto UMTS access over Iu-CS/Iu-Flex interface between Home NodeB Gateway (HNB-GW) service and CS networks elements; i.e. MSC/VLR. This command also configures an existing HNB-CS network instance and enters the HNB-CS Network Configuration mode on a system.

Product
HNB-GW

Privilege
Administrator

Syntax

```
 cs-network cs_instance [-noconfirm]
```

```
 no cs-network cs_instance
```

```
 no
 Removes the specified HNB-CS network instance from the system.
```

⚠️ Caution: Removing the HNB-CS network instance is a disruptive operation and it will affect all UEs accessing MSC(s) configured in specific CS core network through the HNB-GW service.

⚠️ Caution: If any HNB-CS Network instance is removed from system all parameters configured in that mode will be deleted and Iu-CS/Iu-Flex interface will be disabled.

```
 cs_instance
 Specifies the name of the Circuit Switched Core Networks instance which needs to be associated with HNB Radio Network PLMN in HNB RN-PLMN configuration mode. If cs_instance does not refer to an existing HNB-PS network instance, the new HNB-CS network instance is created.
 cs_instance must be from 1 to 63 alpha and/or numeric characters.
```

```
 -noconfirm
 Indicates that the command is to execute without any additional prompt and confirmation from the user.
```

Usage

Use this command to enter the HNB-CS Network Configuration mode for an existing CS network instance or for a newly defined HNB-CS network instance. This command is also used to remove an existing HNB-CS network instance.

This configuration enables/disables the Iu-CS/Iu-Flex interface on HNB-GW service with CS core network elements; i.e. MSC/VLR.

A maximum of 8 HNB-CS network instance can be configured on a system which is further limited to a maximum of 256 services (regardless of type) can be configured per system.
Caution: This is a critical configuration. The HNBs can not access MSC(s) in CS core network without this configuration. Any change to this configuration would lead to disruption in HNB access to CS core network.

Entering this command results in the following prompt:

```
[context_name] hostname(config-cs-network)#
```

The various parameters available for configuration of an HNB-CS network instance are defined in the HNB-CS Network Configuration Mode Commands chapter of Command Line Interface Reference.

**Example**

The following command enters the existing HNB-CS Network configuration mode (or creates it if it doesn’t already exist) for the instance named *hnb-csl*:

```
cs-network hnb-csl
```

The following command will remove HNB-CS network instance *hnb-csl* from the system without any warning to operator:

```
no cs-network hnb-csl
```
css acsmgr-selection-attempts

This is a restricted command. In Release 9.0 and later, this command is obsoleted.
css delivery-sequence

This is a restricted command. In Release 9.0 and later, this command is obsoleted.
css service

This is a restricted command. In Release 9.0 and later, this command is obsoleted.
default

Restores the system default values for the specified parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

default { aaa { domain-matching | username-format } | autoconfirm | banner [ lawful-intercept | motd | pre-login ] | boot [ delay | interface | nameserver | networkconfig ] | card-standby-priority | cli max-sessions | congestion-control | logging { display | filter runtime } | operational-mode | pac-standby-priority | qos npu inter-subscriber traffic { bandwidth | priority{ assigned-to dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef } } } | require session recovery | snmp { engine-id |notif-threshold } | system hostname | task { facility sessmgr start | resource cpu-memory-low } | threshold { value } | timestamps | upgradelimit [ time ] [ usage] } 

aaa { domain-matching | username-format}

domain-matching - Resets the system to consider case when matching domains.
username-format - Resets the username format to the default of username @

autoconfirm

Restores the autoconfirm behavior to its default of disabled.

banner

lawful-intercept - Restores the system default message of the day for SSH CLI sessions.
motd - Restores the system default message of the day banner.
pre-login - Restores the CLI log in banner to the system default.

boot [delay | interface | nameserver | networkconfig]

interface | networkconfig - Restores the default boot interface and network configuration options. The keywords interface and networkconfig are used to restore the default option settings for the interface and network configuration options, respectively.

Defaulting the network configuration boot option removes the network boot option from the boot.sys file. It does not remove the network config options from the configuration file which is managed separately from the boot.sys file.
delay - Removes the boot delay setting (if any). The default for boot delay is “no boot delay”.
	nameserver - Removes the nameserver IP address.

card-standby-priority

Restets the standby priority of the Packet Services Cards.
cli max-sessions
Restores the default value of this command to no cli max-sessions which removes the limit on the number of allowed simultaneous CLI sessions on the system.

congestion-control
Restores the system’s congestion-control functionality to its default setting of disabled.

logging {display | filter runtime}
display: sets the default level of detail to display for trace log information to the system default.
filter runtime: resets the filtering of logged information to log in real time.

operational-mode
Sets the operational mode of the chassis to the system default.

pac-standby-priority
This parameter has been replaced by the card-standby-priority keyword.

qos npu inter-subscriber traffic {bandwidth | priority [ assigned-to dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef } ] }
Restores the following NPU QoS parameters to their default values:
  * bandwidth:
  * gold: 10%
  * silver: 20%
  * bronze: 30%
  * best-effort: 40%
  * priority: All DSCP values are mapped to the best-effort priority queue but are not configured.

require session recovery
 Resets the session recovery feature to its default setting of disabled.

snmp { engine-id | notif-threshold | system hostname | timestamps }
engine-id: restores the SNMP engine ID to the system default.
notify-threshold: restores the SNMP notification threshold to the system default.

task { facility sessmgr start | resource cpu-memory-low }
facility sessmgr start: Restores the default session manager start policy.
resource cpu-memory-low: Resets the system so that when a CPU runs very low on memory (below 12MB) the most over limit task is killed.

system hostname
Sets the system host name for SNMP use to the system default value.
threshold { value }

Restores thresholding values to their default setting. The possible values are:

- **10sec-cpu-utilization**: CPU utilization using a 10 sec average.
- **aaa-acct-failure**: AAA accounting failure threshold settings
- **aaa-acct-failure-rate**: AAA accounting failure rate threshold settings
- **aaa-auth-failure**: AAA authentication failure threshold settings
- **aaa-auth-failure-rate**: AAA authentication failure rate threshold settings
- **aaa-retry-rate**: AAA retry rate threshold settings
- **call-reject-no-resource**: Calls rejected due to no resources threshold settings
- **call-setup**: Calls setup threshold settings
- **call-setup-failure**: Call setup failure threshold settings
- **cpu-available-memory**: CPU available memory threshold settings
- **cpu-load**: PSC/PSC2 CPU load using a 5 minute average measurement
- **cpu-memory-usage**: Percentage of total CPU memory usage
- **cpu-session-throughput**: CPU session throughput threshold settings
- **cpu-utilization**: CPU utilization threshold settings
- **license**: Session license threshold settings
- **model**: Thresholding model settings
- **monitoring**: Threshold monitoring configuration settings
- **packets-filtered-dropped**: Filtered/dropped packet threshold settings
- **packets-forwarded-to-cpu**: Forwarded packet threshold settings
- **pdif-current-sessions**: Threshold monitoring for all current PDIF sessions.
- **pdif-current-active-sessions**: Threshold monitoring for only the currently-active PDIF sessions.
- **per-service-ggsn-sessions**: The number of GGSN sessions per GGSN service
- **per-service-gprs-sessions**: The number of GPRS sessions per GPRS service
- **per-service-gprs-pdp-sessions**: The number of PDP contexts per GPRS service
- **per-service-ha-sessions**: The number of HA sessions per HA service
- **per-service-kins-sessions**: The number of LNS sessions per LNS service
- **per-service-pdsn-sessions**: The number of PDSN sessions per PDSN service
- **per-service-sgsn-sessions**: The number of SGSN sessions per SGSN service
- **per-service-sgsn-pdp-sessions**: The number of PDP contexts per SGSN service
- **poll**: Threshold polling interval configuration settings
- **total**: Total subscriber threshold settings
- **total-ggsn-sessions**: Total GGSN sessions for all GGSN services in the system
- **total-gprs-sessions**: Total GPRS sessions per for all GPRS services in the system
- **total-gprs-pdp-sessions**: Total PDP contexts for all GPRS services in the system
- **total-ha-sessions**: Total HA sessions for all HA services in the system
Global Configuration Mode Commands

**default**

- **total-lns-sessions**: Total LNS sessions for all LNS services in the system
- **total-pdsn-sessions**: Total PDSN sessions for all PDSN services in the system
- **total-sgsn-sessions**: Total SGSN sessions per for all SGSN services in the system
- **total-sgsn-pdp-sessions**: Total PDP contexts for all SGSN services in the system

**timestamps**

Resets the inclusion of timestamps in command.

**upgrade limit [ time ] [ usage ]**

Sets upgrade limit values to the defaults. If the optional keywords are not specified all values are reset to their defaults.

- **time**: Resets the maximum time a session may exist during a software upgrade to the default of 120.
- **usage**: Resets the minimum number of sessions before closing the sessions during a software upgrade to the system default of 100.

**Usage**

Restore system defaults to aid in trouble shooting or just prior to modifying additional configuration options.

**Example**

- default banner motd
- default boot
- default logging display
- default system hostname
- default upgrade limit time
diameter-proxy ram-disk-limit

This command configures the amount of extra RAM disk space in MB to be allocated to Diamproxy task when local storage (hard disk) is enabled.

**Product**
SGW, PGW, HSGW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
diameter-proxy ram-disk-limit mb space_mb
default diameter-proxy ram-disk-limit mb
```

**default**
Confirms the default setting.
Default: 32 MB

**mb space_mb**
Specifies the storage space in MB.
`space_mb` must be an integer from 10 through 256.

**Usage**
Specifies the additional storage space to be allocated to Diamproxy for file write, in MB. The specified memory in MB is added to the existing memory allocated to Diamproxy only if HDD storage is enabled. By default, 32 MB is additionally allocated.

**Example**
The following command specifies that 100 MB of additional storage space be allocated to the Diamproxy task:

```
diameter-proxy ram-disk-limit mb 100
```
end

Exits the configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Change the mode back to the Exec mode.
enforce imsi-min equivalence

Enables the PDSN/HA to treat IMSI and MIN as the same for identifying the PDSN/HA session.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax

enforce imsi-min equivalence

[ no | default ] enforce imsi-min equivalence

[ no | default ]
Disables the PDSN/HA from treating IMSI and MIN as the same for identifying the PDSN/HA session. Default: Disabled.

Usage
Generally on an HA, the IMSI and MIN are treated as different and hence the RRQs with 1x and DO PDSNs are processed as different sessions. You can use this feature to treat the IMSI and MIN with the matching lower 10-digit as the same for identifying a session. The 10-digit MIN and the 15-digit IMSI are treated as equivalent for the purpose of matching sessions if the lower 10 digits are the same. Any handoff from 1x to DO or vice-versa is treated as the same session if the NAI and HoA also match. If the NAI and/or HoA do not match, then the duplicate IMSI session detect and terminate feature is applicable.

Generally on a PDSN, the IMSI and MIN are treated as different and hence RP messages from 1x and DO PDSNs are processed as different sessions. You can use this feature to treat the IMSI and MIN with the matching lower 10-digit as the same for identifying a session. The 10-digit MIN and the 15-digit IMSI are treated as equivalent for the purpose of matching PDSN sessions if the lower 10 digits are the same. Any handoff from 1x to DO or vice-versa is treated as the same session.

Example
To monitor or clear subscriber session information filtered by on IMSI/MIN refer to the show subscribers msid command.

Important: This command must be executed at startup only and will not take effect when reconfigured without rebooting.

Example
The following command enables the treatment of the IMSI and MIN as the same for identifying the session:

enforce imsi-min equivalence

Either of the following commands disables the treatment of the IMSI and MIN as the same for identifying sessions:
enforce imsi-min equivalence

no enforce imsi-min equivalence

default enforce imsi-min equivalence
**exit**

Exits the current mode, global configuration mode, and returns the CLI session to the previous mode, Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Return to the Exec mode. This command has the same effect as the `end` command as the global configuration mode’s parent mode is the Exec mode.
**gtpp compression-process**

This command configures the maximum number of child compression processes that AAA proxy can have. This command is only applicable to the ASR 5000 platform.

**Product**

GGSN, SGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
gtpp compression-process max_number

default gtpp compression-process
```

- **default**
  - Restores the system to the default settings for the number of child compression processes allowed.

- **max_number**
  - Specifies the maximum number of child processes. The default is 1
  - `max_number`: Must be an integer from 1 to 4.

**Usage**

This command configures the maximum number of child compression processes that AAA proxy can have only if hard disk storage is enabled.

**Example**

```
gtpp compression-process 3
```
**gtpp ram-disk-limit**

This command configures additional storage space to be allocated for writing files. This command is only applicable to the ASR 5000 platform.

**Product**
GGSN, SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
gtpp ram-disk-limit mb mega_bytes
default gtpp ram-disk-limit
```

- **default**
  Restores the system to the default settings of 32 MB of storage.

- **mb mega_bytes**
  Specifies the number of megabytes of storage allocated for files.
  `mega_bytes`: Must be an integer from 10 to 256. The default is 32 MB.

**Usage**
The memory specified with this command would be added to the existing memory allocated to the AAA proxy only if hard disk storage is enabled.

**Example**

```
gtpp ram-disk-limit mb 256
```
**gtpp single-source**

Configures the system to reserve a CPU for performing a proxy function for accounting.

**Product**
GGSN, SGSN, P-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
gtpp single-source [ centralized-lrsn-creation | private-extensions ]
no gtpp single-source
```

**centralized-lrsn-creation**
Defines the LRSN generation at proxy. The AAA proxy will generate the LRSN for all CDR types generated by either the GGSN or the SGSN.
Default: disabled

**private-extensions**
It is an optional keyword, enables the proprietary use of customer-specific GTPP extensions.
If `private-extensions` is not configured, all customer specific private extensions related to GTPP message transfer with CGF and recovery through GSS are disabled.

**Important:** In order for the customer-specific extensions to work properly, the `gtpp max-pdu-size` command in the Context Configuration Mode should be set to 65400 and the `gtpp server` command’s `max` value should be set to “1”.

```
no
```

Disables GTPP single-sourcing. This is the default setting.

**Caution:** Entering this command while PDP contexts are in process could cause the loss of pending CDRs. The configuration must be saved and the chassis reloaded for this option to take effect.

**Usage**
When GTPP single-sourcing is enabled, the system’s AAA proxy function generates requests to the accounting server using a single UDP source port number, instead of having each AAA Manager generate independent requests with unique UDP source port numbers. This is accomplished by the AAA Managers forwarding their GTPP PDUs to the AAA Proxy function that runs on a reserved PSC/PSC2 CPU. Since a PSC/PSC2 CPU is being reserved, fewer Session Managers and AAA Managers will be started on that PSC.

**Caution:** This command must be entered prior to the configuration of other services. Specifying it later may return an error due to a lack of CPU availability.
Example

The following command enables GTPP single-sourcing with the use of private GTPP extensions:

```
gtp single-source private-extensions
```

The following command disables GTPP single-sourcing:

```
no gtp single-source
```
**global-title-translation address-map**

Creates an instance of a Global Title Translation (GTT) address-map, a database, for global titles (ISDN-type address) used for SCCP routing. Upon creating the instance, the system enters global title translation address-map configuration mode. For the commands to configuration the database, go to the Global Title Translation Address-Map Configuration Mode chapter in this guide.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
global-title-translation address-map name
no global-title-translation address-map name
```

- **no**
  Removes the specified GTT address-map database from the SCCP portion of the configuration.

- **name**
  This value uniquely identifies a specific instance of a GTT address-map.
  `name`: must be a string of 1 to 63 alphanumeric characters.

**Usage**
Create a GTT address-map with a unique identifier and enter the GTT address-map configuration mode.

**Example**

```
global-title-translation address-map gtt-map1
```
**global-title-translation association**

Creates an instance of a Global Title Translation (GTT) association which defines the rules for handling global title translation. Upon creating the instance, the system enters global title translation association configuration mode. For the commands to configure the rules, go to the Global Title Translation Association Configuration Mode chapter in this guide.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
global-title-translation association name

no global-title-translation association name
```

no

Removes the specified instance of a GTT association from the SCCP portion of the configuration.

name

This value uniquely identifies a specific instance of a GTT association. 
name: must be a string of 1 to 63 alphanumeric characters.

**Usage**

Create a GTT association with a unique identifier and enter the GTT association configuration mode.

**Example**

```
global-title-translation association gtt-asscl
```
hd raid

Provides access to a local RIAD hard drive configuration mode in order to manage parameters supporting local storage of records.

Product
All

Privilege
Security Administrator, Administrator

Syntax

hd raid

raid
Provides access to the HD RAID configuration mode in order to manage the RAID on the ASR 5000 SMC hard drive.

Usage
Enters the HD RAID configuration mode.
Entering this command results in the following prompt:

[context_name]hostname(config-hd-raid)#

HD RAID Configuration Mode commands are defined in the HD RAID Configuration Mode Commands chapter.

Example
The following command opens the hd-raid mode:

hd raid
hd storage-policy

Provides access to the local hard drive configuration mode in order to manage parameters supporting local storage of records.

Product
GGSN, SGSN, HSGW, P-GW, S-GW

Privilege
Administrator

Syntax

**hd storage-policy name**

**no hd storage-policy name**

**no**
Removes a configured HD storage policy from the system.

**storage-policy name**
Specifies a name for an HD storage policy and enters the HD Storage Policy Configuration Mode. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage
Creates a new policy or specifies an existing policy and enters the HD Storage Policy Configuration Mode. Entering this command results in the following prompt:

```
[context_name]hostname(config-hd-storage-policy)#
```

HD Storage Policy Configuration Mode commands are defined in the HD Storage Policy Configuration Mode Commands chapter.

Example
The following command creates an HD storage policy named *policy3* and enters the HD Storage Policy Configuration Mode:

```
hd storage-policy policy3
```
high-availability

Configures PSC/PSC2 task failure detection speed.

Product
PDSN, GGSN, ASN GW

Privilege
Security Administrator, Administrator

Syntax

```
high-availability fault-detection speed { aggressive | normal }
default high-availability fault-detection speed

{ aggressive | normal
Default: normal
• aggressive: Initiates PSC failover without performing additional checks.
• normal: Initiates PSC failover after additional checks are performed.
```

Usage

Use this command to increase the fault detection speed for faster switchovers after a PSC/PSC2 task failure. Setting fault detection speed to aggressive will trigger PSC/PSC2 failover as soon as possible if a potential failure is detected. Aggressive mode will reduce the duration of subscriber outages caused by a failed PSC/PSC2 if session recovery is enabled.

Aggressive mode also bypasses most information gathering steps and logs that can be used to determine the root cause of the failure.

In normal mode, additional checks are performed before triggering a PSC/PSC2 failover to ensure the card has actually failed. In aggressive mode these checks are bypassed so that session recovery can start as soon as possible. These additional checks reduce the likelihood of a false positive failure.

Example

The following command sets the fault detection speed for PSC/PSC2/tasks to aggressive:

```
high-availability fault-detection speed aggressive
```
license

Configures the session license key.

Product
All

Privilege
Security Administrator, Administrator

Syntax

license key key_value [ -force ] session-limit

no license key key_value [ -force ] session-limit

no
Removes the license key(s) installed.

key key_value
Installs the license key specified by key_value. key_value is provided by Cisco Systems operations staff.

session-limit
Use this keyword to suppress fail-over calls from being rejected if the licensed threshold is crossed.

**Important:** This is a customer-specific command that is available for HA, PDSN, EHA, and PDIF. Please contact your local sales representative for more information.

-force
Sets the license key even if resources are not available. The system supports the dynamic resizing of demultiplexor software tasks based on the licensed session capacity and feature type. When installing a license, the system automatically attempts to resize currently functioning tasks. Warning messages are displayed if there is an issue. Though it’s use is not recommended, the -force keyword can be used to suppress these warning messages.

**Caution:** Use of this option is not recommended.

Usage
Install or update system session keys when necessary due to expiration and/or capacity needs.

Example

license key sampleKeyValue
no license key
line

Enters the terminal display line configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
line
```

Usage
Change the terminal display configuration based upon the users own terminal characteristics.
local-user allow-aaa-authentication

Enables/disables the use of administrative accounts other than local-user administrative accounts.

Product
All

Privilege
Security Administrator, Administrator

Syntax

local-user allow-aaa-authentication
no local-user allow-aaa-authentication
default local-user allow-aaa-authentication

**no**
Disables administrative user accounts other than local-user accounts.

**default**
Returns this parameter to its default setting of enabled.

Usage
Local-user administrative accounts are separate from other administrative user accounts configured at the context level (Security Administrator, Administrator, Operator, and Inspector). Context-level administrative users rely on the system’s AAA subsystems for validating user names and passwords during login. This is true for both administrative user accounts configured locally through a configuration file or on an external RADIUS server. Since the T1.276-2003 password security mechanisms are supported only for local-user administrative accounts and not for the AAA-based administrative accounts, this command provides a mechanism for disabling AAA-based administrative accounts. By default, AAA-based administrative accounts are allowed.

Example
The following command forces the system to authenticate local-user accounts based only on the information in the security account file on its CompactFlash:

```
no local-user allow-aaa-authentication
```
local-user lockout-time

Configures the lockout period for local-user administrative accounts.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
local-user lockout-time time

default local-user lockout-time
```

**default**
Restores the parameter to its default setting.

**time**
Default: 60
The amount of time that must elapse before a previously locked-out local-user account can attempt to login again. *time* is measured in minutes and can be configured to any integer value between 1 and 10080.

**Usage**
Local-user administrative accounts can become locked for reasons such as exceeding the configured maximum number of login failures. Once an account is locked, this parameter specifies the lockout duration. Once the amount of time configured by this parameter has elapsed, the local-user can once again attempt to login.

**Example**
The following command configures a lockout time of 120 minutes (2 hours):

```
local-user lockout-time 120
```
**local-user max-failed-logins**

Configures the maximum number of failed login attempts a local-user can have before their account is locked out.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
local-user max-failed-logins number
no local-user max-failed-logins
default local-user max-failed-logins
```

- **no**
  Disables this functionality.

- **default**
  Restores this parameter to its default setting.

- **number**
  Default: 5
  Specifies the maximum number of times a local-user could experience a login failure before their account is locked out. number can be configured to any integer value between 2 and 100.

**Usage**
This command configures the maximum number of failed login attempts a local-user can have before their account is locked out. For example if, this parameter is configured to “3” then after the third failed login attempt, the account would be locked.

**Important:** Local-user accounts can be configured to either enforce or reject a lockout due to the maximum number of failed login being reached. Refer to the `local-user username` command for more information.

Refer to the `local-user lockout-time` command for more information.

**Example**
The following command configures a maximum of three login attempts:

```
local-user max-failed-logins 3
```
local-user password

Configures local-user administrative account password properties.

Product
All

Privilege
Security Administrator, Administrator

Syntax

local-user password { [ complexity { ansi-t1.276-2003 | none } ] [ history length number [ duration days ] ] [ max-age days ] [ min-change-char number ] [ min-change-interval days ] [ min-length number ] }

no local-user password { [ history ] [ max-age ] [ min-change-interval ] }

default local-user password { [ complexity ] [ history ] [ max-age ] [ min-change-char ] [ min-change-interval ] [ min-length ] }

---

no

Disables the specified parameter.

default

Restores the specified parameter to its default setting.

[ complexity { ansi-t1.276-2003 | none } ]

Default: ansi-t1.276-2003
Specifies the password strength as one of the following:

• ansi-t1.276-2003: If this option is selected, then the following rules are enforced:
  • Passwords may not contain the username or the reverse of the username
  • Passwords may contain no more than 3 of the same characters used consecutively
  • Passwords must contain at least three of the following:
    • upper case alpha character
    • lower case alpha character
    • numeric character
    • special character
• none: No additional password checks are performed.

[ history length number [ duration days ] ]

Default: length is 5
Specifies the number of previous password entries kept in the history list maintained by the system. A password can not be reused if it is one of the entries kept in the history list unless the time it was last used was more than the number of days specified by the duration keyword.
If the duration keyword is not used, the only check performed by the system is that it is not in the history list.
**local-user password**

`number` is the number of entries for each account stored in the history list and can be configured to any integer value from 1 to 100. `days` is the number of days during which a password can not be reused and can be configured to any integer value between 1 and 365.

```
[ max-age days ]
Default: 90
Specifies the maximum age for a password. Users logging in with a password older than the specified limit are locked out. Once the lockout period expires, at their next login attempt, they are prompted to change their password before accessing the CLI.
```

**Important:** Local-user accounts can be configured to either enforce or reject a lockout due to a password’s maximum age being reached. Refer to the `local-user username` command for more information.

`days` is the number of days that passwords remain valid and can be configured to any integer value from 1 to 365.

```
[ min-change-char number ]
Default: 2
Specifies the minimum number of characters that must be changed (in comparison to the current password) when a user changes their password.
```

**Important:** Changes in password length are counted as “character” changes. For example: changing a password from “password” to “passwo” is a 2-character change, changing a password from “password” to “password2” is a 1-character change, and changing a password from “password” to “apassword” is a 9-character change.

`number` is the number of characters and can be configured to any integer value between 0 and 16.

```
[ min-change-interval days ]
Default: 1
Specifies the frequency that passwords can be changed (other than first login).
`days` is the minimum number of days that must pass before a user can change their password. It can be configured to any integer value from 1 to 365.
```

**Important:** If the `no local-user password min-change-interval` command is used, users may change their password as often as desired which could allow them to circumvent the password history function.

```
[ min-length number ]
Default: 8
Specifies the minimum length allowed for user-defined password.
`number` is the minimum number of alpha and/or numeric characters that the password must contain and can be configured to any integer value between 3 and 32.
```

**Usage**

This command is used to set the property requirements for user-defined passwords and system behavior in relation to those passwords.
Information pertaining to user passwords, login failures, and password history are stored on the SMC’s CompactFlash and in the software’s Shared Configuration Task (SCT). The system uses the information in SCT for runtime operations such as determining password ages and determining if new passwords meet the criteria specified by this command.

**Example**
The following command configures a minimum password length requirement of 6 characters:

```plaintext
local-user password min-length 6
```

The following command configures the system to store the 4 most recently used passwords per user-account in the history list:

```plaintext
local-user password history length 4
```
local-user username

Adds/removes local-user administrative accounts.

Product
All

Privilege
Security Administrator, Administrator

Syntax

local-user username name [ authorization-level { administrator | inspector | operator | security-admin } ] [ ecs | noecs ] [ ftp | noftp ] [ timeout-min-absolute time ] [ timeout-min-idle time ] [ no-lockout-login-failure ] [ no-lockout-password-aging ] password password

no local-user username

no
Removes a previously configured user.

name
Specifies the name of the user. The name must be from 3 to 16 alpha and/or numeric characters in length and is case sensitive.

[ authorization-level { administrator | inspector | operator | security-admin } ]

Default: Operator

Configures the authorization level for the user as one of the following:

• administrator: Administrator users have read-write privileges and can execute any command throughout the CLI except for a few security functions allowed only in the administrator mode. Administrators can configure or modify the system and are able to execute all system commands, including those available to the operator and inspector user. This level corresponds to the both the System Administrator and Application Administrator levels in T1.276-2003.

• inspector: Inspector users are limited to a small number of read-only Exec Mode commands. The bulk of these are “show” commands giving the inspector the ability to view a variety of statistics and conditions. The Inspector cannot execute show configuration commands and do not have the privilege to enter the Config Mode.

• operator: Operator users have read-only privileges to a larger subset of the Exec Mode commands as depicted in the following figure. Operator users can execute all commands that are part of the inspector mode, plus some system monitoring, statistic, and fault management functions. Operators do not have the ability to enter the Config Mode.

• security-admin: Security Administrator users have read-write privileges and can execute any command throughout the CLI. Security Administrators can execute all system commands, including those available to the administrator, operator, and inspector users. This level corresponds to both the System Security Administrator and Application Security Administrator levels in T1.276-2003.
[ ecs | noecs ]
Default: ecs
Specifies whether or not the user has access to configuration parameters pertaining to the Enhanced Charging Service.

- ecs: The user has access.
- noecs: The user does not have access.

[ ftp | noftp ]
Default: ftp
Specifies whether or not the user is allowed to access the system via the File Transfer Protocol (FTP) and/or the Secure File Transfer Protocol (SFTP).

- ftp: The user has access.
- noftp: The user does not have access.

[ timeout-min-absolute time ]
Default: 0
Specifies the maximum session time for this user. time is measured in minutes and can be configured to any integer value between 0 and 525600. A value of “0” indicates no limit.

**Important:** This limit applies only to the user’s CLI sessions.

[ timeout-min-idle time ]
Default: 0
Specifies the maximum idle time for this user. time is measured in minutes and can be configured to any integer value between 0 and 525600. A value of “0” indicates no limit.

**Important:** This limit applies only to the user’s CLI sessions.

[ no-lockout-login-failure ]
Default: Disabled
Specifies that this user will never be locked out due to login attempt failures.

[ no-lockout-password-aging ]
Default: Disabled
Specifies that this user will never be locked out due to the age of their password.

**password** password
Specifies the initial password for this user. password must from 6 to 32 alpha and or numeric characters in length and is case sensitive.

**Important:** The user is requested to change their password upon their first login.

**Usage**
The ability to configure administrative local-users is provided in support of the login security mechanisms specified in ANSI T1.276-2003. Like administrative users configured at the context level, local-users can be assigned one of 4 security levels:

<table>
<thead>
<tr>
<th>Local-User Level User</th>
<th>Context Level User</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security Administrator</td>
<td>Administrator</td>
</tr>
<tr>
<td>Administrator</td>
<td>Config-Administrator</td>
</tr>
<tr>
<td>Operator</td>
<td>Operator</td>
</tr>
<tr>
<td>Inspector</td>
<td>Inspector</td>
</tr>
</tbody>
</table>

Local-user configuration support is handled differently from that provided for administrative users configured at the context level. Context-level administrative users rely on the system’s AAA subsystems for validating user names and passwords during login. This is true for both administrative user accounts configured locally through a configuration file or on an external RADIUS server. Passwords for these user types are assigned once and are accessible in the configuration file. Local-user account information (passwords, password history, lockout states, etc.) is maintained in non-volatile memory on the CompactFlash module and in the software’s Shared Configuration Task (SCT). This information is maintained in a separate file—not in configuration files used by the system. As such, the configured local-user accounts are not visible with the rest of the system configuration. Local-user and context-level administrative accounts can be used in parallel.

Example

The following command configures a security-administrator level local-user administrative account for a user named User672 that has FTP privileges, a temporary password of abc123, and that does not lockout due to either login attempt failures or password aging:

```
local-user username User672 authorization-level security-admin ftp no-lockout-login-failure no-lockout-password-aging password abc123
```

The following command deletes a previously configured local-user administrative account called admin32:

```
no local-user username admin32
```
logging

The commands in this section set logging parameters.
logging console

Enables the output of logged events to be displayed on the console terminal.

Product
All

Privilege
Security Administrator, Administrator

Syntax
logging console

no logging console

Usage
Log console output to allow for offline review during system monitoring and/or trouble shooting.
logging disable

Enables/disables the logging of the specified event ID or range of IDs.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
logging disable eventid id [ to to_id ]
```

```
no logging disable eventid id [ to to_id ]
```

- `no`
  Indicates the event IDs specified are to be enabled for logging.

- `eventid id`
  Specifies the event for which no logging is to occur. `id` must be a value in the range 1 through 100000.

- `to to_id`
  Specifies the end ID of the events when a range of event ID is to be disabled from being logged. `to_id` must be a value in the range 1 through 100000. The `to_id` must be equal to or larger than the `id` specified.

**Usage**

Disable common events which may occur with a normal frequency are not of interest in monitoring the system for troubles.

**Example**
The following commands disables the logging of event ID 4580 and the range of events from 4500 through 4599, respectively.

```
logging disable eventid 4580

logging disable eventid 4500 to 4599
```

The following enables the subset of disabled event IDs:

```
no logging disable eventid 4500 to 4549
```
logging display

Configures the level of detail for information to be logged.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
logging display [ event-verbosity evt_level ] [ pdu-dataformat ] [ pdu-verbositypdu_level ]
```

---

event-verbosity evt_level

Specifies the level of verboseness to use in logging of events as one of:
- min
- concise
- full

---

pdu-data format

Specifies output format for packet data units when logged as one of:
- none
- hex
- hex-ascii

Where none results in the output in raw format, hex results in the output being displayed in hexadecimal format, and hex-ascii results in the output being displayed in hexadecimal and ASCII similar to a main-frame dump.

---

pdu-verbosity pdu_level

Specifies the level of verboseness to use in logging of packet data units as a value from 1 to 5 where 5 is the most detailed.

---

**Usage**

Tune the level of information to be logged so as to avoid flooding a log file with information which is not useful or critical.

---

**Example**
The following sets the logging display for events to the maximum.

```
logging display event-verbosity full
```

The following command sets the logging display level of detail for packet data units to level 3 and sets the output format to the main-frame style hex-ascii:
logging display pdu-data hex-ascii pdu-verbosity 3
logging filter

Configures the logging of events to be done in real time for the specified facility.

Product
All

Privilege
Security Administrator, Administrator

Syntax

logging filter runtime facility facility_level report_level [ critical-info | no-critical-info ]

facility facility

Specifies the facility to modify the filtering of logged information for as one of:

- **a10**: A10 interface facility
- **a11**: A11 interface facility
- **a11mgr**: A11 Manager facility
- **aaa-client**: AAA client facility
- **aaamgr**: AAA manager logging facility
- **aaaproxy**: AAA Proxy facility
- **acl-log**: Access Control List logging facility
- **acscrl**: Active Charging Service (ACS) Controller facility
- **acsmgr**: Active Charging Service (ACS) Manager facility
- **alarmctrl**: Alarm Controller facility
- **all**: All facilities
- **asf**: Voice Application Server Framework logging facility
- **asfprt**: ASF Protocol Task (SIP) logging facility
- **asngwmg**: ASN Gateway Manager facility
- **asnrmgr**: ASN Paging/Location-Registry Manager facility
- **bgp**: Border Gateway Protocol (BGP) facility
- **bssap**: Base Station Sub-system Application Part+ logging facility
- **bssgp**: Base Station Sub-system GPRS Protocol logging facility
- **cap**: Camel Application Part logging facility
- **chatconf**: Voice Chat/Conference logging facility
- **cli**: CLI logging facility
- **credit-control**: Credit Control facility
- **cscf**: IMS/MMD CSCF
- **cscfmg**: SIP CSCF Manager facility
Global Configuration Mode Commands

- **csp**: Card Slot Port controller facility
- **css**: Content Service Selection (CSS) facility
- **css-sig**: Content Service Selection (CSS) RADIUS Signaling facility
- **dcardctrl**: IPSEC Daughter card Controller logging facility (not used at this time)
- **dcardmgr**: IPSEC Daughter card Manager logging facility (Not used at this time)
- **demuxmgr**: Demux Manager API facility
- **dgmbmgr**: Diameter Gmb Application Manager logging facility
- **dhcpv6**: DHCPV6
- **dhcp**: DHCP facility (GGSN product only)
- **dhost**: Distributed Host logging facility
- **diameter**: Diameter endpoint logging facility
- **diameter-acct**: Diameter Accounting
- **diameter-auth**: Diameter Authentication
- **diameter-ecs**: ECS Diameter signaling facility
- **diameter-svc**: Diameter Service
- **diamproxy**: DiamProxy logging facility
- **dpath**: IPSEC Data Path facility
- **drvctrl**: Driver Controller facility
- **ds3mgr**: DS3 Manager logging facility
- **eap-ipsec**: EAP
- **ecs-css**: ACSMGR <-> Session Manager Signalling Interface Logging facility
- **evlog**: Event log facility
- **famgr**: Foreign Agent manager logging facility
- **firewall**: Inline per-subscriber Stateful Firewall facility
- **gmm**: GMM Protocol logging facility
- **gprs-ns**: GPRS-NS Protocol logging facility
- **gss-gedr**: GTPP Storage Server GCDR facility
- **gtpe**: GTP-C protocol logging facility (GGSN product only)
- **gtpecmgr**: GTP-C protocol Manager logging facility (GGSN product only)
- **gtpp**: GTP-PRIME protocol logging facility (GGSN product only)
- **gtpu**: GTP-U protocol logging facility (GGSN product only)
- **h248pnt**: H.248 Protocol logging facility
- **hamgr**: Home Agent manager logging facility
- **hat**: High Availability Task (HAT) process facility
- **hdctrl**: HD Controller logging facility
- **igmp**: IGMP
- **ikev2**: IKEv2
Global Configuration Mode Commands

- **ims-authorizn**: IMS Authorization Service facility
- **ims-sh**: HSS SH Service facility
- **imsimgr**: SGSN IMSI Manager facility
- **ip-arp**: IP Address Resolution Protocol facility
- **ip-interface**: IP interface facility
- **ip-route**: IP route facility
- **ipsec**: IP Security logging facility
- **ipsg**: IP Service Gateway interface logging facility
- **ipsgmgr**: IP Services Gateway facility
- **ipsps**: IP Pool Sharing Protocol logging facility
- **kvstore**: KV Store facility
- **l2tp-control**: L2TP control logging facility
- **l2tp-data**: L2TP data logging facility
- **l2tpdemux**: L2TP Demux Manager logging facility
- **l2tpmgr**: L2TP Manager logging facility
- **li**: Lawful intercept facility (Logs are visible only to system accounts with li-administrator privileges.)
- **linkmgr**: SGSN/SS7 Links Manager facility
- **llc**: Logical Link Control (LLC) Protocol logging facility
- **m3ua**: MTP3 User Adaptation (M3UA) Protocol logging facility
- **map**: Mobile Application Part (MAP) Protocol logging facility
- **megadiammgr**: Megadiameter Manager (SLF Service)
- **mmgr**: Master Manager logging facility
- **mobile-ip**: Mobile IP processes
- **mobile-ip-data**: Mobile IP data facility
- **mobile-ipv6**: Mobile IPv6 control logging facility
- **mtp3**: Message Transfer Part (MTP3) Protocol logging facility
- **multicast-proxy**: Multicast Proxy logging facility
- **netwstrg**: Network Storage facility
- **npuctrl**: Network Processor Unit Control facility
- **npumgr**: Network Processor Unit Manager facility
- **nsctrl**: Charging Service Controller facility (supported in conjunction with ECSv1)
- **nsmgr**: Charging Service Manager facility
- **nsproc**: Charging Service process facility
- **orbs**: Object Request Broker System logging facility
- **ospf**: OSPF logging facility
- **pdif**: PDIF logging facility
- **pmm-app**: PMM application logging facility
- **ppp**: PPP link and packet facilities
- **ptt**: Voice push-to-talk logging facility
- **push**: VPNMGR CDR push logging facility
- **radius-acct**: RADIUS accounting logging facility
- **radius-auth**: RADIUS authentication logging facility
- **radius-coa**: RADIUS change of authorization and radius disconnect
- **ranap**: RANAP Protocol logging facility
- **rct**: Recovery Control Task logging facility
- **rdt**: Redirect Task logging facility
- **resmgr**: Resource Manager logging facility
- **rip**: RIP logging facility (RIP is not supported at this time.)
- **rohc**: ROBust Header Compression facility
- **rsvp**: Reservation Protocol logging facility
- **sccp**: SCCP Protocol logging facility
- **sct**: Shared Configuration Task logging facility
- **sctp**: SCTP Protocol logging facility
- **sessctrl**: Session Controller logging facility
- **sessmgr**: Session Manager logging facility
- **sft**: Switch Fabric Task logging facility
- **sgsn-app**: SGSN-APP interface logging facility
- **sgsn-gtpe**: SGSNs GTP-C Protocol logging facility
- **sgsn-gtpu**: SGSNs GTP-U Protocol logging facility
- **sgsn-misc**: SGSN miscellaneous logging facility
- **sgsn-system**: SGSNs System Components logging facility
- **sgsn-test**: SGSN Tests logging facility
- **sgtpcmgr**: SGSN GTPC Manager facility
- **sipcdprt**: Sip Call Distributor facility
- **sitmain**: System Initialization Task main logging facility
- **sm-app**: Session Management (SM) Protocol logging facility
- **sms**: Short Message Service (SMS) logging facility
- **sndcp**: Sub-Network Dependent Convergence (SNDCP) Protocol logging facility
- **snmp**: SNMP logging facility
- **srdb**: Static Rating Database
- **srp**: Service Redundancy Protocol (SRP) logging facility
- **sscfnni**: Service Specific Co-ordination Function for UNNI (SCFNNI) Protocol logging facility
- **sscop**: Service Specific Connection Oriented Protocol (SSCOP) logging facility
- **ssh-ipse**: SSH IP Security logging facility
Global Configuration Mode Commands

- **stat**: Statistics logging facility
- **system**: System logging facility
- **tacacsplus**: TACACS+ Protocol logging facility
- **taclcp**: Type Allocation Code (TAC) Local Call Processing logging facility
- **tcap**: Transaction Capabilities Application Part (TCAP) Protocol logging facility
- **threshold**: threshold logging facility
- **ttg**: TTG logging facility
- **tucl**: TUCL logging facility
- **udr**: User detail record facility (used with the Charging Service)
- **user-data**: User data logging facility
- **user-l3tunnel**: User layer-3 tunnel logging facility
- **vim**: Voice Instant Messaging logging facility
- **vinfo**: Voice Information logging facility
- **vpn**: Virtual Private Network logging facility
- **wimax-data**: WiMAX DATA
- **wimax-r6**: WiMAX R6

```
level report_level [ critical-info | no-critical-info ]
```

**level report_level**: specifies the level of information to be logged, `report_level`, as one of:
- **critical**
- **debug**
- **error**
- **info**
- **trace**
- **unusual**
- **warning**.

**critical-info | no-critical-info**: indicates if critical information is to be displayed or not. The keyword **critical-info** specifies that events with a category attribute of critical information are to be displayed. Examples of these types of events can be seen at bootup when system processes and tasks are being initiated. The **no-critical-info** keyword specifies that events with a category attribute of critical information are not to be displayed.

**Usage**

This command is useful when it is necessary to get real time output of events. Event output may be cached otherwise which may make it difficult to trouble shoot problems which do not allow the last cache of events to be output prior to system problems.

**Caution**: Issuing this command could negatively impact system performance depending on system loading, the log level, and/or the type of facility(ies) being logged.
Example
Set real time output for the point-to-point protocol facility and all facilities, respectively, to avoid logging of excessive information.

```
logging filter runtime facility ppp
logging filter runtime facility all level warning
```
logging monitor

Enables/disables the monitoring of a specified user.

Product
All

Privilege
Security Administrator, Administrator

Syntax

logging monitor { ipaddr ip_address | msid ms_id | username user_name }

no logging monitor { ipaddr ip_address | msid ms_id | username user_name }

```
no
Disables the monitoring of the user specified by the options given.
```

```
ipaddr ip_address
Specifies the IP address of the user for which the monitoring filter is to be set. ip_address must be an IP v4 address in dotted decimal notation.
```

```
msid ms_id
msid ms_id specifies the mobile subscriber ID for which the monitoring filter is to be set. ms_id must be from 7 to 16 digits.
This keyword/option can be used to specify the Mobile Subscriber ISDN (MSISDN) for GGSN calls which enables logging based on MSISDN.
```

```
username user_name
username user_name specifies a user for which the monitoring filter is to be set. user_name must refer to a previously configured user.
```

Usage
Monitor subscribers which have complaints of service availability or to monitor a test user for system verification.

⚠️ Caution: Issuing this command could negatively impact system performance depending on the number of subscribers for which monitoring is performed and/or the amount of data they’re passing.

Example
The following command enables the monitoring of user user1 and mobile subscriber ID 4441235555, respectively.

```
logging monitor username user1
logging monitor msid 4441235555
```
The following disables the monitoring of user `user1`.

```
no logging monitor username user1
```
mediation-device

This command is obsolete. Even though the CLI accepts the command no function is performed.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

mediation-device mode { tcs }

no mediation-device mode { tcs }

| tcs  
| N/A |

Usage
N/A

Example
N/A
network-overload-protection

This command configures an attach rate throttle mechanism to control the number of new connections (attaches or inter-SGSN RAUs), through the SGSN, on a per second basis.

Product  SGSN
Privilege Security Administrator, Administrator
Syntax

```
network-overload-protection sgsn-new-connections-per-second
action { drop | reject with cause { congestion | network failure } }
```

default network-overload-protection sgsn-new-connections-per-second

default
Using default in the command, disables this attach rate throttle feature.

```
#_new_connections
```
Define the number of new connections to be accepted per second.

```
#_new_connections: Must be an integer from 50 to 5000.
```

```
action
```
Specifies the action to be taken by the SGSN when the attach rate exceeds the configured limit on the number of attaches. Select one of the following actions:

- drop: Drop the new connection request.
- reject-with-cause: Reject the new connection request. Include one of the following as the cause in the reject message:
  - congestion
  - network failure

Usage
Use this command to configure the rate at which the SGSN must process new connection requests. The rate is the number of new connections to be accepted per second.
In some cases, the incoming new connection rate is higher than this configured rate. When this occurs, all of the new connection requests cannot be processed. This command can also be used to configure the action to be taken when the rate limit is exceeded. The new connection requests, which cannot be processed, can be either dropped or rejected with a specific reject cause.
Counters for this feature are available in the show gmm-sm statistics command display in the Network Overload Protection portion of the table.

Example
Configure the throttle rate or limit to 2500 attaches per second and to drop all requests if the limit is exceeded.
network-overload-protection sgsn-new-connections-per-second 2500 action drop
network-service-entity

This command creates a new instance of an SGSN network service entity for either the IP environment or the Frame Relay environment.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

[ no ] network-service-entity ( ip-local | peer-nsei peer_nsei_number frame-relay )

no
Deletes the network service entity definition from the system configuration.

ip-local
Configures the local endpoint for NS/IP and enters the NSE-IP configuration mode. The prompt will change to [local]<hostname>(nse-ip-local)#

peer-nsei peer_nsei_number frame-relay
Configures a peer NSE and configures that peer with frame relay connectivity. This set of keywords also provides access to the NSE-FR configuration mode. The prompt will change to [local]<hostname>(nse-fr-peer-nsei<peer_nsei_number>)#

Usage
Use this command to access the configuration modes for either the IP or Frame Relay network service entities.

Example
Enter the NSE for a Frame Relay configuration instance identified as 4554:

network-service-entity peer-nsei 4554 frame-relay
network-service-entity ip

This command has been deprecated. See the replacement command network-service-entity.
ntp

Enters the network timing protocol configuration mode or disables the use of NTP on the system.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
ntp
no ntp
```

**no**

Disables the use of NTP for clock synchronization. When omitted, the NTP client support is enabled on the chassis.

**Important:** If the use of NTP is disabled the system clock may drift over a period of time. This may require manual updates to the system clock to synchronize the clock with other network elements.

**Usage**

Used when it is necessary to configure NTP settings.

**Example**

The following command enters the NTP configuration mode:

```
ntp
```

The following disables the use of the network timing protocol for system clock synchronization.

```
no ntp
```
**operational-mode**

Configures the systems operational mode for general use or only as a home agent.

---

**Important:** This command is only required for code versions prior to 4.5.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
operational-mode {general | ggsn-only | ha-only}
```

- **general**
  
  Sets the system operational mode to general use allowing for FA, HA, PSDN, and/or GGSN services to be co-located.

- **ggsn-only**
  
  Configures the system to only allow Gateway GPRS Support Node (GGSN) services.

---

**Important:** Executing this keyword increases the maximum number of PDP contexts supported per Session Manager from 2000 to 4000.

- **ha-only**
  
  This command keyword has been deprecated and no longer performs any function.

---

**Usage**

Set the operational mode to segregating services across multiple systems.

---

**Caution:** In order for this command to function properly, this command must be executed prior to configuring services on the system.

---

**Example**

The following sets the operational mode to general and home agent, respectively.

```
operational-mode general
```
orbem

Enters the object request broker element manager configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

orbem

Usage
Set the configuration mode to allow modification of the ORB element manager configuration data.
pac-standby-priority

This command has been renamed to **card-standby-priority**. Please refer to that command for details. Note that for backwards compatibility, the system accepts this command as valid.
port

The commands in this section set port parameters.
**port atm**

Identifies a physical port on a line card that supports ATM signaling and then enters the configuration mode for the specific interface-type. For the commands to configure the port interface, see the CLI chapter ATM Port Configuration Mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
port atm slot/port
```

- **atm**
  Indicates the port identified is an ATM interface port.

- **slot/port**
  To determine valid ATM slot and port numbers, use the Exec mode’s command `show port table`:
  - **slot**: Identifies the chassis slot holding the line card that supplies ATM ports. The slot ID number can be any valid integer between 17 and 48.
  - **port**: Identifies the physical port that is to be configured to support ATM signaling. The ID number can be any valid integer between 1 and 4.

**Usage**
Change the current configuration mode to Ethernet Port Configuration mode.

**Important**: This command is not supported on all platforms.

**Example**
The following enters the ATM port configuration mode for ATM port 1 on the card in slot 19:

```
port atm 19/1
```
port bits

Enters the BITS port configuration mode by identifying the BITS port on the active or standby SPIO.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
```
portbits slot/port
```

- `bits`:
  Identifies the BITS port.

- `slot/port`:
  - `slot`:
    Identifies the chassis slot holding the SPIO. The slot ID can be either 24 (active SPIO) or 25 (standby SPIO).
  - `port`:
    Identifies the BITS port on the SPIO. The port ID number must be 4.

**Usage**
Change the current configuration mode to BITS port configuration mode.

**Important**: This command is not supported on all platforms.

**Example**
The following enters the BITS port configuration mode for the active SPIO:
```
port bits 24/4
```
**port channelized**

Identifies a physical port on a channelized line card that supports Frame Relay signaling and creates a Frame Relay interface. As well, this command enters the configuration mode for the commands to configure the Frame Relay interface and the channelized port interface, see the CLI chapter Channelized Port Configuration Mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
portchannelized slot/port
```

**channelized**

Selects the channelized frame relay interface for the selected line card and port.

**slot/port**

To determine valid slots and port numbers, use the Exec mode’s command `show port table` to find the channelized line card.

- `slot`: Identifies the chassis slot holding the Channelized line card that supplies Frame Relay ports. The slot ID number can be any valid integer between 17 and 48.
- `port`: Identifies the physical port that is to be configured to support Frame Relay signaling. The ID number can only be 1.

**Usage**

Change the current configuration mode to Channelized Port configuration mode.

**Example**

The following enters the Channelized port configuration mode for port 1 on the card in slot 20:

```
port channelized 20/1
```
port ethernet

Enters the Ethernet Port Configuration mode for the identified port.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
port ethernet slot/port
```

- **ethernet**
  - Indicates the port identified is an Ethernet interface port.

- **slot/port**
  - Specifies the port for which Ethernet Port Configuration mode is being entered. The slot and port must refer to an installed card and port.

Usage

Change the current configuration mode to Ethernet Port Configuration mode.

Example

The following enters the Ethernet Port Configuration mode for ethernet port 1 in slot 17:

```
port ethernet 17/1
```
port mac-address virtual-base-address

This command defines a block of 256 consecutive MAC addresses and enables virtual MAC addressing for Ethernet line card ports. Not available for the XT2 platform.

Product
All

Privilege
Security Administrator, Administrator

Syntax

port mac-address virtual-base-address MAC_Address

no port mac-address virtual-base-address

no
Disables virtual MAC addressing for Ethernet line card ports. The block of virtual MAC addresses is not saved.

MAC_Address
The beginning address of a block of 256 MAC addresses that are used for virtual MAC addressing.

Usage
Use this command to disregard the MAC addresses assigned and stored in the IDEEPROM on Ethernet Line Cards and assign MAC addresses for all ports on all Ethernet Line Cards from the specified block of virtual MAC addresses. This command does not affect the MAC addresses on SPIO cards.

There are 65536 MAC addresses (00:05:47:FF:00:00 - 00:05:47:FF:FF:FF) reserved for use by customers. This range allows for the creation of 256 address blocks each containing 256 MAC addresses (e.g. 00:05:47:FF:00:00, 00:05:47:FF:01:00, 00:05:47:FF:02:00, 00:05:47:FF:03:00, 00:05:47:FF:04:00, etc.).

Caution: This configuration requires the configuration of a valid block of unique MAC addresses that are not used anywhere else. Use of non-unique MAC addresses can degrade and impair the operation of your network.

Important: This command is not supported on all platforms.

Example
To enable virtual MAC addressing for Ethernet ports on all Ethernet line cards in the system using a block of MAC addresses starting at 00:05:47:FF:00:00, enter the following command:

port mac-address virtual-base-address 00:05:47:FF:00:00
**port rs232**

Enters the RS-232 Port Configuration mode for the RS-232 port on the specified SPIO card. Not available on the XT2 platform.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
port rs232 slot 3
```

**Usage**
Change the current configuration mode to RS-232 Port Configuration mode.

**Example**
The following command enters the RS-232 Port Configuration mode for the SPIO in slot 24;

```
port rs232 24 3
```
profile-id-qci-mapping

Creates a QCI - RAN ID mapping table or specifies an existing table and enters the QCI - RAN ID mapping configuration mode for the system.

Product
HSGW

Privilege
Administrator

Syntax

[ no] profile-id-qci-mapping name [ -noconfirm ]

- no
Removes the specified mapping table from the system

- name
Creates a new or enters an existing mapping table configuration. name must be from 1 to 63 alpha and/or numeric characters.

- -noconfirm
Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage
Enters the QCI - RAN ID mapping configuration mode for an existing table or for a newly defined table. This command is also used to remove an existing table.
Entering this command results in the following prompt:
[context_name]hostname(config-hsgw-association-table)#
QCI Mapping Configuration Mode commands are defined in the QCI Mapping Configuration Mode Commands chapter.
Use this command when configuring the following eHRPD component: HSGW.

Important: This command creates a mapping table available to any HSGW context configured on the system.

Example
The following command enters the existing QCI mapping configuration mode (or creates it if it doesn’t already exist) for a mapping table named qci_table1:

    profile-id-qci-mapping qci_table1

The following command will remove qci_table1 from the system:

    no profile-id-qci-mapping qci_table1
**ps-network**

This command creates/removes an HNB-PS network configuration instance for Femto UMTS access over Iu-PS/Iu-Flex interface between Home NodeB Gateway (HNB-GW) service and PS networks elements; i.e. SGSN. This command also configures an existing HNB-CS network instance and enters the HNB-CS Network Configuration mode on a system.

**Product**

HNB-GW

**Privilege**

Administrator

**Syntax**

```
[no] ps-network ps_instance [-noconfirm]
no ps-network ps_instance
```

**no**

Removes the specified HNB-PS network instance from the system.

⚠️ **Caution:** Removing the HNB-PS network instance is a disruptive operation and it will affect all UEs accessing SGSN(s) in specific PS core network through the HNB-GW service.

⚠️ **WARNING:** If any HNB-PS Network instance is removed from system all parameters configured in that mode will be deleted and Iu-PS/Iu-Flex interface will be disabled.

---

**ps_instance**

Specifies the name of the Packet Switched Core Networks instance which needs to be associated with HNB Radio Network PLMN in HNB RN-PLMN configuration mode. If `ps_instance` does not refer to an existing HNB-PS instance, the new HNB-PS network instance is created.

`ps_instance` must be from 1 to 63 alpha and/or numeric characters.

---

**-noconfirm**

Indicates that the command is to execute without any additional prompt and confirmation from the user.

---

**Usage**

Use this command to enter the HNB-PS Network Configuration mode for an existing PS network instance or for a newly defined HNB-PS network instance. This command is also used to remove an existing HNB-PS network instance.

This configuration enables the Iu-PS/Iu-Flex interface on HNB-GW service with CS core network elements; i.e. MSC/VLR.

A maximum of 8 HNB-PS networks instance can be configured on a system which is further limited to a maximum of 256 services (regardless of type) can be configured per system.

⚠️ **Caution:** This is a critical configuration. The HNBs can not access SGSNs in PS core network without this configuration. Any change to this configuration would lead to disruption in HNB access to PS core network.
Entering this command results in the following prompt:

```
[context_name]hostnam{config-ps-network}#
```

The various parameters available for configuration of an HNB-PS network instance are defined in the HNB-PS Network Configuration Mode Commands chapter of Command Line Interface Reference.

---

**Example**

The following command enters the existing HNB-PS Network configuration mode (or creates it if it doesn’t already exist) for the instance named `hnb-ps1`:

```
ps-network hnb-ps1
```

The following command will remove HNB-PS network instance `hnb-ps1` from the system without any prompt to user:

```
no ps-network hnb-ps1
```
qci-qos-mapping

Global QCI-QoS mapping tables are used to map QCI values to appropriate QoS parameters.

Product
HSGW, P-GW, S-GW

Privilege
Administrator

Syntax

qci-qos-mapping name [ -noconfirm ]

no
Removes the specified mapping configuration from the system

name
Creates a new or enters an existing mapping configuration. name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm
Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Enter the QCI-QoS mapping configuration mode for an existing table or for a newly defined table. This command is also used to remove an existing table.

Entering this command results in the following prompt:

[context_name]hostname(config-qci-qos-mapping)#

QCI - QoS Mapping Configuration Mode commands are defined in the QCI - QoS Mapping Configuration Mode Commands chapter.

Use this command when configuring the following eHRPD component: HSGW, P-GW, S-GW.

Important: This command creates a mapping configuration available to any HSGW, P-GW, S-GW context configured on the system.

Example

The following command enters the existing QCI - QoS mapping configuration mode (or creates it if it doesn’t already exist) for a mapping configuration named qci-qos3:

qci-qos-mapping qci-qos3
qos npu inter-subscriber traffic bandwidth

Configures NPU QoS bandwidth allocations for the system.

**Product**
PDSN, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
quos npu inter-subscriber traffic bandwidth
  gold percent
gold percent
```

```
silver percent
default: 20%
specifies the maximum percentage of bandwidth to be allocated to the silver queue priority.
percent can be configured to any integer value from 0 to 100.
```

```
bronze percent
default: 30%
specifies the maximum percentage of bandwidth to be allocated to the bronze queue priority.
percent can be configured to any integer value from 0 to 100.
```

```
best-effort percent
default: 40%
specifies the maximum percentage of bandwidth to be allocated to the best-effort queue priority.
percent can be configured to any integer value from 0 to 100.
```

**Usage**
The bandwidth of a subscriber queue is maintained by rate limiting functions which implement packet-rate limiting at the first level and bit-rate limiting at the next level.
The packet-rate limit of a queue is defined by the number of packets-per-second (PPS) permitted for queuing.
Before queuing a packet on a subscriber queue, the NPU ensures that the packet falls within the limit. If the packet to be queued exceeds the packet rate limit, it is dropped.
Each subscriber queue is configured with a bit rate limit, measured in megabits-per-second (Mbps), referred to as CP-BPS (bit-per-second to CP). The CP-BPS is available as the total bandwidth for the subscriber traffic.
that a CP can sustain. Each subscriber queue receives an allocation of a certain percentage of the CP-BPS. The following maximum CP-BPS values are supported:
- Lead CP (CP0) = 128 Mbps
- Remaining CPs (CP1, CP2, CP3) = 256 Mbps

For additional information on the NPU QoS functionality, refer to the System Administration and Configuration Guide.

**Important:** This functionality is not supported for use with the PDSN at this time.

**Example**
The following command configures bandwidth allocations of 20, 30, 40, and 50% for the gold, silver, bronze, and best-effort queues respectively:

```
qos npu inter-subscriber traffic bandwidth gold 20 silver 30 bronze 40 best-effort 50
```

Upon executing this command, the priority queues will have the following PSC/PSC2 CP bandwidth allocations based on the maximum CP bandwidth specifications:

<table>
<thead>
<tr>
<th>Priority</th>
<th>Lead CP (CP 0) Bandwidth (Mbps)</th>
<th>CP 1 through CP 3 Bandwidth (Mbps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gold</td>
<td>25.6</td>
<td>51.2</td>
</tr>
<tr>
<td>Silver</td>
<td>38.4</td>
<td>76.8</td>
</tr>
<tr>
<td>Bronze</td>
<td>51.2</td>
<td>102.4</td>
</tr>
<tr>
<td>Best-effort</td>
<td>64</td>
<td>128</td>
</tr>
</tbody>
</table>
qos npu inter-subscriber traffic bandwidth-sharing

Configures NPU QoS bandwidth sharing properties for the system.

**Product**
PDSN, GGSN

**Privilege**
Administrator

**Syntax**

```
qos npu inter-subscriber traffic bandwidth-sharing { { enable | disable } { all | slot slot_num | cpu cpu_num } }
```

- **enable**
  Enables bandwidth sharing for the specified criteria.

- **disable**
  Disables bandwidth sharing for the specified criteria.

- **all**
  Specifies that the bandwidth action is to be applied to all PSC/PSC2s and every CPU on each PSC/PSC2.

- **slot slot_num**
  Specifies that the bandwidth action is to be applied to a PSC/PSC2 in a specific chassis slot number. `slot_num` is an integer from 1 to 48 that represents the slot in which a PSC/PSC2 is installed. These cards can be installed in slots 1 through 8, and/or 10 through 16.

- **cpu cpu_num**
  Specifies a specific PSC/PSC2 CP for which to perform the bandwidth action. `cpu_num` is an integer value from 0 to 3. 0 represents the lead CP.

**Usage**

The available bandwidth of a subscriber queue can be shared equally among the other subscriber queues. Any unutilized bandwidth of a queue can be shared with the other queues equally. For example, if only one DSCP is configured and it is mapped to best-effort, that DSCP would get the bandwidth allocated to the best-effort in addition to the rest of the bandwidth allocated to the gold, silver, and bronze. By default, the system enables sharing for all PSCs or PSC2s and their CPs. For additional information on the NPU QoS functionality, refer to the System Administration and Configuration Guide.

**Important:** This functionality is not supported for use with the PDSN at this time.

**Example**

```
```
The following command disables bandwidth sharing for the fourth CP (CP 3) on a PSC/PSC2 installed in chassis slot 4:

```
qos npu inter-subscriber traffic bandwidth-sharing disable slot 4 cpu 3
```
qos npu inter-subscriber traffic priority

Configures the DSCP-to-Priority assignments for the system.

Product
PDSN, GGSN

Privilege
Security Administrator, Administrator

Syntax

qos npu inter-subscriber trafficpriority { best-effort | bronze | gold | silver |
assigned-to dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 |
af33 | af41 | af42 | af43 | be | ef | dscp_num } }

no qos npu inter-subscriber trafficpriority [ assigned-to dscp { af11 | af12 |
af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef } ]

best-effort
Specifies the best-effort queue priority.

bronze
Specifies the bronze queue priority.

gold
Specifies the gold queue priority.

silver
Specifies the silver queue priority.

afXX
Assigns the Assured Forwarding $XX$ PHB DSCP. Each Assured Forwarding PHB has a corresponding DSCP value as follows:
- af11 through af13: DSCP values 5 through 7 respectively
- af21 through af23: DSCP values 9 through 11 respectively
- af31 through af33: DSCP values 13 through 15 respectively
- af41 through af43: DSCP values 17 through 19 respectively

be
Assigns the Best Effort forwarding PHB which has a corresponding DSCP value of 0.

ef
Assigns the Expedited Forwarding PHB which has a corresponding DSCP value of 23.
Specifies a specific DSCP value. The value must be expressed as an integer value from 0 through 31.

Usage

The differentiated services (DS) field of a packet contains six bits (0-5) that represent the differentiated service code point (DSCP) value. Five of the bits (1-5) represent the DSCP. Therefore, up to 32 (2^5) DSCPs can be assigned to the various priorities. By default, they're all assigned to the lowest priority (best-effort). For additional information on the NPU QoS functionality, refer to the System Administration and Configuration Guide.

Important: This functionality is not supported for use with the PDSN at this time.

Example

The following command maps the ef DSCP to the gold priority queue:

```
qos npu inter-subscriber traffic priority gold assigned-to dscp ef
```
**ran-peer-map**

Creates a RAN Peer Map and enters the RAN Peer Map Configuration Mode.

**Product**
ASN GW, PHS

**Privilege**
Administrator

**Syntax**

```bash
[ no ] ran-peer-map name [ -noconfirm ]
```

---

**no**
Removes the RAN Peer Map from the system.

---

**name**
Specifies the name of the RAN Peer Map. *name* must be from 1 to 31 alpha and/or numeric characters.

---

**Usage**

Use this command to create a new RAN Peer Map or edit an existing one. RAN peer maps reconcile base station MAC addresses received in R6 protocol messages to the base station’s IP address. Entering this command results in the following prompt:

```
[context_name]hostname(config-ran-peer-map)#
```

RAN Peer Map Configuration Mode commands are defined in the ASN RAN Peer Map Configuration Mode Commands chapter in this guide.

---

**Example**
The following command creates a RAN peer map named *ran12*:

```bash
ran-peer-map ran12
```
require active-charging

This command enables/disables Active Charging Service (ACS) with or without Category-based Content Filtering application.

Product
ACS, CF

Privilege
Security Administrator, Administrator

Syntax
require active-charging [ isolated-mode ] [ content-filtering category [ static-and-dynamic ] ] [ optimized-mode ]

no require active-charging

---

**isolated-mode**

Enables ACS, and separates ACS-related resources from other sub-system resource sharing.

**Important:** In Release 8.1 and later, this keyword is not supported.

**optimized-mode**

Enables ACS in Optimized mode, wherein ACS functionality is managed by SessMgrs.

**Important:** In Release 8.0 and earlier and in Release 9.0 and later, this keyword is not supported.

**Important:** In Release 8.1, ACS must be configured in the Optimized mode.

**Important:** In Release 8.1, if the active-charging mode is changed from the default (Non-optimized) mode to the Optimized mode, or vice-versa, the system must be rebooted for the change to take effect.

**Important:** In Release 8.3, this keyword is obsolete. With or without this keyword ACS is always enabled in Optimized mode.

Use the `require active-charging` command to enable ACS in the non-optimized mode. Wherein, ACSMgrs will spawn to support ACS.

Use the `require active-charging optimized-mode` command to enable ACS in the Optimized mode. Wherein, ACS is enabled as part of SessMgr.
content-filtering category [ static-and-dynamic ]

Enables the Category-based Content Filtering application with Active Charging support and creates the necessary Static Rating Database (SRDB) tasks to utilize the internal database of static/dynamic URLs. For Dynamic Content Filtering support, the `static-and-dynamic` keyword must be configured to specify that the Dynamic Rater Package (model and feature files) must be distributed to rating modules on startup, recovery, etc. If not configured, by default, the static-only mode is enabled.

**Usage**

Use this command to enable/disable ACS with or without Category-based Content Filtering application on a system.

In Release 8.0 and 8.1, this command must be configured before configuring any services. This is to ensure that the resource subsystem can appropriately reserve adequate memory for ACS Manager (ACSMgr) tasks. If this command is configured after all the Session Manager (SessMgr) tasks are already active, the ACSMgr tasks will not be started even if additional cards are added to the chassis—instead, the chassis must be rebooted.

**Example**

In Release 8.0, the following command enables resource subsystem to configure ACS in isolated mode:

```
require active-charging isolated-mode
```

In Release 8.1, the following command enables ACS in Optimized mode:

```
require active-charging optimized-mode
```

In Release 8.3, the following command enables ACS in Optimized mode:

```
require active-charging
```
**require demux card**

This command enables/disables the demux capabilities.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[default | no ] require demux card
```

- **default**
  Disables the demux capabilities on the card.

- **no**
  Disables the demux capabilities on the card.

**Usage**

Use this command configure the system to allow session recovery task placement scheme when session recovery is off.

**Important:** This command is not supported on all platforms.

**Example**
The following command enables demux capabilities:

```
require demux card
```
require detailed-rohc-stats

Enables or disables context-specific Robust Header Compression (RoHC) statistics.

**Product**
HSGW, PDSN

**Privilege**
Administrator

**Syntax**

```
[ no ] require detailed-rohc-stats
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Disables require detailed-rohc-stats. This is the default condition.</td>
</tr>
</tbody>
</table>

**Usage**
Enables context-specific statistics for RoHC calls.

**Example**
Enter the following command to enable context specific stats for RoHC calls:

```
require detailed-rohc-stats
```
require diameter-proxy

This command enables/disables Diameter Proxy mode.
Default: no require diameter-proxy

Product
All

Privilege
Security Administrator, Administrator

Syntax

require diameter-proxy { multiple | single }  
no require diameter-proxy

Usage
When the Diameter Proxy mode is enabled, each proxy process is a Diameter host, instead of requiring every Diameter application user (i.e., every ACSMgr and/or every SessMgr, depending on the application) to be a host.

Example
To configure a Diameter proxy for each active PSC/PSC2, enter the following command:

require diameter-proxy multiple

To configure a single Diameter proxy for the entire chassis, enter the following command:

require diameter-proxy single
require session recovery

Enables session recovery when hardware or software fault occurs within system.

Product
PDSN, GGSN, SGSN, HA, LNS, ASN GW, PDIF, MME

Privilege
Security Administrator, Administrator

Syntax
require session recovery

no require session recovery

Usage
When this feature is enabled, the system attempts to recover any home agent-based Mobile IP sessions that would normally be lost due to a hardware or software fault within the system. This functionality is available for the following call types:
- ASN GW services supporting simple IP, Mobile IP, and Proxy Mobile IP
- PDSN services supporting simple IP, Mobile IP, and Proxy Mobile IP
- HA services supporting Mobile IP and/or Proxy Mobile IP session types with or without per-user Layer 3 tunnels
- GGSN services for IPv4 and PPP PDP contexts
- SGSN services for all attached and/or activated subscribers
- LNS session types
- PDIF services supporting Simple-IP, Mobile-IP, and Proxy Mobile-P
- MME services

The default setting for this command is disabled. The no option of this command disables this feature. It is important to note that this command only works when the Session Recovery feature is enabled through a valid Session and Feature Use License Key.

Important: Upon entering this command, the system must be restarted before the command takes effect. Remember to save the configuration file before issuing the reload command.
reveal disabled commands

Enables the input of commands for features that do not have license keys installed. The output of the command `show cli` indicates when this is enabled. This command effects all future CLI sessions. This is disabled by default.

