Specifies the offset direction from Coordinated Universal Time (UTC).

hours value

Specifies the offset from UTC in hours as an integer from 0 through 14.

minutes { 0 | 15 | 30 | 45 }

Optionally specifies the offset minutes added to the hours value.

daylight-savings-time-increment { 0 | 1 | 2 }

Specifies the number of hours the timezone should be offset due to daylight savings time. This allows the MME to serve areas that have daylight savings time different than that of the MME. This keyword is available in release 14.0 and higher.

If the TAI management database/object is configured for daylight savings using this keyword, the daylight savings time adjustment is applied in these messages only if the system time is within a daylight savings period.

Usage

Use this command to configure the timezone to be used for the UE timezone in S11 and NAS messages.
**Important:** Time zone configurations at the TAI Management Object level take precedence over time zone configurations at the TAI Management Database level. If neither is configured, the system defaults to the MME (system) time zone.

**Example**

The following command sets the timezone mapping for this management object to plus-3 hours and 15 minutes from UTC:

```
timezone + hours 3 minutes 15
```
zone-code

Configures a zone code for the management object.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > LTE Policy Configuration > LTE TAI Management Database Configuration > LTE TAI Management Object Configuration

```
configure > lte-policy > tai-mgmt-db db_name > tai-mgmt-obj obj_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(tai-mgmt-obj)#
```

Syntax

```
zone-code zc_id

no zone-code
```

```
no

Removes the configured zone-code from the management object.

zc_id

Identifies the zone code configuration instance as an integer from 1 through 65535.

Usage

**Important:** While there is no limit to the number of zone codes that can be created, only 10 LACs per zone code can be defined.

Use this command to define zone code restrictions. Regional subscription data at the home subscriber service (HSS) is used to determine the regional subscription area in which the subscriber is allowed to roam. The regional subscription data consists of a list of zone codes which are comprised of one or more location areas (identified by a LAC) into which the subscriber is allowed to roam. Regional subscription data, if present in the Insert-Subscriber-Data-Request (IDR) and the Update-Location-Answer (ULA) from the HSS, defines the subscriber's subscription area for the addressed MME. It contains the complete list (up to 10 zone codes) that apply to a subscriber in the currently visited PLMN. During the Location Update procedure, the zone code list is received in the ULA from the HSS. The zone code list is validated against the configured values in this command. If matched, the Location Update procedure is allowed to proceed. If not matched, the response is that the Network Node Area is restricted and the Location Update procedure fails.

Example

The following command sets the zone code for this management object to 1:

```
zone-code 1
```
Chapter 210
MAG Service Configuration Mode Commands

The MAG Service Configuration Mode is used to create and manage a Mobility Access Gateway service in an HSGW (eHRPD network) or a P-MIP S-GW (LTE-SAE network). The MAG is the PMIP client and communicates with the Local Mobility Anchor (LMA) configured on a PDN Gateway (P-GW).

Mode

Exec > Global Configuration > Context Configuration > MAG Service Configuration

configure > context context_name > mag-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mag-service)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
bind

Binds the service to a logical IP interface serving as the S2a (HSGW) or S5/S8 (S-GW) interface and specifies the maximum number of subscribers that can access this service over the configured interface.

Product
HSGW
S-GW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MAG Service Configuration

configure > context context_name > mag-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mag-service)#

Syntax

bind address ip_address [ max-subscribers num ]

no bind address

no

Removes the interface binding from this service.

address ipv6_address

Specifies the IPv6 address of the interface configured as the S5/S8 interface. ipv6_address is specified in IPv6 colon-separated-hexadecimal notation.

max-subscribers num

Default: 1500000

Specifies the maximum number of subscribers that can access this service on this interface. num must be an integer from 0 through 3000000.

Important: The maximum number of subscribers supported depends on the installed license key and the number of active packet processing cards in the system. A fully loaded system can support 3,000,000 total subscribers. Refer to the license key command and the Usage section (below) for additional information.

Usage

Associate the MAG service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an S2a or S5/S8 interface that provides the session connectivity to/from a P-GW. Only one interface can be bound to a service. The interface should be configured prior to issuing this command. This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.
When configuring the `max-subscribers` option, be sure to consider the following:

- The total number of S2a or S5/S8 interfaces you will configure
- The total number of subscriber sessions that all of the configured interfaces may handle during peak busy hours
- An average bandwidth per session multiplied by the total number of sessions
- The type of physical port to which these interfaces will be bound

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.

**Example**

The following command would bind the logical IP interface with the address of 4551:0db8:85a3:08d3:3319:8a2e:0370:1344 to the MAG service and specifies that a maximum of 300,000 simultaneous subscriber sessions can be facilitated by the interface/service at any given time:

```
bind address 4551:0db8:85a3:08d3:3319:8a2e:0370:1344 max-subscribers 300000
```
encapsulation

Configures data encapsulation type to be used for specific MAG service.

Product
HSGW
S-GW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MAG Service Configuration

configure > context context_name > mag-service service_name

Entering the above command sequence results in the following prompt:

\[context_name]\host_name(config-mag-service)\$

Syntax

encapsulation { gre | ipip }

default encapsulation

default

Resets the encapsulation type to be used by this service to the default option of GRE.

gre: Specifies that GRE encapsulation is to be used for PMIPv6 tunnel data between the MAG and the Local Mobility Anchor (LMA). This is the default for this command.

ipip: Specifies that IP-in-IP encapsulation is to be used for PMIPv6 tunnel data between the MAG and the LMA.

Usage

Use this command to select the encapsulation type to be used for PMIPv6 tunnel data between the MAG and the LMA.

Example

The following command sets the encapsulation data to IP-in-IP:

encapsulation ipip
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
heartbeat

Configures the PMIPv6 heartbeat message interval, retransmission timeout, and max retransmission for the MAG Service.

Product
HSGW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MAG Service Configuration

configure > context context_name > mag-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mag-service)#

Syntax

heartbeat { interval seconds | retransmission { max number | timeout seconds } }

default heartbeat { interval | retransmission { max | timeout } }

no heartbeat

no

Disables the PMIPv6 heartbeat functionality. The HSGW starts sending heartbeat request to peers when the heartbeat interval is configured.

default

Resets the specified parameter to the system default value.

interval seconds

The interval in seconds at which heartbeat messages are sent. seconds is an integer from 30 through 3600.
Default: 60

retransmission max number

The maximum number of heartbeat retransmissions allowed. number is an integer from 1 through 15.
Default: 3

retransmission timeout seconds

The timeout in seconds for heartbeat retransmissions. seconds is an integer from 1 through 20.
Default: 3
**Usage**

Proxy Mobile IPv6 (PMIPv6) is a network-based mobility management protocol to provide mobility without requiring the participation of the mobile node in any PMIPv6 mobility related signaling. The Mobile Access Gateway (MAG) service sets up tunnels dynamically to manage mobility for a mobile node. This command provides configuration of heartbeat messages between the MAG and LMA services to know the reachability of the peers, to detect failures, quickly inform peers in the event of a recovery from node failures, and allow a peer to take appropriate action.

**Example**

The following command enables PMIPv6 heartbeat messaging to known MAG service peers and sets the heartbeat interval to 160 seconds.

```
heartbeat interval 160
```
information-element-set

Identifies the information element set of mobility options to be used in Proxy Binding Update (PBU) messages sent by the MAG to the LMA.

Product
HSGW
S-GW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MAG Service Configuration
configure > context context_name > mag-service service_name
Entering the above command sequence results in the following prompt:
[context_name]host_name(config-mag-service)#

Syntax
information-element-set { custom1 | custom2 | standard }
default information-element-set

default
Resets the command to the default value of “standard”.

{ custom1 | standard }
custom1: Specifies that a custom set of mobility options will be used in proxy binding update messages that are sent in Vendor Specific Mobility Options. These options are:
• User Location Info
• Hardware Identifier
• Access Network Charging Identifier
custom2: Specifies that a custom set of mobility options will be used in proxy binding update messages that are sent in Vendor Specific Mobility Options. When enabled, BSID will be sent in S2a PMIPv6 message.
custom3: Specifies that a custom set of mobility options will be used in proxy binding update messages that are sent in Vendor Specific Mobility Options.
standard: Specifies that a standard set of mobility options are to be used in proxy binding update messages. 3GPP specification 29.275 defines these as Protocol Configuration Options.

Usage
Use this command to identify the type of information element set of mobility options to be used in PBU messages sent form the MAG to the LMA. The mobility options can be either standards-based (3GPP 29.275) or custom (vendor-specific as defined by 3GPP 29.275).

Example
The following command identifies the information element set of mobility options to use in PBU messages as custom:
information-element-set custom1
max-retransmissions

Configures maximum number of retransmissions of Proxy MIP control messages to the Local Mobility Anchor (LMA).

**Product**
- HSGW
- S-GW

**Privilege**
- Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > MAG Service Configuration
- `configure > context context_name > mag-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mag-service)#
```

**Syntax**

```
max-retransmissions num
```

**default max-retransmissions**

```
default
```

Rests the maximum number of allowed retransmissions to the default value of 5.

```
num
```

Default: 5

Specifies the maximum number of times the MAG service will attempt to communicate with the LMA before it marks it as unreachable.

`count` must be an integer from 0 through 4294967295.

**Usage**

Use this command to limit the number of retransmissions to LMA before marking it as unreachable. If the value configured is reached, the call is dropped.

**Example**

The following command configures the maximum number of retransmissions for the MAG service to 3:

```
max-retransmissions 3
```
**mobility-option-type-value**

Changes the mobility option type value used in mobility messages.

**Product**
- HSGW
- S-GW

**Privilege**
- Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > MAG Service Configuration
- configure > context context_name > mag-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mag-service)#
```

**Syntax**

```
mobility-option-type-value { custom1 | standard }
```

**default mobility-option-type-value**

- **default**
  - Sets the command to the default value of custom1.

- **custom1**
  - (Default) Non-standard type values used before they were defined by IANA.

- **standard**
  - Standard type values as defined by IANA. In addition, standard option uses type values defined in RFC 5844 for home address (HoA) options for the PMIPv6 PBU/PBA/revocation message.

**Usage**

Use this command to change the mobility option type value used in mobility messages.

**Example**

The following command changes the mobility option type value to standard:

```
mobility-option-type-value standard
```
policy

Configures policies applied to MAG service.

**Product**

HSGW

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > MAG Service Configuration

```bash
configure > context context_name > mag-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mag-service)#
```

**Syntax**

```bash
policy include-bsid-binding-update { all | none { dereg | handoff | init | renew }
}
```

```
[ default ] policy include-bsid-binding-update
```

**default**

Restores the command to the default values of `init` and `handoff`.

```bash
include-bsid-binding-update { all | none { dereg | handoff | init | renew } }
```

Configures the MAG Service to include BSID (Base Station Identification) in the PBU (Proxy Binding Update) sent by MAG to the P-GW. By default, BSID information is included in the update (`handoff`) and initialization (`init`) packets.

- `all`: Include BSID in all the types of PBU that are sent.
- `none`: Include BSID in none of the PBUs.
- `dereg`: Include BSID in the PBU sent during deregistration.
- `handoff`: Include BSID in the PBU sent during handoff.
- `init`: Include BSID in the PBU sent during initialization.
- `renew`: Include BSID in the PBU sent during 'registration lifetime' renewal.

**Usage**

Configures policies applied to MAG service.

**Example**

The following command configures the MAG Service to include BSID in the PBU during initialization, ‘registration renewal’, and deregistration.

```bash
policy include-bsid-binding-update init renew dereg
```
reg-lifetime

Configures the Mobile IPv6 session registration lifetime for this service.

Product
HSGW
S-GW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MAG Service Configuration
configure > context context_name > mag-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mag-service)#

Syntax
reg-lifetime seconds

default reg-lifetime

default
Resets the command value to the default setting of 600.

seconds
Default: 600
Sets the time value (in seconds) for session lifetimes for this service.
seconds must be an integer from 1 through 262140.

Usage
Use this command to limit PMIPv6 lifetime on this service. If the Proxy Binding Acknowledge (PBA) from the LMA contains a lifetime shorter or longer than what is specified, it is used instead.

Example
The following command sets the registration lifetime for Mobile IPv6 sessions using this service to 1200 seconds (20 minutes):

reg-lifetime 1200
renew-percent-time

Configures percentage of lifetime at which a registration renewal is sent to the Local Mobility Anchor (LMA).

**Product**
HSGW
S-GW

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MAG Service Configuration

```
configure > context context_name > mag-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mag-service)#
```

**Syntax**

```
renew-percent-time percent
```

```
default renew-percent-time
```

**Usage**

Use this command to specify when a registration renewal is sent to the LMA for subscribers using this service.

If the registration lifetime is 600 seconds (10 minutes) and this command is set to 75 (percent), then the registration renewal message is sent after 450 seconds of the registration lifetime has expired.

**Example**

The following command sets the registration renewal time for subscribers using this service to 90 percent of the registration lifetime:

```
renew-percent-time 90
```
retransmission-policy

Configures the retransmission policy for Proxy MIP control message retransmissions.

Product
HSGW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MAG Service Configuration

configure > context context_name > mag-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mag-service)#

Syntax

retransmission-policy { exponential-backoff | normal }

default retransmission-policy

default

Returns the command to its default setting of exponential-backoff.

{ exponential-backoff | normal }

Sets the retransmission timeout behavior for this service.

exponential-backoff: Specifies that the Proxy Binding Update (PBU) retransmission uses an exponential backoff to increase the retransmission timeout for each retry.

normal: Specifies that the PBU retransmission uses the configured retransmission timeout value for all PBU retransmission retries.

Usage

Use this command to specify the retransmission policy for PMIP control messages.

Example

The following command sets the retransmission timeout policy for PMIP control packets to “normal”:

retransmission-policy normal
retransmission-timeout

Configures the maximum allowable time for the MAG service to wait for a response from the LMA before it attempts to communicate with the LMA again (if the system is configured to retry the LMA), or marks the LMA as unreachable.

Product
- HSGW
- S-GW

Privilege
- Administrator

Mode
- Exec > Global Configuration > Context Configuration > MAG Service Configuration
  - `configure > context context_name > mag-service service_name`

Syntax

```
retransmission-timeout time
```

```
[ default | no ] retransmission-timeout
```

- **default**
  - Resets the timeout setting to the default value of 3,000 milliseconds.

- **no**
  - Deletes a previously configured timeout value.

- **time**
  - Default: 3000
  - Specifies the maximum allowable time (in milliseconds) for the MAG service to wait for a response from the LMA before it: (a) attempts to communicate with the LMA again (if the system is configured to retry the LMA) or (b) marks the LMA as unreachable.
  - `time` must be an integer from 100 through 100000.

Usage

Use the retransmission timeout command in conjunction with the `max-retransmissions` command in order to configure the MAG services behavior when it does not receive a response from a particular LMA.

Example

The following command configures a retransmission timeout value of 5000 milliseconds:

```
retransmission-timeout 5000
```
**signalling-packets**

Enables the QoS Differentiated Services Code Point (DSCP) marking feature for IP headers carrying outgoing signalling packets.

**Product**
- HSGW
- S-GW

**Privilege**
- Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > MAG Service Configuration
  
  ```
  configure > context context_name > mag-service service_name
  ```

  Entering the above command sequence results in the following prompt:

  ```
  [context_name]host_name(config-mag-service)#
  ```

**Syntax**

```
signalling-packets ip-header-dscp value
```

- **default**
  - Restores the specified parameter to its default setting of 0x0.

- **no**
  - Disables the specified functionality.

- **ip-header-dscp value**
  - Used to configure the QoS Differentiated Services Code Point (DSCP) marking for IP header encapsulation.
  - **value**: Represents the DSCP setting as the first six most-significant bits of the ToS field. It can be configured to any hexadecimal value from 0x0 through 0x3F. Default is 0x0.

**Usage**

Use this command to enable or disable the DSCP marking feature for IP headers carrying outgoing signalling packets. DSCP marking is disabled by default.

**Example**

The following command configures the HSGW service to support DSCP marking for IP headers carrying outgoing signalling packets:

```
signalling-packets ip-header-dscp 0x21
```
Chapter 211
MAP Service Configuration Mode Commands

The MAP Service Configuration Mode is used to configure properties for Mobile Application Part (MAP) service. Mobile Application Part (MAP) is a protocol which provides an application layer for the various nodes in the core mobile network and GPRS and UMTS core network to communicate with each other in order to provide services to mobile phone users. The MAP service provides the application-layer protocol support used to access the Home Location Register (HLR).

Mode

Exec > Global Configuration > Context Configuration > MAP Service Configuration

configure > context context_name > map-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-map-service-service_name)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
access-protocol

Configures access protocol parameters for the MAP service as defined for a specific SCCP network instance.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > MAP Service Configuration
configure > context context_name > map-service service_name
Entering the above command sequence results in the following prompt:

[context_name]host_name(config-map-service-service_name)#

Syntax

access-protocol sccp-network sccp_id ssn subsys_num
no access-protocol sccp-network sccp_id ssn subsys_num

<table>
<thead>
<tr>
<th>sccp-network sccp_id</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the ID number of the SCCP network to use for the SGSN connection.</td>
</tr>
<tr>
<td>sccp_id: Must be an integer from 1 to 16.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>ssn subsys_num</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identifies the subsystem number for the destination.</td>
</tr>
<tr>
<td>subsys_num: Enter an integer from 1 through 255.</td>
</tr>
</tbody>
</table>

no

Removes the access protocol SCCP network instance ID from the configuration.

Usage
Use this command to associate access protocol parameters to a specific instance of the MAP service for an SCCP network.

Example
The following command associates the access protocols with the SCCP network ID #10:

access-protocol sccp-network 10
application-context-name

Configure the operation timer(s) for one or more MAP application contexts.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > MAP Service Configuration

configure > context context_name > map-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-map-service-service_name)#

Syntax

application-context-name application operation-timer value

default application-context-name application operation-timer

default

Resets the operation timers for all applications to system defaults.

application

Select one of the following applications to enable the application:

- **authentication-failure-report**: Sets the reporting operation timer for authentication failure. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **cancel-location**: Sets the cancel location operation timer. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **check-imei**: Sets the check-IMEI operation timer. The setting range for this timer is 15 to 30 seconds for releases 8.0 and 8.1 and 1 to 30 seconds for releases 9.0 and higher. The default setting is 15 seconds.
- **delete-subscriber-data**: Sets the delete subscriber data operation timer. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **mo-fwd-sm**: Sets the operation timer for forwarding mobile-originated SMS. The setting range for this timer is 1 to 10 minutes and the default setting is 1 minute (60 seconds).
- **ms-purge**: Sets the operation timer for MS-purge function. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **mt-fwd-sm**: Sets the operation timer for forwarding mobile-terminated SMS. The setting range for this timer is 1 to 10 minutes and the default setting is 1 minute (60 seconds).
- **ready-for-sm**: Sets the operation timer for the ready for SMS operation. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
- **send-authentication-info**: Sets the operation timer for the sending authentication information operation. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.
• **stand-alone-insert-subscriber-data**: Sets the operation timer for the standalone insert subscriber data operation. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.

• **ugl-insert-subscriber-data**: Sets the operation timer for the insert subscriber data portion of the update GPRS location operation. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.

• **update-gprs-location**: Sets the operation timer for the update GPRS location operation. The setting range for this timer is 15 to 30 seconds and the default setting is 15 seconds.

---

**operation-timer value**

Configures the operation timer for the selected application. Timer values are indicated above.

---

**Usage**

Repeat this command entering a different application each time to enable multiple applications.

**Example**

```
application-context-name  stand-alone-insert-subscriber-data operation-timer operation-timer 20
```
auth-vectors

Configures the number of authorization vectors to be requested from the home location register (HLR) during call setup to provide subscriber authentication.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MAP Service Configuration

`configure > context context_name > map-service service_name`

Entering the above command sequence results in the following prompt:

`
[context_name]host_name(config-map-service-service_name)#`

**Syntax**

`auth-vectors number-to-request number`

`default auth-vectors number-to-request`

**Usage**

Set the number of requests to be received from the HLR.

**Example**

```
auth-vectors number-to-request 4
```
end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.
**equipment-identity-register**

Defines the information relevant to the equipment-identity-register (EIR) used by the SGSN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MAP Service Configuration

```
configure > context context_name > map-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-map-service-service_name)#
```

**Syntax**

```
equipment-identity-register { isdn E.164_num | point code pt_code } [ check-imei-every-n-events times | source-ssn ssn] [ include-imsi ]
```

```
no equipment-identity-register { isdn E.164_num | point code pt_code ] [ include-imsi ]
```

---

**no**

Deletes the EIR configuration.

**isdn number**

Enter the E.164 number of the EIR.

*number* must be a string of 1 to 15 digits.

**point code pt_code**

Enter SS7 point code address of the EIR in dotted-decimal format according to variant settings:

- ITU Range 0.0.1 to 7.255.7
- ANSI Range 0.0.1 to 255.255.255
- TTC Range 0.0.1 to 15.31.255
- or a string of 1 to 11 characters

**source-ssn ssn**

Identifies the subsystem number (SSN) to be used.

*ssn* must be an integer from 1 to 255.

**check-imei-every-n-events times**

Configures the frequency with which a ‘check IMEI’ message is sent to the EIR. When set, the SGSN skips sending the ‘check IMEI’ message for the first N-1 where IMDI/IMEISV is received.

*times*:

- For releases 8.0 and 8.1, the value must be an integer from 1 to 15.
• For releases 15.0 and higher, the value must be an integer from 1 to 15.

**Important:** This feature requires the enabling of `verify-equipment-identity` for IMEI or IMEISV as specified with the `gmm retrieve-equipment-identity imei` command of the call-control-profile configuration mode.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>include-imsi</strong></td>
<td>Enables inclusion of IMSI checking during the IMEI check procedure. By default this function is not included.</td>
</tr>
</tbody>
</table>

**Usage**

Configure the identity of the EIR that the SGSN uses and the interaction parameters. Increasing the `check-imei-every-n-events` frequency enables the EIR to avoid overload as the number of data-only devices attaching to the network increases.

**Example**

Configure EIR with point code 1.255.1 to perform IMEI check after every 61st received Attach Request message:

```plaintext
equipment-identity-register point code 1.255.1 check-imei-every-n-events 62
```

Configure IMSI to be included in the MAP-CHECK-IMEI operation:

```plaintext
equipment-identity-register point code 1.255.1 check-imei-every-n-events 62 include-imsi
```
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
gmlc

This command identifies the gateway mobile location center (GMLC) associated with the Location Service functionality.

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > MAP Service Configuration

configure > context context_name > map-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-map-service-service_name)#

Syntax

```
gmlc { isdn E.164_number | point-code point-code } [ gsn-address ipv4 address ] [ source-ssn SSN_value ]
```

```
no gmlc { isdn | point-code }
```

**no**

Deletes the GMLC configuration. When the **no** form of the command is used the SGSN aborts all active Location Requests towards that GMLC and stops the Location Service functions.

**isdn number**

Enter the E.164 number of the GMLC.

number: must be a string of 1 to 15 digits.

**Important:** **isdn** can not be used if **point-code** is used.

**point-code pt_code**

Enter SS7 point code address of the GMLC in dotted-decimal format according to variant settings:

- ITU Range 0.0.1 to 7.255.7
- ANSI Range 0.0.1 to 255.255.255
- TTC Range 0.0.1 to 15.31.255
- or a string of 1 to 11 characters

**Important:** **point-code** can not be used if **isdn** is used.
gsn-address  ipv4 address

Identifies the IP address of the GMLC of the local PLMN. The address will be published to the HLR in the MAP Update_GPRS_Location Request.

Important: Even though gsn-address is optional per the CLI grammar, this keyword is a mandatory parameter when configuring the GMLC for the location service feature in the SGSN.

source-ssn  ssn

Identifies the subsystem number (SSN) to be used.

ssn must be an integer from 1 to 255.

Usage

This command identifies the GMLC associated with the MAP Service configuration in support of the Location Services functionality enabled on the SGSN.

Only one GMLC can be defined per MAP Service configuration.

Related Commands:

• associate map-service in the Location Service configuration mode associates this MAP service when configuring Location Services functionality.

Example

Use a command similar to the following to define a gateway mobility location center (GMLC) with an ISDN ID of 491720499, a GSN address of 192.168.64.1, and an SSN of 131:

\[ \text{gmlc isdn 491720499 gsn-address 192.168.64.1 ssn 131} \]
This command enters the configuration mode for the home location register (HLR). The HLR is a database containing the subscriber profile information for all mobile stations (MS) / user equipment (UE) connecting to a specific GPRS or UMTS core network.

**Important:** The commands and options for this mode are documented in the HLR Configuration Mode chapter.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MAP Service Configuration

```plaintext
configure > context context_name > map-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-map-service-service_name)#
```

**Syntax**

```plaintext
hlr
```
policy

This command configures the Transaction Capabilities Application Part (TCAP) -specific MAP policy for either ANSI or ITU SS7 variants.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > MAP Service Configuration
configure > context context_name > map-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-map-service-service_name)#

Syntax

[ default ] policy tcap { use-received-destination-address | use-received-source-address }

use-received-destination-address
Selecting this keyword overwrites stored CG and CD addresses with a new address received in first TC CNT msg

use-received-source-address
Selecting this keyword instructs the MAP service to use the received source address for the dialog.

Usage
Use this command to determine how TCAP will handle MAP messages.

Example

policy tcap use-received-destination-address
short-message-service

This command enables and disables the short message service (SMS service) and provides access to the SMS Service configuration mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MAP Service Configuration
```
configure > context context_name > map-service service_name
```
Entering the above command sequence results in the following prompt:
```
[context_name]host_name(config-map-service-service_name)#
```

**Syntax**
```
short-message-service

no short-message-service
```

**Usage**
Disables the SMS service.

**Example**
Enter the command to access the SMS service configuration mode to fine tune the SMS functionality.
```
short-message-service
```
### timeout

Use this command to configure the m1 timeout value for the LCS procedure.

**Product**
SGSN

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MAP Service Configuration

```
configure > context context_name > map-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-map-service-service_name)#
```

**Syntax**

```
timeout m1 seconds
```

**ml seconds**
This keyword sets the expiry value for the SGSN’s m1 timer, which sets the time the SGSN waits to send a negative PSL Response and clear the location request.

*seconds* is an integer from 60 to 600. Default is 120.

**Usage**
The m1 timer is used for location service (LCS) specific map message PSL (provide subscriber location). The gateway mobile location center (GMLC), associated with the LCS functionality, also maintains an m1 timer when it sends a PSL Request to the SGSN. If the GMLC’s timer expires before receiving a response from the SGSN, then the GMLC aborts the location procedure.

This command enables the operator to determine the amount of time the SGSN should wait before sending a negative PSL Response and clearing the location request to complete the LCS procedure.

**Example**
Set the expiry value of the m1 timer to 240 seconds.

```
timeout m1 240
```
Chapter 212
MIP HA Assignment Table Configuration Mode Commands

The Mobile IP HA Assignment Table Configuration Mode is used to assign specific Home Agent (HA) IP addresses to ranges of Mobile Node (MN) IP addresses.

Mode

Exec > Global Configuration > Context Configuration > MIP HA Assignment Table

configure > context context_name > mobile-ip ha assignment-table table_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mobile-ip-ha-assignment)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

end

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
hoa-range

This command assigns ranges of Mobile Node (MN) IP addresses to specific Home agent IP addresses.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MIP HA Assignment Table

```
configure > context context_name > mobile-ip ha assignment-table table_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mobile-ip-ha-assignment)#
```

**Syntax**

```
[ no ] hoa-range ip_address ip_address2 ha ip_address3
```

- **no**
  Removes the specified Home Agent assignment from the assignment table.

- **ip_address ip_address2**
  Specifies a range of MN IP addresses. *ip_address* and *ip_address2* must be specified in IPv4 dotted-decimal or IPv6 colon-separated notation.

- **ha ip_address3**
  Specifies the IP address of the Home Agent to assign to MNs that are within the specified range. *ip_address3* must be specified in IPv4 dotted-decimal or IPv6 colon-separated notation.

**Usage**

Use this command to assign ranges of MN IP addresses to specific HAs.

**Important:** A maximum of eight MIP HA assignment tables can be configured per context with a maximum of eight MIP HA assignment tables across all contexts.

**Important:** A maximum of 256 non-overlapping hoa-ranges can be configured per MIP HA Assignment table with a maximum of 256 non-overlapping hoa-ranges across all MIP HA Assignment tables.

**Example**

The following command assigns any MN IP address that falls in the range of 192.168.100.0 through 192.168.101.0 to the HA with the IP address of 192.168.200.10:

```
hoa-range 192.168.100.0 192.168.101.0 ha 192.168.200.10
```
Chapter 213
MIPv6 HA Service Configuration Mode Commands

The MIPv6 HA Service Configuration Mode is used to create and manage Mobile IPv6 (MIPv6) access privileges.

Mode

Exec > Global Configuration > Context Configuration > MIPv6HA Service Configuration
configure > context context_name > mipv6ha-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mipv6ha-service)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
aaa accounting

Configures the sending of subscriber session AAA accounting by the Home Agent (HA) service.

Product
PDSN
HA

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > MIPv6HA Service Configuration
configure > context context_name > mipv6ha-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mipv6ha-service)#

Syntax
[ no ] aaa accounting

  no

  Disables AAA accounting for the HA service.

Usage
Enabling the HA service will send all accounting data (start, stop, and interim) to the configured AAA servers. The default is AAA accounting enabled.

Important: In order for this command to function properly, AAA accounting must be enabled for the context in which the HA service is configured using the aaa accounting subscriber radius command.

Example
AAA accounting for the HA service can be disabled using the no version of the command.

The following command disables AAA accounting for the HA service:

  no aaa accounting
bind

Designates the address of the MIPv6HA service and specifies the maximum number of subscribers that can access this service over the interface.

Product
PDSN
HA

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > MIPv6HA Service Configuration

configure > context context_name > mipv6ha-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mipv6ha-service)#

Syntax

bind address IPv6_address [ max-subscribers count ]

no bind address

no

Removes the bound address from the HA service.

address

Specifies the IPv6 address of the MIPv6HA service using IPv6 colon-separated-hexadecimal notation.

max-subscribers count

Default: 3000000

Specifies the maximum number of subscribers that can access this service on this interface.

count is an integer from 0 through 4000000.

Important: The maximum number of subscribers supported depends on the installed license key and the number of active packet processing cards installed in the system. Refer to the license key command for additional information.

Usage

Use this command to associate the HA service with a specific logical IP address. The logical IP address or interface takes on the characteristics of a Pi interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.

This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.

When configuring the max-subscribers option, be sure to consider the following:

- The total number of interfaces that you will configuring for use as Pi interfaces
The maximum number of subscriber sessions that all of these interfaces may handle during peak busy hours

• The average bandwidth for each of the sessions
• The type of physical port to which these interfaces will be bound

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.

Example

The following command binds the logical IP interface with the address of 2001:4A2B::1f3F to the HA service and specifies that a maximum of 600 simultaneous subscriber sessions can be facilitated by the interface/service at any given time.

```
bind address 2001:4A2B::1f3F max-subscribers 600
```

The following command disables a binding that was previously configured:

```
no bind address
```
default

Restore default values assigned for specified parameter.

Product
PDSN
HA

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > MIPv6HA Service Configuration

configure > context context_name > mipv6ha-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mipv6ha-service)#

Syntax

default { aaa | refresh-advice-option | refresh-interval-percent | reg-lifetime | sequence-number-validate | setup-timeout | simul-bindings | subscriber | timestamp-replay-protection }

aaa
Restores the AAA setting configured by the aaa command to its default of enabled.

refresh-advice-option
Restores the refresh-advice-option setting to its default of disabled.

refresh-interval-percent
Restores the refresh-interval-percent setting to its default of 75.

reg-lifetime
Restores the Mobile IP session registration lifetime setting configured by the reg-lifetime command to its default: 600 seconds.

sequence-number-validate
Restores the sequence-number-validate setting to its default of enabled.

setup-timeout
Restore the maximum amount of time allowed for setting up a session to the default: 60 seconds.

simul-bindings
Restores the simultaneous bindings setting to its default: 1.
subscriber
Configures settings for the default subscriber.

timestamp-replay-protection
Restores the timestamp-replay-protection scheme according to RFC 4285.

Usage
After the system has been modified from its default values, this command is used to set or restore specific parameters to their default values.

Example
The following command is used to return the simultaneous bindings setting parameter to it’s default value:

default simul-bindings
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Use this command to return to the parent configuration mode.
refresh-advice-option

Configures inclusion of refresh advice option in the Binding Acknowledgement sent by the Home Agent (HA).

- **Product**: PDSN, HA
- **Privilege**: Security Administrator, Administrator
- **Mode**: Exec > Global Configuration > Context Configuration > MIPv6HA Service Configuration

```
configure > context context_name > mipv6ha-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mipv6ha-service)#
```

- **Syntax**: `refresh-advice-option`

- **Usage**: Includes the refresh advice option in the binding acknowledgements sent by the home agent. Default is disabled.
refresh-interval-percent

Configures the percentage of the granted lifetime to be used in the refresh interval mobility option in the Binding Acknowledgement sent by the Home Agent (HA).

Product
PDSN
HA

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > MIPv6HA Service Configuration

configure > context context_name > mipv6ha-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mipv6ha-service)#

Syntax

refresh-interval-percent value

value

value represents a percentage expressed as an integer from 1 through 99. Default is 75.

Usage
Use this command to configure the amount of the granted lifetime to be used in the refresh interval mobility option in the Binding Acknowledgement sent by the Home Agent (HA).

Example
The following command sets the refresh-interval-percent value to 50%:

refresh-interval-percent 50
**reg-lifetime**

Specifies the longest registration lifetime that the HA service will be allowed in any Registration Request message from the mobile node.

**Product**

PDSN

HA

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > MIPv6HA Service Configuration

```
configure > context context_name > mipv6ha-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mipv6ha-service)#
```

**Syntax**

```
reg-lifetime time

no reg-lifetime
```

- **time**

  Specifies the registration lifetime in seconds. `time` is an integer from 1 through 262140. Default is 600.

- **no**

  Sets the registration lifetime to infinite.

**Usage**

Use to limit a mobile nodes’ lifetime. If the mobile node requests a shorter lifetime than what is specified, it is granted. However, Per RFC 2002, should a mobile node request a lifetime that is longer than the maximum allowed by this parameter, the HA service will respond with the value configured by this command as part of the Registration Reply.

**Example**

The following command configures the registration lifetime for the HA service to be 2400 seconds:

```
reg-lifetime 2400
```

The following command configures an infinite registration lifetime for MIPv6 calls:

```
no reg-lifetime
```
sequence-number-validate

Configures sequence number validation of the received MIPV6 control packet by the Home Agent (HA) according to RFC 3775.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MIPv6HA Service Configuration

```bash
configure > context context_name > mipv6ha-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-mipv6ha-service) #
```

**Syntax**

```bash
sequence-number-validate
```

**Usage**

Use this command to enable sequence number validation of the received MIPV6 control packet by the Home Agent (HA) as per RFC 3775. Default is enabled.
setup-timeout

The maximum amount of time allowed for session setup.

**Product**
- PDSN
- HA

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > MIPv6HA Service Configuration
  
- `configure > context context_name > mipv6ha-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mipv6ha-service)#
```

**Syntax**

```
setup-timeout seconds
```

seconds

Default: 60 seconds

The maximum amount of time (in seconds) to allow for setup of a session expressed as an integer from 1 through 1000000. Default is 60 seconds.

**Usage**

Use this command to set the maximum amount of time allowed for setting up a session.

**Example**

To set the maximum time allowed for setting up a session to 5 minutes (300 seconds), enter the following command:

```
setup-timeout 300
```
**simul-bindings**

Specifies the maximum number of “care-of” addresses that can be simultaneously bound for the same user as identified by NAI and Home address.

**Product**
- PDSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > MIPv6HA Service Configuration
  - `configure > context context_name > mipv6ha-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mipv6ha-service)#
```

**Syntax**

```
simul-bindings number
```

`number`

Configures maximum number of “care-of” addresses that can be simultaneously bound for the same user as identified by their NAI and home address. `number` is an integer from 1 through 3. Default is 1.

**Usage**

Per RFC 2002, the HA service creates a mobile binding record (MBR) for each subscriber session it is facilitating. Each MBR is associated with a care-of address. As the mobile node roams, it is possible that the session will be associated with a new care-of address.

Typically, the HA service will delete an old binding and create a new one when the information in the Registration Request changes. However, the mobile could request that the HA maintains previously stored MBRs. This command allows you to configure the maximum number of MBRs that can be stored per subscriber if the requested.

**Example**

The following command configures the service to support up to 2 addresses per subscriber:

```
simul-bindings 2
```
timestamp-replay-protection tolerance

Designates timestamp replay protection scheme as per RFC 4285.

Product
PDSN
HA

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > MIPv6HA Service Configuration

configure > context context_name > mipv6ha-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mipv6ha-service)#

Syntax

```
timestamp-replay-protection tolerance seconds
```

tolerance seconds

Defines the acceptable difference in timing (between timestamps) before rejecting packet, in seconds.

seconds must be an integer from 0 through 65535. The default is 7.

Usage

Use this command to define the acceptable difference in timing (between timestamps) before rejecting packet.
Chapter 214
MME LAC Pool Area Configuration Mode Commands

The MME LAC Pool Area Configuration Mode is used to create and manage the Location Area Code (LAC) pool areas.

Mode

Exec > Global Configuration > Context Configuration > SGs Service Configuration > MME LAC Pool Area Configuration

configure > context context_name > sgs-service service_name > pool-area pool_area_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgs-pool-area)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

- **Product**: All
- **Privilege**: Security Administrator, Administrator
- **Syntax**: `exit`

**Usage**
Use this command to return to the parent configuration mode.
hash-value

Configures the Visitor Location Register (VLR) hash value mapping for this pool area.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGs Service Configuration > MME LAC Pool Area Configuration

configure > context context_name > sgs-service service_name > pool-area pool_area_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgs-pool-area)#
```

**Syntax**

```
hash-value { value | non-configured-values | range value to value } use-vlr vlr_name

no hash-value { value | non-configured-values | range value to value }
```

---

**no**
Removes the configured hash-value from the pool-area configuration.

**value**
Specifies the VLR hash value to be used with the configured VLR. `value` must be an integer from 0 through 999.

**non-configured-values**
Specifies that the VLR configured in this command is to be used non-configured hash values.

**range value to value vlr_name**
Specifies a range of hash values to use with the configured VLR as an integer from 0 through 999.

**use-vlr**
Specifies the VLR to be used with the hash value configuration in this command.

---

**Usage**

Use this command to configure hash values to be used with VLRs.
In Release 12.2 and later, a maximum of 48 hash lists can be created per pool area. In older releases, a total of 32 hash lists can be created per pool area.
In a pool configuration, the MME selects the VLR that corresponds to the hash of the UE’s IMSI. If that VLR is inactive, the MME will use the default VLR (as defined by the `non-configured-value` option). If no
default VLR has been configured, or if the default VLR is inactive, the MME selects any other available VLR from the pool.
If the chosen VLR is active at the time of selection and then subsequently becomes inactive when the request is sent to it, the current request fails. On the next request from the UE, the VLR selection mechanism is applied again. A VLR that failed previously will only be selected again if it became active since the earlier failure.

**Example**

The following command configures all hash values within a range of 0 to 500 to use a VLR named `vlr1`:

```
hash-value range 0 to 500 use-vlr vlr1
```

The following command configures hash values of 501 to use a VLR named `vlr2`:

```
hash-value 501 use-vlr vlr2
```

The following command configures all non-configured hash values to use a VLR named `vlr3`:

```
hash-value non-configured-values use-vlr vlr3
```
lac

Configures a 3G location area code or area codes that define this pool area.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > SGs Service Configuration > MME LAC Pool Area Configuration

configure > context context_name > sgs-service service_name > pool-area pool_area_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgs-pool-area)#

Syntax

```plaintext
[ no ] lac { area_code } +
```

- **no**
  Removes a configured forbidden handover area code or area codes from this policy. If no location area code is specified, then all location area codes are removed.

- **area_code**
  Specifies an area code or area codes used to select a VLR for the pool area as an integer from 0 through 65535. Multiple area codes can be entered (up to 16 in a single line, separated by spaces).

Usage

Use this command to configure 3G location-based area codes that define this pool area.

In Release 12.2 and later, a maximum of 96 areas can be added per pool area (in a single line, or separately).

In older releases, a total of 16 area codes can be added (in a single line, or separately).

Example

The following command configures eight location-based area codes (1, 2, 3, 4, 5, 6, 7, 8) that define this pool area:

`lac 1 2 3 4 5 6 7 8`
plmnid

Configures the Public Land Mobile Network (PLMN) identifier for the LAC pool area.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGs Service Configuration > MME LAC Pool Area Configuration

```
configure > context context_name > sgs-service service_name > pool-area pool_area_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgs-pool-area)#
```

**Syntax**

```
plmnid { any | mcc mcc_value mnc mnc_value }

no plmnid
```

- **no**
  - Removes the configured PLMN identifier for the LAC pool area.

- **any**
  - This keyword specifies any PLMN identifier can be configured for the LAC pool area.

  ```
  mcc mcc_value
  ```
  - Specifies the mobile country code (MCC) portion of the PLMN identifier as an integer from 100 through 999.

  ```
  mnc mnc_value
  ```
  - Specifies the mobile network code (MNC) portion of the PLMN identifier as a 2- or 3-digit integer from 00 through 999.

**Usage**
Use this command to set the PLMN identifier for the LAC pool area. Any PLMN identifier can be configured for the LAC pool area or a specific PLMN identifier can be configured by providing the MCC and MNC of the PLMN identifier.

**Example**

The following command configures the PLMN identifier with MCC value as 102 and MNC value as 20 for this MME service:

```
plmnid mcc 102 mnc 20
```
Chapter 215
MME MSC Pool Area Configuration Mode

The MME MSC Pool Area Configuration Mode is used to create and manage the MSC Pool Areas used by the MME for communicating with the Mobile Switching Center (MSC) for Single Radio Voice Call Continuity (SRVCC).

*Important:* The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-pool-area-hash-value)#
```

**Syntax**

```
hash-value { hash_value | range start_value to end_value } use-msc msc_id

no hash-value { hash_value | range start_value to end_value }
```

**Usage**
This command associates an MSC with this pool. It also assigns an the MSC to use based on the hash value as computed from the IMSI digits \([(\text{IMSI} \text{ div } 10) \text{ modulo } 1000]\). A maximum of 24 hash values can be configured within each pool area. If no matching MSC is found, the SRVCC handover fails.

**Example**

```
Cisco ASR 5x00 Command Line Interface Reference
```
The following command configures hash values from 111 to 222 to use the MSC named `mscwest1` in this pool.

```
hash-value range 111 to 222 use-msc mscwest1 arg1
```
plmn-id

Associates a Public Land Mobile Network (PLMN) identifier with a Mobile Switching Center (MSC) pool area.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service Configuration > Pool Area Configuration

configure > context context_name > mme-service service_name > pool-area pool_area_name
type hash-value

or
configure > context context_name > mme-service service_name > pool-area pool_area_name
type round-robin

Entering the above command sequences result in the following prompts, respectively:

[context_name]host_name(config-mme-pool-area-hash-value)#

[context_name]host_name(config-mme-pool-area-round-robin)#

Syntax

plmn-id mcc code mnc code

no plmn-id

no

Removes the configured plmn-id assigned to this MSC pool area.

mcc code

Specifies the Mobile Country Code for this mobile access network. code must be a three-digit integer from 200 to 999.

mnc code

Specifies the Mobile Network Code for this mobile access network. code must be a two or three-digit integer from 00 to 999.

Usage

Use this command to associate a PLMN with an MSC pool area. This PLMN is used to select an MSC pool area based on the target PLMN as specified in the SRVCC handover request.

When configured, the MME attempts to select an MSC using the following selection order:
1. Pool area that matches the PLMN and of type hash.
2. Pool area that matches the PLMN and of type round-robin.
3. Pool area that does not have PLMN associated and of type hash.
4. Pool area that does not have PLMN associated and of type round-robin.
When this command is used, only one PLMN can be assigned per pool area of the same type (either hash-value or round-robin). A hash value pool area and a separate round robin pool area can be configured with the same PLMN. In this case, the hash value pool has the higher priority.

If no matching MSC is found, the SRVCC handover fails.

**Example**

The following command identifies the mobile network with a MCC of 123 and a MNC of 12.

```
plmn-id mcc 123 mnc 12
```
**use-msc**

Associates a Mobile Switching Center (MSC) with the pool area.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service Configuration > Pool Area Configuration
configure > context context_name > mme-service service_name > pool-area pool_area_name
type round-robin

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-pool-area-round-robin)#
```

**Syntax**

```
[ no ] use-msc msc_name
```

- **no**
  - Removes the associated MSC name from this pool area.

**Example**

The following command associates the MSC named `mscsouth1` to this pool.

```
use-msc mscsouth1
```
The MME Pool configuration is used to configure one or more MMEs to which the HeNB-GW is to communicate. This configuration is available under lte-policy configuration mode. Adding or modifying an MME pool instance puts the user into the MME Pool configuration mode.

**Mode**

Exec > Global Configuration > LTE Policy Configuration > HeNBGW MME Pool Configuration

`configure > lte-policy > henbgw mme-pool mme_pool_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(mme-pool)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Use this command to return to the Exec mode.
**exit**

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
mme

Configures a specific MME to HeNBGW.

Product
HeNB-GW

Privilege
Administrator

Mode
Exec > Global Configuration > LTE Policy Configuration > HeNBGW MME Pool Configuration

configure > lte-policy > henbgw mme-pool mme_pool_name

Entering the above command sequence results in the following prompt:

[local]host_name(mme-pool)#

Syntax

[ no ] mme mme_name { ipv4-address ipv4_address [ ipv4-address ipv4_address ] | ipv6-address ipv6_address [ ipv6-address ipv6_address ] [ sctp port port_val ] }

no

Removes the configured MME to HeNBGW.

mme_name

It is the MMe name, a string of size 1 through 63.

ipv4-address ipv4_address

Specifies the remote SCTP IP Address for S1 association to MME. This must be followed by ipv4_address, the IPv4 address using dotted-decimal notation.

ipv6-address ipv6_address

Specifies the remote SCTP IP Address for S1 association to MME. This must be followed by ipv6_address, the IPv6 address using (::/::).

sctp

Configure the S1-MME SCTP parameters.

port port_val

Designates SCTP port.
port_val is an integer ranging from 1 through 65535.

Usage

Use this command to configure a specific MME to HeNBGW.
The following command configures the mme with name `my_mme`, `ipv4-address` 123.456.234.444 with SCTP `port` 302.

```
mme my_mme ipv4-address 123.456.234.444 sctp port 302
```
The MME Service Configuration Mode is used to create and manage the LTE Mobility Management Entity (MME) services for the LTE/SAE network. This service works in conjunction with MME-HSS Service and eGTP Service.

Mode

Exec > Global Configuration > Context Configuration > MME Service

configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

**Caution:** Restarting the MME service leads to termination of UE sessions at the MME, purge of subscriber data and closure of all connections towards peer nodes such as eNodeB, HSS, S-GW, etc. It may also lead to termination of other services associated with the MME. It is strongly advised to make any configuration changes that restarts the service only while in maintenance mode or at startup.
**associate**

Associates or disassociates supportive services and policies, such as an Evolved GPRS Tunnelling Protocol (eGTP) service, an HSS peer service, or an MME policy subscriber map with an MME service.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service

`configure > context context_name > mme-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```
associate { { egtp-service egtp_svc_name | egtp-sv-service egtp_sv_svc_name | foreign-plmn-guti-mgmt-db db_name | hss-peer-service hss_svc_name | location-service location_svc_name | lte-emergency-profile profile_name | network-global-mme-id-mgmt-db | sctp-param-template template_name | sgs-service sgs_svc_name | sgtpc-service sgtpc_svc_name } [ context ctx_name ] | subscriber-map map_name | tai-mgmt-db database_name }`

```

no associate { egtp-service | egtp-sv-service | foreign-plmn-guti-mgmt-db | hss-peer-service | location-service | lte-emergency-profile | network-global-mme-id-mgmt-db | sctp-param-template | sgs-service | sgtpc-service | subscriber-map | tai-mgmt-db }
```

**no**

Disassociates a previously associated service with this MME service.

**egtp-service egtp_svc_name**

Associates an eGTP service with MME service.

`egtp_svc_name` specifies the name for a pre-configured eGTP service to associate with the MME service. The eGTP service provides eGTP-C protocol interface support between EPS nodes. For more information on the eGTP service, refer to the `egtp-service` command in the **Context Configuration Mode Commands** chapter and the **eGTP Service Configuration Mode Commands** chapter.

Only one eGTP service can be associated with a service. The eGTP service should be configured prior to issuing this command.

**egtp-sv-service egtp_svc_name**

Associates an eGTP Sv service with this MME service.

`egtp_svc_name` specifies the name for a pre-configured eGTP Sv service to associate with the MME service. For more information on the eGTP Sv service, refer to the `egtp-service` command in the **Context Configuration Mode Commands** chapter.
**foreign-plmn-guti-mgmt-db**  
*db_name*

Associates a Foreign PLMN GUTI management database with this MME service.  
*db_name* specifies the name for a pre-configured foreign PLMN GUTI management database to associate with the MME service. For more information on the Foreign PLMN GUTI management database, refer to the **foreign-plmn-guti-mgmt-db** command in the LTE Policy Configuration Mode Commands chapter. Only one Foreign PLMN GUTI management database can be associated to an MME service. The Foreign PLMN GUTI management database should be configured prior to issuing this command. Multiple MME services can be associated to the same Foreign PLMN GUTI management database.

**hss-peer-service**  
*hss_svc_name*

Associates an HSS peer service with this MME service.  
*hss_svc_name* specifies the name for a pre-configured HSS peer service to associate with the MME service as an alphanumeric string of 1 through 64 characters. The HSS peer service provides S6a and S13 interface support via the Diameter protocol between the MME and an HSS (S6a) or EIR (S13). For more information about the HSS peer service, refer to the **hss-peer-service** command in the Context Configuration Mode Commands chapter and the HSS Peer Service Configuration Mode Commands chapter. Only one HSS peer service can be associated to a service. The HSS peer service should be configured prior to issuing this command.

**ipne-service**  
*ipne_svc_name*

Associates an IPNE service with this MME service.  
*ipne_svc_name* must be an alphanumeric string of 1 to 63 characters to identify a pre-configured, uniquely-named IPNE service. For more information about the IPNE service, refer to the sections for the IPNE Service Configuration Mode Commands and the IPNE Endpoint Configuration Mode Commands.

**location-service**  
*location_svc_name*

Associates a location service with this MME service. Only one location service should be associated with an MME Service.  
*location_svc_name* specifies the name for a pre-configured location service to associate with the MME service as an alphanumeric string of 1 through 64 characters. For more information about Location Services (LCS), refer to the **location-service** command in the Context Configuration Mode Commands chapter and the Location Services Configuration Mode Commands chapter.

**lte-emergency-profile**  
*profile_name*

Associates an LTE emergency profile with this MME service.  
*profile_name* specifies the name for a pre-configured LTE emergency profile to associate with the MME service as an alphanumeric string of 1 through 64 characters. For more information about the LTE emergency profile, refer to the **lte-emergency-profile** command in the LTE Policy Configuration Mode Commands chapter and the LTE Emergency Profile Configuration Mode Commands chapter.

**network-global-mme-id-mgmt-db**

Associates the configured global MME ID management database with this MME service. The global MME ID management database is configured through the LTE Policy Configuration Mode using the **network-global-mme-id-mgmt-db** command.

**sctp-param-template**  
*template_name*

Associates a Stream Control Transmission Protocol (SCTP) parameter template with this MME service.
associate

template_name specifies the name for a pre-configured SCTP parameter template to associate with this
MME service as an alphanumeric string of 1 through 63 characters. For more information on the SCTP
parameter template, refer to the sctp-param-template command in the Global Configuration Mode
Commands chapter and the SCTP Parameter Template Configuration Mode Commands chapter.

sgs-service  sgs_svc_name

Associates an SGs service with this MME service.
sgs_svc_name specifies the name for a pre-configured SGs service to associate with the MME service as an
alphanumeric string of 1 through 64 characters. For more information on the SGs service, refer to the sgs-
service command in the Context Configuration Mode Commands chapter and the MME SGs Service
Configuration Mode Commands chapter.

sgtpc-service  sgtpc_svc_name

Associates an SGTPC service with this MME service.
sgtpc_svc_name specifies the name for a pre-configured SGTPC service to associate with the MME service
as an alphanumeric string of 1 through 64 characters.

**Important:** When co-locating an SGSN and MME, the MME Service cannot be associated with the same SGTP
service that is used by the SGSN.

For more information on the SGTPC service, refer to the sgtpc-service command in the Context
Configuration Mode Commands chapter and the SGTP Service Configuration Mode Commands chapter.

context  ctx_name

Identifies a specific context name where the named service is configured. If this keyword is omitted, the
named service must exist in the same context as the MME service.
ctx_name is name of the configured context of the named service expressed as an alphanumeric string of 1
through 63 characters that is case sensitive.

subscriber-map  map_name

Associates this MME service with a pre-configured subscriber map.
map_name specifies the name of a pre-configured subscriber map to associate with the MME service as an
alphanumeric string of 1 through 64 characters. For more information on subscriber maps, refer to the
subscriber-map command in the LTE Policy Configuration Mode Commands chapter and the LTE
Subscriber Map Configuration Mode Commands chapter.

tai-mgmt-db  database_name

Associates this MME service with a pre-configured TAI Management Database.
database_name specifies the name of a pre-configured TAI Management Database to associate with the
MME service as an alphanumeric string of 1 through 64 characters. For more information on subscriber maps,
refer to the tai-mgmt-db command in the LTE Policy Configuration Mode Commands chapter and the LTE
TAI Management Database Configuration Mode Commands chapter.

**Usage**

Use this command to associate a pre-configured service or policy with an MME service.
Caution: This is a critical configuration. The MME service cannot be started without this configuration. Any change to this configuration will cause the MME service to be restarted. Removing or disabling this configuration will stop the MME service.

Example

The following command associates a pre-configured eGTP service called egtp1 in the dst_ctx context to an MME service:

associate egtp-service egtp1 context dst_ctx

The following command associates a pre-configured HSS peer service called hss1 in the same context as MME service to an MME service:

associate hss-peer-service hss1
bind s1-mme

Binds the MME service to a logical IP interface serving as the S1-MME interface.

**Important:** Before modifying this bind configuration using the `no bind s1-mme` command, we recommend that the MME Administrator use the `clear mme-service db record` command, under the Exec mode, to empty the MME records database.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service

`configure > context context_name > mme-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```
bind s1-mme { ipv4-address address [ ipv4-address secondary_address ] | ipv6-address address [ ipv6-address secondary_address ] } [ crypto-template name ] [ max-subscribers number ]
```

**no bind s1-mme**

```
no
```

Removes a previously configured IP address used for binding the SCTP (local bind address) to communicate with the eNodeBs using an S1-MME interface.

```
{ ipv4-address address [ ipv4-address secondary_address ] | ipv6-address address [ ipv6-address secondary_address ] }
```

Specifies the IP address for the interface configured as an S1-MME interface in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation. Optionally configure a secondary IP address for either address type.

```
crypto-template name
```

Specifies an existing crypto template name used when implementing IP Security (IPSec) on the S1-MME interface. *name* is an alphanumeric string of 1 through 104 characters.

```
max-subscribers number
```

Specifies the maximum number of subscribers that can access this service on this interface as an integer from 0 through 8000000.
For Release 15.0, the ASR 5500 platform supports up to 10,000,000 MME UE sessions.
**Usage**

Use this command to associate the MME service with a specific logical IP address that will be used for binding the SCTP socket that communicates with the eNodeB using S1AP. Only one IP address can be configured with this command for one MME service. The MME passes the IP address during setting up the SCTP association with the eNodeB.

**Caution:** This is a critical configuration. The MME service can not be started without this configuration. Any change to this configuration will cause the MME service to be restarted. Removing or disabling this configuration will stop the MME service.

**Important:** Up to two IPv4 or IPv6 addresses can be configured to support SCTP multi-homing.

**Example**

The following command would bind the logical IP interface with the address of 192.168.3.1 to the MME service to interact with eNodeB:

```
bind s1-mme ipv4-address 192.168.3.1
```

The following command disables a binding that was previously configured:

```
no bind s1-mme ipv4address
```
csg-change-notification

This command enables or disables the Closed Subscriber Group (CSG) Information reporting (notification) mechanism on the MME. When enabled, the MME includes the CSG Information Reporting Action IE with the appropriate Action field for subscribers.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service

configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

[ default | no ] csg-change-notification

---

default

Returns the command to its default value of disabled.

---

no

Disables the feature.

Usage

Use this command to enable or disable CSG change notification to the SGW/PGW. By default csg-change-notification is disabled; the MME does not send CSG notification to the SGW/PGW.
**dns**

Specifies the context where the Domain Name System (DNS) client service is configured for DNS query to select a P-GW, S-GW, peer SGSN or peer MME for this MME service.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service

```
configure > context context_name > mme-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```
dns { peer-mme | peer-sgsn | pgw | sgw } [ context ctx_name ]
```

```
no dns { peer-mme | peer-sgsn | pgw | sgw }
```

**no**

Removes a previously specified context having a DNS client service configured for DNS query to select a peer MME, peer SGSN, P-GW or S-GW with this MME service.

**peer-mme**

Specifies the context where a DNS client service is configured for DNS queries for selecting a peer MME.

**peer-sgsn**

Specifies the context where a DNS client service is configured for DNS queries for selecting a peer SGSN for inter-RAT handovers.

**pgw**

Specifies the context where a DNS client service is configured for DNS queries for selecting a P-GW.

**sgw**

Specifies the context where a DNS client service is configured for DNS queries for selecting an S-GW.

**context ctx_name**

Optionally associates the specific context name where the DNS client service is configured for this MME service. If this keyword is omitted, the DNS client service is configured to use the same context as this MME service.

`ctx_name` is name of the configured context of the DNS client service expressed as an alphanumeric string of 1 through 79 characters that is case sensitive.
Usage

Use this command to specify a pre-configured context where a DNS client service is configured. The DNS Client service configured in the specified context provides the DNS query support to locate peer MMEs, peer-SGSNs, P-GWs, or S-GWs for this MME service. For more information on DNS Client service and support, refer to the DNS Client Service Configuration Mode Commands chapter. A maximum of one context can be specified for each keyword.

Example

The following command associates a pre-configured context `dns_ctx1` where a DNS client service is configured for DNS query to P-GW for this MME service:

```
        dns pgw context dns_ctx1
```

The following command associates a pre-configured context `dns_ctx2` where a DNS client service is configured for DNS query to S-GW:

```
        dns sgw context dns_ctx2
```
# MME Service Configuration Mode Commands

## emm

Defines the Evolved Mobility Management timer parameters, such as timeout durations for timers and retransmission counts, for Non-Access Stratum (NAS) message retransmission in MME service.

**Product**
- MME

**Privilege**
- Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > MME Service
- `configure > context context_name > mme-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```
emm { implicit-detach-timeout detach_dur | mobile-reachable-timeout mob_reach_dur | t3412-timeout t3412_dur | t3413-timeout t3413_dur | t3422-timeout t3422_dur | t3423-timeout t3423_dur | t3450-timeout t3450_dur | t3460-timeout t3460_dur | t3470-timeout t3470_dur }

default emm { implicit-detach-timeout | mobile-reachable-timeout | t3412-timeout | t3413-timeout | t3422-timeout | t3423-timeout | t3450-timeout | t3460-timeout | t3470-timeout }
```

### default

Resets the specified timer timeout to the system default value.

### implicit-detach-timeout detach_dur

Sets the timer timeout duration (in seconds) after which subscriber will implicitly detached from the network if there is no activity. Generally this timer value is 240 seconds (4 minutes) more than the timeout value of the T3423 timer.

This timer starts when mobile reachable timer expires while the network is in EMM-IDLE mode and ISR is activated and stops when a NAS signalling connection established.

`detach_dur` is an integer from 1 through 12000. Default: 3480

### mobile-reachable-timeout mob_reach_dur

Sets the timeout timer duration (in seconds) after which reachability procedure will be discarded and reattempt starts.

`mob_reach_dur` is an integer from 1 through 12000. Default: 3480

### t3412-timeout t3412_dur

Sets the timeout duration (in seconds) for the T3412 timer. This timer is used for periodic tracking area update (P-TAU). When this timer expires, the periodic tracking area updating procedure starts and the timer is set to its initial value for the next start.

This timer starts when the UE goes from EMM-CONNECTED to EMM-IDLE mode and stops when the UE enters EMM-CONNECTED mode.
t3412_dur is an integer from 1 through 11160. Default: 3240

**t3413-timeout t3413_dur**

Sets the timeout duration (in seconds) for the T3413 timer. The timer starts when MME initiates the EPS paging procedure to the EMM entity in the network and requests the lower layer to start paging. This timer stops for the paging procedure when a response received from the UE.

t3413_dur is an integer from 1 through 20. Default: 6

**t3422-timeout t3422_dur**

Sets the timeout duration (in seconds) for the T3422 timer. This timer starts when MME initiates the detach procedure by sending a DETACH REQUEST message to the UE and stops upon receipt of the DETACH ACCEPT message.

t3422_dur is an integer from 1 through 20. Default: 6

**t3423-timeout t3423_dur**

Sets the timeout duration (in seconds) for the T3423 timer. This timer starts when UE enters the EMM-DEREGISTERED state or when entering EMM-CONNECTED mode. It stops while the UE is in EMM-DEREGISTERED.NO-CELL-AVAILABLE state and Idle mode Signalling Reduction (ISR) is activated.

t3423_dur is an integer from 1 through 11160. Default: 3240

**t3450-timeout t3450_dur**

Sets the timeout duration (in seconds) for the T3450 timer. This timer starts when MME initiates the Globally Unique Temporary Identifier (GUTI) reallocation procedure by sending a GUTI REALLOCATION COMMAND message to the UE and stops upon receipt of the GUTI REALLOCATION COMPLETE message. This timer is also used for the Tracking Area update procedure.

t3450_dur is an integer from 1 through 20. Default: 6

**t3460-timeout t3460_dur**

Sets the timeout duration (in seconds) for the T3460 timer. This timer starts when the network initiates the authentication procedure by sending an AUTHENTICATION REQUEST message to the UE and stops upon receipt of the AUTHENTICATION RESPONSE message.

t3460_dur is an integer from 1 through 20. Default: 6

**t3470-timeout t3470_dur**

Sets the timeout duration (in seconds) for the T3470 timer. The MME starts this timer when the network initiates the identification procedure by sending an IDENTITY REQUEST message to the UE and stops upon receipt of the IDENTITY RESPONSE message.

t3470_dur is an integer from 1 through 20. Default: 6

**Usage**

Use this command to set EMM timers.
The following tables describe the triggers and states for timers:
<table>
<thead>
<tr>
<th>Timer</th>
<th>State</th>
<th>Cause of Start</th>
<th>Normal Stop</th>
<th>On Expiry</th>

NOTE 1: Typically, the procedures are aborted on the fifth expiry of the relevant timer. Exceptions are described in the corresponding procedure description.

### Example

The following command sets the timeout value for EPS paging procedure timer T3413 for 10 seconds.

```
emm t3413-timeout 10
```
enb-cache-timeout

Configures the amount of time that eNodeB information is stored in cache after the eNodeB terminates the connection.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service

configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

enb-cache-timeout min

default enb-cache-timeout

(default

Returns the command to its default value of 10.

min

Specifies the amount of time (in minutes) that the MME stores eNodeB information after the eNodeB terminates the connection. min is an integer value from 1 through 1440. Default: 10

Usage

Use this command to set the amount of time the MME stores eNodeB information in cache after the eNodeB terminates the connection.

Example

The following command sets the amount of time the MME stores eNodeB information to 15 minutes:

    enb-cache-timeout 15
encryption-algorithm-lte

Configures the precedence for LTE encryption algorithms to use for security procedures through this MME service.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service

```bash
configure > context context_name > mme-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```bash
encryption-algorithm-lte priority1 { 128-eea0 | 128-eea1 | 128-eea2 } [ priority2 { 128-eea0 | 128-eea1 | 128-eea2 } ] [ priority3 { 128-eea0 | 128-eea1 | 128-eea2 } ]
```

**default encryption-algorithm-lte**

**default**
Sets the default LTE encryption algorithm for security procedures with configured priority value. Lowest value has highest preference. Default configuration of LTE encryption algorithm is:
- priority1 with 128-eea0 encryption algorithm
- priority2 with 128-eea1 encryption algorithm
- priority3 with 128-eea2 encryption algorithm

**priority1**
Specifies the preference of integrity algorithm for security procedures on this MME service as priority 1.

**priority2**
Specifies the preference of integrity algorithm for security procedures on this MME service as priority 2.

**priority3**
Specifies the preference of integrity algorithm for security procedures on this MME service as priority 3.

**128-eea0**
Sets the Null ciphering algorithm (128-EAA0) for LTE encryption as the encryption algorithm for security procedures. Default: Enabled

**128-eea1**
This keyword sets the SNOW 3G synchronous stream ciphering algorithm (128-EAA1) for LTE encryption as the encryption algorithm for security procedures. SNOW 3G is a stream cipher that forms the base of the 3GPP confidentiality algorithm UEA2 and the 3GPP integrity algorithm UIA2. Default: priority2
128-eea2
Sets the Advance Encryption Standard (AES) ciphering algorithm (128-EEA2) for LTE encryption as the encryption algorithm for security procedures. Default: priority3

Usage
Use this command to set the LTE encryption algorithms for security procedures to use with this MME service.

⚠️ Caution: When this command is executed, all the existing priority-to-algorithm mappings will be removed and the newly configured ones will be applicable for security procedures.

⚠️ Caution: Configuration of the same algorithm to multiple priorities is prohibited.

Example
The following command sets the 128-EEA1 as the LTE encryption algorithm with priority 2 for security procedures with an MME service:

```
encryption-algorithm-lte priority2 128-eea1
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**: All

**Privilege**: Security Administrator, Administrator

**Syntax**

```plaintext
end
```

**Usage**

Use this command to return to the Exec mode.
esm

Defines the Evolved Session Management timer parameters like timeout durations for timers and retransmission counts for the retransmission of Non-Access Stratum (NAS) messages in MME service.

Product: MME
Privilege: Administrator
Mode
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

esm { t3485-timeout t3485_dur | t3486-timeout t3486_dur | t3489-timeout t3489_dur | t3495-timeout t3495_dur }
default esm { t3485-timeout | t3486-timeout | t3489-timeout | t3495-timeout }

default

Sets the specified Evolved Session Management timer timeout to the system default value.

t3485-timeout t3485_dur

Sets the timeout duration (in seconds) for the T3485 timer. This timer is used by the default EPS bearer context activation procedure.
This timer starts when the MME sends an ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST message to UE and stops when it receives ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT or ACTIVATE DEFAULT EPS BEARER CONTEXT REJECT message from UE.
t3485_dur is an integer from 1 through 60. Default: 8

t3486-timeout t3486_dur

Sets the timeout duration (in seconds) for the T3486 timer. This timer is used by the default EPS bearer context modification procedure.
This timer starts when the MME sends a MODIFY EPS BEARER CONTEXT REQUEST message to the UE and stops when it receives a MODIFY EPS BEARER CONTEXT ACCEPT received or a MODIFY EPS BEARER CONTEXT REJECT message from UE.
t3485_dur is an integer from 1 through 60. Default: 8

t3489-timeout t3489_dur

Sets the timeout duration (in seconds) for the T3489 timer. This timer is used for the default EPS bearer context deactivation procedure.
This timer starts when the MME sends an ESM INFORMATION REQUEST message to the UE and stops when it receives a ESM INFORMATION RESPONSE message from the UE.
**t3495_dur** is an integer from 1 through 60. Default: 4

**t3495-timeout t3495_dur**

Sets the timeout duration (in seconds) for the T3495 timer. This timer is used for default EPS bearer context deactivation procedure. This timer starts when the MME sends a DEACTIVATE EPS BEARER CONTEXT REQUEST message to UE and stops when receives DEACTIVATE EPS BEARER CONTEXT ACCEPT or DEACTIVATE EPS BEARER CONTEXT REJECT message from UE. **t3495_dur** is an integer from 1 through 60. Default: 8

**Usage**

Use this command to set Evolved Session Management timers. The following tables describe the triggers and states for timers:

### Table 36. EPS Session Management Timers – Network Side

<table>
<thead>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**NOTE 1:** Typically, the procedures are aborted on the fifth expiry of the relevant timer. Exceptions are described in the corresponding procedure description.

This command can be repeated to set each timer as needed. The retransmission of all type of NAS messages can be configured through `nas-max-retransmissions` command.

**Example**

The following command sets the timeout value for the default EPS bearer context activation procedure timer (T3485) for 10 seconds.

```
esm t3485-timeout 10
```
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
gtpv2

Configures GTPv2 piggybacking support from the MME to the P-GW. A piggybacking flag is sent by the MME to a P-GW in the S11 “Create Session Request” message and determines whether dedicated bearer creation (Create Bearer Request) is piggybacked onto the “Create Session Response” message or not.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```
[ default | no ] gtpv2 piggybacking
```

- **default**
  Returns the command to its default setting of enabled.

- **no**
  Disables the feature.

- **piggybacking**
  Specifies that piggybacking is to be performed by the P-GW.

**Usage**

Use this command to enable the sending of a piggybacking flag to the P-GW over the S11 interface requesting that the Create Bearer Request message is piggybacked on the Create Session Response message (sent from the P-GW to the MME).

**Example**

The following command disables this feature:

```
no gtpv2 piggybacking
```
heuristic-paging

Enables or disables the heuristic or optimized paging feature for the service.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service

configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

\[context_name]host_name(config-mme-service)\

**Syntax**

```
[ default | no ] heuristic-paging [ paging-map paging_map_name ]
```

- **default**
  Returns the command to its default setting of disabled.

- **no**
  Disables the feature.

- **paging-map paging_map_name**
  Specifies the paging-map to be associated with this MME service. This keyword is only supported in Release 14.0 and higher.

**Usage**

⚠️ **Caution:** The paging profiles need to be configured prior to configuring TAI management objects (tai-mgmt-db and tai-mgmt-obj). Otherwise, the configuration would lead to high paging load in the MME node, at peak traffic time, causing service outage.

Use this command to enable or disable the heuristic paging feature for the service. Also known as idle-mode paging, enabling this feature prompts the MME service to keep track of the eNodeBs to which the access terminal (AT) most commonly attaches, thus reducing the signalling otherwise associated with continuous paging.

If no paging-map is associated when this command is issued, the default heuristic paging behavior is used (as opposed to intelligent paging behavior).

Refer to the *Heuristic and Intelligent Paging* chapter in the *MME Administration Guide* for more information about this command.
Important: Heuristic (optimized) Paging is a licensed feature and will not appear as a command option unless the proper licensed is installed.
integrity-algorithm-lte

Configures the precedence of LTE integrity algorithms to use for security procedures through this MME service. By default the integrity algorithm is enabled on MME service and cannot be disabled.

**Product**  
MME

**Privilege**  
Administrator

**Mode**  
Exec > Global Configuration > Context Configuration > MME Service  
`configure > context context_name > mme-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)##
```

**Syntax**

```
integrity-algorithm-lte priority1 { 128-eia1 | 128-eia2 } [ priority2 { 128-eia1 | 128-eia2 } ]
```

```
default integrity-algorithm-lte
```

**default**

Removes the preconfigured integrity algorithm and sets the default LTE integrity algorithm for security procedures. Default configuration of LTE integrity algorithm is:

- priority1 with 128-eia1 integrity algorithm
- priority2 with 128-eia2 integrity algorithm

```
priority1
```

Specifies the preference of integrity algorithm for security procedures on this MME service as priority 1. This is the mandatory and default priority keyword.

```
priority2
```

Specifies the preference of integrity algorithm for security procedures on this MME service as priority 2.

```
128-eia1
```

This keyword sets the SNOW 3G synchronous stream ciphering algorithm (128-EIA1) for LTE integrity as the integrity algorithm for security procedures. SNOW 3G is a stream cipher that forms the base of the 3GPP confidentiality algorithm UEA2 and the 3GPP integrity algorithm UIA2. Default: priority1

```
128-eia2
```

Sets the Advance Encryption Standard (AES) ciphering algorithm (128-EIA2) for LTE integrity as the integrity algorithm for security procedures. Default: Enabled
Usage

Use this command to set the LTE integrity algorithms for security procedures to use with this MME service.

⚠️ **Caution:** Integrity algorithm is a mandatory aspect and can not be disabled in MME service.

⚠️ **Caution:** When this command is executed, all the existing priority to algorithm mappings will be removed and the newly configured ones will be applicable for security procedures.

⚠️ **Caution:** Configuration of same algorithm to multiple priorities is prohibited.

Example

The following command sets the AES ciphering algorithms (128-EIA2) as the LTE integrity algorithm with priority as 1 for security procedures with an MME service:

```
integrity-algorithm-lte priority1 128-eia2
```
inter-rat-nnsf

Configures an NNSF (NAS Node Selection Functionality) entry to define a list of Served MMECs (MME codes) that is indicated to the eNodeB in the S1 Setup Response. This optional configuration is used to aid the eNodeB when selecting the MME for inter-rat handovers when the MME is co-located with an SGSN.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```
[no] inter-rat-nnsf collocated-mme plmn-id mcc mcc_value mnc mnc_value group-id mme_group_id mme-codes mmec
```

- **no**
  - Removes the specified NNSF entry.

- **collocated-mme**
  - Specifies that the MME is co-located with an SGSN.

- **plmn-id mcc mcc_value mnc mnc_value**
  - Specifies the PLMN-ID for this MME service.
    - `mcc`: Specifies the mobile country code (MCC) portion of the PLMN identifier as an integer from 100 through 999.
    - `mnc`: Specifies the mobile network code (MNC) portion of the PLMN identifier as a 2- or 3-digit integer from 00 through 999.

- **group-id mme_group_id**
  - Configures the group id for this MME service.
    - `mme_group_id`: must be an integer value from 0 through 65536.

- **mme-codes mmec**
  - Configures a list of MMEC (MME codes) to be used.
    - `mmec`: must be entered as a series of codes, each separated by a space, such as: 10 25 102 103 105. Each code must be an integer from 0 through 255.
    - A maximum of 16 MME Codes are allowed to be configured per inter-rat-nnsf entry.
Usage

Use this command to indicate a list of served MMECs, in addition to the one assigned to the MME service. The complete list shall be notified to the eNodeB as Served MMECs in the S1 Setup Response. This would aid the eNodeB in selecting a co-located MME during 2G/3G to 4G handovers.

When a UE moves from 2G/3G to 4G, selecting a co-located MME is not possible without some explicit configuration. In this scenario, the entire second Most-Significant-Byte of P-TMSI is copied into the MME-Code (MMEC) field. Depending on the NRI length, this could result in 'n' different MMEC values for the same NRI value.

For example:
- NRI length = 6 bits
- NRI value = 5 (Binary 00 0101)
- Possible MMECs: Binary 00 0101 xx -> {20, 21, 22, 23}

Selecting a co-located MME is only possible if the eNodeB knows that any UE meant for the above set of MMECs should be directed to a given MME. This command enables the operator to specify MMECs that can possibly be mapped from a given NRI value.

A maximum of 16 MME Codes are allowed to be configured per inter-rat-nnsf entry. This allows 4 SGSNs with NRI length of 6, or 2 SGSNs with NRI length of 5. If more than 16 MMECs are required, an alternative is to pick a dummy MME-Group-ID value and create a new nnsf-entry. The Serving MME-Group-ID could also be used for this purpose as MME-Group-Id has no significance during MME node selection.

A Maximum of 32 inter-rat-nnsf entries are allowed. Regardless of the maximum entries configured, the maximum limits placed by S1AP stack take precedence. For example, if the number of plmns configured under 'network-sharing' and 'inter-rat-nnsf' exceeds the maxnoofPLMNPerMME(32) limit set by S1AP-S1-Setup-Response, then inter-rat-nnsf entries that exceed the limit(32) do not get included in the S1 Setup Response message.

Example

For NRI length = 6; NRI Value = 10 (Binary: 00 1010), when a UE moves from 2G/3G to 4G and maps MME Code (8 bits) from P-TMSI, the MME Code value could be:

- Binary: 00 1010 xx, where xx can be binary 10 or 01 or 00 or 11
- Decimal: 40 or 41 or 42 or 43

So, all of the above values should be configured as MMECs as part of `inter-rat-nnsf`, as follows:

```
inter-rat-nnsf collocated-mme plmn-id mcc 121 mnc 102 mme-id group-id 32000 mme-codes 40 41 42 43
```

When updating an existing NNSF entry, any new MMECs must be included with the existing MMECs. For example, to add additional MMECs (48 49 50 51) to the above command, enter the entire command again as follows:

```
inter-rat-nnsf collocated-mme plmn-id mcc 121 mnc 102 mme-id group-id 32000 mme-codes 40 41 42 43 48 49 50 51
```
isr-capability

Enables or disables the Idle-mode Signaling Reduction (ISR) feature on the MME service.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service

configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```
[ no | default ] isr-capability
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Sets the ISR feature to the default setting (disabled) on MME service.</td>
</tr>
<tr>
<td>no</td>
<td>Disables the ISR feature on MME service.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to enable or disable the ISR feature on the MME service. When enabled, the MME can perform ISR functions with a peer SGSN which also supports ISR.

Refer to the Idle-mode Signaling Reduction chapter in the MME Administration Guide for more information about this command.

**Important:** This functionality is a license-controlled feature. A valid feature license must be installed to enable Idle-mode Signaling Reduction.
local-cause-code-mapping apn-mismatch

Configures the reject cause code to send to a UE when an APN mismatch occurs.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

default local-cause-code-mapping apn-mismatch

Returns the cause code mapping to its default value: esm-failure esm-cause-code unknown-apn.

Specifies the EPS Mobility Management (EMM) cause code to return when an APN mismatch occurs.

•eps-service-not-allowed-in-this-plmn
•esm-failure esm-cause-code unknown-apn - Default.
  For the esm-failure cause code only, the unknown-apn ESM code is also reported to the UE.
•no-suitable-cell-in-tracking-area
•plmn-not-allowed
•roaming-not-allowed-in-this-tracking-area
•tracking-area-not-allowed

Usage

Use this command to configure the cause code returned to a UE when an APN mismatch occurs, such as when an APN is present in the HSS subscription but the HSS subscription for this IMSI has other APNs present in the subscription. By default, the MME sends the UE the #23 - ESM Failure cause code for this condition.
Related Commands:
If a condition is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the `local-cause-code-mapping` command in the call-control-profile configuration mode. This command is described in the *Call Control Profile Configuration Mode Commands* chapter.

Example
The following command maps the “PLMN not allowed” cause code to the APN mismatch condition:

```
local-cause-code-mapping apn-mismatch emm-cause-code plmn-not-allowed
```
**local-cause-code-mapping apn-not-subscribed**

Gives the operator the option to specify the local cause-code mapping when the UE-requested APN is not subscribed.

**Product**  
MME

**Privilege**  
Security Administrator, Administrator

**Mode**  
Exec > Global Configuration > Context Configuration > MME Service  
`configure > context context_name > mme-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**  

```
local-cause-code-mapping apn-not-subscribed esm-cause-code requested-service-option-not-subscribed
```

```
default local-cause-code-mapping apn-not-subscribed
```

**Usage**

The operator can specify "Requested-Option-Not-Subscribed" cause code value #33 will be sent in the Reject message when the PDN Connectivity Request is rejected because no subscription is found. If the command option is not configured, then by default the MME uses the cause code value #27 (Unknown or Missing APN) in standalone PDN Connectivity Reject message when the UE-requested APN is not subscribed.

**Example**

The following instructs the MME to use cause code #33 ("Requested-Option-Not-Subscribed") in place of the default #27 (Unknown or Missing APN):.

```
local-cause-code-mapping apn-not-subscribed esm-cause-code requested-service-option-not-subscribed
```
local-cause-code-mapping auth-failure

Configures the reject cause code to send to a UE when an authentication failure occurs.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-mme-service) #
```

**Syntax**

```

default local-cause-code-mapping auth-failure
```

**Usage**

Use this command to configure the cause code returned to a UE when an authentication failure occurs. By default, the MME sends the UE the #3 - Illegal MS cause code when encountering a context transfer failure from an MME.

This condition occurs for TAU and ATTACH procedures in the following cases:
• The Authentication response from the UE does not match the expected value in the MME.
• Security Mode Reject is sent by the UE.
• The UE responds to any identity request with a different type of identity (ie, the MME could query for IMSI and the UE responds with IMEI).

The following are not considered for the authentication failure condition:
• HSS returning a result code other than SUCCESS.
• HSS not available.
• EIR failures.
• UE not responding to requests.

Related Commands:
If a cause code mapping is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the `local-cause-code-mapping` command in the call-control-profile configuration mode. This command is described in the Call Control Profile Configuration Mode Commands chapter.

Example
The following command maps the "network-failure" cause code to the authentication failure condition:

```
local-cause-code-mapping auth-failure emm-cause-code network-failure
```
local-cause-code-mapping congestion

Configures the reject cause code to send to a UE when a procedure fails due to a congestion condition.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service

```plaintext
configure > context context_name > mme-service service_name
```

Entering the above command sequence results in the following prompt:

```plaintext
[context_name]host_name(config-mme-service)#
```

**Syntax**

```plaintext

default local-cause-code-mapping congestion
```

Returns the cause code mapping to its default value: `emm-cause congestion esm-cause congestion`.

```plaintext
```

Specifies the EPS Mobility Management (EMM) cause code to return when a UE requests access when the system is exceeding any of its congestion control thresholds.

- **congestion** - Default
- **eps-service-not-allowed-in-this-plmn**
- **network-failure**
- **no-suitable-cell-in-tracking-area**
- **plmn-not-allowed**
- **roaming-not-allowed-in-this-tracking-area**
- **tracking-area-not-allowed**
esm-cause-code { congestion | insufficient-resources | service-option-temporarily-out-of-order }

Specifies the EPS Session Management (ESM) cause code to return when a UE requests access when the system is exceeding any of its congestion control thresholds.

- congestion - Default
- insufficient-resources
- service-option-temporarily-out-of-order

Usage

Use this command to configure the cause code returned to a UE when a UE procedure fails due to a congestion condition on the MME. By default, the MME sends the UE the #22 - Congestion EMM cause code and ESM cause code when encountering congestion.

Related Commands:

If a condition is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the local-cause-code-mapping command in the call-control-profile configuration mode. This command is described in the Call Control Profile Configuration Mode Commands chapter.

Example

The following command maps the “network failure” cause code to the congestion event:

```
local-cause-code-mapping congestion emm-cause-code network-failure
```
local-cause-code-mapping ctxt-xferr-fail-mme

Configures the reject cause code to send to a UE when a UE context transfer failure from a peer MME occurs.

Product: MME
Privilege: Administrator
Mode: Exec > Global Configuration > Context Configuration > MME Service

configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax:

default local-cause-code-mapping ctxt-xferr-fail-mme

default local-cause-code-mapping ctxt-xferr-fail-mme

Returns the cause code mapping to its default value: unknown-ue-context.

Specifies the EPS Mobility Management (EMM) cause code to return when a UE context transfer failure from an old MME occurs.

• eps-service-not-allowed-in-this-plmn
• network-failure
• no-suitable-cell-in-tracking-area
• plmn-not-allowed
• roaming-not-allowed-in-this-tracking-area
• tracking-area-not-allowed
• unknown-ue-context - Default
Usage

Use this command to configure the cause code returned to a UE when a UE context transfer failure from a peer MME occurs. By default, the MME sends the UE the #9 - MS identity cannot be derived by the network cause code for this condition.

After the peer node has been identified, the MME sends a Context Request to the peer node. If the peer node is an MME, and if the context transfer procedure fails, this condition is detected.

Related Commands:

If a cause code mapping is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the local-cause-code-mapping command in the call-control-profile configuration mode. This command is described in the Call Control Profile Configuration Mode Commands chapter.

Example

The following command maps the “network-failure” cause code to the context transfer failure from MME condition:

```
local-cause-code-mapping ctxt-xfer-fail-mme emm-cause-code network-failure
```
local-cause-code-mapping ctxt-xfer-fail-sgsn

Configures the reject cause code to send to a UE when a UE context transfer failure from a peer SGSN occurs.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:
[context_name]host_name(config-mme-service)#

Syntax

default local-cause-code-mapping ctxt-xfer-fail-sgsn

default local-cause-code-mapping ctxt-xfer-fail-sgsn

Returns the cause code mapping to its default value: unknown-ue-context.

Specifies the EPS Mobility Management (EMM) cause code to return when a UE context transfer failure from an old SGSN occurs.

• eps-service-not-allowed-in-this-plmn
• network-failure
• no-suitable-cell-in-tracking-area
• plmn-not-allowed
• roaming-not-allowed-in-this-tracking-area
• tracking-area-not-allowed
• unknown-ue-context - Default
Usage

Use this command to configure the cause code returned to a UE when a UE context transfer failure from a peer SGSN occurs. By default, the MME sends the UE the #9 - **MS identity cannot be derived by the network** cause code when encountering this condition.

After the peer node has been identified, the MME sends a Context Request to the peer node. If the peer node is an SGSN, and if the context transfer procedure fails, this condition is detected.

Related Commands:

If a cause code mapping is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the `local-cause-code-mapping` command in the call-control-profile configuration mode. This command is described in the *Call Control Profile Configuration Mode Commands* chapter.

Example

The following command maps the “network-failure” cause code to the context transfer failure from SGSN condition:

```
local-cause-code-mapping ctxt-xfer-fail-sgsn emm-cause-code network-failure
```
local-cause-code-mapping gw-unreachable

Configures the reject cause code to send to a UE when a gateway (S-GW or P-GW) does not respond during an EMM procedure.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

default local-cause-code-mapping gw-unreachable [ attach | tau ]

default local-cause-code-mapping gw-unreachable [ attach | tau ]

Returns the cause code mapping to its default value: #19 - ESM Failure cause code for Attach procedures, and no-bearers-active - #40 - NO-EPS-BEARER-CONTEXT-ACTIVATED for TAU procedures.

Specifies the EPS Mobility Management (EMM) cause code to return when a gateway does not respond.

- eps-service-not-allowed-in-this-plmn
- network-failure
- no-bearers-active
- no-suitable-cell-in-tracking-area
- plmn-not-allowed
- roaming-not-allowed-in-this-tracking-area
- tracking-area-not-allowed
[ attach [ tau ] | tau [ attach ] ] | { no-bearers-active tau }

Optionally, the MME can return separate cause codes for Attach procedures and TAU procedures. This capability is available for any of the above EMM cause codes except no-bearers-active, which can only be defined for TAU procedures.

Usage

Use this command to configure the cause code returned to a UE when a gateway does not respond. By default, the MME sends the UE the #19 - ESM Failure cause code when encountering this condition.

Defaults:
Prior to StarOS 15.0 MR5, the MME sends the UE the #19 - ESM Failure cause code when encountering this condition.
In StarOS 15.0 MR5 and higher releases, the MME sends the UE the #19 - ESM Failure cause code for Attach procedures, and #40 - NO-EPS-BEARER-CONTEXT-ACTIVATED for TAU procedures.

Related Commands:
If a cause code mapping is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the local-cause-code-mapping command in the call-control-profile configuration mode. This command is described in the Call Control Profile Configuration Mode Commands chapter.

Example

The following command maps the “network-failure” cause code to the gateway unreachable condition:

    local-cause-code-mapping gw-unreachable emm-cause-code network-failure
local-cause-code-mapping hss-unavailable

Configures the reject cause code to send to a UE when the HSS does not respond.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

remove local-cause-code-mapping hss-unavailable

default local-cause-code-mapping hss-unavailable

Returns the cause code mapping to its default value:

Specifies the EPS Mobility Management (EMM) cause code to return when the HSS does not respond.

• eps-service-not-allowed-in-this-plmn
• network-failure - Default
• no-suitable-cell-in-tracking-area
• plmn-not-allowed
• roaming-not-allowed-in-this-tracking-area
• tracking-area-not-allowed

Usage
Use this command to configure the cause code returned to a UE when the HSS does not respond. By default, the MME sends the UE the #17 - Network failure cause code when encountering this condition. This condition is detected in the following cases:

• HSS resolution fails in the MME.
• HSS does not respond in time.
The cause code configured for this condition will be signaled in TAU and ATTACH REJECT messages.

**Related Commands:**

If a cause code mapping is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the `local-cause-code-mapping` command in the call-control-profile configuration mode. This command is described in the *Call Control Profile Configuration Mode Commands* chapter.

**Example**

The following command maps the “tracking-area-not-allowed” cause code to the HSS unavailable condition:

```
local-cause-code-mapping hss-unavailable emm-cause-code tracking-area-not-allowed
```
local-cause-code-mapping newcall-policy-restrict

Configures the EPS Mobility Management (EMM) reject cause code to send to a UE when a UE requests access but the call control profile has set the call disposition to reject.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

default local-cause-code-mapping newcall-policy-restrict

default local-cause-code-mapping newcall-policy-restrict

Returns the cause code mapping to its default value: congestion.

newcall-policy-restrict emm-cause-code emm_cause_code

Specifies the EPS Mobility Management (EMM) cause code to return when a UE requests access but the call control profile has set the call disposition to reject. 

emm_cause_code must be one of the following options:

•congestion - Default.
•eps-service-not-allowed-in-this-plmn
•network-failure
•no-suitable-cell-in-tracking-area
•plmn-not-allowed
•roaming-not-allowed-in-this-tracking-area
•tracking-area-not-allowed

Usage

Use this command to configure the cause code returned to a UE when a UE procedure fails, such as when the UE requests access to a restricted zone. By default, the MME sends the UE the #22 - Congestion cause code when encountering this condition.
Example

The following command sets the “network-failure” cause code for newcall-policy-restrict calls:

```
local-cause-code-mapping newcall-policy-restrict emm-cause-code network-failure
```
local-cause-code-mapping no-active-bearers

Configures the reject cause code to send to a UE when the context received from a peer SGSN (during a TAU procedure) does not contain any active PDP contexts.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service

```
configure > context context_name > mme-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```

default local-cause-code-mapping no-active-bearers
```

Returns the cause code mapping to its default value: no-bearers-active.

```
```

Specifies the EPS Mobility Management (EMM) cause code to return when no active PDP context exists.

* eps-service-not-allowed-in-this-plmn
* network-failure
* no-bearers-active - Default
* no-suitable-cell-in-tracking-area
* plmn-not-allowed
* roaming-not-allowed-in-this-tracking-area
* tracking-area-not-allowed
Usage

Use this command to configure the cause code returned to a UE when the context received from a peer SGSN (during a TAU procedure) does not contain any active PDP contexts. By default, the MME sends the UE the #40 - No PDP context activated cause code when encountering this condition.

Related Commands:

If a cause code mapping is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the local-cause-code-mapping command in the call-control-profile configuration mode. This command is described in the Call Control Profile Configuration Mode Commands chapter.

Example

The following command maps the “plmn-not-allowed” cause code to the no active bearer condition:

```
local-cause-code-mapping no-active-bearers emm-cause-code plmn-not-allowed
```
local-cause-code-mapping peer-node-unknown

Configures the reject cause code to send to a UE when peer node resolution is not successful.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

**Syntax**

default local-cause-code-mapping peer-node-unknown

Returns the cause code mapping to its default value: unknown-ue-context

Specifies the EPS Mobility Management (EMM) cause code to return when the peer node is not known.

- eps-service-not-allowed-in-this-plmn
- network-failure
- no-suitable-cell-in-tracking-area
- plmn-not-allowed
- roaming-not-allowed-in-this-tracking-area
- tracking-area-not-allowed
- unknown-ue-context - Default

**Usage**

Use this command to configure the cause code returned to a UE when peer node resolution is not successful. By default, the MME sends the UE the #9 - MS identity cannot be derived by the network cause code when encountering this condition. During processing of a TAU Request, the resolution of a peer MME that had allocated the temporary identity that is signaled to the UE takes several steps in the MME. This resolution can be done based on DNS or based
on local configuration. This condition occurs when all mechanisms for peer node resolution are done with no success.

Related Commands:
If a cause code mapping is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the local-cause-code-mapping command in the call-control-profile configuration mode. This command is described in the Call Control Profile Configuration Mode Commands chapter.

Example
The following command maps the “plmn-not-allowed” cause code to the peer node unknown condition:

```
local-cause-code-mapping peer-node-unknown emm-cause-code plmn-not-allowed
```
local-cause-code-mapping pgw-selection-failure

Configures the reject cause code to send to a UE when a failure occurs during P-GW selection.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

default local-cause-code-mapping pgw-selection-failure

default local-cause-code-mapping pgw-selection-failure

Returns the cause code mapping to its default value: network-failure.

Specifies the EPS Mobility Management (EMM) cause code to return when a failure occurs during P-GW selection.

• eps-service-not-allowed-in-this-plmn
• network-failure - Default
• no-suitable-cell-in-tracking-area
• plmn-not-allowed
• roaming-not-allowed-in-this-tracking-area
• tracking-area-not-allowed

Usage

Use this command to configure the cause code returned to a UE when a failure occurs during P-GW selection. By default, the MME sends the UE the #17 - Network failure cause code when encountering this condition.
Related Commands:

If a cause code mapping is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the `local-cause-code-mapping` command in the call-control-profile configuration mode. This command is described in the *Call Control Profile Configuration Mode Commands* chapter.

Example

The following command maps the “plmn-not-allowed” cause code to the P-GW selection failure condition:

```
local-cause-code-mapping pgw-selection-failure emm-cause-code plmn-not-allowed
```
local-cause-code-mapping restricted-zone-code

Configures the reject cause code to send to a UE when a procedure fails.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service

configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

local-cause-code-mapping restricted-zone-code emm-cause-code { eps-service-not-allowed-in-this-plmn | no-suitable-cell-in-tracking-area | plmn-not-allowed | roaming-not-allowed-in-this-tracking-area | tracking-area-not-allowed }

default local-cause-code-mapping restricted-zone-code

default local-cause-code-mapping restricted-zone-code

Returns the cause code mapping to its default value: no-suitable-cell-in-tracking-area.

restricted-zone-code emm-cause-code emm_cause_code

Specifies the EPS Mobility Management (EMM) cause code to return when a UE requests access to a restricted zone.

emm_cause_code must be one of the following options:

- eps-service-not-allowed-in-this-plmn
- no-suitable-cell-in-tracking-area - Default.
- plmn-not-allowed
- roaming-not-allowed-in-this-tracking-area
- tracking-area-not-allowed

Usage

Use this command to configure the cause code returned to a UE when a UE procedure fails, such as when the UE requests access to a restricted zone. By default, the MME sends the UE the #15 - No Suitable Cells in Tracking Area cause code when encountering this condition.
Related Commands:

If a condition is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the `local-cause-code-mapping` command in the call-control-profile configuration mode. This command is described in the Call Control Profile Configuration Mode Commands chapter.

Example

The following command maps the “PLMN not allowed” cause code to the restricted zone code event:

```
local-cause-code-mapping restricted-zone-code emm-cause-code plmn-not-allowed
```
local-cause-code-mapping sgw-selection-failure

Configures the reject cause code to send to a UE when a failure occurs during S-GW selection.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:
[context_name]host_name(config-mme-service)#

**Syntax**

```shell

default local-cause-code-mapping sgw-selection-failure
```

**Usage**

Use this command to configure the cause code returned to a UE when a failure occurs during S-GW selection. By default, the MME sends the UE the #17 - Network failure cause code when encountering this condition.
Related Commands:

If a cause code mapping is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the `local-cause-code-mapping` command in the call-control-profile configuration mode. This command is described in the *Call Control Profile Configuration Mode Commands* chapter.

Example

The following command maps the “plmn-not-allowed” cause code to the S-GW selection failure condition:

```
local-cause-code-mapping sgw-selection-failure emm-cause-code plmn-not-allowed
```
**local-cause-code-mapping vlr-down**

Configures the cause code to send in a ATTACH ACCEPT or TAU ACCEPT to a UE that attachment to the VLR has failed because a VLR down condition is present.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service

```
configure > context context_name > mme-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```
local-cause-code-mapping vlr-down emm-cause-code { congestion | cs-domain-unavailable | imsi-unknown-in-hlr | msc-temp-unreachable | network-failure }
```

```
default local-cause-code-mapping vlr-down
```

Returns the cause code mapping to its default value: `msc-temp-unreachable`.

```
vlr-down emm-cause-code  emm_cause_code
```

Specifies the EPS Mobility Management (EMM) cause code to return when a VLR down condition is present.

`emm_cause_code` must be one of the following options:

- `congestion`
- `cs-domain-unavailable`
- `imsi-unknown-in-hlr`
- `msc-temp-unreachable` - Default.
- `network-failure`

**Usage**

Use this command to configure the cause code returned to a UE when a VLR down condition is present. By default, the MME sends the UE the #16: “**MSC temporarily not reachable**” cause code when encountering this condition.
Related Commands:

If a condition is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the `local-cause-code-mapping` command in the call-control-profile configuration mode. This command is described in the Call Control Profile Configuration Mode Commands chapter.

Example

The following command maps the “network failure” EMM cause code to the VLR down condition:

```
local-cause-code-mapping vlr-down emm-cause-code network-failure
```
**local-cause-code-mapping vlr-unreachable**

Configures the cause code to send in a ATTACH ACCEPT or TAU ACCEPT to a UE that attachment to the VLR has failed because a VLR unreachable condition is present.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service

```plaintext
configure > context context_name > mme-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```plaintext
local-cause-code-mapping vlr-unreachable emm-cause-code { congestion | cs-domain-unavailable | imsi-unknown-in-hlr | msc-temp-unreachable | network-failure }

default local-cause-code-mapping vlr-unreachable
```

**Usage**

Use this command to configure the cause code returned to a UE when a VLR unreachable condition is present. By default, the MME sends the UE the #16: “MSC temporarily not reachable” cause code when encountering this condition.
Related Commands:

If a condition is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the `local-cause-code-mapping` command in the call-control-profile configuration mode. This command is described in the Call Control Profile Configuration Mode Commands chapter.

Example

The following command maps the “network failure” EMM cause code to the VLR unreachable condition:

```
local-cause-code-mapping vlr-unreachable emm-cause-code network-failure
```
location-reporting

Enables or disables the UE location reporting function on the MME service.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service

```
configure > context context_name > mme-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```
[ no | default ] location-reporting
```

- **default**
  - Disables the location reporting feature on MME service.

- **no**
  - Disables the location reporting feature on MME service.

**Usage**

Use this command to enable or disable the UE location reporting feature on the MME service. When enabled the MME forwards a location report request for a specific UE from the P-GW to the eNodeB.

**Important:** Location reporting, also known as User Location Information (ULI) Reporting, is a licensed feature and requires the purchase of the ULI Reporting feature license.

**Example**

The following command sets the MME service to allow for location reporting for UEs:

```
location-reporting
```
mapping

Configures how the MME maps the Target RNC-ID fields to the Target eNodeB-ID and TAC fields for Inter-RAT Gn/Gp handovers.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service

`configure > context context_name > mme-service service_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-mme-service)#`

Syntax

`mapping rncid-to-enbid { maptype-default-includes-only-enb | maptype1-includes-enb-tai }`
`no mapping rncid-to-enbid`

| no |
| Sets the command to use the default value of `maptype-default-includes-only-enb`. |

| maptype-default-includes-only-enb |
| Default mapping logic |
| Maps the Target RNC-ID fields to Target eNodeB-ID fields as follows: |
| • PLMN of LAI => PLMN of MME |
| • LAC of LAI => MME Group ID |
| • RAC => Not used. |
| • RNC-ID (12 or 16bits) => Lowest 12 or 16 bits of eNB ID. |
| • TAC is picked from the list of TAIs supported by the target eNB. |

| maptype1-includes-enb-tai |
| Maps the Target RNC-ID fields to Target eNodeB-ID fields as follows: |
| • PLMN of LAI => PLMN of TAI and eNB |
| • LAC of LAI => TAC of TAI |
| • RAC => Lowest 8 bits of eNB ID |
| • RNC-ID (12bits) => Highest 12 bits of eNB ID |
Usage

Use this command to configure how the MME maps the Target RNC-ID fields to the Target eNodeB-ID and TAC fields for Inter-RAT Gn/Gp handovers.
max-bearers per-subscriber

Specifies the maximum number of EPS bearers that a subscriber may simultaneously use to access this MME service.

Product
MME
Privilege
Administrator
Mode
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

max-bearers per-subscriber max_bearer

default max-bearers per-subscriber

default

Configures the maximum EPS bearers for a subscriber to use simultaneously to the default value of 11.

max_bearer

Specifies the maximum number of EPS bearers for a subscriber may simultaneously use to access this MME service.

max_bearer is an integer from 1 through 11. Default: 11

Usage

Use this command to set the maximum number of EPS bearers that a subscriber may simultaneously use to access this MME service.

Example

The following command specifies that a maximum of 6 simultaneous EPS bearers can be facilitated for a subscriber at any given time:

max-bearers per-subscriber 6
max-paging-attempts

This command configures the maximum number of paging attempts allowed for network requested service creation to a subscriber.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

max-paging-attempts max_paging_attempts

default max-paging-attempts

default

Configures the maximum number of paging attempts to the default value of 3.

max_paging_attempts

Specifies the maximum number of paging attempts allowed for network requested service creation to a subscriber.

max_paging_attempts is an integer from 1 through 10. Default: 3

Usage

Use this command to set the maximum number of paging attempts allowed for network requested service creation to a subscriber.

When Heuristic Paging is enabled, this setting applies only to messages sent to all eNodeBs in all TAIIs present in the TAI list. Paging to the last known eNodeB and paging the TAI from which the UE was last heard is attempted only once. As a result, when max-paging-attempts is set to 3, a maximum of 5 paging retries are attempted with Heuristic Paging enabled.

Refer to the Heuristic and Intelligent Paging chapter in the MME Administration Guide for more information about Heuristic Paging.

Example

The following command specifies that a maximum of 6 paging attempt retransmissions allowed for network requested service creation to a subscriber:

max-paging-attempts 6
**max-pdns per-subscriber**

Specifies the maximum number of Packet Data Networks (PDNs) that a subscriber may simultaneously access through this MME service.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

> [context_name]host_name(config-mme-service)#

**Syntax**

```plaintext
max-pdns per-subscriber max_pdn

default max-pdns per-subscriber
default

max_pdn
```

**Usage**

Use this command to set the maximum number of PDNs that a subscriber may simultaneously access through this MME service.

**Example**

The following command specifies that a maximum of 2 simultaneous PDNs can be accessed by a subscriber at any given time through this MME service:

```plaintext
max-pdns per-subscriber 2
```
mme-id

Configures the MME identifier within an MME service. The MME identifier is constructed from the MME group ID and MME Code.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```
mme-id group-id grp_id mme-code mme_code
```

```
no mme-id
```

- **group-id grp_id**
  Specifies the group identifier for the group of which this MME belongs as an integer from 0 through 65535.

- **mme-code mme_code**
  Specifies the unique code for this MME service as an integer from 0 through 255.

**Usage**

Use this command to set the MME identifier for this MME service. This MME identifier will be the identity of this MME in network.

**Caution:** Changing or removing the MME identifier is a disruptive operation; the MME service will be re-started or removed from service.

**Example**

The following command configures the MME identifier with group id as 41025 and MME code as 101 for this MME service:

```
mme-id group-id 41025 mme-code 101
```
mmemgr-recovery

Configures the recovery action for the MME manager.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service
 configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```
mmemgr-recovery { no-reset | reset-s1-peers }
```

**Default**

```
default mmemgr-recovery
```

- **default**
  Resets the command to its default value.

- **no-reset**
  Specifies that the recovery action is to NOT reset S1 peers.

- **reset-s1-peers**
  Specifies that the recovery action is TO reset S1 peers.

**Usage**

Use this command to set a recovery action for the MME Manager.

**Example**

The following command configures the MME Manager recovery action to reset all S1 peers:

```
mmemgr-recovery reset-s1-peers
```
**msc**

Configures a Mobile Switching Center server enhanced with SRVCC (MSC) for the MME service. The MSC server acts as an endpoint for the Sv interface and is used for the Single Radio Voice Call Continuity (SRVCC) feature.

**Product**

MME

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > MME Service  
`configure > context context_name > mme-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```
msc msc_name ip-address ip_address [ offline | online ]

no msc msc_name
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>msc_name</td>
<td>Specifies a name for this peer MSC server. <code>msc_name</code> must be an alphanumeric string from 1 to 63 characters.</td>
</tr>
<tr>
<td>ip-address</td>
<td>Specifies the IP address of the peer MSC server in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.</td>
</tr>
<tr>
<td>offline</td>
<td>Mark this MSC server offline for maintenance. Once this command is issued, the MME will no longer send future handover requests to this MSC server. No GTPv2 messages are generated when offline/online mode is changed.</td>
</tr>
<tr>
<td>online</td>
<td>Mark this MSC server for online mode. Once this command is issued, the MSC server is added back into the MSC selection algorithm and normal operation is returned. By default, an MSC server is online unless the offline keyword is specified.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to configure a peer MSC server used during SRVCC handovers. This command also can also be used to mark an MSC server offline for maintenance.
Example

For Release 15.0 and higher:
The following command defines an MSC server `mscwest` with an IPv4 address of `10.2.3.4`:

```
msc mscwest ip-address 10.2.3.4
```

The following command marks the above MSC server offline:

```
msc mscwest ip-address 10.2.3.20 offline
```

The following command defines a default MSC server with an IPv4 address of `10.2.3.20`. The MME will select the default when MSC pool areas are not configured, or when an MSC address fails to be returned.

```
msc default ip-address 10.2.3.20
```

For Release 14.0 and earlier:
The following command specifies an IPv4 address for the peer MSC server as `10.2.3.4`:

```
msc 10.2.3.4
```
nas-max-retransmission

Sets the retransmission counter for all type of Non-Access Stratum (NAS) messages in an MME service.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

nas-max-retransmissions nas_retrans_count

default nas-max-retransmissions

default

 Resets the retransmission counter to the default value of 4.

pack_retrans_count

Sets the maximum number of retransmission of NAS messages permitted during any procedure after which the activation procedure will be discarded.

pack_retrans_count is an integer from 1 through 10. Default: 4

Usage

Use this command to set maximum number of retries allowed for any type of NAS messages.

NAS Messages sent by the MME which require a response from the UE for procedure completion are retransmitted. Retransmission happens based on timer expiry. The timers are configured through the emm and esm commands. NAS messages are retransmitted per configuration, and if no response is received from the UE, the pending transaction is abandoned. If the transaction is a DETACH or PDN DISCONNECT REQUEST, the transaction is completed without further UE signaling.

The timeout duration configured through the emm and esm commands will be applicable between two retries.

Example

The following command sets the maximum number of retries allowed as 4 for all type of NAS messages in an MME service.

default nas-max-retransmissions
network-sharing

Configures additional PLMN IDs for this MME service. Refer to the plmn-id command to create the base PLMN identifier for an MME service. Each PLMN ID consists of the Mobile Country Code (MCC) and Mobile Network Code (MNC). A maximum of four network sharing entries can be configured per MME service. These PLMN IDs will be communicated to the eNodeBs in the S1 SETUP response and MME CFG Update messages.

Product
- MME

Privilege
- Administrator

Mode
- Exec > Global Configuration > Context Configuration > MME Service
- configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

Syntax

```
network-sharing plmn-id mcc number mnc number mme-id group-id id mme-code code
```

```
no network-sharing plmn-id mcc number mnc number
```

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disables the network sharing mode on this MME service.</td>
</tr>
</tbody>
</table>

⚠️ **Caution:** Removing the PLMN identifier is a disruptive operation; the MME service will be restarted.

```
plmnid mcc number mnc number
```

Sets the mobile country code (MCC) and mobile network code (MNC) of the PLMN ID for this service.

- **mcc number:** Specifies the MCC portion of the PLMN identifier as an integer from 100 through 999.
- **mnc number:** Specifies the MNC portion of the PLMN identifier as a 2- or 3-digit integer from 00 through 999.

```
mme-id group-id id
```

Specifies the group identifier for the group to which this MME belongs as an integer from 0 through 65535.

```
mme-code code
```

Specifies the unique code for an MME service as an integer from 0 through 255.

Usage

Use this command to configure additional PLMN IDs for an MME service. In a given MME service, each PLMN ID (MCC and MNC) must be unique.
⚠️ **Caution:** Changing or removing the PLMN identifier is a disruptive operation; the MME service will be restarted.

**Example**

The following command configures the network sharing parameters to an MCC of 123, an MNC of 12, a MME-ID/Group ID of 100, and a MME code of 50:

```
network-sharing plmnid mcc 123 mnc 12 mme-id group-id 100 mme-code 50
```
nri

Configures the network resource identifier (NRI) length used for source SGSN discovery via NRI-FQDN (Fully Qualified Domain Name) based DNS resolution.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```
[ no ] nri length length plmn-id mcc mcc_value mnc mnc_value
```

<table>
<thead>
<tr>
<th>no</th>
<th>Removes a configured NRI length.</th>
</tr>
</thead>
<tbody>
<tr>
<td>length length</td>
<td>Specifies the number of bits to be used in the P-TMSI (bits 23 to 18) to define the NRI as an integer from 1 through 8.</td>
</tr>
<tr>
<td>plmn-id mcc mcc_value mnc mnc_value</td>
<td>Specifies the PLMN-ID of the SGSN pool. mcc mcc_value: Specifies the mobile country code (MCC) portion of the PLMN identifier as an integer from 100 through 999. mnc mnc_value: Specifies the mobile network code (MNC) portion of the PLMN identifier as a 2- or 3-digit integer from 00 through 999.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to retrieve the NRI (identity of an SGSN) stored in bits 23 to 18 of the packet-temporary mobile subscriber identity (P-TMSI). Up to eight NRI length values can be configured.

**Important:** In the absence of this configuration, the MME treats the NRI as invalid. The MME will use a plain RAI-based FQDN (and not an NRI-based FQDN) for DNS queries made to resolve the source SGSN.

**Example**

The following command creates an NRI length of 5 and associates it with an SGSN pool with the PLMN-ID of 123:

```
nri length 5 plmnid mcc 123 mnc 23
```
peer-mme

Configures parameters that, when matched by another MME, specifies that MME as a peer for inter-MME relocations.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service

configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

peer-mme { gummei mcc number mnc number group-id id mme-code code address ipv4_address |
   tai-match priority value mcc number mnc number tac { area_code | any | start_area_code to
   end_area_code } address ipv4_address }

no peer-mme { gummei mcc number mnc number group-id id mme-code code | tai-match priority
   value

no

Removes the configured peer Globally Unique MME Identifier (GUMMEI) or TAI match priority from this service.

---

gummei mcc number mnc number group-id id mme-code code address ipv4_address

Specifies that an MME with values matching those configured in this GUMMEI is to be considered a peer MME. This variable supports the lookup of an IP address for a peer MME based on the exact match of the supporting keyword below (which make up the GUMMEI).
mcc number: Sets the mobile country code (MCC) for peer match as an integer from 100 through 999.
mnc number: Sets the mobile network code (MNC) for this peer match as a 2- or 3-digit integer from 00 through 999.
group-id id: Specifies the group identifier for the group to which this MME belongs as an integer from 0 through 65535.
mme-code code: Specifies the unique code for an MME service as an integer from 0 through 255.
address ipv4_address: Specifies the IP address of the peer MME in IPv4 dotted-decimal notation.

---

tai-match priority value mcc number mnc number tac { area_code | any |
   start_area_code to end_area_code } address ipv4_address

Specifies that an MME with values matching those configured in this Tracking Area Identifier (TAI) match, is to be considered a peer MME. This keyword provides a priority-ordered list of TAI descriptions where the Tracking Area Code (TAC) field may be either an exact value, a range of values, or a “wildcard” value. It also provides an IP address of the peer MME corresponding to the TAI description.
priority value:
mcc number: Sets the mobile country code (MCC) for peer match as an integer from 100 through 999.
mnc number: Sets the mobile network code (MNC) for this peer match as an integer from 00 through 999.

tac area_code: Sets a specific Tracking Area Code (TAC) for the peer MME match as an integer from 1 through 65535.

tac any: Specifies that any TAC value can be considered for a peer MME.

tac start_area_code to end_area_code: Specifies a range of TACs. MMEs within this range and matching the rest of the criteria in this command are to be considered peer MMEs. start_area_code and end_area_code are integers from 1 through 268435455.

address ipv4_address: Sets a specific IP address for this TAI peer MME match in IPv4 dotted-decimal notation.

Usage

Use this command to configure parameters that, when matched by another MME, specifies that MME as a peer for inter-MME relocations.

This command allows configuration for two relocation scenarios:

• gummei: an MME receives either an Attach or a TAU request with a Globally Unique Temporary Identity (GUTI) that originated from another MME.

• tai-match: an MME receives an S1 Handover Required message and must select a new MME based on the TAI.

Up to 32 peer-mme gummei or tai-match entries may be configured per MME service.

Example

The following command identifies a peer MME with GUMMEI parameters:

peer-mme gummei mcc 123 mnc 12 group-id 40000 mme-code 100 address 10.2.3.4
peer-sgsn

Statically configures peer SGSN environments to facilitate MME-SGSN relocations over S3 or Gn/Gp interfaces.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service

```
configure > context context_name > mme-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```
peer-sgsn rai mcc mcc_value mnc mnc_value [ nri value ] rac value lac value address ip_address capability [ gn ] [ gp ] [ s16 ] [ s3 ]
```

```
no peer-sgsn rai mcc mcc_value mnc mnc_value [ nri value ] rac value lac value
```

```
peer-sgsn rnc-id mcc mcc_value mnc mnc_value rnc value address ip_address capability [ gn ] [ gp ] [ s16 ] [ s3 ]
```

```
no peer-sgsn rnc-id mcc mcc_value mnc mnc_value rnc value
```

**rai**

Configures Routing Area Identity (RAI) parameters used to facilitate a lookup for a specific peer SGSN.

**rnc-id**

Configures Radio Network Controller Identification (RNC-ID) parameters used to facilitate a lookup for a specific peer SGSN.

**mcc mcc_value**

Specifies the mobile country code (MCC) portion of the PLMN identifier as an integer from 100 through 999.

**mnc mnc_value**

Specifies the mobile network code (MNC) portion of the PLMN identifier as a 2- or 3-digit integer from 00 through 999.

**nri value**

Specifies the Network Resource Identifier (NRI) value used as an additional identity along with the RAC within the RAI parameters as an integer from 0 through 65535.
### MME Service Configuration Mode Commands

**peer-sgsn**

---

**rac value**

Specifies the Routing Area Code (RAC) used to facilitate a lookup for a specific peer SGSN as an integer from 0 through 255.

---

**rnc value**

Specifies the Radio Network Controller (RNC) identification number used to facilitate a lookup for a specific peer SGSN as an integer from 0 through 65535.

---

**lac value**

Specifies the Location Area Code (LAC) value used to facilitate a lookup for a specific peer SGSN as an integer from 0 through 65535.

---

**address ip_address**

Specifies an existing IP address of the peer SGSN in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

---

**capability [ gn ] [ gp ] [ s16 ] [ s3 ]**

Configures the GTP interface capability of the peer SGSN.

- **gn**: Specifies that the peer SGSN is capable of communication over the Gn interface.
- **gp**: Specifies that the peer SGSN is capable of communication over the Gp interface.
- **s16**: Specifies that the peer SGSN is capable of communication over the S16 interface.
- **s3**: Specifies that the peer SGSN is capable of communication over the S3 interface.

---

**Usage**

Use this command to configure parameters that, when matched by an SGSN, specifies that SGSN as a peer for inter-RAT relocations.

This command allows configuration for two relocation scenarios:

- **rai**: the lookup of an IP address for a peer MME based on the exact match of the RAI (and optionally NRI).
- **rnc-id**: the lookup of an IP address for a peer SGSN based on the exact match of the RNC-ID.

Multiple peer-sgsn RNC-ID records can be configured for the same MCC/MNC/RNC, each with different IP addresses. During a handover, if the initial peer SGSN rejects the forward relocation request, the MME will step through any alternate peer SGSNs to attempt the handover.

Up to 32 peer-SGSN RAI and RNC-ID entries may be configured per MME service.

---

**Example**

The following command configures an SGSN lookup using RNC-ID parameters with Gn interface capability:

```
peer-sgsn rnc-id mcc 123 mnc 12 rnc 2000 address 10.2.3.4 capability gn
```
pgw-address

Configures the IPv4 or IPv6 address of the PDN Gateway (P-GW), specifies the protocol for S5 and S8 interfaces, and sets other parameters within the MME service. By default S5 and S8 use GTP protocol for this.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

pgw-address ip_address [ s5-s8-protocol pmip ] [ weight weight ]

no pgw-address address [ s5-s8-protocol pmip ]

no

Removes a previously configured IP address for a P-GW along with the S5 and S8 interface of P-MIP protocol type, and other parameters from this MME service.

address

Specifies the IP address of the P-GW in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

s5-s8-protocol pmip

Specifies that Proxy-MIP is to be used for S5 and S8 interfaces with the P-GW. By default S5 and S8 interface uses GTP protocol.

pmip Sets the protocol to Proxy-MIP for S5 and S8 interface.

weight weight

Specifies the weight (preference) assigned to the address P-GW for load balancing. weight is an integer from 1 through 100 where 1 is the least preferred and 100 is the most preferred. If no weight is specified, the P-GW address is assigned a default weight of 1.

If a weight is assigned to an address, the weights of the P-GW(s) (that are operational) are totaled, and then a weighted round-robin selection is used to distribute new primary PDP contexts among the P-GW(s) according to their weights. As with all weighted round-robin algorithms, the distribution does not look at the current distribution, but simply uses the weights to distribute new requests. For example, two P-GWs assigned weights of 70 and 30 would distribute 70% of calls to one, and 30% to the other. The sum of all weights do not need to total 100.
Usage

Use this command to configure the PDN Gateway (P-GW) addresses to use with MME service. This command also changes the default protocol from GTP to P-MIP for the S5 and S8 interface, and assigns a weight to use when sharing the load between associated P-GWs. A maximum of 16 P-GW addresses can be configured with this command.

This command only changes the use of protocol for the S5 and S8 interface. By default a P-GW uses GTP protocol for S5 and S8 interfaces. This command allows an operator to change the protocol to P-MIP for S5 and S8 interface.

When weight is used, the weights of the operational P-GW(s) are totaled and then weighted round-robin selection is used to distribute new default bearer contexts among P-GW(s).

Example

The following command associates the P-GW IP address of 192.168.3.1 to the MME service with S5 and S8 protocol as P-MIP and weight as 90:

```
pgw-address 192.168.3.1 s5-s8-protocol pmip weight 90
```

The following command removes the above configured P-GW IP address and other parameters:

```
no pgw-address 192.168.3.1 s5-s8-protocol pmip
```
plmn-id

Configures the Public Land Mobile Network (PLMN) identifier for this MME service. The PLMN identifier consists of the Mobile Country Code (MCC) and Mobile Network Code (MNC). A single PLMN ID can be configured per MME service.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

**Syntax**

```
plmn-id mcc mcc_value mnc mnc_value
no plmn-id mcc mcc_value mnc mnc_value
```

no

Removes the configured PLMN identifier for this MME service.

⚠️ **Caution:** Removing the PLMN identifier is a disruptive operation; the MME service will be restarted.

**mcc mcc_value**

Specifies the mobile country code (MCC) portion of the PLMN identifier as an integer from 100 through 999.

**mnc mnc_value**

Specifies the mobile network code (MNC) portion of the PLMN identifier as a 2- or 3-digit integer from 00 through 999.

**Usage**

Use this command to set the PLMN identifier for this MME service.

⚠️ **Caution:** Changing or removing the PLMN identifier is a disruptive operation; the MME service will be restarted.

One PLMN identifier is supported per MME service.

⚠️ **Important:** To configure additional PLMN IDs for this MME service, refer to the `network-sharing` command described in this chapter.
Example

The following command configures the PLMN identifier with MCC value as 102 and MNC value as 20 for this MME service:

```plaintext
plmn-id mcc 102 mnc 20
```
policy attach

Configures parameters for the UE Attach procedure.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service

```bash
configure > context context_name > mme-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```

default policy attach { imei-query-type | set-ue-time }
```

**default**

Returns the command to its default setting of `none` for `imei-query-type` and `disabled` for `set-ue-time`.

**imei-query-type { imei | imei-sv | none }**

Configures the IMEI query type for UE attach.

- **imei**: Specifies that the MME is required to query the UE for its International Mobile Equipment Identity (IMEI).
- **imei-sv**: Specifies that the MME is required to query the UE for its International Mobile Equipment Identity - Software Version (IMEI-SV).
- **none**: Specifies that the MME does not need to query for IMEI or IMEI-SV.

**verify-equipment-identity [ allow-on-eca-timeout | deny-greylisted | deny-unknown | verify-emergency ]**

Specifies that the identification (IMEI or IMEI-SV) of the UE is to be performed by the Equipment Identity Register (EIR) over the S13 interface.

- **allow-on-eca-timeout**: Configures the MME to allow equipment that has timed-out on ECA during the attach procedure.
- **deny-greylisted**: Configures the MME to deny grey-listed equipment during the attach procedure.
- **deny-unknown**: Configures the MME to deny unknown equipment during the attach procedure.
- **verify-emergency**: Configures the MME to ignore the IMEI validation of the equipment during the attach procedure in emergency cases. This keyword is only supported in release 12.2 and higher.
set-ue-time { disable | enable [ prefer-mme | prefer-msc ] }

Configures the MME to set the time in the UE during the Attach procedure. Default: disabled.
[ prefer-mme | prefer-msc ]: Specifies which UE-time to use when delivering EMM messages to the UE for cases when a UE performs combined registration.
- prefer-mme: The MME shall always send its UE-time information (based on the MME’s own settings), and ignore any EMM Information messages sent by the MSC.
- prefer-msc: In cases where a successful Location Update is performed to a MSC, the MME shall NOT send MME configured information to the UE, and shall transmit only MSC-sent information. In cases where a Location Update procedure is not required (for example, for UEs that are performing EPS only ATTACH), or in cases where the Location Update Procedure is unsuccessful, the MME shall send the MME configured information.

Usage

Use this command to configure various MME settings used during the UE Attach procedure.

Example

The following command configures the MME to query the UE for its IMEI and to verify the UEs equipment identity over the S13 interface with an EIR:

    policy attach imei-query-type imei verify-equipment-identity
policy idle-mode

Configures the user-defined policies of session management for an LTE subscriber in an MME service.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service

`configure > context context_name > mme-service service_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-mme-service)#`

**Syntax**

```
policy idle-mode detach { explicit | implicit }
[ default ] policy idle-mode detach
```

- `default`
  Sets the policy of idle mode detach for a subscriber to its default behavior as implicit.

- `idle-mode detach`
  Configures the IDLE mode Detach behavior of a UE.

- `detach`
  Defines the Detach procedure while the UE is in IDLE mode.

- `explicit`
  Enables the Explicit Detach while a UE is in IDLE mode. The system will page the UE before Detach procedure is started, and then perform the Explicit Detach procedure. Default: Enabled

- `implicit`
  Enables the Implicit Detach while a UE is in IDLE mode. The system never sends any message to the UE before Detach, and executes the Implicit Detach procedure immediately. Default: Disabled

**Usage**

Use this command to set the user-defined policies for session management in this MME service.

**Example**

The following command sets the Idle Mode Detach policy to Implicit for a user in this MME service:

```
policy idle-mode detach implicit
```
policy inter-rat

Configures inter-RAT policy settings.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```
policy inter-rat { ignore-sgsn-context-id | indirect-forwarding-tunnels always | select-topologic-sgw }

no policy inter-rat { ignore-sgsn-context-id | indirect-forwarding-tunnels | select-topologic-sgw }
```

**no**
Disables the function.

**ignore-sgsn-context-id**
Configures the MME to ignore any Context-ID mismatch between HSS and HLR and to use the Context-ID from the HSS to override the Context-ID from the source SGSN. If this option is disabled (default), the MME will drop the PDN when there is a Context-ID mismatch.

**indirect-forwarding-tunnels always**
Enables establishment of Indirect Data Forwarding Tunnels (IDFT) for Gn/Gp-based Serving Radio Network Subsystem (SRNS) relocations. By default, the MME is configured to never establish IDFT.

**select-topologic-sgw interface gn**
Configures the MME to select the S-GW based on topological closeness to the P-GW for Gn/Gp handoff scenarios. Weighted distribution will occur across node pairs in the same degree and same order. By default this functionality is disabled.
During inter-RAT Gn/Gp based handoffs, the MME does not learn the P-GW host name from the old Gn/Gp SGSN as part of UE context. Without the P-GW host name, selection of the topologically closest S-GW is not possible per 3GPP standards. This functionality enables the MME to use a proprietary mechanism for learning the P-GW host name. For S3 & S10 cases, there is no need to enable this command, as GTPv2 allows the P-GW host name to be communicated to/from S4-SGSN/MME.
This functionality requires the **gw-selection co-location or gw-selection topology** commands to be enabled in the call-control-profile mode.
Note: The P-GW is anchored in the inter-RAT handoff scenarios, so regardless of the preferred weight specified in `gw-selection`, the MME always considers the S-GW’s weight for weighted distribution purposes.

**Usage**

Use this command to enable or disable establishment of indirect data forwarding tunnels for Gn/Gp-based SRNS relocations, and to enable or disable Context-Identifier overriding, and to enable or disable learning the P-GW host name during Gn/Gp handoffs for purposes of topologically-close S-GW distribution.

**Example**

The following command enables establishment of indirect data forwarding tunnels for Gn/Gp-based SRNS relocations:

```
policy inter-rat indirect-forwarding-tunnels always
```
policy network

Configures the MME to indicate to the P-GW that all peer SGSNs support dual-addressing for bearers and, subsequently, dual-addressing must be supported for all IPv4 and IPv6 PDNs. Dual-addressing on SGSNs is based on the UE’s capability to support inter-RAT roaming.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

[ default | no ] policy network dual-addressing-supported

---

default
Returns the command to its default setting of disabled.

---

no
Removes the ability to send dual-addressing support messaging from the MME to the P-GW.

---

dual-addressing-supported
Specifies that the MME shall indicate to the P-GW that dual-addressing is supported.

Usage
Use this command to configure the MME to send messaging to the P-GW that indicate that all peer SGSNs support dual-addressing for bearers and, subsequently, dual-addressing must be supported for all IPv4 and IPv6 PDNs.

---

Important: This command can be used for Pre-release 8 and Release 8 SGSNs.
policy overcharge-protection

Enables overcharge protection where the MME can detect and signal a Loss of Signal Contact to the S-GW which in turn informs the P-GW to stop charging.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service

`configure > context context_name > mme-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```
policy overcharge-protection slap-cause-code-group group_name
[ default | no ] policy overcharge-protection
```

**default**

Returns the command to its default setting of disabled. This provides the same behavior as the `no` keyword option.

**no**

Disables overcharge protection. This provides the same behavior as the `default` keyword option.

```
slap-cause-code-group group_name
```

`group_name`: Specify the name of a preconfigured S1-AP Cause Code Group.

When the received cause code from the eNodeB matches any the cause codes defined in this Cause Code Group, the MME sets the ARRL (Abnormal Release of Radio Link) bit in the Indication IE of the Release Access Bearer Request to the S-GW.

For more information about creating an S1-AP Cause Code Group, refer to the `cause-code-group` command in the LTE Policy Configuration Mode Commands chapter, and the `class` command in the SIAP Cause Code Configuration Mode Commands chapter.

**Usage**

**Important**: Overcharge protection is a license-controlled feature. A valid feature license must be installed prior to configuring this feature. Contact your Cisco account representative for more information.

Use this command to enable or disable overcharging protection for this MME service. When enabled, the MME can detect and signal a Loss of Signal Contact to the S-GW which in turn informs the P-GW to stop charging for the UE.
Refer to the *Overcharging Protection* chapter of the *MME Administration Guide* for more information about this feature.

**Example**

The following command enables overcharging protection for the S1-AP cause code defined in the S1AP Cause Code Group *group1*:

```
policy overcharge-protection s1ap-cause-code-group group1
```
policy overload

Configures the traffic overload policy to control congestion in this service.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```
policy overload { drop | reject }
default policy overload
```

---

**default**
Sets the traffic overload policy action to the fault behavior of Reject.

**drop**
 Specifies that the system is to drop the incoming packets with new session requests to avoid overload on MME node. Default: Disabled

**reject**
 Configures the system to reject the new session/call request and responds with a reject message when the threshold for allowed call sessions is crossed on the MME node. Default: Enabled

**Usage**

Use this command to set the user-defined policies for new call connection attempts when an MME service is overloaded.

Congestion policies at the service-level can be configured for an individual service. When congestion control functionality is enabled, these policies dictate how services respond when the system detects that a congestion condition threshold has been crossed.

**Example**

The following command sets the nw call connect policy to reject the new session/call request in an MME service:

```
policy overload reject
```
policy pdn-reconnection

Configures the action by the MME when a PDN connection request to an already connected APN is being processed by the MME service.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

policy pdn-reconnection { multiple | reject | restart }

[ default ] policy pdn-reconnection

---

default
Sets the policy for PDN reconnection to its default behavior of Reject.

multiple
Allows multiple connections to a PDN with the same APN and PDN Type. In this case, the existing connection is left unchanged, and the MME attempts to establish an additional connection to the PDN. Default: Disabled

reject
Configures the MME to deny or reject the request, by sending a PDN Connection Reject command. This is the default behavior. Default: Enabled

restart
Deletes the existing connection and initiates an attempt to establish a new connection. Default: Disabled

Usage

Use this command to set the user-defined policies for PDN reconnection attempt procedures initiated by a UE in an MME service.

While attached the UE can request connections to PDNs. The PDNs are identified by APN (Access Point Name) and PDN Type (ipv4, ipv6 or ipv4v6).

If the UE requests connection to a PDN for which a connection with the same APN name and PDN type already exists, the MME can: 1) deny or reject the request, by sending a PDN connection reject command; 2)
allow multiple connections to a PDN with same APN and PDN Type; or 3) delete the existing connection, and attempt to establish a new connection.

**Example**

The following command sets the PDN reconnect policy to delete the existing PDN and start the attempt to establish a new connection in an MME service:

```
policy pdn-reconnection restart
```
policy s1-reset

Configures how the MME responds to an S1 interface reset.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service

configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

policy s1-reset { detach-ue | idle-mode-entry }

default policy s1-reset

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns the command to its default setting of idle-mode-entry.</td>
</tr>
</tbody>
</table>

| { detach-ue | idle-mode-entry } |
|-------------------------------|
| Specifies the action to perform when the S1 interface is reset. |
| detach-ue: Specifies that UEs are to be implicitly detached from the service upon S1 interface reset. |
| idle-mode-entry: Specifies that UEs are to be placed into an idle mode condition during S1 interface reset. |

Usage
Use this command to configure how the MME reacts to an S1 interface reset condition.

Example
The following command configures the MME to place UEs into an idle state while the S1 interface is being reset:

s1-reset idle-mode-entry
policy sctp-down

Configures how the MME responds to a failure of the Stream Control Transmission Protocol (SCTP) connection from the eNodeB.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service

configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

policy sctp-down { detach-ue | idle-mode-entry }

default policy sctp-down

default

Returns the command to its default setting of idle-mode-entry.

{ detach-ue | idle-mode-entry }

Specifies the action to perform when the SCTP connection from the eNodeB fails.

detach-ue: Specifies that UEs are to be detached from the service upon SCTP failure.

idle-mode-entry: Specifies that UEs are to be placed into an idle mode condition upon SCTP failure.

Usage

Use this command to configure how the MME reacts to an SCTP connection failure condition.

Example

The following command configures the MME to place UEs into an idle state while the SCTP connection from the eNodeB fails:

sctp-down idle-mode-entry
policy service-request

Configure the behavior of the MME when an initial context setup failure is received during a service request or extended service request procedure.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

policy service-request initial-context-setup-failure slap-cause-code-group group_name action idle-mode-entry

default policy service-request initial-context-setup-failure

default

Returns the command to its default behavior, where it detaches the UE when an initial context setup failure is received during a service request or extended service request procedure.

initial-context-setup-failure slap-cause-code-group group_name action idle-mode-entry

Configures the behavior of the MME when an initial context failure is received from the eNodeB during a service request or extended service request. By default, the MME detaches the UE. This command configures the MME to move the UE to IDLE MODE instead.

group_name: Specify the name of a preconfigured Cause Code Group. The MME takes the configured action to move the UE to IDLE MODE when the cause code returned from the eNodeB matches any of the cause codes defined in this Cause Code Group.

Refer to the cause-code-group command in the LTE Policy Configuration Mode Commands chapter, and the class command in the S1AP Cause Code Configuration Mode Commands chapter for more information.

action idle-mode-entry : Configures the MME to move the UE to IDLE MODE when the cause code returned from the eNodeB matches any of the cause codes in the specified S1-AP cause code group.

Usage

Use this command to configure the behavior of the MME when an initial context setup failure is received during a service request or extended service request procedure.

Example

The following command configures the MME to detach the UE when an initial context failure occurs and the eNodeB returns a cause code which matches any of the cause codes configured in the idle S1-AP cause code group:
policy service-request initial-context-setup-failure s1ap-cause-code-group idle action idle-mode-entry
policy tau

Configures parameters for the tracking area update (TAU) procedure.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```
policy tau { imei-query-type { imei | imei-sv | none } | verify-equipment-identity [ allow-on-eca-timeout | deny-greylisted | deny-unknown | verify-emergency ] } | initial-context-setup-failure slap-cause-code-group group_name action detach-ue | set-ue-time { disable | enable [ prefer-mme | prefer-msc ] } }
```

```
default policy tau { imei-query-type | initial-context-setup-failure | set-ue-time }
```

**default**

Returns the command to its default settings:

```
imei-query-type: none
initial-context-setup-failure: Returns the MME to the default behavior, where it moves the UE to IDLE MODE when an initial context setup failure is received during a TAU procedure.
set-ue-time: disabled
```

**imei-query-type { imei | imei-sv | none }**

Configures the IMEI query type for TAUs.

- **imei**: Specifies that the MME is required to query the UE for its International Mobile Equipment Identity (IMEI).
- **imei-sv**: Specifies that the MME is required to query the UE for its International Mobile Equipment Identity - Software Version (IMEI-SV).
- **none**: Specifies that the MME does not need to query for IMEI or IMEI-SV.

**verify-equipment-identity [ allow-on-eca-timeout | deny-greylisted | deny-unknown | verify-emergency ]**

Specifies that the identification (IMEI or IMEI-SV) of the UE is to be performed by the Equipment Identity Register (EIR) over the S13 interface.

- **allow-on-eca-timeout**: Configures the MME to allow equipment that has timed-out on ECA during the attach procedure.
- **deny-greylisted**: Configures the MME to deny grey-listed equipment during the attach procedure.
- **deny-unknown**: Configures the MME to deny unknown equipment during the attach procedure.

- **verify-emergency**: Configures the MME to ignore the IMEI validation of the equipment during the attach procedure in emergency cases. This keyword is only supported in release 12.2 and higher.

```bash
initial-context-setup-failure slap-cause-code-group group_name action detach-ue
```

Configures the behavior of the MME when an initial context failure is received from the eNodeB during the processing of a TAU request. By default, the MME moves the UE to IDLE MODE. This keyword configures the MME to detach the UE.

- **group_name**: Specify a preconfigured Cause Code Group. The MME takes the configured action to detach the UE when the cause code returned from the eNodeB matches any of the cause codes defined in this Cause Code Group.

- **action detach-ue**: Configures the MME to detach the UE when the cause code returned from the eNodeB matches any of the cause codes in the specified S1-AP cause code group.

```bash
set-ue-time { disable | enable [ prefer-mme | prefer-msc ] }
```

Configures the MME to set the time in the UE during the TAU procedure. Default: disabled.

- **[ prefer-mme | prefer-msc ]**: Specifies which UE-time to use when delivering EMM messages to the UE for cases when a UE performs combined registration.

- **prefer-mme**: The MME shall always send its UE-time information (based on the MME’s own settings), and ignore any EMM Information messages sent by the MSC.

- **prefer-msc**: In cases where a successful Location Update is performed to a MSC, the MME shall NOT send MME configured information to the UE, and shall transmit only MSC-sent information. In cases where a Location Update procedure is not required (for example, for UEs that are performing EPS only ATTACH), or in cases where the Location Update Procedure is unsuccessful, the MME shall send the MME configured information.

**Usage**

Use this command to configure various MME settings used during the tracking area update (TAU) procedure.

**Example**

The following command configures the MME to query the UE for its IMEI and to verify the UEs equipment identity over the S13 interface with an EIR:

```bash
policy tau imei-query-type imei verify-equipment-identity
```

The following command configures the MME to detach the UE when an initial context failure occurs and the eNodeB returns a cause code which matches any of the cause codes configured in the “detach” S1-AP cause code group:

```bash
policy tau initial-context-setup-failure slap-cause-code-group detach action detach-ue
```
pool-area

Creates an MSC server pool area for the Sv interface or specifies an existing pool area, and enters MME MSC Server Pool Area Configuration Mode.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service

configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service) #
```

**Syntax**

```plaintext
pool-area pool_area_name type { hash-value | round-robin }

no pool-area pool_area_name
```

**no**
Removes the configured pool-area for this MME service.

```plaintext
pool_area_name
```
Specifies the name of the pool-area as an alphanumeric string of 1 through 63 characters.

```plaintext
type { hash-value | round-robin }
```
Defines the MSC server selection scheme, either:

**hash-value**: The MME selects the MSC server based on the result of the IMSI \([\text{IMSI} \div 10] \mod 1000\].

**round-robin**: The MME selects the MSC server based on the round-robin scheme.

**Usage**

Use this command to create an MSC server pool area for the Sv interface or specify an existing pool area configuration and enter the MME Pool Area Configuration Mode.

The command also defines the MSC server selection method for the pool area, using either the IMSI hash value, or round-robin.

This command is also used to remove an existing pool area.

A maximum of 24 pool areas can be configured per MME service.

When configured, the MME attempts to select an MSC using the following selection order:

1. Pool area that matches the PLMN and of type hash.
2. Pool area that matches the PLMN and of type round-robin.
3. Pool area that does not have PLMN associated and of type hash.
4. Pool area that does not have PLMN associated and of type round-robin.

Entering this command results in one of the following prompts, based on the pool selection method specified:
Additional commands are defined in the *MME MSC Server Pool Area Configuration Mode Commands* chapter.

**Example**

The following command defines a pool area named `msc_pool_east` and configures it for the round robin selection mode.

```
pool-area msc_pool_east type round-robin
```
**relative-capacity**

Configures a relative capacity variable that is sent to the eNodeB for use in selecting an MME in order to load balance the pool.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service

```bash
configure > context context_name > mme-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)#
```

**Syntax**

```bash
relative-capacity number
```

**default relative-capacity**

```
default
```

Returns the command to its default setting of 255.

```
number
```

Specifies the relative capacity or weight of an MME compared to others in an MME pool as an integer from 0 through 255.
Default: 255

**Usage**

Use this command to configure the relative capacity or weight of this MME in comparison to other MMEs in a pool. This value is sent to the eNodeB in the S1AP S1 SETUP RESPONSE message. If this value is changed after the S1 interface is initialized, the MME CONFIGURATION UPDATE message is used to update the eNodeB with the change.

**Example**

The following command sets this MME with a relative capacity or weight of 100:

```bash
relative-capacity 100
```
### s1-mme ip

Configures the quality of service (QoS) differentiated service code point (DSCP) used when sending packets of a particular 3GPP QoS class over the S1-MME interface.

**Product**
MME

**Privilege**
Administrator

**Mode**

```
Exec > Global Configuration > Context Configuration > MME Service
configure > context context_name > mme-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mme-service)>
```

**Syntax**

```
s1-mme ip qos-dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 |
| af42 | af43 | be | cs0 | cs1 | cs2 | cs3 | cs4 | cs5 | cs6 | cs7 | ef }

default s1-mme ip qos-dscp
```

**qos-dscp**

```
qos-dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 |
| af42 | af43 | be | cs0 | cs1 | cs2 | cs3 | cs4 | cs5 | cs6 | cs7 | ef }
```

Default: af11

Specifies the DSCP for the specified QoS traffic pattern. *qos-dscp* can be configured to any one of the following:

- **af11**: Assured Forwarding 11 per-hop-behavior (PHB)
- **af12**: Assured Forwarding 12 PHB
- **af13**: Assured Forwarding 13 PHB
- **af21**: Assured Forwarding 21 PHB
- **af22**: Assured Forwarding 22 PHB
- **af23**: Assured Forwarding 23 PHB
- **af31**: Assured Forwarding 31 PHB
- **af32**: Assured Forwarding 32 PHB
- **af33**: Assured Forwarding 33 PHB
- **af41**: Assured Forwarding 41 PHB
- **af42**: Assured Forwarding 42 PHB
- **af43**: Assured Forwarding 43 PHB
- **be**: Best effort forwarding PHB
- **cs0**: Class Selector 0 PHB
- **cs1**: Class Selector 1 PHB
- **cs2**: Class Selector 2 PHB
- **cs3**: Class Selector 3 PHB
- **cs4**: Class Selector 4 PHB
- **cs5**: Class Selector 5 PHB
- **cs6**: Class Selector 6 PHB
- **cs7**: Class Selector 7 PHB
ef: Expedited forwarding PHB

Usage

DSCP levels can be assigned to specific traffic patterns to ensure that packets are delivered according to the precedence with which they are tagged. The diffserv markings are applied to the IP header of every subscriber packet transmitted over the S1-MME interface(s).

Example

The following command sets the DSCP-level for traffic sent over the S1-MME interface to af12:

```
s1-mme ip qos-dscp af12
```
s1-mme sctp port

Configures the source Stream Control Transmission Protocol (SCTP) port that will be used for binding the SCTP socket to communicate with the eNodeB using S1AP with this MME service.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service

configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

s1-mme sctp port port_num

default s1-mme sctp port

default

Sets the SCTP port to the default value of 36412 to communicate with the eNodeBs using S1-MME interface.

port_num

Specifies the SCTP port number to communicate with the eNodeBs using S1-MME interface as an integer from 1 through 65535. Default: 36412

Usage

Use this command to assign the SCTP port with SCTP socket to communicate with the eNodeB using S1AP. Only one SCTP port can be associated with one MME service.

Example

The following command sets the default SCTP port number 699 for to interact with eNodeB using S1AP on S1-MME interface:

    default s1-mme sctp port
setup-timeout

Configures the timeout duration for setting up MME calls in this MME service.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service

configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

setup-timeout dur

default setup-timeout

default
Sets the call setup timeout duration to the default value of 60 seconds.

dur
Specifies the call setup timeout duration (in seconds) for MME calls after which the attempt will be discarded.
dur is an integer from 1 through 10000. Default: 60

Usage

Use this command to configure the timeout duration for setting up an MME call with an MME service. Once this timer expires, the call setup procedure will be discarded within this MME service.

Example

The following command sets the default setup timeout duration of 60 seconds for MME calls:

default setup-timeout
snmp trap

Enables or disables the SNMP trap for S1 interface connection establishment.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME Service

    configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

    [context_name]host_name(config-mme-service)#

**Syntax**

    [ default | no ] snmp trap { s1-initial-establishment | s1-path-establishment }

---

**default**

Returns the command to its default setting of disabled.

---

**no**

Disables the SNMP trap.

---

**s1-initial-establishment**

Specifies that the SNMP trap for the initial S1 interface connection establishment is to be enabled or disabled.

---

**s1-path-establishment**

Specifies that the SNMP trap for the S1 path establishment is to be enabled or disabled.

---

**Usage**

Use this command to enable or disabled the SNMP trap for S1 interface connection establishment.
ue-db

Configures the UE database that is maintained by the MME as a cache of EPS contexts per UE keyed by IMSI/GUTI to allow the UE to attach by a Globally Unique Temporary Identity (GUTI) and reuse previously established security parameters. This cache will be maintained in each session manager where the first attach occurred for the UE.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME Service

configure > context context_name > mme-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mme-service)#

Syntax

ue-db purge-timeout dur_mins

default ue-db purge-timeout

Usage
Use this command to set timeout duration for MME to hold UE database information in cache memory. The MME DB acts as a cache for storing subscriber related information. This subscriber related information helps reduce signaling traffic. The MME DB is a part of the Session Manager and interfaces between the Session Manager Application and Evolved Mobility Management Manager to provide access to the cached data.

Example
The following command configures the MME database cache timer to hold the UE information up to 7 days (10080 minutes) in the MME Database:

default ue-db purge-timeout
Chapter 218
MME SGs Service Configuration Mode Commands

The MME SGs Service Configuration Mode is used to create and manage the LTE Mobility Management Entity (MME) SGs services on this system. The SGs service creates an SGs interface between the MME and a Mobile Switching Center/Visitor Location Register (MSC/VLR).

Mode

Exec > Global Configuration > Context Configuration > MME SGs Service Configuration

`configure > context context_name > sgs-service service_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-sgs-service)#`

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
associate

Associates or disassociates a Stream Control Transmission Protocol (SCTP) parameter template with the SGs service.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME SGs Service Configuration

configure > context context_name > sgs-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgs-service)#

Syntax

associate sctp-param-template template_name

no associate sctp-param-template

no

Removes the SCTP parameter template association.

template_name

Associates an SCTP parameter template with the SGs service.

.template_name specifies the name for a pre-configured SCTP parameter template to associate with this SGs service as an alphanumeric string of 1 through 63 characters. For more information on the SCTP parameter template, refer to the sctp-param-template command in the Global Configuration Mode Commands chapter and the SCTP Parameter Template Configuration Mode Commands chapter.

Usage

Use this command to associate a pre-configured SCTP parameter template with the SGs service.

⚠️ Caution: This is a critical configuration. Any change to this configuration will cause the SGs service to restart.

ℹ️ Important: If no SCTP parameter template is specified, all default settings for the configurable parameters in the SCTP Parameter Template Configuration Mode apply.

Example

The following command associates a pre-configured SCTP parameter template called sctp-3 to the SGs service:

associate sctp-param-template sctp-3
**bind**

Binds the service to a logical IP interface serving as the SGs interface.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME SGs Service Configuration

```
configure > context context_name > sgs-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgs-service)#
```

**Syntax**

```
bind { ipv4-address ipv4_address [ ipv4-address ipv4_address ] | ipv6-address ipv6_address [ ipv6-address ipv6_address ] }
```

**no bind**

Removes the interface binding from this service.

```
no bind
```

**ipv4-address ipv4_address [ ipv4-address ipv4_address ]**

Specifies the IP address of the SGs interface in IPv4 dotted-decimal notation. A secondary IPv4 address can be configured to support SCTP multi-homing.

```
ipv4-address ipv4_address [ ipv4-address ipv4_address ]
```

**ipv6-address ipv6_address [ ipv6-address ipv6_address ]**

Specifies the IP address of the SGs interface in IPv6 colon-separated-hexadecimal notation. A secondary IPv6 address can be configured to support SCTP multi-homing.

```
ipv6-address ipv6_address [ ipv6-address ipv6_address ]
```

**Usage**

Associate the SGs service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an SGs interface that provides the session connectivity for circuit switched fallback (CSFB) to/from a Mobile Switching Center/Visitor Location Register (MSC/VLR). Only one interface can be bound to a service. The interface should be configured prior to issuing this command.

**Caution:** This is a critical configuration. Any change to this configuration will cause the SGs service to restart. Removing or disabling this configuration will stop the SGs service.

**Example**

The following command binds the logical IP interface with the IPv4 address of 192.68.10.22 to the SGs service:

```
bind ipv4-address 192.68.10.22
```
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
non-pool-area

Configures a non-pool area where a group of Location Area Code (LAC) values use a specific visitor Location Register (VLR).

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME SGs Service Configuration

configure > context context_name > sgs-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgs-service)#

Syntax

non-pool-area name use-vlr vlr_name [ lac value(s) ] [ plmnid { any | mcc mcc_value mnc mnc_value } ]

no non-pool-area name [ lac value(s) ]

no non-pool-area name [ lac value(s) ]

Removes the configured non-pool-area from this service. Optionally, removes a specific LAC or LACs from this non-pool area. name is the name of an existing non-pool-area expressed as an alphanumeric string of 1 through 63 characters. value(s) is an existing LAC integer value from 1 through 65535.

name

Specifies the name of the non-pool area as an alphanumeric string of 1 through 63 characters.

use-vlr vlr_name

Specifies the VLR to be used in this non-pool area configuration as an alphanumeric string of 1 through 63 characters.

lac value(s)

Specifies the location area code or codes to be used with the configured VLR in this non-pool area configuration. value(s) is an integer(s) from 1 through 65535.
In Release 12.2 and later, a maximum of 96 areas can be added per non pool area (in a single line, or separately). In older releases, a total of 16 area codes can be added (in a single line, or separately).

plmnid { any | mcc mcc_value mnc mnc_value }

Specifies the Public Land Mobile Network (PLMN) identifier to be used with the VLR in this non-pool area configuration.
any: Specifies that any PLMN ID can be used with the VLR in this configuration.
**mcc mcc_value mnc mnc_value:** Specifies the mobile country code (MCC) and mobile network code (MNC) of the PLMN identifier. `mcc_value` must be an integer from 101 through 998. `mnc_value` must be a 2- or 3-digit integer from 00 through 998.

### Usage

Use this command to configure a non-pool area where LAC values and/or PLMN IDs are associated with a specific VLR.

In Release 12.2 and later, a maximum of 48 combined non pool areas and pool areas can be created. In older releases, a maximum of 8 combined non pool areas and pool areas can be created.

### Example

The following command creates a non-pool area named `svlr1` associated with a VLR named `vlr1` and containing LAC values of 1, 2, 3, 4, 5, 6, 7, and 8:

```
non-pool-area svlr1 use-vlr vlr1 lac 1 2 3 4 5 6 7 8
```
pool-area

Creates a location area code (LAC) pool area configuration or specifies an existing pool area and enters the LAC Pool Area Configuration Mode.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME SGs Service Configuration

```
configure > context context_name > sgs-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgs-service)#
```

**Syntax**

```
[ no ] pool-area pool_name [ -noconfirm ]
```

- **no**
  Removes the selected pool area configuration from the SGs service.

- **pool_name**
  Specifies the name of the LAC pool area configuration. If `pool_name` does not refer to an existing pool, a new pool is created. `pool_name` must be an alphanumeric string of 1 through 64 characters.

**Usage**

Use this command to enter the LAC Pool Area Configuration Mode for an existing pool area configuration or for a newly defined pool area configuration. This command is also used to remove an existing pool area configuration.

In Release 12.2 and later, a maximum of 48 combined pool areas and non pool areas can be created. In older releases, a maximum of 8 combined pool areas and non pool areas can be created.

Entering this command results in the following prompt:

```
[context_name]host_name(config-sgs-pool-area)#
```

LAC Pool Area Configuration Mode commands are defined in the *MME LAC Pool Area Configuration Mode Commands* chapter.

**Example**

The following command enters the LAC Pool Area Configuration Mode for a new or existing pool area configuration named `pool1`:

```
pool-area pool1
```
sctp

Configures the Stream Control Transmission Protocol (SCTP) port number for this service.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME SGs Service Configuration

`configure > context context_name > sgs-service service_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-sgs-service)#`

**Syntax**

```
sctp port port_number

no sctp
```

---

**no**

Removes the SCTP configuration for this service.

---

**port port_number**

Specifies the SCTP port number used to communicate with the MSC/VLR using the SGs interface as an integer from 1 through 65535.

---

**Usage**

Use this command to assign the SCTP port with SCTP socket to communicate with the MSC/VLR through the SGs interface. A maximum of one SCTP port can be associated with one SGs service.

**Example**

The following command sets the SCTP port to 29118 for this service:

```
sctp port 29118
```
tac-to-lac-mapping

Maps any Tracking Area Code (TAC) value or a specific TAC value to a LAC value.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME SGs Service Configuration
configure > context context_name > sgs-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgs-service)#

Syntax

```
tac-to-lac-mapping { any-tac | tac value } map-to lac value +
no tac-to-lac-mapping { any-tac | { tac value } + }
```

```
any-tac | tac value
```

Specifies the TAC to map to the LAC.

any-tac: Specifies that any TAC value is to be mapped to the specified LAC.

```
tac value
```

Maps a specific TAC value to a LAC value expressed as an integer from 1 through 65535. For specific TAC values, multiple mappings can be entered on the same line (see Example).

```
map-to lac value
```

Specifies the LAC value that the selected TAC value, or any TAC value is mapped as an integer from 1 through 65535. For specific TAC values, multiple mappings can be entered on the same line (see Example).

Usage

Use this command to map TAC values to LAC values.
Enter up to 8 mappings per line.
In Release 12.2 and later, a maximum of 64 mapping lists can be created. In older releases, a maximum of 32 mapping lists can be created.
If no mapping is entered, the default behavior is TAC equals LAC.

Example

The following command maps a TAC value of 2 to a LAC value of 3, a TAC value of 4 to a LAC value of 5, and a TAC value of 6 to a LAC value of 7:

```
tac-to-lac-mapping tac 2 map-to lac 3 tac 4 map-to lac 5 tac 6 map-to lac 7
```
**timer**

Configures the SGs-AP timer values.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MME SGs Service Configuration

```plaintext
configure > context context_name > sgs-service service_name
```

Entering the above command sequence results in the following prompt:

```plaintext
[context_name]host_name(config-sgs-service)#
```

**Syntax**

```plaintext
timer { ts6-1 value | ts10 value | ts12-1 value | ts12-2 value | ts13 value | ts8 value | ts9 value }
default timer { ts10 | ts12-1 | ts12-2 | ts13 | ts6-1 | ts8 | ts9 }
```

Returns the timer to its default setting.

**ts10 value**

Specifies the Ts10 timer value (in seconds) as an integer from 1 through 30. This timer is used to guard the Implicit IMSI detach from non-EPS services procedure. Default: 4.

**ts12-1 value**

Specifies the Ts12-1 timer value (in seconds) as an integer from 8 through 23048. This timer is used to control the reset of the 'MME-Reset' variable. It is expected to take a value greater than the longest periodic tracking area update timer running on the MME, plus the transmission delay on the radio interface. Default: 36000.

**ts12-2 value**

Specifies the Ts12-2 timer value (in seconds) as an integer from 1 through 120. This timer is used to guard the MME reset procedure. There is one Ts12-2 timer per VLR for which the MME has an SGs association. Default: 4.

**ts13 value**

Specifies the Ts13 timer value (in seconds) as an integer from 1 through 30. This timer configures the retransmission interval for sending SGs message SGsAP-EPS-DETACH-INDICATION to MSC/VLR due to an Implicit IMSI detach from EPS services. If no SGsAP-EPS-DETACH-ACK is received, the MME will resend SGsAP-EPS-DETACH-INDICATION message upon expiry of this timer. Default: 4.
**ts6-1 value**

Specifies the Ts6-1 timer value (in seconds) as an integer from 10 through 90. This timer is used to guard the Location Update procedure. It is expected to take a value greater than 2 times the maximum transmission time in the SGs interface, plus the supervision timer of the Update Location procedure (as defined in 3GPP TS 29.002 [15]).

Default: 15.

**ts8 value**

Specifies the Ts8 timer value (in seconds) as an integer from 1 through 30. This timer is used to guard the Explicit IMSI detach from EPS services procedure.

Default: 4.

**ts9 value**

Specifies the Ts9 timer value (in seconds) as an integer from 1 through 30. This timer guards the Explicit IMSI detach from non-EPS services procedure.

Default: 4.

**Usage**

Use this command to configure the SGs-AP timers.

**Example**

The following command sets the SGs-AP Ts6-1 timer to 20 seconds:

```
timer ts6-1 20
```
vlr

Configures the Visitor Location Register (VLR) to be used by this service.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > MME SGs Service Configuration
configure > context context_name > sgs-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgs-service)#

Syntax

vlr vlr_name { ipv4-address ipv4_address [ ipv4-address ipv4_address ] | ipv6-address ipv6_address [ ipv6-address ipv6_address ] } port port_number

no vlr vlr_name

no

Removes the configured VLR from this service.

vlr_name

Specifies the name of the VLR as an alphanumeric string of 1 through 63 characters.

ipv4-address ipv4_address [ ipv4-address ipv4_address ]

Specifies the IP address of the VLR in IPv4 dotted-decimal notation.
A secondary IPv4 address can be configured to support SCTP multi-homing.

ipv6-address ipv6_address [ ipv6-address ipv6_address ]

Specifies the IPv6 address of the VLR. ipv6_address must be entered in colon-separated-hexadecimal notation.
A secondary IPv6 address can be configured to support SCTP multi-homing.

port port_number

Specifies the SCTP port number as an integer from 1 through 65535.

Usage

Use this command to configure the VLR used by this SGs service.
In Release 12.2 and later, a maximum of 48 separate VLRs can be created. In older releases, a maximum of 32 separate VLRs can be created.
Each individual VLR can be defined with up to 10 separate associations to a single MSS pool. Each of these associations support SCTP multi-homing by defining a primary/secondary IP address. Application layer
messages are transmitted to the first available association for a particular VLR. If a complete failure of the underlying SCTP layer for a given association (for example, both SCTP paths in a multi-homed configuration) occurs, the VLR association is removed as a candidate for application message transmission until it recovers. A given MMS (VLR) will remain available as long as at least one related association remains available.

Example

The following command configures a VLR to be used by this service with a name of `vlr1`, with an SCTP multi-homed primary IPv4 address of 10.2.3.4, a secondary IPv4 address of 10.2.10.1, and a port number of 29118:

```
vlr vlr1 ipv4-address 10.2.3.4 ipv4-address 10.2.10.1 port 29118
```
Chapter 219
MPLS-IP Configuration Mode Commands

The MPLS-IP Configuration Mode is used for configuration of Multiprotocol Label Switching (MPLS) IP forwarding specific parameters. This mode is entered from the Context Configuration Mode.

Mode

Exec > Global Configuration > Context Configuration > MPLS-IP Configuration
configure > context context_name > mpls-ip

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mpls)#

⚠️ **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
**protocol ldp**

Creates or removes the MPLS label distribution protocol (LDP) configuration, or configures an existing protocol and enters the MPLS-LDP Configuration Mode in the current context. This command configures the protocol parameters for MPLS LDP.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MPLS-IP Configuration

```bash
configure > context context_name > mpls-ip
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mpls)#
```

**Syntax**

```
[ no ] protocol ldp
```

```
no
```

Removes the configured MPLS-LDP mode from MPLS-IP Configuration mode.

**Usage**

Use this command to create/ or remove the MPLS LDP configuration, or configure an existing protocol. If required mode already exists it enters the MPLS-LDP Configuration Mode in the current context. Entering this command results in the following prompt:

```
[context_name]host_name(config-ldp)#
```

The commands configured in this mode are defined in the *MPLS-LDP Configuration Mode Commands* chapter.

**Example**

The following command creates and enters the MPLS-LDP Protocol mode:

```
protocol ldp
```
Chapter 220
MPLS-LDP Configuration Mode Commands

The MPLS-LDP Configuration Mode is used to configure Label Distribution Protocol (LDP) specific parameters for MPLS-IP forwarding.

Mode

Exec > Global Configuration > Context Configuration > MPLS-IP Configuration > MPLS-LDP Configuration

configure > context context_name > mpls-ip > protocol ldp

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ldp)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
advertise-labels

Configures the Label Advertisement parameters.

Product
GGSN
P-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > MPLS-IP Configuration > MPLS-LDP Configuration
configure > context context_name > mpls-ip > protocol ldp

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ldp)#

Syntax
[ no ] advertise-labels { explicit-null | implicit-null }

default advertise-labels

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Disables the label advertisement parameters.</td>
</tr>
</tbody>
</table>

**default**
Advertises the labels from the label space allocated for LDP protocol.

**explicit-null**
Advertises the Explicit NULL label for all the prefixes.

**implicit-null**
Advertises the Implicit NULL label for all the prefixes.

Usage
Use this to configure advertisement of the Implicit NULL or Explicit NULL label for all the prefixes advertised by the system in this context.

Example
The following command configures the MPLS-IP forwarding to advertise the Explicit NULL label for all the prefixes:

```
advertise-labels explicit-null
```

The following command configures the MPLS-IP forwarding to advertise the Implicit NULL label for all the prefixes:

```
advertise-labels implicit-null
```
advertise-labels implicit-null
discovery

Configures the Label Distribution Protocol (LDP) neighbor discovery parameters.

Product

GGSN
P-GW
SAEGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > MPLS-IP Configuration > MPLS-LDP Configuration

configure > context context_name > mpls-ip > protocol ldp

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ldp)#

Syntax

```
discovery { hello { hello-interval integer_value | hold-interval integer_value } | transport-address ipv4_addr } | default discovery hello

no discovery transport-address
```

---

default

Sets the LDP discovery hello interval at 5 seconds and hold interval at 15 seconds.

---

no

Disables the LDP neighbor discovery.

---

`hello { hello-interval integer_value | hold-interval integer_value }`

Configures the LDP Hello parameters.

- `hello-interval` configures the frequency of sending the Discovery Hello packets in seconds. `integer_value` is an integer from 5 through 21845.
- Default: 5

- `hold-interval` configures the Discovery Hold time interval in seconds. `integer_value` is an integer from 15 through 65535.
- Default: 15

---

`transport-address ipv4_addr`

Configures the LDP transport address as an IPv4 address entered in dotted-decimal notation. Transport address is the same as the LDP router ID.
Usage
This is an optional command that is used to configure LDP peer discovery parameters. The LDP discovery hold-interval is always set to three times the LDP discovery hello-interval. Transport address is the address used for the TCP session over which LDP is running. If the transport address is not configured, the LDP router-id is used as transport address. Any update to transport address will take effect only if LDP is disabled and re-enabled. The “default” option sets the hello intervals to the default values.

Example
The following command sequence configures the LDP peer discovery parameters:

```
  discovery hello hello-interval 10
  discovery hello hold-interval 30
  discovery transport-address 10.2.3.4
```
enable

Enables the Label Distribution Protocol (LDP).

**Product**

- GGSN
- P-GW
- SAEGW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > MPLS-IP Configuration > MPLS-LDP Configuration

```bash
configure > context context_name > mpls-ip > protocol ldp
```

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-ldp)#
```

**Syntax**

```
[ no ] enable
```

- **no**
  
  Disables the LDP protocol.

**Usage**

This command is used to enable or disable the LDP protocol. By default the LDP protocol is disabled.

**Example**

Use the following command to enable the LDP protocol:

```
enable
```
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
**router-id**

Configures the Label Distribution Protocol Router ID.

**Product**
GGSN
P-GW
SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MPLS-IP Configuration > MPLS-LDP Configuration

```
configure > context context_name > mpls-ip > protocol ldp
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-idp)#
```

**Syntax**

```
router-id ipv4_addr
no router-id
```

- **no**
  - Disables the router ID.

- **ipv4_addr**
  - Must be an IPv4 address entered in dotted-decimal notation.

**Usage**

This command is used to configure the LDP router-id. This is an optional parameter. If the ID is not configured, the largest operational loopback address is selected as the LDP router ID. If LDP has started, any change will take effect only after disabling and enabling LDP.

**Example**

The following command sequence configures an LDP router ID:

```
router-id 10.2.3.4
```
### session

Configures the LDP session parameters.

#### Product
- GGSN
- P-GW
- SAEGW

#### Privilege
- Security Administrator, Administrator

#### Mode
**Exec > Global Configuration > Context Configuration > MPLS-IP Configuration > MPLS-LDP Configuration**

```bash
configure > context context_name > mpls-ip > protocol ldp
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ldp)#
```

#### Syntax

```text
session timers { hold-interval integer_value | keepalive-interval integer_value }
```

```text
default session timers
```

- **default**
  
  Configures the default values for hold-interval parameter at 45 and keepalive-interval parameter at 15.

- **timers**
  
  Configures the LDP session keepalive parameters.

  ```text
  hold-interval integer_value
  ```

  Configures the session hold time interval in seconds.  
  `integer_value` is an integer from 45 through 65535.  
  Default: 45

  ```text
  keepalive-interval integer_value
  ```

  Configures the frequency of sending keepalive packets in seconds.  
  `integer_value` is an integer from 15 through 21845.  
  Default: 15

#### Usage

This optional command is used to configure LDP session timers. LDP session hold-interval is always set to three times the LDP session keepalive-interval. The “default” option sets the session keepalive and hold intervals to the default values.

#### Example

The following command sequence configures the LDP session parameters:
session timers keepalive-interval 30
session timers hold-interval 45
default session timers
Chapter 221
MRME Service Configuration Mode Commands

The MRME Service Configuration Mode provides commands to enable a trusted WLAN network to provide access to the Evolved Packet Core (EPC) using a AAA peer functionality.

Exec > Global Configuration > Context Configuration > MRME Service Configuration
configure > context context_name > mrme-service mrme_service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mrme-service)#

Important: Available commands or keywords/variables vary based on platform type, product version, and installed license(s).
attribute

This command allows you to include SSID and Calling-Station-Id AVP values as part of DER messages over STa Interfaces.

Product
SaMOG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > MRME Service Configuration

configure > context context_name > mrme-service mrme_service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mrme-service)#

Syntax

attribute sta { anid { ssid | ssid-wlan-prefix | wlan-string } | calling-station-id { imsi | ue-mac } }

default attribute sta { anid | calling-station-id }

default

Sets the configuration to its default value.

Default calling-station-id: imsi
Default anid: wlan-string

anid { ssid | ssid-wlan-prefix | wlan-string }

Specifies to include the information from the ANID AVP in the DER message.

ssid: Include the SSID information from the ANID AVP.
ssid-wlan-prefix: Include the SSID WLAN prefix information from the ANID AVP.
wlan-string: Include the WLAN string information from the ANID AVP.

calling-station-id { imsi | ue-mac }

Specifies to include the calling station ID in the DER message.

imsi: Include the IMSI information.
ue-mac: Include the UE MAC information.

Usage

Use this command to include the received SSID and Calling-StationId-Id values in the ANID/Calling-StationId-Id AVP as part of DER messages over STa Interfaces.

Example

The following command includes ue-mac information from the calling-station-id in the DER message.

attribute sta calling-station-id ue-mac
bind

This command allows you to configure an IPv4 address to be used as the connection point for establishing SAMOG sessions for handling authentication and accounting messages.

**Product**
SaMOG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MRME Service Configuration
configure > context context_name > mrme-service mrme_service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mrme-service)#
```

**Syntax**

```
bind address ipv4_address [ auth-port auth_port_number ] [ acct-port acct_port_number ] [ max-subscribers max_subscriber_number ]
```

**no bind**

```
no
```

Removes a previously configured binding.

```
address ipv4_address
```

**Important:** Currently, MRME supports IPv4 address only.

Specifies the IP address of an interface to be used as the connection point for establishing SAMOG sessions. `ipv4_address` must be an IPv4 address expressed in dotted-decimal notation.

**Important:** To define more than one NAS IP address per context, in Global Configuration Mode use the `aaa large-configuration` command.

```
auth-port auth_port_number
```

Specifies the authentication port number of the interface where authentication requests are received. The system binds the default authentication port to 1812. In addition to the authentication port, the accounting port and maximum subscriber limit can also be configured optionally. `auth_port_number` must be an integer from 1 through 65535.

```
acct-port acct_port_number
```

Specified the accounting port number of the interface where accounting requests are received. The system binds the default accounting port to 1813.
In addition to the accounting port, the maximum subscriber limit can also be configured optionally. 
acct_port_number must be an integer from 1 through 65535.

max-subscribers max_subscriber_number

Specifies the maximum number of subscriber sessions allowed.
max_subscriber_number must be an integer from 0 through 4,000,000.

Usage
Use this command to configure the IPv4 address to be used as the connection point for establishing SAMOG sessions for handling authentication and accounting messages.

Example
The following command binds the service with an IP address of 196.10.2.3 with a accounting port number of 58 and maximum subscriber limit of 1000.

bind address 196.10.2.3 acct-port 58 max-subscribers 1000
**disconnect**

This command allows you to specify the delay duration before which the call is disconnected.

**Product**
SaMOG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MRME Service Configuration

```
configure > context context_name > mrme-service mrme_service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mrme-service)#
```

**Syntax**

```
disconnect { delay-time seconds | wait-time seconds }

[ default ] disconnect { delay-time | wait-time }
```

**default**

Configures this command to its default setting.

- **delay-time** default: 30 seconds
- **wait-time** default: 10 seconds

**delay-time seconds**

Specifies to configure the timer to retain the session on receiving an Accounting Stop, and for roaming scenarios, session continuity on receiving an Accounting Start.

`seconds` must be an integer from 1 through 60.

**wait-time seconds**

Specifies to configure the timer to wait for accounting start message from the new WLC after processing the accounting stop message from the old WLC.

`seconds` must be an integer of 10 through 300.

**Usage**

Specifies to configure the timer to wait for accounting stop message after triggering a Disconnect Req Message to WLC for an SAMOG session.

**Example**

The following command sets the disconnect wait time to 60 seconds.

```
disconnect wait-time 60
```
dns-pgw

This command allows you to configure the source context in which the DNS client is configured, or enable/disable PGW selection based on topology and load-balancing of PGWs, based on weights from DNS.

**Product**
SaMOG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MRME Service Configuration
configure > context context_name > mrme-service mrme_service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mrme-service)#
```

**Syntax**

```
dns-pgw { context context_name | selection { topology [ weight ] | weight } } { default | no } dns-pgw { context | selection { topology [ weight ] | weight } }
```

- **default**
  Returns the command to its default value.
  - **default dns-pgw context**: MRME will fetch the dns-client configuration from the current context.
  - **default dns-pgw selection topology**: MRME will perform PGW selection based on the topology.

- **no**
  If previously configured, deletes the dns-pgw configuration.

- **context context_name**
  Specifies to configure the source context in which the DNS client is configured.
  - **context_name** must be an alphanumeric string of 1 through 79 characters.

- **selection { topology [ weight ] | weight }**
  Specifies to enable/disable PGW selection based on topology and load-balancing of PGWs based on weights from DNS.

**Usage**

Use this command to configure the source context in which the DNS client is configured, or enable/disable PGW selection based on topology and load-balancing of PGWs, based on weights from DNS.

In case of topology-based selection, when the DNS procedure outputs a list of PGW hostnames for the APN FQDN, MRME performs the longest suffix match and selects the PGW which is topologically closest to the MRME/subscriber. In case of weight-based selection, if there are multiple entries with the same priority in the list of PGW hostnames for the APN FQDN in the output from the DNS procedure, calls are distributed to...
the PGWs according to the weight field in RRs. The weight field specifies a relative weight for entries with the same priority.

**Example**

This command will configure the source context in which the DNS client is configured to “mrmectx”.

```
dns-pgw context mrmectx
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
**fqdn**

This command allows you to configure the MRME fully qualified domain name (FQDN) to match the longest suffix during dynamic allocation.

**Product**
SaMOG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MRME Service Configuration

configure > context context_name > mrme-service mrme_service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-mrme-service)#
```

**Syntax**

```
fqdn fqdn_name

{ default | no } fqdn
```

- **default**
  Returns the command to the default setting of “null”.

- **no**
  Removes the configured FQDN from the MRME service configuration.

- **fqdn_name**
  Specifies the MRME FQDN name that will be used for the longest suffix match during dynamic allocation. `fqdn_name` must be an alphanumeric string of 1 to 255 characters.

**Usage**

Use this command to configure the MRME FQDN under MRME service to match the longest suffix during dynamic allocation.

**Example**

The following command sets an MRME FQDN value of “topon.eth.mrme.north.blore.3gppnetwork.org”.

```
fqdn topon.eth.mrme.north.blore.3gppnetwork.org
```
radius

This command allows you to specify the IP address and shared secret of the RADIUS accounting and authentication client from which RADIUS accounting and authentication requests are received.

Product
SaMOG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > MRME Service Configuration

configure > context context_name > mrme-service mrme_service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-mrme-service)#

Syntax

radius client ipv4_address[/mask] { [ encrypted ] key key [ [ disconnect-message [ dest-port port_number ] ] ] [ acct-onoff { [ aaa-context aaa_context_name ] [ aaa-group aaa_group_name ] [ clear-sessions ] } ] } }

no radius client ipv4_address[/mask]

no
Removes a previously coonfigured RADIUS client.

ipv4_address[/mask]

Specifies the IP address, and optional subnet mask of the RADIUS client from which RADIUS accounting and authentication requests are received.

ipv4_address[/mask] must be an IPv4 address expressed in dotted-decimal notation.

[ encrypted ] key key

•encrypted: Specifies that the shared key between the RADIUS client and this service is encrypted.

•key key: Specifies the shared key between the RADIUS client and this service.

key with encryption must be an alphanumeric string of 1 through 288 characters, and without encryption an alphanumeric string of 1 through 127 characters. Note that key is case sensitive.

disconnect-message [ dest-port port_number ]

Specifies to send RADIUS disconnect messages to the configured RADIUS accounting client in call failure scenarios.

•dest-port port_number: Specifies a port number to which the disconnect message must be sent.

port_number must be an integer from 1 through 65535.
MRME Service Configuration Mode Commands

radius

acct-onoff { [ aaa-context context_name ] [ aaa-group group_name ] [ clear-sessions ] }

**Important:** The acct-onoff keyword is currently not supported in this release.

**Usage**

Use this command to specify the IP address and shared secret of the RADIUS accounting and authentication client from which RADIUS accounting and authentication requests are received.

**Example**

The following command configures the service to communicate with a RADIUS client with an IP address of 190.21.33.40 and an encrypted shared secret of key1234Ax3Z, and clear the session when accounting on/off messages are received:

```
radius client 190.21.33.40 encrypted key 123 4Ax3Z acct-onoff clear-sessions
```
setup-timeout

This command is currently not supported in this release.
Chapter 222
Network Service Entity - Peer NSEI Configuration Mode Commands

The Network Service Entity (NSE) - Peer NSEI configuration mode configures the Frame Relay parameters for the peer NSE. This mode is a sub-mode of the Global Configuration mode. This sub-mode provides the commands and parameters to define the management functionality for the Gb interface between a BSS and an SGSN over a 2.5G GPRS Frame Relay network connection.

Mode

Exec > Global Configuration > Network Service Entity - Frame Relay Peer NSEI Configuration

configure > network-service-entity peer-nsei nsei_number frame-relay

Entering the above command sequence results in the following prompt:

[local]host_name(nse-fr-peer-nsei-nse_id)#

⚠️ Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
bssgp-timer

This command has been deprecated.
Exits the current configuration mode and returns to the Exec mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Return to the Exec mode.
exit

Exits the current configuration mode and returns to the previous configuration mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Return to the global configuration mode.
ns-reset-mode

The command configures automatic NS-Reset for a specific Frame Relay peer NSE (network service entity).

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Network Service Entity - Frame Relay Peer NSEI Configuration

`configure > network-service-entity peer-nsei nsei_number frame-relay`

Entering the above command sequence results in the following prompt:

```
[local]host_name(nse-fr-peer-nsei-nse_id)#
```

**Syntax**

```
ns-reset-mode { active | passive }
```

**default ns-reset-mode**

```
default
 Resets the configuration to the passive mode.

active
Configures active mode so that the SGSN is enabled to initiate NS-Reset without manual intervention.

passive
Configures passive mode which means the SGSN continues *not* to initiate NS-Reset. This is the default mode.
```

**Usage**

Use this command to configure the SGSN for active mode regarding the peer NSE, so that the SGSN will initiate:
- NS-Reset when NSVC-DLCI binding is done.
- NS-Reset when the link goes down and then comes back.
- NS-Unblock upon receipt of NS-Reset-Ack message.

Active mode is useful in the following scenarios:
- if the SGSN detects LMI down but the BSC does not detect any link failure so does not send NS-Reset.
- if the NS layer can go down and the SGSN will mark the link as ‘Blocked-Dead’. If the link comes up later, the NS layer state for that link will remain in the Blocked state.

**Example**

Configure active mode to perform NS-Reset when the link goes down and comes back up:
ns-reset-mode active
**NS-VC**

This command creates a network service virtual circuit (NSVC) for this frame relay NSE and enters the configuration sub-mode to define the NSVC parameters. These parameters are described in the NSVC Configuration Mode chapter elsewhere in this CLI Reference Guide.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Network Service Entity - Frame Relay Peer NSEI Configuration

**Syntax**

```
[ no ] ns-vc id ns-vc_id
```

- **no**
  - Removes the specified NSVC configuration.

- **id ns-vc_id**
  - This keyword defines the NSVC configuration identifier.
  - `ns-vc_id`: Must be an integer from 0 to 65535

**Usage**
Access the NSVC configuration mode.

**Example**

Gain access to the NSVC configuration mode to change the 4th instance.

```
ns-vc id 4
```
Chapter 223
Network Service Entity- IP Local Configuration Mode Commands

The Network Service Entity (NSE) - IP Local configuration mode is a sub-mode of the Global Configuration mode. This sub-mode configures the local endpoint for NS/IP with the commands and parameters to define the management functionality for the Gb interface between a BSS and an SGSN over a 2.5G GPRS IP network connection.

Mode
Exec > Global Configuration > Network Service Entity - IP Configuration
configure > network-service-entity ip-local

Entering the above command sequence results in the following prompt:

[local]host_name(nse-ip-local)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**all-nsvc-failure-action**

Configure how the SGSN handles the NSE when all NSVCs go down.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Network Service Entity - IP Configuration

```
configure > network-service-entity ip-local
```

Entering the above command sequence results in the following prompt:

```
[local] host_name(nse-ip-local)#
```

**Syntax**

```
all-nsvc-failure-action clear-nse
```

```
default all-nsvc-failure-action
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>By default, the NSE is not cleared if all NSVCs go down.</td>
</tr>
<tr>
<td>clear-nse</td>
<td>Instructs the SGSN to SGSN to clear NSEs if all NSVCs to the BSC are down. This CLI clears the info only in cases where all the NSVC of NSE go down due to ALIVE time out.</td>
</tr>
</tbody>
</table>

**Usage**

Enable the SGSN to clear NSE information when all NSVCs go down.

**Example**

Use the following command to configure the SGSN to clear NSEs when all NSVCs go down.

```
all-nsvc-failure-action clear-nse
```
associate

This command supports the association of DSCP template at network-service-entity ip local level.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Network Service Entity - IP Configuration
configure > network-service-entity ip-local

Enter the above command sequence results in the following prompt:

[local]host_name(nse-ip-local)#

Syntax

associate dscp-template downlink [<template-name>]

no associate dscp-template downlink

Syntax

no

Removes the associate services needed for all IP nses.

dscp-template

Configures DCSP for all IP nses.

downlink [<template-name>]

Specifies the DSCP template used for the downlink packets.

Usage

Configuring this command allows the SGSN to send the configured DSCP value to:

- All the GPRS nodal messages.
- All the subscriber specific messages, when dscp template association at gprs-service level and nsei level are absent.

The DSCP template can be defined in sgsn global.

By default, SGSN will apply best effort DSCP value (that is, “0”).

Note:

- Atleast one nsvl should be configured, before configuring the DSCP marking at “network-service-entity ip-local” level.
- After the removal of last nsvl, DSCP template association is removed from “network-service-entity ip-local”.

Example
associate

The following example associates a DSCP template at network-service-entity ip local level.

```
associate dscp-template downlink  DSCP
```
bssgp-timer

This command has been deprecated.
end

Exits the current configuration mode and returns to the Exec mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Return to the Exec mode.
exit

Exits the current configuration mode and returns to the global configuration mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Returns to the global configuration mode.
max-ns-retransmissions

This command configures the maximum number of transmission retries counter.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Network Service Entity - IP Configuration
`configure > network-service-entity ip-local`
Entering the above command sequence results in the following prompt:
`[local]host_name(nse-ip-local)#`

**Syntax**
```plaintext
[ default ] max-ns-retransmissions { alive count | sns-proc count }
```

- **default**
  Resets the specified counter configuration to the default value.

- **alive count**
  Sets the maximum number of alive retries.
  `count`: Must be an integer between 0 and 10. Default is 3.

- **sns-proc count**
  Sets the maximum number of retries for the SNS procedure
  `count`: Must be an integer between 0 and 5. Default is 3.

**Usage**
Sets the maximum for NS transmission retries.

**Example**
```
max-ns-retransmission alive 4
```
**ns-timer**

This command sets the network service (NS) counters for the SNS procedure and testing.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Network Service Entity - IP Configuration  
`configure > network-service-entity ip-local`

Entering the above command sequence results in the following prompt:

```
[local] host_name(nse-ip-local)#
```

**Syntax**

```
ns-timer { sns-guard timeout_val | sns-prov timeout_val | test timeout_val }

default ns-timer { sns-guard | sns-prov | test }
```

---

**default**

Resets the selected timer configuration to its default value.

---

**sns-guard timeout_val**

Sets the SNS-guard timer which is used in the auto-learn procedure to clean-up learnt BSC/NSE information.  
`timeout_val`: Enter an integer from 1 to 300. Default is 60.

---

**sns-prov timeout_val**

Sets the SNS procedure timeout value in seconds.  
`timeout_val`: Enter an integer from 1 to 10. Default is 5.

---

**test timeout_val**

Sets the test procedure timeout value in seconds.  
`timeout_val`: Enter an integer from 1 to 60. Default is 30 seconds.

---

**Usage**

Set NS timers to help manage the NSE-IP connection.

---

**Example**

The following example sets the test timer to 4 seconds:

```
ns-timer test 4
```
**nsvc-failure-action**

This command enables and disables the sending of an NS-STATUS message with cause ‘ip-test fail’ when NSVC goes down.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Network Service Entity - IP Configuration

```configure > network-service-entity ip-local```

Entering the above command sequence results in the following prompt:

```
[local] host_name(nse-ip-local)#
```

**Syntax**

```nsvc-failure-action send-ns-status```

```default nsvc-failure-action```

```default```
Sets the command configuration to its default value. The default action is not to send an NS-STATUS message. This is applicable only to NSVCs that are auto-learned and not configured.

```send-ns-status```
Enables the sending of the NS-STATUS message.

**Usage**

Use this command to enable or disable sending an NS-STATUS messages when an NSVC goes down.

**Example**

Enable sending of the message:

```nsvc-failure-action send-ns-status```
nsvl

This command creates and instance of a network service virtual link (NSVL) and enters the NSVL configuration mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Network Service Entity - IP Configuration
configure > network-service-entity ip-local

Entering the above command sequence results in the following prompt:

[local]host_name(nse-ip-local)#

Syntax

[ no ] nsvl instance nsvl_id

no
Removes the identified NSVL definition from the configuration.

instance nsvl_id
Identifies a specific NSVL configuration instance.
nsvl_id: Must be an integer from 0 to 3.

Usage
Access the NSVL configuration mode.

Example
Enter the NSVL configuration sub-mode to modify the configuration for NSVL instance 2:

nsvl instance 2
peer-network-service-entity

This command has been replaced by the Network Service Entity - Peer NSEI Frame Relay configuration mode.
retry-count

This command has been replaced by the `max-ns-retransmissions` command.
timer

This command has been replaced by the ns-timer command.
Chapter 224
Network Service Virtual Connection Configuration Mode Commands

The Network Service Virtual Connection (NSVC) configuration mode is a sub-mode of the Network Service Entity (NSE) - Peer NSEI (for Frame Relay) configuration mode. The NSVC sub-mode creates a configuration instance for a specific NSVC, within the Gb interface, between a BSS and an SGSN in a 2.5G GPRSFrame Relay network connection.

Exec > Global Configuration > Network Service Entity - Frame Relay Peer NSEI Configuration > NSVC Configuration

configure > network-service-entity peer-nsei peer_nsei framerelay > ns-vc nsvc_id

Entering the above command sequence results in the following prompt:

[local] host_name(nse-fr-peer-nsei-nse_id-nsvci-nsvc_instance)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Return to the Exec mode.
exit

Exits the current configuration mode and returns to the previous configuration mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Returns to the network service entity - frame relay configuration mode.
Chapter 225  
Network Service Virtual Link Configuration Mode Commands

The Network Service Virtual Link configuration mode is a sub-mode of the Network Service Entity - IP configuration mode. This sub-mode provides the commands and parameters to define the NSVL of the Gb interface between a BSS and an SGSN in a 2.5G GPRS IP network connection.

**Mode**

Exec > Global Configuration > Network Service Entity - IP Configuration > NSVL Configuration  
`configure > network-service-entity ip > nsvl instance nsvl_id`

Entering the above command sequence results in the following prompt:

```
[local]host_name(nse-ip-local-nsvl-nsvl_instance)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Return to the Exec mode.
exit

Exits the current configuration mode and returns to the previous configuration mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Return to the network service entity - IP configuration mode.
nsvl-address

This command configures the IP address of the NSVL end-point.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Network Service Entity - IP Configuration > NSVL Configuration

configure > network-service-entity ip > nsvl instance nsvl_id

Entering the above command sequence results in the following prompt:

[local]host_name(nse-ip-local-nsvl-nsvl_instance)#

Syntax

nsvl-address ip-address ip_address context ctxt_name port port_num

| ip-address | ip_address | Identifies the address of the NSVL.
| context | ctxt_name | Must be specified using the standard IPv4 dotted decimal notation or colon notation for IPv6.
| port | port_num | Identifies the specific context associated with this NSVL address.
| port_num | Must be an integer from 1 to 65535.
| | | Specifies the UDP port to associate with the NSVL end-point.

Usage
Use this command to configure the IP address, context name and port number for the NSVL end-point.

Example

nsvl-address ip-address 1.1.1.1 context sgsn2 port 3735
weight

This command configures the signaling or data weight for NSVL.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Network Service Entity - IP Configuration > NSVL Configuration

configure > network-service-entity ip > nsvl instance nsvl_id

Entering the above command sequence results in the following prompt:

[local]host_name(nse-ip-local-nsvl-nsvl_instance)#

Syntax

weight { data data_weight | signaling signaling_weight }

---

data data_weight

Defines the data weight for the NSVL.

data_weight: Must be an integer from 0 to 255. Default is 1.

---

signaling signaling_weight

Defines the signaling weight for the NSVL.

signaling_weight: Must be an integer from 0 to 255. Default is 1.

---

Usage

Configure the weight of the signaling or data for the NSVL.

Example

weight data 234
Chapter 226
NTP Configuration Mode Commands

The NTP Configuration Mode is used to manage the Network Time Protocol (NTP) options for the entire system.

Mode

Exec > Global Configuration > NTP Configuration
configure > ntp

Entering the above command sequence results in the following prompt:

[local]host_name(config-ntp) #

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**enable**

Enables the use of the Network Time Protocol (NTP) for synchronizing the system clock. By default, NTP is not enabled externally and should be configured when the system is initially installed. When enabled, the active ASR 5000 SMC or ASR 5500 MIO will synchronize with external sources. If not enabled, the active SMC or MIO will use its local clock as a time source. In the event of an NTP server or network outage, an already running SMC or MIO will continue to use NTP to maintain time accuracy, but in a holdover mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > NTP Configuration

```bash
configure > ntp
```

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-ntp)#
```

**Syntax**

```bash
enable [ context ]
```

- **context**
  Default: local
  Specifies the context for which NTP is to be enabled as an alphanumeric string of 1 through 79 characters.

**Important:** NTP must be configured for use in the *local* context only. Use of other contexts will cause issues.

**Usage**

Sets the NTP server to be used for the system. Only one NTP server may be active at any given time.

The system uses NTP to synchronize internal clocks on the chassis to external time sources (typically GPS NTP sources, or other Stratum 2 or 3 servers, switches or routers).

All cards with CPUs synchronize to the active SMC or MIO internally. This occurs even if an external NTP server is not configured. In the event of a SMC or MIO switchover, all other cards will start synchronizing with the newly active SMC or MIO automatically.

If any NTP server is enabled, the chassis system clock will be synchronized to the active NTP server which covers all contexts for timing synchronization.

Refer to the *System Administration Guide* for additional information on configuring NTP.

**Example**

The following command enables use of NTP for the *local* context.

```bash
enable
```
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Use this command to return to the parent configuration mode.
server

Configures a Network Time Protocol (NTP) server for use by the local NTP client in synchronizing the system clock.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > NTP Configuration

configure > ntp

Entering the above command sequence results in the following prompt:

[local]host_name(config-ntp)#

Syntax

server ip_address [ prefer ] [ version number ] [ minpoll poll_period ] [ maxpoll poll_period ]

no server ip_address

no

Indicates the server specified is to be removed from the list of NTP servers for clock synchronization.

ip_address

Specifies the IP address of the NTP server to be used for clock synchronization in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

NTP should be configured for at least three external NTP servers. With three or more servers, outliers and broken or misconfigured servers can be detected and excluded. Generally, the more servers the better (within reason).

prefer

Indicates the NTP server specified to be the preferred server. Only one server can be set to preferred. The preferred server is the first one contacted for clock synchronization.

Important: Use of the prefer keyword is not recommended.

Important: Do not change the version, minpoll or maxpoll keyword settings unless instructed to do so by Cisco TAC.
version number

Specifies the network timing protocol version to use for server communications as an integer from 1 to 4. Default: 4 (RFC 5905)

minpoll poll_period

Specifies the minimum polling interval (in seconds) for NTP messages as a power of \(2^{\text{poll_period}}\) is the exponent (power of) expressed as an integer from 6 through 17. For example, if you specify the number 6, the value is \(2^6\) and the resultant poll period is 64 seconds. Default: 6

maxpoll poll_period

Specifies the maximum polling interval (in seconds) for NTP messages as a power of \(2^{\text{poll_period}}\) is the exponent (power of) expressed as an integer from 6 through 17. For example, if you specify the number 10, the value is \(2^{10}\) and the resultant poll period is 1024 seconds. Default: 10

Usage

Configure the NTP servers in response to network changes. Refer to the System Administration Guide for important information on configuring NTP servers with local sources, and using a load balancer to communicate with external NTP servers.

Important: Adding, removing, or modifying an NTP server configuration entry causes the NTP client to restart itself and resynchronize with all configured NTP servers.

Example

The following command adds the NTP server with address 10.2.3.4 to the list of NTP servers.

```
server 10.2.3.4
```
Chapter 227
Operator Policy Configuration Mode

Operator Policy configuration mode associates APNs, APN profiles, IMEI ranges, IMEI profiles, an APN remap table and a call control profile to an operator policy. These profiles and tables are created and defined within their own configuration modes to generate sets of rules and instructions that can be reused and assigned to multiple policies.

The Operator Policy Configuration Mode is used to create and manage operator policies for MME, S-GW, SAEGW, and SGSN configurations.

- A maximum of 1,000 operator policies can be defined, including the “default” operator policy.
- A maximum of 128 APN profiles can be associated with a single operator policy.
- A maximum of 128 IMEI profiles can be associated with a single operator policy (SGSN-only).
- Only one APN remap table can be associated with a single operator policy.
- Only one call control profile can be associated with a single operator policy.

Using the Operator Policy feature allows the operator to fine-tune any desired restrictions or limitations needed to control call handling per subscriber or for a group of callers across IMSI ranges.

**Mode**

```
Exec > Global Configuration > Operator Policy Configuration
configure > operator-policy policy_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-opr-policy-policy_name)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**apn**

This command identifies an APN (access point name) and associates it with an APN profile (created separately in the APN Profile Configuration mode).

**Product**

MME
SAEGW
S-GW
SGSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Operator Policy Configuration

configure > operator-policy policy_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-opr-policy-policy_name)#

**Syntax**

apn { default-apn-profile apn_profile_name | network-identifier apn_net_id [ apn-profile apn_profile_name ] | operator-identifier apn_op_id apn-profile apn_profile_name }

no apn { default-apn-profile | network-identifier apn_net_id | operator-identifier apn_op_id }

no

Disables the specified APN to APN Profile correspondence.

**default-apn-profile apn_profile_name**

Enables the use of a default APN profile comprised of default values for all parameters. this profile will be used when none of the configured APNs match the APN in the incoming Request.

`apn_profile_name` must be an alphanumeric string of 1 through 64 characters.

**apn-profile apn_profile_name**

`apn_profile_name` must be an alphanumeric string of 1 through 64 characters.

**network-identifier apn_net_id**

Links the specified APN network ID with the specified APN profile.

`apn_net_id` must be an alphanumeric string of 1 through 63 characters, including dots (.) and dashes (-).

: MME or SGSN only. This optional keyword configures the MME or SGSN to apply congestion control actions for this specific APN. Refer to the `drop` and `reject` commands within the [SGSN] Congestion Action Profile Configuration Mode for more information on configuring APN-based congestion control.
operator-identifier apn_op_id

Links the specified APN operator ID with the specified APN profile.

`apn_op_id`: must be an alphanumeric string of 1 through 18 characters, including dots (.). The string must be in the following format, where # represents a digit: MNC###.MCC###.GPRS.

Usage

Use this command, to associate APNs with APN profiles. This command can be repeated to associate multiple APNs with profiles.

Example

Associate the APN profile named `apnprof1` to APN network ID `starflash.com`:

```
apn apnprof1 network-identifier starflash.com
```

Associate congestion control with APN network ID `starflash.com`:

```
apn network-identifier starflash.com congestion-control
```
associate

Associate an APN remap table and a call control profile with the operator policy.

Product

- MME
- SAEGW
- S-GW
- SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Operator Policy Configuration

```
configure > operator-policy policy_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-opr-policy-policy_name)#
```

Syntax

```
associate { apn-remap-table table_id | call-control-profile profile_id }
```

```
no associate { apn-remap-table | call-control-profile }
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Removes the association definition from the policy configuration.</td>
</tr>
<tr>
<td>apn-remap-table table_id</td>
<td>Identifies the APN remap table to be associated with the operator policy. table_id must be an alphanumeric string of 1 through 65 characters.</td>
</tr>
<tr>
<td>call-control-profile profile_id</td>
<td>Identifies a call control profile to be associated with the operator policy. profile_id must be an alphanumeric string of 1 through 64 characters.</td>
</tr>
</tbody>
</table>

Usage

Use this command to associate an APN remap table and/or a call control profile with this Operator Policy. The APN remap table and the call control profile contain the definitions that instruct the SGSN or MME how to handle calls. Only one of each of these can be associated with an operator policy.

Example

Associate the stardust.net_APNremap1 APN remap table with this operator policy:

```
associate apn-remap-table stardust.net_APNremap1
```
description

Associates a description with or names an operator policy.

Product

MME
SAEGW
S-GW
SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Operator Policy Configuration

configure > operator-policy policy_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-opr-policy-policy_name)#

Syntax

description description

no description

---

description

Enter an alphanumeric string of 1 through 100 characters. If the string includes spaces, punctuation, and case-sensitive letters, it must be bracketed with double quotation marks (“ “).

---

no

Removes the existing description from this operator policy.

Usage

Identity this particularly operator policy using descriptive text.

Example

description “sgsn1 operator policy carrier1”
end

Exits the current configuration mode and returns to the Exec mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
**exit**

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
**imei**

Defines a range of IMEI (International Mobile Equipment Identity) numbers and associates an IMEI profile with the range definition.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Operator Policy Configuration

```bash
configure > operator-policy policy_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-opr-policy-policy_name)#
```

**Syntax**

```bash
imei range IMEI_number to IMEI_number { imei-profile profile_name | sv ## imei-profile profile_name }
```

```bash
no imei range IMEI_number to IMEI_number sv ##
```

**no**

Removes the IMEI definition from the policy configuration.

```bash
range IMEI_number to IMEI_number
```

Defines the beginning and end of a range of IMEI numbers.

**IMEI_number** must be a numerical string of up to 14 digits.

```bash
sv ##
```

Identifies the software version to fine-tune the IMEI definition. This keyword should only be included if the IMEISV is retrievable.

**##** must be a 2-digit integer.

```bash
imei-profile profile_name
```

Identifies the IMEI profile that defines the actions appropriate to the devices identified within the specified range.

**profile_name** must be an alphanumeric string of 1 through 64 characters.

**Usage**

This command defines the IMEI ranges that will be used by the operator policy to determine if the device is appropriately selected for actions defined in the specified IMEI profile.

**Example**

All devices with an IMEI of 123123* requesting Attach shall be subject to actions in the blacklist_profile1.
imei range 1231230 to 1231239 imei-profile name blacklist_profile1
Chapter 228
ORBEM Configuration Mode Commands

The ORBEM Configuration Mode is used to manage the Object Request Broker Element Manager (ORBEM) server options for the current context.

Mode

Exec > Global Configuration > ORBEM Configuration

configure > orbem

Entering the above command sequence results in the following prompt:

[local]host_name(config-orbem)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
activate

Activates/deactivates a Common Object Request Broker Architecture (CORBA) client for the ORBEM interface.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > ORBEM Configuration

configure > orbem

Entering the above command sequence results in the following prompt:

[local]host_name(config-orbem)#

**Syntax**

```
active client id
no active client id
```

**Usage**

Indicates the client specified is to be deactivated. When omitted, the client is activated.

```
no
```

Specifies the client to be activated. *name* must refer to a previously configured client expressed as an alphanumeric string of 1 through 10 characters.

```
id name
```

**Example**

Activates CORBA clients after they have been configured or deactivated by the system or by configuration.

```
active client wem
no active client wem
```
client

Configures/removes a CORBA client from the ORB element manager system interface.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > ORBEM Configuration

configure > orbem

Entering the above command sequence results in the following prompt:

[local]host_name(config-orbem)#

Syntax

client id name [ encrypted ] password pwd

no client id name

no
Indicates the client specified is to be removed from the configuration.

id name
Specifies the client to be configured. *name* must be an alphanumeric string of 1 through 10 characters.

encrypted
Indicates password specified is encrypted.
The *encrypted* keyword is intended only for use by the chassis while saving configuration scripts. The system displays the *encrypted* keyword in the configuration file as a flag that the variable following the *password* keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

password pwd
Specifies the password for the CORBA client. *pwd* must be an alphanumeric string of 1 through 35 characters.

Usage
ORBEM clients must be configured prior to being activated.

Example
The following commands set the password for client *wem* specifying a plain text password and an encrypted password as well.

    client id wem password wem1001
    client id wem encrypted password f54gj801sd
The following deletes `wem` from the configuration.

```
no client id wem
```
default

Restores the system default values for the option specified.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > ORBEM Configuration
configure > orbem

Entering the above command sequence results in the following prompt:

[local]host_name(config-ormb)#

Syntax

default { event-notif-iop-port | event-notif-service filter | event-notif-siop-port | iop-port | iop-address | max-attempt | session-timeout | siop-port }

event-notif-iop-port
Restores the port number for the inter-ORB event notifications to the system default: 7778.

event-notif-service filter
Restores the ORB Notification Service filter to its default behavior of sending all “error” level and higher events, and “info” level events for the orbs facility, CLI command logs, and license change logs.

event-notif-siop-port
Restores the port to use for secure socket layer inter-ORB event communication to the system default: 7777.

iop-port
Restores the port number for inter-ORB communications to the system default: 14132.

iop-address
Restores the IP address for inter-ORB communications to the system default: IP address of current context.

max-attempt
Restores the maximum number of failed login attempts before which the client is deactivated to the system default: 3 attempts.

session-timeout
Restores the amount of idle time (no activity) before a session is terminated to the system default: 300 seconds.
**siop-port**

Restores the secure socket layer I/O port for inter-ORB events to the system default: 14131.

**Usage**

Restore the ORB element manager options to a well known values, the system defaults.

**Example**

```
default event-notif-iiop-port

default max-attempt
```
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
event-notif-iiop-port

Configures the port number for Internet inter-ORB event notifications.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > ORBEM Configuration
    configure > orbem
Entering the above command sequence results in the following prompt:

[local]host_name(config-orbem)#

Syntax

```
event-notif-iiop-port number
```

number
Default: 7778
Specifies the port number to use as an integer from 1 through 65535.

Usage
Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for standardized inter-ORB communications.
Event notification port configured is only used if the Internet inter-ORB transport is enabled via the iiop-transport command with the event notification service being enabled as well.

Example

```
event-notif-iiop-port 25466
```
**event-notif-service**

Enables or disables the ORB Notification Service and allows the configuration of filters dictating which event notifications are sent.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > ORBEM Configuration
configure > orbem

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-orbem)#
```

**Syntax**

```
[ no ] event-notif-service [ filter { event-id event_id [ to final_event_id ] | facility event_facility level event_level } ]
```

- **no**
  - Disables the event notification service.

- **filter**
  - Specifies a filter that determines for which events the system sends notifications.

  ```
event-id  event_id [ to final_event_id ]
```

  - Specifies an event filter based on event identification (event ID) number.
  - `event_id` is a specific event ID to filter or is the initial event ID in range if the `to` keyword is used.
  - In 14.1 and earlier releases, `event_id` is an integer from 1 through 202699.
  - In 15.0 and later releases, `event_id` is an integer from 1 through 204999.
  - `to` allows the specification of a range of event IDs to filter. When used, `final_event_id` specifies the last event ID in the range to be filtered. It can be configured to an integer from 1 through 204999, but must be a value greater than the initial event ID.

- **facility**
  - Specifies an event filter based on facility type and notification severity level.
  - `event_facility` specifies the facility type and can be any one of the following:
    - `a10`: A10 interface facility
    - `a11`: A11 interface facility
    - `a11mgr`: A11 Manager facility
    - `aaa-client`: Authentication, Authorization and Accounting (AAA) client facility
    - `aaamgr`: AAA manager logging facility
    - `aaaproxy`: AAA Proxy facility
• **aal2**: ATM Adaptation Layer 2 (AAL2) protocol logging facility
• **acl-log**: Access Control List (ACL) logging facility
• **acsctrl**: Active Charging Service (ACS) Controller facility
• **acsmgr**: ACS Manager facility
• **afctrl**: Fabric Controller facility [ASR 5500 only]
• **afmgr**: Fabric Manager logging facility [ASR 5500 only]
• **alarmctrl**: Alarm Controller facility
• **alcap**: Access Link Control Application Part (ALCAP) protocol logging facility

• **henbgw-pws**: HENB-GW Public Warning System logging facility

• **henbgw-sctp-acs**: HENB-GW access Stream Control Transmission Protocol (SCTP) facility

• **henbgw-sctp-nw**: HENBGW network SCTP facility

• **henbgwdemux**: HENB-GW Demux facility

• **henbgwmgr**: HENB-GW Manager facility

• **hnb-gw**: HNB-GW (3G Femto GW) logging facility

• **hnbmgr**: HNB-GW Demux Manager logging facility

• **hss-peer-service**: Home Subscriber Server (HSS) Peer Service facility

• **igmp**: Internet Group Management Protocol (IGMP)

• **ikev2**: Internet Key Exchange version 2 (IKEv2)

• **ims-authorizatn**: IP Multimedia Subsystem (IMS) Authorization Service facility

• **ims-sh**: HSS Diameter Sh Interface Service facility

• **imsimgr**: SGSN IMSI Manager facility

• **imsue**: IMS User Equipment (IMSUE) facility

• **ip-arp**: IP Address Resolution Protocol facility

• **ip-interface**: IP interface facility

• **ip-route**: IP route facility
• **ipms**: Intelligent Packet Monitoring System (IPMS) logging facility
• **ipne**: IP Network Enabler (IPNE) facility
• **ipsec**: IP Security logging facility
• **ipsg**: IP Service Gateway interface logging facility
• **ipsmgrr**: IP Services Gateway facility
• **ipsp**: IP Pool Sharing Protocol logging facility
• **kvstore**: Key/Value Store (KVSTORE) Store facility
• **l2tp-control**: Layer 2 Tunneling Precool (L2TP) control logging facility
• **l2tp-data**: L2TP data logging facility
• **l2tpdemux**: L2TP Demux Manager logging facility
• **l2tpmgr**: L2TP Manager logging facility
• **lagmgr**: Link Aggregation Group (LAG) manager logging facility
• **lcs**: Location Services (LCS) logging facility
• **ldap**: Lightweight Directory Access Protocol (LDAP) messages logging facility
• **li**: Refer to the *Lawful Intercept Interface Reference* for a description of this command.
• **linkmgr**: SGSN/BSS SS7 Link Manager logging facility (2.5G only)
• **llc**: Logical Link Control (LLC) Protocol logging facility; for SGSN: logs the LLC layer between the GMM and the BSSGP layers for logical links between the MS and the SGSN
• **local-policy**: Local Policy Service facility
• **location-service**: Location Services facility
• **m3ua**: M3UA Protocol logging facility
• **magmgr**: Mobile Access Gateway manager logging facility
• **map**: Mobile Application Part (MAP) protocol logging facility
• **megadiamgr**: MegaDiameter Manager (SLF Service) logging facility
• **mme-app**: Mobility Management Entity (MME) Application logging facility
• **mme-misc**: MME miscellaneous logging facility
• **mmedemux**: MME Demux Manager logging facility
• **mmemgr**: MME Manager facility
• **mmgr**: Master Manager logging facility
• **mobile-ip**: Mobile IP processes
• **mobile-ip-data**: Mobile IP data facility
• **mobile-ipv6**: Mobile IPv6 logging facility
• **mpls**: Multiprotocol Label Switching (MPLS) protocol logging facility
• **mrme**: Multi Radio Mobility Entity (MRME) logging facility
• **mseg-app**: Mobile Services Edge Gateway (MSEG) application logging facility (This option is not supported in this release.)
• **mseg-gtpc**: MSEG GTP-C application logging facility (This option is not supported in this release.)
• **mseg-gtpu**: MSEG GTP-U application logging facility (This option is not supported in this release.)
• **msegmgr**: MSEG Demux Manager logging facility (This option is not supported in this release.)
• **mtp2**: Message Transfer Part 2 (MTP2) Service logging facility
• **mtp3**: Message Transfer Part 3 (MTP3) Protocol logging facility
• **multicast-proxy**: Multicast Proxy logging facility
• **nas**: Non-Access Stratum (NAS) protocol logging facility [MME 4G]
• **netwstrg**: Network Storage facility
• **npuctrl**: Network Processor Unit Control facility
• **npudrv**: Network Processor Unit Driver facility [ASR 5500 only]
• **npumgr**: Network Processor Unit Manager facility
• **npumgr-acl**: NPUMGR ACL logging facility
• **npumgr-drvt**: NPUMGR DRV logging facility
• **npumgr-flow**: NPUMGR FLOW logging facility
• **npumgr-fwd**: NPUMGR FWD logging facility
• **npumgr-init**: NPUMGR INIT logging facility
• **npumgr-lc**: NPUMGR LC logging facility
• **npumgr-port**: NPUMGR PORT logging facility
• **npumgr-recovery**: NPUMGR RECOVERY logging facility
• **npumgr-rri**: NPUMGR RRI (Reverse Route Injection) logging facility
• **npumgr-vpn**: NPUMGR VPN logging facility
• **npusim**: NPUSIM logging facility [ASR 5500 only]
• **ntfy-intf**: Notification Interface logging facility [Release 12.0 and earlier versions only]
• **ocsp**: Online Certificate Status Protocol logging facility.
• **orbs**: Object Request Broker System logging facility
• **ospf**: OSPF protocol logging facility
• **ospfv3**: OSPFv3 protocol logging facility
• **p2p**: Peer-to-Peer Detection logging facility
• **pagingmgr**: PAGINGMGR logging facility
• **pccmgr**: Intelligent Policy Control Function (IPCF) Policy Charging and Control (PCC) Manager library
• **pdg**: Packet Data Gateway (PDG) logging facility
• **pdgmgr**: PDG Demux Manager logging facility
• **pdif**: Packet Data Interworking Function (PDIF) logging facility
• **pgw**: Packet Data Network Gateway (PGW) logging facility
• **pmm-app**: Packet Mobility Management (PMM) application logging facility
• **ppp**: Point-To-Point Protocol (PPP) link and packet facilities
• **pppoed**: PPP over Ethernet logging facility
ORBEM Configuration Mode Commands

- **push**: VPNMGR CDR push logging facility
- **radius-act**: RADIUS accounting logging facility
- **radius-auth**: RADIUS authentication logging facility
- **radius-coa**: RADIUS change of authorization and radius disconnect
- **ranap**: Radio Access Network Application Part (RANAP) Protocol facility logging info flow between SGSN and RNS (3G)
- **rct**: Recovery Control Task logging facility
- **rdt**: Redirect Task logging facility
- **resmgr**: Resource Manager logging facility
- **rf-diameter**: Diameter Rf interface messages facility
- **rip**: Routing Information Protocol (RIP) logging facility [RIP is not supported at this time.]
- **rlf**: Rate Limiting Function (RLF) logging facility
- **rohc**: Robust Header Compression (RoHC) facility
- **rsvp**: Reservation Protocol logging facility
- **rua**: RANAP User Adaptation (RUA) [3G Femto GW - RUA messages] logging facility
- **s1ap**: S1 Application Protocol (S1AP) Protocol logging facility
- **sabp**: Service Area Broadcast Protocol (SABP) logging facility
- **saegw**: System Architecture Evolution (SAE) Gateway facility
- **scfp**: Signalling Connection Control Part (SCCP) Protocol logging (connection-oriented messages between RANAP and TCAP layers).
- **sct**: Shared Configuration Task logging facility
- **sctp**: Stream Control Transmission Protocol (SCTP) Protocol logging facility
- **sef_ecs**: Severely Errored Frames (SEF) APIs printing facility
- **sess-gr**: SM GR facility
- **sessctrl**: Session Controller logging facility
- **sessmgr**: Session Manager logging facility
- **sesstrec**: session trace logging facility
- **sft**: Switch Fabric Task logging facility
- **sgs**: SGs interface protocol logging facility
- **sgsn-app**: SGSN-APP logging various SGSN “glue” interfaces (for example, between PMM, MAP, GPRS-FSM, SMS).
- **sgsn-failures**: SGSN call failures (attach/activate rejects) logging facility (2.5G)
- **sgsn-gtpc**: SGSN GTP-C Protocol logging control messages between the SGSN and the GGSN
- **sgsn-gtpu**: SGSN GTP-U Protocol logging user data messages between the SGSN and GGSN
- **sgsn-mbms-bearer**: SGSN Multimedia Broadcast/Multicast Service (MBMS) Bearer app (SMGR) logging facility
- **sgsn-misc**: Used by stack manager to log binding and removing between layers
- **sgsn-system**: SGSN System Components logging facility (used infrequently)
• **sgsn-test**: SGSN Tests logging facility; used infrequently
• **sgtpcmgr**: SGSN GTP-C Manager logging information exchange through SGTPC and the GGSN
• **sgw**: Serving Gateway facility
• **sh-diameter**: Sh Diameter messages facility
• **sitmain**: System Initialization Task main logging facility
• **sm-app**: SM Protocol logging facility
• **sms**: Short Message Service (SMS) logging messages between the MS and the SMSC
• **sndep**: Sub Network Dependent Convergence Protocol (SNDCP) logging facility
• **snmp**: SNMP logging facility
• **sprmgr**: IPCF Subscriber Policy Register (SPR) manager logging facility
• **srdb**: Static Rating Database
• **srp**: Service Redundancy Protocol (SRP) logging facility
• **sscfnni**: Service-Specific Coordination Function for Signaling at the Network Node Interface (SSCF-NNI) logging facility
• **sscop**: Service-Specific Connection-Oriented Protocol (SSCOP) logging facility
• **ssh-ipse**: Secure Shell (SSH) IP Security logging facility
• **ssl**: Secure Socket Layer (SSL) message logging facility
• **stat**: Statistics logging facility
• **supserv**: Supplementary Services logging facility [H.323]
• **system**: System logging facility
• **tacacsplus**: TACACS+ Protocol logging facility
• **tcap**: TCAP Protocol logging facility
• **testctrl**: Test Controller logging facility
• **testmgr**: Test Manager logging facility
• **threshold**: threshold logging facility
• **ttg**: Tunnel Termination Gateway (TTG) logging facility
• **tucl**: TCP/UDP Convergence Layer (TUCL) logging facility
• **udr**: User Data Record (UDR) facility (used with the Charging Service)
• **user-data**: User data logging facility
• **user-l3tunnel**: User Layer 3 tunnel logging facility
• **usertcp-stack**: User TCP Stack
• **vim**: Voice Instant Messaging (VIM) logging facility
• **vinfo**: VINFO logging facility
• **vmgctrl**: Virtual Media Gateway (VMG) controller facility
• **vmgctrl**: VMG Content Manager facility
• **vpn**: Virtual Private Network logging facility
• **wimax-data**: WiMAX DATA
- `wimax-r6`: WiMAX R6

### event_level

specifies the severity level of the event notification to filter and can be configured to one of the following:

- `critical`: display critical events
- `error`: display error events and all events with a higher severity level
- `warning`: display warning events and all events with a higher severity level
- `unusual`: display unusual events and all events with a higher severity level
- `info`: display info events and all events with a higher severity level
- `trace`: display trace events and all events with a higher severity level
- `debug`: display all events

### Usage

This command is used to enable or disable the ORB Notification Service. Additionally, it can be used to configure filters dictating which events are sent. This service is disabled by default. Filters can be configured for a specific event identification number (event ID), a range of event IDs, or specific severity levels for events for particular facilities. When no filters are configured and the service is enabled, the ORB Notification Service sends all “error” level and higher events, and “info” level events for the orbs facility, CLI command logs, and license change logs. Multiple instance of this command can be executed to configure multiple filters.

### Example

The following command enables the ORB Notification service:

```
   event-notif-service
```

The following command disables the ORB Notification service:

```
   no event-notif-service
```

The following command configures a filter for the ORB Notification Service allowing only event IDs 800 through 805 to be sent:

```
   event-notif-service filter event-id 800 to 805
```

The following command configures a filter for the ORB Notification Service allowing only `critical` level notifications for all facilities:

```
   event-notif-service filter facility all level critical
```
event-notif-siop-port

Configures the port to use for secure socket layer (SSL) inter-ORB event communication.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > ORBEM Configuration

```bash
configure > orbem
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ORBEM)#
```

**Syntax**

```
event-notif-siop-port number
```

*number*

Default: 7777

Specifies the port number to use as an integer from 1 through 65535.

**Usage**

Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for inter-ORB communications using SSL.

**Example**

```
event-notif-siop-port 25466
```
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
**iiop-port**

Configures the port number for Internet Inter-ORB Protocol (IIOP) communications.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > ORBEM Configuration

`configure > orbem`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ORBEM)#
```

**Syntax**

```
[ no ] iiop-port number
```

- **no**
  
  Disables the IIOP port.

- **number**
  
  Default: 14132
  
  Specifies the port number to use as an integer from 1 through 65535.

**Usage**

Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for standardized inter-ORB communications.

Internet inter-ORB port is only used if IIOP transport is enabled via the `iiop-transport` command.

**Example**

```
iiop-port 25466
```
**iiop-transport**

Enables/disables use of the Internet Inter-ORB Protocol (IIOP) for management across the network.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > ORBEM Configuration

`configure > orbem`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-orbem)#
```

**Syntax**

```
iiop-transport

no iiop-transport
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no iiop-transport</td>
<td>Disables internet inter-ORB protocol communication across the network.</td>
</tr>
</tbody>
</table>

**Usage**

Enables the transport of IIOP messages to support remote management across the network.

The default is IIOP transport disabled.

**Example**

The following commands enable and disable the ORB-based management across the network, respectively.

```
iiop-transport

no iiop-transport
```
**iop-address**

Sets the IP address used by the ORBEM Server to advertise service.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > ORBEM Configuration

```bash
configure > orbem
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-orbem)#
```

**Syntax**

```
iop-address  ip_address
```

`ip_address`

Specifies the IP address to use for inter-ORB communications for the current context. `ip_address` must be specified using IPv4 dotted-decimal notation.

**Usage**

Change the inter-ORB IP address when the IP address of the current context should not be used. The IP address of the local context may not be appropriate when the ORB configuration across nodes would cause conflicts with the IP addresses.

The default inter-ORB IP address is the IP address of the current context.

**Example**

```
iop-address 10.2.3.4
```
**max-attempt**

Configures the maximum number of failed login attempts after which the client is deactivated.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > ORBEM Configuration

`configure > orbem`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-orbem)#
```

**Syntax**

```
max-attempt count
```

`count`

Default: 3 attempts

Specifies the number of failed login attempts prior to deactivating a client. The value must be an integer from 1 through 10.

**Usage**

Adjust the maximum number of attempts to a smaller value to increase the security level of the system.

**Example**

```
max-attempt 3
```
session-timeout

Configures the amount of idle time (no activity) before a client session is terminated.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > ORBEM Configuration

configure > orbem

Entering the above command sequence results in the following prompt:

[local]host_name(config-orbem)#

Syntax

```
session-timeout seconds
```

seconds

Default: 300 seconds
Specifies the number of seconds of idle time before a client session is terminated. The value must be an integer from 1 through 86400.

Usage

Reduce the session timeout when the maximum number of sessions allowed is frequently being reached. Setting this to a lower value will help release idle sessions faster to allow use by other clients.

Example

```
session-timeout 1800
```
siop-port

Configures the SSL I/O port for inter-ORB events.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > ORBEM Configuration
configure > orbem

Entering the above command sequence results in the following prompt:

[local]host_name(config-orbem)#

Syntax

siop-port number

number

Default: 14131
Specifies the port number to use as an integer from 1 through 65535.

Usage
Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for inter-ORB communications.

Example

siop-port 25466
ssl-auth-policy

Configures the SSL peer authentication policy used by the ORBEM server.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > ORBEM Configuration
configure > orbem
Entering the above command sequence results in the following prompt:

[local] host_name(config-orbem)#

Syntax

ssl-auth-policy { auth-none | auth-once | auth-once-fail | auth-peer | auth-peer-fail }

auth-none | auth-once | auth-once-fail | auth-peer | auth-peer-fail

Default: auth-none
auth-none: ORBEM server does not authenticate the peer
auth-once: ORBEM server authenticates the peer once (no fail)
auth-once-fail: ORBEM server authenticates the peer once (fail if no certificate)
auth-peer: ORBEM server authenticates the peer every time (no fail)
auth-peer-fail: ORBEM server authenticates the peer every time (fail if no certificate)

Usage
Use to configure the peer authentication policy used by the SSL transport of ORBEM.

Example
The following command sets the policy to authenticate the peer once without failure.

ssl-auth-policy auth-once
ssl-certificate

Defines the certificate to be used by the SSL transport of ORBEM.

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > ORBEM Configuration
configure > orbem

Entering the above command sequence results in the following prompt:

[local]host_name(config-orbem)#

Syntax

ssl-certificate { string certificate | file url }

string certificate

Specifies an ORBEM SSL certificate. certificate is an alphanumeric string of up to 4096 characters.

file url

Default: /usr/ssl/certs/orbscert.pem
Specifies an ORBEM SSL certificate file and location. url is an alphanumeric string of up to 1024 characters.

Usage

Use to configure the certificate to be used by the SSL transport of ORBEM. Note that if the file option is used, the certificate content is read from the url and converted into a quoted string.

Example

The following command defines the certificate cert3.pem file as being located in the /usr/ssl/certs directory:

ssl-certificate file /usr/ssl/certs/cert3.pem

The following command defines the certificate string (the string shown is abbreviated):

ssl-certificate string

Cisco ASR 5x00 Command Line Interface Reference
ssl-private-key

Configures the SSL private key used by the ORBEM server.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > ORBEM Configuration
configure > orbem

Entering the above command sequence results in the following prompt:

[local]host_name(config-ORBEM)#

Syntax

ssl-private-key { string key | file url }

string key
Specifies an ORBEM SSL private key. key is an alphanumeric string of up to 4096 characters.

file url
Default: /usr/ssl/certs/orbscert.pem
Specifies the ORBEM SSL private key file location. url is an alphanumeric string of up to 1024 characters.

Usage

Use to configure the private key for the SSL transport of ORBEM. Note that if file option is used, the private key is read from the url and converted into a quoted string.

Example

The following command defines the private-key cert3.pem file as being located in the /usr/ssl/certs directory:

ssl-private-key file /usr/ssl/certs/cert3.pem

The following command defines the private-key string (the string shown is abbreviated):

ssl-private-key string

Chapter 229
OSPF Configuration Mode Commands

The OSPF Configuration sub-mode is used to configure the Open Shortest Path First (OSPF) routing protocol. This mode includes commands that configure OSPF routing parameters.

Mode

Exec > Global Configuration > Context Configuration > OSPF Configuration

configure > context context_name > router ospf

Entering the above command sequence results in the following prompt:

[local]host_name(config-ospf)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
area authentication

Enables authentication for the specified OSPF area.

Product
PDSN
HA
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > OSPF Configuration
configure > context context_name > router ospf

Entering the above command sequence results in the following prompt:

[local]host_name(config-ospf)#

Syntax

[ no ] area { ipaddress | decimal_value } authentication { message-digest }

- no
  Disables authentication for the specified area.

- ipaddress
  Specifies the IP address of the area where authentication will be enabled in IPv4 dotted-decimal notation.

- decimal-value
  Specifies the identification number of the area where authentication will be enabled. This must be an integer from 0 through 4294967295.

- authentication
  Sets the OSPF authentication type to use the simple authentication method.

- message-digest
  Sets the OSPF authentication type to use the message digest 5 (MD5) authentication method.

Usage
Use this command to enable authentication of OSPF areas.

Example
The following command enables authentication for an OSPF area defined by the IP address 192.168.100.10 and the OSPF authentication type to MD5:

    area 192.168.100.10 authentication message-digest
area default-cost

Configures the default cost for an area.

Product
PDSN
HA
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > OSPF Configuration
configure > context context_name > router ospf

Entering the above command sequence results in the following prompt:

[local]host_name(config-ospf)#

Syntax
[ no ] area { ipaddress | decimal_value } default-cost cost_value

no
Deletes the default cost for the area.

ipaddress
Specifies the IP address of the area in IPv4 dotted-decimal notation.

decimal-value
Specifies the identification number of the area as an integer from 0 through 4294967295.

cost_value
Sets the default cost to be configured for the specified area as an integer from 0 through 16777215.

Usage
Use this command to configure the default cost for an OSPF area.

Example
The following command sets the default cost for an OSPF area defined by the IP address 192.168.100.10 to 300:

area 192.168.100.10 default-cost 300
area nssa

Defines an area as an NSSA (Not So Stubby Area) and configures OSPF parameters for it.

**Product**

PDSN
HA
GGSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > OSPF Configuration

```
configure > context context_name > router ospf
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospf)#
```

**Syntax**

```
[ no ] area { ipaddress | decimal_value } nssa [ default-information-originate ] [ no-redistribution ] [ no-summary ] [ translate-always ] [ translate-candidate ] [ translate-never ]
```

**ipaddress**

Specifies the IP address of the NSSA in IPv4 dotted-decimal notation.

**decimal-value**

Specifies the identification number of the NSSA area as an integer from 0 through 4294967295.

**default-information-originate**

Originates default information to the NSSA area.

**no-redistribution**

Does not redistribute external routes to the NSSA area.

**no-summary**

Does not inject inter-area routes into NSSA.

**translate-always**

Configures the NSSA-ABR (Area Border Router) to always translate

**translate-candidate**

Configure NSSA-ABR for translate election. (This is enabled by default.)
translate-never

Configure NSSA-ABR to never translate.

Usage

Use this command to define NSSA areas.

Example

The following command defines the area designated by the IP address 192.168.100.10 as an NSSA area:

```
area 192.168.100.10 nssa
```
area stub

Defines an area as an OSPF stub area.

Product
- PDSN
- HA
- GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > OSPF Configuration

configure > context context_name > router ospf

Entering the above command sequence results in the following prompt:

[local]host_name(config-ospf)#

Syntax

[ no ] area { ipaddress | decimal_value } stub [ no-summary ]

ipaddress
Specifies the IP address of the stub area in IPv4 dotted-decimal notation.

decimal-value
Specifies the identification number of the stub area as an integer from 0 through 4294967295.

no-summary
Disables (stops) the ABR (Area Border Router) from sending summary link state advertisements (LSAs) into the stub area.

Usage
Use this command to define an OSPF area as a stub area.