Product
All

Privilege
Security Administrator, Administrator

Syntax

reveal disabled commands

no reveal disabled commands

Usage
When this is enabled and a disabled command is entered, a message is displayed that informs you that the required feature is not enabled and also lists the name of the feature that you need to support the command. When this is disabled and a disabled command is entered, the CLI does not acknowledge the existence of the command and displays a message that the keyword is unrecognized.

Example
Set the CLI to accept disabled commands and display the required feature for all future CLI sessions with the following command:

`reveal disabled commands`

Set the CLI to reject disabled commands and return an error message for all future CLI sessions:

`no reveal disabled commands`
rohc-profile

This command allows you to create an RoHC (Robust Header Compression) profile and enter the RoHC Profile Configuration Mode. This mode is used to configure RoHC Compressor and Decompressor parameters. RoHC profiles can then be assigned to specific subscriber sessions when RoHC header compression is configured.

Product
HSGW, PDSN

Privilege
Security Administrator, Administrator

Syntax

rohc-profile profile-name name [ -noconfirm ] [common-options | compression-options| decompression-options]

no rohc-profile profile-name name

---

common-options
Configures common parameters for compressor and decompressor.

compression-options
Configures ROHC compression options.

decompression-options
Configures ROHC decompression options.

no
Remove the specified RoHC profile.

name
The name of the RoHC profile to create or remove. name must be an alphanumeric string of from 1 through 63 characters in length.

-noconfirm
Do not prompt for additional verification when executing this command.

Usage
Use this command to enter the RoHC Profile Configuration mode.
Entering this command results in the following prompt:

[context_name]host(config-rohcprofile<profile_name>)#

RoHC Profile Configuration Mode commands are defined in the RoHC Profile Configuration Mode Commands chapter.

Example
Enter the following command to create an RoHC profile named `HomeUsers` and enter the RoHC Configuration mode without prompting for verification:

```
rohc-profile profile-name HomeUsers
```

The following command removes the RoHC profile named `HomeUsers`:  

```
no rohc-profile profile-name HomeUsers
```
sccp-network

This command creates or removes a Signaling Connection Control Part (SCCP) network instance which is used to define the SS7 end-to-end routing in a UMTS network. As well, this command enters the SCCP network configuration mode. The SGSN supports up to 12 SCCP network instances at one time.

Product
SGSN, HNB-GW

Privilege
Security Administrator, Administrator

Syntax

```
sccp-network sccp_net_id [-noconfirm]

no sccp-network sccp_net_id
```

- **no**
  Remove the SCCP network configuration with the specified index number from the system configuration.

- **sccp_net_id**
  This number identifies a specific SCCP network configuration.
  *sccp_net_id:* must be an integer from 1 through 12.

- **-noconfirm**
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create or modify an SCCP network and enter the SCCP network configuration mode. The SCCP network is not a standard SS7 or UMTS concept - this concept is specific to this platform. For details about the commands and parameters needed to create and edit the SCCP Network configuration, check the *SCCP Network Configuration Mode* chapter.

Example

The following command creates an SCCP network with the index number of 1:

```
sccp-network 1
```

The following command creates an SCCP network with the index number of 2 to associate with HNB-GW service for HNB access network users without any prompt:

```
sccp-network 2 -noconfirm
```
session trace

This command configures the type of network elements, file transfer protocol, and Trace collection entity mode to be used for the transportation of trace files collected for the subscriber session tracing on the EPC network element(s) along with network connection parameters and timers.

Product
MME, P-GW, S-GW

Privilege
Administrator

Syntax

```
session trace [ collection-timer sec ] [ network-element { all | mme | pgw | sgw } ] [ retry-timer sec ] [ tce-mode { none | push transport { ftp | sftp } path string username name { encrypted password enc_pw | password password } ] ]
```

```
no session trace [network-element {all | mme | pgw | sgw}]
```

no
Removes the entire session trace configuration from the system or a specific network element trace configuration.

```collection-timer sec```
Specifies the amount of time, in seconds, to wait from initial activation/data collection before data is reported to the Trace Collection Entity (TCE). `sec` must be an integer value from 0 to 255.

```network-element {all | mme | pgw | sgw}```
Identifies the type of service to the session trace application in order to determine the applicable interfaces.
- **all**: Specifies that all network elements and their associated interfaces are to be made available to the session trace application.
- **mme**: Specifies that the MME network element and its associated interfaces is to be made available to the session trace application.
- **pgw**: Specifies that the P-GW network element and its associated interfaces is to be made available to the session trace application.
- **sgw**: Specifies that the P-GW network element and its associated interfaces is to be made available to the session trace application.

```retry-timer sec```
Specifies the amount of time, in seconds, to wait before retrying a file transfer after a failure. `sec` must be an integer value from 0 to 255.

```tce-mode none```
Specifies that session trace files are to be stored locally and must be pulled by the TCE.
Global Configuration Mode Commands

**session trace**

```plaintext
tce-mode push transport \{ ftp | sftp \} path string username name \{ encrypted password enc_pw | password password \}
```

Specifies that session trace files are to be pushed to the Trace Collection Entity (TCE).
- `{ ftp | sftp }`: Specifies that FTP or Secure FTP is used to push session trace files to the TCE.
- `path string`: Specifies the directory path on the TCE where files will be placed.
- `username name`: Specifies the username to be used when pushing files to the TCE.
- `encrypted password enc_pw`: Specifies the encrypted password to be used when pushing files to the TCE.
- `password password`: Specifies the password to be used when pushing files to the TCE.

**Usage**

Use this command to configure the file transfer methods and modes for subscriber session trace functionality and to how and where session trace files are sent after collection.
This configuration contains collection timer, EPC network element, type of file transfer, and user credentials setting to send the collected trace files to the TCE.

**Example**

The following command configures the collection time for session traces to 30 seconds, identifies the network element as all elements (MME, S-GW, and P-GW), sets the retry timer to 5 seconds, and pushes session trace files to a TCE via SFTP into a directory named `/trace/sgw` using a username `admin` and a password of `pw123`:

```
session trace collection-timer 30 network-element all retry-timer 5 tce-mode push transport sftp path /trace/sgw username admin password pw123
```

The following command configures the collection time for session traces to 30 seconds, identifies the network element as an MME, sets the retry timer to 5 seconds, and pushes session trace files to a TCE via SFTP into a directory named `/trace/mme` using a username `admin` and a password of `pw123`:

```
session trace collection-timer 30 network-element mme retry-timer 5 tce-mode push transport sftp path /trace/mme username admin password pw123
```
**sgsn-operator-policy**

This command creates an SGSN Operator Policy and enters the SGSN operator policy configuration mode. Commands for configuration of the policies are available in the SGSN Operator Policy Configuration Mode chapter elsewhere in this Command Line Interface Reference.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

sgsn-operator-policy { default | name name } [ -noconfirm ]

no sgsn-operator-policy { default | name name }

- **-noconfirm**
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

- **no**
  Remove the specified SGSN operator policy from the system configuration.

- **default**
  default, in this case, is the name of a specific operator policy. This default policy is used when no other defined operator policy matches the incoming IMSI.

**Important:** We recommend that you configure this default operator policy so that it is available to handle IMSIs that are not matched with other defined policies.

**Usage**

Use this command to create an SGSN operator policy and to enter the SGSN operator policy configuration mode to define or modify policies. The SGSN Operator Policy specifies rules governing the services, facilities and privileges available to subscribers. These policies can override standard behaviors and provide mechanisms for an operator to get around the limitations of other infrastructure elements such as DNS servers and HLRs. The system supports up to 1000 operator policies, including the default operator policy.

**Important:** Once the instance of an operator policy is defined, to use the policy it is necessary to go into the SGSN Operator Policy Configuration Mode to define the IMSI range with the MCC command - this requirement does not hold if you are using a default operator policy.

**Example**
The following command accesses the default SGSN operator policy and enters the SGSN operator policy configuration mode to view or modify the specified policy:

```bash
sgsn-operator-policy default
```
snmp

The commands in this section set SNMP parameters.
snmp authentication-failure-trap

Enables/disables the SNMP traps for authentication failures.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
no snmp authentication-failure-trap
```

**Usage**

Disables authentication failure traps if they are not of interest. At this time the option may be changed to support trouble shooting.

The chassis is shipped from the factory with the SNMP authentication failure traps disabled.

### snmp community

Configures the SNMP v1 and v2 community strings.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```markdown
snmp community string [ context ctx_name ] [ view view_name ] [ read-only | read-write ]
```

```markdown
no snmp community string
```

---

**no**

The specified community string is removed from the configuration.

---

**string**

Specifies a community string whose options are to be modified. `string` must be a from 1 to 31 alpha and/or numeric characters.

---

**context ctx_name**

Default: community string applies to all contexts.

Specifies a the context to which the community string shall be applied. `ctx_name` must be from 1 to 1023 alpha and/or numeric characters.

---

**view view_name**

Default: community string applies to all views.

Specifies the view to which the community string shall be applied. `view_name` must from 1 to 1023 alpha and/or numeric characters.

---

**read-only | read-write**

Default: read-only

Specifies if access rights for the community string.

- **read-only**: the configuration may only be viewed.
- **read-write**: the configuration may be viewed and edited.

---

**Usage**

The community strings define the privileges of SNMP users. It may be desirable to give read-only access to front line operators.

---

**Example**
snmp community sampleString
snmp community sampleString context sampleContext
snmp community sampleString context sampleContext view sampleView
snmp community sampleString view sampleView read-write
no snmp community sampleString
### snmp engine-id

Configures the SNMP engine to use for SNMP requests when SNMPv3 agents are utilized.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
snmp engine-id local id
```

*id*

Specifies the SNMPv3 engine to employ. *id* must be from 1 to 31 alpha and/or numeric characters.

**Usage**

When SNMPv3 is used for SNMP access to the chassis the engine ID can be used to quickly change which schema is used for SNMP access.

**Important:** The system can send either SNMPv1, SNMPv2c, or SNMPv3 traps to numerous target devices. However, the Web Element Manager can only process SNMP version 1 (SNMPv1) and SNMP version 2c (SNMPv2c) traps. If the SNMP target being configured is Web Element Manager application, then you must not configure this command to use.

**Example**

```
snmp engine-id local id
```
snmp heartbeat

Enables the sending of periodic “heartbeat” notifications (traps).

Product
All

Privilege
Administrator

Syntax

```
snmp heartbeat { interval [ minutes ] | second-interval [ seconds ] }

deafult snmp heartbeat

no snmp heartbeat
```

- **default**
  Returns the command to its default setting of disabled.

- **no**
  Disables the feature.

- **interval [ minutes ]**
  Default: 60
  Specifies the interval time, in minutes, between notifications. minutes must be an integer value between 1 and 1440.

- **second-interval [ seconds ]**
  Default: 30
  Specifies the secondary interval time, in seconds, between notifications. seconds must be an integer value between 10 and 50.

Usage

Use this command to enable the sending of a heartbeat notification periodically to confirm a system is up and communicating.

Example

The following command sets the snmp heartbeat notification interval to 2 hours, 15 minutes and 30 seconds:

```
snmp heartbeat interval 135 second-interval 30
```
**snmp history heartbeat**

Enables the recording of heartbeat notifications in SNMP history.

**Product**
All

**Privilege**
Administrator

**Syntax**

```
[ default | no ] snmp history heartbeat
```

- **default**
  Returns the command to the default setting of enabled.

- **no**
  Disables the history recording feature.

**Usage**

Use this command to enable the recording of SNMP heartbeat notifications in SNMP history files.
snmp notif-threshold

Configures the number of SNMP notification that need to be generated for a given event before it is propagated to the SNMP users.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
snmp notif-threshold count [ low low_count ] [ period seconds ]
```

```
no snmp notif-threshold
```

**no**

Removes all SNMP notification thresholds. All notifications will be broadcast to SNMP users.

**count**

Default: 100
Specifies the number of notifications that must be generated before the next notification is broadcast to SNMP users. `count` must be a value in the range from 1 to 10000.

**low low_count**

Default: 20
Specifies the number of notifications within the monitoring period before which any subsequent notification for each specific event. `low_count` must be a value in the range from 1 through 10000.

**period seconds**

Default: 300
Specifies the number of seconds of the monitoring window size used to determine when any subsequent notification may be broadcast to users. `seconds` must be a value in the range from 10 through 3600.

Usage

Set the notification threshold to avoid a flood of events which may be the result of a single failure or maintenance activity.

Example

```
snmp notif-threshold 100
```

```
snmp notif-threshold 100 period 30
```
**snmp server**

Enables the SNMP server as well the configuration of the SNMP server port.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
snmp server [ port number ]
```

```
no snmp server
```

- **no**
  Restores the default SNMP port assignment.

- **port number**
  Default: 161
  Specifies the port number to use for SNMP communications. *number* must be a value in the range from 1 to 65535.

**Usage**
Set the SNMP port for communications when SNMP is enabled.

**Important:** This will result in restarting the SNMP agent when the `no` keyword is omitted. SNMP queries as well as notifications/traps will be blocked until the agent has restarted.

**Example**

```
snmp server port 100

no snmp server
```
**snmp target**

Configures remote receivers of SNMP notifications.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
snmp targetname ip_address [ portnumber ] [ non-default ] [ security-namestring ] [ version { 1 | 2c | 3 | view } [security-level { noauth | { auth | priv-auth } privacy [encrypted] des privpassword } authentication [encrypted] { md5 | sha } authpassword } ] [ informs | traps ]
```

```plaintext
no snmp targetname
```

**no**

Removes the specified target as a receiver of unsolicited SNMP messages.

```plaintext
authentication { md5 | sha } authpassword
```

Reads the authentication type and password if the security level of the SNMP messages is set to `auth` or `priv-auth`. Authentication types are:
- **md5**: Configures the hash-algorithm to implement MD5 per RFC 1321.
- **sha**: Specifies that the hash protocol is Secure Hash Algorithm.

```plaintext
security-level { noauth | { auth | priv-auth } privacy [encrypted] des privpassword }
```

Sets the security level of the SNMPv3 messages, as follows:
- **noauth**: No authentication and encryption is used.
- **auth**: Only authentication will be used.
- **priv-auth**: Both authentication and encryption will be used.
- **privacy des privpassword**: Reads the privacy type and password.

```plaintext
name
```

Specifies a logical name to use to refer to the remote receiver. `name` must be from 1 to 31 alpha and/or numeric characters.

```plaintext
ip_address
```

Specifies the IP address of the receiver. `ip_address` must be specified using the standard IPv4 dotted decimal notation.

```plaintext
non-default
```

Specifies that this destination is only used for SNMP traps which have been specifically identified.
**port number**
Default: 162
Specifies the port which is to be used in communicating with the remote receivers. `number` must be a value in the range from 0 through 65535.

**security-name string**
Default: no community string included
Specifies the community string to use in the unsolicited messages. `string` must be from 1 to 31 alpha and/or numeric characters.

**version { 1 | 2c | 3 | view }**
Default: 1
Specifies the SNMP version the target supports and consequently the version of the SNMP protocol to use for communications.

---

**Important:** The system can send either SNMPv1, SNMPv2c, or SNMPv3 traps to numerous target devices. However, the Web Element Manager can only process SNMP version 1 (SNMPv1) and SNMP version 2c (SNMPv2c) traps. If the SNMP target being configured is Web Element Manager application, then you must configure this command to use version 1 or version 2c.

**informs | traps**
Default: traps
Specifies the type of SNMP event to use to send notifications to SNMP targets. `traps` are unacknowledged (fire and forget) whereas `informs` require a response from the SNMP target.
If the notification type is set to `informs`, the notification is resent if no response is received within 5 seconds. The notification is resent at most two times.

**Usage**
The target manages the list of remote receivers to which unsolicited messages are sent, e.g., this is necessary if a new monitoring system is added to a network or removed.

**Example**

```bash
snmp target sampleReceiver 1.2.3.4 security-name sampleComm
snmp target sampleReceiver 1.2.5.6 port 100
snmp target sampleReceiver 1.2.7.8 version 2c traps
no snmp target sampleReceiver
```
snmp trap

This command enables/disables generation of specific or all SNMP traps.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
snmp trap { enable | suppress } [trap_name1 trap_name2 ... trap_nameN| all ]
```

- **enable**
  Enables or allows the generation of one or more SNMP traps by the system.

- **suppress**
  Disables the generation of one or more SNMP traps by the system.

- **trap_name1 trap_name2 ... trap_nameN**
  The name of the specific SNMP trap to enable or disable. Multiple traps can be listed for a single instance of this command.

**Important:** The system disregards character case when entering trap names.

- **all**
  Default: Enable All
  Specifies that all SNMP traps will be affected by the specified operation (enable or suppress).

**Usage**

SNMP traps are used by the system to indicate that certain events have occurred. A complete listing of the traps supported by the system and their descriptions can be found in the SNMP MIB Reference. Additionally, a trap listing can be viewed using the following command:

```
snmp trap { enable | suppress }?
```

By default, the system enables the generation of all traps. However, individual traps can be disabled allowing only traps of a certain type or alarm level to be generated. This command can be used to disable un-desired traps and/or re-enable previously suppressed traps.

**Example**

The following command suppresses the LogMessage trap:

```
snmp trap suppress logmessage
```

The following command suppresses the `CLISessEnd` and `CLISessStart`: 

---
snmp trap suppress clisessend clisessstart
snmp trap-timestamps

Adds an additional system-time varbind to generated traps.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no ] snmp trap-timestamps

no

Disables the adding of timestamps to generated traps.

Usage

The timestamp added to the generated trap reflects the current system time. The timestamp is proprietary. This functionality is disabled by default.

Important: If the Web Element Manager application is used as your alarm server, the application relies on the timestamp provided by enabling this command to identify duplicate traps. As a result, it is recommended that this parameter be enabled for this case.

Example

The following command enables the inclusion of a timestamp with each generated trap:

snmp trap-timestamps
snmp user

Configures an SNMPv3 user for SNMP access.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
  snmpuser user_name [ [ encrypted ] password password | engine id | group grp_name | security-model model auth [ [ encrypted ] password password ] ]
  no snmp user user_name
```

- **no**
  Removes the specified user from the list of valid SNMPv3 users.

- **user_name**
  Specifies the user which is to use SNMPv3 interfaces to the system. `user_name` must be from 1 to 31 alpha and/or numeric characters.

- **engine id**
  The SNMP engine ID. `id` must be a string of alpha and/or numeric characters from 1 to 31 characters in length.

- **group grp_name**
  Default: undefined (not a member of any group)
  Specifies the user SNMPv3 group the into which user will be added. `grp_name` must be from 1 to 1023 alpha and/or numeric characters.

- **security-model model auth**
  Default: USM
  Specifies the security model used to authenticate the user. `model` must be configured to the following:
  - `usm`: User Security Model

- **[ encrypted ] password password**
  Default: undefined
  Specifies the password for authenticating the user when the security model is set to USM.
  The `encrypted` keyword indicates the password will be received in an encrypted form. `password` must be from 8 to 31 alpha and/or numeric characters.
  The `encrypted` keyword is intended only for use by the chassis while saving configuration scripts. The system displays the `encrypted` keyword in the configuration file as a flag that the variable following the `password` keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.
Usage
Add and remove SNMPv3 users as operations staff or automated systems are updated. The security model will be user dependant based upon the support the users system provides.

Important: The system can send either SNMPv1, SNMPv2c, or SNMPv3 traps to numerous target devices. However, the Web Element Manager can only process SNMP version 1 (SNMPv1) and SNMP version 2c (SNMPv2c) traps. If the SNMP target being configured is Web Element Manager application, then you must not configure this command to use.

Example

```
snmp user user1

snmp user user1 security-model 2c auth

snmp user user1 group sampleGroup security-model usm auth

no snmp user user1
```
ss7-routing-domain

This command creates an SS7 routing domain instance and enters the SS7 routing domain configuration mode.

**Product**
SGSN, HNB-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ss7-routing-domain rd_id variant v_type [-noconfirm]

no ss7-routing-domain rd_id
```

- **no**
  Removes the specified SS7 routing domain from the system configuration.

- **rd_id**
  This number identifies a specific SS7 routing domain. Once it has been created, it can be accessed for further configuration and modification by entering the `rd_id` without entering the variant. `rd_id` must be an integer from 1 to 12.

- **variant v_type**
  Identifies the national standard to be used for call setup, routing and control, signaling. Select one of the following:
  - `ansi`: American National Standards Institute (U.S.A.)
  - `bici`: Broadband Intercarrier Interface standard
  - `china`: Chinese standard
  - `itu`: International Telecommunication Union (ITU-T) Telecommunication Standardization Sector
  - `ntt`: Japanese standard
  - `ttc`: Japanese standard

- **-noconfirm**
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

**Usage**

Use this command to create an SS7 routing domain configuration instance or to enter the SS7 routing domain configuration mode to edit the configuration.

A routing domain groups configuration items to facilitate the management of the SS7 connection resources for an SGSN service. An Access Gateway supports up to 12 configured SS7 routing domains at one time. After entering this command, the prompt appears as:

```
[context_name]<hostname> (config-ss7-routing-domain-routing_domain_id) #
```

For details about the commands and parameters used to define or edit an SS7 routing domain, refer SS7 Routing Domain Configuration Mode chapter.
Example
The following creates an SS7 routing domain with an index of 1 and the variant selection of Broadcast Intercarrier Interface (bici):

```
ss7-routing-domain 1 variant bici
```

The following command creates an SS7 routing domain instance with an index of 2 and the variant selection of Broadcast Intercarrier Interface (bici) to be associated with HNB RN-PLMN in an HNB access network:

```
ss7-routing-domain 2 variant bici
```
suspend local-user

Suspends a local-user administrative account.

Product
All

Privilege
Administrator

Syntax

```
suspend local-user name

no suspend local-user name
```

- **no**
  Removes the suspended status for the specified local-user account.

- **name**
  The name of the local-user account. It can be from 3 to 16 alpha and/or numeric characters and is case sensitive.

Usage
This command allows a security administrator to suspend local-user administrative accounts. A “suspended” user can not login to the system. The user’s account information (passwords, password history, etc.), however, is preserved.

Example
The following command suspends a local-user account called Inspector1:

```
suspend local-user Inspector1
```

The following command removes the suspension from a local-user account called Admin300:

```
no suspend local-user Admin300
```
system

Configures system information which is accessible via SNMP.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
system { carrier-id mcc_id mnc_id | contact who | hostname host_name | location text }
```

default system { contact | location }

default
This keyword removes the configured system contact and system location on system.

carrier-id mcc mcc_id mnc mnc_id

Important: This carrier ID is not used by the GGSN

This keyword specifies a carrier-id that is a unique identifier for the carrier that has installed the system. When the carrier ID values are set, the carrier-id and gmt_offset attributes are included in access-request and accounting packets when using the following RADIUS dictionaries:

- 3gpp2
- 3gpp2-835
- starent
- starent-835
- starent-vsa1
- starent-vsa1-835
- custom9

mcc mcc_id: The mobile country code. This must be specified as a string of integers from 001 through 999. Values must be expressed as three integers.
mnc mnc_id: The mobile network code. This must be specified as a string of integers from 01 through 999. Values must be expressed as a minimum of two integers and a maximum of three integers.

contact who

Default: No contact specified.
contact who specifies the contact information for the chassis. who must be a string of 0 to 255 characters. The string specified must be embedded in double quotes (") if spaces and special punctuation is to be used.
hostname host_name

hostname host_name: configures the chassis host name where host_name must be from 1 to 63 characters.

Important: Please note that changing the chassis host name results in the command prompt changing as well to reflect the new name. This may affect any scripted interfaces from OSS or maintenance facility.

location text

Default: No location specified.

location text: specifies the location text to use which may be a string of 0 to 255 characters. The text specified must be embedded in double quotes ("") if spaces are to be used.

Usage
Specify system basic information which is useful back at a network operations center which uses the SNMP interfaces for management.

Example
The following commands configure the contact information, system host name, and location text, or remove configured location and system respectively.

    system contact user1@company.com
    system hostname system16
    system location "Clark Street Closet\nBasement Rack 4"

The following commands remove the configured contact and location from system respectively

    default system contact
    default system location
task facility ipsecmgr

Configures IPSec manager settings.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
task facility ipsecmgr { max-crypto-maps-each-ipsecmgr max_num | max-ipsecmgr-tasks max_num | start-at-a-time num | task-count { increased | normal }}
```

default task facility ipsecmgr { max-crypto-maps-each-ipsecmgr max_num | max-ipsecmgr-tasks max_num | start-at-a-time num | task-count normal }

| max-crypto-maps-each-ipsecmgr max_num |
Default: 2
The maximum number of crypto maps per IPSEC manager.
max_num must be an integer from 1 through 150.

| max-ipsecmgr-tasks max_num |
Default: 200
The maximum number of IPSEC manager tasks that can be started for all services.
max_num must be an integer from 1 through 200.

| start-at-a-time num |
Default: 1
The number of IPSEC manager tasks created at once when they are required.
num must be an integer from 1 to 128.

| task-count { increased | normal } |
Default: normal
Adjusts the IPSec manager task count to support EHA.
**increased**: Increases the number of IPSec manager tasks operating on the PSCs/PSC2s while reducing the number of session manager tasks.
**normal**: Uses the standard algorithm for allocation memory for IPSec manager tasks.

**Caution**: If **task-count** is set to **normal** and session-recovery is enabled, IPSecMgr tasks are not allowed to start on most PSCs/PSC2s.

**Usage**
Set the IPSec manager parameters for all IPSec managers in the system.
Example
Use the following command to set the maximum number of crypto maps per IPSec manager to 25:

```
task facility ipsecmgr max-crypto-maps-each-ipsecmgr 25
```
task facility sessmgr

Configures system information which is accessible via SNMP.

Product
All

Privilege
Security Administrator, Administrator

Syntax

task { facility sessmgr start { aggressive | normal } | resource cpu-memory-low { kill | warn } }

facility sessmgr start { aggressive | normal }

Default: Normal
Specifies the facility options for the session manager.

aggressive: specifies the maximum number of session manager processes are started immediately.

⚠️ Caution: The task facility sessmgr start aggressive command should only be used if the system will reach capacity (for the existing configuration) during the first few minutes of service.

⚠️ Caution: This command must only be executed last during configuration (or appended to the end of the configuration file) to ensure the availability of memory resources to contexts and services.

normal: indicates the session manager processes are started as needed.

resource cpu-memory-low { kill | warn }

Default: kill
Sets the action for the Resource Manager to take when the amount of free memory on a CPU falls below 12MB. An SNMP TRAP and CORBA notification are generated and the event is logged.
Once the free memory threshold is crossed, the Resource Manager examines all tasks on that CPU and finds the most over limit task and kills it. If there are no over limit tasks nothing happens. Resource Manager takes preference on killing a non-sessmgr task over a sessmgr task.

kill: The task most over memory limit (if any) is killed and recovered.
warn: The event is logged and no tasks are killed.

Usage

Set the session manager start policy to aggressive on heavily utilized systems to avoid undue delays in processing subscriber sessions.
Set the CPU memory low action to only log CPU low memory events.

Example

task facility sessmgr start aggressive
task facility sessmgr start normal

task resource cpu-memory-low warn
task facility acsmgr

This command configures the ACSMgr tasks setting.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

task facility acsmgr start [ aggressive | normal ]

no task facility acsmgr start

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
</table>
| Disables the configured ACSMgr setting.

<table>
<thead>
<tr>
<th>aggressive</th>
</tr>
</thead>
</table>
| Specifies to start the maximum possible ACSMgr tasks.

<table>
<thead>
<tr>
<th>normal</th>
</tr>
</thead>
</table>
| Configures the resource subsystem to start/stop ACSMgr tasks on as needed basis.

Usage
This command provides option for the resource subsystem to start maximum possible ACSMgr tasks based on the license configured and the available system configuration.

Example
The following command starts the maximum possible ACSMgr tasks:

```plaintext
task facility acsmgr start aggressive
```
Global Configuration Mode Commands

terminal

Configures the console port on the SPIO.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
terminal { carrierdetect { off | on } | databits { 7 | 8 } | flowcontrol { hardware {off | on } | none } | parity { even | none | odd } | speed { 115200 | 19200 | 38400 | 57600 | 9600 } | stopbits { 1 | 2 } }
```

carrierdetect { off | on }

Specifies whether or not the console port is to use Data Carrier Detect (DCD) when connecting to a terminal.
Default: off
off: Do not use DCD
on: Use DCD

databits { 7 | 8 }

Specifies the number of data bits used to transmit and receive characters.
Default: 8
7: Use 7 databits to transmit and receive characters.
8: Use 8 databits to transmit and receive characters.

flowcontrol { hardware {off | on } | none }

Specifies how the flow of data is controlled between the SPIO and a terminal.
Default: none
hardware: Enable or disable the use of hardware-based flow control
off: Disable the use of Ready to Send (RTS) and Clear to Send (CTS).
on: Enable the use of Ready to Send (RTS) and Clear to Send (CTS).
none: Disable the use of DCD, RTS and CTS.

parity { even | none | odd }

Specifies the type of error checking used on the port.
Default: none
even - Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits even.
none - Disables error checking.
odd - Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits odd.

speed { 115200 | 19200 | 38400 | 57600 | 9600 }

Specifies the flow of data in bits per second between the console port and terminal.
Default: 9600
stopbits { 1 | 2 }

Specifies the number of stop bits between each transmitted character.
Default: 1
  1: Use one stop bit between each transmitted character.
  2: Use two stop bits between each transmitted character.

Usage

Sets the SPIO’s console port parameters for communication with the terminal device.

Example

The following command sets the SPIO’s console port. The terminal must support these values.

```
terminal carrierdetect off databits 7 flowcontrol hardware on parity even speed 115200 stopbits 1
```
threshold

The commands in this section set global thresholding parameters.
threshold 10sec-cpu-utilization

Configures a threshold that measures a 10 second average of cpu utilization. Its polling interval can be set down to 30 seconds.

Product
PDSN, GGSN, HA, ASN GW

Privilege
Security Administrator, Administrator

Syntax

```
threshold 10sec-cpu-utilization percent [ clear percent ]
```

**percent**
Default: 0
Configures the high threshold for 10 second average cpu-utilization. If the monitored CPU utilization is greater than or equal to the specified percentage an alert is sent. Regardless of the length of the polling interval, only one sample at the end of the polling interval is tested.

**clear percent**
Default: 0:
This is a low watermark value that sets the alarm clearing threshold value. If not specified it is taken from the first value.

**Important**: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**
Use this command to set a threshold that sends an alert when CPU utilization over a 10 second average exceeds the limit set.
Alerts or alarms are triggered for 10-second sample of CPU utilization based on the following rules:

- **Enter condition**: 10-second average percentage of CPU utilization ≥ High Threshold
- **Clear condition**: 10-second average percentage of CPU utilization < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the threshold poll command to configure the polling interval and the threshold monitoring command to enable thresholding for this value.

**Important**: This command is not supported on all platforms.

**Example**
Send an alert when the 10 second average CPU utilization reaches 45 percent by entering the following command:
threshold 10sec-cpu-utilization 45
threshold aaa-acct-archive-size

This command configures accounting message archive size threshold.

Product
PDSN, GGSN, HA, ASN GW

Privilege
Security Administrator, Administrator

Syntax

```
threshold aaa-acct-archive-size high_thresh [ clear low_thresh ]
```

<table>
<thead>
<tr>
<th>high_thresh</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 1</td>
</tr>
<tr>
<td>The high threshold number of archived accounting messages that must be met or exceeded within the polling interval to generate an alert or alarm.</td>
</tr>
<tr>
<td>The number can be configured to any integer value between 0 and 1044000.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>clear low_thresh</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 1</td>
</tr>
<tr>
<td>The low threshold number of archived accounting messages that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.</td>
</tr>
<tr>
<td>The number can be configured to any integer value between 0 and 1044000.</td>
</tr>
</tbody>
</table>

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
In the event that the system cannot communicate with configured AAA accounting servers (RADIUS or CGFs), either due to the server being busy or loss of network connectivity, the system buffers, or archives, the accounting messages.

Accounting message archive size thresholds generate alerts or alarms based on the number of AAA accounting messages buffered in the archive during the specified polling interval. Accounting requests are counted for all AAA accounting servers that the system is configured to communicate with.

Alerts or alarms are triggered for accounting failures based on the following rules:

- **Enter condition:** Actual number of archived messages ≥ High Threshold
- **Clear condition:** Actual number of archived messages < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

Example
The following command configures a high threshold count of 250 AAA accounting archived messages and low threshold of 100 for an system using the Alarm thresholding model:

```
threshold aaa-acct-archive-size 250 clear 100
```
threshold aaa-acct-failure

Configures accounting failure thresholds for the system.

Product
PDSN, GGSN, HA, ASN GW

Privilege
Security Administrator, Administrator

Syntax

threshold aaa-acct-failure high_thres [ clear low_thres ]

**high_thres**
Default: 0
The high threshold number of accounting failures that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

**clear low_thres**
Default: 0
The low threshold number of accounting failures that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
Accounting failure thresholds generate alerts or alarms based on the number of failed AAA accounting message requests that occur during the specified polling interval. Accounting requests are counted for all AAA accounting servers that the system is configured to communicate with.
Alerts or alarms are triggered for accounting failures based on the following rules:
- **Enter condition:** Actual number of failures ≥ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

Example
The following command configures a high threshold count of 100 AAA accounting failures and low threshold of 25 for an system using the Alarm thresholding model:
threshold aaa-acct-failure 100 clear 25
threshold aaa-acct-failure-rate

Configures accounting failure rate thresholds for the system.

Product
PDSN, GGSN, HA, ASN GW

Privilege
Security Administrator, Administrator

Syntax

threshold aaa-acct-failure-rate high_thresh [ clear low_thresh ]

- **high_thresh**
  - Default: 1
  - The high threshold percent of accounting failures that must be met or exceeded within the polling interval to generate an alert or alarm.
  - high_thresh can be configured to any integer value between 0 and 100.

- **clear low_thresh**
  - Default: 1
  - The low threshold percent of accounting failures that maintains a previously generated alarm condition. If the percentage of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
  - low_thresh can be configured to any integer value between 0 and 100.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
Accounting failure rate thresholds generate alerts or alarms based on the percentage of AAA accounting message requests that failed during the specified polling interval. Accounting requests are counted for all AAA accounting servers that the system is configured to communicate with.

Alerts or alarms are triggered for accounting failure rates based on the following rules:

- **Enter condition:** Actual failure percentage \( \geq \) High Threshold
- **Clear condition:** Actual failure percentage \(< \) Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

Example
The following command configures a AAA accounting failure rate high threshold percentage of 30 and a low threshold percentage of 10 for an system using the Alarm thresholding model:
threshold aaa-acct-failure-rate 30 clear 10
threshold aaa-auth-failure

Configures authentication failure thresholds for the system.

**Product**
PDSN, GGSN, HA, ASN GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold aaa-auth-failure high_thresh [ clear low_thresh ]
```

<table>
<thead>
<tr>
<th><strong>high_thresh</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 0</td>
</tr>
<tr>
<td>The high threshold number of authentication failures that must be met or exceeded within the polling interval to generate an alert or alarm. The number can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>clear low_thresh</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 0</td>
</tr>
<tr>
<td>The low threshold number of authentication failures that maintains a previously generated alarm condition. A value of 0 disables the threshold.</td>
</tr>
</tbody>
</table>

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Authentication failure thresholds generate alerts or alarms based on the number of failed AAA authentication message requests that occur during the specified polling interval. Authentication requests are counted for all AAA authentication servers that the system is configured to communicate with. Alerts or alarms are triggered for authentication failures based on the following rules:

- **Enter condition:** Actual number of failures ≥ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval. Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**
The following command configures a high threshold count of 100 AAA authentication failures for an system using the Alert thresholding model:

```
threshold aaa-auth-failure 100
```
threshold aaa-auth-failure-rate

Configures authentication failure rate thresholds for the system.

Product
PDSN, GGSN, HA, ASN GW

Privilege
Security Administrator, Administrator

Syntax
threshold aaa-auth-failure-rate high_thresh [ clear low_thresh ]

**high_thresh**
Default: 5
The high threshold percent of authentication failures that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 100.

**clear**
Allows the configuration of the low threshold.

**low_thresh**
Default: 5
The low threshold percent of authentication failures that maintains a previously generated alarm condition. If the percentage of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 100.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**
Authentication failure rate thresholds generate alerts or alarms based on the percentage of AAA authentication message requests that failed during the specified polling interval. Authentication requests are counted for all AAA authentication servers that the system is configured to communicate with. Alerts or alarms are triggered for authentication failures based on the following rules:
- **Enter condition:** Actual failure percentage ≥ High Threshold
- **Clear condition:** Actual failure percentage < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.
Example

The following command configures a AAA authentication failure rate high threshold percentage of 30 for an system using the Alert thresholding model:

```
threshold aaa-auth-failure-rate 30
```
**threshold aaa-retry-rate**

Configures AAA retry rate thresholds for the system.

**Product**

PDSN, GGSN, HA, ASN GW

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
threshold aaa-retry-rate [high_thresh] [clear low_thresh]
```

**high_thresh**

Default: 5

The high threshold percent of AAA request message retries that must be met or exceeded within the polling interval to generate an alert or alarm.

high_thresh can be configured to any integer value between 0 and 100.

**clear low_thresh**

Default: 5

The low threshold percent of AAA request message retries that maintains a previously generated alarm condition. If the percentage of retries falls beneath the low threshold within the polling interval, a clear alarm will be generated.

low_thresh can be configured to any integer value between 0 and 100.

---

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

---

**Usage**

AAA request message retry rate thresholds generate alerts or alarms based on the percentage of request messages (both authentication and accounting) that were retried during the specified polling interval. The percentage is based on a message count taken for all AAA authentication and accounting servers that the system is configured to communicate with.

Alerts or alarms are triggered for request message retries based on the following rules:

- **Enter condition:** Actual retry percentage ≥ High Threshold
- **Clear condition:** Actual retry percentage < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

---

**Example**

The following command configures a AAA message retry rate high threshold percentage of 25 and a low threshold percentage of 10 for an system using the Alarm thresholding model:
threshold aaa-retry-rate 25 clear 10
threshold aaamgr-request-queue

This command configures the AAA Manager internal request queue threshold.

Product
PDSN, GGSN, HA, ASN GW

Privilege
Security Administrator, Administrator

Syntax

threshold aaamgr-request-queue high_thresh [ clear ] low_thresh

high_thresh
Default: 0
The high threshold number of AAA Manager Requests that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 1 and 100.

clear
Allows the configuration of the low threshold.

low_thresh
Default: 5
The low threshold number of AAA Manager Requests that maintains a previously generated alarm condition. If the percentage of failures falls beneath the low threshold within the polling interval, a clear alarm is generated.
low_thresh can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
AAA Manager Request thresholds generate alerts or alarms based on the number of AAA Manager Requests for an AAA manager process during the specified polling interval.
Alerts or alarms are triggered for AAA Manager Requests based on the following rules:

- **Enter condition:** Actual number of AAA Manager Requests per AAA manager ≥ High Threshold
- **Clear condition:** Actual number of AAA Manager Requests per AAA manager process < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm is not generated until the end of the polling interval.
Refer to the threshold poll command to configure the polling interval and the threshold monitoring command to enable thresholding for this value.
Example
The following command configures a AAA authentication failure rate high threshold percentage of 30 for a system using the Alert thresholding model:

```plaintext
threshold aaamgr-request-queue 30
```
threshold asngw-auth-failure

Configures authentication failure thresholds for the ASN-GW system.

Product
ASN-GW

Privilege
Security Administrator, Administrator

Syntax

```
threshold asngw-auth-failure high_thresh [ clear low_thresh ]
```

default threshold asngw-auth-failure

```
high_thresh
Default: 0
The high threshold number of authentication failures that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.
```

```
clear low_thresh
Default: 0
The low threshold number of authentication failures that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.
```

```
| Important: | This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold. |
```

Usage

Use this command to configure threshold limits to generate alerts or alarms based on the number of failed ASN-GW authentication message requests that occur during the specified polling interval. Authentication requests are counted for all ASN Gateway authentication servers that the system is configured to communicate with.

Alerts or alarms are triggered for authentication failures based on the following rules:

- **Enter condition:** Actual number of failures ≥ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.
Example
The following command configures a high threshold count of 100 authentication failures for an ASN-GW using the Alert thresholding model:

```
threshold asngw-auth-failure 100
```
threshold asngw-handoff-denial

Configures thresholds for hand-off denial for the ASN-GW service.

**Product**
ASN-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold asngw-handoff-denial high_thresh[ clear low_thresh]
default threshold asngw-handoff-denial
```

**high_thresh**
Default: 0
The high threshold number of hand-off denials that must be met or exceeded within the polling interval to generate an alert or alarm.
`high_thresh` can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

**clear low_thresh**
Default: 0
The low threshold number of hand-off denials that maintains a previously generated alarm condition. If the number of hand-off denials falls beneath the low threshold within the polling interval, a clear alarm will be generated.
`low_thresh` can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Use this command to set threshold limits to generate alerts or alarms based on the number of denied hand-off that occurred during the specified polling interval. Hand-off denial messages are counted for all ASN Gateways that the system is configured to communicate with.
Alerts or alarms are triggered for hand-off denials based on the following rules:
- **Enter condition:** Actual number of failures ≥ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold
If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.
Example
The following command configures a high threshold count of 100 hand-off denials using the Alert thresholding model:

```
threshold asngw-handoff-denial 100
```
**threshold asngw-max-eap-retry**

Configures thresholds for maximum retries for Extensible Authentication Protocol (EAP) authentication on an ASN-GW service.

**Product**
ASN-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold asngw-max-eap-retry high_thresh[ clear low_thresh]
default threshold asngw-max-eap-retry
```

**high_thresh**
Default: 0
The high threshold number of retries for EAP authentication that must be met or exceeded within the polling interval to generate an alert or alarm. `high_thresh` can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

**clear low_thresh**
Default: 0
The low threshold number of retries for EAP authentication that maintains a previously generated alarm condition. If the number of retries falls beneath the low threshold within the polling interval, a clear alarm will be generated. `low_thresh` can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**
Use this command to set threshold limits to generate alerts or alarms based on the number of retries for EAP authentication that occur during the specified polling interval. Alerts or alarms are triggered for maximum number of retries for EAP authentication based on the following rules:

- **Enter condition:** Actual number of failures ≥ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval. Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.
Example
The following command configures a high threshold count of 100 alerts or alarms generated on maximum number of retries for EAP authentication for an ASN Gateway using the Alert thresholding model:

```
threshold asngw-handoff-denial 100
```
**threshold asngw-network-entry-denial**

Configures thresholds for denial of network entry to an MS with in the ASN-GW service.

**Product**
ASN-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold asngw-network-entry-denial high_thresh [ clear low_thresh ]
```

default threshold asngw-network-entry-denial

```
high_thresh

Default: 0
The high threshold number of denial of network entry to an MS that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.
```

```
clear low_thresh

Default: 0
The low threshold number of denial of network entry to an MS that maintains a previously generated alarm condition. If the number of denials falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.
```

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Use this command to set threshold limits to generate alerts or alarms based on the number of network entry denials that occurred during the specified polling interval. Network denial messages are counted for an MS that the system is configured to communicate with. Alerts or alarms are triggered for network entry denials based on the following rules:

- **Enter condition:** Actual number of failures ≥ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval. Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.
Example
The following command configures a high threshold count of 100 network entry denials for an MS using the Alert thresholding model:

```
threshold asngw-network-entry-denial 100
```
threshold asngw-r6-invalid-nai

Configures thresholds to generate alert/alarm for invalid Network Access Identifier (NAI) in R6 message.

Product
ASN-GW

Privilege
Security Administrator, Administrator

Syntax

```
threshold asngw-r6-invalid-nai high_thresh [ clear low_thresh ]
default threshold asngw-r6-invalid-nai
```

**high_thresh**
Default: 0
The high threshold number of invalid NAIs in R6 messages that must be met or exceeded within the polling interval to generate an alert or alarm. 
`high_thresh` can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

**clear low_thresh**
Default: 0
The low threshold number of invalid NAIs in R6 messages that maintains a previously generated alarm condition. If the number of denials falls beneath the low threshold within the polling interval, a clear alarm will be generated. 
`low_thresh` can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
Use this command to set threshold limits to generate alerts or alarms based on the number of invalid NAIs in R6 messages that occurred during the specified polling interval. Invalid NAIs are counted for an MS that the system is configured to communicate with or per system for all R6 messages. 
Alerts or alarms are triggered for invalid NAIs based on the following rules:
- **Enter condition:** Actual number of failures ≥ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval. 
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.
Example
The following command configures a high threshold count of 100 invalid NAIs in R6 messages using the Alert thresholding model:

    threshold asngw-r6-invalid-nai 100
threshold asngw-session-setup-timeout

Configures thresholds to generate alert/alarm for session setup timeouts in an ASN-GW service.

Product
ASN-GW

Privilege
Security Administrator, Administrator

Syntax

```plaintext
threshold asngw-session-setup-timeouthigh_thresh[ clearlow_thresh]
default threshold asngw-session-setup-timeout
```

### high_thresh

Default: 0
The high threshold number of timeouts during session setup that must be met or exceeded within the polling interval to generate an alert or alarm.

*high_thresh* can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

### clear low_thresh

Default: 0
The low threshold number of timeouts during session setup that maintains a previously generated alarm condition. If the number of denials falls beneath the low threshold within the polling interval, a clear alarm will be generated.

*low_thresh* can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

> **Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Use this command to set threshold limits to generate alerts or alarms based on the number of timeouts during session setup that occurred during the specified polling interval.

Alerts or alarms are triggered for session setup timeouts based on the following rules:

- **Enter condition:** Actual number of failures ≥ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**
The following command configures a high threshold count of 100 timeouts during session setup using the Alert thresholding model:

```
threshold asngw-session-setup-timeout 100
```
threshold asngw-session-timeout

Configures thresholds to generate alert/alarm for session timeouts in an ASN-GW service.

Product
ASN-GW

Privilege
Security Administrator, Administrator

Syntax

```
threshold asngw-session-timeout high_thresh [ clear low_thresh ]
default threshold asngw-session-timeout
```

```
high_thresh
Default: 0
The high threshold number of timeouts during session that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

clear low_thresh
Default: 0
The low threshold number of timeouts during session that maintains a previously generated alarm condition. If the number of session timeouts falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.
```

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of timeouts during a session that occurred during the specified polling interval. Alerts or alarms are triggered for session timeouts based on the following rules:

- **Enter condition:** Actual number of failures ≥ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

Example

```
```
The following command configures a high threshold count of 100 timeouts during a session using the Alert thresholding model:

```
threshold asngw-session-timeout 100
```
threshold call-reject-no-resource

Configures thresholds on the system for calls rejected due to insufficient resources.

Product
All

Privilege
Security Administrator, Administrator

Syntax

threshold call-reject-no-resource high_thresh [ clear low_thresh ]

high_thresh

Default: 0
The high threshold number of no-resource call rejects issued by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

clear low_thresh

Default: 0
The low threshold number of no-resource call rejects issued by the system that maintains a previously generated alarm condition. If the number of rejections falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

No resource call reject thresholds generate alerts or alarms based on the total number of calls that were rejected by the system due to insufficient or no resources (memory and/or session licenses) during the specified polling interval.
Alerts or alarms are triggered for no-resource-rejected calls based on the following rules:

- **Enter condition:** Actual number of calls rejected due to no resources ≥ High Threshold
- **Clear condition:** Actual number of calls rejected due to no resources < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

Example
The following command configures a high threshold count for the number of calls rejected by the system due to insufficient or no resources to 100 and allow threshold of 40 for an system using the Alarm thresholding model:

```
threshold call-reject-no-resource 100 clear 40
```
threshold call-setup

Configures call setup thresholds for the system.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold call-setup high_thresh[ clear low_thresh]
```

**high_thresh**
Default: 0
The high threshold number of calls setup by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

**clear low_thresh**
Default: 0
The low threshold number of calls setup by the system that maintains a previously generated alarm condition.
If the number of setups falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**
Call setup thresholds generate alerts or alarms based on the total number of calls setup by the system during the specified polling interval.
Alerts or alarms are triggered for call setups based on the following rules:
- **Enter condition:** Actual number of call setups \( \geq \) High Threshold
- **Clear condition:** Actual number of call setups < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll monitoring` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**
The following command configures a high threshold count of 100 calls setup for an system using the Alert thresholding model:
threshold call-setup 100
threshold call-setup-failure

Configures call setup failure thresholds for the system.

**Product**  
All

**Privilege**  
Security Administrator, Administrator

**Syntax**

```
threshold call-setup-failure [high_thresh] [clear low_thresh]
```

**high_thresh**

Default: 0  
The high threshold number of call setup failures experienced by the system that must be met or exceeded within the polling interval to generate an alert or alarm.  
The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

**clear low_thresh**

Default: 0  
The low threshold number of call setup failures experienced by the system that maintains a previously generated alarm condition. If the number of setup failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.  
The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

**Important**: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Call setup failure thresholds generate alerts or alarms based on the total number of call setup failures experienced by the system during the specified polling interval.  
Alerts or alarms are triggered for call setup failures based on the following rules:

- **Enter condition**: Actual number of call setup failures ≥ High Threshold  
- **Clear condition**: Actual number of call setup failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.  
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**

The following command configures a high threshold count of 100 call setup failures and a low threshold of 80 for an system using the Alarm thresholding model:
threshold call-setup-failure 100 clear 80
threshold cpu-available-memory

Configures thresholds for available CPU memory for the system.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```bash
threshold cpu-available-memory low_thresh [ clear high_thresh ]
```

<table>
<thead>
<tr>
<th>low_thresh</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 32</td>
</tr>
<tr>
<td>The low threshold amount of CPU memory that must be met or exceeded at the polling time to generate an alert or alarm.</td>
</tr>
<tr>
<td><code>low_thresh</code> is measured in mega bytes (MB) and can be configured to any integer value between 0 and 2048.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>clear high_thresh</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 32</td>
</tr>
<tr>
<td>The high threshold amount of CPU memory that maintains a previously generated alarm condition. If the memory amount rises above the high threshold within the polling interval, a clear alarm will be generated.</td>
</tr>
<tr>
<td><code>high_thresh</code> is measured in mega bytes (MB) and can be configured to any integer value between 0 and 2048.</td>
</tr>
</tbody>
</table>

**Important**: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

**Usage**

CPU available memory thresholds generate alerts or alarms based on the amount of available memory for each PSC/PSC2 CPU at the polling time. Although, a single threshold is configured for all CPUs, separate alerts or alarms can be generated for each CPU.

Alerts or alarms are triggered for available CPU memory based on the following rules:

- **Enter condition**: Average measured amount of memory/CPU for last 5 minutes £ Low Threshold
- **Clear condition**: Average measured amount of memory/CPU for last 5 minutes > High Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Important**: This command is not supported on all platforms.
Example
The following command configures a low threshold count of 50 MB CPU memory available and a high threshold of 112 MB for an system using the Alarm thresholding model:

```
threshold cpu-available-memory 50 clear 112
```
threshold cpu-load

Configures the threshold for monitoring PSC/PSC2 CPU loads using a 5 minute average measurement. The threshold is enabled by enabling CPU resource monitoring.

Product
All

Privilege
Security Administrator, Administrator

Syntax

threshold cpu-load high_thresh [ clear low_thresh ]

- high_thresh
  Default: 0
  If the monitored CPU load is greater than or equal to the specified number an alert is sent. high_thresh must be an integer from 0 through 15.

- clear low_thresh
  Default: 0
  This is a low watermark value that sets the alarm clearing threshold value. If not present it is taken from the first value. low_thresh must be an integer from 0 through 15.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

Use this command to set an alert when the card’s CPU load is equal to or greater than the number specified. Alerts or alarms are triggered for CPU load based on the following rules:
- Enter condition: Actual CPU load ≥ High Threshold
- Clear condition: Actual CPU load < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the threshold poll command to configure the polling interval and the threshold monitoring command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

To set an alert when the PSC/PSC2 CPU load is over 10 and set an alert clear when the CPU load drops down equal or less than 7, enter the following command;

threshold cpu-load 10 clear 7
threshold cpu-memory-usage

Configures the threshold for monitoring the percentage of total CPU memory used during the polling interval.

Product
All

Privilege
Security Administrator, Administrator

Syntax

threshold cpu-memory-usage high_thresh [ clear low_thresh ]

 high_thresh
Default: 0
The high threshold for percentage of total memory used that must be met or exceeded at the end of the polling interval to generate an alert or alarm.
high_thresh is measured in percentage of total CPU memory used and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

clear low_thresh
Default: 0
The low threshold for percentage of total CPU memory used that maintains a previously generated alarm condition. If the memory usage falls below the low threshold within the polling interval, a clear alarm is generated.
low_thresh is measured in percentage of total CPU memory used and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

CPU memory usage generate alerts or alarms based on the percentage of total CPU memory used during the polling interval.
Alerts or alarms are triggered for CPU memory usage session based on the following rules:

• Enter condition: Actual percentage of CPU memory usage ≥ specified percentage of total CPU memory.

• Clear condition: Actual CPU memory usage < specified clear percentage of total CPU memory usage.

If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the threshold poll command to configure the polling interval and the threshold monitoring command to enable thresholding for this value.

Example
The following command configures a threshold of 65 percent of total PSC/PSC2 CPU memory usage and a clear threshold of 35 percent:

```
threshold cpu-memory-usage 65 clear 35
```
threshold cpu-orbs-crit

Configures threshold for generating critical-level alerts or alarms based on the percentage of CPU utilization by the ORBS software task

Product
All

Privilege
Security Administrator, Administrator

Syntax

threshold cpu-orbs-crit [default]
high_thresh [clear low_thresh]

default
Restores this parameter to its default setting.

high_thresh
Default: 60
The high threshold percent of CPU utilization by the ORB software task that must be exceeded as measured at the time of polling to generate a critical-level alert or alarm.
high_thresh is measured in percentage of total CPU utilization and can be configured to any integer value 0 through 100. A value of 0 disables the threshold.

clear low_thresh
Default: 60
The low threshold percent of CPU utilization by the ORB software task that maintains a previously generated alarm condition. If the percentage is measured as less than or equal to the low threshold at the time of polling, a clear alarm will be generated.
low_thresh is measured in percentage of total CPU utilization and can be configured to any integer value 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage
Object Request Broker (ORB) software task CPU utilization thresholds generate critical-level alerts or alarms based on the percentage of SMC CPU resources it is consuming at the time of polling.
Critical-level alerts or alarms are triggered for CPU usage by the ORBs software task based on the following rules:

• Enter condition: Actual CPU usage percentage > High Threshold
• Clear condition: Actual CPU usage percentage £ Low Threshold

Refer to the threshold poll command to configure the polling interval and the threshold monitoring command to enable thresholding for this value.
**Example**
The following command configures a critical-level alarm threshold of 35 percent of CPU utilization by the ORBS task and a clear threshold of 35 percent:

```plaintext
threshold cpu-orbs-crit 35 clear 35
```
threshold cpu-orbs-warn

Configures threshold for generating warning-level alerts or alarms based on the percentage of CPU utilization by the ORBS software task.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold cpu-orbs-warn high_thresh[ clear low_thresh]
[ default ] threshold cpu-orbs-warn
```

**default**
Restores this parameter to its default setting.

**high_thresh**
Default: 50
The high threshold percent of CPU utilization by the ORB software task that must be exceeded as measured at the time of polling to generate a warning-level alert or alarm.

`high_thresh` is measured in percentage of total CPU utilization and can be configured to any integer value 0 through 100. A value of 0 disables the threshold.

**clear low_thresh**
Default: 50
The low threshold percent of CPU utilization by the ORB software task that maintains a previously generated alarm condition. If the percentage is measured as less than or equal to the low threshold at the time of polling, a clear alarm will be generated.

`low_thresh` is measured in percentage of total CPU utilization and can be configured to any integer value 0 through 100. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

**Usage**
Object Request Broker (ORB) software task CPU utilization thresholds generate warning-level alerts or alarms based on the percentage of SMC CPU resources it is consuming at the time of polling.

Warning-level alerts or alarms are triggered for CPU usage by the ORBs software task based on the following rules:

- **Enter condition:** Actual CPU usage percentage > High Threshold
- **Clear condition:** Actual CPU usage percentage £ Low Threshold

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.
Example
The following command configures a warning-level alarm threshold of 25 percent of CPU utilization by the ORBS task and a clear threshold of 25 percent:

```
threshold cpu-orbs-warn 25 clear 25
```
**threshold cpu-session-throughput**

Configures thresholds for CPU session throughput for the system.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
threshold cpu-session-throughput high_thres [ clear low_thres ]
```

**high_thres**

Default: 0
The high threshold session throughput that must be met or exceeded within the polling interval to generate an alert or alarm.
`high_thres` is measured in Kilobytes per second (Kbps) and can be configured to any integer value between 0 and 1000000000. A value of 0 disables the threshold.

**clear low_thres**

Default: 0
The low threshold session throughput that maintains a previously generated alarm condition. If the throughput falls below the low threshold within the polling interval, a clear alarm will be generated.
`low_thres` is measured in Kilobytes per second (Kbps) and can be configured to any integer value between 0 and 1000000000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

CPU session throughput thresholds generate alerts or alarms based on total throughput for all Session Manager tasks running on each PSC/PSC2 CPU during the polling interval. Although, a single threshold is configured for all CPUs, separate alerts or alarms can be generated for each CPU.
Alerts or alarms are triggered for CPU session throughput based on the following rules:

- **Enter condition:** Actual CPU session throughput \( \geq \) High Threshold
- **Clear condition:** Actual CPU session throughput < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Important:** This command is not supported on all platforms.
Example
The following command configures a high threshold count of 900 Kbps session throughput and a low threshold of 500 KBps for a system using the Alarm thresholding model:

```
threshold cpu-session-throughput 900 clear 500
```
threshold cdr-file-space

Configures the threshold for monitoring the percentage of total file space allocated for CDRs used during the polling interval.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

```
threshold cdr-file-space high_thresh [ clear low_thresh ]
default threshold cdr-file-space
```

default
Configures the default setting.

```
high_thresh
```

Default: 90
The high threshold for percentage of total allocated CDR file space used that must be met or exceeded at the end of the polling interval to generate an alert or alarm. *high_thresh* is measured in percentage of total allocated CDR file space used and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

```
clear low_thresh
```

Default: 0
The low threshold for percentage of total allocated CDR file space used that maintains a previously generated alarm condition. If the space usage falls below the low threshold within the polling interval, a clear alarm is generated. *low_thresh* is measured in percentage of total allocated CDR file space used and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

CDR file space usage generate alerts or alarms based on the percentage of total allocated CDR file space used during the polling interval.

Alerts or alarms are triggered for CDR file space usage session based on the following rules:

- **Enter condition:** Actual percentage of allocated CDR file space usage \( \geq \) specified percentage of total CDR file space.
- **Clear condition:** Actual CDR file space used < specified clear percentage of total allocated CDR file space usage.
If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**

The following command configures a threshold of 65 percent of total allocated CDR file space usage and a clear threshold of 35 percent:

```
threshold cdr-file-space 65 clear 35
```
threshold contfilt-block

Configures the threshold for Content Filtering rating operations blocked during a polling interval at which the threshold are raised or cleared.

**Product**

CF

**Privilege**

Security Administrator, Administrator

**Syntax**

```
threshold contfilt-block high_thresh_value [ clear low_thresh_value ]
default threshold contfilt-block
```

**high_thresh**

Default: 90
The high threshold for number of rating operations blocked for content filtering service that must be met or exceeded at the end of the polling interval to generate an alert or alarm.

*high_thresh* is measured in numbers of total rating operations blocked and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

**clear low_thresh**

Default: 0
The low threshold for the total number of rating operations blocked for a content filtering service that maintains a previously generated alarm condition. If the threshold falls below the low threshold within the polling interval, a clear alarm is generated.

*low_thresh* is measured in number of total rating operations blocked and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

**Usage**

Use this command to configure the threshold for a content filtering service to generates alerts or alarms based on the number of rating operations blocked for a content filtering service during the polling interval. If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll contfilt-block` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**

The following command configures a threshold of 65 percent of total rating operations blocked and a clear threshold of 35 percent:

```
threshold contfilt-block 65 clear 35
```
threshold contfilt-rating

Configures the threshold for Content Filtering rating operations performed during a polling interval at which the threshold are raised or cleared.

**Product**
CF

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold contfilt-rating high_thresh_value [ clear low_thresh_value ]
default threshold contfilt-rating
```

**high_thresh**
Default: 90
The high threshold for number of rating operations performed for content filtering service that must be met or exceeded at the end of the polling interval to generate an alert or alarm.

**clear low_thresh**
Default: 0
The low threshold for the total number of rating operations performed for a content filtering service that maintains a previously generated alarm condition. If the threshold falls below the low threshold within the polling interval, a clear alarm is generated.

**Usage**
Use this command to configure the threshold for a content filtering service to generates alerts or alarms based on the number of rating operations performed for a content filtering service during the polling interval. If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll contfilt-rating` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**
The following command configures a threshold of 65 percent of total rating operations performed and a clear threshold of 35 percent:

```
threshold contfilt-rating 65 clear 35
```
threshold cpu-utilization

Configures thresholds for CPU utilization for the system.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
threshold cpu-utilization high_thresh [ clear low_thresh ]
```

- **high_thresh**
  - Default: 85
  - The high threshold CPU utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
  - `high_thresh` can be configured to any integer value between 0 and 100.

- **clear low_thresh**
  - Default: 85
  - The low threshold CPU utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
  - `low_thresh` can be configured to any integer value between 0 and 100.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

CPU utilization thresholds generate alerts or alarms based on the utilization percentage of each PSC/PSC2 CPU during the specified polling interval. Although, a single threshold is configured for all CPUs, separate alerts or alarms can be generated for each CPU. Alerts or alarms are triggered for CPU utilization based on the following rules:

- **Enter condition:** Average measured CPU utilization for last 5 minutes ≥ High Threshold
- **Clear condition:** Average measured CPU utilization for last 5 minutes < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Important:** This command is not supported on all platforms.

**Example**

```
```

Cisco ASR 5000 Series Command Line Interface Reference
The following command configures a high threshold CPU utilization percentage of 90 for an system using the Alert thresholding model:

```
threshold cpu-utilization 90
```
threshold dcca-bad-answer

Configures the threshold for invalid or bad responses to the system from Diameter server.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

[ default ] threshold dcca-bad-answer high_thres [ clear low_thres ]

default
Disables the threshold for configured alarm and set the high_thres and low_thres values to 0.

high_thres
Default: 0
The high threshold number of invalid messages or responses that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 1044000.

clear low_thres
Default: 0
The low threshold number of invalid messages/responses that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 1044000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
In the event that the system receives invalid message or response from Diameter server dcca-bad-answer is generated.
DCCA bad answer messages size threshold generates alerts or alarms based on the number of invalid response or messages received during the specified polling interval.
Alerts or alarms are triggered for DCCA bad answers based on the following rules:

● Enter condition: Actual number of DCCA bad answer messages ≥ High Threshold

● Clear condition: Actual number of DCCA bad answer messages < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Example
The following command configures a high threshold count of 250 DCCA bad answer messages and low threshold of 100 for an system using the Alarm thresholding model:

```
threshold dcca-bad-answer 250 clear 100
```
threshold dcca-protocol-error

Configures the threshold for Diameter Credit Control Application (DCCA) protocol error from Diameter server.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

[ default ] threshold dcca-protocol-error high_thresh [ clear low_thresh ]

default
Disables the threshold for configured alarm and sets the high_thresh and low_thresh values to 0.

high_thresh
Default: 0
The high threshold number of protocol error received from Diameter server that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 1044000.

clear low_thresh
Default: 0
The low threshold number of protocol error received from Diameter server that maintains a previously generated alarm condition. If the number of errors falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 1044000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
In the event that the system receives the protocol errors from Diameter server, dcca-protocol-error is generated.
DCCA protocol error threshold generates alerts or alarms based on the number of protocol error messages received from Diameter server during the specified polling interval.
Alerts or alarms are triggered for DCCA protocol error based on the following rules:

• Enter condition: Actual number of DCCA protocol error ≥ High Threshold

• Clear condition: Actual number of DCCA protocol errors < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Example
The following command configures a high threshold count of 250 protocol errors and low threshold of 100 for a system using the Alarm thresholding model:

```
threshold dcca-protocol-error 250 clear 100
```
threshold dcca-rating-failed

Configures Diameter Credit Control Application (DCCA) Rating Group (content-id) request reject thresholds.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

[ default ] threshold dcca-rating-failed high_thresh [ clear low_thresh ]

default
Disables the threshold for configured alarm and sets the high_thres and low_thres values to 0.

high_thresh
Default: 0
The high threshold number of requests for a block of credits due to invalid Rating Group (content-id), rejected from the Diameter server that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 1044000.

clear low_thresh
Default: 0
The low threshold number of requests for a block of credits due to invalid Rating Group (content-id), rejected from the Diameter server that maintains a previously generated alarm condition. If the number of errors falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 1044000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

In the event that the Diameter server rejects the system request for a block of credits due to invalid Rating Group, defined as content-id, dcca-rating-failed message is generated.
Rating Group failed threshold generates alerts or alarms based on the number of requests rejected from Diameter server during the specified polling interval.
Alerts or alarms are triggered for Rating Group failed based on the following rules:

- Enter condition: Actual number of DCCA Rating Group failed ≥ High Threshold
- Clear condition: Actual number of DCCA Rating Group failed < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Example
The following command configures a high threshold count of 250 requests rejected and low threshold of 100 for an system using the Alarm thresholding model:

```
threshold dcca-rating-failed 250 clear 100```

threshold dcca-unknown-rating-group

Configures the unknown Diameter Credit Control Application (DCCA) Rating Group (content-id) returned by Diameter to system thresholds.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

```
[ default ] threshold dcca-unknown-rating-group high_thresh [ clear low_thresh ]
```

**default**
Disables the threshold for configured alarm and sets the `high_thresh` and `low_thresh` values to 0.

**high_thresh**
Default: 0
The high threshold number of unknown Rating Group (content-id) sent by Diameter server and received by system that must be met or exceeded within the polling interval to generate an alert or alarm. The number can be configured to any integer value between 0 and 1044000.

**clear low_thresh**
Default: 0
The low threshold number of unknown Rating Group (content-id) sent by Diameter server and received by system that maintains a previously generated alarm condition. If the number of errors falls beneath the low threshold within the polling interval, a clear alarm will be generated. The number can be configured to any integer value between 0 and 1044000.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**
In the event that the Diameter server sends invalid Rating Groups, **content-ids** to the system, **dcca-unk-rating-group** message is generated.
Unknown Rating Group threshold generates alerts or alarms based on the number of unknown Rating Groups received by the system from Diameter server during the specified polling interval. Alerts or alarms are triggered for unknown rating groups based on the following rules:

- **Enter condition:** Actual number of unknown rating groups \( \geq \) High Threshold
- **Clear condition:** Actual number of unknown rating groups \( < \) Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Example
The following command configures a high threshold count of 250 unknown rating groups and low threshold of 100 for an system using the Alarm thresholding model:

```
threshold dcca-unknown-rating-group 250 clear 100
```
threshold diameter diameter-retry-rate

This command configures Diameter Retry Rate threshold for generating alerts or alarms based on the percentage of Diameter requests that were retried during the polling interval.

**Product**
ECS

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold diameter diameter-retry-rate high_thresh [ clear low_thresh ]
default threshold diameter diameter-retry-rate
```

**default**
Configures the default setting.
Default: Disables the thresholds; the threshold values are reset to 0.

```
high_thresh
```

Default: 0
Specifies the high threshold. If, within the polling interval, the percentage of Diameter requests retried equals or exceeds `high_thresh`, an alert or alarm is generated.
`high_thresh` must be an integer from 0 through 100.

```
clear low_thresh
```

Default: 0
Specifies the low threshold. If, within the polling interval, the percentage of Diameter requests retried falls below `low_thresh`, a clear alarm is generated.
`low_thresh` must be an integer from 0 through 100.

**Important:** This value is applicable for the Alarm mode, and ignored for the Alert mode. In addition, if this value is not configured for the Alarm mode, the system assumes it is identical to the high threshold.

**Usage**
Diameter Retry Rate threshold generates alerts or alarms based on the percentage of Diameter requests that were retried during the specified polling interval.
Alerts or alarms are triggered based on the following rules:

- **Enter condition:** Percentage of Diameter requests retried > High Threshold
- **Clear condition:** Percentage of Diameter requests retried < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Example
The following command configures a high threshold of 75 percent, and a low threshold of 50 percent for a system using the Alarm thresholding model:

```
threshold diameter diameter-retry-rate 75 clear 50
```
threshold edr-file-space

Configures the threshold for monitoring the percentage of total file space allocated for EDRs used during the polling interval.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

[ default ] threshold edr-file-space high_thresh [ clear low_thresh ]

- **high_thresh**
  Default: 90
  The high threshold for percentage of total allocated EDR file space used that must be met or exceeded at the end of the polling interval to generate an alert or alarm. **high_thresh** is measured in percentage of total allocated EDR file space used and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

- **clear low_thresh**
  Default: 0
  The low threshold for percentage of total allocated EDR file space used that maintains a previously generated alarm condition. If the space usage falls below the low threshold within the polling interval, a clear alarm is generated. **low_thresh** is measured in percentage of total allocated EDR file space used and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

EDR file space usage generate alerts or alarms based on the percentage of total allocated EDR file space used during the polling interval. Alerts or alarms are triggered for EDR file space usage session based on the following rules:

- **Enter condition:** Actual percentage of allocated EDR file space usage \( \geq \) specified percentage of total EDR file space.
- **Clear condition:** Actual EDR file space used < specified clear percentage of total allocated EDR file space usage.

If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval. Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.
Example
The following command configures a threshold of 65 percent of total allocated EDR file space usage and a clear threshold of 35 percent:

```
threshold edr-file-space 65 clear 35
```
### threshold edr-udr-dropped flow control

This command configures thresholds to monitor the total number of EDRs and UDRs discarded due to flow control.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
threshold edr-udr-dropped-flow-control high_thresh [ clear low_thresh ]
default threshold edr-udr-dropped-flow-control
```

- **default**
  
  Configures the default setting.
  
  Default: High threshold: 90; Low threshold: 10

- **high_thresh**
  
  Default: 90
  
  The high threshold for total number of EDRs + UDRs dropped due to flow control, which must be met or exceeded within the polling interval to generate an alert or alarm. `high_thresh` must be an integer from 0 through 100000.
  