Example
The following command defines the OSPF area defined by the IP address 192.168.100.10 as a stub area:

area 192.168.100.10 stub
area virtual-link

Configures a virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

**Product**

PDSN  
HA  
GGSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > OSPF Configuration  
`configure > context context_name > router ospf`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospf)#
```

**Syntax**

```
[ no ] area { ipaddress | decimal_value } virtual-link router_id_address
```

- **no**  
  Disables area virtual-link.

- **ipaddress**  
  Specifies the IP address of the transit area in IPv4 dotted-decimal notation.

- **decimal-value**  
  Specifies the identification number of the transit area as an integer from 0 through 4294967295.

- **router_id_address**  
  Specifies the router id of the ABR to be linked to in IPv4 dotted-decimal notation.

**Usage**

Use this command to create a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

**Example**

The following command creates a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20:

```
area 192.168.100.10 virtual-link 192.168.200.20
```
area virtual link authentication

Configures the OSPF authentication method to be used by the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

**Product**
PDSN
HA
GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > OSPF Configuration

```
configure > context context_name > router ospf
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospf)#
```

**Syntax**

```
[ no ] area { ipaddress | decimal_value } virtual-link router_id_address authentication { message-digest | null | text }
```

- **no**
  Disables area virtual link authentication.

- **ipaddress**
  Specifies the IP address of the transit area in IPv4 dotted-decimal notation.

- **decimal-value**
  Specifies the identification number of the transit area as an integer from 0 through 4294967295.

- **router_id_address**
  Specifies the router id of the ABR to be linked to in IPv4 dotted-decimal notation.

- **authentication**
  Sets the OSPF authentication type to use the simple authentication method.

- **message-digest**
  Sets the OSPF authentication type to use the message digest (MD) authentication method.

- **null**
  Set the OSPF authentication type to use no authentication, thus disabling either MD or clear text methods.
area virtual link authentication

text
Set the OSPF authentication type to use the clear text authentication method.

Usage
Use this command to set the authentication method for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example
The following command sets the authentication method for a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20 to use no authentication:

```text
area 192.168.100.10 virtual-link 192.168.200.20 null
```
area virtual-link authentication-key

Configures the authentication password for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Mode**

- Exec > Global Configuration > Context Configuration > OSPF Configuration
- configure > context context_name > router ospf

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-ospf)#
```

**Syntax**

```
area { ipaddress | decimal_value } virtual-link router_id_address authentication-key { encrypted password | encrypted_authentication_key | password authentication_key }

no area { ipaddress | decimal_value } virtual-link router_id_address authentication-key
```

**no**

Disables the area virtual link authentication key.

**ipaddress**

Specifies the IP address of the transit area in IPv4 dotted-decimal notation.

**decimal-value**

Specifies the identification number of the transit area as an integer from 0 through 4294967295.

**router_id_address**

Specifies the router id of the ABR to be linked to in IPv4 dotted-decimal notation.

**encrypted password**

`encrypted_authentication_key` is an alphanumeric string of 1 through 523 characters. Use this if you are pasting a previously encrypted authentication key into the CLI command.

**password authentication_key**

The password to use for authentication. `authentication_key` is an alphanumeric string of 1 through 16 characters that denotes the authentication password. This variable is entered in clear text format.
Usage

Use this command to specify the authentication password for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example

The following command creates an authentication password of 123456 for a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20:

```
area 192.168.100.10 virtual-link 192.168.200.20 authentication-key password 123456
```
area virtual link intervals

Configures the interval or delay type, and the delay time in seconds, for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
```
Exec > Global Configuration > Context Configuration > OSPF Configuration
```
```
configure > context context_name > router ospf
```

Entering the above command sequence results in the following prompt:
```
[local]host_name(config-ospf)>
```

**Syntax**
```
[ no ] area { ipaddress | decimal_value } virtual-link router_id_address [ dead-interval value ] [ hello-interval value ] [ retransmit-interval value ] [ transmit-delay value ]
```

- **no**
  - Disables the area virtual link intervals.

- **ipaddress**
  - Specifies the IP address of the area in IPv4 dotted-decimal notation.

- **decimal-value**
  - Specifies the identification number of the transit area as an integer from 0 through 4294967295.

- **router_id_address**
  - Specifies the router id of the ABR to be linked to in IPv4 dotted-decimal notation.

- **dead-interval value**
  - Specifies The interval (in seconds) that the router should wait, during which time no packets are received and after the router considers a neighboring router to be off-line. value must be an integer from 1 through 65535.

- **hello-interval value**
  - Specifies the interval (in seconds) before sending a hello packet. value must be an integer from 1 through 65535.
retransmit-interval value

Specifies the interval (in seconds) that router should wait before retransmitting a packet. value must be an integer from 1 through 3600.

transmit-delay value

Specifies the interval (in seconds) that the router should wait before transmitting a packet. value must be an integer from 1 through 3600.

Usage

Use this command to set the intervals or delay types for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example

The following command sets the retransmit interval for a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20 to 60 seconds:

```
area 192.168.100.10 virtual-link 192.168.200.20 retransmit-interval 60
```
area virtual link message-digest-key

Enables the use of MD5-based OSPF authentication for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Product
PDSN
HA
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > OSPF Configuration
configure > context context_name > router ospf

Entering the above command sequence results in the following prompt:

[local] host_name(config-ospf) #

Syntax
area { ipaddress | decimal_value } virtual-link router_id_address message-digest-key
key_id md5 { encrypted password encrypted_authentication_key | password
authentication_key }

no area { ipaddress | decimal_value } virtual-link router_id_address message-digest-key
key_id

no
Disables the area virtual link message digest key.

ipaddress
Specifies the IP address of the transit area in IPv4 dotted-decimal notation.

decimal-value
Specifies the identification number of the transit area as an integer from 0 through 4294967295.

router_id_address
Specifies the router id of the ABR to be linked to in IPV4 dotted-decimal notation.

message-digest-key key_id
Specifies the key identifier number. key_id must be an integer from 1 through 255.

encrypted password
Specifies the use of an encrypted password. encrypted_authentication_key is an alphanumeric string of 1 through 523 characters.
Used this if you are pasting a previously encrypted authentication key into the CLI command.
password authentication_key

Specifies the password to use for authentication. authentication_key is an alphanumeric string from 1 through 16 characters that is entered in clear text format.

Usage

Use this command to enable the use of MD5-based OSPF authentication for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example

The following command enables the use of MD5-based OSPF authentication for a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20, sets the MD5 Key ID to 25, and the password to 123456:

```
area 192.168.100.10 virtual-link 192.168.200.20 message-digest-key 25 md5 password 123456
```
**bfd-all-interfaces**

Enables or disables Bidirectional Forwarding Detection (BFD) on all OSPF interfaces.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > OSPF Configuration
```plaintext
configure > context context_name > router ospf
```
Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospf)#
```

**Syntax**
```
[no] bfd-all-interfaces
```

- **no**
  Disables BFD capability on all interfaces.

- **Usage**
  Use this command to configure BFD on all OSPF interfaces. See the *System Administration Guide* for additional information on how to configure BFD.

- **Example**
  The following command configures BFD on all OSPF interfaces:

```
bfd-all-interfaces
```
capability graceful-restart

Configures graceful-restart. By default, this capability is set to enabled.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > OSPF Configuration
- `configure > context context_name > router ospf`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospf)#
```

**Syntax**

```
[ no | default ] capability graceful-restart
```

- **no**
  - Disables the graceful-restart capability.

- **default**
  - Enables the graceful-restart capability if it has been disabled.

**Usage**

Use this command to configure graceful-restart.

**Example**

The following command configures graceful-restart:

```
capability graceful-restart
```
default-information originate

Creates a default external route into an OSPF routing domain.

Product
- PDSN
- HA
- GGSN

Privilege
- Security Administrator, Administrator

Mode
- Exec > Global Configuration > Context Configuration > OSPF Configuration
  
  configure > context context_name > router ospf

Entering the above command sequence results in the following prompt:

[local]host_name(config-ospf)#

Syntax

default-information originate

default-information originate [ always ] [ metric metric_value ] [ metric-type { 1 | 2 } ] [ route-map route_map_name ]

no default-information originate

no

Disables the default external route.

- **always**
  - Always advertise the route regardless of whether or not the software has a default route.

- **metric metric_value**
  - Sets the OSPF metric used in creating the default route as an integer from 1 through 16777214.

- **metric-type { 1 | 2 }**
  - Sets the default route metric type.
  - 1: Sets the OSPF external link type for default routes to Type 1.
  - 2: Sets the OSPF external link type for default routes to Type 2.

- **route-map route_map_name**
  - Specifies the name of the default route-map to be use as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to set the default external route into an OSPF routing domain.
The following command sets the default external route to originate from the route map named `rmap1`:

```
default-information originate route-map rmap1
```
default-metric

Configures the default metric value for the OSPF routing protocol. All OSPF interfaces have a cost, which is a routing metric that is used in the link-state calculation. Routes with lower total path metrics are preferred over those with higher path metrics. When several equal-cost routes to a destination exist, traffic is distributed equally among them. The default metric is a global parameter that specifies the cost applied to all OSPF routes by default.

Product
- PDSN
- HA
- GGSN

Privilege
Security Administrator, Administrator

Mode
- Exec > Global Configuration > Context Configuration > OSPF Configuration
- configure > context context_name > router ospf

Entering the above command sequence results in the following prompt:

[local]host_name(config-ospf)#

Syntax

```plaintext
default-metric metric_value

no default-metric
```

**metric-value**

Sets the metric value expressed as an integer from 1 through 16777214. Default: 26385.

**no**

Enables or disables the default metric value for OSPF.

Usage

Use this command to set the default metric for routes.

Example

The following command sets the default metric to 235:

```
default-metric 235```
distance

Configures the OSPF route administrative distances for all OSPF route types or based on specific route type. Administrative distance is the measure used by Cisco routers to select the best path when there are two or more different routes to the same destination from two different routing protocols. Administrative distance defines the reliability of a routing protocol. Each routing protocol is prioritized in order of most to least reliable (believable) using an administrative distance value. A lower numerical value is preferred.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > OSPF Configuration

```
configure > context context_name > router ospf
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospf)#
```

**Syntax**

```
[ no ] distance { distance_value | ospf { [ external distance_value ] [ inter-area distance_value ] [ intra-area distance_value ] } }
```

- **no**
  Disables the OSPF route administrative distances for all OSPF route types.

- **distance_value**
  Specifies the OSPF route administrative distances as an integer from 1 to 255. The default distance value is 110.

- **ospf { [ external distance_value ] [ inter-area distance_value ] [ intra-area distance_value ] }**
  Set the distance value for the specified route type.
  - **external distance_value**: Set the OSPF route administrative distance for routes from other routing domains, learned by redistribution. This must be an integer from 1 through 255. The default is 110.
  - **inter-area distance_value**: sets the OSPF route administrative distance for routes from one routing area to another. This must be an integer from 1 through 255. The default is 110.
  - **intra-area distance_value**: sets the OSPF route administrative distance for all routes within an area. This must be an integer from 1 through 255. The default is 110.

- **no**
  Enables or disables the specified option.
**Usage**

Use this command to set the administrative distance for OSPF routes.

**Example**

The following command sets the administrative distance for all OSPF route types to 30:

```
distance 30
```
**distribute-list**

Enables or disables the filtering of networks in outgoing routing updates.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > OSPF Configuration

```bash
configure > context context_name > router ospf
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospf)#
```

**Syntax**

```
[ no ] distribute-list route_access_list out { connected | rip | static }
```

- **no**
  Disables the filtering of networks in outgoing routing updates.

- **route_access_list**
  Specifies the name of the OSPF route access list to use for filtering as an alphanumeric string of 1 through 63 characters.

- **connected**
  Filters connected routes.

- **rip**
  Filters RIP routes. (RIP is not supported at this time.)

- **static**
  Filters static routes.

- **no**
  Disables the specified option.

**Usage**

Use this command to enable the filtering of outgoing route updates by using the specified route access list.

**Example**

Use this command to enable the filtering of outgoing route updates by using the specified route access list.
The following command uses the route access list named *ral1* to filter outgoing routing updates for all connected routes:

```
distribute-list ral1 out connected
```
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
ip vrf

Configures the Virtual Routing and Forwarding (VRF) instances for OSPF routing protocol.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > OSPF Configuration

configure > context context_name > router ospf

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospf)#
```

**Syntax**

```
[ no ] ip vrf vrf_name
```

- **no**
  
  Disables the VRF instances and removes the configured VRF context association for OSPF routing.

- **vrf vrf_name**

  Configures Virtual Routing & Forwarding (VRF) parameters.
  
  *vrf_name* is name of a preconfigured VRF context configured in Context Configuration Mode via the `ip vrf` command. It is an alphanumeric string of 1 through 63 characters.

**Usage**

Use this command to configure the IP VRF forwarding also to associate the preconfigured VRF context with the specific tunnel interface.

This command creates and enters the OSPF VRF Configuration Mode if required to configure the VRF context instances for OSPF routing.

**Example**

The following command enables preconfigured VRF context instance *ospf_vrf1* for OSPF routing and enters the OSPF VRF Configuration mode:

```
ip vrf ospf_vrf1
```
neighbor

Configures OSPF routers that interconnect to non-broadcast networks.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > OSPF Configuration

```
configure > context context_name > router ospf
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospf)#
```

**Syntax**

```
[ no ] neighbor ip_address [ poll-interval poll_interval_value ] [ priority priority_value ]
```

**no**

Disables OSPF routers that interconnect to non-broadcast networks.

---

**ip_address**

Specifies the interface IP address of the OSPF neighbor expressed using IPv4 dotted-decimal notation.

**poll-interval poll_interval_value**

Default: 120
Sets the number of seconds in the dead neighbor polling interval as an integer from 1 through 65535.

**priority priority_value**

Default: 0
Sets the 8-bit number that represents the router priority value of the non-broadcast neighbor associated with the specified IP address. This must be an integer from 0 through 255. This keyword does not apply to point-to-multipoint interfaces.

**Usage**

Use this command to configure OSPF routers that connect to non-broadcast networks.

**Example**

The following command specifies an OSPF router neighbor with the IP address of `192.168.100.10`:

```
neighbor 192.168.100.10
```
network area

Enables OSPF on an interface and defines the OSPF area for that network.

Product

- PDSN
- HA
- GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > OSPF Configuration

configure > context context_name > router ospf

Entering the above command sequence results in the following prompt:

[local]host_name(config-ospf)#

Syntax

[ no ] network network_ip_address / network_mask area { area_id | area_ip_address }

- no
  Enables OSPF on an interface and defines the OSPF area for that network.

- network_ip_address/network_mask
  Specifies the network address and mask as well as the interface on which OSPF will be enabled. network_ip_address is entered in IPv4 dotted-decimal notation, followed by the “/” and the mask (CIDR).

- area_id
  Specifies the OSPF area identification number for the specified network as an integer from 0 through 4294967295.

- area_ip_address
  Specifies the IP address of the OSPF area for this network. This must be entered in IPv4 dotted-decimal notation.

Usage

Use this command to specify the IP address of the network interface that the OSPF router will use.

Example

The following command specified that the OSPF router will use the interface at IP address 192.168.1.0 with a netmask of 24:

    network 192.168.1.0/24
ospf graceful-restart

Configures OSPF graceful-restart settings.

Product

- PDSN
- HA
- GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > OSPF Configuration

configure > context context_name > router ospf

Entering the above command sequence results in the following prompt:

[local]host_name(config-ospf)#

Syntax

ospf graceful-restart { grace-period grace_period | helper { never | policy { only-reload | only-upgrade } } |

<table>
<thead>
<tr>
<th>grace-period grace-period</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the OSPF graceful restart grace period (in seconds) as an integer from 1 through 1800. Default grace period is 60 seconds.</td>
</tr>
</tbody>
</table>

| helper { never | policy { only-reload | only-upgrade } } |
|---------------------------------------------------------|
| Helps configure OSPF helper settings. |
| never: Do not allow helper mode. |
| policy { only-reload | only-upgrade }): Allows ospf graceful-restart helper mode. |
| only-reload: Allows ospf graceful-restart helper mode only for a reload. |
| only-upgrade: Allows ospf graceful-restart helper mode only for an upgrade. |
| Default is ospf graceful-restart grace-period. |

Usage

Use this command to configure graceful-restart specific settings.

Example

The following command sets the graceful restart grace period to 60 seconds:

ospf graceful-restart grace-period 60

ospf graceful-restart helper policy only-reload

ospf graceful-restart helper policy only-upgrade
**ospf router-id**

This command configures the router ID for the OSPF process.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > OSPF Configuration
- `configure > context context_name > router ospf`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospf)#
```

**Syntax**

```
[ no ] ospf router-id ip_address
```

- `no`
  - Disables the router ID for the OSPF process.

- `router-id ip_address`
  - Specifies the router ID for the OSPF process. `ip_address` is entered using IPv4 dotted-decimal notation.

**Usage**

Use this command to set the router ID for the current OSPF router process.

**Example**

The following command sets the router ID to `192.168.200.1`:

```
ospf router-id 192.168.200.1
```
**passive-interface**

Enables or disables the suppression of OSPF routing updates on the specified interface.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > OSPF Configuration
- `configure > context context_name > router ospf`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospf)#
```

**Syntax**

```
[ no ] passive-interface interface_name
```

- **no**
  - Disables the name assigned to a logical interface within the specific context.

- **interface_name**
  - Specifies the name assigned to a logical interface within the specific context as an alphanumeric string of 1 through 79 characters.

**Usage**

Use this command to suppress router updates on an interface in the current context.

**Example**

The following command suppresses OSPF routing updates on the interface named `Intfcl`:

```
passive-interface Intfcl
```
**redistribute**

Redistributes routes from other protocols to OSPF neighbors using the OSPF protocol.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > OSPF Configuration
configure > context context_name > router ospf

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospf)#
```

**Syntax**

```
redistribute { connected | rip | static } [ metric metric_value ] [ metric-type { 1 | 2 } ] [ route-map route_map_name ]
```

```
no redistribute { connected | rip | static }
```

**no**
Disables the redistributed routes.

**connected**
Redistributes connected routes.

**rip**
Specifies that RIP routes will be redistributed. (RIP is not supported at this time.)

**static**
Redistributes static routes.

**metric metric_value**
Sets the OSPF metric used in the redistributed route. This must be an integer from 1 through 16777214.

**metric-type { 1 | 2 }**
Default: 2
Sets route metric type that is applied to redistributed routes.
1: Sets the OSPF external link type for routes to Type 1.
2: Sets the OSPF external link type for routes to Type 2.
route-map route_map_name

Filter routes through the specified route map before redistribution. route_map_name specifies the name of the route-map to use as an alphanumeric string of 1 through 79 characters.

**Usage**

Use this command to define what routing protocols should have their routes redistributed into OSPF.

**Example**

The following command defines that BGP routes should be redistributed:

```
redistribute connected
```
refresh timer

Adjusts settings for the OSPF refresh timer.

Product
PDSN
HA
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > OSPF Configuration
configure > context context_name > router ospf

Entering the above command sequence results in the following prompt:
[local]host_name(config-ospf)#

Syntax

[ no ] refresh timer value

no
Disables the refresh timer.

value
Default: 10
Specifies the minimum amount of time (in seconds) to wait before refreshing a Link-state Advertisement (LSA). This must be an integer from 10 through 1800.

Usage
Use this command to define the amount of time to wait before refreshing an LSA.

Example
The following command sets the refresh timer to 90 seconds:

    refresh timer 90
router-id

Configures the router ID for the OSPF process.

Product
- PDSN
- HA
- GGSN

Privilege
- Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > OSPF Configuration

configure > context context_name > router ospf

Entering the above command sequence results in the following prompt:

[local]host_name(config-ospf)#

Syntax

[ no ] router-id ip_address

no
Disables the router ID for the OSPF process.

ip_address
Specifies the router ID for the OSPF process in IPv4 dotted-decimal notation.

Usage
Use this command to set the router ID for the current OSPF router process.

Example
The following command sets the router ID to 192.168.200.1:

    router-id 192.168.200.1
timers spf

Sets the Shortest Path First (SPF) timers.

Product

PDSN
HA
GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > OSPF Configuration

configure > context context_name > router ospf

Entering the above command sequence results in the following prompt:

[local]host_name(config-ospf)#

Syntax

```
timers spf delay_value hold_time_value
no timers spf
```

**no**

Disables SPF timers.

```
delay_value
```

Default: 5

Specifies the delay time (in seconds) between receiving changes to an SPF calculation. This must be an integer from 0 through 4294967295.

```
hold_time_value
```

Default: 10

Specifies the hold time (in seconds) between consecutive SPF calculations. This must be an integer from 0 through 4294967295.

Usage

Use this command to set the SPF delay and hold timers for the current OSPF router process.

Example

The following command sets the delay timer to 15 and the hold timer to 15:

```
timers spf 15 15
```
Chapter 230
OSPFv3 Configuration Mode Commands

The OSPFv3 Configuration sub-mode is used to configure the OSPFv3 routing protocol. This mode includes commands that configure OSPFv3 routing parameters.

**Mode**

Exec > Global Configuration > Context Configuration > OSPFv3 Configuration

```bash
configure > context context_name > router ospfv3
```

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-ospfv3) #
```

⚠️ **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
area

Configures an Open Shortest Path First Version 3 (OSPFv3) area and enables authentication for that area.

Product

- PDSN
- HA
- GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > OSPFv3 Configuration

```bash
configure > context context_name > router ospfv3
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospfv3)#
```

Syntax

```bash
[ no | area { decimal_value | ipv4address } default-cost default_integer_value | stub [ no-summary ] | virtual-link virtuallink_neighbour_Ipv4_address [ dead-interval virtuallink_dead_interval ] [ hello-interval virtuallink_hello_interval ] [ retransmit-interval virtuallink_retransmit_interval ] [ transmit-delay virtuallink_transmit_delay ]
```

- `[ no | area { decimal_value | ipv4address } default-cost default_integer_value | stub [ no-summary ] | virtual-link virtuallink_neighbour_Ipv4_address [ dead-interval virtuallink_dead_interval ] [ hello-interval virtuallink_hello_interval ] [ retransmit-interval virtuallink_retransmit_interval ] [ transmit-delay virtuallink_transmit_delay ]

Disables authentication for the specified area.

```bash
decimal_value | ipv4address
```

- `decimal_value` specifies the identification number of the area where authentication will be enabled as an integer from 0 through 4294967295.
- `ipv4address`: Specifies the IP address of the area where authentication will be enabled in IPv4 dotted-decimal notation.

```bash
default-cost default_integer_value
```

Sets the OSPFV3 authentication area’s default cost as an integer from 1 through 16777215.

```bash
stub [ no-summary ]
```

Sets the OSPFV3 stub area. Only Router-LSAs, Network-LSAs, Inter-area Prefix-LSAs, Intra-area Prefix-LSAs and Link-LSAs are allowed in a Stub area.

```bash
no-summary
```

Does not inject inter-area routes into stub area.

```bash
virtual-link virtuallink_neighbour_Ipv4_address
```

Configures a virtual link to the authentication area.

```bash
virtuallink_neighbour_Ipv4_address
```

Is the IPv4 address for the virtual link of the authenticated area in dotted-decimal notation.

The following interval timers can be set for the virtual link:
OSPFv3 Configuration Mode Commands

- **dead-interval virtuallink_dead_interval**: Sets the virtual link dead-interval (in seconds) as an integer from 1 through 65535.
- **hello-interval virtuallink_hello_interval**: Sets the virtual link hello interval (in seconds) as an integer from 1 through 65535.
- **retransmit-interval virtuallink_retransmit_interval**: Sets the virtual link retransmit interval (in seconds) as an integer from 1 through 3600.
- **transmit-delay virtuallink_transmit_delay**: Sets the virtual link transmit delay (in seconds) as an integer from 1 through 3600.

**Usage**

Use this command to establish OSPFv3 areas and enable authentication.

**Example**

The following command enables authentication for an OSPFv3 area defined by the IP address 192.168.100.10 with default cost of 256

```
area 192.168.100.10 default-cost 256
```
default-metric

Configures the default metric value for routes redistributed from another protocol into Open Shortest Path First Version 3 (OSPFv3).

**Product**
- PDSN
- HA
- GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > OSPFv3 Configuration
configure > context context_name > router ospfv3

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-ospfv3)#
```

**Syntax**

```
[ no ] default-metric default_metric_integer_value
```

- **no**
  - Disables the default metric.

```
default_metric_integer_value
```

- Specifies the default metric as an integer from 1 through 16777214.

**Usage**
Use this command to configure OSPFv3 default metric.

**Example**
The following command configures OSPFv3 default metric to 256

```
default-metric 256
```
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.
passive Interface

Configures an OSPFv3 passive interface as passive. If a network interface is configured as passive, it will not receive or send any OSPFv3 packets.

Product
PDSN
HA
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > OSPFv3 Configuration
configure > context context_name > router ospfv3

Entering the above command sequence results in the following prompt:

[local]host_name(config-ospfv3)#

Syntax

[ no ] passive-interface passive_interface_name

no
Disables the passive interface.

passive-interface passive_interface_name
Sets the named interface to be a passive interface as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to configure an OPSFv3 passive interface in this context.

Example

The following command configures an OSPFv3 passive interface.

passive-interface OSPF-if1
**redistribute**

Redistributes routes from other protocols to OSPFv3 neighbors using the OSPFv3 protocol.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > OSPFv3 Configuration
- `configure > context context_name > router ospfv3`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospfv3)#
```

**Syntax**

```
[ no ] redistribute { connected | static }

redistribute connected [ metric metric_value [ metric-type external_metric_type ] [ route-map route_map_name ] ] [ metric-type external_metric_type [ route-map route_map_name ] ] [ route-map route_map_name ]

static [ metric metric_value [ metric-type external_metric_type ] [ route-map route_map_name ] ] [ metric-type external_metric_type [ route-map route_map_name ] ] [ route-map route_map_name ]
```

- **no**
  Disables the route redistribution.

- **connected**
  Redistributes connected routes.

- **static**
  Redistributes static routes.

- **metric metric_value**
  Specifies the OSPFv3 default metric value as an integer from 0 through 16777214.

- **metric-type external_metric_type**
  Specifies the OSPFv3 external metric type as the integer 1 or 2

- **route-map route_map_name**
  Specifies a route map as an alphanumerical string of 1 through 79 characters.
Usage
Use this command to configure OSPFv3 redistribution of connected or static routes.

Example
The following command configures OSPFv3 redistribution of connected routes.

```
redistribute connected metric 45 metric-type 1 route-map rt
```
router-id

Sets the OSPFv3 router ID for the Open Shortest Path First Version 3 (OSPFv3) routing process.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > OSPFv3 Configuration
- `configure > context context_name > router ospfv3`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospfv3)#
```

**Syntax**

```
[ no ] router-id router_id_ipaddress
```

- **no**
  - Disables the router-id.

- **router_id_ipaddress**
  - Specifies the router-id an IPv4 address in dotted-decimal notation.

**Usage**

Use this command to configure OPSF v3 router id to the given IPv4 address.

**Example**

The following command configures OSPFv3 router id to the given IPv4 address.

```
router-id 11.22.22.21
```
**timers spf**

Sets OSPFv3 the delay in the time between the detection of a topology change and when the SPF algorithm actually runs.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > OSPFv3 Configuration

```
configure > context context_name > router ospfv3
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospfv3)#
```

**Syntax**

```
[ no ] timers spf spf_delay_timer_value
```

- **no**
  Disables the SPF delay timer.

- **spf spf_delay_timer_value**
  Sets the Shortest Path First (SPF) delay timer (in milliseconds) as an integer from 0 through 4294967295.

**Usage**

Use this command to configure the OSPFv3 SPF delay timer.

**Example**

The following command sets OSPFv3 SPF timer.

```
timers spf 256
```
Chapter 231
OSPF VRF Configuration Mode Commands

The OSPF VRF Configuration sub-mode is used to configure the virtual routing and forwarding (VRF) context instances for OSPF routing protocol. This mode includes commands that configure VRF instance for OSPF routing parameters.

Mode

Exec > Global Configuration > Context Configuration > OSPF Configuration > OSPF VRF Configuration

configure > context context_name > router ospf > ip vrf vrf_name

Entering the above command sequence results in the following prompt:

[local] host_name(config-ospf-vrf) #

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
area

Configures various parameters, including authentication, area identification, virtual link ID, and delay/interval values for the specified OSPF area using a specific VRF instance.

Product

PDSN
HA
GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > OSPF Configuration > OSPF VRF Configuration

configure > context context_name > router ospf > ip vrf vrf_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-ospf-vrf)#

Syntax

[no] area {decimal_value | ip_address} {authentication [message-digest] | default-cost cost_value | nssa [default-information-originate] [no-redistribution] [no-summary] [translate-always] [translate-candidate] [translate-never] | stub [no-summary] | virtual-link router_ip_address [authentication {message-digest | null | text}] [authentication-key {encrypted password encrypted_string | password password_string}] [message-digest-key key_id md5 [encrypted password encrypted_string | password password_string]] [dead-interval] [hello-interval] [retransmit-interval] [transmit-delay]

no

Disables or removes configured parameters for the specified OSPF area using a specific VRF instance.

ip_address

Specifies the IP address of the area where authentication will be enabled in IPv4 dotted-decimal notation.

decimal_value

Specifies the identification number of the area where parameters to be configured as an integer from 0 through 4294967295.

authentication

Sets the OSPF authentication type to use the simple authentication method.

message-digest

Sets the OSPF authentication type to use the message digest 5 (MD5) authentication method.

default-cost cost_value

Sets the default cost for an OSPF area. cost_value must be an integer from 0 through 16777215.
**nssa [default-information-originate] [no-redistribution no-summary] [translate-always] [translate-candidate] [translate-never]**

Configures and defines an area as an NSSA (Not So Stubby Area) and configures OSPF parameters for it.

- **default-information-originate**: Configures the OSPF VRF instances to originate default information to the NSSA area.
- **no-redistribution**: Configures the OSPF VRF instance to not to redistribute external routes to the NSSA area.
- **no-summary**: Configures the OSPF VRF instance to not to inject the inter-area routes into NSSA.
- **translate-always**: Configures the NSSA-ABR (Area Border Router) always to translate. By default this is disabled.
- **translate-candidate**: Configures the NSSA-ABR always to translate election. By default this is enabled.
- **translate-never**: Configures the NSSA-ABR never to translate. By default this is disabled.

**stub [no-summary]**

Specifies an OSPF area as an stub area configures the NSSA-ABR never to translate. By default this is disabled.
- **no-summary**: Disables (stops) the ABR from sending summary LSAs into the stub area.

**virtual-link router_id**

Specifies the router identifier which provides a virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.
- **router_id**: Must be an IP address in IPv4 dotted-decimal notation of the ABR to be linked to.

**authentication {message-digest | null | text}**

Configures the OSPF authentication method to be used by the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.
- **message-digest**: Set the OSPF authentication type to use the message digest (MD) authentication method.
- **null**: Set the OSPF authentication type to use no authentication, thus disabling either MD or clear text methods.
- **text**: Set the OSPF authentication type to use the clear text authentication method.

**authentication-key**

Configures the authentication password for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

**message-digest-key key_id**

Specifies the MD key identifier number for virtual link connection. `key_id` must be an integer from 1 through 255.

**md5**

Sets the message digest to MD5 for virtual link connection.

**[encrypted] password passwd_string**

Specifies the password required for virtual link connection authentications. The keyword `password` is optional and if specified `passwd_string` must be an alphanumeric string of 1 through 63 characters. The password specified must be in an encrypted format if the optional keyword `encrypted` was specified.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file. **encrypted_string** is an alphanumeric string of 1 through 523 characters.

---

### dead-interval value

Specifies the dead interval (in seconds) that the router should wait, during which time no packets are received and after the router considers a neighboring router to be off-line. **value** must be an integer from 1 through 65535.

---

### hello-interval value

Specifies the hello interval (in seconds) before sending a hello packet. **value** must be an integer from 1 through 65535.

---

### retransmit-interval value

Specifies the delay between retransmission (in seconds) that router should wait before retransmitting a packet. **value** must be an integer from 1 through 3600.

---

### transmit-delay value

Specifies the interval (in seconds) that the router should wait before transmitting a packet. **value** must be an integer from 1 through 3600.

---

### Usage

Use this command to configure/set the various network/connection/authentication parameters of OSPF areas using specific VRF instance.

### Example

The following command enables authentication for an OSPF area defined by the IP address 192.168.100.10 and the OSPF authentication type to MD5:

```
area 192.168.100.10 authentication message-digest
```

The following command defines the area designated by the IP address 192.168.100.10 as an NSSA area where translation of NSSA candidate is enabled by default:

```
area 192.168.100.10 nssa
```

The following command defines the OSPF area defined by the IP address 192.168.100.10 as a stub area:

```
area 192.168.100.10 stub
```

The following command creates a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20:

```
area 192.168.100.10 virtual-link 192.168.200.20
```

The following command sets the authentication method for a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20 to use no authentication:

```
area 192.168.100.10 virtual-link 192.168.200.20 null
```
The following command creates an authentication password of 123456 for a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20:

```bash
area 192.168.100.10 virtual-link 192.168.200.20 authentication-key password 123456
```

The following command enables the use of MD5-based OSPF authentication for a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20, sets the MD5 Key ID to 25, and the password to 123456:

```bash
area 192.168.100.10 virtual-link 192.168.200.20 message-digest-key 25 md5 password 123456
```

The following command sets the retransmit interval for a virtual link between the OSPF areas defined by the IP address 192.168.100.10 and the IP address 192.168.200.20 to 60 seconds:

```bash
area 192.168.100.10 virtual-link 192.168.200.20 retransmit-interval 60
```
default-information originate

Creates a default external route into an OSPF routing domain.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > OSPF Configuration > OSPF VRF Configuration

```
configure > context context_name > router ospf > ip vrf vrf_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospf-vrf)#
```

**Syntax**

```
default-information originate

default-information originate [ always ] [ metric metric_value ] [ metric-type { 1 | 2 } ] [ route-map route_map_name ]
```

```
no default-information originate
```

- **no**
  
  Disables the default external route.

- **always**
  
  Always advertise the route regardless of whether or not the software has a default route.

- **metric metric_value**
  
  Sets the OSPF metric used in creating the default route as an integer from 1 through 16777214.

- **metric-type { 1 | 2 }**
  
  Sets the default route metric type.
  1: Sets the OSPF external link type for default routes to Type 1.
  2: Sets the OSPF external link type for default routes to Type 2.

- **route-map route_map_name**
  
  Specifies the name of the default route-map to be use as an alphanumeric string of 1 through 79 characters.

**Usage**

Use this command to set the default external route into an OSPF routing domain.
Example

The following command sets the default external route to originate from the route map named `rmap1`:

```
default-information originate route-map rmap1
```
**default metric**

Configures the default metric value for the OSPF routing protocol.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > OSPF Configuration > OSPF VRF Configuration
```
configure > context context_name > router ospf > ip vrf vrf_name
```

Entering the above command sequence results in the following prompt:
```
[local]host_name(config-ospf-vrf)#
```

**Syntax**

```
default-metric metric_value
default-metric
```

Sets the metric value expressed as an integer from 1 through 16777214. The default metric value setting is 26385.

```
no
```

Enables or disables the default metric value for OSPF.

**Usage**
Use this command to set the default metric for routes.

**Example**
The following command sets the default metric to 235:
```
default-metric 235
```
distance

Configures the OSPF route administrative distances for all OSPF route types or based on specific route type. Administrative distance is the measure used by Cisco routers to select the best path when there are two or more different routes to the same destination from two different routing protocols. Administrative distance defines the reliability of a routing protocol. Each routing protocol is prioritized in order of most to least reliable (believable) using an administrative distance value. A lower numerical value is preferred.

Product
PDSN

GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > OSPF Configuration > OSPF VRF Configuration
configure > context context_name > router ospf > ip vrf vrf_name

Entering the above command sequence results in the following prompt:
[local]host_name(config-ospf-vrf)#

Syntax

\[ no \] distance \{ distance_value | ospf \{ [ external distance_value ] [ inter-area distance_value ] [ intra-area distance_value ] \} \}

no
Disables the OSPF route administrative distances for all OSPF route types.

distance_value
Specifies the OSPF route administrative distances as an integer from 1 to 255. The default distance value is 110.

ospf \{ [ external distance_value ] [ inter-area distance_value ] [ intra-area distance_value ] \}
Set the distance value for the specified route type.
external distance_value: Set the OSPF route administrative distance for routes from other routing domains, learned by redistribution. This must be an integer from 1 through 255. The default is 110.
inter-area distance_value: sets the OSPF route administrative distance for routes from one routing area to another. This must be an integer from 1 through 255. The default is 110.
intra-area distance_value: sets the OSPF route administrative distance for all routes within an area. This must be an integer from 1 through 255. The default is 110.

no
Enables or disables the specified option.
**Usage**

Use this command to set the administrative distance for OSPF routes.

**Example**

The following command sets the administrative distance for all OSPF route types to **30**:

```
   distance 30
```
**distribute-list**

Enables or disables the filtering of networks in outgoing routing updates.

**Product**

PDSN  
HA  
GGSN  

**Privilege**

Security Administrator, Administrator  

**Mode**

Exec > Global Configuration > Context Configuration > OSPF Configuration > OSPF VRF Configuration  
`configure > context context_name > router ospf > ip vrf vrf_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospf-vrf)#
```

**Syntax**

```
[ no ] distribute-list route_access_list out { connected | rip | static }
```

- **no**  
  Disables the filtering of networks in outgoing routing updates.

- **route_access_list**  
  Specifies the name of the OSPF route access list to use for filtering as an alphanumeric string of 1 through 63 characters.

- **connected**  
  Filters connected routes.

- **rip**  
  Filters RIP routes. (RIP is not supported at this time.)

- **static**  
  Filters static routes.

- **no**  
  Disables the specified option.

**Usage**

Use this command to enable the filtering of outgoing route updates by using the specified route access list.

**Example**

The following command uses the route access list named `ral1` to filter outgoing routing updates for all connected routes:

```
distribute-list ral1 out connected
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
dec
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
neighbor

Configures OSPF routers that interconnect to non-broadcast networks.

Product
PDSN
HA
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > OSPF Configuration > OSPF VRF Configuration

configure > context context_name > router ospf > ip vrf vrf_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-ospf-vrf)#

Syntax

no neighbor ip_address [ poll-interval poll_interval_value ] [ priority priority_value ]

no
Disables OSPF routers that interconnect to non-broadcast networks.

ip_address
Specifies the interface IP address of the OSPF neighbor expressed using IPv4 dotted-decimal notation.

poll-interval poll_interval_value
Default: 120
Sets the number of seconds in the dead neighbor polling interval as an integer from 1 through 65535

priority priority_value
Default: 0
Sets the 8-bit number that represents the router priority value of the non-broadcast neighbor associated with the specified IP address. This must be an integer from 0 through 255. This keyword does not apply to point-to-multipoint interfaces.

Usage
Use this command to configure OSPF routers that connect to non-broadcast networks.

Example

The following command specifies an OSPF router neighbor with the IP address of 192.168.100.10:

neighbor 192.168.100.10
**network area**

Enables OSPF on an interface and defines the OSPF area for that network.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > OSPF Configuration > OSPF VRF Configuration

```
configure > context context_name > router ospf > ip vrf vrf_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospf-vrf)#
```

**Syntax**

```
[ no ] network network_ip_address / network_mask area { area_id | area_ip_address }
```

- **no**
  Disables OSPF on an interface and defines the OSPF area for that network.

- **network_ip_address/network_mask**
  Specifies the network address and mask as well as the interface on which OSPF will be enabled.
  *network_ip_address* entered in IPv4 dotted-decimal notation, followed by the “/” and the mask (CIDR).

- **area_id**
  Specifies the OSPF area identification number for the specified network as an integer from 0 through 4294967295.

- **area_ip_address**
  Specifies the IP address of the OSPF area for this network. This must be entered in IPv4 dotted-decimal notation.

**Usage**

Use this command to specify the IP address of the network interface that the OSPF router will use.

**Example**

The following command specified that the OSPF router will use the interface at IP address 192.168.1.0 with a netmask of 24:

```
network 192.168.1.0/24
```
**ospf router-id**

Configures the router ID for the OSPF process.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > OSPF Configuration > OSPF VRF Configuration
- `configure > context context_name > router ospf > ip vrf vrf_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospf-vrf)#
```

**Syntax**

```
ospf router-id ip_address
no ospf router-id ip_address
```

- `no`
  - Disables `ospf router-id`.
- `ip_address`
  - Specifies the router ID for the OSPF process as an IP address entered using IPv4 dotted-decimal notation

**Usage**

Use this command to set the router ID for the current OSPF router process.

**Example**

The following command sets the router ID to 192.168.200.1:

```
ospf router-id 192.168.200.1
```
passive-interface

Enables or disables the suppression of OSPF routing updates on the specified interface.

Product
PDSN
HA
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > OSPF Configuration > OSPF VRF Configuration
configure > context context_name > router ospf > ip vrf vrf_name

Entering the above command sequence results in the following prompt:
[local]host_name(config-ospf-vrf)#

Syntax

[ no ] passive-interface interface_name

no
Disables the name assigned to a logical interface within the specific context.

interface_name
Specifies the name assigned to a logical interface within the specific context as an alphanumeric string of 1 through 79 characters.

Usage
Use this command to suppress router updates on an interface in the current context.

Example
The following command suppresses OSPF routing updates on the interface named Intfcl:

    passive-interface Intfcl
**redistribute**

Redistributes routes from other protocols to OSPF neighbors using the OSPF protocol.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > OSPF Configuration > OSPF VRF Configuration

```
configure > context context_name > router ospf > ip vrf vrf_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospf-vrf)>
```

**Syntax**

```
redistribute { connected | rip | static } [ metric metric_value ] [ metric-type { 1 | 2 } ] [ route-map route_map_name ]
```

**no redistribute { connected | rip | static }**

- **no**
  Disables the redistributed routes.

- **connected**
  Redistributes connected routes.

- **rip**
  Specifies that RIP routes will be redistributed. (RIP is not supported at this time.)

- **static**
  Redistributes static routes.

- **metric metric_value**
  Sets the OSPF metric used in the redistributed route. This must be an integer from 1 through 16777214.

- **metric-type { 1 | 2 }**
  Default: 2
  Sets route metric type that is applied to redistributed routes.
  1: Sets the OSPF external link type for routes to Type 1.
  2: Sets the OSPF external link type for routes to Type 2.
route-map route_map_name

Filter routes through the specified route map before redistribution. `route_map_name` specifies the name of the route-map to use as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to define what routing protocols should have their routes redistributed into OSPF.

Example

The following command defines that BGP routes should be redistributed:

```
redistribute connected
```
refresh timer

Adjusts settings for the OSPF refresh timer.

Product
PDSN
HA
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > OSPF Configuration > OSPF VRF Configuration
configure > context context_name > router ospf > ip vrf vrf_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-ospf-vrf)#

Syntax

[ no ] refresh timer value

| no          | Disables the refresh timer. |
| value       | Default: 10                  |
|             | Specifies the minimum amount of time (in seconds) to wait before refreshing a Link-state Advertisement (LSA). This must be an integer from 10 through 1800. |

Usage
Use this command to define the amount of time to wait before refreshing an LSA.

Example
The following command sets the refresh timer to 90 seconds:

    refresh timer 90
**router-id**

Configures the router ID for the OSPF process.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > OSPF Configuration > OSPF VRF Configuration

```
configure > context context_name > router ospf > ip vrf vrf_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospf-vrf)#
```

**Syntax**

```
[ no ] router-id ip_address
```

- **no**
  Disables the router ID for the OSPF process.

- **ip_address**
  Specifies the router ID for the OSPF process in IPv4 dotted-decimal notation.

**Usage**

Use this command to set the router ID for the current OSPF router process.

**Example**

The following command sets the router ID to `192.168.200.1`:

```
router-id 192.168.200.1
```
timers spf

Sets the Shortest Path First (SPF) timers.

**Product**
PDSN
HA
GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > OSPF Configuration > OSPF VRF Configuration

```
configure > context context_name > router ospf > ip vrf vrf_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ospf-vrf)#
```

**Syntax**

```
timers spf delay_value hold_time_value
```

```
no timers spf
```

**Usage**
Use this command to set the SPF delay and hold timers for the current OSPF router process.

**Example**
The following command sets the delay timer to 15 and the hold timer to 15:

```
timers spf 15 15
```
Chapter 232
Out-Address Configuration Mode Commands

The Out-Address configuration mode provides the commands to configure the outbound parameters for the SCCP entities as part of the gtt-address-map configuration.

Mode

Exec > Global Configuration > GTT Address-Map Configuration > Out-Address Configuration

```
configure > gtt address-map map_id > out-address address_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-gtt-addrmmap-outaddr-out_address)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the configuration mode and returns to the Exec mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Change the mode back to the Exec mode.
exit

Exits the configuration mode and returns to the Global configuration mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
```
exit
```

**Usage**
Return to the Global configuration mode.
gt-address

Configures the SCCP short address.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > GTT Address-Map Configuration > Out-Address Configuration

configure > gtt address-map map_id > out-address address_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-gtt-addrmap-outaddr-out_address)#

Syntax

gt-address gt_address

    gt_address
    A string of 1 to 15 digits to define the GT-address

Usage
Define the GT-address

Example

gt-address 010405525397
**gt-format**

The GT-format provides four formats that can be used during GTT.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > GTT Address-Map Configuration > Out-Address Configuration

```bash
configure > gtt address-map map_id > out-address address_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-gtt-addrmapp-outaddr-out_address)#
```

**Syntax**

```bash
gt-format format_num
```

- **format_num**
  1: Selects GT-format 1 options which include `nature-of-address` and `odd/even`. Once selected, the system enters GT-Format1 configuration mode.
  2: Selects GT-format2 options which include `translation-type`. Once selected, the system enters GT-Format2 configuration mode.
  3: Selects GT-format3 options which include `encoding-scheme`, `numbering-plan3` and `translation-type`. Once selected, the system enters GT-Format1 configuration mode.
  4: Selects GT-format4 options which include `encoding-scheme`, `nature-of-address`, `numbering-plan`, and `translation-type`. Once selected, the system enters GT-Format4 configuration mode.

**Usage**
Select the a GT-format that include encoding-scheme as part of the GTT process.

**Example**

```bash
gt-format 3
```
ni-indicator

Configures the National and International indicator to use during the GTT process.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > GTT Address-Map Configuration > Out-Address Configuration

```
configure > gtt address-map map_id > out-address address_name
```

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-gtt-addrmap-outaddr-out_address)#
```

**Syntax**

```
ni-indicator ni_ind
```

- **ni_ind**

  Select one of the following as the appropriate type of national indicator for the address structure:
  - *national*
  - *international*

**Usage**

Select the international indicator to be used for out-going addresses.

**Example**

```
ni-indicator international
```
point-code

Selects and configures the SS7-type point code for use with the out-going address.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > GTT Address-Map Configuration > Out-Address Configuration

```bash
configure > gtt address-map map_id > out-address address_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-gtt-addrmdep-outaddr-out_address)#
```

**Syntax**

```
point-code pt_code
```

<table>
<thead>
<tr>
<th>pt_code</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter 1 to 11 digits in the point code format predefined during variant selection of GTT association.</td>
</tr>
</tbody>
</table>

**Usage**
Define an ITU point code to be used for out-going address processing.

**Example**

```bash
point-code 6.255.6
```
routing-indicator

Selects the type of routing and the indicator to be included in the out-going message.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > GTT Address-Map Configuration > Out-Address Configuration

`configure > gtt address-map map_id > out-address address_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-gtt-addrrmap-outaddr-out_address)#
```

**Syntax**

```
routing-indicator routing_ind
```

<table>
<thead>
<tr>
<th>routing_ind</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gt</td>
<td>Inserts an indicator that identifies routing based on global title.</td>
</tr>
<tr>
<td>ssn</td>
<td>Inserts an indicator that identifies routing based on the subsystem number.</td>
</tr>
</tbody>
</table>

**Usage**
Select global title as the appropriate routing indicator.

**Example**
```
routing-indicator gt
```
ssf

Selects the subservice field as factor in the out-going address processing. ssf sets the network indicator in the subservice field for SS7 Message Signal Units (MSUs). The indicator carried in the message’s routing information typically identifies the structure of the point code as a message from within a nation or as a message coming from outside the national - international.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > GTT Address-Map Configuration > Out-Address Configuration

configure > gtt address-map map_id > out-address address_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-gtt-addrmapping-outaddr-out_address)#

Syntax

ssf sub_svc_fld

sub_svc_fld

Select one of the following options:

• international: The network indicator identifies the message as international with a point code structure that does not match the national point code structure,

• national: The network indicator identifies the messages as having a national point code structure.

• reserved: Provides an alternate network indicator for national messages.

• spare: Provides an alternate network indicator for international messages.

Usage

Select the international NI for inclusion in out-going address subservice fields.

Example

ssf international
**ssn**

Selects the subsystem number to be included in the out-going message.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > GTT Address-Map Configuration > Out-Address Configuration

```bash
configure > gtt address-map map_id > out-address address_name
```

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-gtt-addrmap-outaddr-out_address)#
```

**Syntax**

```bash
ssn sub_sys_num
```

<table>
<thead>
<tr>
<th>sub_sys_num</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter an integer from 1 to 255.</td>
</tr>
</tbody>
</table>

**Usage**

Use subsystem number 44 in the out-going address.

**Example**

```bash
ssn 44
```
Chapter 233
PCC-Action-Set Configuration Mode Commands

The PCC-Action-Set Configuration Mode provides the parameters to indicate the policy and charging as well as event generation related decisions that will get activated when the corresponding PCC-Condition-Group is evaluated to TRUE within a profile. A maximum of 32 actions can be configured in an instance of PCC-Action-Set.

**Important:** This configuration mode is supported from StarOS Release 12.1 onward.

Mode

Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Action-Set Configuration

```
configure > context context_name > pcc-service service_name > action-set action_set_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-action-set)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
af-media-type

This command is used to set the action to be taken when specific media type is received from Application Function (AF) over Rx interface.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Action-Set Configuration

configure > context context_name > pcc-service service_name > action-set action_set_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-action-set)#

Syntax

[ no ] af-media-type {application | audio | control | data | message | other | text | video} {qos-profile qos_profile_value} {gate-status {disabled | enabled | enabled-downlink | enabled-uplink}} | {gate-status {disabled | enabled | enabled-downlink | enabled-uplink} [qos-profile qos_profile_value]} | [monitoring-key mon_key_id]

no
Removes the configured action set for different type of AF media in a PCC-Action-Set configuration instance for PCC-Service configuration.

application
Sets the AF media type to ‘application’ data traffic for various action configuration under PCC-Action-Set configuration instance for PCC-Service configuration.

audio
Sets the AF media type to ‘audio’ data traffic for various action configuration under PCC-Action-Set configuration instance for PCC-Service configuration.

control
Sets the AF media type to ‘control’ signal for various action configuration under PCC-Action-Set configuration instance for PCC-Service configuration.

data
Sets the AF media type to ‘data’ for various action configuration under PCC-Action-Set configuration instance for PCC-Service configuration.

message
Sets the AF media type to ‘message’ data for various action configuration under PCC-Action-Set configuration instance for PCC-Service configuration.
other
Sets the AF media type to ‘other’, out of AF media type configured here, for various action configuration under PCC-Action-Set configuration instance for PCC-Service configuration.

text
Sets the AF media type to ‘text’ for various action configured under PCC-Action-Set configuration instance for PCC-Service configuration.

video
Sets the AF media type to ‘video’ for various action configured under PCC-Action-Set configuration instance for PCC-Service configuration.

qos-profile qos_profile_value
Associate the pre-defined PCC-QoS-Profile for specific AF media type for various action configured for PCC-Service configuration.
qos_profile_value is name of the pre-defined PCC-QoS-Profile in PCC-Service Configuration instance.

gate-status {disabled | enabled | enabled-downlink | enabled-uplink}
Default: Enabled
Associate the status of Gate for specific AF media type for various action configured for PCC-Service configuration.
disabled: disables the Gate status in downlink and uplink direction for specific type of AF media type along optionally with PCC-QoS-Profile in PCC-Service Configuration instance.
enabled: Enables the Gate status in downlink and uplink direction for specific type of AF media type along optionally with PCC-QoS-Profile in PCC-Service Configuration instance. This is the default status of Gate.
enabled-downlink: Enables the Gate status in downlink direction for specific type of AF media type along optionally with PCC-QoS-Profile in PCC-Service Configuration instance.
enabled-uplink: Enables the Gate status in uplink direction for specific type of AF media type along optionally with PCC-QoS-Profile in PCC-Service Configuration instance.

monitoring-key mon_key_id
Specifies the Monitoring Key identifier to be associated with AF-Media-type under PCC-Action-Set configuration instance for PCC-Service configuration.
mon_key_id must be a preconfigured monitoring key having integer between 1 through 65535.

Usage
Use this command to set the action to be taken when specific media type is received from Application Function (AF) over Rx interface.
It also associates the pre-defined PCC-QoS-Profile and Gate function and monitoring key with specific media type.

Example
The following command sets the AF media type to ‘video’ with PCC-QoS-Profile named video_qos1 with gate status enabled in downlink and uplink traffic for various action configured under PCC-Action-Set configuration instance for PCC-Service configuration:

af-media-type video qos-profile video_qos1 gate-status enabled
associate monitoring-key

This command associates a Monitoring Key id with a PCC-Usage-Monitor in PCC-Action-Set configuration for PCC-Service instance.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Action-Set Configuration

configure > context context_name > pcc-service service_name > action-set action_set_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-action-set)#

Syntax

[no] associate monitoring-key mon_key_id usage-monitor usage_mon_name

no
Removes the associated Monitoring Key id configuration along with the association to PCC-Usage-Monitor from a PCC-Action-Set configuration instance for PCC-Service configuration.

mon_key_id
Specifies the Monitoring Key identifier to be associated with PCC-Usage-Monitor under PCC-Action-Set configuration instance for PCC-Service configuration.

mon_key_id must be an integer between 1 through 65535.

usage-monitor usage_mon_name

Specifies the PCC-Usage-Monitor associated with Monitoring Key mon_key_id under PCC-Action-Set configuration instance for PCC-Service configuration.

usage_mon_name is a pre-configured PCC-Usage-Monitor instance in PCC-Service Profile Configuration for PCC-Service configuration.

Usage

Use this command to associate a Monitoring Key with a PCC-Usage-Monitor in PCC-Action-Set configuration for PCC-Service instance.

There is a Many-To-Many relationship between Usage-Monitor and Monitoring-Key. Operator can change this relationship using required command.

When usage is reported to IPCF for a particular Monitoring Key, the usage is added to all the Usage Monitoring to which the Monitoring Key is associated.

Operator can break the relationship between Monitoring Key and Usage Monitor by dissociate monitoring-key command.

Example

The following command associates Monitoring Key id 102 with pre-defined PCC-Usage-Monitor named usage_mon1 under PCC-Action-Set configuration instance for PCC-Service configuration:
associate monitoring-key 102 usage-monitor usage_mon1
authorize

This command sets an action to change the various authorization parameters used for the IP-CAN session under PCC-Action-Set configuration instance for PCC-Service configuration.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Action-Set Configuration

configure > context context_name > pcc-service service_name > action-set action_set_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-action-set)#

**Syntax**

```
[no] authorize {apn-mbr | default-eps-bearer | qci qci_value} qos-profile qos_prof_name
```

- **no**
  Removes the configured action for QoS Profile authorization parameters from PCC-Action-Set configuration instance for PCC-Service configuration.

- **apn-mbr**
  Sets the action for QoS authorization of Maximum Bit Rate (MBR) at APN through a pre-configured QoS profile name `qos_prof_name` which is to use for the authorization at different level in an PCC-Service instance.
  This keyword is applicable only to EPS access type. MBR Download and MBR Upload values of the QoS profile is used with this authorization.

- **default-eps-bearer**
  Sets the action QoS authorization of the Default EPS bearer in an EPS access network through a pre-configured QoS profile name `qos_prof_name` which is to use for the authorization at different level in an PCC-Service instance.
  This keyword is applicable only to EPS access type. QoS Class Identifier (QCI) and Allocation and Retention Priority (ARP) values of the QoS profile is used with this authorization.

- **qci qci_value**
  Sets the action QoS authorization per QCI in case of PCEF binding through a pre-configured QoS profile name `qos_prof_name` which is to use for the authorization at different level in an PCC-Service instance.
  `qci_value` must be an integer value between 1 through 255.

**Important:** This keyword is applicable only in case of PCEF binding. QCI defined in QoS profile is not used when this keyword is active, so this keyword is repeated per QCI that has to be authorized by IPCF. For each QCI authorization Maximum Bit Rate Upload/Download (MBR DL/MBR UL) or Guaranteed Bit Rate Upload/Download (GBR DL/MBR UL) and ARP values of the QoS profile is used with this authorization.
authorize qos-profile qos_prof_name

This keyword associates the action configured for authorization with a pre-configured PCC-QoS-Profile named qos_prof_name and uses configured values from specific PCC-QoS-Profile during authorization. qos_prof_name specifies the pre-configured QoS profile name which is to use for the authorization at different level in an PCC-Service instance.

Usage

Use this command to define an action for the authorization parameters in PCC-QoS-Profile which is to be used under PCC-Action-Set configuration instance for PCC-Service configuration.

Example

Following command sets the action for QoS authorization for APN MBR with PCC-QoS-Profile apn_qos_prof1 under PCC-Action-Set configuration instance for PCC-Service configuration.

authorize apn-mbr qos-profile apn_qos_profile apn_qos_prof1
dissociate monitoring-key

This command dissociates a Monitoring Key id with a PCC-Usage-Monitor in PCC-Action-Set configuration for PCC-Service instance.

**Product**

IPCF

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Action-Set Configuration

configure > context context_name > pcc-service service_name > action-set action_set_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-action-set)#
```

**Syntax**

```
[no] dissociate monitoring-key mon_key_id usage-monitor usage_mon_name
```

- **[no]**
  - Removes the dissociated Monitoring Key id configuration from a PCC-Action-Set configuration instance for PCC-Service configuration.

- **mon_key_id**
  - Specifies the Monitoring Key identifier to be dissociated with PCC-Usage-Monitor under PCC-Action-Set configuration instance for PCC-Service configuration.
  - `mon_key_id` must be an integer between 1 through 65535.

- **usage-monitor usage_mon_name**
  - Specifies the PCC-Usage-Monitor need to be dissociated with Monitoring Key `mon_key_id` under PCC-Action-Set configuration instance for PCC-Service configuration.
  - `usage_mon_name` is a pre-configured PCC-Usage-Monitor instance in PCC-Service Profile Configuration for PCC-Service configuration.

**Usage**

Use this command to dissociate a Monitoring Key with a PCC-Usage-Monitor in PCC-Action-Set configuration for PCC-Service instance.

There is a Many-To-Many relationship between Usage-Monitor and Monitoring-Key. Operator can change this relationship using required commands.

When usage is reported to IPCF for a particular Monitoring Key, the usage is added to all the Usage Monitoring to which the Monitoring Key is associated.

Operator can reassociate the relationship between Monitoring Key and Usage Monitor by `associate monitoring-key` command.

**Example**

The following command dissociates a associated pair of Monitoring Key id 102 and PCC-Usage-Monitor named `usage_mon1` under PCC-Action-Set configuration instance for PCC-Service configuration:
dissociate monitoring-key 102 usage-monitor usage_mon1
dynamic-rule-install

This command sets an action to install a PCC Dynamic rule for the specified PCC-Data-service in PCC-Action-Set configuration for PCC-Service instance.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Action-Set Configuration

configure > context context_name > pcc-service service_name > action-set action_set_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-action-set)#

Syntax

[no] dynamic-rule-install data-service data_svc_name [qos-profile qos_prof_name]
[precedence preced_value] [monitoring-key mon_key_id [rating-group rating_grp_id] [gate-status [disabled | enabled | enabled-downlink | enabled-uplink]] [defer-by interval delayed_dur] [metering-method {both-duration-volume | duration | volume}] [reporting-level {service-identifier-level | rating-group-level}] [failure-policy { continue | terminate }]

no

Removes the Dynamic Rule install action configured for specific PCC-Data-Service from a PCC-Action-Set configuration instance for PCC-Service configuration.

data-service data_svc_name

Specifies the name of the pre-configured PCC-Data-Service for which Dynamic Rules to be installed under PCC-Action-Set configuration instance for PCC-Service configuration.

data_svc_name is a pre-configured PCC-Data-Service instance in PCC-Service Configuration mode.

metering-method {both-duration-volume | duration | volume}

Specifies the reporting level to be used by PCEF to report the data usage for the related PCC rule in a PCC-Data-service instance on IPCF node.

• both-duration-volume sets the metering method as based on volume of data usage and duration of session, both for offline charging in a PCC-Data-service instance on IPCF node.

• duration sets the metering method as based on duration of session usage for offline charging in a PCC-Data-service instance on IPCF node.

• volume sets the metering method as based on the volume of data usage for offline charging in a PCC-Data-service instance on IPCF node.

If no metering method is defined, the reporting level preconfigured at PCEF is considered.
monitoring-key *mon_key_id*

Specifies the pre-defined Monitoring Key identifier which is to be used in Dynamic Rule for specific PCC-Data-service under PCC-Action-Set configuration instance for PCC-Service configuration.

*mon_key_id* is a pre-defined Monitoring Key identifier in PCC-Service Configuration mode.

precedence *preced_value*

Specifies the precedence value for the Dynamic Rule for specific PCC-Data-service under PCC-Action-Set configuration instance for PCC-Service configuration.

*preced_value* must be an integer between 1 through 65535.

qos-profile *qos_prof_name*

Specifies the name of the pre-configured PCC-QoS-Profile which is to be used in Dynamic Rule for specific PCC-Data-Service under PCC-Action-Set configuration instance for PCC-Service configuration.

*qos_prof_name* is a pre-configured PCC-QoS-Profile instance in PCC-Service Configuration mode.

rating-group *rating_grp_id*

Specifies the pre-defined Rating Group identifier which is to be used in Dynamic Rule for specific PCC-Data-service under PCC-Action-Set configuration instance for PCC-Service configuration.

*rating_grp_id* is a pre-defined Rating Group identifier in PCC-Service Configuration mode.

reporting-level {service-identifier-level | rating-group-level}

Specifies the reporting level to be used by PCEF to report the data usage for the related PCC rule in a PCC-Data-service instance on IPCF node.

  • *service-identifier-level* sets the data usage reporting level to be used by PCEF to report the data usage for the related PCC rule at the Service Identifier level which is configured in a PCC-Data-service instance on IPCF node.

  • *rating-group-level* sets the data usage reporting level to be used by PCEF to report the data usage for the related PCC rule at the Rating Group level which is configured in a PCC-Data-service instance on IPCF node.

If no reporting level is defined, the reporting level preconfigured at PCEF is considered.

gate-status {disabled | enabled | enabled-downlink | enabled-uplink}

Default: Enabled

Sets the Gate-status which is to be used in Dynamic Rule for specific PCC-Data-Service under PCC-Action-Set configuration instance for PCC-Service configuration.

*disabled*: disables the Gate status in downlink and uplink direction which is to be used in Dynamic Rule for specific PCC-Data-Service under PCC-Action-Set configuration instance for PCC-Service configuration.

*enabled*: Enables the Gate status in downlink and uplink direction which is to be used in Dynamic Rule for specific PCC-Data-Service under PCC-Action-Set configuration instance for PCC-Service configuration. This is the default status of Gate.

*enabled-downlink*: Enables the Gate status in downlink direction which is to be used in Dynamic Rule for specific PCC-Data-Service under PCC-Action-Set configuration instance for PCC-Service configuration.

*enabled-uplink*: Enables the Gate status in uplink direction which is to be used in Dynamic Rule for specific PCC-Data-Service under PCC-Action-Set configuration instance for PCC-Service configuration.
**defer-by interval delayed_dur**

This optional keyword supports the time-of-day-based procedures under PCC-Action-Set instance by configuring the relative time delay for dynamic rule installation.

*delayed_dur* configures the relative delay time by which the corresponding dynamic rule installation is deferred. The action is triggered only when the time specified by *delayed_dur* is passed.

*delayed_dur* specifies the delayed interval in *HH MIN SS* format.

Following format is used for *HH MIN SS* in *delayed_dur*:

- **HH** specifies the hour to defer the action trigger and must be an integer between 00 through 23.
- **MIN** specifies the minutes to defer the action trigger and must be an integer between 00 through 59.
- **SS** specifies the seconds to defer the action trigger and must be an integer between 00 through 59.

**failure-policy { continue | terminate }**

Default: Continue

This optional keyword configures the rule failure policy action when failure occurs on PCEF for PCC rules.

- **Continue**: If this option enabled, the IPCF continues even if PCEF reports rule failure through charging rule report. This is the default action.

- **Terminate**: If this option enabled, the IPCF triggers PCC session termination on receiving rule failure through charging rule report.

**Usage**

Use this command to set an action to install a PCC Dynamic rule for the specified PCC-Data-Service in PCC-Action-Set configuration for PCC-Service instance

Operator can override parameters such as, QoS profile, Precedence, Gate-status, Monitoring Key and PCC-Rating-id.

The same command is used to modify already installed PCC Dynamic-rule for the PCC-Data-Service by overriding required parameters only.

Additionally **defer-by interval** keyword is used to configure relative time by which the corresponding dynamic rule installation is deferred.

IPCF handles operation of PCC Rule and activate/deactivate/install/modify/remove the PCC rules at PCEF through this configuration. PCC rule operation may fail on PCEF due to various reasons. In such failure cases PCEF sends back a Charging Rule Report containing name of the failed PCC rule and corresponding failure cause.

The IPCF handles these charging rule report and take appropriate actions based on configuration done through **failure-policy** keyword.

Charging Rule Report comes through CCA or RAA messages in a call flow used for handling the charging-rule-report.

IPCF supports following charging rule failure codes in report:

- Out-of-credit
- Reallocation-of-credit
- Unknown rule name
- Invalid Rating Group
- Invalid Service Identifier
- GW/PCEF Malfunction
• Limited Resources
• Max No. of Bearers Reached
• Unknown Bearer Id
• Missing Bearer Id
• Missing Flow Description
• Resource Allocation Failure
• QoS Validation Failure

Charging rule status can any one of the following in this scenario:
• Active
• Inactive
• Temporarily Inactive

A charging rule report can occur in CCR message multiple times and maximum of 16 charging rule reports per CCR message is supported by IPCF.

**Example**

The following command sets the action for PCC-Data-Service named `temp_data1` for Dynamic Rule install with PCC-QoS-Profile named `temp_qos1` having precedence 22 and Gate-status as **Enabled** under PCC-Action-Set configuration instance for PCC-Service configuration:

```
dynamic-rule-install data-service temp_data1 qos-profile temp_qos1 precedence 22
```
dynamic-rule-uninstall

This command sets an action to uninstall a Dynamic Rule for the specified PCC-Data-Service in PCC-Action-Set configuration for PCC-Service instance.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Action-Set Configuration

```bash
configure > context context_name > pcc-service service_name > action-set action_set_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-action-set)#
```

**Syntax**

```
[no] dynamic-rule-uninstall data-service data_svc_name [defer-by interval delayed_dur]
```

- **no**
  Removes the Dynamic Rule Uninstall action configured for specific PCC-Data-Service from a PCC-Action-Set configuration instance for PCC-Service configuration.

- **data-service** *data_svc_name*
  Specifies the name of the pre-configured PCC-Data-Service for which Dynamic Rules to be uninstalled under PCC-Action-Set configuration instance for PCC-Service configuration. *data_svc_name* is a pre-configured PCC-Data-Service instance in PCC-Service Configuration mode.

- **defer-by interval** *delayed_dur*
  This optional keyword supports the time-of-day-based procedures under PCC-Action-Set instance by configuring the relative time delay for dynamic rule removal. *delayed_dur* configures the relative delay time by which the corresponding dynamic rule uninstallation is deferred. The action is triggered only when the time specified by *delayed_dur* is passed. *delayed_dur* specifies the delayed interval in HH MIN SS format. Following format is used for HH MIN SS in *delayed_dur*:

  - **HH** specifies the hour to defer the action trigger and must be an integer between 00 through 23.
  - **MIN** specifies the minutes to defer the action trigger and must be an integer between 00 through 59.
  - **SS** specifies the seconds to defer the action trigger and must be an integer between 00 through 59.

**Usage**

Use this command to set an action to uninstall a PCC Dynamic rule for the specified PCC-Data-Service in PCC-Action-Set configuration for PCC-Service instance. Additionally **defer-by interval** keyword is used to configure relative time by which the corresponding dynamic rule uninstallation is deferred.
Example

The following command sets the action of Dynamic Rule uninstall for PCC-Data-Service named temp_data1 under PCC-Action-Set configuration instance for PCC-Service configuration:

```
dynamic-rule-uninstall data-service temp_data1
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
- All

Privilege
- Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.
### log-event

This command allows operator to specify a string to be logged at Subscriber Service Controller (SSC) when the corresponding action set is triggered under PCC-Action-Set configuration for PCC-Service instance.

#### Product

IPCF

#### Privilege

Security Administrator, Administrator

#### Mode

Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Action-Set Configuration  
`configure > context context_name > pcc-service service_name > action-set action_set_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-action-set)#
```

#### Syntax

```
[no] log-event msg-text message_string
```

- **no**
  
  Removes the notification message configured for specific action under a PCC-Action-Set configuration instance for PCC-Service configuration.

- **msg-text message_string**
  
  Specifies the message notification text string to be logged at the SSC when a particular PCC-Action-Set triggered for PCC-Service instance.  
  `message_string` is a string of alphanumerical characters of 1 through 255 characters

#### Usage

Use this command to allow operator to specify a string to be logged at Subscriber Service Controller (SSC) when the corresponding action set is triggered under PCC-Action-Set configuration for PCC-Service instance.

#### Example

The following command sets the notification message for an action under PCC-Action-Set configuration instance for PCC-Service configuration:

```
log-event msg-text "This Action is Applicable for EPS Session Only."
```
notify-user

This command allows operator to specify a string template-id at SSC under PCC-Action-Set configuration for PCC-Service instance.

**Product**
- IPCF

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Action-Set Configuration
- `configure > context context_name > pcc-service service_name > action-set action_set_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-action-set)#
```

**Syntax**

```
[no] notify-user message-id message_id [parameter value_pair]
```

- **no**
  - Removes the user notification message id configured for specific action under a PCC-Action-Set configuration instance for PCC-Service configuration.

- **message-id message_id**
  - Specifies the message template id stored at SSC to be used for user notification for action under PCC-Action-Set configuration for PCC-Service instance.
  - `message_id` is a string of alphanumerical characters of 1 through 255 characters

- **parameter value_pair**
  - Specifies the parameters in the form of name value pairs separated by comma. A maximum of 16 name value pairs can be defined for action under PCC-Action-Set configuration for PCC-Service instance.
  - The name value pairs is encoded into XML data like other parameters and sent out to SSC for user notification.
  - `value_pair` is a string of alphanumerical characters of 1 through 255 characters which can accommodate up to 16 name value pair separated by comma (,).

**Usage**

Use this command to allow operator to specify a string template-id under PCC-Action-Set configuration for PCC-Service instance.

The template description exists at SSC and when the corresponding action set is hit, the subscriber is notified with the specified template configured via this command.

The action set makes a XML remote procedure call towards SSC. The XML contains information like IMSI, template-id of the SMS/E-mail template and other details like MSISDN, NAI if available. To give more flexibility to the operator, now the this command accepts name value pairs, which are also sent along with the said data.

**Example**
The following command sets the message id “Invalid User.” for user notification message to an action under PCC-Action-Set configuration instance for PCC-Service configuration:

```
notify-user message-id "Invalid User."
```
**offline-charging-server**

This command sets the action to change the offline charging server applicable to an IP-CAN session under PCC-Action-Set configuration instance for PCC-Service configuration.

**Product**

IPCF

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Action-Set Configuration

```
configure > context context_name > pcc-service service_name > action-set action_set_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-action-set)#
```

**Syntax**

```
[no] offline-charging-server primary pri_serv_address [secondary sec_serv_address]
```

- **no**
  
  Removes the action set to change the offline charging server under PCC-Action-Set configuration instance for PCC-Service configuration.

- **primary pri_serv_address**
  
  Identifies the name of the primary offline charging server which is to be used for action to change under PCC-Action-Set configuration instance for PCC-Service configuration.
  
  The `pri_serv_address` must be the address of an offline charging server in Diameter URI format (`FQDN [port][transport][protocol]`).

- **secondary sec_serv_address**
  
  Identifies the name of the secondary offline charging server which is to be used for action to change under PCC-Action-Set configuration instance for PCC-Service configuration.
  
  The `sec_serv_address` must be the address of an offline charging server in Diameter URI format (`FQDN [port][transport][protocol]`).

**Usage**

Use this command to set an action to change the offline charging server applicable to an IP-CAN session under PCC-Action-Set configuration instance for PCC-Service configuration.

**Example**

Following command configures an action change the offline charging server to primary server `aaa://host.abc.com:6666;transport=tcp;protocol=diameter` and secondary server `aaa://host.xyz.com:6666;transport=sctp;protocol=radius` under PCC-Action-Set configuration instance for PCC-Service configuration:
offline-charging-server

offline-charging-server primary
aaa://host.abc.com:6666;transport=tcp;protocol=diameter

offline-charging-server secondary
aaa://host.xyz.com:6666;transport=sctp;protocol=radius
online-charging-server

This command sets the action to change the online charging server applicable to an IP-CAN session under PCC-Action-Set configuration instance for PCC-Service configuration.

**Product**

IPCF

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Action-Set Configuration

configure > context context_name > pcc-service service_name > action-set action_set_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-action-set)#

**Syntax**

[no] online-charging-server primary pri_serv_address [secondary sec_serv_address]

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Removes the action set to change the online charging server under PCC-Action-Set configuration instance for PCC-Service configuration.</td>
</tr>
<tr>
<td>primary</td>
<td>Identifies the name of the primary online charging server which is to be used for action to change under PCC-Action-Set configuration instance for PCC-Service configuration. The pri_serv_address must be the address of an online charging server in Diameter URI format (FQDN [port][transport][protocol]).</td>
</tr>
<tr>
<td>secondary</td>
<td>Identifies the name of the secondary online charging server which is to be used for action to change under PCC-Action-Set configuration instance for PCC-Service configuration. The sec_serv_address must be the address of an online charging server in Diameter URI format (FQDN [port][transport][protocol]).</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to set an action to change the online charging server applicable to an IP-CAN session under PCC-Action-Set configuration instance for PCC-Service configuration.

**Example**

Following command configures an action change the online charging server to primary server aaa://host.abc.com:6666;transport=tcp;protocol=diameter and secondary server aaa://host.xyz.com:6666;transport=sctp;protocol=radius under PCC-Action-Set configuration instance for PCC-Service configuration:
online-charging-server primary
aaa://host.abc.com:6666;transport=tcp;protocol=diameter
secondary
aaa://host.xyz.com:6666;transport=sctp;protocol=radius
request-usage-report monitoring-key

This command configures the action to allow operator to explicitly request usage report for the specified Monitoring Key or all Monitoring Keys under PCC-Action-Set configuration for PCC-Service instance.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Action-Set Configuration

```configure > context context_name > pcc-service service_name > action-set action_set_name```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-action-set)#
```

**Syntax**

```
[no] request-usage-report monitoring-key {mon_key_id | any}
```

- **no**
  Removes the usage request action configuration for Monitoring Key id from a PCC-Action-Set configuration instance for PCC-Service configuration.

- **mon_key_id**
  Specifies the Monitoring Key identifier for which usage report action is to be set under PCC-Action-Set configuration instance for PCC-Service configuration.
  
  - `mon_key_id` must be an integer between 1 through 65535.

- **any**
  Specifies the Monitoring Key identifier to “ANY” value for which usage report action is to be set under PCC-Action-Set configuration instance for PCC-Service configuration.

**Usage**

Use this command to configure the action to allow operator to explicitly request usage report for the specified Monitoring Key or all Monitoring Keys under PCC-Action-Set configuration for PCC-Service instance.

**Example**

The following command sets an action to request the usage report for Monitoring Key id 102 under PCC-Action-Set configuration instance for PCC-Service configuration:

```
request-usage-report monitoring-key 102
```
rule-activate

This command sets an action to activate a pre-configured Rule in PCC-Action-Set configuration for PCC-Service instance.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Action-Set Configuration
configure > context context_name > pcc-service service_name > action-set action_set_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-action-set)#

Syntax

[no] rule-activate rule_name[defer-by interval delayed_dur]

no
Removes the action to activate a pre-configured Rule from a PCC-Action-Set configuration instance for PCC-Service configuration.

rule_name
Specifies the name of the pre-configured Rule on PCEF for an activation action is set under PCC-Action-Set configuration instance for PCC-Service configuration.
rule_name is a pre-configured Rule in PCEF.

defer-by interval delayed_dur
This optional keyword supports the time-of-day-based procedures under PCC-Action-Set instance by configuring the relative time delay for rule activation. 
delayed_dur configures the relative delay time by which the corresponding rule activation is deferred. The action is triggered only when the time specified by delayed_dur is passed.
delayed_dur specifies the delayed interval in HH MIN SS format.
Following format is used for HH MIN SS in delayed_dur:

- HH specifies the hour to defer the action trigger and must be an integer between 00 through 23.
- MIN specifies the minutes to defer the action trigger and must be an integer between 00 through 59.
- SS specifies the seconds to defer the action trigger and must be an integer between 00 through 59.

Usage
Use this command to set an action to activate a pre-configured Rule in PCC-Action-Set configuration for PCC-Service instance.
Additionally defer-by interval keyword is used to configure relative time by which the corresponding rule activation is deferred.
PCC-Action-Set Configuration Mode Commands

Example

The following command sets an action to activate for Rule \texttt{rule1} under PCC-Action-Set configuration instance for PCC-Service configuration:

\begin{verbatim}
rule-activate rule1
\end{verbatim}
rule-deactivate

This command sets an action to deactivate a pre-configured Rule in PCC-Action-Set configuration for PCC-Service instance.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Action-Set Configuration

configure > context context_name > pcc-service service_name > action-set action_set_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-action-set)#

Syntax

[no] rule-deactivate rule_name [defer-by interval delayed_dur]

no
Removes the action to deactivate a pre-configured Rule from a PCC-Action-Set configuration instance for PCC-Service configuration.

rule_name
Specifies the name of the pre-configured Rule on PCEF for a deactivation action is set under PCC-Action-Set configuration instance for PCC-Service configuration.

rule_name is a pre-configured Rule in PCEF.

defer-by interval delayed_dur
This optional keyword supports the time-of-day-based procedures under PCC-Action-Set instance by configuring the relative time delay for rule deactivation.

delayed_dur configures the relative delay time by which the corresponding rule deactivation is deferred. The action is triggered only when the time specified by delayed_dur is passed.

delayed_dur specifies the delayed interval in HH MIN SS format.

Following format is used for HH MIN SS in delayed_dur:

• HH specifies the hour to defer the action trigger and must be an integer between 00 through 23.
• MIN specifies the minutes to defer the action trigger and must be an integer between 00 through 59.
• SS specifies the seconds to defer the action trigger and must be an integer between 00 through 59.

Usage
Use this command to set an action to deactivate a pre-configured Rule in PCC-Action-Set configuration for PCC-Service instance.

Additionally defer-by interval keyword is used to configure relative time by which the corresponding rule deactivation is deferred.
Example

The following command sets an action to deactivate for Rule `rule1` under PCC-Action-Set configuration instance for PCC-Service configuration:

```
rule-deactivate rule1
```
rulebase-activate

This command sets an action to activate a pre-configured Rulebase in PCC-Action-Set configuration for PCC-Service instance.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Action-Set Configuration

configure > context context_name > pcc-service service_name > action-set action_set_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-action-set)#

Syntax

[no] rulebase-activate rulebase_name [defer-by interval delayed_dur]

no

Removes the action to activate a pre-configured Rulebase from a PCC-Action-Set configuration instance for PCC-Service configuration.

rulebase_name

Specifies the name of the pre-configured Rulebase on PCEF for an activation action is set under PCC-Action-Set configuration instance for PCC-Service configuration.

rulebase_name is a pre-configured Rulebase in PCEF.

defer-by interval delayed_dur

This optional keyword supports the time-of-day-based procedures under PCC-Action-Set instance by configuring the relative time delay for Rulebase activation.

delayed_dur configures the relative delay time by which the corresponding Rulebase activation is deferred. The action is triggered only when the time specified by delayed_dur is passed.

delayed_dur specifies the delayed interval in HH MIN SS format.

Following format is used for HH MIN SS in delayed_dur:

- HH specifies the hour to defer the action trigger and must be an integer between 00 through 23.
- MIN specifies the minutes to defer the action trigger and must be an integer between 00 through 59.
- SS specifies the seconds to defer the action trigger and must be an integer between 00 through 59.

Usage

Use this command to set an action to activate a pre-configured Rulebase in PCC-Action-Set configuration for PCC-Service instance.

Additionally defer-by interval keyword is used to configure relative time by which the corresponding Rulebase activation is deferred.
Example

The following command sets an action to activate for Rulebase *rulebase1* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
rulebase-activate rulebase1
```
**rulebase-deactivate**

This command sets an action to deactivate a pre-configured Rulebase in PCC-Action-Set configuration for PCC-Service instance.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Action-Set Configuration

```
configure > context context_name > pcc-service service_name > action-set action_set_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-action-set)#
```

**Syntax**

```
[no] rulebase-deactivate rulebase_name [defer-by interval delayed_dur]
```

- **no**
  Removes the action to deactivate a pre-configured Rulebase from a PCC-Action-Set configuration instance for PCC-Service configuration.

- **rulebase_name**
  Specifies the name of the pre-configured Rulebase on PCEF for a deactivation action is set under PCC-Action-Set configuration instance for PCC-Service configuration.

  *rule_name* is a pre-configured Rulebase in PCEF.

- **defer-by interval delayed_dur**
  This optional keyword supports the time-of-day-based procedures under PCC-Action-Set instance by configuring the relative time delay for Rulebase deactivation.

  *delayed_dur* configures the relative delay time by which the corresponding Rulebase deactivation is deferred. The action is triggered only when the time specified by *delayed_dur* is passed.

  *delayed_dur* specifies the delayed interval in **HH MIN SS** format.

  Following format is used for **HH MIN SS** in *delayed_dur*:

  - **HH** specifies the hour to defer the action trigger and must be an integer between 00 through 23.
  - **MIN** specifies the minutes to defer the action trigger and must be an integer between 00 through 59.
  - **SS** specifies the seconds to defer the action trigger and must be an integer between 00 through 59.

**Usage**

Use this command to set an action to deactivate a pre-configured Rulebase in PCC-Action-Set configuration for PCC-Service instance.

Additionally **defer-by interval** keyword is used to configure relative time by which the corresponding Rulebase deactivation is deferred.
Example

The following command sets an action to deactivate for Rulebase *rulebase1* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
rulebase-deactivate rulebase1
```
service-tag

This command sets an action to activate/deactivate a pre-configured Service Tag rule in PCC-Action-Set configuration for PCC-Service instance.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Action-Set Configuration
configure > context context_name > pcc-service service_name > action-set action_set_name

Entering the above command sequence results in the following prompt:
[context_name]host_name(config-pcc-action-set)#

Syntax

[no] service-tag svc_tag {activate-rule | deactivate-rule}

---

no
Removed the action to activate/deactivate a pre-configured Service Tag rule in PCC-Action-Set configuration for PCC-Service instance.

svc_tag
Specifies the name of the pre-configured Service Tag rule for an activation/deactivation is set under PCC-Action-Set configuration instance for PCC-Service configuration.
svc_tag is a pre-configured Service Tag name.

activate-rule
Specifies that action to be set for Service Tag activation rule under PCC-Action-Set configuration instance for PCC-Service configuration.

deactivate-rule
Specifies that action to be set for Service Tag deactivation rule under PCC-Action-Set configuration instance for PCC-Service configuration.

Usage
Use this command to set an action to activate/deactivate a pre-configured Service Tag rule in PCC-Action-Set configuration for PCC-Service instance.

Example

The following command sets the an activation rule for Service Tag named service_1 under PCC-Action-Set configuration instance for PCC-Service configuration:

    service-tag service_1 activate-rule
**terminate-session**

This command sets an action to terminate a Bearer based on **bearer-id** or unique combination of QCI and ARP received through current CCR message in PCC-Action-Set configuration for PCC-Service instance.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Action-Set Configuration
configure > context context_name > pcc-service service_name > action-set action_set_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-action-set)#
```

**Syntax**

```
[no] terminate-session
```

- **no**
  Removes the action to terminate a Bearer based on **bearer-id** from a PCC-Action-Set configuration instance for PCC-Service configuration.

**Usage**
Use this command to set an action to terminate a Bearer based on **bearer-id** or unique combination of QCI and ARP received through current CCR message in PCC-Action-Set configuration for PCC-Service instance. Termination of Bearer is possible only in case of PCRF binding and limited to Dynamic rules.

**Important:** This action is only applicable to IP-CAN sessions with access type as GPRS. When terminate Bearer is initiated, IPCF triggers **Bearer Termination Procedure** for the **bearer-id** received through current CCR message.

**Caution:** This command triggers termination of Gx and SPR sub session active under PCC-Service instance.

**Example**
The following command sets an action to terminate a Bearer based on **bearer-id** received through current CCR message under PCC-Action-Set configuration instance for PCC-Service configuration:
```
terminate-session
```
usage-monitor

This command sets an action to allow operator to stop, reset or start the counting for a PCC-Usage-Monitor in PCC-Action-Set configuration for PCC-Service instance.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Action-Set Configuration
configure > context context_name > pcc-service service_name > action-set action_set_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-action-set)#

Syntax

[no] usage-monitor usage_mon_name {reset-counter | start-counter | stop-counter}

no
Removes the action to allow operator to stop, reset or start the counting for a PCC-Usage-Monitor in PCC-Action-Set configuration for PCC-Service instance.

usage_mon_name
Specifies the name of the pre-configured PCC-Usage-Monitor for which counter action is configured under PCC-Action-Set configuration instance for PCC-Service configuration. usage_mon_name is a pre-configured PCC-Usage-Monitor.

reset-counter
 Resets the usage counts for PCC-Usage-Monitor under PCC-Action-Set configuration instance for PCC-Service configuration.

start-counter
 Starts the accumulation of usage counts for PCC-Usage-Monitor under PCC-Action-Set configuration instance for PCC-Service configuration.

stop-counter
 Stops the accumulation of usage counts for PCC-Usage-Monitor under PCC-Action-Set configuration instance for PCC-Service configuration.

Usage
Use this command to set an action to allow operator to stop, reset or start the counting for a usage monitor in PCC-Action-Set configuration for PCC-Service instance.

Example
The following command sets the an action to stop the accumulation of usage counts for PCC-Usage-Monitor named `usage_1` under PCC-Action-Set configuration instance for PCC-Service configuration:

```
usage-monitor usage_1 stop-counter
```
Chapter 234
PCC-AF-Service Configuration Mode Commands

The PCC-AF-Service Configuration mode provides a mechanism to IPCF to manage the external interfaces required for media and application function management. The PCC-AF-Service manages Rx interface which would be based on the dictionary used.

An Application Function (AF) provides Application (layer 7) proxies for client server applications. It also provides enforcement of operator and subscriber QoS, Charging, and Security policies to subscriber session and represents the network element that supports applications that require dynamic policy and/or charging control. In the IMS model, the AF is implemented by the Proxy Call Session Control Function (P-CSCF).

*Important:* This configuration mode is supported from StarOS Release 12.1 onward.

**Mode**

Exec > Global Configuration > Context Configuration > PCC AF Service Configuration

```
configure > context context_name > pcc-af-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-imsapp-service)#
```

*Important:* The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
associate pcc-service

This command is used to associate a pre-configured PCC-Service with a PCC-AF-Service for IPCF configuration.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC AF Service Configuration

configure > context context_name > pcc-af-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-imsapp-service)#

**Syntax**

```
associate pcc-service pcc_svc_name
```

```
[no] associate pcc-service
```

**no**

Removes/disassociate the configured PCC-service from this PCC-AF-Service instance configured for IPCF configuration.

**pcc_svc_name**

Specifies the name of a pre-configured PCC-service configured in Context Configuration mode for IPCF configuration.

The `pcc_svc_name` is name of a predefined PCC-Service instance and must be an alphanumerical string from 1 through 63 characters.

**Usage**

Use this command to associate a pre-configured PCC-Service instance for IPCF configuration.

**Important:** For more information on PCC-Service configuration, refer *PCC-Service Configuration Mode Commands*.

**Example**

Following command binds a PCC-Service named `pcc_svc1` with in a PCC-AF-Service.

```
associate pcc-service pcc_svc1
```

Following command removes an associated PCC-Service named `pcc_svc1` from a PCC-AF-Service.

```
no associate pcc-service pcc_svc1
```
diameter dictionary

This command is used to assign a Diameter dictionary for Rx messaging with a PCC-AF-Service for IPCF configuration.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC AF Service Configuration  
```
configure > context context_name > pcc-af-service service_name
```
Enter the above command sequence results in the following prompt:

```
[context_name]host_name(config-imsapp-service)#
```

**Syntax**

```text
diameter dictionary {r8-standard | standard}

default diameter dictionary
```

**default diameter dictionary**

Sets the Diameter Rx dictionary to default dictionary r8-standard (3GPP Rel. 8 standard) for a PCC-AF-Service instance configured for IPCF configuration.

**r8-standard**

Default: Enabled  
Sets the Diameter Rx dictionary to be used by a PCC-AF-Service instance configured for IPCF configuration over Rx interface to 3GPP Rel. 8 standard.

**standard**

Default: Disabled  
Sets the Diameter Rx dictionary to be used by a PCC-AF-Service instance configured for IPCF configuration over Rx interface to 3GPP Rel. 7 standard.

**Usage**

Use this command to configure the PCC-AF-Service to determine which of the 3GPP dictionary to be used for Rx interface messaging for media and application function management.

**Example**

Following command sets the PCC-AF-Service to use 3GPP Rel. 8 standard dictionary for Rx interface and application function management related messaging in a PCC-AF-Service.

```
default diameter dictionary
```
diameter origin end-point

This command is used to bind/associate a pre-configured Diameter host/realm (AF) over Rx interface with a PCC-AF-Service to be used for subscriber service control and AF profile management.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC AF Service Configuration
configure > context context_name > pcc-af-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-imsapp-service)#
```

**Syntax**

```
diameter origin endpoint dia_endpoint_name

no diameter origin endpoint
```

- **no**
  Removes the associated Diameter Origin Endpoint configuration from PCC-AF-Service instance configured for IPCF configuration.

- **any**
  Sets the PCC-AF-Service instance to use any available AF node over Rx interface for AF support.

- **dia_endpoint_name**
  The dia_endpoint_name is a predefined Diameter origin endpoint node and must be an alphanumerical string from 1 through 63 characters.

**Usage**

Use this command to bind the AF node over Rx interface by associating a pre-configured Diameter Origin Endpoint with a PCC-AF-Service.

The Diameter origin endpoint must be a pre-configured instance in the Context Configuration Mode. For more information on Diameter origin endpoint configuration, refer Diameter Endpoint Configuration Mode Commands chapter.

**Example**

Following command associates a pre-configured Diameter endpoint node configuration named af_pcscfl with a PCC-AF-Service for AF profile management.

```
diameter origin endpoint af_pcscfl
```

Following command removes the pre-associated Diameter endpoint node configuration named af_pcscfl with a PCC-AF-Service.
no diameter origin endpoint
end

Exits the current configuration mode and returns to the Exec mode.

Use this command to return to the parent configuration mode.
Chapter 235
PCC-Condition-Group Configuration Mode Commands

The PCC-Condition-Group Configuration Mode is used to configure the various rating parameters under a logical identifier name in the PCC-Service. A PCC-Condition-Group is a collection of conditions that identify a network or state constraint represented as a logical expression. A maximum of 128 conditions can be configured in one PCC-Condition-Group.

**Important:** This configuration mode is supported from StarOS Release 12.1 onward.

**Mode**

Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

```
configure > context context_name > pcc-service service_name > condition group group_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-condition-group)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
af-application-id

This command defines a condition based on the application id of an Application Function service through the Rx interface over which the IPCF receives media information for the application usage in an IP-CAN session.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

configure > context context_name > pcc-service service_name > condition group group_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-condition-group)#

Syntax

[ no ] af-application-id operator value af_app_id

[ no ] af-application-id operator profile-attribute spr_attr_value

[ no ] af-application-id operator subscription-attribute subs_prof_attr_value

no
Removes the specified condition definition.

operator
Specifies how to logically match the AF-Application id.
operator must be one of the following:

- !=: Does not equal
- <: Equals

af_app_id
Specifies the identity string for AF-Application identifier over Rx interface.
af_app_id must be an alphanumeric string of 1 to 256 characters.

profile-attribute spr_attr_value
Specifies the profile attribute value in SPR to match with application id of an Application Function service condition validation in an IP-CAN session.
spr_attr_value must be an alphanumeric string of from 1 through 63 characters.

subscription-attribute subs_prof_attr_value
Specifies the subscriber profile attribute parameter value to match with application id of an Application Function service condition validation in an IP-CAN session.
subs_prof_attr_value must be an alphanumeric string of from 1 through 31 characters.
Usage

Use this command to define a condition based on the application id of an Application Function service through the Rx interface over which the IPCF receives media information for the application usage in an IP-CAN session.

Example

The following command creates a condition definition to analyze the PCC service user traffic for the AF Application id is not equal to pcc_af_1:

```
af-application-id != pcc_af_1
```
af-media-codec

This command defines a condition based on the media Codec used by AF application in an IP-CAN session.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group
Configuration
configure > context context_name > pcc-service service_name > condition group group_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-condition-group)#

Syntax

[ no ] af-media-codec operator value {g722 | g726 | ilbc | pcma | pcmu}
[ no ] af-media-codec operator profile-attribute spr_attr_value
[ no ] af-media-codec operator subscription-attribute subs_prof_attr_value

no

Removes the specified condition definition.

operator

Specifies how to logically match the AF-media Codec.

operator must be one of the following:

- !=: Does not equal
- ==: Equals

G.722

Specifies the media Codec as G.722 used for user traffic from AF server over Rx interface.

G.722 is a ITU-T standard 7 kHz wideband speech codec operating at 48, 56 and 64 kbit/s.

G.726

Specifies the media codec as G.726 used for user traffic from AF server over Rx interface.

G.726 is an ITU-T ADPCM speech codec standard covering the transmission of voice at rates of 16, 24, 32, and 40 kbit/s.

ilbc

Specifies the media codec as Internet Low Bitrate Codec (iLBC) used for user traffic from AF server over Rx interface.

iLBC is a narrowband speech codec suitable for VoIP applications, streaming audio, archival and messaging.

The encoded blocks encapsulated in Real-time Transport Protocol (RTP) protocol for transport.
pcma
Specifies the media codec as Pulse Code Modulation A-law scaling (PCMA) used for user traffic from AF server over Rx interface.
PCMA is an ITU-T Recommendation G.711 audio data encoding in eight bits per sample, after A-law logarithmic scaling.

pcmu
Specifies the media codec as Pulse Code Modulation mu-law scaling (PCMU) used for user traffic from AF server over Rx interface.
PCMU is an ITU-T Recommendation G.711 audio data encoding in eight bits per sample, after mu-law logarithmic scaling.

profile-attribute spr_attr_value
Specifies the profile attribute value in SPR to match with application media codec of an Application Function service condition validation in an IP-CAN session.
spr_attr_value must be an alphanumeric string of from 1 through 63 characters.

subscription-attribute subs_prof_attr_value
Specifies the subscriber profile attribute parameter value to match with application media codec of an Application Function service condition validation in an IP-CAN session.
subs_prof_attr_value must be an alphanumeric string of from 1 through 31 characters.

Usage
Use this command to define a condition based on the media codecs used by AF service through the Rx interface over which the IPCF receives media information for the application usage in an IP-CAN session.

Example
The following command creates a condition definition to analyze the PCC service user traffic for the AF Media codec is equal to PCMA:

af-media-codec = pcma
af-media-type

This command defines a condition based on the media type used by AF application in an IP-CAN session.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

configure > context context_name > pcc-service service_name > condition group group_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-condition-group)#

Syntax

[ no ] af-media-type operator value {application | audio | control | data | message | other | text | video}

[ no ] af-media-type operator profile-attribute spr_attr_value

[ no ] af-media-type operator subscription-attribute subs_prof_attr_value

no

Removes the specified condition definition.

operator

Specifies how to logically match the media type in user traffic.

operator must be one of the following:

- !=: Does not equal
- ==: Equals

application

Specifies the media type as Application in user traffic from AF server over Rx interface.

audio

Specifies the media type as Audio in user traffic from AF server over Rx interface.

ccontrol

Specifies the media type as Control in user traffic from AF server over Rx interface.

data

Specifies the media type as Data in user traffic from AF server over Rx interface.
message
Specifies the media type as Message in user traffic from AF server over Rx interface.

Text
Specifies the media type as Text in user traffic from AF server over Rx interface.

video
Specifies the media type as Video in user traffic from AF server over Rx interface.

profile-attribute $spr_attr_value$
Specifies the profile attribute value in SPR to match with application media type of an Application Function service condition validation in an IP-CAN session.
$spr_attr_value$ must be an alphanumeric string of from 1 through 63 characters.

subscription-attribute $subs_prof_attr_value$
Specifies the subscriber profile attribute parameter value to match with application media type of an Application Function service condition validation in an IP-CAN session.
subs_prof_attr_value must be an alphanumeric string of from 1 through 31 characters.

Usage
Use this command to define a condition based on the media type used by AF service through the Rx interface over which the IPCF receives media information for the application usage in an IP-CAN session.

Example
The following command creates a condition definition to analyze the PCC service user traffic for the AF Media type is equal to Video:

   af-media-type = video
af-service-urn

This command defines a condition based on the service Uniform Resource Names (URNs) used by AF application in an IP-CAN session.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

```
configure > context context_name > pcc-service service_name > condition group group_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-condition-group)#
```

**Syntax**

```
[ no ] af-service-urn operator value urn_string
[ no ] af-service-urn operator profile-attribute spr_attr_value
[ no ] af-service-urn operator subscription-attribute subs_prof_attr_value
```

**no**

Removes the specified condition definition.

**operator**

Specifies how to logically match the information in the analyzed field.

- `!==`: Does not equal
- `<=`: Lesser than or equals
- `==`: Equals
- `>=`: Greater than or equals

**urn_string**

Specifies the URN in user traffic from AF server over Rx interface.

- `urn_string` must be an alphanumeric string of 1 through 256 characters.

**profile-attribute spr_attr_value**

Specifies the profile attribute value in SPR to match with URN used by AF service condition validation in an IP-CAN session.

- `spr_attr_value` must be an alphanumeric string of from 1 through 63 characters.
subscription-attribute subs_prof_attr_value

Specifies the subscriber profile attribute parameter value to match with URN used by AF service condition validation in an IP-CAN session.

*subs_prof_attr_value* must be an alphanumeric string of from 1 through 31 characters.

**Usage**

Use this command to define a condition based on the URN used by AF service through the Rx interface over which the IPCF receives media information for the application usage in an IP-CAN session. Uniform Resource Names (URNs) serves as persistent, location-independent resource identifiers and are designed to make it easy to map other namespaces into URN-space.

**Example**

The following command creates a condition definition to analyze the PCC service user traffic for the AF service URN is equal to ietf:rfc:4003:

```
af-service-urn = ietf:rfc:4003
```
an-gw-address

This command defines a condition based on the IP address of Access Node Gateway (AN-GW) on which subscriber is attached in an IP-CAN session.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

configure > context context_name > pcc-service service_name > condition group group_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-condition-group)#

**Syntax**

```
[ no ] an-gw-address [operator value anw_ip/mask | [in-range | !in-range] range_start_ip to range_end_ip]

[ no ] an-gw-address operator profile-attribute spr_attr_value

[ no ] an-gw-address operator subscription-attribute subs_prof_attr_value
```

**no**
Removes the specified condition definition.

**operator**
Specifies how to logically match the information in the analyzed field. 

`operator` must be one of the following:

- `!=`: Does not equal
- `=`: Equals

**in-range**
Specifies the condition to accept the IP address which are in range as argument to define the Access Node Gateway address which is used by subscriber in IP-CAN session.

**!in-range**
Specifies the condition to accept the IP address which are NOT in range as argument to define the Access Node Gateway address which is used by subscriber in IP-CAN session.

**range_start_ip**
Specifies the starting IP address which is used for defining the range of AN-GW IP addresses which is used by subscriber in IP-CAN session.

`range_start_ip` is an IP address and must be lesser than `end_start_ip` address.
range_end_ip

Specifies the ending IP address which is used for defining the range of AN-GW IP addresses which is used by subscriber in IP-CAN session.
range_end_ip is an IP address and must be greater than end_start_ip address.

angw_ip/mask

Specifies the IP address of the Access Node Gateway which is used by subscriber in IP-CAN session along with IP mask as well.
angw_ip must be an IP address in IPv4 or IPv6 notation.
mask: Specifies the IP address mask bits to determine the number of IP addresses of AN-GW in condition.
mask must be specified using the standard IPv4 dotted decimal notation.

profile-attribute spr_attr_value

Specifies the profile attribute value in SPR to match with AN gateway IP address condition validation in an IP-CAN session.
spr_attr_value must be an alphanumeric string of from 1 through 63 characters.

subscription-attribute subs_prof_attr_value

Specifies the subscriber profile attribute parameter value to match with AN gateway IP address condition validation in an IP-CAN session.
subs_prof_attr_value must be an alphanumeric string of from 1 through 31 characters.

Usage

Use this command to define a condition based on the AN-GW IP address used by subscriber in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on AN-GW IP address 1.2.3.4 in an IP-CAN session:

    an-gw-address = 1.2.3.4
**authorized-qci**

This command defines a condition based on the authorized QoS Class Identifier used in an IP-CAN session.

**Product**

IPCF

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

```
configure > context context_name > pcc-service service_name > condition group group_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-condition-group)#
```

**Syntax**

```
[ no ] authorized-qci operator value qci
[ no ] authorized-qci operator profile-attribute spr_attr_value
[ no ] authorized-qci operator subscription-attribute subs_prof_attr_value
```

- **no**
  - Removes the specified condition definition.

- **operator**
  - Specifies how to logically match the information in the analyzed field.
  - **operator** must be one of the following:
    - !=: Does not equal
    - <=: Lesser than or equal
    - =: Equals
    - >=: Greater than or equal

- **qci**
  - Specifies the authorized QoS class identifier in user traffic for condition validation.
  - **qci** must be an integer between 1 through 255.

- **profile-attribute spr_attr_value**
  - Specifies the profile attribute value in SPR to match with authorized QoS class identifier condition validation in an IP-CAN session.
  - **spr_attr_value** must be an alphanumeric string of from 1 through 63 characters.
subscription-attribute subs_prof_attr_value

Specifies the subscriber profile attribute parameter value to match with authorized QoS class identifier condition validation in an IP-CAN session.

subs_prof_attr_value must be an alphanumeric string of from 1 through 31 characters.

Usage

Use this command to define a condition based on the authorized QCI used by the subscriber in an IP-CAN session.

The condition evaluates to TRUE, if Bearer Control Mode is UE and network (PCEF bearer binding) and IPCF has authorized the specified QCI earlier.

QCI is a number which describes the error rate and delay that are associated with the service. It includes bearer parameters including scheduling weights and queue management thresholds.

Example

The following command creates a condition definition to analyze the PCC service user traffic for the authorized QCI is greater than or equal to 4:

```bash
authorized-qci >= 4
```
**base-station-id**

This command defines a condition based on the various parameters used in base-station id by subscriber in an IP-CAN session between PCEF (PDSN) and IPCF over Gx interface.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

```bash
configure > context context_name > pcc-service service_name > condition group group_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-condition-group)#
```

**Syntax**

```bash
[no] base-station-id { [sid operator sys_identifier] | range start_range to end_range] } [ nid operator netwrk_identifier ] | range start_range to end_range } [ cellid operator cell_identifier ] | range start_range to end_range ]}
```

- **no**
  Removes the specified condition definition.

**operator**

Specifies how to logically match the information in the analyzed field.

* operator must be one of the following:

- • !=: Does not equal
- • <: Lesser than
- • <=: Lesser than or equals
- • =: Equals
- • >: Greater than
- • >=: Greater than or equals

**sid operator sys_identifier**

Specifies the system identifier in base-station id of subscriber for condition validation in an IP-CAN session.

*sys_identifier* must be an integer between 0 through 65535.

**nid operator netwrk_identifier**

Specifies the network identifier in base-station id, which is used by subscriber, for condition validation in an IP-CAN session.

*netwrk_identifier* must be an integer between 0 through 65535.
**cellid operator cell_identifier**

Specifies the cell identifier in base-station id, which is used by subscriber, for condition validation in an IP-CAN session.

*cell_identifier* must be an integer between 0 through 65535.

**range start_range to end_range**

This optional keyword specifies range of the identifiers (SID, Cell Id, Network Id) to be used for condition validation in an IP-CAN session.

*start_range* is the start value of range having integer between 0 through 65535 and it must be lesser than *end_range*.

*end_range* is the end value of range having integer between 0 through 65535 and it must be greater than *start_range*.

**Usage**

User this command to define a condition based on the parameters used in base-station id of subscriber, which is composition of SID, Cell Id, and/or Network Id, in an IP-CAN session between PCEF (PDSN) and IPCF over Gx interface.

This condition is defined for PCC functionality support to CDMA users over Gx interface.

**Example**

The following command creates a condition definition to analyze the condition based on base-station id of subscriber where SID is 1001 and cell id is in range of 2001 to 2069 in an IP-CAN session between PDSN and IPCF having network id as 3989:

```
base-station-id sid = 1001 nid = 3989 cellid = range 2001 to 2069
```
**bearer-count**

This command defines a condition based on the number of bearers allowed in a subscriber session on IPCF to accept bearer-count in an IP-CAN session.

**Product**

IPCF

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

`configure > context context_name > pcc-service service_name > condition group group_name`

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-pcc-condition-group) #
```

**Syntax**

```
[ no ] bearer-count operator value num_bearer
[ no ] bearer-count operator profile-attribute spr_attr_value
[ no ] bearer-count operator subscription-attribute subs_prof_attr_value
```

**no**

Removes the specified condition definition.

**operator**

Specifies how to logically match the information in the analyzed field. `operator` must be one of the following:

- `!=`: Does not equal
- `<=`: Lesser than or equals
- `=`: Equals
- `>=`: Greater than or equals

**num_bearer**

Specifies the number of bearers in user traffic for condition validation. `num_bearer` indicates a condition based on the number of bearer established in a IP-CAN session and must be an integer between 1 through 11.

**profile-attribute spr_attr_value**

Specifies the profile attribute value in SPR to match with number of bearers allowed for a subscriber in an IP-CAN session as condition. `spr_attr_value` must be an alphanumeric string of from 1 through 63 characters.
**subscription-attribute subs_prof_attr_value**

Specifies the subscriber profile attribute parameter value to match with number of bearers allowed for a subscriber in an IP-CAN session as condition.

`subs_prof_attr_value` must be an alphanumerical string of from 1 through 31 characters.

**Usage**

Use this command to define a condition based on the number of bearers allowed for a subscriber in an IP-CAN session.

**Example**

The following command creates a condition definition to analyze the PCC service user traffic for bearers allowed in a subscriber session is equal to 4:

```
bearer-count = 4
```
connectivity-access-network

This command defines a condition based on the access network type used by subscriber in an IP-CAN session.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group
Configuration

configure > context context_name > pcc-service service_name > condition group group_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-condition-group)#

Syntax

[ no ] connectivity-access-network operator value {3gpp-gprs | 3gpp2 | 3gpp2-eps | docsis | non-3gpp-eps | wimax | xdsl }

[ no ] connectivity-access-network operator profile-attribute spr_attr_value

[ no ] connectivity-access-network operator subscription-attribute subs_prof_attr_value

no

Removes the specified condition definition.

operator

Specifies how to logically match the media type in user traffic.
operator must be one of the following:

- !=: Does not equal
- ==: Equals

3gpp-gprs

Specifies the network access connectivity type as 3GPP-GPRS for user traffic in condition definition.

3gpp2

Specifies the network access connectivity type as 3GPP2 (CDMA) for user traffic in condition definition.

3gpp2-eps

Specifies the network access connectivity type as 3GPP2-EPS for user traffic in condition definition.

docsis

Specifies the network access connectivity type as Data Over Cable Service Interface Specification (DOCSIS) for user traffic in condition definition.
non-3gpp-eps
Specifies the network access connectivity type as non-3GPP-EPS to connect with Gxa based HSGW for user traffic in condition definition.

wimax
Specifies the network access connectivity type as Wi-MAX for user traffic in condition definition.

xdsl
Specifies the network access connectivity type as xDSL (ADSL/SDSL) or user traffic in condition definition.

profile-attribute spr_attr_value
Specifies the profile attribute value in SPR to match with type of connectivity used for network access by subscriber in an IP-CAN session as condition.

subscription-attribute subs_prof_attr_value
Specifies the subscriber profile attribute parameter value to match with type of connectivity used for network access by subscriber in an IP-CAN session as condition.

Usage
Use this command to define a condition based on the type of connectivity used for network access by subscriber in an IP-CAN session.

Example
The following command creates a condition definition to analyze the PCC service user traffic for the network type is equal to Wi-MAX:

```
connectivity-access-network = wimax
```
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
end
```

**Usage**
Use this command to return to the Exec mode.
**eval-condition-group**

This command defines a condition based on the TRUE or FALSE setting of a configured PCC-Condition-Group for subscriber in an IP-CAN session.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

```
configure > context context_name > pcc-service service_name > condition group group_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-condition-group)#
```

**Syntax**

```
[no] eval-condition-group cond_grp_name operator {FALSE | TRUE}
```

- **no**
  Removes the specified condition definition.

- **cond_grp_name**
  Specifies the name of the configured PCC-Condition-Group which is used for evaluation with in this PCC-Condition-Group for user traffic.
  `cond_grp_name` must be a pre-configured PCC-Condition-Group in this configuration mode.

- **operator**
  Specifies how to logically match the media type in user traffic.
  `operator` must be one of the following:
  - `!=`: Does not equal
  - `==`: Equals

- **FALSE**
  Sets the evaluation condition for specified PCC-Condition-Group to FALSE.
  With this keyword system rejects all conditions defined in specific PCC-Condition-Group and match the same in user traffic.

- **TRUE**
  Sets the evaluation condition for specified PCC-Condition-Group to TRUE.
  With this keyword system accepts all conditions defined in specific PCC-Condition-Group and match the same in user traffic.
**Usage**

Use this command to define a condition based on the acceptance or rejection of specific pre-configured PCC-Condition-Group for user traffic in an IP-CAN session. This command allows the operator to use configured PCC-Condition-Group in another PCC-Condition-Group as subset of PCC-Condition-Group.

**Important:** A maximum of 3 level of recursion depth is allowed for PCC-Condition-Group evaluation in a PCC-Condition-Group.

**Example**

The following command creates a condition definition to accept the all conditions defined in PCC-Condition-Group named `af_1`:

```
eval-condition-group af_1 = TRUE
```
event-time

This command defines a condition based on the event-trigger time as per the time specified by the named Time definition (Timedef) configured for subscriber session in an IP-CAN session.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

configure > context context_name > pcc-service service_name > condition group group_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-condition-group)#

Syntax

[no] event-time operator timedef_name

---

no

Removes the specified condition definition.

---

operator

Specifies how to logically match the information in the analyzed field.

operator must be one of the following:

- !=: Does not equal
- <=: Lesser than or equals
- ==: Equals
- >=: Greater than or equals

---

timedef_name

Specifies the name of the configured time definition (start and end timer of session) which is used for evaluation with this PCC-Condition-Group for user traffic.

timedef_name must be a pre-configured Time definition in PCC-Service Configuration Mode.

---

Usage

Use this command to define a condition based on the start and end time defined in a Time Definition configuration in PCC-Service Configuration Mode for user traffic in an IP-CAN session.

Event trigger in this command indicates a condition when the event-trigger time was as per the time specified by the named Time Definition.

This command allows the operator to use configured time period as event trigger for this PCC-Condition-Group.

Example
The following command creates a condition definition to trigger the condition based on the start and end time defined in Timedef named `timedef_night`:

```
  event-time = timedef_night
```
event-trigger

This command defines a condition based on the event triggers due to various conditions for subscriber in an IP-CAN session.

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group

Configuration

configure > context context_name > pcc-service service_name > condition group group_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-condition-group)#

Syntax

[no] event-trigger operator event_trigger

---

no

Removes the specified condition definition.

---

operator

Specifies how to logically match the media type in user traffic.

operator must be one of the following:

- !=: Does not equal
- ==: Equals

---

event_trigger

Specifies the network events as condition definition for user traffic in an IP-CAN session. Following event triggers are supported with this command:

- an-gw-change
- bearer-qos-change
- bearer-setup
- bearer-termination
- default-eps-bearer-qos-change
- ip-can-change
- loss-of-bearer
- out-of-credit
- pgw-trace-control
event-trigger

*plmn-change
*qos-change
*qos-change-exceeding-authorization
*rai-change
*rat-change
*reallocation-of-credit
*recover-of-bearer
*resource-modification-request
*revalidation-timeout
*session-setup
*session-termination
*sgsn-change
*successful-resource-allocation
*tft-change
*ue-ip-address-allocate
*ue-ip-address-release
*ue-time-zone-change
*user-location-change

Usage

Use this command to define a condition based on the event triggered in network for user traffic.

Example

The following command creates a condition definition when there is a change in traffic flow template for subscriber:

```
    event-trigger = tft-change
```
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
**imsi**

This command defines a condition based on the International Mobile Station Identification number (IMSI) of a subscriber in an IP-CAN session.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

```
configure > context context_name > pcc-service service_name > condition group group_name
```

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-pcc-condition-group)#
```

**Syntax**

```
[ no ] imsi operator value imsi
[ no ] imsi operator profile-attribute spr_attr_value
[ no ] imsi operator subscription-attribute subs_prof_attr_value
```

**no**
Removes the specified condition definition.

**operator**
Specifies how to logically match the information in the analyzed field.

- `!=`: Does not equal
- `==`: Equals

**imsi**
Specifies the IMSI of subscriber to be used for condition validation in an IP-CAN session.

- `imsi` must be a string of between 8 to 15 digits which starts with 3 digit of MCC then 2 to 3 digit of MNC.
- Wildcard characters `$` and `*` are allowed. The `*` wildcard matches multiple characters and the `$` wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘’). For example; ‘$’.

**profile-attribute**
Specifies the profile attribute value in SPR to match with IMSI in an IP-CAN session as condition.

- `spr_attr_value` must be an alphanumeric string of from 1 through 63 characters.
subscription-attribute subs_prof_attr_value

Specifies the subscriber profile attribute parameter value to match with IMSI in an IP-CAN session as condition.

subs_prof_attr_value must be an alphanumeric string of from 1 through 31 characters.

Usage

Use this command to define a condition based on the IMSI of a subscriber used in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on subscriber IMSI as 12334566434 in an IP-CAN session:

```
imsi = 12334566434
```
**msisdn**

This command defines a condition based on the Mobile Station International Subscriber Directory Number (MSISDN) of a subscriber in an IP-CAN session.

**Product**
- IPCF

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

```
configure > context context_name > pcc-service service_name > condition group group_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-condition-group)#
```

**Syntax**

```
[ no ] msisdn operator value msisdn
[ no ] msisdn operator profile-attribute spr_attr_value
[ no ] msisdn operator subscription-attribute subs_prof_attr_value
```

If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘’). For example; ‘$’.</th>
</tr>
</thead>
</table>

| profile-attribute spr_attr_value | Specifies the profile attribute value in SPR to match with MSISDN in an IP-CAN session as condition. **spr_attr_value** must be an alphanumeric string of from 1 through 63 characters. |
subscription-attribute  subs_prof_attr_value

Specifies the subscriber profile attribute parameter value to match with MSISDN in an IP-CAN session as condition.

subs_prof_attr_value must be an alphanumeric string of from 1 through 31 characters.

Usage

Use this command to define a condition based on the MS ISDN of a subscriber used in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on subscriber MSISDN as 380561234567 in an IP-CAN session:

msisdn = 380561234567
multi-line-or

This command enables/disables the “OR” relation across all conditions exist in PCC-Condition-Group Configuration Mode.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

configure > context context_name > pcc-service service_name > condition group group_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-condition-group)#

Syntax

[no] multi-line-or

no

Sets the PCC-Condition-Group to “AND” relation across all conditions exist in a PCC-Condition-Group Configuration Mode.

Usage
Use this command to enable the “OR” relation across all conditions exist in PCC-Condition-Group Configuration Mode.
In absence of this command the default relation of “AND” applies across all conditions exist in PCC-Condition-Group Configuration Mode.

Example

The following command enables the “OR” relation across all conditions exist in PCC-Condition-Group Configuration Mode:

multi-line-or

The following command enables the default “AND” relation across all conditions exist in PCC-Condition-Group Configuration Mode:

no multi-line-or
nai

This command defines a condition based on the Network Access Identifier (NAI) of a subscriber in an IP-CAN session between PCEF (PDSN) and IPCF over Gx interface.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

Syntax

[ no ] nai operator {username user_name [domain domain] | domain domain}
[ no ] nai operator profile.attribute spr_attr_value
[ no ] nai operator subscription.attribute subs_prof_attr_value

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.

operator must be one of the following:
- !=: Does not equal
- ==: Equals

username user_name

Specifies the subscriber user name to be used for condition validation in an IP-CAN session.

user_name must be an alpha and/or numeric string of 1 through 128 characters in length. The user name can contain all special characters.

domain domain

Specifies the domain (Realm) of subscriber to be used for condition validation in an IP-CAN session.

domain must be an alpha and/or numeric string of 1 through 128 characters in length. The domain name can contain all special characters.

profile.attribute spr_attr_value

Specifies the profile attribute value in SPR to match with NAI in an IP-CAN session as condition.

spr_attr_value must be an alphanumeric string of from 1 through 63 characters.
subscription-attribute subs_prof_attr_value

Specifies the subscriber profile attribute parameter value to match with NAI in an IP-CAN session as condition.

*subs_prof_attr_value* must be an alphanumeric string of from 1 through 31 characters.

### Usage

User this command to define a condition based on the NAI, which contains of user name and domain name, of a subscriber in an IP-CAN session between PCEF (PDSN) and IPCF over Gx interface.

This condition is defined for PCC functionality support to CDMA users over Gx interface.

### Example

The following command creates a condition definition to analyze the condition based on subscriber user name as *cdma2000_subs1* in an IP-CAN session between PDSN and IPCF having *xyz.com* as domain:

```
nai = username cdma2000_subs1 domain xyz.com
```
out-of-credit rulename

This command defines a condition based on the exhaustion of credit for subscriber Rulename at PCEF in an IP-CAN session.

Product
- IPCF

Privilege
- Security Administrator, Administrator

Mode
- Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

configure > context context_name > pcc-service service_name > condition group group_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-condition-group)#

Syntax

[no] out-of-credit rulename operator rule_name

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.

operator must be one of the following:

- !=: Does not equal
- ==: Equals

rule_name

Specifies the name of the Rulename for which out of credit condition is to match in an IP-CAN session.

rule_name is a pre-configured Rulename on PCEF and must be an alphanumeric string of from 1 through 63 characters.

Usage

Use this command to define a condition based on the exhaustion of credit for subscriber Rulename at PCEF in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on the exhaustion of credit for subscriber Rulename rule_101 at PCEF in an IP-CAN session:

    out-of-credit rulename = rule_101
**out-of-credit rulebase-name**

This command defines a condition based on the exhaustion of credit for subscriber Rulebase name at PCEF in an IP-CAN session.

**Product**

IPCF

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

```bash
configure > context context_name > pcc-service service_name > condition group group_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-condition-group)#
```

**Syntax**

```
[no] out-of-credit rulebase-name operator rulebase_name
```

- **no**
  
  Removes the specified condition definition.

- **operator**
  
  Specifies how to logically match the information in the analyzed field. **operator** must be one of the following:
  
  - `!=`: Does not equal
  
  - `==`: Equals

- **rulebase_name**
  
  Specifies the name of the Rulebase for which out of credit condition is to match in an IP-CAN session. **rulebase_name** is a pre-configured Rulebase on PCEF and must be an alphanumeric string of from 1 through 63 characters.

**Usage**

Use this command to define a condition based on the exhaustion of credit for subscriber Rulebase name at PCEF in an IP-CAN session.

**Example**

The following command creates a condition definition to analyze the condition based on the exhaustion of credit for subscriber Rulebase name *rulebase_101* at PCEF in an IP-CAN session:

```
out-of-credit rulebase-name = rulebase_101
```
pcef-address

This command defines a condition based on the IP address of Policy and Charging Enforcement Function (PCEF) which is served by IPCF and through which subscriber is attached to an IP-CAN session.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

```
configure > context context_name > pcc-service service_name > condition group group_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-condition-group)#
```

**Syntax**

```
[ no ] pcef-address {operator value pcef_ip/mask | (in-range | !in-range) value range_start_ip to range_end_ip}
```

```
[ no ] pcef-address operator profile-attribute spr_attr_value
```

```
[ no ] pcef-address operator subscription-attribute subs_prof_attr_value
```

---

**no**

Removes the specified condition definition.

---

**operator**

Specifies how to logically match the information in the analyzed field.

*operator* must be one of the following:

- `!=`: Does not equal
- `==`: Equals

---

**in-range**

Specifies the condition to accept the IP address which are in range as argument to define the PCEF address which is used by subscriber in IP-CAN session.

---

**!in-range**

Specifies the condition to accept the IP address which are NOT in range as argument to define the PCEF address which is used by subscriber in IP-CAN session.

---

**range_start_ip**

Specifies the starting IP address which is used for defining the range of PCEF IP addresses which is used by subscriber in IP-CAN session.

*range_start_ip* is an IP address and must be lesser than *end_start_ip* address.
range_end_ip

Specifies the ending IP address which is used for defining the range of PCEF IP addresses which is used by subscriber in IP-CAN session.

*range_end_ip* is an IP address and must be greater than *end_start_ip* address.

pcef_ip/mask

Specifies the IP address of the PCEF which is used by subscriber in IP-CAN session along with IP mask as well.

pcef_ip must be an IP address in IPv4 or IPv6 notation.

*mask* Specifies the IP address mask bits to determine the number of IP addresses of PCEF in condition. *mask* must be specified using the standard IPv4 dotted decimal notation.

profile-attribute spr_attr_value

Specifies the profile attribute value in SPR to match with PCEF address in an IP-CAN session as condition.

*spr_attr_value* must be an alphanumeric string of from 1 through 63 characters.

subscription-attribute subs_prof_attr_value

Specifies the subscriber profile attribute parameter value to match with PCEF address in an IP-CAN session as condition.

*subs_prof_attr_value* must be an alphanumeric string of from 1 through 31 characters.

Usage

Use this command to define a condition based on the PCEF IP address used by subscriber in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on PCEF P address 1.2.3.4 in an IP-CAN session:

```
pcef-address = 1.2.3.4
```
pdn-id

This command defines a condition based on the PDN or calling station id in an IP-CAN session.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

```
configure > context context_name > pcc-service service_name > condition group group_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-condition-group)#
```

**Syntax**

```
[ no ] pdn-id [case-insensitive] operator value pdn_id
[ no ] pdn-id [case-insensitive] operator profile-attribute spr_attr_value
[ no ] pdn-id [case-insensitive] operator subscription-attribute subs_prof_attr_value
```

no
Removes the specified condition definition.

---

**case-insensitive**

This optional keyword sets the condition to not to consider the case of argument phrase for condition definition.

---

**operator**

Specifies how to logically match the information in the analyzed field. **operator** must be one of the following:

- `!=`: Does not equal
- `=`: Equals
- `contains`: Contains
- `!contains`: Does not contain
- `starts-with`: Starts with
- `!starts-with`: Does not start with
- `ends-with`: Ends with
- `!ends-with`: Does not end with

---

**pdn_id**

Specifies the PDN or calling station id to be used for condition validation in an IP-CAN session.
**pdn-id**

*pdn_id* must be an alphanumeric string of between 1 to 128 characters.

**profile-attribute** `spr_attr_value`

Specifies the profile attribute value in SPR to match with PDN id in an IP-CAN session as condition.

*spr_attr_value* must be an alphanumeric string of from 1 through 63 characters.

**subscription-attribute** `subs_prof_attr_value`

Specifies the subscriber profile attribute parameter value to match with PDN id in an IP-CAN session as condition.

*subs_prof_attr_value* must be an alphanumeric string of from 1 through 31 characters.

**Usage**

Use this command to define a condition based on the PDN or calling station id used in an IP-CAN session.

**Example**

The following command creates a condition definition to analyze the condition based on calling station id *ggsn_all_102* in an IP-CAN session:

```
pdn-id = ggsn_all_102
```
profile-attribute

This command defines a condition based on the matching between subscriber profile attribute value and SPR attribute value in an IP-CAN session.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

```
configure > context context_name > pcc-service service_name > condition group group_name

<td>Specifies the attribute value in SPR to match with Subscriber profile attribute for condition validation in an IP-CAN session. spr_attr_value must be an alphanumeric string of from 1 through 63 characters.</td>
</tr>
</tbody>
</table>

**Important:** This keyword deprecated in StarOS Release 14.0 and onward.
Usage

Use this command to define a condition based on the matching parameters between subscriber profile attribute and SPR attribute parameters used in an IP-CAN session and provides a generic way of specifying and triggering actions based on any of the subscriber profile attribute received from SPR interactions.

Example

The following command creates a condition definition to analyze the condition based on matching of subscriber profile attribute value `subs_gold_102` with SPR attribute value `spr_gold_102` in an IP-CAN session:

```plaintext
profile-attribute parameter subs_gold_102 = spr_gold_102
```
**radio-access-technology**

This command defines a condition based on the radio access technology used by subscriber in an IP-CAN session.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

```
configure > context context_name > pcc-service service_name > condition group group_name
```

Entering the above command sequence results in the following prompt:
```
[context_name]host_name(config-pcc-condition-group)#
```

**Syntax**

```
[ no ] radio-access-technology operator value RAT
[ no ] radio-access-technology operator profile-attribute spr_attr_value
[ no ] radio-access-technology operator subscription-attribute subs_prof_attr_value
```

- **no**
  Removes the specified condition definition.

- **operator**
  Specifies how to logically match the media type in user traffic.
  `operator` must be one of the following:
  - `!=`: Does not equal
  - `=`: Equals

- **RAT**
  Specifies the radio access technology used by subscriber to access the network as condition definition for user traffic in an IP-CAN session.
  Following RAT are supported with this command:
  - `cdma2000-1x`: 3GPP2 CDMA 2000 - 1x RTT
  - `eutran`: Evolved Universal Terrestrial Radio Access Network (eUTRAN)
  - `gan`: Generic Access Network (GAN)
  - `geran`: GSM Edge Radio Access Network (GERAN)
  - `hrpd`: High Rate Packet Data (CDMA 2000 1xEV-DO)
  - `hspa-evolution`: Evolved High-Speed Packet Access (eHSPA/HSPA+)
  - `umb`: Ultra-Mobile Broadband
• **utran**: Universal Terrestrial Radio Access Network (UTRAN)
• **wlan**: Wireless Local Area Network (WLAN/xDSL)

### profile-attribute spr_attr_value

Specifies the profile attribute value in SPR to match with type of RAT in an IP-CAN session as condition. `spr_attr_value` must be an alphanumeric string of from 1 through 63 characters.

### subscription-attribute subs_prof_attr_value

Specifies the subscriber profile attribute parameter value to match with type of RAT in an IP-CAN session as condition. `subs_prof_attr_value` must be an alphanumeric string of from 1 through 31 characters.

### Usage

Use this command to define a condition based on the type of radio technology used for network access by subscriber in an IP-CAN session.

### Example

The following command creates a condition definition to analyze the PCC service user traffic for the radio access technology type as WLAN:

```
radio-access-technology = wlan
```
**sgsn-ip**

This command defines a condition based on the IP address of SGSN on which subscriber is attached in an IP-CAN session.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

```
configure > context context_name > pcc-service service_name > condition group group_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-condition-group)#
```

**Syntax**

```
[ no ] sgsn-ip {operator value sgsn_ip/mask | {in-range | !in-range} range_start_ip to range_end_ip}

[ no ] sgsn-ip operator profile-attribute spr_attr_value

[ no ] sgsn-ip operator subscription-attribute subs_prof_attr_value
```

---

**no**

Removes the specified condition definition.

**operator**

Specifies how to logically match the information in the analyzed field.

- `!=`: Does not equal
- `==`: Equals

**in-range**

Specifies the condition to accept the IP address which are in range as argument to define the SGSN address which is used by subscriber in IP-CAN session.

**!in-range**

Specifies the condition to accept the IP address which are NOT in range as argument to define the SGSN address which is used by subscriber in IP-CAN session.

**range_start_ip**

Specifies the starting IP address which is used for defining the range of SGSN IP addresses which is used by subscriber in IP-CAN session.

`range_start_ip` is an IP address and must be lesser than `end_start_ip` address.
range_end_ip

Specifies the ending IP address which is used for defining the range of SGSN IP addresses which is used by subscriber in IP-CAN session.

*range_end_ip* is an IP address and must be greater than *end_start_ip* address.

gsn_ip/mask

Specifies the IP address of the SGSN which is used by subscriber in IP-CAN session along with IP mask as well.

*gsn_ip* must be an IP address in IPv4 or IPv6 notation.

*mask* specifies the IP address mask bits to determine the number of IP addresses of SGSN in condition. *mask* must be specified using the standard IPv4 dotted decimal notation.

profile-attribute spr_attr_value

Specifies the profile attribute value in SPR to match with SGSN IP address in an IP-CAN session as condition.

*spr_attr_value* must be an alphanumeric string of from 1 through 63 characters.

subscription-attribute subs_prof_attr_value

Specifies the subscriber profile attribute parameter value to match with SGSN IP address in an IP-CAN session as condition.

*subs_prof_attr_value* must be an alphanumeric string of from 1 through 31 characters.

Usage

Use this command to define a condition based on the SGSN IP address used by subscriber in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on SGSN IP address 1.2.3.4 in an IP-CAN session:

```
sgsn-ip = 1.2.3.4
```
sgsn-mcc-mnc

This command defines a condition based on the PLMN (MCC+MNC) of SGSN on which subscriber is attached in an IP-CAN session.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

configure > context context_name > pcc-service service_name > condition group group_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-condition-group)#

Syntax

[ no ] sgsn-mcc-mnc operator {mcc mcc_value [mnc mnc_value] | [mcc mcc_value] mnc mnc_value}

[ no ] sgsn-mcc-mnc operator profile-attribute spr_attr_value

[ no ] sgsn-mcc-mnc operator subscription-attribute subs_prof_attr_value

---

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
• !=: Does not equal
• ==: Equals

mcc mcc_value

 Specifies the Mobile Country Code in PLMN of SGSN which is used by subscriber in IP-CAN session.
mcc_value must be an integer between 101 and 998.

mnc mnc_value

Specifies the Mobile Network Code in PLMN of SGSN which is used by subscriber in IP-CAN session.
mnc_value must be an integer between 1 and 998.

profile-attribute spr_attr_value

Specifies the profile attribute value in SPR to match with PLMN of SGSN used by subscriber in an IP-CAN session as condition.
spr_attr_value must be an alphanumeric string of from 1 through 63 characters.
subscription-attribute subs_prof_att_value

Specifies the subscriber profile attribute parameter value to match with PLMN of SGSN used by subscriber in an IP-CAN session as condition.

`subs_prof_att_value` must be an alphanumeric string of from 1 through 31 characters.

### Usage

Use this command to define a condition based on the PLMN of SGSN used by subscriber in an IP-CAN session.

### Example

The following command creates a condition definition to analyze the condition based on PLMN of SGSN with MCC as 102 and MNC as 99 in an IP-CAN session:

```
sgsn-mcc-mnc = mcc 102 mnc 99
```
subscription-attribute

This command defines a condition based on the matching between subscriber subscription attribute value and SPR attribute value in an IP-CAN session.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

configure > context context_name > pcc-service service_name > condition group group_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-condition-group)#

Syntax

[no] subscription-attribute subscription_attr_value operator spr_attr_value

- **no**
  Removes the specified condition definition.

- **subscription_attr_value**
  Specifies the subscriber subscription attribute value to match with SPR attribute for condition validation in an IP-CAN session. **subscription_attr_value** must be an alphanumeric string of from 1 through 31 characters.

- **operator**
  Specifies how to logically match the information in the analyzed field. **operator** must be one of the following:
  - !: Does not equal
  - =: Equals

- **spr_attr_value**
  Specifies the attribute value in SPR to match with subscriber subscription attribute for condition validation in an IP-CAN session. **spr_attr_value** must be an alphanumeric string of from 1 through 63 characters.

Usage

Use this command to define a condition based on the matching parameters between subscriber subscription attribute and SPR attribute value used in an IP-CAN session.

Example

...)
The following command creates a condition definition to analyze the condition based on matching of subscriber subscription attribute value `subs_gold_102` with SPR attribute value `spr_gold_101` in an IP-CAN session:

```
subscription.attribute subscribe_gold_102 = spr_gold_101
```
spr-profile-not-found

This command defines a condition based on the availability of SPR profile for a subscriber in an IP-CAN session.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

configure > context context_name > pcc-service service_name > condition group group_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-condition-group)#

Syntax

[no] spr-profile-not-found

no

Removes the specified condition definition.

Usage
Use this command to define a condition based on the availability of SPR profile for a subscriber in an IP-CAN session.

Example
The following command creates a condition definition to analyze the condition if SPR profile is not available for a subscriber in an IP-CAN session:

spr-profile-not-found
threshold-condition usage-monitor

This command defines a condition based on the threshold conditions in usage of traffic by subscriber session in an IP-CAN session. It is used to support usage tracking and dynamic Policy control based on subscriber usage.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

configure > context context_name > pcc-service service_name > condition group group_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-condition-group)#

Syntax

[ no ] threshold-condition usage-monitor usage_mon_name { time | vol-or-time | volume } usage operator { absolute value volume | subscription-limit | subscription-threshold subs_thres_limit }

no
Removes the specified condition definition.

usage_mon_name

Specifies a unique name for configured usage monitor condition which is used for evaluation with this condition group for user traffic in IP-CAN session.

usage_mon_name must be an alphanumeric string of 1 through 63 characters.

usage

This keyword specifies the condition as usage for threshold condition which is used for evaluation with this condition group for user traffic in IP-CAN session.

operator

Specifies how to logically match the information in the analyzed field.

operator must be one of the following:

- !=: Does not equal
- <=: Lesser than or equals
- =: Equals
- >=: Greater than or equals

{time | vol-or-time | volume }

This keywords sets the type of threshold; time or volume or both as condition definition for user traffic in IP-CAN session.
• **time**: This keyword sets the threshold condition to use time as condition definition for a user traffic in IP-CAN session.

• **vol-or-time**: This keyword sets the threshold condition to use time or volume as condition definition for a user traffic in IP-CAN session. The condition is matched if either of the two usage values fulfills the condition.

• **volume**: This keyword sets the threshold condition to use volume as condition definition for a user traffic in IP-CAN session.

---

**absolute value** `volume`

Specifies the threshold limit condition definition based on absolute usage `volume` in Kilo Bytes which is used for evaluation with this condition group for user traffic in IP-CAN session. `volume` must be an integer between 1 through 4294967295.

---

**subscription-limit**

Specifies the threshold limit condition based on Subscriber’s subscription limit which is used for evaluation with this condition group for user traffic in IP-CAN session. In this condition the system takes Subscriber’s subscription limit as defined in subscriber subscription policy for threshold limit monitoring.

---

**subscription-threshold** `subs_thres_limit`

Specifies the condition definition for threshold limit based on a configured usage monitor threshold named `subs_thres_limit` in IP-CAN session. `subs_thres_limit` is a pre-configured subscription limit in this configuration mode. This command allows the operator to use configured subscription limit as subset of a threshold condition.

---

**Usage**

Use this command to define a condition based on the duration of usage of service in seconds or volume usage in Bytes for user traffic in an IP-CAN session. This usage monitor is used to support usage tracking and dynamic Policy control based on subscriber usage.

IPCF supports the concept of Monitoring Key. PCEF, when instructed by PCRF, keeps track of usage per Monitoring Key. PCEF reports the usage when thresholds are reached or requested by PCRF. To allow operator to have dynamic Policy control, IPCF uses Usage Monitor. This Usage Monitor has attribute of volume-limit, time-limit or both. Operator can “associate” different Monitoring Keys to these usage monitors. It can be a Many-To-Many relationship between Usage-Monitor and Monitoring-Key. Operator can use Usage conditions on Usage Monitors instead of Monitoring Keys directly. IPCF tracks usage per usage-monitor. Different monitoring keys associated to a Usage-Monitor. When monitoring key is associated to a Usage-Monitor, the usage reported for that particular monitoring key is added to all the usage monitoring to which it is associated.

IPCF supports 2 types of usage monitors; it can be defined on IPCF or SSC supplied usage monitors. The name `usage_mon_name` identifies an usage-monitor, which is locally defined or received from SSC. The `absolute` value applies to both types of usage monitors. This command allows the operator to use configured threshold condition with another threshold condition as subset. A maximum of 8 thresholds can be configured per usage monitor.

---

**Example**

The following command creates a threshold condition with usage monitor name `threshold1` as usage monitor to trigger the condition based on the `subscription limit` as provide in Subscriber policy:
threshold-condition usage-monitor

threshold-condition usage-monitor threshold1 usage = subscription-limit
user-access-network

This command defines a condition based on the access location type of the subscriber in an IP-CAN session as received on Gx interface.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

`configure > context context_name > pcc-service service_name > condition group group_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-condition-group)#
```

**Syntax**

```
[ no ] user-access-network operator value { home | roaming | visiting }
[ no ] user-access-network operator profile-attribute spr_attr_value
[ no ] user-access-network operator subscription-attribute subs_prof_attr_value
```

---

**no**
Removes the specified condition definition.

---

**operator**
Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- `!=`: Does not equal
- `==`: Equals

---

**value home**
Specifies the subscriber network access type as Home for condition validation in an IP-CAN session.
This condition contains all subscribers active in Home networks in this condition.

---

**value roaming**
Specifies the subscriber network access type as Roaming for condition validation in an IP-CAN session.
This condition contains all subscribers active in Roaming networks in this condition.

---

**value visiting**
Specifies the subscriber network access type as Visiting for condition validation in an IP-CAN session.
This condition contains all subscribers active in Visiting networks in this condition.
profile-attribute spr_attr_value

Specifies the profile attribute value in SPR to match with user access network condition validation in an IP-CAN session.

spr_attr_value must be an alphanumeric string of from 1 through 63 characters.

subscription-attribute subs_prof_attr_value

Specifies the subscriber profile attribute parameter value to match with user access network condition validation in an IP-CAN session.

subs_prof_attr_value must be an alphanumeric string of from 1 through 31 characters.

Usage

Use this command to define a condition based on the location of the user as defined in SPR attribute or subscriber profile attribute or location of user in Home, Roaming, Visiting in an IP-CAN session as received on Gx interface.

This configuration compares ULI and other location information from Gx data with the Home/roaming/visiting location as received from SSC. IPCF will also use global data as received from SSC in determining user access network through Subscriber profile attribute or SPR attribute in profile attribute.

Example

The following command creates a condition definition to analyze the condition based on location of the subscribes as roaming in an IP-CAN session:

user-access-network = value roaming
user-equipment-info esn

This command defines a condition based on the Electronic Serial Number (ESN) used for the identification of mobile device (UE) in a Non-3GPP IP-CAN session received over Gx interface between PDSN and IPCF.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Condition Group Configuration

```
configure > context context_name > pcc-service service_name > condition group group_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-condition-group)#
```

**Syntax**

```
[ no ] user-equipment-info esn  operator value esn
[ no ] user-equipment-info esn  operator profile-attribute spr_attr_value
[ no ] user-equipment-info esn  operator subscription-attribute subs_prof_attr_value
```

---

**no**

Removes the specified condition definition.

**operator**

Specifies how to logically match the information in the analyzed field.

*operator* must be one of the following:

- !=: Does not equal
- ==: Equals

**esn**

Specifies the Electronic Serial Number used for the identification of UE in 64 bit format as condition value for UE information received over Gx interface in a Non-3GPP IP-CAN session.

*esn* must be a 15 character long string of Hexadecimal numbers only.

**profile-attribute spr_attr_value**

Specifies the profile attribute value in SPR to match with ESN of the UE in an IP-CAN session as condition.

*spr_attr_value* must be an alphanumeric string of from 1 through 63 characters.

**subscription-attribute subs_prof_attr_value**

Specifies the subscriber profile attribute parameter value to match with ESN of the UE in an IP-CAN session as condition.

*subs_prof_attr_value* must be an alphanumeric string of from 1 through 31 characters.
Usage

Use this command to define a condition based on the ESN of the UE received over Gx interface in a Non-3GPP IP-CAN session between PDSN and IPCF.

Example

The following command creates a condition definition to analyze the condition based on the ESN of the UE as 1234567890120AF in a Non-3GPP IP-CAN session:

```
user-equipment-info esn = 1234567890120AF
```
user-equipment-info eui64

This command defines a condition based on the Extended Unique Identifier in 64 bit (EUI-64) used for the identification of mobile device (UE) in an IP-CAN session received over Gx interface.

**Syntax**

```plaintext
[ no ] user-equipment-info eui64 operator value eui64
[ no ] user-equipment-info eui64 operator profile-attribute spr_attr_value
[ no ] user-equipment-info eui64 operator subscription-attribute subs_prof_attr_value
```

- **no**
  - Removes the specified condition definition.

- **operator**
  - Specifies how to logically match the information in the analyzed field.
  - `!=`: Does not equal
  - `==`: Equals

- **eui64**
  - Specifies the Extended Unique Identifier in 64 bit format as a condition value for UE information received over Gx interface in an IP-CAN session.
  - `eui64` is a 16 character long string of Hexadecimal numbers only.

- **profile-attribute spr_attr_value**
  - Specifies the profile attribute value in SPR to match with EUI-64 value of the UE in an IP-CAN session as condition.
  - `spr_attr_value` must be an alphanumeric string of from 1 through 63 characters.

- **subscription-attribute subs_prof_attr_value**
  - Specifies the subscriber profile attribute parameter value to match with EUI-64 value of the UE in an IP-CAN session as condition.
user-equipment-info eui64

subs_prof_attr_value must be an alphanumeric string of from 1 through 31 characters.

Usage

Use this command to define a condition based on the EUI-64 value of the UE received over Gx interface in an IP-CAN session between PCEF and IPCF.

Example

The following command creates a condition definition to analyze the condition based on the EUI-64 of the UE as 0012989099832345 in an IP-CAN session:

user-equipment-info eui64 = 0012989099832345
user-equipment-info imeisv

This command defines a condition based on the International Mobile Equipment Identity Software Version (IMEI-SV) used for the identification of mobile device (UE) in an IP-CAN session received over Gx interface.

Product  
IPC

Privilege  
Security Administrator, Administrator

Mode

[context_name]host_name(config-pcc-condition-group)#

Syntax

[ no ] user-equipment-info imeisv  operator value imei_sv
[ no ] user-equipment-info imeisv  operator profile-attribute spr_attr_value
[ no ] user-equipment-info imeisv  operator subscription-attribute subs_prof_attr_value

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:
• !=: Does not equal
• ==: Equals

imei_sv

Specifies the International Mobile Equipment Identity Software Version (IMEI-SV) as a condition value for UE information received over Gx interface in an IP-CAN session.
imei_sv is a 16 digit long string of decimal numbers only.

profile-attribute spr_attr_value

Specifies the profile attribute value in SPR to match with IMEI-SV value of the UE in an IP-CAN session as condition.
spr_attr_value must be an alphanumerical string of 63 characters.

subscription-attribute subs_prof_attr_value

Specifies the subscriber profile attribute parameter value to match with IMEI-SV value of the UE in an IP-CAN session as condition.
user-equipment-info imeisv

\[ subs_prof_attr_value \] must be an alphanumeric string of from 1 through 31 characters.

Usage

Use this command to define a condition based on the IMEI-SV value of the UE received over Gx interface in an IP-CAN session between PCEF and IPCF.

Example

The following command creates a condition definition to analyze the condition based on the IMEI-SV of the UE as 0012989099832345 in an IP-CAN session:

\[ \text{user-equipment-info eui64} = 0012989099832345 \]
user-equipment-info mac

This command defines a condition based on the Media Access Control (MAC) address used for the UE information in an IP-CAN session as received over Gx interface.

Product

[ no ] user-equipment-info mac operator profile-attribute spr_at_value
[ no ] user-equipment-info mac operator subscription-attribute subs_prof_attr_value

---

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.

operator must be one of the following:

• !=: Does not equal
• ==: Equals

mac_value

Specifies the Media Access Control (MAC) address as condition value for UE information received over Gx interface in an IP-CAN session.

mac_value is a 17 character long string of Hexadecimal numbers in xx:xx:xx:xx:xx:xx format only.

profile-attribute spr_at_value

Specifies the profile attribute value in SPR to match with MAC value of the UE in an IP-CAN session as condition.

spr_at_value must be an alphanumeric string of from 1 through 63 characters.

subscription-attribute subs_prof_attr_value

Specifies the subscriber profile attribute parameter value to match with MAC value of the UE in an IP-CAN session as condition.
subs_prof_attr_value must be an alphanumeric string of from 1 through 31 characters.

Usage
Use this command to define a condition based on the MAC address value as UE information received over Gx interface in an IP-CAN session.

Example
The following command creates a condition definition to analyze the condition based on the MAC value of the UE as 00:12:98:90:99:83 in an IP-CAN session:

```
user-equipment-info mac = 00:12:98:90:99:83
```
user-equipment-info meid

This command defines a condition based on the Mobile Equipment Id (MEID) used for the identification of CDMA mobile device (UE) in a Non-3GPP IP-CAN session received over Gx interface between PDSN and IPCF.

• ==: Equals

**me_id**

Specifies the Mobile Equipment identifier used for the identification of UE in 64 bit format as condition value for UE information received over Gx interface in a Non-3GPP IP-CAN session. 
me_id must be a 14 character long string of Hexadecimal numbers only.

**profile-attribute spr_attr_value**

Specifies the profile attribute value in SPR to match with Mobile Equipment id of the UE in an IP-CAN session as condition. 
spr_attr_value must be an alphanumeric string of from 1 through 63 characters.

**subscription-attribute subs_prof_attr_value**

Specifies the subscriber profile attribute parameter value to match with Mobile Equipment id of the UE in an IP-CAN session as condition.
user-equipment-info meid

subs_prof_attr_value must be an alphanumeric string of from 1 through 31 characters.

Usage
Use this command to define a condition based on the MEID of the CDMAUE received over Gx interface in a Non-3GPP IP-CAN session between PDSN and IPCF.

Example
The following command creates a condition definition to analyze the condition based on the MEID of the CDMA UE as 123456780120AF in a Non-3GPP IP-CAN session:

```plaintext
user-equipment-info meid = 123456780120AF
```
user-equipment-info modified-eui64

This command defines a condition based on the modified-Extended Unique Identifier in 64 bit (EUI-64) used for the identification of mobile device (UE) in an IP-CAN session received over Gx interface.

operator must be one of the following:

• !=: Does not equal
• ==: Equals

meui64
Specifies the modified Extended Unique Identifier (EUI) in 64 bit format as condition value for UE information received over Gx interface in an IP-CAN session.
meui64 is a 16 character long string of Hexadecimal numbers only.

profile-attribute spr_attr_value
Specifies the profile attribute value in SPR to match with modified EUI-64 value of the UE in an IP-CAN session as condition.
spr_attr_value must be an alphanumeric string of from 1 through 63 characters.
subscription-attribute subs_prof_attr_value

Specifies the subscriber profile attribute parameter value to match with modified EUI-64 value of the UE in an IP-CAN session as condition.

subs_prof_attr_value must be an alphanumeric string of from 1 through 31 characters.

Usage

Use this command to define a condition based on the modified EUI-64 value of the UE received over Gx interface in an IP-CAN session between PCEF and IPCF.

Example

The following command creates a condition definition to analyze the condition based on the EUI-64 of the UE as 0012989099832345 in an IP-CAN session:

```
user-equipment-info modified-eui64 = 0012989099832345
```

- **operator**
  - Specifies how to logically match the information in the analyzed field.

  ```
  operator
  ```

  \textit{operator} must be one of the following:
- !=: Does not equal
- ==: Equals

mcc mcc_value
Specifies the Mobile Country Code used in UE location information received over Gx interface in IP-CAN session.
mcc_value must be an integer between 101 through 998.

mnc mnc_value
Specifies the Mobile Network Code used in UE location information received over Gx interface in IP-CAN session.
mnc_value must be an integer between 1 through 998.

lac lac_value
Specifies the Location Area Code used in UE location information received over Gx interface in IP-CAN session.
lac_value must be an integer between 1 through 65535.

ci ci_value
Specifies the Cell Identifier used in UE location information received over Gx interface in IP-CAN session.
ci_value must be an integer between 1 through 65535.

ecgi ecgi_value
Specifies the E-UTRAN Cell Global Identifier used in UE location information received over Gx interface in IP-CAN session.
ecgi_value must be an integer between 1 through 1048575.

rai rai_value
Specifies the Routing Area Identifier used in UE location information received over Gx interface in IP-CAN session.
rai_value must be an integer between 1 through 65535.

sac sac_value
Specifies the Service Area Code used in UE location information received over Gx interface in IP-CAN session.
sac_value must be an integer between 1 through 65535.

tai tai_value
Specifies the Tracking Area Code used in UE location information received over Gx interface in IP-CAN session.
tai_value must be an integer between 1 through 65535.

Usage
Use this command to define a condition based on the UE location information received over Gx interface in an IP-CAN session.

Example
The following command creates a condition definition to analyze the condition based on the RAI received for UE location in an IP-CAN session:

```
user-location-info rai = mcc 102 mnc 99 lac 1003 rai 3521
```
Chapter 236
PCC-Data-Service Configuration Mode Commands

The PCC-Data-Service Configuration Mode is used to configure the data flow parameters for the media data, as well as corresponding attributes that are necessary for charging and policy enforcement decisions for the media parameters represented by its service flows in the PCC-service. A maximum of ten service data flows can be configured in a PCC-Data-Service instance.

**Important:** This configuration mode is supported from StarOS Release 12.1 onward.

Mode

Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Data Service Configuration
\n**configure** > **context** **context_name** > **pcc-service** **service_name** > **data-service** **service_name**

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-data-service)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
flow direction in

This command configures the flow service parameters for incoming data flow in PCC-Data-Service instance.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Data Service Configuration

configure > context context_name > pcc-service service_name > data-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-data-service)#

**Syntax**

```
[no] flow direction in protocol {ip | tcp | udp} from {src_ip_addr[/maskbit] | any} port {src_port_num | any} to {dest_ip_addr[maskbit] | any} port {dest_port_num | any}
```

*no*

Removes the configured data service flow parameters from PCC-Data-Service instance for IPCF configuration.

**protocol {ip | tcp | udp}**

This keyword configures the data flow parameters for specific protocol. Following protocols are supported through this keyword:

- **ip**: Sets the parameters for IP traffic.
- **tcp**: Sets the parameters for TCP traffic.
- **UDP**: Sets the parameters for UDP traffic.

*from {src_ip_addr[/maskbit] | any} port {src_port_num | any} to {dest_ip_addr[maskbit] | any} port {dest_port_num | any}*

This keyword configures the data flow condition parameters for specific protocol through IP address and port as source of flow. Following parameters are defined with this keyword:

- **src_ip_addr**: specifies the specific IP address in IPv4/IPv6 notation as source of flow.
- **maskbit**: Specifies the IP address suffix in IPv4 or IPv6 notation.
- **any**: specifies that flow from any source IP address/port can be analyzed or considered.
- **port src_port_num**: specifies the specific source port parameter for flow.
  
  src_port_num is the source port number of flow and must be an integer from 1 through 65535.
flow direction in protocol tcp from any port any to any port any
flow direction out

This command configures the flow service parameters for outgoing data flow in PCC-Data-Service instance.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Data Service Configuration

configure > context <context_name> > pcc-service <service_name> > data-service <service_name>

Entering the above command sequence results in the following prompt:

```
[<context_name>]host_name(config-pcc-data-service)#
```

**Syntax**

```
[no] flow direction in protocol {ip | tcp | udp} from {src_ip_addr [ /maskbit] | any} port {src_port_num | any} to {dest_ip_addr [ /maskbit] | any} port {dest_port_num | any}
```

**no**
Removes the configured data service flow parameters from PCC-Data-Service instance on IPCF node.

```
protocol {ip | tcp | udp}
```

This keyword configures the data flow parameters for specific protocol.

Following protocols are supported through this keyword:

- **ip**: Sets the parameters for IP traffic.
- **tcp**: Sets the parameters for TCP traffic.
- **UDP**: Sets the parameters for UDP traffic.

```
from {src_ip_addr | any} port {src_port_num | any}
```

This keyword configures the data flow condition parameters for specific protocol through IP address and port as source of flow.

Following parameters are defined with this keyword:

- **src_ip_addr**: specifies the specific IP address in IPv4/IPv6 notation as source of flow.
- **maskbit**: Specifies the IP address suffix in IPv4 or IPv6 notation.
- **any**: specifies that flow from any source IP address/port can be analyzed or considered.
- **port src_port_num**: specifies the specific source port parameter for flow.

```
src_port_num is the source port number of flow and must be an integer from 1 through 65535.
```

```
to {dest_ip_addr | any} port {dest_port_num | any}
```

This keyword configures the data flow condition parameters for specific protocol through IP address and port as source of flow.
Following parameters are defined with this keyword:

- `dest_ip_addr`: specifies the specific IP address in IPv4/IPv6 notation as destination of flow.
- `maskbit`: Specifies the IP address suffix in IPv4 or IPv6 notation.
- `any`: specifies that flow to any destination IP address/port can be analyzed or considered.
- `port dest_port_num`: specifies the specific destination port parameter for flow.
  
  `dest_port_num` is the destination port number of flow and must be an integer from 1 through 65535.

### Usage

Use this command to configure the flow service parameters for outgoing data flow in PCC-Data-Service instance on IPCF node.

### Example

Following command sets the data service parameters for `tcp` type protocol from `any` IP/port source to `any` IP/port in outgoing direction with in a PCC-Data-Service.

```
flow direction out protocol tcp from any port any to any port any
```
metering-method

This command specifies the metering method to be used by PCEF for offline charging in a PCC-Data-Service instance on IPCF node.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Data Service Configuration

configure > context context_name > pcc-service service_name > data-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-data-service)#

Syntax

[no] metering-method {both-duration-volume | duration | volume}

- no
  Removes the configured metering method from PCC-Data-Service instance on IPCF node.
  In such scenario, the metering method pre-configured at PCEF is considered.

- both-duration-volume
  Specifies the metering method as based on volume of data usage and duration of session, both for offline charging in a PCC-Data-Service instance on IPCF node.

- duration
  Specifies the metering method as based on the duration of session usage for offline charging in a PCC-Data-Service instance on IPCF node.

- volume
  Specifies the metering method as based on the volume of data usage for offline charging in a PCC-Data-Service instance on IPCF node.

Usage

Use this command to define the metering method to be used for offline charging in a PCC-Data-Service instance on IPCF node.
If no metering method is defined, the metering method preconfigured at PCEF is considered.

Example

Following command sets the metering method as based on volume of data usage and duration of session, both for offline charging in a PCC-Data-Service instance on IPCF node.

    metering-method both-duration-volume
monitoring-key

This command defines the monitoring key under which data is monitored for the PCC-Data-Service instance.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Data Service Configuration

configure > context context_name > pcc-service service_name > data-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-data-service)#

Syntax

monitoring-key mon_key_value

[no] monitoring-key

---

no

Removes the configured monitoring-key from PCC-Data-Service instance on IPCF node.

mon_key_value

Specifies the monitoring key value under which data usage is monitored for the PCC-Data-Service instance and must be an integer from 1 through 65535.

Usage

Use this command to define the monitoring key under which data is monitored for the PCC-Data-Service instance on IPCF node.

Example

Following command sets the monitoring key 123 for data monitoring in PCC-Data-Service instance on IPCF node.

  monitoring-key 123
precedence

This command defines the precedence that is assigned to the Dynamic PCC rule created for a PCC-Data-Service instance.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Data Service Configuration

configure > context context_name > pcc-service service_name > data-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-data-service)#

Syntax

precedence preced_value

[no] precedence

no

Removes the configured precedence value from PCC-Data-Service instance on IPCF node.

preced_value

Specifies the precedence that is assigned to the dynamic PCC rule created for a PCC-Data-Service instance and must be an integer from 1 through 65535.

Usage

Use this command to define the precedence value that is assigned to the Dynamic PCC rule created for a PCC-Data-Service instance on IPCF node.

Example

Following command sets the precedence value 2 to assign to the dynamic PCC rule created for a PCC-Data-Service instance on IPCF node.

precedence 2
qos-profile

This command defines the PCC-QoS-Profile which is to use for the PCC-Data-Service instance on IPCF node.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Data Service Configuration

configure > context context_name > pcc-service service_name > data-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-data-service)#

Syntax

qos-profile qos_prof_name

[no] qos-profile

no

Removes the configured PCC-QoS-Profile from PCC-Data-Service instance on IPCF node.

qos_prof_name

Specifies the pre-configured PCC-QoS-Profile name which is to use for the PCC-Data-Service instance.

Usage

Use this command to define the PCC-QoS-Profile for a PCC-Data-Service instance on IPCF node.

Example

Following command sets the PCC-QoS-Profile ipcf_qos_prof1 for PCC-Data-Service instance on IPCF node.

qos-profile ipcf_qos_prof1
rating-group

This command defines the PCC-Rating-Group that is assigned for a PCC-Data-Service instance.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Data Service Configuration

configure > context context_name > pcc-service service_name > data-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-data-service)#

**Syntax**

```
rating-group rating_grp_id

[no] rating-group
```

- **no**
  Removes the configured PCC-Rating-Group Id from PCC-Data-Service instance on IPCF node.

- **rating_grp_id**
  Specifies the PCC-Rating-Group Id that is assigned to the PCC-Data-Service instance and must be an integer from 1 through 99.

**Usage**

Use this command to define the PCC-Rating Id value for a PCC-Data-Service instance on IPCF node.

**Example**

Following command sets the Rating Group id 11 for a PCC-Data-Service instance on IPCF node.

```
rating-group 11
```
reporting-level

This command specifies the reporting level to be used by PCEF to report the data usage for the related PCC rule in a PCC-Data-Service instance on IPCF node.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Data Service Configuration

configure > context context_name > pcc-service service_name > data-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-data-service)#

Syntax

[no] reporting-level {service-identifier-level | rating-group-level}

no
Removes the configured usage reporting level from PCC-Data-Service instance on IPCF node. In such scenario, the reporting level configured at PCEF is considered.

service-identifier-level
Sets the data usage reporting level to be used by PCEF to report the data usage for the related PCC rule at the service identifier level in a PCC-Data-Service instance on IPCF node.

ingroup-level
Sets the data usage reporting level to be used by PCEF to report the data usage for the related PCC rule at the Rating-group level in a PCC-Data-Service instance on IPCF node.

Usage
Use this command to define the reporting level to be used by PCEF to report the data usage for the related PCC rule in a PCC-Data-Service instance on IPCF node. If no reporting level is defined, the reporting level preconfigured at PCEF is considered.

Example

Following command sets the reporting level at ‘Rating-group’ level which is to be used by PCEF to report the data usage for the related PCC rule in a PCC-Data-Service instance on IPCF node.

    reporting-level rating-group-level
service-identifier

This command defines the service identifier for a PCC-Data-Service instance.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Data Service Configuration

`configure > context context_name > pcc-service service_name > data-service service_name`

Entering the above command sequence results in the following prompt:

```plaintext
[context_name]host_name(config-pcc-data-service)#
```

**Syntax**

```
service-identifier svc_id

[no] service-identifier
```

### no
Removes the configured Service Identifier from PCC-Data-Service instance on IPCF node.

### svc_id
Specifies the Service Identifier that is assigned to the PCC-Data-Service instance and must be an integer from 1 through 65535.

**Usage**

Use this command to define the Service Identifier for a PCC-Data-Service instance on IPCF node.

**Example**

Following command sets the Service Identifier 1011 for a PCC-Data-Service instance on IPCF node.

```
service-identifier 1011
```
Chapter 237
PCC-Event-Notification-Interface-Endpoint Configuration Mode Commands

The PCC-Event-Notification-Interface-Endpoint configuration mode is used to enable the event notification interface mechanism for the Intelligent Policy Control Function (IPCF) and to configure the Event Notification collection server endpoint related parameters.

**Important:** This configuration mode is supported from StarOS Release 12.1 onward.

---

**Mode**

```
Exec > Global Configuration > Context Configuration > Event Notification Interface Endpoint Configuration
```

```
configure > context context_name > event-notif-endpoint endpoint_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ntfyintf-endpoint)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
address

This command binds an IP address to the local IPCF node which is to be used for event notification processing with remote event collection server endpoint during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Event Notification Interface Endpoint Configuration

configure > context context_name > event-notif-endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ntfyintf-endpoint)#

Syntax

address ip_address

ip_address

Specifies the IP address bind with local IPCF node to be used by the event collection server endpoint for event message processing during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

Usage
Use this command to bind an IP address to interact with the remote event notification collection server endpoint to which the event messages are sent for IP-CAN session events.

Example
Following command binds the 1.2.3.4 for event notification message with remote event notification endpoint.

address 1.2.3.4
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Use this command to return to the Exec mode.
**exit**

Exits the current mode and returns to the parent configuration mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```bash
exit
```

**Usage**

Use this command to return to the parent configuration mode.
peer name

This command binds/associates a remote Event Notification collection server as peer having specified IP address and optionally port for event notification during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Event Notification Interface Endpoint Configuration

configure > context context_name > event-notif-endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ntfyintf-endpoint)#

Syntax

peer name peer_name address ip_address [port port_num]

name peer_name

Sets the in PCC-Event-Notification-Interface-Endpoint instance to use a particular peer node configured by a peer name peer_name for event notification interface.
The peer_name is name of the peer node to be sued for event collection and must be an alphanumerical string from 1 through 31 characters. peer_name allows punctuation marks.

ip-address ip_address

Sets the PCC-Event-Notification-Interface-Endpoint instance to bind the particular peer node name with IP address ip_address in IPv4 or IPv6 notation for event notification message processing.
The ip_address is an IP address in IPv4/IPv6 notation.

port port_num

This optional keyword sets a particular port number to be used with in the PCC-Event-Notification-Interface-Endpoint instance to configure a particular peer node having a pre assigned IP address ip_address in IPv4 or IPv6 notation for event notification message processing.
The port_num must be an integer between 1 and 65535.

Usage

Use this command to bind/associate a remote Event Notification collection server as peer having specified IP address and optionally port for event notification during IP-CAN session in the PCC-Event-Notification-Interface-Endpoint instance.
Multiple peers can be configured using this command and peer selection methods, primary-secondary or round-robin can be applied using peer select-algorithm command for event notification during IP-CAN session in this configuration mode.

Example
Following command configures and associates an Event Notification peer node named \textit{event_peer_1} having an IP address 1.2.3.4 with port number as 2345 in an PCC-Event-Notification-Interface-Endpoint instance.

peer name event_peer_1 ip-address 1.2.3.4 port 2345
**peer select-algorithm**

This command applies the peer selection algorithm to select the configured remote Event Notification collection server during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

**Product**

IPC

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Event Notification Interface Endpoint Configuration

```bash
configure > context context_name > event-notif-endpoint endpoint_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ntfyintf-endpoint)#
```

**Syntax**

```
peer select-algorithm {primary-secondary | round-robin}
```

<table>
<thead>
<tr>
<th>primary-secondary</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sets the PCC-Event-Notification-Interface-Endpoint peer selection algorithm to select the configured remote peer servers in primary and secondary method during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance. This mode is applicable only when multiple peers are configured and primary and secondary peer is defined using <code>peer select-peer</code> command in this configuration mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>round-robin</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sets the PCC-Event-Notification-Interface-Endpoint peer selection algorithm to select the configured remote peer servers in round-robin method mode during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance. This mode is applicable only when multiple peers are configured in this configuration mode.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command apply the peer selection algorithm to select the configured remote Event Notification collection server during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

**Example**

Following command configures the peer selection algorithm to select the configured remote peer in `round-robin` method in PCC-Event-Notification-Interface-Endpoint instance.

```
peer select-algorithm round-robin
```

Following command configures the peer selection algorithm to select the configured primary and secondary remote peers in `primary-secondary` method in PCC-Event-Notification-Interface-Endpoint instance.

```
peer select-algorithm primary-secondary
```
peer select-peer

This command sets the configured remote Event Notification collection server as primary and secondary servers for event notification collection during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Event Notification Interface Endpoint Configuration
configure > context context_name > event-notif-endpoint endpoint_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ntfyintf-endpoint)#
```

**Syntax**

```
peer select-peer pri_peer_name secondary sec_peer_name
```

- **pri_peer_name**
  Sets the configured remote PCC-Event-Notification-Interface-Endpoint peer as primary peer for event notification collection during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance. `pri_peer_name` must be a pre-configured peer name configured with `peer name` command in this configuration mode.

- **secondary sec_peer_name**
  Sets the configured remote PCC-Event-Notification-Interface-Endpoint peer as secondary peer for event notification collection during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance. `sec_peer_name` must be a pre-configured peer name configured with `peer name` command in this configuration mode.

**Usage**

Use this command to set the configured remote Event Notification collection server as primary and secondary node for event notification collection during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance. This configuration is used when peer selection algorithm is set to `primary-secondary` using `peer select-algorithm` command in this configuration mode.

**Example**

Following command configures the specified peer `event1` as primary and `event2` as secondary node for event notification collection during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

```
peer select-peer event1 secondary event2
```
Chapter 238
PCC-Policy-Service Configuration Mode Commands

The PCC-Policy-Service Configuration mode provides a mechanism for the Intelligent Policy Control Function (IPCF) to manage the external interfaces required for policy authorization purpose between IPCF and PCEF Bearer Binding and Event Reporting Function (BBERF). The PCC-Policy-Service manages Gx/Gx based on the Diameter dictionary used.

**Important:** This configuration mode is supported from StarOS Release 12.1 onward.

**Mode**

Exec > Global Configuration > Context Configuration > PCC Policy Service Configuration

```
configure > context context_name > pcc-policy-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pccpolicy-service)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
associate pcc-service

This command associates a pre-configured PCC-Service with a PCC-Policy-Service for IPCF configuration.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Policy Service Configuration
configure > context context_name > pcc-policy-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pccpolicy-service)#

Syntax
associate pcc-service pcc_service_name

[no] associate pcc-service

no

Removes/disassociate the configured PCC-Service from this PCC-Policy-Service instance configured for IPCF configuration.

pcc_service_name

Specifies the name of a pre-configured PCC-Service configured in Context Configuration mode for IPCF configuration.
The pcc_service_name is name of a predefined PCC-Service instance and must be an alphanumerical string from 1 through 63 characters.

Usage
Use this command to associate a pre-configured PCC-Service instance for IPCF configuration.

Important: For more information on PCC-Service configuration, refer PCC-Service Configuration Mode Commands.

Example
Following command binds a PCC-Service named pcc_svc1 with in a PCC-Policy-Service.

associate pcc-service pcc_svc1

Following command removes an associated PCC-Service named pcc_svc1 from a PCC-Policy-Service.

no associate pcc-service pcc_svc1
diameter dictionary

This command assigns a Diameter dictionary for Gx/Gxa messaging with a PCC-Policy-Service for IPCF configuration.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Policy Service Configuration

`configure > context context_name > pcc-policy-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pccpolicy-service)#
```

**Syntax**

```
diameter dictionary {gxa-standard | r7-standard | standard}

default diameter dictionary
```

**default diameter dictionary**

```
default
Sets the Diameter Gx dictionary to default dictionary standard (3GPP Rel. 8 standard) for a PCC-Policy-Service instance configured for IPCF configuration.
```

```
gxa-standard
Default: Disabled
Sets the Diameter Gxa dictionary to be used by a PCC-Policy-Service instance configured for IPCF configuration over Gxa interface to 3GPP Rel. 8 standard.
```

```
r7-standard
Default: Disabled
Sets the Diameter Gx dictionary to be used by a PCC-Policy-Service instance configured for IPCF configuration over Gx interface to 3GPP Rel. 7 standard.
```

```
standard
Default: Enabled
Sets the Diameter Gx dictionary to be used by a PCC-Policy-Service instance configured for IPCF configuration over Gx interface to 3GPP Rel. 8 standard.
```

**Usage**

Use this command to configure the PCC-Policy-Service to determine which of the 3GPP dictionary to be used for Gx or Gxa interface messaging for policy and/or quota management.

**Example**

Following command sets the PCC-Policy-Service to use 3GPP Rel. 8 standard dictionary for Gx interface and policy management related messaging in a PCC-Policy-Service.
default diameter dictionary
diameter origin end-point

This command binds/associates a pre-configured Diameter host/realm (PCEF/BBERF) over Gx/Gxa interface with a PCC-Policy-Service to be used for subscriber service control and policy profile management.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Policy Service Configuration

configure > context context_name > pcc-policy-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pccpolicy-service)#

Syntax

diameter origin endpoint dia_endpoint_name

no diameter origin endpoint

no

Removes the associated Diameter Origin Endpoint configuration from PCC-Policy-Service instance configured for IPCF configuration.

any

Sets the PCC-Policy-Service instance to use any available PCEF/BBERF node for policy interfaces (Gx/Gx-like) support.

dia_endpoint_name

The dia_endpoint_name is a predefined Diameter origin endpoint node and must be an alphanumerical string from 1 through 63 characters.

Usage
Use this command to bind the PCEF/BBERF node over Gx/Gx-like interface by associating a pre-configured Diameter Origin Endpoint with a PCC-Policy-Service. The Diameter origin endpoint must be a pre-configured instance in the Context Configuration Mode. For more information on Diameter origin endpoint configuration, refer Diameter Endpoint Configuration Mode Commands chapter.

Example
Following command associates a pre-configured Diameter endpoint node configuration named pcef_1 with a PCC-Policy-Service for policy profile management.

diameter origin endpoint pcef_1
Following command removes the pre-associated Diameter endpoint node configuration named `pcef_1` with a PCC-Policy-Service.

```
no diameter origin endpoint
```
**ehrpd-access-bcm**

This command configures the PCC-Policy-Service to accept the applicable Bearer-Control-Mode for eHRPD access over Gxa interface on IPCF.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Policy Service Configuration

```
configure > context context_name > pcc-policy-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pccpolicy-service)#
```

**Syntax**

```
ehrpd-access-bcm {as-requested | ue-nw | ue-only}
```

```
default ehrpd-access-bcm
```

<table>
<thead>
<tr>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as-requested</td>
<td>Default: Enabled. Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from Application Server (AS) for eHRPD access over Gxa interface on IPCF node.</td>
</tr>
<tr>
<td>ue-nw</td>
<td>Default: Disabled. Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from UE and/or network element for eHRPD access over Gxa interface on IPCF node.</td>
</tr>
<tr>
<td>ue-only</td>
<td>Default: Disabled. Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from UE only for eHRPD access over Gxa interface on IPCF node.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to set the PCC-Policy-Service to accept the Bearer-Control-Mode request from AS or UE or Network for eHRPD access over Gxa interface on IPCF node.

**Example**

Following command sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from AS for eHRPD access over Gxa interface on IPCF node.
default ehrpd-access-bcm

Following command sets the PCC-Policy-Service to accept the Bearer-Control-Mode request only from UE for eHRPD access over Gxa interface on IPCF node.

ehrpd-access-bcm ue-only
end

Exits the current configuration mode and returns to the Exec mode.

Product

**Syntax**

exit

**Usage**

Use this command to return to the parent configuration mode.
gprs-access-bcm

This command configures the PCC-Policy-Service to accept the applicable Bearer-Control-Mode for GPRS access over Gx interface on IPCF.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Policy Service Configuration
configure > context context_name > pcc-policy-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pccpolicy-service)#

Syntax

gprs-access-bcm {as-requested | ue-nw | ue-only}

default gprs-access-bcm

default
Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from Application Server (AS) for GGSN access over Gx interface on IPCF node.

as-requested
Default: Enabled.
Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from Application Server (AS) for GGSN access over Gx interface on IPCF node.

ue-nw
Default: Disabled.
Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from UE and/or network element for GGSN access over Gx interface on IPCF node.

ue-only
Default: Disabled.
Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from UE only for GGSN access over Gx interface on IPCF node.

Usage
Use this command to set the PCC-Policy-Service to accept the Bearer-Control-Mode request from AS or UE or Network for GGSN access over Gx interface on IPCF node.

Example
Following command sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from AS for GGSN access over Gx interface on IPCF node.

    default gprs-access-bcm

Following command sets the PCC-Policy-Service to accept the Bearer-Control-Mode request only from UE for GGSN access over Gx interface on IPCF node.

    gprs-access-bcm ue-only
max policy-sessions

This command configure the maximum limit of the policy sessions allowed in a PCC-Policy-Service instance on IPCF.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Policy Service Configuration
configure > context context_name > pcc-policy-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pccpolicy-service)#

Syntax

max policy-sessions max_session

default max policy-sessions

default

Sets the maximum policy sessions allowed in PCC-Policy-Service instance to default value of 10000 sessions.

max_session

Default: 10000

Specifies the maximum number of policy sessions configured in PCC-Policy-Service to allow to be connected in PCC-Quota service instance.

max_session must be an integer between 0 and 4000000.

Usage

Use this command to set the maximum number of policy sessions allowed by a PCC-Policy-Service instance on IPCF.

Example

Following command sets the maximum number of policy sessions allowed in PCC-Policy-Service instance to 10000.

default max policy-sessions
**subscriber-binding-identifier**

This command specifies the subscriber binding identifier to be used by `bindmux` for binding different subscriber session to PCC-Policy-Service on IPCF node.

**Product**

IPCF

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PCC Policy Service Configuration

```
configure > context context_name > pcc-policy-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pccpolicy-service)#
```

**Syntax**

```
subscriber-binding-identifier {imsi | msisdn | nai | sip-uri}
```

```
default subscriber-binding-identifier
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Sets the subscriber binding identifier to default value; i.e. IMSI, to be used by <code>bindmux</code> for binding different subscriber session to PCC-Policy-Service on IPCF node.</td>
</tr>
<tr>
<td>imsi</td>
<td>Default: Enabled. Sets the subscriber binding identifier as IMSI to be used by <code>bindmux</code> for binding different subscriber session to PCC-Policy-Service on IPCF node.</td>
</tr>
<tr>
<td>msisdn</td>
<td>Default: Disabled. Sets the subscriber binding identifier as MSISDN to be used by <code>bindmux</code> for binding different subscriber session to PCC-Policy-Service on IPCF node.</td>
</tr>
<tr>
<td>nai</td>
<td>Default: Disabled. Sets the subscriber binding identifier as Network Access Identifier (NAI) to be used by <code>bindmux</code> for binding different subscriber session to PCC-Policy-Service on IPCF node.</td>
</tr>
<tr>
<td>sip-uri</td>
<td>Default: Disabled. Sets the subscriber binding identifier as SIP URI (Uniform Resource Identifier) to be used by <code>bindmux</code> for binding different subscriber session to PCC-Policy-Service on IPCF node.</td>
</tr>
</tbody>
</table>
Usage
Use this command to configure the bindmux in PCC-Policy-Service instance on IPCF node to use specific subscriber identifier for binding different subscriber session to IP-CAN session.

Example
The following command sets the PCC-Policy-Service to use IMSI as subscriber binding identifier for IP-CAN session on an IPCF node.

```
default subscriber-binding-identifier
```
subscription-id-absence-action

This command configures the PCC-Policy-Service instance to handle the Initial Credit Control Request (CCR-I) messages during initial authentication over Gx interface when CCR-I message received by IPCF node is without a valid Subscription-Id AVP (IMSI, NAI, E164 etc.).

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Policy Service Configuration

configure > context context_name > pcc-policy-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pccpolicy-service)#

Syntax

{default} subscription-id-absence-action initial-auth {continue | reject}

---

default

Sets the PCC-Policy-Service instance to reject the CCR-I message during initial authentication over Gx interface if received without a valid Subscription-Id AVP (IMSI, NAI, E164 etc.) on IPCF node.

---

continue

Default: Disabled.
Sets the PCC-Policy-Service instance to accept the CCR-I message and continue with the session if CCR-I is received without a valid Subscription-Id AVP (IMSI, NAI, E164 etc.) on IPCF node.
In this case, IPCF will receive the CCR-I message and will do the PCC provisioning as per the operator configuration in associated PCC-Service.

---

reject

Default: Enabled.
Sets the PCC-Policy-Service instance to reject the CCR-I message and continue with the session if CCR-I is received without a valid Subscription-Id AVP (IMSI, NAI, E164 etc.) on IPCF node.
In this case, IPCF will send CCA-I message with Result-code as Permanent Error and rejects the session establishment with PCEF.

Usage
Use this command to configure the PCC-Policy-Service instance to handle the Initial Credit Control Request (CCR-I) message processing during the initial authentication over Gx interface if CCR-I message received by IPCF node has no valid Subscription-Id AVP.

Example
The following command sets the PCC-Policy-Service to reject the CCR-I request and terminations the session establishment with PCEF.
default subscription-id-absence-action initial-auth
unsolicited-provisioning

This command is used to enable/disable the support for unsolicited time-of-day-based procedures to PCC-Policy-Service on IPCF node.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Policy Service Configuration
configure > context context_name > pcc-policy-service service_name

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-pccpolicy-service)#`

**Syntax**

```
[no | default] unsolicited-provisioning time-of-day
```

- **default**
  Sets the support for unsolicited time-of-day-based procedures to default mode; i.e. disabled, in PCC-Policy-Service instance on IPCF node.

- **no**
  Removes the configured support for unsolicited time-of-day-based procedures in PCC-Policy-Service instance on IPCF node.

**Usage**

Use this command to enable/disable the support for unsolicited time-of-day-based procedures to PCC-Policy-Service on IPCF node.
By default this command is disabled.

**Example**

The following command enables the unsolicited time-of-day-based procedures to PCC-Policy-Service on an IPCF node.

```
unsolicited-provisioning time-of-day
```
Chapter 239
PCC-QoS-Profile Configuration Mode Commands

The PCC-QoS-Profile Configuration Mode is used to define the QoS logic used by the operator for managing the QoS policy requirements and objectives for the network specific to a group of subscribers in the network. A QoS Profile represents a resource requirement identified by means of the corresponding QoS attributes like QCI, MBR, GBR, ARP etc.

**Important:** This configuration mode is supported from StarOS Release 12.1 onward.

Mode

Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC QoS Profile Configuration

configure > context context_name > pcc-service service_name > qos-profile profile_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-qos-profile)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
arp-priority

This command is used to define the Allocation and Retention Priority (ARP) values of the QoS profile in PCC-QoS-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC QoS Profile Configuration

```
configure > context context_name > pcc-service service_name > qos-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-qos-profile)#
```

**Syntax**

```
[no] arp-priority arp_priority pre-emption {capable | not-capable} {not-vulnerable | vulnerable}
```

- **no**
  Removes the configured ARP priority set for PCC-QoS-Profile for PCC-Service instance on IPCF node.

- **arp-priority**
  Specifies the priority value for ARP in a PCC-QoS-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.
  *arp_priority* must be an integer from 1 through 15.

- **pre-emption {capable | not-capable}**
  Sets the Pre-emption capability related parameters with ARP priority in PCC-QoS-Profile name which is to use in Subscriber profile in PCC-Service instance on IPCF node.
  Pre-emption capability determines whether a bearer with a lower ARP priority level should be dropped to free up the required resources.
  - **capable**: This keyword indicates that the service data flow is allowed to get resources that were already assigned to another service data flow with a lower priority level.
  - **non-capable**: This keyword indicates that the service data flow is not allowed to get resources that were already assigned to another service data flow with a lower priority level.

- **{not-vulnerable | vulnerable}**
  Sets the Pre-emption vulnerability related parameters with ARP priority in PCC-QoS-Profile name which is to use in Subscriber profile in PCC-Service instance on IPCF node.
  Pre-emption vulnerability determines whether a bearer is applicable for dropping by a pre-emption capable bearer with a higher ARP priority value.
  - **not-vulnerable**: This keyword indicates that the resources assigned to the service data flow shall not be pre-empted and allocated to a service data flow with a higher priority level.
  - **vulnerable**: This keyword indicates that the resources assigned to the service data flow can be pre-empted and allocated to a service data flow with a higher priority level.
Usage
Use this command to define the ARP priority and pre-empt parameters in PCC-QoS-Profile which is to be used in Subscriber profile in PCC-Service instance on IPCF node. ARP controls how the IPCF reacts when there are insufficient resources to establish the new RAB. Typically it manages it by; 1) Deny the RAB request and 2) Preempt an existing RAB and accept the new RAB request.

Example
Following command sets the ARP Priority 2 with preemption capability and vulnerability in PCC-QoS-Profile instance on IPCF node.

```
arp-priority 2 pre-emption capable vulnerable
```
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
guaranteed-bitrate

This command defines the Guaranteed Bit Rate (GBR) value in bits per second for downlink and uplink traffic in PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

**Product**

IPCF

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC QoS Profile Configuration

```
configure > context context_name > pcc-service service_name > qos-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-qos-profile)#
```

**Syntax**

```
[no] guaranteed-bitrate downlink downlink_gbr uplink uplink_gbr
```

- **no**
  
  Removes the configured GBR value set for PCC-QoS-Profile for PCC-Service instance on IPCF node.

- **downlink**
  
  `downlink_gbr`
  
  Sets the Guaranteed Bit Rate allowed in downlink direction (from PCEF to UE) in bits per second for a PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node. `downlink_gbr` must be an integer from 0 through 104857600. A ‘zero’ value disables the downlink in specified PCC-QoS-Profile.

- **uplink**
  
  `uplink_gbr`
  
  Sets the Guaranteed Bit Rate allowed in uplink direction (from PCEF to PDN) in bits per second for a PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node. `uplink_gbr` must be an integer from 0 through 104857600. A ‘zero’ value disables the uplink in specified PCC-QoS-Profile.

**Usage**

Use this command to define the Guaranteed Bit Rate value in bits per second for downlink and uplink traffic in PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

**Example**

Following command sets the 1024 bits per seconds as uplink GBR and 2048 bits per second as downlink GBR in PCC-QoS-Profile instance on IPCF node.

```
guaranteed-bitrate downlink 2048 uplink 1024
```
max-bitrate

This command defines the Maximum Bit Rate (MBR) value in bits per second for downlink and uplink traffic in PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC QoS Profile Configuration

configure > context context_name > pcc-service service_name > qos-profile profile_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-qos-profile)#

Syntax

[no] max-bitrate downlink downlink_mbr uplink uplink_mbr

[no]

Removes the configured Maximum Bit Rate value set for PCC-QoS-Profile for PCC-Service instance on IPCF node.

downlink downlink_mbr

Sets the Maximum Bit Rate allowed in downlink direction (from PCEF to UE) in bits per second for a PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

downlink_mbr must be an integer from 0 through 104857600. A ‘zero’ value disables the downlink in specified PCC-QoS-Profile.

uplink uplink_mbr

Sets the Maximum Bit Rate allowed in uplink direction (from PCEF to PDN) in bits per second for a PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

uplink_mbr must be an integer from 0 through 104857600. A ‘zero’ value disables the uplink in specified PCC-QoS-Profile.

Usage

Use this command to define the Maximum Bit Rate value in bits per second for downlink and uplink traffic in PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

Example

Following command sets the 1024 bits per seconds as uplink MBR and 2048 bits per second as downlink MBR in PCC-QoS-Profile instance on IPCF node.

max-bitrate downlink 2048 uplink 1024
qci

This command sets the QoS Class Identifier (QCI) for PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC QoS Profile Configuration

```
configure > context context_name > pcc-service service_name > qos-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-qos-profile)#
```

**Syntax**

```
[no] qci qci_id
```

- **no**
  Removes the configured QCI value set for PCC-QoS-Profile for PCC-Service instance on IPCF node.

- **qci qci_id**
  Sets the QoS Class Identifier for a PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.
  
  qci_id must be an integer from 1 through 255.

**Usage**

Use this command to set the QoS Class Identifier for PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

**Example**

Following command sets the QCI 101 for PCC-QoS-Profile instance on IPCF node.

```
qci 101
```
Chapter 240
PCC-Service-Profile Configuration Mode Commands

The PCC-Service-Profile Configuration Mode is used to define the business logic used by the operator for managing the policy requirements and objectives for the network specific to a group of subscribers in the network. A PCC-Service-Profile manages multiple PCC-Conditions-Groups and associated PCC-Action-Sets pairs in an ordered manner. A maximum of 32 PCC-Service-Profile can be configured in a PCC-Service instance.

**Important:** This configuration mode is supported from StarOS Release 12.1 onward.

**Mode**

Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Service Profile Configuration

```
configure > context context_name > pcc-service service_name > profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-profile)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
default-rulebase-name

This command is used to associate the default PCC-Rulebase with a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Service Profile Configuration

configure > context context_name > pcc-service service_name > profile profile_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-profile)#

Syntax

[no] default-rulebase-name rulebase_name

---

no

Removes the configured default PCC-Rulebase from PCC-Service-Profile instance on IPCF node.

---

rulebase_name

This keyword specifies the default PCC-Rulebase name to be associated with PCC-Service-Profile instance. rulebase_name is the Rulebase name configured at PCEF and must be an alphanumeric string of 1 through 63 characters.

---

Usage

Use this command to associate the default PCC-Rulebase configured on PCEF with a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.

Example

Following command associates the PCC-Rulebase named pcc_rulebase1 for PCC-Profile instance on IPCF node.

    default-rulebase-name pcc_rulebase1
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
eval-priority

This command sets the priority for evaluation of PCC-Condition-Group with corresponding PCC-Action-Set in a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.

Product  
IPCF

Privilege  
Security Administrator, Administrator

Mode  
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Service Profile Configuration

```bash
configure > context context_name > pcc-service service_name > profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-profile)#
```

Syntax

```
[no] eval-priority last action-set actionset_name
[no] eval-priority priority_value timedef timedef_name [condition-group cond.grp_name] action-set actionset_name
[no] eval-priority priority_value condition-group cond_grp_name action-set actionset_name
```

no

Removes the configured evaluation priority for PCC-Condition-Group with corresponding PCC-Action-Set from PCC-Service-Profile instance on IPCF node.

last

Sets last evaluation priority action-set configured for the PCC-Service-Profile instance. no removes the last evaluation priority action-set.

priority_value

Specifies the priority to be set for PCC-Condition-Group with corresponding PCC-Action-Set in a PCC-Service-Profile instance. priority_value must be an integer from 1 through 1023.

timedef timedef_name

Specifies a pre-configured time definition in PCC-Timedef Configuration mode and to be set for evaluation priority in a PCC-Service-Profile instance. timedef_name is a pre-configured PCC-Timedef and must be an alphanumerical string of 1 through 63 characters.
condition-group  cond_grp_name
Specifies a pre-configured PCC-Condition-Group to be set for evaluation priority in a PCC-Service-Profile instance.
cond_grp_name is a pre-configured PCC-Condition-Group and must be an alphanumerical string of 1 through 63 characters.

Important: An special PCC-Condition-Group “none” can be used to set the default PCC-Condition-Group for any-match typically used for a default condition for a session which does not match any of the conditions specified with higher evaluation priority.

action-set  actionset_name
Specifies a pre-configured PCC-Action-Set for PCC-Condition-Group to be set for evaluation priority in a PCC-Service-Profile instance.
actionset_name is a pre-configured PCC-Action-Set and must be an alphanumerical string of 1 through 63 characters.

Usage
Use this command to set the priority for evaluation of PCC-Condition-Group with corresponding PCC-Action-Set in a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.
Additionally timedef is used to accept the Timedefs to support the time-of-day-based procedures to trigger an evaluation priority. The action is triggered only when the time of session lies in the time span defined in specific PCC-Timedef timedef_name.
Default eval-priority has the lowest priority in the PCC-Service-Profile and as default eval-priority does not have any PCC-Condition-Group associated with it, all the actions in the action-set always be applied.
A maximum of 64 PCC-Evaluation-Priorities can be configured in a PCC-Service-Profile.

Example
Following command sets the evaluation priority value as 1 for PCC-Condition-Group cond_1 along with PCC-Action-Set act_cond1 for PCC-Service-Profile instance on IPCF node:

    eval-priority 1 condition-group cond_1 action-set act_cond1

Following command sets the evaluation priority value as 2 for PCC-Condition-Group none for any-match typically used for a default condition for a session which does not match any of the conditions specified with higher evaluation priority along with PCC-Action-Set act_cond1 for PCC-Service-Profile instance on IPCF node:

    eval-priority 1 condition-group none action-set act_cond1
**exit**

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
service-tag

This command configures the PCC-Service Tags to be used for PCC-Rulename or PCC-Rule-base in a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Service Profile Configuration

```
configure > context context_name > pcc-service service_name > profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-profile)#
```

**Syntax**

```
[no] service-tag svc_tag [rule-name rule_name | rulebase-name rulebase_name]
```

---

**no**

Removes the configured PCC-Service Tags for PCC-Rulename and PCC-Rulebase from PCC-Service-Profile instance on IPCF node.

---

**svc_tag**

Specifies the name of the PCC-Service Tag to be used for PCC-Rulename and PCC-Rulebase in a PCC-Service-Profile instance.

- **svc_tag** must be an alphanumerical string of 1 through 63 characters.

---

**rule-name rule_name**

Specifies a pre-defined PCC-Rulename on PCEF to be used with PCC-Service Tag svc_tag in a PCC-Service-Profile instance.

- **rule_name** is a pre-defined PCC-Rulename on PCEF and must be an alphanumerical string of 1 through 63 characters.

---

**rulebase-name rulebase_name**

Specifies a pre-defined PCC-Rulebase name pre-defined on PCEF to be used with PCC-Service Tag svc_tag in a PCC-Service-Profile instance.

- **rulebase_name** is a pre-defined PCC-Rulebase name on PCEF and must be an alphanumerical string of 1 through 63 characters.

**Usage**

Use this command to set the PCC-Service Tag for PCC-Rulename and PCC-Rulebase which are defined on PCEF with a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance.

**Example**
Following command sets the PCC-Service Tag named *Rule1* for PCC-Rulebase named *pcc_rulebase1* for PCC-Service-Profile instance on IPCF node:

```
service-tag Rule1 rulebase-name pcc_rulebase1
```

Following command sets the PCC-Service Tag named *Rule11* for PCC-Rulename *pcc_rule1* for PCC-Service-Profile instance on IPCF node:

```
service-tag Rule11 rule-name pcc_rule1
```
timeout long-duration

Configures the long duration timeout and inactivity duration for subscriber session before system notifies or terminates session in PCC Profile instance.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Service Profile Configuration

```
configure > context context_name > pcc-service service_name > profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-profile)#
```

**Syntax**

```
timeout long-duration ldt_timeout [action {detection | disconnect}]
no timeout long-duration
default timeout long-duration
```

**no**
Removes the configured long duration timeout value and action in PCC Profile instance.

**default**
Sets the the long duration timeout value to the default value of ‘0’ which disables the long duration timeout configuration in PCC Profile instance.

**long-duration ldt_timeout**
Default: 0
Designates the maximum duration of the session, in seconds, before the system automatically reports/terminates the session.
Specifies the maximum amount of time, in seconds, before the specified timeout action is activated.
`ldt_timeout` must be a value in the range from 0 through 4294967295.
The special value 0 disables the timeout specified.

**action {detection | disconnect}**
Default: Detection
Specifies the action to be taken on expiry of long duration timeout duration `ldt_timeout` set with `timeout long-duration` command.

*`detection`: sets the system to detect the sessions for which long duration timeout timer is exceeded and sends the SNMP TRAP and CORBA notification. This is the default behavior.*
**Timeout long-duration**

- **disconnect**: sets the system to send SNMP TRAP and CORBA notification and disconnect the subscriber session once the long duration timeout timer is expired.

**Usage**

Use this command to set the long duration timeout period and actions to be taken on expiry of duration of timer for subscriber session.

**Important**: Reduce the timeout duration to free session resources faster for use by new requests.

**Important**: In case of long-duration timeout configured at PCC Service Configuration mode as well as at the PCC-Profile Configuration mode level, the long-duration timeout and action set in PCC-Profile Configuration mode will prevail. This enables defining session behavior as per profile provisioning.

**Example**

Following command sets the system to detect the subscriber sessions that exceeds the long duration timer of 6000 seconds and sends SNMP TRAP and CORBA notification:

```
timeout long-duration 6000 action detection
```

Following command sets the system to detect and disconnect the subscriber sessions that exceeds the long duration timer of 6000 seconds and disconnect the session after sending SNMP TRAP and CORBA notification:

```
timeout long-duration 6000 action disconnect
```
usage-monitor

This command creates/modifies/deletes the PCC-Usage-Monitor Configuration instance to track the usage volume across the PCC-services based on the usage monitor settings in a PCC-service instance for IPCF configuration.

**Product**

IPCF

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Service Profile Configuration

```plaintext
configure > context context_name > pcc-service service_name > profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-profile)#
```

**Syntax**

```plaintext
[no] usage-monitor usage_mon_name [-noconfirm]
```

- **no**
  
  Removes the configured PCC-Usage-Monitor from PCC-Service-Profile instance for IPCF configuration.

- **usage_mon_name**
  
  Identifies the name of the PCC-Usage-Monitor instance which is to be created or modified through this command. 
  The `usage_mon_name` must be an alphanumerical string from 1 through 63 characters.

- **-noconfirm**
  
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

⚠️ **Caution:** If this keyword option is used with `no usage-monitor usage_mon_name` command, the PCC-Usage-Monitor instance named `usage_mon_name` is deleted with all configured parameters without prompting any warning or confirmation.

**Usage**

Use this command to create and configure a PCC-Usage-Monitor for PCC-Service-Profile in a PCC-service instance of IPCF configuration. 
A maximum number of 8 PCC-Usage-Monitors can be configured per PCC-Service-Profile. 
Entering this command results in the following prompt:

```
[context_name]host_name(config-pcc-profile-usage-mon)#
```

The commands configured in this mode are defined in the PCC-Usage-Monitor Configuration Mode Commands chapter of Command Line Interface Reference.
Caution: This is a critical configuration. The PCC-Usage-Monitor for volume usage cannot be configured without this configuration. Any change to this configuration would lead to removing or disabling configuration parameters defined here.

Example

Following command configures the PCC-Usage-Monitor named `pcc_usage1` to track the usage of service with in a PCC-Service-Profile instance.

```
usage-monitor pcc_usage1
```
unknown-services-treatment

This command configures the PCC-Service for handling of unknown services at IPCF which is to be used in Subscriber profile in PCC-Service instance on IPCF node.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Service Profile Configuration
configure > context context_name > pcc-service service_name > profile profile_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-profile)#

Syntax

[default] unknown-services-treatment |not-allowed | qos-profile qos_prof_name precedence from start_preced to end_preced order {ascending | descending}]

default
Sets the configured PCC-Service for handling of unknown services at IPCF to default value of “Not allowed” which is to be used in Subscriber profile in PCC-Service instance on IPCF node.

not-allowed
Sets the PCC-Service-Profile instance to reject the packet filters and does not installs any dynamic rule when IPCF receives any request to authorize Packet Filters from PCEF and no matching service flow is found in data service list.

qos-profile qos_prof_name
Specifies a pre-defined PCC-QoS profile name to be used to create dynamic rule when IPCF receives any request to authorize Packet Filters from PCEF and no matching service flow is found in data service list. qos_prof_name is a pre-defined PCC-QoS Profile and must be an alphanumerical string of 1 through 63 characters.

precedence from start_preced to end_preced
Specifies the precedence parameters to install dynamic rules for selection of QoS profile when QoS profile is configured to create dynamic rule when IPCF receives any request to authorize Packet Filters from PCEF and no matching service flow is found in data service list. start_preced is an integer between 1 through 65535 and must be less than end_preced value where end_preced is an integer between 1 through 65535 and must be more than start_preced value.

order {ascending | descending}
Specifies the order of precedence for QoS profile to be used to install dynamic rule when IPCF receives any request to authorize Packet Filters from PCEF and no matching service flow is found in data service list.
• **ascending** sets the precedence setting in ascending order.
• **descending** sets the precedence setting in descending order.

---

## Usage

Use this command to set the PCC-Service Tag for PCC-Rulename and PCC-Rulebase which are defined on PCEF with a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance. Whenever IPCF receives any request to authorize Packet Filters from PCEF, it does a lookup in data service list to find a match. If No service flow is found matching then the requested filters are treated as **unknown service request** and handled as per the mentioned configuration.

When unknown-service-treatment is set to **not-allowed**, then Packet Filters are rejected and no dynamic rule is installed. Otherwise, dynamic rule is created using the requested packet filters, data rates mentioned in the QoS profile name `qos_prof_name` and precedence value derived from the configured values.

The precedence configuration works in following manner:

- If precedence limits are configured as 1000 to 2000 with order **ascending** then precedence of subsequent dynamic rules will go from 1000 to 2000.
- If precedence limits are configured as 1000 to 2000 with order **descending** then precedence of subsequent dynamic rules will go from 2000 to 1000.

---

## Example

Following command sets the PCC-Service for handling of unknown services for PCC-Service-Profile instance on IPCF node to default action of **not allowed**:

```
default unknown-services-treatment
```
Chapter 241
PCC-Service Configuration Mode Commands

The PCC-Service Configuration Mode is used to link, consolidate and manage the policy logic for the network. It defines the authorization of resources for a subscriber’s data usage under various conditions and policies in the PCC-service.

Important: This configuration mode is supported from StarOS Release 12.1 onward

Mode

Exec > Global Configuration > Context Configuration > PCC Service Configuration

configure > context context_name > pcc-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-service)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
action-set

This command is used to create a new set of action, action-set, or modify a previously configured action set and enters the PCC-Action-Set Configuration Mode. This command can also be used to delete an existing PCC-Action-Set.

Product
- IPCF

Privilege
- Security Administrator, Administrator

Mode
- Exec > Global Configuration > Context Configuration > PCC Service Configuration
  
  configure > context context_name > pcc-service service_name

  Entering the above command sequence results in the following prompt:
  
  [context_name] host_name(config-pcc-service)#

Syntax

- action-set act_set_name [-noconfirm]

  no action-set act_set_name

  no
  
  Removes the configured PCC-Action-Set from this PCC-service instance for IPCF configuration.

  act_set_name
  
  Identifies the name of the PCC-Action-Set which is to be created or modified through this command. The act_set_name must be an alphanumerical string from 1 through 63 characters.

  -noconfirm
  
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/remove/configure an action-set in a PCC-service instance for IPCF Configuration.

An Action-set indicates the policy and charging as well as event generation related decisions that will get activated when the corresponding Condition-Group is evaluated to TRUE within a subscriber policy/profile. A maximum of 512 PCC-Action-Sets can be configured in 1 instance of PCC-Service.

Entering this command results in the following prompt:

  [context_name] host_name(config-pcc-action-set)

Important: For more information on PCC-Action-Set configuration, refer PCC-Action-Set Configuration Mode Commands.

Example

Cisco ASR 5x00 Command Line Interface Reference

7380
Following command creates a PCC-action-set named `pcc_act1` with in a PCC-service.

```
action-set pcc_act1
```

Following command removes a pre-configured PCC-action-set named `pcc_act1` from a PCC-service.

```
no action-set pcc_act1
```
charging method

This command defines the charging method selection parameters in a PCC-service instance for IPCF.

**Product**

IPCF

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PCC Service Configuration

`configure > context context_name > pcc-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-service)#
```

**Syntax**

```
charging method {both-offline-and-online | offline | online} 
[default | no] charging method
```

<table>
<thead>
<tr>
<th>Charging Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>default</strong></td>
<td>Sets the charging method to “no” in a PCC-service instance on IPCF node.</td>
</tr>
<tr>
<td><strong>no</strong></td>
<td>Removes the configured charging method from a PCC-service instance on IPCF node.</td>
</tr>
<tr>
<td><strong>both-offline-and-online</strong></td>
<td>Default: Disabled. Defines that this PCC-service instance is configured for both, online and offline, charging method for IPCF configuration.</td>
</tr>
<tr>
<td><strong>offline</strong></td>
<td>Default: Disabled. Defines that this PCC-service instance is configured only for offline charging method for IPCF configuration.</td>
</tr>
<tr>
<td><strong>online</strong></td>
<td>Default: Disabled. Defines that this PCC-service instance is configured only for online charging method for IPCF configuration.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to define the charging method selection parameters in a PCC-service instance for IPCF. Charging method used can be online, offline or both.

**Example**

Following command defines the charging method for a PCC-service instance as both, online and offline:
default charging method
charging server

This command defines the charging server parameters in a PCC-service instance for IPCF.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration

```
configure > context context_name > pcc-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-service)#
```

**Syntax**

```
charging server server_name function {offline | online} {primary | secondary}
no charging server {all | function {offline | online} {primary | secondary}

no
Removes/disables the charging server parameters in a PCC-service instance for IPCF configuration.

server_name
Identifies the name of the charging server which is to be configured with these parameters in a PCC-service instance for IPCF configuration. The server_name must be an alphanumerical string from 1 through 63 characters.

offline
Sets the specific charging server to be used as offline server in a PCC-service instance for IPCF configuration.

online
Sets the specific charging server to be used as online server in a PCC-service instance for IPCF configuration.

primary
Sets the specific charging server to be used as primary charging server for offline or online charging method in a PCC-service instance for IPCF configuration.

secondary
Sets the specific charging server to be used as secondary charging server for offline or online charging method in a PCC-service instance for IPCF configuration.
**Usage**

Use this command to configure the online or offline charging servers to be used as primary or secondary in a PCC-service instance for IPCF configuration.

**Example**

Following command configures the online charging server named Gx1 as primary for online charging method for a PCC-service instance:

```
charging server Gx1 function online primary
```

Following command removes the all, online/offline/primary/secondary, type of charging servers from a PCC-service instance:

```
no charging server function all
```
**condition-group**

This command creates a new group of conditions, condition-group, or modify a previously configured condition-group and enters the PCC-Condition-Group Configuration Mode. This command can also be used to delete an existing PCC-Condition-Group.

**Product**

IPCF

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PCC Service Configuration

`configure > context context_name > pcc-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-service)#
```

**Syntax**

```condition-group cond_grp_name [-noconfirm]
```

```no condition-group cond_grp_name
```

**no**

Removes the configured PCC-condition-group from a PCC-service instance for IPCF configuration.

```cond_grp_name```

Identifies the name of the PCC-condition-group which is to be created or modified through this command. The `cond_grp_name` must be an alphanumerical string from 1 through 63 characters.

```-noconfirm```

Indicates that the command is to execute without any additional prompt and confirmation from the user.

**Usage**

Use this command to create/remove/configure a group of condition, condition-group, in a PCC-service instance for IPCF configuration.

A Condition-group is a collection of conditions that identify a network or state constraint represented as an logical expression. A condition-group may use another `condition-group` within with the nesting level limited to 3.

Within a condition-group the conditions and condition-groups can either be linked with an **AND** or an **OR** relation. A Condition is built using predefined keywords representing unique service conditions such as `user-location`, `app-service` etc.

A maximum of 1024 PCC-Condition-Groups can be configured in 1 instance of PCC-Service.

Entering this command results in the following prompt:

```
[context_name]host_name(config-pcc-condition-group)#
```
The commands configured in this mode are defined in the *PCC-Condition-Group Configuration Mode Commands* chapter of *Command Line Interface Reference*.

⚠️ **Caution:** This is a critical configuration. The PCC-Condition Group can not be configured without this configuration. Any change to this configuration would lead to removing or disabling configuration parameters defined here.

**Example**

Following command creates a PCC-condition-group named `cond_grpl` with in a PCC-service instance.

```plaintext
condition-group cond_grpl
```

Following command removes a pre-configured PCC-condition-group named `cond_grpl` from a PCC-service instance.

```plaintext
no condition-group cond_grpl
```
**data-service**

This command creates a new service for data, data-service, or modify a pre-configured data-service and enters the PCC-Data-Service Configuration Mode. This command can also be used to delete an existing PCC-Data-Service.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration

`configure > context context_name > pcc-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-service)##
```

**Syntax**

```
data-service data_svc_name [-noconfirm]

no data-service data_svc_name
```

- **no**
  Removes the configured PCC-Data-Service from a PCC-service instance for IPCF configuration.

- **data_svc_name**
  Identifies the name of the PCC-Data-Service which is to be created or modified through this command. The `data_svc_name` must be an alphanumerical string from 1 through 63 characters.

- **-noconfirm**
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

**Usage**

Use this command to create and configure a PCC-data-service in a PCC-service instance for IPCF configuration.

A PCC-Data-Service defines the flows for the media data as well as corresponding attributes that are necessary for the charging as well as policy enforcement decisions for the kind of media represented by its Service-Flows.

A maximum of 256 PCC-Data-Services can be configured in 1 instance of PCC-Service.

Entering this command results in the following prompt:

```
[context_name]host_name(config-pcc-data-service)##
```

The commands configured in this mode are defined in the *PCC-Data Service Configuration Mode Commands* chapter of *Command Line Interface Reference*. 
Caution: This is a critical configuration. The PCC-Data-service can not be configured without this configuration. Any change to this configuration would lead to removing or disabling configuration parameters defined here.

Example

Following command defines a PCC-data-service named `pcc_data_svc1` in a PCC-service instance without any confirmation prompt.

```
data-service pcc_data_svc1 -noconfirm
```

Following command removes a pre-configured PCC-data-service named `pcc_data_svc1` from a PCC-service instance without any confirmation prompt.

```
no data-service pcc_data_svc1 -noconfirm
```
emergency-apn-map-profile

This command creates an emergency APN profile with a given condition group name. The condition group will define a group of APNs which correspond to the Operator's chosen emergency-APN, and a corresponding policy profile, which defines operator's QoS configuration for the emergency APN. This command can also be used to delete an existing emergency APN profile.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration

configure > context context_name > pcc-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-service)#

Syntax

[ no ] emergency-apn-map-profile condition-group cond_grp_name profile-policy name pcc_prof_name

no
Removes/disables the set emergency APN profile from this configuration mode.

condition-group cond_grp_name
This keyword associates a pre-configured/defined PCC-Condition-Group configured in PCC-Service Configuration mode to map with specific emergency APN profile. The cond_grp_name is pre-configured PCC-Condition-Group and must be an alphanumerical string from 1 through 63 characters.

Important: For more information on PCC-Condition-Group configuration, refer condition-group command in this chapter.

profile-policy pcc_prof_name
This keyword associates a pre-configured/defined PCC-Service-Profile configured in PCC-Service Configuration mode to map with specific emergency APN profile mapping configuration. The pcc_prof_name is pre-configured PCC-Service-Profile and must be an alphanumerical string from 1 through 63 characters.

Important: For more information on PCC-Service-Profile configuration, refer profile-policy command in this chapter.
Usage

Use this command to create an emergency APN profile with a given condition group name. The condition group defines a bunch of APNs for emergency services as created by the operator. A corresponding policy profile, which defines the operator's QoS configuration for the emergency APN, is also mapped with these APNs. Emergency services, e.g., 911 in the US, are those services that can be provided via an emergency APN and may or may not require subscription. Since subscription to such services is optional, the fetching of subscriber profile information is also not mandatory.

Example

Following command sets an emergency APN profile named sos_prof1 with condition group sos_cond1 in this PCC-service instance to support emergency services for a subscriber.

```
emergency-apn-map-profile condition-group sos_cond1 profile-policy name sos_prof1
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
map-profile priority

This command defines the parameter and key priorities to match the profile condition for a subscriber in a PCC-service instance for IPCF configuration.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration
configure > context context_name > pcc-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-service)#

Syntax

[no] map-profile priority map_prio_value apn [apn_name profile-policy name pcc_prof_name]

[ no ] map-profile priority map_prio_value profile-policy name pcc_prof_name]

[ no ] map-profile priority map_prio_value subscription-attribute name subs_attrib_name [value subs_attrib_value ] profile-policy name pcc_prof_name]

no

Removes/disables the set priority value of specific profile mapping parameters.

map_prio_value

Identifies the priority value of specific profile mapping parameters.
The map_prio_value must be an integer value from 1 through 1024.

apn  apn_name

This keywords associates a pre-configured/defined APN name to map with specific profile mapping priority. The apn_name specifies the name of the APN configured for subscriber session to which a priority value is set for profile mapping and must be an alphanumerical string from 1 through 63 characters.

condition-group  cond_grp_name

This keywords associates a pre-configured/defined PCC-Condition-Group configured in PCC-Service Configuration mode to map with specific profile making priority. The cond_grp_name is pre-configured PCC-Condition-Group and must be an alphanumerical string from 1 through 63 characters.

Important: For more information on PCC-Condition-Group configuration, refer condition-group command in this chapter.
**map-profile priority**

This command identifies the keys used to match the profile for a subscriber in a PCC-service instance for IPCF configuration. The profile map is used when the subscriber session established. It is based on the priority of map and condition matches the corresponding named profile is used for the subscriber session.

**Important:** For a subscriber session, only a single profile will match.

**Example**

Following command configures the profile mapping priority to 2 for an APN named **apn_ipcf1** with PCC-Service-Profile named **pcc_prof1** with in a PCC-service instance.

```
map-profile priority 2 apn apn_ipcf1 profile-policy name pcc_prof1
```

Following command configures the profile mapping priority to 0 for all sessions with PCC-Service-Profile named **pcc_prof2** with in a PCC-service instance.

```
map-profile priority 2 profile-policy name pcc_profile2
```
monitoring-key

This command creates a monitoring key and sets the threshold to provide the facility for tracking and dynamic Policy control based on subscriber usage in a PCC-service instance for IPCF configuration.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration

configure > context context_name > pcc-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-service)#

Syntax

monitoring-key { any | mon_key_value } grant-size { time dur_value | volume volume_value [ time dur_value] }

no monitoring-key mon_key_value

default monitoring-key any

no

Resets the grant size for specified Monitoring Key mon_key_value used in this PCC service instance to default threshold of 1024 KB for grant volume and 10 second for grant time.

default

Resets the grant size for any Monitoring Key used in this PCC service instance to default threshold of 1024 KB for grant volume and 10 second for grant time.

any

Default: Enabled
This keywords sets the threshold size for ANY monitoring key to configured grant volume or grant time duration. IPCF uses the configured grant size while installing a Monitoring Key in PCEF.

mon_key_value

This keywords configures the Monitoring Key with a configurable grant volume size. IPCF installs this Monitoring Key in PCEF for usage tracking.

mon_key_value must be an integer between 1 through 65535.

grant-size { time dur_value | volume volume_value [ time dur_value] }

Default: 1024 for volume and 10 second for time
This keywords associates a configurable grant size in seconds for time or in Kilo Bytes volume for specific usage Monitor Key on IPCF to install on PCEF.
**time** `dur_value` : This keyword sets the threshold time in seconds for usage monitoring key and `dur_value` be an integer between 1 through 4294967296.

**volume** `volume_value` : This keyword sets the threshold volume in Kilo Bytes for usage Monitoring Key and `volume_value` must be an integer between 1 through 4294967296.

**Usage**

Use this command to allow operator to configure the threshold size for a monitoring key in a PCC-service instance in IPCF considering grant volume size or grant time duration. IPCF uses the configured volume size or time duration in seconds while installing a Monitoring Key in PCEF. The configured threshold values are configurable to reduce the amount of usage for any of the usage conditions. PCEF when instructed by IPCF keeps track of usage per Monitoring Key and also reports the usage when either thresholds reached or requested by IPCF.

To allow operator to have dynamic Policy control, the IPCF uses objects called as Usage Monitor. Operator can “associate” different Monitoring Keys to these usage monitors. It can be a Many-To-Many relationship between Usage-Monitor and Monitoring-Key.

Operator has option to set usage conditions on Usage Monitors instead of Monitoring Keys directly.

**Example**

Following command configures the Monitoring Key 2 for a grant volume threshold size of 2048 Kilo Bytes with in a PCC-service instance.

```
monitoring-key 2 grant-size volume 2048
```
**multiple-pcef-per-subscriber**

This command enables the IPCF to support more than one Gx-session for single subscriber session coming from multiple PCEF in a PCC-service instance.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration

`configure > context context_name > pcc-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-service)#
```

**Syntax**

```
[no | default] multiple-pcef-per-subscriber
```

- **no**
  
  Default: Disabled
  
  Removes the multiple Gx session for a single subscriber from a PCC-service instance for IPCF configuration.

- **default**
  
  Sets the PCC-service instance to default setting to accept the multiple Gx session for a single subscriber for IPCF configuration.

**Usage**

Use this command to enable multiple Gx session and multiple PCEF support for a single subscriber in a PCC-service instance for IPCF configuration.

By default this feature is enabled.

**Example**

Following command sets the IPCF to accept multiple Gx sessions from multiple PCEFs for a single subscriber with in a PCC-service instance.

```
multiple-pcef-per-subscriber
```
profile

This command creates a new PCC-Service-Profile or modifies a previously configured policy profile and enters the PCC-Service-Profile Configuration Mode. This command can also be used to delete an existing PCC-Service-Profile.

**Product**

IPCF

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PCC Service Configuration

configure > context context_name > pcc-service service_name

Entering the above command sequence results in the following prompt:

[context_name]hostname(config-pcc-service)#

**Syntax**

profile pcc_prof_name [-noconfirm]

no profile pcc_prof_name

**no**

Removes the configured PCC-Service-Profile from a PCC-service instance for IPCF configuration.

**pcc_prof_name**

Identifies the name of the PCC-Service-Profile which is to be created or modified through this command. The pcc_prof_name must be an alphanumerical string from 1 through 63 characters. A maximum of 32 profiles can be configured in a PCC-service instance.

**-noconfirm**

Indicates that the command is to execute without any additional prompt and confirmation from the user.

**Usage**

Use this command to create/remove/configure a PCC-Service-Profile for managing the policy requirement and objectives for network specific to a group of subscribers in the network in a PCC-service instance for IPCF configuration.  
A profile manages multiple Condition-Groups and associated Action-Sets pairs in an ordered manner. On internal or external triggers that cause the profile evaluation, the PCC-rules-engine, evaluates the conditions within the Condition-Groups in the specified priority. Corresponding actions performed for Condition-Groups that evaluates to TRUE. Once a TRUE match found the evaluation of Condition-Groups does not continue further.  
A maximum of 32 PCC-Service-Profiles can be configured in 1 instance of PCC-Service.  
Entering this command results in the following prompt:

[context_name]hostname(config-pcc-profile)#
The commands configured in this mode are defined in the *PCC-Service-Profile Configuration Mode Commands* chapter of *Command Line Interface Reference*.

⚠️ **Caution:** This is a critical configuration. The PCC-Service-Profile can not be configured without this configuration. Any change to this configuration would lead to removing or disabling configuration parameters defined here.

**Example**

Following command creates a PCC-Service-Profile named `pcc_prof1` with in a PCC-service instance.

```
profile pcc_prof1
```

Following command removes a pre-configured PCC-Service-Profile named `pcc_prof1` from a PCC-service instance.

```
no profile pcc_prof1
```
qos-profile

This command creates a new PCC-QoS-Profile for QoS parameters or modify a pre-configured PCC-QoS-Profile and enters the PCC-QoS-Profile Configuration Mode. This command can also be used to delete an existing PCC-QoS-Profile.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration
configure > context context_name > pcc-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-service)#

Syntax

qos-profile qos_prof_name [-noconfirm]

no qos-profile qos_prof_name

- no
  Removes the configured PCC-QoS-Profile from a PCC-service instance for IPCF configuration.

  qos_prof_name
  Identifies the name of the PCC-QoS-Profile which is to be created or modified through this command. The qos_prof_name must be an alphanumerical string from 1 through 63 characters.

- noconfirm
  Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create and configure a PCC-QoS profile in a PCC-service instance for IPCF configuration.

A PCC-QoS-Profile represents a resource requirement identified by means of the corresponding QoS attributes such as:

- QoS class identifier
- Maximum Requested bandwidth for uplink (UL)
- Maximum Requested bandwidth downlink (DL)
- Guaranteed bandwidth for uplink (UL)
- Guaranteed bandwidth downlink (DL)
- Allocation and Retention Priority (ARP)
A maximum of 256 PCC-QoS-Profiles can be configured in 1 instance of PCC-Service. Entering this command results in the following prompt:

```
[context_name]hostname(config-pcc-qos-profile))#
```

The commands configured in this mode are defined in the PCC-QoS-Profile Configuration Mode Commands chapter of Command Line Interface Reference.

⚠️ **Caution:** This is a critical configuration. The PCC-QoS-Profiles can not be configured without this configuration. Any change to this configuration would lead to removing or disabling configuration parameters defined here.

**Example**

Following command creates a PCC-QoS-Profile named `qos_profile1` with in a PCC-service instance.

```
qos-profile qos_profile1
```

Following command removes a pre-configured PCC-QoS-Profile named `qos_profile1` from a PCC-service instance.

```
no qos-profile qos_profile1
```
spr-failure

This command defines SSC session failure handling policies in a PCC-service instance on an IPCF node.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration
configure > context context_name > pcc-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-service)#

Syntax

spr-failure after-auth {continue | terminate}
[default] spr-failure after-auth

default
Sets the configured SSC session failure handling parameters and actions to default action of continue with a PCC-service instance for IPCF configuration.

after-auth {continue | terminate}
This keyword is used to set the PCC-service to take decision on SSC communication failure after authorization of session.
Following actions are initiated on SSC session failure after authorization:

• continue: IPCF allows session to continue.
• terminate: IPCF terminates the session for subscriber.

Usage
Use this command to set the PCC-service to take decision on SSC communication failure after authorization of session.

Example
Following command sets the session failure handling policy with SSC to terminate the session on failure of communication with SSC after authorization in a PCC-service instance.

spr-failure after-auth terminate
ssc-usage-update-policy

This command provides the configuration to manage the SSC update frequency over Sp interface for usage reports received from PCEF over Gx interface in a PCC-service instance for IPCF configuration.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration
```
configure > context context_name > pcc-service service_name
```

Entering the above command sequence results in the following prompt:
```
[context_name]host_name(config-pcc-service)#
```

**Syntax**
```
[default] ssc-usage-update-policy [always | average-tps tps | on-terminate]
```

**default**
Sets the PCC-service to configure the SSC update frequency to **always** over Sp interface for usage reports received from PCEF over Gx interface in a PCC-service instance for IPCF configuration.

**always**
Default: Enabled
This keyword sets the PCC-service instance to generate SSC usage update every time PCC-service instance received Usage Report from PCEF over Gx interface for IPCF configuration.

**average-tps tps**
Default: Disabled
This keyword generates the SSC usage update towards the SSC over Sp interface for Usage Reports received by IPCF from PCEF over Gx interface only when average transaction-per-second exceeds the configured threshold tps. The tps specifies the average transactions-per-second on IPCF and must be an integer from 1 through 5000.

**on-terminate**
Default: Disabled
This keyword generates the SSC usage update towards the SSC over Sp interface for Usage Reports received by IPCF from PCEF over Gx interface only when IP-CAN session terminates.

**Usage**
Use this command to configure the PCC-service to manage the SSC update frequency over Sp interface for Usage Reports received from PCEF over Gx interface in a PCC-service instance for IPCF configuration.
Following command configures the SSC usage update over Sp interface every time when a usage report is received over Gx interface in a PCC-service instance.

```bash
default ssc-usage-update-policy
```
timedef

This command creates a new Time Definition (TimeDef), or modify a pre-configured Timedef and enters the PCC-TimeDef Configuration Mode. This command can also be used to delete an existing PCC-TimeDef.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration

configure > context context_name > pcc-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-service)#

Syntax

[no] timedef timedef_name [-noconfirm]

no
Removes the configured PCC-TimeDef from a PCC-service instance for IPCF configuration.

timedef_name
Identifies the name of the PCC-TimeDef which is to be created or modified through this command. The timedef_name must be an alphanumerical string from 1 through 127 characters.

-noconfirm
Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create and configure a PCC-Time Definition (TimeDef) in a PCC-service instance for IPCF configuration.
The PCC-TimeDefs can be used to configured date and time for triggering the event for policy related procedures as well.
Entering this command results in the following prompt:

[context_name]host_name(config-pcc-service)#

A maximum of 512 PCC-TimeDefs can be configured in 1 instance of PCC-Service.
The commands configured in this mode are defined in the PCC-TimeDef Configuration Mode Commands chapter of Command Line Interface Reference.

⚠️ Caution: This is a critical configuration. The PCC-TimeDefs can not be configured without this configuration. Any change to this configuration would lead to removing or disabling configuration parameters defined here.
Example

Following command creates a PCC-TimeDef named `time_day1` with in a PCC-service instance.

```
timedef time_day1
```

Following command removes a pre-configured PCC-TimeDef named `time_day1` from a PCC-service instance.

```
no timedef time_day1
```
**timeout idle**

Configures the idle timeout duration for subscriber session and also sets the action to be taken by system on expiry of timeout duration.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration

```bash
configure > context context_name > pcc-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-service)#
```

**Syntax**

```
timeout idle idle_dur [ action reauthorize ]

[ no | default ] timeout idle
```

- **no**
  Removes the configured idle timeout value and action set in in PCC Service instance.

- **default**
  Sets the the idle timeout duration to the default value of ‘0’ which disables the idle timeout configuration in PCC Service instance.

- **idle_dur**
  Default: 0
  Designates the maximum duration of the session, in seconds, after the expiry of which the system considers the session as dormant or idle and invokes the reauthorization of session action, if configured.
  **idle_dur** must be a value in the range from 0 through 4294967295. The special value 0 disables the timeout specified.

- **action reauthorize**
  This optional keyword sets the system to trigger the reauthorization of session after expiry of the timeout duration configured through idle_dur value.

**Usage**

Use this command to set the idle time duration for subscriber session to determine the dormant session. This configuration sets the time in seconds for idle session (sessions with no activity/signaling). On expiry of this timeout duration action of reauthorization of session shall be triggered. In case of reauthorization request failure, session termination shall be triggered. Refer to the **timeout long-duration** command in this chapter for additional information.
Important: Reduce the timeout duration to free session resources faster for use by new requests.

Example

Following command sets the idle timeout duration to 450 seconds.

```
timeout idle 450
```
timeout setup

Configures the timeout duration for IPCF setup session.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration

configure > context context_name > pcc-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-service)#

Syntax

timeout setup setup_dur

[ no | default ] timeout setup

---

no

Removes the configured setup timeout value and action set in PCC Service instance.

---

default

Sets the setup timeout duration to the default value of 60. The special value of ‘0’ disables the setup timeout configuration in PCC Service instance.

---

setup_dur

Default: 60

Designates the maximum duration for the IPCF session setup, in seconds, after the expiry of which the system considers the IPCF session setup as failure and terminates the setup process.

setup_dur must be a value in the range from 0 through 120.

The special value 0 disables the setup timeout specified.

---

Usage

Use this command to set the time duration for IPCF session setup to determine the failure of IPCF setup process.

---

Example

Following command sets the IPCF session timeout duration to 30 seconds.

    timeout setup 30
timeout long-duration

Configures the long duration timeout and inactivity duration for subscriber session before system notifies or terminates session in PCC Service instance.