  A value of 0 indicates the threshold.

- **clear low_thresh**
  
  Default: 10
  
  The low threshold for total number of EDRs + UDRs dropped that maintains a previously generated alarm condition. If the total number of EDRs + UDRs dropped falls below the low threshold within the polling interval, a clear alarm is generated. `low_thresh` must be an integer from 0 through 100000, and must be lower than `high_thresh`.
  
  A value of 0 disables the threshold.

**Usage**

Use this command to configure thresholds to monitor the total number of EDRs + UDRs discarded due to flow control. Alerts or alarms are generated based on the total number of EDRs + UDRs dropped during polling interval.

Alerts or alarms are triggered for EDR file space usage session based on the following rules:

- **Enter condition:** Actual number of EDRs + UDRs dropped >= specified number of EDRs + UDRs dropped.
- **Clear condition:** Actual number of EDR + UDRs dropped < specified clear number of EDRs + UDRs dropped.

If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.
Example
The following command configures a high threshold of 90 and a clear threshold of 45 to monitor EDRs + UDRs dropped due to flow control:

```
threshold edr-udr-dropped-flow-control 90 clear 45
```
threshold fw-deny-rule

This command configures thresholds for Stateful Firewall Deny Rule.

Product
FW

Privilege
Security Administrator, Administrator

Syntax

threshold fw-deny-rule high_thresh [ clear low_thresh ]

default threshold fw-deny-rule

default
Disables the threshold and sets high_thresh and low_thresh to the default values.

high_thresh
Specifies the Stateful Firewall Deny-Rule threshold value, which if met or exceeded generates an alert or alarm.
high_thresh must be an integer from 0 through 1000000.
Default: 0

clear low_thresh
Specifies the Stateful Firewall Deny-Rule alarm clear threshold value. If, in the same polling interval, the threshold falls below low_thresh a clear alarm is generated.
low_thresh must be an integer from 0 through 1000000.
Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage
When the number of Deny-Rule exceeds a given value, a threshold is raised and it is cleared when the number of Deny-Rule fall below a value within the polling interval.
Refer to the threshold poll command to configure the polling interval, and the threshold monitoring command to enable thresholding for this value.

Example
The following command configures a Stateful Firewall Deny Rule high threshold of 1000 and a low threshold of 100 for a system using the Alarm Thresholding model:

threshold fw-deny-rule 1000 clear 100
threshold fw-dos-attack

This command configures thresholds for Stateful Firewall Denial-of-Service (DoS) attacks.

Product  
FW

Privilege  
Security Administrator, Administrator

Syntax

threshold fw-dos-attack high_thresh [ clear low_thresh ]

default threshold fw-dos-attack

default
Disables the threshold and sets high_thresh and low_thresh to the default values.

high_thresh
Specifies the Stateful Firewall DoS attacks threshold value, which if met or exceeded generates an alert or alarm.
high_thresh must be an integer from 0 through 1000000.
Default: 0

clear low_thresh
Specifies the Stateful Firewall DoS attacks clear threshold value. If, in the same polling interval, the threshold falls below low_thresh a clear alarm is generated.
low_thresh must be an integer from 0 through 1000000.
Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

When the number of DoS attacks exceed a given value, a threshold is raised and it is cleared when the number of DoS attacks fall below a value within the polling interval.
Refer to the threshold poll command to configure the polling interval and the threshold monitoring command to enable thresholding for this value.

Example

The following command configures a Stateful Firewall DoS attacks high threshold of 1000 and a low threshold of 100 for a system using the Alarm Thresholding model:

threshold fw-dos-attack 1000 clear 100
threshold fw-drop-packet

This command configures thresholds for Stateful Firewall drop packets.

Product
FW

Privilege
Security Administrator, Administrator

Syntax
threshold fw-drop-packet high_thresh [ clear low_thresh ]

default threshold fw-drop-packet

default
Disables the threshold and sets high_thresh and low_thresh to the default values.

high_thresh
Specifies the Stateful Firewall drop packets threshold value, which if met or exceeded generates an alert or alarm.
high_thresh must be an integer from 0 through 1000000.
Default: 0

clear low_thresh
Specifies the Stateful Firewall drop packets clear threshold value. If, in the same polling interval, the threshold falls below low_thresh a clear alarm is generated.
low_thresh must be an integer from 0 through 1000000.
Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage
When the number of drop packets exceed a given value, a threshold is raised and it is cleared when the number of drop packets fall below a value within the polling interval.
Refer to the threshold poll command to configure the polling interval and the threshold monitoring command to enable thresholding for this value.

Example
The following command configures a Stateful Firewall drop packets high threshold of 1000 and a low threshold of 100 for a system using the Alarm thresholding model:

threshold fw-drop-packet 1000 clear 100
threshold fw-no-rule

This command configures thresholds for Stateful Firewall no rules.

**Product**
FW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold fw-no-rule high_thresh [ clear low_thresh ]
default threshold fw-no-rule
```

**default**

Disables the threshold and sets `high_thresh` and `low_thresh` to the default values.

**high_thresh**

Specifies the Stateful Firewall no rules threshold value, which if met or exceeded generates an alert or alarm. `high_thresh` must be an integer from 0 through 1000000.

Default: 0

**clear low_thresh**

Specifies the Stateful Firewall no rules clear threshold value. If, in the same polling interval, the threshold falls below `low_thresh` a clear alarm is generated.

`low_thresh` must be an integer from 0 through 1000000.

Default: 0

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

**Usage**

When the number of no rules exceed a given value, a threshold is raised and it is cleared when the number of no rules fall below a value within the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**

The following command configures a Stateful Firewall no rules high threshold of 1000 and a low threshold of 100 for a system using the Alarm Thresholding model:

```plaintext
threshold fw-no-rule 1000 clear 100
```
threshold license

Configures thresholds for session license utilization for the system.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] threshold license remaining-sessions low_thresh clear high_thresh
```

- **remaining-sessions low_thresh**
  - Default: 10
  - The low threshold session license utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
  - `low_thresh` can be configured to any integer value between 0 and 100.

- **clear high_thresh**
  - Default: 10
  - The high threshold session license utilization percentage that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm will be generated.
  - `high_thresh` can be configured to any integer value between 0 and 100.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

**Usage**

Session license utilization thresholds generate alerts or alarms based on the utilization percentage of all session capacity licenses during the specified polling interval.

As described in Chapter 7 of the Administration and Configuration Guide, the system uses session capacity license to dictate the maximum number of simultaneous sessions that can be supported. There are multiple session types that require licenses (i.e. Simple IP, Mobile IP, L2TP, etc.). Although, a single threshold is configured for all session types, alerts or alarms can be generated for each type.

Alerts or alarms are triggered for session license utilization based on the following rules:

- **Enter condition:** Actual session license utilization percentage per session type £ Low Threshold
- **Clear condition:** Actual session license utilization percentage per session type > High Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**
The following command configures a session license low threshold percentage of 10 and a high threshold of 35 for an system using the Alarm thresholding model:

```
threshold license remaining-sessions 10 clear 35
```
threshold mgmt-cpu-memory-usage

Configures the thresholds for CPU memory usage.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold mgmt-cpu-memory-usage high_thresh [ clear low_thresh ]
```

**high_thresh**

Default: 0
The high threshold percent of CPU memory usage that must be met or exceeded within the polling interval to generate an alert or alarm. 
*high_thresh* is measured in percentage of total memory used and can be configured to any integer value 0 through 100. A value of 0 disables the threshold.

**clear low_thresh**

The low threshold percent of CPU memory usage that maintains a previously generated alarm condition. If the percentage falls beneath the low threshold within the polling interval, a clear alarm will be generated. *low_thresh* is measured in percentage of total memory used and can be configured to any integer value 0 through 100. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

CPU memory usage thresholds generate alerts or alarms based on memory usage for the SMC CPU during the polling interval. A single threshold enables CPU monitoring for both the active and standby SMCs allowing for alerts or alarms to be generated for each CPU.
Alerts or alarms are triggered for SMC CPU memory usage based on the following rules:

- **Enter condition:** Actual CPU memory usage ≥ High Threshold
- **Clear condition:** Actual CPU memory usage < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Important:** This command is not supported on all platforms.

**Example**

This command is not supported on all platforms.
The following command configures a threshold of 65 percent of total SMC CPU memory usage and a clear threshold of 35 percent:

```
threshold mgmt-cpu-memory-usage 65 clear 35
```
threshold mgmt-cpu-utilization

Configures the thresholds for CPU utilization.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold mgmt-cpu-utilization high_thres [ clear low_thres ]
```

- **high_thres**
  - Default: 0
  - The high threshold CPU utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
  - high_thres can be configured to any integer value between 0 and 100.

- **clear low_thres**
  - The low threshold CPU utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls beneath the low threshold within the polling interval, a clear alarm will be generated.
  - low_thres can be configured to any integer value between 0 and 100.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

CPU utilization thresholds generate alerts or alarms based on the utilization percentage of each SMC CPU during the specified polling interval. Although, a single threshold is configured for both SMC CPUs, separate alerts or alarms can be generated for each CPU.

Alerts or alarms are triggered for SMC CPU utilization based on the following rules:

- **Enter condition:** Average measured CPU utilization for last 5 minutes ≥ High Threshold
- **Clear condition:** Average measured CPU utilization for last 5 minutes < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Important:** This command is not supported on all platforms.

**Example**
The following command configures a high threshold SMC CPU utilization percentage of 90 for an system using the Alert thresholding model:

```
threshold mgmt-cpu-utilization 90
```
threshold mme-attach-failure

Use this command to configure thresholds for the total number of MME Attach Failure messages to count across all the MME services in the system as threshold limit to generate alert or alarm.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold mme-attach-failure high_thresh [ clear low_thresh ]
```

**high_thresh**
Default: 0 (Disabled)
The high threshold number of total MME Attach Failure messages across all MME services on a system that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 100000. A value of 0 disables the threshold.

**clear low_thresh**
Default: 0 (Disabled)
The low threshold number of total MME Attach Failure messages across all services on a system that maintains a previously generated alarm condition. If the number of MME Attach Failure messages, across all the services in a system, falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Use this command to monitor and set alarms or alerts when the total number of MME Attach Failure message across all the MME services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of MME Attach Failure message based on the following rules:

- **Enter condition:** Actual total number of MME Attach Failure messages ≥ High Threshold
- **Clear condition:** Actual total number of MME Attach Failure messages < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll mme-attach-failure` command to configure the polling interval and the `threshold monitoring mme-service` command to enable thresholding for this value.
Example
The following command configures the limit of MME Attach Failure high threshold count of 10000 for a system using the Alert thresholding model:

```
threshold mme-attach-failure 10000
```
**threshold mme-auth-failure**

Use this command to configure thresholds for the total number of MME Auth Failure messages to count across all the MME services in the system as threshold limit to generate alert or alarm.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold total-mme-auth-failure high_thresh [ clear low_thresh ]
```

- **high_thresh**
  Default: 0 (Disabled)
  The high threshold number of total MME Auth Failure messages across all MME services on a system that must be met or exceeded within the polling interval to generate an alert or alarm.
  The number can be configured to any integer value from 0 through 100000. A value of 0 disables the threshold.

- **clear low_thresh**
  Default: 0 (Disabled)
  The low threshold number of total MME Auth Failure messages across all services on a system that maintains a previously generated alarm condition. If the number of MME Attach Failure messages, across all the services in a system, falls beneath the low threshold within the polling interval, a clear alarm will be generated.
  The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Use this command to monitor and set alarms or alerts when the total number of MME Auth Failure messages across all the MME services in the system is equal to or greater than the set limit.

Alerts or alarms are triggered for the total number of MME Auth Failure message based on the following rules:

- **Enter condition:** Actual total number of MME Auth Failure messages ≥ High Threshold
- **Clear condition:** Actual total number of MME Auth Failure messages < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll mme-auth-failure** command to configure the polling interval and the **threshold monitoring mme-service** command to enable thresholding for this value.
**Example**

The following command configures a total MME Auth Failure high threshold count of **10000** for an system using the Alert thresholding model:

```
threshold mme-auth-failure 10000
```
threshhold model

Configures the thresholding model for the system to use.

Product
All

Privilege
Security Administrator, Administrator

Syntax

threshold model { alarm | alert }

**alarm**
Selects the alarm thresholding model as described in the Usage section for this command.

**alert**
Selects the alert thresholding model as described in the Usage section for this command.

Usage

The system supports the following thresholding models:

- **Alert**: A value is monitored and an alert condition occurs when the value reaches or exceeds the configured high threshold within the specified polling interval. The alert is generated then generated and/or sent at the end of the polling interval.

In the example shown in the figure below, this model generates alerts during period 2, 3, and 5 at the point where the count exceeded HT.

- **Alarm**: Both high and low threshold are defined for a value. An alarm condition occurs when the value reaches or exceeds the configured high threshold within the specified polling interval. The alert is generated then generated and/or sent at the end of the polling interval.

The alarm is cleared at the end of the first interval where the measured value is below the low threshold.

In the example shown in the figure below, this model generates an alarm during period 2 when the count exceeds HT. A second alarm is generated in period 6 when the count falls beneath LT. The second alarm indicates a “clear” condition.
Figure 5. Thresholding Model Example

---

**Important:** Note that for certain values, the alert or alarm serves to warn of low quantities (i.e., memory, session licenses, etc.). In these cases, the low threshold is the condition that must be met or exceeded within the polling interval to generate the alert or alarm. Once the high threshold is exceeded during an interval, the low quantity condition is cleared.

Refer to the `threshold monitoring` command for additional information on thresholding.

**Example**
The following command configures the system to support the Alarm thresholding model:

```
threshold model alarm
```
**threshold monitoring**

Enables thresholding for the selected value.

**Product**
All

**Privilege**
Administrator

**Syntax**

```bash
[ no | default ] threshold monitoring { aaa-acct-archive-size | aaa-acct-failure
| aaa-auth-failure | aaa-retry-rate | aaamgr-request-queue | asngw | call-setup
| content-filtering | cpu-resource | cpu-session-throughput | csaf-service |
diameter | ecs | fa-service | firewall | ha-service | hsgw-service | ipsec |
license | lma-service | mme-service | packets-filtered-dropped | packets-forwarded-to-cpu | pdm-service | pgw-service |
route-service | sgw-service | subscriber | system }
```

**no**
Disables threshold monitoring for the specified value.

**default**
Sets / restores default value assigned for the specified parameter.

**aaa-acct-archive-size**
Enables threshold monitoring for the size of the AAA accounting record archive.

**aaa-acct-failure**
Enables threshold monitoring for AAA accounting failures and AAA accounting failure rate values. Refer to the `threshold aaa-acct-failure` and `threshold aaa-acct-failure-rate` commands for additional information on these values.

**aaa-auth-failure**
Enables threshold monitoring for AAA authentication failures and AAA authentication failure rate values. Refer to the `threshold aaa-auth-failure` and `threshold aaa-auth-failure-rate` commands for additional information on these values.

**aaa-retry-rate**
Enables threshold monitoring for the AAA retry rate value. Refer to the `threshold aaa-retry-rate` command for additional information on this value.

**aaamgr-request-queue**
Enables threshold monitoring for AAA Manager Requests for each AAA manager process. Refer to the `threshold aaamgr-request-queue` command for additional information on these values.
asngw
Enables the threshold monitoring for ASN-GW services.

call-setup
Enables threshold monitoring for the call setup, call setup failures, and no-resource rejected call values. Refer to the `threshold call-setup`, `threshold call-setup-failure`, `threshold ppp-setup-fail-rate`, `threshold rp-setup-fail-rate`, and `threshold call-reject-no-resource` commands for additional information on these values.

cpu-resource

cpu-session-throughput
Enables threshold monitoring for the CPU session throughput value. Refer to the `threshold cpu-session-throughput` command for additional information on this value.

content-filtering
Enables threshold monitoring for the Content Filtering service.

cscf-service
Enables threshold monitoring for the CSCF service.

diameter
Enables threshold monitoring for Diameter.

ces
Enables threshold monitoring for the Enhanced Charging Service (ECS).

fa-service
Enables threshold monitoring for Registration Reply errors for each FA service. Refer to the `threshold reg-reply-error` FA Service Configuration Mode command for additional information on this value.

firewall
Enables threshold monitoring for the Stateful Firewall service. Default: Disabled
Refer to the `threshold fw-deny-rule`, `threshold fw-dos-attack`, `threshold fw-drop-packet`, and `threshold fw-no-rule` commands for additional information on this value.
**Important:** Stateful Firewall thresholds can only be enabled if the Stateful Firewall license is present.

**ha-service**
Enables threshold monitoring for Registration Reply errors, re-registration reply errors, deregistration reply errors, and average calls setup per second for each HA service and average calls setup per second at the context level. Refer to the `threshold init-rrq-rcvd-rate`, `threshold reg-reply-error`, `threshold rereg-reply-error`, and `threshold dereg-reply-error` HA Service Configuration Mode commands and the `threshold ha-service init-rrq-rcvd-rate` Context Configuration mode command for additional information on this value.

**hsgw-service**
Enables threshold monitoring for HSGW services. Refer to the `threshold total-hsgw-sessions` for more information on HSGW thresholds.

**ipsec**
Enables monitoring of IPSec thresholds. Refer to the HA-Service Configuration Mode chapter of the Command Line Interface Reference for information on the IPSec thresholds.

**license**
Enables threshold monitoring for the session license value. Refer to the `threshold license` command for additional information on this value.

**lma-service**
Enables threshold monitoring for LMA services. Refer to the `threshold total-lma-sessions` for more information on LMA thresholds.

**mme-service**
Default: Disabled. Enables threshold monitoring for the MME services. Refer to the `threshold total-mme-sessions` commands for additional information on this value.

**packets-filtered-dropped**
Enables threshold monitoring for the filtered/dropped packet value. Refer to the `threshold packets-filtered-dropped` command for additional information on this value.

**packets-forwarded-to-cpu**
Enables threshold monitoring for the forwarded packet value. Refer to the `threshold packets-forwarded-to-cpu` command for additional information on this value.

**pdg-service**
Enables threshold monitoring for PDG service. Threshold monitoring for PDG service is disabled by default.
Enables threshold monitoring for PDIF service.

**pdsn-service**

Enables threshold monitoring for average calls setup per second for contexts and for PDSN services, A11 Request.

Refer to the `threshold packets-forwarded-to-cpu` command for additional information on this value.

**pgw-service**

Enables threshold monitoring for P-GW services.

Refer to the `threshold total-pgw-sessions` for more information on P-GW thresholds.

**route-service**

Enables threshold monitoring for BGP/VRF route services.

Refer to the `ip maximum-routes` command in Context configuration mode and `threshold route-service bgp-routes` in this mode for more information on route thresholds.

**sgw-service**

Enables threshold monitoring for S-GW services.

Refer to the `threshold total-sgw-sessions` for more information on S-GW thresholds.

**subscriber**

Enables threshold monitoring for the subscriber and session values.

Refer to the `threshold subscriber active`, `threshold subscriber total`, `threshold total-ggsn-sessions`, `threshold total-gprs-sessions`, `threshold total-gprs-pdp-sessions`, `threshold total-ha-sessions`, `threshold total-lns-sessions`, `threshold total-pdsn-sessions`, and `threshold per-service-ggsn-sessions`, `threshold per-service-ha-sessions`, `threshold per-service-lns-sessions`, and `threshold per-service-pdsn-sessions` commands for additional information on these values.

**system**

Enables system (chassis) thresholds monitoring.

---

**Usage**

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e., high CPU utilization, or packet collisions on a network) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps**: SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the starentMIB(8164).starentTraps(2) section of the SNMP MIB Reference.
The generation of specific traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs**: The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of WARNING.

- **Alarm System**: High threshold alarms generated within the specified polling interval are considered “outstanding” until the condition no longer exists and/or a condition clear alarm is generated. “Outstanding” alarms are reported through the system’s alarm subsystem and are viewable through the system’s CLI.

The following table indicates the reporting mechanisms supported by each of the above models.

**Table 24. Thresholding Reporting Mechanisms by Model**

<table>
<thead>
<tr>
<th>Model</th>
<th>SNMP Traps</th>
<th>Logs</th>
<th>Alarm System</th>
</tr>
</thead>
<tbody>

<tr>
<td>Alarm</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

In addition to the values that can be enabled by this command, the system supports the enabling of threshold monitoring for IP pool address availability (refer to the `ip pool` and threshold commands in this reference) and port utilization (refer to the threshold commands in this chapter).

**Example**

The following command enables thresholding for subscriber totals:

```bash
threshold monitoring subscriber
```
threshold nat-port-chunks-usage

This command configures the NAT port chunk utilization threshold settings.

**Important:** This command is only available in Release 8.3 and later releases.

**Product**
NAT

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
threshold nat-port-chunks-usage high_thresh [ clear low_thresh ]
default threshold nat-port-chunks-usage
```

- **default**
  Configures the default settings.

- **high_thresh**
  Default: 0
  Specifies the high nat-port-chunks-usage threshold that must be met or exceeded within the polling interval to generate an alert or alarm.
  `high_thresh` must be an integer from 0 through 100. A value of 0 disables the threshold.

- **clear low_thresh**
  Default: 0
  Specifies the low nat-port-chunks-usage threshold that must be met within the polling interval for a clear alarm to be generated.
  `low_thresh` must be an integer from 0 through 100. A value of 0 disables the threshold. If not set, the `high_thresh` will be high and low threshold setting.

**Usage**
Use this command to configure the NAT port chunk utilization threshold settings.

**Example**
The following command sets the NAT port chunk utilization threshold settings to a high of 75 and a low of 15:

```plaintext
threshold nat-port-chunks-usage 75 clear 15
```
threshold packets-filtered-dropped

Configures filtered/dropped packet thresholds for the system.

**Product**

PDSN, GGSN, HA, SGSN, ASN GW

**Privilege**

Security Administrator, Administrator

**Syntax**

```
threshold packets-filtered-dropped high_thres [ clear low_thres ]
```

1. **high_thres**
   - Default: 0
   - The high threshold number of filtered/dropped packets experienced by the system resulting from ACL rules that must be met or exceeded within the polling interval to generate an alert or alarm.
   - The number can be configured to any integer value between 0 and 1000000000. A value of 0 disables the threshold.

2. **clear low_thres**
   - Default: 0
   - The low threshold number of filtered/dropped packets experienced by the system resulting from ACL rules that maintains a previously generated alarm condition. If the number of packets falls beneath the low threshold within the polling interval, a clear alarm will be generated.
   - The number can be configured to any integer value between 0 and 1000000000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Filtered/dropped packet thresholds generate alerts or alarms based on the total number of packets that were filtered or dropped by the system as a result of access control list (ACL) rules during the specified polling interval.

Alerts or alarms are triggered for filtered/dropped packets based on the following rules:

- **Enter condition:** Actual number of filtered/dropped packets ≥ High Threshold
- **Clear condition:** Actual number of filtered/dropped packets < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value. In addition, refer to information on ACLs in this reference.

**Example**

Refer to the command reference for examples.
The following command configures a filtered/dropped packet high threshold count of 150000 for a system using the Alert thresholding model:

```
threshold packets-filtered-dropped 150000
```
threshold packets-forwarded-to-cpu

Configures forwarded packet thresholds for the system.

Product
PDSN, GGSN, HA, SGSN, ASN GW

Privilege
Security Administrator, Administrator

Syntax

\texttt{threshold packets-forwarded-to-cpu high\_thresh \{ clear low\_thresh\}}

\texttt{high\_thresh}
Default: 0
The high threshold number of forwarded packets experienced by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 1000000000. A value of 0 disables the threshold.

\texttt{clear low\_thresh}
Default: 0
The low threshold number of forwarded packets experienced by the system that maintains a previously generated alarm condition. If the number of packets falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 1000000000. A value of 0 disables the threshold.

\textbf{Important:} This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
Forwarded packet thresholds generate alerts or alarms based on the total number of packets that were forwarded to active system CPU(s) during the specified polling interval. Packets are forwarded to active system CPUs when the NPUs do not have adequate information to properly route them.

\textbf{Important:} Ping and/or traceroute packets are intentionally forwarded to system CPUs for processing. These packet types are included in the packet count for this threshold.

Alerts or alarms are triggered for forwarded packets based on the following rules:

\begin{itemize}
  \item \textbf{Enter condition:} Actual number of forwarded packets \geq \text{High Threshold}
  \item \textbf{Clear condition:} Actual number of forwarded packets < \text{Low Threshold}
\end{itemize}

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

Example
The following command configures a forwarded packet high threshold count of 10000 for an system using the Alert thresholding model:

```
threshold packets-forwarded-to-cpu 10000
```
threshold pdg-current-active-sessions

Configures the threshold for monitoring the total number of all current PDG sessions only.

Product
PDG/TTG

Privilege
Security Administrator, Administrator

Syntax

```
threshold pdg-current-active-sessions high_thresh [ clear low_thresh ]
```

- **high_thresh**
  Configures the total number of active PDG sessions to be monitored on a chassis. `high_thresh` is any integer from 0 to 300000.
  There is no default, but 0 means that there is no threshold monitoring.

- **clear low_thresh**
  Clears any percentage of the number of sessions being monitored using the `high_thresh` variable defined above.
  `low_thresh` is any integer from 0 to 300000.

Usage
Thresholds are provided for monitoring the overall PDG usage on a chassis. This command is used to monitor the total number of active PDG sessions for an entire chassis.

Example
The following command configures a monitoring threshold of 300000 active PDG sessions on a chassis:

```
threshold pdg-current-active-sessions 300000
```

which turns out to be too many, so the following command clears 100000:

```
threshold pdg-current-active-sessions 30000 clear 10000
```
threshold pdg-current-sessions

Configures the threshold for monitoring the total number of all current PDG sessions, including inactive sessions.

**Product**
PDG/TTG

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold pdg-current-sessions high_thresh [ clear low_thresh ]
```

- **high_thresh**
  Configures the total number of PDG sessions on a chassis, both active and inactive. `high_thresh` is any integer from 0 to 300000.
  There is no default, but 0 means that there is no threshold monitoring.

- **clear low_thresh**
  Clears any percentage of the number of sessions being monitored using the `high_thresh` variable defined above.
  `low_thresh` is any integer from 0 to 300000.

**Usage**

Thresholds are provided for monitoring the overall PDG usage on a chassis. This command is used to monitor the total number of PDG sessions, both active and inactive, for an entire chassis.

**Example**
The following command configures a monitoring threshold of 300000 active and inactive PDG sessions on a chassis:

```
threshold pdg-current-sessions 300000
```

which turns out to be too many, so the following command clears 100000:

```
threshold pdg-current-sessions 300000 clear 100000
```
threshold pdif-current-sessions

Configures the threshold for monitoring the total number of all current pdif sessions, including inactive sessions.

Product
PDIF

Privilege
Security Administrator, Administrator

Syntax

```bash
threshold pdif-current-sessions high_thresh [ clear low_thresh ]
```

- **high_thresh**
  Configures the total number of PDIF sessions on a chassis, both active and inactive. *high_thresh* is any integer from 0 to 300000.
  There is no default, but 0 means that there is no threshold monitoring.

- **clear low_thresh**
  Clears any percentage of the number of sessions being monitored using the *high_thresh* variable defined above. *low_thresh* is any integer from 0 to 300000.

Usage
Thresholds are provided for monitoring the overall PDIF usage on a chassis. This command is used to monitor the total number of PDIF sessions, both active and inactive, for an entire chassis.

Example
The following command configures a monitoring threshold of 300000 active and inactive PDIF sessions on a chassis:

```bash
threshold pdif-current-sessions 300000
```

which turns out to be too many, so the following command clears 100000:

```bash
threshold pdif-current-sessions 300000 clear 100000
```
threshold pdif-current-active-sessions

Configures the threshold for monitoring the total number of current pdif sessions only.

**Product**
PDIF

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold pdif-current-active sessions high_thres [ clear low_thres ]
```

* high_thres

Configures the total number of active PDIF sessions to be monitored on a chassis. `high_thres` is any integer from 0 to 300000. There is no default, but 0 means that there is no threshold monitoring.

* clear low_thres

Clears any percentage of the number of sessions being monitored using the `high_thres` variable defined above. `low_thres` is any integer from 0 to 300000.

**Usage**
Thresholds are provided for monitoring the overall PDIF usage on a chassis. This command is used to monitor the total number of active PDIF sessions for an entire chassis.

**Example**
The following command configures a monitoring threshold of 300000 active PDIF sessions on a chassis:

```
threshold pdif-current-active-sessions 300000
```

which turns out to be too many, so the following command clears 100000:

```
threshold pdif-current-active-sessions 300000 clear 100000
```
threshold per-service-ggsn-sessions

Configures thresholds for the number of PDP contexts per GGSN service in the system.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

```
threshold per-service-ggsn-sessions high_thresh [clear low_thresh]
```

**high_thresh**
Default: 0
The high threshold number of PDP contexts for any one GGSN service that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 4000000. A value of 0 disables the threshold.

**clear low_thresh**
Default: 0
The low threshold number of PDP contexts for any one GGSN service that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 4000000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
Monitor and set alarms or alerts when the number of PDP contexts for any GGSN service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:
- **Enter condition:** Actual number of PDP contexts for any GGSN service ≥ High Threshold
- **Clear condition:** Actual number of PDP contexts < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

Example
The following command configures a high threshold count of 10000 subscriber attaches per GGSN service for the Alert thresholding model:
threshold per-service-ggsn-sessions 10000
threshold per-service-gprs-pdp-sessions

Configures thresholds for the number of 2G-activated PDP contexts per GPRS service.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

threshold per-service-gprs-pdp-sessions high_thresh [ clear low_thresh ]

<table>
<thead>
<tr>
<th>high_thresh</th>
</tr>

A value of 0 disables the threshold.</td>
</tr>
</tbody>
</table>

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
Monitor and set alarms or alerts when the number of 2G-activated PDP contexts for any GPRS service in the system is equal to or greater than the set limit.

Alerts or alarms are triggered for PDP contexts based on the following rules:
- **Enter condition:** Actual number of PDP contexts for any GPRS service ≥ High Threshold
- **Clear condition:** Actual number of PDP contexts < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll monitoring` command to configure the polling interval and the `threshold poll monitoring` command to enable thresholding for this value.

Example
The following command configures a high threshold count of 10000 2G-activated PDP contexts per GPRS service for the Alert thresholding model:
threshold per-service-gprs-sessions 10000
threshold per-service-gprs-sessions

Configures the thresholds for the number of 2G-attached subscribers per GPRS service.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold per-service-gprs-sessions high_thresh [ clear low_thresh ]
```

**high_thresh**
Default: 0
The high threshold number of 2G-attached subscribers for any one GPRS service. This threshold number must be met or exceeded within the polling interval to generate an alert or alarm. The number can be configured to any integer value from 0 through 2000000. A value of 0 disables the threshold.

**clear low_thresh**
Default: 0
The low threshold number of 2G-attached subscribers for any one GPRS service. The number of subscribers must remain above this threshold in order to maintain a previously generated alarm condition. If the number of 2G subscribers falls beneath the low threshold within the polling interval, then a clear alarm will be generated. The number can be configured to any integer value between 0 and 2000000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**
Monitor and set alarms or alerts when the number of 2G-attached subscribers for any GPRS service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:

- **Enter condition:** Actual number of 2G-attached subscribers for any GPRS service ≥ High Threshold
- **Clear condition:** Actual number of 2G-attached subscribers < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**
The following command configures a high threshold count of 10000 2G-attaches per GPRS service for the Alert thresholding model:

```
threshold per-service-gprs-sessions 10000
```
threshold per-service-ha-sessions

Configures thresholds for the number of HA sessions per HA service in the system.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

```
threshold per-service-ha-sessions high_thresh [ clear low_thresh ]
```

**high_thresh**

Default: 0
The high threshold number of HA sessions for any one HA service that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 500000. A value of 0 disables the threshold.

**clear low_thresh**

Default: 0
The low threshold number of HA sessions for any one HA service that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 500000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of HA sessions for any HA service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for HA sessions based on the following rules:

- **Enter condition:** Actual number of HA sessions for any HA service \( \geq \) High Threshold
- **Clear condition:** Actual number of HA sessions \(<\) Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

Example

The following command configures a HA session per service high threshold count of 10000 for an system using the Alert thresholding model:
threshold per-service-ha-sessions 10000
threshold per-service-Ins-sessions

Configures thresholds for the number of LNS sessions per LNS service in the system.

Product
PDSN, GGSN, HA, ASN GW

Privilege
Security Administrator, Administrator

Syntax

```
threshold per-service-Ins-sessions high_thresh [ clear low_thresh]
```

**high_thresh**
Default: 0
The high threshold number of LNS sessions for any one LNS service that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 500000. A value of 0 disables the threshold.

**clear low_thresh**
Default: 0
The low threshold number of LNS sessions for any one LNS service that maintains a previously generated alarm condition. If the number of LNS sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 500000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
Monitor and set alarms or alerts when the number of LNS sessions for any LNS service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for LNS sessions based on the following rules:
- **Enter condition:** Actual number of LNS sessions for any LNS service \( \geq \) High Threshold
- **Clear condition:** Actual number of LNS sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example
The following command configures a LNS session per service high threshold count of 10000 for an system using the Alert thresholding model:
threshold per-service-1ns-sessions 10000
threshold per-service-pdsn-sessions

Configures thresholds for the number of PDSN sessions per PDSN service in the system.

Product
PDSN

Privilege
Security Administrator, Administrator

Syntax

```
threshold per-service-pdsn-sessions high_thresh [ clear low_thresh ]
```

**high_thresh**
Default: 0
The high threshold number of PDSN sessions for any one PDSN service that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 500000. A value of 0 disables the threshold.

**clear low_thresh**
Default: 0
The low threshold number of PDSN sessions for any one PDSN service that maintains a previously generated alarm condition. If the number of PDSN sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 500000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
Monitor and set alarms or alerts when the number of PDSN sessions for any PDSN service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDSN sessions based on the following rules:

- **Enter condition:** Actual number of PDSN sessions for any PDSN service ≥ High Threshold
- **Clear condition:** Actual number of PDSN sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**
The following command configures a HA session per service high threshold count of 10000 for an system using the Alert thresholding model:
threshold per-service-pdsn-sessions 10000
Global Configuration Mode Commands

threshold per-service-sgsn-pdp-sessions

Configures the thresholds for the number of 3G-activated PDP contexts per SGSN service on the system.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

threshold per-service-sgsn-pdp-sessions high_thresh [ clear low_thresh ]

**high_thresh**
Default: 0
The high threshold number of 3G-activated PDP contexts for any one SGSN service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 4000000. A value of 0 disables the threshold.

**clear low_thresh**
Default: 0
The low threshold number of 3G-activated PDP contexts for any one SGSN service. This number or higher maintains a previously generated alarm condition. If the number of 3G-activated PDP contexts falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 2400000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
Monitor and set alarms or alerts when the number of 3G-activated PDP contexts for any SGSN service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:
- **Enter condition:** Actual number of 3G-activated PDP contexts for any SGSN service ≥ High Threshold
- **Clear condition:** Actual number of 3G-activated PDP contexts < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example
The following command configures a high threshold count of 10000 3G-activated PDP contexts per SGSN service for the system’s Alert thresholding model:
threshold per-service-sgsn-sessions 10000
threshold per-service-sgsn-sessions

Configures the thresholds for the number of 3G-attached subscribers per SGSN service in the system.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
threshold per-service-sgsn-sessions high_thresh [ clear low_thresh ]
```

**high_thresh**

Default: 0
The high threshold number of 3G-attached subscribers for any one SGSN service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 2000000. A value of 0 disables the threshold.

**clear low_thresh**

Default: 0
The low threshold number of 3G-attached subscribers for any one SGSN service. This number must be met or exceeded to maintain a previously generated alarm condition. If the number of subscribers falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 2000000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**
Monitor and set alarms or alerts when the number of 3G-attached subscribers for any one SGSN service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:

- **Enter condition:** Actual number of 3G-attached subscribers for any single SGSN service ≥ High Threshold
- **Clear condition:** Actual number of 3G-attached subscribers for any single SGSN service < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**
The following command configures a high threshold count of 10000 3G-attached subscribers per SGSN service for a system using the Alert thresholding model:

```
threshold per-service-sgsn-sessions 10000
```
**threshold poll**

This command configures the polling interval over which to count or measure the thresholding value.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
```

**default**

Restores the specified parameter to its default value.
**10sec-cpu-utilization percent**
Default: 300 seconds (5 minutes)
Configures the polling interval for measuring a 10 second average of CPU utilization.

---

**Important:** When specifying `interval time` for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

---

**all-rrp-failure**
Default: 0
Configures the polling interval over which to count A11 Registration Response failures. When specifying `interval time` for this threshold, the range is from 60 through 900 seconds.

---

**all-rrq-msg-discard**
Default: 0
Configures the polling interval over which to count how many A11 Registration Request messages are discarded. When specifying `interval time` for this threshold, the range is from 60 through 900 seconds.

---

**all-rac-msg-discard**
Default: 0
Configures the polling interval over which to count how many A11 Registration Acknowledgement messages are discarded. When specifying `interval time` for this threshold, the range is from 60 through 900 seconds.

---

**aaa-acct-archive-size**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to count archived AAA accounting messages.

---

**aaa-acct-failure**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to count failed AAA accounting requests.

---

**aaa-acct-failure-rate**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of AAA accounting failures.

---

**aaa-auth-failure**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to count failed authentication requests.

---

**aaa-auth-failure-rate**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of AAA authentication failures.

---

**aaa-retry-rate**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percent of AAA request message retries.

### aaamgr-request-queue
Default: 0
Configures the polling interval over which to count the number AA Manager Requests for each AAA manager process. When specifying `interval time` for this threshold, the range is from 60 through 900 seconds.

### active-subscriber
Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of active subscriber sessions.

### all-ppp-send-discard
Default: 0
Configures the polling interval over which to count the number of discarded PPP send packets. When specifying `interval time` for this threshold, the range is from 60 through 900 seconds.

### available-ip-pool-group
Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure IP pool utilization.

**Important:** When specifying `interval time` for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

### call-reject-no-resource
Default: 900 seconds (15 minutes)
Configures the polling interval over which to count the number of calls rejected due to insufficient resources.

### call-setup
Default: 900 seconds (15 minutes)
Configures the polling interval over which to count the number of calls setup.

### call-setup-failure
Default: 900 seconds (15 minutes)
Configures the polling interval over which to count the number of calls setup failures.

### call-setup-failures
Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count CSCF call setup failures. `time` must be an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

### call-total-active
Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count CSCF total active calls.
$time$ must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

**cpu-available-memory**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure PSC/PSC2 CPU memory availability.

**Important:** When specifying $interval$ $time$ for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

**Important:** This command is not supported on all platforms

**cpu-load**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure PSC/PSC2 CPU load using a 5 minute average measurement.

**Important:** When specifying $interval$ $time$ for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

**Important:** This command is not supported on all platforms

**cpu-memory-usage**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of total PSC/PSC2 CPU memory used.

**Important:** When specifying $interval$ $time$ for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

**Important:** This command is not supported on all platforms

**cpu-orbs-crit**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of CPU utilization by the ORBS software task for critical-level alerts.

**cpu-orbs-warn**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of CPU utilization by the ORBS software task for warning-level alerts.
**threshold poll**

*Global Configuration Mode Commands*

**cpu-session-throughput**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure PSC/PSC2 CPU session throughput.

**Important:** This command is not supported on all platforms

**cpu-utilization**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure PSC/PSC2 CPU utilization.

**Important:** When specifying interval time for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

**Important:** This command is not supported on all platforms

**cscf-invite-rcvd**
Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count the CSCF calls. time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

**cscf-reg-rcvd**
Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count the CSCF registrations. time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

**cscf-service-route-failures**
Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count the CSCF service route failures. time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

**dcca-bad-answers**
Configures the polling interval in seconds over which to count Diameter bad answers.

**dcca-protocol-error**
Configures the polling interval in seconds over which to count Diameter protocol errors.

**dcca-rating-failed**
Configures the polling interval in seconds over which to count Diameter rating failures.
**dcca-unknown-rating-group**
Configures the polling interval in seconds over which to count Diameter unknown rating group errors.

**dereg-reply-error**
Default: 0
Configures the polling interval over which to measure the number of de-registration reply errors for HA services. When specifying `interval time` for this threshold, the range is from 60 through 900 seconds.

**edr-file-space**
Configures the polling interval in seconds over which to count EDR file space.

**edr-udr-dropped-flow-control**
Configures the polling interval in seconds over which to count EDR-UDRs Dropped due to Flow Control at ACSMGR.

**error-no-resource**
Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count CSCF No Resource Errors.

*time* must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

**error-presence**
Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count CSCF Presence Errors.

*time* must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

**error-reg-auth**
Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count CSCF Reg-Auth Errors.

*time* must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

**error-tcp**
Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count CSCF TCP Errors.

*time* must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

**fa-reg-reply-error**
Default: 0
Configures the polling interval over which to measure the number of registration reply errors for FA services. When specifying `interval time` for this threshold, the range is from 60 through 900 seconds.

**fng-current-active-sessions**
Configures the polling interval in seconds over which to count FNG current active sessions.
### Global Configuration Mode Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>

Global Configuration Mode Commands

**Important:** When specifying `interval time` for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

### ip-pool-release
Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of IP pool address that are in the release state.

### ip-pool-used
Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of the IP pool addresses that are used.

### ipsec-ipsec-call-req-rej
Default: 900
Configures the polling interval over which to count the IPSec call requests that are rejected.

### ipsec-ike-failrate
Default: 900
Configures the polling interval over which to count the IPSec IKE failure rate.

### ipsec-ike-failures
Default: 900
Configures the polling interval over which to count the IPSec IKE failures.

### ipsec-ike-requests
Default: 900
Configures the polling interval over which to count the IPSec IKE request.

### ipsec-tunnels-established
Default: 900
Configures the polling interval over which to count the IPSec tunnels established.

### ipsec-tunnels-setup
Default: 900
Configures the polling interval over which to count the IPSec tunnels setup.
**license-remaining-session**
Default: 900 seconds (15 minutes)
Configures the polling interval over which to measure session license utilization.

**mgmt-cpu-memory-usage interval**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure SMC CPU memory usage.

**Important:** When specifying `interval time` for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

**Important:** This command is not supported on all platforms.

**mgmt-cpu-utilization**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure SMC CPU usage.

**Important:** When specifying `interval time` for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

**Important:** This command is not supported on all platforms.

**nat-port-chunks-usage**

**Important:** This keyword is only available in Release 8.3 and later.

Default: 900 seconds (15 minutes)
Configures the polling interval over which to measure NAT port chunks usage.

**packets-filtered-dropped**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the filtered/dropped packets.

**packets-forwarded-to-cpu**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the forwarded packets.

**pdg-current-active-sessions**
Configures how frequently the system polls the pdg-current-active-sessions threshold.
**Threshold Poll**

### pdg-current-sessions

Configures how frequently the system polls the pdg-current-sessions threshold.

#### threshold poll pdif-current-sessions interval period

Configures the polling interval for all current PDIF sessions in seconds rounded to the nearest multiple of 30 seconds. `period` is any integer from 30 to 60000.

#### threshold poll pdif-current-active-sessions interval period

Configures the polling interval for active sessions only in seconds rounded to the nearest multiple of 30 seconds. `period` is any integer from 30 to 60000.

### psdn-init-rrq-rcvd-rate

Default: 0

Configures the polling interval over which to measure the average number of calls setup per second for a PDSN-service. When specifying `interval time` for this threshold, the range is from 60 through 900 seconds.

### psdn-svc-init-rrq-rcvd-rate

Configures the polling interval in seconds over which to count PDSN per-service call received rate.

### per-service-asngw-sessions

Configures the polling interval in seconds over which to count per service ASNGW sessions.

### per-service-ggsn-sessions

Default: 300 seconds (5 minutes)

Configures the polling interval over which to count the number of PDP contexts per GGSN service.

**Important:** When specifying `interval time` for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

### per-service-gprs-sessions

Default: 300 seconds (5 minutes)

Configures the polling interval during which the SGSN counts the number of 2G-attached subscriber per GPRS service.

**Important:** When specifying `interval time` for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

### per-service-gprs-pdp-sessions

Default: 300 seconds (5 minutes)

Configures the polling interval during which the SGSN counts the number of 2G-activated PDP contexts per GPRS service.

</table>
rp-setup-fail-rate
Default: 900 seconds (15 minutes)
Configure the polling interval over which to measure the RP setup failure rate.

spc-cpu-memory-usage interval

Important: This command has been renamed to threshold mgmt-cpu-memory-usage. Please refer to that command for details. Note that for backwards compatibility, the system accepts this command as valid.

Important: This command is not supported on all platforms

spc-cpu-utilization

Important: This command has been renamed to threshold mgmt-cpu-utilization. Please refer to that command for details. Note that for backwards compatibility, the system accepts this command as valid.

Important: This command is not supported on all platforms

storage-utilization
Default: 900 seconds (15 minutes)
Configures the polling interval over which to record the CompactFlash utilization percentage threshold interval in seconds.

total-asngw-sessions
Configures the polling interval over which to measure total ASNGW sessions on the system.

total-ggsn-sessions
Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of GGSN sessions on the system.

Important: When specifying interval time for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-gprs-sessions
Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of 2G-attached subscribers on the system.

Important: When specifying interval time for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)
**total-gprs-pdp-sessions**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of 2G-activated PDP contexts per GPRS sessions on the system.

**Important:** When specifying interval time for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

**total-ha-sessions**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of HA sessions on the system.

**Important:** When specifying interval time for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

**total-hsgw-sessions**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of HSGW sessions on the system.

**Important:** When specifying interval time for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

**total-lma-sessions**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of LMA sessions on the system.

**Important:** When specifying interval time for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

**total-lns-sessions**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of LNS sessions on the system.

**Important:** When specifying interval time for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

**total-pdsn-sessions**
Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of PDSN sessions on the system.
<table>

**Important:** When specifying *interval time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

*interval* time

Specifies the amount of time that comprises the polling interval. *time* is measured in seconds and can be configured to any integer value from 60 to 60000 unless otherwise noted in keyword descriptions.
Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

**Important:** All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the `threshold model` and `threshold monitoring` commands for additional information on the system's support for thresholding.

Example

The following command configures the polling interval for the total subscribers threshold value to 600 seconds (10 minutes):

```
threshold poll total-subscriber interval 600
```
threshold poll asngw-auth-failure

Configures the polling interval over which to count or measure the thresholding value for ASN Gateway authentication failure.

**Product**
ASN-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold poll asngw-auth-failure interval dur
```

```
default threshold poll asngw-auth-failure interval
```

```
default
Restores the specified parameter to its default value 300 seconds.
```

```
interval dur
Default: 300 seconds.
Specifies the amount of time that comprises the polling interval.
dur is measured in seconds and can be configured to any integer value from 30 to 60000 in multiple of 30.
```

**Usage**
This command dictates the time period over which to monitor the specified value for threshold crossing.

**Important:** All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the `threshold monitoring` and other threshold commands for additional information on the system’s support for thresholds in this chapter.

**Example**
The following command configures the polling interval to 600 seconds for the ASN Gateway authentication failure threshold:

```
threshold poll asngw-auth-failure interval 600
```
threshold poll asngw-handoff-denial

Configures the polling interval over which to count or measure the thresholding value for ASN Gateway hand-off denial.

**Product**
ASN-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold poll asngw-handoff-denial interval \( \text{dur} \)
default threshold poll asngw-handoff-denial interval
```

**Default**
Restores the specified parameter to its default value 300 seconds.

**interval \( \text{dur} \)**
Default: 300 seconds.
Specifies the polling interval time.
\( \text{dur} \) is measured in seconds and can be configured to any integer value from 30 to 60000 in multiple of 30.

**Usage**
This command dictates the time period over which to monitor the specified value for threshold crossing.

**Important:** All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system’s support for thresholds in this chapter.

**Example**
The following command configures the polling interval to 600 seconds for hand-off denial threshold:

```
threshold poll asngw-handoff-denial interval 600
```
threshold poll asngw-max-eap-retry

Configures the polling interval over which to count or measure the thresholding value for maximum EAP authentication retries.

**Product**

ASN-GW

**Privilege**

Security Administrator, Administrator

**Syntax**

```
threshold poll asngw-max-eap-retry interval dur
```

```
default threshold poll asngw-max-eap-retry interval
```

<table>

**Important:** All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the `threshold monitoring` and other threshold commands for additional information on the system’s support for thresholds in this chapter.

**Example**

The following command configures the polling interval to 600 seconds for maximum EAP authentication retry threshold:

```
threshold poll asngw-max-eap-retry interval 600
```
threshold poll asngw-network-entry-denial

Configures the polling interval over which to count or measure the thresholding value for network entry denial to an MS.

Product
ASN-GW

Privilege
Security Administrator, Administrator

Syntax

threshold poll asngw-network-entry-denial interval \textit{dur}

default threshold poll asngw-network-entry-denial interval

default
Restores the specified parameter to its default value 300 seconds.

\textbf{interval} \textit{dur}
Default: 300 seconds.
Specifies the amount of time that comprises the polling interval.
\textit{dur} is measured in seconds and can be configured to any integer value from 30 to 60000 in multiple of 30.

Usage
This command dictates the time period over which to monitor the specified value for threshold crossing.

\textbf{Important:} All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the \textbf{threshold monitoring} and other threshold commands for additional information on the system’s support for thresholds in this chapter.

Example
The following command configures the polling interval to 600 seconds for network entry denial threshold:

\texttt{threshold poll asngw-network-entry-denial interval 600}
threshold poll asngw-r6-invalid-nai

Configures the polling interval over which to count or measure the thresholding value for invalid NAIs in R6 messages.

Product
ASN-GW

Privilege
Security Administrator, Administrator

Syntax

threshold poll asngw-r6-invalid-nai interval \textit{dur}

default threshold poll asngw-r6-invalid-nai interval

default
Restores the specified parameter to its default value 300 seconds.

interval \textit{dur}
Default: 300 seconds.
Specifies the amount of time that comprises the polling interval.
\textit{dur} is measured in seconds and can be configured to any integer value from 30 to 60000 in multiple of 30.

Usage
This command dictates the time period over which to monitor the specified value for threshold crossing.

\textbf{Important:} All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the \textit{threshold monitoring} and other threshold commands for additional information on the system’s support for thresholds in this chapter.

Example
The following command configures the polling interval to \textit{600} seconds for invalid NAIs in R6 messages threshold:

\texttt{threshold poll asngw-r6-invalid-nai interval 600}
threshold poll asngw-session-setup-timeout

Configures the polling interval over which to count or measure the thresholding value for session setup timeout.

**Product**
ASN-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
threshold poll asngw-session-setup-timeout interval \( \text{dur} \)
```

default threshold poll asngw-session-setup-timeout interval

- **default**
  Restores the specified parameter to its default value 300 seconds.

- **interval \( \text{dur} \)**
  Default: 300 seconds.
  Specifies the amount of time that comprises the polling interval.
  \( \text{dur} \) is measured in seconds and can be configured to any integer value from 30 to 60000 in multiple of 30.

**Usage**
This command dictates the time period over which to monitor the specified value for threshold crossing.

**Important:** All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the `threshold monitoring` and other threshold commands for additional information on the system’s support for thresholds in this chapter.

**Example**
The following command configures the polling interval to 600 seconds for session setup timeout threshold:

```plaintext
threshold poll asngw-session-setup-timeout interval 600
```
threshold poll asngw-session-timeout

Configures the polling interval over which to count or measure the thresholding value for session timeout.

**Product**
ASN-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold poll asngw-session-timeout interval dur
```

```
default threshold poll asngw-session-timeout interval
```

**default**
Restores the specified parameter to its default value 300 seconds.

**interval**  `dur`
Default: 300 seconds.
Specifies the amount of time that comprises the polling interval.
`dur` is measured in seconds and can be configured to any integer value from 30 to 60000 in multiple of 30.

**Usage**
This command dictates the time period over which to monitor the specified value for threshold crossing.

**Important:** All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the `threshold monitoring` and other threshold commands for additional information on the system’s support for thresholds in this chapter.

**Example**
The following command configures the polling interval to 600 seconds for session timeout threshold:

```
threshold poll asngw-session-timeout interval 600
```
threshold poll cdr-file-space

This command configures the polling interval for CDR File Space Usage threshold.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

threshold poll cdr-file-space interval duration

default threshold poll cdr-file-space interval

default
- Configures the default setting.
- Default: 300 seconds.

interval duration
- Specifies the polling interval for CDR File Space Usage threshold, in seconds.
- duration must be an integer value from 60 through 60000.

Usage
This command configures the polling interval for CDR File Space Usage threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the threshold monitoring and other threshold commands for additional information on the system’s support for thresholds in this chapter.

Example
The following command configures the polling interval to 600 seconds for the CDR file space usage threshold:

    threshold poll cdr-file-space interval 600
threshold poll contfilt-block

This command configures the polling interval Content Filtering Block threshold.

**Product**
CF

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold poll contfilt-block interval duration

default threshold poll contfilt-block
```

**Usage**
This command configures the polling interval Content Filtering Block threshold.

**Important:** All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system’s support for thresholds in this chapter.

**Example**
The following command configures the polling interval to **600 seconds** for the content filtering blocking threshold:

```
threshold poll contfilt-block interval 600
```
threshold poll contfilt-rating

This command configures the polling interval for the Content Filtering Rating threshold.

**Product**
CF

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold poll contfilt-rating interval duration
default threshold poll contfilt-rating
```

default
Configures the default setting.
Default: 300 seconds.

```
interval dur
```
Specifies the polling interval for the Content Filtering Rating threshold, in seconds.
`duration` must be an integer value from 60 through 60000.

**Usage**
This command configures the polling interval for the Content Filtering Rating threshold.

**Important:** All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the `threshold monitoring` and other threshold commands for additional information on the system’s support for thresholds in this chapter.

**Example**
The following command configures the polling interval to 600 seconds for the content filtering rating processing threshold:

```
threshold poll contfilt-rating interval 600
```
threshold poll dcca-protocol-error

This command configures the polling interval for DCCA Protocol Error threshold.

**Product**
- ECS

**Privilege**
- Security Administrator, Administrator

**Syntax**

```
threshold poll dcca-protocol-error interval duration

default threshold poll dcca-protocol-error interval
```

**default**
- Configures the default setting.
- Default: 900 seconds

**interval duration**
- Specifies the polling interval for DCCA Protocol Error threshold, in seconds.
- `duration` must be an integer value from 60 through 60000.

**Usage**
- Use this the polling interval for DCCA Protocol Error threshold.

**Important:** All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the `threshold monitoring` and other threshold commands for additional information on the system’s support for thresholding in this chapter.

**Example**
- The following command configures the polling interval to 600 seconds for the DCCA protocol error threshold:

```
threshold poll dcca-protocol-error interval 600
```
threshold poll dcca-rating-failed

This command configures the polling interval for DCCA Rating Failed threshold.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

```
threshold poll dcca-rating-failed interval duration
```

default threshold poll dcca-rating-failed interval

<table>
<thead>
<tr>
<th>default</th>
</tr>

<th>interval duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the polling interval for DCCA Rating Failed threshold.</td>
</tr>
<tr>
<td>duration must be an integer value from 60 through 60000.</td>
</tr>
</tbody>
</table>

Usage
This command configures the polling interval for DCCA Rating Failed threshold.

**Important:** All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the `threshold monitoring` and other threshold commands for additional information on the system’s support for thresholding in this chapter.

Example
The following command configures the polling interval to 600 seconds for the Diameter Credit Control Application (DCCA) Rating Group (content-id) request reject thresholds:

```
threshold poll dcca-rating-failed interval 600
```
threshold poll dcca-bad-answers

This command configures the polling interval for DCCA Bad Answers threshold—invalid or bad response to the system from the Diameter server.

**Product**
ECS

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold poll dcca-bad-answers interval duration
```

default threshold poll dcca-bad-answers interval

default
Configures the default setting.
Default: 900 seconds

```
interval duration
```

Specifies the polling interval for DCCA Bad Answers threshold, in seconds.
`duration` must be an integer value from 60 through 60000.

**Usage**
This command configures the polling interval for DCCA Bad Answers threshold.

**Important:** All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the `threshold monitoring` and other threshold commands for additional information on the system’s support for thresholding in this chapter.

**Example**
The following command configures the polling interval to 600 seconds for invalid or bad response threshold to the system from Diameter server:

```
threshold poll dcca-rating-failed interval 600
```
threshold poll dcca-unknown-rating-group

This command configures the polling interval for DCCA Unknown Rating Group threshold.

**Product**
ECS

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold poll dcca-unknown-rating-group interval duration
default threshold poll dcca-unknown-rating-group interval
```

**Usage**
This command configures the polling interval for DCCA Unknown Rating Group threshold.

**Important:** All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the `threshold monitoring` and other threshold commands for additional information on the system’s support for thresholding in this chapter.

**Example**
The following command configures the polling interval to 600 seconds to threshold for the unknown DCCA Rating Group (content-id) returned by Diameter to system:

```
threshold poll dcca-unknown-rating-group interval 600
```
threshold poll diameter-retry-rate

This command configures the polling interval for Diameter Retry Rate threshold.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

- `threshold poll diameter-retry-rate interval duration`
- `default threshold poll diameter-retry-rate interval`

**default**

Configures the default setting.
Default: 300 seconds

**interval duration**

Specifies the polling interval for Diameter Retry Rate threshold, in seconds.
`duration` must be an integer from 60 through 60000. The input will be rounded up to the closest multiple of 30.

Usage

This command specifies the polling interval for Diameter Retry Rate threshold.

**Important:** All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the `threshold monitoring` and other threshold commands in this chapter for additional information on the system’s support for thresholding.

Example

The following command configures the Diameter Retry Rate threshold polling interval to 600 seconds:

```
threshold poll diameter-retry-rate interval 600
```
threshold poll edr-file-space

This command configures the polling interval for EDR File Space Usage threshold.

Product
ECS

Privilege
Security Administrator, Administrator

Syntax

threshold poll edr-file-space interval duration

interval duration
Default: 300 seconds.
Specifies the polling interval for EDR File Space Usage threshold, in seconds.
duration must be an integer value from 60 through 60000.

Usage
This command configures the polling interval for EDR File Space Usage threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling
interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the threshold monitoring ecs and other threshold commands for additional information on
the system’s support for thresholds in this chapter.

Example
The following command configures the polling interval to 600 seconds for the EDR file space usage threshold:

threshold poll edr-file-space interval 600
threshold poll mme-attach-failure

This command configures the polling interval to count the MME Attach Failure messages across all MME services in the system.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold poll mme-attach-failure interval <dur>
default threshold poll mme-attach-failure interval
```

**default**
Restores the poll interval value to its default value of 900 seconds.

**interval <dur>**
Default: 900 seconds.
Specifies the amount of time that comprises the polling interval for threshold to count the MME Attach Failure messages across all MME services in the system.
<dur> is measured in seconds and can be configured to any integer value from 30 to 60000 in multiple of 30.

**Usage**
Use this command to configure the polling interval to count the MME Attach Failure messages across all MME services in the system to generate threshold value.

**Important:** All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the `threshold monitoring mme-service` and other threshold commands for additional information on the system’s support for thresholds in this chapter.

**Example**
The following command configures the polling interval of 600 seconds to count the MME Attach Failure messages for threshold limit:

```
threshold poll mme-attach-failure interval 600
```
threshold poll mme-auth-failure

This command configures the polling interval to count the MME Authentication Failure messages across all MME services in the system.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold poll mme-auth-failure interval <dur>
default threshold poll mme-auth-failure interval
```

**default**
Restores the specified poll interval value to its default value of 900 seconds.

**interval <dur>**
Default: 900 seconds.
Specifies the amount of time that comprises the polling interval for threshold to count the MME Authentication Failure messages across all MME services in the system.
<dur> is measured in seconds and can be configured to any integer value from 30 to 60000 in multiple of 30.

**Usage**
Use this command to configure the polling interval to count the MME Auth Failure messages across all MME services in the system to generate threshold value.

**Important:** All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the `threshold monitoring mme-service` and other threshold commands for additional information on the system’s support for thresholds in this chapter.

**Example**
The following command configures the polling interval of 600 seconds to count the MME Auth Failure messages for threshold limit:

```
threshold poll mme-auth-failure interval 600
```
threshold poll total-mme-sessions

This command configures the polling interval over which to count or measure the thresholding value for MME sessions on the system.

Product
MME

Privilege
Security Administrator, Administrator

Syntax

```plaintext
[ default ] threshold poll total-mme-sessions interval time
```

- **default**
  Restores the threshold poll interval value to its default value of 300 seconds.

- **interval time**
  Default: 900 seconds
  Specifies the amount of time that comprises the polling interval over which to count the total number of MME sessions on the system.
  `time` is measured in seconds and can be configured to any integer value from 30 to 60000.

Usage
This command dictates the time period over which to monitor the specified value for threshold crossing.

**Important**: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the `threshold model` and `threshold monitoring` commands for additional information on the system’s support for thresholding.

Example
The following command configures the polling interval for the total MME session threshold polling duration value to 600 seconds (10 minutes):

```
threshold poll total-mme-sessions interval 600
```
threshold poll port-rx-utilization

Enables the generation of alerts or alarms based on the port utilization percentage for data received during the polling interval.

Product
All

Privilege
Administrator Security Administrator

Syntax

```
threshold poll port-rx-utilization interval seconds
```

- **interval seconds**
  Configures the threshold polling interval in multiples of 30 seconds from 30 to 60000

Usage

Receive port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data received during the specified polling interval. This threshold is configured on a per-port basis configured using the port `port-type slot#/port#` command syntax.

**Important:** This command is not available on all platforms

**Important:** Ports configured for half-duplex do not differentiate between data received and data transmitted. (The transmitted and received percentages are combined.) Therefore, to avoid redundant alarms, it is recommended that only the receive or transmit utilization threshold be configured.

Example

Use the following example to configure a threshold poll interval of 300 seconds (5 minutes)

```
threshold poll port-rx-utilization interval 300
```
threshold poll port-tx-utilization

Enables the generation of alerts or alarms based on the port utilization percentage for data transmitted during the polling interval.

**Product**
All

**Privilege**
Administrator Security Administrator

**Syntax**

```
threshold poll port-tx-utilization interval seconds
```

**Usage**
Transmit port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data transmitted during the specified polling interval. This threshold is configured on a per-port basis configured using the port `port-type slot#/port#` command syntax.

**Important:** This command is not available on all platforms

**Important:** Ports configured for half-duplex do not differentiate between data received and data transmitted. (The transmitted and received percentages are combined.) Therefore, to avoid redundant alarms, it is recommended that only the receive or transmit utilization threshold be configured.

**Example**
Use the following example to configure a threshold poll interval of 300 seconds (5 minutes)

```
threshold poll port-tx-utilization interval 300
```
**threshold poll port-high-activity**

Enables the generation of alerts or alarms based on the overall port utilization percentage during the polling interval.

**Product**
All

**Privilege**
Administrator Security Administrator

**Syntax**

```
threshold poll port-high-activity interval seconds
```

**Usage**

High port activity thresholds generate alerts or alarms based on the peak utilization percentage of each configured port during the specified polling interval. This threshold is configured on a per-port basis. Alerts or alarms are triggered for high port activity based on the following rules:

- Enter condition: Actual percent peak utilization of a port ≥ High Threshold
- Clear condition: Actual percent peak utilization of a port < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval. This threshold is configured on a per-port basis configured using the `port-type slot#/port#` command syntax.

**Important:** This command is not available on all platforms

**Example**

Use the following example to configure the polling interval over which to measure for high port activity to 300 seconds:

```
threshold poll port-high-activity interval 300
```
threshold poll route-service

This command configures the polling interval over which to count or measure the thresholding value for route services on the system.

**Product**
All

**Privilege**
Administrator Security Administrator

**Syntax**

```
[ default ] threshold poll route-service interval dur
```

- **default**
  Restores the threshold poll interval value to its default value of 900 seconds.

- **interval time**
  Default: 900 seconds
  Specifies the amount of time that comprises the polling interval over which to count the total number of BGP route on the system.
  `dur` is measured in seconds and can be configured to any integer value from 30 to 60000.

**Usage**

This command dictates the time period over which to monitor the specified value for threshold crossing.

**Important:** All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the `threshold model` and `threshold monitoring` commands for additional information on the system’s support for thresholding.

**Example**
The following command configures the polling interval for the total BGP routes threshold polling duration value to 600 seconds (10 minutes):

```
threshold poll route-service interval 600
```
threshold ppp-setup-fail-rate

Configures PPP setup failure rate thresholds.

**Product**
PDSN, GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold ppp-setup-fail-rate high_thresh [ clear low_thresh ]
```

- **high_thresh**
  
  Default: 0
  
  The high threshold rate for PPP setup failures experienced by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
  
  `high_thresh` can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

- **clear low_thresh**
  
  Default: 0
  
  The low threshold rate for PPP setup failures experienced by the system that maintains a previously generated alarm condition. If the number of setup failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
  
  `low_thresh` can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

PPP setup failure rate thresholds generate alerts or alarms based on the rate of call setup failures experienced by the system during the specified polling interval. The failure rate is the percentage of failures as determined by number of PPP setup failures divided by the total number of PPP sessions initiated. Alerts or alarms are triggered for PPP setup failure rates based on the following rules:

- **Enter condition:** Actual number of call setup failures ≥ High Threshold
- **Clear condition:** Actual number of call setup failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**

The following command configures a PPP setup failure rate high threshold of 50 and a clear threshold of 45:
threshold ppp-setup-fail-rate 50 clear 45
threshold route-service bgp-routes

This command configures the threshold limits for route services to BGP routes.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold route-service bgp-routes high_thresh [ clear low_thresh ]
```

*high_thresh*

Default: 0

The high threshold rate for BGP routes on the system that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

*clear low_thresh*

Default: 0

The low threshold rate for BGP routes on the system that maintains a previously generated alarm condition. If the number of setup failures falls beneath the low threshold within the polling interval, a clear alarm will be generated. *low_thresh* can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Use this command to configure a threshold in percentage of maximum BGP routes allowed. If the percentage of the number of BGP routes in a context (including all VRFs) reaches *high_thresh*, a notification is generated. Optionally, if the threshold subsystem is configured in ‘alarm’ mode, a Threshold_Clear notification is generated when the percentage of the number of BGP routes in a context (including all VRFs) goes below *low_thresh*. The maximum number of BGP routes is also sent by BGP task when getting the stats.

Alerts or alarms are triggered for BGP routes based on the following rules:

- **Enter condition:** Actual number of call setup failures > High Threshold
- **Clear condition:** Actual number of call setup failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.
Example
The following command configures system for high threshold of 50 and a clear threshold of 45:

```
threshold route-service bgp-routes 50 clear 45
```
threshold rp-setup-fail-rate

Configures RP setup failure rate thresholds.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold rp-setup-fail-rate high_thresh [ clear low_thresh ]
```

**high_thresh**

Default: 0
The high threshold rate for RP setup failures experienced by the system that must be met or exceeded within the polling interval to generate an alert or alarm.

*high_thresh* can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

**clear low_thresh**

Default: 0
The low threshold rate for RP setup failures experienced by the system that maintains a previously generated alarm condition. If the number of setup failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.

*low_thresh* can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**
RP setup failure rate thresholds generate alerts or alarms based on the rate of call setup failures experienced by the system during the specified polling interval. The failure rate is the percentage of failures as determined by number of Registration Request Messages rejected divided by the total number of Registration Request Messages received.

Alerts or alarms are triggered for RP setup failure rates based on the following rules:

- **Enter condition:** Actual number of call setup failures ≥ High Threshold
- **Clear condition:** Actual number of call setup failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**
The following command configures a RP setup failure rate high threshold of 50 and a clear threshold of 45:

```
threshold rp-setup-fail-rate 50 clear 45
```
threshold rp-setup-fail-rate

threshold rp-setup-fail-rate 50 clear 45
threshold spc-cpu-memory-usage

This command has been renamed to threshold mgmt-cpu-memory-usage. Please refer to that command for details. Note that for backwards compatibility, the system accepts this command as valid.

**Important:** This command is not supported on all platforms.
threshold spc-cpu-utilization

This command has been renamed to `threshold mgmt-cpu-utilization`. Please refer to that command for details. Note that for backwards compatibility, the system accepts this command as valid.
**threshold storage-utilization**

Configures SMC CompactFlash memory utilization thresholds.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold storage-utilization high_thresh[ clear low_thresh]
```

- **high_thresh**
  
  Default: 90
  
  The high threshold memory utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
  
  The number can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

- **clear low_thresh**
  
  Default: 90
  
  The low threshold memory utilization percentage that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
  
  The number can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

CompactFlash memory utilization thresholds generate alerts or alarms based on the utilization percentage of the CompactFlash on each installed SMC during the specified polling interval. Although, a single threshold is configured for both SMCs, separate alerts or alarms can be generated for each.

Alerts or alarms are triggered for CompactFlash memory utilization based on the following rules:

- **Enter condition:** Actual percentage memory utilization $\geq$ High Threshold
- **Clear condition:** Actual percentage memory utilization $< Low Threshold$

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**

The following command configures a high threshold CompactFlash utilization percentage of 85 for an system using the Alert thresholding model:
threshold storage-utilization
threshold subscriber active

Configures active subscriber thresholds for the system.

Product
PDSN, GGSN, SGSN, HA

Privilege
Security Administrator, Administrator

Syntax
threshold subscriber active high_thresh [ clear low_thresh ]

high_thresh
Default: 0
The high threshold number of active subscriber sessions facilitated by the system that must be met or exceeded within the polling interval to generate an alert or alarm. The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

clear low_thresh
Default: 0
The low threshold number of active subscriber sessions facilitated by the system that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated. The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
Active subscriber thresholds generate alerts or alarms based on the total number of active subscriber sessions facilitated by the system during the specified polling interval. Alerts or alarms are triggered for active subscriber totals based on the following rules:
● Enter condition: Actual total number of active subscriber sessions ≥ High Threshold
● Clear condition: Actual total number of active subscriber sessions < Low Threshold
If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the threshold poll command to configure the polling interval and the threshold monitoring command to enable thresholding for this value.