**Product**
- IPCF

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > PCC Service Configuration
  ```
  configure > context context_name > pcc-service service_name
  ```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-service)#
```

**Syntax**

```
timeout long-duration ldt_timeout [ action {detection | disconnect } ]

[ no | default] timeout long-duration
```

- no
  - Removes the configured long duration timeout value and action in PCC Service instance.

- default
  - Sets the the long duration timeout value to the default value of ‘0’ which disables the long duration timeout configuration in PCC Service instance.

- long-duration ldt_timeout
  - Default: 0
  - Designates the maximum duration of the session, in seconds, before the system automatically reports/terminates the session.
  - Specifies the maximum amount of time, in seconds, before the specified timeout action is activated.
  - ldt_timeout must be a value in the range from 0 through 4294967295.
  - The special value 0 disables the timeout specified.

- action {detection | disconnect}
  - Default: Detection
  - Specifies the action to be taken on expiry of long duration timeout duration ldt_timeout set with timeout long-duration command.
    - **detection**: sets the system to detect the sessions for which long duration timeout timer is exceeded and sends the SNMP TRAP and CORBA notification. This is the default behavior.
    - **disconnect**: sets the system to send SNMP TRAP and CORBA notification and disconnect the subscriber session once the long duration timeout timer is expired.
timeout long-duration

Usage
Use this command to set the long duration timeout period and actions to be taken on expiry of duration of timer for subscriber session.

Important: Reduce the timeout duration to free session resources faster for use by new requests.

Important: In case of long-duration timeout configured at PCC Service Configuration mode as well as at the PCC-Profile Configuration mode level, the long-duration timeout and action set in PCC-Profile Configuration mode will prevail. This enables defining session behavior as per profile provisioning.

Example
Following command sets the system to detect the subscriber sessions that exceeds the long duration timer of 6000 seconds and sends SNMP TRAP and CORBA notification:

    timeout long-duration 6000 action detection

Following command sets the system to detect and disconnect the subscriber sessions that exceeds the long duration timer of 6000 seconds and disconnect the session after sending SNMP TRAP and CORBA notification:

    timeout long-duration 6000 action disconnect
Chapter 242
PCC-Sp-Endpoint Configuration Mode Commands

The PCC-Sp-Endpoint Configuration mode provides a mechanism for Intelligent Policy Control Function (IPCF) to support the Sp interface endpoint. It represents a client end for SSC interactions. The PCC-Sp-Endpoint configuration mode facilitates the configuration of Sp interface, and manages the connection and operational parameters related to its peer.

Important: This configuration mode is supported from StarOS Release 12.1 onward.

Mode

Exec > Global Configuration > Context Configuration > PCC Sp Endpoint Configuration

configure > context context_name > pcc-sp-endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-spendpoint)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
access-type

This command is used to define the type of access protocol to be used with a PCC-Sp-Endpoint instance for IPCF configuration.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Sp Endpoint Configuration

configure > context context_name > pcc-sp-endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-spendpoint)#

Syntax

access-type {diameter | ldap}

default access-type

default

Sets access type protocol to be used by endpoints to default protocol of Diameter protocol in a PCC-Sp-Endpoint instance for IPCF configuration.

diameter

Default: Enabled
Sets access type protocol to be used by endpoints to Diameter protocol in a PCC-Sp-Endpoint instance for IPCF configuration.

ldap

Default: Disabled
Sets access type protocol to be used by endpoints to Lightweight Directory Access Protocol (LDAP) in a PCC-Sp-Endpoint instance for IPCF configuration.

Usage

Use this command to define the type of access protocol to be used with a PCC-Sp-Endpoint instance for IPCF configuration.

Example

Following command sets the access type of protocol to Diameter for a PCC-Sp-Endpoint instance.

default access-type
**diameter dictionary**

This command is used to assign a Diameter dictionary for interaction with SSC and messaging over Sp interface in a PCC-Sp-Endpoint instance of IPCF configuration.

**Product**

IPCF

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PCC Sp Endpoint Configuration

```bash
configure > context context_name > pcc-sp-endpoint endpoint_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config- spendpoint)#
```

**Syntax**

```
diameter dictionary { sh-custon-starent | sh-custom2 | sh-standard }
```

**default diameter dictionary**

```
default
  Sets the Diameter Sh dictionary to default dictionary sh-custon-starent (3GPP Rel. 8 Sh standard) for Sh interaction and messaging over Sp interface in a PCC-Sp-Endpoint instance of IPCF configuration.
```

```
sh-custom-starent
  Default: Enabled
  Sets the Diameter Sh dictionary to default dictionary sh-custon-starent for Sh interaction and messaging over Sp interface in a PCC-Sp-Endpoint instance of IPCF configuration.
```

```
sh-custom2
  Default: Disabled
  Sets the Diameter Sh dictionary to sh-custom2 with Cisco ULI AVP support for Sh interaction and messaging over Sp interface in a PCC-Sp-Endpoint instance of IPCF configuration.
```

```
sh-standard
  Default: Disabled
  Sets the Diameter Sh dictionary to default dictionary sh-standard (3GPP Rel. 8 standard) for Sh interaction and messaging over Sp interface in a PCC-Sp-Endpoint instance of IPCF configuration.
```

**Usage**

Use this command to assign a Diameter dictionary for Sh interaction and messaging over Sp interface in a PCC-Sp-Endpoint instance of IPCF configuration.

**Example**

Following command sets the Diameter dictionary for Sh interaction and messaging over Sp interface in a PCC-Sp-Endpoint instance of IPCF configuration to 3GPP Rel. 8 standard.
diameter dictionary sh-standard
diameter origin end-point

This command is used to bind/associate a pre-configured Diameter host/realm (SSC) over Sp interface for SPR interactions with a PCC-Sp-Endpoint instance to be used for subscriber profile and policy management.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Sp Endpoint Configuration

```
configure > context context_name > pcc-sp-endpoint endpoint_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sp-endpoint)#
```

**Syntax**

```
diameter origin endpoint ssc_node_name
```

```
no diameter origin endpoint
```

- **no**
  Removes the associated Diameter Origin Endpoint configuration from PCC-Sp-Endpoint instance configured for IPCF configuration.

- **ssc_node_name**
  The `ssc_node_name` is a predefined Diameter origin endpoint node (SSC) and must be an alphanumerical string from 1 through 63 characters.

**Usage**

Use this command to bind the SSC node over Sp interface by associating a pre-configured Diameter Origin Endpoint configuration with a PCC-Sp-Endpoint instance. The Diameter origin endpoint must be a pre-configured instance in the Context Configuration Mode. For more information on Diameter origin endpoint configuration, refer Diameter Endpoint Configuration Mode Commands chapter.

**Example**

Following command associates a pre-configured Diameter endpoint node configuration named `ssc_1` with a PCC-Sp-Endpoint instance for subscriber policy profile management.

```
diameter origin endpoint ssc_1
```

Following command removes the pre-associated Diameter endpoint node configuration named `ssc_1` from a PCC-Sp-Endpoint instance.

```
no diameter origin endpoint
```
diameter peer-select

This command nominates primary and secondary Diameter peers amongst the peers configured under Diameter Endpoint Configuration instance which is associated with a PCC Sp-Endpoint configuration.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Sp Endpoint Configuration

configure > context context_name > pcc-sp-endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-spendpoint)#

Syntax

diameter peer-select peer pri_peer_name [row-precedence row_prec_name selection-condition imsi {mcc mcc-string [mnc mnc-string] [msin msin-string] | mnc mnc-string [msin msin-string] | msin msin-string}] [realm realm_name] [secondary-peer sec_peer_name [realm sec_realm_name]]

no diameter peer-select

no diameter peer-select row-precedence

---

no

To remove all the configuration parameters.
To remove a particular selection-condition, a row-precedence value is specified.

peer pri_peer_name

Sets a configured Diameter peer, which is configured in Diameter Endpoint configuration associated with PCC-Sp-Endpoint instance configuration, as primary in Diameter peer selection process for IPCF configuration.

The pri_peer_name is a pre-configured Diameter peer in Diameter Endpoint configuration which is associated with a PCC-Sp-Endpoint configuration and must be an alphanumerical string from 1 through 63 characters. pri_peer_name allows punctuation marks.

row-precedence row_prec_name

The row-precedence decides order of evaluation of the selection conditions.
The row_prec_name is an integer between 1 and 63. Lower the value, higher is the priority of evaluation.

selection-condition

The selection-condition parameter is used to define Diameter SPR peer selection condition.
**imsi**

It indicates that the selection condition is based on subscriber IMSI.

---

**mcc mcc-string**

It indicates that the selection condition is based on MCC component of subscriber IMSI. The `mcc-string` can have one of the following formats: `mccval1` or `mccval1-mccval2`. The first format compares single MCC value and second one incorporates the range with `mccval1 <= mccval2`. The values for both `mccval1` and `mccval2` must be between 100 to 999.

---

**mnc mnc-string**

It indicates that the selection condition is based on MNC component of subscriber IMSI. The `mnc-string` can have one of the following formats: `mncval1` or `mncval1-mncval2`. The first format compares single MNC value and second one incorporates the range with `mncval1 <= mncval2`. The values for both `mncval1` and `mncval2` must be between 1 to 999.

---

**msin msin-string**

It indicates that the condition is based on MSIN component of subscriber IMSI. The `msin-string` can have following format: `msinval1-msinval2`. The format incorporates the range with `mccval1 <= mccval2`. The values for both `mccval1` and `mccval2` must be of maximum of 10 digits.

---

**realm realm-name**

This keyword optionally defines the realm (domain) of a configured **primary** Diameter peer, which is configured in Diameter Endpoint configuration associated with PCC-Sp-Endpoint instance configuration, in Diameter peer selection process for IPCF configuration. The `realm_name` is the realm (domain) of the associated primary Diameter peer in Diameter Endpoint configuration which associated with a PCC-Sp-Endpoint configuration. The `realm_name` must be an alpha and/or numeric string of 1 to 127 characters. The realm may typically be a company or service name and it allows punctuation marks.

---

**secondary-peer sec_peer_name**

Sets a configured Diameter peer, which is configured in Diameter Endpoint configuration associated with PCC-Sp-Endpoint instance configuration, as **secondary** in Diameter peer selection process for IPCF configuration. The `sec_peer_name` is a pre-configured Diameter peer in Diameter Endpoint configuration which is associated with a PCC-Sp-Endpoint configuration and must be an alphanumerical string from 1 through 63 characters. `sec_peer_name` allows punctuation marks.

---

**realm sec_realm-name**

This keyword optionally defines the realm (domain) of a configured **secondary** Diameter peer, which is configured in Diameter Endpoint configuration associated with PCC-Sp-Endpoint instance configuration, in Diameter peer selection process for IPCF configuration. The `sec_realm_name` is the realm (domain) of the associated primary Diameter peer in Diameter Endpoint configuration which associated with a PCC-Sp-Endpoint configuration. The `sec_realm_name` must be an alpha and/or numeric string of from 1 to 127 characters. The realm may typically be a company or service name and it allows punctuation marks.
Usage
Use this command to nominate primary and secondary Diameter peers amongst the peers configured under Diameter Endpoint Configuration instance which is associated with a PCC-Sp-Endpoint configuration. When both primary and secondary are down, the remaining Diameter peers are chosen based on their configured weight in round robin manner.
When row-precedence and selection-conditions are not defined for peer selection configuration, the row precedence value is assumed to be 64 (which is the lowest). This is a default peer selection when all the other configured selection conditions fail.
Multiple Diameter peers can be configured in a PCC-Sp-Endpoint instance by entering this command multiple times.

Example
Assume the operator has two MCC-MNC combinations: 123-456 and 123-457 respectively for subscriber IMSI values. If operator wishes to divert subscribers with these two different combinations to different SSC peers (say ssc123456 and ssc123457) then the operator needs to use following commands under PCC-Sp-Endpoint:

diameter peer-select row-precedence 4 selection-condition imsi mcc 123 mnc 456 peer ssc123456

diameter peer-select row-precedence 6 selection-condition imsi mnc 123 mnc 456 peer ssc223457

Following command nominates a pre-configured Diameter peer dia1 as primary and dia2 as secondary for Diameter peer selection process in a PCC-Sp-Endpoint configuration instance.

diameter peer-select peer dia1 secondary peer dia2
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
profile-data

This command allows the operator to specify data-reference and service indication AVP values used in UDR/SNR message for profile data sent over Sp endpoint when access type is set to Diameter.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Sp Endpoint Configuration
configure > context context_name > pcc-sp-endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-spendpoint)#

Syntax

profile-data key data-reference data_ref_value [service-indication svc_ind_value]
default profile-data key

default

Specifies the data-reference value used in UDR/SNR message for profile data sent over Sp endpoint to default value of ‘0’ (zero) and service indication AVP value to profile data when access type is set to Diameter in PCC-Sp-Endpoint instance.

data-reference data_ref_value

Default: 0
Specifies the data-reference values used in UDR/SNR message for profile data sent over Sp endpoint when access type is set to Diameter in PCC-Sp-Endpoint instance.
The data reference value data_ref_value must be an integer from 1 through 65535.

service-indication svc_ind_value

Specifies the service indication AVP value used in UDR/SNR message for profile data sent over Sp endpoint when access type is set to Diameter in PCC-Sp-Endpoint instance.

Important: The Service-Indication values are set as per application logic and are supposed to be used only with SSC.

The service indication value svc_ind_value must be a string of alpha and/or numeric characters from 1 to 32 characters.
Usage

Use this command to allow the operator to specify data-reference and service indication AVP values used in UDR/SNR message for profile data sent over Sp endpoint when access type is set to Diameter in PCC-Sp-Endpoint configuration instance. Default service-indication value varies as per other interface configuration default profile-data key is used to set the service indication value.

Example

Following command set the data-reference value used in UDR/SNR message for profile data sent over Sp endpoint to default value of '0' (zero) and service-indication value as per application logic when access type is set to Diameter in PCC-Sp-Endpoint instance.

```text
default profile-data key
```
**profile-update-notification**

This command sets the system to indicate whether SSC and IPCF are capable of supporting profile update notifications in a PCC-Sp-Endpoint instance.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Sp Endpoint Configuration

```plaintext
configure > context context_name > pcc-sp-endpoint endpoint_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-spendpoint)#
```

**Syntax**

```
profile-update-notification {allow | disallow}
```

**default profile-update-notification**

- **default**
  
  Set the PCC-Sp-Endpoint instance default mode for supporting profile update notifications in a PCC-Sp-Endpoint instance and also to use the same in a PCC-Sp-Endpoint configuration instance.

- **allow**
  
  Default: Enabled
  
  Set the PCC-Sp-Endpoint instance to support the profile update notifications and also allow to use the same in Sp interaction.

- **disallow**
  
  Default: Disabled
  
  Set the PCC-Sp-Endpoint instance to not to support the profile update notifications and also does not allow to use the same in Sp interaction.

**Usage**

Use command to set to indicate whether SSC and IPCF are capable of supporting profile update notifications in a PCC-Sp-Endpoint instance. It also sets that whether profile update notification should be used or not for a PCC-Sp-Endpoint configuration instance.

**Example**

Following command indicates that SSC and IPCF are capable of supporting profile update notifications in a PCC-Sp-Endpoint instance and also allow to use it for a PCC-Sp-Endpoint configuration instance.

```
default profile-update-notification
```
spr subscriber identifier

This command sets the PCC-Sp-Endpoint instance to indicate how a subscriber is uniquely identified in SPR database while requesting subscriber data from SSC.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Sp Endpoint Configuration
`configure > context context_name > pcc-sp-endpoint endpoint_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-spendpoint)#
```

**Syntax**

```
spr subscriber identifier {imsi | msisdn | nai}
```

**default spr subscriber identifier**

```
default
```
Sets the PCC-Sp-Endpoint instance to use subscriber IMSI to identify subscriber uniquely in SPR database while requesting subscriber data from SSC.

```
imsi
```
Default: Enabled
Sets the PCC-Sp-Endpoint instance to use subscriber IMSI to identify subscriber uniquely in SPR database while requesting subscriber data from SSC.

```
msisdn
```
Default: Disabled
Sets the PCC-Sp-Endpoint instance to use subscriber MSISDN to identify subscriber uniquely in SPR database while requesting subscriber data from SSC.

```
nai
```
Default: Disabled
Sets the PCC-Sp-Endpoint instance to use Network Address Identifier as token to identify subscriber uniquely in SPR database while requesting subscriber data from SSC.
This token facilitates CDMA users for Policy Control and Charging functions.

**Usage**

Use command to set the PCC-Sp-Endpoint instance to indicate how a subscriber is uniquely identified in SPR database on SSC while requesting subscriber data. By default it uses Subscriber IMSI for identification in SPR database.
For IP-CAN session between PDSN and IPCF the subscriber token NAI facilitates the Policy Control and Charging functions to subscribers.

Example

Following command sets the PCC-Sp-Endpoint instance to use a subscriber IMSI to uniquely identified in SPR database at SSC.

```
default spr subscriber identifier
```
Chapter 243

PCC-TimeDef Configuration Mode Commands

The PCC-TimeDef Configuration Mode is used to configure various time definitions (TimeDefs) in the PCC-service instance. A PCC-TimeDef specifies the start and end time for triggering policy-related procedures or conditions.

**Important:** This configuration mode is supported from StarOS Release 12.1 onward.

**Mode**

Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC TimeDef Configuration

`configure > context context_name > pcc-service service_name > timedef timedef_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-pcc-timedef)#`

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Use this command to return to the parent configuration mode.
start date

This command defines PCC-TimeDefs with a start and end dates with time for an event to trigger a procedure or condition in an IP-CAN session.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC TimeDef Configuration

configure > context context_name > pcc-service service_name > timedef timedef_name

Entering the above command sequence results in the following prompt:

[context_name] host_name(config-pcc-timedef)#

Syntax

(no) start date start_date time start_time end date end_date time end_time

no

Removes the specified time definition.

date start_date

Specifies the start date start_date in MM/DD/YY format.
Following format is used for MM/DD/YY in start_date:

- MM specifies the month of the start date from January through December and must be an integer between 1 through 12.
- DD specifies the date of month of the start date 1 through 31 and must be an integer between 1 through 31.
- YY specifies the year of the start date from 2010 through 2037 and must be an integer between 10 through 37.

time start_time

Specifies the start time start_time in HH MIN SS format.
Following format is used for HH MIN SS in start_time:

- HH specifies the hour of the start date in 24 hour format and must be an integer between 00 through 23.
- MIN specifies the minutes of the hour of the start date must be an integer between 00 through 59.
- SS specifies the seconds of the minute of the start date must be an integer between 00 through 59.

date end_date

Specifies the end date end_date in MM/DD/YY format.
Following format is used for MM/DD/YY in end_date:
- **MM** specifies the month of the end date from January through December and must be an integer between 1 through 12.
- **DD** specifies the date of month of the end date 1 through 31 and must be an integer between 1 through 31.
- **YY** specifies the year of the end date from 2010 through 2037 and must be an integer between 10 through 37.

```
time end_time
```

Specifies the end time `end_time` in **HH MIN SS** format.
Following format is used for `HH MIN SS` in `end_time`:
- **HH** specifies the hour of the end date in 24 hour format and must be an integer between 00 through 23.
- **MIN** specifies the minutes of the hour of the end date must be an integer between 00 through 59.
- **SS** specifies the seconds of the minute of the end date must be an integer between 00 through 59.

**Usage**

Use this command to define a PCC-TimeDef with a start and end dates with time for an event to trigger a procedure or condition in an IP-CAN session.

**Example**

The following command defines a PCC-TimeDef with start date as December 31st 2010 at 00 Hrs. 30 mins. and 00 seconds and end date as January 31st 2011 at 23 Hrs. 59 mins. and 59 seconds:

```
start date 12/31/10 time 00 30 00 end date 01/31/11 time 23 59 59
```
start day

This command defines PCC-TimeDefs with a start and end week days with time for an event to trigger a procedure or condition in an IP-CAN session.

Product
IPCF
Privilege
Security Administrator, Administrator
Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC TimeDef Configuration

```
configure > context context_name > pcc-service service_name > timedef timedef_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-timedef)#
```

Syntax

```
[start day start_weekdays time start_time end day end_weekdays time end_time]
```

**no**

Removes the specified time definition.

**day start_weekdays**

Specifies the start day as week days.
Following days are used as `start_weekdays`:

- **friday** specifies Friday of the week as start day.
- **monday** specifies Monday of the week as start day.
- **saturday** specifies Saturday of the week as start day.
- **sunday** specifies Sunday of the week as start day.
- **thursday** specifies Thursday of the week as start day.
- **tuesday** specifies Tuesday of the week as start day.
- **wednesday** specifies Wednesday of the week as start day.

**time start_time**

Specifies the start time `start_time` in **HH MIN SS** format.
Following format is used for **HH MIN SS** in `start_time`:

- **HH** specifies the hour of the start day in 24 hour format and must be an integer between 00 through 23.
- **MIN** specifies the minutes of the hour of the start day must be an integer between 00 through 59.
- **SS** specifies the seconds of the minute of the start day must be an integer between 00 through 59.
### PCC-TimeDef Configuration Mode Commands

**end day end_weekdays**

Specifies the end day as week days. Following days are used as `end_weekdays`:

- `friday` specifies Friday of the week as end day.
- `monday` specifies Monday of the week as end day.
- `saturday` specifies Saturday of the week as end day.
- `sunday` specifies Sunday of the week as end day.
- `thrusday` specifies Thursday of the week as end day.
- `tuesday` specifies Tuesday of the week as end day.
- `wednesday` specifies Wednesday of the week as end day.

**time end_time**

Specifies the end time `end_time` in `HH MIN SS` format. Following format is used for `HH MIN SS` in `end_time`:

- `HH` specifies the hour of the end day in 24 hour format and must be an integer between 00 through 23.
- `MIN` specifies the minutes of the hour of the end day must be an integer between 00 through 59.
- `SS` specifies the seconds of the minute of the end day must be an integer between 00 through 59.

### Usage

Use this command to define a PCC-TimeDef with a start and end weekdays with time for an event to trigger a procedure or condition in an IP-CAN session.

### Example

The following command defines a PCC-TimeDef with start day as Friday at 00 Hrs. 30 mins. and 00 seconds and end day as Sunday at 23 Hrs. 59 mins. and 59 seconds:

```
start day friday time 00 30 00 end day sunday time 23 59 59
```
start time

This command defines PCC-TimeDefs with a start and end time of a day for an event to trigger a procedure or condition in an IP-CAN session.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC TimeDef Configuration

configure > context context_name > pcc-service service_name > timedef timedef_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcc-timedef)#

Syntax

[no] start time start_time end time end_time

no
Removes the specified time definition.

time start_time
Specifies the start time start_time in HH MIN SS format.
Following format is used for HH MIN SS in start_time:

• HH specifies the hour of the day in 24 hour format and must be an integer between 00 through 23.
• MIN specifies the minutes of the hour of the day must be an integer between 00 through 59.
• SS specifies the seconds of the minute of the day must be an integer between 00 through 59.

d time end_time
Specifies the end time end_time in HH MIN SS format.
Following format is used for HH MIN SS in end_time:

• HH specifies the end hour of the day in 24 hour format and must be an integer between 00 through 23.
• MIN specifies the minutes of the end hour of the day must be an integer between 00 through 59.
• SS specifies the seconds of the minute of the end hour must be an integer between 00 through 59.

Usage
Use this command to define a PCC-TimeDef with a start and end time for an event to trigger a procedure or condition in an IP-CAN session.

Example

The following command defines a PCC-TimeDef with start at 00 Hrs. 30 mins. and 00 seconds and end at 23 Hrs. 59 mins. and 59 seconds:
start time 00 30 00 end time 23 59 59
**time-slot**

This command defines PCC-TimeDefs with a start and end week days with time for an event to trigger a procedure or condition in an IP-CAN session.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC TimeDef Configuration
configure > context context_name > pcc-service service_name > timedef timedef_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-timedef)#
```

**Syntax**

```
[ no ] time-slot slot_num{ [ no ] time-slot slot_num

[ no ] time-slot slot_num

no

Removes the specified time slot definition.

slot_num

Specifies the time slot number to be configured with this command and it must be an integer between 1 through 64.

date start_date

Specifies the start date start_date in MM/DD/YY format. Following format is used for MM/DD/YY in start_date:

- **MM** specifies the month of the start date from January through December and must be an integer between 1 through 12.
- **DD** specifies the date of month of the start date 1 through 31 and must be an integer between 1 through 31.
- **YY** specifies the year of the start date from 2010 through 2037 and must be an integer between 10 through 37.

time start_time

Specifies the start time start_time in HH:MIN:SS format. Following format is used for HH:MIN:SS in start_time:

- **HH** specifies the hour of the start date in 24 hour format and must be an integer between 00 through 23.
**MIN** specifies the minutes of the hour of the start date must be an integer between 00 through 59.

**SS** specifies the seconds of the minute of the start date must be an integer between 00 through 59.

**end date  end_date**

Specifies the end date **end_date** in **MM/DD/YY** format.
Following format is used for **MM/DD/YY** in **end_date**:

- **MM** specifies the month of the end date from January through December and must be an integer between 1 through 12.
- **DD** specifies the date of month of the end date 1 through 31 and must be an integer between 1 through 31.
- **YY** specifies the year of the end date from 2010 through 2037 and must be an integer between 10 through 37.

**time  end_time**

Specifies the end time **end_time** in **HH MIN SS** format.
Following format is used for **HH MIN SS** in **end_time**:

- **HH** specifies the hour of the end date in 24 hour format and must be an integer between 00 through 23.
- **MIN** specifies the minutes of the hour of the end date must be an integer between 00 through 59.
- **SS** specifies the seconds of the minute of the end date must be an integer between 00 through 59.

**day  start_weekdays**

Specifies the start day as week days.
Following days are used as **start_weekdays**:

- **friday** specifies Friday of the week as start day.
- **monday** specifies Monday of the week as start day.
- **saturday** specifies Saturday of the week as start day.
- **sunday** specifies Sunday of the week as start day.
- **thursday** specifies Thursday of the week as start day.
- **tuesday** specifies Tuesday of the week as start day.
- **wednesday** specifies Wednesday of the week as start day.

**time  start_time**

Specifies the start time **start_time** in **HH MIN SS** format.
Following format is used for **HH MIN SS** in **start_time**:

- **HH** specifies the hour of the start day in 24 hour format and must be an integer between 00 through 23.
- **MIN** specifies the minutes of the hour of the start day must be an integer between 00 through 59.
- **SS** specifies the seconds of the minute of the start day must be an integer between 00 through 59.

**end day  end_weekdays**

Specifies the end day as week days.
Following days are used as $end\_weekdays$:

- **friday** specifies Friday of the week as end day.
- **monday** specifies Monday of the week as end day.
- **saturday** specifies Saturday of the week as end day.
- **sunday** specifies Sunday of the week as end day.
- **thrusday** specifies Thursday of the week as end day.
- **tuesday** specifies Tuesday of the week as end day.
- **wednesday** specifies Wednesday of the week as end day.

\[time\] $end\_time$

Specifies the end time $end\_time$ in $HH\ MIN\ SS$ format.

Following format is used for $HH\ MIN\ SS$ in $end\_time$:

- $HH$ specifies the hour of the end day in 24 hour format and must be an integer between 00 through 23.
- $MIN$ specifies the minutes of the hour of the end day must be an integer between 00 through 59.
- $SS$ specifies the seconds of the minute of the end day must be an integer between 00 through 59.

\[time\] $start\_time$

Specifies the start time $start\_time$ in $HH\ MIN\ SS$ format.

Following format is used for $HH\ MIN\ SS$ in $start\_time$:

- $HH$ specifies the hour of the day in 24 hour format and must be an integer between 00 through 23.
- $MIN$ specifies the minutes of the hour of the day must be an integer between 00 through 59.
- $SS$ specifies the seconds of the minute of the day must be an integer between 00 through 59.

\[time\] $end\_time$

Specifies the end time $end\_time$ in $HH\ MIN\ SS$ format.

Following format is used for $HH\ MIN\ SS$ in $end\_time$:

- $HH$ specifies the end hour of the day in 24 hour format and must be an integer between 00 through 23.
- $MIN$ specifies the minutes of the end hour of the day must be an integer between 00 through 59.
- $SS$ specifies the seconds of the minute of the end hour must be an integer between 00 through 59.

**Usage**

Use this command to define a time slot with a start day, start time, and start date option for an event to trigger a procedure or condition in an IP-CAN session. A maximum of 12 time-slots can be configured through this command.

**Example**

The following command defines a time slot 2 which will start on Friday at 00:30:00 and ends on Saturday at 23:00:00:

```
start day friday start time 00 30 00 end day saturday time 23 00 00
```
Chapter 244
PCC-Usage-Monitor Configuration Mode Commands

The PCC-Usage-Monitor Configuration mode provides a mechanism to set the usage threshold limit in a PCC-Service-Profile to trigger a required condition and action set in PCC-Service instance.

**Important:** This configuration mode is supported from StarOS Release 12.1 onward.

Mode

Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Service Profile Configuration > PCC Usage-Monitor Configuration

```
configure > context context_name > pcc-service service_name > profile profile_name > usage-monitor usage_monitor_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-profile-usage-mon)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
usage-limit time

Sets the usage limit by time for a subscriber profile for a PCC-Service-Profile on an IPCF node.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Service Profile Configuration > PCC Usage-Monitor Configuration

```
configure > context context_name > pcc-service service_name > profile profile_name >
usage-monitor usage_monitor_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-profile-usage-mon)#
```

**Syntax**

```
[ default ] usage-limit time time_dur
```

- **default**
  
  Sets the usage limit time to 10 seconds for IP-CAN traffic in a PCC-Service-Profile.

- **time** time_dur
  
  Default: 10 secs.
  
  Specifies the usage duration (in seconds) for a PCC-service profile instance.
  
  `time_dur` must be an integer from 1 through 4294967296.

**Usage**

Use this command to set the usage limit in duration for subscriber profile for a PCC-Service-Profile on IPCF node.

**Example**

The following command sets the usage duration limit to 20000 seconds within a PCC-Service-Profile.

```
usage-limit time 20000
```
usage-limit volume

Sets the usage limit by volume for a subscriber profile for a PCC-Service-Profile on an IPCF node.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PCC Service Configuration > PCC Service Profile Configuration > PCC Usage-Monitor Configuration

```
configure > context context_name > pcc-service service_name > profile profile_name > usage-monitor usage_monitor_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pcc-profile-usage-mon)#
```

Syntax

```
[default usage-limit volume [downlink dlink_volume | total total_volume | uplink uplink_volume]
```

---

default

Sets the usage limit volume to “0” for downlink, uplink and total bucket in a PCC-Service-Profile.

---

downlink dlink_volume

Specifies the usage volume (in kilobytes) in the downlink direction (from PCEF to UE) as an integer from 1 through 4294967296. A “0” (zero) value disables the downlink volume usage. Default: 0

---

total total_volume

Specifies the usage volume (in kilobytes) in the downlink and uplink directions (from PCEF to UE and PCEF to PDN) as an integer from 1 through 4294967296. A “0” (zero) value disables the downlink volume usage. Default: 0

---

uplink uplink_volume

Specifies the usage volume (in kilobytes) in the uplink direction (from PCEF to PDN) as an integer from 1 through 4294967296. A “0” (zero) value disables the downlink volume usage. Default: 0

---

Usage

Use this command to set the usage limit in volume for subscriber profile for a PCC-Service-Profile on IPCF node.

Example

The following command sets the usage limit volume to 20000 kilobytes in the upload direction within a PCC-Service-Profile.

```
usage-limit volume uplink 20000
```
The following command sets the usage limit volume to 400000 kilobytes in the download direction within a PCC-Service-Profile.

```
usage-limit volume downlink 400000
```
Chapter 245
PCP Configuration Mode Commands

The Port Control Protocol Service Configuration Mode is used to manage Port Control Protocol (PCP) service related configurations.

Important: This configuration mode is customer specific. For more information, contact your Cisco account representative.

Exec > ACS Configuration > Port Control Protocol Service Configuration

```
active-charging service service_name > pcp-service service_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-pcp-service)#
```

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed (s).
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
policy-control

This command enters the PCP Policy Control Configuration mode to configure policy control parameters for PCP service.

**Important:** This command is customer specific. For more information, contact your Cisco account representative.

**Product**
ACS
NAT
PSF

**Privilege**
Security Administrator, Administrator
Exec > ACS Configuration > Port Control Protocol Service Configuration

```
active-charging service service_name > pcp-service service_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-pcp-service)#
```

**Syntax**

```
[ default ] policy-control
```

- **default**
  Configures this command with the default setting.
  Default: Enabled

**Usage**

Use this command to enter the PCP Policy Control Configuration Mode to configure the policy control parameters for the PCP service.

On entering this command, the CLI prompt changes to:

```
[context_name]hostname(config-pcp-policy-control)#
```

Also see the **PCP Policy Control Configuration Mode Commands** chapter.
server

Configures the IP address of the PCP server to receive PCP packets.

**Important:** This command is customer specific. For more information, contact your Cisco account representative.

**Product**
- ACS
- NAT
- PSF

**Privilege**
- Security Administrator, Administrator
- Exec > ACS Configuration > Port Control Protocol Service Configuration

```bash
active-charging service service_name > pcp-service service_name
```

Entering the above command sequence results in the following prompt:
```
[local]host_name(config-pcp-service)#
```

**Syntax**

```bash
server ipv4-address ipv4_address [port port_number]

no server ipv4-address
```

- **server ipv4_address**
  - Specifies the IPv4 address of the server to receive PCP packets.
  - `ipv4_address` must be specified using the IPv4 dotted-decimal notation.

- **port port_number**
  - Specifies the UDP port number where PCP Request messages are received by the PCP service.
  - `port_number` must be an integer from 1 through 65535.
  - Default: 5351

**Usage**

Use this command to configure the IPv4 address on which the PCP service will receive PCP packets and the port on which PCP Request messages will be received from the PCP service.

**Example**

The following command configures the IPv4 address 1.2.3.4 with port number 5351 for the PCP service:

```bash
server ipv4-address 1.2.3.4 port 5351
```
Chapter 246
PCP Policy Control Configuration Mode Commands

The PCP Policy Control Configuration Mode is used to manage PCP policy control related configurations.

Important: This configuration mode is customer specific. For more information, contact your Cisco account representative.

Exec > ACS Configuration > PCP Configuration > Port Control Protocol Service Policy Control Configuration

active-charging service service_name > pcp-service service_name > policy-control

Entering the above command sequence results in the following prompt:

[local]host_name(config-pcp-policy-control)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed(s).
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
**exit**

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```Syntax
exit
```

**Usage**

Use this command to return to the parent configuration mode.
request-opcode

This command allows you to configure various PCP Request Opcode options.

Important: This command is customer specific. For more information, contact your Cisco account representative.

Product

ACS
NAT
PSF

Privilege

Security Administrator, Administrator
Exec > ACS Configuration > PCP Configuration > Port Control Protocol Service Policy Control Configuration

active-charging service service_name > pcp-service service_name > policy-control

Entering the above command sequence results in the following prompt:

[local]host_name(config-pcp-policy-control)#

Syntax

[ no ] request-opcode [ announce | map [ filter | prefer-failure ] | peer ] +

default request-opcode [ announce | map | peer ] +

no

Deletes the specific PCP opcode settings.

announce

Configures PCP ANNOUNCE opcode to process Announce Request messages.

map [ filter | prefer-failure ]

Configure PCP MAP opcode to process MAP Request messages.

•filter: MAP opcode received with this option contains remote IP/port. Processing will be the same as MAP without option but NAT binding will be 5-tuple if remote port is non-zero or 4-tuple if remote port is zero.

•prefer-failure: MAP opcode received with this option contains mapping IP/port which will be non-zero. Processing will be the same as MAP without option but if NAT binding allocation fails with the suggested mapping IP/port, then error will be returned.

peer

Configures PCP PEER opcode to process Peer Request messages.
Usage

Use this command to configure various PCP Request Opcode options.
**response-opcode**

This command allows you to configure various PCP Response Opcode options.

**Product**

ACS  
NAT  
PSF

**Privilege**

Security Administrator, Administrator

```
Exec > ACS Configuration > PCP Configuration > Port Control Protocol Service Policy Control Configuration
```

```
active-charging service service_name > pcp-service service_name > policy-control
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-pcp-policy-control)#
```

**Syntax**

```
response-opcode { map | peer } [ error { long life-time long_life_time | short life-time short_life_time } ] | success life-time succ_life_time ] +
{ default | no } response-opcode { map | peer } +
```

- **default**
  
  Configures this command with its default setting.

- **map**
  
  Configures the lifetime for which Map mappings are available.

- **peer**
  
  Configures the lifetime for which Peer mappings are available.

- **error**
  
  Configures the lifetime for long and short error cases, in seconds.  
  `long_life_time` and `short_life_time` must be an integer from 30 through 7200.

- **success**
  
  Configures the lifetime for successful long and short cases, in seconds. 
  `succ_life_time` must be an integer from 30 through 7200.

- **peer**
  
  Configures this command with its default setting.
Usage

Use this command to configure the PCP Response Opcode options.

Example

The following command configures the MAP opcode with lifetime for long and short error cases set to 600 and 30 respectively:

```
response-opcode map error long life-time 600 short life-time 30
```
Chapter 247
PDG Service Configuration Mode Commands

The PDG Service Configuration Mode is used to specify the properties required for the UEs in the WLAN (Wireless Local Access Network) to interface with the Packet Data Gateway/Tunnel Termination Gateway (PDG/TTG).

Mode

Exec > Global Configuration > Context Configuration > PDG Service Configuration

configure > context context_name > pdg-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdg-service)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
aaa attribute

Sets the attributes that the system uses in AAA messages.

Product
PDG/TTG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDG Service Configuration
configure > context context_name > pdg-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdg-service)#

Syntax

aaa attribute { 3gpp-negotiated-qos-profile string }

no aaa attribute

---

3gpp-negotiated-qos-profile string

Specifies the 3GPP negotiated QoS profile to use in AAA messages during IMS emergency call handling as an alphanumeric string of 1 through 31 characters.

no aaa attribute

Removes a previously configured AAA attribute.

---

Usage

Specifies the 3GPP negotiated QoS profile to use in AAA messages during IMS emergency call handling.

Example

The following command specifies the 3GPP negotiated QoS profile to use during IMS emergency call handling:

aaa attribute 3gpp-negotiated-qos-profile 100
### associate sgtp-service

Identifies the SGTP service to be associated with the PDG service to enable TTG functionality on the PDG/TTG. TTG functionality supports GTP-C (GTP control plane) messaging and GTP-U (GTP user data plane) messaging between the TTG and the GGSN over the Gn’ interface.

Important: This command can be used before the associated service instance is created and configured but care should be used to match the service names.

<table>
<thead>
<tr>
<th>Product</th>
<th>PDG/TTG</th>
</tr>
</thead>
<tbody>
<tr>
<td>Privilege</td>
<td>Security Administrator, Administrator</td>
</tr>
<tr>
<td>Mode</td>
<td>Exec &gt; Global Configuration &gt; Context Configuration &gt; PDG Service Configuration</td>
</tr>
</tbody>
</table>

**Syntax**

```
[ no ] associate sgtp-service sgtp_service_name [ context sgtp_context_name ]
```

**no**

Removes the service association definition from the configuration.

**sgtp-service sgtp_service_name**

Specifies which SGTP service configuration, by naming the SGTP service instance, to associate with this PDG service.

*sgtp_service_name* is an alphanumeric string of 1 through 63 characters with no spaces.

**context sgtp_context_name**

Defines the context in which the SGTP service was created. If no context is specified, the current context is used.

*sgtp_context_name* is an alphanumeric string of 1 through 63 characters with no spaces.

**Usage**

Use this command to associate the SGTP service to be associated with the PDG service to enable TTG functionality on the PDG/TTG.

**Example**

The following command associates SGTP service *sgtp_service_1* with this PDG service:

```
associate sgtp-service sgtp_service_1 context sgtp_context_1
```
certificate-selection

Configures the PDG/TTG to select the trusted certificate (and the private key for calculating the AUTH payload) to be included in the first IKE_AUTH message from the PDG/TTG based on the APN (Access Point Name). The selected certificate is associated with the APN included in the IDr payload of the first IKE_AUTH message from the UE.

Product
PDG/TTG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDG Service Configuration

configure > context context_name > pdg-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdg-service)#

Syntax

[ no ] certificate-selection apn-based

default certificate-selection

certificate-selection apn-based

Selects a trusted certificate for the first IKE-AUTH message based on the APN.

no certificate-selection

Disables APN-based certificate selection and resumes sending a certificate bound to a crypto template.

default certificate-selection

Sets the default certificate selection method to a certificate bound to a crypto template.

Usage

Configures the PDG/TTG to select the trusted certificate to be included in the first IKE_AUTH message based on the APN.

Example

Use the following example to enable APN-based certificate selection:

certificate-selection apn-based
bind

Binds the PDG service IP address to a crypto template and specifies the maximum number of sessions the PDG service supports.

**Product**
PDG/TTG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDG Service Configuration

`configure > context context_name > pdg-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdg-service)#
```

**Syntax**

```
[ no ] bind address ipv4_address { crypto-template string } mode { ttg | pdg } [ max-sessions number ]
```

---

**no**

Removes a previously configured binding.

```
bind address ipv4_address
```

Specifies the IPv4 address of the PDG service with which the UE attempts to establish an IKEv2/IPSec tunnel. This address must be a valid IP address within the context. This is a mandatory parameter.

```
crypto-template string
```

Specifies the name of the crypto template to be bound to the PDG service. This is the name of the IPSec policy to be used as a template for PDG/TTG subscriber session IPSec policies. The crypto template includes most of the IPSec and IKEv2 parameters for keepalive, lifetime, NAT-T, and cryptographic and authentication algorithms. There must be one crypto template per PDG service. This is a mandatory parameter.

*string* is an alphanumeric string of 0 through 127 characters.

```
mode { ttg | pdg }
```

Default: There is no default value.

Specifies whether the PDG service provides TTG or PDG functionality, as follows:

- In TTG mode, PDN connectivity is provided through the GGSN. PDG functionality is provided by the combined TTG and GGSN.
- In PDG mode, PDN connectivity and PDG functionality are provided directly through the PDG service.

This is a mandatory parameter.

---

**Important:** PDG mode is not supported in this software release.
Dependencies:
When you configure the PDG service to be in TTG mode, you must also configure the SGTP service using the `associate sgtp-service` command, as the TTG needs to connect with the GGSN to complete the PDG functionality.

The following behaviors occur when the PDG service operates in TTG mode:

- If the SGTP service associated with PDG service is not configured, the PDG service is not started.
- If the SGTP service associated with PDG service is not started, the PDG service is not started.
- If the SGTP service associated with PDG service is stopped, the PDG service is stopped.
- If the SGTP service associated with PDG service is re-started, the PDG service is re-started.
- If the SGTP service is not yet configured, whenever the SGTP service is started, the PDG service is started.

Note that starting or stopping the PDG service has no impact on the SGTP service.

```
max-sessions number
```

Specifies the maximum number of sessions to be supported by the PDG service as an integer from 0 through 1000000. Default: 1000000.

If the `max-sessions` value is changed on an existing system, the new value takes effect immediately if it is higher than the current value. If the new value is lower than the current value, existing sessions remain established, but no new sessions are permitted until usage falls below the newly-configured value.

Usage
Use this command in PDG Service Configuration Mode to bind the IP address used as the connection point for establishing IKEv2/IPSec sessions to a crypto template. You can also use it to define the maximum number of sessions the PDG service supports.

Example
The following command binds a PDG service with an IP address of 10.2.3.4 to the crypto template `crypto_template_1`, sets the mode to TTG, and sets the maximum number of sessions to 500000:

```
bind address 10.2.3.4 crypto-template crypto_template_1 mode ttg max-sessions 500000
```
end

Exits the current configuration mode and returns to the Exec mode.

All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
ip gnp-qos-dscp

Configures the quality of service (QoS) differentiated service code point (DSCP) used when sending data packets over the Gn’ interface in the uplink direction.

**Product**
PDG/TTG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDG Service Configuration

    configure > context context_name > pdg-service service_name

Entering the above command sequence results in the following prompt:

    [context_name]host_name(config-pdg-service)#

**Syntax**

```
[ no ] ip gnp-qos-dscp {   background dscp | conversational dscp | interactive dscp | streaming dscp | interactive [ traffic-handling-priority traffic_priority ] { allocation-retention-priority allocation_retention_priority } } +
default ip gnp-qos-dscp
```

no

Disables the overriding of the ToS (Type of Service) field and enables the pass-through option.

**background dscp**

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP background class, in which the data transfer is not time-critical (for example, in e-mail exchanges). This traffic class is the lowest QoS.

*dscp:* Sets the DSCP for the specified traffic class. See the dscp section below.

**conversational dscp**

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP conversational class, in which there is a constant flow of traffic in both the uplink and downlink direction. This traffic class is the highest QoS.

*dscp:* Sets the DSCP for the specified traffic pattern. See the dscp section below.

**interactive [ traffic-handling-priority traffic_priority ]**

Specifies the DSCP marking to be used for packets of sessions subscribed to three possible traffic priorities in the 3GPP interactive class, in which there is an intermittent flow of packets in the uplink and downlink direction. This traffic class has a higher QoS than the background class, but not as high as the streaming class. *traffic_priority* is the 3GPP traffic handling priority and can be the integers 1, 2 or 3.
**allocation-retention-priority** `allocation_retention_priority`

Specifies the DSCP for the interactive class if the allocation priority is present in the QoS profile.  
`allocation-retention-priority` can be the integers 1, 2, or 3.  
DSCP uses the values in the following table based on the traffic handling priority and allocation/retention priority if the allocation priority is present in the QoS profile.

<table>
<thead>
<tr>
<th>Allocation Priority</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Traffic Handling Priority</td>
<td>ef</td>
<td>ef</td>
<td>ef</td>
</tr>
<tr>
<td>1</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>af21</td>
<td>af21</td>
<td>af21</td>
</tr>
<tr>
<td>3</td>
<td>af21</td>
<td>af21</td>
<td>af21</td>
</tr>
</tbody>
</table>

**Important**: If you only configure DCSP marking for interactive traffic classes without specifying ARP, it may not properly take effect. The CLI allows this scenario for backward compatibility however, it is recommended that you configure all three values.

**streaming** `dscp`

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP streaming class, in which there is a constant flow of data in either in the uplink or downlink direction. This traffic class has a higher QoS than the interactive class, but not as high as the conversational class.

dscp: Set the DSCP for the specified traffic pattern. See the dscp section below.

**dscp**

Default:

- **background**: be
- **interactive**
- **Traffic Priority 1**: ef
- **Traffic Priority 1**: af21
- **Traffic Priority 1**: af21
- **streaming**: af11
- **conversational**: ef

Specifies the DSCP for the specified traffic pattern. `dscp` can be configured to any one of the following:

- af11: Assured Forwarding 11 per-hop-behavior (PHB)
- af12: Assured Forwarding 12 PHB
- af13: Assured Forwarding 13 PHB
- af33: Assured Forwarding 33 PHB
- af41: Assured Forwarding 41 PHB
- af42: Assured Forwarding 42 PHB
Related Keywords

- af21: Assured Forwarding 21 PHB
- af22: Assured Forwarding 22 PHB
- af23: Assured Forwarding 23 PHB
- af31: Assured Forwarding 31 PHB
- af32: Assured Forwarding 32 PHB
- af41: Assured Forwarding 41 PHB
- af42: Assured Forwarding 42 PHB
- af43: Assured Forwarding 43 PHB
- be: Best effort forwarding PHB
- ef: Expedited forwarding PHB

More than one of the above keywords can be entered within a single command.

Usage

DSCP levels can be assigned to specific traffic patterns in order to ensure that data packets are delivered according to the precedence with which they’re tagged. The diffserv markings are applied to the IP header of every subscriber data packet transmitted over the Gn’ interface(s).

The four traffic patterns have the following order of precedence: background (lowest), interactive, streaming, and conversational (highest). Data packets falling under the category of each of the traffic patterns are tagged with a DSCP that further indicate their precedence as shown in the following tables:

<table>
<thead>
<tr>
<th>Drop Precedence</th>
<th>Class</th>
<th>Class</th>
<th>Class</th>
<th>Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low</td>
<td>af11</td>
<td>af21</td>
<td>af31</td>
<td>af41</td>
</tr>
<tr>
<td>Medium</td>
<td>af12</td>
<td>af22</td>
<td>af32</td>
<td>af41</td>
</tr>
<tr>
<td>High</td>
<td>af13</td>
<td>af23</td>
<td>af33</td>
<td>af43</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Precedence (low to high)</th>
<th>DSCP</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Best Effort (be)</td>
</tr>
<tr>
<td>2</td>
<td>Class 1</td>
</tr>
<tr>
<td>3</td>
<td>Class 2</td>
</tr>
<tr>
<td>4</td>
<td>Class 3</td>
</tr>
<tr>
<td>5</td>
<td>Class 4</td>
</tr>
<tr>
<td>6</td>
<td>Express Forwarding (ef)</td>
</tr>
</tbody>
</table>

The DSCP level can be configured for multiple traffic patterns within a single instance of this command.

Example

The following command configures the DSCP level for the streaming traffic pattern to be ef:

```
ip gnp-qos-dscp streaming ef
```
The following command configures the DSCP levels for the conversational, streaming, interactive and background traffic patterns to be ef, af22, and af41, respectively:

```
ip gnp-qos-dscp conversational ef streaming ef interactive af22 background af41
```
**ip qos-dscp**

Configures the quality of service (QoS) differentiated service code point (DSCP) used when sending data packets over the Wu interface in the downlink direction.

**Product**
PDG/TTG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDG Service Configuration

```
configure > context context_name > pdg-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdg-service)#
```

**Syntax**

```
ip qos-dscp { qci { 1 { dscp-pt } | 2 { dscp-pt } | 3 { dscp-pt } | 4 { dscp-pt } | 5 { allocation-retention-priority 1..3 | dscp-pt } | 6 { allocation-retention-priority 1..3 | dscp-pt } | 7 { allocation-retention-priority 1..3 | dscp-pt } | 8 { allocation-retention-priority 1..3 | dscp-pt } | 9 { dscp-pt } + } allocation-retention-priority
```

```
no ip qos-dscp { qci { 1 | 2 | 3 | 4 | 5 { allocation-retention-priority 1..3 | dscp-pt } | 6 { allocation-retention-priority 1..3 | dscp-pt } | 7 { allocation-retention-priority 1..3 | dscp-pt } | 8 { allocation-retention-priority 1..3 | dscp-pt } | 9 { allocation-retention-priority 1..3 | dscp-pt } | 9 {+ allocation-retention-priority }
```

**allocation-retention-priority**

Specifies the DSCP for interactive class if the allocation priority is present in the QOS profile.

** allocation-retention-priority ** can be the integers 1, 2, or 3.

DSCP values use the following matrix to map based on traffic handling priority and Alloc/Retention priority if the allocation priority is present in the QOS profile.

The following table shows the DSCP value matrix for **allocation-retention-priority**.

**Table 37. Default DSCP Value Matrix**

<table>
<thead>
<tr>
<th>Traffic Handling Priority</th>
<th>Allocation Priority 1</th>
<th>Allocation Priority 2</th>
<th>Allocation Priority 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ef</td>
<td>ef</td>
<td>ef</td>
</tr>
<tr>
<td>2</td>
<td>af21</td>
<td>af21</td>
<td>af21</td>
</tr>
<tr>
<td>3</td>
<td>af21</td>
<td>af21</td>
<td>af21</td>
</tr>
</tbody>
</table>
**qci**

Configures the QCI attribute of QoS. Here the qci_val is the QCI for which the negotiate limit is being set, it ranges from 1 to 9.

**dscp**

Default QCI:
- 1: ef
- 2: ef
- 3: af11
- 4: af11
- 5: ef
- 6: ef
- 7: af21
- 8: af21
- 9: be

Specifies the DSCP for the specified traffic pattern. dscp can be configured to any one of the following:

<table>
<thead>
<tr>
<th>af11: Assured Forwarding 11 per-hop-behavior (PHB)</th>
<th>af32: Assured Forwarding 32 PHB</th>
</tr>
</thead>
<tbody>
<tr>
<td>af12: Assured Forwarding 12 PHB</td>
<td>af33: Assured Forwarding 33 PHB</td>
</tr>
<tr>
<td>af13: Assured Forwarding 13 PHB</td>
<td>af41: Assured Forwarding 41 PHB</td>
</tr>
<tr>
<td>af21: Assured Forwarding 21 PHB</td>
<td>af42: Assured Forwarding 42 PHB</td>
</tr>
<tr>
<td>af22: Assured Forwarding 22 PHB</td>
<td>af43: Assured Forwarding 43 PHB</td>
</tr>
<tr>
<td>af23: Assured Forwarding 23 PHB</td>
<td>be: Best effort forwarding PHB</td>
</tr>
<tr>
<td>af31: Assured Forwarding 31 PHB</td>
<td>ef: Expedited forwarding PHB</td>
</tr>
</tbody>
</table>

More than one of the above keywords can be entered within a single command.

**Usage**

You can assign DSCP to specific traffic patterns to ensure that data packets are delivered according to the precedence with which they are tagged. The diffserv markings are applied to the outer IP header of every GTP data packet. The diffserv marking of the inner IP header is not modified.

The traffic patterns are defined by QCI (1 to 9). Data packets falling under the category of each of the traffic patterns are tagged with a DSCP that further indicate their precedence as shown in the following tables:
Table 38. Class structure for assured forwarding (af) levels

<table>
<thead>
<tr>
<th>Drop Precedence</th>

</tbody>
</table>

The DSCP level can be configured for multiple traffic patterns within a single instance of this command. The no ip qos command can be issued to remove a QOS setting and return it to it’s default setting.

Example

The following command configures the DSCP level for QCI to be Expedited Forwarding, `ef`:

```
   ip qos-dscp qci 1 ef
```
ip source-violation

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected, or for verifying packet routing and labeling within the network.

Product
PDG/TTG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDG Service Configuration
configure > context context_name > pdg-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdg-service)#

Syntax

ip source-violation { clear-on-valid-packet | drop-limit num period secs }
default ip source-violation { drop-limit num period secs }
no ip source-violation clear-on-valid-packet

clear-on-valid-packet
Configures the service to reset the drop-limit counters upon receipt of a properly addressed packet. Default: disabled

drop-limit num
Sets the maximum number of allowed IP source violations within the detection period before dropping a call. If num is not specified, the value is set to the default value. num is an integer from 1 to 1000000. Default: 10

period secs
Sets the detection period (in seconds) for IP source violations as an integer from 1 through 1000000. If secs is not specified, the value is set to the default value. Default: 120

default ip source-violation { drop-limit num period secs }
Sets or restores the IP source violation detection defaults, as follows:

• drop-limit: Sets or restores the maximum number of IP source violations within the detection period before dropping the call to the default value of 10.

• period: Sets or restores the detection period for IP source violations to the default value of 120 seconds.

no ip source-violation clear-on-valid-packet
The drop-limit counters are not reset upon receipt of a properly addressed packet.
**Usage**

Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.

This function operates in the following manner: When a subscriber packet is received with a source IP address violation, the system increments the IP source violation drop-limit counter and starts the timer for the IP source violation period. Every subsequent packet received with a bad source address during the IP source violation period causes the drop-limit counter to increment. For example, if the drop-limit is set to 10, after 10 source violations, the call is dropped. The detection period timer continues to count throughout this process.

**Example**

The following command sets the drop limit to 15 and leaves the other values at their default values:

```
  ip source-violation drop-limit 15
```
max-tunnels-per-ue

Specifies the maximum number of IKEv2/IPSec tunnels allowed per UE by the PDG/TTG. This maximum number is specified per PDG service.

Product
PDG/TTG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDG Service Configuration

configure > context context_name > pdg-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdg-service)#

Syntax

max-tunnels-per-ue integer

default max-tunnels-per-ue

integer

Specifies the maximum number of IKEv2/IPSec tunnels allowed per UE as an integer from 1 to 11. Default: 11

default max-tunnels-per-ue

Sets the maximum number of IKEv2/IPSec tunnels allowed per UE to its default value, which is 11.

Usage

Use this command to set the maximum number of IKEv2/IPSec tunnels allowed per UE.

Example

Use the following command to set the maximum number of IKEv2/IPSec tunnels allowed per UE to 2:

max-tunnels-per-ue 2
**plmn id**

Configures location specific mobile network identifiers used to help translate local emergency and service-related numbers. Default is disabled.

**Product**
PDG/TTG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDG Service Configuration

```
configure > context context_name > pdg-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdg-service)#
```

**Syntax**

```
plmn id mcc mcc_number mnc mnc_number
no plmn id mcc mcc_number mnc mnc_number
```

- **mcc mcc_number**
  Specifies the mobile country code (MCC) portion of the PLMN identifier as an integer from 200 through 999.

- **mnc mnc_number**
  Specifies the mobile network code (MNC) portion of the PLMN identifier as a 2- or 2-digit integer from 00 through 999.

- **no plmn id mcc mcc_number mnc mnc_number**
  Removes a previously configured PLMN identifier for the PDG service.

**Usage**
The PLMN ID is included in the RAI (Routing Area Identity) field of the PDP Create Request messages sent to the GGSN. Multiple PDG services can be configured with the same PLMN identifier. Up to five PLMN IDs can be configured for each PDG service.

**Example**
The following command configures the PLMN identifier with an MCC of 462 and MNC of 2:

```
plmn id mcc 462 mnc 02
```
setup-timeout

Specifies the maximum time allowed to set up a session.

Product
PDG/TTG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDG Service Configuration
configure > context context_name > pdg-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdg-service)#

Syntax

```plaintext
setup-timeout integer

default setup-timeout
```

setup-timeout integer

Sets the session setup timeout value (in seconds) as an integer from 2 through 300. Default: 60

default setup-timeout

Sets or restores the default session setup timer value to 60 seconds.

Usage
The PDG/TTG clears both the user session and tunnels if a call does not initiate successfully before the session setup timer expires.

Example
The following command sets the session setup timeout value to the default value of 60 seconds:

```plaintext
default setup-timeout
```
Chapter 248
PDIF Service Configuration Mode Commands

The PDIF Service Configuration Mode is used to configure the properties required for a mobile station to interface with a Packet Data Interworking Function (PDIF).

**Mode**

Exec > Global Configuration > Context Configuration > PDIF Service Configuration

```
configure > context context_name > pdif-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdif-service)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
aaa attribute

Sets the system attributes for AAA messages.

**Product**
PDIF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDIF Service Configuration

```bash
configure > context context_name > pdif-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdif-service)#
```

**Syntax**

```bash
aaa attribute { 3gpp2-bsid string | 3gpp2-service-option integer | calling-station-id integer | 3gpp2-serving-pcf ip-address }
```

```bash
no aaa attribute
```

```bash
default aaa attribute 3gpp2-service-option integer
```

- **no**

  Removes a previously configured AAA attribute.

- **default**

  Returns the specified aaa attribute to the original default system settings.

- **3gpp2-bsid string**

  Specifies the base-station ID and consists of the SID + NID + CELLID. `string` must contain 12 hexadecimal upper-case ASCII characters.

- **3gpp2-service-option integer**

  Specifies the radius attribute value when sending authentication and accounting messages as an integer from 0 through 32767. Default: 4095

- **calling-station-id integer**

  Specifies the calling station phone number as a sequence of 1 through 15 digits.

- **3gpp2-serving-pcf ip-address**

  Use this command to generate attribute values without creating a new ASR 5000ASR 5500 image.
Usage
If the RADIUS protocol is being used, accounting messages can be sent over a AAA interface to the RADIUS server.
3gpp2-serving-pcf attribute value (if configured) is sent in both RADIUS authentication and accounting messages. If the attribute value is not configured (or explicitly “not configured” using the no keyword), RADIUS attributes are still included with just type and length. This is because inclusion/exclusion of RADIUS attributes are still controlled through the dictionary, not via the CLI.

Example
The following command identifies the base station ID:

```
    aaa attribute 3gpp2-bsid 0ab2389acb3
```
aaa authentication

Sets the aaa authentication for first and second phase authentication when multiple authentication is configured on the system.

Product
PDIF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDIF Service Configuration

configure > context context_name > pdif-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdif-service)#

Syntax

aaa authentication { { first-phase | second-phase } | { context-name name aaa-group name } }

no aaa authentication { first-phase | second-phase }

no aaa authentication { first-phase | second-phase }

Removes any existing authentication configuration.

first-phase context-name name aaa-group name

Specifies the context name and the aaa group name configured in the context for the first authentication phase.

Important: First phase authentication is mandatory when multiple authentication is configured on the system.

• context-name name: Specifies the context where the aaa server group is defined as an alphanumeric string of 1 through 79 characters.

• aaa-group name: Specifies the name of the aaa-group to be used for authentication as an alphanumeric string of 1 through 79 characters.

second-phase context-name name aaa-group name

Specifies the context name and the aaa group name configured in the context for the second authentication phase.

• context-name name: Specifies the context where aaa server group is defined as an alphanumeric string of 1 through 79 characters.

• aaa-group name: Specifies the name of the aaa-group to be used for authentication as an alphanumeric string of 1 through 63 characters.
Usage

Two phase-authentication happens in IKEv2 setup for setting up the IPSec session. The first authentication uses Diameter AAA EAP method and second authentication uses RADIUS AAA authentication. The same AAA context may be used for both authentications. PDIF service allows you to specify only a single AAA group, which could normally be used for the first authentication method.

A given AAA group only supports either Diameter or RADIUS authentication. If the NAI in the first authentication is different from NAI in the second authentication each NAI can point to a different domain profile in the PDIF. Each domain profile may be configured with each AAA group, one for Diameter and the other for RADIUS.

Example

Use the following to configure first-phase authentication for an aaa group named `aaa-10` in the PDIF context:

```
first-phase context-name pdif aaa-group aaa-10
```
bind

Binds the service IP address to a crypto template and configures the number of sessions the PDIF can support.

**Product**
PDIF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDIF Service Configuration

```
configure > context context_name > pdif-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdif-service)#
```

**Syntax**

```
bind address address { crypto-template string } [ max-sessions number ]
no bind
```

- **no**
  Removes a previously configured binding.

- **address**
  Specifies the IP address of the service.

- **crypto-template string**
  Specifies the name of the crypto template to be bound to the service as an alphanumeric string of 0 through 127 characters.

- **max-sessions number**
  Specifies the maximum number of sessions to be supported by the service as an integer from 0 to 3000000.
  Default: 3000000
  If the max-sessions value is changed on an existing system, the new value takes effect immediately if it is higher than the current value. If the new value is lower than the current value, existing sessions remain established, but no new sessions are permitted until usage falls below the newly-configured value.

**Usage**

Binds the IP address used as the connection point for establishing the IKEv2 sessions to the crypto template. It can also define the number of sessions the PDIF can support.

**Example**

The following command binds a service with the IP address 13.1.1.1 to the crypto template T1 and sets the maximum number of sessions to 200000:

```
bind address 13.1.1.1 crypto-template T1 max-sessions 200000
```
default

Sets or restores the default condition for the selected parameter.

**Product**

PDIF

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PDIF Service Configuration

```bash
configure > context context_name > pdif-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdif-service)#
```

**Syntax**

```bash
default { { aaa attribute 3gpp2-service-option } | duplicate-session-detection | hss { failure-handling mac-address-validation-failure | mac-address-validation | update-profile } | ip source-violation { drop-limit | period } | setup-timeout | subscriber name | username mac-address-stripping } }
```

---

**aaa attribute 3gpp2-service-option**

Configures the default value 4095.

---

**duplicate-session-detection**

Configures the default to be NAI-based.

---

**hss { failure-handling mac-address-validation-failure | mac-address-validation | update-profile }**

Configures the HSS server defaults:
- **failure-handling mac-address-validation-failure**: By default, the MAC address is validated by IMS-Sh interface.
  - **mac-address-validation**: By default, validating the MAC address is disabled.
  - **update-profile**: By default, updating the PDIF profile is disabled.

---

**ip source-violation { drop-limit | period }**

Configures IP source-violation detection defaults.
- **drop-limit**: Default number of IP source violations permitted in detection period before the call is dropped is 10.
- **period**: Default detection period is 120 seconds.

---

**setup-timeout**

Default call setup time limit is 60 seconds.
**subscriber name**

Configures the default subscriber name. *name* is a string of 1-127 characters.

**username mac-address-stripping**

Default is to disable stripping the MAC address from the username.

**Usage**

Configures the default settings for a given parameter.

**Example**

Use the following example to configure the default call setup time limit:

```
default setup-timeout
```
duplicate-session-detection

Configures the PDIF to detect duplicate call sessions using old IMSI or NAI addresses and clear old call information.

**Product**
PDIF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDIF Service Configuration
configure > context context_name > pdif-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdif-service)#

**Syntax**

```
[ no | default ] duplicate-session-detection { imsi-based | nai-based }
```

- **no**
  Stops duplicate session detection.

- **default**
  Configures the default setting, which is NAI-based detection.

- **imsi-based**
  Configures the PDIF to detect duplicate call sessions based on the IMSI address.

- **nai-based**
  Configures the PDIF to detect duplicate call sessions based on the NAI address. This is the default setting.

**Usage**

If an MS leaves the Wi-Fi coverage area and subsequently comes back online, it may initiate a new session setup procedure. After both the device authentication with HSS and the subscriber authentication with AAA server are completed, PDIF runs the internal mechanism to see whether there was any other session bound with the same IMSI. If an old session is detected, PDIF starts clearing this old session by sending a proxy-MIP Deregistration request to the HA. PDIF resumes new session setup by sending a proxy-MIP registration request. When the old session is aborted, PDIF sends Diameter STR messages and RADIUS Acct STOP messages to corresponding AAA servers.

PDIF allows duplicate session detection based on either the NAI or IMSI addresses. When detecting based on NAI, it is the first-phase (device authentication) NAI that is used.

**Example**

The following command configures duplicate session detection to use IMSI addressing:

```
duplicate-session-detection imsi
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Use this command to return to the parent configuration mode.
**hss**

Configures the Home Subscriber Server (HSS) parameters.

**Product**
PDIF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDIF Service Configuration

```
configure > context context_name > pdif-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdif-service)#
```

**Syntax**

```
hss { failure-handling { { mac-address-validation-failure | update-profile } action { continue | terminate } } | update-profile | mac-address-validation } 

[ no | default ] hss { failure-handling | update-profile | mac-address-validation }
```

- **no**
  Removes a previously configured HSS profile.

- **default**
  Resets the defaults for this command.

- **failure-handling mac-address-validation-failure**
  Configures how the HSS is to handle errors.
  If HSS returns a list of MAC addresses and if PDIF fails to match the subscriber MAC address against the list, the session is always terminated.

  - **action { continue | terminate }**
    Configures the action to be performed depending on the failure type.
    - **continue**: Ignores a mac-address-validation-failure and continue the session.
    - **terminate**: Terminates the session on a mac-address-validation-failure.

- **mac-address-validation**
  If mac-address-validation is enabled, the PDIF queries the HSS for a list of MAC addresses associated with the Mobile Directory Number (MDN). Default: Disabled

- **update-profile**
  Update the HSS with the subscriber profile. Default: Disabled
Usage

An HSS provides MAC address validation and store part of the subscriber profile. This command enables or disables validation and profile updates, and configures how the system responds to failures: terminate or continue a session.

An ims-sh-service and Diameter interface need to be configured to communicate with the HSS.

Example

The following example enables mac-address validation:

```
hss mac-address-validation
```
ims-sh-service

Associates the IMS-Sh-service parameters.

Product
PDIF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDIF Service Configuration

configure > context context_name > pdif-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdif-service)#

Syntax

ims-sh-service name name

no ims-sh-service name name

no

Removes a previously configured IMS-Sh-service.

name

Names the IMS-Sh-service in the pdif-service context.

Usage

This command is used to name the IMS-Sh-service.

Example

The following command names the IMS-Sh-service ims1:

ims-sh-service name ims1
**ip source-violation**

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Source validation requires that the source address of the received packets matches the IP address assigned to the subscriber (either statically or dynamically) during the session.

**Product**
PDIF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDIF Service Configuration

```bash
configure > context context_name > pdif-service service_name
```

Entering the above command sequence results in the following prompt:

```
context_name host_name(config-pdif-service)#
```

**Syntax**

```bash
ip source-violation { clear-on-valid-packet | drop-limit num | period secs }

no ip source-violation clear-on-valid-packet
```

**clear-on-valid-packet**

Configures the service to reset the reneg-limit and drop-limit counters after receipt of a properly addressed packet. Default: disabled

**drop-limit**

```bash
num
```

Sets the number of allowed source violations within a detection period before forcing a call disconnect. If `num` is not specified, the value is set to the default.

`num` is an integer from 1 to 1000000. Default: 10

**period**

```bash
secs
```

Sets the length of time (in seconds) for a source violation detection period to last. If `secs` is not specified, the value is set to the default.

`secs` is an integer from 1 to 1000000. Default: 120

**Usage**

This function is intended to allow the operator to configure a network to prevent problems such as when a user gets handed back and forth between two PDIFs a number of times during a handoff scenario.

This function operates in the following manner:

When a subscriber packet is received with a source address violation, the system increments the IP source-violation drop-limit counter and starts the timer for the IP-source violation period. Every subsequent packet received with a bad source address during the IP-source violation period causes the drop-limit counter to increment.
For example, if the drop-limit is set to 10, after 10 source violations, the call is dropped. The period timer continues to count throughout this process.

Example

The following command sets the drop limit to 15 and leaves the other values at their defaults:

```
ip source-violation drop-limit 15
```
**mobile-ip**

Sets the MIP FA context for the specific PDIF service.

**Product**

PDIF

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PDIF Service Configuration

```plaintext
configure > context context_name > pdif-service service_name
```

Entering the above command sequence results in the following prompt:

```plaintext
[context_name]host_name(config-pdif-service)#
```

**Syntax**

```plaintext
mobile-ip foreign-agent context string [ fa-service string ]

no mobile-ip
```

- **no**
  
  Removes previously configured parameters.

- **foreign-agent context string**
  
  Specifies the context name in which the FA is configured as an alphanumeric string of 1 through 79 characters.

- **fa-service string**
  
  Specifies the name of the FA service in the FA context as an alphanumeric string of 1 through 79 characters.

**Usage**

Shows in which context the FA is located and names the FA service.

**Example**

This command configures MIP for the FA context named *fal*:

```plaintext
mobile-ip foreign-agent context fal
```
setup-timeout

Configures the maximum time allowed to set up a session.

**Product**

PDIF

**Privilege**

Security-Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PDIF Service Configuration

```
configure > context context_name > pdif-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdif-service)#
```

**Syntax**

```
setup-timeout integer

default setup-timeout
```

```
setup-timeout integer

Specifies the session setup timer (in seconds) as an integer from 2 through 300. Default: 60
```

```
default setup-timeout

Defaults the session setup timer to 60 seconds.
```

**Usage**

PDIF clears both user session and tunnels if a call does not initiate successfully before the timer expires.

**Example**

The following command sets the setup-timeout to the default 30 seconds:

```
default setup-timeout
```
username

Configures mac-address-stripping on a username coming in from a mobile station session.

**Product**
PDIF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDIF Service Configuration

```config
configure > context context_name > pdif-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdif-service)#
```

**Syntax**

```
username mac-address-stripping

[ default | no ] username mac-address-stripping
```

- **username mac-address-stripping**
  
  Configures mac-address stripping from the Network Access Identifier (NAI).

- **default**
  
  Configures the default parameter which is **disabled**.

- **no**
  
  Returns the configuration to the default condition.

**Usage**

When enabled, PDIF strips the MAC address from a mobile username NAI before sending to the RADIUS AAA server.

**Example**

The following example disables mac-address-stripping.

```
no username mac-address-stripping
```
Chapter 249
PDSN Service Configuration Mode Commands

The PDSN Service Configuration Mode is used to create and manage PDSN service instances for the current context.

Mode

Exec > Global Configuration > Context Configuration > PDSN Service Configuration
configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdsn-service)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
a11-signalling-packets
Applies DSCP marking for IP header carrying outgoing A11-signalling packets.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration
configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdsn-service)#

Syntax
a11-signalling-packets ip-header-dscp hexa_number

[ no | default ] a11-signalling-packets ip-header-dscp

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
</table>
| Disables the a11-signalling-packets ip-header-dscp option configuration.

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
</table>
| Sets / Restores default value assigned for specified parameter a11-signalling-packets ip-header-dscp.

hexa_number

a Hexa decimal number between 0x0 and 0x3F.

Usage
Use this command to configured value of DSCP to be set for all outgoing A11 signaling msg. By default the CLI is disabled and DSCP is marked as 0 in ip-header.

Example
The following command configures value of DSCP to be set for all outgoing to A11 signaling message 0x3F:

a11-signalling-packets ip-header-dscp 0x3F
aaa 3gpp2-service-option

Specifies the value for the 3gpp2-service option.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration
configure > context context_name > psdn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-psdn-service)#

Syntax

aaa 3gpp2-service-option number
no aaa 3gpp2-service-option
default aaa 3gpp2-service-option

---

no
Disables the aaa 3gpp2-service option configuration.

---

default
Sets / Restores default value assigned for specified parameter aaa 3gpp2-service-option.

---

number
Service option number is integer and should be between 0 to 32767.

---

Usage

Allows the configuration of a default service option value to be sent in accounting when service option values are not received from PCF. The PDSN will default the service option value to the configured value if the value is not specified by the PCF.

Example

The following command sets the service option to be 40:

    aaa 3gpp2-service-option 40
aaa nas-ip-address

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration
configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-psdn-service)#

Syntax

aaa nas-ip-address IPv4 address

no aaa nas-ip-address

default aaa 3nas-ip-address

no
Disables the aaa nas-ip-address option configuration.

default
Sets / Restores default value assigned for specified parameter aaa nas-ip-address by default this is disabled.

ipv4 address
Specifies the IPv4 addresses to be used.

Usage
Allows the configuration.

Example
The following command configures 1.2.3.4:

aaa as-ip-address 1.2.3.4
access-flow traffic-validation

If access-flow traffic-validation is enabled for the service and the subscriber then the flows are checked against the filter rules. If the packets does not match the filter rules, and N violations occur in K seconds, the rp connection is downgraded to best-effort flow, if it is not already a best-effort flow.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration
configure > context context_name > pdn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdsn-service)#

Syntax

access-flow traffic-validation [ threshold { interval seconds | violations limit } ]

no access-flow traffic-validation

default access-flow traffic-validation [ threshold { interval | violations } ]

---

no

Disable traffic validation for the service.

---

default

Traffic validation configuration for the service is set to the default value.

---

threshold { [ violations limit ] [ interval seconds ] }

violations limit: Sets the parameters that determine traffic access violations. This is determined by setting the maximum number of violations within a set time period. must be an integer from 1 through 100000.

interval seconds Sets the time interval, in seconds. must be an integer from 1 through 100000.

---

Usage

Use this command to enable traffic validation for the current PDSN service.

Example

The following command enables traffic validation for the current PDSN service and sets the limit allowed to 100 violations within 5 seconds:

access-flow traffic-validation threshold violations 100 interval 5
access-network

Configures access network parameters.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdsn-service)#

Syntax

access-network { accounting identifier identifier_name | realm realm_name }
no access-network { accounting identifier | realm } }

no
Disables the access-network.

accounting identifier
Configures accounting for the access-network. This value must be a string from 1 to 128 characters in length.

realm realm_name
Configures the realm for the access-network. realm_name must be a string from 1 to 128 characters in length.

Usage
Use this command to configure access-network parameters for accounting and realms.

Example
The following command creates an access-network realm named realm2.

access-network realm realm2
airlink bad-sequence-number

Configures PDSN behavior for airlink related parameters.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

```
configure > context context_name > psdn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-psdn-service) #
```

```
airlink bad-sequence-number { accept | deny [use-deny-code { poorly-formed-request | unsupported-vendor-id}]

[ no | default ] airlinkbad-sequence-number
```

**no**
Disables the deny of bad-sequence number and accept it.

---

**default**

It is the default behavior.

---

**accept**

Accepts the A11 RRQ messages that have an Airlink Sequence number less than or equal to a previously received sequence number.

It is the default behavior.

---

**deny**

Rejects the A11 RRQ messages that have an Airlink Sequence number less than or equal to a previously received sequence number.

It uses `poorly-formed-request` option by default to deny a request.

---

**use-deny-code { poorly-formed-request | unsupported-vendor-id }**

These are optional keywords that used with `deny` sub-command to deny the A11 RRQ messages that have either an unsupported vendor Id or A11 Requests with bad/poor formation.

**unsupported-vendor-id** denies request on the basis of vendor Id.

**poorly-formed-request** will deny the A11 request on the basis of request formation or structure. It is the default deny code for `deny` sub-command.

---

**Usage**

This command is used to configure the airlink parameters for A11 RRQs.

When configured it denies the A11 RRQ messages that have an Airlink Sequence number less than or equal to a previously received sequence number.
Example

The following command would configure the system to deny all A11 RRQ messages having unsupported vendor Id or bad structure of message, including those having arilink sequence number less than or equal to a previously received sequence number:

```
airlinkbad-sequence-number deny
```
allow alt-ppp

Allows proprietary modified versions of PPP type sessions to connect this PDSN service.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdsn-service)#

Syntax

allowalt-ppp

no allow alt-ppp

default allow alt-ppp

Disables the allowed alternate PPP feature.

Sets the specified parameter to default.

Usage

This command is used to deviate from standard PPP protocol and use a proprietary modified version of PPP with a pre-defined non-negotiable PPP parameters.

It is a vendor-specific licensed feature command.

Example

allow alt-ppp
always-on-indication

Enables/disables the inclusion of 3GPP2 Always On Indicators in messages to the PCF.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration
configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```
always-on-indication

no always-on-indication
```

**Usage**

This command is available when the 3GPP2 Always-On RP Extensions feature-use license is installed. When enabled, this command causes the PDSN service to include the Always On Indicators in the Normal Vendor Specific Extension (NVSE) part of an A11 Session Update message to the PCF. The indicator will only be sent for those subscriber sessions in which Always On functionality is enabled as determined after a successful authentication: the 3GPP2-Always-On attribute is set to a value of 1 (Active) for subscribers configured on a AAA server, or the always-on parameter is set for locally configured subscribers. This functionality is enabled by default.

**Example**

use the following command to Enables the inclusion of 3GPP2 Always On Indicators in messages to the PCF.

```
always-on-indication
```
associate

Associates a PDSN-service with a Quality of Service (QoS) policy.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdsn-service)#

Syntax

associate qci-qos-mapping string

no associate qci-qos-mapping

no
Disables the configuration to associate PDSN-service with qos policy.

qci-qos-mapping string

qci-qos-mapping configures QCI to QoS mapping for this PDSN service.

string a string of size 1 to 63.

Usage

The following is used for configuration to associate PDSN-service with qos policy.

Example

associate qci-qos-mapping sample
**authentication**

Configures authentication parameters for specific PDSN service.

**Product**

PDSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PDSN Service Configuration

```plaintext
configure > context context_name > pdsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```plaintext
authentication { [ allow-noauth ] [ chap chap_priority ] [ mschap mschap_priority ] [ pap pap_priority ] } | [ msid-auth ]
```

**default authentication**

**allow-noauth**

*Default: Disabled*

This option configures the system to provide subscribers with network access even though they have not been authenticated. This command issued by itself would cause the system to not attempt to authenticate subscribers.

When the allow-noauth option is used in conjunction with commands specifying other authentication protocols and priorities to use, then if attempts to use those protocols fail, the system will treat the allow-noauth option as the lowest priority.

If no authentication is allowed, then NAI construct will be implemented in order to provide accounting records for the subscriber.

**chap chap_priority**

*Default: 1*

This option configures the system to attempt to use the Challenge Handshake Authentication Protocol (CHAP) to authenticate the subscriber.

A `chap_priority` must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.

`chap_priority` must be an integer from 1 through 1000. The lower the integer, the higher the preference.

CHAP is enabled by default as the highest preference.

**mschap mschap_priority**

*Default: Disabled*
This option configures the system to attempt to use the Microsoft Challenge Handshake Authentication Protocol (MSCHAP) to authenticate the subscriber.
A `mschap_priority` must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.
`mschap_priority` must be an integer from 1 through 1000. The lower the integer, the higher the preference.

```
mschap_priority
```

**Default:** 1

This option configures the system to attempt to use the Password Authentication Protocol (PAP) to authenticate the subscriber.
A `pap_priority` must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.
`pap_priority` must be an integer from 1 through 1000. The lower the integer, the higher the preference. PAP is enabled by default as the second highest preference.

```
pap  pap_priority
```

**Default:** 2

This option configures the system to attempt to authenticate the subscriber based on their Mobile Station Identity (MSID).

```
msid-auth
```

**Default:** Disabled

Use to specify how the PDSN service should handle authentication and what protocols to use. The flexibility is given to configure this option to accommodate the fact that not every mobile will implement the same authentication protocols.
The chassis is shipped from the factory with the authentication options set as follows:
- allow-noauth disabled
- chap enabled with a priority of 1
- mschap disabled
- msid-auth disabled
- pap enabled with a priority of 2

**Important:** At least one of the keywords must be used to complete the command.

**Example**

The following command would configure the system to allow no authentication for subscribers and would perform accounting using the default NAI-construct of `username@domain`:

```
authentication allow-noauth
```

The following command would configure the system to attempt subscriber authentication first using CHAP, then MSCHAP, and finally PAP. If the allow-noauth command was also issued, if all attempts to authenticate the subscriber using these protocols fail, then the subscriber would be allowed access:

```
authentication chap 1 mschap 2 pap 3
```
**bcmcs**

Sets the BCMCS (Broadcast Multicast Service) group username and password for RADIUS access.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

```
configure > context context_name > pdsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```
bcmcs { customptt | encrypted grppasswd group_passwd | flow-id value [flow-id-type { flow-id | program-id }] | grppasswd group_password | grpusrname group_name | ptt { destination-context dest_name | disconnect-dscp-label dscp_label | mtu transmission_unit | rohc-profile-name rohc_profile_name } }

default bcmcs [ custom ptt | ptt { disconnect-dscp-label | mtu | rohc-profile-name } ]

no bcmcs { custom ptt | flow-id value [flow-id-type { flow-id | program-id }] | grppasswd | grpusrname | ptt { destination-context | disconnect-dscp-label | mtu | rohc-profile-name } }
```

---

**custom**

Customise the BCMCS configuration.

---

**flow-id value**

Set the BCMCS flow-id. This value must be a hex string between 0x1000 and 0xFFFFFFFF. Making this entry opens a new mode: bcmcs-flow-id.

**rohc-profile name**

Configure ROHC parameters name, name should be string of size 1 to 63.

---

**grpusrname group_name**

Sets the BCMCS group name for RADIUS access requests. This value must be a string from 1 to 127 characters in length.

---

**encrypted grppasswd group_passwd**

Set the BCMCS group password for RADIUS access requests. This value must be a string from 1 to 63 characters in length.

Password can be encrypted or clear.
ptt {destination-context dest_name | disconnect-dscp-label dscp_label | mtu transmission_unit | rohc-profile-name rohc_profile_name }

destination-context: Specify the intended destination context name. This value must be string of 1 to 79 characters in length.
disconnect-dscp-label: Configures the DSCP label to be present in the In Call Signalling packet based on which In Call Signalling and Media Flows will be disconnected. This value must be a Hexadecimal number between 0x0 and 0xFF.
mtu transmission_unit: Configures maximum transmission unit. This value must be ranging from 100 to 2000. Default is 1500.
rohc_profile_name rohc_profile_name: Profile name of the ROHC compressor and decompressor. This value should be a string of 1 to 63.

Usage
Use this command to set the BCMCS group username and password for RADIUS access requests.

Example

```bash
bcmcsgrpusername group_name bcmcsgrppasswd group_password
```
bind

Binds the PDSN service to a logical IP interface serving as the R-P interface. Specifies the maximum number of subscribers that can access this service over the interface.

**Product**

PDSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PDSN Service Configuration

configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name] host_name(config-pdsn-service)#

**Syntax**

bind address [ max-subscribers count ]

no bind address

no

Removes a previously configured binding.

address

Specifies the IP address (address) of the interface configured as the R-P interface. address is specified in dotted decimal notation.

max-subscribers count

**Default:** 500000

Specifies the maximum number of subscribers that can access this service on this interface.

count can be configured to any integer value between 0 and 2500000.

**Important:** The maximum number of subscribers supported is dependent on the license key and the number of active PACs/PSCs installed in the system. A fully loaded system with 13 active PACs/PSCs can support 2500000 total subscribers. Refer to the license key command for additional information.

**Usage**

Associate or tie the PDSN service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an R-P interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.

This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.

When configuring the max-subscribers option, be sure to consider the following:

- The total number of interfaces that you will configure for use as R-P interfaces
• The maximum number of subscriber sessions that all of the interfaces may handle during peak busy hours
• The average bandwidth for each of the sessions
• The type of physical port (10/100Base-Tx or 1000Base-T) to which these interfaces will be bound

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.

Example

The following command would bind the logical IP interface with the address of 192.168.3.1 to the PDSN service and specifies that a maximum of 600 simultaneous subscriber sessions can be facilitated by the interface/service at any given time.

bind address 192.168.3.1 max-subscribers 600

The following command disables a binding that was previously configured:

nobind address
data-available-indicator

Enables sending Data Available Indicator extension in R-P Registration Reply.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

```
configure > context context_name > psdn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-psdn-service)#
```

**Syntax**

```
[ no | default ] data-available-indicator
```

- **no**
  - Default: Disabled
  - Disable the sending of the Data Available Indicator extension in R-P Registration Reply.

- **default**
  - Sets / Restores default value assigned for specified parameter for `data-available-indicator`.

**Usage**

Use this command to enable or disable the sending of the Data Available Indicator extension in R-P Registration Reply.

**Example**

Use the following command to enable sending the Data Available Indicator extension in R-P Registration Reply:

```
data-available-indicator
```

Use the following command to disable sending the Data Available Indicator extension in R-P Registration Reply:

```
no data-available-indicator
```
data-over-signaling

Enables the data-over-signaling marking feature for A10 packets.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration
configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdsn-service)#

Syntax

[ no | default ] data-over signaling

default
Sets / Restores default value assigned for specified parameter for data-over signaling

no
Default: Enabled
Disable the data-over signaling feature for A10 packets.

Usage

Use this command to enable or disable the data-over signaling feature for A10 packets.

Important: This is a customer-specific command.

Example

no data-over-signaling
default subscriber

Specifies the name of a subscriber profile configured within the same context as the PDSN service from which to base the handling of all other subscriber sessions handled by the PDSN service.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

`configure > context context_name > pdsn-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

Syntax

```
defaultsubscriber profile_name

no default subscriber
```

no

Enables/Disables the option `default subscriber profile_name`

profile_name

Specifies the name of the configured subscriber profile. `profile_name` can be between 1 and 127 alpha and/or number characters and is case sensitive.

Usage

Each subscriber profile specifies “rules” such as permissions, PPP settings, and timeout values. By default, the PDSN service will use the information configured for the subscriber named default within the same context. This command allows for multiple PDSN services within the same context to apply different “rules” to sessions they process. Each set of rules can be configured under a different subscriber name which is pointed to by this command.

Use the `no default subscriber profile_name` command to delete the configured default subscriber.

Example

To configure the PDSN service to apply the rules configured for a subscriber named `user1` to every other subscriber session it processes, enter the following command:

```
default subscriber user1```
direct-lte-indicator

Enables sending Direct LTE Indicator VSA in Access Request.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```
[ no | default ] direct-lte-indicator
```

- **default**
  
  Sets / Restores default value assigned for specified parameter for *data-over signaling*

- **no**
  
  Default: Enabled
  
  Disables sending Direct LTE Indicator VSA in Access Request.

**Usage**

Use this command to enable or disable sending Direct LTE Indicator VSA in Access Request.

**Important:** This is a customer-specific command.

**Example**

```
nodirect-lte-indicator
```
dormant-transition

Configures the PDSN behavior to terminate A10 session, when the PDSN receives the A11-RRQ (Type 4) before the session for the original MN is established completely.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

`configure > context context_name > pdsn-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```
[ no | default ] dormant-transition initial-session-setup
```

- **no**
  Terminates the A10 session, when PDSN receives the A11-RRQ (Type 4) before the original session established completely.

- **default**
  Keeps the A10 session live in case of A11-RRQ (Type 4) is received before the original session is established completely.

**Usage**

When the status of A10 session goes to dormant before the session for the original MN is established completely, the different MN may possibly send the A11-RRQ (Type 4) to the PDSN and PPP renegotiation may start.

This command is used to terminate the A10 session when the PDSN receives the A11-RRQ (Type 4) before the session for original MN is established completely.

**Example**

Following command is used to release the A10 session in case of receiving A11-RRQ (Type 4) before the original session is established completely:

```
no dormant-transition initial-session-setup
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Use this command to return to the Exec mode.
enhanced-pcf-redirection

Enables or disables PDSN support for enhanced PCF redirection.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

```
configure > context context_name > pdsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```
[no] enhanced-pcf-redirection
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Disables PDSN support for enhanced PCF redirection.</td>
</tr>
<tr>
<td>enhanced-pcf-redirection</td>
<td>Enables PDSN support for enhanced PCF redirection.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to enable or disable PDSN support for enhanced PCF redirection. By default, this feature is disabled.

**Important:** This is a customer-specific command.

**Example**

The following command will disable PDSN support for enhanced PCF redirection.

```
no enhanced-pcf-redirection
```
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
**fragment**

Enables or disables PPP payload fragmentation.

**Product**

PDSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PDSN Service Configuration

`configure > context context_name > pdsn-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```
[ no | default ] fragment ppp-data
```

- **no**
  
  Disables the fragmentation of ppp data.

- **default**
  
  Default enables ppp data fragmentation.

**Usage**

This command is to indicate to the RP module to NOT fragment PPP payloads being sent to the PCF, if the total packet size (PPP+GRE+IP) exceeds 1500 bytes. Disabling fragmentation may cause the `sessmgr` to perform outer IP fragmentation of the outgoing packet, if the resulting packet exceeds the MED MTU.

**Example**

The following command enables PPP payload fragmentation.

```
fragment ppp-data
```
**gre**

Configures Generic Routing Encapsulation (GRE) parameters for the A10 protocol within the PDSN service.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

```bash
configure > context context_name > pdsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```bash
gre { checksum | checksum-verify | ip-header-dscp value { all-control-packets | setup-packets-only } | protocol-type {any | byte-stream | ppp } | reorder-timeout value | segmentation | sequence-mode { none | reorder } | sequence-numbers | threegppp2-ext-header qos-marking }

no gre { checksum | checksum-verify | ip-header-dscp | segmentation | sequence-numbers | threegppp2-ext-headers qos-marking }

default gre { checksum | checksum-verify | ip-header-dscp | segmentation | sequence-numbers | threegppp2-ext-headers qos-marking }

no gre { checksum | checksum-verify | ip-header-dscp | segmentation | sequence-numbers | threegppp2-ext-headers qos-marking }

default gre { checksum | checksum-verify | ip-header-dscp | segmentation | sequence-numbers | threegppp2-ext-headers qos-marking }
```

---

**no**

Disables the specified functionality.

---

**default**

Restores the specified parameter to its default setting.

---

**checksum**

Default: disabled

Enables the introduction of the checksum field in outgoing GRE packets.

---

**checksum-verify**

Default: disabled

Enables verification of the GRE checksum (if present) in incoming GRE packets.

---

**ip-header-dscp value { all-control-packets | setup-packets-only }**

Default: Disabled

Used to configure the QoS Differentiated Services Code Point (DSCP) marking for GRE packets.
value: Represents the DSCP setting. It represents the first six most-significant bits of the ToS field. It can be configured to any hex value from 0x0 through 0x3F.

all-control-packets: Dictates that the DSCP marking is to be provided in all GRE control packets.

setup-packets-only: Dictates that the DSCP marking is to be provided only in GRE setup packets.

\[ \text{protocol-type} \{ \text{any} | \text{byte-stream} | \text{ppp} \} \]

Specifies the protocol used for GRE encapsulation that is acceptable to:
any: Specifies that the PDSN service will accept GRE packets encapsulated using any protocol.
byte-stream: Specifies that the PDSN service will accept GRE packets only encapsulated using byte stream. Using byte stream encapsulation, PPP packets are framed at different intervals and sent.
ppp: Specifies that the PDSN service will accept GRE packets only encapsulated using the Point-to-Point Protocol (PPP). Using PPP encapsulation, PPP packets are framed at regular intervals and sent.

reorder-timeout

Default: 100

Configures max number of milliseconds to wait before processing reordered out-of-sequence GRE packets. milliseconds must be an integer from 0 through 5000.

segmentation

Default: disabled

Enables GRE Segmentation for the PDSN service.

sequence-mode \{ none | reorder \}

Default: none

Configures handling of incoming out-of-sequence GRE packets.
none: Specifies that sequence numbers in packets are ignored and all arriving packets are processed in the order they arrive.
reorder: Specifies that out of sequence packets are stored in a sequencing queue until one of the conditions is met:
- The reorder timeout occurs: All queued packets are sent for processing and the accepted sequence number is updated to the highest number in the queue.
- The queue is full (five packets): All packets in the queue are sent for processing, the reorder timer is stopped and the accepted sequence number is updated to the highest number in the queue.
- An arriving packet has a sequence number such that the difference between this and the packet at the head of the queue is greater than five. All the packets in the queue are sent for processing, the reorder timer is stopped and the accepted sequence number is updated to the highest number that arrived.
- A packet arrives that fills a gap in the sequenced numbers stored in the queue and creates a subset of packets whose sequence numbers are continuous with the current accepted sequence number. This subset of packets in the queue is sent for processing. The reorder timer continues to run and the accepted sequence number is updated to the highest number in the subset delivered.

sequence-numbers

Enables insertion of GRE sequence numbers in data that is about to be transmitted over the A10 interface. Data coming into the system containing sequence numbers but that is out of sequence is not re-sequenced.
threegpp2-ext-headers qos-marking

When threegpp2-ext-headers qos-marking is enabled and the PCF negotiates capability in the A11 RRQ, the PDSN will include the qos optional data attribute in the GRE 3gpp2 extension header.

The no keyword, enables qos-marking in the gre header based on the tos value in the header.

Usage

The gre protocol-type command can be used to prevent the PDSN service from servicing PCFs that use a specific form of encapsulation.

Use the no gre sequence-numbers command to disable the inclusion of GRE sequence numbers in the A10 data path.

The chassis is shipped from the factory with the authentication options set as follows:

- protocol-type any
- sequence-numbers enabled

Example

Use this command to configure the PDSN service to exclude byte stream encapsulated GRE traffic:

    gre protocol-type ppp
**inter-pdsn-handoff mobility-event-indicator**

Configures the PDSN to support the Mobility Event Identifier (MEI) during inter-PDSN handoffs. The presence of the Mobility Event Indicator (MEI) and Access Network Identifier (ANID) elements in a A11 handoff request represents an Inter-PDSN handoff.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

`configure > context context_name > pdsn-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#!
```

**Syntax**

```
inter-pdsn-handoff mobility-event-indicator

no inter-pdsn-handoff mobility-event-indicator

default inter-pdsn-handoff mobility-event-indicator
```

---

**no**

Disables support for the MEI during inter-PDSN handoffs.

---

**default**

Sets / Restores default value assigned for `inter-pdsn-handoff mobility-event-indicator`. By default it is disabled.

---

**Usage**

Use this command to configure support for the MEI during inter-PDSN handoffs.

**Example**

Use the following command to enable support for the MEI during inter-PDSN handoffs

```
inter-pdsn-handoff mobility-event-indicator
```
inter-pdsn-handover

Configures Inter-PDSN handoff related parameters.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdsn-service)#

Syntax

inter-pdsn-handover use-canid-panid

no inter-pdsn-handover use-canid-panid

default inter-pdsn-handover use-canid-panid

Usage
Disables support for the MEI during inter-PDSN handoffs parameters.

default
Sets / Restores default value assigned for inter-pdsn-handoff mobility-event-indicator. By default it is disabled.

Example
Use this command to configure Inter-PDSN handoff related parameters.

Use the following command to configure Inter-PDSN handoff related parameters.

    inter-pdsn-handover use-canid-panid
ip header-compression rohc

Enters PDSN Service ROHC Configuration Mode and allows you to configure ROHC parameters that the PDSN conveys to the PCF in the initial A11 RRP message before PPP authentication.

By default, ROHC is disabled for a PDSN service.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration
configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdsn-service)#

Syntax

ipheader-compression rohc
default ipheader-compression rohc
no ipheader-compression rohc

Usage
Use this command to enter the PDSN Service ROHC Configuration Mode or disable ROHC for the current PDSN service.

Example
The following command disables ROHC for the current PDSN service and sets all of the values for commands in PDSN Service ROHC Configuration Mode back to their default settings:

no ip header-compression rohc
**ip local-port**

Configures the local User Datagram Protocol (UDP) port for the R-P interfaces’ IP socket.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration
configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```
ip local-port number
```

```
default ip local-port
```

```
  number
  Default: 699
  Specifies the UDP port number.
  number can be any integer value between 1 and 65535.
```

```
default
  Designates UDP port, default value as 699.
```

**Usage**

Specify the UDP port that should be used for communications between the Packet Control Function (PCF) and the PDSN.

**Important:** The UDP port setting on the PCF must match the local-port setting for the PDSN service on the system in order for the two devices to communicate.

**Example**

Use the following command to specify a UDP port of 3950 for the PDSN service to use to communicate with the PCF on the R-P interface:

```
iplocal-port 3950
```
**ip source-violation**

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.

**Product**

PDSN
PDIF

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PDSN Service Configuration

configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```
ip source-violation { clear-on-valid-packet | drop-limit num | period secs | reneg-limit num }

no ip source-violation clear-on-valid-packet

defaultip source-violation { drop-limit | period | reneg-limit }
```

**Syntax Description**

- **no**
  
  Enables/Disables `ip source-violation clear-on-valid-packet`.

- **default**
  
  Configure default settings related to `ip source-violation`.

- **clear-on-valid-packet**
  
  Default: disabled
  
  Configures the service to reset the reneg-limit and drop-limit counters after receipt of a properly addressed packet.

- **drop-limit num**
  
  Default: 10
  
  Sets the number of allowed source violations within a detection period before forcing a call disconnect. If `num` is not specified, the value is set to the default. `num` can be any integer value from 1 to 1000000.

- **period secs**
  
  Default: 120
The length of time, in seconds, for a source violation detection period to last. drop-limit and reneg-limit counters are decremented each time this value is reached.

The counters are decremented in this manner: reneg-limit counter is reduced by one (1) each time the period value is reached until the counter is zero (0); drop-limit counter is halved each time the period value is reached until the counter is zero (0). If \( secs \) is not specified, the value is set to the default. 

\( secs \) can be any integer value from \( 1 \) to \( 1000000 \).

**reneg-limit num**

Default: \( 5 \)

Sets the number of allowed source violations within a detection period before forcing a PPP renegotiation. If \( num \) is not specified, the value is set to the default.

\( num \) can be any integer value from \( 1 \) to \( 1000000 \).

**Usage**

This function is intended to allow the operator to configure a network to prevent problems such as when a user gets handed back and forth between two PDISFs/PDSNs a number of times during a handoff scenario.

This function operates in the following manner:

When a subscriber packet is received with a source address violation, the system increments both the IP source-violation reneg-limit and drop-limit counters and starts the timer for the IP source-violation period.

Every subsequent packet received with a bad source address during the IP source-violation period causes the reneg-limit and drop-limit counters to increment.

For example, if reneg-limit is set to 5, then the system allows 5 packets with a bad source address (source violations), but on the 5th packet, it renegotiates PPP.

If the drop-limit is set to 10, the above process of receiving 5 source violations and renegotiating PPP occurs only once. After the second 5 source violations, the call is dropped. The period timer continues to count throughout this process.

If the configured source-violation period is exceeded at any time before the call is dropped, the reneg-limit counter is checked. If the reneg-limit counter equals zero, the drop-limit counter is decremented by half.

**Example**

The following command sets the drop limit to 15 and leaves the other values at their defaults:

```
ip source-violation drop-limit 15
```
### lifetime

Specifies the time that an A10 connection can exist before its registration is considered expired.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

```
configure > context context_name > pdsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

#### Syntax

```
lifetime time

no lifetime

default lifetime
```

- **no lifetime**
  Specifies that an A10 connection can exist for an infinite amount of time.

- **default lifetime**
  Sets / Restores default value assigned for `lifetime` as 1800.

- **time**
  Default: 1800
  Specifies the time that an A10 connection can exist before its registration is considered expired.
  `time` is measured in seconds and can be configured to any integer value between 1 and 65534.

#### Usage

Set a limit to the amount of time that a subscriber session can remain up whether or not the session is active or dormant. If the lifetime timer expires before the subscriber terminates the session, their connection will be terminated automatically.

Use the `no lifetime` command to delete a previously configured lifetime setting. If after deleting the lifetime setting you desire to return the lifetime parameter to its default setting, use the `default lifetime` command.

#### Example

The following command specifies a time of 3600 seconds (1 hour) for subscriber sessions on this PDSN service:

```
lifetime 3600
```
max-retransmissions

Configures the maximum number of times the PDSN service will attempt to communicate with a PCF before it marks it as unreachable.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdsn-service)#

Syntax

max-retransmissions count

default max-retransmissions

default

Sets / Restores default value assigned for max-retransmissions as 5.

count

Specifies the maximum number of times the PDSN service will attempt to communicate with a PCF before it marks it as unreachable.

count can be configured to any integer value between 1 and 1,000,000.

Usage

If the value configured for the max-retransmissions is reached the call will be dropped.

The chassis is shipped from the factory with the Internet maximum number of retransmissions set to 5.

Example

The following command configures the maximum number of retransmissions for the PDSN service to 3:

max-retransmissions 3
mobile-ip foreign-agent context

For Mobile IP support, specifies the context in which the FA service(s) are configured.

**Product**

PDSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PDSN Service Configuration

`configure > context context_name > pdsn-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```
mobile-ip foreign-agent context context_name [ fa-service name ]
```

```
no mobile-ip foreign-agent context
```

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enables/Disables mobile-ip foreign-agent context</td>
</tr>
</tbody>
</table>

```
context_name
```

Specifies the name of the previously configured context that facilitates the FA service(s). context_name must be between 1 and 79 alpha or numeric characters and is case sensitive.

```
[ fa-service name ]
```

This optional keyword allows you to link the PDSN service to a particular FA service in the specified context. name is the name of the FA service to link to. name is a string of size 1 to 63

**Usage**

FA services on the system can be configured either in the same or different contexts from those facilitating PDSN services. When they are configured in separate contexts, this command configured with a PDSN service instructs the PDSN service to route traffic to the context facilitating the FA service.

Use the `no mobile-ip foreign-agent context` to delete a previously configured destination context.

**Example**

The following command instructs the PDSN service to use the context named FA-destination for FA functionality:

```
mobile-ip foreign-agent context fa-destination
```
mobile-ipv6

Configures Mobile IPv6 parameters within specific PDSN service.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration
configure > context context_name > psdn-service service_name

Entering the above command sequence results in the following prompt:
[context_name]host_name(config-psdn-service)#

Syntax

mobile-ipv6 mobile-access-gateway context context_name [ mag-service name ]

mobile-access-gateway

Configures Mobile Access Gateway (MAG) parameters within specific PDSN service.

class context context_name

Designates name of the context in which the MAG service is configured. Must be followed by context name of MAG service.
context_name is a string of size 1 to 79.

mag-service name

Designates name of the MAG service in that context. Must be followed by MAG service name.
name is a string of size 1 to 63.

Usage
This command is used to configure Mobile IPv6 parameters and Mobile Access Gateway (MAG) parameters within specific PDSN service.

Example
The following command configures Mobile IPv6 parameters and Mobile Access Gateway (MAG) parameters within specific PDSN service.

mobile-ipv6 mobile-access-gateway context psdn1 mag-service serv1
**msid length**

Configures checking the length of the A11 MSID in A11 Session Specific Extn and airlink records.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

```
configure > context context_name > pdsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```
msid length { [ min min_length ] | max max_length }
```

**default msid length**

```
default
```

Specifies the default length of MSID (10 to 15) as per standard. By default `msid` is disabled.

```
min min_length
```

Specifies the minimum length for MSID.

`min_length` is any Integer value between 10 to 15, but should be less than `max_length` specified with `max`. Default is 10.

```
max max_length
```

Specifies the maximum length for MSID.

`max_length` is any Integer value between 10 to 15, but should be more than `min_length` specified with `min`. Default is 15.

**Usage**

MSID length can be configured either in the standard length or different customized length form. This command is used to specify the allowed length of MSID.

**Example**

The following command specifies an MSID length between 12 and 15:

```
msid length min 12 max 15
```
nai-construction

Specifies a domain alias that will be used to represent the context which the PDSN service should use for AAA functionality.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

```
configure > context context_name > pdsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```
nai-construction domain alias

no nai-construction domain
```

```
domain alias
```

`alias` represents the “domain” name that you would like to associate with the context in which AAA functionality is configured. `alias` can be between 1 and 79 alpha and/or numeric characters and is case-sensitive.

**Usage**

Enabling NAI will be constructed for the subscriber in the event that their mobile station (MS) does not negotiate CHAP, PAP, or MSCHAP. If this option is selected, no further attempts will be made to authenticate the user. Instead, the constructed NAI will be used for accounting purposes.

The context specified by this command would be used to provide the communication with the RADIUS accounting server.

Use the `no nai-construction domain` command to deleted a configured alias.

**Important:** This command should only be used if the PDSN service is configured to allow no authentication using the authentication allow-noauth command.

Additionally, the `aaa constructed-nai` command in the Context Configuration mode can be used to configure a password for constructed NAIs.

**Example**

The following command configured a domain alias of `aaa_context` for the PDSN service to use when an NAI is constructed for a subscriber session:

```
nai-construction domain aaa_context
```
new-call conflict

Enable or disable to send A11-RUPD to current PCF, when system receives the A11-RRQ(Type1) from new PCF during the session exists.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

[context_name]host_name(config-pdsn-service)#

Syntax

[ no | default ] new-call conflict terminate-session-old-pcf

no
Disable to send A11-RUPD to current PCF, when system receives the A11-RRQ(Type1) from new PCF during the session exists.

default
Enable to send A11-RUPD to current PCF, when system receives the A11-RRQ(Type1) from new PCF during the session exists.

Usage
This configuration supports to enable or disable to send A11-RUPD to current PCF, when the system receives the A11-RRQ(Type1) from new PCF during the session exists.

If the configuration is **no new-call conflict terminate-session-old-pcf** system will not send registration update to old PCF on receiving a new call (A11-RRQ(Type1)) request for an existing active/dormant session. The default behavior is to send registration updates.

Example
The following command configured a system to send a registration update on receiving an A11-RRQ (Type 1) request for an existing active/dormant session:

    new-call conflict terminate-session-old-pcf
**pcf-monitor**

Enables the monitoring of all the PCFs that have sessions associated with it. The PDSN stops monitoring a PCF if it is determined to be down. Once a PCF is determined to be down, the PDSN tears down all sessions that correspond to the PCF and generates AAA Accounting Stop messages. All the PCFs that are connected to the PDSN service are monitored.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

```plaintext
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```plaintext
cpf-monitor [ interval seconds | max-inactivity-time seconds | num-retry num | timeout seconds ]

[ no | default ] pcf-monitor
```

---

**pcf-monitor**

Entering the command with no keywords enables the PCF monitoring function with all parameters set to the defaults.

---

**no**

Disables the pcf monitoring function.

---

**default**

Sets / Restores default value assigned for pcf-monitor.

---

**interval seconds**

Default: 60 seconds
Sets the amount of time to wait between ping request messages.
seconds must be an integer in the range from 1 through 3600.

---

**max-inactivity-time seconds**

Default: 120 seconds
The maximum amount of time (seconds) with no A10 traffic from a PCF before the ICMP-ping mechanism is triggered.
seconds must be an integer from 1 through 3600.
num-retry num

Default: 5
Sets the number of times that the PDSN retries to ping the PCF. When num-retry for a given PCF has been exhausted with no response, sessions that correspond to the non-responsive PCF are terminated and Accounting Stop records for each terminated session are generated. num must be an integer in the range from 0 through 100.

timeout seconds

Default: 3 seconds
The amount of time to wait for a response before retrying. seconds must be in the range from 1 through 10.

Usage
Use this command to enable the PDSN service to monitor the PCFs that have sessions associated with the PDSN service.

Example
The following command enables PCF monitoring with parameters set to the defaults:

    pcf-monitor

The following command enables PCF monitoring and sets the timeout to 10 seconds:

    pcf-monitor timeout 10

The following command disables pcf-monitoring:

    no pcf-monitor
pcf-session-id-change restart-ppp

Manages current session and PPP renegotiation on GRE-key change without any change in PCF/PANID/CANID. This command disables or enables the PPP renegotiation restart on receiving an RP registration request from the current PCF with GRE key (PCF session Id) change. With this command the PDSN aborts and restarts the call causing PPP renegotiation.

This is enabled by default.

**Product**

PDSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > PDSN Service Configuration

`configure > context context_name > pdsn-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```
[ no | default ] pcf-session-id-change restart-ppp
```

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disables the pcf-session-id-change restart-ppp function. With this option PDSN does not restart the PPP renegotiation on GRE key change from current PCF in an RP registration request, unless it indicates change in PCF/PANID/CANID.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set the pcf-session-id-change function to the default state on enabled.</td>
</tr>
</tbody>
</table>

**Usage**

GRE key (PCF session ID) is sued to identify the data packet for a session and is negotiated through the A11 signaling messages between PCF and PDSN. By default PDSN aborts and restart the PPP renegotiation on receipt of any RP registration request with change in GRE key or PCF session Id. With use of no pcf-session-id-change restart-ppp command PDSN is configured to disable the restart of call or PPP renegotiation on receipt of any RP registration request with changed GRE key, unless it has any PCF/ANID/CANID change. PDSN silently switches the GRE key for the session, retaining the existing PPP session.

**Example**

The following command disables the PPP renegotiation restart action on receipt of any RP RRQ with changed GRE key from same PCF/PANID/CANID.

```
no pcf-session-id-change restart-ppp
```
pdsn type0-tft attempt-inner-match

Configures a type0 traffic flow template (tft) to a type1 traffic flow template.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

```
configure > context context_name > pdsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```
[ no | default ] pdsn type0-tft attempt-inner-match
```

- **no**
  
  Disables *pdsn type0-tft attempt-inner-match*.

- **default**
  
  Sets / Restores default value assigned for *pdsn type0-tft attempt-inner-match*.

**Usage**

This CLI is used make PDSN match inner IP packets for an AIMS call. When enabled, the PDSN tries to match a type-0 tft to match both outer and inner packet, so that MN can use a Type-0 filter for HoA traffic which are tunneled.

This is disabled by default.

**Example**

The following command enables type0 tft:

```
pdsn type0-tft attempt-inner-match
```
peer-pcf

Configures settings for any PCF that has a connection with this PDSN.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

```
configure > context context_name > pdsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```
peer-pcf { ip_address | ip_address/mask } bcmcs-framing { hdlc-like | segment-based }
```

- `ip_address` must be specified using the standard IPv4 dotted decimal notation or colon notation for IPv6.
- `ip_address/mask` must be specified using the standard IPv4 dotted decimal notation or colon notation for IPv6, followed by the mask.

```
bcmcs-framing { hdlc-like | segment-based }
```

Specifies the type of bcmcs_framing to use for this PCF connection.

- `hdlc-like`: applies HDLC-like framing for all BCMCS flows
- `segment-based`: applies segment-based framing for all BCMCS flows

**Usage**
Use this command to configure the settings for any PCF that is connected to this PDSN. You can also specify bcmcs framing settings to use for the connection.

**Example**

The following command configures the peer-pcf for an IP address of 131.2.3.4:

```
peer-pcf 131.2.3.4
```
pma-capability-indicator

Enables sending PMIP Capability Indicator VSA in Access Request.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

```bash
configure > context context_name > pdsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```
pma-capability-indicator  [ 3gpp2 ]
[ no  |  default  ] pma-capability-indicator
```

---

3gpp2

Use 3GPP2 defined VSA. Default is to use Custom1 VSA.

---

no

Enables/Disables sending PMIP Capability Indicator VSA in Access Request.

---

default

Sets / Restores default value assigned for PMIP Capability Indicator.

---

**Usage**

Use this command to enable sending PMIP Capability Indicator VSA in Access Request.

**Example**

The following command enables sending PMIP Capability Indicator using 3GPP2 defined VSA in Access Request.

```
pma-capability-indicator 3gpp2
```
policy

Configures PDSN service policies.

Sets / Restores default value assigned for specified PDSN service policies.
policy msid-match msid_with_wildcards redirect address [ weight weight_num ] [ address2 [ weight weight_num ] ... address16 [ weight weight_num ] ] [ weight weight_num ]

Specifies how a PDSN service should handle an incoming call that matches a list of wildcard MSIDs.

- **msid_with_wildcards**: An MSID in which up to 16 digits have been replaced with the wildcard ‘$’. This defines the list of possible matches for incoming calls.
- **redirect**: This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the PDSN service rejects new sessions with an A11 Registration Reply Code of 88H (unknown PDSN address) and provides the IP address of an alternate PDSN. This command can be issued multiple times.
- **address**: The IP address of an alternate PDSN expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.
- **weight weight_num**: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. weight_num must be an integer from 1 through 10.

policy overload { redirect address [ weight weight_num ] [ address2 [ weight weight_num ] ... address16 [ weight weight_num ] ] | reject [ use-reject-code { admin-prohibited | insufficient-resources } ] } }

Specifies how a PDSN service should handle an overload condition.

- **redirect**: This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the PDSN service rejects new sessions with an A11 Registration Reply Code of 88H (unknown PDSN address) and provides the IP address of an alternate PDSN. This command can be issued multiple times.
- **address**: The IP address of an alternate PDSN expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.
- **weight weight_num**: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. weight_num must be an integer from 1 through 10.
- **reject**: This option will cause any overload traffic to be rejected. The PDSN will send an A11 Registration Reply Code of 82H (insufficient resources).
- **use-reject-code admin-prohibited**: When this keyword is specified and traffic is rejected, the error code admin prohibited is returned instead of the error code insufficient resources. This is the default behavior.
- **use-reject-code insufficient-resources**: When this keyword is specified and traffic is rejected, the error code insufficient resources is returned instead of the error code admin prohibited.

policy pcf-zone-match zone_number redirect address [ weight weight_num ] [ address2 [ weight weight_num ] ... address16 [ weight weight_num ] ] [ [ redirect address [ weight weight_num ] [ address2 [ weight weight_num ] ... address16 [ weight weight_num ] ] ]

Specifies how a PDSN service should handle an incoming call that matches a predefined zone number.

- **zone_number**: An integer between 1 and 32 that defines the zone incoming calls must match for redirection.
- **redirect**: This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the PDSN service rejects new sessions with an A11 Registration Reply Code of 88H (unknown PDSN address) and provides the IP address of an alternate PDSN. This command can be issued multiple times.
address: The IP address of an alternate PDSN expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.

weight weight_num: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. weight_num must be an integer from 1 through 10.

policy rrq mei-from-current-pcf suppress-ppp-restart
rrq configures policy for PPP restart after getting mei in rrq.
mei-from-current-pcf mei is received in rrq from current pcf.
suppress-ppp-restart suppresses ppp restart when mei is received in rrq from current pcf

policy service-option enforce
service-option configures R-P service-option to use for specific PDSN service. Must be followed by valid service-option number, ranging from 0 to 1000.
enforce designates enforcement of R-P service-option number.

policy unknown-cvse enforce
unknown-cvse configures PDSN service unknown cvse policy.
enforce enforces unknown cvse policy where unknown CVSEs in RRQs will cause Deny

Usage
Policies can be implemented to dictate PDSN service behavior for various conditions such as overloading. The system invokes the overload policy if the number of calls currently being processed exceeds the licensed limit for the maximum number of sessions supported by the system. The system automatically invokes the overload policy when an on-line software upgrade is started.
Use the no policy { overload | service-option } command to delete a previously configured policy. If after deleting the policy setting you desire to return the policy parameter to its default setting, use the default policy command.
The chassis is shipped from the factory with the policy options set as follows:
• overload disabled
• sequence-numbers enforced enabled

Caution: Incorrect configuration of the policy msid-match and policy pcf-zone-match keywords could result in sessions failing to be established. For example, if PDSN1 is configured to redirect sessions to PDSN2 while PDSN2 is configured to redirect sessions to PDSN1, a loop is created in which all sessions would fail to be connected. In addition, sessions will not be established if the PDSN to which the sessions are being redirected is unavailable.

Example
The following command configures the PDSN service to redirect traffic to two different destinations with weights of 1 and 10 respectively:

policy overload redirect 192.168.1.100 weight 1 192.168.1.200 weight 10
ppp

Sets PPP tunneling parameters for subscribers in the current PDSN service.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-psdn-service)#

Syntax

ppp [ tunnel-context context_name | tunnel-type { l2tp | none } ]

[ no | default ] ppp tunnel-type

no
Enables/Disables the PPP tunneling parameters for subscribers in the current PDSN service.

default
Sets / Restores default value assigned for PPP tunneling parameters for subscribers in the current PDSN service.

tunnel-context context_name
The name of the context that has a LAC service configured to handle all tunnels from this PDSN service.

tunnel-type { l2tp | none }
12tp: Force all subscriber sessions in this PDSN service to use L2TP tunneling.
none: Do not force L2TP tunneling. This is the default.

Important: If the context specified by the ppp tunnel-context context_name command does not have a LAC service configured and tunnel-type is set to l2tp or the call is rejected.

Important: If the PPP tunnel context has not been set or has been cleared with the no ppp tunnel-context command and tunnel-type is set to l2tp, the context where the current PDSN service resides is used. If that context does not have a LAC service configured the call is rejected.

Usage
Use this command to enable or disable forced L2TP tunneling for all subscribers using this PDSN service. Also use this command to define which context defines the L2TP tunneling parameters.
Example

To set the tunnel context to the context named `context1` and enable forced L2TP tunneling, use the following commands;

```plaintext
ppp tunnel-context context1
ppp tunnel-type l2tp
```

To enable forced L2TP tunneling with IPSEC security, use the following commands;

```plaintext
ppp tunnel-type l2tp-secure
```

To disable forced tunneling, use the following command;

```plaintext
ppp tunnel-type none
```

To clear the setting for the tunnel context, use the following command;

```plaintext
no ppp tunnel-context
```
qos-profile-id-mapping

Creates the customized QoS profile identifier to QoS mapping for IMS authorization support.

**Product**
PDSN

**HA**

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

```
configure > context context_name > pdsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service) #
```

**Syntax**

```
qos-profile-id-mapping profile-id id_num { [ description desc ] | [ downlink-bw dl_bw] | [ drop-rate drop_percentage ] | [ latency latency_duration ] | [ qos-class { class-A | class-B | class-C | class-D | class-E | class-F } ] | [ uplink-bw ul_bw ] } +
[ default | no ] qos-profile-id-mapping profile-id id_num
```

**default**

Configures the specified QoS profile ID for QoS mapping with default values in this PDSN service.

**no**

Removes the configured QoS profile ID mapping in this PDSN service.

**profile-id id_num**

Specifies the profile identifier for QoS parameters to be used as the customized profile ID or modifies the QoS parameters in a profile ID (id_num) coming from RAN.

*id_num* must be an integer between 0 and 65535.

**description desc**

Specifies the user defined description for profile identifier.

*desc* must be an alpha and/or numeric string between 1 and 32 characters.

**downlink-bw dl_bw**

Default: 32
Specifies the downlink (towards the MN) data traffic bandwidth in kilo-bits per second for this QoS profile.

*dl_bw* must be an integer value between 0 and 100000.

**drop-rate drop_percentage**

Default: 0
Specifies the permitted packet drop rate in percentage for traffic flow to this QoS profile. 
\textit{drop\_percentage} must be an integer value between 0 and 1000.

\textbf{latency} \textit{latency\_duration}

Default: 1000

Specifies the permitted latency duration in milli-seconds for this QoS profile. 
\textit{latency\_duration} must be an integer value between 0 and 1000.

\textbf{qos-class \{class-A | class-B | class-C | class-D | class-E | class-F\}}

Default: Class-C

Specifies the type of QoS class associated with this QoS profile

- class-A: Specifies the A type of QoS class.
- class-B: Specifies the B type of QoS class.
- class-C: Specifies the C type of QoS class.
- class-D: Specifies the D type of QoS class.
- class-E: Specifies the E type of QoS class.
- class-F: Specifies the F type of QoS class.

\textbf{uplink-bw ul\_bw}

Default: 32

Specifies the uplink (from the MN) data traffic bandwidth in kilo-bits per second for this QoS profile. 
\textit{ul\_bw} must be an integer value between 0 and 100000.

More than one of the above keywords can be entered within a single command.

\textbf{Usage}

Use this command to define the values associated with the profile ID on the PDSN. This profile ID is used during the mapping to and from the authorized QoS to the QoS parameters for the A10 link. This mapping is required because the PDSN only knows the profile IDs and not the actual configured values for the profile ID in the RAN. Also this configuration allows the use of custom profile IDs for the subscribers.

If no values are defined with a QoS profile ID, the values from matching QoS profile ID from RAN will be applicable to the subscriber traffic.

\textbf{Example}

The following command sets the downlink bandwidth to 32 kbps, latency duration as 1000 ms, uplink bandwidth to 32 kbps, and QoS class to Class-C for the QoS profile ID 11 in a PDSN service:

\begin{verbatim}
default qos-profile-id-mapping profile-id 11
\end{verbatim}
**qos update**

Sets QoS update parameters for policy mismatches or wait timeouts.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

```
configure > context context_name > pdsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```
qos-update { policy-mismatch | wait-timeout seconds action { disconnect-session | downgrade-to-best-effort | drop-packets } }
[ no | default ] qos-update { policy-mismatch | wait-timeout }
```

**no**

**default**

Sets / Restores default value for `qos-update [ policy-mismatch | wait-timeout ]`.

**policy-mismatch**

PDSN raises a TFT violation if there is a QoS policy mismatch.

**wait-timeout seconds action { disconnect-session | downgrade-to-best-effort | drop-packets }**

Sets the wait time for A11 RRQ for QoS changes. `seconds` must be an integer from 1 through 1000.

**action:** configures the action on the wait-timeout

- **disconnect-session:** Drops the call if the A11 RRQ has not been received for the QoS update. This includes all of the IP flows for the session.

- **downgrade-to-best-effort:** Drops packets if the A11 RRQ has not been received for the QoS update. Sends the forward traffic over best effort (flow FF or FE if available).

- **drop-packets:** Drops packets if the A11 RRQ has not been received for the QoS update.

**Usage**

This command provides a PDSN service level configurable to configure an action, if the PCF ignores the QoS Update request from PDSN. It sets the amount of time to wait and the action to take, if no RRQ is received before the timeout. The action can be to drop packets for the flow, disconnect the session or to downgrade to best effort.
Example

```
qos-update policy-mismatch
```

The following command sets `wait-timeout` to 60 seconds and invokes `downgrade-to-best-effort` if the A11 RRQ has not been received for the QoS update:

```
qos-update wait-timeout 60 action downgrade-to-best-effort
```
registration-accept

Allows the PDSN to accept registration requests when a handoff disconnect is in progress. When the PDSN is tearing
down a session and the MN moves over to a new PCF and initiates a new session, the PDSN by default does not accept
the handoff until it tears down the old session.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration
configure > context context_name > psdn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-psdn-service)#

Syntax

[ no | default ]registration-accept handoff session-disconnect-in-progress

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disable accepting of registration requests when a handoff disconnect is still in progress.</td>

<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default is disabled.</td>
</tr>
<tr>
<td>Sets / Restores default value assigned for registration-accept handoff session-disconnect-in-progress.</td>
</tr>
</tbody>
</table>

Usage
Use this command to allow the PDSN service to accept registration requests when a handoff disconnect is still in progress.

Example
registration-accept handoff session-disconnect-in-progress
registration-ack-deny terminate-session-on-error

Configures the PDSN service to terminate an A11 session when a Registration ACK received from the PCF has an error status.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration
configure > context context_name > psdn-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-psdn-service)#
```

**Syntax**

```
[ no | default ] registration-ack-deny terminate-session-on-error
```

- **no**
  Disable terminating A11 sessions on a Registration ACK error from the PCF.

- **default**
  Sets / Restores default value assigned to `registration-ack-deny terminate-session-on-error`.

**Usage**

Use this command to enable the PDSN service to terminate A11 sessions on a Registration ACK error from the PCF.

**Example**

Use the following command to enable this functionality in the PDSN:

```
registration-ack-deny terminate-session-on-error
```
registration-deny

Configures parameters related to registration rejection.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdsn-service)#

Syntax

registration-deny { handoff { closedrp-rp handoff-in-progress | connection-setup-record-absent [ use-deny-code { poorly-formed-request | reason-unspecified } | max-deny-reply-limit num | mismatched-coa-source-address | new-call { connection-setup-record-absent | reverse-tunnel-unavailable } | session-already-active | session-already-closed | session-already-dormant | terminate-session-on-error | use-zero-gre-key}]

[ default | no ] registration-deny { handoff { closedrp-rp handoff-in-progress | connection-setup-record-absent } | mismatched-coa-source-address | new-call | connection-setup-record-absent | reverse-tunnel-unavailable } | session-already-active | session-already-closed | session-already-dormant | terminate-session-on-error | use-zero-gre-key}

default
Sets / Restores default value for registration-deny.

no
Disables the specified option.

handoff { closedrp-rp handoff-in-progress | connection-setup-record-absent [ use-deny-code { poorly-formed-request | reason-unspecified }]

This command configures the handoff behavior.

closedrp-rp handoff-in-progress: Configures parameters related to denying handoffs from Closed-RP to RP systems. When enabled the PDSN rejects retransmitted handoff R-P requests when a handoff is already in progress from Closed RP to RP. The deny code used is 'Reason Unspecified'. The default is disabled meaning that the PDSN simply discards such requests.

connection-setup-record-absent [ use-deny-code { poorly-formed-request | reason-unspecified }]: When enabled the PDSN denies or discards handoff R-P sessions that do not have an Airlink Connection Setup record in the A11 Registration Request. Default is disabled. Default PDSN behavior is to accept such requests.

[ use-deny-code { poorly-formed-request | reason-unspecified }]: Sets the specified Registration Deny Code when denying a handoff because of a missing connection setup record.
max-deny-reply-limit  \texttt{num}

Default: 3

Configures max number of retries of erroneous registration request message from PCF for a session before PDSN terminates the session. \texttt{num} can be from 1 to 10.

mismatched-coa-source-address

Default: disabled

Denies RP requests which have a care-of-address field that is different from the request source address.

new-call \{ connection-setup-record-absent \} \{ use-deny-code \{ poorly-formed-request \} \{ reason-unspecified \} \{ reverse-tunnel-unavailable \}

connection-setup-record-absent: Configures the PDSN to reject calls that do not have the airlink connection setup record in the RRQ.

use-deny-code \{ poorly-formed-request \} \{ reason-unspecified \} When rejecting calls that do not have the airlink setup record, use the specified deny code.

reverse-tunnel-unavailable: Configures the PDSN to reject calls if the GRE key for a user collides with that of another user.

session-already-active

PDSN denies Registration requests for sessions that are already active with the error code “poorly formed request”.

session-already-closed

PDSN denies RP renew and dereg requests with error code 0x8E for absent R-P sessions.

session-already-dormant

PDSN denies Registration requests for sessions that are already dormant with the error code “poorly formed request”.

terminate-session-on-error

Default: Disabled.

Configures PDSN to terminate session if erroneous registration request message is received for the session.

use-zero-gre-key

Configures the PDSN to set the GRE key to zero (0) when denying a new R-P session.

Usage

Use this command to configure parameters relating to the rejection of registration requests.

Example

To reject calls that do not have the airlink setup record in the RRQ, enter the following command:

\texttt{registration-deny new-call connection-setup-record-absent}

To reject calls if the GRE key collides with that of another user, enter the following command:

\texttt{registration-deny new-call reverse-tunnel-unavailable}
To set the GRE key to 0 (zero) when a new R-P session is denied, enter the following command:

```
registration-deny new-call use-zero-gre-key
```
registration-discard

Configures the PDSN service to discard any Registration Request message containing multiple information elements of the same type or a different GRE key for existing IMSI session.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdsn-service)#

Syntax

[ default | no ] registration-discard { bad-extension | gre-key-change | handoff-connection-setup-record-absent }

default
Sets / Restores default value assigned for registration-discard.

no
Disables the discarding of Registration request messages containing multiple information elements or different GRE keys.

bad-extension
Default: Disabled
Configures the PDSN to discard Registration Request message containing multiple information elements of same type.

gre-key-change
Default: Disabled
Configures PDSN to discard Registration Request message containing different GRE key for existing IMSI session. Default is disable

handoff connection-setup-record-absent
Default: Disabled
When enabled, discards A11 Handoff requests that do not contain the Airlink Setup record.

Usage
Use this command to configure the PDSN service to discard and Registration Requests that contain multiple information elements of the same type or discard Registration Requests that contain GRE keys that have different GRE keys for the existing IMSI session.
Example

To configure the PDSN service to discard of Registration Requests that have multiple information elements of the same type, enter the following command:

```
registration-discard bad-extension
```

To configure the PDSN service to discard registration Requests that contain a GRE key that is different than the existing one for the existing IMSI session, enter the following command:

```
registration-discard gre-key-change
```
registration-update

Configures registration update related parameters for the PDSN.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdsn-service)#

Syntax

registration-update { pdsn-code-nvse | wait-timeout secs }
[ default | no ] registration-update { pdsn-code-nvse | wait-timeout }

no
If this option is used with the pdsn-code-nvse keyword, then pdsn-code-nvse configuration is disabled. If this option is used with the wait-timeout keyword, a separate A11 timer is not used. The PDSN waits for the ppp retransmit-timeout and then sends the A11 Update. If a value is provided, then the "ppp retransmit-timeout" is ignored and a separate A11 timeout is started immediately upon sending the LCP Term-Ack. The A11 Update is then sent when the timer expires. A value of 0 sends the A11 Update immediately after sending the LCP Term-Ack.

default
Sets / Restores default value assigned for registration-update { pdsn-code-nvse | wait-timeout }

pdsn-code-nvse
Adds the PDSN code NVSE in all A11 registration update messages.

secs
The number of seconds to wait. secs must be an integer in the range from 0 through 16.

wait-timeout
After the Mobile Node terminates a PPP session between the PDSN and the Mobile Node, the PDSN service waits for the specified time period to receive an A11 RRQ from the PCF before it sends out a Registration-Update to clear the Session from the PCF.

Usage
Use this command to configure registration update related
The `wait-timeout` keyword configures the PDSN to wait the specified amount of time before sending out a Registration-Update to clear the Session from the PCF.

**Example**

Use the following command to set the registration wait-timeout to 16 seconds:

```
registration-update wait-timeout 16
```
retransmission-timeout

Configures the maximum allowable time for the PDSN service to wait for a response from the PCF before it a) attempts to communicate with the PCF again (if the system is configured to retry the PCF) or b) marks the PCF as unreachable.

Product: PDSN
Privilege: Security Administrator, Administrator
Mode: Exec > Global Configuration > Context Configuration > PDSN Service Configuration
configure > context context_name > psdn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-psdn-service)#

Syntax:

retransmission-timeout time

[ default | no ] retransmission-timeout

no

Enables/Disables the retransmission-timeout.

default

Sets / Restores default value assigned for retransmission-timeout.

time

Specifies the maximum allowable time for the PDSN service to wait for a response from the PCF before it a) attempts to communicate with the PCF again (if the system is configured to retry the PCF) or b) marks the PCF as unreachable.

time is measured in seconds and can be configured to any integer value between 1 and 1,000,000.

Usage:

Use the retransmission timeout command in conjunction with the max-retransmissions command in order to configure the PDSN services behavior when it does not receive a response from a particular PCF.
Use the no retransmission-timeout command to delete a previously configured timeout value. If after deleting the lifetime setting you desire to return the lifetime parameter to its default setting, use the default retransmission-timeout command.
The chassis is shipped from the factory with the retransmission timeout set to 3 seconds.

Example:

The following command configures a retransmission timeout value of 5 seconds:

retransmission-timeout 5

The following command deletes a previously configured retransmission-timeout setting:
noretransmission-timeout
service-option

If the service option policy is enabled, this command specifies the service options supported by the PDSN service.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdsn-service)#

Syntax

service-option number
no service-option number

no
Enables/Disables the service-option number

default
Sets / Restores default value assigned for service-option.

number
Default: 7, 15, 22, 23, 24, 25, 33, 59, 67
Specifies a specific Service Option (SO) number that this PDSN service is allowed to support.
number can be configured to any integer value between 1 and 1000.

Usage

Use the service option command in conjunction with the policy service option enforce command to configure specific SO numbers that are supported. If a particular SO number is not configured, then any subscriber session received with that SO number will be rejected and an A11 Registration Reply Code of 86 (poorly formed request) will be sent.

By default, PDSN services are configured to support the following service option numbers:

• 7: PCF specific
• 15: PCF specific
• 22: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS1 forward, RS1 reverse)
• 23: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS1 forward, RS2 reverse)
• 24: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS2 forward, RS1 reverse)
• 25: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS2 forward, RS2 reverse)
• 33: 3G High Speed Packet Data
- 59: High Rate Packet Data
- 67: RP A10 connection

**Important:** Option 67 is used for auxiliary connections for Rev-A calls. PPP encapsulation of data packets does not flow over this service option connection. ROHC can be performed without PPP for this service option.

Use the `no service-option number` command to delete a previously configured service option. If after deleting the service option setting you desire to return the service option parameter to its default setting, use the `default service-option command`.

**Example**

The following command enables a service option of 12:

```
service-option 12
```

The following command disables the default service option 59:

```
no service-option 59
```
**setup-timeout**

Specifies the maximum amount of time allowed for session setup.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

```
configure > context context_name > pdsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```
[ no ] setup-timeout seconds
```

- **default setup-timeout**
  
  ```
  default
  
  Sets / Restores default value assigned for setup-timeout.
  
  seconds
  
  Default: 60 seconds
  
  The maximum amount of time, in seconds, to allow for setup of a session. seconds must be an integer from 1 through 1000000
  ```

**Usage**

Use this command to set the maximum amount of time allowed for setting up a session.

**Example**

Use the following command to set the maximum time allowed for setting up a session to 300 seconds:

```
setup-timeout 300
```
simple-ip allow

Enables or disables Simple-IP sessions from making a connection before authorization takes place.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

```
configure > context context_name > pdsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)#
```

**Syntax**

```
[no | default ] simple-ip allow
```

- **no**
  
  When a session attempts PPP authentication, it is assumed that it is a Simple-IP session and it is disconnected before the user is authenticated (RADIUS or local authentication). Also, if `allow-noauth` is enabled and PPP authentication is not performed, after IPCP the session is disconnected if it is discovered that it is a Simple-IP session.

- **default**
  
  Reset this command to allow Simple-IP sessions to connect.

**Usage**

Use this command to prevent Simple-IP sessions from connecting to a PDSN service.

**Example**

The following command configures the PDSN service so that it will reject any Simple-IP sessions:

```
nosimple-ip allow
```

The following command configures the PDSN service to allow Simple-IP sessions:

```
simple-ip allow
```
spi

Configures the security parameter index (SPI) between the PDSN service and the PCF. This command also configures the redirection of call based on PCF zone.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdsn-service)#

Syntax

```
spi remote-address { pcf_ip_address | ip_addr_mask_combo } spi-number number {
encrypted secret enc_secret | secret secret } [ description string ] [ hash-algorithm { md5 | rfc2002-md5 } ] [ replay-protection { nonce | timestamp } ] [ timestamp-tolerance tolerance ] [ zone zone_id ]
```

no spi remote-address pcf_ip_address spi-number number

remote-address { pcf_ip_address | ip_addr_mask_combo }

pcf_ip_address: Specifies the IP address of the PCF. pcf_ip_address is an IP address expressed in IP v4 dotted decimal notation.

ip_addr_mask_combo: Specifies the IP address of the PCF and specifies the IP address network mask bits. ip_addr_mask_combo must be specified using the form ‘IP Address/Mask Bits’ where the IP address must either be an IPv4 address expressed in dotted decimal notation or an IPv6 address expressed in colon notation and the mask bits are a numeric value which is the number of bits in the subnet mask.

spi-number number

Specifies the SPI (number) which indicates a security context between the PCF and the PDSN in accordance with IOS 4.1 and RFC 2002. number can be configured to any integer value between 256 and 4294967295.

encrypted secret enc_secret | secret secret

Configures the shared-secret between the PDSN service and the PCF. The secret can be either encrypted or non-encrypted.

encrypted secret enc_secret: Specifies the encrypted shared key (enc_secret) between the PCF and the PDSN service. enc_secret must be between 1 and 254 alpha and/or numeric characters and is case sensitive.

secret secret: Specifies the shared key (secret) between the PCF and the PDSN services. secret must be between 1 and 127 alpha and/or numeric characters and is case sensitive.

The encrypted keyword is intended only for use by the chassis while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the

secret keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

```
description string
```
This is a description for the SPI. string must be an alpha and or numeric string of from 1 through 31 characters.

```
hash-algorithm { md5 | rfc2002-md5 }
```
Default: md5
Specifies the hash-algorithm used between the PDSN service and the PCF.
- md5: Configures the hash-algorithm to implement MD5 per RFC 1321.
- rfc2002-md5: Configures the hash-algorithm to implement keyed-MD5 per RFC 2002.

```
replay-protection { nonce | timestamp }
```
Default: timestamp
Specifies the replay-protection scheme that should be implemented by the PDSN service.
- nonce: Configures replay protection to be implemented using NONCE per RFC 2002.
- timestamp: Configures replay protection to be implemented using timestamps per RFC 2002.

```
timestamp-tolerance tolerance
```
Default: 60
Specifies the allowable difference (tolerance) in timestamps that is acceptable. If the difference is exceeded, then the session will be rejected. If this is set to 0, then time stamp tolerance checking is disabled at the receiving end.
tolerance is measured in seconds and can be configured to any integer value between 0 and 65535.

```
zone zone_id
```
Specifies the different PCF zones to configure in PDSN service. Mapping of a zone-number to a set of PDSNs can be done per PDSN service basis.
zzone_id must be an integer value between 1 and 32. A maximum of 32 PCF zones can be configured for a PDSN service.

**Usage**

An SPI is a security mechanism configured and shared by the PCF and the PDSN service. Please refer to IOS 4.1 and RFC 2002 for additional information.
Multiple SPIs can be configured if the PDSN service is communicating with multiple PCFs.

**Important:** The SPI configuration on the PCF must match the SPI configuration for the PDSN service on the system in order for the two devices to communicate properly.

Use the `no` version of this command to delete a previously configured SPI.
This command used with `zone zone_id` redirects all calls on the basis of PCF zone to the specific PDSN on the basis of parameters configured at policy pcf-zone-match command.

**Example**

The following command configures the PDSN service to use an SPI of 256 when communicating with a PCF with the IP address 192.168.0.2. The key that would be shared between the PCF and the PDSN service is q397F65.
spi remote-address 192.168.0.2 spi-number 256 secret q397F65

The following command deletes the configured SPI of 400 for an PCF with an IP address of 172.100.3.200:

```
no spi remote-address 172.100.3.200 spi-number 400
```

The following command creates the configured SPI of 400 for an PCF with an IP address of 172.100.3.200 and zone id as 11:

```
spi remote-address 172.100.3.200 spi-number 400 zone 11
```
**tft-validation wait-timeout**

Configures the TFT validation wait timeout value for QoS changes. The QoS update timer triggers automatic QoS updates based on dynamic policies.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

```plaintext
configure > context context_name > pdsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pdsn-service)>
```

**Syntax**

```plaintext
tft-validation wait-timeout seconds
[ default | no ] tft-validation wait-timeout
```

- **no**
  
  Removes the wait-timeout timer.

- **default**
  
  Sets / Restores default value assigned for tft-validation wait-timeout.

**Usage**

Configures the TFT validation wait time value for A11 RRQ for QoS changes. `seconds` must be an integer from 1 through 65535.

**Example**

Use the following command to set the TFT validation wait-timeout to 5 seconds:

```plaintext
tft-validation wait-timeout 5
```
threshold a11-ppp-send-discard

Sets an alarm or alert for the PDSN service based on the number of packets that the PPP protocol processing layer internally discarded on transmit for any reason.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration
configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdsn-service)#

Syntax

threshold all-ppp-send-discard high_thresh [ clear low_thresh ]

no threshold all-ppp-send-discard

---

high_thresh

Default: 0
The high threshold number of discarded PPP send packets that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

---

clear low_thresh

Default: 0
The low threshold number of discarded PPP send packets that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

---

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of discarded PPP send packets is equal to or greater than a specified number. Alerts or alarms are triggered for the number of discarded PPP send packets is based on the following rules:

- **Enter condition:** Actual number of discarded PPP send packets > High Threshold
- **Clear condition:** Actual number of discarded PPP send packets ≤ Low Threshold

Example
The following command configures a number of discarded PPP send packets threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:

```
threshold all-ppp-send-discard 1000 clear 500
```
threshold a11-rac-msg-discard

Sets an alarm or alert based on the number of Discarded A11 Registration Acknowledgements for the PDSN service.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdsn-service)#

Syntax

threshold a11-rac-msg-discard high_thresh [ clear low_thresh ]

no threshold a11-rac-msg-discard

no

Deletes the alert or alarm.

high_thresh

Default: 0

The high threshold number of Discarded A11 Registration Acknowledgements that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of Discarded A11 Registration Acknowledgements is equal to or greater than a specified number.

Alerts or alarms are triggered for the number of Discarded A11 Registration Acknowledgements based on the following rules:

- **Enter condition:** Actual number of Discarded A11 Registration Acknowledgements > High Threshold
- **Clear condition:** Actual number of Discarded A11 Registration Acknowledgements £ Low Threshold
Example

The following command configures a number of Discarded A11 Registration Acknowledgements threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:

```
threshold all-rac-msg-discard 1000 clear 500
```
threshold a11-rrp-failure

Sets an alarm or alert based on the number of A11 Registration Response failures for the PDSN service.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdsn-service)#

Syntax

threshold a11-rrp-failure high_thresh [ clear low_thresh ]

no threshold a11-rrp-failure

do

Deletes the alert or alarm.

high_thresh

Default: 0

The high threshold number of A11 Registration Response failures that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

clear low_thresh

Default: 0

The low threshold number of A11 Registration Response failures that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of A11 Registration Response failures is equal to or greater than a specified number. Alerts or alarms are triggered for the number of A11 Registration Response failures based on the following rules:

- **Enter condition:** Actual number of A11 Registration Response failures > High Threshold
- **Clear condition:** Actual number of A11 Registration Response failures £ Low Threshold

Example
The following command configures a number of A11 Registration Response failures threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:

```
threshold all-rrp-failure 1000 clear 500
```
threshold a11-rrq-msg-discard

Sets an alarm or alert based on the number of Discarded A11 Registration Requests for the PDSN service.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

configure > context context_name > pdsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pdsn-service) #

Syntax

threshold a11-rrq-msg-discard high_thresh [ clear low_thresh ]

no threshold a11-rrq-msg-discard

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold number of Discarded A11 Registration Requests that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

clear low_thresh

Default: 0
The low threshold number of Discarded A11 Registration Requests that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of Discarded A11 Registration Requests is equal to or greater than a specified number.
Alerts or alarms are triggered for the number of Discarded A11 Registration Requests based on the following rules:

• Enter condition: Actual number of Discarded A11 Registration Requests > High Threshold
• Clear condition: Actual number of Discarded A11 Registration Requests ≤ Low Threshold

Example
The following command configures a number of Discarded A11 Registration Requests threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:

```
threshold all-rrq-msg-discard 1000 clear 500
```
threshold init-rrq-rcvd-rate

Sets an alarm or alert based on the average number of calls setup per second for the context.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration

configure > context context_name > psdn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-psdn-service)#

Syntax

threshold init-rrq-rcvd-rate high_thresh [ clear low_thresh ]

no threshold init-rrq-rcvd-rate

no

Deletes the alert or alarm.

high_thresh

Default: 0

The high threshold average number of calls setup per second must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 1000000.

clear low_thresh

Default: 0

The low threshold average number of calls setup per second that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 1000000.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the average number of calls setup per second is equal to or greater than a specified number of calls per second.

Alerts or alarms are triggered for the number of calls setup per second based on the following rules:

- **Enter condition:** Actual number of calls setup per second $>$ High Threshold
- **Clear condition:** Actual number of calls setup per second $\leq$ Low Threshold

Example
The following command configures a number of calls setup per second threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:

```
threshold init-rrq-rcvd-rate 1000 clear 500
```
Chapter 250
PDSN Service RoHC Configuration Mode Commands

The PDSN Service RoHC Configuration Mode is used to configure RoHC (Robust Header Compression) parameters the PDSN service conveys to the PCF in the initial A11 RRP message before PPP authentication.

Mode

Exec > Global Configuration > Context Configuration > PDSN Service Configuration > PDSN Service ROHC configure > context context_name > psdn-service service_name > ip header-compression rohc

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ip-header-compression-rohc)#

Important: The commands, keywords and variables in this mode are available dependent on platform type, product version, and installed license(s).
cid-mode

Enters the RoHC Profile Compression Options Configuration mode and configures options that apply during RoHC compression for the current RoHC profile.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration > PDSN Service ROHC configure > context context_name > pdsn-service service_name > ip header-compression rohc

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ip-header-compression-rohc)#
```

**Syntax**

cid-mode { large | small } max-cid integer
default cid-mode

**default cid-mode**

- **default**
  Reset all options in the RoHC Profile Compression Configuration mode to their default values.

- **large**
  Use large packets with optional information for RoHC

- **small**
  This is the default packet size.
  Use small RoHC packets.

- **max-cid integer**
  Default: 15
  The highest context ID number to be used by the compressor. integer must be an integer from 0 through 15 when small packet size is selected and must be an integer from 0 through 31 when large packet size is selected.

**Usage**

Use this command to set the RoHC packet size and define the maximum

**Example**

The following command sets large RoHC packet size and sets the maximum CID to 100:

```
cid-mode large max-cid 100
```

The following command sets the cid-mode to the default settings of small packets and max-cid 0:
default cid-mode
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
exit
```

Usage
Use this command to return to the parent configuration mode.
mrru

Sets the size of the largest reconstructed reception unit, in octets, that the decompressor is expected to reassemble from segments. The size includes the CRC. If MRRU is negotiated to be 0, no segment headers are allowed on the channel.

Mode
Exec > Global Configuration > Context Configuration > PDSN Service Configuration > PDSN Service ROHC
configure > context context_name > pdsn-service service_name > ip header-compression rohc

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ip-header-compression-rohc)#

Syntax

mrru num_octets

default mrru

default
reset the value of this command to its default setting

num_octets

Default: 0
This is the number of octets for the maximum size of the largest reconstructed reception unit allowed.
num_octets must be an integer from 0 through 65535.

Usage

Use this command to set the size, in octets, of the largest reconstructed reception unit, in octets, that the decompressor is expected to reassemble from segments.

Example

The following command sets the largest reconstructed reception unit to 1024 octets:

mrru 1024

The following command resets the mrru size to its default of 0 octets:

default mrru
**profile**

Specifies the header compression profiles to use. A header compression profile is a specification of how to compress the headers of a specific kind of packet stream over a specific kind of link. At least one profile must be specified.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PDSN Service Configuration > PDSN Service ROHC configure > context context_name > pdsn-service service_name > ip header-compression rohc

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ip-header-compression-rohc)#
```

**Syntax**

```
profile { [ esp-ip ] [ rtp-udp ] [ udp-ip ] [ uncompressed-ip ] }
```

**default profile**

```
default
Default: esp-ip rtp-udp udp-ip uncompressed-ip
This command sets the RoHC profile configuration back to its default setting.
```

```
esp-ip
This enables RoHC Profile 0x0003 which is for ESP/IP compression, compression of the header chain up to and including the first ESP header, but not subsequent subheaders.
```

```
rtp-udp
This enables RoHC Profile 0x0001 which is for RTP/UDP/IP compression
```

```
udp-ip
This enables RoHC Profile 0x0002 which is for UDP/IP compression, compression of the first 12 octets of the UDP payload is not attempted.
```

```
uncompressed-ip
This enables RoHC Profile 0x0000 which is for sending uncompressed IP packets.
```

**Usage**

Use this command to specify the RoHC header compression profiles to use.

**Example**

The following command sets the profiles to use as esp-ip and rtp-udp:

```
profile esp-ip rtp-udp
```
Chapter 251
Peer Profile Configuration Mode Commands

The Peer Profile Configuration Mode is used to configure the peer profiles for GGSN, P-GW, or S-GW service to allows flexible profile based configuration to accommodate growing requirements of customizable parameters with default values and actions for peer nodes of GGSN, P-GW, or S-GW.

Mode

Exec > Global Configuration > Peer Profile Configuration

configure > peer-profile service-type <service-type> {default | name peer_profile_name}

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-peer-profile-ggsn/pgw/sgw-access/nw)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
description

Sets a relevant descriptive string for the specific peer profile. By default it is blank.

Product

GGSN
P-GW
SAEGW
S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Peer Profile Configuration

configure > peer-profile service-type <service-type> {default | name peer_profile_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-peer-profile-ggsn/pgw/sgw-access/nw)#

Syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>description desc_string</td>
<td>Indicates the description for GGSN, P-GW, or S-GW service peer profile configured through this mode; must be an alphanumeric string from 1 through 64 characters.</td>
</tr>
<tr>
<td>no description</td>
<td>Removes the set description for GGSN, P-GW, or S-GW service peer profile configured through this mode.</td>
</tr>
</tbody>
</table>

Usage

Use this command to set a relevant description for GGSN, P-GW, or S-GW peer profile configured through this mode.

Example

The following command sets the description ggsn_gtpc_SGSN_profile1 for a GGSN peer profile:

description ggsn_gtpc_SGSN_profile1
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
dend

Usage
Use this command to return to the Exec mode.
`exit`

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
gtpc

Configure the GTP-C parameters for this peer profile.

Product
GGSN
P-GW
SAEGW
S-GW

Privilege
Administrator

Mode
Exec > Global Configuration > Peer Profile Configuration

configure > peer-profile service-type <service-type> {default | name peer_profile_name}

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-peer-profile-ggsn/pgw/sgw-access/nw)#

Syntax

gtpc { echo { interval inter_dur | retransmission-timeout echo_retrans_dur } | max-retransmission retrans_num | retransmission-timeout retrans_dur }

default gtpc { echo [ interval | retransmission-timeout ] | max-retransmissions | retransmission-timeout }

no gtpc echo

---

default
Resets the specified parameter to its default value.

---

no
Disables or removes the configured GTP-C echo settings.

---

echo interval inter_dur
Default: 60
Configures the duration, in seconds, between the sending of echo request messages. inter_dur must be an integer from 60 through 3600.

---

echo retransmission-timeout echo_retrans_dur
Default: 3
Configures the echo retransmission timeout, in seconds, for the this peer profile. echo_retrans_dur must be an integer ranging from 1 to 20.
max-retransmissions retrans_num
retransmission-timeout retrans_dur
retransmission-timeout-ms retrans_dur

Usage
Use this command to configure GTP-C parameters for GGSN, P-GW, or S-GW peer profile.

Example
The following command sets the GTP-C echo parameters to default values:

  default gtpc echo

The following command sets the GTP-C retransmission timeout parameters to 4 seconds:

  default gtpc retransmission-timeout-ms
lawful-intercept

Refer to the *Cisco ASR 5x00 Lawful Intercept Configuration Guide* for a description of this command.
Chapter 252
Peer-Server Configuration Mode Commands

The Peer-Server configuration mode provides the commands to define and manage the peer server configuration part of the SS7 routing on an SGSN.

Mode

Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration

configure > ss7-routing-domain rd_id variant variant_type > peer-server id server_id

Entering the above command sequence results in the following prompt:

[local]host_name(config-ss7-rd-ss7rd_id-ps-id-peer-server_id)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Change the mode back to the Exec mode.
exit

Exits the configuration mode and returns to the Global configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Return to the Global configuration mode.
mode

Configures the operational mode of the peer-server.

Product

SGSN

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration

cfg mode ( loadshare | standby )

loadshare

Sets the peer-server to load share. This is the default.

standby

Sets the peer-server to be in standby mode.

Usage

Configure the operational mode of the peer-server.

Example

Configure the peer-server for standby mode.

    mode standby
**name**

Defines the unique identification - the name - of the peer-server in the SS7 routing domain.

**Product**

SGSN

HNB-GW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration

configure > ss7-routing-domain rd_id variant variant_type > peer-server id server_id

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ss7-rd-ss7rd_id-ps-id-peer-server_id)#
```

**Syntax**

```
name name

no name
```

**no**

Removes the peer server’s name from this configuration instance.

**name**

```
name name
```

name: Must be a string of 1 to 64 alphanumeric characters to define a unique identification for the peer-server within the specific SS7 routing domain. Double quotes must be used to create a name that includes spaces.

**Usage**

Create peer server names that are easy to remember and uniquely identify the PSP.

**Example**

Use this command to create an easily remembered alphanumeric name for the peer-server:

```
name "Berlin West"
```
**psp**

Creates the peer-server-process (PSP) instance and enters the PSP configuration mode. See the PSP Configuration Mode chapter in this guide for information on the configuration commands.

![Important:](Image) This command configures a mandatory parameter in the configuration of the peer server.

**Product**
- SGSN
- HNB-GW

**Privilege**
- Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration

```
configure > ss7-routing-domain rd_id variant variant_type > peer-server id server_id
```

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-ss7-ss7-ss7rd_id-ps-id-peer-server_id)#
```

**Syntax**

```
[ no ] psp instance id
```

no

Removes the PSP instance from the peer server configuration.

```
id
```

id Uniquely identifies the specific peer-server-process configuration. The Id must be an integer from 1 to 4 or for SGSN with Release 15.0 or higher, the value range is 1 to 12.

**Usage**

Use this command to define the peer-server-process (PSP) instance ID number for the SGSN configuration.

**Example**

Use this command to create instance #3 for the PSP configuration:

```
psp instance 3
```
routing-context

Defines the ID of the routing context for the peer-server to use.

Important: This command configures a mandatory parameter in the configuration of the peer server.

Product
SGSN
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration
configure > ss7-routing-domain rd_id variant variant_type > peer-server id server_id

Entering the above command sequence results in the following prompt:

[local]host_name(config-ss7-ss7rd_id-ps-ps-id-peer-server_id)#

Syntax

routing-context id
no routing-context

id

id Uniquely identifies a specific routing context for the peer-server-process to use. The Id must be an integer from 1 to 65535.

no

Removes the routing-context definition from the peer server configuration.

Usage
Use this command to define routing contexts for the peer server.

Example
Define routing-context instance 15:

routing-context 15
self-point-code

This command defines the point-code to identify the SGSN as a peer server.

Product
SGSN
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration
configure > ss7-routing-domain rd_id variant variant_type > peer-server id server_id

Entering the above command sequence results in the following prompt:

[local]host_name(config-ss7-ss7rd_id-ps-id-peer-server_id)#

Syntax

self-point-code point-code

no self-point-code

point-code

Point-code is an SS7-type address for an element in the SS7 network. Point-codes must be defined in dotted-decimal format in a string of 1 to 11 digits. Options include:

• 0.0.1 to 7.255.7 for point-code in the ITU range.
• 0.0.1 to 255.255.255 for point-code in the ANSI range.
• 0.0.1 to 15.31.255 for point-code in the TTC Range.
• A string of 1 to 11 digits in dotted-decimal to represent a point-code in a different range.

no

Removes the self-point-code configuration for this linkset in the peer server.

**Important:** Removing the self-point-code will result in the termination of all traffic on this link.

Usage

Use this command to define the point-code to identify the SGSN.

Example

Use the following command to remove the self-point-code definition from the peer-server configuration:

no self-point-code
Chapter 253
P-GW Service Configuration Mode Commands

The P-GW (PDN Gateway) Service Configuration Mode is used to create and manage the relationship between specified services used for either GTP or PMIP network traffic.

**Mode**

Exec > Global Configuration > Context Configuration > P-GW Service Configuration

```
configure > context context_name > pgw-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pgw-service)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
associate

Associates the P-GW service with specific pre-configured services and/or policies configured in the same context.

Product
P-GW
SAEGW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > P-GW Service Configuration
configure > context context_name > pgw-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pgw-service)#

Syntax

associate { egtp-service name [ lma-service name ] | ggsn-service name | lma-service name [ egtp-service name ] | peer-map map_name ] | qci-qos-mapping name }

no associate { egtp-service | lma-service | peer-map | qci-qos-mapping }

no
Removes the selected association from this service.

egtp-service name [ lma-service name ] | lma-service name [ egtp-service name ]

egtp-service name [ lma-service name ]: Specifies that the P-GW service is to be associated with an existing eGTP service within this context.
Name must be an alphanumeric string of 1 through 63 characters and be an existing eGTP service.
Configure an associated LMA service name to support handoffs between PMIPv6 and GTP. Name must be an alphanumeric string of 1 through 63 characters and be an existing LMA service.
lma-service name [ egtp-service name ]: Specifies that the P-GW service is to be associated with an existing LMA service within this context.
Name must be an alphanumeric string of 1 through 63 characters and be an existing LMA service.
Configure an associated eGTP service name to support handoffs between PMIPv6 and GTP. Name must be an alphanumeric string of 1 through 63 characters and be an existing eGTP service.

ggsn-service name

Specifies that the P-GW service is to be associated with an existing GGSN service within this context.
Name must be an alphanumeric string of 1 through 63 characters and be an existing GGSN service.

peer-map map_name

Specifies that the P-GW service is to be associated with an existing peer map within this context.
map_name must be an alphanumeric string of 1 through 63 characters and be an existing peer map.
Refer to the LTE Policy Configuration Mode Commands chapter for more information on peer map creation.
associate

qci-qos-mapping name

Specifies that the P-GW service is to be associated with an existing QCI-QoS mapping configuration within this context.

*name* must be an alphanumeric string of 1 through 63 characters and be an existing QCI-QoS mapping configuration.

QCI-QoS mapping is typically configured in a AAA context. Refer to the *QCI-QoS Mapping Configuration Mode Commands* chapter for more information.

**Important:** If a GGSN service is associated with a P-GW service, then the GGSN service will use the QCI-QoS mapping tables specified in the *qci-qos-mapping* command and assigned to its associated P-GW service.

**Usage**

Use this command to associate the P-GW service with other pre-configured services and/or policies configured in the same context.

**Example**

The following command associates this service with an eGTP service called *egtp1*:

```
associate egtp-service egtp1
```
authorize-with-hss

This command enables or disables subscriber session authorization via a Home Subscriber Server (HSS) over an S6b Diameter interface. This feature is required to support the interworking of GGSN with P-GW and HA.

**Product**
P-GW
SAEGW

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > P-GW Service Configuration

```
configure > context context_name > pgw-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pgw-service)#
```

**Syntax**

```
authorize-with-hss [ egtp | lma [ s6b-aaa-group aaa-group-name | report-ipv6-addr ] | report-ipv6-addr ]
[ default | no ] authorize-with-hss
```

- **default | no**
  Disables the default authorization of subscriber over S6b interface. Resets the command to the default setting of “authorize locally” from an internal APN authorization configuration.

- **egtp**
  Enables S6b authorization for eGTP only.

- **lma**
  Enables S6b authorization for LMA only.

- **report-ipv6-addr**
  Enables the IPv6 address reporting through Authorization-Authentication-Request (AAR) towards the S6b interface.

**Usage**

Use this command to enable/disable the authorization support for subscriber over S6b interface, which is used between P-GW and the 3GPP AAA to exchange the information related to charging, GGSN discovery, etc.
**dns-client**

Specifies the DNS client context to use for sending DNS queries.

**Product**
- P-GW
- SAEGW

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > P-GW Service Configuration

```plaintext
configure > context context_name > pgw-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pgw-service)#
```

**Syntax**

```plaintext
dns-client context name

[ default | no ] dns-client context
```

---

**default**

Returns the command to the default setting of targeting the DNS client in the context where the P-GW service resides.

---

**no**

Disables DNS queries.

---

**context name**

Specifies the name of the context where the DNS client is used for the resolution of PCSCF-FQDN received from S6b interface.

*name* must be an existing context expressed as an alphanumeric string of 1 through 79 characters.

**Usage**

Use this command to specify the context where the DNS client resides to perform P-CSF-FQDN resolution from the S6b interface.

**Example**

The following command identifies the *egress1* context as the context where the DNS client resides:

```plaintext
dns-client context egress1
```
**egtp**

Configures handling of eGTP related procedures.

**Product**
P-GW
SAEGW

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > P-GW Service Configuration

```bash
configure > context context_name > pgw-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pgw-service)#
```

**Syntax**

```bash
egtp { cause-code temp-fail timeout sec retry retries | modify-bearer-cmd-negotiate-qos | overcharge-protection | sgw-restoration session-hold timeout seconds }
```

**default egtp { cause-code temp-fail | modify-bearer-cmd-negotiate-qos | overcharge-protection | sgw-restoration session-hold }**

**no egtp { cause-code temp-fail | modify-bearer-cmd-negotiate-qos | overcharge-protection | sgw-restoration session-hold }**

**default**

 Resets the command to the default setting.

**no**

 Disables the configuration statement.

- **cause-code temp-fail timeout sec retry retries**

  Enables EGTP Cause Code Handling for when the P-GW receives a temporary failure response from peer (cause code 110). All transactions that were moved to pending queue because of temporary cause failure would be reattempted after temporary failure timer expires. After timer expiry, the P-GW informs PCRF about the transient failure. PCRF sends new RAR and CBR/MBR/UBR would succeed.

  - **timeout sec**: Specifies the time to wait (in seconds) before reattempting the Create Bearer Request (CBR)/Modify Bearer Request (MBR)/Update Bearer Request (UBR).
  - **sec** must be an integer from 1 to 100.
  - **retry retry**: Specifies the maximum number of retries. The P-GW discards CBR/MBR/UBR after the maximum number of retries are exceeded.
  - **retries** must be an integer from 1 to 4.
modify-bearer-cmd-negotiate-qos
This configuration only impacts the PGW QoS negotiation behavior when PCRF is unreachable or event trigger is not registered while handling Modify Bearer Command. By default, this configuration is disabled. When enabled, P-GW will always enforce old QoS values authorized by the PCRF. When disabled, the P-GW will always accept new QoS values (APN-AMBR/Def-EPS-Bearer-QoS) received in Modify Bearer Command.

overcharge-protection
Configures overcharging protection by temporarily not charging during loss of radio coverage. By default, this configuration is disabled.

sgw-restoration session-hold timeout seconds
Enables S-GW restoration functionality and configure session hold timeout on a P-GW service. By default, S-GW restoration is disabled. seconds must be an integer from 1 to 3600. Default: 0 (disabled). On S-GW failure indication, P-GW shall check if S-GW restoration feature is enabled or not. If enabled, P-GW shall maintain all the affected sessions for session-hold timeout. After session-hold timeout, P-GW shall clear all the sessions which are not recovered yet.

Usage
Use this command to configure the behavior of the P-GW/SAEGW for eGTP procedures.

Example
The following command sets the temporary failure timer to 30 seconds and 2 retries:

```
   egtp cause-code temp-fail timeout 30 retry 2
```

The following command configures the P-GW to accept new QoS values from the modify bearer command while the PCRF is not reachable:

```
   egtp modify-bearer-cmd-negotiate-qos
```

The following command enables S-GW restoration functionality and configures session hold timeout on a P-GW service:

```
   sgw-restoration session-hold timeout seconds
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

`exit`

**Usage**

Use this command to return to the parent configuration mode.
fqdn

Configures a Fully Qualified Domain Name for this P-GW service used in messages between the P-GW and a 3GPP AAA server over the S6b interface.

Product
P-GW
SAEGW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > P-GW Service Configuration

configure > context context_name > pgw-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pgw-service)#

Syntax

fqdn host domain_name realm realm_name

[ default | no ] fqdn

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
</table>
| Returns the command to the default setting of “null”.

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
</table>
| Removes the configured FQDN from this service configuration.

<table>
<thead>
<tr>
<th>host domain_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the domain name of the P-GW service.</td>
</tr>
<tr>
<td>domain_name must be an alphanumeric string of 1 through 255 characters.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>realm realm_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the realm name of the P-GW service.</td>
</tr>
<tr>
<td>realm_name must be an alphanumeric string of 1 through 255 characters.</td>
</tr>
</tbody>
</table>

Usage
Use this command to identify the P-GW service using an FQDN required when sending messages over the S6b interface to a 3GPP AAA server.

Important: In order to properly interact with other nodes in the network, the FQDN should be less than or equal to 96 alphanumeric characters.
Topology Matching (eHRPD only)

You may specify which P-GW you wish an HSGW interface to connect with by enabling topology matching within the FQDNs for both the HSGW service and P-GW service. Topology matching selects geographically closer nodes and reduces backhaul traffic for a specified interface.

The following optional keywords enable or disable topology matching when added to the beginning of an FQDN:

- **topon.**`interface_name`
  
  Beginning an FQDN with topon initiates topology matching with available HSGWs in the network. Once this feature is enabled, the rest of the FQDN is processed from right to left until a matching regional designator is found on a corresponding HSGW FQDN.

- **topoff.**`interface_name`
  
  By default, topology matching is disabled. If you enable topology matching for any interfaces within a node, however, all interfaces not using this feature should be designated with topoff.

**Example**

The following command configures the FQDN for this P-GW service as 123abc.all.com with a realm name of all.com:

```plaintext
fqdn host 123abc.all.com realm all.com
```

The following command configures this P-GW service with an FQDN that enables topology matching:

```plaintext
fqdn host topon.interface_name.pgw01.bos.ma.node.epc
    .mnc<value>.mcc<value>.3gppnetwork.org realm
node.epc.mnc.mcc.3gppnetwork.org
```

**Important:** The associated HSGW service must have a corresponding FQDN similar to the following:

```plaintext
topon.interface_name.hsgw01.bos.ma.node.epc.mncvalue.mccvalue.3gppnetwork.org
```
gx-li

Refer to the *Lawful Intercept Configuration Guide* for a description of this command.
newcall

Configures the P-GW to accept or reject requests for a static IP address if the address is already in use by another session.

Product
P-GW
SAEGW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > P-GW Service Configuration

```bash
configure > context context_name > pgw-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pgw-service)#
```

Syntax

```
newcall duplicate-subscriber-requested-address { accept | reject }

no newcall duplicate-subscriber-requested-address
```

no

Returns the command to the default setting of “reject”.

```
duplicate-subscriber-requested-address { accept | reject }
```

Default: reject
accept: Specifies that the old session with the requested address will be ended to accept the new session with the same address.
reject: Specifies that the new session requesting the same address will be rejected.

Usage

Use this command to configure the behavior of the P-GW service when receiving requests for static IP address already in use by other sessions.

Important: This command is only applicable to sessions using services supporting duplicate address abort. These services include HA, GGSN, and P-GW.

Example

The following command allows for the acceptance of requests for static IP addresses already in use by other sessions:

```
newcall duplicate-subscriber-requested-address accept
```
plmn

Configures Public Land Mobile Network identifiers used to determine if a mobile station is visiting, roaming, or belongs to this network.

Product
P-GW
SAEGW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > P-GW Service Configuration
configure > context context_name > pgw-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pgw-service)#

Syntax

plmn id mcc number mnc number [ primary ]

<table>
<thead>
<tr>
<th>id mcc number mnc number</th>
</tr>
</thead>
<tbody>
<tr>
<td>mcc number: Specifies the mobile country code (MCC) portion of the PLMN identifier.</td>
</tr>
<tr>
<td>number is the PLMN MCC identifier and must be an integer from 100 through 999.</td>
</tr>
<tr>
<td>mnc number: Specifies the mobile network code (MNC) portion of the PLMN identifier.</td>
</tr>
<tr>
<td>number is the PLMN MNC identifier and can be configured to a 2- or 3-digit integer from 00 through 999.</td>
</tr>
</tbody>
</table>

primary

When multiple PLMN IDs are configured, the primary keyword can be used to designate one of the PLMN IDs to be used for the AAA attribute.

Usage

The PLMN identifier is used to aid the P-GW service in the determination of whether or not a mobile station is visiting, roaming, or home. Multiple P-GW services can be configured with the same PLMN identifier. Up to five PLMN IDs can be configured for each P-GW Service.

Example

The following command configures the PLMN identifier with an MCC of 462 and MNC of 02:

plmn id mcc 462 mnc 02
**session-delete-delay**

Configures a delay in terminating a session.

**Product**
- P-GW
- SAEGW

**Privilege**
- Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > P-GW Service Configuration
- `configure > context context_name > pgw-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-pgw-service)#
```

**Syntax**

```
session-delete-delay timeout [ msec ]
[ default | no ] session-delete-delay timeout
```

**Usage**

Use this command to set a delay to provide session continuity in break-before-make scenarios.

**Example**

The following command sets the session delete delay to the default setting of 10,000 milliseconds:

```
session-delete-delay timeout
```
setup-timeout

Configures the maximum amount of time the P-GW service takes for creating a session.

Product

P-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > P-GW Service Configuration

configure > context context_name > pgw-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pgw-service)#

Syntax

setup-timeout setup_time

default setup-timeout

default

Configures the default guard timer value for session creation.

setup-time

Default: 60

Specifies the maximum amount of time taken by P-GW for service creation.

setup_time is measured in seconds and can be configured to an integer from 1 through 120.

Usage

Use this command to limit the amount of time allowed for creating a session. If a “Create Session Request” is received and the setup-timeout is configured, the timer starts with the configured value. If the setup timeout is not configured, the timer starts with the default value of 60 seconds.

Example

The following command allows a maximum of 120 seconds for creating a session:

setup-timeout 120
Chapter 254
Plugin Configuration Mode Commands

This chapter describes the commands available in the Plugin Configuration Mode. This mode is associated with the Dynamic Software Upgrade (DSU) process described in the System Administration Guide.

You enter this mode using the plugin command in the Global Configuration mode.

Mode

Exec > Global Configuration > Plugin Configuration
configure > plugin plugin_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-plugin-plugin_name)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**attribute**

This command is not supported in this release.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Plugin Configuration

```bash
configure > plugin plugin_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-plugin-plugin_name)#
```

**Syntax**

```bash
attribute attribute_name attribute_value
```

**Usage**

The command is not supported in this release.
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Use this command to return to the parent configuration mode.
module priority

Configures the priority in the Version Priority List (VPL) for a specified version of a plugin module.

Product
ADC

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Plugin Configuration

configure > plugin plugin_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-plugin-plugin_name)#

Syntax

module priority number version plugin_version attribute attribute_name attribute_value

no module priority number

no

Removes the configured priority in the module priority list.

priority number

Specifies the priority of the plugin module as an integer from 1 through 100. Priority “1” has the highest priority.

version plugin_version

Specifies the version number of the plugin module. The version number is derived from the filename of the downloaded plugin.

attribute attribute_name attribute_value

Specifies an attribute value pair.
attribute_name specifies the name of an attribute value pair as an alphanumeric string from 1 through 255 characters.
attribute_value specifies the value of an attribute value pair as an alphanumeric string from 1 through 255 characters.

Usage

Assign a priority number to a specific version of patch for the corresponding plugin. The priority number in the module priority list determines which version will be loaded when the update module command is used.

The show plugin command displays the VPL configuration status of this plugin module.

Example
The following command sets the priority of p2p plugin module version 1.17.4340 to 2 where the filename was **libp2p-1.2.0.so.tgz**:

```
module priority 2 version 1.2.0
```
Chapter 255
Policy Control Configuration Mode Commands

Policy Control Configuration mode is used to configure the Diameter dictionary, origin host, host table entry and host selection algorithm for IMS Authorization service.

Mode
Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration

configure > context context_name > ims-auth-service service_name > policy-control

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-imsa-dpca)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**apn-name-to-be-included**

This command configures the APN name to be included in CCR Gx messages.

**Product**
GGSN
IPSG
P-GW
SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration
`configure > context context_name > ims-auth-service service_name > policy-control`

Entering the above command sequence results in the following prompt:
`[context_name]host_name(config-imsa-d pca)#`

**Syntax**

```
apn-name-to-be-included { gn | virtual }
default apn-name-to-be-included
```

`gn | virtual`
Specifies which APN name must be sent in the Gx messages.
`gn`: Specifies to send the real APN name.
`virtual`: Specifies to send the virtual APN name if present, else to send the real APN name.

`default`
Applies the default setting for this command.
Default: `gn`

**Usage**
This feature is developed to implement a single global APN for the Enterprise services with the ability to have separate virtual APNs per single Enterprise, group of Enterprises sharing the same service group or per department.

To implement this feature, a configurable option is introduced per interface Rf, Gx, Gy and per APN. That is, a service specific CLI "apn-name-to-be-included" is configured for interfaces Rf, Gx, Gy separately. It can take values ‘gn’ or ‘virtual’. Based on the value configured for this command, the Called-Station-Id AVP is populated.

This command is used to configure the APN name to be included in the CCR Gx messages to the PCRF — the real APN name or the virtual APN name.

The name of the virtual APN and the IP pool are signaled during the UE attach to the Enterprise PDN from the 3GPP AAA server over S6b interface with a new vendor-specific AVP “Virtual-APN-Name”. The
RADIUS Start, Gy CCR to OFCS and Rf ACR to OCS messages contain the Virtual APN name instead of the Enterprise APN. This feature provides customers the desired granularity per enterprise and per department. This also allows bundling of number of small enterprises under the umbrella of single APN and logically separating them by virtual APN.

**Example**

The following command configures sending the real APN name in Gx messages:

```
apn-name-to-be-included gn
```
arp-priority-level

This command enables mapping of the ARP priority-level value received from PCRF to inter-user-priority value and be sent in A11 session update.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration

configure > context context_name > ims-auth-service service_name > policy-control

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-imsa-dpca)#

Syntax

arp-priority-level map-to inter-user-priority

{ default | no } arp-priority-level map-to

  default
  Configures the default setting for this command.
  Default: arp-priority-level to inter-user-priority mapping not applicable

  no
  Disables arp-priority-level to inter-user-priority mapping.

Usage

Important: This command is for a customer-specific implementation to support IP-CAN policy control via Gx interface in PDSN, wherein the PCRF informs the subscriber’s subscription level (such as gold, silver, bronze) to PDSN/PCEF via Priority-Level AVP, then PDSN maps the subscriber’s subscription level to inter-user-priority and transmits it to PCF via A11 session update message. For more information on the use of this command contact your Cisco account representative.
associate

This command associates/disassociates a failure handling template or a local policy template with the IMS authorization service.

Product

GGSN
HA
HSGW
IPSG
PDSN
P-GW
SAEGW
S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration

configure > context context_name > ims-auth-service service_name > policy-control

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-imsa-dpca)#

Syntax

associate { failure-handling-template template_name | local-policy-service service_name }

no associate { failure-handling-template | local-policy-service }

no

Disassociates a failure handling template or local policy template with the IMS authorization service.

failure-handling-template template_name

Associates a previously created failure handling template with the IMS authorization service.

template_name specifies the name for a pre-configured failure handling template. template_name must be an alphanumeric string of 1 through 63 characters.

For more information on failure handling templates, refer to the failure-handling-template command in the Global Configuration Mode Commands chapter.

local-policy-service service_name

Associates a previously created local policy service with the IMS authorization service. service_name specifies the name for a pre-configured local policy service. service_name must be an alphanumeric string of 1 through 63 characters.
For more information on local policy service configuration, refer to the `local-policy-service` command in the *Global Configuration Mode Commands* chapter.

### Usage

Use this command to associate a configured failure handling template or local policy service with the IMS authorization service.

The failure handling template defines the action to be taken when the Diameter application encounters a failure supposing a result-code failure, tx-expiry or response-timeout. The application will take the action given by the template. For more information on failure handling template, refer to the *Failure Handling Template Configuration Mode Commands* chapter.

**Important:** Only one failure handling template can be associated with the IMS authorization service. The failure handling template should be configured prior to issuing this command.

If the association is not made to the template then failure handling behavior configured in the application with the `failure-handling` command will take effect.

To support fallback to local policy in case of failure at PCRF for CCFH continue, the local policy service should be associated with an IMS authorization service. In case of any failures, the local policy template associated with the ims-auth service will be chosen for fallback.

### Example

The following command associates a pre-configured failure handling template called `fht1` to the IMS authorization service:

```
associate failure-handling-template fht1
```
cc-profile

This command configures the value of the **Offline** AVP sent to the PCRF based on the Charging Characteristics (CC) profile received from the SGSN.

**Product**

GGSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration

```bash
configure > context context_name > ims-auth-service service_name > policy-control
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-imsa-dpca)#
```

**Syntax**

```bash
cc-profile cc_profile_number [to cc_profile_number_range_end] map-to offline-avp { 0 | 1 }
{ default | no } cc-profile
```

<table>
<thead>
<tr>
<th><strong>Argument</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Configures the default setting for this command. Default: Deletes all previously configured mappings.</td>
</tr>
<tr>
<td>no</td>
<td>Deletes all previously configured mappings.</td>
</tr>
<tr>
<td>cc_profile_number</td>
<td>Specifies the CC profile number to map. For example, 1 for Hot Billing.</td>
</tr>
<tr>
<td>cc_profile_number_range_end</td>
<td>Specifies, for a range of CC profile numbers to map, the end number. That is, from cc_profile_number through cc_profile_number_range_end. cc_profile_number_range_end must be an integer from 1 through 15.</td>
</tr>
<tr>
<td>map-to offline-avp</td>
<td>Specifies to map the CC profile number(s) to the <strong>Offline</strong> AVP value sent to the PCRF.</td>
</tr>
</tbody>
</table>

- 0: Corresponds to the value DISABLE_OFFLINE (0).
- 1: Corresponds to the value ENABLE_OFFLINE (1).
Usage

Use this command to configure the CC Profile to Offline AVP value mapping. The Offline AVP’s value (DISABLE_OFFLINE (0), ENABLE_OFFLINE (1)) is derived based on the CC profile received from the SGSN as specified by this mapping.

The following example shows how this command can be configured multiple times:

```
cc-profile 1 to 2 map-to offline-avp 1
cc-profile 4 map-to offline-avp 0
cc-profile 8 map-to offline-avp 1
```

On configuring the above set of commands, the Offline AVP value is sent as 1 (Offline enabled) for the CC profiles 1 (Hot Billing), 2 (Flat Rate), and 8 (Post-Paid). And, as 0 (Offline disabled) for the CC profile 4 (Pre-paid).

When configuring this command, overlapping of CC profile numbers is not permitted. In the following example, after configuring the first command, which specifies to send the Offline AVP’s value as 1 (Offline enabled) for the CC profiles 1 through 15, the second command, which specifies to map CC profile 7, is not permitted:

```
cc-profile 1 to 15 map-to offline-avp 1
cc-profile 7 map-to offline-avp 0
```

Example

The following command specifies to send Offline AVP value as 1 (Offline enabled) for the CC profile 1 (Hot Billing):

```
cc-profile 1 map-to offline-avp 1
```

The following command specifies to delete all previously configured mappings:

```
no cc-profile
```
# custom-reauth-trigger

This command enables custom reauthorization event triggers.

## Product

All

## Privilege

Security Administrator, Administrator

## Mode

Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration

```bash
configure > context context_name > ims-auth-service service_name > policy-control
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-imsa-dpca)#
```

## Syntax

```
custom-reauth-trigger { none | { preservation-changed | reactivation-changed } + }
```

```bash
default custom-reauth-trigger
```

- **default**
  
  Configures the default setting for this command. The default setting is to enable all the event triggers.

- **none**
  
  Disables all custom event triggers.

- **preservation-changed**
  
  Enables preservation-changed event trigger.

- **reactivation-changed**
  
  Enables reactivation-changed event trigger.

**Important:** This keyword is for use with a customer-specific implementation, and will be available only if a valid license is installed.

- **reactivation-changed**
  
  Enables reactivation-changed event trigger.

**Important:** This keyword is for use with a customer-specific implementation, and will be available only if a valid license is installed.

## Usage

Use this command to enable/disable custom reauth event triggers.
It is recommended that the preservation-changed and reactivation-changed triggers both be enabled. As, when the bearer goes into preservation mode with the preservation-changed trigger, the reactivation-changed trigger must also be enabled for the bearer to get reactivated subsequently.

Example

The following command disables all custom event triggers:

```
custom-reauth-trigger none
```
diameter dictionary

This command specifies the Diameter Policy Control Application dictionary to be used by the IMS Authorization Service for the policy control application.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration

configure > context context_name > ims-auth-service service_name > policy-control

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-imsa-dpca)#

Syntax

default diameter dictionary

---

dpca-custom1

Custom-defined Diameter dictionary for the Gx interface.

---

dpca-custom2

Custom-defined Diameter dictionary for Rel. 7 Gx interface.

---

dpca-custom3

Custom-defined Diameter dictionary for the Gx interface in conjunction with IP Services Gateway (IPSG).

---

dpca-custom4

Standard Diameter dictionary for 3GPP Rel. 7 Gx interface.

---

dpca-custom5

Custom-defined Diameter dictionary for Rel. 7 Gx interface.

---

dpca-custom6 ... dpca-custom30

Custom-defined Diameter dictionaries.
diameter dictionary

Configures the dynamically loaded Diameter dictionary. The dictionary name must be an alphanumeric string of 1 through 15 characters.
For more information on dynamic loading of Diameter dictionaries, see the \textit{diameter dynamic-dictionary} in the \textit{Global Configuration Mode Commands} chapter of this guide.

gx-wimax-standard
Gx WiMAX standard dictionary.

gxa-3gpp2-standard
Gxa 3GPP2 standard dictionary.

gxc-standard
Gxc standard dictionary.

pdsn-ty
This keyword is restricted.

r8-gx-standard
R8 Gx standard dictionary.

Standard
Standard Diameter dictionary for the 3GPP Rel. 6 Gx interface.
Default: Enabled for Gx support in 3GPP networks.

std-pdsn-ty
This keyword is restricted.

ty-plus
This keyword is restricted.

ty-standard
This keyword is restricted.

default
Sets the default Diameter dictionary.
Default: Standard

Usage
Use this command to specify the Diameter dictionary for IMS Authorization Service.

Example
The following command sets the \texttt{Standard} dictionary for Diameter Policy Control functions in 3GPP network:

\begin{verbatim}
diameter dictionary Standard
\end{verbatim}
diameter encode-event-avps

This command enables encoding of all the event-related information AVPs in CCR-U messages.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration

```
configure > context context_name > ims-auth-service service_name > policy-control
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-imsa-dpca)#
```

**Syntax**

```
[ default ] diameter encode-event-avps { always | local-fallback }
```

- **default**
  
  Applies the default setting for this command.
  
  Default: Sends AVPs relevant to the Event-Trigger subscribed by the PCRF.

- **always**
  
  This keyword option always sends the event-related AVPs in all CCR messages.

- **local-fallback**
  
  This keyword option sends the event-related AVPs in CCR-U messages in the event of local fallback scenario.

**Usage**

Use this command to facilitate sending of all the event-related information AVPs in CCR-U messages. In releases prior to 14.0, per the 3GPP standards for Gx, AVPs relevant to the Event-Trigger subscribed by the PCRF were always sent in the CCR messages. This release onwards, sending of event-related AVPs for all update (both access side and internal) and terminate requests is CLI controlled. Note that the QoS-Info AVP will be encoded in all CCR messages if the CLI command “diameter encode-event-avps always” is enabled. This implementation impacts only the dpca-custom15 dictionary.

**Example**

The following command enables to always send the event-related AVPs in all CCR messages:

```
diameter encode-event-avps always
```
**diameter encode-supported-features**

This command enables/disables encoding and sending of Supported-Features AVP.

**Product**

GGSN
P-GW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration

```shell
configure > context context_name > ims-auth-service service_name > policy-control
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-imsa-dpca)#
```

**Syntax**

```
diameter encode-supported-features sponsored-connectivity

{ default | no } diameter encode-supported-features
```

- **sponsored-connectivity**

  Enables the Sponsored (data) Connectivity feature.
  With sponsored data connectivity, the sponsor has a business relationship with the operator and the sponsor reimburses the operator for the user's data connectivity in order to allow the user access to an associated Application Service Provider's (ASP) services. Alternatively, the user pays for the connectivity with a transaction which is separate from the subscriber's charging. It is assumed the user already has a subscription with the operator.
  The purpose of this feature is to identify the data consumption for a certain set of flows differently and charge it to sponsor. To support this, a new reporting level “SPONSORED_CONNECTIVITY_LEVEL” is added for reporting at Sponsor Connection level and two new AVPs “Sponsor-Identity” and “Application-Service-Provider-Identity” have been introduced at the rule level.
  This CLI command “diameter encode-supported-features” has been added in Policy Control Configuration mode to send Supported-Features AVP with Sponsor Identity.
  Sponsored Connectivity feature will be supported only when both P-GW and PCRF support 3GPP Rel. 10. P-GW advertises release as a part of supported features in CCR-I to PCRF. If P-GW supports Release 10 and also Sponsored Connectivity but PCRF does not support it (as a part of supported features in CCA-I), this feature is turned off.
  This feature implementation impacts only the Gx dictionary “dpca-custom15”.

- **default | no**

  This keyword removes the previously configured supported features.

**Usage**

This command is used to enable encoding and sending of Supported-Features AVP.
diameter host-select reselect

This command controls pacing of the reselection or switching of the PCRF after a change occurs in the table configuration for an IMS Authorization Service.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration

```plaintext
configure > context context_name > ims-auth-service service_name > policy-control
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-imsa-dpca)#
```

**Syntax**

```plaintext
diameter host-select reselect subscriber-limit subs_limit time-interval duration
```

```plaintext
{ default | no } diameter host-select reselect
```

### subscriber-limit subs_limit

Specifies the limit of subscribers to switch or reselect the PCRF for subscribers not more than `subs_limit` in time duration of `duration` second(s).

- `subs_limit` must be an integer from 1 through 1000000.

### time-interval duration

Specifies the time duration, in seconds, to reselect PCRF for subscribers not more than `subs_limit` in time duration of `duration` second(s).

- `duration` must be an integer from 1 through 3600.

### default

Applies the default setting for this command.

Sets the PCRF reselection or switching to default state.

### no

Removes the configured PCRF reselection method and disables the reselection or switching of PCRF.

**Usage**

Use this command to specify the pacing of reselection or switching of the PCRF in an IMS authorization service..

In case IMS authorization session have been opened on certain PCRF on the basis of the current selection table, and the current active table configuration is changed, the IMSA starts selection procedure for the PCRF. Existing sessions on current PCRF from earlier table is required to close and reopened on the selected
PCRF from the new table. This reselection periodicity is controlled by this command and it indicates the number of subscriber sessions `subs_limit` to be reselected or moved in `duration` seconds.
For example, if this command is configured with 100 subscribers and 2 seconds, then the system reselects the PCRF for no more than 100 subscribers per 2 seconds.

Example

The following command sets the system to reselect the new PCRF for no more than 1000 subscriber in 15 seconds:

```
diameter host-select reselect subscriber-limit 1000 time-interval 15
```
diameter host-select row-precedence

This command adds/appends rows with precedence to a Diameter host table or MSISDN prefix range table.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration
configure > context context_name > ims-auth-service service_name > policy-control

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-imsa-dpca)#

Syntax

diameter host-select row-precedence precedence_value table { { { 1 | 2 } host host_name [ realm realm_id ] [ secondary host host_name [ realm realm_id ] ] } | { prefix-table { 1 | 2 } msisdn-prefix-from msisdn-prefix_from msisdn-prefix-to msisdn_prefix_to host host_name [ realm realm_id ] [ secondary host sec_host_name [ realm sec_realm_id ] algorithm { active-standby | round-robin } ] } } [ -noconfirm ]

no diameter host-select row-precedence precedence_value table { { 1 | 2 } | prefix-table { 1 | 2 } }

diameter host-select row-precedence precedence_value table { { 1 | 2 } host host_name [ realm realm_id ] [ secondary host sec_host_name [ realm sec_realm_id ] ] }

This command adds/appends a row in the specified Diameter host table.

In 8.0, a maximum of 16 rows can be added to a table. In 8.1 and later releases, a maximum of 128 rows can be added per table.

row-precedence precedence_value: Specifies precedence of the row in the Diameter host table.

Important: In 8.1 and later releases, precedence_value must be an integer from 1 through 128. In 8.0 and previous releases, precedence_value must be an integer from 1 through 100.

table { 1 | 2 }: Specifies the Diameter host table to add/append the primary and secondary Diameter host addresses.
host host_name: Specifies the primary host name. host_name must be an alphanumeric string of 1 through 127 characters in length.
realm realm_id: Specifies the primary realm ID. realm_id must be an alphanumeric string of 1 through 127 characters in length.
secondary host sec_host_name [ realm sec_realm_id ]: Specifies the secondary host name and realm ID:
host sec_host_name: Specifies the secondary host name. host_name must be an alphanumeric string of 1 through 127 characters in length.
**Policy Control Configuration Mode Commands**

**diameter host-select row-precedence**

```plaintext
realm sec Realm_id: Specifies the secondary realm ID. realm_name must be an alphanumeric string of 1 through 127 characters in length.
```

```plaintext
no diameter host-select row-precedence precedence_value table prefix-table { 1 | 2 }
```

Removes the row with the specified precedence from the specified MSISDN prefix range table.

```plaintext
diameter host-select row-precedence precedence_value table prefix-table { 1 | 2 }
msisdn-prefix-from msisdn_prefix_from msisdn-prefix-to msisdn_prefix_to host
host_name [ realm realm_id ] [ secondary host sec_host_name [ realm sec Realm_id ]
algorithm { active-standby | round-robin } ] [ -noconfirm ]
```

Use this command to configure the MSISDN prefix range based PCRF selection mechanism for Rel. 7 Gx interface support, wherein the PCEF is required to discover and select an appropriate PCRF to establish control relationship at primary PDP context activation.

This command adds a row in the specified MSISDN prefix range table. A maximum of 128 rows can be added per prefix range table.

```plaintext
row-precedence precedence_value: Specifies precedence of the row in the table.
```

**Important:** In 8.1 and later releases, precedence_value must be an integer from 1 through 128. In 8.0 and previous releases, precedence_value must be an integer from 1 through 100.

```plaintext
prefix-table { 1 | 2 }: Specifies the MSISDN prefix range table to add the primary and/or secondary Diameter host addresses.
msisdn-prefix-from msisdn_prefix_from: For a range of MSISDNs, specifies the starting MSISDN.
msisdn-prefix-to msisdn_prefix_to: For a range of MSISDNs, specifies the ending MSISDN.
```

**Important:** To enable the Gx interface to connect to a specific PCRF for a range of MSISDNs/subscribers configure msisdn prefix from and msisdn prefix to with the starting and ending MSISDNs respectively. The MSISDN ranges must not overlap between rows. To enable the Gx interface to connect to a specific PCRF for a specific MSISDN/subscriber, configure both msisdn prefix from and msisdn prefix to with the same MSISDN.

```plaintext
host host_name: Specifies the primary host name. host_name must be an alphanumeric string of 1 through 127 characters in length.
realm realm_id: Specifies the primary realm ID. realm_id must be an alphanumeric string of 1 through 127 characters in length.
secondary host sec_host_name [ realm sec Realm_id ]: Specifies the secondary host name and realm ID: host sec_host_name: Specifies the secondary host name. sec_host_name must be an alphanumeric string of 1 through 127 characters in length.
realm sec Realm_id: Specifies the secondary realm ID. sec Realm_id must be an alphanumeric string of 1 through 127 characters in length.
algorithm { active-standby | round-robin }: Specifies the algorithm for selection between primary and secondary servers in the MSISDN prefix range table.
Default: active-standby
active-standby: Specifies selection of servers in the Active-Standby fashion.
round-robin: Specifies selection of servers in the Round-Robin fashion.
```

**Important:** The Round Robin algorithm for PCRF selection is effective only over a large number of PCRF selections, and not at a granular level.
no diameter host-select row-precedence precedence_value table { 1 | 2 }
Removes the row with the specified precedence from the specified Diameter host table.

Usage
Use this command to add, update, or delete rows specified with a precedence from a Diameter host table or MSISDN prefix range table.
In the Rel. 7 Gx implementation, when the Gateway interworks with multiple PCRFs, the Gateway can configure the primary and secondary server based on the MSISDN-prefix range in the MSISDN prefix range table. Using this command, you can add a new prefix row into the MSISDN prefix table.
If a row with the precedence that you add already exists in a table, the existing prefix row is removed and the new row is inserted with the same precedence.

Example
The following command adds a row with precedence 12 in table 2 with primary host name as star_ims1 and secondary host name as star_ims2 to Diameter host table.

diameter host-select row-precedence 12 table 2 host star_ims1 secondary host star_ims2
diameter host-select table

This command selects the Diameter host table or the MSISDN prefix range table, and the algorithm to select rows from the Diameter host table.

Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration

configure > context context_name > ims-auth-service service_name > policy-control

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-imsa-dpca)#

Syntax

diameter host-select table { { 1 | 2 } algorithm { ip-address-modulus [ prefer-ipv4 | prefer-ipv6 ] | msisdn-modulus | round-robin } | prefix-table { 1 | 2 } }

{ default | no } diameter host-select table

diameter host-select table { 1 | 2 } algorithm { ip-address-modulus | msisdn-modulus | round-robin }
table { 1 | 2 }: Specifies the Diameter host table to obtain the primary and secondary host names for PCRF.
algorithm { ip-address-modulus [ prefer-ipv4 | prefer-ipv6 ] | msisdn-modulus | round-robin }: Specifies the algorithm to select row from the Diameter host table.
Default: round-robin
•ip-address-modulus [ prefer-ipv4 | prefer-ipv6 ]: This algorithm divides the IP address, in binary, of the subscriber by the number of rows in the table, and the remainder is used as an index into the specified table to select the row.
•prefer-ipv4: Specifies that IPv4 addresses are to be used, if an IPv4v6 call is received, for selecting the rows in the host table.
•prefer-ipv6: Specifies that IPv6 addresses are to be used, if an IPv4v6 call is received, for selecting the rows in the host table.
•msisdn-modulus: This algorithm divides the MSISDN value in binary without the leading “+” of the subscriber by the number of rows in the table, and the remainder is used as an index in the specific table to select the row.
•round-robin: This algorithm rotates all rows in the active table for selection of the row in round-robin fashion. If no algorithm is specified this is the default behavior.

**Important:** The Round Robin algorithm is effective only over a large number of selections, and not at a granular level.
diameter host-select table prefix-table { 1 | 2 }

Specifies the MSISDN Prefix Range table to be used in case of MSISDN prefix range based PCRF discovery mechanism.

**default**

Applies the default setting for this command.

**no**

Removes previous configuration.

When no table is selected, the system will not communicate with any PCRF for new sessions.

**Usage**

Use this command to configure the Diameter host table and row selection methods to select host name or realm for PCRF.

When this command is used to change which table the system should be using, user must re-determine which E-PDF the system should be using for each subscriber. If a different E-PDF results from the configuration change in the table, the system will wait for all of the IMS sessions for the subscriber to be no longer active and then the system either closes/opens Gx sessions with the old/new PDFs respectively, or the system deactivates the PDP contexts of the subscriber.

Here is an example of how row selection is configured for three hosts that the system will use for load-balancing. Operator can configure six rows in a table, as follows.

<table>
<thead>
<tr>
<th>Modulo 6</th>
<th>Primary Host</th>
<th>Secondary Host</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>3</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>3</td>
<td>2</td>
<td>3</td>
</tr>
<tr>
<td>4</td>
<td>3</td>
<td>1</td>
</tr>
<tr>
<td>5</td>
<td>3</td>
<td>2</td>
</tr>
</tbody>
</table>

In the above table, the three hosts are named 1, 2, and 3. When all hosts are working, the load will be distributed among all the three hosts. If host 1 fails, then the load will be distributed between the remaining two hosts. In this scenario, the modulo 6 results of 2 and 4 will return rows that have primary hosts but no working back-up host.

In the Rel. 7 Gx implementation, the GGSN/PCEF is required to discover and select an appropriate PCRF to establish control relationship at primary PDP context activation. The ip-address-modulus, msisdn-modulus, and round-robin algorithms are supported by the GGSN/PCEF for PCRF discovery. In addition, the active/standby and round-robin algorithms are used for selection between primary and secondary servers based on the MSISDN Prefix Range Table.

**Example**

The following command specifies **table 1** with **round-robin** algorithm to select the rows with host name for E-PDF in Diameter host table.

```
diameter host-select table 1 algorithm round-robin
```
diameter host-select-template

This command specifies the Diameter host server template to be associated with this IMS Authorization service. The service uses the specified template (and associated host-select table) to select a Diameter peer server. It then uses the returned host name(s) to contact the PCRF and establish the call.

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration

configure > context context_name > ims-auth-service service_name > policy-control

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-imsa-d pca)#

Syntax

diameter host-select-template tmplt_name

no diameter host-select-template

no

Removes the binding of the Diameter host select template with the IMS Authorization service.

__tmplt_name__

Specifies the name of an existing Diameter host server template (configured in Global Configuration mode) to bind with the IMS Authorization service. It is an alphanumeric string of 1 through 255 characters.

Usage

Use this command to bind a configured Diameter host select template to the IMS Authorization service for DPCA. This IMS authorization service searches the associated host select table to select a Diameter peer server. For additional information refer to the Diameter Host Select Configuration Mode Commands chapter and the description of the diameter-host-template command in the Global Configuration Mode Commands chapter.
Important: Prior to issuing this command, the Diameter host select template should be configured using the `diameter-host-template` command in the Global Configuration mode.

Important: If no association is made to the template then the `diameter peer-select` command configured at the application level will be used for peer selection.

Example

The following command binds a configured Diameter host select template named `diamtemplate` to the IMS authorization service:

```
diameter host-select-template diamtemplate
```
diameter map

This command enables selecting the value to which the USAGE_REPORT and APN_AMBR_MOD_FAILURE Event-Trigger should be mapped to.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration

```bash
configure > context context_name > ims-auth-service service_name > policy-control
```

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-imsa-dpca)#
```

**Syntax**

```bash
diameter map usage-report { 29 | 26 | 33 }
default diameter map usage-report
```

Maps the USAGE_REPORT of Event-Trigger AVP to one or a combination of these values.

- 26 – Event-Trigger 26 will mapped to USAGE_REPORT. Note this will not affect any other Event-Trigger.
- 29 – Event-Trigger 29 will mapped to USAGE_REPORT, and 33 to APN_AMBR_MOD_FAILURE.
- 33 – Event-Trigger 33 will mapped to USAGE_REPORT, and 29 to APN_AMBR_MOD_FAILURE.

**default**

The default behavior is to configure the Event-Trigger USAGE_REPORT to be mapped to 26.

**Usage**

The Event-Trigger AVP’s USAGE_REPORT has been given different values in the 3GPP TS 29.212 standard spec. As a result of that, the releases of TS 29.212 are not backward compatible. To address this, this CLI command has been introduced in Policy Control configuration mode to map the USAGE_REPORT to either 26/29/33 in order to be flexible enough to interoperate with various operators.

- TS 29.212 v9.5.0 - USAGE_REPORT (26)
- TS 29.212 v9.6.0 - USAGE_REPORT (29)
- TS 29.212 v9.7.0 - USAGE_REPORT (33)

If this CLI command `diameter map usage-report 29` is configured in the chassis and PCRF sends 29 event-trigger then on volume threshold breach CCR-U with volume-report and event-trigger 29 will be sent to the PCRF. Same is the case with the values 26 and 33.
Example

The following command maps the Event-Trigger USAGE_REPORT to 29 and APN_AMBR_MOD_FAILURE to 33:

```
diameter map usage-report 29
```
**diameter origin endpoint**

This command binds the origin endpoint configured in Context Configuration mode to the IMS Authorization service for Diameter Policy Control Application (DPCA).

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration

```
configure > context context_name > ims-auth-service service_name > policy-control
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-imsa-dpca)#
```

**Syntax**

```
diameter origin endpoint endpoint_name

no diameter origin
```

`endpoint endpoint_name`

`endpoint_name` is the Diameter endpoint configured in Context Configuration Mode to bind with IMS authorization service, and must be an alpha/numeric string of 1 through 63 characters in length.

```
no
```

Removes the binding of Diameter origin endpoint with IMS Authorization service.

**Usage**

Use this command to bind a configured Diameter origin endpoint to the IMS Authorization service for DPCA. This IMS authorization service searches all system contexts until it finds one with a matching Diameter origin endpoint name specified.

**Example**

The following command binds a configured endpoint named test to the IMS authorization service:

```
diameter origin endpoint test
```
**diameter request-timeout**

This command configures the request-timeout setting for Diameter-IMSA Gx interface.

**Product**

GGSN  
P-GW  
SAEGW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration  
\texttt{configure > context \ context_name > ims-auth-service \ service_name > policy-control}

Entering the above command sequence results in the following prompt:

\texttt{[context_name]host_name(config-imsa-dpca)\#}

**Syntax**

\texttt{diameter request-timeout \ timeout}

\texttt{default \ diameter request-timeout}

\begin{verbatim}
timeout
\end{verbatim}

Specifies the timeout duration (in seconds). The value must be an integer from 1 through 300. Default: 10 seconds

\begin{verbatim}
default
\end{verbatim}

Applies the default setting for this command.

**Usage**

Use this command to configure the request-timeout setting for Diameter-IMSA Gx interface. At the request-timeout value, DPCA will apply failure-handling to the subscriber. Action will be taken based on the failure-handling configuration (terminate/retry-terminate/continue).

**Example**

The following command configures the Diameter request-timeout setting to 20 seconds:

\texttt{diameter request-timeout 20}
diameter update-dictionary-avps

This command enables dictionary control of the AVPs that need to be added based on the version of the specification to which the PCEF is compliant with.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration

configure > context context_name > ims-auth-service service_name > policy-control

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-imsa-dpca)#

Syntax

diameter update-dictionary avps { 3gpp-r8 | 3gpp-r9 | 3gpp-r10 }

{ default | no } diameter update-dictionary avps

default | no

Configures this command with the default setting.
The default behavior is that R9 support will not be indicated as part of Supported-Features AVP in a R7/R8 dictionary and R8 support will not be indicated as part of Supported-Features AVP in a R7 dictionary.

3gpp-r8
Specifies to select the 3GPP Rel. 8 AVPs for encoding.

3gpp-r9
Specifies to select the 3GPP Rel. 9 AVPs for encoding.

3gpp-r10
Specifies to select the 3GPP Rel. 10 AVPs for encoding.

Usage

Important: This command is applicable only to Diameter dictionaries that support standard based volume reporting over Gx feature.

Use this command to encode the AVPs in the dictionary based on the release version of the specification to which the PCEF is compliant with.
Release 12.0 onwards, if a 3GPP Rel. 7 based dictionary is already configured with diameter dictionary dpca-custom4 command, and then if the diameter update-dictionary-avps 3gpp-r9 command is
applied, the Supported-Features AVP with feature bit 1 being set will be sent in the CCR-I to indicate that 3GPP Rel. 9 AVPs are also supported.

Both default and no command have the same behavior, as if the CLI command is not configured. Hence, in the output of show configuration verbose command, the default and no command is shown as no diameter update-dictionary-avps.

This CLI command when configured results in behavioral changes as indicated in the following table.

<table>
<thead>
<tr>
<th>Possible Upgrade Scenarios</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>3GPP Rel. 7 based dictionary upgraded to 3GPP Rel. 9&lt;br&gt;For example:&lt;br&gt;<strong>diameter dictionary dpca-custom4 diameter update-dictionary-avps 3gpp-r9</strong></td>
<td>In the CCR-I, Supported-Features AVP will be encoded with value 2 for the Feature-List AVP.&lt;br&gt;[$V$] [$M$] Supported-Features:&lt;br&gt;[$M$] Vendor-Id: 10415&lt;br&gt;[$V$] [$M$] Feature-List-ID: 1&lt;br&gt;[$V$] [$M$] Feature-List: 2&lt;br&gt;The Feature-List AVP value suggest that it is 3GPP Rel. 9 compliant. But, it is not fully compliant to 3GPP Rel. 9.&lt;br&gt;In the current release, for this upgrade scenario (3GPP Rel. 7 to 3GPP Rel. 9), only volume reporting related AVPs mentioned in the 3GPP Rel. 9 will be supported.</td>
</tr>
<tr>
<td>3GPP Rel. 7 based dictionary upgraded to 3GPP Rel. 8&lt;br&gt;For example:&lt;br&gt;<strong>diameter dictionary dpca-custom4 diameter update-dictionary-avps 3gpp-r8</strong></td>
<td>In the CCR-I, Supported-Features AVP will be encoded with value 1 for the Feature-List AVP.&lt;br&gt;[$V$] [$M$] Supported-Features:&lt;br&gt;[$M$] Vendor-Id: 10415&lt;br&gt;[$V$] [$M$] Feature-List-ID: 1&lt;br&gt;[$V$] [$M$] Feature-List: 1&lt;br&gt;The Feature-List AVP value suggest that it is 3GPP Rel. 8 compliant. But, it is not fully compliant to 3GPP Rel. 8.&lt;br&gt;In the current release, for this upgrade scenario (3GPP Rel. 7 to 3GPP Rel. 8), none of the features mentioned in 3GPP Rel. 8 will be supported.</td>
</tr>
<tr>
<td>3GPP Rel. 8 based dictionary upgraded to 3GPP Rel. 9&lt;br&gt;For example:&lt;br&gt;<strong>diameter dictionary r8-gx-standard diameter update-dictionary-avps 3gpp-r9</strong></td>
<td>In the CCR-I, value for the Feature-List AVP in the Supported-Features AVP will be 2.&lt;br&gt;[$V$] [$M$] Supported-Features:&lt;br&gt;[$M$] Vendor-Id: 10415&lt;br&gt;[$V$] [$M$] Feature-List-ID: 1&lt;br&gt;[$V$] [$M$] Feature-List: 2&lt;br&gt;The Feature-List AVP value suggest that it is 3GPP Rel. 9 compliant. But, it is not fully compliant to 3GPP Rel. 9.&lt;br&gt;Currently for this upgrade scenario (3GPP Rel. 8 to 3GPP Rel. 9), only volume reporting related AVPs mentioned in 3GPP Rel. 9 will be supported.</td>
</tr>
<tr>
<td>3GPP Rel. 9 based dictionary upgraded to 3GPP Rel. 10&lt;br&gt;For example:&lt;br&gt;<strong>diameter dictionary r8-gx-standard diameter update-dictionary-avps 3gpp-r10</strong></td>
<td>In the CCR-I, value for the Feature-List AVP in the Supported-Features AVP will be 8.&lt;br&gt;[$V$] [$M$] Supported-Features:&lt;br&gt;[$M$] Vendor-Id: 10415&lt;br&gt;[$V$] [$M$] Feature-List-ID: 1&lt;br&gt;[$V$] [$M$] Feature-List: 8&lt;br&gt;The Feature-List AVP value suggest that it is 3GPP Rel. 10 compliant. But, it is not fully compliant to 3GPP Rel. 10.</td>
</tr>
</tbody>
</table>

In 14.1 and later releases, Supported-Features AVP is extended to support 3GPP Rel. 10 in EPS 3.0 in addition to 3GPP Rel. 8 and Rel. 9. If the **diameter update-dictionary-avps 3gpp-r10** command is applied, the Supported-Features AVP with feature bit 1 being set will be sent in the CCR-I / CCA to indicate that 3GPP Rel. 10 AVPs are also supported. The 'M' bit setting for the Feature-List AVP and Feature-List-ID AVP must be the same as defined in 3GPP TS 29.229 and must not be affected by the 'M' bit setting of the Supported-Features AVP.

Example
The following command enables encoding of AVPs in the dictionary based on 3GPP Rel. 9:

```
diameter update-dictionary-avps 3gpp-r9
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**

**Syntax**

```
end
```

**Usage**
Use this command to return to the Exec mode.
endpoint-peer-select

This command enables Diabase to select the Diameter peers in all failure scenarios.

Product
- GGSN
- PGW

Privilege
- Security Administrator, Administrator

Mode
- Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration
  - configure > context context_name > ims-auth-service service_name > policy-control

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-imsa-dpca)#

Syntax

endpoint-peer-select [ on-host-select-failure | on-inactive-host ]

{ default | no } endpoint-peer-select

- on-host-select-failure
  Specifies to perform server selection at Diabase when the hosts could not be selected by IMS Authorization application.

- on-inactive-host
  Specifies to perform server selection at diabase when the hosts selected by application are inactive.

{ default | no }
Default/no behavior is to terminate the call when the hosts could not be selected by application or when the hosts selected by application are inactive.

Usage

Use this command to perform server selection at Diabase when the hosts could not be selected by application or when the hosts selected by the IMS Authorization application is inactive. For example, host table is not configured in IMSA service, host table is configured but not activated, none of the rows in prefix table match the subscriber, host template is not associated with IMSA service, host template could not select the hosts. This CLI command is added in policy control configuration mode to maintain backward compatibility with the old behavior of terminating the call when server selection fails at application.

Example

The following command enables Diabase to select peers when the hosts selected by application are inactive.

endpoint-peer-select on-inactive-host
event-report-indication

This command enables event report indication.

Product
P-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration

configure > context context_name > ims-auth-service service_name > policy-control

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-imsa-dpca)#

Syntax

event-report-indication { all | pgw-trace-control | qos-change | rai-change | rat-change
| sgsn-change | ue-timezone-change | user-loc-change } [ pgw-trace-control ] [ qos-change
] [ rai-change ] [ rat-change ] [ sgsn-change ] [ ue-timezone-change ] [ user-loc-change ]

{ default | no } event-report-indication

all | pgw-trace-control | qos-change | rai-change | rat-change | sgsn-change |
ue-timezone-change | user-loc-change

 Specifies which types of changes will trigger an event report from the PCRF.
• all: all triggers
• pgw-trace-control: P-GW trace control change trigger
• qos-change: QoS change trigger
• rai-change: RAI change trigger
• rat-change: RAT change trigger
• sgsn-change: SGSN change trigger
• ue-timezone-change: UE time zone change trigger
• user-loc-change: User location change trigger

default | no

Disables event report indication.

Usage
Use this command to determine what type of event changes are reported from the PCRF.

Example
The following command enables event report indication for all triggers.

```
event-report-indication all
```
event-update

This command configures sending usage monitoring information in event updates either for all event triggers or for a specific event trigger.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration

configure > context context_name > ims-auth-service service_name > policy-control

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-imsa-dpca)#

Syntax

{ default | no } event-update

default
Configures the default setting for this command.
Default: Usage report is not sent in event update.

no
Disables sending usage report in event update.

reset-usage
Resets the usage at PCEF after reporting in event update.

Sends the custom usage report based on the following event triggers:
- an-gw-change — AN GW change event trigger
• apn-ambr-mod-failure — APN AMBR Modification Failure event trigger
• bearer-loss — Loss of bearer trigger
• bearer-rcvry — Recovery of bearer trigger
• charging-correlation-exchange — Charging Correlation Exchange trigger
• default-bearer-qos-change — Default EPS bearer QoS change event trigger
• default-bearer-qos-mod-failure — Default EPS Bearer QOS Modification Failure event trigger
• ip-can-change — IP-CAN Change trigger
• out-of-credit — Out of credit trigger
• pgw-trace-control — P-GW Trace Control
• plmn-change — PLMN change trigger
• qos-change — QoS change trigger
• qos-excess-change — QoS Change Exceeding Authorization trigger
• rai-change — RAI Change trigger
• rat-change — RAT change trigger
• reallocation-of-credit — Reallocation of credit trigger
• resource-modification-request — Resource modification trigger
• revalidation-timeout — Revalidation timeout trigger
• sgsn-change — SGSN change trigger
• successful-resource-alloc — Successful Resource Allocation event trigger
• tft-change — TFT change trigger
• ue-ip-addr-allocate — UE IP address allocate trigger
• ue-ip-addr-release — UE IP address release trigger
• ue-timezone-change — UE Time Zone Change event trigger
• user-loc-change — User Location Change trigger

Usage
Use this command to send volume usage information when an event change is reported to the PCRF in a CCR-U message.
To send customized usage information based on specific event triggers, the event should be accordingly configured with the `event-update send-usage-report events` command. For example, if the usage report is required whenever RAT change occurs, this can be accomplished using the `event-update send-usage-report events rat-change` command.

Example
The following command specifies to send volume usage report in event updates to the PCRF for all event triggers:

```
event-update send-usage-report reset-usage
```

The following command specifies to send volume usage report in event updates to the PCRF for RAT change scenarios:

```
event-update send-usage-report reset-usage events rat-change
```
The following command specifies to send volume usage report in event updates to the PCRF if either RAT change or QOS change occurs:

```
event-update send-usage-report reset-usage events rat-change qos-change
```
exit

Exits the current mode and returns to the parent configuration mode.

Product

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
failure-handling

This command configures Diameter failure handling behavior.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration

```plaintext
configure > context context_name > ims-auth-service service_name > policy-control
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-imsa-dpca)#
```

**Syntax**

In Release 8.0:

```plaintext
failure-handling { continue | retry-and-terminate | terminate | diameter-result-code { any-error | result_code } ccfh { continue | retry-and-terminate | terminate } [ cc-request-type { initial-request | terminate-request | update-request } ] }

no failure-handling diameter-result-code { any-error | integer result_code } [ cc-request-type { initial-request | terminate-request | update-request } ]
```

In 8.1 and later releases:

```plaintext
failure-handling cc-request-type { any-request | initial-request | terminate-request | update-request } [ diameter-result-code { any-error | result_code [ to end_result_code ] } ] [ continue [ retry-server-on-event | send-ccrt-on-call-termination ] | retry-and-terminate | terminate ]

no failure-handling cc-request-type { any-request | initial-request | terminate-request | update-request } [ diameter-result-code { any-error | result_code [ to end_result_code ] } ] [ continue [ send-ccrt-on-call-termination ] ]
```

---

**no**
Disables previous failure-handling configuration.

---

**retry-and-terminate**

Specifies that in the event of a failure the user session continues for the duration of one retry attempt with the server. If this retry attempt also fails, the session is terminated.

---

**terminate**

Specifies that in the event of a failure the user session be terminated.
Policy Control Configuration Mode Commands

---

**diameter-result-code** { any-error | result_code [ to end_result_code ] }

Specifies failure handling behavior for any/specific result-code(s) to identify the type of failure and failure handling action for specific credit control request type.
- **any-error**: Specifies failure handling behavior for those result-codes for which failure-handling behavior has not been specified.
- **result_code**: Specifies a Diameter failure result code. `result_code` is the code returned for a failure handling action and must be an integer from 3000 through 4999.
- **to end_result_code**: Use to specify a range of Diameter failure result codes. `end_result_code` must be an integer from 3000 through 4999, and must be greater than `result_code`.

---

**continue** [ retry-server-on-event | send-ccrt-on-call-termination ] | retry-and-terminate | terminate

**As in 8.1 and later releases:**

Specifies the credit control failure handling action.
- **continue**: In the event of a failure the user session continues. DPCA/Diameter will make periodic request and/or connection retry attempts and/or will attempt to communicate with a secondary peer depending on the peer config and session-binding setting.
- **retry-server-on-event**: This optional keyword enables reconnecting with PCRF server on update and termination requests or re-authorization from server, for failure-handling CONTINUE sessions.

---

**Important**: This keyword is valid only for `update-request` though it is allowed to configure for all the requests. The `failure-handling` command configuration will throw an error/warning message if it is configured for any request other than the update request.

---

**Important**: Failure handling action “continue retry-server-on-event” will be taken only if failure happens to CCR-U message, not for CCR-I messages.

---

**send-ccrt-on-call-termination**: This optional keyword enables to send CCR-T on call termination if the failure action is `continue`.

---

**Important**: This keyword is valid only for `update-request` though it is allowed to configure for all the requests. The `show configuration errors` command will throw an error/warning message if it is configured for any request other than the update request.

---

- **retry-and-terminate**: In the event of a failure the user session continues for the duration of one retry attempt with the server. If this retry attempt also fails, the session is terminated.
- **terminate**: In the event of a failure the user session is terminated.

---

**ccfh** { continue | retry-and-terminate | terminate }

**As in 8.0 release:**

Specifies the credit control failure handling (CCFH) action with or without credit control request type.

---
• **continue**: In the event of a failure the user session continues. DPCA/Diameter will make periodic request and/or connection retry attempts and/or will attempt to communicate with a secondary peer depending on the peer config and session-binding setting.

• **retry-and-terminate**: In the event of a failure the user session continues for the duration of one retry attempt with the server. If this retry attempt also fails, the session is terminated.

• **terminate**: In the event of a failure the user session is terminated.

---

**cc-request-type**

**As in 8.0 release:**

This optional keyword defines the type of credit control request with failure result code and credit control failure handling action for a session.

• **any-request**: Specifies the request type as any request for a new session.

• **initial-request**: Specifies the request type as initial request for a new session.

• **terminate-request**: Specifies the request type as terminate request for a session.

• **update-request**: Specifies the request type as update request for an active session.

---

**Usage**

Use this command to configure the Diameter Policy Control Application (DPCA) failure handling behavior. When an unknown rulebase comes in CCA, changing of rulebase and failure handling is managed in the following manner:

• If the new and existing rulebases have the same CCA policy, then switch to the new rulebase is successful.

• If the new rulebase is valid and has CCA-enabled, in CCA-Initial/Update request, switch to the new rulebase is successful.

• If the new rulebase is valid and does NOT have CCA enabled, whereas the existing rulebase has credit enabled, or vice versa, in CCA-Initial/Update request:
  
  • CCFH-Continue: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.
  
  • CCFH-RETRY&TERMINATE: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.
  
  • CCFH-TERMINATE: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.

• If the new rulebase is invalid, in CCA-Initial/Update request:
  
  • CCFH-Continue: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.
  
  • CCFH-RETRY&TERMINATE: Terminates on successful CCA-T, or terminates after successful/failed retry to secondary.
  
  • CCFH-TERMINATE: Terminates on successful/failed CCR-T to Primary.

The default failure handling behavior is:

**failure-handling diameter-result-code any-error ccfh terminate**

In StarOS release 14.1 and earlier, when an IP CAN session is up, if any CCR-U message delivery fails due to timeout or TCP link failure, the failure-handling action “**continue**” will be taken for the session and there will not be any further interaction with PCRF and RAR from PCRF is also not accepted (result code 5002 is
sent in RAA). If the CCR-U that is triggered for reporting Usage-Monitoring-Information AVP fails, then the usage information is lost.

In 15.0 and later releases, after the IP-CAN session is up, if CCR-U message delivery fails due to timeout or TCP link failure, the failure-handling action “continue retry-server-on-event” will be taken at PCEF. Any request coming from session manager will be forwarded to PCRF, and if message delivery again fails session manager will be notified with status “SN_STATUS_NO_ACTIONS_TAKEN”.

If CCR-U for reporting Usage-Monitoring-Information fails, then the unreported usage information is given back to ECS and the usage information is stored at ECS. Usage will be reported in CCR-T or in the next CCR-U (if CLI “event-update send-usage-report” is configured). Also, RAR message from PCRF will be processed and responded with result-code success in RAA.

**Important:** Unreported usage will be lost, if CCR-U message delivery fails for last rule removal or usage reporting for monitoring stop indication from PCRF. Also, note that preserving unreported usage monitoring information is currently not supported for dpca-custom9 dictionary.

**Example**

The following command sets the DPCA failure handling to retry-and-terminate and return a result code of 3456 for credit control request type initial-request:

As in 8.0 release:

```plaintext
failure-handling diameter-result-code 3456 ccfh retry-and-terminate cc-request-type initial-request
```

As in 8.1 and later releases:

```plaintext
failure-handling cc-request-type initial-request diameter-result-code 3456 retry-and-terminate
```
li-secret

Refer to the *Cisco ASR 5000 Lawful Intercept Configuration Guide* for a description of this command.
re-auth-trigger

This command configures the Event-Trigger AVP with the value “CHARGING_CORRELATION_EXCHANGE (28)”.

Product
GGSN
HA
HSGW
IPSG
PDSN
P-GW
S-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration

configure > context context_name > ims-auth-service service_name > policy-control

Entering the above command sequence results in the following prompt:

[context_name] host_name(config-imsa-dpca)#

Syntax

re-auth-trigger charging-correlation-exchange

{ default | no } re-auth-trigger

default
Applies the default setting for this command.

no
Disables the event trigger “CHARGING_CORRELATION_EXCHANGE (28)”.

charging-correlation-exchange
This keyword enables the event trigger “CHARGING_CORRELATION_EXCHANGE (28)”.

Usage
Use this command to configure the Event-Trigger AVP with the value “CHARGING_CORRELATION_EXCHANGE (28)”. When this trigger is configured, the Access-Network-Charging-Identifier-Gx AVP will be encoded in all CCR messages and sent to PCRF. Unless configured, the Event-Trigger AVP will not contain the value “CHARGING_CORRELATION_EXCHANGE (28)”. The PCRF will use this event trigger value in CCA and RAR commands to indicate that the PCEF will report the access network charging identifier associated to one or more dynamic PCC rules through the Access-
Network-Charging-Identifier-Gx AVP. The Charging-Correlation-Indicator AVP with the value CHARGING_IDENTIFIER_REQUIRED will be provided. When used in a CCR command, this value indicates that an access network charging identifier has been assigned. The actual value will be reported through the Access-Network-Charging-Identifier-Gx AVP. In releases prior to 15.0, the Access-Network-Charging-Identifier-Gx AVP was always included in CCR-I/CCR-U messages sent from the system to PCRF and contains default bearer's charging ID. Now in 15.0 and later releases, it is sent only if the event trigger “CHARGING_CORRELATION_EXCHANGE (28)” is enabled and a new AVP “Charging-Correlation-Indicator 0 (identifier required)” is sent by PCRF to the system. This behavioral change is introduced to conform to the 3GPP TS 29.212 V10.5.0, and it is important to be noted that this CLI command helps to retain the old behavior, that is, send the Access-Network-Charging-Identifier-Gx AVP in all CCR messages. PCRF can install the event trigger (28) and request for the charging correlation while installing/modifying a dynamic rule in RAR/CCA. PCRF can install the trigger and request for charging correlation alone without modifying the rule in RAR/CCA message. Earlier, this AVP “Access-Network-Charging-Identifier-Gx” was included in the RAA message. But, in 15.0 and later releases, this AVP is not sent in RAA but a new CCR-U is triggered if the system receives Charging-Correlation-Indicator AVP in RAR message and the trigger is enabled.

**Example**

The following command enables the CHARGING_CORRELATION_EXCHANGE event trigger.

```
re-auth-trigger charging-correlation-exchange
```
subscription-id service-type

This command enables required subscription-id types for various services. The Subscription-ID AVP will be encoded based on the configured subscription-ID type.

Product
- GGSN
- HA
- IPSG
- PDSN
- P-GW

Privilege
- Security Administrator, Administrator

Mode
- Exec > Global Configuration > Context Configuration > IMS Authorization Configuration > Policy Control Configuration
- configure > context context_name > ims-auth-service service_name > policy-control

Entering the above command sequence results in the following prompt:

```
{context_name}@host_name(config-imsa-dpca)#
```

Syntax

```
subscription-id service-type { closed_rp | ggsn | ha | ipsg | l2tpls | mipv6ha | pdsn | pgw } { e164 | imsi | nai }
```

```
{ default | no } subscription-id service-type { closed_rp | ggsn | ha | ipsg | l2tpls | mipv6ha | pdsn | pgw } { e164 | imsi | nai }
```

```
default | no
```

Configures this command with the default setting.
The default behavior is that Subscription-ID AVP will be encoded based on service-type and Diameter dictionary.

```
{ closed_rp | ggsn | ha | ipsg | l2tpls | mipv6ha | pdsn | pgw } { e164 | imsi | nai }
```

Controls the encoding of Subscription-ID AVP based on the following service-types associated with services such as GGSN, HA, IPSG, PDSN, etc.

- E164
- IMSI
- NAI

Usage

In releases prior to 15.0, Subscription-ID AVP is encoded based on service-type and Diameter dictionary.
In 15.0 and later releases, when IMS Authorization service encodes the Subscription-ID AVP, IMSA will first check whether or not this CLI command `subscription-id service-type` is configured. If the CLI is configured for the current service, then IMSA will encode the Subscription-ID AVP based on the configured subscription-ID type. This CLI command takes more precedence than the default behavior. If the CLI configuration does not encode any Subscription-ID AVP, then IMSA will encode this AVP based on the default behavior. For example, in GGSN/IPSG service, NAI support is not available. If this CLI command is configured for GGSN/IPSG service with NAI type, then based on CLI IMSA cannot encode any subscription-ID AVP. By this time default behavior (old behavior based on service-type and dictionary) will add the subscription-ID.

**Example**

The following command enables encoding of the Subscription-ID AVP based on IMSI parameter for GGSN service:

```
subscription-id service-type ggsn imsi
```
Chapter 256
PVC Configuration Mode Commands

The Permanent Virtual Connection (PVC) configuration mode commands bind IP interfaces or SS7-Frame Relay links a PVC as well as configure PVC operational parameters for a specific port.

Mode

Exec > Global Configuration > ATM Port Configuration > PVC Configuration

```
configure > port atm slot_number/port_number > pvc vpi vpi_number vci vci_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number-pvc-pvc_number/vci_number)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, version, and installed license(s).
bind

This command binds an IP interface or an SS7 link to the PVC.

**Important:** Prior to attempting the binding, the interface and context or the SS7 routing information and link must have been configured.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > ATM Port Configuration > PVC Configuration

```bash
configure > port atm slot_number/port_number > pvc vpi vpi_number vci vci_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number-pvc-pvc_number/vci_number)#
```

**Syntax**

```bash
[ no ] bind { interface interface_name context_name | link ss7-routing-domain rd_id linkset-id id link-id id }
```

- **no**
  Removes the binding from the configuration.