Example
The following command configures an active subscriber high threshold count of 150000 and a low threshold of 1500 for an system using the Alarm thresholding model:
threshold subscriber active 150000 clear 1500
threshold subscriber total

Configures total subscriber thresholds for the system.

Product
PDSN, GGSN, HA

Privilege
Security Administrator, Administrator

Syntax

```
threshold subscriber total high_thresh [ clear low_thresh ]
```

---

**high_thresh**

Default: 0

The high threshold number of subscriber sessions (active and dormant) facilitated by the system that must be met or exceeded within the polling interval to generate an alert or alarm.

The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

---

**clear low_thresh**

Default: 0

The low threshold number of subscriber sessions (active and dormant) facilitated by the system that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.

The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

---

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

---

**Usage**

Total subscriber thresholds generate alerts or alarms based on the total number of subscriber sessions (active and dormant) facilitated by the system during the specified polling interval.

Alerts or alarms are triggered for subscriber totals based on the following rules:

- **Enter condition:** Actual total number of subscriber sessions ≥ High Threshold
- **Clear condition:** Actual total number of subscriber sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

---

**Example**

The following command configures an active subscriber high threshold count of 450000 and a low threshold of 250000 for an system using the Alarm thresholding model:
threshold subscriber total 450000 clear 250000
threshold total-ggsn-sessions

Configures thresholds for the total number of GGSN sessions across all the services in the system.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold total-ggsn-sessions high_thresh [ clear low_thresh ]
```

- **high_thresh**
  Default: 0 (Disabled)
  The high threshold number of total GGSN sessions across all the sessions in the system that must be met or exceeded within the polling interval to generate an alert or alarm.
  The number can be configured to any integer value from 0 through 4000000. A value of 0 disables the threshold.

- **clear low_thresh**
  Default: 0 (Disabled)
  The low threshold number of total GGSN sessions that maintains a previously generated alarm condition. If the number of GGSN sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
  The number can be configured to any integer value between 0 and 4000000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**
Monitor and set alarms or alerts when the total number of GGSN sessions across all the services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of GGSN sessions based on the following rules:
- **Enter condition:** Actual total number of GGSN sessions ≥ High Threshold
- **Clear condition:** Actual total number of GGSN sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**
The following command configures a total GGSN session high threshold count of 10000 for an system using the Alert thresholding model:
threshold total-ggsn-sessions

threshold total-ggsn-sessions 10000
threshold total-gprs-sessions

Configures thresholds for the total number of GPRS sessions in the system.

Product
SGSN

Privilege
Administrator

Syntax

```
threshold total-gprs-sessions high_thresh [ clear low_thresh ]
```

**high_thresh**
Default: 0
The high threshold number of total GPRS sessions for all GPRS services that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 1 through 2000000. A value of 0 disables the threshold.

**clear low_thresh**
Default: 0
The low threshold number of total GPRS sessions for all GPRS services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 200000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**
Monitor and set alarms or alerts when the total number of GPRS sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for GPRS sessions based on the following rules:
- **Enter condition:** Actual total number of GPRS sessions ≥ High Threshold
- **Clear condition:** Actual total number of GPRS sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

**Example**
The following command configures a total number of GPRS sessions high threshold count of 10000 for a system using the Alert thresholding model:
threshold total-gprs-sessions 10000
threshold total-gprs-pdp-sessions

Configures thresholds for the total number of PDP contexts per GPRS sessions in the system.

**Product**
SGSN

**Privilege**
Administrator

**Syntax**

```
threshold total-gprs-pdp-sessions high_thresh [ clear low_thresh ]
```

**high_thresh**
Default: 0
The high threshold number of total PDP contexts per GPRS session for all GPRS services that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 1 through 2000000. A value of 0 disables the threshold.

**clear low_thresh**
Default: 0
The low threshold number of total PDP contexts per GPRS session for all GPRS services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 2000000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**
Monitor and set alarms or alerts when the total number of GPRS sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for GPRS sessions based on the following rules:

- **Enter condition:** Actual total number of PDP Contexts ≥ High Threshold
- **Clear condition:** Actual total number of PDP contexts < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**
The following command configures a total number of PDP contexts per GPRS session high threshold count of 10000 for a system using the Alert thresholding model:
threshold total-gprs-pdp-sessions 10000
threshold total-ha-sessions

Configures thresholds for the total number of HA sessions across all services in the system.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

threshold total-ha-sessions high_thresh [ clear low_thresh]

high_thresh
Default: 0
The high threshold number of HA sessions for all HA services that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 4000000. A value of 0 disables the threshold.

clear low_thresh
Default: 0
The low threshold number of HA sessions for all HA services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
Monitor and set alarms or alerts when the total number of HA sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for HA sessions based on the following rules:
• Enter condition: Actual total number of HA sessions ≥ High Threshold
• Clear condition: Actual total number of HA sessions < Low Threshold
If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the threshold poll command to configure the polling interval and the threshold monitoring command to enable thresholding for this value.

Example
The following command configures a total number of HA sessions high threshold count of 10000 for an system using the Alert thresholding model:
threshold total-ha-sessions 10000
threshold total-hsgw-sessions

Configures thresholds for the total number of HSGW sessions across all services in the system.

**Product**
HSGW

**Privilege**
Administrator

**Syntax**

```
threshold total-hsgw-sessions high_thresh[ clear low_thresh]
```

**high_thresh**
Default: 0
The high threshold number of HSGW sessions for all HSGW services that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 1 through 1500000. A value of 0 disables the threshold.

**clear low_thresh**
Default: 0
The low threshold number of HSGW sessions for all HSGW services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 1500000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**
Monitor and set alarms or alerts when the total number of HSGW sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for HSGW sessions based on the following rules:
- **Enter condition:** Actual total number of HSGW sessions ≥ High Threshold
- **Clear condition:** Actual total number of HSGW sessions < Low Threshold
If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**
The following command configures a total number of HSGW sessions high threshold count of 500000 for an system using the Alert thresholding model:
threshold total-hsgw-sessions 500000
threshold total-lma-sessions

Configures thresholds for the total number of LMA sessions across all services in the system.

**Product**
P-GW

**Privilege**
Administrator

**Syntax**

```plaintext
threshold total-lma-sessions high_thresh [ clear low_thresh]
```

**high_thresh**

Default: 0
The high threshold number of LMA sessions for all LMA services that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 1 through 1500000. A value of 0 disables the threshold.

**clear low_thresh**

Default: 0
The low threshold number of LMA sessions for all LMA services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 1500000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**
Monitor and set alarms or alerts when the total number of LMA sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for LMA sessions based on the following rules:

- **Enter condition:** Actual total number of LMA sessions ≥ High Threshold
- **Clear condition:** Actual total number of LMA sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**
The following command configures a total number of LMA sessions high threshold count of 500000 for an system using the Alert thresholding model:
threshold total-lma-sessions 50000
threshold total-lns-sessions

Configures thresholds for the total number of LNS sessions in the system.

**Product**
PDSN, GGSN, HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold total-lns-sessions high_thresh [ clear low_thresh ]
```

- **high_thresh**
  
  Default: 0
  
  The high threshold number of total LNS sessions that must be met or exceeded within the polling interval to generate an alert or alarm.
  
  The number can be configured to any integer value from 0 through 4000000. A value of 0 disables the threshold.

- **clear low_thresh**
  
  Default: 0
  
  The low threshold number of total LNS sessions that maintains a previously generated alarm condition. If the number of LNS sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
  
  The number can be configured to any integer value between 0 and 4000000. A value of 0 disables the threshold.

**Important**: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Monitor and set alarms or alerts when the total number of LNS sessions in the system is equal to or greater than the set limit.

Alerts or alarms are triggered for the total number of LNS sessions based on the following rules:

- **Enter condition**: Actual total number of LNS sessions ≥ High Threshold
  
- **Clear condition**: Actual total number of LNS sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll monitoring` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**

The following command configures a total LNS session high threshold count of 10000 for a system using the Alert thresholding model:

```
threshold total-lns-sessions high_thresh 10000
```
threshold total-INS-sessions 10000
threshold total-mme-sessions

Use this command to configure thresholds for the total number of MME sessions across all the MME services in the system.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold total-mme-sessions high_thresh [ clear low_thresh ]
```

- **high_thresh**
  
  Default: 0 (Disabled)

  The high threshold number of total MME sessions that must be met or exceeded within the polling interval to generate an alert or alarm.

  The number can be configured to any integer value from 0 through 4000000. A value of 0 disables the threshold.

- **clear low_thresh**

  Default: 0 (Disabled)

  The low threshold number of total MME sessions that maintains a previously generated alarm condition. If the number of MME sessions, across all the services in a system, falls beneath the low threshold within the polling interval, a clear alarm will be generated.

  The number can be configured to any integer value between 0 and 4000000. A value of 0 disables the threshold.

**Important**: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Use this command to monitor and set alarms or alerts when the total number of MME sessions across all the MME services in the system is equal to or greater than the set limit.

Alerts or alarms are triggered for the total number of MME sessions based on the following rules:

- **Enter condition**: Actual total number of MME sessions ≥ High Threshold
- **Clear condition**: Actual total number of MME sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll total-mme-sessions` command to configure the polling interval and the `threshold monitoring mme-service` command to enable thresholding for this value.

**Example**
The following command configures a total MME session high threshold count of 10000 for an system using the Alert thresholding model:

```
threshold total-mme-sessions 10000
```
threshold total-pdsn-sessions

Configures thresholds for the total number of PDSN sessions in the system.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold total-pdsn-sessions high_thresh [ clear low_thresh ]
```

**high_thresh**

Default: 0
The high threshold number of total PDSN sessions that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 4000000. A value of 0 disables the threshold.

**clear low_thresh**

Default: 0
The low threshold number of total PDSN sessions that maintains a previously generated alarm condition. If the number of PDSN sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 4000000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**
Monitor and set alarms or alerts when the total number of PDSN sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of PDSN sessions based on the following rules:
- **Enter condition:** Actual total number of PDSN sessions \( \geq \) High Threshold
- **Clear condition:** Actual total number of PDSN sessions < Low Threshold
If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**
The following command configures a total PDSN session high threshold count of 10000 for an system using the Alert thresholding model:
threshold total-pdsn-sessions 10000
threshold total-pgw-sessions

Configures thresholds for the total number of P-GW sessions across all services in the system.

**Product**
P-GW

**Privilege**
Administrator

**Syntax**

```c
threshold total-pgw-sessions high_thres[ clear low_thres]
```

<table>
<thead>
<tr>
<th>high_thres</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 0</td>
</tr>
<tr>
<td>The high threshold number of P-GW sessions for all P-GW services that must be met or exceeded within the polling interval to generate an alert or alarm.</td>
</tr>
<tr>
<td>The number can be configured to any integer value from 1 through 1500000. A value of 0 disables the threshold.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>clear low_thres</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 0</td>
</tr>
<tr>
<td>The low threshold number of P-GW sessions for all P-GW services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.</td>
</tr>
<tr>
<td>The number can be configured to any integer value between 0 and 1500000. A value of 0 disables the threshold.</td>
</tr>
</tbody>
</table>

⚠️ **Important**: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Monitor and set alarms or alerts when the total number of P-GW sessions in the system is equal to or greater than the set limit.

Alerts or alarms are triggered for P-GW sessions based on the following rules:

- **Enter condition**: Actual total number of P-GW sessions ≥ High Threshold
- **Clear condition**: Actual total number of P-GW sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

**Example**
The following command configures a total number of P-GW sessions high threshold count of 500000 for an system using the Alert thresholding model:
threshold total-pgw-sessions 50000
threshold total-sgw-sessions

Configures thresholds for the total number of S-GW sessions across all services in the system.

### Product

S-GW

### Privilege

Administrator

### Syntax

```
threshold total-sgw-sessions high_thresh[ clear low_thresh]
```

#### high_thresh

Default: 0
The high threshold number of S-GW sessions for all S-GW services that must be met or exceeded within the polling interval to generate an alert or alarm.

The number can be configured to any integer value from 1 through 1500000. A value of 0 disables the threshold.

#### clear low_thresh

Default: 0
The low threshold number of S-GW sessions for all S-GW services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.

The number can be configured to any integer value between 0 and 1500000. A value of 0 disables the threshold.

---

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

### Usage

Monitor and set alarms or alerts when the total number of S-GW sessions in the system is equal to or greater than the set limit.

Alerts or alarms are triggered for S-GW sessions based on the following rules:

- **Enter condition:** Actual total number of S-GW sessions ≥ High Threshold
- **Clear condition:** Actual total number of S-GW sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

### Example

The following command configures a total number of S-GW sessions high threshold count of 500000 for an system using the Alert thresholding model:
threshold total-sgw-sessions

threshold total-sgw-sessions 500000
threshold total-sgsn-sessions

Configures thresholds for the total number of SGSN sessions in the system.

Product
SGSN

Privilege
Administrator

Syntax

```
threshold total-sgsn-sessions high_thresh[ clear low_thresh]
```

### high_thresh

Default: 0
The high threshold number of total SGSN sessions for all SGSN services that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 1 through 2000000. A value of 0 disables the threshold.

### clear low_thresh

Default: 0
The low threshold number of total SGSN sessions for all SGSN services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 2000000. A value of 0 disables the threshold.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

### Usage

Monitor and set alarms or alerts when the total number of SGSN sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for SGSN sessions based on the following rules:

- **Enter condition:** Actual total number of SGSN sessions ≥ High Threshold
- **Clear condition:** Actual total number of SGSN sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

### Example

The following command configures a total number of SGSN sessions high threshold count of 10000 for a system using the Alert thresholding model:
threshold total-sgsn-sessions 10000
threshold total-sgsn-pdp-sessions

Configures thresholds for the total number of PDP contexts per SGSN sessions in the system.

Product
SGSN

Privilege
Administrator

Syntax

```
threshold total-sgsn-pdp-sessions high_thresh[ clear low_thresh]
```

- **high_thresh**
  - Default: 0
  - The high threshold number of total PDP contexts per SGSN session for all SGSN services that must be met or exceeded within the polling interval to generate an alert or alarm.
  - The number can be configured to any integer value from 1 through 2000000. A value of 0 disables the threshold.

- **clear low_thresh**
  - Default: 0
  - The low threshold number of total PDP contexts per SGSN session for all SGSN services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
  - The number can be configured to any integer value between 0 and 2000000. A value of 0 disables the threshold.

**Important**: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of SGSN sessions in the system is equal to or greater than the set limit.

Alerts or alarms are triggered for SGSN sessions based on the following rules:

- **Enter condition**: Actual total number of PDP contexts ≥ High Threshold
- **Clear condition**: Actual total number of PDP contexts < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command to configure the polling interval and the `threshold monitoring` command to enable thresholding for this value.

Example

The following command configures a total number of PDP contexts per SGSN session high threshold count of 10000 for a system using the Alert thresholding model:
threshold total-sgsn-pdp-sessions 10000
timestamps

Enables/disables the generation of a timestamp in response to each command entered. The timestamp does not appear in any logs as it is a CLI output only. This command affects all future CLI sessions. Use the `timestamps` command in the Exec Mode to change the behavior for the current CLI session only.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
timestamps
no timestamps
```

Disables generation of timestamp output for each command entered. When omitted, the output of a timestamp for each entered command is enabled.

**Usage**
Enable the timestamps when logging a CLI session on a remote terminal such that each command will have a line of text indicating the time when the command was entered.

**Example**

```
timestamps
no timestamps
```
upgrade limit

Configures upgrade session limits, which are used to trigger the system as to when it may execute the software upgrade.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
upgradelimit [ timesession_life ] [ usagesession_num ]
```

- **upgradelimit**
  
  This command issued with no keywords sets all parameters to their defaults.

- **time session_life**
  
  Default: 120

  Defines the maximum number of minutes that a session may exist on the system, undergoing a software upgrade, before it is terminated by the system. As individual user sessions reach this lifetime limit, the system terminates the individual session(s). `session_life` must be an integer ranging from 1 through 1440.

- **usage session_num**
  
  Default: 100

  This keyword defines a low threshold limit of sessions running either on a PSC/PSC2 or system-wide. When a software upgrade is invoked, this parameter applies to the entire system. When the threshold is crossed (when the number of sessions on the PSC/PSC2 or system is less than this value), the remaining sessions on the card or system are terminated allowing the upgrade to begin. The remaining sessions on the PSC/PSC2 or system are terminated regardless of their session life. `session_num` must be an integer from 0 to 6000.

**Usage**

Use this command to configure upgrade session limits, which are used to trigger the system as to when it may execute the software upgrade.

**Important:** This command is not supported on all platforms.

**Important:** Software Patch Upgrades are not supported in this release.

**Example**

The following command sets the number of minutes a session can exist to `200` and the minimum number of sessions that may exist before terminating them to `50`:

```
upgrade limit time 200 usage 50
```
url-blacklisting database

This command configures URL Blacklisting database directory parameters.

Product
CF

Privilege
Security Administrator, Administrator

Syntax

```
url-blacklisting database { directory path path | max-versions max_versions | override file file_name }

default url-blacklisting database { directory path | max-versions | override file }
```

**default**
Configures the default values.

**directory path path**
Specifies the path to the directory to be used for storing URL Blacklisting databases.
path must be a string of 1 through 255 characters in length.
Default: /flash/bl

**max-versions max_versions**
Specifies the maximum number of URL Blacklisting database versions to be maintained in the URL Blacklisting database directory path with the base file name specified by the URL Blacklisting database override file.
max_versions must be an integer from 0 through 3.
Default: 0

**override file file_name**
Specifies the URL Blacklisting database override file name.
file_name must be in name.extension format. For example, abc.bin. And, must be a string of 1 through 10 characters in length.
Default: optblk.bin

Usage
Use this command to configure URL Blacklisting database directory parameters.

Example
The following command configures the maximum number of URL Blacklisting database versions to be maintained:

```
url-blacklisting database max-versions 3
```
Chapter 104
Global Title Translation Address-Map Configuration Mode Commands

The Global Title Translation (GTT) Address-Map configuration mode provides the commands to create, configure, and manage a specific GTT address map database.

- Exec Mode
  - configure
  - Global Configuration Mode
    - global title translation address-map instance instance
  - Global Title Translation Address-Map Configuration Mode

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
associate

This command associates (links) the global title translation (GTT) address-map with a specific GTT association, which includes the translation action rules.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

\[
\text{associate \ gtt-association \ assoc\_num \ action \ id \ id}
\]

\[
\text{no \ association}
\]

\[
\text{no}
\]
Removes the association definition from the GTT address-map configuration.

\[
\text{gtt-association \ assoc\_num}
\]
Identifies a specific GTT association to link (associate) with the GTT address-map.
\*assoc\_num\* Must be an integer from 1 to 16.

\[
\text{action \ id \ id}
\]
Identifies a specific action defined in the GTT association database configuration.
\*id\* Must be an integer from 1 to 8.

Usage
Create an association between a specific translation action rule in a specific GTT association and this GTT address-map.

Example

\[
\text{associate \ gtt-association \ 1 \ action \ id \ 1}
\]
description

This command defines a descriptive string to facilitate identification of this particular global title translation (GTT) address-map. This is used for operator reference only.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

description string

no description

no
Removes the description string from the current global title translation address-map configuration.

string
Specifies the alphanumeric string that is stored. must be from 1 through 127 alphanumeric characters. Strings with spaces must be enclosed in double-quotes. See the example below.

Usage
Use this command to set a description for reference by operators.

Example
description "GTT for Finnish national carrier."
end

Exits the configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
end
```

Usage
Change the mode back to the Exec mode.
exit

Exits the configuration mode and returns to the Global configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
exit
```

Usage
Return to the Global configuration mode.
gt-address

Configures the SCCP global title address.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

gt-address gt_address

no gt-address

no
Removes the GT address from the GTT address-map configuration.

gt_address
Up to 15 digits.

Usage
Define the SCCP short address.

Example

gt-address 01040552073424
mode

Configures the mode of operation of the SCCP entities.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

mode [ dominant | loadshare ]

  dominant
  This instructs the system to maintain the associated entity as the primary traffic pipe.

  loadshare
  This instructs the system to distribute the traffic load.

Usage
This command configure load balance for the system.

Example

mode loadshare
out-address

Identifies the out-going address of the SCCP entity. After this command is completed, the system enters the Out-Address configuration mode. Refer to the Out-Address Configuration Mode chapter for information about commands to define the out-address.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```plaintext
out-address name

no out-address
```

<table>
<thead>
<tr>
<th>Description</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Removes the <code>out-address</code> definition from the GSS address-map configuration.</td>
</tr>
<tr>
<td>name</td>
<td>Defines a unique string to identify the out-going address using 1 to 63 alphanumeric characters.</td>
</tr>
</tbody>
</table>

Usage
Use this command to identify the address of the SCCP in the GTT configuration. This command also provides access to the Out-Address configuration mode so that the parameters for the out-going SCCP can be configured and maintained.

Example

```plaintext
out-address SCCP_London
```
Chapter 105
Global Title Translation Association Configuration Mode Commands

The Global Title Translation (GTT) Association configuration mode provides the commands to create the rules for translating the global titles (destination point codes and subsystem address in the messages) used for routing at the SCCP layer.

---

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
action

This command configures the actions that determine the operation of rules of the global title translation (GTT).

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
action id id type action_type start-digit value end-digit value
no action id id
```

- **id**
  id uniquely identifies an action. The id must be an integer from 1 to 8.

- **type action_type**
  The following defines the action rules that will determine how global titles (GT) are translated to locally understood addresses - in most cases point code (PC). The command can be re-issued multiple times to define multiple action rules.
  
  **constant**: Defines the starting digit in the range of digits in the incoming global titles that are translated to fixed addresses.
  
  **fixed**: Defines the starting digit in a fixed range of digits used for performing GTT.
  
  **gt-to-pc**: Use these digits as first of range of global title digits in incoming message to convert to point code for routing.
  
  **insert-pc**: Defines the rule for inserting destination point code before the incoming GTAI and change TT, ES and NAI. Use digits of incoming message global title digits as pc for routing.
  
  **selins**: Selective insertion type to perform GTT.
  
  **strip-pc**: Strip first 6 digits from GTAI if first 6 dgt in stripped point code are in INT format.
  
  **var-asc**: Use a variable number of digits, in ascending order, to perform GTT.
  
  **var-des**: Use a variable number of digits, in descending order, to perform GTT.

- **start-digit value**
  value must be an integer from 0 to 255.

- **end-digit value**
  value must be an integer from 0 to 255.

Usage

Create a global title translation rule that bases the translation on a fixed range of digits starting at 23 and ending at 122.

Example
action id 1 type fixed start-digit 23 end-digit 122
description

This command defines a descriptive string to facilitate identification of this particular global title translation (GTT) association. This is used for operator reference only.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

description string
no description

string
Specifies the alphanumeric string that is stored. must be from 1 through 127 alphanumeric characters. Strings with spaces must be enclosed in double-quotes. See the example below.

no
Removes the description string from the current global title translation association configuration.

Usage
Use this command to set a description for reference by operators.

Example
The following command sets the description to identify a routing domain for messages transmitted within a national boundary.

description "GTT database 2"
end

Exits the configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Change the mode back to the Exec mode.
exit

Exits the configuration mode and returns to the Global configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Return to the Global configuration mode.
gt-format

This command creates an instance of a global title formatting that is applied to the database in the process of address translation. Once the command is completed, the system enters global title (GT) format database configuration mode. The commands for configuration can be found in the GT Format Configuration Mode chapter in this reference guide.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
gt-format format_num
```

- **format_num**
  1: Selects GT-format 1 options which include `nature-of-address` and `odd/even`. Once selected, the system enters GT-Format1 configuration mode.
  2: Selects GT-format2 options which include `translation-type`. Once selected, the system enters GT-Format2 configuration mode.
  3: Selects GT-format3 options which include `encoding-scheme`, `numbering-plan`, and `translation-type`. Once selected, the system enters GT-Format3 configuration mode.
  4: Selects GT-format4 options which include `encoding-scheme`, `nature-of-address`, `numbering-plan`, and `translation-type`. Once selected, the system enters GT-Format4 configuration mode.

Usage
Selects GT format #2 for the database GTT process.

Example

```
gt-format 2
```
variant

This command configures the choice of national standard protocols to associate with the GTT process databases.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
variant type
```

**default**
Sets the `variant` configuration to `itu`.

**type**
The following network variant national standards-based protocols are possible:

- `ansi`
- `china`
- `itu`
- `japan`

**Usage**
Use this command to select the national standard protocols to associate with the GTT process database.

**Example**
The following command sets the variant to `ansi`:

```
variant ansi
```
Chapter 106
GPRS Service Configuration Mode Commands

The GPRS Service Configuration Mode is used within the context configuration mode to define the criteria the SGSN needs to operate within a GPRS network. The GPRS Service works with other services, such as SGSN GPRS Tunneling Protocol (see SGTP Service Configuration Mode Commands) and Mobile Application Part (see MAP Service Configuration Mode Commands), to handle communication parameters required to work with other network entities such as the base station subsystem (BSS).

The prompt for this mode appears as:

```
[context_name]hostname(config-gprs-service)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
accounting

Defines the accounting context name and enables/disables specific types of CDR generation for the accounting in the GPRS service.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
accounting { cdr-types { mcdr | scdr | sms { mo-cdr | mt-cdr } + | context cntx_name }
default accounting cdr-types
no accounting { cdr-types | context }
```

**default**

Returns the system to default CDR generation which includes M-CDR, S-CDR, and SMS CDRs.

**no**

Disables all CDR types.

**cdr-types { mcdr | scdr | sms { mo-cdr | mt-cdr }**

Default: all types enabled.
Defines the types of CDRs to be generated within the specified GPRS service for accounting:

- **mcdr**: Enables generation of M-CDRs.
- **scdr**: Enables generation of S-CDRs.
- **sms**: Enables generation of SMS-type CDRs based on one of the following:
  - **mo-cdr**: SMS CDRs originates from the mobile.
  - **mt-cdr**: SMS CDRs terminates at the mobile.

**+**

This symbol indicates that more than one keyword can be used and repeated. This enables you to include more than one type of CDR selection in a single command.

**context cntx_name**

Specifies an accounting context to be associated with the GPRS service.

**cntx_name**: Define a string of 1 to 79 alphanumeric characters.

Usage
Use this command to define the type of CDRs to generate for GPRS service. By default all types of CDRs are generated. Note that change of this configuration will be applied to new calls and/or to new PDP contexts only.

By default, generation of the S-CDR, M-CDR, SMS-MT-CDR, and SMS MO-CDR types is enabled.

**Example**

The following command configures the system to generate only M-CDRs for accounting in the current GPRS service:

```
accounting cdr-types mcdr
```
associate-service

Identifies services to be associated with the GPRS Service.

**Important:** This command can be used before the associated service instance is created and configured but care should be used to match the service names.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] associate-service { gs name | map name | sgtp name } [ context ctxt_name ]
```

- **no**
  Removes the service association definition from the configuration.

- **gs name**
  Specifies which Gs service configuration, by naming the Gs service instance, to associate with this GPRS service.
  *name* must be a string of 1 to 63 alphanumeric characters with no spaces.

- **map name**
  Specifies which MAP service configuration, by naming the MAP service instance, to associate with this GPRS service.
  *name* must be a string of 1 to 63 alphanumeric characters with no spaces.

- **sgtp name**
  Specifies which SGTP service configuration, by naming the SGTP service instance, to associate with this GPRS service.
  *name* must be a string of 1 to 63 alphanumeric characters with no spaces.

- **context ctxt_name**
  Defines the context in which the service was created.
  *ctxt_name* must be a string of 1 to 63 alphanumeric characters with no spaces.

**Usage**

Use this command to associate other services, that have been or will be configured, to this GPRS service.
Example
The following command associates Gs service gs1 with this GPRS service.

    associate-service gs gs1 context sgsn2
cc profile

Configures the charging characteristic (CC) profile index properties.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax
[ no ] cc profile index { buckets number | interval time | tariff time1 mins hours [ time2 mins hours [ time3 mins hours [ time4 mins hours ] ] ] | volume { downlink octets uplink octets | total octets } }

default cc profile index

no
Removes the a specific charging characteristics configuration definition.

default
Resets the charging characteristics to system defaults.

index
Configures a profile index for the parameter to be specified. index can be configured to any integer value from 0 to 15.

**Important:** 3GPP standards suggest that profile index values of 1, 2, 4, and 8 be used for hot billing, flat rate billing, prepaid billing and normal billing, respectively. A single charging characteristics profile can contain multiple behavior settings.

buckets number
Default: 4
Specifies the number of statistics container changes due to QoS changes or tariff time that can occur before an accounting record should be closed.
number can be configured to any integer value from 1 through 4.

interval time
time is measured in seconds and can be configured to any integer value from 60 to 40,000,000.

tariff time1 mins hours time2 mins hours time3 mins hours time4 mins hours
Specifies time-of-day time values to close the current statistics container (but not necessarily the accounting record). Six different tariff times may be specified. If less than six times are required, the same time can be specified multiple times.
GPRS Service Configuration Mode Commands

**Important:** The system assumes that the billing system uses the day/date to determine if the statistics container represents an actual tariff period.

For each of the different tariff times, the following parameters must be configured:
- **mins:** The minutes of the hour, an integer value from 0 to 59.
- **hours:** The hour of the day, an integer value from 0 to 23.

```plaintext
volume { downlink vol_down_octets uplink vol_up_octets | total total_octets }
```

Specifies the downlink, uplink, and total volumes that must be met before closing a CDR.
- **vol_down_octets:** Measured in octets; can be configured to any integer value from 100,000 to 4,000,000,000.
- **vol_up_octets:** Measured in octets; can be configured to any integer value from 100,000 to 4,000,000,000.
- **total_octets:** The total traffic volume (up and downlink) measured in octets; can be configured to any integer value from 100,000 to 4,000,000,000.

**Usage**

Charging characteristics consist of a profile index and behavior settings. This command configures profile indexes for the SGSN's charging characteristics. The SGSN supports up to 16 profile indexes. This command works in conjunction with the cc-sgsn command located in the APN configuration mode that dictates which CCs should be used for subscriber PDP contexts.

**Example**

The following command configures a profile index of 10 for tariff times of 7:00 AM and 7:30 PM:

```
cr profile 10 tariff time1 0 7 time2 30 19
```
check-imei-timeout-action

This command configures the action to be taken on the Gf interface if a Check-IMEI fails due to a timeout.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

check-imei-timeout-action [ continue | reject ]
default check-imei-timeout-action

default
Rejects the Attach or ISRAU procedure if a Check-IMEI timeout occurs.

continue
Instructs the SGSN to continue the Attach or ISRAU procedure if a Check-IMEI timeout occurs because the EIR is not reachable. This functionality matches standard call flow.

reject
Instructs the SGSN to reject the Attach or ISRAU procedure if a Check-IMEI timeout occurs.

Usage
Use this command to control the SGSN reaction if a Check-IMEI fails due to a timeout. The continue option allows the SGSN to go forward with the MS Attach if the first Check-IMEI fails to reach the EIR due to a timeout. Any subsequent activity (such as a RAU or Service Request) would force another Check-IMEI towards the EIR. If this subsequent MAP Check-IMEI should fail, then the same policy of continuing the procedure would apply.

Example
Use the following command to reject Attach Requests if the Check-IMEI timer runs out:

check-imei-timeout-action reject
ciphering-algorithm

This command configures the priority, ordering, for the use of the GPRS encryption ciphering algorithms.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

ciphering-algorithm priority priority algorithm

default ciphering-algorithm priority priority

default
Returns the system ciphering-algorithm priority to the default of GEA0 - which means that no ciphering will be done.

priority
Defines the priority or order of use for the ciphering algorithm. 
priority must be an integer from 1 to 8.

algorithm
Identifies the algorithm to be matched to the priority. Options include:

• gea0 - No ciphering
• gea1 - GPRS Encryption Algorithm - GEA1
• gea2 - GPRS Encryption Algorithm - GEA2
• gea3 - GPRS Encryption Algorithm - GEA3
• gea4 - GPRS Encryption Algorithm - GEA4 (not yet supported)
• gea5 - GPRS Encryption Algorithm - GEA5 (not yet supported)
• gea6 - GPRS Encryption Algorithm - GEA6 (not yet supported)
• gea7 - GPRS Encryption Algorithm - GEA7 (not yet supported)

Usage
Use this command to specify the order (priority) of usage for the GPRS encryption algorithms. All of the GPRS encapsulation algorithms use a 64-bit key derived from a common mechanism: the mobile receives a random challenge, then the SIM calculates an authentication signature and an encryption key.

Example
The following command sets no ciphering to be used after two encryption algorithms have been used:

ciphering-algorithm priority 3 gea0
dns israu-mcc-mnc-encoding

Configures either decimal or hexadecimal format for the MCC and MNC values in the DNS query.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

dns israu-mcc-mnc-encoding { decimal | hexadecimal }

default dns israu-mcc-mnc-encoding

default
Resets the SGSN to send the MCC and MNC values in decimal format for DNS queries.

decimal
Default.
Instructs the SGSN to send the MCC and MNC in decimal format in the DNS query.

hexadecimal
Instructs the SGSN to send the MCC and MNC in hexadecimal format in the DNS query.

Usage
Use this command to determine the type of encoding for the MCC and MNC to be included in the DNS query. For example:
In decimal, the MNC/MCC in a DNS query would appear like:

    rac0017.lac42e3.mnc310.mcc722.gprs

In hexadecimal, the MNC/MCC in a DNS query would appear like:

    rac0017.lac42e3.mnc0136.mcc02d2.gprs

Example
Use hexadecimal values for the MCC/MNC in the DNS query.

    dns israu-mcc-mnc-encoding hexadecimal
end

Exits the current configuration mode and returns to the Exec mode.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Return to the Exec mode.
exit

Exits the current configuration mode and returns to the previous configuration mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
exit
```

Usage
Return to the context configuration mode.
gmm

This command defines the GPRS mobility management parameters for the SGSN service.

**Important:** The `gmm` command can be repeated to set each timer as needed.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
gmm { accept-procedure [ new-tlli | old-tlli ] mobile-reachable-timeout mins | negotiate-t3314-timeout secs | purge-timeout mins | T3302-timeout mins | T3312-timeout mins | T3313-timeout secs | T3350-timeout secs | T3360-timeout secs | T3370-timeout secs | trau-timeout secs }
default gmm { mobile-reachable-timeout | negotiate-t3314-timeout | purge-timeout | T3302-timeout | T3312-timeout | T3313-timeout | T3350-timeout | T3360-timeout | T3370-timeout | trau-timeout }
no gmm negotiate-t3314-timeout

default
Resets the specified timer timeout to the system default.

no
Removes the specified GMM definition from the configuration.

accept-procedure [ new-tlli | old-tlli ]
Default: new-tlli
This keyword enables the use of either a new TLLI (temporary logical link identifier) or an old TLLI for attach-accept or RAU-accept messages sent by the SGSN to the MS during related procedures.

mobile-reachable-timeout mins
Default: 58 minutes
Timer value for the mobile reachability timer.
`mins` must be an integer from 4 to 1440.

negotiate-T3314-timeout secs
Set the number of seconds for the T3314-timeout ready timer value.
`secs` must be an integer from 0 to 11160. Default is 44 seconds.
- If the MS does not send the ready timer in the Attach/RAU request, then the SGSN sends this T3314-timeout (ready timer) value.
If the MS sends the requested value of the ready timer in the Attach/RAU Request, and if the requested value is less than or equal to the value of the negotiate-T3314-timeout timer, then the SGSN sends Att/RAU Accept with the requested T3314 value.

If the MS sends the requested value of the ready timer in the Attach/RAU Request, and if the requested value is greater than the value of the negotiate-T3314-timeout timer, then the SGSN sends Att/RAU Accept with the negotiate-T3314-timeout value.

**Important:** This is the only GMM timer that can be disabled by entering `no` at the beginning of the command syntax. `no gmm negotiate-t3314-timeout` By disabling negotiation of the T3314-timeout value, if the MS sends the requested value of the ready timer in the Att/RAU Request, then the SGSN sends the T3314-timeout value in the Att/RAU Accept.

---

**purge-timeout** *mins*

Default: 10080 minutes
Value defines the mm-context lifetime in minutes.
*mins* must be an integer from 1 to 20160.

**T3302-timeout** *mins*

Default: 12 minutes
Defines the number of minutes for timer to send to MS.
*mins* is an integer from 1 to 186.

**T3312-timeout** *min*

Default: 54 minutes
Periodic RAU update timer to send to MS.
*min* is an integer from 0 to 186.

**T3313-timeout** *secs*

Default: 5 seconds
Initial page timeout timer for retransmission for Paging Requests.
*secs* is an integer from 1 to 186.

**T3314-timeout** *secs*

Default: 44 seconds
Ready Timer for controlling Cell Update Procedure.
*secs* must be an integer from 0 to 500.

**T3350-timeout** *secs*

Default: 6 seconds
Retransmission timer for Attach Accept/RAU Accept/Ptmsi Realloc Command.
*secs* must be an integer from 0 to 20.

**T3360-timeout** *secs*

Default: 6 seconds
Retransmission timer for Authentication Request.
*secs* must be an integer from 0 to 20.
**T3370-timeout**  
Default: 6 seconds  
Retransmission timer for Identity Request.  
secs must be an integer from 0 to 20.

**trau-timeout**  
This timer is available in releases 9.0 and higher.  
Default: 30  
Specifies the number of seconds the “old” 3G SGSN waits to purge the MS’s data. This timer is started by the “old” SGSN after completion of the inter-SGSN RAU.  
secs: Must be an integer from 5 to 60.

**Usage**  
Use this command to set GMM timers.

**Example**  
Set the t3370 timer expiration for 15 seconds.  

```
gmm t3370-timeout 15
```
llc

Configures the timers that control the data flow for the logical link control (LLC) sub-layer.

---

**Important**: This command may be repeated as often as necessary to define the needed timers.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
llc { iov-ui-in-xid-reset | n201u-max } { sapi11 pkt-size | sapi3 pkt-size |
  sapi5 pkt-size | sapi9 pkt-size } | pdu-lifetime secs | t200 sapi1 time | t200 sapi11 time | t200 sapi13 time | t200 sapi15 time | t200 sapi7 time | t200 sapi9 time | uplink-pdu-len-validation }

default { iov-ui-in-xid-reset | n201u-max } { sapi11 | sapi3 | sapi5 | sapi9 |
  pdu-lifetime | T200 sapi1 | T200 sapi11 | T200 sapi13 | T200 sapi15 | T200 sapi7 | T200 sapi9 | uplink-pdu-len-validation }

no llc uplink-pdu-len-validation
```

---

**defaul**
Resets the configuration to the default values.

---

**no**
Disables the **uplink-pdu-len-validation**.

---

**iov-ui-in-xid-reset**
Available in 8.0 releases only.
This keyword makes it possible for the operator to configure whether or not to send IOV-UI in an XID-RESET. This is useful when the MS is not setup to accept IOV-UI (for example, MS sends Attach/RAU Requests with cksn=7) and including IOV-UI in the XID-Reset would result in Attach/RAU failure.
Default: Enabled

---

**n201u-max sapin pkt_size**
This keyword sets the maximum number of octets, per service access point identifier (SAPI), for the downlink data packets. This is the upper limit that the SGSN will negotiate with the subscriber for packets sent from the SGSN to the BSC.

- **sapin**: Command must identify one of the following SAPI: sapi11, sapi3, sapi5, or sapi9.
- **pkt_size**: Must be an integer from 140 to 1520. Default size is 1520 octets.
**pdu-lifetime secs**
Defines LLC layer PDU lifetime at the BSC.
*secs* must be an integer from 0 to 90.
Default: 6

**T200 sapi1 time**
Sets the retransmission timer (in seconds) for sapi1.
*time* must be an integer of 1 to 10.
Default: 5

**T200 sapi11 time**
Sets the retransmission timer (in seconds) for sapi11.
*time* must be an integer of 1 to 50.
Default: 40

**T200 sapi3 time**
Sets the retransmission timer (in seconds) for sapi3.
*time* must be an integer of 1 to 10.
Default: 5

**T200 sapi5 time**
Sets the retransmission timer (in seconds) for sapi5.
*time* must be an integer of 1 to 20.
Default: 10

**T200 sapi7 time**
Sets the retransmission timer (in seconds) for sapi7.
*time* must be an integer of 1 to 40.
Default: 20

**T200 sapi9 time**
Sets the retransmission timer (in seconds) for sapi9.
*time* must be an integer of 1 to 40.
Default: 20

**uplink-pdu-len-validation**
Available in releases 8.1 and higher.
This feature enables validation of the size of the uplink LLC packets. With validation enabled, the SGSN will drop any uplinked packets that are larger than the negotiated limit.
If the **no** form of the command is used, then this feature is disabled. The SGSN will be more flexible with uplink packet sizes. So if the SGSN and MS have a mismatch and the MS sends packets that are larger than expected, then the SGSN will not drop the packets.
Default: Enabled.

**Usage**
Use the command repeatedly to configure additional timers and features for the LLC sub-layer.
Example
Set the T200 retransmission timer to timeout at 12 seconds for SAPI5:

```plaintext
llc t200 sapi5 12
```

Use the following command to instruct the SGSN to ignore the N201_U packet size limits for uplink packets from an MS:

```plaintext
no uplink-pdu-len-validation
```
nri

This command configures the network resource identifier (NRI) to identify a specific SGSN. The NRI is stored in the P-TMSI. The SGSN uses a portion of this NRI to set the parameters for Gb flex (SGSN pooling) functionality.

Product

SGSM

Privilege

Security Administrator, Administrator

Syntax

nri length nri_length { nri-value nri_value | null-nri-value null_nri_value non-broadcast-lac lac_id rac rac_id { nri-value value } }

no nri

no

Removes the configured NRI value and location in P-TMSI for retrieval by this SGSN operator policy.

nri length nri_length

Specifies the number of bits to be used in the P-TMSI, bits 23 to 18, to define the network resource identifier (NRI). The NRI length configuration also sets the maximum size of the pool. If not configured, the NRI length will be of zero length.

nri_length: Must be an integer from 1 to 6 to identify the number of bits.

null-nri-value null_nri_value

Configures the null NRI value which must be unique across the pool areas. This keyword is used for the offloading procedure for SGSN pooling (enabled with the sgsn offloading command, see the Exec Mode chapter).

null_nri_value: 0 (zero) indicates the keyword is not to be used and 1 to 63 are used to identify the SGSN to be used for the offloading procedure for SGSN pooling. There is no default value for this parameter.

non-broadcast lac lac_id rac rac_id

Defines the non-broadcast LAC/RAC to be used in combination with the null-NRI for the offloading procedure.

lac_id defines a location area code associated with a BSS. Must be an integer between 1 and 65535.

rac_id defines the remote area code to be associated with a BSS. Must be an integer between 1 and 255.

nri-value nri_value

Specifies the MS-assigned value of the NRI to retrieve from the P-TMSI. This value must not exceed the maximum possible value specified by the NRI length. The NRI value must be unique across the pool or across all overlapping pools.

nri_value must be an integer from 1 to 63 to identify a specific SGSN in a pool. Use of 0 (zero) value is not recommended.

Multiple NRI values can be identified by providing multiple nri-values separated by a blank space for example: nri length 6 nri-value 29 43 61
Usage

Use this command to add or remove the Gb flex pool configuration for this GPRS service. The command can be repeated to specify different values for any of the keyword parameters. If more than one NRI is configured, the GPRS service will round-robin between the available NRIs when new subscribers (re)connect.

Use this command to retrieve the NRI (identity of an SGSN) stored in in bits 23 to 18 of the packet-temporary mobile subscriber identity (P-TMSI). If more than one NRI value is configured, the GPRS service will round-robin between the available NRIs when new subscribers (re)connect.

Example

The following command specifies the the NRI length as 5 bits, identifies SGSN 23 with LAC 222 and RAC 12 for offloading procedure with NRIs 6 and 41:

```
nri length 5 null-nri-value 34 non-broadcast lac 222 rac 12 nri-value 6 41
```
paging-policy

Configures the paging parameters for the GPRS service.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

paging-policy { last-known-area { all | bsc | cell | location-area | routing-area } + | max-retransmissions:retran_num}

no paging-policy last-known-area { bsc | cell | location-area | routing-area }

default paging-policy { last-known-area | max-retransmissions } 

no
Disables the paging-policy definition for this GPRS service configuration.

default
Resets the defaults for parameters managed by this paging policy.

last-known-area
Select one or more paging areas and enter them in preferred paging order:
• all : Pages in the last known BSC.
• bsc : Pages in last known BSC.
• cell : Pages in last known cell.
• location-area : Pages in last known location area.
• routing-area : Pages in last known routing area.

By default, paging occurs in the following order:
cell, BSC, routing area, location area.

max-retransmission retn_num

Configures the maximum number of retries for a page request per paging area.

retn_num: Enter an integer from 0 to 5.
• 2 : default.
• 0 : disables retransmission for paging request so that the SGSN only sends a single 2G PS-paging request to the BSC with no retransmissions.

+ Keywords can be repeated or combined as needed to complete the paging policy configuration.
Usage
Use this command to configure the order of preference for retransmitting into specified paging-areas.

Example
Use the following command to instruct the SGSN to page the cell and BSC as the last-known areas:

```
paging-policy last-known-area cell bsc
```
**peer-nsei**

This command associates a peer (remote) network service entity (NSEI) for a BSS with this GPRS service.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
peer-nsei nse_id { lac lac_id rac rac_id | pooled }

[ no ] peer-nsei nse_id { lac lac_id rac rac_id | pooled }
```

- **no**
  Removes the NSEI LAC/RAC or pooling configuration from this BSS peer configuration.

- **nse_id**
  Defines the NSEI for this GPRS service.
  *nse_id* must be an integer from 0 to 65535.

- **lac lac_id**
  Defines a location area code associated with the NSE BSS.
  *lac_id* must be an integer between 1 and 65535.

- **rac rac_id**
  Defines the remote area code to be associated with the NSE BSS.
  *rac_id* must be an integer between 1 and 255.

- **pooled**
  Enables pooling with non-pooled BSCs within the pool area.

**Usage**

Use this command repeatedly to associate one or more LAC/RAC combinations and/or pooling with this peer-GPRS service configuration.

The Network Service Entity (NSE) at the BSS and the SGSN provides the network management functionality required for the operation of the Gb interface. Each NSE is identified by means of NSE identifier (NSEI).

**Example**

The following command configures the NSE with identifier as 4114 having location area code 234 and routing area code as 22:

```
peer-nsei 4114 lac 234 rac 22
```

The following command enables Gb flex (pooling) functionality for this GPRS service:
peer-nsei 4114 pooled
plmn

This command identifies the Public Land Mobile Network (PLMN) for the GPRS service.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
plmn id mcc mcc_num mnc mnc_num

no plmn id
```

```
no
Removes the PLMN information from the configuration for the current SGSN service.
```

```
mcc mcc_num
Define the mobile country code (MCC) portion of the PLMN Id.
mnc_num must be a 3 digit integer from 100 to 999.
```

```
mnc mnc_num
Define the mobile network code (MNC) portion of the PLMN Id.
mnc_num must be a 2 or 3 digit integer from 00 to 999.
```

Usage
Use this command to set PLMN parameters for the current SGSN service.

Example
The following command identifies the PLMN MCC as 200 and the MNC as 10:

```
plmn id mcc 200 mnc 10
```
**setup-timeout**

This command configures the maximum number of seconds allowed for session setup.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
setup-timeout seconds
```

```
default setup-timeout
```

**default**

Returns the configuration to the default, 60 seconds.

**seconds**

An integer from 1 to 100000.

**Usage**

Use this command to set the time allowed for session setup.

**Example**

The following command sets the maximum session setup time to 300 seconds:

```
setup-timeout 300
```
sgsn-context-request

This command specifies whether or not the PTMSI signature check should be skipped if the PTMSI signature is not included in the SGSN context request.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sgsn-context-request ptmsi-signature-absence allowed
no sgsn-context-request ptmsi-signature-absence allowed
default sgsn-context-request ptmsi-signature-absence
```

- **no**
  - Removes this definition from the system configuration.

- **default**
  - Returns the configuration to the default action to perform the PTMSI signature check.

**Usage**
Use this command to skip the PTMSI signature check.

**Example**
The following command instructs the system to perform the PTMSI signature check.

```
default sgsn-context-request ptmsi-signature-absence
```
sgsn-number

Define the SGSN E.164 number to be used when interacting via MAP protocol for this GPRS service.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sgsn-number sgsn_number
no sgsn-number
```

**Usage**

Use this command to identify the ISDN number for the SGSN associated with this GPRS service.

**Example**

Disable the E.164 number for this GPRS service.

```
no sgsn-number
```
**sm**

This command configures the session management (SM) parameters associated with this particular GPRS service context.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sm { activate-max-retransmissions num_retries | deactivate-max-retransmissions num_retries |
ignore-pco-decode-error | modify-max-retransmissions num_retries |
partial-apn-match | requested-apn-from-first-subrec | t3385-timeout secs |
t3386-timeout secs | t3395-timeout secs | trim-trailing-spaces-in-apn }
```

```
default sm { activate-max-retransmissions | deactivate-max-retransmissions | 
ignore-pco-decode-error | modify-max-retransmissions | t3385-timeout | t3386-
timeout | t3395-timeout | trim-trailing-spaces-in-apn }
```

**default**

Resets the SM parameters to the defaults.

**activate-max-retransmissions num_retries**

Defines the maximum number of retries to transmit ‘activate PDP context request’.

- `num_retries`: Must be an integer from 1 to 10.
- Default: 4

**deactivate-max-retransmissions num_retries**

Defines the maximum number of retries to transmit ‘deactivate PDP context request’.

- `num_retries`: Must be an integer from 1 to 10.
- Default: 4

**ignore-pco-decode-error**

Enables the SGSN to ignore received decode errors that are due to incorrectly encoded PCO IE length in SM Requests.

- Default: disabled

**modify-max-retransmissions num_retries**

Defines the maximum number of retries to transmit ‘modify PDP context request’.

- `num_retries`: integer from 1 to 10.
- Default: 4

**partial-apn-match**

Enables partial matching of requested APN during APN selection.
Partial APN or APN with trailing spaces may be present in an Activate Request because incorrect information was keyed in by the user. Though it is valid to reject such Activation Requests, it increases the signaling between the MS and the SGSN. This has an impact on the radio resources.

**requested-apn-from-first-subrec**

Enables use of a ‘requested APN’ from the first subscription record. When this feature is enabled, the PDP Activation is not rejected during APN Selection; instead, the APN from the first subscription record is used as the requested APN and the SGSN continues with the rest of the APN Selection process.

A requested APN is an optional IE in an Activate PDP Request. To get the requested PDP type, if multiple PDP subscription records exist for the subscriber, then the MS has to include the APN information to choose the PDP subscription record during APN selection. Otherwise, such activations will be rejected during APN selection (per TS 23.060 Appendix A). Though it is valid to reject such activation requests, it increases the signaling between the MS and the SGSN, which impacts the radio resources.

**t3385-timeout secs**

Defines the maximum amount of time for retransmission of ‘activate request’ messages.

*secs*: Must be an integer from 1 to 60.

Default: 8

**t3386-timeout secs**

Defines the maximum amount of time for retransmission of ‘modify request’ messages.

*secs*: Must be an integer from 1 to 60.

Default is 8 seconds.

**t3395-timeout secs**

Defines the maximum amount of time for retransmission of ‘deactivate request’ messages.

*secs*: Must be an integer from 1 to 60.

Default: 8

**trim-trailing-spaces-in-apn**

Enables SGSN to strip off any trailing space(s) in requested APN.

If a requested APN in an Activate PDP Context Request has any trailing spaces, then those trailing spaces will be removed and the length field will be updated.

**Usage**

Repeat this command with different keywords (parameters) to configure the SM (session management) as needed for this GPRS service. Keywords can be used to optimize signaling between the MS and the SGSN to reduce the impact on the radio resources.

**Example**

Reset the number of retransmission messages for deactivate PDP context request to 5.

```
sm deactivate-max-retransmissions 5
```
**sndcp**

Define the SNDCP reassembly-timeout interval associated with this GPRS service.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
sndcp reassembly-timeout time

default sndcp reassembly-timeout
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>default</code></td>
<td>Resets the timer configuration to the default value.</td>
</tr>
<tr>
<td><code>time</code></td>
<td>Defines the interval. <code>time</code>: Must be an integer from 1 to 5. The default is 5 seconds.</td>
</tr>
</tbody>
</table>

**Usage**
Use this command to modify the SNDCP reassembly timer.

**Example**
Reset the default for the timer.

```plaintext
default sndcp reassembly-timeout
```
Chapter 107
GRE Tunnel Interface Configuration Mode Commands

The Generic Routing Encapsulation (GRE) Tunnel Interface Configuration Mode is used to create and manage the GRE tunneling interfaces for addresses, address resolution options, etc.

![Diagram]

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**destination**

This command configures the destination IPv4 address of the tunnel by specifying the IPv4 destination end address. This is a mandatory configuration for GRE tunnel interface.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[no] destination address ip_address
```

- **no**
  Removes/disassociates the configured destination IP address from specific GRE tunnel interface configuration.

- **address ip_address**
  Configures the IP address for the interface specifying the IPv4 IP address.
  *ip_address* must be specified using the standard IPv4 dotted decimal notation.

**Usage**

Use this command to configure the destination IPv4 address of the tunnel by specifying the IP address of destination tunnel end for GRE tunnel interface.

**Important**: State of source address will affect the operational state of the tunnel.

**Example**

The following command sets the 1.2.3.4 as destination IP address of the GRE tunnel interface:

```
destination address 1.2.3.4
```
end

Exits the interface configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Change the mode back to the Exec mode.
exit

Exits the Interface Configuration Mode and returns to the Context Configuration Mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
exit
```

**Usage**
Return to the context configuration mode.
keepalive

This command configures various parameters for sending Keepalives to the remote end-point in GRE tunnel interface configuration. By default sending keepalives is disabled.

Product
All

Privilege
Security Administrator, Administrator

Syntax

keepalive [interval time_interval num-retry retry]

[default | no] keepalive

default
Sets the sending of Keepalives with default parameters.
interval: 10 seconds
num-retry: 3 retries

no
Disables the keepalive and turns off the sending of Keepalives messages.

interval time_interval
Default: 10
Specifies the time interval (in seconds) between two Keepalives sent to remote ends of GRE tunnel interface configuration.
time_interval must be an integer from 5 through 3600.

num-retry retry
Default: 3
Specifies number of retransmission of keepalives to remote node without getting any response before the remote node is marked as dead/down.
retry must be an integer between 0 through 10.

Usage
Use this command to configure the parameters for sending Keepalives to the remote end-point of GRE tunnel. It also configures the interval at which GRE Keepalives are sent on the interface and number of retries without getting a response from the remote end-point before the tunnel is shutdown. By default, Keepalives will not be sent.

Example
The following command enables the keepalive and sets the other parameters to defaults:

default keepalive
keepalive
source

This command configures the source IPv4 address of the tunnel either by specifying the IP address (host address) or by specifying another configured non-tunnel IPv4 interface. This is a mandatory configuration for GRE tunnel interface.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[no] source {address ip_address | interface interface_name}

- **no**
  Removes/disassociates the configured source IP address or host interface from specific GRE tunnel interface configuration.

- **address ip_address**
  Configures the IP address for the interface specifying the IPv4 IP address.
  *ip_address* must be specified using the standard IPv4 dotted decimal notation.

- **interface interface_name**
  Specifies the name of the preconfigured non-tunnel IPv4 interface, whose address is used as the source address of the GRE tunnel.

Usage
Use this command to configure the source IPv4 address of the tunnel either by specifying the IP address (host address) or by specifying another configured non-tunnel IPv4 interface for GRE tunnel interface.

**Important:** State of source address will affect the operational state of the tunnel.

Example
The following command sets the 1.2.3.4 as source IP address of the GRE tunnel interface:

```
source address 1.2.3.4
```
tos

This command configures the parameters/action for the TOS parameter in the IPv4 tunnel transport protocol header.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
ip tos {value [af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef | lower-bits tos_value] | copy}
```

no ip tos

**default**
Sets the IP TOS to lower bits value of 0.

**value [tos_value]**
Default: af11
Specifies the IP QoS DSCP per-hop behavior to be marked on the outer header of signalling packets originating from the Access Gateway. This is a standards-based feature (RFC 2597). The following forwarding types are supported:

- **af11**: Designates the use of Assured Forwarding 11 per-hop behavior
- **af12**: Designates the use of Assured Forwarding 12 per-hop behavior
- **af13**: Designates the use of Assured Forwarding 13 per-hop behavior
- **af21**: Designates the use of Assured Forwarding 21 per-hop behavior
- **af22**: Designates the use of Assured Forwarding 22 per-hop behavior
- **af23**: Designates the use of Assured Forwarding 23 per-hop behavior
- **af31**: Designates the use of Assured Forwarding 31 per-hop behavior
- **af32**: Designates the use of Assured Forwarding 32 per-hop behavior
- **af33**: Designates the use of Assured Forwarding 33 per-hop behavior
- **af41**: Designates the use of Assured Forwarding 41 per-hop behavior
- **af42**: Designates the use of Assured Forwarding 42 per-hop behavior
- **af43**: Designates the use of Assured Forwarding 43 per-hop behavior
- **be**: Designates the use of Best Effort forwarding per-hop behavior
- **ef**: Designates the use of Expedited Forwarding per-hop behavior typically dedicated to low-loss, low-latency traffic.

The assured forwarding behavior groups are listed in the table below.

<table>
<thead>
<tr>
<th></th>
<th>Class 1</th>
<th>Class 2</th>
<th>Class 3</th>
<th>Class 4</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Low Drop</strong></td>
<td>AF11</td>
<td>AF21</td>
<td>AF31</td>
<td>AF41</td>
</tr>
<tr>
<td><strong>Medium Drop</strong></td>
<td>AF12</td>
<td>AF22</td>
<td>AF32</td>
<td>AF42</td>
</tr>
<tr>
<td><strong>High Drop</strong></td>
<td>AF13</td>
<td>AF23</td>
<td>AF33</td>
<td>AF43</td>
</tr>
</tbody>
</table>

Traffic marked with a higher class is given priority during congestion periods. If congestion occurs to traffic with the same class, the packets with the higher AF value are dropped first.
**lower-bits** *tos_value*

Default: 0
Sets the least-significant 6 bits in the TOS byte with the specified numeric value.
*tos_value* must be an integer from 0 through 255.

**copy**

This keyword instructs the system to copy the TOS value from the passenger IPv4 packet or Traffic class value from the passenger IPv6 packet to the TOS value of the IPv4 tunnel transport protocol header.

**Usage**

Use this command either to set the TOS parameter in the IPv4 tunnel transport protocol header to the specified value or instructs to copy the TOS value from the passenger IPv4 packet or Traffic class value from the passenger IPv6 packet to the TOS value of the IPv4 tunnel transport protocol header. If one of the enumerated values is set, the DSCP bits which are the six most-significant bits in the TOS byte are marked. If the integer value is set, it will be written into the six least-significant bits of the TOS byte.

**Example**

The following command instructs the system to copy the TOS value from the passenger IPv4 packet or Traffic class value from the passenger IPv6 packet to the TOS value of the IPv4 tunnel transport protocol header:

```
tos copy
```
ttl

This command configures the Time to live (TTL) parameter to be used in the tunnel transport protocol header for the current GRE tunnel interface.

### Product
All

### Privilege
Security Administrator, Administrator

### Syntax
```
ttl ttl_value
```
```
default ttl
```

```
default
Sets the TTL value to system default value; i.e. 15.
```

```
ttl_value
Default: 15
Specifies the maximum time to live to be used in the tunnel transport protocol header
The time to live (TTL) is not a measure of time but the number of hops through the network.
ttl_value must be an integer between 1 through 255.
```

### Usage
Use this command to set the TTL parameter to be used in tunnel transport protocol header for GRE tunnel configuration.

### Example
The following configures the IP address to associate with the interface:
```
ttl 10
```
The Group of Ruledefs Configuration Mode is used to configure groups of ruledefs. This mode is accessed by entering the group-of-ruledefs command in the Active Charging Service Configuration Mode.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
add-ruledef

This command enables adding/removing ruledefs in the current group-of-ruledefs.

**Important:** A maximum of 128 ruledefs can be added to a group-of-ruledefs.

**Product** ACS

**Privilege** Security Administrator, Administrator

**Syntax**

```
add-ruledef priority priority ruledef ruledef_name
no add-ruledef priority priority
```

- **no**
  Specifies that the ruledef associated with the specified priority number is to be removed from the current group-of-ruledefs.

- **priority priority**
  Specifies priority of a ruledef in the current group-of-ruledefs. `priority` must be unique in the group-of-ruledefs, and must be an integer from 1 through 10000.

- **ruledef ruledef_name**
  Specifies name of the ruledef to add to the current group-of-ruledefs. `ruledef_name` must be the name of a ruledef, and must be an alpha and/or numeric string of 1 through 63 characters in length.

**Usage**

Use this command to add/remove ruledefs from a group-of-ruledefs. A group-of-ruledefs may contain optimizable ruledefs. Whether a group is optimized or not is decided on whether all the ruledefs in the group-of-ruledefs can be optimized, and if the group is included in a rulebase that has optimization turned on, then the group will be optimized. When a new ruledef is added, it is checked if it is included in any group-of-ruledefs, and whether it needs to be optimized, etc.

**Example**

The following command adds the ruledef `ruledef23` to the current group-of-ruledefs, and assigns it a priority of 3:

```
add-ruledef priority 3 ruledef ruledef23
```
end

This command returns the CLI prompt to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

end

Usage
Use this command to change to the Exec mode.
exit

This command exits the Group of Ruledefs Configuration mode and returns to the Active Charging Service Configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
exit
```

Usage
Use this command to return to the Active Charging Service Configuration mode.
**group-of-ruledefs-application**

This command specifies the purpose of setting up a group-of-ruledefs as either for charging or for post processing.

**Product**
ACS

**Privilege**
Security Administrator, Administrator

**Syntax**

```
  group-of-ruledefs-application { charging | post-processing }

  no group-of-ruledefs-application
```

- **no**
  - Removes the group-of-ruledefs-application configuration from the current group-of-ruledefs.

- **charging**
  - Specifies that the current group-of-ruledefs is for charging purpose.

- **post-processing**
  - Specifies that the current group-of-ruledefs is for post-processing purpose.

**Usage**

Use this command to specify the purpose of setting up a group-of-ruledefs as either for charging or for post processing. If not configured, by default the rule-application type will be charging.

**Example**

The following command configures the current group-of-ruledefs as for post-processing purpose:

```
group-of-ruledefs-application post-processing
```
Chapter 109
Gs Service Configuration Mode Commands

The Gs Service configuration mode configures the parameters used to setup and maintain a Gs interface for a connection between the SGSN and an MSC/VLR.

```
Exec Mode
| configure
  | Global Configuration Mode
  | context name
  | Context Configuration Mode
  | gs-service name
  | Gs Service Configuration Mode

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
```
### associate-sccp-network

This command associates a previously defined Signaling Connection Control Part (SCCP) network instance with the Gs service. This association is required to access Visitor Location Register(s) (VLRs).

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
associate-sccp-network sccp_net_id
no associate-sccp-network
```

- **no**
  Removes the associated SCCP network configuration instance from this Gs service configuration.

- **sccp_net_id**
  Identifies the SCCP network configuration instance to associate with this Gs interface to enable connection with VLR(s).

  - `sccp_network_num`: Must be an integer from 1 through 12.

**Usage**

Use this command to associate the SCCP network configuration instance with the Gs interface in this service.

**Important:** A single SCCP network configuration instance can not be shared with multiple Gs services.

**Important:** To enable a Gs service, the user needs to configure `ssn` with the `bssap+` command.

**Example**

Following command associates SCCP network 2 with this Gs service.

```plaintext
associate-sccp-network 2
```
bssap+

This command defines the Base Station System Application Part Plus configuration parameters for the Gs service to enable the SGSN to access a Visitor Location Register(s) (VLRs).

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

[ no ] bssap+ ssn ss_num

no
Removes the configured BSSAP+ subsystem number from this Gs service.

ssn ss_num
Specifies the subsystem number to configure in this Gs interface to use BSSAP+.
ss_num must be an integer from 1 through 255.

Usage
Use this command to configure the BSSAP+ subsystem with Gs interface in this service to communicate with VLR(s).

Important: A single SCCP network configuration instance can not be shared with multiple Gs services.

Important: To start a Gs service, the user needs to configure the command parameter.

Example
Following command configures subsystem 101 with BSSAP+ in this Gs service.

bssap+ ssn 101
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
end
```  

**Usage**

Return to the Exec mode.
exit

Exits the current configuration mode and returns to the previous configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Return to the previous configuration mode.
max-retransmission

This command configures the retransmission values for different procedure counters in Gs service as described in TS 29.018.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

max-retransmissions { n8 | n9 | n10 | n12 } retrans_num

default max-retransmissions { n8 | n9 | n10 | n12 }

no
Removes the configured Gs procedures from this Gs service.

{ n8 | n9 | n10 | n12 }
Specifies the various Gs service procedures that are available to be used to communicate with VLR(s).

- n8: Defines the maximum number of retries for explicit IMSI detach from a non-GPRS service. Default is 2.
- n9: Defines the maximum number of retries for implicit IMSI detach from the GPRS service. Default is 2.
- n10: Defines the maximum number of retries for BSSAP+ to send Reset Indication messages. Default is 2.
- n12: Defines the maximum number of retries for BSSAP+ to send Reset Indication messages. Default is 2.

retrans_num
Default: 2
Specifies the number of re-transmission of message for specified procedures.
retrans_num Must be an integer from 0 through 10.

Usage
Use this command to configure the retransmission values for specific procedure counters in Gs service. counters are based on TS 29.018. This command can be entered for each procedure counter separately.

Example
Following command configure retransmission value as 3 for counter for procedure to send BSSAP+ Reset Indication messages in this Gs service.

max-retransmissions n12 3
non-pool-area

This command creates a non-pool area for a set of subscriber location area code (LAC) values that can be used with a specific VLR for the Gs service.

**Product**  
SGSN

**Privilege**  
Security Administrator, Administrator

**Syntax**

non-pool-area non_pool_name { use-vlr vlr_name lac lac_num }+
no non-pool-area non_pool_name

---

**no**
Removes the configured non-pool area from this Gs service.

---

**non_pool_name**
Specifies the name of the non-pool area to configure with this command.  
non_pool_name must be an alpha and/or numeric string of 1 to 63 characters.

---

**use-vlr vlr_name**
Specifies the name of the VLR to be associated with this non-pool area.  
vlr_name is the name of VLR and must be an alpha and/or numeric string of 1 to 63 characters.

---

**lac lac_num**
Specifies the subscribers’ location area code to be attached with this non-pool area and specific VLR. This LAC of subscriber is obtained from the radio area indicator (RAI).  
lac_num is the LAC value and must be an integer value from 1 through 65535.

---

More than one of the above keywords can be entered within a single command.

**Usage**

Use this command to specify the non-pool area containing VLR name to use for a set of LAC. This command can be used multiple times, subject to a limit of 32 LAC values (the total for non-pool-area and pool-area configurations) per Gs service.

**Example**

Following command configure a non-pool area starpool1 to use VLR named starvrl1 for LAC 101 in a Gs service.

non-pool-area starpool1 use-vlr starvrl1 lac 101
**pool-area**

This command creates a pool area configuration instance. This command also enters the Pool Area configuration mode to define the set of VLRs to use for a pool area for a set of subscriber location area code (LAC) values in the Gs service.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
pool-area pool_name [-noconfirm ]
```

```
no pool-area non_pool_name
```

- **no**
  Removes the configured pool area from this Gs service.

- **pool_name**
  Specifies the name of the pool area to configure with this command for VLR pooling and association of a LAC.
  
  `pool_name`: Must be an alpha and/or numeric string of 1 to 63 characters.

- **-noconfirm**
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

**Usage**

Use this command to create/enter the pool area configuration mode. This mode is used configure the set of VLRs to be used for a set of subscriber LAC. This command can be used multiple times, subject to a limit of 32 LAC values (the total number of `non-pool-area` and `pool-area` configurations) per Gs service.

**Example**

The following command configures a pool area named `starpool1` in a Gs service without any confirmation prompt.

```
pool-area starpool1 -noconfirm
```
sgsn-number

Define the SGSN’s E164 number to associate an SGSN with this Gs Service.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
sgsn-number E.164_number
```

<table>
<thead>
<tr>
<th>E.164_number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Defines the SGSN’s ‘telephone’ number, the ISDN number for per ITU-T E.164 numbering plan. The number must be a numerical string of 1 to 15 digits.</td>
</tr>
</tbody>
</table>

Usage
For releases 8.1 or higher, use this command to define the SGSN’s E.164 ISDN number. This value should match the `sgsn-number` defined for SGSN Service or GPRS Service.

**Important:** Note: the Gs Service will not start unless the SGSN’s E.164 number is configured.

Example

```
sgsn-number 12345678901234
```
timeout

This command configures various timers defining the wait before retransmitting a specific message for Gs service procedures.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
timeout { t6-1-timer t6_1_dur | t8-timer t8_dur | t9-timer t9_dur | t10-timer t10_dur | t12-1-timer minute t12_1_dur | t12-2-timer t12_2_dur }

[ default ] timeout { t6-1-timer | t8-timer | t9-timer | t10-timer | t12-1-timer | t12-2-timer }
```

default

Sets the timer value to wait in seconds/minutes to default values. Default values for timers are:

- **t6-1-timer**: 10 seconds
- **t8-timer**: 4 seconds
- **t9-timer**: 4 seconds
- **t10-timer**: 4
- **t12-1-timer**: 54 mins (+ 8 seconds)
- **t12-2-timer**: 4 seconds

---

t6-1-timer t6_1_dur

Default: 10
Specifies the retransmission timer value to guard the location update.

`t6_1_dur` is the waiting duration in seconds before retransmitting the specific message and must be an integer from 10 through 90.

---

t8-timer t8_dur

Default: 4
Specifies the retransmission timer value to guard the explicit IMSI detach from the GPRS service procedure.

`t8_dur` is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 30.

---

t9-timer t9_dur

Default: 4
Specifies the retransmission timer value to guard the explicit IMSI detach from the non-GPRS service procedure.