- **interface_name**
  Defines the name of the virtual interface to be bound to the PVC. *interface_name:* Must be a unique string consisting of 1 to 79 alphanumeric characters.

- **context_name**
  Specifies the name of the context to be bound to the virtual interface. *context_name:* Must be a unique string consisting of 1 to 79 alphanumeric characters.

- **ss7-routing-domain rd_id**
  Identifies a specific SS7 routing domain. *rd_id:* must be an integer from 1 to 12

- **linkset-id id**
  Identifies a specific linkset within the routing domain. *id:* must be an integer from 1 to 33

- **link-id id**
  Identifies a specific link within the linkset. *id:* must be an integer value 1 - 16
Usage
Use this command to bind the PVC to an interface or a specific link.

Example
Use a command similar to the following to bind a PVC to a link ID #2:

```
bind ss7-routing-domain 1 linkset-id 23 link-id 2
```
encapsulation aal5

Specify the data encapsulation type for the ATM adaptation layer 5 (AAL5) frames for the PVC.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > ATM Port Configuration > PVC Configuration

configure > port atm slot_number/port_number > pvc vpi vpi_number vci vci_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number-pvc-pvc_number/vci_number)#

Syntax

encapsulation aal5 { llc-snap | vc-mux }

<table>
<thead>
<tr>
<th>llc-snap</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frames protocol is identified in the AAL5 using logical link control (LLC) encapsulation.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>vc-mux</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frames are not encapsulated and use virtual circuit multiplexing (VC-MUX) to identify the protocols used for the AAL5 frames.</td>
</tr>
</tbody>
</table>

Usage
Use this command to identify the protocol type for the circuit.

Example

encapsulation aal5 vc-mux
end

Exits the PVC configuration mode and returns to the Exec mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Change the mode back to the Exec mode.
**exit**

Exits the PVC configuration mode and returns to the ATM port configuration mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
exit
```

**Usage**

Return to the port configuration mode.
shaping

Specify the type of traffic shaping (rates) for this PVC.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > ATM Port Configuration > PVC Configuration
configure > port atm slot_number/port_number > pvc vpi vpi_number vci vci_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number-pvc-pvc_number/vci_number)#

Syntax

shaping { cbr pcr pcr_num | ubr pcr pcr_num | ubr+ pcr pcr_num mrc mrc_num | vbr pcr pcr_num scr src_num mbs mbs_num }

---

cbr

Constant bit rate
pcr - peak cell rate = cells per second
pcr_num: Must be an integer from 75 to 1412830

---

ubr

Unspecified Bit Rate
pcr - peak cell rate = cells per second
pcr_num: Must be an integer from 75 to 1412830

---

ubr+

Unspecified Bit Rate with Minimum Cell Rate.
The PCR and MCR values should be set to maintain the following relationship: PCR >= (MCR + minRate), where the current recommended minRate is 75.
pcr - peak cell rate = cells per second
pcr_num: Must be an integer from 75 to 1412830
mcr - minimum cell rate
mcr_num: Must be an integer from 75 to 1412830

---

vbr

Variable Bit Rate, NRT (not real time) type.
The PCR and MCR values should be set to maintain the following relationship: PCR >= (MCR + minRate), where the current recommended minRate is 75.
pcr - peak cell rate = cells per second
pcr_num must be an integer from 75 to 1412830
scr - sustained cell rate
scr_num must be an integer from 75 to 1412830
mbs - maximum burst size

mbs_num must be an integer from 75 to 1412830

Usage
Use this command to configure the shaping for egress traffic on this PVC.

Example

    shaping cbr pcr 56000
**shutdown**

Disables/enables traffic over the current VLAN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > ATM Port Configuration > PVC Configuration

```
configure > port atm slot_number/port_number > pvc vpi vpi_number vci vci_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number-pvc-pvc_number/vci_number)#
```

**Syntax**

```
shutdown

no shutdown
```

Enables the VLAN. When omitted the VLAN is non-functional.

**Usage**

Enables/ Disables specified VLAN.

This command is necessary to bring a VLAN into service by enabling it via the `no` keyword.

**Example**

To disable a VLAN from sending or receiving network traffic use the following command:

```
shutdown
```

To enable a VLAN use the following command:

```
no shutdown
```
The PVC (permanent virtual connection) Interface configuration mode is used to create and manage the IP parameters for PVC interface(s) associated with an OLC (ATM-type) for a specific context.

**Mode**

```
Exec > Global Configuration > Context Configuration > PVC Interface Configuration

configure > context context_name > interface interface_name point-to-point
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-if-pvc)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
description

Defines descriptive text to provide useful information about the current interface.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PVC Interface Configuration

```
configure > context context_name > interface interface_name point-to-point
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-if-pvc)#
```

**Syntax**

```
description text
```

```
no description
```

**no**
Erases the port’s description from the configuration file.

**text**
```
text: Must be a string of 1 to 79 alphanumeric characters with no spaces or a string within double quotes that includes printable characters. The description is case-sensitive.
```

**Usage**
Set the description to provide helpful information, for example the port’s primary function, services, end users. Define any information, the only limit is the number of characters, 79.

**Example**

```
description "PVC12 connects server 1 to home office."
```
end

Exits the PVC interface configuration mode and returns to the Exec mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

end

Usage
Change the mode back to the Exec mode.
exit

Exits the interface configuration mode and returns to the context configuration mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Return to the context configuration mode.
ip

The commands in this section are used to configure the IP parameters for the PVC interface.

Important: Before configuring the OSPF parameters in this section, you need to enable OSPF using the router command and OSPF configuration sub-mode commands accessed in the Context configuration mode and documented in the Context Configuration Mode chapter of this Command Line Interface Reference.
ip access-group

This command identifies the access control list (ACL) to be associated with this PVC interface in this context.

**Important:** Prior to using this command, the access list must be created for this context with the `ip access-list` command in the Context configuration mode and then the ACL must be configured using the commands described in CLI chapter ACL Configuration Mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PVC Interface Configuration

command: `configure > context context_name > interface interface_name point-to-point`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-if-pvc)#
```

**Syntax**

```
ip access-group name { in | out }

no ip access-group name { in | out }
```

**no**
Indicates the specified access group to be removed from the access list.

**name**
Specifies the access control list (ACL) rule to be added or removed from the group.

**name:** Must be a string of 1 to 79 alphanumeric characters with no spaces.

**Important:** Up to 8 ACLs can be applied to a group provided that the number of rules configured within the ACL(s) does not exceed the 128 rule limit for the interface.

**in | out**

**in:** Specifies list is for in-bound access control.

**out:** Specifies the list is for out-bound access control.

**Important:** Even though “in” or “out” can be specified, context-level ACL rules are automatically applied to both directions.
Usage
Use this command to add IP access lists configured for the same context to an IP access-group. The list can be configured to apply to all inbound and/or outbound traffic.

Example
The following adds ACL access-list-1 to the IP access-group associated with this PVC for this context.

```
ip access-group access-list-1 in
```
**ip address**

Defines the primary IP address and the network mask to be associated with this PVC interface for this context. This command can also be used to configure the secondary IP address.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PVC Interface Configuration

`configure > context context_name > interface interface_name point-to-point`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-if-pvc)#`

**Syntax**

```plaintext
ip address ip_address ip_mask [ secondary ]

no ip address ip_address
```

**Usage**

Configures or deletes the IPv4 or IPv6 addresses and subnet mask to be associated with this PVC.

**Example**

The following configures the secondary IP address to associate with the interface.

```plaintext
ip address 131.2.3.4 255.255.255.0 secondary
```

The following set of commands removes the primary IP address from the PVC interface configuration for this context.

```plaintext
no ip address secondary address
```
no ip address primary address
**ip mtu**

Configures the maximum transmission unit (MTU) to be supported on this interface.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PVC Interface Configuration

```
configure > context context_name > interface interface_name point-to-point
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-if-pvc)#
```

**Syntax**

```
ip mtu value

no ip mtu
```

- **no**
  - Disables and/or restores the option to the system default.

- **mtu value**
  - Configures the maximum transmission unit in octets.
  - **value**: Enter an integer between 576 and 1600. Default is 1500.

**Usage**

Change the maximum transmission unit size to 1300.

**Example**

```
ip mtu 1300
```
**ip ospf authentication-key**

This command configures the password or key to be used for OSPF (Open Shortest Path First) authentication with neighboring routers.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PVC Interface Configuration
configure > context context_name > interface interface_name point-to-point

Entering the above command sequence results in the following prompt:

([context_name]host_name(config-if-pvc)#

**Syntax**

```
ip ospf authentication-key [ encrypted ] password auth_key
no ip ospf authentication-key
```

**Usage**

Use this command to set the authentication key used when authenticating with neighboring routers.

**Example**

To set the authentication key to 123abc, use the following command;

```
ip ospf authentication-key password 123abc
```

Use the following command to delete the authentication key;

```
no ip ospf authentication-key
```
**ip ospf authentication-type**

This command configures the OSPF authentication method to be used with OSPF neighbors over the logical interface.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PVC Interface Configuration

`configure > context context_name > interface interface_name point-to-point`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-if-pvc)#
```

**Syntax**

```
ip ospf authentication-type { message-digest | null | text }
no ip ospf authentication-type { message-digest | null | text }
```  

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>message-digest</strong></td>
<td>Set the OSPF authentication type to use the message digest (MD) authentication method.</td>
</tr>
<tr>
<td><strong>null</strong></td>
<td>Set the OSPF authentication type to use no authentication, thus disabling either MD or clear text methods.</td>
</tr>
<tr>
<td><strong>text</strong></td>
<td>Set the OSPF authentication type to use the clear text authentication method.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to set the type of authentication to use when authenticating with neighboring routers.

**Example**

To set the authentication type to use clear text, enter the following command;

```
ip ospf authentication-type text
```
ip ospf cost

This command configures the cost associated with sending a packet over this logical interface.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PVC Interface Configuration

configure > context context_name > interface interface_name point-to-point

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-if-pvc)#

Syntax

ip ospf cost value

no ip ospf cost

no

Disable this function.

value

Default: 10

The cost to assign to OSPF packets. This must be an integer from 1 through 65535.

Usage

Use this command to set the cost associated with routes from the interface.

Example

Use the following command to set the cost to 20;

    ip ospf cost 20

Use the following command to disable the cost setting;

    no ip ospf cost
**ip ospf dead-interval**

This command configures the dead-interval and the delay time in seconds, for OSPF communications.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PVC Interface Configuration

configure > context context_name > interface interface_name point-to-point

Entering the above command sequence results in the following prompt:

\[\text{context_name}\text{host_name(config-if-pvc)}\#$

**Syntax**

`ip ospf dead-interval value`

`no ip ospf dead-interval`

- **no**
  Deletes the value set and returns the value to its default.

- **value**
  The interval, in seconds, that the router should wait. During this interval, if no packets are received then the system considers the neighboring router to be off-line. This interval is typically 4 times the duration of the hello-interval.
  Value must be an integer from 1 through 65535. Default: 40

**Usage**

Use this command to set the dead-intervals or delays for OSPF communications.

**Example**

To set the dead-interval to 100, use the following command;

```
ip ospf dead-interval 100
```

To delete the setting for the dead-interval and reset the dead-interval value to its default of 40, use the following command:

```
oip ospf dead-interval
```
ip ospf hello-interval

This command configures the delay time in seconds, for OSPF hello interval.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PVC Interface Configuration

\texttt{configure > context context\_name > interface interface\_name point-to-point}

Entering the above command sequence results in the following prompt:

\texttt{[context\_name]\host\_name(config-if-pvc)#}

Syntax

\texttt{ip ospf hello-interval value}

\texttt{no ip ospf hello-interval}

\texttt{no}

Deletes the value set and returns the value to its default.

\texttt{value}

The interval, in seconds, between sending hello packets. This value is typically set to be 1/4 of the value of the dead-interval. \texttt{value} must be an integer from 1 through 65535. Default: 10

Usage

Use this command to set the delays for the hello-interval.

Example

To set the hello-interval to 25, use the following command;

\texttt{ip ospf hello-interval 25}

To delete the setting for the hello-interval and reset the hello-interval value to its default of 10, use the following command:

\texttt{no ip ospf hello-interval}
ip ospf message-digest-key

This command enables the use of MD5-based OSPF authentication.

Product
- SGSN

Privilege
- Security Administrator, Administrator

Mode
- Exec > Global Configuration > Context Configuration > PVC Interface Configuration
  configure > context context_name > interface interface_name point-to-point

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-if-pvc)#

Syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip ospf message-digest-key key_id md5 [ encrypted ] password authentication_key</td>
<td>Creates an authentication key. Use this command to create an authentication key that uses MD5-based OSPF authentication.</td>
</tr>
<tr>
<td>no ip ospfmessage-digest-key key_id</td>
<td>Deletes the key.</td>
</tr>
</tbody>
</table>

Usage

Use this command to create an authentication key that uses MD5-based OSPF authentication.

Example

To create a key with the ID of 25 and a password of 123abc, use the following command;

    ip ospf message-digest-key 25 md5 password 123abc

To delete the same key, enter the following command;

    no ip ospf message-digest-key 25
**ip ospf network**

Configures the OSPF network type.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PVC Interface Configuration

```
configure > context context_name > interface interface_name point-to-point
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-if-pvc)#
```

**Syntax**

```
ip ospf network { broadcast | non-broadcast | point-to-multipoint | point-to-point }
no ip ospf network
```

**Usage**

Use this command to specify the OSPF network type.

**Example**

To set the OSPF network type to broadcast, enter the following command;

```
ip ospf network broadcast
```

To disable the OSPF network type, enter the following command;

```
no ip ospf network
```
ip ospf priority

This command designates the OSPF router priority.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > PVC Interface Configuration

configure > context context_name > interface interface_name point-to-point

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-if-pvc)#

Syntax

ip ospf priority value

no ip ospf priority value

no
Disable this function.

value
The priority value to assign. This must be an integer from 0 through 255.

Usage

Use this command to set the OSPF router priority.

Example

To set the priority to 25, enter the following command:

   ip ospf priority 25

To disable the priority, enter the following command:

   no ip ospf priority
**ip ospf retransmit-interval**

This command configures the retransmit-interval and the delay time in seconds, for OSPF communications.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PVC Interface Configuration

```bash
configure > context context_name > interface interface_name point-to-point
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-if-pvc)#
```

**Syntax**

```bash
ip ospf dead-interval value

no ip ospf dead-interval
```

- **no**
  - Deletes the value set and returns the value to its default.

- **value**
  - The interval, in seconds, between LSA (Link State Advertisement) retransmissions. Value must be an integer from 1 through 65535. Default: 5

**Usage**

Use this command to set the retransmit-intervals or delays for OSPF communications.

**Example**

To set the dead-interval to 25, use the following command;

```bash
ip ospf retransmit-interval 25
```
**ip ospf transmit-delay**

This command configures the transmit-delay the OSPF communications parameters.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > PVC Interface Configuration

```
configure > context context_name > interface interface_name point-to-point
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-if-pvc)#
```

**Syntax**

```
ip ospf transmit-delay value

no ip ospf transmit-delay
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>The interval, in seconds, that the router should wait before transmitting a packet. Value must be an integer from 1 through 65535. Default: 1</td>
</tr>
<tr>
<td>no</td>
<td>Deletes the value set and returns the value to its default.</td>
</tr>
</tbody>
</table>

**Usage**
Use this command to set the transmit-delay.

**Example**
To set the transmit delay to 5 seconds, use the following command:

```
ip ospf transmit-delay 5
```

To delete the setting for the transmit-delay or reset the transmit-delay value to its default of 1, use the following command:

```
no ip ospf transmit-delay
```
Chapter 258
QCI - QoS Mapping Configuration Mode Commands

The QoS Class Index (QCI) to QoS Mapping Configuration Mode is used to map QoS Class Indexes to enforceable QoS parameters. Mapping can occur between the RAN and the Serving Gateway (S-GW), the Mobility Management Entity (MME), and/or the PDN Gateway (P-GW) in an LTE network or between the RAN and the eHRPD Serving Gateway (HSGW) in an eHRPD network.

Mode

Exec > Global Configuration > QCI-QoS Mapping Configuration
configure > qci-qos-mapping name

Entering the above command sequence results in the following prompt:

[local]host_name(config-qci-qos-mapping)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

Product

[llocal]host_name(config-qci-qos-mapping)#

Syntax information

- Syntax for releases 15 and earlier

Syntax for releases 15 and earlier

```plaintext
qci num [ delay-class num precedence-class num reliability-class num [ downlink | uplink ] ]

qci num [ gbr [ delay-class | downlink | max-packet-delay | traffic-policing | uplink ] ]

qci num [ max-packet-delay num max-error-rate num [ downlink | uplink ] ]

qci num [ non-gbr [ delay-class | downlink | max-packet-delay | traffic-policing | uplink ] ]

qci num [ traffic-policing interval interval [ delay-class | downlink | max-packet-delay | uplink ] ]

```
QCI - QoS Mapping Configuration Mode Commands

[ default | no ] qci num

**Important:** The optional keywords associated with each of the initial optional keywords are abbreviated in the syntax examples above for clarity. Refer to the definitions below for the full keyword paths and associated descriptions for each keyword string in this command.

**default**
Resets the default values for the select standards-based QCI value.

**no**
Disables the selected standards-based QCI value.

**num**
Specifies the standards-based QCI value to be enabled.

**Important:** Only standards-based QCI values of 1 through 9 are supported.

QCI values 1 through 9 are defined in 3GPP Specification TS 23.203 "Policy and charging control architecture".

**delay-class** num precedence-class num reliability-class num

delay-class num: Specifies the pre-release 8 value for configuring packet delay.

**precedence-class** num: Specifies the pre-release 8 value for configuring packet precedence.

**reliability-class** num: Specifies the pre-release 8 value for configuring packet reliability.

Configures parameters for downlink traffic.

802.1p-value priority: Maps the qci value to the priority value set in the Ethernet frame header.

**encaps-header:** Specifies that the DSCP marking must be set on the encapsulation header for IP-in-IP, GRE, or GTP encapsulation.

**user-datagram dscp-marking hex:** Specifies that the IP DSCP marking is to be defined by this keyword.

**Important:** The optional keywords associated with each of the initial optional keywords are abbreviated in the syntax examples above for clarity. Refer to the definitions below for the full keyword paths and associated descriptions for each keyword string in this command.

**copy-inner**

• copy-inner: Specifies that the DSCP marking is to be acquired from the UDP headers within the encapsulation.

• dscp-marking hex: Specifies that the DSCP marking is to be defined by this keyword.

hex is expressed as a hexadecimal number from 0x00 through 0x3F.
**gbr**

Specifies that this QCI type is Guaranteed Bit Rate (GBR).

**max-packet-delay num max-error-rate num**

**max-packet-delay num**: Specifies the maximum packet delay (in milliseconds) that can be applied to the data with the QCI.

* num must be an integer from 10 through 100.

**max-error-rate num**: Specifies the maximum error loss rate of non-congestion related packet loss.

* num must be an integer from 1 through 6, specifying 10-1 through 10-6.

---

**Important**: Defaults for standards-based QCI values are defined in *3GPP Specification TS 23.203 “Policy and charging control architecture”*.

---

**non-gbr**

Specifies that this QCI type is non-Guaranteed Bit Rate (non-GBR).

**traffic-policing interval interval**

Specifies the traffic policing interval associated with the this QCI.

* interval must be an integer from 1 through 100.

Configures parameters for uplink traffic.

**802.1p-value priority**: Maps the qci value to the priority value set in the Ethernet frame header.

* priority is an integer value from 0 through 7.

**encaps-header**: Specifies that the DSCP marking must be set on the encapsulation header for IP-in-IP, GRE, or GTP encapsulation.

**mpls-exp-value value**: Sets EXP bits for MPLS for mobile to egress side traffic.

* value is an integer value from 0 through 7.

**user-datagram dscp-marking hex**: Specifies that the IP DSCP marking is to be defined by this keyword.

* hex is expressed as a hexadecimal number from 0x00 through 0x3F.

{ copy-inner | dscp-marking hex }

- **copy-inner**: Specifies that the DSCP marking is to be acquired from the UDP headers within the encapsulation.

- **dscp-marking hex**: Specifies that the DSCP marking is to be defined by this keyword.

* hex is expressed as a hexadecimal number from 0x00 through 0x3F.

---

**Usage**

Use this command to create and map QCI values to enforceable QoS parameters.
Non-standard QCI values are only supported with the license-enabled operator-defined qci command.

Example

The following command creates a QCI value of 8 and defines the uplink encapsulation header as using the DSCP marking from the encapsulated UDP header:

```plaintext
qci 8 uplink encaps-header copy-inner
```
Chapter 259
QCI - RAN ID Mapping Configuration Mode Commands

The QoS Class Index (QCI) Mapping Configuration Mode is used to map RAN profile IDs to QoS Class Indexes via the HRPD Serving Gateway (HSGW) in an eHRPD network.

Mode

Exec > Global Configuration > QCI - RAN ID Mapping Configuration

configure > profile-id-qci-mapping-table name

Entering the above command sequence results in the following prompt:

[local]host_name(config-profile-id-qci-mapping-table)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current mode and returns to the Exec Mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Change the mode back to the Exec mode.
exit

Exits the current mode and returns to the previous mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
``` 

**Usage**
Return to the previous mode.
profile-id

Maps a QCI ID to a RAN profile ID and modifies data flow bit rate ranges.

**Product**
HSGW

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > QCI - RAN ID Mapping Configuration

```console
configure > profile-id-qci-mapping-table name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-profile-id-qci-mapping-table)#
```

**Syntax**

```bash
profile-id id qci num [ uplink { gbr rate [ mbr rate ] | mbr rate [ gbr rate ] } downlink { gbr rate [ mbr rate ] | mbr rate [ gbr rate ] } ]
no profile-id id
```

**no profile-id id**

Removes the specified profile ID entry from this map.

**id**

Specifies the profile ID to which a QCI ID will be mapped. `id` must be an integer value from 1 to 65535.

**qci num**

Specifies the QCI number to which the profile ID will be mapped. `num` must be an integer value from 1 to 255.

**uplink**

Specifies that the guaranteed bit rate (GBR) and/or maximum bite rate (MBR) setting that follow this keyword will be applied to the uplink data flow.

**downlink**

Specifies that the guaranteed bit rate (GBR) and/or maximum bite rate (MBR) settings that follow this keyword will be applied to the downlink data flow.

**gbr rate**

Specifies the guaranteed bit rate for the uplink or downlink data flow. `rate` must be an integer value from 0 to 4294967295.
mbr rate

Specifies the maximum bit rate for the uplink or downlink data flow. rate must be an integer value from 0 to 4294967295.

Usage

Use this command to map a QCI ID to a RAN profile ID and, optionally, modify data flow bit rate ranges.

Example

The following command maps a QCI ID (1) to a profile ID (10) and sets the uplink guaranteed bite rate to 10000 and the downlink guaranteed bit rate to 20000:

```
profile-id 10 qci 1 uplink gbr 10000 downlink gbr 20000
```
Chapter 260
Remote Address List Configuration Mode Commands

The Remote Address List Configuration Mode is used to configure address lists for the Remote Address-based Accounting feature on a per-context basis.

Mode

Exec > Global Configuration > Context Configuration > Remote Address List Configuration

configure > context context_name > radius accounting ip remote-address list list_number

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-remaddr-list)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
address

Configures addresses within a Remote Address List.

Product

- PDSN
- HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Remote Address List Configuration

```
configure > context context_name > radius accounting ip remote-address list list_number
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-remaddr-list)#
```

Syntax

```
[ no ] address ip_address netmask subnet
```

<table>
<thead>
<tr>
<th>no</th>
<th>Removes a previously configured address.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip_address</td>
<td>Specifies the IP address of the remote device.</td>
</tr>
<tr>
<td>netmask subnet</td>
<td>Specifies the subnet mask of the remote device.</td>
</tr>
</tbody>
</table>

Usage

Use this command to configure remote address lists for use with the Remote Address-based accounting feature. A maximum of 10 address can be configured per list.

Example

The following command adds an IP address of 192.168.100.1 with a subnet mask of 255.255.255.0 to the list:

```
address 192.168.100.1 netmask 255.255.255.0
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
The Remote Secret List Configuration Mode manages the list of remote secrets based on ID type.

Mode

Exec > Global Configuration > Remote Secret List Configuration

> crypto remote-secret-list listname

[local_context]host_name(config-remote-server-list)#
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
remote-id

Configures the remote pre-shared key based on the ID type.

**Product**
WSG

**Privilege**
Security Administrator

**Mode**
Exec > Global Configuration > Remote Secret List Configuration
> crypto remote-secret-list listname
[local_context]host_name(config-remote-server-list)#

**Syntax**

```plaintext
remote-id id-type { der-asn1-dn | fqdn | ip-addr | key-id | rfc822-addr } id id_value
secret [ encrypted ] key key_value

no remote-id id-type { der-asn1-dn | fqdn | ip-addr | key-id | rfc822-addr } id id_value
```

**Usage**

Use this command to enter up to 1000 entries in the remote secret list. Each entry is designated by ID type and ID value. Repeat the command sequence to add entries to the list.

**Example**

The following command enters an ip address in the remote secret list:
remote-id id-type ip-addr id 10.1.1.1
Chapter 262
Remote Server List Configuration Mode Commands

The Remote Server List Configuration Mode manages the list of server addresses to which a context has access.

Mode

Exec > Global Configuration > Remote Server List Configuration

configure > context context_name > remote-server-list name list_name

[context_name]host_name(config-remote-server-list)#

Important: Available commands or keywords/variables vary based on platform type, product version, and installed license(s).
address

Configures or removes an IP address to a remote server.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Remote Server List Configuration
configure > context context_name > remote-server-list name list_name

[context_name]host_name(config-remote-server-list)#

Syntax

address remote-ip-address netmask ip_netmask

no address remote-ip-address netmask ip_netmask

Usage
Removes the specified IP address from the Remote Server List.

remote-ip-address netmask ip_netmask

Specifies the IP address and netmask of the remote server in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

Example

Use this command to create and maintain a list of remote servers accessible by this context.

address 193.154.78.9 netmask 255.255.255.0
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Use this command to return to the parent configuration mode.
Chapter 263
RLF Template Configuration Mode Commands

Rate Limiting Function (RLF) Template Configuration Mode is accessed from the Global Configuration Mode. This mode allows an operator to configure the RLF template that can be associated with Diameter and other applications for throttling and rate controlling of messages sent to external network interfaces.

**Important:** Rate Limiting Function (RLF) is a license-controlled feature. A valid feature license must be installed prior to configuring this feature. Contact your Cisco account representative for more information.

Mode

Exec > Global Configuration > RLF Template Configuration

```
configure > rlf-template rlf_template_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(cfg-rlf-template)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**delay-tolerance**

Defines the maximum number of seconds a control plane signaling message can be queued before being processed. After exceeding this delay, the message is dropped.

**Product**

GGSN

P-GW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > RLF Template Configuration

`configure > rlf-template rlf_template_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(cfg-rlf-template)#
```

**Syntax**

```
delay-tolerance tolerance_value [ -noconfirm ]
```

**default delay-tolerance**

```
default
```

Removes the configuration associated with the RLF template. Default value is 2.

```
tolerance_value
```

Specifies the maximum number of seconds a message can be queued in the RLF module. The message must be sent after expiry of “delay-tolerance” seconds. `tolerance_value` must be an integer from 0 through 10. Default value is 2.

```
[ -noconfirm ]
```

Specifies that the command must execute without any prompts and confirmation from the user.

**Usage**

Use this command to define the maximum number of seconds a message can be queued in the RLF module before being processed. After exceeding this delay, the message is dropped.

**Example**

The following command sets the value of delay tolerance to 4 seconds:

```
delay-tolerance 4
```
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.
**msg-rate**

Sets the maximum number of messages that can be processed per second.

**Product**

GGSN
P-GW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > RLF Template Configuration

```
configure > rlf-template rlf_template_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(cfg-rlf-template)#
```

**Syntax**

```
msg-rate tps_value burst-size size [ -noconfirm ]
```

- **tps_value**

  Specifies the number of messages that can be processed per second. This is the maximum number of allowed transactions per second (TPS) for an external interface.

- **Important**: The TPS value (configured per external interface) is at a chassis-level and is distributed appropriately to all session managers, AAA manager, Diamproxy, or any other applications that use RLF. RLF employs the Token Bucket Algorithm to achieve the rate limiting.

  - **tps_value** must be an integer from 1 through 100000.

- **burst_size**

  Defines the maximum number of messages (burst) that can be sent out together at any instant of time. If this setting is not configured, the default value is the current message rate. Burst size is used to derive the shaping interval in such a way that it splits the 1000 ms in N slots, where N can be 1, 2, 4, 5, 10, 20, 50, and 100.

  - **size** must be an integer from 1 through 100000.

  - **[-noconfirm]**

  Specifies that the command must execute without any prompts and confirmation from the user.

**Usage**

Use this command to define the number of messages that can be processed per second. This is the maximum number of allowed transactions per second (TPS) for an external interface. The RLF ensures that the maximum configured TPS rate is not exceeded on the interface.
If burst-size is not configured, the messages are sent without delay when they arrive in RLF. For example, if the CLI command `msg-rate 1000 burst-size 100` is configured, then all 1,000 messages are sent to an external interface in bursts of 100 messages (burst-size). If the burst size is not configured, then all 1,000 messages are sent as they arrive in RLF (regardless of TPS).

**Example**

The following command sets the value of message rate to 20:

```
msg-rate 20
```
threshold

Configures the threshold for rate-limiting the outgoing messages.

Product

GGSN
P-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > RLF Template Configuration
configure > rlf-template rlf_template_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(cfg-rlf-template)#

Syntax

threshold { lower lowerThreshold_value | upper upperThreshold_value } [ -noconfirm ]

default threshold

default

Returns the command to its default settings.

lower lowerThreshold_value

This threshold indicates that the application has message-rate control enabled. Default is 30%. If the number of outstanding messages in the RLF queue drops below 30% of msg-rate, RLF will transition to READY state.

upper upperThreshold_value

This threshold indicates that action will be taken when the message-rate reaches the maximum limit. Default is 80%. If the number of outstanding messages in the RLF queue exceeds 80% of msg-rate, RLF will transition to OVER_THRESHOLD state.

Usage

Use this command to configure the desired threshold value for rate limiting the outgoing messages. The configurable threshold value of TPS for an interface is used to notify applications of corrective actions when the threshold criteria is met.

Example

The following command configures the upper threshold to 80 and the lower threshold to 60 for throttling and rate control:

    threshold upper 80 lower 60
Chapter 264
RNC Configuration Mode Commands

The RNC (radio network controller) configuration mode defines the parameters related to the SGSN connection with an RNC.

Mode

Exec > Global Configuration > Context Configuration > luPS Service Configuration > RNC Configuration

configure > context context_name > iups-service service_name > rnc id rnc_id

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-iups-service-rnc)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
associate-gtpu-bind-address

This command defines the GTP-U loopback address and associates (binds) this address with a particular interface (non-loopback) address.

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > luPS Service Configuration > RNC Configuration

configure > context context_name > iups-service service_name > rnc id rnc_id

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-iups-service-rnc)#

Syntax

[ no ] associate-gtpu-bind-address ip_address to-interface-address ip_address

- **no**
  - Removes the loopback address definition and interface association from the current RNC configuration.

- **ip_address**
  - **ip_address**: Must be specified using the standard IPv4 dotted decimal notation.

Usage

Use this command to setup associations between loopback GTP-U addresses and a non-loopback addresses.

Example

Bind the GTP-U loopback address of 123.1.1.1 to interface address 222.1.1.1:

associate-gtpu-bind-address 123.1.1.1 to-interface-address 222.1.1.1
description

This command defines an alphanumeric string that is intended to provide descriptive information about the radio network controller (RNC). This is used for operator reference only.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > IuPS Service Configuration > RNC Configuration

configure > context context_name > iups-service service_name > rnc id rnc_id

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-iups-service-rnc)#

Syntax

description string

no description

no

Removes the description string from the current RNC configuration.

string

Specifies the alphanumeric string that is stored. must be from 1 through 255 alphanumeric characters. Strings with spaces must be enclosed in double-quotes. See the example below.

Usage

Use this command to set a description for reference by operators.

Example

The following command sets the description to identify a particular RNC and carrier in Uganda "RNC1 Carrier2 Uganda":

description "RNC1 Carrier2 Uganda"
**direct-tunnel**

This command enables/disables the direct tunnel feature through the interface to the radio network controller (RNC).

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > luPS Service Configuration > RNC Configuration

```plaintext
configure > context context_name > iups-service service_name > rnc id rnc_id
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-iups-service-rnc)#
```

**Syntax**

```plaintext
direct-tunnel not-permitted-by-rnc

default direct-tunnel
```

**default**

Sets the direct tunnel support on RNC to default mode; i.e. enabling direct tunnel.

**not-permitted-by-rnc**

Default: enabled

Disables the direct-tunnel support on radio network controller (RNC).

**Usage**

Use this command to disable/enable the direct-tunnel function through the interface to the RNC.

**Example**

Following command disables the direct tunnel support to the RNC:

```plaintext
direct-tunnel not-permitted-by-rnc
```
**dual-address-pdp**

This command enables the SGSN to work with an RNC with functioning dual address (IPv4v6) bearer support capability. By default, it is assumed that the RNC does not support dual PDP-type addressing.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > LuPS Service Configuration > RNC Configuration

`configure > context context_name > iups-service service_name > rnc id rnc_id`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-ctx-iups-service-rnc)#`

**Syntax**

```
dual-address-pdp { not-supported | supported }

default dual-address-pdp
```

---

**default**

Resets the SGSN to function with an RNC that is not supporting dual PDP addressing.

---

**not-supported**

Default

Enables the SGSN to work with an RNC that does not support dual PDP-type addressing. It allows a single address bearer PDP-type to be activated with a configured PDP-type.

---

**supported**

Enables the SGSN to work with an RNC that does support dual PDP-type addressing.

---

**Usage**

This command enables the SGSN to support dual PDP-type addressing (IPv4v6) per RNC. For a dual PDP context to be activated, the RNC should support the PDP-type IPv4v6 in the RAB assignment request. For an RNC that does support the dual PDP-type addressing, use this command to change the default configuration and to configure the SGSN to work with the RNC’s dual address bearer support capability. If the RNC does not support this functionality, then the `default` form of this command should be configured to enable the SGSN to activate a single-address bearer PDP context even if (1) the UE requests PDP type IPv4v6 and if (2) the subscription allows this PDP type. The single address bearer PDP type will be activated with a configured PDP type.

When a UE moves from an RNC that supports dual PDP-type addressing to another RNC that does not support dual PDP-type addressing, then the SGSN will deactivate the PDP context. This is done because, even if we preserve the PDP contexts, the UE would be unaware of the preserved PDP context. This would lead to non-synchronized behavior in the network. So the SGSN deactivates the PDP context with cause code...
"reactivation-required" to ensure the UE, RNC, SGSN, and GGSN are in synch. As well, this gives the UE the opportunity to activate a PDP context again without dual bearers.

The `sgsn-rnc-no-dual-pdp-init-pdp-deact` disconnect reason is used to indicate that a PDP context has been deactivated because of roaming into an RNC that does not support this feature.

**Important:** For this configuration to function, support for dual PDP-type addressing must be enabled at the global level (the default). To confirm the functionality is enabled, issue the `show sgsn-mode` command from the Exec mode. If the PDP-type addressing is not enabled, then refer to the instructions for the `dual-address-pdp` command in the `SGSN Global Configuration Mode Commands` section.

**Example**

Use the following command to enable dual PDP-type addressing with a supporting RNC:

```
dual-address-pdp supported
```
enb-direct-data-forward

Selects the setup of indirect data forwarding tunnels (IDFT) between the eNodeB and the RNC via the SGW during SRNS relocation, or, selects the use of direct data forwarding.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > luPS Service Configuration > RNC Configuration

```bash
configure > context context_name > iups-service service_name > rnc id rnc_id
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-iups-service-rnc)#
```

**Syntax**

```
[no] enb-direct-data-forward
```

- **[no]**
  Disables direct data forwarding and enables the setup of indirect data forwarding tunnels between the eNodeB and the RNC via the SGW during SRNS relocation. This allows the S4-SGSN to support connected mode handovers between the UTRAN and E-UTRAN networks across the S3 interface. This is the default setting.

- **enb-direct-data-forward**
  Enables the use of direct data forwarding between the eNodeB and the RNC via the SGW. If this setting is configured and the SGSN receives a Relocation Required message from this RNC for a subscriber with target node as an eNodeB, then the SGSN will set the indication->DFI (direct forwarding indicator) flag in the Forward Relocation Request message sent across the S3 interface. Use of this command disables the setup of indirect data forwarding tunnels.

**Usage**

Use this command to enable the setup of direct data forwarding tunnels between the eNodeB and the RNC during inter RAT connected mode handover. Enabling direct data forwarding tunnels allows the S4-SGSN to support connected mode handovers between the UTRAN and E-UTRAN networks across the S3 interface without the use of indirect data forwarding tunnels through SGW. Once direct data forwarding is enabled, indirect data forwarding is automatically disabled.

**Example**

Enable the setup of indirect data forwarding tunnels between the eNodeB and RNC via the SGW during SRNS relocation. This command also disables direct data forwarding.

```
no enb-direct-data-forward
```
end

Exits the configuration mode and returns to the Exec mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Change the mode to the Exec mode.
exit

Exits the current configuration mode and returns to the IuPS Service configuration mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Return to the previous configuration mode.
**lac**

This command identifies a Local Area Concentrator (LAC) and a Remote Area Concentrator (RAC) and associates them with this RNC definition.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > luPS Service Configuration > RNC Configuration
configure > context context_name > iups-service service_name > rnc id rnc_id

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-iups-service-rnc)#
```

**Syntax**

```
[ no ] lac lac_id rac rac_id
```

- **no**
  Deletes the LAC and RAC information from the system configuration.

- **lac_id**
  A unique numeric identifier for the LAC associated with the RNC.
  **lac_id** must be an integer between 1 and 65535.

- **rac_id**
  A unique numeric identifier for the RLAC associated with the RNC.
  **rac_id** must be an integer between 1 and 255.

**Usage**

Creates an association with a specific LAC and RAC.

**Example**

Associate LAC 545 and RAC 23 with this RNC:

```
lac 545 rac 23
```
mbms

Configures RNC options for multimedia broadcast multicast service.

Important: This feature and command are currently under development and are not supported.

Product

SGSN
overload-action disable

This command maps an action to be taken if traffic reaches or exceeds defined levels.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > luPS Service Configuration > RNC Configuration

configure > context context_name > iups-service service_name > rnc id rnc_id

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-iups-service-rnc)#
```

**Syntax**

```
overload-action disable { activate | attach | auth-challenge | modify-request | paging-downlink-data | ptmsi-reallocation | service-request-data | sms | srns } traffic-level

[ no | default ] overload-action disable { activate | attach | auth-challenge | modify-request | paging-downlink-data | ptmsi-reallocation | service-request-data | sms | srns }
```

- **no**
  Removes the defined overload action from configuration.

- **default**
  Resets the traffic level to the default level for the associated overload action.

```
activate traffic-level traffic-level
```

The system rejects new requests to activate PDP contexts if the defined traffic-level is exceeded.

*traffic-level*: An integer 1 to 15.
Default: 14

```
attach traffic-level traffic-level
```

The system rejects new requests for GPRS attach if the defined traffic-level is exceeded.

*traffic-level*: An integer 1 to 15.
Default: 15

```
auth-challenge traffic-level traffic-level
```

The system skips performing authentication challenges if the defined traffic-level is exceeded.

*traffic-level*: An integer 1 to 15.
Default: 4
modify-request traffic-level

The system rejects requests to modify a PDP context if the defined traffic-level is exceeded.

traffic-level: An integer 1 to 15.
Default: 12

paging-downlink-data traffic-level traffic-level

If the defined traffic-level is exceeded, then paging is not performed for data during downlinks if RABs are not available.

traffic-level: An integer 1 to 15.
Default: 11

ptmsi-reallocation traffic-level traffic-level

The system skips performing ptmsi-reallocation if the defined traffic-level is reached or exceeded.

traffic-level: An integer from 1 to 15.
Default: 4

service-request-data traffic-level traffic-level

The system rejects service requests to accept data and establish new RABs if the defined traffic-level is reached or exceeded.

traffic-level: An integer from 1 to 15.
Default: 10

sms traffic-level traffic-level

The system rejects SMS signaling if the defined traffic-level is reached or exceeded.

traffic-level: An integer 1 to 15.
Default: 8

srns traffic-level traffic-level

The SGSN rejects/disables SRNS if the target RNC is in overload at the specified traffic level. This keyword setting is effective for both Inter-SGSN SRNS and Intra-SGSN SRNS.

traffic-level: An integer 1 to 15.
Default: 15

Usage

This command defines traffic levels and the actions to take if traffic exceeds the defined levels. The command can be re-entered multiple times to create individual definitions for each type of traffic level and action.

Example

Use the following to instruct the system to reject service requests to establish new RABs if the traffic level reaches 3:

overload-action disable service-request-data traffic-level 3
paging-non-searching-indication

This command instructs the SGSN to include the non-searching indicator flag in the page-request message.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > luPS Service Configuration > RNC Configuration
configure > context context_name > iups-service service_name > rnc id rnc_id
Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-iups-service-rnc)#

Syntax

paging-non-searching-indication { non-searching | searching }

[ no | default ] paging-non-searching-indication

<table>
<thead>
<tr>
<th>no</th>
<th>default</th>
</tr>
</thead>
</table>
| This is the default. Entering no or default with this command disables the inclusion of the flag.

<table>
<thead>
<tr>
<th>non-searching</th>
</tr>
</thead>
</table>
| Set the non-searching-indication to non-searching in the page-request message.

<table>
<thead>
<tr>
<th>searching</th>
</tr>
</thead>
</table>
| Set the non-searching-indication to searching in the page-request message.

Usage

Use this command to determine which type of search indicator flag will be included in the page-request message.

Example

Use this command to include the non-searching flag in page-request messages:

    paging-non-searching-indication non-searching
pointcode

Configures the point code of the RNC.

The access protocol that is part of the IuPS Service configuration mode must be configured prior to defining the RNC’s point code.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > IuPS Service Configuration > RNC Configuration

configure > context context_name > iups-service service_name > rnc id rnc_id

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-iups-service-rnc)#

Syntax

pointcode pt_code

no pointcode

no

Deletes the RNC’s point code information from the system configuration.

pt_code

Point code in dotted-decimal format:

•ITU Range 0.0.1 to 7.255.7
•ANSI Range 0.0.1 to 255.255.255
•TTC Range 0.0.1 to 15.31.255
•string of 1 to 11 characters

Usage

Use this command to identify the point code of the associated RNC.

Example

Identify the pointcode for this RNC as 1.234.2:

pointcode 1.234.2
pooled

Configure an RNC as either ‘pooled’ or ‘non-pooled’.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > luPS Service Configuration > RNC Configuration

\[ \text{configure} \] > context context_name > iups-service service_name > rnc id rnc_id

Entering the above command sequence results in the following prompt:

\[[context_name]host_name(config-ctx-iups-service-rnc)\#

**Syntax**

\[ \text{pooled} \]

\[ \text{[default | no] pooled} \]

\[ \text{default | no} \]

Entering either \text{default} or \text{no} returns the RNC configuration to the default ‘non-pooled’ state.

**Usage**

Each RNC, one-at-a-time, can be identified as ‘pooled’ -- as participating within an SGSN pool -- or ‘non-pooled’. Pooled RNCs can co-exist with non-pooled RNCs.

**Example**

Identify this RNC as being part of an SGSN pool:

\[ \text{pooled} \]
rab-asymmetry-indicator

Configures the SGSN to force “Asymmetric-Bidirecitonal” as the RAB Asymmetry Indicator when uplink/downlink bitrates are equal.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > 1uPS Service Configuration > RNC Configuration

configure > context context_name > iups-service service_name > rnc id rnc_id

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-iups-service-rnc)#

Syntax

rab-asymmetry-indicator symmetric-bidirectional force-asymmetric-bidirectional

no rab-asymmetry-indicator symmetric-bidirectional force-asymmetric-bidirectional

default rab-asymmetry-indicator

    default | no

Disables the override and sets the indicator based on the symmetry of the bitrates as described for the Default Functionality below.

Usage

This command defines an override that uses “Asymmetric-Bidirecitonal” as the RAB Asymmetry Indicator when uplink/downlink bitrates are equal (default functionality item #1). This overrides the default functionality (see below) for the RAB indicator in the RAB Assignment Request. As a result of using this override command, two sets of bitrates, one for downlink and one for uplink, will be included in RAB Assignment Requests for establish or modify per 3GPP TS 25.413.

Default Functionality: The SGSN sets the value of the RAB Asymmetry Indicator based on symmetry of negotiated maximum bitrates in the following manner:

• If the uplink and downlink bitrates are equal, then it is set to “Symmetric-Bidirectional”.
• If uplink bitrate is set to 0 kbps, then it is set to “Asymmetric-Unidirectional-Downlink”.
• If downlink bitrate is set to 0 kbps, then it is set to “Asymmetric-Unidirectional-Uplink”.
• If the uplink and downlink bitrates are non-zero and different, then it is set to “Asymmetric-Bidirectional”.

Example

Override the use of the “Symmetric-Bidirecitonal” RAB Asymmetry Indicator for equal up/downlink bitrates with the following command:
rab-asymmetry-indicator symmetric-bidirectional force-asymmetric-bidirectional

Disable the override with the following command:

    no rab-asymmetry-indicator symmetric-bidirectional force-asymmetric-bidirectional
rab-modify-procedure

This command configures how the RAB (radio access bearer) assignment procedure will be modified.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > IuPS Service Configuration > RNC Configuration
configure > context context_name > iups-service service_name > rnc id rnc_id

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-iups-service-rnc)#

Syntax

default rab-modify-procedure

no rab-modify-procedure normal-modify [ data-vol-report-ind-ie | pdp-type-info-ie ]

default

Resets the configuration to use ‘release-and-establish’, the SGSN’s default RAB Assignment modification procedure.

normal-modify

Selects the normal modification procedure for RAB assignment. Either one of two IE options can be included:

*data-vol-report-ind-ie sends the “Data Volume Reporting Indication IE” as part of the modification request of the RAB Assignment Request procedure.

*pdp-type-info-ie sends the "PDP Type Information IE" as part of the modification request of the RAB Assignment Request procedure.

release-and-establish

Instructs the system to release and establish the RAB procedure.

Usage

Set the type of modification procedure to be used to establish the radio access bearer (RAB) assignment. The command can be issued multiple times to configure either or both IEs for ‘normal-modify’ procedure. The effect of adding the no prefix to the command depends on the keyword options included with the command:
• no rab-modify-procedure normal-modify disables a previously configured normal modify procedure and sets the configuration to use the default RAB Assignment modification procedure (i.e., release-an-establish).

• no rab-modify-procedure normal-modify data-vol-report-ind-ie changes the configuration to disable sending "Data Volume Reporting Indication IE" in the RAB Assignment request for modification. NOTE: This command does not change the use of the normal RAB modification procedure (i.e., normal-modify).

• no rab-modify-procedure normal-modify pdp-type-info-ie changes the configuration to disable sending "PDP Type Information IE" in the RAB Assignment request for modification. NOTE: This command does not change the use of the normal RAB modification procedure (i.e.: normal-modify).

Use either of the following commands to verify the current configuration for type of RAB Assignment modification procedure, and if optional IEs are to be used:

• show configuration verbose
• show iups-service

Example

Use the following command to enable ‘normal-modify’ as the modification procedure to be used for RAB Assignment:

    rab-modify-procedure normal-modify

Use the following command to configure ‘release-establish’ as the modification procedure to be used by the SGSN for RAB Assignments:

    default rab-modify-procedure

Use the following command to enable the “Data Volume Reporting Indication IE” as part of the normal modification request of the RAB Assignment Request procedure.

    rab-modify-procedure normal-modify data-vol-report-ind-ie
ranap arp-ie

This command enables or disables the inclusion of ARP-IE in RAB assignment / Relocation request RANAP messages per RNC.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > LuPS Service Configuration > RNC Configuration
configure > context context_name > iups-service service_name > rnc id rnc_id

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-iups-service-rnc)#

Syntax

    ranap arp-ie

    [ default | no ] ranap arp-ie

---

**default**

Returns the configuration to the default setting, the inclusion of ARP-IE in RAB assignment / Relocation request RANAP messages is disabled.

---

**no**

Disables the inclusion of ARP-IE in RAB assignment / Relocation request RANAP messages per RNC.
ranap eutran-service-handover-ie

Enables/disables the inclusion of the E-UTRAN Service Handover Information Element in RAB Assignment Request messages (during the PDP activation phase) and Relocation Request RANAP messages (during the SRNS relocation phase). This ensures that an SRNS relocation handover to E-UTRAN is not allowed for E-UTRAN capable UEs that have only a UTRAN/GERAN roaming agreement in place.

Product
SGSN

Privilege
Administrator, Security Administrator

Mode
Exec > Global Configuration > Context Configuration > lUPS Service Configuration > RNC Configuration

configure > context context_name > iups-service service_name > rnc id rnc_id

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-iups-service-rnc)#

Syntax

ranap eutran-service-handover-ie

[ default | no ] ranap eutran-service-handover-ie

---

ranap eutran-service-handover-ie

Enables the inclusion of the E-UTRAN Service Handover Information Element in RAB Assignment Request (during the PDP activation phase) and Relocation Request RANAP messages (during the SRNS relocation phase). The IE in the RAB Assignment Request during the PDP activation phase informs the RNC not to handover the subscriber to E-UTRAN. The IE in Relocation Request is sent when there is an intra-SGSN SRNS or inter-SGSN SRNS relocation within the UTRAN itself so that the target RNC knows that it shall not handover the subscriber to E-UTRAN.

no ranap eutran-service-handover-ie

Specifies that the SGSN will not include the E-UTRAN Service Handover IE in RAB Assignment Request and Relocation Request RANAP messages.

default

Returns the configuration to the default setting. The inclusion of the E-UTRAN Service Handover Information Element in RAB Assignment Request and Relocation Request RANAP messages is disabled.

no

Disables the inclusion of the E-UTRAN Service Handover Information Element in RAB Assignment Request and Relocation Request RANAP messages is disabled.

Usage

Use this feature to prevent handovers to E-UTRAN in the following scenarios:
1. A UE is E-UTRAN capable, the PLMN is E-UTRAN capable, but the UE has not subscribed to EPS services (no 4G subscription available).

2. The VPLMN is E-UTRAN-capable, and the UE of an inbound roamer is E-UTRAN capable, but the UE has only a UTRAN/GERAN roaming agreement in place. Enabling this parameter helps ensure that an SRNS relocation handover to E-UTRAN is not allowed for E-UTRAN capable UEs that have only a UTRAN/GERAN roaming agreement. This results in an elimination of potential service denial or disruption issues, and unnecessary signaling. The following commands and features must be executed before enabling the `ranap eutran-service-handover-ie` setting:

   - The SRNS relocation feature must be configured in Call Control Profile Configuration Mode via the `srns-inter` and/or `srns-intra` commands.
   - The `eutran-not-allowed` flag must be enabled in the access-restriction-data command in Call Control Profile Configuration Mode.
   - The call-control-profile must then be associated with an operator policy via the `associate` command in Operator Policy Configuration Mode.

**Example**

This example enables the inclusion of the E-UTRAN Service Handover IE in RAB Assignment Request and Relocation Request RANAP messages.

```
ranap eutran-service-handover-ie
```
ranap global-cn-id

This command configures the SGSN to use include the Global Core Network ID IE in the various messages.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > luPS Service Configuration > RNC Configuration

```
configure > context context_name > iups-service service_name > rnc id rnc_id
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-iups-service-rnc)#
```

**Syntax**

```
ranap global-cn-id { paging-request | relocation-request | reset-procedure | reset-resource-procedure } [ network-sharing selected-plmn ]

[ default | no ] ranap global-cn-id { paging-request | relocation-request }
```

---

**default**

Returns the configuration to the default setting and sends the common-plmn in the Global CN ID IE.

**no**

Disables sending the Global CN ID IE.

**paging-request**

Instructs the SGSN to send the Global CN ID IE in the Paging Request message.

**relocation-request**

Instructs the SGSN to send the Global CN ID IE in the Relocation Request message.

**reset-procedure**

Instructs the SGSN to send the Global CN ID IE in the Reset/Ack message.

**reset-resource-procedure**

Instructs the SGSN to send the Global CN ID IE in the Reset-Resource/Ack message.

**network-sharing selected-plmn**

Instructs the SGSN to send the selected-plmn in the Global CN ID IE if network sharing has been enabled.
### Usage

Use this command to configure the SGSN to use ‘selected-plmn’ in the Global Core Network ID IE in various messages when network sharing is enabled.

### Example

Use the following command to include the global-cn-id IE in a Paging Request with the common PLMN when network sharing is enabled:

```
default ranap global-cn-id paging-request
```

Use the following command to include global-cn-id IE in Relocation Request with the selected-plmn (assumes network sharing has been enabled):

```
ranap global-cn-id relocation-request network-sharing selected-plmn
```
**ranap paging-area-id**

This command configures the SGSN to use include the Paging Area ID IE in the Paging Request message.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > luPS Service Configuration > RNC Configuration

`configure > context context_name > iups-service service_name > rnc id rnc_id`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-iups-service-rnc)#
```

**Syntax**

```
ranap paging-area-id paging-request [ network-sharing selected-plmn ]

[ default | no ] ranap paging-area-id paging-request [ network-sharing selected-plmn ]
```

<table>
<thead>
<tr>
<th><strong>default</strong></th>
<th>Returns the configuration to the default setting and sends the common-plmn in the Paging Area ID IE.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>no</strong></td>
<td>Disables sending the Paging Area ID IE.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to configure the SGSN to use ‘selected-plmn’ in the Paging Area ID IE in the Paging Request message when network sharing is enabled.

**Example**

Use the following command to include the paging-area-id IE in a Paging Request with the common PLMN when network sharing is enabled:

```
default ranap paging-area-id paging-request
```

Use the following command to include global-cn-id IE in Paging Request with the selected-plmn (assumes network sharing has been enabled):

```
ranap global-cn-id paging-request network-sharing selected-plmn
```
ranap paging-cause-ie

This command sets the paging cause value and either includes or suppresses the Paging Cause IE in responses to Paging Requests due to various sources. This command is available in releases 8.1 and higher.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > luPS Service Configuration > RNC Configuration
configure > context context_name > iups-service service_name > rnc id rnc_id

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-iups-service-rnc)#
```

**Syntax**

```
```

---

**default**

Resets the specific parameters value to default.

**no**

Suppresses the Paging Cause IE so that it is not included in responses to Paging Requests from respective sources.

**all**

Using **all** sets the action for the Paging Cause IE value for all paging due to all sources.

**background-data [ value ]**

Default: 3 (terminating background call)
Set the Paging Cause IE value for paging due to background data.

\[value\]: Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

**conversational-data [ value ]**

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to conversational data.

\[value\]: Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.
gmm-signalling [ value ]

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to gmm-signaling.
value: Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

gs-signalling [ value ]

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to VLR Paging Request.
value: Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

interactive-data [ value ]

Default: 2 (terminating interactive call)
Set the Paging Cause IE value for paging due to interactive data.
value: Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

mme-signalling [ value ]

Default: 5 (terminating high priority signaling)
Sets the Paging Cause IE value for paging from MME due to Circuit Switch Fallback (CSFB).
value: Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

sm-signalling [ value ]

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to SM signaling.
value: Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

sms-signalling [ value ]

Default: 4 (terminating low priority signaling)
Set the Paging Cause IE value for paging due to SMS signaling.
value: Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

streaming-data [ value ]

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to streaming data.
value: Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

Usage

This command can be used to set the value (meaning) of the Paging Cause IE included in responses to Paging Requests or it can be used to suppress the inclusion of the Paging Cause IE in the responses. These actions can be configured for paging for all sources or for a specified source.
The following values are applicable to all Paging Cause IEs:

- **0**: Terminating conversational call
- **1**: Terminating streaming call
- **2**: Terminating interactive call
- **3**: Terminating background call
- **4**: Terminating low priority signaling
- 5 - Terminating high priority signaling

**Example**

Use the following command to set Paging Cause value to 3 for paging due to GMM signaling without affecting cause values for other sources:

```
ranap paging-cause-ie gmm-signalling 3
```

Use the following command to suppress the Paging Cause IE from all Paging Requests to the RNC:

```
no ranap paging-cause-ie all
```

Either of the following commands will cause the Paging Cause IE to be included in Paging Requests with the default value for SM signaling without affecting the cause for other sources:

```
ranap paging-cause-ie sm-signalling
default ranap paging-cause-ie sm-signalling
```
**ranap signalling-indication-ie**

This command enables/disables the inclusion of the Signaling Indication IE in either or both the RAB Assignment Request and/or the Relocation Request RANAP messages.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > luPS Service Configuration > RNC Configuration

```
configure > context context_name > iups-service service_name > rnc id rnc_id
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-iups-service-rnc)#
```

**Syntax**

```
ranap signalling-indication-ie { rab-assignment-request [ relocation-request ] | relocation-request [ rab-assignment-request ] }

no ranap signalling-indication-ie

default ranap signalling-indication-ie
```

- **no**
  Sets the configuration so that the SGSN never includes the IE.

- **default**
  Resets the configuration to the default - the SGSN includes the IE in the messages if preconditions are met (see Usage section).

- **rab-assignment-request | relocation-request**
  Including one or both of these keywords configures what type of RANAP message will include the IE.

**Usage**

The command enables the operator to determine whether the signalling indication information element is included in either or both the RAB Assignment Request and Relocation Request messages during the PDP context setup procedure.

For this command configuration to work so that the IE is included, two preconditions must be met:

- Received QoS traffic class for the context must be interactive
- Received QoS has a signalling indication value as optimized

When an RNC receives this IE, the RNC assumes that the customer is using IMS signaling and allocates massive amounts of bandwidth, potentially causing cell congestion. This command enables the operator to determine the usage of this IE which provides the operator with additional session management control.

**Example**
Use the following command to include the signalling indication IE in the RAB Assignment Request:

```
ranap signalling-indication-ie rab-assignment-request
```
**ran-information-management**

Use this command to inform the SGSN which RNC are capable of handling RAN information management (RIM) messages.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > luPS Service Configuration > RNC Configuration

```bash
configure > context context_name > iups-service service_name > rnc id rnc_id
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-iups-service-rnc)#
```

**Syntax**

```
[ default | no ] ran-information-management
```

- **default**
  
  Resets the default so RIM is disabled.

- **no**
  
  Disables the RIM support in the configuration file.

**Usage**

By default, handling of RAN information management (RIM) messages is disabled. This command informs the SGSN which RNC are capable of handling RIM messages. This configuration only becomes ‘operational’ if the `ran-information-management` command is enabled in the SGSN global configuration mode.

When RIM support is enabled on both the SGSN and the destination node, then all RIM PDUs are forwarded to the BSC/RNC. If RIM message handling is not enabled on both nodes, then the RIM PDUs are dropped silently.

**Example**

Use the following command to enable RIM support:

```
ran-information-management
```

Use the following command to disable RIM support that has been added to the configuration:

```
no ran-information-management
```
release-compliance

This command allows the SGSN to set support based on the RNC’s 3GPP release compliance and to define per RNC QoS overrides.

**mbr-up mbr_up_val**

Defines a maximum kbps bit rate for uplink direction,

• options for `pre-release-7` include: 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 11500, 16000. Default cap is 16000.

• options for `release-7` include: 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 11500, 16000, 21000, 28000, 42000. See default cap information below.

**Usage**

Use this command to match the 3GPP release support by the RNC. As the 3GPP releases each support differing data rate options - R6 supports HSPA and R7 supports HSPA+ - then selecting the compliance is a method of preforming data rate management on a per RNC basis. Also use this command to set QoS capping overrides for each RNC separately. Default caps for Release 7 RNC will vary depending upon which overrides are set.

**Important:** Once caps are set for an RNC, if the RNC release level changes the capping remains the same until the QoS override values are changed for that RNC. Values do not automatically change to the default values appropriate for that release.

**Example**

Enable HSPA fallback to R6 compliance:

```
release-compliance pre-release-7
```
reset-resource

This command enables the operator to control message length by configuring the number of IuConIDs sent in each RANAP Reset Resource messages.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > IuPS Service Configuration > RNC Configuration

configure > context context_name > iups-service service_name > rnc id rnc_id

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-iups-service-rnc)#

Syntax

reset-resource max-iuconid-per-msg number

default reset-resource max-iuconid-per-msg

default
Resets the number of Iu connection Ids included in the Reset Resource messages. Default is 250.

max-iuconid-per-msg number
Sets the number of Iu connection Ids to be included in the Reset Resource messages.

number: Integer from 1 to 250.
Default: 250

Usage
Id numbers for each Iu connection are included in the RANAP Reset Resource messages. Including this potentially long stream of numbers can make the message very long. With this command, the operator can control the size of the messages by controlling the number of Id messages included in the messages.

Example
Limit the number of Iu connection IDs to 30:

       reset-resource max-iuconid-per-msg 30
Chapter 265
RoHC Profile Common Options Configuration Mode Commands

The RoHC Profile Common Options Configuration Mode is used to set timers that, upon expiration, release robust header compression contexts.

Mode
Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Common Options Configuration

configure > rohc-profile profile-name profile_name > compression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcprofile-profile_name-common)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
delay-release-hc-context-timer

Sets a delay in releasing Robust Header Compression (RoHC) contexts allowing for context continuation during intra-gateway handoffs.

Product
HSGW
PDSN

Privilege
Administrator

Mode
Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Common Options Configuration

configure > rohc-profile profile-name profile_name > compression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcprofile-profile_name-common)#

Syntax

delay-release-hc-context-timer seconds

no delay-release-hc-context-timer

no
- Removes previously configured value for this command. No value disables the feature.

seconds
- Specifies the number of seconds the system delays before releasing the header compression context as an integer from 0 to 65535.

Usage

Use this command to set a delay in releasing a header compression context. This command is necessary when employing RoHC and mobility. Typically, when an RP connection is released, the header compression context is also released immediately. However, in mobility situations, such as intra-PDSN handoffs, the header compression context should be preserved. Adding a delay to cover the handoff time allows the context to be maintained.

A header compression context contains the compression/decompression configuration and statistics for the session.

Example

The following command sets the header compression release delay to 20 seconds:

delay-release-hc-context-timer 20
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
inactive-traffic-release-hc-context-timer

Sets an inactivity timer that is checked when inactivity is detected on an SO67 A10 bearer connection with negotiated RoHC parameters. When this timer expires, the header compression context is released.

**Product**
HSGW
PDSN

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Common Options Configuration

```plaintext
configure > rohc-profile profile-name profile_name > compression-options
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-rohcprofile-profile_name-common)#
```

**Syntax**

```
inactive-traffic-release-hc-context-timer seconds
```

```
o inactive-traffic-release-hc-context-timer
```

**Usage**
Use this command to set a timer that is started upon detecting inactivity on the bearer channel. Upon expiry, the header compression context is released. Enable this feature for more efficient memory utilization.

**Example**
The following command sets the bearer channel inactivity timer to 60 seconds:

```
inactive-traffic-release-hc-context-timer 60
```
Chapter 266
RoHC Profile Compression Configuration Mode Commands

The RoHC Profile Compression Configuration Mode is used to configure RoHC (Robust Header Compression) Compressor parameters. RoHC is not supported on GGSN.

Mode

Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Compression Configuration

configure > rohc-profile profile-name profile_name > compression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcprofile-profile_name-comp)#

Important: The availability of commands, keywords and variables in this mode are dependent on platform type, product version, and installed license(s).
context-timeout

Context timeout in seconds.

Product

- HSGW
- PDSN

Privilege

Administrator

Mode

Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Compression Configuration
configure > rohc-profile profile-name profile_name > compression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcafterrofiprofile-name-comp)#

Syntax

context-timeout seconds

default context-timeout

default

Returns the command to its default value.

seconds

Specifies the context timeout value (in seconds) as an integer from 0 through 100.
Default: 20

Usage

Use this command to set the context timeout.

Example

The following command sets the context timeout to 10 seconds:

context-timeout-period 10
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
ipid-history-size

Specifies the number of IP-IDs of previously sent packets to store. An IP ID is a 16-bit header field that stores IPv4 Identification information.

Product
HSGW
PDSN

Privilege
Administrator

Mode
Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Compression Configuration
configure > rohc-profile profile-name profile_name > compression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcprofile-profile_name-comp)#

Syntax

ipid-history-size number

default ipid-history-size

____________
default
Returns the command to its default value.

____________

number
Specifies the number of IP IDs to store as an integer from 1 through 32.
Default: 8

Usage
Use this command to set the number of IP IDs to store in the history.

Example
The following command sets the history size to 24 IP-IDs:

ipid-history-size 24
max-jitter-cd

Specifies the upper boundary of jitter expected on the communication channel between the compressor and decompressor.

Product

HSGW
PDSN

Privilege

Administrator

Mode

Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Compression Configuration
configure > rohc-profile profile-name profile_name > compression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcprofile-profile_name-comp)#

Syntax

max-jitter-cd num_ms

default max-jitter-cd

default

Returns the command to its default value.

num_ms

Specifies the number of milliseconds for the maximum jitter setting as an integer from 0 through 999999999. Default: 150

Usage

Use this command to set the maximum amount of jitter allowed on the communication channel between compressor and decompressor.

Example

The following command sets the jitter limit to 1000 ms (1 second):

max-jitter-cd 1000
max-sliding-window

Specifies the width of the sliding window for W-LSB (Windows-based Least Significant Bits) encoded values.

Product
HSGW
PDSN

Privilege
Administrator

Mode
Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Compression Configuration
configure > rohc-profile profile-name profile_name > compression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcprofile-profile_name-comp)#

Syntax

max-sliding-window size

default max-sliding-window

default
Returns the command to its default value.

size
Specifies the size of the sliding window as an integer from 1 through 1000.
Default: 6

Usage
Use this command to set the size of the sliding window used to compute jitter for W-LSB encoded values.

Example
The following command sets the sliding window size to 500:

max-sliding-window 500
multiple-ts-stride

Enables or disables the use of repeated transmission of RTS_STRIDE for timer-based compression.

**Product**
- HSGW
- PDSN

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Compression Configuration
`configure > rohc-profile profile-name profile_name > compression-options`

Entering the above command sequence results in the following prompt:

<td>Specifies the context blocking time (in seconds) as an integer from 0 through 100. Default: 20</td>
</tr>
</tbody>
</table>

Usage

Use this command to set the context blocking time after the compressor has received a feedback reject.

Example

The following command sets the context blocking time to 10 seconds:

```
new-context-blocking-time 10
```
num-pkts-ts

Specifies the number packets per RTP timestamp (TS).

Product
HSGW
PDSN

Privilege
Administrator

Mode
Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Compression Configuration
configure > rohc-profile profile-name profile_name > compression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcpprofile-profile_name-comp)#

Syntax

num-pkts-ts num_pkts

default num-pkts-ts

---------------------------------------------------------------

default
Returns the command to its default value.

---------------------------------------------------------------

num_pkts
Specifies the number of packets for the timestamp as an integer from 0 through 999.
Default: 6

Usage

Use this command to set the number of packets for each RTP timestamp (TS).

Example

The following command sets the number of packets per timestamp to 50:

num-pkts-ts 50
**num-pkts-u-mode**

Specifies the number of packets sent when operating in U-Mode (unidirectional mode).

**Product**
HSGW
PDSN

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Compression Configuration

configure > rohc-profile profile-name profile_name > compression-options

```

**Syntax**

```
num-pkts-u-mode num_pkts

default num-pkts-u-mode

default

Returns the command to its default value.

```

**num_pkts**

Specifies the number of packets sent in U-Mode as an integer from 0 through 999.
Default: 1

**Usage**

Use this command to set the number of packets sent when in U-Mode.

**Example**

The following command sets the number of packets for U-Mode to 50:

```
um-pkts-u-mode 50```
num-updates-ir

Configures the number of IR (Initiation and Refresh state) updates.

**Product**
- HSGW
- PDSN

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Compression Configuration
configure > rohc-profile profile-name profile_name > compression-options

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-rohcprofile-profile_name-comp)#
```

**Syntax**

```
num-updates-ir num_pkts

default num-updates-ir
```

**default**

Returns the command to its default value of 4.

```
num_pkts
```

Specifies the number of IR updates as an integer from 0 through 999.
Default: 4

**Usage**

Use this command to set the number of IR updates.

**Example**

The following command sets the number of IR updates to 30:
```
num-updates-ir 30
```
optimistic-repeats

Specifies the number of repeated packets to send to the decompressor. For transition from the FO (First Order) to the SO (Second Order) state, the compressor should be confident that the decompressor has all the parameters needed to decompress according to a fixed pattern. The compressor obtains its confidence about decompressor status by sending several packets with the same information according to the lower compression state. If the decompressor receives any of these packets, it is in sync with the compressor.

Product
HSGW
PDSN

Privilege
Administrator

Mode
Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Compression Configuration

configure > rohc-profile profile-name profile_name > compression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcuprofile-profile_name-comp)#

Syntax

optimistic-repeats num_pkts

default optimistic-repeats

default

Returns the command to its default value.

num_pkts

Specifies the number of packets to repeat with the same information to assure synchronization with the decompressor.

num_pkts must be an integer from 0 through 10.
Default: 6

Usage

Use this command to set the number of packets to repeat to the decompressor to assure synchronization before transition states.

Example

The following command sets the number of repeated packets to 5:

optimistic-repeats 5
rtp-sn-p

Specifies the value of p in RTP SN (RTP Sequence Number) calculation. Least Significant Bits (LSB) encoding is used for header fields whose values are usually subject to small changes. With LSB encoding, the k least significant bits of the field value are transmitted instead of the original field value, where k is a positive integer. After receiving k bits, the decompressor derives the original value using a previously received value as reference (v_ref). The scheme is guaranteed to be correct if the compressor and the decompressor each use interpretation intervals as follows:

- In which the original value resides
- And in which the original value is the only value that has the exact same k least significant bits as those transmitted.

The interpretation interval can be described as a function:

\[ f(v_{\text{ref}}, k) = [v_{\text{ref}} - p, v_{\text{ref}} + (2^k - 1) - p] \]

Where p is an integer.

Syntax

```rtp-sn-p p_value
default rtp-sn-p
```

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Returns the command to its default value.</td>
</tr>
<tr>
<td>p_value</td>
<td>Specifies the value of p in the RTP SN calculation as an integer from 0 through 999. Default: 6</td>
</tr>
</tbody>
</table>

Usage

Use this command to set the value for p when performing the RTP SN calculation.

Example

The following command sets the value of p to 100:

```
rtp-sn-p 100
```
**rtp-sn-p-override**

Enables an override of p in the RTP SN calculation. This is disabled by default.

**Product**
- HSGW
- PDSN

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Compression Configuration

```plaintext
configure > rohc-profile profile-name profile_name > compression-options
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-rohcprofile-profile_name-comp)#
```

**Syntax**

```
[ default | no ] rtp-sn-p-override
```

- **default**
  Returns the command to its default value of disabled.

- **no**
  Disables overriding p in RTP SN calculation.

**Usage**

Use this command to enable an override of p in RTP SN calculation.

**Example**

The following command enables the override of p in the RTP SN calculation:

```
rtp-sn-p-override
```
rtp-time-stride

Sets the time interval used for one TS (RTP Time Stamp) stride. This interval is used when timer-based encoding is enabled.

Product
HSGW
PDSN

Privilege

[context_name]host_name(config-rohcprofile-profile_name-comp)#

Syntax

rtp-time-stride num_ms

default rtp-time-stride

default

Returns the command to its default value.

num_ms

Specifies the number of milliseconds to use for TS_STRIDE as an integer from 0 through 999999999. Default: 20

Usage

Use this command to set the length of the TS_STRIDE in milliseconds.

Example

The following command sets TS_STRIDE to 100ms:

  rtp-time-stride 100
rtp-ts-deviation

Sets the maximum percentage of deviation allowed for input RTP packets for timer-based compression.

Product
HSGW
PDSN

Privilege
Administrator

Mode
Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Compression Configuration
configure > rohc-profile profile-name profile_name > compression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcprofile-profile_name-comp)#

Syntax

rtp-ts-deviation percentage

default rtp-ts-deviation

default
Returns the command to its default value of 25.

percentage
Specifies the maximum percentage of deviation allowed for input RTP packets for timer-based compression as an integer value from 0 through 100.
Default: 25

Usage

Use this command to set the maximum percentage of deviation allowed for input RTP packets for timer-based compression.

Example

The following command sets the percentage to 30:

rtp-ts-deviation 30
**rtp-ts-stride**

Specifies the amount by which TS (RTP time stamp) is incremented. This value is used for Scaled RTP TS encoding.

**Product**
- HSGW
- PDSN

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Compression Configuration
configure > rohc-profile profile-name profile_name > compression-options

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-rohcprofile-profile_name-comp)#
```

**Syntax**

```
rtp-ts-stride num_ms
```

```
default rtp-ts-stride
```

**default**
Returns the command to its default value of 160.

```
num_ms
```

Specifies the number of milliseconds to use incrementing TS as an integer from 0 through 999999999. Default: 160

**Usage**

Use this command to set the amount by which TS is incremented for Scaled RTP TS encoding.

**Example**

The following command sets amount by which TS is incremented to 100ms:

```
rtp-ts-stride 100
```
sliding-window-ts

Sets the sliding window used to compute jitter.

Administrator

Mode
Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Compression Configuration

configure > rohc-profile profile-name profile_name > compression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohc-profile-profile_name-comp)#

Syntax

sliding-window-ts size

default sliding-window-ts

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Returns the window to its default value of 4.</td>
</tr>
<tr>
<td>size</td>
<td>Specifies the size of the sliding window as an integer from 1 through 1000. Default: 4</td>
</tr>
</tbody>
</table>

Usage

Use this command to set the size of the sliding window used to compute jitter for the current RoHC profile.

Example

The following command sets the sliding window size to 500:

sliding-window-ts 500
total-jitter-ipv4

Specifies the total jitter allowed after compression for IPv4.

Product
HSGW
PDSN

Privilege
Administrator

Mode
Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Compression Configuration

configure > rohc-profile profile-name profile_name > compression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcsprofile-profile_name-comp)#

Syntax

total-jitter-ipv4 time

default total-jitter-ipv4

default
default

Returns the command to its default value of 270.

time
time

Specifies the time interval to use (in milliseconds) as an integer from 0 through 999999999. Default: 270

Usage
Use this command to set the jitter limit after compression.

Example
The following command sets the jitter after compression limit to 900 ms:

total-jitter-ipv4 900
total-jitter-ipv6

Specifies the total jitter allowed after compression for IPv6.

Product
HSGW
PDSN

Privilege

Mode
Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Compression Configuration

configure > rohc-profile profile-name profile_name > compression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcprofile-profile_name-comp)#

Syntax

total-jitter-ipv6 time

default total-jitter-ipv6

default
Returns the command to its default value 580.

time
Specifies the total jitter interval allowed (in milliseconds) as an integer from 0 through 999999999. Default: 580

Usage
Use this command to set the jitter limit after compression.

Example
The following command sets the jitter after compression limit to 900 ms:

total-jitter-ipv6 900
unimode-timeout-to-fo-state

Specifies the time period in seconds before falling back to the FO (First Order) state.

Product
HSGW
PDSN

Privilege
Administrator

Mode
Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Compression Configuration

configure > rohc-profile profile-name profile_name > compression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcprofile-profile_name-comp)#

Syntax

unimode-timeout-to-fo-state num_ms

default unimode-timeout-to-fo-state

default

Returns the command to its default value of 3.

num_ms

Specifies the timeout period (in seconds) as an integer from 0 through 10.
Default: 3

Usage
Use this command to set the timeout before falling back to the FO state when in Unimode.

Example
The following command sets the fall back timeout to 2 seconds:

unimode-timeout-to-fo-state 2
unimode-timeout-to-ir-state

Specifies the time period in seconds before falling back to the IR (Initiation and Refresh) state.

**Syntax**

```
unimode-timeout-to-ir-state num_ms
```

default unimode-timeout-to-ir-state

  default
  Returns the command to its default value of 5.

  num_ms
  Specifies the timeout period in seconds as an integer from 0 through 20.
  Default: 5

**Usage**

Use this command to set the timeout before falling back to the IR state when in Unimode.

**Example**

The following command sets the fall back timeout to 3 seconds:

```
unimode-timeout-to-ir-state 3
```
use-calculated-rtp-time-stride

Overides the configured value of rtp-time-stride with a calculated value.

Product

`[context_name]host_name(config-rohcprofile-profile_name-comp)#`

**Syntax**

```
[ default | no ] use-ipid-override
```

default

Returns the command to its default value of disabled.

no

Disables the IP-ID override.

**Usage**

Use this command to enable overriding of the IP-ID.

**Example**

The following command enables the IP-ID override feature:

```
use-ipid-override
```

The following command disables the IP-ID override feature:

```
no use-ipid-override
```

The following command also disables the IP-ID override feature:

```
default use-ipid-override
```

```

**Syntax**

```
[ default | no ] use-optimized-transience
```

- **default**
  Returns the command to its default value of enabled.

- **no**
  Disables the use of optimized transience.

**Usage**

Use this command to enable or disable the use of optimized transience.

**Example**

The following command enables the use of optimized transience.

```
use-optimized-transience
```

The following command disables the use of optimized transience.

```
no use-optimized-transience
```
use-timer-based-compression

Enables or disables timer-based compression of the RTP time stamp (TS) at the compressor.

**Product**
HSGW
PDSN

**Privilege**

```

**Syntax**

```
[ default | no ] use-timer-based-compression
```

- **default**
  Returns the command to its default value of enabled.

- **no**
  Disables the use of timer-based compression.

**Usage**
Use this command to enable or disable the use of timer-based compression.

**Example**
The following command enables the use of timer-based compression.

```
use-timer-based-compression
```

The following command disables the use of timer-based compression.

```
no use-timer-based-compression
```
use-uncomp-profile

Enables or disables the use of the Uncompressed Profile (0x0000) if required at the compressor.

**Product**
- HSGW
- PDSN

**Privilege**
- Administrator

**Mode**
- Exec > Global Configuration > RoHC Profile Configuration > RoHC Profile Compression Configuration

[context_name] host_name(config-rohcpprofile-profile_name-comp)##
```

**Syntax**

```
[default | no ] useS-uncomp-profile
```

- **default**
  - Returns the command to its default value of disabled.

- **no**
  - Disables the use of the Uncompressed Profile.

**Usage**

Use this command to enable or disable the use of the Uncompressed Profile.

**Example**

The following command enables the use of the Uncompressed Profile.

```
use-uncomp-profile
```

The following command disables the use of the Uncompressed Profile.

```
no use-uncomp-profile
```
Chapter 267
RoHC Profile Configuration Mode Commands

The RoHC Profile Configuration Mode is used to configure RoHC (Robust Header Compression) Compressor and Decompressor parameters. The profiles can then be assigned to specific subscriber sessions when RoHC header compression is configured. RoHC is not supported on GGSN.

Mode

Exec > Global Configuration > RoHC Profile Configuration

`configure > rohc-profile profile-name profile_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-rohcprofile-profile_name)#`

Important: The availability of commands, keywords and variables in this mode is dependent on platform type, product version, and installed license(s).
common-options

Enters the RoHC Profile Common Options Configuration Mode where inactivity and delay timers are set to support dynamic header compression contexts and context preservation during handoffs.

Product
HSGW
PDSN

Privilege
Administrator

Mode
Exec > Global Configuration > RoHC Profile Configuration

configure > rohc-profile profile-name profile_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcprofile-profile_name)#

Syntax

[ default ] common-options

default

Reset all parameters in the RoHC Profile Common Options Configuration Mode to default values.

Usage

Use this command to enter the RoHC Profile Common Options Configuration Mode where parameters for maintaining header compression contexts and inactivity timers can be configured.

Entering this command results in the following prompt:

[context_name]host(config-rohcprofile-profile_name-common)#

RoHC Profile Common Options Configuration Mode commands are defined in the RoHC Profile Common Options Configuration Mode Commands chapter.
compression-options

Enters the RoHC Profile Compression Options Configuration Mode allowing configuration of options applied during RoHC compression for the current RoHC profile.

Product
HSGW
PDSN

Privilege
Administrator

Mode
Exec > Global Configuration > RoHC Profile Configuration
configure > rohc-profile profile-name profile_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcprofile-profile_name)#

Syntax

[ default ] compression-options

default
Reset all options in the RoHC Profile Compression Configuration Mode to their default values.

Usage
Use this command to enter RoHC Profile Compression Configuration Mode to set the compression options that are used for subscriber sessions using the current RoHC profile.

Entering this command results in the following prompt:

[context_name]host(config-rohcprofile-profile_name-comp)#

RoHC Profile Compression Options Configuration Mode commands are defined in the RoHC Profile Compression Configuration Mode Commands chapter.

Example

The following command enters RoHC Profile Compression Options Configuration Mode:

compression-options

The following command sets all compression options to their default values:

default compression-options
decompression-options

Enters the RoHC Profile Decompression Options Configuration Mode allowing configuration of options applied during RoHC decompression for the current RoHC profile.

**Product**
- HSGW
- PDSN

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > RoHC Profile Configuration
```
configure > rohc-profile profile-name profile_name
```
Entering the above command sequence results in the following prompt:
```
[context_name]host_name(config-rohcprofile-profile_name)#
```

**Syntax**
```
[default ] decompression-options
```

**Usage**
Use this command to enter RoHC Profile Decompression Options Configuration Mode to set the decompression options used for subscriber sessions using the current RoHC profile.
Entering this command results in the following prompt:
```
[context_name]host(config-rohcprofile<-profile_name>-decomp)#
```
RoHC Profile Decompression Options Configuration Mode commands are defined in the RoHC Profile Decompression Configuration Mode Commands chapter.

**Example**
The following command enters RoHC Profile Decompression Options Configuration Mode:
```
decompression-options
```
The following command sets all decompression options to their default values:
```
default decompression-options
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
The RoHC Profile Decompression Configuration Mode is used to configure RoHC (Robust Header Compression) Decompressor parameters.

Mode

Exec > Global Configuration > RoHC Profile Configuration >
configure > rohc-profile profile-name profile_name > decompression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcprofile-profile_name-decomp)#

Important: The availability of commands, keywords and variables in this mode are dependent on platform type, product version, and installed license(s).
accept-delayed-pkts

Accepts delayed packets

**Product**
- HSGW
- PDSN

**Privilege**
- Administrator

**Mode**
Exec > Global Configuration > RoHC Profile Configuration >
configure > rohc-profile profile-name profile_name > decompression-options

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-rohcprofile-profile_name-decomp)#
```

**Syntax**

```
[ default ] accept-delayed-pkts
```

- **default**
  
  Returns the command to its default value of disabled.

**Usage**

This command helps reduce packet loss during context repair.

**Example**

Use the following command to enable the system to accept delayed packets:

```
accept-delayed-pkts
```
context-timeout

Ensures that no expired contexts are used for data compression.

Product

HSGW
PDSN

Privilege

Administrator

Mode

Exec > Global Configuration > RoHC Profile Configuration >
configure > rohc-profile profile-name profile_name > decompression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcprofile-profile_name-decomp)#

Syntax

context-timeout seconds

default context-timeout

default
Returns the command to its default value.

seconds
Specifies the context timeout value (in seconds) as an integer from 0 through 100.
Default: 20

Usage

The RoHC stack should periodically clean up expired contexts and release memory in case there is no data activity for the call on this context. The context cleanup period is internally calculated to be set to half of the value of the context-timeout value. This will ensure that no expired contexts are used for data compression.

Example

The following command sets the context-timeout parameter to 30 seconds:

context-timeout 30
crc-errors-fo

Sets the limits for when a NACK message is sent while in the FO (First Order) state. A NACK is sent whenever CRC errors are detected within a specified number of packets.

Product
HSGW
PDSN

Privilege
Administrator

Mode
Exec > Global Configuration > RoHC Profile Configuration >
configure > rohc-profile profile-name profile_name > decompression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcprofile-profile_name-decomp)#

Syntax

crc-errors-fo-k num_errors

crc-errors-fo-n num_packts

default crc-errors-fo-k

default crc-errors-fo-n

default

Returns the command to its default value.

Important: num_errors must be less than or equal to the value specified with the crc-errors-fo-n command.

crc-errors-fo-n num_packts

Specifies the number of packets to check for CRC errors as an integer from 1 through 10. Default: 1

Usage

Use this command to set the parameters that trigger sending a NACK message when in the FO state.

Example

To configure a NACK to be sent when 4 out of the last 10 packets have CRC errors when in the FO state, use the following commands:
crc-errors-fo-k 4

crc-errors-fo-n 10
**crc-errors-so**

Sets the limits for when a NACK message is sent while in the SO (Second Order) state. A NACK is sent whenever CRC errors are detected within a specified number of packets.

**Product**

HSGW
PDSN

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > RoHC Profile Configuration >

`configure > rohc-profile profile-name profile_name > decompression-options`

[context_name]host_name(config-rohcprofile-profile_name-decomp)#
```

**Syntax**

```
crc-errors-so-k num_errors

crc-errors-so-n num_packets

default crc-errors-so-k

default crc-errors-so-n
```

**Example**

Use this command to set the parameters that trigger sending a NACK message when in the SO state.

To configure a NACK to be sent when 4 out of the last 10 packets have CRC errors when in the SO state, use the following commands:
crc-errors-so-k 4

crc-errors-so-n 10
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
nack-limit

Sets the number of unsuccessful decompressions allowed before a NACK is sent.

**Product**
- HSGW
- PDSN

**Privilege**
- Administrator

**Mode**
Exec > Global Configuration > RoHC Profile Configuration >
```bash
command_profile > rohc-profile profile-name profile_name > decompression-options
```
Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-rohcprofile-profile_name-decomp)#
```

**Syntax**
```
nack-limit limit

default nack-limit
```

- **default**
  Returns the command to its default value.

- **limit**
  Specifies the number of unsuccessful decompressions allowed as an integer from 0 through 20. Default: 0

**Usage**
Use this command to set the maximum number of unsuccessful decompressions before a NACK message is sent.

**Example**
The following command sets the number of unsuccessful decompressions allowed to 10:
```
nack-limit 10
```
**optimistic-mode-ack**

When this command is enabled and a type 2 IR-DYN packet is successfully decompressed, an optional ACK is sent in U-mode.

**Product**
HSGW

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > RoHC Profile Configuration >
`configure > rohc-profile profile-name profile_name > decompression-options`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-rohcprefile-profile_name-decomp)#
```

**Syntax**

```
[ default | no ] optimistic-mode-ack
```

- **default**
  - Returns the command to its default value of enabled.

- **no**
  - Disables the sending of the optional ACK.

**Usage**

Use this command to enable and disable the sending of an optional ACK in U-mode when a type 2 IR-DYN packet is successfully decompressed.

**Example**

To enable the sending of the optional ACK, enter the following command:

```
optimistic-mode-ack
```

To disable the sending of the optional ACK, enter the following command:

```
no optimistic-mode-ack
```
optimistic-mode-ack-limit

Sets the number of packets for which to send ACKs.

Product
HSGW
PDSN

Privilege
Administrator

Mode
Exec > Global Configuration > RoHC Profile Configuration >
configure > rohc-profile profile-name profile_name > decompression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcpprofile-profile_name-decomp)#

Syntax

optimistic-mode-ack-limit num_pkts

default optimistic-mode-ack-limit

default
Returns the command to its default value.

num_pkts
Specifies the number of packets for which to send ACKs as an integer from 0 through 20.
Default: 3

Usage
Use this command to set the number of packets to send the optional ACK for when a type 2 IR-DYN packet is successfully decompressed.

Example
Enter the following command to set the number of packets to send and ACK for to 6:

optimistic-mode-ack-limit 6

Use the following command to set the number of packets to send an ACK for back to the default of 3:

default optimistic-mode-ack-limit
piggyback-wait-time

Specifies the time in milliseconds to wait for a feedback packet to be picked up as piggybacked feedback by the associated compressor.

Product
HSGW
PDSN

Privilege
Administrator

Mode
Exec > Global Configuration > RoHC Profile Configuration >
configure > rohc-profile profile-name profile_name > decompression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcprofile-profile_name-decomp)#

Syntax

piggyback-wait-time m_secs

default piggyback-wait-time

default

Returns the command to its default value.

m_secs

Specifies the time (in milliseconds) to wait for a feedback packet to be picked up as an integer value from 0 through 1000.
Default: 80

Usage

Use this command to set the time in milliseconds to wait for a feedback packet to be picked up as piggybacked feedback by the associated compressor.

Example

The following command sets the wait time to 120 ms:

piggyback-wait-time 120
preferred-feedback-mode

Specifies the preferred feedback mode to use between the compressor and the decompressor

Product
- HSGW
- PDSN

Privilege
Administrator

Mode
Exec > Global Configuration > RoHC Profile Configuration >
configure > rohc-profile profile-name profile_name > decompression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcprofile-profile_name-decomp)#

Syntax

preferred-feedback-mode { bidirectional-optimistic | bidirectional-reliable | unidirectional }

default preferred-feedback-mode

Returns the command to its default setting of bidirectional-optimistic.

bidirectional-optimistic

This mode is similar to the Unidirectional mode, with the exception of a feedback channel used to send error recovery requests from the decompressor to compressor. This is the default mode.

bidirectional-reliable

Reliable mode makes extensive use of a feedback channel to avoid packet loss from context invalidation. A secure reference model is used instead of the optimistic approach used in the other modes. With the secure reference model, the confidence of the compressor depends on acknowledgements from the decompressor for every context updating packet. Periodically the compressor sends context updating packets repeatedly until an acknowledgement is received from the decompressor.

unidirectional

Packets are sent in only one direction, from the compressor to the decompressor.

Usage

Use this command to specify the preferred feedback method to use between the compressor and the decompressor for the current RoHC profile.

Example

Use this command to specify the preferred feedback method to use between the compressor and the decompressor for the current RoHC profile.
Use the following command to set the preferred feedback mode to bidirectional-reliable:

```bash
preferred-feedback-mode bidirectional-reliable
```
rtp-sn-p

Specifies the value of p in RTP SN (RTP Sequence Number) calculation. Least Significant Bits (LSB) encoding is used for header fields whose values are usually subject to small changes. With LSB encoding, the k least significant bits of the field value are transmitted instead of the original field value, where k is a positive integer. After receiving k bits, the decompressor derives the original value using a previously received value as reference (v_ref). The scheme is guaranteed to be correct if the compressor and the decompressor each use interpretation intervals as follows:

- In which the original value resides
- And in which the original value is the only value that has the exact same k least significant bits as those transmitted.

The interpretation interval can be described as a function:

\[ f(v_{\text{ref}}, k) = [v_{\text{ref}} - p, v_{\text{ref}} + (2^k - 1) - p] \]

Where p is an integer.

Syntax

rtp-sn-p value

default rtp-sn-p

default

Returns the command to its default value.

value

Specifies the number the value of p in the RTP SN calculation as an integer from 0 through 999.

Usage

Use this command to set the value to use for p when performing the RTP SN calculation.

Example

The following command sets the RTP Sequence Number integer “p” value to 100:

rtp-sn-p 100
rtp-sn-p-override

Allows an override of p in RTP SN calculation. This is disabled by default.

Product

HSGW
PDSN

Privilege

Administrator

Mode

Exec > Global Configuration > RoHC Profile Configuration >
configure > rohc-profile profile-name profile_name > decompression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcprofile-profile_name-decomp)#

Syntax

[ default | no ] rtp-sn-p-override

---

default

Returns the command to its default value of disabled.

---

no

Disables overriding p in RTP SN calculation.

Usage

Use this command to allow an override of p in RTP SN calculations.

Example

The following command enables the override of p in the RTP SN calculation:

rtp-sn-p-override
sliding-window-ts

Computes jitter as described in RFC 3095.[4.5.4]

Product
HSGW
PDSN

Privilege
Administrator

Mode
Exec > Global Configuration > RoHC Profile Configuration >
configure > rohc-profile profile-name profile_name > decompression-options
Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcprofile-profile_name-decomp)#

Syntax

sliding-window-ts size

default sliding-window-ts

default
Returns the command to its default value of 4.

size
Sets the size of the sliding window. size must be an integer from 1 through 1000.
Default: 4

Usage
Use this command to set the size of the sliding window used to compute jitter for the current RoHC profile.

Example
The following command sets the sliding window size to 500:

sliding-window-ts 500
use-clock-option

Controls usage of the RoHC clock option. The clock option informs the compressor of the clock resolution of the decompressor. This allows the compressor to estimate the jitter introduced by the clock of the decompressor when doing timer-based compression of the RTP timestamp.

Product
HSGW
PDSN

Privilege
Administrator

Mode
Exec > Global Configuration > RoHC Profile Configuration >
configure > rohc-profile profile-name profile_name > decompression-options

Entering the above command sequence results in the following prompt:

Syntax

[ default | no ] use-clock-option

  default
  Returns the command to its default value of enabled.

  no
  Disables use of the RoHC clock option.

Usage
Use this command to enable and disable the use of the RoHC clock option.

Example

The following command enables RoHC clock option usage:

  use-clock-option

The following command disables RoHC clock option usage:

  no use-clock-option
**use-crc-option**

Controls usage of the RoHC cyclic redundancy check (CRC) option. The CRC option contains an 8-bit CRC computed over the entire feedback payload, without the packet type and code octet, but including any CID fields.

**Product**
- HSGW
- PDSN

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > RoHC Profile Configuration >
configure > rohc-profile profile-name profile_name > decompression-options

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-rohcprofile-profile_name-decomp)#
```

**Syntax**

```
[ default | no ] use-crc-option
```

- **default**
  Returns the command to its default value of enabled.

- **no**
  Disables use of the CRC option.

**Usage**

Use this command to enable and disable the use of the RoHC CRC option.

**Example**

The following command enables RoHC CRC option usage:

```
use-crc-option
```

The following command disables RoHC CRC option usage:

```
no use-crc-option
```
**use-feedback**

Controls use of the feedback channel. A feedback channel sends error recovery requests and (optionally) acknowledgments of significant context updates from the decompressor to the compressor.

**Product**
- HSGW
- PDSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > RoHC Profile Configuration >
  - `configure > rohc-profile profile-name profile_name > decompression-options`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-rohcreprofile-profile_name-decomp)#
```

**Syntax**

```
[ default | no ] use-feedback
```

- `default`
  - Returns the command to its default value of disabled.

- `no`
  - Disables use of the feedback channel.

**Usage**

Use this command to enable and disable the use of the RoHC feedback channel.

**Example**

The following command enables RoHC feedback channel usage:

```
use-feedback
```

The following command disables RoHC feedback channel usage:

```
no use-feedback
```
**use-jitter-option**

Controls usage of RoHC jitter option. The jitter option allows the decompressor to report the maximum jitter it has observed.

**Product**
- HSGW
- PDSN

**Privilege**
- Administrator

**Mode**
Exec > Global Configuration > RoHC Profile Configuration >
- configure > rohc-profile profile-name profile_name > decompression-options

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-rohcprofile-profile_name-decomp)#
```

**Syntax**

```
[ default | no ] use-jitter-option
```

- **default**
  Returns the command to its default value of enabled.

- **no**
  Disables use of the jitter option.

**Usage**

Use this command to enable and disable the use of the RoHC jitter option.

**Example**

The following command enables RoHC jitter option usage:

```
use-jitter-option
```

The following command disables RoHC jitter option usage:

```
no use-jitter-option
```
use-reject-option

Controls usage of RoHC reject option. The reject option informs the compressor that the decompressor does not have sufficient resources to handle the flow.

Product
HSGW
PDSN

Privilege
Administrator

Mode
Exec > Global Configuration > RoHC Profile Configuration >

configure > rohc-profile profile-name profile_name > decompression-options

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-rohcprofile-profile_name-decomp)#

Syntax

[ default | no ] use-reject-option

default
Returns the command to its default value of disabled.

no
Disables use of the reject option.

Usage
Use this command to enable and disable the use of the RoHC reject option.

Example
The following command enables RoHC reject option usage:

use-reject-option

The following command disables RoHC reject option usage:

no use-reject-option
use-sn-not-valid-option

Controls usage of the RoHC SN not valid option. The sn-not-valid option indicates that the SN of the feedback is not valid. A compressor must not use the SN of the feedback to find the corresponding sent header when this option is present.

**Product**
HSGW
PDSN

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > RoHC Profile Configuration >

```bash
configure > rohc-profile profile-name profile_name > decompression-options
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-rohcprofile-profile_name-decomp)#
```

**Syntax**

```
[ default | no ] use-sn-not-valid-option
```

- **default**
  Returns the command to its default value of enabled.

- **no**
  Disables use of the sn-not-valid option.

**Usage**

Use this command to enable and disable the use of the RoHC sn not valid option.

**Example**

The following command enables RoHC sn not valid option usage:

```
use-sn-not-valid-option
```

The following command disables RoHC sn not valid option usage:

```
no use-sn-not-valid-option
```
use-sn-option

Controls usage of RoHC sn option. The sn option provides eight additional bits of SN (Sequence Number, usually the RTP Sequence Number.)

Syntax

[ default | no ] use-sn-option

default
Returns the command to its default value of enabled.

no
Disables use of the SN option.

Usage
Use this command to enable and disable the use of the RoHC SN option.

Example
The following command enables RoHC SN option usage:

    use-sn-option

The following command disables RoHC SN option usage:

    no use-sn-option
Chapter 269
Route-map Configuration Mode Commands

The Route-Map Configuration sub-mode is used for the OSPFv2 and BGP-4 routing protocols. This mode includes commands that configure matching rules and set actions to perform on matched routes.

Mode

Exec > Global Configuration > Context Configuration > Route-map Configuration

configure > context context_name > route-map map_name { deny | permit } seq_number

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-route-map)#

⚠️ **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

`exit`

**Usage**
Use this command to return to the parent configuration mode.
match as-path

Matches an Autonomous System (AS) path access list

Product
HA

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Route-map Configuration

```
configure > context context_name > route-map map_name { deny | permit } seq_number
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-route-map)#
```

Syntax

```
[ no ] match as-path AS_list
```

- `no`
  Disables matching the specified AS path access list.

- `AS_list`
  Specifies the name of an AS path access list for matching as an alphanumeric string of 1 through 79 characters.

Usage

This command is used for BGP-4 routing to specify an AS path access list to be matched. Refer to the `ip as-path access-list` command for more information.

Example

To match entries in an AS path access list named `ASlist1`, enter the following command;

```
match as-path ASlist1
```
match interface

Specifies the next-hop interface name of a route to be matched.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Route-map Configuration
configure > context context_name > route-map map_name ( deny | permit ) seq_number

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-route-map)#

Syntax

[ no ] match interface interface-name

no
Disables matching the specified interface name.

interface-name
Specifies the name of the virtual interface for matching as an alphanumeric string of 1 through 79 characters.

Usage
Use this command to specify the next hop interface name for routes to be matched.

Example
To match routes that have the next hop interface specified as Interface123, enter the following command:

    match interface Interface123

To disable matching routes that have the next hop interface specified as Interface123, enter the following command:

    no match interface Interface123
match ip address

Matches IPv4 routes with entries in a route-access-list or prefix-list.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Route-map Configuration

```
configure > context context_name > route-map map_name { deny | permit } seq_number
```

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-route-map)#
```

**Syntax**

```
[ no ] match ip address { prefix-list | route-access-list } list_name
```

- **no**
  Disables matching from the specified prefix list or route access list.

- **prefix-list**
  Matches any routes with entries in a prefix-list.

- **route-access-list**
  Matches any routes with entries in a route-access-list.

- **list_name**
  Specifies the name of the IPv4 prefix list or IPv4 route access-list as an alphanumeric string of 1 through 79 characters.

**Usage**

Use this command to match routes specified in an IPv4 route-access-list or prefix-list.

**Example**

To match routes that are specified in an IPv4 prefix list named Prefix100, enter the following command:

```
match ip address prefix-list Prefix100
```

To disable matching routes that are specified in an IPv4 prefix list named Prefix100, enter the following command:

```
no match ip address prefix-list Prefix100
```
**match ip next-hop**

Matches next-hop IPv4 addresses with entries in a specified prefix-list or route-access-list.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Route-map Configuration

`configure > context context_name > route-map map_name { deny | permit } seq_number`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-route-map)#`

**Syntax**

```
[ no ] match ip next-hop { prefix-list | route-access-list }list_name
```

- **prefix-list**
  Matches any routes that have a next-hop router IPv4 address that has an entry in the specified prefix list.

- **route-access-list**
  Matches any routes that have a next-hop router IPv4 address that has an entry in the specified route-access-list.

- **list_name**
  Specifies the name of the prefix-list or route-access-list as an alphanumeric string of 1 through 79 characters.

**Usage**

Use this command to match next-hop IPv4 addresses that have entries in the specified prefix-list or route-access-list.

**Example**

To match next-hop IPv4 addresses with entries in a prefix-list named *Prefix100*, enter the following command:

```
matic ip next-hop prefix-list Prefix100
```

To disable matching next-hop IPv4 addresses with entries in a prefix-list named *Prefix100*, enter the following command:

```
no match ip next-hop prefix-list Prefix100
```
**match ipv6 address**

Matches IPv6 routes with entries in a specified route-access-list or prefix-list.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Route-map Configuration

configure > context context_name > route-map map_name { deny | permit } seq_number

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-route-map)#

**Syntax**

```
[ no ] match ipv6 address { prefix-list | route-access-list } list_name
```

- **no**
  Disables matching from the specified prefix list or route access list.

- **prefix-list**
  Matches any routes with entries in a prefix-list.

- **route-access-list**
  Matches any routes with entries in a route-access-list.

- **list_name**
  Specifies the name of the IPv6 prefix list or IPv6 route access-list as an alphanumeric string of 1 through 79 characters.

**Usage**

Matches IPv6 routes with entries in a specified route-access-list or prefix-list.

**Example**

To match routes that are specified in an IPv6 prefix list named *Prefix600*, enter the following command:

```
match ipv6 address prefix-list Prefix600
```

To disable matching routes that are specified in an IPv6 prefix list named *Prefix600*, enter the following command:

```
no match ipv6 address prefix-list Prefix100
```
match ipv6 next-hop

Matches next-hop IPv6 addresses with entries in specified standard prefix-list or route-access-list.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Route-map Configuration
configure > context context_name > route-map map_name { deny | permit } seq_number

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-route-map)#

Syntax

[ no ] match ipv6 next-hop { prefix-list | route-access-list }list_name

---

prefix-list
Matches any routes that have a next-hop router IPv6 address that has an entry in the specified prefix list.

route-access-list
Matches any routes that have a next-hop router IPv6 address that has an entry in the specified route-access-list.

list_name
Specifies the name of the prefix-list or route-access-list as an alphanumeric string of 1 through 79 characters.

Usage
Use this command to match next-hop IPv6 addresses that have entries in the specified prefix-list or route-access-list.

Example
To match next-hop IPv6 addresses with entries in a prefix-list named Prefix600, enter the following command:

    match ipv6 next-hop prefix-list Prefix600

To disable matching next-hop IPv6 addresses with entries in a prefix-list named Prefix600, enter the following command:

    no match ipv6 next-hop prefix-list Prefix600
match metric

Matches routes that have the specified route metric.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Route-map Configuration

configure > context context_name > route-map map_name { deny | permit } seq_number

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-route-map)#

Syntax

[ no ] match metric metric_value

no
Disables matching of the specified route metric.

metric_value
Specifies the route metric to match as an integer from 0 through 4294967295.

Usage
Use this command to match routes that have the specified route metric.

Example
To match routes with the route metric of 1200, enter the following command:

match metric 1200

To disable matching routes with a route metric of 1200, enter the following command:

no match metric 1200
match origin

Matches the origin code learned from BGP. This command is for route maps that are used with BGP routing only.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Route-map Configuration

configure > context context_name > route-map map_name { deny | permit } seq_number

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-route-map)#

**Syntax**

[ no ] match origin { egp | igp | incomplete }

- **no**
  Disables matching of the origin code.

- **egp**
  Matches origins learned via the External Gateway Protocol (EGP)

- **igp**
  Match origins learned via the local Interior Glittery Protocol (IGP)

- **incomplete**
  Match origins with unknown heritage.

**Usage**

Use this command to match origin codes for BGP routing.

**Example**

To match origin codes learned from EGP, enter the following command:

```
match origin egp
```
**match route-type external**

Match external Open Shortest Path First (OSPF) routes of the specified type.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Route-map Configuration

```
configure > context context_name > route-map map_name { deny | permit } seq_number
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-route-map)#
```

**Syntax**

```
[ no ] match route-type external { type-1 | type-2 }
```

- **type-1**
  Only matches type-1 external routes.

- **type-2**
  Only matches type-2 external routes.

**Usage**

Use this command to match external routes of a specific type.

**Example**

The following command matches all external routes that are type-2:

```
match route-type external type-2
```

The following command disables matching external routes that are type-2:

```
no match route-type external type-2
```
match tag

Matches routes with the specified route tag value.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Route-map Configuration
configure > context context_name > route-map map_name { deny | permit } seq_number

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-route-map)#

Syntax

[ no ] match tag tag_value

no
Disables matching routes with the specified route tag value.

tag_value
Specifies the route tag value to match as an integer from 0 through 4294967295.

Usage
Use this command to match routes that have the specified route tag value.

Example
Use the following command match routes that have a route tag value of 1234:

    match tag 1234

Use the following command to disable matching routes that have a route tag value of 1234:

    no match tag 1234
set as-path

Modifies an Autonomous System (AS) path for a route by adding the specified AS numbers to the front of the path.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Route-map Configuration

```
configure > context context_name > route-map map_name { deny | permit } seq_number
```

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-route-map) #
```

**Syntax**

```
[ no ] set as-path prepend ASN
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Disables prepending the AS path. Any previously set prepends are removed.</td>
</tr>
<tr>
<td>prepend</td>
<td>Prepends the AS path.</td>
</tr>
<tr>
<td>ASN</td>
<td>AS number(s) to be prepended to the AS path. You can specify up to 16 different AS numbers to be prepended in the order specified. Each AS number must be separated by a space. ASN must be an integer from 1 through 65535.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to add up to 16 specified AS numbers to the front of the AS path.

**Example**

The following command prepends the AS numbers 100, 200, and 1000 to matching AS paths:

```
set as-path prepend 100 200 1000
```
set ip next-hop

Sets the IPv4 address that is applied as the next hop for routes.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Route-map Configuration

configure > context context_name > route-map map_name { deny | permit } seq_number

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-route-map)#

Syntax

[ no ] set ip next-hop ipv4_address

- **no**
  - Disables the specified next hop IPv4 address.

- **ipv4_address**
  - Specifies the IPv4 address of the next hop to which packets are output, entered using IPv4 dotted-decimal notation.

Usage

Use this command to set the IPv4 address that is used as the next hop for routes.

Example

To set the next hop for routes to the IPv4 address 192.168.2.100, use the following command:

```
set ip next-hop 192.168.2.100
```

To disable setting the next hop for routes to the IP address 192.168.2.100, use the following command:

```
o set ip next-hop 192.168.2.100
```
set ipv6 next-hop

Sets the IPv6 address that is applied as the next hop for routes.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Route-map Configuration
```
configure > context context_name > route-map map_name { deny | permit } seq_number
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-route-map)#
```

**Syntax**
```
[ no ] set ipv6 next-hop ipv6_address
```

- **no**
  
  Disables the specified next hop address.

- **ipv6_address**
  
  Specifies the IPv6 address of the next hop to which packets are output, entered using IPv6 colon-separated-hexadecimal notation.

**Usage**

Use this command to set the IPv6 address that is used as the next hop for routes.

**Example**

To set the next hop for routes to the IPv6 address `2001:4A2B::1f3F`, use the following command:
```
set ip next-hop 2001:4A2B::1f3F
```

To disable setting the next hop for routes to the IP address `2001:4A2B::1f3F`, use the following command:
```
no set ip next-hop 2001:4A2B::1f3F
```
**set metric**

Sets the route metric for matching routes to a specified value.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Route-map Configuration

```bash
configure > context context_name > route-map map_name { deny | permit } seq_number
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-route-map)#
```

**Syntax**

```
[ no ] set metric metric_value
```

**Usage**

Specifies the metric value that is set for routes as an integer from 1 through 16777214.

**Example**

Use this command to set the route metric for matched routes.

To set the route metric to **12345**, use the following command:

```bash
set metric 12345
```

To disable setting the route metric to **12345**, enter the following command:

```bash
no set metric 12345
```
set metric-type

This command sets the route metric type to either Type-1 or Type-2 in the AS-external-LSA.

Product

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-route-map)#

Syntax

[ no ] set metric-type { type-1 | type-2 }

type-1
Sets the route metric to external type-1.

type-2
Sets the route metric to external type-2

Usage

Use this command to set the route metric to either external type-1 or external type-2.

Example

To set the route metric to type-1, enter the following command:

set metric type-1

To disable setting the metric to type, enter the following command:

no set metric type-1
set origin

Sets the Border Gateway Protocol (BGP) origin code to a specified value. This command is for route maps that are used with BGP routing only.

Product
HA

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Route-map Configuration

configure > context context_name > route-map map_name { deny | permit } seq_number

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-route-map)#

Syntax

[ no ] set origin { egp | igp | incomplete }

no
Disables setting the origin code.

ejp
Sets the origin code to specify that the path is from a remote External Gateway Protocol (EGP) system.

igp
Sets the origin code to specify that the path is from a local Interior Gateway Protocol (IGP) system.

incomplete
Sets the origin code to specify that the path is from an unknown system.

Usage
Use this command to set a specified origin code for BGP.

Example
To set the origin code to be from an External Gateway Protocol (EGP) system, enter the following command:

set origin egp
set tag

Sets the route tag value for matched routes.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Route-map Configuration

configure > context context_name > route-map map_name { deny | permit } seq_number

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-route-map)#

Syntax

[ no ] set tag tag_value

---

no

Disable setting the route tag to the specified value.

tag_value

Specifies the route tag value as an integer from 0 through 4294967295.

Usage

Use this command to set the route tag value that is applied to all matched routes.

Example

To set the route tag value to 12345, enter the following command:

    set tag 12345

To disable setting the route tag value to 12345, enter the following command:

    no set tag 12345
**set weight**

Sets the weight in the routing table for matching routes to the specified value.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Route-map Configuration

```text
configure > context context_name > route-map map_name { deny | permit } seq_number
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-route-map)#
```

**Syntax**

```
[ no ] set weight value
```

- **no**
  Disable setting the routing weight value.

- **value**
  Specifies the weight in the routing table as an integer from 1 through 4294967295.

**Usage**

Use this command to set the routing table weight on matched routes.

**Example**

The following command sets the routing table weight for matched routes to 1000:

```
set weight 1000
```
The RS-232 Port Configuration Mode is used to manage the RS-232 ports on the SPIO cards.

**Mode**

Exec > Global Configuration > RS-232 Port Configuration

`configure > port rs232 slot_number/port_number`

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-port-slot_number/port_number)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
default

Restores the port’s default speed and communication mode.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > RS-232 Port Configuration

configure > port rs232 slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Syntax

default { preferred slot | terminal { all | databits | flowcontrol | parity | speed | stopbits } }

preferred slot

Sets the port for non-revertive operation for port redundancy auto-recovery; requiring an administrative user to manually issue a port switch to command to return service to the original port.

terminal { all | databits | flowcontrol | parity | speed | stopbits } 

Sets the terminal settings for the RS-232 port to their default settings.
all: Restores all settings to their default values.
databits: Restores the databits setting to its default value of 8.
flowcontrol: Restores the flowcontrol setting to its default value of none.
parity: Restores the parity setting to its default value of none.
speed: Restores the speed setting to its default value of 9600.
stopbits: Restores the stopbits setting to its default value of 1.

Usage

Restores port-level parameters to their default values.

Example

The following command restores all terminal settings to their default values:

    default terminal all
end

Usage
Use this command to return to the parent configuration mode.
preferred slot

Assigns revertive or non-revertive control to port redundancy auto-recovery.
Default: non-revertive operation

Product
PDSN
FA
HA
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > RS-232 Port Configuration
configure > port rs232 slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Syntax

preferred slot slot#
no preferred slot slot#

Usage
This command enables or disables revertive port redundancy, wherein after a port failover, when the original port is restored to service (such as link up) the system will return service to that port automatically. Disabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue a port switch to command to return service to the original port.

This command must be issued on a per port basis, allowing you to configure specific ports to be used on individual line cards or SPIO cards. For example, ports 1 through 4 could be configured as “preferred” on the line card in slot 17, while ports 5 through 8 are “preferred” on the line card in slot 33. In this scenario, both line cards would be in an Active operational state while still providing LC and port redundancy for the other.

Important: This command is not supported on all platforms.

Example
preferred slot 24
snmp trap link-status

Enables or disables the generation of an SNMP trap for link status changes.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > RS-232 Port Configuration
configure > port rs232 slot_number/port_number

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**

```
snmp trap link-status

no snmp trap link-status
``` 

Disables the sending of traps for link status changes.

**Usage**

Enable link status change traps when a monitoring facility can use the information or if there are troubleshooting activities are in progress.

**Example**

```
  snmp trap link-status

  no snmp trap link-status
```
terminal

Configures the console port on the SPIO.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > RS-232 Port Configuration

configure > port rs232 slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Syntax

terminal { carrierdetect { off | on } | databits { 7 | 8 } | flowcontrol { hardware | none } | parity { even | none | odd } | speed { 115200 | 19200 | 38400 | 57600 | 9600 } | stopbits { 1 | 2 } }

carrierdetect { off | on }  
Default:  
Specifies whether or not the console port is to use carrier detect when connecting to a terminal.

databits { 7 | 8 }  
Default: 8  
Specifies the number of data bits used to transmit and receive characters.

flowcontrol { hardware | none }  
Default: none  
Specifies how the flow of data is controlled between the SPIO and a terminal.

parity { even | none | odd }  
Default: none  
Specifies the type of error checking used on the port.  
 even: Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits even.  
 none: Disables error checking.  
 odd: Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits odd.

speed { 115200 | 19200 | 38400 | 57600 | 9600 }  
Default: 9600  
Specifies the flow of data in bits per second between the console port and terminal.
stopbits { 1 | 2 }
Default: 1
Specifies the number of stop bits between each transmitted character.

Usage
Sets the SPIO console port parameters for communication with the terminal device.

Example
The following command sets the SPIO’s console port. The terminal must support these values.

    terminal carrierdetect off databits 7 flowcontrol hardware parity even
    speed 115200 stopbits 1
Chapter 271
S1AP Cause Code Configuration Mode Commands

The cause code group object allows an operator to group together a set of cause codes. This group can then be used as a named object in other commands.

Mode
Exec > Global Configuration > LTE Policy Configuration > S1AP Cause Code Configuration
configure > lte-policy > cause-code-group group_name

Entering the above command sequence results in the following prompt:

[local] host_name (slap-cause-code)

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
class

Configures a set of cause codes within a cause code group.

Product

MME

Privilege

Administrator

Mode

Exec > Global Configuration > LTE Policy Configuration > S1AP Cause Code Configuration

configure > lte-policy > cause-code-group group_name

Entering the above command sequence results in the following prompt:

[local] host_name (s1ap-cause-code)

Syntax

[no] class { miscellaneous | nas | protocol | radio | transport } cause cause_no

- **no**
  - Removes the specified cause code class.

- **miscellaneous**
  - Specifies the class of miscellaneous cause codes.

- **nas**
  - Specifies the class of NAS cause codes.

- **protocol**
  - Specifies the class of protocol cause codes.

- **radio**
  - Specifies the class of radio cause codes.

- **transport**
  - Specifies the class of transport cause codes.

- **cause cause_no**
  - Specifies the cause codes to add to this class. Cause codes must be defined one at a time.
  - *cause_no* is a numeric cause code value, as defined in 3GPP TS 36.413.

Usage

Use this command to configure the specific cause codes within this S1AP Cause Code Group. A maximum of 16 cause codes can be added to a cause-code-group entry.
Refer to the `policy service-request` command and `policy tau` command in the MME Service Configuration Commands Chapter to configure the behavior of the MME when the initial context setup fails during a service request procedure or while processing a TAU request.

The specific action taken by the MME can be mapped to the cause codes defined in this command.

**Example**

The following commands add causes `failure-in-radio-interface-procedure` and `interaction-with-other-procedure` to the cause code group.