`t9_dur` is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 30.
**t10-timer** t10_dur
Default: 4
Specifies the retransmission timer value to guard the implicit IMSI detach from the GPRS service procedure. t10_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 30.

**t12-1-timer** minute t12_1_dur
Default: 54 minutes (plus 8 seconds for transmission delay)
Specifies the retransmission timer value to control the resetting of SGSN-Reset variable procedure. t12_1_dur is the waiting duration in minutes before retransmitting reset message for the SGSN Reset variable and must be an integer from 0 through 380.

**t12-2-timer** t12_2_dur
Default: 4
Specifies the retransmission timer value to guard the SGSN reset procedure. t12_2_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 30.

**Usage**
Use this command to configure the time, for different procedure timers, to wait before retransmitting a procedure message.
This command can be repeated for each timer to configure multiple timers.

**Example**
Following command sets the timeout duration of 4 seconds for t8 timer to wait before retransmitting the procedure message to explicitly do the IMSI detach from GPRS service:

```
default timeout t8-timer
```
vlr

This command defines a VLR configuration for use with this Gs service.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
vlr vlr_name isdn-number E164_num [ bssap+ ssn ssn ] [ point-code pt_code ]

no vlr vlr_name
```

**vlr_name**
Specifies the name of the VLR to configure in this Gs mode with ISDN number.

**isdn-number**
Specifies the VLR number to configure with this command.

**bssap+ ssn ssn**
Specifies the subsystem number to configure with this VLR to use BSSAP+.

**point-code**
Specifies SS7 address of VLR in point code value to this configured VLR name.

**Usage**
Use this command to define VLR configuration instances to be associated with the Gs service.

A maximum of 32 VLRs can be configured per Gs service.

**Example**
Following command configures the VLR named starvlr1 with an ISDN number 12344567, a subsystem number of 252, and a point code value of 123.345.567:

```
vlr starvlr1 isdn-number 12344567 point-code 123.345.567
```
Chapter 110
GT-Format1 Configuration Mode Commands

The GT-Format1 configuration mode is a sub-mode for either the Global Title Translation Association configuration mode or the Global Title Translation Address-Map configuration mode. This sub-mode configures a set of rules used in the global title translation (GTT) process.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

end

Usage
Change the mode back to the Exec mode.
exit

Exits the configuration mode and returns to the Global configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Return to the Global configuration mode.
nature-of-address

Configures the indicator to identify the nature of the address.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
nature-of-address ( international | national | subscriber )
```

- **international**
  
  Identifies the numbers as international.

- **national**
  
  Identifies the numbers as matching the national configuration.

- **subscriber**
  
  Identifies the numbers as subscriber numbers.

**Usage**

Configure the identify of the GT format as national.

**Example**

```
nature-of-address national
```
**odd-even-indicator**

Configures the bits for matching the global title translation.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
odd-even-indicator type
```

- **type**
- **odd**: Sets the odd bit for matching the GTT.
- **even**: Sets the even bit for matching the GTT.
Chapter 111
GT-Format2 Configuration Mode Commands

The GT-Format2 configuration mode is a sub-mode for either the Global Title Translation Association configuration mode or the Global Title Translation Address-Map configuration mode. This sub-mode configures a set of rules used in the global title translation (GTT) process.

```
Exec Mode
  configure
    Global Configuration Mode
      gtt association id
        GTT Association Configuration Mode
          gt-format 2
            GT-Format2 Configuration Mode
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the configuration mode and returns to the Exec mode.

**Product**  
All

**Privilege**  
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Change the mode back to the Exec mode.
exit

Exits the configuration mode and returns to the Global configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
exit
```

Usage
Return to the Global configuration mode.
translation-type

Configures the translation type to be applied during the translation process.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

\texttt{translation-type \textit{number}}

\textit{number}
Must be an integer between 0 and 255.
Default is 0

Usage
Use this command to configure the GTT translation type to be applied during global title translation process.

Example

\texttt{translation-type 232}
Chapter 112
GT-Format3 Configuration Mode Commands

The GT-Format3 configuration mode is a sub-mode for either the Global Title Translation Association configuration mode or the Global Title Translation Address-Map configuration mode. This sub-mode configures a set of rules used in the global title translation (GTT) process.

```
Exec Mode

configure

Global Configuration Mode

gtt association id

GTT Association Configuration Mode

gt-format 3

GT-Format3 Configuration Mode
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
encoding-scheme

Configures the encoding-scheme to use during global title translation (GTT).

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
encoding scheme scheme_type
```

- `scheme_type`

Select one of the following encoding scheme types to determine the encoding type to be used during GTT:
- `bcd-even`: BCD even encoding scheme
- `bcd-odd`: BCD odd encoding scheme
- `nw-specific`: Network specific encoding scheme
- `unknown`: Unknown encoding scheme

Usage
Select BCD even encoding for GTT

Example

```
encoding scheme bcd-even
```
end

Exits the configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```plaintext
end
```

Usage
Change the mode back to the Exec mode.
exit

Exits the configuration mode and returns to the Global configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Return to the Global configuration mode.
numbering-plan

Configures the GTT process to apply one of the numbering-plans during the GT translation process.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

numbering-plan plan_type

plan_type
Select one of the following numbering plans be employed during GTT:
• data: Data numbering plan
• generic: Generic number plan
• isdn: ISDN tel numbering plan
• isdn-mobile: ISDN mobile numbering plan
• land-mobile: Land mobile numbering plan
• maritime-mobile: Maritime mobile numbering plan
• nw-specific: Private network / network-specific numbering plan
• telex: Telex numbering plan
• unknown: Unknown numbering plan

Usage
Select ISN telephone number plan for GTT process.

Example
The following command sets the numbering plan to use during GTT processing to isdn

numbering-plan isdn
**translation-type**

Configures the global title translation (GTT) process to apply a specific number for translation during the GTT process.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
translation-type number
```

*number*

Must be an integer between 0 and 255. Default is 0

**Usage**

Use this command to define the translation-type to be used during the global title translation process.

**Example**

```
translation-type 233
```
Chapter 113
GT-Format4 Configuration Mode Commands

The GT-Format4 configuration mode is a sub-mode for either the Global Title Translation Association configuration mode or the Global Title Translation Address-Map configuration mode. This sub-mode configures a set of rules used in the global title translation (GTT) process.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
encoding-scheme

Configures the encoding-scheme to use during GTT.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
encoding scheme scheme_type
```

- **scheme_type**
  Select one of the following encoding scheme types to determine the encoding type to be used during GTT:
  - `bcd-even`: BCD even encoding scheme
  - `bcd-odd`: BCD odd encoding scheme
  - `nw-specific`: Network-specific encoding scheme
  - `unknown`: Unknown encoding scheme

**Usage**
Select BCD even encoding for GTT

**Example**

```
encoding scheme bcd-even
```
end

Exits the configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
end
```

**Usage**
Change the mode back to the Exec mode.
exit

Exits the configuration mode and returns to the Global configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Return to the Global configuration mode.
nature-of-address

Configures the indicator to identify the nature of the address.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
nature-of-address ( international | national | subscriber )
```

- **international**
  Identifies the numbers as international.

- **national**
  Identifies the numbers as matching the national configuration.

- **subscriber**
  Identifies the numbers as subscriber numbers.

Usage

Configure the identify of the GT format as national.

Example

```
nature-or-address national
```
numbering-plan

Configures the GTT process to apply one of the numbering-plans during the GT translation process.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

numbering-plan plan_type

- **plan_type**
  Select one of the following numbering plans be employed during GTT:
  - **data**: Data numbering plan
  - **generic**: Generic number plan
  - **isdn**: ISDN tel numbering plan
  - **isdn-mobile**: ISDN mobile numbering plan
  - **land-mobile**: Land mobile numbering plan
  - **maritime-mobile**: Maritime mobile numbering plan
  - **nw-specific**: Private network/ network-specific numbering plan
  - **telex**: Telex numbering plan
  - **unknown**: Unknown numbering plan

Usage

Select ISN telephone number plan for GTT process.

Example

numbering-plan isdn
translation-type

Configures the GTT process to apply a specific number for translation during the GTT process.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
translation-type number
```

- `number`
  Must be an integer between 0 and 255.
  Default is 0.

Usage
Use this command to configure the translation-type to be implemented during the global title translation process.

Example

```
translation-type 231
```
Chapter 114
GTPP Server Group Configuration Mode Commands

The GTPP Server Group Configuration Mode is used to create and manage the GTPP server groups within the context or system.

GTPP server group commands facilitate the setup of the SMC hard disk for CDR storage. As well, for accounting and charging functionality within a context, these commands can be used to configure the management of a group (list) of charging gateway function (CGF) servers on a per subscriber or per GGSN APN level.

In this mode, your prompt will be similar to `/context_name>hostname(config-gtpp-group)#`
gtpp attribute

Enables the specification of some of the optional fields in the CDRs that the GSN (GGSN or SGSN) generates and/or how the information is to be presented.

Product
GGSN, SGSN

Privilege
Security Administrator, Administrator

Syntax

```
gtpp attribute { cell-plmn-id | diagnostics | duration-ms | imei | local-record-sequence-number | misisdn | node-id-suffix STRING | plmn-id | rat | record-extensions | sms { destination-number | recording-entity | service-centre } } +
```

```
no gtpp attribute { cell-plmn-id | diagnostics | duration-ms | imei | local-record-sequence-number | misisdn | node-id-suffix | plmn-id | rat | record-extensions | rat | sms { destination-number | recording-entity | service-centre } }
```

```
default gtpp attribute { cell-plmn-id | diagnostics | duration-ms | imei | local-record-sequence-number | misisdn | plmn-id | rat | record-extensions | sms { destination-number | recording-entity | service-centre } }
```

---

default

 Resets the default attribute values for this GTPP group configuration.

---

no

 Disables the specified optional field so that the information will not be present in generated CDRs.

---

cell-plmn-id

SGSN only
Default: Disabled
Enter this keyword to enable the system to include the Cell PLMN ID field in the M-CDR.

---

diagnostics

Default: Disabled
Enter this keyword to enable the system to include the Diagnostic field in the CDR that is created when PDP contexts are released. The field will include one of the following values:

- **26** - For GGSN: if the GGSN sends “delete PDP context request” for any other reason (e.g., the operator types “clear subscribers” on the GGSN). For SGSN: The SGSN includes this cause code in the S-CDR to indicate that a secondary PDP context activation request or a PDP context modification request has been rejected due to insufficient resources.

- **36** - For GGSN: this cause code is sent in the G-CDR to indicate the PDP context has been deactivated in the GGSN due to the SGSN having sent a “delete PDP context request” to the GGSN. For SGSN, this cause code is used to indicate a regular MS or network-initiated PDP context deactivation.
- 37 - when the network initiates a QoS modification, the SGSN sends in the S-CDR to indicate that the MS initiation deactivate request message has been rejected with QoS not accepted as the cause.

- 38 - if the GGSN sends “delete PDP context request” due to GTP-C/GTP-U echo timeout with SGSN. If the SGSN sends this cause code, it indicates PDP context has been deactivated due to path failure, specifically GTP-C/GTP-U echo timeout.

- 39 - SGSN only - this code indicates the network (GGSN) has requested a PDP context reactivation after a GGSN restart.

- 40 - if the GGSN sends “delete PDP context request” due to receiving a RADIUS Disconnect-Request message.

duration-ms
Default: Disabled
Specifies that the information contained in the mandatory Duration field be reported in milliseconds instead of seconds (as the standards require).

imei
Default: Disabled
For SGSN: includes the IMEI value in the S-CDR.
For GGSN: includes the IMEISV value in the G-CDR.

local-record-sequence-number
Default: Disabled
This keyword provides both the local record sequence number and the Node ID. In the x-CDRs, this field indicates the number of CDRs generated by the node and is unique within the session manager. The Node ID field is included in the x-CDR for any of several reasons, such as when PDP contexts are released or if partial-CDR is generated based on configuration. The field will consist of a AAA Manager identifier automatically appended to the name of the SGSN or GGSN service. The name of the SGSN or GGSN service may be truncated, because the maximum length of the Node ID field is 20 bytes. Since each AAA Manager generates CDRs independently, this allows the Local Record Sequence Number and Node ID fields to uniquely identify a CDR.

**Important:** If this keyword is enabled and the `gtpp centralized-lrsn-creation` option is enabled with the `gtpp single-source centralized-lrsn` command, then the Node ID format changes as follows.

- `<1-byte-AAProxy-restart-counter> <3-byte AAProxy instance number> <node-id-suffix>` If “centralized-lrsn-creation” is not enabled, then node-id format for CDRs generated by Sessmgr is as follows.

  - `<1-byte Sessmgr restart-value> <3-byte Sessmgr instance number> <node-id-suffix>` If “centralized-lrsn-creation” is not enabled, then node-id format for CDRs generated by ACSMgr is as follows.

  - `<1-byte ACSmgr restart-value> <3-byte ACSmgr instance number>` <Active charging service-name>

msisdn
Default: Enabled
For SGSN: includes the MSISDN value in the S-CDR.
For GGSN: includes the MSISDN value in the G-CDR.

node-id-suffix STRING
Default: Disabled
Specifies the string suffix to use in the NodeID field of GTPP CDRs. Each Session Manager task generates a unique NodeID string per GTPP context.

**STRING:** This is the configured Node-ID-Suffix having any string between 1 to 16 characters.

**Important:** The NodeID field is a printable string of the nddddSTRING format: n: The first digit is the Sessmgr restart counter having a value between 0 and 7. ddd: The number of sessmgr instances. Uses the specified NodeID-suffix in all CDRs. The “Node-ID” field consists of sessMgr Recovery counter (1 digit) n + AAA Manager identifier (3 digits) ddd + the configured Node-id-suffix (1 to 16 characters) STRING. If the centralized LRSN feature is enabled, the “Node-ID” field will consist of only the specified NodeID-suffix (NodeID-prefix is not included). If this option is not configured, then GTPP group name will be used instead (For default GTPP groups, context-name will be used).

**Important:** If this node-id-suffix is not configured, the GGSN uses the GTPP context name as the Node-id-suffix (truncated to 16 characters) and the SGSN uses the GTPP group named as the node-id-suffix.

<table>
<thead>
<tr>
<th>plmn-id [ unknown-use ]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: Enabled</td>
</tr>
<tr>
<td>For SGSN, reports the SGSN PLMN Identifier value (the RAI) in the S-CDR provided if the dictionary supports it.</td>
</tr>
<tr>
<td>For GGSN, reports the SGSN PLMN Identifier value (the RAI) in the G-CDR if it was originally provided by the SGSN in the GTP create PDP context request. It is omitted if the SGSN does not supply one. Normally when SGSN PLMN-id information is not available, the attribute sgsnPLMNIdentifier is not included in the CDR. This keyword enables the inclusion of the sgsnPLMNIdentifier with a specific value when the SGSN PLMN-id is not available.</td>
</tr>
<tr>
<td>unknown-use hex_num must be a hexadecimal number from 0x0 through 0xFFFFFFFF to identify a foreign SGSN that has not provided a PLMN-id. For GGSN only.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>rat</th>
</tr>

</tr>
<tr>
<td>For GGSN: includes the RAT (identifies the radio access technology type) value in the G-CDR.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>record-extensions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: Disabled</td>
</tr>
<tr>
<td>Enables network operators and/or manufacturers to add their own recommended extensions to the CDRs according to the standard record definitions from 3GPP TS 32.298 Release 7 or higher.</td>
</tr>
</tbody>
</table>

| sms { destination-number | recording-entity | service-centre } |
|----------------------|
| This keyword is specific to the SGSN. |
| Entering this keyword causes the inclusion of an SMS-related field in the SMS-MO-CDR or SMS-MT-CDR. |
| destination-number - Entering this option includes the "destinationNumber" field in the SMS-MO-CDR or SMS-MT-CDR. |
| recording-entity - Entering this option includes the "recordingEntity" field in the SMS-MO-CDR or SMS-MT-CDR. |
| service-centre - Entering this option includes the "serviceCentre" field in the SMS-MO-CDR or SMS-MT-CDR. |

| + |
| Indicates that this command can be entered multiple times to configure multiple attributes. |
Usage
This command dictates some of the optional information fields that should be reported in CDRs generated by the GGSN. In addition, it controls how the information for some of the mandatory fields are reported. Fields described as optional by the standards but not listed above will always be present in the CDRs, except for Record Extensions (which will never be present).

Example
The following command dictates that the time provided in the Duration field of the CDR is reported in milliseconds:

```
gtp attribute duration-ms
```
gtpp charging-agent

Configures the IP address and port of the system interface within the current context used to communicate with the CGF or the GSS.

Product
GGSN, SGSN

Privilege
Security Administrator, Administrator

Syntax

gtpp charging-agent address ip_address [ port port ]
nogtpp charging-agent

no
Removes a previously configured charging agent address.

address ip_address
Specifies the IP address of the interface configured within the current context that is used to transmit G-CDR records to the CGF or the GSS.

ip_address must be configured using dotted decimal notation.

port port
It is an optional parameter. It specifies the Charging Agent UDP port. If port is not defined, the IP will take the default port number 49999.

Default: 49999

port must be followed by an integer, ranging from 1 to 65535.

Important: Configuring GTPP charging-agent on port 3386 may interfere with ggsn-service configured with the same ip address.

Usage
This command can be used to establish a UDP interface to connect to the GSS or this command can establish a Ga interface to connect to the CFG. These interfaces must exist in the same context in which GTPP functionality is configured (refer to the gtpp commands in this chapter).

This command instructs the system as to what interface to use. The IP address supplied is also the address by which the GGSN/SGSN is known to the CGF or the GSS. Therefore, the IP address used for the Ga or UDP interface could be identical to one bound to a GGSN/SGSN service (a Gn interface).

If no GGSN/SGSN services are configured in the same context as the Ga/UDP interface, the address configured by this command is used to receive unsolicited GTPP packets.

Example
The following command configures the system to use the interface with an IP address of 192.168.13.10 as the accounting interface with port 20000 to the CGF:

```
gtp charging-agent address 192.168.13.10

gtp charging-agent address 192.168.13.10 port 20000
```
gtpp data-request sequence-numbers

Configures the range of sequence numbers to be used in the GTPP data record transfer record (DRT). Use this command to set the start value for the sequence number.

Product
GGSN, SGSN

Privilege
Security Administrator, Administrator

Syntax

```
gtpp data-request sequence-numbers start { 0 | 1 }
default gtpp data-request sequence-numbers start
```

**default**
Default is 0 (zero).

**start { 0 | 1 }**
Specifies the value of the start sequence number for the GTPP Data Record Transfer Request. Default: 0

- `0` = Designates the start sequence number as 0.
- `1` = Designates the start sequence number as 1.

Usage

When the GGSN/SGSN is configured to send GTPP echo request packets, the SGSN always uses 0 as the sequence number in those packets. Re-using 0 as a sequence number in the DRT packets is allowed by the 3GPP standards; however, this CLI command ensures the possibility of inter-operating with CGFs that can not properly handle the re-use of sequence number 0 in the echo request packets.

Example

The following command sets the sequence to start at 1.

```
gtpp data-request sequence-numbers start 1
```
**gtpp deadtime**

Configures the amount of time the GGSN/SGSN waits before attempting to communicate with a CGF that was previously marked as unreachable (non-responsive).

**Product**
GGSN, SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
gtpp deadtime time

default deadtime
```

| default
| Resets the deadtime to the default of 120 seconds.

| time
| Default: 120
| Specifies the amount of time that must elapse before the system attempts to communicate with a CGF that was previously unreachable.
| time is measured in seconds and can be configured to any integer value from 1 to 65535.

**Usage**
If the system is unable to communicate with a configured CGF, after a pre-configured number of failures the system marks the CGF as being down.
This command specifies the amount of time that the system waits prior to attempting to communicate with the downed CGF.
Refer to the `gtpp detect-dead-server` and `gtpp max-retries` commands for additional information on the process the system uses to mark a CGF as down.

**Example**
The following command configures the system to wait 60 seconds before attempting to re-communicate with a CGF that was marked as down:

```
gtpp deadtime 60
```
gtpp dead-server suppress-cdrs

This command configures the action the GGSN or the SGSN will take on CDRs generated during a communication failure between the GGSN or the SGSN and the GTPP servers.

**Product**
GGSN, SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no | default ] gtpp dead-server suppress-cdrs
```

- **no**
  Removes the suppression instruction from the configuration and sets the CDR suppression mode as disabled.

- **default**
  Resets the GGSN or the SGSN to the default mode: disable suppression of CDRs when GTPP server detected as “dead” or unreachable.

**Usage**

*For the GGSN:* This command works in conjunction with the `gtpp detect-dead-server` to set an action when a communication failure is detected between the GGSN and a configured GTPP server. It disables the archiving of CDRs on the system when the GTPP server is unreachable or dead.

*For the GGSN and the SGSN:* Typically, during a communication or server failure, the GGSN or SGSN retains the GTPP requests until the system buffer runs out of resources. This command enables suppression of the CDRs, so with this command the GGSN or the SGSN will start purging all CDRs associated with this GTPP group as soon as the GGSN/SGSN detects that the GTPP server is down or that a communication failure has occurred. The CDRs generated, for the period while the server is down/unreachable, will also be purged.

**Example**
The following command configures the system to start purging CDRs when a communication failure with a server is detected:

```
gtpp dead-server suppress-cdrs
```
**gtpp detect-dead-server**

Configures the number of consecutive communication failures that could occur before the system marks a CGF as ‘dead’ (unreachable).

**Product**
GGSN, SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
gtpp detect-dead-server consecutive-failures max_number

default gtpp detect-dead-server consecutive-failures
```

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resets the system to the default number of consecutive failures.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>consecutive-failures  max_number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 5</td>
</tr>
<tr>
<td>Specifies the number of failures that could occur before marking a CGF as down. If 0 (zero) is the value entered, then the system will mark the CGF as dead after a single instance of max-retries has been attempted with no success, regardless of configured deadtime. max_number could be configured to any integer value from 0 to 1000.</td>
</tr>
</tbody>
</table>

**Usage**
This command works in conjunction with the gtpp max-retries parameter to set a limit to the number of communication failures that can occur with a configured CGF. The gtpp max-retries parameter limits the number of attempts to communicate with a CGF. Once that limit is reached, the system treats it as a single failure. The gtpp detect-dead-server parameter limits the number of consecutive failures that can occur before the system marks the CGF as down and communicate with the CGF of next highest priority. If all of the configured CGFs are down, the system ignores the detect-dead-server configuration and attempt to communicate with highest priority CGF again. If the system receives a GTPP Node Alive Request, Echo Request, or Echo Response message from a CGF that was previously marked as down, the system immediately treats it as being active. Refer to the gtpp max-retries command for additional information.

**Example**
The following command configures the system to allow 8 consecutive communication failures with a CGF before it marks it as down:

```
gtpp detect-dead-server consecutive-failures 8
```
gtpp dictionary

This command designates specific dictionary used by GTPP for specific context.

Product
GGSN, SGSN

Privilege
Security Administrator, Administrator

Syntax

```
gtpp dictionary {custom1 | custom10 | custom11 | custom12 | custom13 | custom14 | custom15 | custom16 | custom17 | custom18 | custom19 | custom20 | custom21 | custom22 | custom23 | custom24 | custom25 | custom26 | custom27 | custom28 | custom29 | custom3 | custom30 | custom4 | custom5 | custom6 | custom7 | custom8 | custom9 | standard}

default gtpp dictionary
```

```
default
Configures the default dictionary.
```

```
custom1
Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99. It supports the encoding of IP addresses in text format for G-CDRs.
```

```
custom2
Custom-defined dictionary.
```

```
custom3
Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99 but it does support the encoding of IP addresses in binary format for CDRs.
```

```
custom4
Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99 except that:
  ● the Data Record Format Version information element contains 0x1307 instead of 0x1308
  ● “QoSRequested” is not present in the LoTV containers
  ● “QoSnegotiated” is added only for the first container and the container after a QoS change
```

```
custom5 ... custom20
Custom-defined dictionaries.
```

```
custom21 ... custom25
Custom-defined dictionaries for GGSN only.
```
**gtpp dictionary**

---

**custom26**
Custom-defined dictionary for customization of G-CDR records for GGSN only. This is compliant to 3GPP TS 32298 (R6 v 6.5.0) for proprietary fields and encoding.

---

**custom27**
Custom-defined dictionary for customization of S-CDR records for SGSN only. This is compliant to 3GPP TS 32298 (R6 v 6.6.0) for proprietary fields and encoding.

---

**custom28 ... custom30**
Custom-defined dictionaries for GGSN only.

---

**standard**
Default: Enabled
A dictionary conforming to TS 32.215 v 4.6.0 for R4 (and also R5 - extended QoS format).

---

**Usage**
Use this command to designate specific dictionary used by GTPP for specific context.

---

**Example**
The following command configures the system to use custom3 dictionary to encode IP address in Binary format in G-CDRs:

```
gtpp dictionary custom3
```
**gtpp duplicate-hold-time**

This command configures the number of minutes to hold onto CDRs that are possibly duplicates while waiting for the primary CGF to come back up.

**Product**
GGSN, SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
gtpp duplicate-hold-time minutes minutes
default gtpp duplicate-hold-time
```

**default**
Resets the configuration to the default value of 60 minutes for the duplicate hold time.

**minutes**
When the primary CGF is down, the number of minutes to hold onto CDRs that may be duplicates.

*minutes* must be an integer from 1 to 10080. Default is 60.

**Usage**
Use this command to configure how long to hold onto CDRs, that are possibly duplicates, while waiting for the primary CGF to come back up. If the GGSN determines that the primary CGF is down, CDRs that were sent to the primary CGF, but not acknowledged, are sent by the GGSN to the secondary CGF as “possibly duplicates”. When the primary CGF comes back up, the GGSN uses GTPP to determine whether the possibly duplicate CDRs were received by the primary CGF. Then the secondary CGF is told whether to release or cancel those CDRs. This command configures how long the system should wait for the primary CGF to come back up. As soon as the configured time expires, the secondary CGF is told to release all of the possibly duplicate CDRs.

**Example**
Use the following command to set the amount of time to hold onto CDRs to 2 hours (120 minutes):

```plaintext
gtpp duplicate-hold-time minutes 120
```
gtpp echo-interval

Configures the frequency at which the system sends GTPP echo packets to configured CGFs.

Product
GGSN, SGSN

Privilege
Security Administrator, Administrator

Syntax

gtpp echo-interval time
{default | no} gtpp echo-interval

default
Resets the configuration to the default echo-interval of 60 seconds.

no
Disables the use of the echo protocol except for the scenarios described in the Usage section for this command.

time
Specifies the number of seconds for sending GTPP echo packets.
time must be an integer from 60 to 3600. Default: 60

Usage
The GTPP echo protocol is used by the system to ensure that it can communicate with configured CGFs. The system initiates this protocol for each of the following scenarios:
- Upon system boot
- Upon the configuration of a new CGF server on the system using the gtpp server command as described in this chapter
- Upon the execution of the gtpp test accounting command as described in the Exec Mode Commands chapter of this reference
- Upon the execution of the gtpp sequence-numbers private-extensions command as described in this chapter

The echo-interval command is used in conjunction with the gtpp max-retries and gtpp timeout commands as described in this chapter.
In addition to receiving an echo response for this echo protocol, if we receive a GTPP Node Alive Request message or a GTPP Echo Request message from a presumed dead CGF server, we will immediately assume the server is active again.
The alive/dead status of the CGFs is used by the AAA Managers to affect the sending of CDRs to the CGFs. If all CGFs are dead, the AAA Managers will still send CDRs, (refer to the gtpp deadtime command), albeit at a slower rate than if a CGF were alive. Also, AAA Managers independently determine if CGFs are alive/dead.
Example
The following command configures an echo interval of 120 seconds:

```
gtp echo-interval 120
```
gtpp egcdr

Configures the eG-CDR parameters and triggers.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

```

default gtpp egcdr {final-record include-content-ids only-with-traffic closing-cause same-in-all-partials | losdv-max-containers | lotdv-max-containers | service-idle-timeout 0}

no gtpp egcdr service-data-flow threshold {interval | volume { downlink [uplink ] | total | uplink [downlink]}}
```

- **final-record [ closing-cause [ same-in-all-partials | unique ] | include-content-ids [ all | only-with-traffic ] ]**

  Enables configuration of the final eG-CDR.

  - **closing-cause** - Configures closing cause for the final eG-CDR.
  - **same-in-all-partials** - Specifies that the same closing cause is to be included for multiple final eG-CDRs.
  - **unique** - Specifies that the closing cause for final eG-CDRs is to be unique.
  - **include-content-ids** - Controls which content-ids are being included in the final eG-CDR.
  - **all** - Specifies that all content-ids be included in the final eG-CDR.
  - **only-with-traffic** - Specifies that only content-ids with traffic be included in the final eG-CDRs.

- **losdv-max-containers number**

  The maximum number of List of Service Data Volume (LoSDV) containers in one eG-CDR. number can be configured to any integer value from 1 to 255.

  Default: 10

- **lotdv-max-containers number**

  The maximum number of List of Traffic Data Volume (LoTDV) containers in one eG-CDR. number can be configured to any integer value from 1 to 8.

  Default: 8
service-data-flow threshold [ interval seconds | volume { downlink | total | uplink } bytes ]

Configures the thresholds for closing a service data flow container within an eG-CDR.
- interval - configures the time interval in seconds
- volume - can specify uplink or downlink or combined total (uplink + downlink) byte thresholds.

A service data flow container has statistics for an individual content-id. When the threshold is reached, the service data flow container is closed.
Default: disabled

service-idle-timeout seconds

Specifies a time period where if no data is reported for a service flow, then the service container is closed and added to eG-CDR (as part of LOSDV container list) with service condition change as ServiceIdleOut.
seconds can be configured to any integer value from 10 to 86,400.
Default: 0. This means there is no service-idle-timeout trigger.

Usage
Use this command to configure individual triggers for eG-CDR generation.

Example
Use the following command to set the maximum number of LoSDV containers to 7.

    gtpp egcdr losdv-max-containers 7
**gtpp error-response**

This command configures the response when the system receives an error response after transmitting a DRT (data record transfer) request.

**Product**
GGSN, SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
gtpp error-response { discard-cdr | retry-request }

default gtpp error-response
```

- **default**
  Resets the system’s configuration to the default value for error-response. Default is retry-request.

- **discard-cdr**
  Instructs the system to purge the request upon receipt of an error response and not to retry.

- **retry-request**
  Instructs the system to retry sending a DRT after receiving an error response. This is the default behavior.

**Usage**

This command configures the system’s response to receiving an error message after sending a DRT request.

**Example**

```
gtpp error-response discard-cdr
```
gtpp max-cdrs

Configures the maximum number of charging data records (CDRs) to be included in a packet.

Product
GGSN, SGSN

Privilege
Security Administrator, Administrator

Syntax

gtp max-cdrs number_cdrs [ wait-time seconds ]
default gtpp max-cdrs

default
Sets the default configuration.

number_cdrs
Default: 1
Specifies the maximum number of CDRs to insert in a single packet must be an integer from 1 to 255.

wait-time seconds
Default: Disabled
Configures the number of seconds the GSN waits to send the packet while accumulating CDRs as defined by max-cdr. If the wait-time interval expires before max-cdrs is reached, then this keyword over-rides and the packet is sent.
seconds any integer from 1 to 300.

Important: wait-time interval can only be enabled if the value for max-cdrs number_cdrs is greater than 1.

Usage
The system places CDRs into a packet until either max-cdrs is met, wait-time times out, or the maximum PDU size, configured by the gtpp max-pdu-size command, is met.
The gtpp max-pdu-size and the wait-time parameters take priority over max-cdrs.

Important: This command’s configuration is ignored if CDRs are stored on an SMC hard disk.

Example
The following command configures the system to place a maximum of 10 CDRs in a single GTPP packet with a wait-time of 30 seconds:

    gtpp max-cdrs 10 wait-time 30
**gtpp max-pdu-size**

Configures the maximum payload size of a single GTPP packet that could be sent by the system.

**Product**
GGSN, SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```bash
gtpp max-pdu-size pdu_size
default gtpp max-pdu-size
```

- **default**
  Resets the default `max-pdu-size` of 4096.

- **pdu_size**
  Default: 4096
  Specifies the maximum payload size of the GTPP packet. The payload includes the CDR and the GTPP header.
  `pdu_size` is measured in octets and can be configured to any integer value from 1024 to 65400.

**Usage**

The GTPP packet contains headers (layer 2, IP, UDP, and GTPP) followed by the CDR. Each CDR contains one or more volume containers. If a packet containing one CDR exceeds the configured maximum payload size, the system creates and sends the packet containing the one CDR regardless.

The larger the packet data unit (PDU) size allowed, the more volume containers that can be fit into the CDR.

The system performs standard IP fragmentation for packets that exceed the system’s maximum transmission unit (MTU).

**Important:** The maximum size of an IPv4 PDU (including the IPv4 and subsequent headers) is 65,535. However, a slightly smaller limit is imposed by this command because the system’s `max-pdu-size` doesn't include the IPv4 and UDP headers, and because the system may need to encapsulate GTPP packets in a different/larger IP packet (for sending to a backup device).

**Example**
The following command configures a maximum PDU size of 2048 octets:

```bash
gtpp max-pdu-size 2048
```
**gtp max-retries**

Configures the maximum number of times the system attempts to communicate with an unresponsive CGF.

**Product**
GGSN, SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
gtp max-retries max_attempts
```

**default gtp max-retries**

---

```
default
```

Resets the system's **max-retries** to the default of 4.

```
max_attempts
```

Default: 4

Specifies the number of times the system attempts to communicate with a CGF that is not responding. **max_attempts** can be configured to any integer value from 1 to 15.

**Usage**

This command works in conjunction with the **gtpp detect-dead-server** and **gtpp timeout** parameters to set a limit to the number of communication failures that can occur with a configured CGF. When the value specified by this parameter is met, a failure is logged. The **gtpp detect-dead-server** parameter specifies the number of consecutive failures that could occur before the server is marked as down. In addition, the **gtpp timeout** command controls the amount of time between re-tries. If the value for the max-retries is met, the system begins storing CDRs in Random Access Memory (RAM). The system allocates memory as a buffer, enough to store one million CDRs for a fully loaded chassis (a maximum of one outstanding CDR per PDP context). Archived CDRs are re-transmitted to the CGF until they are acknowledged or the system’s memory buffer is exceeded. Refer to the **gtpp detect-dead-server** and **gtpp timeout** commands for additional information.

**Example**
The following command configures the maximum number of re-tries to be 8.

```
gtp max-retries 8
```
gtpp mbms bucket

This command configures the traffic data volume (bucket) limit of charging buckets due to QoS changes of tariff time that can occur before a G-MBMS-CDR should be closed.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp mbms buckets number
[ no ] gtpp mbms buckets

no
Disables the configured traffic data volume bucket limits trigger for G-MBMS-CDR generation for MBMs user service data.

buckets number
Default: 4
Specifies the number of statistics container changes due to QoS changes or tariff time that can occur before a G-MBMS-CDR should be closed.

number can be configured to any integer value from 1 through 4.

Usage

Use this command to configure the traffic data volume (bucket) based G-MBMS-CDR generation triggers for MBMS user data service.

Example

The following command configures the bucket-based trigger to generate G-MBMS-CDRs after changes in 2 container:

   gtpp mbms buckets 2
gtpp mbms interval

This command configures the interval duration for interval-based triggers for GTPP MBMS Charging Data Record (G- MBMS-CDR) generation.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

```
gtpp mbms interval duration_sec
no gtpp mbms interval
```

- **no**
  Disables the interval-based trigger for G- MBMS-CDR generation for MBMs user service data.

- **interval duration_sec**
  Default: Disabled
  Specifies the normal time duration that must elapse before closing an accounting record provided that any or all of the following conditions occur:
  - Downlink traffic volume is reached within the time interval
  - Tariff time based trigger occurred within the time interval
  - Data volume (up and downlink) bucket trigger occurred within the time interval
  
  *duration_sec* is measured in seconds and can be configured to any integer value from 60 through 40,000,000.

Usage

Use this command to configure the G- MBMS-CDR generation triggers for MBMS user data service.

Example

The following command configures the interval-based trigger to generate G- MBMS-CDRs in every 60 seconds:

```
gtpp mbms interval 60
```
**gtpp mbms tariff**

This command configures the tariff slots for tariff-based triggers for GTPP MBMS Charging Data Record (G-MBMS-CDR) generation.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
gtpp mbms tariff time1 mins hours [ time2 mins hours [ time3mins hours [ time4mins hours ] ] ]
[ no ] gtpp mbms tariff
```

- **no**
  - Disables the tariff-based triggers for GTPP MBMS Charging Data Record (G-MBMS-CDR) generation.

- **t tariff time1 mins hours [ time2 mins hours [ time3mins hours [ time4mins hours ] ] ]**
  - Default: Disabled
  - Specified time-of-day time values to close the current statistics container (but not necessarily the accounting record).

**Important:** The system assumes that the billing system uses the day/date to determine if the statistics container represents an actual tariff period.

For each of the different tariff times, the following parameters must be configured:
- **mins**: The minutes of the hour, an integer value from 0 through 59.
- **hours**: The hour of the day, an integer value from 0 through 23.

**Usage**
Use this command to configure the tariff-time-based triggers for G-MBMS-CDR generation in MBMS user data service.

**Example**
The following command configures the tariff-time-based trigger to generate G-MBMS-CDRs every day at 11 hours and 30 min:

```plaintext
gtpp mbms tariff time1 30 11
```
gtpp mbms volume

This command configures the download traffic data volume based trigger for GTPP MBMS Charging Data Record (G-MBMS-CDR) generation.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

```
gtpp mbms volume download_bytes
[ no ] gtpp mbms volume
```

**no**
Disables the configured download traffic data volume based trigger for G-MBMS-CDR generation for MBMS user service data.

**volume download_bytes**
Default: Disabled
Specifies the threshold of downlink data volumes that must be met before a G-MBMS-CDR should be closed. `download_bytes` is the total download traffic volume measured in octets and can be configured to any integer value from 100,000 through 4,000,000,000.

Usage
Use this command to configure the traffic data volume (download) based G-MBMS-CDR generation triggers for MBMS user data service.

Example
The following command configures the traffic data volume (download) limit to trigger to generate G-MBMS-CDRs after reaching 150,000 octets:

```
gtpp mbms volume download_bytes
```
gtpp redirection-allowed

Configures the system to allow/disallow the redirection of CDRs when the primary CGF is unavailable.

Product
GGSN, SGSN

Privilege
Security Administrator, Administrator

Syntax

[ default | no ] gtpp redirection-allowed

default
Resets the system to allow redirection of CDRs.

no
Removes the redirection definition from the configuration.

Usage
This command allows operators to better handle erratic network links, without having to remove the configuration of the backup server(s) via the **no gtpp server** command. This functionality is enabled by default.

If the **no gtpp redirection-allowed** command is executed, the system only sends CDRs to the primary CGF. If that CGF goes down, the system will buffer the CDRs in memory until the CGF comes back or until the system runs out of buffer memory. In addition, if the primary CGF announces its intent to go down (with a GTPP Redirection Request message), the system responds to that request with an error response.

Example
The following command configures the system to allow the redirection of CDRs when the primary CGF is unavailable:

```
default gtpp redirection-allowed
```
gtpp redirection-disallowed

This command has been obsoleted and is replaced by the gtpp redirection-allowed command.
gtpp server

Configures the charging gateway function (CGF) accounting server(s) with in GTPP server group that the system is to communicate with.

Product
GGSN, SGSN

Privilege
Security Administrator, Administrator

Syntax

gtpp server ip_address [ max msgs ] [ priority priority ] [ udp-port port ] [ node-alive { enable | disable } ] [-noconfirm ]

no gtpp server ip_address [ udp-port port ]

no
Deletes a previously configured CGF.

ip_address
Specifies the IP address of the CGF in dotted decimal notation for IPv4 or colon notation for IPv6.

max msgs
Default: 256
Specifies the maximum number of outstanding or unacknowledged GTPP packets (from any one AAA Manager task) allowed for this CGF before the system begins buffering the packets.
msgs can be configured to any integer value from 1 to 256.

priority priority
Default: 1000
Specifies the relative priority of this CGF. When multiple CGFs are configured, the priority is used to determine which CGF server to send accounting data to.
priority can be configured to any integer value from 1 to 1000. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this. If you use the -noconfirm option, you are not asked for confirmation and multiple servers could be assigned the same priority.

udp-port port
Default: 3386
Specifies the UDP port over which the GGSN communicates with the CGF. port can be configured to any integer value between 1 and 65535.

node-alive { enable | disable }
Default: Disable.
This optional keyword allows operator to enable/disable GGSN to send Node Alive Request to GTPP Server (i.e. CGF). This configuration can be done per GTPP Server basis.
-noconfirm
Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage
Use this command to configure the CGF(s) that the system sends CDR accounting data to. Multiple CGFs can be configured using multiple instances of this command subject to the following limits:
- Up to 4 CGFs can be configured in one GTPP server group
- Total 32 CGFs can be configured per context.

Each configured CGF can be assigned a priority. The priority is used to determine which server to use for any given subscriber based on the routing algorithm that has been implemented. A CGF with a priority of "1" has the highest priority.

Important: The configuration of multiple CGFs with the same IP address but different port numbers is not supported.

Each CGF can also be configured with the maximum allowable number of unacknowledged GTPP packets. Since multiple AAA Manager tasks could be communicating with the same CGF, the maximum is based on any one AAA Manager instance. If the maximum is reached, the system buffers the packets Random Access Memory (RAM). The system allocates memory as a buffer, enough to store one million CDRs for a fully loaded chassis (a maximum of one outstanding CDR per PDP context).

Example
The following command configures a CGF with an IP address of 192.168.2.2 and a priority of 5.

```
gtpp server 192.168.2.2 priority 5
```

The following command deletes a previously configured CGF with an IP address of 100.10.35.7:

```
no gtpp server 100.10.35.7
```
gtpp source-port-validation

This command configures whether the system validates the UDP source port in received GTPP messages.

**Product**
GGSN, SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[no | default] gtpp source-port-validation
```

- **no**
  Validates the IP source address but not the UDP source port.

- **default**
  Restores this parameter to its default setting of enabled.

**Usage**
This command configures whether the system validates the UDP source port in received GTPP messages.

**Example**
The following command disables UDP port validation:

```
no gtpp source-port-validation
```
gtpp storage-server

Configures information for the GTPP back-up storage server.

Product
GGSN, SGSN

Privilege
Security Administrator, Administrator

Syntax

```
gtpp storage-server  ip_address  port  port_num
no gtp storage-server  ip_address  port  port_num
```

**no**
Removes a previously configured back-up storage server.

**ip_address**
The IP address of the back-up storage server expressed in dotted decimal notation.

**port  port_num**
Default: 3386
Specifies the UDP port number over which the GGSN communicates with the back-up storage server.

Usage
This command identifies the connection to the GSS. One backup storage server can be configured per GTPP group.

Example
The following command configures a GSS with an IP address of 192.168.1.2:

```
gtpp storage-server  192.168.1.2
```
gtpp storage-server local file

Configures the parameters for GTPP files stored locally on the GTPP storage server.

Product
GGSN, SGSN

Privilege
Security Administrator, Administrator

Syntax

gtpp storage-server local file { compression { gzip | none } | format { custom1 | custom2 | custom3 | custom4 | custom5 | custom6 | custom7 | custom8 } | name prefix prefix | purge-processed-files | rotation { cdr-count count | time-interval time [force-file-rotation] | volume size } }

default gtpp storage-server local file { compression | format | name prefix | purge-processed-files | rotation { cdr-count | time-interval | volume } }

no gtpp storage-server local file rotation { purge-processed-files | rotation { cdr-count | time-interval } }

no
Removes a previously configured parameters for local storage of CDR files on HDD on SMC card.

compression { gzip | none }

Configures the type of compression to be used on the files stored locally.
gzip – Enables Gzip file compression.
none – Disables Gzip file compression - this is the default value.

format custom1 .. 8

Configures the file format to be used to format files to be stored locally.
custom1 – File format custom1 - this is the default file format.
custom2 to custom5 Customer specific CDR file formats.
custom6 – File format custom6 with a block size of 8K for CDR files.
custom7 – File format custom7 is a customer specific CDR file format.
custom8 – File format custom8 is a customer specific CDR file format. It uses node-id-suffix_date_time_fixed-length-seq-num format for file naming where:

- date is date in MMDDYYYY (01312010) for mat
- time is time in HHMMSS (023508) format
- fixed-length-seq-num is the fixed length of sequence number for specific file having 6 digit counter starting from 000001 and end to 999999. Once file sequence reached to 999999 the sequence will be reset to 000001.

name prefix prefix

Defines the prefix to be used for the file name. By default the file name prefix would be ‘GTPP-group-name + VPN-ID’.
prefix— Enter a string of 1 to 64 alphanumeric characters.

    purge-processed-files [ purge-interval purge_dur ]

Default: Disabled
Enables the GSN to periodically delete locally processed (*.p) CDR files from the HDD on the SMC card.

**Important:** This option is available only when GTPP server storage mode is configured for local storage of CDRs with the `gtpp storage-server mode local` command.

`purge-interval purge_dur` provides an option for user to control the purge interval duration in minutes by setting `purge_dur`.
`purge_dur` must be an integer from 1 through 259200.
Default: 60 minutes

**rotation**

    rotation { cdr-count count | time-interval time [ force-rotation ] | volume size }

Specifies rotation related configuration for GTPP files stored locally.
`cdr-count count` - Configure the CDR count for the file rotation. Enter a value from 1000 to 65000. Default value 10000.
`time-interval time` - Configure the time interval for file rotation. Enter a value in seconds ranging from 30 to 86400. Default value is 3600 seconds (1 hour).
`force-file-rotation` - Force CDR file-rotation at specified interval, configured with `time-interval time` keyword, even if there are no CDRs generated. By default this keyword is “Disabled”.
`volume size` - Configure the file volume, in MB, for file rotation. Enter a value ranging from 2 to 40. This trigger can not be disabled. Default value is 10MB.

**Usage**

This command configures the parameters for storage of GTPP packets as files on the local server - meaning the hard disk.

**Example**

The following command configures rotation for every 1.5 hours for locally stored files.

    gtpp storage-server local file rotation time-interval 5400
gtpp storage-server max-retries

Configures the maximum number of times the system attempts to communicate with an unresponsive GTPP back-up storage server.

**Product**
GGSN, SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
gtpp storage-server max-retries max_attempts

default gtpp storage-server max-retries
```

- **default**
  Restores the system to the default value of 2 retry attempts.

- **max_attempts**
  Default: 2
  Specifies the number of times the system attempts to communicate with a GTPP back-up storage server that is not responding.
  `max_attempts` can be configured to any integer value from 1 to 15.

**Usage**

This command works in conjunction with the `gtpp storage-server timeout` parameters to set a limit to the number of communication failures that can occur with a configured GTPP back-up storage server. The `gtpp storage-server` timeout command controls the amount of time between re-tries. Refer to the `gtpp storage-server` timeout command for additional information.

**Example**
The following command configures the maximum number of re-tries to be 8.

```
gtpp storage-server max-retries 8
```
**gtpp storage-server mode**

This command configures storage mode, local or remote, for CDRs. Local storage mode is available with ASR 5000 platforms only.

**Product**
GGSN, SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
gtpp storage-server mode { local | remote | streaming }
default gtpp storage-server mode
```

- **default**
  Returns the GTPP group configuration to the default 'remote' value for the GTPP storage server mode.

- **local**
  Default: Disabled
  Specifies the use of the hard disk on the SMC for storing CDRs

  **Important:** This option is available with ASR 5000 platforms only.

- **remote**
  Specifies the use of an external server for storing CDRs. This is the default value.

- **streaming**
  Default: Disabled
  This keyword allows the operator to configure “streaming” mode of operation for GTPP group. When this keyword is supplied the CDRs will be stored in following fashion:
  - When GTPP link is active with CGF, CDRs are sent to a CGF via GTPP and local hard disk is NOT used as long as every record is acknowledged in time.
  - If the GTPP connection is considered to be down, all streaming CDRs will be saved temporarily on the local hard disk and once the connection is restored, unacknowledged records will be retrieved from the hard disk and sent to the CGF.

  **Important:** This option is available with ASR 5000 platforms only.

**Usage**

This command configures whether the CDRs should be stored on the hard disk of the SMC or remotely, on an external server.
Example
The following command configures use of a hard disk for storing CDRs.

```
gtpp storage-server mode local
```
gtpp storage-server timeout

Configures the amount of time that must pass with no response before the system re-attempts to communicate with the GTPP back-up storage server.

Product
GGSN, SGSN

Privilege
Security Administrator, Administrator

Syntax

```gtpp storage-server timeout duration```
```
default gtpp storage-server timeout```

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Restores the timeout duration to the 30-second default.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 30</td>
</tr>
<tr>
<td>Specifies the maximum amount of time the system waits for a response from the GTPP back-up storage server before assuming the packet is lost.</td>
</tr>
<tr>
<td><code>duration</code> is measured in seconds and can be configured to any integer value from 30 to 120.</td>
</tr>
</tbody>
</table>

Usage

This command works in conjunction with the `gtpp storage-server max-retries` command to establish a limit on the number of times that communication with a GTPP back-up storage server is attempted before a failure is logged.

This parameter specifies the time between retries.

Example

The following command configures a retry timeout of 60 seconds:

```
gtpp storage-server timeout 60```

gtpp suppress-cdrs zero-volume-and-duration

This command suppresses the CDRs created by session having zero duration and/or zero volume. By default this mode is ‘disabled’.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

gtpp suppress-cdrs zero-volume-and-duration { gcdrs [ egcdrs ] | egcdrs [ gcdrs ] }

default gtpp suppress-cdrs zero-volume-and-duration

**default**
Disables the CDR suppression mode.

**gcdrs [ egcdrs ]**
Specifies that this command will handle G-CDRs before eG-CDRs.

**egcdrs [ gcdrs ]**
Specifies that this command will handle eG-CDRs before G-CDRs.

Usage
Use this command to suppress the CDRs (G-CDRs and eG-CDRs) which were created due with zero-duration session and zero-volume session due to any reason. By default this command is disabled and system will not suppress any CDR.

Example
The following command configures the system to suppression the eG-CDRs created for a zero duration session or zero volume session:

```
gtpp suppress-cdrs zero-volume-and-duration egcdrs gcdrs
```
gtpp timeout

Configures the amount of time that must pass with no response before the system re-attempts to communicate with the CGF.

Product
GGSN, SGSN

Privilege
Security Administrator, Administrator

Syntax

```
gtpp timeout time
default gtpp timeout
```

```
default
Resets the systems GTPP timeout value to 20 seconds.
```

```
time
Default: 20
Specifies the maximum amount of time the system waits for a response from the CGF before assuming the packet is lost.
time is measured in seconds and can be configured to any integer value from 1 to 60.
```

Usage
This command works in conjunction with the `gtpp max-retries` command to establish a limit on the number of times that communication with a CGF is attempted before a failure is logged. This parameter specifies the time between retries.

Example
The following command configures a retry timeout of 30 seconds:

```
gtpp timeout 30
```
gtpp trigger

This command disables GTTP trigger conditions that cause either partial CDR record closure or opening of a new CDR record container. GTTP Triggers are specified in 3GPP TS 32.251 v6.6.0. All GTTP trigger changes take affect immediately, except volume-limit.

Product
ECS, GGSN, SGSN

Privilege
Security Administrator, Administrator

Syntax

default gtpp trigger

default
Sets the specified trigger condition back to the default setting. All trigger conditions are enabled by default.

no
Re-enables the specified trigger condition.

cell-update
Enables the cell update trigger for S-CDRs, if the dictionary specified in the gtpp dictionary configuration includes support for cell update. This trigger is available only for 2G. Currently, custom18 dictionary supports the cell update trigger.

direct-tunnel
Enables the direct tunnel trigger for CDRs.

egcdr max-losdv
Default: Disabled
Enables the trigger for an eG-CDR if the List of Service Data Volume (LoSDV) containers crosses the configured limit for LOSDV containers.

inter-plmn-sgsn-change
This keyword is for GGSN only.
Default: Enabled
Disabling this trigger ignores an Inter-PLMN SGSN change and doesn't release a G-CDR.

ms-timezone-change
This keyword is specific to GGSN.
Default: Enabled
No partial record closure for a time zone change occurs when this trigger is disabled. MS Time zone change should be applicable only for 3GPP R6 based GTPP dictionaries.

plmn-id-change
This trigger keyword is specific to the 2G SGSN and is proprietary (non-standard).
Default: Disabled
Enables the PLMNID change trigger for S-CDRs if the dictionary specified in the gtpp dictionary configuration supports the PLMNID change. If enabled, the SGSN generates a partial S-CDR when the MS changes the PLMN while under the same SGSN (intra-system intra-SGSN PLMN-ID handover). Currently, custom18 dictionary supports this trigger.

qos-change
Default: Enabled
Enables the QoS-change trigger for CDRs. Disabling this trigger ignores a QoS-change and does not open a new CDR for it.

rat-change
Default: Enabled
This keyword enable/disable the partial record closure for a RAT change. If disabled no partial record closure for a RAT change occurs. RAT change should be applicable only for 3GPP R6 based GTPP dictionaries.
In SGSN, RAT change trigger (2G<->3G) means inter-service handoff (SGSN service <-> GPRS service). If this trigger is enabled, after the RAT change interim CDR is generated. After this RAT change CDR, CDR thresholds such as volume/time etc. and GTPP Group are applicable from new service. If RAT change trigger is disabled, the CDR thresholds and GTPP group etc. will not change and will continue to use from old service.
After the RAT change the System Type field in CDR changes to indicate the new system type. If this trigger is disabled then the next CDR generated will indicate System Type but the data count in the CDR does not necessarily belong to the system type indicated in CDR instead it may belong to both 2G and 3G as CDR is not closing when handover takes place.

Important: However System Type field in CDR related change is not applicable to customized CDR formats which does not use System Type field

routing-area-update
Enables the routing-area-update trigger for CDRs.

sgsn-change-limit [ also-intra-sgsn-multiple-address-group-change ]
This keyword is for GGSN only.
Default: Enabled
Disabling this trigger ignores an SGSN change and does not add the SGSN IP address into the SGSN address list of the CDR. This helps to reduce the release of CDRs due to SGSN changes crossing the configured limit.
also-intra-sgsn-multiple-address-group-change : This keyword includes Intra-SGSN group changes as an SGSN change.

tariff-time-change
Default: Enabled
When this trigger is disabled container closure does not happen for a tariff-time change. This trigger is applicable for G-MB-CDRs for MBMS session too.
**time-limit**
Default: Enabled
When this trigger is disabled no partial record closure occurs when the configured time limit is reached.
This trigger is applicable for G-MB-CDRs for MBMS session too.

**volume-limit**
Default: Enabled
When this trigger is disabled no partial record closure occurs when volume limit is reached.
This trigger is applicable for G-MB-CDRs for MBMS session too.

**Usage**
Use this command to disable or re-enable GTTP triggers that can cause partial CDR record closure or cause a new CDR to be created.

**Example**
The following command disables partial record closure when a configured time limit is reached:

```
gtp trigger time-limit
```

The following command re-enables partial record closure when a configured time limit is reached:

```
no gtp trigger time-limit
```
gtpp transport-layer

This commands selects the transport layer protocol for Ga interface for communication between AGW (GSNs) and GTPP servers.

**Product**
GGSN, SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
gtpp transport-layer { tcp | udp }
default gtpp transport-layer
```

---

**default**
Reset the transport layer protocol to GTPP servers to the default UDP.

---

**tcp**
Default: Disabled
Enables the system to implement TCP as transport layer protocol for communication with GTPP server.

---

**udp**
Default: Enabled
Enables the system to implement UDP as transport layer protocol for communication with GTPP server.

---

**Usage**
Use this command to select the TCP or UDP as the transport layer protocol for Ga interface communication between GTPP servers and AGWs (GSNs).

---

**Example**
The following command enables TCP as the transport layer protocol for the GSN’s Ga interface.

```
gtpp transport-layer tcp
```
Chapter 115
GTP-U Service Configuration Mode Commands

The GTP-U Service Configuration Mode is used to manage parameters applied to incoming GTP-U packets.

```
Exec Mode
  configure
    Global Configuration Mode
      context name
        Context Configuration Mode
          gtpu-service name
            GTP-U Service Configuration Mode
```
bind

Configures the IP address to use for GTP-U data packets.

Product
GGSN, P-GW, S-GW

Privilege
Administrator

Syntax

bind { ipv4-address ipv4_address [ ipv6-address ipv6_address ] | ipv6-address ipv6_address [ ipv4-address ipv4_address ] }

[ no ]

no

removes a configured IP address from this service.

bind { ipv4-address ipv4_address [ ipv6-address ipv6_address ] | ipv6-address ipv6_address [ ipv4-address ipv4_address ] }

Binds the service to an interface with an IPv4 address, IPv6 address or both.

ipv4-address ipv4_address [ ipv6-address ipv6_address ]: Binds this service to the IPv4 address of a configured interface. Optionally, bind the service to a configured interface with an IPv6 address. ipv4_address must be entered as a standard IPv4 address in dotted decimal notation.

ipv6-address ipv6_address [ ipv4-address ipv4_address ]: Binds this service to the IPv6 address of a configured interface. Optionally, bind the service to a configured interface with an IPv4 address. ipv6_address must be entered as a standard IPv6 address in colon-separated notation.

Usage

Use this command to bind the service to an interface for sending/receiving GTP-U packets.

Example

The following command configures the IPv4 address for this GTP-U service as 1.2.3.4:

bind ipv4-address 1.2.3.4
echo-interval

Configures the rate at which GPRS Tunneling Protocol (GTP) v1-U echo packets are sent.

**Product**

GGSN, P-GW, S-GW

**Privilege**

Administrator

**Syntax**

```plaintext
echo-interval seconds
[ default | no ] echo-interval
```

- **default**
  Returns the command to its default setting of disabled.

- **no**
  Removes the configured echo-interval setting.

- **seconds**
  Specifies the number of seconds between the sending of a GTP-Uv1 echo packet. `seconds` must be an integer value from 60 to 3600.

**Usage**

Use this command to configure the rate at which GTP-Uv1 echo packets are sent.

**Example**

The following command sets the rate between the sending of echo packets at 120 seconds:

```plaintext
echo-interval 120
```
**end**

Exits the current mode and returns to the Exec Mode.

**Product**
All

**Privilege**
Administrator

**Syntax**
```
end
```

**Usage**
Change the mode back to the Exec mode.
exit

Exits the current mode and returns to the previous mode.

Product
All

Privilege
Administrator

Syntax
exit

Usage
Return to the previous mode.
extention-header

Configures the addition of an extention header, in the GTP-U packet header, allowing for error indication messages.

Product
GGSN, P-GW, S-GW

Privilege
Administrator

Syntax

```
[ default | no ] extention-header source-udp-port
```

- **default**
  Returns the command to its default setting of disabled.

- **no**
  Disables the feature.

- **source-udp-port**
  Configures extension header type UDP Port support in GTP-U header for GTP-U Error Indication messages.

Usage

Example
The following command enables the inclusion of an extention header to allow for error indication messages:

```
extention-header source-udp-port
```
max-retransmissions

Configures the maximum retry limit for GTP-U echo retransmissions.

Product
GGSN, P-GW, S-GW

Privilege
Administrator

Syntax

max-retransmissions num

no max-retransmissions

no
Disables the feature.

num
Default: 4
Specifies the number of GTP-U echo message retransmissions allowed before triggering a path failure error condition. num must be an integer value from 0 to 15.

Usage
Use this command to set the maximum number of GTP-U echo message retransmissions in order to define a limit that triggers a path failure error.

Example
The following command sets the maximum GTP-U echo message retransmissions for this service to 10:
max-retransmissions 10
path-failure detection-policy

Configures a path failure detection policy on GTP-U echo messages that have been retransmitted the maximum number of retry times.

Product
GGSN, P-GW, S-GW

Privilege
Administrator

Syntax

path-failure detection-policy gtp echo

[ default | no ] path-failure detection-policy

- default
  Resets the command to its default setting of enabled.

- no
  Disables the feature.

- gtp echo
  Sets the detection policy to detect a failure upon reaching the maximum number of GTP-U echo message retransmissions.

Usage
Use this command to set the detection policy for path failures.

Example
The following command sets the path failure detection policy to detect failures upon reaching the maximum number of GTP-U echo message retries:

    path-failure detection-policy gtp echo
retransmission-timeout

Configures retransmission timeout for GTPU echo message retransmissions for this service.

Product
GGSN, P-GW, S-GW

Privilege
Administrator

Syntax

retransmission-timeout seconds

default retransmission-timeout

default
Returns the command to its default setting of 5.

seconds
Default: 5
Specifies the number of seconds between the re-sending of GTP-U echo messages. seconds must be an integer value between 1 and 20.

Usage
Use this command to set the number of seconds between the retransmission of GTP-U echo messages.

Example
The following command sets the number of seconds between the sending of GTP-U echo messages to 7:
retransmission-timeout 7
Chapter 116
HA Proxy DNS Configuration Mode Commands

The HA Proxy DNS Configuration Mode is used to create rules for HA proxy DNS intercept lists that redirect packets with unknown foreign DNS addresses to a home network DNS server.

**Important:** HA Proxy DNS Intercept is a license-enabled feature.

> **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the HA Proxy DNS Configuration Mode and returns to the Exec Mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the HA Proxy DNS Configuration Mode and returns to the Context Configuration Mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

exit

**Usage**

Use this command to return to the Context Configuration Mode.
pass-thru

Sets IP addresses that should be allowed through the proxy DNS intercept feature.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] pass-thru ip_address [ /ip_mask ]
```

- **no**
  Removes the DNS IP address from the pass-thru rule.

```
pass-thru ip_address [ /ip_mask ]
```

Specifies an DNS IP address that is allowed through the intercept feature.

- `ip_address[/ip_mask]`: Specifies the IP address and network mask bits. `ip_address[/ip_mask]` is specified using the standard IPv4 or IPv6 dotted decimal notation and the mask bits are a numeric value which is the number of bits in the subnet mask (x.x.x.x/x).

**Usage**

Use this command to identify DNS IP addresses that should be allowed through the intercept feature. For a more detailed explanation of the proxy DNS intercept feature, see the `proxy-dns intercept-list` command in the Context Configuration Mode Commands chapter. A maximum of 16 intercept rules (either `redirect` or `pass-thru`) are allow for each intercept list.

**Important:** To allow packets through that do not match either the `pass-thru` or `redirect` rules, set a `pass-thru` rule address as: 0.0.0.0/0. If a packet does not match either the `pass-thru` or `redirect` rule, the packet is dropped.

**Example**

The following command allows a foreign network’s DNS with an IP address of 12.3.456.789 to avoid being redirected:

```
pass-thru 12.3.456.789
```
**redirect**

DNS IP addresses from foreign networks matching an IP address in this command are redirected to a home network DNS.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] redirect any [ primary-dns ip_address [ secondary-dns ip_address ] ]
```

- `no`
  Removes the DNS IP address from the redirect rule.

- `primary-dns ip_address`
  Specifies the IP address of the primary home network DNS. `ip_address` is specified using the standard IPv4 or IPv6 dotted decimal notation.

- `secondary-dns ip_address`
  Specifies the IP address of the secondary home network DNS. `ip_address` is specified using the standard IPv4 or IPv6 dotted decimal notation.

**Usage**

Use this command to identify DNS IP addresses from foreign networks that are to be redirected to the home DNS. For a more detailed explanation of the Proxy DNS feature, see the `proxy-dns intercept-list` command in the Context Configuration Mode Commands chapter. A maximum of 16 intercept rules (either `redirect` or `pass-thru`) are allowed for each intercept list.

Since this command is configured in the source context, the destination context containing the path to the home network DNS is identified using the Context Configuration Mode command `ip dns-proxy source-address`.

**i Important:** If a packet does not match the `pass-thru` or `redirect` rule, the packet is dropped. If `primary-dns` or `secondary-dns` is not configured, DNS messages are redirected to the primary-dns-server (or the secondary-dns-server) configured for the subscriber OR inside the context.

The following command identifies a foreign network DNS with an IP address of 1.23.456.789 and redirects it to a primary home network DNS with an IP address of 1.98.765.432:

```
redirect 1.23.456.789 primary-dns 1.98.765.432.
```
Chapter 117
HA Service Configuration Mode Commands

The Home Agent Service Configuration Mode is used to create and manage the Home Agent (HA) services associated with the current context.

```
Exec Mode

configure

Global Configuration Mode

context name

Context Configuration Mode

ha-service name

HA Service Configuration Mode
```
aaa

Configures the sending of subscriber session AAA accounting by the HA service.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

aaa accounting

no aaa accounting

Usage
Enabling the HA service will send all accounting data (start, stop, and interim) to the configured AAA servers.
The chassis is shipped from the factory with the AAA accounting enabled.

Important: In order for this command to function properly, AAA accounting must be enabled for the context in which the HA service is configured using the aaa accounting subscriber radius command.

AAA accounting for the HA service can be disabled using the no version of the command.

Example
The following command disables aaa accounting for the HA service:

no aaa accounting
authentication

Configures authentication parameters for a specific HA service of a specific context.

**Product**
HA, ASN-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
authentication {aaa-distributed-mip-keys [ disabled | optional | required ] | dmu-refresh-key | imsi-auth | mn-aaa {allow-noauth | always | dereg-noauth | noauth | renew-reg-noauth | renew-and-dereg-noauth } | mn-ha { allow-noauth | always } }

no authentication {aaa-distributed-mip-keys required | imsi-auth }

default authentication [aaa-distributed-mip-keys | imsi-auth | mn-aaa | mn-ha ]
```

- **no**
  Disable the parameter.

- **default**
  Reset the specified option to its default setting.

- **aaa-distributed-mip-keys [ disabled | optional | required ]**
  Configures use of AAA distributed MIP keys for authenticating RRQ for WiMAX HA calls.
  Default is disabled.
  - **disabled**: Disables using AAA distributed WiMAX MIP keys for authenticating MIP RRQ.
  - **optional**: Use AAA distributed WiMAX MIP keys for authenticating RRQ with fallback option to use static/3GPP2 based MIP keys.
  - **required**: AAA distributed WiMAX MIP keys for authenticating MIP RRQ are mandatory

- **dmu-refresh-key**
  Typically, when a DMU resets then the next MIP re-registration causes MN-HA authorization failure and the HA rejects the MIP RRQ. This parameter enables the HA to retrieve the MN-HA key again from the AAA during the call and to use the freshly retrieved key value to recheck authentication.
  Default is disabled.

- **imsi-auth**
  Enable uses the IMSI to determine if MN-AAA or MN-FAC extensions are not present in the RRQ.
  Default is disabled.

- **mn-aaa { allow-noauth | always | dereg-noauth | noauth | renew-reg-noauth | renew-and-dereg-noauth }**
  Specifies how mobile node-to-AAA authentication extension in registration requests from the mobile node should be handled by the HA service.
Default is always.

**allow-noauth**: Specifies that the HA service does not require authentication for every mobile node registration request. However, if the mn-aaa extension is received, the HA service will authenticate it.

**always**: Specifies that the HA service will perform authentication each time a mobile node registers.

**dereg-noauth**: Disables authentication request upon de-registration.

**noauth**: Specifies that the HA service will not look for mn-aaa extension and will not authenticate it.

**renew-reg-noauth**: Specifies that the HA service will not perform authentication for mobile node re-registrations. Initial registration and de-registration will be handled normally.

**renew-and-dereg-noauth**: Disables authentication request upon re-registration and de-registration.

```
mn-ha { allow-noauth | always }
```

Specifies whether the HA service looks for an MN-HA authentication extension in the RRQ. Default is always.

**allow-noauth**: Allows a request that does not contain the auth extension.

**always**: A request should always contain the auth extension to be accepted.

**Usage**

The `authentication` command, combined with a keyword, can be used to specify how the system will perform authentication of registration request messages.

**Example**

The following command configures the HA service to always perform mobile node authentication for every registration request.

```
authentication mn-aaa always
```

The following command configures the HA service to always look for an MN-HA authentication extension in the RRQ.

```
authentication mn-ha always
```
bind

Binds the HA service to a logical IP interface serving as the Pi interface and specifies the maximum number of subscribers that can access this service over the interface.

Product
HA

Privilege
Security Administrator, Administrator

Syntax
bind address address [max-subscribers count]

  no bind address

address
Specifies the IP address (address) of the interface configured as the Pi interface. address is specified in dotted decimal notation.

max-subscribers count
Default: 500000
Specifies the maximum number of subscribers that can access this service on this interface.

count can be configured to any integer value between 0 and 1,000,000.

Important: The maximum number of subscribers supported is dependant on the license key installed and the number of active PACs/PSCs installed in the system. A fully loaded system with 13 active PACs/PSCs can support 1,000,000 total subscribers. Refer to the license key command for additional information.

Usage
Associate the HA service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an Pi interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.

This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.

When configuring the max-subscribers option, be sure to consider the following:

  ● The total number of interfaces that you will configuring for use as Pi interfaces

  ● The maximum number of subscriber sessions that all of these interfaces may handle during peak busy hours

  ● The average bandwidth for each of the sessions

  ● The type of physical port (10/100Base-T or 1000Base-Tx) that these interfaces will be bound to

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.

Use the no bind address command to delete a previously configured binding.
Example

The following command would bind the logical IP interface with the address of 192.168.3.1 to the HA service and specifies that a maximum of 600 simultaneous subscriber sessions can be facilitated by the interface/service at any given time.

```
bind address 192.168.3.1 max-subscribers 600
```

The following command disables a binding that was previously configured:

```
no bind address
```
binding-update

Configures MIP binding-update message related parameters.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

```
binding-update { max-retransmission num | retransmission-timeout seconds }
```

- **max-retransmission num**
  - Default 3.
  - Configures the number of times the message shall be transmitted. *num* must be an integer from 1 through 5.

- **retransmission-timeout seconds**
  - Default 2.
  - Configures the transmission timeout for the message in seconds. *seconds* must be an integer from 1 through 60.

Usage

Configure binding update parameters.

Example

Set the maximum number of times a MIP binding update message is transmitted to 4 with the following command:
```
binding-update max-retransmission 4
```
default

Restore default values assigned for specified parameter.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

```
default { authentication { imsi-auth | mn-aaa | mn-ha } | binding-update { max-retransmission | retransmission-timeout } | encapsulation { gre { checksum | checksum-verify | reorder-timeout | sequence-mode | sequence-numbers } | ip local-port | policy | null-username | nw-reachability-fail | overload | private-address allow-to-reverse-tunnel | reg-lifetime | reverse-tunnel | revocation { enable | max-retransmission | retransmission-timeout | trigger handoff | setup-timeout | simul-bindings } }
```

authentication

**imsi-auth**: Restores imsi-authentication to its default which is disabled.

**mn-aaa**: Restores the Foreign Agent (FA) mobile node re-registration authentication setting to its default: always.

**mn-ha**: Configures the HA service to it’s default behavior of looking for an MN-HA authentication extension in the RRQ.

**binding-update { max-retransmission | retransmission-timeout }**

Sets the MIP binding-update message related parameters to their defaults.

**max-retransmission**: Default 3.

Configures the number of times the message shall be transmitted to 3.

**retransmission-timeout**: Configures the transmission timeout for the message to 2 seconds.

**encapsulation**

Sets MIP data encapsulation using GRE to its default: enabled.

**gre { checksum | checksum-verify | reorder-timeout | sequence-mode | sequence-numbers }**

Sets default Generic Routing Encapsulation (GRE) parameters.

**checksum**: Disables the introduction of the checksum field in outgoing GRE packets.

**checksum-verify**: Disables verification of the GRE checksum (if present) in incoming GRE packets.

**reorder-timeout**: sets the maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets to the default setting: 100.

**sequence-mode**: Disables the reordering of incoming out-of-sequence GRE packets by setting this parameter to the default setting: none.

**sequence-numbers**: Disables the insertion or removal of GRE sequence numbers in GRE packets.

**ip local-port**

Restores the ip local-port setting to its default: 434.
policy (null-username | nw-reachability-fail | overload )
Restores the Home Agent service session policy settings.
null-username: Reject all RRQs that do not have an NAI.
nw-reachability-fail: If the network is not reachable, reject all incoming sessions.
overload: Restores the Home Agent service session overload policy setting to its default: reject.

private-address allow-no-reverse-tunnel
Reset the HA so that it does not accept MIP calls that use a private address without reverse tunneling.

reg-lifetime
Restores the Mobile IP session registration lifetime setting configured by the reg-lifetime command to its default: 600 seconds.

reverse-tunnel
Restores the reverse tunneling setting to its default: enabled.

revocation [ enable | max-retransmission | retransmission-timeout | trigger { handoff | idle-timeout} ]
Sets the MIP Registration Revocation settings to their default values. When no optional keywords are specified all revocation settings are set to their defaults.
enable: Disables MIP Registration Revocation on the FA.
max-retransmission: Sets the maximum number of retransmissions to 3.
retransmission-timeout: Sets the retransmission timeout to 3 seconds.
trigger { handoff | idle-timeout}: handoff enables inter-Access Gateway/FA handoff as a trigger for MIP Registration Revocation. idle-timeout enables session idle timer expiration as a trigger for MIP Registration Revocation.

setup-timeout
Restore the maximum amount of time allowed for setting up a session to the default: 60 seconds.

simul-bindings
Restores the simultaneous bindings setting to its default: 3.

Usage
After the system has been modified from its default values, this command is used to set/restore specific parameters to their default values.

Example
The following command is used to return the ip local-port parameter to it’s default value:
default ip local-port
default subscriber

Specifies the name of a subscriber profile configured within the same context as the HA service from which to base the handling of all other subscriber sessions handled by the HA service.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

```
default subscriber profile_name
```

```
no default subscriber profile_name
```

(profile_name)

Specifies the name of the configured subscriber profile. profile_name can be between 1 and 63 alpha and/or number characters and is case sensitive.

Usage
Each subscriber profile specifies “rules” such as permissions, PPP settings, and timeout values. By default, the HA service will use the information configured for the subscriber named default within the same context. This command allows for multiple HA services within the same context to apply different “rules” to sessions they process. Each set of rules can be configured under a different subscriber name which is pointed to by this command.

Use the no default subscriber profile_name command to delete the configured default subscriber.

Example
To configure the HA service to apply the rules configured for a subscriber named user1 to every other subscriber session it processes, enter the following command:

```
default subscriber user1
```
encapsulation allow gre

Enables or disables the use of Generic Routing Encapsulation (GRE) when establishing a MIP (Mobile IP) session with an FA. When enabled, if requested by the FA, GRE encapsulation is used when establishing a Mobile IP (MIP) session. If disabled, when an FA requests GRE encapsulation, the HA denies the request.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

```
encapsulation allow { gre | keyless-gre }
no encapsulation allow { gre | keyless-gre }
```

```
<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>gre</strong></td>
<td>Default: Enabled. Configures the use of GRE in Mobile IP session with an FA.</td>
</tr>
<tr>
<td><strong>keyless-gre</strong></td>
<td>Default: Disabled. Configures the GRE without key encapsulation in Mobile IP session with an FA.</td>
</tr>
</tbody>
</table>
```

Usage
Use to disable or re-enable the use of GRE encapsulation or Key-less encapsulation for MIP sessions. In case of chassis HA operating with other vendor equipment, which does not support the 3GPP2 to exchange key, this command with `keyless-gre` keyword will make the chassis HA to accept MIP data with legacy GRE.

Example
To disable GRE encapsulation for MIP sessions, enter the following command:
```
no encapsulation allow gre
```
To re-enable GRE encapsulation for MIP sessions, enter the following command:
```
encapsulation allow gre
```
To enable Key-less GRE encapsulation for MIP sessions, enter the following command:
```
encapsulation allow keyless-gre
```
end

Exits the HA service configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
end
```

Usage
Change the mode back to the Exec mode.
exit

Exits the HA service configuration mode and returns to the context configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Return to the context configuration mode.
fa-ha-spi

Configures the security parameter index (SPI) between the HA service and the FA.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

fa-ha-spi remote-address fa_ip_address spi-number number { encrypted secret enc_secret | secret secret } [description string] [hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }] [replay-protection { timestamp | timestamp-tolerance | nonce }] +
no fa-ha-spi remote-address ha_ip_address spi-number number

remote-address fa_ip_address

Specifies the IP address of the FA. fa_ip_address is an IP address or an IP address and mask expressed in dotted decimal notation.

Important: The system supports unlimited peer FA addresses per HA but only maintains statistics for a maximum of 8192 peer FAs. If more than 8192 FAs are attached, older statistics are identified and overwritten.

spi-number number

Specifies the SPI (number) which indicates a security context between the FA and the HA in accordance with RFC 2002.

number can be configured to any integer value between 256 and 4294967295.

encrypted secret enc_secret | secret secret

Configures the shared-secret between the HA service and the FA. The secret can be either encrypted or non-encrypted.

encrypted secret enc_secret: Specifies the encrypted shared key (enc_secret) between the HA service and the FA. enc_secret must be between 1 and 254 alpha and/or numeric characters and is case sensitive.

secret secret: Specifies the shared key (secret) between the HA service and the FA. secret must be between 1 and 127 alpha and/or numeric characters and is case sensitive.

The encrypted keyword is intended only for use by the chassis while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the secret keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

description string

This is a description for the SPI. string must be an alpha and or numeric string of from 1 through 31 characters.

hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }

Default: hmac-md5
Specifies the hash-algorithm used between the HA service and the FA.

`hmac-md5`: Configures the hash-algorithm to implement HMAC-MD5 per RFC 2002bis.
`md5`: Configures the hash-algorithm to implement MD5 per RFC 1321.
`rfc2002-md5`: Configures the hash-algorithm to implement keyed-MD5 per RFC 2002.

```
replay-protection { timestamp [timestamp-tolerance tolerance] | nonce }
```

Specifies the replay-protection scheme that should be implemented by the FA service for this SPI.

- `nonce`: Configures replay protection to be implemented using NONCE per RFC 2002.
- `timestamp`: Configures replay protection to be implemented using timestamps per RFC 2002.
- `timestamp-tolerance`: Specifies the allowable difference (tolerance) in timestamps that is acceptable. If the difference is exceeded, then the session will be rejected. `tolerance` is measured in seconds and can be configured to any integer value between 1 and 65535. The default is 60.

```
traffic-group grp_num
```

The traffic-group attribute is meant to tag the remote FA so that traffic policy can be enforced according to the traffic-group value. This attribute can be used by ECS to handle subscriber traffic coming from FAs with a specified traffic group differently.

Note: the functionality controlled by this keyword is only available if a License for Content Access Control has been purchased and enabled.

`grp_num` must be an integer from 1 through 255.

More than one of the above keywords can be entered within a single command.

---

**Usage**

An SPI is a security mechanism configured and shared by the HA service and the FA. Please refer to RFC 2002 for additional information.

Though it is possible for FAs and HAs to communicate without SPIs being configured, the use of them is recommended for security purposes. It is also recommended that a “default” SPI with a remote address of 0.0.0.0/0 be configured on both the HA and FA to prevent hackers from spoofing addresses.

---

**Important:** The SPI configuration on the HA must match the SPI configuration for the FA service on the system in order for the two devices to communicate properly.

A maximum of 2048 SPIs can be configured per HA service.

Use the `no` version of this command to delete a previously configured SPI.

---

**Example**

The following command configures the FA service to use an SPI of 512 when communicating with an HA with the IP address 192.168.0.2. The key that would be shared between the HA and the FA service is q397F65. When communicating with this HA, the FA service will also be configured to use the rfc2002-md5 hash-algorithm.

```
fa-ha-spi remote-address 192.168.0.2 spi-number 512 secret q397F65 hash-algorithm rfc2002-md5
```

The following command deletes the configured SPI of 400 for an HA with an IP address of 172.100.3.200:

```
no fa-ha-spi remote-address 172.100.3.200 spi-number 400
```
gre

Configures Generic Routing Encapsulation (GRE) parameters.

**Product**

HA

**Privilege**

Security Administrator, Administrator

**Syntax**

```
gre { checksum | checksum-verify | reorder-timeout timeout | sequence-mode { none | reorder } | sequence-numbers }
```

no gre { checksum | checksum-verify | sequence-numbers }

Disables the specified functionality.

**checksum**

Default: disabled

Enables the introduction of the checksum field in outgoing GRE packets.

**checksum-verify**

Default: disabled

Enables verification of the GRE checksum (if present) in incoming GRE packets.

**reorder-timeout timeout**

Default: 100

Configures maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets. `timeout` must be an integer from 0 through 5000.

**sequence-mode { none | reorder }**

Default: none

Configures how incoming out-of-sequence GRE packets should be handled.

- **none**: Disables reordering of incoming out-of-sequence GRE packets.
- **reorder**: Enables reordering of incoming out-of-sequence GRE packets.

**sequence-numbers**

Default: Disabled

Enables the insertion of sequence numbers into the GRE packets.

**Usage**

Use this command to configure how the HA service handles GRE packets.

**Example**

To set maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets to 500 milliseconds, enter the following command:
gre reorder-timeout 500
To enable the reordering of incoming out of sequence GRE packets, enter the following command:
gre sequence-mode reorder
To enable the insertion or removal of GRE sequence numbers in GRE packets, enter the following command:
gre sequence-numbers
idle-timeout-mode

Configures the method the HA service uses to determine when to reset a session idle timer.

**Product**  
HA

**Privilege**  
Security Administrator, Administrator

**Syntax**

```
idle-timeout-mode { aggressive | handoff | normal } [ upstream-only ]
default idle-timeout-mode
```

**default**  
Reset the idle timeout mode to the default settings.  
Defaults: aggressive, upstream-only is disabled.

**aggressive**  
The session idle timer is reset only when MIP user data is detected. This is the default behavior.

**handoff**  
The session idle timer is reset when MIP user data is detected and when an inter-Access Gateway/FA handoff occurs.

**normal**  
The session idle timer is reset when MIP user data is detected and when any MIP control signaling occurs.

**upstream-only**  
Only upstream user data (data from the mobile node) resets the idle timer for the session. This is disabled by default.

**Usage**

Use this command to set how the current HA service resets the idle timer for a session.

**Example**

To reset the idle timer whenever user data is detected or whenever an inter-Access Gateway/FA occurs, use the following command:

```
idle-timeout-mode handoff
```
**ip context-name**

Specifies name of the destination context to be applied to the subscribers; this would take precedence over the same in subscriber configuration and RADIUS return attributes.

This new configuration overrides the local subscriber configuration as well as the return attributes sent by RADIUS. All calls coming to this HA service are assigned this particular destination context and IP address is allocated from the specified IP pool or group that is configured in the context specified in the service.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ip context-name name
```

**name**

Specifies the name of the context to assign the subscriber to once authenticated. name must be from 1 to 79 alpha and/or numeric characters.

**no**

**Usage**

Removes the current assigned context from the subscriber’s data. Set the name of the destination context to be applied to the subscribers.

**Example**

```
ip context-name sampleName
no ip context-name sampleName
```
ip local-port

Configures the local User Datagram Protocol (UDP) port for the Pi interfaces’ IP socket on which to listen for MOBILE IP Registration messages.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

```
ip local-port number
```

`number`

Specifies the UDP port number.
`number` can be any integer value between 1 and 65535.

Usage
Specify the UDP port that should be used for communications between the FA service and the HA. The chassis is shipped from the factory with the local port set to 434.

Example
The following command specifies a UDP port of 3950 for the HA service to use to communicate with the HA on the Pi interface:

```
ip local-port 3950
```
ip pool

Specifies name of the IP address pool or group to use for subscriber IP address allocation; this takes precedence over the same in subscriber configuration and RADIUS return attributes.

This new configuration overrides the local subscriber configuration as well as the return attributes sent by RADIUS. All calls coming to this HA service are assigned this particular destination context and IP address is allocated from the specified IP pool or group that is configured in the context specified in the service.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

ip pool name

- name
  Specifies the logical name of the IP address pool. name must be from 1 to 31 alpha and/or numeric characters.

- no
  Indicates the IP address pool specified is to be removed from the current context’s configuration or disable the specified option for an IP pool.

Usage
Define a pool of IP addresses for the context to use in assigning IPs for this service.

Example

ip pool pool1
no ip pool pool1
isakmp

Configures the crypto map for a peer HA and configures the default crypto map for the FA service.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
isakmp { peer-fa fa_address | skew-lifetime time | aaa-context context_name }
```

no

Deletes the reference to the crypto map for the specified HA, deletes the reference for the default crypto map, resets the skew-lifetime to the default, or resets the aaa-context to the default.

```
peer-fa fa_address { crypto map map_name [[ encrypted ] secret secret ]}
```

Configures a crypto map for a peer FA.

- **fa_address**: IP address of the peer FA to which this IPSEC SA will be established.
- **crypto map map_name**: The name of a crypto map configured in the same context that defines the IPSEC tunnel properties. `map_name` is the name of the crypto map and can be from 1 to 127 alpha and/or numeric characters.
- **encrypted**: This keyword is intended only for use by the chassis while saving configuration scripts. The system displays the `encrypted` keyword in the configuration file as a flag that the variable following the `secret` keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.
- **secret secret**: The pre-shared secret that will be used to during the IKE negotiation. `secret` is the secret string and can be from 1 to 127 alpha and/or numeric characters.

```
skew-lifetime time
```

Default: 10 seconds

Configures the IKE pre-shared key’s time skew.

`time` is the amount of time the IKE S key fetched from AAA is considered valid after the key has expired. It is measured in seconds and can be configured to any integer value from 1 to 65535.

```
aaa-context context_name
```

Default: The context in which the service is configured

Configures the name of the context on the system in which AAA functionality is performed. `context_name` is the name of the context through which the HA service accesses the HAAA server to fetch the IKE S Key and S Lifetime parameters. The name must be from 1 to 79 alpha and/or numeric characters and is case sensitive.

**Usage**

Use this command to configure the FA-service’s per-HA IPSEC parameters. These dictate how the HA service is to establish an IPsec SA with the specified FA.
| HA Service Configuration Mode Commands |

**Important:** For maximum security, it is recommended that the above command be executed for every possible FA that the HA service communicates with.

Note that once an IPSec tunnel is established between the FA and HA for a particular subscriber, all new Mobile IP sessions using the same FA and HA are passed over the tunnel regardless of whether or not IPSec is supported for the new subscriber sessions. Data for existing Mobile IP sessions is unaffected.

**Example**
The following command creates a reference for an HA with the IP address 1.2.3.4 to a crypto map named map1:

```
isakmppeer-fa 1.2.3.4 crypto map map1
```

The following command deletes the crypto map reference for the HA with the IP address 1.2.3.4.

```
o isakmppeer-fa 1.2.3.4
```

The following command sets the time an S key can used after the S lifetime expires to 120 seconds.

```
isakmp skew-lifetime 120
```

The following command creates the default reference for an HA to a crypto map named `map1`, where peer address is unknown:

```
isakmp default crypto map map1
```
mn-ha-spi

Configures the security parameter index (SPI) between the HA service and the mobile node.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

```
mn-ha-spi spi-number number [description string] [encrypted secret enc_secret | secret secret] [hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }] [permit-any-hash-algorithm] [replay-protection { nonce | timestamp }] [timestamp-tolerance tolerance]
```

```
no mn-ha-spi spi-number number
```

`spi-number number`

Specifies the SPI (number) which indicates a security context between the mobile node and the HA service in accordance with RFC 2002. number can be configured to any integer value between 256 and 4294967295.

`description string`

This is a description for the SPI. string must be an alpha and or numeric string of from 1 through 31 characters.

`encrypted secret enc_secret | secret secret`

Configures the shared-secret between the HA service and the mobile node. The secret can be either encrypted or non-encrypted.

- `encrypted secret enc_secret`: Specifies the encrypted shared key (enc_secret) between the HA service and the mobile node. enc_secret must be between 1 and 254 alpha and/or numeric characters and is case sensitive.
- `secret secret`: Specifies the shared key (secret) between the HA service and the mobile node. secret must be between 1 and 127 alpha and/or numeric characters and is case sensitive.

The `encrypted` keyword is intended only for use by the chassis while saving configuration scripts. The system displays the `encrypted` keyword in the configuration file as a flag that the variable following the `encrypted` keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

`hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }

Default: hmac-md5

Specifies the hash-algorithm used between the HA service and the mobile node.

- `hmac-md5`: Configures the hash-algorithm to implement HMAC-MD5 per RFC 2002bis.
- `md5`: Configures the hash-algorithm to implement MD5 per RFC 1321.
- `rfc2002-md5`: Configures the hash-algorithm to implement keyed-MD5 per RFC 2002.

`permit-any-hash-algorithm`

Default: disabled
HA Service Configuration Mode Commands

Allows verification of the MN-HA authenticator using all other hash-algorithms after failure with configured hash-algorithm. Successful algorithm is logged to aid in troubleshooting and is used to create the MN-HA authenticator in the Registration Reply message.

```
replay-protection { nonce | timestamp }
```
Default: timestamp
Specify the replay-protection scheme that should be implemented by the HA service for this SPI.
- `nonce`: configures replay protection to be implemented using NONCE per RFC 2002.
- `timestamp`: configures replay protection to be implemented using timestamps per RFC 2002.

```
timestamp-tolerance tolerance
```
Default: 60
Specifies the allowable difference (tolerance) in timestamps that is acceptable. If the difference is exceeded, the session will be rejected. If this is set to 0, then time stamp tolerance checking is disabled at the receiving end.
Tolerance is measured in seconds and can be configured to any integer value between 0 and 65535.

Usage
An SPI is a security mechanism configured and shared by the HA service and the mobile node. Please refer to RFC 2002 for additional information.
Use the no version of this command to delete a previously configured SPI.

Example
The following command configures the HA service to use an SPI of 640 when communicating with a mobile node. The key that would be shared between the mobile node and the HA service is q397F65.

```
mn-ha-spi spi-number 640 secret q397F65
```
The following command deletes the configured SPI of 400:
```
no mn-ha-spi spi-number 400
```
**nat-traversal**

This command enables NAT traversal and also configures the forcing of UDP tunnels for NAT traversal.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```bash
nat-traversal [force-accept]
no nat-traversal [force-accept]
default nat-traversal [force-accept]
```

**no**
Disables NAT traversal or disables forcing the acceptance of UDP tunnels for NAT traversal.

**default**
Reset the defaults for this command.
Default: NAT traversal disabled, force-accept disabled.

**force-accept**
This keyword configures the HA to accept requests when NAT is not detected but the Force (F) bit is set in the RRQ with the UDP Tunnel Request. By default this type of request is rejected if NAT is not detected.

**Usage**
Use this command to enable NAT traversal and enable the forcing of UDP tunnels for NAT traversal.

**Example**
The following command enables NAT traversal for the current HA service and forces the HA to accept UDP tunnels for NAT traversal:

```
nat-traversal force-accept
```
**optimize tunnel-reassembly**

Configures HA to FA optimization for tunnel reassembly.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
optimize tunnel-reassembly

no optimize tunnel-reassembly
```

**Usage**

Enabling this functionality fragments large packets prior to encapsulation for easier processing.

Tunnel reassembly optimization is disabled by default.

**Important:** Cisco Systems strongly recommends that you do not use this command without first consulting Cisco Systems Technical Support. This command applies to very specific scenarios where packet reassembly is not supported at the far end of the tunnel. There are cases where the destination network may either discard the data, or be unable to reassemble the packets.

**Important:** This functionality works best when the HA service is communicating with an FA service running in a system. However, an HA service running in the system communicating with an FA from a different manufacturer will operate correctly even if this parameter is enabled.

Use the `no` version of this command to disable tunnel optimization if enabled.

**Example**

The following command enables tunnel reassembly optimization:

```
optimize tunnel-reassembly
```
**policy bc-query-result**

Configures the response code to send in a binding cache (BC) query result in response to a network failure or error.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
policy bc-query-result network-failure code
[ default ] policy bc-query-result network-failure
```

- **network-failure code**
  Default: 0xFFFF
  Specify the response code for BC responses sent on network failures.
  `code` must be either 0xFFFF or 0xFFFE.

**Usage**
Use this command to specify the type of response code to send in a P-MIP BC query result.

**Example**
The following command sets the P-MIP BC query result response code to 0xFFFE:
```
policy bc-query-result network-failure 0xFFFE
```
**policy nw-reachability-fail**

Specifies the action to take upon detection of an up-stream network-reachability failure.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
policy nw-reachability-fail { reject [use-reject-code { admin-prohibited | insufficient-resources } ] | redirect ip_addr1 [weight value] [ip_addr2 [weight value] ... ip_addr16 [weight value]] }
nopoly nw-reachability-fail [redirect ip_addr1 ... ip_addr16]
```

**Usage**

Use this command to set the action for the HA service to take upon a network reachability failure.
**Important:** Refer to the context configuration mode command `nw-reachability server` to configure network reachability servers.

**Important:** Refer to the subscriber configuration mode command `nw-reachability-server` to bind the network reachability to a specific subscriber.

**Important:** Refer to the `nw-reachability server server_name` keyword of the context configuration mode `ip pool` command bind the network reachability server to an IP pool.

**Example**

To set the HA service to reject all new calls on a network reachability failure, enter the following command:

```
policy nw-reachability-fail reject
```

Use the following command to set the HA service to redirect all calls to the HA at IP address 192.168.100.10 and 192.168.200.10 on a network reachability failure:

```
policy nw-reachability-fail redirect 192.168.100.10 192.168.200.10
```
policy overload

Configures the overload policy within the HA service.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

```
policy overload { redirect address [ weight weight_num ] [ address2 [ weight weight_num ] ... address16 [ weight weight_num ] ] | reject [ use-reject-code { admin-prohibited | insufficient-resources } ] }

no policy overload [ redirect address [ address2 ... address16 ] ]
```

Deleted previously set policy or removes a redirect IP address.

overload: This keyword without any options deletes the complete overload policy from the PDSN service.

overload redirect address [ address2 ... address16 ]; deletes up to 16 IP addresses from the overload redirect policy. The IP addresses must be expressed in IP v4 dotted decimal notation.

```
redirect address [ weight weight_num ] [ address2 [ weight weight_num ] ... address16 [ weight weight_num ] ]
```

This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the HA service rejects new sessions with a Registration Reply Code of 136H (unknown home agent address) and provides the IP address of an alternate HA. This command can be issued multiple times.

address: The IP address of an alternate HA expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.

```
weight weight_num: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. weight_num must be an integer from 1 through 10.
```

```
reject [ use-reject-code { admin-prohibited | insufficient-resources } ]
```

This option causes any overload traffic to be rejected. If no reject code is specified, the HA sends a registration reply code of 81H (admin-prohibited).

```
use-reject-code { admin-prohibited | insufficient-resources } : Use the specified reject code when rejecting traffic.
```

```
admin-prohibited: When this keyword is specified and traffic is rejected, the error code 81H (admin-prohibited) is returned.
```

```
insufficient-resources: When this keyword is specified and traffic is rejected, the error code 82H (insufficient resources) is returned.
```

Usage
The system invokes the overload policy if the number of calls currently being processed exceeds the licensed limit for the maximum number of sessions supported by the system. The system automatically invokes the overload policy when an on-line software upgrade is started. Use the **no** version of this command to restore the default policy. The setting for overload policy is reject.

**Example**
The following command enables an overload redirect policy for the HA service that will send overload calls to either of two destinations with weights of 1 and 10 respectively:

```
policy overload redirect 192.168.100.10 weight 1 192.168.100.20 weight 10
```
policy null-username

Configures the current HA service to accept or reject an RRQ without an NAI extension.

**Important:** This command is customer specific and is license enabled.

**Product:**
HA

**Privilege:**
Security Administrator, Administrator

**Syntax**

```
policy null-username { accept-static | reject }
no policy null-username
```

**no**
Set the HA back to the default behavior of rejecting an RRQ without an NAI extension.

**accept-static**
This enable the HA to accept an RRQ with a static (i.e, non-zero) home address request but without NAI extension, when MN-AAA authentication is disabled at the HA. MN-NAI is required for MN-AAA authentication.

**reject**
Default. This is the default behavior of rejecting an RRQ without an NAI extension.

**Usage**
Use this command to enable or disable the HA from accepting an RRQ without an NAI.

**Example**
The following command enables the current HA service to accept RRQs that do not have an NAI extension:

```
policy null-username accept-static
```
private-address allow-no-reverse-tunnel

This command allows the HA service to accept private addresses without using reverse tunneling.

**Important:** This command is customer specific and is license enabled.

**Product**  
HA

**Privilege**  
Security Administrator, Administrator

**Syntax**

```
private-address allow-no-reverse-tunnel
no private-address allow-no-reverse-tunnel

no
```

Reject MIP calls that use private addresses and do not use reverse tunneling.

**Usage**

Use this command to enable or disable the HA from accepting calls that use private addresses without reverse tunneling.

**Example**

The following command enables the current HA service to accept MIP calls that use private addresses but do not use reverse tunneling:

```
private-address allow-no-reverse-tunnel
```
**reg-lifetime**

Specifies the longest registration lifetime that the HA service will allow in any Registration Request message from the mobile node.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```text
reg-lifetime time
no reg-lifetime
```

- **no**
  Sets the registration lifetime to infinite.

- **time**
  Specifies the registration lifetime.
  time is measured in seconds and can be configured to any integer value between 1 and 65534.

**Usage**

Use to limit a mobile node's lifetime. If the mobile node requests a shorter lifetime than what is specified, it is granted. However, Per RFC 2002, should a mobile node request a lifetime that is longer than the maximum allowed by this parameter, the HA service will respond with the value configured by this command as part of the Registration Reply.

The chassis is shipped from the factory with the registration lifetime set to 600 seconds.

**Example**

The following command configures the registration lifetime for the HA service to be 2400 seconds:

```text
reg-lifetime 2400
```

The following command configures an infinite registration lifetime for MIP calls:

```text
no reg-lifetime
```
reverse-tunnel

Enables the use of reverse tunneling for a Mobile IP sessions when requested by the mobile node.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
reverse-tunnel

no reverse-tunnel
```

**Usage**
Reverse tunneling involves tunneling datagrams originated by the mobile node to the HA service via the FA. When an MN arrives at a foreign network, it listens for agent advertisements and selects an FA that supports reverse tunnels. The MN requests this service when it registers through the selected FA. At this time, the MN may also specify a delivery technique such as Direct or the Encapsulating Delivery Style.

Among the advantages of using reverse-tunneling are that:
- All datagrams from the mobile node seem to originate from its home network
- The FA can keep track of the HA that the mobile node is registered to and tunnel all datagrams from the mobile node to its HA

Use the `no` version of this command to disable reverse tunneling. If reverse tunneling is disabled, and the mobile node does not request it, triangular routing will be performed. Routing will be used.

The chassis is shipped from the factory with the reverse tunnel enabled.

**Important:** If reverse tunneling is disabled on the system and a mobile node requests it, the call will be rejected with a reply code of 74H (reverse-tunneling unavailable).

**Example**
The following command disables reverse-tunneling support for the HA service:

```plaintext
no reverse-tunnel
```
revocation

Enables the MIP revocation feature and configures revocation parameters.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
revocation { enable | max-retransmission number | negotiate-i-bit | retransmission-timeout secs | send-nai-ext | trigger { handoff | idle-timeout } }
```

```
o revocation | enable | negotiate-i-bit | send-nai-ext | trigger { handoff | idle-timeout }
```

**no**

Completely disables registration revocation on the HA, disables trigger handoff, or disables revocation on idle timer expiration.

**enable**

Enables the MIP registration revocation feature on the HA. When enabled, if revocation is negotiated with an FA and a MIP binding is terminated, the HA can send a Revocation message to the FA. This feature is disabled by default.

**max-retransmission number**

Default: 3
The maximum number of retransmissions of a Revocation message before the revocation fails. `number` must be an integer from 0 through 10.

**negotiate-i-bit**

Default: disabled
Enables the HA to negotiate the i-bit via PRQ/RRP messages and processes the i-bit revocation messages.

**retransmission-timeout secs**

Default: 3
The number of seconds to wait for a Revocation Acknowledgement from the FA before retransmitting the Revocation message. `secs` must be an integer from 1 through 10.

**send-nai-ext**

Default: off
Enables sending the NAI extension in the revocation message.

**trigger { handoff | idle-timeout }**

**handoff:** Default: Enabled
Triggers the HA to send a Revocation message to the FA when an inter-Access Gateway/FA handoff of the MIP session occurs. If this is disabled, the HA is never triggered to send a Revocation message.

**idle-timeout**: Default: Enabled

Triggers the HA to send a Revocation message to the FA when a session idle timer expires.

---

### Usage

Use this command to enable or disable the MIP revocation feature on the HA or to change settings for this feature. Both the HA and the FA must have Registration Revocation enabled and FA/HA authorization must be in use for Registration Revocation to be negotiated successfully.

---

### Example

The following command enables Registration Revocation on the HA:

```
revocation enable
```

The following command sets the maximum number of retries for a Revocation message to 10:

```
revocation max-retransmission 10
```

The following command sets the timeout between retransmissions to 3:

```
revocation retransmission-timeout 3
```

The behavior of send MIP revocation to FA is as follows:

1. **1st retry**: Retransmit in 3 seconds after previous MIP revocation send.
2. **2nd retry**: Retransmit in 6 seconds after previous MIP revocation send (9 seconds after sending initial MIP revocation).
3. **3rd retry**: Retransmit in 12 seconds after previous MIP revocation send (21 seconds after sending initial MIP revocation).
4. **4th retry**: Retransmit in 24 seconds after previous MIP revocation send (45 seconds after sending initial MIP revocation).
5. **5th retry**: Retransmit in 48 seconds after previous MIP revocation send (93 seconds after sending initial MIP revocation).

---

**Important**: The value of retransmission-timeout doubles. HA disconnects the session forcibly in 120 seconds after sending initial MIP revocation.
setup-timeout

The maximum amount of time allowed for session setup.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

setup-timeout seconds

seconds
Default: 60 seconds
The maximum amount of time, in seconds, to allow for setup of a session. must be an integer from 1 through 1000000

Usage
Use this command to set the maximum amount of time allowed for setting up a session.

Example
To set the maximum time allowed for setting up a session to 5 minutes (300 seconds), enter the following command:
setup-timeout 300
simul-bindings

Specifies the maximum number of “care-of” addresses that can simultaneously be bound for the same user as identified by NAI and Home address.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

```
simul-bindings number
```

`number`

Configures the maximum number of simultaneous “care-of” bindings that the HA service will maintain for any given subscriber. The number can be configured to any integer value between 1 and 5.

Usage
Per RFC 2002, the HA service creates a mobile binding record (MBR) for each subscriber session it is facilitating. Each MBR is associated with a care-of address. As the mobile node roams, it is possible that the session will be associated with a new care of address. Typically, the HA service will delete an old binding and create a new one when the information in the Registration Request changes. However, the mobile could request that the HA maintains previously stored MBRs. This command allows you to configure the maximum number of MBRs that can be stored per subscriber if the requested. The chassis is shipped from the factory with the simultaneous sessions set to 3.

Example
The following command configures the HA service to support up to 4 MBRs per subscriber:

```
simul-bindings 4
```
threshold init-rrq-rcvd-rate

Set an alarm or alert based on the average number of calls setup per second for the context.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

```
threshold init-rrq-rcvd-rate high_thresh [ clear low_thresh ]
no threshold init-rrq-rcvd-rate
```

```
no
```

Deletes the alert or alarm.

```
high_thresh
```

Default: 0
The high threshold average number of calls setup per second must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 1000000.

```
clear low_thresh
```

Default: 0
The low threshold average number of calls setup per second that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 1000000.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the average number of calls setup per second is equal to or greater than a specified number of calls per second.

Alerts or alarms are triggered for the number of calls setup per second based on the following rules:

- **Enter condition:** Actual number of calls setup per second > High Threshold
- **Clear condition:** Actual number of calls setup per second ≤ Low Threshold

Example

The following command configures a number of calls setup per second threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:

```
threshold init-rrq-rcvd-rate 1000 clear 500
```
threshold ipsec-call-req-rej

Configures a threshold for the total IPSec calls request rejected.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold ipsec-call-req-rej high_thresh [ clear low_thresh ]

no threshold ipsec-call-req-rej
```

- **high_thresh**
  - Default: 0
  - The high threshold number of IPSec call requests rejected per second must be met or exceeded within the polling interval to generate an alert or alarm.
  - `high_thresh` can be configured to any integer value between 0 and 100000.

- **clear low_thresh**
  - Default: 0
  - The low threshold number of IPSec call requests rejected per second that must be met or exceeded within the polling interval to clear an alert or alarm.
  - `low_thresh` can be configured to any integer value between 0 and 100000.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Use this command to set an alert or an alarm when the number of IPSec call requests rejected is equal to or greater than a specified number per second.

Alerts or alarms are triggered for the number of IPSec IKE requests on the following rules:

- **Enter condition:** Actual number of IPSec IKE requests > High Threshold
- **Clear condition:** Actual number of IPSec IKE requests ≤ Low Threshold

**Example**

The following command configures a number of IPSec call requests rejected threshold of 1000 and a low threshold of 800 for a system using the Alarm thresholding model:

```
threshold ipsec-call-req-rej 1000 clear 800
```
threshold ipsec-ike-failrate

Configures a threshold for the percentage of IPSec IKE failures.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

```
threshold ipsec-ike-failrate high_thresh [ clear low_thresh ]
```

no threshold ipsec-ike-failrate

no

Deletes the alert or alarm.

```
high_thresh
```

Default: 0

The high threshold percentage of IPSec IKE failures per second must be met or exceeded within the polling interval to generate an alert or alarm.

`high_thresh` can be configured to any integer value between 0 and 100.

```
clear low_thresh
```

Default: 0

The low threshold percentage of IPSec IKE failures per second that must be met or exceeded within the polling interval to clear an alert or alarm.

`low_thresh` can be configured to any integer value between 0 and 100.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the percentage of IPSec IKE failures is equal to or greater than a specified number per second.

Alerts or alarms are triggered for the percentage of IPSec IKE failures on the following rules:

- **Enter condition:** Percentage of IPSec IKE failures > High Threshold
- **Clear condition:** Percentage of IPSec IKE failures £ Low Threshold

Example

The following command configures a percentage of IPSec IKE failures threshold of 1000 and a low threshold of 800 for a system using the Alarm thresholding model:

threshold ipsec-ike-failrate 90 clear 80
threshold ipsec-ike-requests

Configures a threshold for the total IPSec IKE failures.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold ipsec-ike-failures high_thresh [ clear low_thresh ]
```

```
no threshold ipsec-ike-failures
```

```
no
```

Deletes the alert or alarm.

```
high_thresh
```

Default: 0
The high threshold number of IPSec IKE failures per second must be met or exceeded within the polling interval to generate an alert or alarm.

```
high_thresh can be configured to any integer value between 0 and 100000.
```

```
clear low_thresh
```

Default: 0
The low threshold number of call IPSec IKE failures per second that must be met or exceeded within the polling interval to clear an alert or alarm.

```
low_thresh can be configured to any integer value between 0 and 100000.
```

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Use this command to set an alert or an alarm when the number of IPSec IKE failures is equal to or greater than a specified number per second.
Alerts or alarms are triggered for the number of IPSec IKE failures on the following rules:

- **Enter condition:** Actual number of IPSec IKE failures > High Threshold
- **Clear condition:** Actual number of IPSec IKE failures ≤ Low Threshold

**Example**
The following command configures a number of IPSec IKE failures threshold of 1000 and a low threshold of 800 for a system using the Alarm thresholding model:
```
threshold ipsec-ike-failures 1000 clear 800
```
threshold ipsec-ike-requests

Configures a threshold for the total IPSec IKE failures.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

```
threshold ipsec-ike-failures high_thresh [ clear low_thresh ]

no threshold ipsec-ike-failures
```

<table>
<thead>
<tr>
<th>no threshold ipsec-ike-failures</th>
</tr>
</thead>
<tbody>
<tr>

| Default: 0 |
| The low threshold number of call IPSec IKE failures per second that must be met or exceeded within the polling interval to clear an alert or alarm. |

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Use this command to set an alert or an alarm when the number of IPSec IKE failures is equal to or greater than a specified number per second.

Alerts or alarms are triggered for the number of IPSec IKE failures on the following rules:

- **Enter condition:** Actual number of IPSec IKE failures > High Threshold
- **Clear condition:** Actual number of IPSec IKE failures ≤ Low Threshold

**Example**

The following command configures a number of IPSec IKE failures threshold of 1000 and a low threshold of 800 for a system using the Alarm thresholding model:

```
threshold ipsec-ike-failures 1000 clear 800
```
threshold ipsec-tunnels-established

Configures a threshold for the total IPSec tunnels established.

**Product**

HA

**Privilege**

Security Administrator, Administrator

**Syntax**

```
threshold ipsec-tunnels-established high_thresh [ clear low_thresh ]
```

```
no threshold ipsec-tunnels-established
```

`no`

Deletes the alert or alarm.

`high_thresh`

Default: 0

The high threshold number of IPSec tunnels established per second must be met or exceeded within the polling interval to generate an alert or alarm.

*high_thresh* can be configured to any integer value between 0 and 1000000.

`clear low_thresh`

Default: 0

The low threshold number of call IPSec tunnels established per second that must be met or exceeded within the polling interval to clear an alert or alarm.

*low_thresh* can be configured to any integer value between 0 and 1000000.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Use this command to set an alert or an alarm when the number of IPSec tunnels established is equal to or greater than a specified number per second.

Alerts or alarms are triggered for the number of IPSec tunnels established on the following rules:

- **Enter condition:** Actual number of IPSec tunnels established > High Threshold
- **Clear condition:** Actual number of IPSec tunnels established £ Low Threshold

**Example**

The following command configures a number of IPSec tunnels established threshold of 1000 and a low threshold of 800 for a system using the Alarm thresholding model:

```
threshold ipsec-tunnels-established 1000 clear 800
```
**threshold ipsec-tunnels-setup**

Configures a threshold for the total IPSec tunnels setup.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold ipsec-tunnels-setup high_thresh [ clear low_thresh ]

no threshold ipsec-tunnels-setup
```

**no**

Deletes the alert or alarm.

**high_thresh**

Default: 0
The high threshold number of IPSec tunnels setup per second must be met or exceeded within the polling interval to generate an alert or alarm.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**clear low_thresh**

Default: 0
The low threshold number of call IPSec tunnels setup per second that must be met or exceeded within the polling interval to clear an alert or alarm.

```
low_thresh can be configured to any integer value between 0 and 1000000.
```

**Usage**

Use this command to set an alert or an alarm when the number of IPSec tunnels setup is equal to or greater than a specified number per second.

Alerts or alarms are triggered for the number of IPSec tunnels setup on the following rules:

- **Enter condition:** Actual number of IPSec tunnels setup > High Threshold
- **Clear condition:** Actual number of IPSec tunnels setup £ Low Threshold

**Example**

The following command configures a number of IPSec tunnels setup threshold of 1000 and a low threshold of 800 for a system using the Alarm thresholding model:

```
threshold ipsec-tunnels-setup 1000 clear 800
```
threshold reg-reply-error

Set an alarm or alert based on the number of registration reply errors per HA service.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

```
threshold reg-reply-error high_thresh [ clear low_thresh ]
no threshold reg-reply-error
```

no
Deletes the alert or alarm.

```
high_thresh
```
Default: 0
The high threshold number of registration reply errors that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

```
clear low_thresh
```
Default: 0
The low threshold number of registration reply errors that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

⚠️ Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
Use this command to set an alert or an alarm when the number of registration reply errors is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of registration reply errors on the following rules:
- **Enter condition:** Actual number of registration reply errors > High Threshold
- **Clear condition:** Actual number of registration reply errors £ Low Threshold

Example
The following command configures a registration reply error threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:
```
threshold reg-reply-error 1000 clear 500
```
threshold rereg-reply-error

Set an alarm or alert based on the number of re-registration reply errors per HA service.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold rereg-reply-error high_thresh [ clear low_thresh ]
no threshold rereg-reply-error
```

*no*

Deletes the alert or alarm.

*high_thresh*

Default: 0

The high threshold number of re-registration reply errors that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 1000000.

*clear low_thresh*

Default: 0

The low threshold number of re-registration reply errors that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 1000000.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Use this command to set an alert or an alarm when the number of re-registration reply errors is equal to or greater than a specified number of calls per second.

Alerts or alarms are triggered for the number of re-registration reply errors on the following rules:

- **Enter condition:** Actual number of re-registration reply errors > High Threshold
- **Clear condition:** Actual number of re-registration reply errors ≤ Low Threshold

**Example**

The following command configures a re-registration reply error threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:

```
threshold rereg-reply-error 1000 clear 500
```
threshold dereg-reply-error

Set an alarm or alert based on the number of de-registration reply errors per HA service.

**Product**

HA

**Privilege**

Security Administrator, Administrator

**Syntax**

```
threshold dereg-reply-error high_thresh [ clear low_thresh ]
no threshold dereg-reply-error
```

**no**

Deletes the alert or alarm.

**high_thresh**

Default: 0
The high threshold number of de-registration reply errors that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 1000000.

**clear low_thresh**

Default: 0
The low threshold number of de-registration reply errors that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 1000000.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Use this command to set an alert or an alarm when the number of de-registration reply errors is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of de-registration reply errors on the following rules:

- **Enter condition:** Actual number of de-registration reply errors > High Threshold
- **Clear condition:** Actual number of de-registration reply errors £ Low Threshold

**Example**

The following command configures a de-registration reply error threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:

```
threshold reg-reply-error 1000 clear 500
```
wimax-3gpp2 interworking

Configures the interworking between WiMAX and 3GPP2 network at HA. This support provides handoff capabilities from 4G to 3G (PDSN) network access and vice-versa.

Product
HA

Privilege
Security Administrator, Administrator

Syntax

[no | default] wimax-3gpp2 interworking

no
Disables the pre-configured interworking between WiMAX and 3GPP2 networks at HA level.

default
Configures the WiMAX-3GPP2 interworking to default setting; i.e. disabled.

Usage
Use this command to enable/disable the interworking between WiMAX and 3GPP2 network for seamless session continuity.
This functionality provides HA support for both 4G and 3G technology HA (WiMAX HA and PDSN/HA) for handoff from 4G and 3G network access (ASN GW/FA and PDSN/FA) and vice-versa.

Important: Use this command in conjunction with authentication aaa-distributed-mip-keys required command.

Example
The following command enables the interworking for a subscriber between WiMAX and 3GPP2 network.

wimax-3gpp2 interworking
Chapter 118
HD RAID Configuration Mode Commands

This mode develops default policies designed to minimize administrative intervention when setting up a RAID on ASR 5000 SMC hard disks.
default

Sets or restores the default condition for the selected parameter

Product

All

Privilege

Security Administrator, Administrator

Syntax

default ( overwrite { invalid | unknown | valid } disk | select )

overwrite { invalid | unknown | valid } disk
Confirms the system to overwrite any of the disk types

select
Selects the newer of the valid RAID disks when two valid RAID disks are available.

Usage

Selects default parameters

Example

Use the following example to select the newest disk in an SMC pair:

default select
end

Exits the HD RAID configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Change the mode back to the Exec mode.
exit

Exits the HD RAID configuration mode and returns to the previous mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Return to the previous mode.
overwrite

Sets the RAID overwrite properties.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ no | default ] overwrite { invalid | unknown | valid } disk [ -noconfirm ]

no
Prevents a disk from being overwritten.

default
Configures the default overwrite action:

invalid
This option allows the system to automatically overwrite invalid disks including empty disks, wrongly partitioned disks, and partially constructed disks.
This is the default overwrite action.

unknown
This option allows the system to automatically overwrite unknown disks that has a valid RAID superblock but is not configured in the standard way; most likely because it has data from a different version.

valid
This option allows the system to automatically overwrite a disk that is a clean RAID component but not part of the current or selected RAID.

-noconfirm
Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage
Sets a policy for automatically overwriting different disk types. If there is a disk that satisfies the changed overwrite policy then the disk would overwrite immediately.

Example
The following command configures a policy for overwriting invalid RAID disks:

overwrite invalid disk -noconfirm
select

Configures the disk preference when both hard disks on the ASR 5000 have valid RAID information.

Product
All

Privilege
Security Administrator, Administrator

Syntax

[ default ] select { newer | none } disk [ -noconfirm ]

- **default**
  Configures the command to its default condition.

- **newer**
  Selects the newer disk by timestamp and event counter in superblocks. If all are the same, then the same array will start with both SMC disks, but a different array will need admin intervention).

- **none**
  Does not select any disk but defers to administrator intervention.

- **-noconfirm**
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage
Determines the selected disc when two valid disks from either the same or different RAIDs are running on the ASR 5000.

Example
This command forces the RAID to be configured on the newer SMC hard disk:

```
select newer disk -noconfirm
```
The HD Storage Policy Configuration Mode is used to configure directory name and file parameters for Diameter record files being stored on the HD storage device.
**directory**

Configures the name of the directory on the HD storage drive where Diameter records are stored.

**Product**

HSGW, P-GW, S-GW

**Privilege**

Administrator

**Syntax**

`directory name dir_name`

`default directory name`

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>directory</code></td>
<td>Configures the name of the directory on the HD storage drive where Diameter records are stored.</td>
</tr>
<tr>
<td><code>default</code></td>
<td>Returns the command to its default setting of using the policy name as the directory name.</td>
</tr>
<tr>
<td><code>name dir_name</code></td>
<td>Specifies the name to be applied to the directory. <code>dir_name</code> must be an alpha and or numeric string from 1 to 63 characters. When configured, the actual directory path is: <code>/hd-raid/records/&lt;record-type&gt;/&lt;dir_name&gt;/</code>. So if the directory name variable is entered as &quot;sgwpgw&quot;, the path is: <code>/hd-raid/records/acr/sgwpgw</code>.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to name a directory on the HD storage drive where Diameter records are to be stored.

**Example**

The following command configures a directory named `cdr1`:

`directory name cdr1`
end

Exits the current mode and returns to the Exec Mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Change the mode back to the Exec mode.
exit

Exits the current mode and returns to the previous mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Return to the previous mode.
file

Configures file parameters for Diameter records being stored on the HD storage device.

Product
HSGW, P-GW, S-GW

Privilege
Administrator

Syntax

```plaintext
file { format acr { custom1...custom10 } | name { extension string | prefix string } | rotation { record-count num | time-interval sec | volume mb mbytes } }

default file { format acr | name prefix | rotation { record-count | time-interval | volume } }

no file { extension | rotation { record-count | time-interval } }
```

**default**

Returns the command to the default settings for the specified keywords.

**no**

Removes the configuration for the specified parameters.

**format acr { custom1...custom10 }**

Default: `custom1`

Specifies the file format used when storing records on the HD storage device. `custom1` is a vendor-specific file format.

**name { extension string | prefix string }**

Specifies a string to be prepended or appended to the filenames. By default, the policy name is used for the prefix.

- `extension string`: Specifies a file extension to append to the filename. `string` must be an alpha and/or numeric string from 1 to 10 characters.
- `prefix string`: Specifies a file prefix to append to the filename. `string` must be an alpha and/or numeric string from 1 to 63 characters. This parameter replaces the policy name used by default.

**rotation { record-count num | time-interval sec | volume mb mbytes }**

Specifies the triggers that prompt file rotation on the HD storage drive. All options can be configured and upon reaching any of the thresholds, file rotation is initiated.

- `record-count num`: Specifies that file rotation is to occur when the number of records reaches the number configured in this keyword. `num` must be an integer value from 1000 to 65000. Default = 10000
- `time-interval sec`: Specifies that file rotation is to occur a time intervals configured in this keyword. `sec` must be an integer value from 30 to 86400. Default = 3600 (1 hour)
- `volume mb mbytes`: Specifies that file rotation is to occur when the record volume exceeds the value configured in the keyword. `mbytes` must be an integer value from 2 to 40. Default = 4 (mb)
Usage
Use this command to configure file parameters for Diameter records being stored on the HD storage device.

Example
The following command set the file rotation thresholds for files being stored on the HD storage device:

```
file rotation volume mb 4
file rotation record-count 15000
file rotation time-interval 7200
```

The following command replaces the policy name as the prefix of all files being stored through this policy with the prefix `sgw`:

```
file name prefix sgw
```
Chapter 120
HLR Configuration Mode Commands

The HLR Configuration Mode provides the commands and parameters to configure the home location register (HLR) node that is the database containing the subscriber profile and connection information for a specific GPRS/UMTS core network.

The HLR Configuration Mode is a sub-mode derived from the MAP Configuration Mode which controls the MAP service configuration. It is the MAP service that provides the application-layer protocol support used to connect the HLR to other nodes in the network such as the SGSN.
**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Return to the Exec mode.
exit

Exits the current configuration mode and returns to the global configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Return to the context configuration mode.

**imsi**

This command sets up IMSI (International Mobile Subscriber Identity) -based configuration. (IMSI) prefix which includes the Mobile Country Code (MCC), the Mobile Network Code (MNC).

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
```

- **no**
  Removes the imsi-prefix definition from the configuration.

- **any**
  Configures acceptance of any IMSI prefix.

- **starts-with prefix_number**
  Selects IMSI prefix-based routing.
  `prefix_number` is a string of up to 15 integers.

- **imsi**
  Enables configurable default behavior for routing.
  Entering **imsi** with the **any** keyword preserves the default behavior and the E.212 address is used as a destination address and the MAP request will be sent towards the HLR.
  If this keyword is not used with the **any** keyword, then the MAP request will be rejected.

- **isdn isdn_number**
  Defines the E.164 number of the HLR.
  `isdn_number` is a string of integers, up to 15.

- **mobile-global-title mgt_number**
  `mgt_number` is a string of integers, up to 15.

- **point-code pt-code source-ssn ssn**
  Defines the point code for the HLR.
  `pt-code` is a string of digits, up to 11; SS7 format preferred.

- **sgsn-source-address-format point-code-ssn**
  Selects HLR call process according to SCCP calling party address of the SGSN. This will be filled at MAP level, including the ITU point code address.
source-ssn \textit{ssn}

Defines the SSN of the source that will be used for the call filtering.
\textit{ssn}: Must be an integer from 1 to 255.

\textbf{Usage}

Routing will be done according to IMSI parameters configured with this command.

\textbf{Example}

\texttt{imsi starts-with 3 isdn 123456789 sgsn-source-address-form at point-code-ssn}
policy routing

This command configures the policy for the routing of MAP messages. If this command is not configured or disabled (with the `default` keyword), then routing is done according to the configuration of the IMSI parameters.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ default | no ] policy routing { hlr-isdn | ms-isdn }
```

- **default**
  Resets the policy routing to the system default, disabled.

- **no**
  Removes the policy routing configuration from the system.

- **hlr-isdn**
  Selects HLR-ISDN based routing.

- **ms-isdn**
  Selects mobile station (MS)-ISDN based routing.

**Usage**

Use this command to set the policy for routing MAP messages.

**Example**

```
policy routing hlr-isdn
```
Chapter 121
HNB-GW Service Configuration Mode Commands

The 3G UMTS Home-NodeB Gateway Service Configuration Mode is used to create, provide, and manage the Femto UMTS HNB access with UMTS core network in a 3G UMTS network.
associate gtpu-service

This command associates a previously configured GTP-U service to bind the HNB-GW service with an HNB towards the HNB side. A GTP-U service must be configured in Context Configuration mode before using this configuration.

Product
HNB-GW

Privilege
Security Administrator, Administrator

Syntax

associate gtpu-service svc_name

no associate gtpu-service

no

Removes the associated GTP-U service from this HNB-GW service configuration.

svc_name

Identifies the name of the GTP-U service preconfigured in Context configuration mode to associate with an HNB-GW service towards the Home-NodeB side. The svc_name must be an alphanumerical string from 1 through 63 characters.

Usage
Use this command to configure GTP-U data plan between HNB-GW service and Home-NodeB. The service defined for GTP-U can be configured in Context configuration mode.

Important: Another GTP-U service can be used to bind the HNB-GW service towards the Core Nework and can be configured in HNB-PS Configuration mode. For more information on GTP-U service configuration, refer GTP-U Service Configuration Mode Commands.

Example
Following command associates GTP-U service named gtpu-hnb1 with specific HNB-GW service towards Home-NodeB side.

     associate gtpu-service gtpu-hnb1
end

Exits the current mode and returns to the Exec Mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Change the mode back to the Exec mode.
exit

Exits the current mode and returns to the previous mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Return to the previous mode.
radio-network-plmn

This command creates/remove and enters the HNB-RN-PLMN Configuration mode and associate/disassociate it with HNB-GW service. This mode provides configuration mode to configure various parameters for radio network public mobile land networks (PLMNs). A maximum of 16 radio PLMN id can be configured in an HNB-GW service.

**Product**

HNB-GW

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
radio-network-plmn mcc mcc_value mnc mnc_value [-noconfirm]
no radio-network-plmn mcc mcc_value mnc mnc_value
```

**no**

Removes the configured radio network PLMN identifier for an HNB-GW service.

⚠️ **Caution:** Removing the PLMN identifier is a disruptive operation; the HNB-GW service shall be re-started.

<table>
<thead>
<tr>
<th>mcc mcc_value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the mobile country code (MCC) part of radio network PLMN identifier.</td>
</tr>
<tr>
<td><em>mcc_value</em> must be an integer value from 101 through 998.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>mnc mnc_value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the mobile network code (MNC) part of radio network PLMN identifier.</td>
</tr>
<tr>
<td><em>mcc_value</em> must be an integer value from 01 through 99 or 100 through 998.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>-noconfirm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indicates that the command is to execute without any additional prompt and confirmation from the user.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to configure the radio network PLMN identifier for an HNB-GW service. This command also creates a configuration mode to configure various parameters for defined radio network PLMN identifier in HNB-GW service.

⚠️ **Caution:** Changing or removing the PLMN identifier is a disruptive operation; the MME service shall be re-started.

Entering this command results in the following prompt:

`[context_name]hostname(config-radio-network-plmn)#`

A maximum of 16 radio network PLMN identifiers are supported for an HNB-GW service.
Example

The following command configures the radio network PLMN identifier with MCC value as 102 and MNC value as 20 for an HNB-GW service:

```
radio-network-plmn mmc 102 mnc 20
```
ranap reset

This command configures various RAN Application Part reset procedure parameters with HNB-GW service.

Product
HNB-GW

Privilege
Security Administrator, Administrator

Syntax

```
ranap reset { ack-timeout timer_value | guard-timeout g_timer | hnbgw-initiated |
max-retransmissions retries}
```

```
no ranap reset hnbgw-initiated
```

```
default ranap reset { ack-timeout | guard-timeout | hnbgw-initiated | max-
retransmissions}
```

no

Disables the HNB-GW initiated RANAP reset procedure for an HNB-GW service.

---

ack-timeout timer_value

Set the timer value in seconds to wait for Reset Acknowledge from SGSN/MSC. This will be used when HNBGW Initiated Reset procedure is enabled.

`timer_value` must be an integer value from 5 through 10.

Default: 10

---

guard-timeout g_timer_value

Sets the timer value to send Reset Acknowledge to SGSN/MSC. After this duration the HNBGW sends RESET-ACK to SGSN/MSC. This will be used when SGSN/MSC Initiated Reset procedure is enabled.

`g_timer_value` must be an integer value from 5 through 10.

Default: 10

---

hnbgw-initiated

Enables the HNB-GW Initiated RANAP Reset procedures.

Default: Disabled

---

max-retransmission retries

Sets the maximum number of retries allowed for transmission of RESET-ACK message to SGSN/MSC. This parameter is used when HNB-GW initiated Reset procedure is enabled.

`retries` must be an integer value from 0 through 2. When 0 is used retransmission will be disabled.

Default: 1

---

Usage

Use this command to configure the RANAP Reset procedures related parameters in HNB-GW service.
Example
The following command configures the HNB-GW initiated RANAP RESET Procedure for an HNB-GW service:

```
ranap reset hnbgw-initiated
```
rtp address

This command configures the Real Time Protocol (RTP) address on HNB-GW and send it HNB to map RTP streams with this IP while HNB-GW connects to MSC/VLR through IuCSoIP (IuCS-over-IP) tunnel. This command is used for RTP stream management on HNB-GW.

**Product**
HNB-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
rtp address address
no rtp address
```

**no**
Removes the RTP IP address association to be used for communication between HNB and HNB-GW while communicating with MSC/VLR-GW through IuCS over IP tunnel.

**address address**
Specifies the IP address of HNB-GW to use as an end point by HNB and HNB maps the RTP streams with this IP address and HNB-GW communicates with MSC/VLR through IuCS-over-IP Tunnel. 

*address* is the same IP address as assigned to HNB-GW to communicate with HNB and must be an IP address in IPv4 or IPv6 notation.

**Important:** This command cannot be entered more than once. Only one RTP IP address can be configured for one HNB-GW service.

**Usage**

Use this command to enable the HNB-GW IP address as RTP IP address and send the same to HNB to map RTP streams while HNB-GW communicates with MSC/VLR through IuCS-over-IP tunnel. This command is used for RTP stream management on HNB-GW.

**Example**
The following command sets the RTP IP address 1.2.3.4 on HNB-GW to communicate with HNB while using IuCS-over-IP tunnel with CS network:

```
rtp address 1.2.3.4
```
rtp port

This command configures the Real Time Protocol (RTP) port range to listen from HNB while connecting to MSC/VLR through IuCSoIP (IuCS-over-IP) interface support via an HNB-GW service. This command is used for RTP stream management on HNB-GW.

Product
HNB-GW

Privilege
Security Administrator, Administrator

Syntax

```
port range port_start to port_end
default rtp port range
```

```
default
```

Sets the RTP port range to default range from 16384 to 65535.

```
port range range_start to range_end
```

Specifies the port number range to be used by HNB to map the RTP streams and HNB-GW listen on these ports while communicating with MSC/VLR through IuCS-over-IP tunnel.

- `range_start` must be an integer between 16384 through 65535 and should be less than `range_end`.
- `range_end` must be an integer between 16384 through 65535 and should be more than `range_start`.

Default: port 16384 through 65535

**Important:** This command cannot be entered more than once. Only one range of RTP port can be configured for one HNB-GW service.

Usage

**Caution:** This command is NOT active now.

Use this command to assign the RTP port range to be used by HNB to map RTP streams and HNB-GW listen these ports for RTP streams while communicating with MSC/VLR through IuCS-over-IP tunnel. This command is used for RTP stream management on HNB-GW.

Example

The following command sets the RTP port number 20000 to 21000 on HNB-GW to listen from HNB for RTP streams while connecting with MSC/VLR using IuCS-over-IP tunnel.

```
rtp port range 20000 to 21000
```
rtp mux

This command configures the HNB-GW service to allow an Home-NodeB to multiplex multiple RTP streams in one IP packet. This configuration support is provided for RTP stream management feature on HNB-GW.

Product
HNB-GW

Privilege
Security Administrator, Administrator

Syntax

[no | default] rtp mux

no

Removes the configured option to multiplex multiple RTP stream in one packet by Home-NodeB in HNB-GW configuration.

default

Sets the multiplexing option to default state of “disabled”.

Usage

Use this command to allow an Home-NodeB to multiplex multiple RTP streams in one IP packet. This configuration support is provided for RTP stream management feature on HNB-GW and it is disabled by default.

Example

The following command sets the HNB-GW to allow HNB to multiplex multiple RTP stream in one packet:

rtp mux
This command configures the SCTP IP address and port that will be used for binding the SCTP socket to communicate with the Home-NodeB over Iuh interface with an HNB-GW service.

**Product**

HNB-GW

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
sctp bind {address address | port port_num }
no sctp bind { address | port }
```

**default**

Sets the SCTP port to default value of 600 to communicate with the Home-NodeB using Iuh interface.

```plaintext
address address
```

Specifies the IP address of HNB-GW in IPv4 or IPv6 notation for the interface configured as Iuh interface to connect with Home-NodeB.

*address* must be an IP address in IPv4 or IPv6 notation.

```plaintext
port port_num
```

Specifies the SCTP port number to communicate with the Home-NodeBs using Iuh interface.

*port_num* must be an integer between 1 through 65535.

**Usage**

Use this command to assign the SCTP IP address and port with SCTP socket on HNB-GW to communicate with the Home-NodeB using Iuh interface. This SCTP configuration provides the IP-address and listen port where HNB-GW service shall bind to listen for incoming SCTP associations from HNB.

**Example**

The following command sets the SCTP port number 999 on HNB-GW to listen from Home-NodeB over Iuh interface:

```plaintext
sctp bind port 999
```

The following command sets the SCTP address 1.2.3.4 of HNB-GW to use with Home-NodeB over Iuh interface:

```plaintext
sctp bind address 1.2.3.4
```
security-gateway aaa

This command associates a preconfigured AAA Servicer group to use authentication parameters for Security Gateway (SeGW) functionality in HNB-GW service. Associated AAA server group is a preconfigured AAA server group configured in Context configuration mode.

Product
HNB-GW

Privilege
Security Administrator, Administrator

Syntax

```plaintext
security-gateway aaa authentication {first-phase | second-phase} context
ctx_name aaa-group aaa_grp

no security-gateway aaa {attribute calling-station-id | authentication {first-
phase | second-phase}
```

**no**
Removes previously configured AAA authentication or attribute setting from HNB-GW service while using SeGW functionality.

**attribute calling-station-id**  *ms_id*
Specifies the calling station id from where the user placed the call.

**authentication {first-phase | second-phase} context**  *ctx_name aaa-group aaa_grp*
Specifies the AAA authentication parameters to be used while using SeGW functionality in an HNB-GW service.
**first-phase** specifies the parameters to be used for first phase of authentication while using SeGW functionality in an HNB-GW service. This associates the AAA parameters through AAA server group association with in it.
**second-phase** specifies the parameters to be used for second phase of authentication while using SeGW functionality in an HNB-GW service. This associates the AAA parameters through AAA server group association with in it.
**context**  *ctx_name aaa-group aaa_grp* specifies the name of the pre-configured AAA server group and its context to associate AAA parameters to be used for first/second or both phase of authentication while using SeGW functionality in an HNB-GW service.
**ctx_name** specifies the name of the context in which AAA server group is configured.
**aaa_grp** specifies the name of the AAA server group configured in Context configuration mode with AAA parameters which need to be used for first/second or both phase of authentication while using SeGW functionality in an HNB-GW service.

**Important:** For more information on AAA server groups, refer *AAA Server Group Configuration Mode Commands*.
Usage

Use this command to associate or tie the AAA authentication or attribute parameters with an HNB-GW service which is to be used for first/second or both phase of authentication while using SeGW functionality in an HNB-GW service or removing AAA attribute “calling-sation-id” from AAA message. This functionality is part of SeGW configuration support in an HNB-GW service.

⚠️ Caution: This is a critical configuration and need to be configured carefully if Security Gateway (SeGW) functionality is to enable on HNB-GW service.

Example

The following command associates an AAA server group named `sec_gw_grp1` with HNB-GW service to use specific AAA authentication parameters in first phase of authentication and another AAA server group named `sec_gw_grp2` to use different AAA authentication parameter in second phase of authentication. Both AAA server groups are configured in same context named `SeGW_ctx1`:

```
security-gateway aaa authentication first-phase context SeGW1 aaa-group sec_gw_grp1
security-gateway aaa authentication second-phase context SeGW1 aaa-group sec_gw_grp2
```

The following command disables a previously configured AAA authentication parameter for first phase of authentication:

```
no security-gateway aaa authentication first-phase
```
security-gateway bind

This command binds the SeGW in HNB-GW service to a logical IP interface serving as an Iuh interface and associates an IPsec IKV2 crypto-map template to the HNB-GW service.

Product
HNB-GW

Privilege
Security Administrator, Administrator

Syntax

```
security-gateway bind address address crypto-template cryp_name

no security-gateway bind address
```

no
Removes a previously configured IPSec IP address use for binding the IKv2 IPSec tunnel (local bind address) to communicate with the Home-NodeBs using Iuh interface.

bind address address
Specifies the IP address in IPv4 or IPv6 notation for the interface configured as an Iuh for IPsec tunnel. This is the IP address where the HNB-GW service is bound and shall be provided to Home-NodeB during HNB-GW discovery.

address specifies the IPsec IP address in IPv4/IPv6 notation to be used for binding the IKEv2 IPSec tunnel (local bind address) to communicate with the Home-NodeBs using Iuh interface.

crypto-template cryp_name
Specifies the Crypto-map template to be used for IPsec IKEv2 tunneling for the interface configured as an Iuh.

cryp_name specifies the name of the pre-configured Crypto-map template which is configured in Crypto-Map Template Configuration Mode and associated with HNB-GW service to create IPSec tunnel with Home-NodeB during HNB-GW discovery procedure on Iuh interface.

Usage
Use this command to associate or tie the HNB-GW service to a specific logical IP address that will be used for binding the Iuh socket to communicate with the Home-NodeB using IPSec tunnel. A maximum of one IP address can be configured with this command for one HNB-GW service.
The HNB-GW passes the IP address during setting up the HNB-GW discovery procedure with the Home-NodeB.

⚠️ Caution: This is a critical configuration. The HNB-GW service can not be started without this configuration. Any change to this configuration would lead to restarting the HNB-GW service and removing or disabling this configuration will stop the HNB-GW service.

Example

---

Cisco ASR 5000 Series Command Line Interface Reference

OL-22948-01
The following command binds the logical IP interface with the address of 1.2.3.4 to the HNB-GW service using existing IPsec Crypto-Map template *crypto1* to establish IPSec tunnel with Home-NodeB:

```
security-gateway bind address 1.2.3.4 crypto-template crypto1
```

The following command disables a binding that was previously configured:

```
security-gateway bind address
```
security-gateway username

This command configures the options related to user name received from MS.

**Product**
HNB-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[no | default] security-gateway username mac-address-stripping
```

**no**
Disables previously configured option for user name received from MS.

**default**
Sets the user name option configuration of default setting of “Disable”.

**mac-address-stripping**
Default: Disabled
This keyword sets the system to strip the MAC address from the user name received from the MS.

**Usage**
Use this command to set the user name related options. By enabling this option system strips the MAC address from the user name received from MS.

**Example**
The following command sets the system to strip the MAC address from user name received from user MS:

```
security-gateway username mac-address-stripping
```
Chapter 122
HNB-CS Network Configuration Mode Commands

The HNB-CS Network Configuration Mode is used to create, provide, and manage the Circuit Switched (CS) network instance on HNB-GW service to provide HNB access with CS core network in a 3G UMTS network.
associate alcap-service

This command associates a previously defined Access Link Control Application Part (ALCAP) service with the CS network instance for multiplexing of different users onto one AAL2 transmission path using channel IDs (CIDs). This configuration is provided to support IuCS-over-ATM functionality.

**Product**
HNB-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
associate alcap-service svc_name context ctx_name
no associate alcap-service
```

- `svc_name`:
  Identifies the name of the ALCAP service preconfigured in Context configuration mode to associate with an HNB-CS network instance for multiplexing of different users onto one AAL2 transmission path using channel IDs (CIDs). The `svc_name` must be a preconfigured ALCAP service. Only one instance of this command can be configured.

**Caution:** If this CLI is not configured any RAB-ASST-REQ message requesting AAL2 connection setup shall be rejected with an appropriate cause.

- `context ctx_name`:
  Specifies the name of the context in which ALCAP service is configured. The `ctx_name` must be an existing context name in which this ALCAP service is configured.

**Usage**

Use this command to configure IuCS-over-ATM support. This association of ALCAP protocol service configuration in HNB-CS network instance provides multiplexing of different users onto one AAL2 transmission path using channel IDs (CIDs).

**Caution:** If this CLI is not configured any RAB-ASST-REQ message requesting AAL2 connection setup shall be rejected with an appropriate cause.

**Important:** This command must not be used more than once to configure IuCS-over-ATM support.

**Example**

Cisco ASR 5000 Series Command Line Interface Reference
Following command associates ALCAP service `alcap_svc1` configured in context named `Ctx_alcap1` with specific HNB-CS network instance:

```
associate alcap-service alcap_svc1context Ctx_alcap1
```
associate rtp pool

This command associates a previously defined RTP pool (IP pool) with the CS network instance to be used for assignment of IP address/port as RTP streams end point address over IuCS interface. This configuration support is provided for RTP stream management feature in an HNB-GW service.

Product
HNB-GW

Privilege
Security Administrator, Administrator

Syntax

```
associate rtp pool pool_name context ctx_name
no associate rtp pool
```

**No**

Removes the associated RTP pool (IP pool) from this HNB-CS network instance configuration.

```
pool_name
```

Identifies the name of the RTP IP pool preconfigured in Context configuration mode to associate with an HNB-CS network instance to be used for assignment of IP address/port over the IuCS interface RTP streams. The `pool_name` must be an existing IP pool name configured in Context configuration mode.

**Important:** For IP pool (RTP pool) configuration, refer Context Configuration Commands Mode chapter.

```
context ctx_name
```

Specifies the name of the context in which RTP pool (IP pool) is configured. The `ctx_name` must be an existing context name in which this IP pool is configured.

Usage

Use this command to associate RTP pool (IP Pool) with an HNB-CS network instance for allotment of IP address/port over IuCS interface for RTP streams across all sessions. A fixed range of RTP ports from 5000 through 65000 shall be used to allocate to RTP stream.

**Important:** This command must be used to provide IP address/port for RTP streams end point address over IuCS interface.

**Important:** This configuration support is provided for RTP stream management feature on an HNB-GW service.

Example

Following command associates RTP pool named `rtp_1` with specific HNB-CS network instance:
associate rtp pool rtp_1
**associate sccp-network**

This command associates a predefined Signaling Connection Control Part (SCCP) network id with the CS network instance in order to route the messages towards MSC/VLR over IuCS interface.

**Product**

HNB-GW

**Privilege**

Security Administrator, Administrator

**Syntax**

associate-sccp-network sccp_net_id

no associate-sccp-network

**Usage**

Use this command to associate a preconfigured SCCP network id over IuCS interface in HNB-GW service to connect with CS network elements; i.e. MSC.

⚠️ **Caution:** The SCCP network id must be defined in Global Configuration mode before using it with this command.

🔥 **Important:** A single SCCP network configuration instance can not be shared with multiple HNB-CS network instances.

**Example**

Following command associates SCCP network 2 with specific HNB-CS network instance:

```
associate-sccp-network 2
```
end

Exits the current mode and returns to the Exec Mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

end

Usage
Change the mode back to the Exec mode.
**exit**

Exits the current mode and returns to the previous mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

`exit`

**Usage**

Return to the previous mode.
**HNB-CS Network Configuration Mode Commands**

**msc point-code**

This command is used to configure default MSC point-code with HNB-CS network instance. This command is used when HNB-GW is to be connected to only one MSC with in a CS network or as default MSC for all HNBs connected through specific HNB-CS network instance.

**Product**

HNB-GW

**Privilege**

Security Administrator, Administrator

**Syntax**

```
[no] msc point-code point_code
```

**no**

Removes the configured default MSC point code from specific HNB-CS network instance.

⚠️ **Caution:** Removing the MSC point code is a disruptive operation and affects all HNB sessions which are connected to particular MSC through an HNB-CS network instance.

**Usage**

Use this command to configure a default MSC to which HNB will connect for CS network access through HNB-GW service.

Point-code is an SS7 address for an element in the SS7 network. Point-codes must be defined in dotted-decimal format in a string of 1 to 11 digits. Format options include:

- 0.0.1 to 7.255.7 for point-code in the ITU range.
- 0.0.1 to 255.255.255 for point-code in the ANSI range.
- 0.0.1 to 15.31.255 for point-code in the TTC Range.
- a string of 1 to 11 digits in dotted-decimal to represent a point-code in a different range.

⚠️ **Important:** This command can be entered only once. If entered again the previous value shall be overwritten.

**Example**

The following command configures a default MSC with point code **01.201.101** for HNBs to access CS network through HNB-GW service in this HNB-CS network instance:
msc point-code 101.201.101
Chapter 123
HNB-PS Network Configuration Mode Commands

The HNB-PS Network Configuration Mode is used to create, provide, and manage the Packet Switched (PS) network instance on HNB-GW service to provide HNB access with PS core network in a 3G UMTS network.
associate gtpu-service

This command associates a previously configured GTP-U service to bind the HNB-GW service to provide a GTP-U tunnel with an SGSN towards the core network side. A GTP-U service must be configured in Context configuration mode before using this configuration.

Product
HNB-GW

Privilege
Security Administrator, Administrator

Syntax
associate gtpu-service svc_name context ctx_name

no associate gtpu-service

no

Removes the associated GTP-U service from this HNB-GW service configuration.

svc_name

Identifies the name of the GTP-U service preconfigured in Context configuration mode to associate with an HNB-GW service towards the Home-NodeB side. The svc_name is name of a preconfigured GTP-U service.

context ctx_name

Specifies the name of the context in which GTP-U service is configured. The ctx_name must be an existing context name in which this GTP-U service is configured.

Usage
Use this command to configure GTP-U data plan tunnel between HNB-GW service and GSNs in core network. The service defined for GTP-U tunnel must be configured in Context configuration mode.

Important: Another GTP-U service can be used to bind the HNB-GW service to GTP-U tunnel with HNB in HNB access network and can be configured in HNB-GW Service Configuration mode. For more information on GTP-U service configuration, refer GTP-U Service Configuration Mode Commands.

Example
Following command associates GTP-U service gtpu_svc1 configured in context named Ctx_gtpu1 with specific HNB-PS network instance for GTP-U tunnel towards GSN in core network:

associate gtpu-service gtpu_svc1 context Ctx_gtpu1
associate-sccp-network

This command associates a previously defined Signaling Connection Control Part (SCCP) network id with the PS network instance in order to route the messages towards SGSN over IuPS interface.

**Product**
HNB-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
associate-sccp-network sccp_net_id
no associate-sccp-network
```

**Usage**

Use this command to associate a predefined SCCP network id with the IuPS interface in HNB-GW service to connect with PS network elements; i.e. SGSN.

**Caution:** The SCCP network id must be defined in Global Configuration mode before using it with this command.

**Important:** A single SCCP network id can not be shared with multiple HNB-PS network instances.

**Example**

Following command associates SCCP network id 2 with specific HNB-PS network instance:

```
associate-sccp-network 2
```
end

Exits the current mode and returns to the Exec Mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Change the mode back to the Exec mode.
exit

Exits the current mode and returns to the previous mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
exit
```

**Usage**

Return to the previous mode.
sgsn point-code

This command is used to configure default SGSN point-code with HNB-PS network instance. This command is used when HNB-GW is to be connected to only one SGSN with in a PS network or as default SGSN for all HNBs connected through specific HNB-PS network instance.

Product
HNB-GW

Privilege
Security Administrator, Administrator

Syntax

[no] sgsn point-code point_code

no

Removes the configured default SGSN point code from specific HNB-PS network instance.

⚠️ Caution: Removing the SGSN point code is a disruptive operation and affects all HNB sessions which are connected to particular SGSN through an HNB-PS network instance.

point_code

Specifies SS7 address of default SGSN in PS network in point code value to this configured HNB-PS network instance.

point_code must be in SS7 point code dotted-decimal ###.###.### format or 8-digit decimal ####### format.

Only one instance of this command can be configured.

Usage

Use this command to configure a default SGSN to which HNB will connect for PS network access through HNB-GW service.

Point-code is an SS7 address for an element in the SS7 network. Point-codes must be defined in dotted-decimal format in a string of 1 to 11 digits. Format options include:

- 0.0.1 to 7.255.7 for point-code in the ITU range.
- 0.0.1 to 255.255.255 for point-code in the ANSI range.
- 0.0.1 to 15.31.255 for point-code in the TTC Range.

- a string of 1 to 11 digits in dotted-decimal to represent a point-code in a different range.

⚠️ Important: This command can be entered only once. If entered again the previous value shall be overwritten.

Example

The following command configures a default SGSN with point code 101.201.101 for HNBs to access PS network through HNB-GW service in this HNB-PS network instance:
sgsn point-code 101.201.101
This HNB Radio Network PLMN configuration mode provides configuration to define the radio network PLMN parameters related to the HNB-GW connection with UMTS Femto radio network.
associate cs-network

This command associates a preconfigured circuit switched (CS) network within an HNB radio network PLMN with HNB-GW service.

Product
HNB-GW

Privilege
Security Administrator, Administrator

Syntax

```
[no] associate cs-network cs_name [lac lac]
```

**no**
Disassociates/removes the configured CS network with an HNB radio network PLMN configured in HNB-GW service mode.

**cs_name**
Specifies the name of a preconfigured CS network in Global configuration mode with `cs-network` command and to be associated with an HNB radio network PLMN configured in HNB-GW service mode. To configure CS network, refer *HNB-CS Configuration Mode Commands* chapter.

**lac lac_id**
This keyword defines the granularity level of circuit switch network to a location area code (LAC) level to be associated with radio network PLMN in HNB-GW service. `lac_id` must be an integer between 1 and 65535.

**Usage**

Use this command to associate pre-defined CS networks with a radio network PLMN in an HNB-GW service.

The circuit switched network comprises of one or more MSCs, where CS-domain IU-connections shall be routed. In a typical deployment HNB-GW is connected to only one MSC. However due to Iu-flex and networks-sharing requirements, HNB-GW can be connected to more than one MSCs as well.

Another scenario when HNB-GW can be connected to multiple MSCs is when a set of HNBs should be connected to a particular MSC based on their UTRAN location or geographical location.

This command provides configuration to have one or more MSCs such that these are used in load-shared (IuFlex) or network-shared mode. If location based distribution of HNBs to MSCs is desired then more than one circuit switched network configuration will be required.

This configuration allows association of a circuit switched network with a radio network PLMN and granularity can either be at the PLMN level or at the level of a location area (LAC) in that PLMN.

To configure CS network, refer *HNB-CS Configuration Mode Commands* chapter.

**Example**
The following command associates a CS network `umts1` with radio network PLMN with a granularity of LAC 234:
associate cs-network umts1 lac 234
associate ps-network

This command associates a preconfigured packet switched (PS) network within an HNB radio network PLMN with HNB-GW service.

Product
HNB-GW

Privilege
Security Administrator, Administrator

Syntax

[no] associate ps-network ps_name [lac lac [rac rac]]

no

Disassociates/removes the configured PS network with an HNB radio network PLMN configured in HNB-GW service mode.

ps_name

Specifies the name of a preconfigured PS network in Global configuration mode with ps-network command and to be associated with an HNB radio network PLMN configured in HNB-GW service mode. To configure PS network, refer HNB PS Configuration Mode Commands chapter.

lac lac_id

This keyword defines the granularity level of packet switched network to a location area code (LAC) level to be associated with radio network PLMN in HNB-GW service. lac_id must be an integer between 1 and 65535.

rac rac_id

This keyword defines the granularity level of packet switched network to a radio area code (RAC) level to be associated with radio network PLMN in HNB-GW service. rac_id must be an integer between 1 and 65535.

Usage

Use this command to associate pre-defined PS networks with HNB radio network PLMN in an HNB-GW service.

The packet switched network comprises of one or more SGSNs where PS-domain IU-connections shall be routed. In a typical deployment HNB-GW is connected to only one SGSN. However with IuFlex and network-sharing functionality, HNB-GW can be connected to more than one SGSNs as well. Another scenario when HNB-GW can be connected to multiple SGSNs is when a set of HNBs should be connected to a particular SGSN based on their UTRAN location or geographical location. This command provides configuration to have one or more to have one or more SGSNs such that these are used in load-shared (iu-flex) or network-shared mode. If location based distribution of HNBs to SGSNs is desired then more than one packet switched network configuration will be required.

This command allows association of a packet switched network with a radio network PLMN and granularity could either be at the PLMN level or at the level of a location area code (LAC) in that PLMN or at the level of a routing area code (RAC) in that LAC.

To configure PS network, refer HNB-PS Configuration Mode Commands chapter.
Example
The following command associates a PS network `umts_psi` with radio network PLMN with a granularity of LAC 234 and RAC as 123:

```
associate ps-network umts_psi lac 234 rac 123
```
end

Exits the configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Change the mode back to the Exec mode.
exit

Exits the configuration mode and returns to the Global configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Return to the Global configuration mode.
rnc-id

This command configures the Radio Network Concentrator (RNC) identifier in a Radio Network PLMN associated with HNB-GW service to provide RNC identifier to HNB during HNB-REGISTRATION procedure. Depending upon the requirement the RNC Identifier can be provided at the desired granularity.

Product
HNB-GW

Privilege
Security Administrator, Administrator

Syntax

```
[rno] rnc-id rnc_id [lac lac_id [rac rac_id | cell-id cell_id]]
```

- **no**
  Deletes the LAC and RAC information from the system configuration.

- **rnc-id**
  Specified the RNC id to be configured in radio network PLMN associated with HNB-GW and to be provided to HNB during HNB-REGISTRATION procedure from HNB-GW. It also configures RNC Id for all HNBs operating in a particular PLMN.
  
  - `rnc_id` must be an integer between 1 and 65535.

- **lac lac_id**
  This keyword defines the granularity level of location of HNB to a location area code (LAC) level and configures RNC ID for all HNBs operating in particular location-area.
  
  - `lac_id` must be an integer between 1 and 65535.

- **rac rac_id**
  This keyword defines the granularity level of location of HNB to a routing area code (RAC) level and configures RNC ID for all HNBs operating in particular routing area.
  
  - `rac_id` must be an integer between 1 and 65535.

- **cell-id cell_id**
  This keyword defines the granularity level of location of HNB to a UTRAN cell level and configures RNC ID for all HNBs operating in particular UTRAN cell area.
  
  - `cell_id` must be an integer between 1 and 65535.

Usage

Use this command to configure RNC id for Radio Network PLMN which will be sent to HNBs from HNB-GW during HNB-REGISTRATION procedure. Depending upon the requirement the RNC Identifier can be provided at the desired granularity.

When HNB-REGISTRATION request is received the RNC Id is looked up by matching the parameters received in the request. The most specific entry that matches the request shall have the highest priority. For example in the following configuration:
rnc-id 257 lac 1 cell-id 3
rnc-id 258 lac 1 rac 2
rnc-id 259 lac 1
rnc-id 260

• If request is received with LAC=1, RAC=2, and Cell-Id=3, the selected RNC id will be 257.
• If request is received with LAC=1, RAC=3, and Cell-Id != 3, the selected RNC id will be 258.
• If request is received with LAC=1 and any other values of RAC and Cell-id, the selected RNC id will be 259. For all other requests 260 will be returned.

Example
Following command will configure the HNB-GW service to return RNC id as 102 when HNB-REGISTRATION request is received with LAC 1, and RAC 2:

```
rnc-id 102 lac 1 rac 2
```

Following command will configure the HNB-GW service to return RNC id as 102 when HNB-REGISTRATION request is received with LAC 1 and cell-id 4:

```
rnc-id 102 lac 1 cell-id 5
```
Chapter 125
HSGW Service Configuration Mode Commands

The HSGW Service Configuration Mode is used to create and manage a configuration allowing the HSGW to communicate, send and receive call data, and session flows to/from a eAN/PCF in an eHRPD network.

**Important:** This appendix will be added to the CLI Reference when the product releases. Use this appendix in conjunction with the latest release of the Command Line Interface Reference.
associate

Associates accounting policies and QCI-QoS mapping parameters with this HSGW service.

Product
HSGW

Privilege
Administrator

Syntax

```
associate { accounting-policy name | qci-qos-mapping name }
```

```
o associate { accounting-policy [ name ] | qci-qos-mapping }
```

```
no
```

Removes the specified associated policy or mapping from the service.

```
accounting-policy name
```

Specifies the accounting policy to associate with the HSGW service. `name` must be an existing accounting policy and be from 1 to 63 alpha and/or numeric characters.

```
qci-qos-mapping name
```

Associates the HSGW service with QCI to QoS mapping parameters. `name` must be an existing QCI-QoS mapping configuration and be from 1 to 63 alpha and/or numeric characters.

QCI-QoS mapping is configured through the `qci-qos-mapping` command in the Global Configuration Mode.

Usage
Use this command to associate an accounting policy with the HSGW service.

Example
The following command associates an accounting policy named `acct2` to the HSGW service:

```
associate accounting-policy acct2
```
bind address

Binds the service to a logical IP interface serving as the A10 interface and specifies the maximum number of subscribers that can access this service over the configured interface.

**Product**
HSGW

**Privilege**
Administrator

**Syntax**

```
bind address ip_address [ max-subscribers num ]
no bind address
```

- **no**
  Removes the interface binding from this service.

- **ip_address**
  Specifies the IPv4 address of the interface configured as the A10/A11 interface. *ip_address* is specified in dotted decimal notation.

- **max-subscribers num**
  Default: 250000
  Specifies the maximum number of subscribers that can access this service on this interface. *num* must be configured to an integer between 0 and 2,500,000.

**Important:** The maximum number of subscribers supported is dependant on the license key installed and the number of active PSCs in the system. A fully loaded system with 13 active PSCs can support 3,000,000 total subscribers. Refer to the license key command and the Usage section (below) for additional information.

**Usage**

Associate the HSGW service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an A10/A11 interface that provides the session connectivity to/from an eAN/PCF. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.

This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.

When configuring the **max-subscribers** option, be sure to consider the following:

- The total number of A10/A11 interfaces you will configure
- The total number of subscriber sessions that all of the configured interfaces may handle during peak busy hours
- An average bandwidth per session multiplied by the total number of sessions
- The type of physical port (10/100Base-T or 1000Base-Tx) that these interfaces will be bound to
Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.

Example
The following command would bind the logical IP interface with the address of 112.334.556.778 to the HSGW service and specifies that a maximum of 200,000 simultaneous subscriber sessions can be facilitated by the interface/service at any given time:

```
bind address 112.334.556.778 max-subscribers 200000
```
**context-retention-timer**

Configures the maximum number of consecutive seconds that a UE session context (which includes the LCP, authentication and A10 session context for a given UE) is maintained by the HSGW before it is torn down.

**Product**
HSGW

**Privilege**
Administrator

**Syntax**

```
context-retention-timer timeout [ sec ]
[ default | no ] context-retention-timer timeout
```

- **default**
  Disables the timer.

- **no**
  Disables the timer.

- **timeout [ sec ]**
  Default: 60
  Specifies the amount of time, in seconds, that the session context is maintained before it is disassembled. `sec` must be an integer value from 1 to 3600.

**Usage**

Use this command to configure a timer to retain session contexts for a specified amount of time before disassembling it.

**Example**

The following command allows the HSGW to maintain session contexts for 120 seconds before tearing them down:

```
context-retention-timer timeout 120
```
**data-available-indicator**

Enable sending Data Available Indicator extension in A10/A11 Registration Reply messages.

**Product**
HSGW

**Privilege**
Administrator

**Syntax**

```
data-available-indicator
```

**Usage**

Use this command to enable the sending of the Data Available Indicator extension in A10/A11 Registration Reply messages.
data-over-signaling

Enable the data-over-signaling marking feature for A10 packets.

Product
HSGW

Privilege
Administrator

Syntax

[ default | no ] data-over-signaling

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enables the data-over signaling feature for A10 packets.</td>
</tr>
</tbody>
</table>

| no |
| Disable the data-over signaling feature for A10 packets. |

Usage

Use this command to enable or disable the data-over signaling feature for A10 packets.
**dns-pgw**

Identifies to the HSGW service the location of the DNS client. The DNS client is used to identify a FQDN for the peer P-GW. This command defaults to the same context as the HSGW service.

**Product**
HSGW

**Privilege**
Administrator

**Syntax**
```
dns-pgw context name
```

- **default**
  Returns the command to its default setting of the current context.

- **no**
  Removes the configured DNS client context name from this service.

- **context name**
  Specifies the context in which the DNS client is configured. `name` must be an existing context and be from 1 to 63 alpha and/or numeric characters.

**Usage**
Use this command to identify to the HSGW service the context where the DNS client is configured.

**Example**
The following command identifies the context where the DNS client is configured as `isp3`:
```
dns-pgw context isp3
```
**end**

Exits the current mode and returns to the Exec Mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Change the mode back to the Exec mode.
exit

Exits the current mode and returns to the previous mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
exit
```

**Usage**
Return to the previous mode.
fqdn

Configures the Fully Qualified Domain Name (FQDN) for this HSGW.

**Product**

HSGW

**Privilege**

Administrator

**Syntax**

fqdn domain_name

[ default | no ] fqdn

default

Returns the command to the default setting of “null”.

no

domain_name

Specifies an FQDN for the HSGW. domain_name must be from 1 to 256 alpha and/or numeric characters.

**Usage**

Use this command to configure an FQDN for this HSGW. The FQDN is used by a P-GW (APN FQDN) when selecting an HSGW.

**Example**

The following command configures this HSGW with an FQDN of abc123.com

```
  fqdn abc123.com
```
fragment

Enables/Disables PPP payload fragmentation.

Product
HSGW

Privilege
Administrator

Syntax

[ default | no ] fragment ppp-data

---

default
Returns the command to its default setting of enabled.

---

no
Disables PPP payload fragmentation.

Usage

Use this command to enable or disable PPP payload fragmentation.
**gre**

Configures Generic Routing Encapsulation (GRE) parameters for the A10 protocol within the HSGW service.

**Product**
HSGW

**Privilege**
Administrator

**Syntax**

```
gre { checksum | checksum-verify | flow control [ action { disconnect-session | resume-session } ] [ timeout msecs ] + | ip-header-dscp value { all-control-packets | setup-packets-only } | reorder-timeout msecs | segmentation | sequence-mode { none | reorder } | sequence-numbers | threegpp2-ext-headers qos-marking }

default gre { checksum | checksum-verify | flow-control | ip-header-dscp | reorder-timeout | sequence-mode | sequence-numbers | threegpp2-ext-headers qos-marking }

no gre { checksum | checksum-verify | flow-control | ip-header-dscp | segmentation | sequence-numbers | threegpp2-ext-headers qos-marking }
```

**default**
Restores the specified parameter to its default setting.

**no**
Disables the specified functionality.

**checksum**
Default: disabled
Enables the introduction of the checksum field in outgoing GRE packets.

**checksum-verify**
Default: disabled
Enables verification of the GRE checksum (if present) in incoming GRE packets.

**flow-control [ action { disconnect-session | resume-session } ] [ timeout msecs ] +**
Default: no GRE flow-control
Enables 3GPP2 GRE flow control which causes the HSGW to send flow control enabled Normal Vendor Specific Extensions (NVSE) in A11 RRPs.

**action { disconnect-session | resume-session }**:
Default: disconnect-session
Specifies the action to be taken when timeout is reached:

- **disconnect-session**: Ends the session and releases the call.
- **resume-session**: Switches flow control to XON and resumes delivery of packets to the RAN.
**timeout**`msecs`
Default: 1000 milliseconds (10 seconds)
Sets the amount of time wait for an XON indicator from the RAN (after receiving an XOFF). Also sets the action to be taken if the timeout limit is reached.

`msecs`: Specifies the amount of time in milliseconds before the timeout is reached. `msecs` must be an integer from 1 through 1000000.

---

**ip-header-dscp** `value { all-control-packets | setup-packets-only }`
Default: Disabled
Used to configure the QoS Differentiated Services Code Point (DSCP) marking for GRE packets.

- `value`: Represents the DSCP setting. It represents the first six most-significant bits of the ToS field. It can be configured to any hex value from 0x0 through 0x3F.
- `all-control-packets`: Dictates that the DSCP marking is to be provided in all GRE control packets.
- `setup-packets-only`: Dictates that the DSCP marking is to be provided only in GRE setup packets.

---

**reorder-timeout**`msecs`
Default: 100
Configures max number of milliseconds to wait before processing reordered out-of-sequence GRE packets.
`msecs` must be an integer from 0 through 5000.

---

**segmentation**
Default: disabled
Enables GRE Segmentation for the HSGW service.

---

**sequence-mode { none | reorder}**
Default: none
Configures handling of incoming out-of-sequence GRE packets.

- `none`: Specifies that sequence numbers in packets are ignored and all arriving packets are processed in the order they arrive.
- `reorder`: Specifies that out of sequence packets are stored in a sequencing queue until one of the conditions is met:
  - The reorder timeout occurs: All queued packets are sent for processing and the accepted sequence number is updated to the highest number in the queue.
  - The queue is full (five packets): All packets in the queue are sent for processing, the reorder timer is stopped and the accepted sequence number is updated to the highest number in the queue.
  - An arriving packet has a sequence number such that the difference between this and the packet at the head of the queue is greater than five. All the packets in the queue are sent for processing, the reorder timer is stopped and the accepted sequence number is updated to the highest number that arrived.
  - A packet arrives that fills a gap in the sequenced numbers stored in the queue and creates a subset of packets whose sequence numbers are continuous with the current accepted sequence number. This subset of packets in the queue is sent for processing. The reorder timer continues to run and the accepted sequence number is updated to the highest number in the subset delivered.
**sequence-numbers**

Enables insertion of GRE sequence numbers in data that is about to be transmitted over the A10 interface. Data coming into the system containing sequence numbers but that is out of sequence is not re-sequenceed.

**threegppp2-ext-headers qos-marking**

When threegppp2-ext-headers qos-marking is enabled and the PCF negotiates capability in the A11 RRQ, the HSGW will include the QoS optional data attribute in the GRE 3gpp2 extension header. The **no** keyword, enables qos-marking in the GRE header based on the tos value in the header.

**Usage**

Use the **no gre sequence-numbers** command to disable the inclusion of GRE sequence numbers in the A10 data path. More Usage....

**Example**

The following command configures the HSGW service to support the inclusion of GRE sequence numbers in outgoing traffic:

```
gre sequence-numbers
```
Sets the use of Robust Header Compression (RoHC) and enters the HSGW Service ROHC Configuration Mode where RoHC parameters are configured for the service.

Configures the local User Datagram Protocol (UDP) port for the A10/A11 interface IP socket.

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.

**Product**
HSGW

**Privilege**
Administrator

**Syntax**

```plaintext
ip { header-compression rohc | local-port number | source-violation { clear-on-valid-packet | drop-limit num | period secs | reneg-limit num } }

default ip { local-port | source-violation drop-limit | period | reneg-limit }

no { header-compression rohc | ip source-violation clear-on-valid-packet }
```

---

**default**
Resets the keyword to its default value.

**no**

- **header-compression rohc**: Removes the RoHC configuration from this service.
- **ip source-violation clear-on-valid-packet**: Disables the ability of the service to reset the reneg-limit and drop-limit counters after receipt of a properly addressed packet.

---

**header-compression rohc**
Specifies that Robust Header Compression will be applied to sessions using this service and enters the HSGW Service RoHC Configuration Mode where RoHC parameters are configured.

**local-port number**
Default: 699
Specifies the UDP port number.
`number` can be any integer value between 1 and 65535.

**source-violation { clear-on-valid-packet | drop-limit num | period secs | reneg-limit num }**

**clear-on-valid-packet**
Default: disabled
Configures the service to reset the reneg-limit and drop-limit counters after receipt of a properly addressed packet.
**drop-limit num**  
Default: 10  
Sets the number of allowed source violations within a detection period before forcing a call disconnect. If num is not specified, the value is set to the default.  
num can be any integer value from 1 to 1000000.

**period secs**  
Default: 120  
The length of time, in seconds, for a source violation detection period to last. drop-limit and reneg-limit counters are decremented each time this value is reached.  
The counters are decremented in this manner: reneg-limit counter is reduced by one (1) each time the period value is reached until the counter is zero (0); drop-limit counter is halved each time the period value is reached until the counter is zero (0). If secs is not specified, the value is set to the default.  
secs must be an integer value from 1 to 1000000.

**reneg-limit num**  
Default: 5  
Sets the number of allowed source violations within a detection period before forcing a PPP renegotiation. If num is not specified, the value is set to the default.  
num can be any integer value from 1 to 1000000.

**Usage**

**Header Compression RoHC**: Use this command to specify that sessions using this service will have Robust Header Compression applied and configure parameters supporting RoHC.  
Entering this command results in the following prompt:  
```shell
[context_name]hostname(config-ip-header-compression-rohc)#
```
HSGW Service RoHC Configuration Mode commands are defined in the HSGW Service RoHC Configuration Mode Commands chapter.

**Local Port**: Specify the UDP port that should be used for communications between the Packet Control Function (PCF) and the HSGW.

**Important**: The UDP port setting on the PCF must match the local-port setting for the HSGW service on the system in order for the two devices to communicate.

**Source Violation**: This function is intended to allow the operator to configure a network to prevent problems such as when a user gets handed back and forth between two HSGWs a number of times during a handoff scenario.  
This function operates in the following manner:  
When a subscriber packet is received with a source address violation, the system increments both the IP source-violation reneg-limit and drop-limit counters and starts the timer for the IP-source violation period.  
Every subsequent packet received with a bad source address during the IP-source violation period causes the reneg-limit and drop-limit counters to increment.  
For example, if reneg-limit is set to 5, then the system allows 5 packets with a bad source address (source violations), but on the 5th packet, it re-negotiates PPP.  
If the drop-limit is set to 10, the above process of receiving 5 source violations and renegotiating PPP occurs only once. After the second 5 source violations, the call is dropped. The period timer continues to count throughout this process.  
If the configured source-violation period is exceeded at any time before the call is dropped, the reneg-limit counter is checked. If the reneg-limit counter is greater than zero (0), the reneg-limit is decremented by 1. If the reneg-limit counter equals zero, the drop-limit is decremented by half.
Example
The following command specifies a UDP port of 3950 for the HSGW service to use to communicate with the PCF on the A10/A11 interface:

```
ip local-port 3950
```

The following command sets the drop limit to 15 and leaves the other values at their defaults:

```
ip source-violation drop-limit 15
```
**lifetime**

Specifies the time that an A10 connection can exist before its registration is considered expired.

**Product**
HSGW

**Privilege**
Administrator

**Syntax**

```
lifetime time

[ default | no ] lifetime
```

- **default**
  Resets the lifetime value to the default setting of 1800 seconds.

- **no**
  Specifies that an A10 connection can exist for an infinite amount of time.

- **time**
  Default: 1800
  Specifies the time that an A10 connection can exist before its registration is considered expired.
  `time` is measured in seconds and can be configured to any integer value between 1 and 65534.

**Usage**

Use this command to set a limit to the amount of time that a subscriber session can remain up whether or not the session is active or dormant. If the lifetime timer expires before the subscriber terminates the session, the connection is terminated automatically.

**Example**

The following command specifies a time of 3600 seconds (1 hour) for subscriber sessions on this HSGW service:

```
lifetime 3600
```
max-retransmissions

Configures the maximum number of times the HSGW service will attempt to communicate with an eAN/PCF before it marks it as unreachable.

Product
HSGW

Privilege
Administrator

Syntax

max-retransmissions count

default max-retransmissions

default
Rests the maximum number of allowed retransmissions to the default value of 5.

count
Default: 5
Specifies the maximum number of times the HSGW service will attempt to communicate with an eAN/PCF before it marks it as unreachable.

count can be configured to any integer value between 1 and 1000000.

Usage
Use this command to limit the number of retransmissions to an eAN/PCF before marking it as unreachable. If the value configured is reached, the call is dropped.

Example
The following command configures the maximum number of retransmissions for the HSGW service to 3:

max-retransmissions 3
mobile-access-gateway

Identifies the mobile access gateway (MAG) context through which MIPv6 calls are to be routed.

**Product**
HSGW

**Privilege**
Administrator

**Syntax**

```
mobile-access-gateway context context_name [ mag-service service_name ]
```

```
o mobile-access-gateway context
```

```
no
```

Removes the configured MAG context route from this service.

```
context context_name [ mag-service service_name ]
```

Specifies the name of the context and, optionally, the service through which MIPv6 sessions are to be routed. `context_name` must be an existing context and be from 1 to 79 alpha and/or numeric characters. `service_name` must be an existing Mag service and be from 1 to 63 alpha and/or numeric characters.

**Usage**

Use this command to specify where MIPv6 sessions are routed through this service.

**Example**
The following command identifies the MAG context `MAG1` as the context through which MIPv6 sessions are to be routed and further narrows the route by specifying the service name (`mag_serv3`):

```
mobile-access-gateway context MAG1 mag-service mag_serv3
```
plmn id

Configures Public Land Mobile Network identifiers used to determine if a mobile station is visiting, roaming, or belongs to this network.

Product
HSGW

Privilege
Administrator

Syntax

```
plmn id mcc number mnc number
```

- `mcc number`: Specifies the mobile country code (MCC) portion of the PLMN’s identifier. `number` is the PLMN MCC identifier and must be an integer value between 100 and 999.
- `mnc number`: Specifies the mobile network code (MNC) portion of the PLMN’s identifier. `number` is the PLMN MNC identifier and can be configured to any 2 or 3 digit integer value between 00 and 999.

Usage
The PLMN identifier is used to aid the HSGW service in the determination of whether or not a mobile station is visiting, roaming, or home. Multiple P-GW services can be configured with the same PLMN identifier. Up to five PLMN IDs can be configured for each P-GW Service. The configured IDs are used in Diameter-EAP-Request messages (as a Visited-Network-Identifier AVP).

Example
The following command configures the PLMN identifier with an MCC of 462 and MNC of 2:

```
plmn id mcc 462 mnc 02
```
policy overload

Specifies how an HSGW service should handle overload conditions.

Product
HSGW

Privilege
Administrator

Syntax

\[ \text{policy overload \{ redirect address [ weight weight\_num ] [ address2 [ weight weight\_num ] \ldots address16 [ weight weight\_num ] \] | reject [ use reject-code { admin-prohibite | insufficient-resources } ] \}} \]

\[ \text{default policy overload} \]

\[ \text{no policy overload \{ redirect address [ address2 ] \ldots [ address16 ] } \]

---

**default**

Returns the command to its default setting of “reject” with the “admin-prohibited” code.

---

**no**

Removes a specified “redirect address” from this service.

---

**redirect address [ weight weight\_num ] [ address2 [ weight weight\_num ] \ldots address16 [ weight weight\_num ] ]**

This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the HSGW service rejects new sessions with an A11 Registration Reply Code of 88H (unknown HSGW address) and provides the IP address of an alternate HSGW. This command can be issued multiple times.

*address*: The IP address of an alternate HSGW expressed in IPv4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.

*weight weight\_num*: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified, the entry is automatically assigned a weight of 1 (default). *weight\_num* must be an integer value from 1 through 10.

---

**reject [ use reject-code { admin-prohibite | insufficient-resources } ]**

This option will cause any overload traffic to be rejected. The HSGW sends an A11 Registration Reply Code of 82H (insufficient resources).

*use-reject-code admin-prohibited*: When this keyword is specified and traffic is rejected, the error code admin prohibited is returned instead of the error code “insufficient resources”. This is the default behavior.

*use-reject-code insufficient-resources*: When this keyword is specified and traffic is rejected, the error code “insufficient resources” is returned instead of the error code admin prohibited.
Usage
Policies can be implemented to dictate HSGW service behavior for overload conditions. The system invokes the overload policy if the number of calls currently being processed exceeds the licensed limit for the maximum number of sessions supported by the system. The system automatically invokes the overload policy when an on-line software upgrade is started. Use the `no policy overload` command to delete a previously configured policy. If after deleting the policy setting you desire to return the policy parameter to its default setting, use the `default policy` command.

The chassis is shipped from the factory with the policy options overload disabled.

Example
The following command configures the HSGW service to redirect overload traffic to two IPv4 address, one priority weighted 1 and the other priority weighted 5:

```
policy overload redirect 1.2.3.4 weight 1 1.2.3.5 weight 5
```
**profile-id-qci-mapping**

Associates a configured mapping table for RP QoS Profile ID to LTE QoS Class Index (QCI) mapping with this service.

**Product**

HSGW

**Privilege**

Administrator

**Syntax**

```
profile-id-qci-mapping name
no profile-id-qci-mapping [ name ]
```

**no**

Removes all profile maps or a specific profile map from this service.

**name**

Specifies the name of the table to be associated with this service. *name* must be an existing Profile ID - QCI Mapping table and be from 1 to 63 alpha and/or numeric characters in length.

**Usage**

Use this command to associate the HSGW service with a configured Profile ID - QCI Mapping table. The table is configured in the Global Configuration Mode using the `profile-id-qci-mapping-table` command.

**Example**

The following command associates a Profile ID - QCI Mapping table named *table3* with this service:

```
profile-id-qci-mapping table3
```
**registration-deny**

Configures parameters related to registration rejection.

**Product**
HSGW

**Privilege**
Administrator

**Syntax**

```
registration-deny { handoff connection-setup-record-absent | newcall connection-setup-record-absent } [ use-deny-code { poorly-formed-request | reason-unspecified } ]
```

**handoff connection-setup-record-absent**

When enabled, the HSGW denies or discards handoff sessions that do not have an Airlink Connection Setup record in the A11 Registration Request. Default is disabled. Default HSGW behavior is to accept such requests.

**newcall connection-setup-record-absent**

When enabled, the HSGW denies or discards new sessions that do not have the airlink connection setup record in the RRQ.

```
[ use-deny-code { poorly-formed-request | reason-unspecified } ]
```

Sets the specified Registration Deny Code when denying a new call or handoff because of a missing connection setup record.

**Usage**

Use this command to configure parameters relating to the rejection of registration requests.

**Example**

The following command denies registration for registration requests missing the connection setup record and replies with a use deny code of “poorly formed request”:

```
registration-deny handoff connection-setup-record-absent use-deny-code poorly-formed-request
```
retransmission-timeout

Configures the maximum allowable time for the HSGW service to wait for a response from the eAN/PCF before it attempts to communicate with the eAN/PCF again (if the system is configured to retry the PCF) or marks the eAN/PCF as unreachable.

**Product**
HSGW

**Privilege**
Administrator

**Syntax**

```
retransmission-timeout time
{ default | no } retransmission-timeout
```

- **default**
  Resets the timeout setting to the default value of 3.

- **no**
  Deletes a previously configured timeout value.

- **time**
  Default: 3
  Specifies the maximum allowable time, in seconds, for the HSGW service to wait for a response from the eAN/PCF before it: a) attempts to communicate with the eAN/PCF again (if the system is configured to retry the PCF) or b) marks the eAN/PCF as unreachable.
  `time` must be an integer value between 1 and 1000000.

**Usage**

Use the retransmission timeout command in conjunction with the `max-retransmissions` command in order to configure the HSGW services behavior when it does not receive a response from a particular PCF.

**Example**

The following command configures a retransmission timeout value of 5 seconds:

```
retransmission-timeout 5
```
**setup-timeout**

The maximum amount of time allowed for session setup.

**Product**
HSGW

**Privilege**
Administrator

**Syntax**

```
setup-timeout seconds
[ default| no ] setup-timeout
```

- **default**
  Rests the command to the default value of enabled with a timeout of 60 seconds.

- **no**
  Disables the feature.

- **seconds**
  Default: 60
  The maximum amount of time, in seconds, to allow for setup of a session in this service. *seconds* must be an integer value from 1 through 100000.

**Usage**

Use this command to set the maximum amount of time allowed for setting up a session.

**Example**

The following command sets the maximum time allowed for setting up a session to 5 minutes (300 seconds):

```
setup-timeout 300
```
**spi remote-address**

Configures the security parameter index (SPI) between the HSGW service and the eAN/ePCF. This command also configures the redirection of call based on the PCF zone.

**Product**
HSGW

**Privilege**
Administrator

**Syntax**

```
spi remote-address {pcf_ip_address | ip_addr_maskCombo} spi-number number {
encrypted secret enc_secret | secret secret } [ description string ] [ hash-algorithm { md5 | rfc2002-md5 } ] [ replay-protection { nonce | timestamp } ] [ timestamp-tolerance tolerance ] [ zone zone_id ]
```

```
no spi remote-address pcf_ip_address spi-number number
```

- **pcf_ip_address**: Specifies the IP address of the ePCF. pcf_ip_address is an IP address expressed in IPv4 dotted decimal notation or IPv6 colon separated notation.
- **ip_addr_maskCombo**: Specifies the IP address of the PCF and specifies the IP address network mask bits. ip_addr_maskCombo must be specified using the form ‘IP Address/Mask Bits’ where the IP address must either be an IPv4 address expressed in dotted decimal notation or an IPv6 address expressed in colon separated notation and the mask bits are a numeric value which is the number of bits in the subnet mask.

**spi-number number**

Specifies the SPI (number) which indicates a security context between the PCF and the HSGW. number can be configured to any integer value between 256 and 4294967295.

**encrypted secret enc_secret | secret secret**

Configures the shared-secret between the HSGW service and the PCF. The secret can be either encrypted or non-encrypted.

- **encrypted secret enc_secret**: Specifies the encrypted shared key (enc_secret) between the PCF and the HSGW service. enc_secret must be between 1 and 254 alpha and/or numeric characters and is case sensitive.
- **secret secret**: Specifies the shared key (secret) between the PCF and the HSGW services. secret must be between 1 and 127 alpha and/or numeric characters and is case sensitive.

The encrypted keyword is intended only for use by the chassis while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the secret keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

**description string**

This is a description for the SPI. string must be an alpha and/or numeric string from 1 through 31 characters.
### hash-algorithm \{ md5 | rfc2002-md5 \}

Default: md5
Specifies the hash-algorithm used between the HSGW service and the PCF.
- **md5**: Configures the hash-algorithm to implement MD5.
- **rfc2002-md5**: Configures the hash-algorithm to implement keyed-MD5.

### replay-protection \{ nonce | timestamp \}

Default: timestamp
Specifies the replay-protection scheme that should be implemented by the HSGW service.
- **nonce**: Configures replay protection to be implemented using NONCE.
- **timestamp**: Configures replay protection to be implemented using timestamps.

### timestamp-tolerance tolerance

Default: 60
Specifies the allowable difference (tolerance) in timestamps that is acceptable. If the difference is exceeded, then the session will be rejected. If this is set to 0, then time stamp tolerance checking is disabled at the receiving end.
- **tolerance** is measured in seconds and can be configured to any integer value between 0 and 65535.

### zone zone_id

Specifies the different PCF zones to configure in HSGW service. Mapping of a zone-number to a set of HSGWs can be done per HSGW service basis.
- **zone_id** must be an integer value between 1 and 32. A maximum of 32 PCF zones can be configured for a HSGW service.

### Usage

An SPI is a security mechanism configured and shared by the PCF and the HSGW service. Please refer to IOS 4.1 and RFC 2002 for additional information.
Multiple SPIs can be configured if the HSGW service is communicating with multiple eAN/PCFs.

### Important:

The SPI configuration on the PCF must match the SPI configuration for the HSGW service on the system in order for the two devices to communicate properly.

This command used with the **zone** keyword redirects all calls on the basis of PCF zone to the specific HSGW on the basis of parameters configured using the **policy pcf-zone-match** command.

### Example

The following command configures the HSGW service to use an SPI of 256 when communicating with a PCF with the IP address **192.168.0.2**. The key that would be shared between the PCF and the HSGW service is **q397F65**.

```
spi remote-address 192.168.0.2 spi-number 256 secret q397F65
```

The following command creates the configured SPI of **400** for an PCF with an IP address of **172.100.3.200** and zone id as **11**:

```
spi remote-address 172.100.3.200 spi-number 400 zone 11
```
HSGW Service Configuration Mode Commands

spi remote-address
**unauthorized-flows**

Configures the service to wait a specified number of seconds before triggering a QoS update to downgrade an unauthorized flow.

**Product**
HSGW

**Privilege**
Administrator

**Syntax**

```
unauthorized-flows qos-update wait-timeout seconds
[ default | no ] unauthorized-flows qos-update wait-timeout
```

- **default**
  Returns the command to its default setting of

- **no**
  Removes the configure wait-timeout setting for this service.

- **qos-update wait-timeout seconds**
  Specifies the number of seconds to wait before triggering the QoS update to downgrade the unauthorized flow. `seconds` must be an integer value from 1 to 65534.

**Usage**

Use this command to specific a wait timeout trigger for flows that are unauthorized by policy rules received via the Gxa interface from the PCRF. When the wit timer expires, the HSGW triggers a QoS update to downgrade the unauthorized flow.

**Example**

The following command configures the HSGW service to apply the wait time of 30 seconds after receiving an flow unauthorized by the PCRF:

```
unauthorized-flow qos-update wait-timeout 30
```
Chapter 126
HSGW Service RoHC Configuration Mode Commands

The HSGW Service RoHC Configuration Mode is used to configure RoHC parameters for the service.

```
Exec Mode
  configure
    context name
      hsgw-service name
        HSGW Service Configuration Mode
          ip header-compression rohc
            HSGW Service RoHC Config Mode
```
cid-mode

This mode allows you to configure options that apply during RoHC compression for the service.

Product
HSGW

Privilege
Administrator

Syntax

cid-mode \{ large | small \} max-cid integer

default cid-mode

default
Reset all options in the RoHC Profile Compression Configuration mode to their default values.

large
Use large packets with optional information for RoHC

small
This is the default packet size.
Use small RoHC packets.

max-cid integer
Default: 15
The highest context ID number to be used by the compressor. integer must be an integer from 0 through 15 when small packet size is selected and must be an integer from 0 through 31 when large packet size is selected.

Usage
Use this command to set the RoHC packet size and define the maximum

Example
The following command sets large RoHC packet size and sets the maximum CID to 100:
cid-mode large max-cid 100

The following command sets the cid-mode to the default settings of small packets and max-cid 0:
default cid-mode
end

Exits the current mode and returns to the Exec Mode.

Product
All

Privilege
Administrator

Syntax
end

Usage
Change the mode back to the Exec mode.
exit

Exits the current mode and returns to the previous mode.

**Product**
All

**Privilege**
Administrator

**Syntax**

```
exit
```

**Usage**

Return to the previous mode.
mrru

This command sets the size of the largest reconstructed reception unit, in octets, that the decompressor is expected to reassemble from segments. The size includes the CRC. If MRRU is negotiated to be 0, no segment headers are allowed on the channel.

Product

HSGW

Privilege

Administrator

Syntax

```plaintext
mrru num_octets

default mrru
```

- `default`
  reset the value of this command to its default setting

- `num_octets`
  Default: 0
  This is the number of octets for the maximum size of the largest reconstructed reception unit allowed. `num_octets` must be an integer from 0 through 65535.

Usage

Use this command to set the size, in octets, of the largest reconstructed reception unit, in octets, that the decompressor is expected to reassemble from segments.

Example

The following command sets the largest reconstructed reception unit to 1024 octets:

```
mrru 1024
```

The following command resets the mrru size to its default of 0 octets:

```
default mrru
```
profile

This command specifies the header compression profiles to use. A header compression profile is a specification of how to compress the headers of a specific kind of packet stream over a specific kind of link. At least one profile must be specified.

Product
HSGW

Privilege
Administrator

Syntax

```
profile { [ esp-ip ] [ rtp-udp ] [ udp-ip ] [ uncompressed-ip ] }
```

default profile

default
Default: esp-ip rtp-udp udp-ip uncompressed-ip
Returns the RoHC profile configuration to its default setting.

esp-ip
This enables RoHC Profile 0x0003 which is for ESP/IP compression, compression of the header chain up to and including the first ESP header, but not subsequent subheaders.

rtp-udp
This enables RoHC Profile 0x0001 which is for RTP/UDP/IP compression

udp-ip
This enables RoHC Profile 0x0002 which is for UDP/IP compression, compression of the first 12 octets of the UDP payload is not attempted.

uncompressed-ip
This enables RoHC Profile 0x0000 which is for sending uncompressed IP packets.

Usage
Us this command to specify the RoHC header compression profiles to use.

Example
The following command sets the profiles to use as esp-ip and rtp-udp:

```
profile esp-ip rtp-udp
```
Chapter 127
IKEv2 Security Association Configuration Mode
Commands

The IKEv2 Security Association Configuration Mode is used to configure a Security Association at the outset of an IPsec session. A security association is the collection of algorithms and parameters (such as keys) that is being used to encrypt and authenticate a particular flow in one direction. In normal bi-directional traffic, the flows are secured by a pair of security associations.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**default**

Sets the default properties for the selected parameter.

**Product**
PDIF

**Privilege**
Security Administrator, Administrator

**Syntax**

```
default { encryption | group | hmac | lifetime | prf }
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>encryption</td>
<td>Default algorithm for the IKEv2 IKE SA is AES-CBC-128</td>
</tr>
<tr>
<td>group</td>
<td>Default Diffie-Hellman group is Group 2</td>
</tr>
<tr>
<td>hmac</td>
<td>Default IKEv2 IKE SA hashing algorithm is SHA1-96</td>
</tr>
<tr>
<td>lifetime</td>
<td>Default lifetime for SAs derived from this transform-set is 86400 seconds.</td>
</tr>
<tr>
<td>prf</td>
<td>Default PRF for the IKEv2 IKE SA is SHA1.</td>
</tr>
</tbody>
</table>

**Usage**
Configure default parameters for the IKEv2 IKE SA transform-set.

**Example**
Use the following configuration to set the default encryption algorithm:

```
default encryption
```
encryption

Configure the appropriate encryption algorithm and encryption key length for the IKEv2 IKE security association. AES-CBC-128 is the default.

Product
PDIF

Privilege
Security Administrator, Administrator

Syntax

```
encryption { 3des-cbc | aes-cbc-128 | aes-cbc-256 | des-cbc }
default encryption
```

<table>
<thead>
<tr>
<th>3des-cbc</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Triple DES.” Data Encryption Standard Cipher Block Chaining encryption applied to the message three times using three different cypher keys.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>aes-cbc-128</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced Encryption Standard Cipher Block Chaining with a key length of 128 bits. This is the default setting for this command.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>aes-cbc-256</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced Encryption Standard Cipher Block Chaining with a key length of 256 bits.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>des-cbc</th>
</tr>
</thead>
</table>

Usage
IKEv2 requires a confidentiality algorithm to be applied in order to work. In cipher block cryptography, the plaintext is broken into blocks usually of 64 or 128 bits in length. In cipher block chaining (CBC) each encrypted block is chained into the next block of plaintext to be encrypted. A randomly-generated vector is applied to the first block of plaintext in lieu of an encrypted block. CBC provides confidentiality, but not message integrity. Because RFC 4307 calls for interoperability between IPsec and IKEv2, the IKEv2 confidentiality algorithms must be the same as those configured for IPsec in order for there to be an acceptable match during the IKE message exchange. Because of RFC4307, in IKEv2, there is no viable NULL option, it is available for testing only.

Example
The following command configures the encryption to be the default aes-cbc-128:

```
default encryption
```
end

Exits the current mode and returns to the Exec Mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
end
```

**Usage**

Change the mode back to the Exec Mode.
exit

Exits the current mode and returns to the previous mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
exit
```

**Usage**

Returns to the previous mode.
group

Configure the appropriate key exchange cryptographic strength by applying a Diffie-Hellman group. Default is Group 2.

Product
PDIF

Privilege
Security Administrator, Administrator

Syntax

group { 1 | 2 | 5 | 14 }
default group

1
Configures crypto strength at the Group 1 level. Lowest security.

2
Configures crypto strength at the Group 2 (default) level. Medium security.
This is the default setting for this command.

5
Configures crypto strength at the Group 5 level. Higher security.

14
Configures crypto strength at the Group 14 level. Highest security

Usage
Diffie-Hellman groups are used to determine the length of the base prime numbers used during the key exchange process in IKEv2. The cryptographic strength of any key derived depends, in part, on the strength of the Diffie-Hellman group upon which the prime numbers are based.
Group 1 provides 768 bits of keying strength, Group 2 provides 1024 bits, Group 5 provides 1536 bits and Group 14 provides 2048 bits of encryption strength.
Configuring a DH group also enables Perfect Forward Secrecy, which is disabled by default.

Example
This command configures security at the default level (Group 2):

default group
**hmac**

Configures the IKEv2 IKE SA integrity algorithm. Default is SHA1-96.

**Product**  
PDIFF

**Privilege**  
Security Administrator, Administrator

**Syntax**

```  
hmac { md5-96 | sha1-96 }  
default hmac
```

**md5-96**  
HMAC-MD5 uses a 128-bit secret key and produces a 128-bit authenticator value.

**sha1-96**  
HMAC-SHA-1 uses a 160-bit secret key and produces a 160-bit authenticator value. This is the default setting for this command.

**Usage**  
IKEv2 requires an integrity algorithm be configured in order to work. A keyed-Hash Message Authentication Code, or HMAC, is a type of message authentication code (MAC) calculated using a cryptographic hash function in combination with a secret key to verify both data integrity and message authenticity. A hash takes a message of any size and transforms it into a message of a fixed size: the authenticator value. This is truncated to 96 bits and transmitted. The authenticator value is reconstituted by the receiver and the first 96 bits are compared for a 100 percent match. Because RFC 4306 calls for interoperability between IPsec and IKEv2, the IKEv2 integrity algorithms must be the same as those configured for IPsec in order for there to be an acceptable match during the IKE message exchange.

**Example**  
The following command configures the default HMAC value (SHA1-96):

```  
default hmac
```
lifetime

Configure the lifetime of a security association (SA) in seconds. Default timeout time is 86400 seconds.

Product
PDIF

Privilege
Security Administrator, Administrator

Syntax

```
lifetime sec
```

default lifetime

```
lifetime sec
Default: 86400
Sets the value of the timeout parameter. sec must be an integer from 60 - 86400.
```

Usage

The secret keys that are used for various aspects of a configuration should only be used for a limited amount of time before timing out. This exposes a limited amount of data to the possibility of hacking. If the SA expires, the options are then to either close the SA and open a new one, or renew the existing SA.

Example

The following command sets the lifetime timeout to be the default value (86400):

```
default lifetime
```
prf

Select one of the HMAC integrity algorithms to act as the IKE Pseudo-Random Function. A PRF produces a string of bits that an attacker cannot distinguish from random bit string without knowledge of the secret key. The default is SHA1.

Product
PDIF

Privilege
Security Administrator, Administrator

Syntax

```
prf { md5 | sha1 }

default prf
```

---

| md5 |
| MD5 uses a 128-bit secret key and produces a 128-bit authenticator value. |

| sha1 |
| SHA-1 uses a 160-bit secret key and produces a 160-bit authenticator value. SHA-1 is considered cryptographically stronger than MD5, but it takes more CPU cycles to compute. This is the default setting for this command. |

---

Usage
The prf is used for generating keying material for all the cryptographic algorithms used in both the IKE-SA and the CHILD_SAs.

Example
This configuration sets the prf to be the default value (sha1):

```
default prf
```
Chapter 128
IMS Authorization Service  Configuration Mode
Commands

IP Multimedia Sub-system (IMS) authorization service is used to configure authorization parameters to manage policy control functions and Gx and Ty interface support with Diameter based procedures for flow based charging within a context. The system uses Gx/Gy andTx/Ty functionality based on the charging policy and rules configured to flow based charging for a subscriber session.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the IMS Authorization Configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

end

Usage
Use this command to change to the Exec mode.
exit

Exits the current configuration mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Use this command to return to the parent configuration mode.
p-cscf discovery

This command defines the method of Proxy-Call Session Control Function (P-CSCF) discovery to be used.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
p-cscf discovery {table { 1 | 2 } [ algorithm { ip-address-modulus | msisdn-modulus | round-robin } ] | diameter-configured } [ default | no ] p-cscf discovery
```

- **default**
  Sets the P-CSCF discovery to default parameter.

- **no**
  Removes/deletes configured parameters for P-CSCF discovery.

- **table { 1 | 2 }**
  This keyword specifies that which P-CSCF table is to be used to obtain the primary and secondary P-CSCF addresses. Total 2 tables can be configured for P-CSCF discovery.

- **algorithm { ip-address-modulus | msisdn-modulus | round-robin }**
  Default: round-robin.
  This keyword specifies the algorithm to select the row from the P-CSCF table to be used for P-CSCF discovery.
  - **ip-address-modulus**: This algorithm divides the IP address, in binary, of the subscriber by the number of rows in the table, and the remainder is used as an index into the specified table to select the row.
  - **msisdn-modulus**: This algorithm divides the MSISDN value in binary without the leading “+” of the subscriber by the number of rows in the table, and the remainder is used as an index in the specific table to select the row.
  - **round-robin**: This algorithm rotates all rows in the active table for selection of the row in round-robin way. If no algorithm is specified this is the default behavior.

- **diameter-configured**
  This option enables the table number and algorithm specified by the `diameter host-select table` configuration in Policy Control Configuration mode.
  If the primary host in that configuration is down it assumes that the primary P-CSCF in the row of P-CSCF table is also down, and it does not return that IP address in the create PDP context response.
  This option also performs the deactivation processing of the PDP contexts when Diameter Policy Control Application (DPCA) switches, host tables as detailed in the `diameter host-select` command description in Policy Control Configuration mode.
Usage
Use this command to configure the table and row selection methods to select IP address/host address for P-CSCF discovery.

Example
The following command specifies table 1 with round-robin algorithm to select the rows with IP address for P-CSCF discovery.

```
p-cscf discovery table 1 algorithm round-robin
```
p-cscf table

This command adds/appends rows with primary and/or secondary IPv4/IPv6 address to a P-CSCF discovery table with precedence for Proxy-Call Session Control Function (P-CSCF) discovery.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
p-cscf table { 1 | 2 } row-precedence precedence_value { address ip_address | ipv6-address ipv6_address } [ secondary { address ip_address | ipv6-address ipv6_address } ]
```

```
no p-cscf table { 1 | 2 } row-precedence precedence_value
```

**no**
Removes/deletes configured row with precedence in specified table for P-CSCF discovery address.

```
{ 1 | 2 }
```
Specifies which P-CSCF table is to be used to add/append the primary and secondary P-CSCF addresses. Two tables can be configured for P-CSCF discovery address.

**row-precedence precedence_value**
This keyword adds/appends the row with the specified row-precedence to the P-CSCF address table. In StarOS 8.1 and later, `precedence_value` must be an integer from 1 through 128, and a maximum of 128 rows can be added to a table. In StarOS 8.0, `precedence_value` must be an integer from 1 through 100, and a maximum of 16 rows can be added to a table.

**secondary**
Specifies the secondary IPv4/IPv6 address to be entered in P-CSCF table rows.

**address ip_address**
Specifies the primary and/or secondary IPv4 address for P-CSCF discovery table. This keyword, if used with `secondary` keyword, specifies the secondary IPv4 address. `ip_address` must be an IPv4 IP address entered using dotted decimal notation.

**ipv6-address ipv6_address**
Specifies the primary and/or secondary IPv6 address for P-CSCF discovery table. This keyword, if used with `secondary` keyword, specifies the secondary IPv6 address. `ipv6_address` must be an IPv6 IP address entered using colon (:) separated notation.

**Usage**
Use this command to add rows with primary and/or secondary IP addresses for P-CSCF discovery. The row is added with the specified row-precedence. The operator can add/remove rows to the table that is not currently selected by the `diameter host-select table` command in Policy Control Configuration Mode.

**Example**
The following command adds a row in `table 2` with primary IP address `1.2.3.4`, secondary IP address as `5.6.7.8`, and row-precedence value as `20` for P-CSCF discovery.

```plaintext
p-cscf table 2 row-precedence 20 address 1.2.3.4 secondary 5.6.7.8
```
policy-control

This command enters the Policy Control Configuration mode for Diameter Policy Control Application (DPCA) to configure Diameter authorization and policy control parameter for IMS authorization.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] policy-control
```

**no**

Disables the pre-configured policy control parameters for IMS authorization in this IMS authorization service.

**Usage**

Use this command to enter the Policy Control Configuration Mode to configure the policy control parameters for Diameter authorization and charging policy in IMS Authorization Service.

**Example**

```plaintext
policy-control
```
qos-update-timeout

This command sets the Quality of Service update timeout for a subscriber in IMS authorization service.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

```
qos-update-timeout timeout_duration
[ no ] qos-update-timeout
```

**no**
Disables the pre-configured QoS update timeout parameter in this IMS authorization service.

```
timeout_duration
```
Default: 60
Specifies the duration of timeout in seconds, and must be an integer from 0 through 3600.

**Usage**
Use this command to set the maximum time to wait for a subscriber to initiate the update QoS procedure in IMS authorization service.

**Example**
Following command sets the QoS update timeout to 90 seconds.

```
qos-update-timeout 90
```
reauth-trigger

This command specifies the trigger events to initiate re-authorization for a subscriber in IMS authorization service.

**Important:** This command now moved to Policy Control Config mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ default ] reauth-trigger{ all | { an-gw-change | bearer-loss | bearer-recovery |
plmn-change | policy-failure | qos-change | rat-change | sgsn-change | tft-change |
tft-delete } + }
```

**Default**
Sets the pre-configured Re-authorization trigger to default value.

**all**
Sets the IMS authorization service to initiate re-authorization process for a subscriber on all events listed in this command.

**an-gw-change**
Sets the IMS authorization service to initiate re-authorization process for a subscriber whose access network gateway changed.

**bearer-loss**
Sets the IMS authorization service to initiate re-authorization process for a subscriber on loss of bearer or service.

**bearer-recovery**
Sets the IMS authorization service to initiate re-authorization process for a subscriber when a bearer or service recovered after loss of bearer or service.

**default-bearer-qos-change**
Sets the IMS authorization service to initiate re-authorization process when QoS is changed and DEFAULT_EPS_BEARER_QOS_CHANGE event triggered for the default EPS bearer context of a subscriber in LTE network.

**plmn-change**
Sets the IMS authorization service to initiate re-authorization process for a subscriber on change in Public Land Mobile Network (PLMN) of subscriber.
IMS Authorization Service Configuration Mode Commands

**policy-failure**
Sets the IMS authorization service to initiate re-authorization process for a subscriber on failure of credit and charging policy for subscriber.

**qos-change**
Sets the IMS authorization service to initiate re-authorization process for a subscriber on change in Quality of Service level/rating of subscriber.

**rat-change**
Sets the IMS authorization service to initiate re-authorization process for a subscriber on change in Radio Access Type (RAT) of subscriber node.

**sgsn-change**
Sets the IMS authorization service to initiate re-authorization process for a subscriber on change in SGSN for subscriber node.

**tft-change**
Sets the IMS authorization service to initiate re-authorization process for a subscriber on change in Traffic Flow Template (TFT) of subscriber session.

**tft-delete**
Sets the IMS authorization service to initiate re-authorization process for a subscriber when Traffic Flow Template (TFT) of subscriber session is deleted by a system administrative user.

**Usage**
Use this command to set the triggers to initiate QoS re-authorization process for a subscriber in IMS authorization service.

**Example**
Following command sets the re-authorization trigger to **bearer-loss**, so that re-authorization of subscriber session is initiated on loss of bearer.

```
reauth-trigger bearer-loss
```
signaling-flag

This command specifies whether a request for a PDP context dedicated to signaling (for IMS sessions) should be granted or denied.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
signaling-flag { deny | permit }
[ default ] signaling-flag
```

**default**
Sets the signaling flag to default mode of deny.

**deny**
Default: Enabled.
When specified this keyword denies the request for a signaling PDP context for IMS session and keeps signaling co-existed with other traffic on PDP contexts.

**permit**
Default: Disabled.
When specified this keyword permit the request for a signaling PDP context for IMS session and a separate signaling context activated.

**Usage**

Use this command to allow or deny the activation of dedicated PDP context for signaling. The user equipment (UE) may indicate that the PDP context should be dedicated for IP multimedia (IM) signaling by setting the IP Multimedia Core Network (IM CN) signaling flag in the Protocol Configuration Options (PCO).

The **deny** option causes the system to inform the UE that the PDP context will not be dedicated for IM signaling and signaling will co-exist with other traffic on PDP context.

The **permit** option is used to activate the signaling context for signal traffic and the other traffic uses other PDP context for traffic with the following destinations:

- Towards the DHCP and DNS servers for the IMS domain.
- Towards the P-CSCF(s).

The UE is not trusted to follow these restrictions, and the system monitors and restricts the traffic from the dedicated PDP context. The **signaling-flow class-map** command is used to configure the restrictions.

**Example**

Following command denies the request for a signaling PDP context for IMS session.
default signaling-flag
signaling-flow permit

This command specifies the packet filters and policy servers for bandwidth control and singling context enforcement that define the traffic that is allowed through the dedicated signaling context.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

```
signaling-flow permit server-address ip_address [ server-port { port_num | range start_port to end_port } ] [ description STRING ]

[ no ] signaling-flow permit server-address ip_address [ server-port { port_num | range start_port to end_port } ]
```

**no**
Disables the signaling flow option configured with his command.

**server-address ip_address**
The server address `ip_address` refers to the destination IP address in uplink packets, and the source IP address in downlink packets.
`ip_address` is IPv4/IPv6 address in standard notation and can be used with sub-net mask.
A maximum of 16 signaling server address can be configured per IMS Authorization service.

**server-port { port_num | range start_port to end_port }**
Specifies the TCP/UDP port number(s) of the server and to be used for communication.
`port_num` must be an integer from 1 through 65535.
`range start_port to end_port` provides the option to configure the range of ports on server for communication.
`start_port` must be an integer from 1 through 65535 but lesser than `end_num`, and `end_port` must be an integer from 1 through 65535 but greater than `start_num`

**description STRING**
Specifies the customized description for configured signaling server.
`STRING` must be an alpha and/or numeric string with maximum of 64 characters.

Usage
Traffic that matches any instance of the signaling-flow command will be forwarded via the signaling PDP context. In addition, the policy server gives policy gates to use for the signaling PDP context.

Example
Following command sets the packet filter server address to `1.2.3.4` with port number `1234` for packet filtering.
signaling-flow permit

signaling-flow server-address 1.2.3.4 server-port 1234
traffic-policy general-pdp-context

This command specifies the action on packets which do not match any policy gates in the general purpose PDP context.

Product
GGSN

Privilege
Security Administrator, Administrator

Syntax

```
traffic-policy general-pdp-context no-matching-gates direction { downlink | uplink } { forward | discard }

default traffic-policy general-pdp-context no-matching-gates direction { downlink | uplink }
```

**default**
Sets the default traffic policy for packets without any policy gate match in general purpose PDP context. By default packets which do not have any matching policy gate are forwarded.

**no-matching-gates**
This keyword applies traffic policy for packets which do not match any policy gate.

**direction { downlink | uplink }**
Specifies the direction of traffic to apply this traffic policy in general PDP context.
- **downlink**: specifies the traffic from system to MN. Default is set to forward.
- **uplink**: specifies the traffic from MN to system. Default is set to forward.

**forward**
Default: Enabled.
This option forward the packets which do not match any policy gates.

**discard**
Default: Disabled.
This option discards the packets which do not match any policy gates.

Usage
This command provides configuration on traffic policy applied on packets which are not matching any policy gate in general PDP context. Packets can either forwarded or discarded on the basis of operators configuration.
This command needs to be configured once for downlink and once for uplink separately.

Example
Following command discard uplink packets which do not match any policy gate in general purpose PDP context.
traffic-policy general-pdp-context no-matching-gates direction uplink discard
Chapter 129
IMS Sh Service Configuration Mode Commands

The IMS Sh Interface Configuration Mode is used to configure various Diameter parameters in order for:
PDIF to communicate with the HSS server. HSS server is used for MAC address validation in the IKEv2 exchanges to set up SAs and for storing part of the user profile.
SCM to communicate with the HSS server. HSS server is used for retrieval and update of call feature parameters and call restriction data.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
diameter

This command configures Diameter parameters.

Product
PDIF, SCM

Privilege
Administrator

Syntax

    diameter { dictionary { custom1 | standard } | endpoint string }

    default diameter { dictionary | endpoint }

    no diameter endpoint

    no
    Removes previously configured endpoint.

    default
    Configures parameters to the default value.

    dictionary
    Specifies the dictionary to use.
    • custom1: A custom dictionary
    • standard: The standard dictionary

    Important: SCM uses only the standard dictionary.

    endpoint string
    Selects an endpoint to use in the configuration.
    string must be the endpoint name, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage
The Diameter endpoint contains information on the peer names and IP addresses and port, and the local IP address to use for Diameter.
You can have more than one Diameter endpoint configured on the chassis and the ims-sh-service needs to know which Diameter endpoint to use. This command is to select the appropriate Diameter endpoint, even if only one has been configured.

Example
The following example selects a diameter endpoint diam1:
diameter endpoint diam1
end

Exits the current mode and returns to the Exec Mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to change to the Exec Mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Use this command to return to the parent configuration mode.
failure-handling

This command configures the action to take in the event of an HSS server request failure.

Product
PDIF, SCM

Privilege
Administrator

Syntax

[ default ] failure-handling { profile-update-request | user-data-request } { { diameter-result-code result_code [ to result_code ] } | timeout } action { continue | retry-and-terminate | terminate } }

default
 Resets configuration for the specified keyword to the default setting.

profile-update-request
 Configures failure-handling as a result of a profile update request error.

user-data-request
 Configures failure-handling as a result of a user data request.

diameter-result-code result_code [ to result_code ]
The Result-Code data field contains a space representing errors. Diameter provides the following classes of errors, all identified by the thousands digit in the decimal notation:
- 3xxx (Protocol Errors)
- 4xxx (Transient Failures)
- 5xxx (Permanent Failure)

result_code specifies either a result code value (diameter-result-code 3001) or a range of result code values (diameter-result-code 3000 to 9999) to which the failure-handling applies.

action
 Configures the action to take depending on the diameter-result-code:
- Continue the session
- Retry and then terminate
- Terminate the session

request-timeout action
 Configures the action to take as a result of a request timeout error:
- Continue the session
- Retry and then terminate
- Terminate the session
**Usage**

Configures all failure-handling parameters.

**Example**

The following command configures profile-update-request failure-handling using a result-code configuration with the terminate session option:

```
failure-handling profile-update-request diameter-result-code 3005 to 3600
action terminate
```
request

Configures application request timeout.

Product
PDIF, SCM

Privilege
Administrator

Syntax

request timeout secs

[ no | default ] request timeout

no
Disables a configured timeout request.

default
Default: 300 seconds
Resets configuration to the default setting.

request timeout secs
Configures the request timeout in seconds.
secs must be an integer from 1 through 300.

Usage
Specifies the session request timeout period in seconds after which the request is deemed to have failed.

Example
The following example configures the default timeout request of 300 seconds:

default request timeout
Chapter 130
IPMS Client Configuration Mode Commands

The IPMS Client Configuration Mode is used to enable the IPMS client service on an Access Gateway and to set basic service wide options in a context.

**Important:** This is a license enabled external application support. For more information on this product, refer to the IPMS Installation and Administration Guide.

```
Exec Mode
  configure
    Global Configuration Mode
      context name
        Context Configuration Mode
          ipms
            IPMS Configuration Mode
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Change the mode back to the Exec mode.
**exit**

Exits the current mode and returns the CLI session to the previous parent mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
exit
```

**Usage**
Return to the parent CLI mode.
export keys

This command enables the encryption key export in specific key exchange events to IPMS server from IPMS-enabled AGW.

Important: This is a license enabled customer specific command.

Product
IPMS

Privilege
Security Administrator, Administrator

Syntax

no
Removes the configured source IP address from this context for IPMS client communication with IPMS server.

ikev2
This keyword enables the security association (SA) key export for Internet Key Exchange (IKEv2) protocol to IPMS server.

Usage
Monitor subscribers which have complaints of service availability or to monitor a test user for system verification.

Example
The following command assigns the IP address 1.2.3.4 to the IPMS client service in context to communicate with IPMS server. This is the IP address allocated for IPMS client service on chassis.

source address 1.2.3.4
heartbeat

This command configures the IPMS heartbeating between IPMS-enabled AGW and IPMS server.

**Product**
IPMS

**Privilege**
Security Administrator, Administrator

**Syntax**

```
heartbeat [ period dur [ permitted-failure no_of_failures ] ]
[ no | default ] heartbeat
```

- **default**
  Configures the heartbeat period and permitted number of failure to default value of 10 seconds and 1 failure respectively.

- **no**
  Disables/removes the configured heartbeat period and permitted number of failure.

- **period dur**
  Default: 10
  Specifies the periodicity in seconds of heartbeat messages.
  `dur` is the duration in second between two heartbeat messages and must be an integer value from 1 through 3600.

- **permitted-failure no_of_failures**
  Default: 1
  Specifies the number of errors/failures allowed before declaring an IPMS server as dead/unreachable.
  `no_of_failures` is the number of errors/failure of heartbeat message response and must be an integer value from 1 through 10.

**Usage**

Use this command to configure the heartbeat message periodicity and permissible failure of heartbeat message response before declaring an IPMS server as dead or unreachable. When an IPMS server is declared down an SNMP trap is sent.

**Example**

Following command configures the heartbeat message periodicity to 5 second and number of failures allowed as 3 to determine an IPMS server as dead.

```
heartbeat period 5 permitted-failure 3
```
server

This command configures the IPMS server address and ports on which IPMS client on IPMS-enabled AGW communicates. This is the IP address and port range of IPMS server.

**Product**
- IPMS

**Privilege**
- Security Administrator, Administrator

**Syntax**

```
server address <ip_address> [ start-port <start_port> [ end-port <end_port> ]] [ secondary ]
```

[ no ] server address <ip_address>

- **no**
  - Removes the configured IPMS server IP address and port range from this context.

- **address <ip_address>**
  - Specifies the IP address of the IPMS server to which the IPMS client service communicates. This is the address which is used by IPMS client service to locate the IPMS server.
  - A maximum of 4 IPMS servers can be configured with this command in one context.
  - `ip_address` must be an IP v4 address in dotted decimal notation.

- **[ start-port <start_port> [ end-port <end_port> ]]**
  - Default: 45001 source port
  - 45005 end port
  - Specifies the range of UDP ports on which IPMS client communicates with IPMS server.
  - start-port `start_port` is the starting port number and must be an integer value in the range from 1 through 65535 but less than `end_port`, if `end_port` is specified.
  - end-port `end_port` is the end port number and must be an integer value in the range from 1 through 65535 but more than `start_port`.

- **secondary**
  - The secondary keyword is used to configure the specified server address as secondary IP address on the IPMS client interface.

**Usage**

Use this command to configure/remove the IPMS servers. Up to 4 different IPMS servers can be configured with this command. UDP port number can also be configured with this command. IPMS client will search for this IP address to push the event and traffic logs.

**Example**
The following command configures IPMS server having IP address 1.2.3.4 in the IPMS client service export the event and traffic logs for intelligent packet monitoring functionality. It also specifies the UDP port range from 48000 to 48005 for communication.

```
server address 1.2.3.4 start-port 48000 end-port 48005
```
source

This command configures the source address of IPMS client in this context to communicate with IPMS server. This is the IP address for IPMS client on the chassis.

**Product**
IPMS

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] source address ip_address
```

- **no**
  Removes the configured source IP address IPMS client from this context for communication with IPMS server.

- **address ip_address**
  Specifies the IP address of the IPMS client on the AGW in this context. This is the address which is bound to the IPMS client service in this context.
  *ip_address* must be an IP v4 address in dotted decimal notation.

**Usage**
Monitor subscribers which have complaints of service availability or to monitor a test user for system verification.

**Example**
The following command assigns the IP address 1.2.3.4 to the IPMS client service in context to communicate with IPMS server. This is the IP address allocated for IPMS client service on chassis.

```
source address 1.2.3.4
```
Chapter 131
IPSec Transform Set Configuration Mode Commands

The IPSec Transform Set Configuration Mode is used to configure IPsec security parameters. There are two core protocols, the Authentication Header (AH) and Encapsulating Security Payload (ESP). AH may be considered redundant as ESP can provide the same authentication services that AH does.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
default

Set or restore the default mode for a given parameter

Product  
PDIF

Privilege  
Security Administrator, Administrator

Syntax

default { encryption | group | hmac | mode }

default { encryption | group | hmac | mode }

Set the defaults for the IPSec transform-set as follows:

- **encryption**: Default Child SA IPSec ESP algorithm is AES-CBC-128
- **group**: Default Diffie-Hellman group algorithm is none. This also deactivates PFS.
- **hmac**: Default Child SA IPSec hashing algorithm is SHA1-96.
- **mode**: Default Child SA IPSec Mode is Tunnel.

Usage

Defines the default values for the Child SA IPSec transform-set.

Example

Use the following configuration to set the default mode to Tunnel:

default mode
encryption

Configures the appropriate IPsec ESP encryption algorithm and encryption key length. AES-CBC-128 is the default.

Product
PDIF

Privilege
Security Administrator, Administrator

Syntax

```plaintext
encryption { 3des-cbc | aes-cbc-128 | aes-cbc-256 | des-cbc | null }
default encryption
```

3des-cbc

“Triple DES.” Data Encryption Standard Cipher Block Chaining encryption applied to the message three times using three different cipher keys.

aes-cbc-128

Advanced Encryption Standard Cipher Block Chaining with a key length of 128 bits. This is the default setting for this command.

aes-cbc-256

Advanced Encryption Standard Cipher Block Chaining with a key length of 256 bits.

des-cbc

null

The NULL encryption algorithm represents the optional use of applying encryption within ESP. ESP can then be used to provide authentication and integrity without confidentiality.

Usage
In cipher block cryptography, the plaintext is broken into blocks usually of 64 or 128 bits in length. In cipher block chaining (CBC) each encrypted block is chained into the next block of plaintext to be encrypted. A randomly generated vector is applied to the first block of plaintext in lieu of an encrypted block. CBC provides confidentiality, but not message integrity.

Because RFC 4307 calls for interoperability between IPsec and IKEv2, the IKEv2 confidentiality algorithms must be the same as those configured for IPsec in order for there to be an acceptable match during the IKE message exchange. In IKEv2, there is no NULL option.

Example
The following command configures the encryption to be the default aes-cbc-128:
default encryption
end

Exits the current mode and returns to the Exec Mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Change the mode back to the Exec Mode.
exit

Exits the current mode and returns to the previous mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
exit
```

**Usage**

Returns to the previous mode.
group

Configure the appropriate key exchange cryptographic strength and activate Perfect Forward Secrecy by applying a Diffie-Hellman group.

Product
PDIF

Privilege
Security Administrator, Administrator

Syntax

```
group { 1 | 2 | 5 | 14 | none }
default group
```

- **default group**
  Configures the default crypto strength to be `none` and disables Perfect Forward Secrecy.

- **1**
  Configures crypto strength at the Group 1 level. Lowest security.

- **2**
  Configures crypto strength at the Group 2 level. Medium security.

- **5**
  Configures crypto strength at the Group 5 level. Higher security.

- **14**
  Configures crypto strength at the Group 14 level. Highest security.

- **none**
  Applies no group and disables Perfect Forward Secrecy. This is the default.

Usage

Diffie-Hellman groups are used to determine the length of the base prime numbers used during the key exchange process. The cryptographic strength of any key derived depends, in part, on the strength of the Diffie-Hellman group upon which the prime numbers are based.

Group 1 provides 768 bits of keying strength, Group 2 provides 1024 bits, Group 5 provides 1536 bits and Group 14 2048 bits. Selecting a group automatically activates Perfect Forward Secrecy. The default value is `none`, which disables PFS.

Example

This command configures security at Group 2 and activates PFS:
group 2
**hmac**

Configures the IPsec ESP integrity algorithm.

**Product**

PDIF

**Privilege**

Security Administrator, Administrator

**Syntax**

```
hmac { md5-96 | sha1-96 | null }
default hmac
```

**default**

Configures the default hmac value of sha1-96.

**md5-96**

MD5-96 uses a 128-bit secret key and produces a 128-bit authenticator value.

**sha1-96**

SHA-1 uses a 160-bit secret key and produces a 160-bit authenticator value.

This is the default setting for this command.

**null**

Configures the hmac value to be null. The NULL encryption algorithm represents the optional use of applying encryption within ESP. ESP can then be used to provide authentication and integrity without confidentiality.

**Usage**

HMAC is an encryption technique used by IPsec to make sure that a message has not been altered. A keyed-Hash Message Authentication Code, or HMAC, is a type of message authentication code (MAC) calculated using a cryptographic hash function in combination with a secret key to verify both data integrity and message authenticity. A hash takes a message of any size and transforms it into a message of a fixed size: the authenticator value. This is truncated to 96 bits and transmitted. The authenticator value is reconstituted by the receiver and the first 96 bits are compared for a 100 percent match. Because RFC 4306 calls for interoperability between IPsec and IKEv2, the IKEv2 integrity algorithms must be the same as those configured for IPsec in order for there to be an acceptable match during the IKE message exchange.

**Example**

The following command configures the default HMAC value (SHA1-96):

```
default hmac
```
hmac
mode

Configures the security of IP datagrams based on header placement. Tunnel mode applies security to a completely encapsulated IP datagram, while Transport does not. Default is Tunnel mode.

**Product**
PDIF

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
mode { transport | tunnel }
default mode
```

**transport**

In Transport mode, the IPSec header is applied only over the IP payload, not over the IP header in front of it. The AH and/or ESP headers appear between the original IP header and the IP payload, as follows:
Original IP header, IPSec headers (AH and/or ESP), IP payload (including transport header).
Transport mode is used for host-to-host communications and is generally unsuited to PDIF traffic.

**tunnel**

In Tunnel mode, the original IP header is left intact, so a complete IP datagram is encapsulated, forming a virtual tunnel between IPSec-capable devices. The IP datagram is passed to IPSec, where a new IP header is created ahead of the AH and/or ESP IPSec headers, as follows:
New IP header, IPSec headers (AH and/or ESP), old IP header, IP payload.
Tunnel mode is used for network-to-network communications (secure tunnels between routers) or host-to-network and host-to-host communications over the Internet.
This is the default setting for this command.

**Usage**

IPSec modes are closely related to the function of the two core protocols, the Authentication Header (AH) and Encapsulating Security Payload (ESP). Both of these protocols provide protection by adding to a datagram a header (and possibly other fields) containing security information. The choice of mode does not affect the method by which each generates its header, but rather, changes what specific parts of the IP datagram are protected and how the headers are arranged to accomplish this.

**Example**
The following command configures the default Tunnel mode:

```plaintext
default mode
```
Chapter 132
IPSG RADIUS Server Configuration Mode Commands

The IP Services Gateway (IPSG) RADIUS Server Configuration Mode is used to create and configure IPSG services within the current system context. The IPSG RADIUS Server Mode configures the system to receive RADIUS accounting requests as if it is a RADIUS Accounting Server, and reply after accessing those requests for user information.

```
Exec Mode
  configure
    Global Configuration Mode
      context name
        Context Configuration Mode
          ipsg-service name mode radius-server
            IPSG RADIUS Server Config Mode
```

**Important**: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
bind

bind

Binds the IPSG RADIUS Server service to a logical AAA interface and specifies the number of allowed subscriber sessions.

Product
IPSG

Privilege
Security Administrator, Administrator

Syntax

```
bind { accounting-proxy address address | address address } [ max-subscribers num | port num | source-context name ]
bind authentication-proxy address address [ acct-port port | auth-port port | max-subscribers num | source-context name ]
```

```
no bind
```

no

Removes the binding for the service.

```
accounting-proxy address address | address address } [ max-subscribers num | port num | source-context name ]
```

accounting-proxy address address: Specifies IP address of the interface where accounting proxy requests are received by this service. address must be specified using standard IPv4 or IPv6 dotted decimal notation.

address address: Specifies IP address of the interface where accounting requests are received by this service. address must be specified using standard IPv4 or IPv6 dotted decimal notation.

max-subscribers num: Specifies the maximum number of subscriber sessions allowed for the service. If this option is not configured, the system defaults to the license limit.

In Release 8.x, num must be an integer from 0 through 300000.
In Release 9.x and later, num must be an integer from 0 through 4000000.

port num: Default: 1813. Specifies the port number of the interface where accounting requests are received by this service. num must be an integer from 0 through 65535.

source-context name: Specifies the source context where RADIUS accounting requests are received. name must be an alpha and/or numeric string of 1 through 79 characters in length. This keyword should be configured if the source of the RADIUS requests is in a different context than the IPSG service. If this keyword is not configured, the system will default to the context in which the IPSG service is configured.

```
authentication-proxy address address [ acct-port port | auth-port port | max-subscribers num | source-context name ]
```

authentication-proxy address address: Specifies the IP address of the interface where authentication proxy requests are received by this service. address must be specified using standard IPv4 or IPv6 dotted decimal notation.
Important: Enabling authentication proxy also enables accounting proxy.

```
acct-port port: Default: 1813. Specifies the port number of the interface where accounting proxy requests are received by this service. port must be an integer from 0 through 65535.
auth-port port: Default: 1812. Specifies the port number of the interface where authentication proxy requests are received by this service. port must be an integer from 0 through 65535.
max-subscribers num: Specifies the maximum number of subscriber sessions allowed for the service. If this option is not configured, the system defaults to the license limit. In Release 8.x, num must be an integer from 0 through 3000000. In Release and 9.0 later, num must be an integer from 0 through 4000000.
source-context name: Specifies the source context where RADIUS accounting requests are received. name must be an alpha and/or numeric string of 1 through 79 characters in length. This keyword should be configured if the source of the RADIUS requests is in a different context than the IPSG service. If this keyword is not configured, the system will default to the context in which the IPSG service is configured.
```

Usage

Use this command to bind the IPSG RADIUS Server service to a logical AAA interface and specify the number of allowed subscriber sessions. If the AAA interface is not located in this context, configure the source-context parameter.

Use the accounting and authentication proxy settings to enable RADIUS proxy server functionality on the IPSG. These commands are used when the NAS providing the RADIUS request messages is incapable of sending them to two separate devices. The IPSG in RADIUS Server mode proxies the RADIUS request and response messages while performing the user identification task in order to provide services to the session.

Example

The following command binds the service to a AAA interface with and IP address of 1.2.3.4 located in the source context named aaa_ingress:

```
bind address 1.2.3.4 source-context aaa_ingress
```
connection authorization

Sets the RADIUS authorization password that must be matched by the RADIUS accounting requests received by this service.

**Product**  
IPSG

**Privilege**  
Security Administrator, Administrator

**Syntax**

```
connection authorization { [ encrypted ] password password }
```

```
no connection authorization
```

- `encrypted`: Indicates that the received RADIUS authorization password is encrypted.
- `password`: Specifies the password that must be matched by incoming RADIUS accounting requests. `password` must be an alpha and/or numeric string of 1 through 63 characters in length.

**Usage**

The IPSG RADIUS server service does not terminate RADIUS user authentication so the user password is unknown. Use this command to configure the authorization password that the RADIUS accounting requests must match in order for the service to examine and extract user information.

**Example**

The following command sets the RADIUS authorization password that must be matched by the RADIUS accounting requests sent to this service. The password must be encrypted and the example provided is the word “secret”.

```
connection authorization encrypted password secret
```
end

Exits the current mode and returns to the Exec Mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to change to the Exec Mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
profile

Configures the service to use APN or subscriber profiles.

Product
IPSG

Privilege
Security Administrator, Administrator

Syntax

profile { APN | subscriber }

default profile

<table>
<thead>
<tr>
<th>APN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sets the service to support APN configuration required to enable Gx support. This is the default setting for this command.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>subscriber</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sets the service to support subscriber profile lookup.</td>
</tr>
</tbody>
</table>

Usage

Use this command to set the service to support APN profiles (supporting Gx through the enabling of `ims-auth-service`) or for basic subscriber profile lookup.
radius accounting

Specifies the IP address and shared secret of the RADIUS accounting client from which RADIUS accounting requests are received. The RADIUS client can be either the access gateway or the RADIUS accounting server depending on which device is sending accounting requests.

Product
IPSG

Privilege
Security Administrator, Administrator

Syntax

```
radius accounting { { client { ip_address | ip_address/mask } [ encrypted ] key secret [ dictionary dictionary ] [ disconnect-message { dest-port destination_port } ] } } | { interim create-new-call } }

no radius accounting client { ip_address | ip_address/mask }

default radius accounting interim create-new-call
```

- **no**
  Removes the RADIUS accounting client address identifier from the service.

- **ip_address | ip_address/mask**
  Specifies the IP address and, optionally, subnet mask of the RADIUS client from which RADIUS accounting requests are received. `ip_address` and `ip_address/mask` must be specified using standard IPv4 or IPv6 dotted decimal notation. Up to 16 addresses can be configured.

- **dictionary dictionary**
  Specifies what dictionary database to use. The possible values for `db` are described in the following table:

<table>
<thead>
<tr>
<th>Dictionary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3gpp2</td>
<td>This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835-A.</td>
</tr>
<tr>
<td>3gpp2-835</td>
<td>This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835.</td>
</tr>
<tr>
<td>custom(x)</td>
<td>These are dictionaries that can be customized to fit your needs. Customization information can be attained by contacting your local service representative. (x) is the integer value of the custom dictionary.</td>
</tr>
<tr>
<td>standard</td>
<td>This dictionary consists only of the attributes specified in RFC 2865, RFC 2866, and RFC 2869.</td>
</tr>
<tr>
<td>Dictionary</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>starent</td>
<td>This dictionary consists of all of the attributes in the starent-vsa1 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the dictionaries supported by the system.</td>
</tr>
<tr>
<td>starent-835</td>
<td>This dictionary consists of all of the attributes in the starent-vsa1-835 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the -835 dictionaries supported by the system.</td>
</tr>
<tr>
<td>starent-vsa1</td>
<td>This dictionary consists not only of the 3gpp2 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0 - 255). This is the default dictionary.</td>
</tr>
<tr>
<td>starent-vsa1-835</td>
<td>This dictionary consists not only of the 3gpp2-835 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0 - 255). This is the default dictionary.</td>
</tr>
</tbody>
</table>

```
[ encrypted ] key secret
```

**encrypted**: Specifies that the shared key between the RADIUS client and this service is encrypted.

**key secret**: Specifies the shared key between the RADIUS client and this service. **secret** must be an alpha and/or numeric string of 1 through 127 characters in length, and is case sensitive.

```
disconnect-message [ dest-port destination_port ]
```

Specifies sending disconnect message.

**dest-port destination_port**: Optionally, the port number to which the disconnect message must be sent can be specified.

**destination_port** must be an integer from 1 through 65535.

```
interim create-new-call
```

Default: disabled

Enables the ability to create a new session upon receipt of a RADIUS interim message.

**Usage**

Use this command to configure the communication with the RADIUS client from which RADIUS accounting requests are received.

**Example**

The following command configures the service to communicate with a RADIUS client with an IP address of 1.2.3.4 and an encrypted shared secret of **secret_1234**:

```
radius accounting client 1.2.3.4 encrypted key secret_1234
```
radius dictionary

Configures the RADIUS database dictionary to use for the IPSG service.

**Product**
IPSG

**Privilege**
Security Administrator, Administrator

**Syntax**

```
radius dictionary db
```

default radius dictionary

dictionary db
Default: starent-vsa1
Specifies what dictionary database to use. The possible values for db are described in the table that follows:

**Table 26.**

<table>
<thead>
<tr>
<th>Dictionary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3gpp2</td>
<td>This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835-A.</td>
</tr>
<tr>
<td>3gpp2-835</td>
<td>This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835.</td>
</tr>
<tr>
<td>customXX</td>
<td>These are dictionaries that can be customized to fit your needs. Customization information can be attained by contacting your local service representative. XX is the integer value of the custom dictionary.</td>
</tr>
<tr>
<td>standard</td>
<td>This dictionary consists only of the attributes specified in RFC 2865, RFC 2866, and RFC 2869.</td>
</tr>
<tr>
<td>starent</td>
<td>This dictionary consists of all of the attributes in the starent-vsa1 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the dictionaries supported by the system.</td>
</tr>
<tr>
<td>starent-835</td>
<td>This dictionary consists of all of the attributes in the starent-vsa1-835 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the -835 dictionaries supported by the system.</td>
</tr>
<tr>
<td>starent-vsa1</td>
<td>This dictionary consists not only of the 3gpp2 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0-255). This is the default dictionary.</td>
</tr>
<tr>
<td>starent-vsa1-835</td>
<td>This dictionary consists not only of the 3gpp2-835 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0-255). This is the default dictionary.</td>
</tr>
</tbody>
</table>
radius dictionary

Usage
Use this command to specify the RADIUS database dictionary to use for the IPSG service.

Example
The following command configures the IPSG service to use the custom10 RADIUS database dictionary:

radius dictionary custom10
setup-timeout

Configures a timeout value for IPSG session set up attempts.

**Product**
IPSG

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
setup-timeout seconds

default setup-timeout

seconds
```

Default: 60

Specifies the time period, in seconds, the IPSG session setup is allowed to continue before the set up attempt is terminated. `seconds` must be an integer from 1 through 100000.

**Usage**

Use this command to prevent IPSG session set up attempts from continuing without termination.

**Example**

The following command sets the session set up timeout to 20 seconds:

```plaintext
setup-timeout 20
```
Chapter 133
IPSG RADIUS Snoop Configuration Mode Commands

The IP Services Gateway (IPSG) RADIUS Snoop Configuration Mode is used to create and configure IPSG services within the current system context. The IPSG RADIUS Snoop Mode configures the system to inspect RADIUS accounting requests on the way to the RADIUS accounting server and extract user information.

```
Exec Mode
configure
Global Configuration Mode
context name
Context Configuration Mode
ipsg-service name mode radius-snoop
IPSG RADIUS Snoop Config Mode
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
bind

Configures the service to accept data on any interface configured in the context. Optionally allows the system to limit the number of sessions processed by this service.

Product
IPSG

Privilege
Security Administrator, Administrator

Syntax

bind [ max-subscribers num ]

no bind

no
Removes the binding for the service.

max-subscribers num

Specifies the maximum number of subscriber sessions allowed for the service. If this option is not configured, the system defaults to the license limit.
In Release 8.x, on an ASR 5000 chassis, num must be an integer from 0 through 3000000.
In Release 9.0 and later, num must be an integer from 0 through 4000000.

Usage
Use this command to initiate the service and begin accepting data on any interface configured in the context.

Example
The following command prepares the system to receive subscriber sessions on any interface in the context and limits the sessions to 10000:

bind max-subscribers 10000
connection authorization

Sets the RADIUS authorization password that must be matched by the RADIUS accounting requests “snooped” by this service.

**Product**
IPSG

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
connection authorization { [ encrypted ] password password }
no connection authorization
```

- **no**
  
  Removes the RADIUS authorization for the IPSG RADIUS snoop service.

- **[ encrypted ] password password**
  
  encrypted: Indicates that the received RADIUS authorization password is encrypted.
  
  password: Specifies the password that must be matched by incoming RADIUS accounting requests.
  
  password must be an alpha and/or numeric string of 1 through 63 characters in length.

**Usage**

RADIUS accounting requests being examined by the IPSG RADIUS snoop service are destined for a RADIUS Accounting Server. Since the “snoop” service does not terminate user authentication, the user password is unknown.

Use this command to configure the authorization password that the RADIUS accounting requests must match in order for the service to examine and extract user information.

**Example**

The following command sets the RADIUS authorization password that must be matched by the RADIUS accounting requests “snooped” by this service. The password must be encrypted and the example provided is the word “secret”.

```plaintext
connection authorization encrypted password secret
```
end

Exits the current mode and returns to the Exec Mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to change to the Exec Mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to returns to the parent configuration mode.
radius

Specifies RADIUS Accounting Servers where accounting requests are sent after being “inspected” by this service.

Product
IPSG

Privilege
Security Administrator, Administrator

Syntax

[ no ] radius { accounting server address [ port num | source-context name ] |
dictionary { 3gpp2 | 3gpp2-835 | customXX | standard | starent | starent-835 |
starent-vsa1 | starent-vsa1-835 } }

no
Removes the RADIUS accounting server identifier from this service.

radius accounting server address

Specifies the IP address of a RADIUS Accounting Server where accounting requests are sent after being “snooped” by this service. address must be specified using standard IPv4 or IPv6 dotted decimal notation and must be a valid IP address.
Up to 16 addresses can be configured.

port num

Default: 1813
Specifies the port number of the RADIUS Accounting Server where accounting requests are sent after being “snooped” by this service.
num must be an integer from 0 through 65535.

source-context name

Specifies the source context where RADIUS accounting requests are received.
name must be an alpha and/or numeric string of 1 through 79 characters in length.
If this keyword is not configured, the system will default to the context in which the IPSG service is configured.

dictionary { 3gpp2 | 3gpp2-835 | customXX | standard | starent |
starent-835 | starent-vsa1 | starent-vsa1-835 }

Specifies what dictionary database to use. The possible values are described in the following table:

Table 27.

<table>
<thead>
<tr>
<th>Dictionary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3gpp</td>
<td>This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in 3GPP 32.015.</td>
</tr>
<tr>
<td>Dictionary</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>3gpp2</td>
<td>This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835-A.</td>
</tr>
<tr>
<td>3gpp2-835</td>
<td>This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835.</td>
</tr>
<tr>
<td>customXX</td>
<td>These are dictionaries that can be customized to fit your needs. Customization information can be attained by contacting your local service representative. XX is the integer value of the custom dictionary.</td>
</tr>
<tr>
<td>standard</td>
<td>This dictionary consists only of the attributes specified in RFC 2865, RFC 2866, and RFC 2869.</td>
</tr>
<tr>
<td>starent</td>
<td>This dictionary consists of all of the attributes in the starent-vsa1 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the dictionaries supported by the system.</td>
</tr>
<tr>
<td>starent-835</td>
<td>This dictionary consists of all of the attributes in the starent-vsa1-835 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the -835 dictionaries supported by the system.</td>
</tr>
<tr>
<td>starent-vsa1</td>
<td>This dictionary consists not only of the 3gpp2 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0 - 255). This is the default dictionary.</td>
</tr>
<tr>
<td>starent-vsa1-835</td>
<td>This dictionary consists not only of the 3gpp2-835 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0 - 255). This is the default dictionary.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to specify the RADIUS Accounting Servers where accounting requests are sent after being snooped by this service.

**Example**

The following command specifies the IP address (1.2.3.4) of a RADIUS Accounting Server whose accounting requests are to be “snooped”, and the source context (aaa_ingress) where the requests are received on the system:

```
radius accounting server 1.2.3.4 source-context aaa_ingress
```
setup-timeout

Configures a timeout value for IPSG session setup attempts.

Product
IPSG

Privilege
Security Administrator, Administrator

Syntax

```
setup-timeout seconds

default setup-timeout

seconds

Default: 60
Specifications the period of time, in seconds, the IPSG session setup is allowed to continue before the setup attempt is terminated.

seconds must be an integer from 1 through 100000.
```

Usage
Use this command to prevent IPSG session setup attempts from continuing without termination.

Example
The following command sets the session setup timeout to 20 seconds:

```
setup-timeout 20
```
Chapter 134
IPSP Configuration Mode Commands

The IPSP Configuration Mode is used to configure properties for the IP pool sharing protocol (IPSP).

Important: For information on configuring and using IPSP refer to the System Administration and Configuration Guide.
dead-interval

Configures the retry time to connect to the remote system for the IP Pool Sharing Protocol.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax

`dead-interval seconds`

`[ no | default ] dead-interval`

no
Disables the dead interval. On loss of connectivity to the remote system, no retries are attempted and the remote system is marked dead immediately on failure.

default
Resets the dead interval to the default of 3600 seconds.

seconds
Default: 3600 seconds
The amount of time in seconds to wait before retrying the remote system. `seconds` must be an integer from 25 through 259200.

Usage
Use this command to set the amount of time to wait before retrying to connect with the remote system for the IP pool sharing protocol.

Example
Use the following command to set the interval to 180 seconds (3 minutes):

dead-interval 180
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
- PDSN, HA

**Privilege**
- Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Return to the Exec mode.
exit

Exits the current configuration mode and returns to the context configuration mode.

**Product**

PDNS, HA

**Privilege**

Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Return to the context configuration mode.
reserved-free-percentage

This command is used to set the amount of free addresses reserved for use on the primary HA.

Product
PDSN, HA

Privilege
Security Administrator, Administrator

Syntax

reserved-free-percentage value

default reserved-free-percentage

value
Default: 100

value specifies the percentage of free addresses reserved for the use on the primary HA for IP pool sharing during upgrade.

Usage
This command is used with pool-sharing-protocol active mode on primary HA. Before using this command, pool-sharing-protocol in Ethernet Interface Configuration Mode must be configured.

For more information, refer to the Ethernet Interface Configuration Mode Commands chapter in this guide.

Example
To reserve 40 percent of free addresses in primary HA for IP pool sharing, enter the following command:

reserved-free-percentage 40
Chapter 135
IPv6 ACL Configuration Mode Commands

The IPv6 Access Control List Configuration Mode is used to create and manage IPv6 access privileges.
deny/permit

The following commands set access permissions based on various parameters:
deny/permit (by source IP address masking)

Used to filter subscriber sessions based on the IPv6 address mask sent by the source to the mobile node or the network.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
{ deny | permit } [ log ] source_address source_wildcard
after { deny | permit } [ log ] source_address source_wildcard
before { deny | permit } [ log ] source_address source_wildcard
no { deny | permit } [ log ] source_address source_wildcard
```

**after**
Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**before**
Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**no**
Removes the rule which exactly matches the options specified.

**deny | permit**
Specifies the rule is either block (deny) or an allow (permit) filter.
**deny:** indicates the rule, when matched, drops the corresponding packets.
**permit:** indicates the rule, when matched, allows the corresponding packets.

**log**
Default: packets are not logged.
Indicates all packets which match the filter are to be logged.
deny/permit (by source IP address masking)

**source_address**

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the source wildcard parameter.

**sourceWildcard**

This option is used in conjunction with the source_address option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

**Usage**

Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rules as it does not require a rule for each source and destination pair.

**Important:** The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.
deny/permit (any)

Used to filter subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Product
All

Privilege
Security Administrator, Administrator

Syntax

\[
\text{deny/permit (any)} \quad \text{[ log ] any}
\]

\text{after (deny | permit) [ log ] any}

\text{before (deny | permit) [ log ] any}

\text{no (deny | permit) [ log ] any}

\text{after}
Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

\text{Important: If the options specified do not exactly match an existing rule, the insertion point does not change.}

\text{before}
Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

\text{Important: If the options specified do not exactly match an existing rule, the insertion point does not change.}

\text{no}
Removes the rule which exactly matches the options specified.

\text{deny | permit}
Specifies the rule is either block (deny) or an allow (permit) filter.
\text{deny}: indicates the rule, when matched, drops the corresponding packets.
\text{permit}: indicates the rule, when matched, allows the corresponding packets.

\text{log}
Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

**any**

Indicates all packets will match the filter regardless of source and/or destination.

---

**Usage**

Define a catch all rule to place at the end of the list of rules.

---

**Important:** It is suggested that any rule which is added to be a catch all should also have the `log` option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security. The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.

---

**Example**

The following command defines two rules with the second logging filtered packets.

```
permit any deny log any
```

The following sets the insertion point to before the first rule defined above.

```
before permit any
```

The following command sets the insertion point after the second rule defined above.

```
after deny log any
```

The following deletes the first rule defined above.

```
no permit any
```
deny/permit (by host IP address)

Used to filter subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
{ deny | permit } [ log ] host source_host_address
after { deny | permit } [ log ] host source_host_address
before { deny | permit } [ log ] host source_host_address
no { deny | permit } [ log ] host source_host_address
```

**after**
Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**before**
Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**no**
Removes the rule which exactly matches the options specified.

**deny | permit**
Specifies the rule is either block (deny) or an allow (permit) filter.
**deny**: indicates the rule, when matched, drops the corresponding packets.
**permit**: indicates the rule, when matched, allows the corresponding packets.

**log**
Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

Usage

Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.
deny/permit (by source ICMP packets)

Used to filter subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
{ deny | permit } [ log ] icmp { source_address source wildcard | any |
hostsource_host_address } { dest_address dest wildcard | any |
hostdest_host_address } [ icmp_type [ icmp_code ] ]
```

```
after { deny | permit } [ log ] icmp { source_address source wildcard | any |
hostsource_host_address } { dest_address dest wildcard | any |
hostdest_host_address } [ icmp_type [ icmp_code ] ]
```

```
before { deny | permit } [ log ] icmp { source_address source wildcard | any |
hostsource_host_address } { dest_address dest wildcard | any |
hostdest_host_address } [ icmp_type [ icmp_code ] ]
```

```
no { deny | permit } [ log ] icmp { source_address source wildcard | any |
hostsource_host_address } { dest_address dest wildcard | any |
hostdest_host_address } [ icmp_type [ icmp_code ] ]
```

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

```
no
```

Removes the rule which exactly matches the options specified.
deny | permit
Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: indicates the rule, when matched, drops the corresponding packets.
- **permit**: indicates the rule, when matched, allows the corresponding packets.

log
Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address
The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the `source_wildcard` parameter.

source_wildcard
This option is used in conjunction with the `source_address` option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

any
Specifies that the rule applies to all packets.

host
Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address
The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address
The IP address of the destination host to filter against expressed in IPv6 colon notation.

dest_address
The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the `dest_wildcard` parameter.
**deny/permit (by source ICMP packets)**

- **dest_wildcard**
  
  This option is used in conjunction with the `dest_address` option to specify a group of addresses for which packets are to be filtered. The mask must be entered as a complement:
  - Zero-bits in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be identical.
  - One-bits in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

- **icmp_type**
  
  Specifies that all ICMP packets of a particular type are to be filtered. The type can be any integer value between 0 and 255.

- **icmp_code**
  
  Specifies that all ICMP packets of a particular code are to be filtered. The type can be any integer value between 0 and 255.

**Usage**

Define a rule to block ICMP packets which can be used for address resolution and possible be a security risk. The IP filtering allows flexible controls for pairs of individual hosts or groups by IP masking which allows the filtering of entire subnets if necessary.

**Important:** The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.
deny/permit (by IP packets)

Used to filter subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

\[
\begin{align*}
\text{deny | permit | log | ip} & \{ \text{source_address source_wildcard | any} | \\
& \text{hostsource_host_address} \} \{ \text{dest_address dest_wildcard | any} | \\
& \text{hostdest_host_address} \} [ \text{fragment} | \text{protocol num} ] \\
\text{after} & \{ \text{deny | permit | log | ip} \{ \text{source_address source_wildcard | any} | \\
& \text{hostsource_host_address} \} \{ \text{dest_address dest_wildcard | any} | \\
& \text{hostdest_host_address} \} [ \text{fragment} | \text{protocol num} ] \\
\text{before} & \{ \text{deny | permit | log | ip} \{ \text{source_address source_wildcard | any} | \\
& \text{hostsource_host_address} \} \{ \text{dest_address dest_wildcard | any} | \\
& \text{hostdest_host_address} \} [ \text{fragment} | \text{protocol num} ] \\
\text{no} & \{ \text{deny | permit | log | ip} \{ \text{source_address source_wildcard | any} | \\
& \text{hostsource_host_address} \} \{ \text{dest_address dest_wildcard | any} | \\
& \text{hostdest_host_address} \} [ \text{fragment} | \text{protocol num} ] \\
\end{align*}
\]

**after**
Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed. This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**before**
Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed. This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**no**
Removes the rule which exactly matches the options specified.
deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.
deny: indicates the rule, when matched, drops the corresponding packets.
permit: indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the sourceWildcard parameter.

sourceWildcard

This option is used in conjunction with the source_address option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the destWildcard parameter.
**deny/permit (by IP packets)**

**dest_wildcard**

This option is used in conjunction with the `dest_address` option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

**fragment**

Indicates packet filtering is to be applied to IP packet fragments only.

**protocol num**

Indicates that the packet filtering is to be applied to a specific protocol number.

`num` can be any integer ranging from 0 to 255.

**Usage**

Block IP packets when the source and destination are of interest.

**Important:** The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.
deny/permit (by TCP/UDP packets)

Used to filter subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```plaintext
{ deny | permit } [ log ] { tcp | udp } { { source_address source wildcard | any | hostsource_host_address } [ eqsource_port | gtsource_port | ltsource_port | neqsource_port ] } { { dest_address dest wildcard | any | hostdest_host_address } [ eqdest_port | gtdest_port | ltdest_port | neqdest_port ] }
```

```plaintext
after { deny | permit } [ log ] { tcp | udp } { { source_address source wildcard | any | hostsource_host_address } [ eqsource_port | gtsource_port | ltsource_port | neqsource_port ] } { { dest_address dest wildcard | any | hostdest_host_address } [ eqdest_port | gtdest_port | ltdest_port | neqdest_port ] }
```

```plaintext
before { deny | permit } [ log ] { tcp | udp } { { source_address source wildcard | any | hostsource_host_address } [ eqsource_port | gtsource_host_port | ltsource_port | neqsource_port ] } { { dest_address dest wildcard | any | hostdest_host_address } [ eqdest_port | gtdest_port | ltdest_port | neqdest_port ] }
```

```plaintext
no { deny | permit } [ log ] { tcp | udp } { { source_address source wildcard | any | hostsource_host_address } [ eqsource_port | gtsource_port | ltsource_port | neqsource_port ] } { { dest_address dest wildcard | any | hostdest_host_address } [ eqdest_port | gtdest_port | ltdest_port | neqdest_port ] }
```

**after**

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**before**

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.
**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**source_host_address**
The IP address of the source host to filter against expressed in IPv6 colon notation.

**dest_host_address**
The IP address of the destination host to filter against expressed in IPv6 colon notation.

**eq source_port**
Specifies a single, specific source TCP port number to be filtered. 
*source_port* must be configured to any integer value from 0 to 65535.

**gt source_port**
Specifies that all source TCP port numbers greater than the one specified are to be filtered. 
*source_port* must be configured to any integer value from 0 to 65535.

**lt source_port**
Specifies that all source TCP port numbers less than the one specified are to be filtered. 
*source_port* must be configured to any integer value from 0 to 65535.

**neq source_port**
Specifies that all source TCP port numbers not equal to the one specified are to be filtered. 
*source_port* must be configured to any integer value from 0 to 65535.

**dest_address**
The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *destWildcard* parameter.

**destWildcard**
This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

**eq dest_port**
Specifies a single, specific destination TCP port number to be filtered. 
*dest_port* must be configured to any integer value from 0 to 65535.
### configure acl (by TCP/UDP packets)

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>gt dest_port</code></td>
<td>Specifies that all destination TCP port numbers greater than the one specified are to be filtered. <code>dest_port</code> must be configured to any integer value from 0 to 65535.</td>
</tr>
<tr>
<td><code>lt dest_port</code></td>
<td>Specifies that all destination TCP port numbers less than the one specified are to be filtered. <code>dest_port</code> must be configured to any integer value from 0 to 65535.</td>

<td>Specifies that all destination TCP port numbers not equal to the one specified are to be filtered. <code>dest_port</code> must be configured to any integer value from 0 to 65535.</td>
</tr>
</tbody>
</table>

**Usage**

Block IP packets when the source and destination are of interest but for only a limited set of ports.

**Important:** The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.
**end**

Exits the ACL configuration mode and returns to the Exec mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Change the mode back to the Exec mode.

**Example**

```
end
```
exit

Exits the ACL configuration mode and returns to the context configuration mode.

Privilege
Security Administrator, Administrator

Product
All

Syntax

```
exit
```

Usage
Return to the context configuration mode.

Example

```
exit
```
readdress server

Alter the destination address and port number in TCP or UDP packet headers to redirect packets to a different server.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
readdress server
```

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

```
before
```

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

```
no
```

Removes the rule which exactly matches the options specified.

```
redirect_address
```

The IP address to which the IP packets are redirected. TCP or UDP packet headers are rewritten to contain the new destination address. This must be an IPv6 address specified in either : or :: notation.

```
port port_no
```

The number of the port at the redirect address where the packets are sent. TCP or UDP packet headers are rewritten to contain the new destination port number.

```
tcp | udp
```

Specifies the redirect is to be applied to the IP based transmission control protocol or the user datagram protocol.

tcp: redirect applies to TCP packets.

udp: redirect applies to UDP packets.
source_address
The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then
be configured using the source_wildcard parameter.

any
Specifies that the rule applies to all packets.

host
Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address
The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address
The IP address of the destination host to filter against expressed in IPv6 colon notation.

eq source_port
Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to any integer value from 0 to 65535.

gt source_port
Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

lt source_port
Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

neq source_port
Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

dest_address
The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then
be configured using the dest_wildcard parameter.

eq dest_port
Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

gt dest_port
Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

<table>
<thead>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lt dest_port</td>
<td>Specifies that all destination TCP port numbers less than the one specified are to be filtered. dest_port must be configured to any integer value from 0 to 65535.</td>
</tr>
</tbody>
</table>

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information. Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
redirect context

The following commands redirect subscriber sessions to a different context based on various parameters:
redirect context (by IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

**Product**  
All

**Privilege**  
Security Administrator, Administrator

**Syntax**

- `redirect context context_id [ log ] source_address source_wildcard`
- `after redirect context context_id [ log ] source_address source_wildcard`
- `before redirect context context_id [ log ] source_address source_wildcard`
- `noredirect context context_id [ log ] source_address source_wildcard`

**after**

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**before**

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**no**

Removes the rule which exactly matches the options specified.

**context context_id**

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the `show context all` command to display context names and context IDs.

**log**

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.
redirect context (by IP address masking)

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the source wildcard parameter.

source wildcard

This option is used in conjunction with the source address option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the source address parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source address parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

Usage

Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of redirect rules as it does not require a rule for each source and destination pair.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information. Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
redirect context (any)

Used to redirect subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
redirect context context_id [ log ] any
after redirect context context_id [ log ] any
before redirect context context_id [ log ] any
no redirect context context_id [ log ] any
```

**after**
Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**before**
Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**no**
Removes the rule which exactly matches the options specified.

**context context_id**
The context identification number of the context to which packets are redirected. At the executive mode prompt, use the `show context all` command to display context names and context IDs.

**log**
Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.
any
Indicates all packets will match the redirect regardless of source and/or destination.

Usage
Define a catch all rule to place at the end of the list of rules to provide explicit handling of rules which do not fit any other criteria.

Important: It is suggested that any rule which is added to be a catch all should also have the log option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security. The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information. Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example
The following command defines a rule that redirects packets to the context with the context ID of 23 and any source IP.

```
redirect context 23 any
```

The following sets the insertion point to before the first rule defined above.

```
before redirect context 23 any
```

The following command sets the insertion point after the second rule defined above.

```
after redirect context 23 any
```

The following deletes the first rule defined above.

```
no redirect context 23 any
```
redirect context (by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Product
All

Privilege
Security Administrator, Administrator

Syntax

redirect context context_id [ log ] host source_ip_address
after redirect context context_id [ log ] host source_ip_address
before redirect context context_id [ log ] host source_ip_address
noredirect context context_id [ log ] host source_ip_address

**after**
Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**before**
Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**no**
Removes the rule which exactly matches the options specified.

**context context_id**
The context identification number of the context to which packets are redirected. At the executive mode prompt, use the `show context all` command to display context names and context IDs.

**log**
Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.
**host**

Specifies that the rule applies to a specific host as determined by its IP address.

**source_host_address**

The IP address of the source host to filter against expressed in IPv6 colon notation.

**Usage**

Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

**Important:** The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information. Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
redirect context (by source ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
redirect context context_id [ log ] icmp { source_address source_wildcard | any | hostsource_host_address } { dest_address dest_wildcard | any | hostdest_host_address } [ icmp_type [ icmp_code ] ]
```

```
after redirect context context_id [ log ] icmp { source_address source_wildcard | any | hostsource_host_address } { dest_address dest_wildcard | any | hostdest_host_address } [ icmp_type [ icmp_code ] ]
```

```
before redirect context context_id [ log ] icmp { source_address source_wildcard | any | hostsource_host_address } { dest_address dest_wildcard | any | hostdest_host_address } [ icmp_type [ icmp_code ] ]
```

```
no redirect context context_id [ log ] icmp { source_address source_wildcard | any | hostsource_host_address } { dest_address dest_wildcard | any | hostdest_host_address } [ icmp_type [ icmp_code ] ]
```

```
  after
  Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
  This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.
```

```
  Important: If the options specified do not exactly match an existing rule, the insertion point does not change.
```

```
  before
  Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
  This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.
```

```
  Important: If the options specified do not exactly match an existing rule, the insertion point does not change.
```

```
  no
  Removes the rule which exactly matches the options specified.
```
redirect context (by source ICMP packets)

context context_id
The context identification number of the context to which packets are redirected. At the executive mode prompt, use the show context all command to display context names and context IDs.

log
Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address
The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the sourceWildcard parameter.

sourceWildcard
This option is used in conjunction with the source_address option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be identical.

- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

any
Specifies that the rule applies to all packets.

host
Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address
The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address
The IP address of the destination host to filter against expressed in IPv6 colon notation.

dest_address
The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the destWildcard parameter.
**dest_wildcard**

This option is used in conjunction with the `dest_address` option to specify a group of addresses for which packets are to be filtered. The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

**icmp_type**

Specifies that all ICMP packets of a particular type are to be filtered. The type can be any integer value between 0 and 255.

**icmp_code**

Specifies that all ICMP packets of a particular code are to be filtered. The type can be any integer value between 0 and 255.

**Usage**

Define a rule to block ICMP packets which can be used for address resolution and possibly be a security risk. The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

**Important:** The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
redirect context (by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect context context_id [ log ] ip { source_address source_wildcard | any | hostsource_host_address } { dest_address dest_wildcard | any | hostdest_host_address } [ fragment ] [ protocol num ]

after redirect context context_id [ log ] ip { source_address source_wildcard | any | hostsource_host_address } { dest_address dest_wildcard | any | hostdest_host_address } [ fragment ] [ protocol num ]

before redirect context context_id [ log ] ip { source_address source_wildcard | any | hostsource_host_address } { dest_address dest_wildcard | any | hostdest_host_address } [ fragment ] [ protocol num ]

no redirect context context_id [ log ] ip { source_address source_wildcard | any | hostsource_host_address } { dest_address dest_wildcard | any | hostdst_host_address } [ fragment ] [ protocol num ]
```

**after**

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**before**

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**no**

Removes the rule which exactly matches the options specified.
**context context_id**

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the `show context all` command to display context names and context IDs.

**log**

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

**source_address**

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the `source_wildcard` parameter.

**source_wildcard**

This option is used in conjunction with the `source_address` option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be ignored.

**Important**: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

**any**

Specifies that the rule applies to all packets.

**host**

Specifies that the rule applies to a specific host as determined by its IP address.

**source_host_address**

The IP address of the source host to filter against expressed in IPv6 colon notation.

**dest_host_address**

The IP address of the destination host to filter against expressed in IPv6 colon notation.

**dest_address**

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the `dest_wildcard` parameter.
dest wildcard
This option is used in conjunction with the dest_address option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:
• Zero-bits in this parameter mean that the corresponding bits configured for the dest_address parameter must be identical.
• One-bits in this parameter mean that the corresponding bits configured for the dest_address parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

fragment
Indicates packet redirection is to be applied to IP packet fragments only.

protocol num
Indicates that the packet filtering is to be applied to a specific protocol number.
num can be any integer ranging from 0 to 255.

Usage
Block IP packets when the source and destination are of interest.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information. Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
redirect context (by TCP/UDP packets)

Used to redirect subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```plaintext
redirect context context_id [ log ] { tcp | udp } { { source_address
gtsource_port | ltsource_port | neqsource_port } } { { dest_address
destWildcard | any | hostdest_host_address } [ eqdest_port | gtdest_port |
ltdest_port | neqdest_port ] }

after redirect context context_id [ log ] { tcp | udp } { { source_address
gtsource_port | ltsource_port | neqsource_port } } { { dest_address
destWildcard | any | hostdest_host_address } [ eqdest_port | gtdest_port |
ltdest_port | neqdest_port ] }

before redirect context context_id [ log ] { tcp | udp } { { source_address
gtsource_port | ltsource_port | neqsource_port } } { { dest_address
destWildcard | any | hostdest_host_address } [ eqdest_port | gtdest_port |
ltdest_port | neqdest_port ] }

noredirect context context_id [ log ] { tcp | udp } { { source_address
gtsource_port | ltsource_port | neqsource_port } } { { dest_address
defstWildcard | any | hostdest_host_address } [ eqdest_port | gtdest_port |
ltdest_port | neqdest_port ] }
```

**after**
Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

**before**
Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.
**Important:** If the options specified do not exactly match an existing rule, the insertion point does not change.

- **no**
  Removes the rule which exactly matches the options specified.

- **context context_id**
  The context identification number of the context to which packets are redirected. At the executive mode prompt, use the `show context all` command to display context names and context IDs.

- **log**
  Default: packets are not logged.
  Indicates all packets which match the redirect are to be logged.

- **tcp | udp**
  Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.
  - `tcp`: redirect applies to TPC packets.
  - `udp`: redirect applies to UDP packets.

- **source_address**
  The IP address(es) form which the packet originated.
  This option is used to filter all packets from a specific IP address or a group of IP addresses.
  When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the `source_wildcard` parameter.

- **source_wildcard**
  This option is used in conjunction with the `source_address` option to specify a group of addresses for which packets are to be filtered.
  The mask must be entered as a complement:
  - Zero-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be identical.
  - One-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

- **any**
  Specifies that the rule applies to all packets.

- **host**
  Specifies that the rule applies to a specific host as determined by its IP address.
IPv6 ACL Configuration Mode Commands

**source_host_address**
The IP address of the source host to filter against expressed in IPv6 colon notation.

**dest_host_address**
The IP address of the destination host to filter against expressed in IPv6 colon notation.

**eq source_port**
Specifies a single, specific source TCP port number to be filtered.
*source_port* must be configured to any integer value from 0 to 65535.

**gt source_port**
Specifies that all source TCP port numbers greater than the one specified are to be filtered.
*source_port* must be configured to any integer value from 0 to 65535.

**lt source_port**
Specifies that all source TCP port numbers less than the one specified are to be filtered.
*source_port* must be configured to any integer value from 0 to 65535.

**neq source_port**
Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
*source_port* must be configured to any integer value from 0 to 65535.

**dest_address**
The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *destWildcard* parameter.

**destWildcard**
This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

**eq dest_port**
Specifies a single, specific destination TCP port number to be filtered.
*dest_port* must be configured to any integer value from 0 to 65535.
**redirect context (by TCP/UDP packets)**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>gt dest_port</code></td>
<td>Specifies that all destination TCP port numbers greater than the one specified are to be filtered. <code>dest_port</code> must be configured to any integer value from 0 to 65535.</td>
</tr>
<tr>
<td><code>lt dest_port</code></td>
<td>Specifies that all destination TCP port numbers less than the one specified are to be filtered. <code>dest_port</code> must be configured to any integer value from 0 to 65535.</td>
</tr>
<tr>
<td><code>neq dest_port</code></td>
<td>Specifies that all destination TCP port numbers not equal to the one specified are to be filtered. <code>dest_port</code> must be configured to any integer value from 0 to 65535.</td>
</tr>
</tbody>
</table>

**Usage**

Block IP packets when the source and destination are of interest but for only a limited set of ports.

**Important:** The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information. Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

**Example**

The following command defines a rule that redirects packets to the context with the context ID of 23, and UDP packets coming from any host are matched.

```
redirect context 23 udp any
```

The following sets the insertion point to before the rule defined above.

```
before redirect context 23 udp any
```

The following command sets the insertion point after the rule defined above.

```
after redirect context 23 udp any
```

The following deletes the rule defined above.

```
no redirect context 23 udp any
```
redirect css delivery-sequence

This is a restricted command. In StarOS 9.0 and later, this command is obsoleted.
redirect css service

The following commands redirect subscriber sessions to Content Service Steering (CSS) services based on various parameters:
**redirect css service (any)**

Used to redirect subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
redirect css service svc_name[ log] any
before redirect css service svc_name[ log] any
after redirect css service svc_name[ log] any
no redirect css service svc_name[ log] any
```

**after**
Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**before**
Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definitions which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**no**
Removes the rule definition which exactly matches the options specified.

**css service svc_name**
The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the `show active-charging service all` command to display the names of all configured charging services.

`svc_name` must be a string of 1 through 15 characters in length.

**log**
Default: packets are not logged.
redirect css service (any)

Indicates all packets which match the redirect are to be logged.

any
Indicates all packets will match the redirect regardless of source and/or destination.

Usage
Define a catch all rule definitions to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

**Important**: It is suggested that any rule definition which is added to be a catch all should also have the `log` option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.

**Important**: A maximum of 16 rule definitions can be configured per ACL.

**Important**: Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example
The following command defines a rule definition that redirects packets to the charging service with the name `chgsvc1` and any source IP.

```
redirect css service chgsvc1 any
```

The following sets the insertion point to before the first rule definition above.

```
before redirect service chgsvc1 any
```

The following command sets the insertion point after the second rule definitions above.

```
after redirect service chgsvc1 any
```

The following deletes the first rule definition above.

```
no redirect service chgsvc1 any
```
**redirect css service (by host IP address)**

Used to redirect subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
redirect css service svc_name[ log ] host source_host_address
before redirect css service svc_name[ log ] host source_host_address
after redirect css service svc_name[ log ] host source_host_address
no redirect css service svc_name[ log ] host source_host_address
```

- **after**
  Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
  This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

- **Important**: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

- **before**
  Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
  This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

- **Important**: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

- **no**
  Removes the rule definition which exactly matches the options specified.

- **css service svc_name**
  The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the `show active-charging service all` command to display the names of all configured charging services.
  `svc_name` must be a string of 1 through 15 characters in length.

- **log**
  Default: packets are not logged.
redirect css service (by host IP address)

Indicates all packets which match the redirect are to be logged.

**host**

Specifies that the rule definition applies to a specific host as determined by its IP address.

**source_host_address**

The IP address of the source host to filter against expressed in IPv6 colon notation.

**Usage**

Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.

**Important:** A maximum of 16 rule definitions can be configured per ACL. Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
redirect css service (by ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
redirect css service svc_name[log]icmp {any|host source_host_address|source_address source_wildcard}{any|host dest_host_address|dest_address dest_wildcard}[icmp_type[icmp_code]]
before redirect css service svc_name[log]icmp {any|host source_host_address|source_address source_wildcard}{any|host dest_host_address|dest_address dest_wildcard}[icmp_type[icmp_code]]
after redirect css service svc_name[log]icmp {any|host source_host_address|source_address source_wildcard}{any|host dest_host_address|dest_address dest_wildcard}[icmp_type[icmp_code]]
no redirect css service svc_name[log]icmp {any|host source_host_address|source_address source_wildcard}{any|host dest_host_address|dest_address dest_wildcard}[icmp_type[icmp_code]]
```

**after**

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**before**

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**no**

Removes the rule definition which exactly matches the options specified.
**css service svc_name**  
The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the `show active-charging service all` command to display the names of all configured charging services.  
`svc_name` must be a string of 1 through 15 characters in length.

**log**  
Default: packets are not logged.  
Indicates all packets which match the redirect are to be logged.

**source_address**  
The IP address(es) form which the packet originated.  
This option is used to filter all packets from a specific IP address or a group of IP addresses.  
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the `source wildcard` parameter.

**source wildcard**  
This option is used in conjunction with the `source_address` option to specify a group of addresses for which packets are to be filtered.  
The mask must be entered as a complement:  
- Zero-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be identical.  
- One-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

**any**  
Specifies that the rule definition applies to all packets.

**host**  
Specifies that the rule definition applies to a specific host as determined by its IP address.

**source_host_address**  
The IP address of the source host to filter against expressed in IPv6 colon notation.

**dest_host_address**  
The IP address of the destination host to filter against expressed in IPv6 colon notation.

**dest_address**  
The IP address(es) to which the packet is to be sent.  
This option is used to filter all packets to a specific IP address or a group of IP addresses.  
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the `dest wildcard` parameter.
IPv6 ACL Configuration Mode Commands

**redirect css service (by ICMP packets)**

`dest_wildcard`

This option is used in conjunction with the `dest_address` option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- **Zero-bits** in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be identical.
- **One-bits** in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

`icmp_type`

Specifies that all ICMP packets of a particular type are to be filtered. The type can be any integer value between 0 and 255.

`icmp_code`

Specifies that all ICMP packets of a particular code are to be filtered. The type can be any integer value between 0 and 255.

**Usage**

Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.

The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

**Important:** A maximum of 16 rule definitions can be configured per ACL. Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
**redirect css service (by IP packets)**

Used to redirect subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
redirect css service svc_name [ log ] ip { any | host source_host_address | source_address source_wildcard } { any | host dest_host_address | dest_address dest_wildcard } [ fragment ]
before redirect css service svc_name [ log ] ip { any | host source_host_address | source_address source_wildcard } { any | host dest_host_address | dest_address dest_wildcard } [ fragment ]
after redirect css service svc_name [ log ] ip { any | host source_host_address | source_address source_wildcard } { any | host dest_host_address | dest_address dest_wildcard } [ fragment ]
no redirect css service svc_name [ log ] ip { any | host source_host_address | source_address source_wildcard } { any | host dest_host_address | dest_address dest_wildcard } [ fragment ]
```

**after**
Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed. This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**before**
Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed. This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**no**
Removes the rule definition which exactly matches the options specified.
The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the `show active-charging service all` command to display the names of all configured charging services. *svc_name* must be a string of 1 through 15 characters in length.

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

This option is used to filter all packets from a specific IP address or a group of IP addresses. When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the `source_wildcard` parameter.

This option is used in conjunction with the `source_address` option to specify a group of addresses for which packets are to be filtered. The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be ignored.

Note: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

Specifies that the rule definition applies to all packets.

Specifies that the rule definition applies to a specific host as determined by its IP address.

The IP address of the source host to filter against expressed in IPv6 colon notation.

The IP address of the destination host to filter against expressed in IPv6 colon notation.

The IP address(es) to which the packet is to be sent. This option is used to filter all packets to a specific IP address or a group of IP addresses. When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the `dest_wildcard` parameter.
**destWildcard**

This option is used in conjunction with the `destAddress` option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the `destAddress` parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the `destAddress` parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

**fragment**

Indicates packet redirection is to be applied to IP packet fragments only.

**Usage**

Block IP packets when the source and destination are of interest.

**Important:** A maximum of 16 rule definitions can be configured per ACL. Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
redirect css service (by source IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name[log]source_address source_wildcard
before redirect css service svc_name[log]source_address source_wildcard
after redirect css service svc_name[log]source_address source_wildcard
no redirect css service svc_name[log]source_address source_wildcard
```

**before**

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**after**

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**no**

Removes the rule definition which exactly matches the options specified.

**css service svc_name**

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the `show active-charging service all` command to display the names of all configured charging services.

`svc_name` must be a string of 1 through 15 characters in length.

**log**

Default: packets are not logged.

Indicates all packets which match the filter are to be logged.
**redirect css service (by source IP address masking)**

<table>
<thead>
<tr>
<th>source_address</th>
</tr>
</thead>
<tbody>
<tr>
<td>The IP address(es) form which the packet originated. This option is used to filter all packets from a specific IP address or a group of IP addresses. When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the <code>source_wildcard</code> parameter.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>source_wildcard</th>
</tr>
</thead>
</table>
| This option is used in conjunction with the `source_address` option to specify a group of addresses for which packets are to be filtered. The mask must be entered as a complement:  
  • Zero-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be identical.  
  • One-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be ignored. |

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

**Usage**

Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.

**Important:** A maximum of 16 rule definitions can be configured per ACL.

**Example**

The following command defines a rule definition to redirect packets to a charging service named `chgsvc1`.

```
redirect css service chgsvc1 1:1:1:1:1:1:1
```
redirect css service (by TCP/UDP packets)

Used to redirect subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by
the source to the mobile node or the network.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
redirect css service svc_name[log]{tcp|udp}{ {source_address
source_wildcard|any|host source_host_address}{eq source_port|gt

```

```
before
```

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by
the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options
specified such that new rule definitions will be added, in order, after the matching rule definition.

```
Important: If the options specified do not exactly match an existing rule definition, the insertion point does not
change.
```

```
after
```

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by
the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**no**
Removes the rule definition which exactly matches the options specified.

**css service svc_name**
The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the `show active-charging service all` command to display the names of all configured charging services.

- **svc_name** must be a string of 1 through 15 characters in length.

**log**
Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

**tcp | udp**
Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.

- **tcp**: redirect applies to TCP packets.
- **udp**: redirect applies to UDP packets.

**source_address**
The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the `source wildcard` parameter.

**source wildcard**
This option is used in conjunction with the `source_address` option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

**any**
Specifies that the rule definition applies to all packets.
**host**
Specifies that the rule definition applies to a specific host as determined by its IP address.

**source_host_address**
The IP address of the source host to filter against expressed in IPv6 colon notation.

**dest_host_address**
The IP address of the destination host to filter against expressed in IPv6 colon notation.

**eq source_port**
Specifies a single, specific source TCP port number to be filtered. 
`source_port` must be configured to any integer value from 0 to 65535.

**gt source_port**
Specifies that all source TCP port numbers greater than the one specified are to be filtered.
`source_port` must be configured to any integer value from 0 to 65535.

**lt source_port**
Specifies that all source TCP port numbers less than the one specified are to be filtered.
`source_port` must be configured to any integer value from 0 to 65535.

**neq source_port**
Specifies that all source TCP port numbers not equal to the one specified are to be filtered. 
`source_port` must be configured to any integer value from 0 to 65535.

**range start_source_port end_source_port**
Specifies that all source TCP ports within a specific range are to be filtered.
`start_source_port` is the initial port in the range and `end_source_port` is the final port in the range. 
Both `start_source_port` and `end_source_port` can be configured to any integer value from 0 to 65535.

**dest_address**
The IP address(es) to which the packet is to be sent. 
This option is used to filter all packets to a specific IP address or a group of IP addresses. 
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the `dest_wildcard` parameter.

**dest_wildcard**
This option is used in conjunction with the `dest_address` option to specify a group of addresses for which packets are to be filtered. 
The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the `dest_address` parameter must be ignored.
**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

</tbody>
</table>

**Usage**
Block IP packets when the source and destination are of interest but for only a limited set of ports.

**Important:** A maximum of 16 rule definitions can be configured per ACL. Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

**Example**
The following command defines a rule definition that redirects packets to the charging service named `chgsvc1`, and UDP packets coming from any host are matched.
```
redirect css service chgsvc1 udp any
```
The following sets the insertion point to before the rule definition above.
```
before redirect css service chgsvc1 udp any
```
The following command sets the insertion point after the rule definition above.
```
after redirect css service chgsvc1 udp any
```
The following deletes the rule definition above.
```
no redirect css service chgsvc1 udp any
```
redirect css service (for downlink, any)

Used to redirect subscriber sessions based on any packet received in the downlink (from the Mobile Node) direction. This command is also used to set the access control list insertion point.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
redirect css service svc_name[ log]downlink any
before redirect css service svc_name[ log]downlink any
after redirect css service svc_name[ log]downlink any
no redirect css service svc_name[ log]downlink any
```

**after**
Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**before**
Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**no**
Removes the rule definition which exactly matches the options specified.

**css service svc_name**
The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the `show active-charging service all` command to display the names of all configured charging services.
`svc_name` must be a string of 1 through 15 characters in length.

**downlink**
Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.
**redirect css service (for downlink, any)**

**log**
Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

**any**
Indicates all packets will match the redirect regardless of source and/or destination.

**Usage**
Define a catch all rule definition to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

**Important:** It is suggested that any rule definition which is added to be a catch all should also have the log option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.

**Important:** A maximum of 16 rule definitions can be configured per ACL.

**Important:** Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

**Example**
The following command defines a rule definition that redirects packets to the charging service with the name chgsvcl and any source IP.

```
redirect css service chgsvcl downlink any
```

The following sets the insertion point to before the first rule definition above.

```
before redirect service chgsvcl downlink any
```

The following command sets the insertion point after the second rule definition above.

```
after redirect service chgsvcl downlink any
```

The following deletes the first rule definition above.

```
no redirect service chgsvcl downlink any
```
redirect css service (for downlink, by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address in the downlink (from the Mobile Node) direction.

Syntax

```plaintext
redirect css service svc_name[log]downlink host source_host_address
before redirect css service svc_name[log]downlink host
source_host_address
after redirect css service svc_name[log]downlink host source_host_address
no redirect css service svc_name[log]downlink host source_host_address
```

- **before**
  - Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
  - This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

  **Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

- **after**
  - Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
  - This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

  **Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

- **no**
  - Removes the rule definition which exactly matches the options specified.

- **css service svc_name**
  - The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the `show active-charging service all` command to display the names of all configured charging services.
  - `svc_name` must be a string of 1 through 15 characters in length.
redirect css service (for downlink, by host IP address)

**downlink**
Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

**log**
Default: packets are not logged. Indicates all packets which match the redirect are to be logged.

**host**
Specifies that the rule definition applies to a specific host as determined by its IP address.

**source_host_address**
The IP address of the source host to filter against expressed in IPv6 colon notation.

**Usage**
Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.

**Important**: A maximum of 16 rule definitions can be configured per ACL. Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
redirect css service (for downlink, by ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets in the downlink (from the Mobile Node) direction.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
redirect css service svc_name[ log] downlink icmp { any | host
source_host_address| source_address source wildcard} | any | host
dest_host_address| dest_address dest wildcard}[ icmp_type| icmp_code]
```

```
before redirect css service svc_name[ log] downlink icmp { any | host
source_host_address| source_address source wildcard} | any | host
dest_host_address| dest_address dest wildcard}[ icmp_type| icmp_code]
```

```
after redirect css service svc_name[ log] downlink icmp { any | host
source_host_address| source_address source wildcard} | any | host
dest_host_address| dest_address dest wildcard}[ icmp_type| icmp_code]
```

```
o redirect css service svc_name[ log] downlink icmp { any | host
source_host_address| source_address source wildcard} | any | host
dest_host_address| dest_address dest wildcard}[ icmp_type| icmp_code]
```

---

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

---

**before**

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed. This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

---

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

---

**no**

Removes the rule definition which exactly matches the options specified.
**css service svc_name**

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the `show active-charging service all` command to display the names of all configured charging services. `svc_name` must be a string of 1 through 15 characters in length.

**downlink**

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

**log**

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

**source_address**

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the `source_wildcard` parameter.

**source_wildcard**

This option is used in conjunction with the `source_address` option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be ignored.

**Important:** The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

**any**

Specifies that the rule definition applies to all packets.

**host**

Specifies that the rule definition applies to a specific host as determined by its IP address.

**source_host_address**

The IP address of the source host to filter against expressed in IPv6 colon notation.

**dest_host_address**

The IP address of the destination host to filter against expressed in IPv6 colon notation.
IPv6 ACL Configuration Mode Commands

redirect css service (for downlink, by ICMP packets)

---

**dest_address**

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the **dest_wildcard** parameter.

---

**dest_wildcard**

This option is used in conjunction with the **dest_address** option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the **dest_address** parameter must be identical.

- One-bits in this parameter mean that the corresponding bits configured for the **dest_address** parameter must be ignored.

---

**Important**: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

---

**icmp_type**

Specifies that all ICMP packets of a particular type are to be filtered. The type can be any integer value between 0 and 255.

---

**icmp_code**

Specifies that all ICMP packets of a particular code are to be filtered. The type can be any integer value between 0 and 255.

---

**Usage**

Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.

The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

---

**Important**: A maximum of 16 rule definitions can be configured per ACL. Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
redirect css service (for downlink, by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets in the downlink (from the Mobile Node) direction.

Syntax

```
redirect css service svc_name [log] downlink ip {any | host
source_host_address | source_address source_wildcard}
{any | host
derest_host_address | dest_address dest_wildcard} [fragment]
before redirect css service svc_name [log] downlink ip {any | host
source_host_address | source_address source_wildcard}
{any | host
derest_host_address | dest_address dest_wildcard} [fragment]
after redirect css service svc_name [log] downlink ip {any | host
source_host_address | source_address source_wildcard}
{any | host
derest_host_address | dest_address dest_wildcard} [fragment]
no redirect css service svc_name [log] downlink ip {any | host
source_host_address | source_address source_wildcard}
{any | host
derest_host_address | dest_address dest_wildcard} [fragment]
```

**after**
Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**before**
Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

**Important:** If the options specified do not exactly match an existing rule definition, the insertion point does not change.

**no**
Removes the rule definition which exactly matches the options specified.

---

IPv6 ACL Configuration Mode Commands
**css service svc_name**
The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the `show active-charging service all` command to display the names of all configured charging services. `svc_name` must be a string of 1 through 15 characters in length.

**downlink**
Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

**log**
Default: packets are not logged. Indicates all packets which match the redirect are to be logged.

**source_address**
The IP address(es) form which the packet originated. This option is used to filter all packets from a specific IP address or a group of IP addresses. When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the `source_wildcard` parameter.

**source_wildcard**
This option is used in conjunction with the `source_address` option to specify a group of addresses for which packets are to be filtered. The mask must be entered as a complement:
- Zero-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the `source_address` parameter must be ignored.

**Important**: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.

**any**
Specifies that the rule definition applies to all packets.

**host**