```
class radio cause 26
class radio cause 29
```
end

Exits the current configuration mode and returns to the Exec mode.

Use this command to return to the parent configuration mode.
Chapter 272
S1-U Relay Configuration Mode Commands

The S1-U Relay configuration option enables the S1-U Relay service functionality to the HeNB-GW Access Service. In this mode user can configure associations to the Access and Network GTP-U services for S1-U Relay

Mode
Exec > Global Configuration > Context Configuration > HeNB-GW Access Service Configuration > S1-U Relay Configuration

configure > context context_name > henbgw-access-service access_svc_name > slu-relay

Entering the above command sequence results in the following prompt:

[context_name]host_name(slu-relay) #

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**associate**

Associates previously configured Access GTP-U service as well as the Network GTP-U service to this HeNB-GW Access Service for S1-U relay service functionality. The Access and Network GTP-U services must be configured in the Context Configuration mode before using this configuration.

**Product**
HeNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > HeNB-GW Access Service Configuration > S1-U Relay Configuration

*configure > context context_name > henbgw-access-service access_svc_name > slu-relay*

Entering the above command sequence results in the following prompt:

*[context_name]host_name(slu-relay)#*

**Syntax**

```
associate { access-gtpu-service access_gtpu_svc | network-gtpu-service network_gtpu_svc } [ context ctxt_name ]
```

```
no associate { access-gtpu-service | network-gtpu-service }
```

- **no**
  Removes the associated Access or Network GTP-U service from this HeNB-GW Access service configuration.

  ```
  access_gtpu_svc
  ```

  Identifies the name of the pre-configured Access GTP-U service in Context Configuration Mode to associate with this HeNB-GW Access Service for S1-U relay.

  *access_gtpu_svc* is an alphanumeric string of 1 through 63 characters.

  ```
  network_gtpu_svc
  ```

  Identifies the name of the pre-configured Network GTP-U service to associate with this HeNB-GW Access Service for S1-U relay.

  *network_gtpu_svc* is an alphanumeric string of 1 through 63 characters.

**Usage**

Use this command to bind/associate a pre-configured Access or Network GTP-U service to this HeNB-GW Access service. When S1-U Relay is enabled, the association to ingress and egress GTP-U services is considered as critical configuration for the HeNB-GW Access service. When S1-U relay is enabled, both access and network gtpu services needs to be in STARTED state for the HENBGW access service to be started.

**Example**

```
```
Following command associates a Network GTP-U service named `net_gtpu` in egress context with a specific HeNB-GW Access service:

```
associate network-gtpu-service net_gtpu context egress
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
**ip**

Configures the Internet protocol (IP) parameters including downlink and uplink data IP QoS DSCP marking to this HeNB-GW Access Service for S1-U relay service functionality.

**Product**
HeNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > HeNB-GW Access Service Configuration > S1-U Relay Configuration

```
configure > context context_name > henbgw-access-service access_svc_name > slu-relay
```

Entering the above command sequence results in the following prompt:
```
[context_name]host_name(slu-relay)#
```

**Syntax**

```
ip { downlink | uplink } { qos-dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef } }
```

```
no ip { downlink | uplink }
```

**no**

Removes the IP parameters for downlink/uplink data from this HeNB-GW Access service configuration.

```
qos-dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef }
```

Default: **af11**

Specifies the DSCP for the specified QoS traffic pattern. **qos-dscp** can be configured to any one of the following:

- **af11**: Assured Forwarding 11 per-hop-behavior (PHB)
- **af12**: Assured Forwarding 12 PHB
- **af13**: Assured Forwarding 13 PHB
- **af21**: Assured Forwarding 21 PHB
- **af22**: Assured Forwarding 22 PHB
- **af23**: Assured Forwarding 23 PHB
- **af31**: Assured Forwarding 31 PHB
- **af32**: Assured Forwarding 32 PHB
- **af33**: Assured Forwarding 33 PHB
- **af41**: Assured Forwarding 41 PHB
- **af42**: Assured Forwarding 42 PHB
- **af43**: Assured Forwarding 43 PHB
- **be**: Best effort forwarding PHB
- **ef**: Expedited forwarding PHB
Usage

Use this command to configure the S1-U relay uplink and downlink data traffic IP-QoS-DSCP value marking to this HeNB-GW Access service.

Example

Following command configures the DSCP-level for uplink data traffic through a specific HeNB-GW Access service to `af31`:

```
ip uplink qos-dscp af31
```
Chapter 273
SAEGW Service Configuration Mode Commands

The System Architecture Evolution Gateway (SAEGW) Service Configuration Mode is used to create and manage the relationship between specified services used for S-GW and P-GW network traffic.

Mode

Exec > Global Configuration > Context Configuration > SAEGW Service Configuration

configure > context context_name > saegw-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-saegw-service)#

⚠️ **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**associate**

Associates the SAEGW service with specific pre-configured services configured in the same context.

**Product**
SAEGW

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SAEGW Service Configuration

`configure > context context_name > saegw-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-saegw-service)#
```

**Syntax**

```
[ no ] associate { pgw-service name | sgw-service name }
```

- **no**
  Removes the selected association from this service.

- **pgw-service name**
  Specifies that the SAEGW service is to be associated with an existing P-GW service within this context.

  *name* must be an alphanumeric string of 1 through 63 characters and be an existing P-GW service.

- **sgw-service name**
  Specifies that the SAEGW service is to be associated with an existing S-GW service within this context.

  *name* must be an alphanumeric string of 1 through 63 characters and be an existing S-GW service.

**Important:** S-GW egress eGTP service must be in the same context as this SAEGW service. In addition, PMIP is not supported for the S-GW service egress.

**Usage**

Use this command to associate the SAEGW service with other pre-configured services configured in the same context.

**Important:** Each P-GW or S-GW service may only be associated with one SAEGW service; however, there may be multiple SAEGW services configured on a system in separate contexts.

**Example**

The following commands associate this SAEGW service with a P-GW service called *pgw1* and a S-GW service called *sgw2*:

```
associate pgw-service pgw1
```
associate sgw-service sgw2
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
Chapter 274
SaMOG Service Configuration Mode Commands

Creates SaMOG service and enters SaMOG service configuration mode.

Mode

Exec > Global Configuration > Context Configuration > SAMOG Service Configuration
configure > context context_name > samog-service samog_service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-samog-service)#

Important: Available commands or keywords/variables vary based on platform type, product version, and installed license(s).
associate

SaMOG associates another service to this SAMOG service.

Product
SaMOG

Mode
Exec > Global Configuration > Context Configuration > SAMOG Service Configuration

configure > context context_name > samog-service samog_service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-samog-service)#

Syntax

associate { cgw-service cgw_service_name | mrme-service mrme_service_name | subscriber-map subscriber_map_name }

no associate { cgw-service | dhcpv6-service | mrme-service | subscriber-map }

no

Disables the association of the service with the SaMOG service.

---

cgw-service cgw_service_name

The CGW service should be configured before associating the same with SaMOG service.
cgw_service_name must be an alphanumeric string between 1 and 63 characters.

---

mrme-service mrme_service_name

The MRME service should be configured before associating the same with SaMOG service.
mrme_service_name must be an alphanumeric string from 1 through 63 characters.

---

subscriber-map subscriber_map_name

The subscriber map service should be configured before associating the same with SaMOG service.
subscriber_map_name must be an alphanumeric string from 1 through 63 characters.

---

Usage

Use this command to associate the SaMOG service to CGW service, DHCPv4 service, MRME service, or Subscriber Mapping.

Example

The following command associates subscriber-map smap with SaMOG Service.

    associate subscriber-map smap

The following command associates cgw-service cgw with SaMOG Service.

    associate cgw-service cgw

The following command associates mrme-service mrme with SaMOG Service.
associate mrme-service mrme
end

Exits the current configuration mode and returns to the Exec mode.

Product

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
max-sessions

Configures maximum number of subscribers SAMOG service can support, ranging from 0 to 4000000.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > SAMOG Service Configuration

configure > context context_name > samog-service samog_service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-samog-service)#

Syntax

max-sessions max_sessions

default max-sessions

max-sessions max_sessions

Configures maximum number of subscribers SAMOG service can support.

max_sessions is an integer value between 0 and 4000000.

default

Sets the default value, 4000000 for Max Sessions.

Usage

Use this command to configure the maximum number of subscribers SAMOG service can support.

Example

Use the following command to configure the maximum number of subscribers SAMOG service can support:

max-sessions 500
timeout

Configures the session's time-to-live (TTL) settings under SAMOG service.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > SAMOG Service Configuration
configure > context context_name > samog-service samog_service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-samog-service)#

Syntax

`timeout { absolute absolute | idle idle | setup-timeout setup_timeout }

defaulttimeout [ absolute absolute | idle idle | setup-timeout setup_timeout ]

notimeout [ absolute absolute | idle idle ]`

- **timeout { absolute absolute | idle idle | setup-timeout setup_timeout }**
  - **absolute absolute**: Designates the maximum duration of the session, in seconds, before system automatically terminates the session. `absolute` is number of seconds, an integer value between 0 and 2147483647.
  - **idle idle**: Designates the maximum duration a session can remain idle, in seconds, before system automatically terminates the session. Zero indicates function is disabled. Default is 0. `idle` is number of seconds, an integer value between 0 and 2147483647.
  - **setup-timeout setup_timeout**: It is the maximum time allowed for session setup in seconds. Default is 60 seconds. `setup_timeout` is number of seconds, an integer value between 0 and 1000000.

- **default**
  - Sets / Restores default value assigned for timeout. The default value of absolute and idle timeout is 0, which indicates the function is disabled. The default value of setup-timeout is 60.

- **no**
  - Enables / Disables the timeout option.

Usage

Use this command to configure the session's time-to-live (TTL) settings under SAMOG service.

Example

Use the following command to configure the setup-timeout to 500 seconds:

`timeout setup-timeout 500`
Use the following command to configure the absolute timeout to 120 seconds:

```
timeout absolute 120
```
Chapter 275
SCCP Network Configuration Mode Commands

The SCCP Network Configuration Mode is used to configure properties for Signaling Connection Control Part (SCCP) services for SS7.

Signaling Connection Control Part (SCCP) is a routing protocol in the SS7 protocol suite in layer 4, which provides end-to-end routing for TCAP messages to their proper database.

**Mode**

Exec > Global Configuration > SCCP Network Configuration

`configure > sccp-network id_number`

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-sccp-network-sccp_id)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
associate

Associates an SS7 routing domain with the SCCP network.

**Product**
SGSN
HNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SCCP Network Configuration

```bash
configure > sccp-network id_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-sccp-network-sccp_id)#
```

**Syntax**

```bash
associate ss7-routing-domain rd_id
```

```bash
no associate
```

no

Removes the association with the SS7 routing domain from the system configuration.

```bash
rd_id
```

This number identifies an already defined SS7 routing domain.

**Usage**

Use this command to associate SS7 routing domain configurations with SCCP network configurations.

**Example**

The following command associates the SCCP network with SS7 routing domain 2:

```bash
associate ss7-routing-domain 2
```
description

This command defines a string that describes the SCCP network. The description is used for operator reference.

Product
SGSN
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SCCP Network Configuration
configure > sccp-network id_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-sccp-network-sccp_id)#

Syntax

description string

no description

string

This is a string to describe the SCCP network.

string must be an alphanumeric string from 1 through 127 characters in length. If there are spaces in the string the string must be enclosed in double-quotes. For example; “This is a Description”.

no

Removes the description from the system configuration.

Usage

Use this command to configure a description of this SCCP service for operator reference.

Example

The following command sets the description to “This is the SCCP Service Number 1”:

    description "This is the SCCP Service Number 1."

**destination**

This command configures the SCCP network destination information. Use this command multiple times to set all of the destination information required.

**Product**

SGSN
HNB-GW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > SCCP Network Configuration

```
configure > sccp-network id_number
```
Entering the above command sequence results in the following prompt:

```
[local]host_name(config-sccp-network-sccp_id)#
```

**Syntax**

```
destination dpc pt_code { name route_name | next-hop pt_code [ priority priority ] | ssn subsys_num | version sccp_ver }

no destination dpc p_code [ name route_name | ssn subsys_num | version sccp_ver ]
```

**no**

Deletes the specified destination information from the SCCP network configuration.

**dpc pt_code**

Specifies the SCCP destination point code.

*pt_code*: Must be in SS7 point code dotted-decimal ###.###.### format or decimal ####### format.

**name route_name**

The name of the SCCP destination route.

*route_name*: enter an alphanumeric string from 1 through 64 characters in length.

**next-hop pt_code [ priority priority ]**

Associates the next destination defined in the SS7 routing domain and assigns the next-hop a priority for use.

*pt_code*: Must be in SS7 point code dotted-decimal ###.###.### format or decimal ####### format.

*priority*: Must be an integer from 0 to 15, with 0 setting the highest priority.

**ssn subsys_num**

The destination subsystem number.

*subsys_num*: enter an integer from 1 through 255.

**version sccp_ver**

*sccp_ver*: enter one of the following to select the SCCP variant:
- ANSI88
- ANSI92
- ANSI96
- BELL05
- CHINA
- GSM0806
- ITU88
- ITU92
- ITU96

Usage

Use this command to configure the destination information for the SCCP network.

Example

The following commands set the name of the destination route to default_route, the subsystem number to 1, and the variant version to ITU96, all with a destination point code of 1:

```plaintext
destination dpc 1 name default_route
destination dpc 1 ssn 1
destination dpc version ITU96
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**

SGSN
HNB-GW

**Privilege**

Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Return to the Exec mode.
exit

Exits the current configuration mode and returns to the global configuration mode.

Product
SGSN
HNB-GW

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Return to the global configuration mode.
global-title-translation

This command associates a GTT address-map with this SCCP network.

Product
SGSN
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SCCP Network Configuration
configure > sccp-network id_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-sccp-network-sccp_id)#

Syntax

global-title-translation address-map instance instance

no global-title-translation address-map instance instance

no

Deletes the GTT address-map instance associated with this SCCP network.

instance

This value uniquely identifies a specific previously defined instance of a GTT address-map.
instance: enter an integer from 1 to 4096.

Usage

Use this command to link a GTT address-map, configured with the GTT Address Map configuration mode, to a specific SCCP network configuration.

Example

global-title-translation address-map instance gtt-map1
hop-count

This command specifies the hop count for this SCCP network.

Product
SGSN
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SCCP Network Configuration
configure > sccp-network id_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-sccp-network-sccp_id)#

Syntax

hop-count hop_cnt

default hop-count

default

Resets the hop-count value to the system default of 5.

hop_cnt

The hop count to assign to this SCCP network.

hop_cnt: enter an integer from 1 to 15.

Usage

Use this command to define the hop count for this SCCP network.

Example

The following command sets the hop count to 3:

hop-count 3
self-point-code

This command specifies the SS7 point code for this SCCP service.

Product
SGSN
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SCCP Network Configuration
configure > sccp-network id_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-sccp-network-sccp_id)#

Syntax

self-point-code point_code

no self-point-code

no

Deletes the configured self point code.

point_code

Defines the point code to assign to this SCCP network service.

point_code: value entered must adhere to the point code variant selected when the SCCP network instance was defined:

- ITU Range 0.0.1 to 7.255.7
- ANSI Range 0.0.1 to 255.255.255
- TTC Range 0.0.1 to 15.31.255
- a string of 1 to 11 combined digits ad period.

Usage
Use this command to assign the self point code to use for this SCCP service.

Example
The following command sets an ITU-based point code for this SCCP service:

self-pointcode 4.121.5

The following command removes the configured self-point code:

no self-pointcode
timeout

This command configures the timeout parameters for this SCCP network.

Product
SGSN
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SCCP Network Configuration
configure > sccp-network id_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-sccp-network-sccp_id)#

Syntax

timeout { attack-timer | congestion-timer | conn-est-timer | crd-timer | decay-timer | iar-timer | ias-timer | interval-timer | reassembly-timer | release-timer | repeat-release-timer | reset-timer | sst-timer } +

default timeout

no timeout timer

---

attack-timer time

Defines the time before the attack timer expires.

`time`: enter an integer between 1 and 10.

---

congestion-timer time

Defines the time before the congestion timer expires.

`time`: enter an integer between 1 and 10.

---

conn-est-timer time

Defines the time before the connection timer expires.

`time`: enter an integer between 6 and 12.

---

crd-timer time

Defines the time before the coordinated-state-change timer expires.

`time`: enter an integer between 60 and 120.

---

decay-timer time

Defines the time before the decay timer expires.

`time`: enter an integer between 1 and 10.
### timeout

**iar-timer time**
Defines the time before the inactivity-receive timer expires.
`time`: enter an integer between 60 and 120.

**ias-timer time**
Defines the time before the inactivity-send timer expires.
`time`: enter an integer between 30 and 60.

**interval-timer time**
Defines the time before the interval timer expires.
`time`: enter an integer between 6 and 12

**reassembly-timer time**
Defines the time before the reassembly-timer expires.
`time`: enter an integer between 10 and 20.

**release-timer time**
Defines the time before the release-assembly timer expires.
`time`: enter an integer between 1 and 2.

**repeat-release-timer time**
Defines the time before repeat-release timer expires.
`time`: enter an integer between 1 and 2

**reset-timer time**
Defines the amount of time before the reset timer expires.
`time`: enter an integer between 1 and 2

**sst-timer time**
Defines the amount of time before the subsystem status test timer expires.
`time`: enter an integer between 5 and 1200.

**default**
Resets the timeout parameter to the system default.

**no**
Deletes the specified timer configuration.

#### Usage
Use this command to assign timeout timers and timeout values for this SCCP service.

#### Example
`
timeout reset-timer 75
`
Chapter 276
SCTP Parameter Template Configuration Mode Commands

This chapter provides information about commands used to configure parameters for Stream Control Transmission Protocol (SCTP) associations. The commands become part of a template that can be associated with services running on the system.

Mode

Exec > Global Configuration > SCTP Parameter Template Configuration

configure > sctp-param-template template_name

Entering the above command sequence results in the following prompt:

[local]host_name(sctp-param-template)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
sctp-alpha

Configures the SCTP retransmission timeout (RTO) alpha value.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > SCTP Parameter Template Configuration

configure > sctp-param-template template_name

Entering the above command sequence results in the following prompt:

[local]host_name(sctp-param-template)#

Syntax

sctp-alpha value

default sctp-alpha

default

Returns the command to its default setting of 5.

value

Default: 5
Specifies the SCTP retransmission timeout alpha value. value must be an integer from 0 through 65535.

Usage

Use this command to configure the SCTP RTO alpha value. The RTO alpha value is used in calculating the smoothed round-trip time (SRTT) and the round-trip time variation (RTTVAR) for new round trip time (RTT) measurements.

Example

The following command sets the SCTP RTO alpha value to 10:

    sctp-alpha 10
sctp-alt-accept-flag

Configures the SCTP alternate accept flag for additional life time for the association.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > SCTP Parameter Template Configuration

configure > sctp-param-template template_name

Entering the above command sequence results in the following prompt:

[local]host_name(sctp-param-template)#

Syntax

sctp-alt-accept-flag { disable | enable }

default sctp-alt-accept-flag

default

Returns the command to its default setting of enable.

disable | enable

Specifies if the alternate accept flag is enabled or disabled.

Usage

Use this command to configure the SCTP alternate accept flag for additional life time for the association.

Example

The following command disables the alternate accept flag for the SCTP association:

sctp-alt-accept-flag disable
**sctp-beta**

Configures the SCTP retransmission timeout (RTO) beta value.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > SCTP Parameter Template Configuration

```
configure > sctp-param-template template_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(sctp-param-template)#
```

**Syntax**

```
sctp-beta value
```

```
default sctp-beta
```

<table>
<thead>
<tr>
<th>default</th>
<th>Returns the command to its default setting of 10.</th>
</tr>
</thead>
</table>

```
value
```

Specifies the SCTP retransmission timeout beta value as an integer from 0 through 65535. Default: 10

**Usage**

Use this command to configure the SCTP RTO beta value. The RTO beta value is used in calculating the smoothed round-trip time (SRTT) and the round-trip time variation (RTTVAR) for new round trip time (RTT) measurements.

**Example**

The following command sets the SCTP RTO beta value to 20:

```
sctp-beta 20
```
sctp-checksum-type

Configures the checksum type used to increase the integrity of the SCTP packets during transmission.

Product
- MME

Privilege
- Administrator

Mode
- Exec > Global Configuration > SCTP Parameter Template Configuration
- configure > sctp-param-template template_name

Entering the above command sequence results in the following prompt:

[local]host_name(sctp-param-template)#

Syntax

```
sctp-checksum-type { adler32 | crc32 }
```

```
default sctp-checksum-type
```

**sctp-cookie-life**

Configures the lifetime of the SCTP cookie.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > SCTP Parameter Template Configuration

```bash
configure > sctp-param-template template_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(sctp-param-template)#
```

**Syntax**

```
sctp-cookie-life value
```

**default sctp-cookie-life**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>default</strong></td>
<td>Returns the command to its default setting of 600 (60000 milliseconds).</td>
</tr>
</tbody>
</table>
| **value** | Default: 600 (60000 milliseconds)  
Specifies the lifetime of the SCTP cookie. value is an integer from 50 through 1200. The range translates to 5000 milliseconds to 120000 milliseconds, as the granularity is in 100-millisecond increments. |

**Usage**

Use this command to configure the lifetime of the SCTP cookie.

**Example**

The following command configures the lifetime of the SCTP cookie to 80000 milliseconds:

```
sctp-cookie-life 800
```
sctp-max-assoc-retx

Configures the maximum number of retransmissions for SCTP associations.

**Product**

MME

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > SCTP Parameter Template Configuration

configure > sctp-param-template template_name

Entering the above command sequence results in the following prompt:

[local]host_name(sctp-param-template)#

**Syntax**

```
sctp-max-assoc-retx value

default sctp-max-assoc-retx
```

---

**default**

Returns the command to its default setting of 10.

---

**value**

Specifies the maximum number of retransmissions allowed by this template for SCTP associations as an integer from 0 through 255. Default: 10

---

**Usage**

Use this command to configure the maximum number of retransmissions allowed.

**Example**

The following command configures the maximum number of retransmissions to 7:

```
sctp-max-assoc-retx 7
```
sctp-max-in-strms

Configures the maximum number of incoming SCTP streams.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > SCTP Parameter Template Configuration

configure > sctp-param-template template_name

Entering the above command sequence results in the following prompt:

[local]host_name(sctp-param-template)#

Syntax

sctp-max-in-strms value

default sctp-max-in-strms

default

Returns the command to its default setting of 16.

default

value

Specifies the maximum number of incoming SCTP streams as an integer from 1 through 16. Default: 16. The MME restricts the allowable range as 2-16. If a value of 1 is entered, value 2 will be applied for any MME service associated with this SCTP parameter template.

Usage

Use this command to configure the maximum number of incoming SCTP streams.

Example

The following command configures the maximum number of incoming SCTP streams to 5:

sctp-max-in-strms 5
sctp-max-init-retx

Configures the maximum number of retransmissions for SCTP initiations.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > SCTP Parameter Template Configuration
configure > sctp-param-template template_name

Entering the above command sequence results in the following prompt:

[local]host_name(sctp-param-template)#

**Syntax**

```text
sctp-max-init-retx value

default sctp-max-init-retx
```

- **default**
  Returns the command to its default setting of 5.

- **value**
  Specifies the maximum number of retransmissions for SCTP initiations as an integer from 0 through 255. Default: 5

**Usage**

Use this command to configure the maximum number of retransmissions for SCTP initiations.

**Example**

The following command configures the maximum number of retransmissions for SCTP initiations to 10:

```text
sctp-max-init-retx 10
```
sctp-max-mtu-size

Configures the maximum transmission unit (MTU) size (in bytes) for SCTP streams.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > SCTP Parameter Template Configuration

configure > sctp-param-template template_name

Entering the above command sequence results in the following prompt:

[local]host_name(sctp-param-template)#

Syntax

sctp-max-mtu-size bytes

default sctp-max-mtu-size

<table>
<thead>
<tr>
<th>bytes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns the command to its default setting of 1500 bytes.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>bytes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the maximum MTU size (in bytes) for SCTP streams as an integer from 508 through 65535. Default: 1500</td>
</tr>
</tbody>
</table>

Usage
Use this command to configure the maximum MTU size, in bytes, for SCTP streams.

Example
The following command configures the maximum MTU size for SCTP streams to 3000:

    sctp-max-mtu-size 3000
sctp-max-out-strms

Configures the maximum number of outgoing SCTP streams.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > SCTP Parameter Template Configuration

configure > sctp-param-template template_name

Entering the above command sequence results in the following prompt:

[local]host_name(sctp-param-template)#

Syntax

sctp-max-out-strms value

default sctp-max-out-strms

default

Returns the command to its default setting of 2.

value

Specifies the maximum number of outgoing SCTP streams as an integer from 1 through 16.
MME Default 16.
SGSN Default: 2.

Usage

Use this command to configure the maximum number of outgoing SCTP streams.
The MME restricts the allowable range as 2-16. If a value of 1 is entered, value 2 will be applied for any
MME service associated with this SCTP parameter template.
For the SGSN, if the user tries to configure the value of sctpmax-out-strms less than "2", a message is
displayed and the default value is set.

Example

The following command configures the maximum number of outgoing SCTP streams to 5:

sctp-max-out-strms 5
sctp-max-path-retx

Configures the maximum number of retransmissions of SCTP paths.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > SCTP Parameter Template Configuration

configure > sctp-param-template template_name

Entering the above command sequence results in the following prompt:

[local]host_name(sctp-param-template)#

**Syntax**

sctp-max-path-retx value

default sctp-max-path-retx

default

Returns the command to its default setting of 5.

value

Specifies the maximum number of retransmissions of SCTP paths as an integer from 0 through 255. Default: 5

**Usage**

Use this command to configure the maximum number of retransmissions of SCTP paths. An SCTP path is a connection between an endpoint address and a peer endpoint address.

**Example**

The following command configures the maximum number of retransmissions of SCTP paths to 10:

```
sctp-max-path-retx 10
```
sctp-min-mtu-size

Configures the minimum maximum transmission unit (MTU) size (in bytes) for SCTP streams.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > SCTP Parameter Template Configuration
configure > sctp-param-template template_name

Entering the above command sequence results in the following prompt:

[local]host_name(sctp-param-template)#

Syntax

sctp-min-mtu-size bytes

default sctp-min-mtu-size

Syntax

default

Returns the command to its default setting of 508 bytes.

bytes

Specifies the minimum MTU size (in bytes) for SCTP streams as an integer from 508 through 65535.
Default: 508

Usage

Use this command to configure the minimum MTU size, in bytes, for SCTP streams.

Example

The following command configures the minimum MTU size for SCTP streams to 1000:

sctp-min-mtu-size 1000
sctp-rto-initial

Configures the initial time for SCTP retransmission timeouts (RTOs).

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > SCTP Parameter Template Configuration

**configure > sctp-param-template template_name**

Entering the above command sequence results in the following prompt:

[local]host_name(sctp-param-template)#

Syntax

```plaintext
sctp-rto-initial value

default sctp-rto-initial
```

**default**

Returns the command to its default setting of 30 (3000 milliseconds).

**value**

Specifies the initial time for SCTP RTO as an integer from 1 through 1200. The granularity is in 100ms increments (20 = 2000ms). Default: 30 (3000 milliseconds)

Usage

Use this command to configure the initial time for SCTP RTOs.

Example

The following command configures the initial SCTP RTO to 6000ms:

```plaintext
sctp-rto-initial 60
```
sctp-rto-max

Configures the maximum time for SCTP retransmission timeouts (RTOs).

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > SCTP Parameter Template Configuration
configure > sctp-param-template template_name

Entering the above command sequence results in the following prompt:

[local]host_name(sctp-param-template)#

**Syntax**

```
  sctp-rto-max  value
  default  sctp-rto-max
```

- **default**
  Returns the command to its default setting of 600 (60000 milliseconds).

- **value**
  Specifies the maximum time for SCTP RTOs as an integer from 5 through 1200. The granularity is in 100ms increments (120 = 12000ms). Default: 600 (60000 milliseconds)

**Usage**

Use this command to configure the maximum time for SCTP RTOs.

**Example**

The following command configures the maximum time for SCTP RTOs to 120000ms:

```
sctp-rto-max 120
```
sctp-rto-min

Configures the minimum SCTP retransmission timeout (RTO).

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > SCTP Parameter Template Configuration

```
configure > sctp-param-template template_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(sctp-param-template)#
```

**Syntax**

```
sctp-rto-min [ units-10ms ] value
```

```
default sctp-rto-min
```

<table>
<thead>
<tr>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns the command to its default setting of 10 (1000 milliseconds).</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>units-10ms</th>
</tr>
</thead>
<tbody>
<tr>
<td>Including this keyword specifies that the integer <em>value</em> is to be calculated using 10ms increments (instead of 100ms increments) to allow for finer granularity. <em>value</em> is an integer from 0 through 500.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the minimum time for SCTP RTOs as an integer from 1 through 50. The granularity is in 100ms increments (20 = 2000ms). Default: 10 (1000 milliseconds)</td>
</tr>
</tbody>
</table>

**Usage**
Use this command to configure the minimum time for SCTP RTOs.

**Example**
The following command configures the minimum time for SCTP RTOs to 2000ms:
```
  sctp-rto-min 20
```
**sctp-sack-frequency**

Configures the frequency of transmission of SCTP selective acknowledgements (SACK).

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > SCTP Parameter Template Configuration

```bash
configure > sctp-param-template template_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(sctp-param-template)#
```

**Syntax**

```
sctp-sack-frequency value
```

```bash
default sctp-sack-frequency
```

```
default
   Returns the command to its default setting of 2.
```

```
value
   Specifies the frequency of SCTP selective acknowledgements as an integer from 1 through 20. Default: 2
```

**Usage**

Use this command to configure the frequency of SCTP selective acknowledgements.

**Example**

The following command configures the frequency of SCTP selective acknowledgements to 10:

```
sctp-sack-frequency 10
```
**sctp-sack-period**

Configures the delay before sending an SCTP selective acknowledgement (SACK).

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > SCTP Parameter Template Configuration
configure > sctp-param-template template_name

Entering the above command sequence results in the following prompt:

```
[local]host_name(sctp-param-template)#
```

**Syntax**

```
sctp-sack-period [ units-10ms ] value
default sctp-sack-period
```

**default sctp-sack-period**

```
default
```

Returns the command to its default setting of 2 (200 milliseconds).

```
units-10ms
```

Including this keyword specifies that the integer `value` is to be calculated using 10ms increments (instead of 100ms increments) to allow for finer granularity. `value` is an integer from 0 through 50.

```
value
```

Specifies the period for SCTP selective acknowledgements as an integer from 0 through 5. The granularity is in 100ms increments (3 = 300ms). Default: 2 (200 milliseconds).

**Important:** If this value is set to 0, the MME service will automatically configure a 10 ms sack period in order to allow proper initialization of the CCPU SCTP stack.

**Usage**

Use this command to configure the period for SCTP selective acknowledgements.

**Example**

The following command configures the period for SCTP selective acknowledgements to 400ms (using the 10ms granularity):

```
sctp-sack-period units-10ms 40
```
sctp-start-mtu-size

Configures the start maximum transmission unit (MTU) size (in bytes) for SCTP streams.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > SCTP Parameter Template Configuration

```
configure > sctp-param-template template_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(sctp-param-template)#
```

**Syntax**

```
sctp-start-mtu-size bytes
```

```
default sctp-start-mtu-size
```

<table>
<thead>
<tr>
<th>default</th>
<th>Returns the command to its default setting of 1500 bytes.</th>
</tr>
</thead>
<tbody>
<tr>
<td>bytes</td>
<td>Specifies the start MTU size (in bytes) for SCTP streams as an integer from 508 through 65535. Default: 1500</td>
</tr>
</tbody>
</table>

**Usage**
Use this command to configure the start MTU size, in bytes, for SCTP streams.

**Example**
The following command configures the start MTU size for SCTP streams to 3000:

```
sctp-start-mtu-size 3000
```
timeout

Configures timeouts for SCTP data chunk bundle transmissions and/or SCTP heartbeat request responses.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > SCTP Parameter Template Configuration

configure > sctp-param-template template_name

Entering the above command sequence results in the following prompt:

[local]host_name(sctp-param-template)#

Syntax

timeout { sctp-bundle [ units-10ms ] timer | sctp-heart-beat value }

[ default | no ] timeout { sctp-bundle | sctp-heart-beat }

default
Returns the command to its default setting of disabled for sctp-bundle and 30 seconds for sctp-heart-beat.

no
Removes the selected configuration.

sctp-bundle [ units-10ms ] timer
Specifies that SCTP data chunks are to be queued until this timer expires at which time the data chunks are bundled and committed for transmission.

timer is an integer from 1 through 65535, in 100ms increments (10 = 1000ms or 1 second).

[ units-10ms ]: Including this optional keyword specifies that the integer timer is to be calculated using 10ms increments (instead of 100ms increments) to allow for finer granularity.

Default: Disabled.

sctp-heart-beat value

Default: 30 seconds
Specifies the SCTP heartbeat timeout (in seconds) as an integer from 1 through 300. An SCTP heartbeat is sent to a peer to determine reachability. If an acknowledgement is not received before this timer runs out, heartbeat requests are no longer sent and the peer is considered unreachable.

Usage
Use this command to configure timeouts for SCTP data chunk bundle transmissions and/or SCTP heartbeat request responses.

Example

The following command enables the SCTP data chunk bundle timeout value and configures it to 2 seconds:
timeout sctp-bundle 20
Chapter 277
Service Redundancy Protocol Configuration Mode Commands

The Service Redundancy Protocol Mode is used to configure properties for Interchassis Session Recovery (ICSR) services.

Mode

Exec > Global Configuration > Context Configuration > Service Redundancy Protocol Configuration

configure > context context_name > service-redundancy-protocol

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-srp)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

Important: SRP commands must be identically configured on both the active and standby ICSR chassis.
**audit**

Sets the start time and periodicity for ICSR Service Redundancy Protocol (SRP) audits.

**Product**
All products supporting ICSR

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Service Redundancy Protocol Configuration

`configure > context context_name > service-redundancy-protocol`

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-srp) #
```

**Syntax**

```
[no] audit daily-start-time hour minute
[no] audit periodicity minutes

default audit periodicity
```  

**default**

Resets the specified parameter to its default setting of 60.

**no**

Disables the specified function.

**daily-start-time** *hour* *minute*

Specifies the daily start time. *hour* is a two-digit integer from 00 through 23. *minute* is a two-digit interval from 00 through 59. For example, a start time of 06 00 indicates that the audit will begin at 6:00 AM.

**periodicity** *minutes*

Specifies the interval in minutes for generating SRP audit statistics as an integer from 60 through 43200. For example, a periodicity of 90 indicates that SRP audit statistics will be generated every 90 minutes beginning at the specified start time. Default = 60.

**Usage**

Use this command and its keywords to specify the start time and periodicity for generating ICSR SRP audit statistics. This audit ensures that two ICSR peers are in synch and identifies any discrepancies prior to scheduled or unscheduled switchover events.

**Example**

The following command sequence specifies a start time of midnight and a periodicity of every two hours for generating SRP statistics:

```
audit daily-start-time 06 00
```
audit periodicity 90
bind

Binds the service to the IP address of the local chassis.

**Product**
All products supporting ICSR

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Service Redundancy Protocol Configuration

```bash
configure context context_name service-redundancy-protocol
```

Entering the above command sequence results in the following prompt:

```bash
[context_name]host_name(config-srp)#
```

**Syntax**

```bash
bind address { ipv4_address | ipv6_address }
```

**no bind address**

```bash
no
```

Removes the IP bind address.

```bash
ipv4_address | ipv6_address
```

Specifies the system IP address using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**Important:** Both peers must be using the same address family (IPv4 or IPv6) or the Service Redundancy Protocol (SRP) connection will not be established.

**Usage**

Defines the IP address of the local chassis defined as part of the ICSR configuration.

**Example**

The following example binds the service to the IP address 10.1.1.1:

```bash
bind address 10.1.1.1
```
chassis-mode

Defines the chassis’s operational mode - primary or backup - for ICSR.

Product
All products supporting ICSR

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Service Redundancy Protocol Configuration

configure > context context_name > service-redundancy-protocol

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-srp)#

Syntax

chassis-mode { backup | primary }

default chassis-mode

default
 Resets the chassis mode to the default setting of backup.

backup
 (Default) Configures the system as the backup chassis operating in standby state.

primary
 Configures the system as the primary chassis operating in active state.

Usage
Sets the chassis mode (primary or backup) for the system within the framework of ICSR.

Example

The following example configures the system as the primary chassis operating in active state

chassis-mode primary
checkpoint session

Configures checkpointing parameters between ICSR active and standby chassis.

Product
All products supporting ICSR

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Service Redundancy Protocol Configuration

configure > context context_name > service-redundancy-protocol

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-srp)#

Syntax

checkpoint session duration seconds
default checkpoint session

default

Resets the following checkpoint session parameters to their default values:

Usage
Sets the amount of time the chassis waits before checkpointing an existing call session.
Configures the interval between the sending of macro-checkpoints (full checkpoints) between the active and standby chassis.
For additional information on ICSR checkpointing, see the System Administration Guide.

Example

The following example configures sets the checkpoint session duration to 6500 seconds:

checkpoint session duration 6500
configuration-interval

Defines the configuration validation interval.

Product
All products supporting ICSR

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Service Redundancy Protocol Configuration

\texttt{configure \> context context\_name \> service\_redundancy\_protocol}

Entering the above command sequence results in the following prompt:

\texttt{[context\_name]host\_name(config\_srp)\#}

Syntax

configuration-interval \textit{interval}

default configuration-interval

---

default

Resets the configuration interval to the default setting of 3600 seconds.

interval

Specifies the amount of time (number of seconds) between one configuration validation and the next configuration validation. \textit{interval} must be an integer from 1 through 65535. Default = 3600.

Usage

This configures the interval between configuration validations of the primary and backup chassis.

Example

The following example sets the configuration interval to 34 seconds:

configuration-interval 34
dead-interval

Defines the timeout interval before a peer is determined to be down.

**Product**
All products supporting ICSR

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Service Redundancy Protocol Configuration

```
configure > context context_name > service-redundancy-protocol
```

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-srp)#
```

**Syntax**

```
dead-interval interval
```

```
default dead-interval
```

```
default
```
Resets the dead interval to the default setting of 30 seconds.

```
interval
```
Specifies the amount of time (in seconds) for the dead interval. `interval` must be an integer from 1 through 65535. Default = 30.

**Usage**
This command specifies the amount of time that one chassis waits to receive a communication from a peer before the listening chassis determines that the peer chassis is down.

**Example**
The following example sets the dead interval to 65 seconds:

```
deal-interval 65
```
**delay-interval**

Configures the delay time for starting the dead timer after configuration files are loaded.

### Product
All products supporting ICSR

### Privilege
Security Administrator, Administrator

### Mode
Exec > Global Configuration > Context Configuration > Service Redundancy Protocol Configuration

```plaintext
configure > context context_name > service-redundancy-protocol
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-srp)#
```

### Syntax

- `delay-interval interval`
- `default delay-interval`

#### default delay-interval

- `default`
  
  Sets or restores the default value assigned for the specified parameter.

- `interval`
  
  Specifies the amount of time (in seconds) for the delay interval. `interval` must be an integer from 1 through 65535.

### Usage

This configures interval for starting the dead timer after configuration files are loaded.

### Example

The following example sets the delay interval to 65 seconds after the configuration files are loaded:

```
delay interval 65
```
delta-route-modifier

Specifies the delta used to compute the route modifier difference between the active and standby chassis. This delta is applied only in the standby state. For Release 15.0 or higher, it is used in both states.

**Product**

All products supporting ICSR

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Service Redundancy Protocol Configuration

configure > context context_name > service-redundancy-protocol

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-srp)#
```

**Syntax**

```
delta-route-modifier value

default delta-route-modifier
```

**Usage**

The delta-route-modifier is used to compute the route modifier difference between active and standby chassis.

**Example**

The following example sets the delta for the route modifier to 2:

```
delta-route-modifier 2
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
**hello-interval**

Defines the lapse time between sending the hello message.

**Product**
All products supporting ICSR

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Service Redundancy Protocol Configuration

`configure > context context_name > service-redundancy-protocol`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-srp)#
```

**Syntax**

```
hello-interval interval

default hello-interval
```

**Usage**

Resets the hello interval to the default setting of 10 seconds.

```
interv
```

Specifies the lapse time (in seconds) between sending the hello message. `interval` must be an integer from 1 through 65535. Default = 10.

**Example**

This command configures the hello interval - the amount of time that lapses between the sending of each hello message. Each chassis sends the other chassis a hello message at the expiration of every hello interval.

The following example sets the hello interval to 35 seconds:

```
hello-interval 35
```
**internal-switchover-retry-interval**

Defines the interval between internal switchover retries.

**Product**
All products supporting ICSR

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Service Redundancy Protocol Configuration

```
configure > context context_name > service-redundancy-protocol
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-srp)#
```

**Syntax**

```
internal-switchover-retry-interval interval
```

```
default internal-switchover-retry-interval
```

```
default

Resets the internal switchover retry interval to the default setting of 60 seconds.
```

```
interval

Specifies the amount of time (in seconds) between internal switchover retries. *interval* must be an integer from 10 through 120. Default = 60.
```

**Usage**

This configures the interval between internal switchover retries. The system only initiates internal switchovers if Service Redundancy Protocol (SRP) monitoring is configured.

**Important:** See the `monitor authentication-probe`, `monitor bgp`, or `monitor diameter` commands for more information on associated SRP monitoring.

**Example**

The following example sets the internal switchover retry interval to 34 seconds:

```
internal-switchover-retry-interval 34
```
**monitor authentication-probe**

Enables SRP monitoring of the connection between the specified AAA server and the primary chassis.

**Product**
All products supporting ICSR

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Service Redundancy Protocol Configuration

configure > context context_name > service-redundancy-protocol

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-srp)#
```

**Syntax**

```
[ no ] monitor authentication-probe context context_name { ipv4_address | ipv6_address } [ group group_id ] [ port port_number ]
```

- **no**
  Turns off the monitoring.

- **context context_name**
  Identifies the context being used.
  context_name must be an existing context expressed as an alphanumeric string of 1 through 79 characters.

- **ipv4_address | ipv6_address**
  Defines the IP address of the AAA server to be monitored in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

- **group group_id**
  Defines a Service Redundancy Protocol (SRP) peer group as an integer from 0 through 9. Default = 0.
  In an Interchassis Session Recovery (ICSR) configuration, failover would occur if all peers within a group fail.

- **port port_number**
  Identifies a specific AAA server port for the authentication probe. port_number must be an integer from 1 through 65535.

**Usage**
This command initiates monitoring of the connection between the primary chassis and the specified AAA server through the use of authentication probe packets. If the connection drops, the standby chassis becomes active.

**Example**

This section provides an example of how to use the `monitor authentication-probe` command.
The following example initiates the connection monitoring between the primary chassis and AAA server 10.2.3.4 at port 1025:

```
monitor authentication-probe context test1 10.2.3.4 port 1025
```
monitor bfd

Enables SRP monitoring of the connection between the specified Bidirectional Forwarding Detection (BFD) neighbor and the primary chassis.

Product
All products supporting ICSR

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Service Redundancy Protocol Configuration

configure > context context_name > service-redundancy-protocol

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-srp)#

Syntax

[ no ] monitor bfd context context_name { ipv4_address | ipv6_address } { chassis-to-chassis | chassis-to-router }

no
Disables monitoring.

countext context_name
Identifies the context being used. context_name must be an existing context expressed as an alphanumeric string of 1 through 79 characters.

ipv4 _address | ipv6_address
Defines the IP address of the BFD neighbor to be monitored, entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation

chassis-to-chassis | chassis-to-router

chassis-to-chassis: BFD runs between primary and backup chassis on non-SRP links.
chassis-to-router: BFD runs between chassis and router.

Usage

This command initiates monitoring of the connection between the primary chassis and the specified BFD neighbor in the specified context. If the connection drops, the standby chassis becomes active.

**Important:** BFD monitoring must run between chassis-to-chassis or chassis-to-router.

Example

The following example initiates the chassis-to-chassis connection monitoring between the primary chassis and BFD neighbor 12.2.1.54:
monitor bfd context test 12.2.1.54 chassis-to-chassis
monitor bgp

Enables SRP monitoring of the connection between the specified Border Gateway Protocol (BGP) peer and the primary chassis.

Product
All products supporting ICSR

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Service Redundancy Protocol Configuration
configure > context context_name > service-redundancy-protocol

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-srp)#

Syntax

[ no ] monitor bgp context context_name { ipv4_address | ipv6_address } [ group group_id [ vrf vrf_name ] ]

no
Disables monitoring.

class context context_name
Identifies the context being used. context_name must be an existing context expressed as an alphanumeric string of 1 through 79 characters.

ipv4_address | ipv6_address
Specifies the IP address of the BGP peer to be monitored in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

group group_id
Defines a Service Redundancy Protocol (SRP) peer group as an integer from 0 through 9. Default = 0. In an Interchassis Session Recovery (ICSR) configuration, failover would occur if all peers within a group fail (instead of all BGP peers in a context). This option is useful in deployments in which a combination of IPv4 and IPv6 peers are spread across multiple paired VLANs and IPv4 or IPv6 connectivity is lost by all members of a peer group.

vrf vrf_name
Defines the VPN Routing/Forwarding instance as an alphanumeric string of 1 through 63 characters.

Usage
This command initiates monitoring of the connection between the primary chassis and the specified BGP peer in the specified context. If the connection drops, the standby chassis becomes active.

Example
The following example initiates the connection monitoring between the primary chassis and BGP peer 125.2.1.56:

```
monitor bgp context test 125.2.1.56
```
monitor diameter

Enables SRP monitoring of the connection between the specified Diameter server and the primary chassis.

**Product**
All products supporting ICSR

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Service Redundancy Protocol Configuration

```bash
configure > context context_name > service-redundancy-protocol
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-srp)#
```

**Syntax**

```
[ no ] monitor diameter context context_name endpoint endpoint_name  [ fqdn fqdn | group group_id | peer { ipv4_address | ipv6_address } ] [ port port_number ]
```

- **no**
  Turns off the monitoring.

- **context context_name**
  Identifies the context being used. `context_name` must be an existing context expressed as an alphanumeric string of 1 through 79 characters.

- **endpoint endpoint_name**
  Identifies the endpoint being used. `endpoint_name` must be for the Diameter server expressed as an alphanumeric string of 1 through 63 characters.

- **fqdn fqdn**
  Identifies a Fully Qualified Domain Name (FQDN). `fqdn` must be for the Diameter server expressed an alphanumeric string of 1 through 127 characters.

- **group group_id**
  Defines a Service Redundancy Protocol (SRP) peer group as an integer from 0 through 9. Default = 0. In an Interchassis Session Recovery (ICSR) configuration, failover would occur if all peers within the specified group fail.

- **peer { ipv4_address | ipv6_address }**
  Defines the IP address of the Diameter server to be monitored, entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
**monitor diameter**

`port port_number`

Identifies a specific port to monitor. `port_number` must be the port for the Diameter server and an integer from 1 through 65535.

**Usage**

This command initiates monitoring of the connection between the primary chassis and the specified Diameter server in the specified context. If the connection drops, the standby chassis becomes active.

**Important:** Endpoint name, FQDN, IP address, and port must all match the Diameter protocol configured values for the peer state to be updated.

**Example**

The following example initiates the connection monitoring between the primary chassis and the Diameter server on context `test1` and endpoint `end2`:

```
monitor diameter context test1 10.6.7.8 endpoint end2
```
num-internal-switchover-retry

Defines the number of times an internal switchover would be retried.

Product
All products supporting ICSR

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Service Redundancy Protocol Configuration

configure > context context_name > service-redundancy-protocol

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-srp)#

Syntax

num-internal-switchover-retry retries

default num-internal-switchover-retry

default

Resets the configuration interval to the default setting of 3 retries.

retries

The number of times an internal switchover would be retried in case of standby chassis. retries must be an integer from 1 through 10.
Default: 3

Usage

This configures the number of times an internal switchover would be retried in case of standby chassis failure to respond or become active.

Example

The following example sets the retry number to 5:

num-internal-switchover-retry 5
**peer-ip-address**

Specifies the IP address for the peer chassis.

**Product**
All products supporting ICSR

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Service Redundancy Protocol Configuration

```bash
configure > context context_name > service-redundancy-protocol
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-srp)#
```

**Syntax**

```
peer-ip-address { ipv4_address | ipv6_address }
```

```bash
no peer-ip-address
```

- **no**
  Removes the peer IP address of the backup chassis.

- **ipv4_address | ipv6_address**
  Specifies the IP address of the backup chassis, entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**Important:** Both peers must be using the same address family (IPv4 or IPv6) or the Service Redundancy Protocol (SRP) connection will not be established.

**Usage**

This command is used to identify the peer chassis in the ICSR configuration. From the primary’s perspective, the peer is the backup and from the backup’s perspective, the peer is the primary.

**Example**

The following example specifies 10.2.3.4 as a backup peer system to the primary system:

```
peer-ip-address 10.2.3.4
```
priority

Sets the initial ICSR priority of each peer chassis.

**Important:** `priority` takes affect only during simultaneous initializing of all chassis in an ICSR configuration, and only if a misconfiguration has both chassis in the same mode (both Primary or both Backup).

**Product**
All products supporting ICSR

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Service Redundancy Protocol Configuration

`configure > context context_name > service-redundancy-protocol`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-srp)#
```

**Syntax**

```
priority priority_value

default priority
```

**default priority**

Resets the priority to the default setting of 125.

**priority_value**

Specifies the priority for the chassis. `priority_value` must be an integer from 1 through 255, where 1 is the highest priority. Default = 125.

**Usage**

This command determines which chassis transitions to the Active state when all chassis have the same mode configuration. `priority` acts as a tie breaker for the state determination only when all chassis initialize simultaneously. The chassis with the higher priority (lower number) becomes Active, while the chassis with the lower priority (higher number) becomes Standby.

Once chassis become operational (after initialization), if there is an event requiring a chassis change of state, then each chassis returns to its previous state (Active or Standby) after both chassis recover.

**Example**

The following example sets the priority value to 5:

```
priority 5
```
route-modifier

Sets the route modifier for the peer chassis.

**Product**
All products supporting ICSR

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Service Redundancy Protocol Configuration

```
configure > context context_name > service-redundancy-protocol
```
Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-srp)#
```

**Syntax**

```
route-modifier threshold threshold_value
```

```
default route-modifier
```

```
default
```
Resets the route modifier to the default setting of 16.

```
threshold_value
```
Specifies the value that causes the route-modifier counter to be reset to the initial value. `threshold_value` must be an integer from 2 through 32. Default = 16.

**Usage**
This command is used to determine when the route modifier should be reset to its initial value to avoid rollover.

**Example**
The following example sets the route modifier threshold to 10:

```
route-modifier threshold 10
```
Chapter 278
Session Event Module Configuration Mode Commands

The Session Event Module Configuration Mode is used to configure how subscriber-specific event data is handled on the S-GW. As users attach, detach, and move through the network, they trigger signaling events that need to be recorded. To provide a per-subscriber level of reporting, the S-GW sends a stream of user event data to an event reporting server over SFTP.

Mode

Exec > Global Configuration > Context Configuration > Session Event Module Configuration

`configure > context context_name > session-event-module`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-event)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Use this command to return to the Exec mode.
event

Sets the method and destination for transferring event files.

Product
SAEGW
S-GW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > Session Event Module Configuration
configure > context context_name > session-event-module

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-event)#

Syntax

```bash
event { purge { storage-limit bytes | time-limit seconds } | push-interval value | push-trigger space-usage-percent trigger_percentage | remove-file-after-transfer | transfer-mode { pull [ module-only ] | push primary { encrypted-url encrypted_url | url url } [ max-files files ] [ module-only ] [ secondary { encrypted-secondary-url url | secondary-url url } ] [ via local-context ] } | use-harddisk }

default event [ purge | push-interval | push-trigger space-usage-percent | remove-file-after-transfer | transfer-mode | use-harddisk ]

no event [ purge | remove-file-after-transfer | use-harddisk ]
```

default

Configures the default setting for the specified keyword(s):

- `purge`: Not enabled.
- `push-interval`: 60 seconds
- `push-trigger`: 80 percent
- `remove-file-after-transfer`: Disabled
- `transfer mode`: Push
- `use-harddisk`: Disabled

no

Disables the configured event file storage and processing in this mode:

- `purge`: Disables the deleting of record files on the hard disk based on a storage limit or a time limit.
- `remove-file-after-transfer`: Retains a copy of the file even after it has been pushed or pulled to another server.
- `use-harddisk`: Disables data storage on the system’s hard disk.
purge { storage-limit bytes | time-limit seconds }

Configures parameters for deleting event records from the hard drive. This command is not enabled by default.

storage-limit bytes: Specifies that event records are to be deleted from the hard drive upon reaching a storage limit defined in bytes. bytes must be an integer value from 10485760 to 146800640.

time-limit seconds: Specifies that event records are to be deleted from the hard drive upon reaching a time limit defined in seconds. seconds must be an integer value from 600 to 2592000.

push-interval value

Default: 60
Specifies the transfer interval (in seconds) when event files will be pushed to an external file server. value must be an integer from 30 through 3600.

push-trigger space-usage-percent trigger_percentage

Default: 80
Specifies the disk space utilization percentage threshold at which an automatic push is triggered and files are transferred to the external server. trigger_percentage must be an integer from 10 through 80.

remove-file-after-transfer

Default: Disabled
Specifies that the system must delete event files after they have been transferred to the external file server.

transfer-mode { pull [ module-only ] | push primary { encrypted-url encrypted_url | url url } [ max-files files ] [ module-only ] [ secondary { encrypted-secondary-url url | secondary-url url } ] [ via local-context ] }

Specifies the transfer mode to be used when transferring event files to an external file server.

• pull: Specifies that the destination server will pull the event files.

• push: Specifies that the system will push event files to the destination server. This is the default mode.

• primary encrypted-url encrypted_url: Specifies the primary URL location to which the system pushes the files in encrypted format. encrypted_url must be an alphanumeric string of 1 through 8192 characters.

• primary url url: Specifies the primary URL location to which the system pushes the event files. url must be an alphanumeric string of 1 through 1024 characters in the format: //user:password@host:[port]/direct.

• max-files number: Specifies the maximum number of files that can be transferred per push. number must be an integer from 4 to 4000.

• module-only: Specifies that the transfer of event records is to be applied only to the module type for which the configuration was originally created. If this option is not enabled, the transfer will occur for all record types.

• secondary encrypted-secondary-url url: Specifies the secondary URL location to which the system pushes the files in encrypted format. url must be an alphanumeric string of 1 through 8192 characters.
• **secondary-url url**: Specifies the secondary URL location to which the system pushes the event files.
  
  `url` must be an alphanumeric string of 1 through 1024 characters in the format:
  `/user:password@host:[port]/direct`

• **via local-context**: Specifies that the local context, and, subsequently, the SPIO management ports, will be used to pull or push event files from/to the event server.

---

**use-harddisk**

Default: Disabled

Specifies that the hard disk drive on the SMC is to be used to store S-GW event records.

---

**Usage**

Use this command to configure how the S-GW event records are moved and stored. By default, records are stored in the PSC RAM where the CDRMOD instance is running.

The `event use-harddisk` command can be run only in a context where CDRMOD is running. Configuring in any other context will result in failure with the message “Failure: Please Check if CDRMOD is running in this context or not.”

If push transfer mode is configured, the server URL to which the event files will be transferred must be specified.

When changing the transfer-mode from pull to push, disable the pull setting before changing the transfer mode to push. The push to server URL must be accessible from the local context. Also, make sure that its base directory contains an `event` subdirectory.

After changing the transfer mode from push to pull, enable pull on the destination server. Any ongoing push activity will continue until all the file transfers are completed. If there is no ongoing push activity at the time of this configuration change, the push-related configuration is nullified immediately.

---

**Example**

The following command sets the space usage trigger for pushing files to the event server to 60%:

```
event push-trigger space-usage-percent 60
```

The following command specifies that the event files are to be transferred to a server with the URL of `user:password@event-server.com`:

```
event transfer-mode push primary url //user:password@event-server.com
```
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Use this command to return to the parent configuration mode.
**file**

Sets the format and handling characteristics of event files.

**Product**

SAEGW

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Session Event Module Configuration

configure > context context_name > session-event-module

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-event)#
```

**Syntax**

```
file [ compression { gzip | none } ] [ current-prefix string ] [ delete-timeout seconds ]
[ directory directory_name ] [ exclude-checksum-record ] [ field-separator { hyphen | omit | underscore } ]
[ file-sequence-number rulebase-seq-num ] [ headers ] [ name file_name ] [ reset-indicator ]
[ rotation { num-records number | time seconds | volume bytes } ] [ sequence-number { length length | omit | padded | padded-six-length | unpadded } ]
[ storage-limit limit ] [ time-stamp { expanded-format | rotated-format | unix-format } ]
[ trailing-text string ] [ trap-on-file-delete ] [ xor-final-record ] +
```

**default**

Configures the default setting for the specified keyword(s).

**compression { gzip | none }**

Specifies compression of S-GW event files.

- **gzip**: Enables GNU zip compression of the event file at approximately 10:1 ratio.
- **none**: Disables Gzip compression.

**current-prefix string**

Specifies a string to add to the beginning of the event file that is currently being used to store records. `string` must be an alphanumeric string of 1 through 31 characters. Default: **curr**

**delete-timeout seconds**

Specifies a time period, in seconds, after which event files are deleted. By default, files are never deleted. `seconds` must be an integer from 3600 through 3153600. Default: Disabled
**directory directory_name**

Specifies a subdirectory in the default directory in which to store event files.

*directory_name* must be an alphanumeric string of 1 through 191 characters. Default: /records/event

**exclude-checksum-record**

Excludes the final record containing #CHECKSUM followed by the 32-bit Cyclic Redundancy Check (CRC) of all preceding records from the event file.

Default: Disabled, a checksum record is included in the event file header.

**field-separator [ hyphen | omit | underscore ]**

Specifies the type of separators between two fields of an event file name:

- **hyphen**: Specifies the field separator as a “-” (hyphen) symbol between two fields.
- **omit**: Removes or omits the field separator between two fields.
- **underscore**: Specifies the field separator as an “_” (underscore) symbol between two fields.

**file-sequence-number rulebase-seq-num**

Specifies that the file name sequence numbers be unique per rulebase and event format name combination.

**headers**

Includes a file header summarizing the record layout.

**name file_name**

Specifies a string to be used as the base file name for event files.

*file_name* must be an alphanumeric string of 1 through 31 characters. The file name format is as follows:

```
base_sequencenum_timestamp
```

Default: event

- **base**: Specifies type of record in file or contains the operator-specified string. Default: event
- **sequencenum**: This is a 5-digit sequence number to detect the missing file sequence. It is unique among all event files on the system.
- **timestamp**: Adds a file creation timestamp (UTC time) in MMDDYYYYHHHMSS format.

**reset-indicator**

Specifies the inclusion of the reset indicator counter (value from 0 through 255) in the event file name. The counter is incremented whenever any of the following conditions occur:

- A peer chassis has taken over in compliance with Interchassis Session Recovery (ICSR).
- The sequence number (see sequence-number keyword) has rolled over to zero.

**rotation { num-records number | time seconds | volume bytes }**

Specifies when to close an event file and create a new one.

- **num-records number**: Specifies the maximum number of records that should be added to an event file. When the number of records in the file reaches this value, the file is complete.
  
  *number* must be an integer 100 through 10240. Default: 1024

- **time seconds**: Specifies the period of time to wait (in seconds) before closing the current event file and creating a new one.
  
  *seconds* must be an integer from 30 through 86400. Default: 3600
**volume bytes**: Specifies the maximum size of the event file (in bytes) before closing it and creating a new one.

`bytes` must be an integer from 51200 through 62914560. Note that a higher setting may improve the compression ratio when the compression keyword is set to gzip. Default: 102400

---

**sequence-number** { length length | omit | padded | padded-six-length | unpadded }

Includes with a specified format or excludes the sequence number in the file name.

- **length length**: Includes the sequence number with the specified length.
  
  `length` must be the file sequence number length with preceding zeroes in the file name, and must be an integer from 1 through 9.

- **omit**: Excludes the sequence number from the file name.

- **padded**: Includes the padded sequence number with preceding zeros in the file name. This is the default setting.

- **padded-six-length**: Includes the padded sequence number with six preceding zeros in the file name.

- **unpadded**: Includes the unpadded sequence number in the file name.

Default: padded

---

**storage-limit limit**

Files will be deleted when the specified amount of space (in bytes) is reached.

`limit` must be an integer from 10485760 through 536870912. Default: 33554432

---

**time-stamp** { expanded-format | rotated-format | unix-format }

Specifies the format of the file creation timestamp to be included in the file name.

- **expanded-format**: Specifies the UTC (Universal Time Coordinated) MMDDYYYYHHMMSS format.

- **rotated-format**: Specifies the time stamp format to YYYYMMDDHHMMSS format.

- **unix-format**: Specifies the UNIX format of `x.y`, where `x` is the number of seconds since 1/1/1970 and `y` is the fractional portion of the current second that has elapsed.

---

**trailing-text string**

Specifies the inclusion of an arbitrary text string in the file name as an alphanumeric string of 1 through 30 characters.

---

**trap-on-file-delete**

Instructs the system to send an SNMP notification (trap) when an event file is deleted due to lack of space.

Default: Disabled

---

**xor-final-record**

Specifies inserting an exclusive OR (XOR) checksum (instead of a CRC checksum) into the event file header if the `exclude-checksum-record` is left at its default setting. Default: Disabled

---

More than one of the previous keywords can be entered within a single command.
Usage
Use this command to configure event file characteristics.

Example
The following command sets the prefix of the current active event file to `Current`:

```
file current-prefix Current
```

The following command sets the base file name to `Eventfile`:

```
file name Eventfile
```
Chapter 279
SGSN ASP Configuration Mode Commands

The ASP (application server process) configuration mode defines the M3UA end-point parameters for a specific SS7 routing domain instance. The ASP instance is generated and accessed via the SS7 routing domain configuration mode commands.

Mode

Exec > Global Configuration > SS7 Routing Domain Configuration > ASP Configuration

```
configure > ss7-routing-domain routing_domain_id variant variant_type > asp instance
asp_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ss7-rd-ss7rd_id-asp-inst-instance)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**end**

Exits the current mode and returns to the Exec Mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Change the mode back to the Exec Mode.
end-point

This command defines or deletes the IP address and/or port number to be associated with the local SCTP end-point for this ASP. At least one address needs to be configured before the end-point can be activated.

When using the `bind` keyword, this command also activates the end-point once the address has been defined. Once bound, it cannot be reconfigured until it is unbound with the `no end-point bind` command.

**Product**
SGSN
HNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SS7 Routing Domain Configuration > ASP Configuration

```
configure > ss7-routing-domain routing_domain_id variant variant_type > asp instance
asp_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ss7-ss7rd_id-asp-inst-instance)#
```

**Syntax**

```
end-point { address ip_address context context_id | bind | port port_number }

no end-point { address ip_address context context_id | bind }
```

- **address ip_address context context_id:**
  Specifies the IP address and the context associated with the address for this end-point.
  - `ip_address`: must be defined using the standard IPv4 dotted decimal notation or the colon notation of IPv6.
  - `context context_id`: a string of 1 to 79 alphanumeric characters to identify the specific context associated with the end-point address.

- **bind**
  Activates (binds) the end-point.

- **Important:** Only use `bind` after you have configured other parameters.

- **port port_number**
  Identifies the M3UA’s SCTP port associated with this end-point.
  - `port_number`: must be an integer from 1 to 65535. Default is 2905.

- **no**
  Removes the end-point configuration or deactivates the end-point.
Caution: Entering this command will terminate all current subscriber sessions for associated peers.

Usage
Use this command to manage the ASP end-point. Once the ASP end-point is bound the end-point configuration cannot be changed until it is unbound.

Example
Activate the end-point with the following command:

```
end-point bind
```

Deactivate or unbind the end-point with the following command:

```
no end-point bind
```

Set the end-point port to default for ASP 1 with the following command:

```
default asp instance 1 end-point port
```
exit

Exits the current mode and returns to the previous mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Returns to the previous mode.
Chapter 280
SGSN Global Configuration Mode Commands

The commands in this mode configure parameters that impact the entire SGSN and that are independent of the GPRS or the IuPS services.

Mode

Exec > Global Configuration > SGSN Global Configuration
configure > sgsn-global

Entering the above command sequence results in the following prompt:

[local]host_name(config-sgsn-global)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
aggregate-ipc-msg

Configures the number of inter-process communication (IPC) messages that can be aggregated in the various managers and defines the frequency of flushing the messages.

**Product**
SGSN
HNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SGSN Global Configuration
configure > sgsn-global

Entering the above command sequence results in the following prompt:

[local]host_name(config-sgsn-global)#

**Syntax**

```
aggregate-ipc-msg \{ gbmgr | linkmgr | sessmgr \} \{ flush-frequency frequency | num-msgs number_msgs \}

default aggregate-ipc-msg \{ gbmgr | linkmgr | sessmgr \}
```

- **default**
  Resets the managers to default values for flushing.

- **gbmgr**
  Selects the Gb manager to configure the number of IPC messages to be aggregated and frequency of flushing messages to the Session Manager that have been aggregated at the Gb Manager.

- **linkmgr**
  Selects the linkmgr to configure the number of IPC messages to be aggregated and frequency of flushing.

- **sessmgr**
  Selects the sessmgr to configure the number of IPC messages to be aggregated and frequency of flushing.

- **flush-frequency frequency**
  Configure the frequency, in 100-millisecond intervals, that the aggregated IPC messages will be flushed. Flushing limits the number of messenger calls between managers to transfer the received packets.
  
  *frequency*: Enter an integer from 1 to 3. Default is 1.

- **num-msgs number_msgs**
  Configure the number of IPC messages to aggregate before flushing.
  
  *number_msgs*: Enter the integer 1 (to disable aggregation) or an integer from 2 to 164 to define the number of messages. Default is 10.
**Usage**

Use this command to enable/disable aggregation of IPC messages in the linkmgr and/or the sessmgr. This command includes options to configure the frequency of aggregated message flushing and the number of packets to be buffered before the flush. This command provides a solution for reducing latency while sending the IPC messages towards the core network (CN).

The flushing limit will be based on either desired flush-frequency or maximum number of messages to be aggregated. Repeat the command to engage multiple limits.

By default, the link manager buffers packets and then send them over the SCCP link if there are events to be sent via SCCP Connection Request (SCCP CR) towards the core node. The HNB-GW/SGSN aggregate packets for 100 msecs and send them with whatever aggregation has been done during those 100 msecs.

At the HNB-GW/SGSN, this command can be used to reduce the processing involved in sending every event individually towards the core node in the following manner:

- If aggregation is enabled, then there could be a time delay for sending SCCP CRs depending on configuration of the HNB-GW or SGSN.
- If aggregation is reduced to 1, then there will be no delay for aggregation and events are sent via SCCP CR without delay. This reduces the SCCP connection setup time.

To view aggregate IPC message statistics, use command `show config | grep aggregate-ipc-msg`.

**Example**

Configure the linkmgr to buffer 45 messages before flushing the linkmgr IPC messages:

```
aggregate-ipc-msg linkmgr flush-frequency 45
```

The following command configures the `linkmgr` to flush the IPC messages towards the CN without aggregation:

```
aggregate-ipc-msg linkmgr:
```

The following command configures the `sessmgr` to flush the IPC messages towards the CN without aggregation:

```
aggregate-ipc-msg sessmgr:
```
apn-resolve-dns-query snaptr

Enable/disable sending of SNAPTR DNS query to resolve an APN for a subscriber with an EPS (evolved packet system)-capable handset.

**Important:** This command is no longer available in all 12.0 and 12.2 releases. If you do not see this command in your release, look for the `apn-resolve-dns-query snaptr` command in the APN Profile configuration mode to accomplish the same task.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SGSN Global Configuration
configure > sgsn-global

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-sgsn-global) #
```

**Syntax**

```
[ no ] apn-resolve-dns-query snaptr
```

**default apn-resolve-dns-query**

```
default

Resets the default, the ability to send SNAPTR DNS query is disabled.
```

```
no

Disables the ability to send SNAPTR DNS query.
```

**Usage**

By default, sending the SNAPTR DNS query is disabled. Use this command to send SNAPTR DNS query when resolving an APN for an EPS-capable subscriber.

At PDP context activation, the SGSN will use the UE capability as input to select either a GGSN or a P-GW for the EPS-capable subscriber. The SNAPTR DNS query will be used for P-GW resolution. Enabling this feature will give priority to P-GW selection for E-UTRAN-capable UEs.

**Example**

Use the following command to enable sending of SNAPTR DNS query for APN resolution:

```
apn-resolve-dns-query
```

Use the following command to disable the use of SNAPTR DNS query for APN resolution:

```
no apn-resolve-dns-query
```
bssgp-message ms-flow-control-from-unknown-ms

This command determines the SGSN response to MS-Flow-Control messages received from an unknown MS.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SGSN Global Configuration
configure > sgn-global

Entering the above command sequence results in the following prompt:

[local]host_name(config-sgsn-global)#

Syntax

bssgp-message ms-flow-control-from-unknown-ms { discard-message | send-ack | send-status }

default bssgp-message ms-flow-control-from-unknown-ms
default

Including default with the command configures the SGSN to use default behavior so that the SGSN sends BSSGP-Status messages whenever the SGSN receives an MS-Flow-Control message from an unknown MS.

discard-message

This keyword instructs the SGSN to discard the received BSSGP message. With this option, the SGSN does not send any response to the MS after discarding the received BSSGP message.

send-ack

This keyword instructs the SGSN to send an acknowledgement message (MS-Flow-Control-ACK) after receiving an MS-Flow-Control message.

send-status

Default
This keyword instructs the SGSN to send a BSSGP-Status message to the MS whenever the SGSN receives an MS-Flow-Control message from an unknown MS.

Usage

This command allows the operator to specify the action the SGSN needs to take whenever the SGSN receives an MS-Flow-Control message from an unknown mobile station. This configuration determines the response for the SGSN globally.

The list of possible actions are:
- send a BSSGP-Status response message
- send an ACK message (MS-Flow-Control-ACK)
- discard the BSSGP message

To see the statistics for the number of MS-Flow-Control messages that have been discarded, use the `show bssgp statistics` command from the Exec mode.

**Example**

Change the default configuration and have the SGSN acknowledge receipt of the MS-Flow-Control message:

```
bssgp-message ms-flow-control-from-unknown-ms send-ack
```
bssgp-message ptp-bvc-reset

This command determines the SGSN response, per BVCI, to receipt of a peer-to-peer BVC Reset.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SGSN Global Configuration
configure > sgsn-global

Entering the above command sequence results in the following prompt:

[local]host_name(config-sgsn-global)#

Syntax

bssgp-message ptp-bvc-reset { frc-subscriber-standby | retain-current-state }

default bssgp-message ptp-bvc-reset

default
Including default with the command configures the SGSN to use default behavior so that the SGSN continues with the current state once a peer-to-peer BVC Reset is received.

frc-subscriber-standby
This keyword instructs the SGSN to change the state of the subscribers to standby when the peer-to-peer BVC Reset is received.

retain-current-state
Default
This keyword instructs the SGSN to continue the current state of the subscribers when the BVC Reset message is received.

Usage
This command allows the operator to specify the action the SGSN needs to take whenever the SGSN receives a peer-to-peer BVC Reset message for a specific BVCI.
To confirm the configuration for the response to the BVC Reset, use the show sgsn-mode command from the Exec mode.

Example
Change the default configuration and have the SGSN change subscriber states to standby:

bssgp-message ptp-bvc-reset frc-subscriber-standby
bssgp-timer

Configures the T2 and TH timers for the BVCs (BSSGP virtual connections) of the NSE (network service entities).

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SGSN Global Configuration

```
configure > sgsn-global
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-sgsn-global)#
```

**Syntax**

```
bssgp-timer { t2 \( T2\_time \) | th \( TH\_time \) }
default bssgp-timer { t2 | th }
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>default</strong></td>
<td>Resets the specified timers to default settings.</td>
</tr>
<tr>
<td><strong>t2 ( T2_time )</strong></td>
<td>Configures the BVC reset guard timer (at the BSSGP layer) in units of 1 second. ( T2_time ): Enter an integer from 1 to 120. Default is 30 seconds.</td>
</tr>
<tr>
<td><strong>th ( TH_time )</strong></td>
<td>Configures, at the BSSGP layer, the MS flow control parameter validity timeouts in units of 1 second. ( TH_time ): Enter an integer from 6 to 5999. Default is 500 seconds.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to configure timer timeout values for MS flow control and BVC reset timers that control BVCs for the NSEs.

**Example**

Set the TH timeout for 20 seconds:

```
bssgp-timer th 20
```
bvc-unblock

This command enables (disabled by default) or disables the SGSN to unblock blocked BVCs based on the receipt of uplink packets from the BSC.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SGSN Global Configuration
configure > sgsn-global

Entering the above command sequence results in the following prompt:

[local]host_name(config-sgsn-global)#

Syntax

bvc-unblock { data-or-flow-control | flow-control | ul-data }

[ default | no ] bvc-unblock

default
Include default with the command to disable the function.

no
Include no with the command to disable this function.

data-or-flow-control
Enables the BVC-Unblock function when the SGSN receives either a FLOW-CONTROL-BVC packet or a UL-UNITDATA packet.

flow-control
Enables the BVC-Unblock function when the SGSN receives a FLOW-CONTROL-BVC packet.

ul-data
Enables the BVC-Unblock function when the SGSN receives a UL-UNITDATA packet.

Usage
Configurations defined with this command are common to all NSE defined for the SGSN. This command is useful if there is a BVC status mismatch across different SGSN managers (such as the sessmgr and the linkmgr) when the BSC sends BVC-Block (SGSN should move to BLOCKED) followed by a BVC-Reset (SGSN should move to UNBLOCKED). Such mismatches can easily occur, particularly on Gb-IP network connection, when one link receives the BVC-Block and a different link receives the BVC-Reset with little delay between the two.
bvc-unblock

If BVC-Unblock function is enabled, the SGSN ensures that BVCs which are in the BLOCKED state move to the UNBLOCKED state upon receipt of the configured packet type(s).

**Example**

Instruct the SGSN to perform BVC-Unblock when a mismatch occurs and the SGSN receives a FLOW-CONTROL-BVC packet:

```
bvc-unblock flow-control
```
dscp-template

Creates and/or deletes DSCP templates that can be configured for use for all GPRS services on the SGSN and provides access to the DSCP Template configuration mode. This command is also supported on HNB-GW service to create a DSCP template.

Product
SGSN
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SGSN Global Configuration
    configure > sgsn-global

Entering the above command sequence results in the following prompt:

[local]host_name(config-sgsn-global)#

Syntax

```
dscp-template template_name [ -noconfirm ]
no dscp-template template_name
```

no
Deletes the template instance from the SGSN Global configuration.

```
template_name
```

Enter 1 to 64 alphanumeric characters, including dots (.), dashes (-), and forward slashes (/) to identify a unique instance of a DSCP template.
There is no known limit to the number of templates that can be created.

Usage

This command enables the operator to create or delete an instance of a DSCP template and access the DSCP Template configuration mode. The DSCP templates are used to define the DSCP configuration for control packets and data packets for the GPRS services.

Related commands:

- This command provides access to the mode containing all the configuration commands used to define DSCP markings for the control packets and data packets for a particular GPRS service (see the DSCP Template Configuration Mode Commands section).

- To associated a specific DSCP template with a specific GPRS service configuration, for builds prior to release 14.0 use the `associate-dscp-template downlink` command and for builds in releases 14.0 and higher use the `associate dscp-template downlink` command. Both commands are documented in the GPRS Service Configuration Mode Commands section.

- To check the list of DSCP templates configured, use the `show sgsn-mode` command documented in the Exec Mode Commands section.
This command is also supported on HNB-GW service to create a DSCP template.

**Related commands for HNB-GW:**

- This command provides access to the mode containing all the configuration commands used to define DSCP markings for the control packets and data packets for a particular HNB-GW service (see the *DSCP Template Configuration Mode Commands* chapter).

- To associate a specific DSCP template with a system for a PSP instance in SS7 routing domain, use the `associate-dscp-template downlink` documented in the *SGSN PSP Configuration Mode Commands* chapter.

**Example**

Use a command similar to the following to create a DSCP template with ID `dscp_london` that can be used specifically for Gb/IP calls from subscribers in London:

```
dscp-template dscp_london
```

Following command creates a DSCP template with ID `dscp_hnb1` that can be used specifically for HNB-GW services on a chassis:

```
dscp-template dscp_hnb1
```
dual-address-pdp

This command makes it possible for the operator to enable (default) / disable SGSN support for MS requests for dual PDP type (IPv4v6) addressing.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SGSN Global Configuration

```
configure > sgsn-global
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-sgsn-global)#
```

**Syntax**

```
[ default | no ] dual-address-pdp
```

- `default`
  Enables dual PDP type address support.

- `no`
  Disables the default behavior so that the SGSN does not honor requests for dual PDP type addresses.

**Usage**

With release 12.2 and in accordance with 3GPP Release 9.0 specifications, by default the SGSN honors the MS/UE request for dual PDP type addressing (IPv4v6) for PDP context association with one IPv4 address and one IPv6 address/prefix. This support can be disabled by configuration.

**Important:** For the dual PDP addressing feature to function, `common-flags` must be enabled with the `gptc send` command in the SGTP service configuration mode prior to enabling the feature with the `dual-address-pdp` command.

With this default behavior, the operator has multiple options to refine the level of support for dual PDP type addressing through the use of several related commands.

- `dual-address-pdp` command in the RNC configuration mode disables SGSN support for dual PDP type addressing for a specific RNC that either does or does not support this type of addressing.

- `pdp-type-ipv4v6-override` in the APN profile configuration mode allows the SGSN to override the MS/UE request for dual PDP type addressing.

- Using the `dual-ipv4v6` keyword with the `wildcard-apn pdp-type` command in the APN remap table configuration mode enables the operator to configure a default APN with a wildcard subscription with PDP type IPv4v6.

**Example**

With release 12.2 and in accordance with 3GPP Release 9.0 specifications, by default the SGSN honors the MS/UE request for dual PDP type addressing (IPv4v6) for PDP context association with one IPv4 address and one IPv6 address/prefix. This support can be disabled by configuration.

**Important:** For the dual PDP addressing feature to function, `common-flags` must be enabled with the `gptc send` command in the SGTP service configuration mode prior to enabling the feature with the `dual-address-pdp` command.

With this default behavior, the operator has multiple options to refine the level of support for dual PDP type addressing through the use of several related commands.

- `dual-address-pdp` command in the RNC configuration mode disables SGSN support for dual PDP type addressing for a specific RNC that either does or does not support this type of addressing.

- `pdp-type-ipv4v6-override` in the APN profile configuration mode allows the SGSN to override the MS/UE request for dual PDP type addressing.

- Using the `dual-ipv4v6` keyword with the `wildcard-apn pdp-type` command in the APN remap table configuration mode enables the operator to configure a default APN with a wildcard subscription with PDP type IPv4v6.
Use the following command to disable support for dual PDP type addressing (IPv4v6):

    no dual-address-pdp

If dual PDP addressing has been disabled, to re-enable the feature, move to the SGTP service configuration mode, in the appropriate context, to perform the following as the first command needed to re-enable support for dual PDP type addressing in the configuration:

    gtpc send common-flags

Now in the SGSN global configuration mode, use the following as the second command required to re-enable support for dual PDP type addressing in the configuration:

    dual-address-pdp
end

Exits the current mode and returns to the Exec Mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

end

Usage
Change the mode back to the Exec Mode.
exit

Exits the current mode and returns to the previous configuration mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Change the mode to the Global Configuration Mode.
gmm-message

This command configures the SGSN to discard (drop) the Attach-Request message received with a random TLLI already in use.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SGSN Global Configuration
configure > sgsn-global

Entering the above command sequence results in the following prompt:

[local]host_name(config-sgsn-global)#

Syntax

[ default ] gmm-message attach-with-tlli-in-use discard-message

default
Resets the default function allowing multiple MS, using the same random TLLI, to attempt to Attach simultaneously and disables discarding the Attach-Request message for random TLLI already in use.

Usage

Working with the two related commands (noted below), this command is part of a procedure for handling multiple MS Attaches all with the Same Random TLLI. Use this command to configure the SGSN to allow only one subscriber at a time to attach using a fixed random TLLI.

Related Commands:

- The old-tlli invalidate tlli command configures a list of random TLLI to be invalidated from the GMM after the invalidate old-TLLI timer expires.
- The old-tlli hold-time command configures the old-TLLI expiry timer.

Example

Configure the SGSN to drop Attach Request containing TLLI already in use:

\[ gmm-message attach-with-tlli-in-use discard-message \]
gmm-sm-statistics

**Important:** This command has been deprecated.

**Product**
SGSN

**Privilege**

**Mode**
Exec > Global Configuration > SGSN Global Configuration

- configure > sgsn-global

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-sgsn-global)#
```

**Syntax**

```
gmm-sm-statistics attach-rejects cause network-failure only-internal

no gmm-sm-statistics attach-rejects
```
gprs-mocn

Enables or disables General Packet Radio Service (GPRS) Multi-Operator Core Network (MOCN). With 2G MOCN, the radio network is shared among different operators, while each operator maintains its separate core network.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SGSN Global Configuration
configure > sgsn-global

Entering the above command sequence results in the following prompt:

[local]host_name(config-sgsn-global)#

Syntax

[ no ] gprs-mocn

no
Disables GPRS MOCN when it has been previously enabled.

Usage
Use this command to enable 2G MOCN, which is disabled by default.
For complete information about the 2G (GPRS) MOCN feature and its configuration, refer to the MOCN for 2G SGSN feature section in the Serving GPRS Support Node Administration Guide

Example
The following command enables GPRS MOCN support for SGSN:

gprs-mocn
**interface-management**

This command creates an interface management configuration and provides access to the SGSN Interface Management configuration mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SGSN Global Configuration
`configure > ssgn-global`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ssgn-global)#
```

**Syntax**

```
interface-management
```

**Usage**

Use this command to access the SGSN Interface Management configuration mode to map NSE-ID and NSE-name to the Gb interface and/or to lock and unlock interface by the NSE/BSC identifier.

**Example**

Access the SGSN Interface Management configuration mode:

```
interface-management
```
**imsi-range**

Configure an IMSI range or a PLMN ID to associate with an Operator Policy.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > SGSN Global Configuration

configure > sgsn-global

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-sgsn-global)#
```

**Syntax**

```
imsi-range mcc mcc_num mnc mnc_num { msin first start_number last stop_number [ operator-policy policy_name [ description description ] ] | plmnid plmn_id operator-policy policy_name [ description description ] } +

no imsi-range mcc mcc_num mnc mnc_num { msin first start_number last stop_number | plmnid plmn_id }
```

Using **no** in the command deletes the definition from the SGSN Global configuration.

---

**mcc mcc_num**

`mcc` defines the mobile country code (MCC) of an IMSI.

`mcc_num`: Enter a 3-digit number from 100 to 999 - 000 to 099 are reserved.

---

**mnc mnc_num**

`mnc` defines the mobile network code (MNC) of an IMSI.

`mnc_num`: Enter a 2 or 3-digit number from 00 to 999.

---

**msin**

MSIN (mobile subscriber international number) portion of the IMSI.

`first start_number`: Defines first MSIN prefix number in a range

`last stop_number`: Defines the last or final MSIN prefix number in a range.

---

**operator-policy policy_name description description**

Identify the operator policy that the IMSI range definition and/or the PLMN-ID is to be associated.

`policy_name`: Enter a string of 1 to 64 alphanumeric characters.

`description`: Enter a string of 1 to 100 alphanumeric characters to provide range clarification for converted Release 9.0 configurations.

If a PLMN-ID is to be included in the definition, enter the **plmnid** before entering the operator policy name.
plmnid  plmn_id

The 5-6 digit PLMN-ID consists of the MCC (mobile country code) plus the MNC (mobile network code) to identify the public land mobile network (PLMN) for a specific operator. This keyword associates a specific PLMN with this specific SGSN operator policy.

plmn_id: Enter 5 to 6 digits.

+ This symbol indicates that command can be repeated to create repeated definitions.

Usage

An IMSI = maximum of 15 digits. An IMSI consists of the MCC (3 digits) + the MNC (2 or 3 digits) + the MSIN (the remaining 10 or 9 digits depending on the length of the MNC).

MCC and MNC are the minimum amount of information required to identify a unique operator policy with IMSI filtering. The MCC and MNC combine uniquely to identify the country and the network operator, for example: Cingular Wireless in the United States = mcc 311 mnc 180

To improve the granularity of call handling, an operator policy with additional IMSI filtering parameters can be defined, to include filtering based on the MSIN, by defining a MSIN range - first (or start-of-range) MSIN and last (or end-of-range) MSIN. The range numbers do not include the maximum allowed for the MSIN but should include a sufficient number to enable the operator policy to filter effectively.

For the most efficient IMSI filter, the operator policy should include all of the above parameters and the PLMN ID which defines the current location of the MS -- this parameter is particularly useful for highlighting which calls are roaming.

And if none of the operator policies contain useful filtering information, then the default operator policy will be applied as the information in this command is never defined for the default operator policy.

The following table will illustrate how these filtering parameters determine which operator policy will govern a call:

<table>
<thead>
<tr>
<th>Operator Policy ID</th>
<th>MCC</th>
<th>MNC</th>
<th>MSINfirst</th>
<th>MSINlast</th>
<th>PLMN ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpPol-1</td>
<td>123</td>
<td>45</td>
<td>67890</td>
<td>67898</td>
<td></td>
</tr>
<tr>
<td>OpPol-2</td>
<td>123</td>
<td>45</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>OpPol-3</td>
<td>123</td>
<td>45</td>
<td>67890</td>
<td>67898</td>
<td>23232</td>
</tr>
<tr>
<td>OpPol-4</td>
<td>123</td>
<td>45</td>
<td></td>
<td></td>
<td>23232</td>
</tr>
<tr>
<td>OpPol-5</td>
<td>123</td>
<td>45</td>
<td>6789012</td>
<td>6789019</td>
<td></td>
</tr>
<tr>
<td>OpPol-6</td>
<td>123</td>
<td>45</td>
<td>6789012</td>
<td>6789019</td>
<td>23232</td>
</tr>
<tr>
<td>default</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The filtering selects which operator policy will be used to determine how a call is handled - the operator policy that best matches the IMSI. So, a call with IMSI 123456789012345 PLMNID 23232 is best matched with OpPol-6.

In most cases, the operator policy with the most information defined will be used as a combination of PLMNID and IMSI provides the best match. But OpPol-6 won’t always be the best match. Using the table above:

OpPol-1 is the best match for IMSI 123456789011111
OpPol-2 is the best match for IMSI 123456789099999
OpPol-5 is the best match for IMSI 123456789012345 if the PLMNID is 12344
Example

The following associates operator policy `oppol1` with country code 310, mobile network code of 33, and IMSI range 1231234 - 1231244:

```
imsi-range mcc 310 mnc 33 msin first 1231234 last 1231244 operator-policy oppol1
```
location-services

Enable or ‘start’ Location Services (LCS) on the SGSN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SGSN Global Configuration

```
configure > sgsn-global
```

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-sgsn-global)#
```

**Syntax**

```
location-services

no location-services
```

---

**Usage**

By default, Location Services is not enabled on the SGSN. This command is mandatory to enable the SGSN to support LCS, which is a license-controlled feature. Multiple other commands are required to configure LCS functionality. For more information about the operation and configuration of LCS on the SGSN, refer to the *Location Services* section of the *SGSN Administration Guide*.

**Example**

Use the following command to disable Location Services once they have been enabled:

```
no location-services
```
**map-message**

This command instructs the SGSN to ignore the CAMEL subscription when there is no CAMEL service associated or in existence.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SGSN Global Configuration

```
configure > sgsn-global
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-sgsn-global)#
```

**Syntax**

```
map-message insert-subscriber-data csi-handling when-camel-not-associated ignore-subscription
```

```
default map-message insert-subscriber-data csi-handling
```

**Example**

Instruct the SGSN to validate the CAMEL subscription:

```
default map-message insert-subscriber-data csi-handling
```
max-pending-attaches

Configure the maximum length of the pending attach queue.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SGSN Global Configuration
configure > sgsn-global
Entering the above command sequence results in the following prompt:

[local]host_name(config-sgsn-global)#

Syntax

max-pending-attaches limit

default max-pending-attaches

default
Resets the SGSN’s Attach queue to a maximum pending value of 10,000.

limit
Set the a maximum limit to the pending Attach/RAU messages queue in the LinkMgr. When the limit is reached a message is sent to the IMSIMgr.

limit: Enter an integer from 5000 - 50000. Default is 10000.

Usage

With this command, configure the maximum limit to the pending ATTACH/RAU messages queue in the LinkMgr. When the limit is reached, the LinkMgr sends the Query/Forward messages to the IMSIMgr. As the IMSIMgr gets busier and does not responded to Query/Forward requests, the response to the requests will get slower and slower and the queue size continues inflating if the incoming message rate is high. To avoid this situation, set the max-pending-attaches for the pending queue for Attach and RAU messages. All other messages from the HLR will be added to the queue as they cannot be dropped. High and low watermarks are set to the queue at 80% of max-pending-attaches ” and 60% of max-pending-attaches respectively.

Once a high watermark is reached, the new Attach and RAU requests are dropped and relevant statistics are incremented. Once a low watermark is hit, the new Attach/RAU requests are accepted and added to the pending queue. The entries are added to the pending queue only when the window-size between IMSIMgr and LinkMgr becomes zero. This is a very rare occurrence and will not affect the current behavior in normal circumstances.

Example

Set the queue length to a maximum of 15000 requests:

max-pending-attaches 15000
old-tlli invalidate tlli

This command configures a list of random TLLI to be invalidated (removed) from the GMM after the invalidate old-TLLI timer expires.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SGSN Global Configuration
configure > sgsn-global

Entering the above command sequence results in the following prompt:

[local]host_name(config-sgsn-global)#

**Syntax**

```
[ no ] old-tlli invalidate tlli < hexadecim al >
```

- **no**
  Removes a single random TLLI from the configured list.

- **< hexadecimal >**
  Identifies a single random TLLI to be removed from the GMM after the old-TLLI timer expires.

**Usage**

Use this command to create a list of up to 50 random TLLI to be dropped from the GMM after the old-TLLI timer expires. This command also starts the invalidate old-TLLI timer.

**Important:** If the old-TLLI expiry timer is not configured with the `old-tlli hold-time` command, then the SGSN will only drop second Attach Requests using the same random TLLI already in use.

**Related Commands:**
- The `gmm-message` command configures the SGSN to discard (drop) the Attach-Request message received with a random TLLI already in use
- The `old-tlli hold-time` command configures the old-TLLI expiry timer.

**Example**

Add random TLLI `0x7f05a30a` to the Invalidate List:

```
old-tlli invalidate tlli 0x7f05a30a
```
old-tlli hold-time

This command configures the old-TLLI expiry timer to be started in GMM when anyone of the listed random TLLI are received.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SGSN Global Configuration
configure > sgsn-global

Entering the above command sequence results in the following prompt:

[local] host_name(config-sgsn-global) #

Syntax

[ default ] old-tlli hold-time < seconds >

<table>
<thead>
<tr>
<th>default</th>
<th>Resets the timer to 5 seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; seconds &gt;</td>
<td>Sets the numbers of seconds before the timer expires; range 1 to 125.</td>
</tr>
</tbody>
</table>

Usage
Use this command to configure the old-TLLI expiry timer to be started in GMM when anyone of the listed random TLLI are received. If the timer expires prior to receiving Attach-Complete then the SGSN invalidates (removes) the TLLI from the GMM.

Important: For this configuration to work, the list of random TLLI to be removed (invalidated) from the GMM must be defined with the old-tlli invalidate tlli command.

Related Commands:
- The gmm-message configures the SGSN to discard (drop) the Attach-Request message received with a random TLLI already in use
- The old-tlli invalidate tlli command configures the random invalidate TLLI list.

Example
Set the timer for 2 seconds:

old-tlli hold-time 2
pdp-deactivation-rate

Set the rate the SGSN deactivates PDP connections per second per SessMgr when GTP-C path failure is detected. Beginning with release 15.0, this command is also supported on the S4-SGSN.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SGSN Global Configuration
configure > sgsn-global
Entering the above command sequence results in the following prompt:

[local]host_name(config-sgsn-global)#

Syntax

pdp-deactivation-rate { connected-ready rate | idle-standby rate }

default pdp-deactivation-rate { connected-ready | idle-standby }

default

If this keyword is used with the command, then the default deactivation rates are used.

connected-ready rate

Subscribers that are in the PMM-Connected / GPRS-Ready state and actively using the SGSN service need to be deactivated at a faster rate to facilitate the deactivation/re-activation process.
rate - sets the number of subscribers to be deactivated per second per SessMgr and the valid range is 1 to 1000 and the default is 760 connected-ready subscribers deactivated per second.

idle-standby rate

Subscribers that are in the PMM-Idle / GPRS-Standby state are not actively using the SGSN service and can be deactivated at a slower rate. The deactivation process for idle-standby subscribers includes paging before the Deactivate Request is sent.
rate - sets the number of subscribers to be deactivated per second per SessMgr and the valid range is 1 to 1000 and the default is 240 idle-standby subscribers deactivated per second.

Usage

Use this command to define a rate at which the SGSN processes PDP deactivations when a GTP-C path failure is detected (and confirmed according to the SGSN's default behavior). The operator can use this command to set a deactivation rate that ensures radio network congestion is avoided.

Related commands:
* max-remote-restart-counter-change - allows the operator to set a maximum variance between stored and received values for restart counter changes coming from the GGSN. For details, refer to the SGSN Global configuration mode documentation.
**disable-remote-restart-counter-verification** - allows the operator to disable the default behavior. For details, refer to this command in the SGSN Global configuration mode documentation.

**Example**

Use the following command to deactivate PDP connections for **600** PMM-Connected / GPRS-Ready subscribers per second:

```
pdp-deactivation-rate connected-ready 600
```

Use the following command to deactivate PDP connections for **320** PMM-Idle / GPRS-Standby subscribers per second:

```
pdp-deactivation-rate idle-standby 320
```

Use the following command to reset the default **760** per second deactivation rate for PMM-Connected / GPRS-Ready subscribers:

```
default pdp-deactivation-rate connected-ready
```
**ranap excess-len ignore**

Configure the SGSN to ignore excess length of received RANAP messages.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SGSN Global Configuration
   configure > sgsn-global

Entering the above command sequence results in the following prompt:

[local]host_name(config-sgsn-global)#

**Syntax**

```
[ default | no ] ranap excess-len ignore
```

- **default**
  Resets the default behavior - a decode error is generated when received RANAP messages are more than an extra octet in length.

- **no**
  Disables the configuration to ignore overly long RANAP messages.

**Usage**

By default, the SGSN issues a decode error when the RANAP messages include extra octets. Use this command to ignore RANAP messages that have extra octets.

**Example**

Use the following command to enable the SGSN to ignore overly long RANAP messages:

```
ranap excess-len ignore
```

Use the following command to disable ignoring of RANAP messages that are excessive in length:

```
no ranap excess-len ignore
```
ran-information-management

Enable/disable RAN information management (RIM) support for the SGSN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SGSN Global Configuration

```configure > sgsn-global```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-sgsn-global)#
```

**Syntax**

```
[ default | no ] ran-information-management
```

- **default**
  
  Resets the default so RIM is disabled.

- **no**
  
  Disables the RIM support in the configuration file.

**Usage**

By default, handling of RAN information management (RIM) messages is disabled. This command enables the SGSN to handle RIM messages. When this command is enabled and RIM message handling is enabled on the destination node, then RIM PDUs will be forwarded to the BSC/RNC. If RIM message handling is not enabled on both nodes, then the RIM PDUs will be dropped silently.

Confirm RIM configuration with the `show sgsn-mode` command in the Exec mode.

**Example**

Use the following command to enable RIM support:

```
ran-information-management
```

Use the following command to disable RIM support that has been added to the configuration:

```
no ran-information-management
```
target-offloading

Selects the subscriber offloading algorithm to be applied to the SessMgr and the IMSIMgr.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SGSN Global Configuration
configure > sgsn-global

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-sgsn-global)##
```

**Syntax**

```
target-offloading algorithm [ optimized-for-speed | optimized-for-target-count ]
```

**default target-offloading algorithm**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Resets the configuration to default values.</td>
</tr>
<tr>
<td>optimized-for-speed</td>
<td>Enables faster algorithm to achieve the target count.</td>
</tr>
<tr>
<td>optimized-for-target-count</td>
<td>Enables a reliable algorithm to achieve the target count. Default.</td>
</tr>
</tbody>
</table>

**Usage**

With the SGSN’s distributed architecture, there are many SessMgrs and offloading will happen in parallel at all SessMgrs. This command enables the operator to control the total number of subscribers being offloaded.

**Important:** The value for this command can not be altered once dynamic offloading has begun - refer to the command description for the `sgsn-offload` command in the *Exec Mode* chapter.

**Example**

Set the SGSN to use the faster algorithm for offloading:

```
target-offloading algorithm optimized-for-speed
```
**tlli-cb-audit**

This command enable (default is disabled) or disables a periodic (hourly) audit of TLLI-CBs in the BSSGP layer.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SGSN Global Configuration
configure > sgsn-global
Entering the above command sequence results in the following prompt:

```
[local]host_name(config-sgsn-global)#
```

**Syntax**

```
tlli-cb-audit
[ default | no ] tlli-cb-audit
```

- **default**
  Include **default** with the command to disable the audit function.

- **no**
  Include **no** with the command to disable the audit function.

**Usage**

This command is used to clean-up hanging or unassociated TLLI in the BSSGP layer. This configuration defined with this command will be common to all NSE configured for this SGSN.

Independent of this command configuration, the SGSN triggers and audit when the number of TLLI-CBs reaches 35,000.

**Example**

Use the following command to enable the hourly audit for unassociated TLLI-CBs:

```
tlli-cb-audit
```
umts-aka-r99

This command enables the operator to authenticate mobile equipment (MEs) with R99+ USIMs and capable of UMTS AKA.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SGSN Global Configuration
configure > sgsn-global

Entering the above command sequence results in the following prompt:

[local]host_name(config-sgsn-global)#

Syntax

umts-aka-r99

no umts-aka-r99

 Including no with the command disables the authentication.

Usage

This command enables operators to authenticate MEs that are attempting to connect to a 2.5G network with R99+ USIMs if the MEs are UMTS AKA capable. For R99 mobiles, the SGSN will continue to perform GSM AKA even if quintuplets are received from the HLR.

Example

Use the following command to disable UMTS AKA authentication for MEs with R99+ USIMs:

no umts-aka-r99
Chapter 281
SGSN Interface Management Configuration Mode

The interface management commands, accessed via the SGSN Global configuration mode, are applicable to the SGSN on a global level. They map the NSC/BSC to the SGSN’s Gb interface and enable the operator to quickly configure lock or unlock for the BSC interface on the basis of the NSE’s ID or name.

Mode

Exec > Global Configuration > SGSN Global Configuration > Interface Management Configuration

configure > sgsn-global > interface-management

Entering the above command sequence results in the following prompt:

[local]host_name(config-sgsn-interface-mgmt)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Return to the Exec mode.
exit

Exits the current configuration mode and returns to the SGSN Global configuration mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Returns to the SGSN Global configuration mode.
interface

Maps the Gb interface to an NSE-ID and an NSE-name to facilitate the identification of the peer NSE/BSC.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SGSN Global Configuration > Interface Management Configuration

Syntax
interface gb peer-nsei id { name <value> | id <value> }

no interface gb peer-nsei id { name <value> | id <value> }

Usage
This command configures mapping between an NSE-ID and an NSE name and the SGSN’s Gb interface. The mapping allows the operator to use the lock-interface command (also in this mode) to more easily configure locking or unlocking of the interface to the BSC by identifying the network service entity by ID or by name.

Related Commands:
lock-interface

Example
Map NSE with ID of 422 and the name Dover to the Gb interface:

interface gb peer-nsei id 422 name Dover

The following example disables the mapping for NSEI 2321:

no interface gb peer-nsei id 2321
lock-interface

This command enables the operator to configure the SGSN’s Gb interface, toward the peer NSE/BSC, as locked or unlocked on the basis of the NSE’s name or identifier.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SGSN Global Configuration > Interface Management Configuration
configure > sgsn-global > interface-management

Entering the above command sequence results in the following prompt:

[local]host_name(config-sgsn-interface-mgmt)#

Syntax

[ no ] lock-interface gb peer-nsei { id nsei-id | name nsei_name }

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disables a previously configured lock on the interface to the NSE/BSC.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>peer-nsei id nsei_id</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the numeric identifier of the network service entity mapped to the Gb interface.</td>
</tr>
<tr>
<td>nsei_id - Enter an integer from 0 to 65535.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>peer-nsei nsei_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the name of the NSE associated with the BSC, which is stored in the SCT.</td>
</tr>
<tr>
<td>nsei_id - Enter an alphanumeric string of 1 to 64 characters.</td>
</tr>
</tbody>
</table>

Usage
This command allows the operator to lock/unlock the interface, towards the NSE/BSC, based on the NSE name or NSE identifier.
Lock is configured primarily to avoid the high CPU usage the SGSN can experience when BSCs attempt to reconnect after an SGSN reboot or reload. The lock stops the auto-learn procedure for the locked BSC connected via Gb over IP.
The auto-learn facility can be enabled in a staggered manner for each BSC after reboot/reload by unlocking the BSCs one-by-one.
The NSE unlock state is the default state and the NSE can accept or send any uplink and downlink data.

Related Commands:
interface

Example
Lockout NSE/BSC ID 319 from the SGSN:

lock-interface gb peer-nsei id 319
Chapter 282
SGSN Pool Area Configuration Mode Commands

The Pool Area configuration mode configures the parameters used to setup the VLRs to use with a pool area in a Gs service.

Mode

Exec > Global Configuration > Context Configuration > Gs Service Configuration > Pool Area Configuration

configure > context context_name > gs-service service_name > pool-area pool_area_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-gs-pool-area)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Return to the Exec mode.
exit

Exits the current configuration mode and returns to the previous configuration mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Return to the previous configuration mode.
hash-value

This command configures the load distribution for the VLRs that service this pool area.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Gs Service Configuration > Pool Area Configuration

configure > context context_name > gs-service service_name > pool-area pool_area_name

Entering the above command sequence results in the following prompt:

}\[context_name]host_name(config-gs-pool-area)#

Syntax

`hash-value { hash_value | non-configured-values | range start_value to end_value } use-vlr vl_r_name`

`no hash-value { hash_value | non-configured-values | range start_value to end_value }`

**no**
Removes the configured Gs procedures from this Gs service.

**hash_value**
Specifies the specific hash value for VLR(s).

*hash_value* must be an integer value from 0 through 999.

**range start_value to end_value**
Specifies the range of hash values for a VLR.

*start_value* specifies the start value for range of hash and is an integer value from 0 through 999.

*start_value* must be lower than *end_value*.

*end_value* specifies the end value for range of hash and is an integer value from 0 through 999. *end_value* must be higher than *start_value*.

**non-configured-values**
This keyword assign all non-configured hash values to use the named VLR.

**use-vlr vl_r_name**
Specifies the name of the VLR to be associated with this pool area.

*vl_r_name* is the name of VLR and must be an alpha and/or numeric string of 1 to 63 characters.
Usage

Use this command to configure the load distribution for the VLRs that service this pool area as defined in TS 23.236.

The algorithm for selection of VLR from a pool area is based on the hash value computed on the IMSI digits. The SGSN derives a hash value (V) using procedure as defined in TS 23.236. Every hash value from the range 0 to 999 corresponds to a single MSC/VLR node. Typically many hash values may point to the same MSC/VLR node.

This command can be entered multiple times for different hash value.

Example

Following command configure the all non configured hash values to use VLR named `starvlr1` in this pool area:

```
hash-value non-configured-values use-vlr starvlr1
```
lac

This command defines a set of location area code (LAC) values for a pool area.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Gs Service Configuration > Pool Area Configuration
configure > context context_name > gs-service service_name > pool-area pool_area_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-gs-pool-area)#
```

**Syntax**

```
lac lac_id +

no lac lac_id
```

- `lac` Removes the configured LAC value from this pool area configuration.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lac</td>
<td>Specifies the subscribers’ location area code (LAC) to be associated with this pool area and a specific VLR. This LAC is obtained from the radio area identity (RAI). <code>lac_id</code>: Must be an integer from 1 through 65535.</td>
</tr>
<tr>
<td>+</td>
<td>More than one <code>lac_id</code>, separated by a space, can be entered within a single command.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to specify a set of LACs to use for a pool area. This command can be entered multiple times, subject to a limit of 32 LAC definitions (total for non-pool-area and pool-area configuration) per Gs service.

**Important:** LAC values across multiple pool areas and non-pool-areas must be unique within the Gs service.

**Example**

The following command configures LACs 101, 301, and 222 for the pool area.

```
lac 101 301 222
```
Chapter 283
SGSN PSP Configuration Mode Commands

The Peer-Server Process (PSP) configuration mode provides the commands to create, configure, bind, and manage a specific PSP instance included in an SS7 routing domain configuration.

Mode
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id > psp instance psp_instance

Entering the above command sequence results in the following prompt:

[local] host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-psp-psp_instance)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**associate**

Defines an association between the PSP instance and an application server process (ASP) instance and/or a DSCP marking template.

**Product**

SGSN

HNB-GW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

```configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id > psp instance psp_instance```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-psp-psp_instance)#
```

**Syntax**

```
associate { asp instance asp_num | dscp-template downlink template_name }
```

```
no associate [ asp | dscp-template downlink ]
```

**Important:** Using the `no associate` command will most likely result in the termination of all current subscriber sessions active through the peer-server.

**asp instance asp_num**

Identifies a specific ASP configuration. Up to four ASP instances can be configured for a single SS7 routing domain.

`asp_num` is a digit from 1 to 4.

**dscp-marking downlink template_name**

Identifies a specific DSCP marking template to associate with this PSP configuration.

`template_name` is a string of 1 to 64 characters, including letters, digits, dots (.), dashes (-), and forward slashes (/), to identify a unique instance of a DSCP template. For more information about DSCP marking templates, refer to the `DSCP Template Configuration Commands Mode` chapter.

The DSCP marking template provides a mechanism enabling the SGSN to perform differentiated services code point (DSCP) marking of control packets and signaling messages at the SGSN’s M3UA level on the Gb interface. This DSCP marking feature enables the SGSN to perform classifying and managing of network traffic and to determine quality of service (QoS) for the interfaces to an IP network.

While enabling DSCP marking of SCTP (control packets) on HNB-GW only `associate dscp-template downlink template_name` command is applicable. This command is used to provides a mechanism
enabling the HNB-GW to perform differentiated services code point (DSCP) marking of control packets and signaling messages at the HNB-GW. This DSCP marking feature enables the HNB-GW to perform classifying and managing of network traffic and to determine quality of service (QoS) for the interfaces to an IP network.

Usage

Use this command to create an association between a specific peer-server process (PSP) and a specific application server process (ASP) instance or a specific differentiated services code point (DSCP marking template).

Before using the `associate` command, the values for the `psp-mode` and `end-point` commands must be configured.

Before using the `associate` command, the M3UA end-point of the ASP must be configured. Use the commands defined in the ASP Configuration Mode chapter of the Command Line Interface Reference.

While enabling DSCP marking of SCTP (control packets) on HNB-GW only associated dscp-template downlink template_name command is applicable. For more information about DSCP marking templates, refer to the DSCP Template Configuration Commands Mode chapter.

Example

Associate this PSP instance with ASP configuration instance 2:

```
associate asp instance 2
```

Use the following command to terminate all associations with this PSP instance:

```
no associate
```

Associate this PSP instance with a DSCP marking template identified as `dscptemp1`:

```
associate dscp-template downlink dscptemp1
```
end

Exits the configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Change the mode back to the Exec mode.
end-point

This command defines or deletes the IP address to be associated with the local SCTP end-point for the application server process (ASP).

**Product**

SGSN
HNB-GW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id > psp instance psp_instance

Entering the above command sequence results in the following prompt:

[local]host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-psp-psp_instance)#

**Syntax**

```
end-point { address ip_address | port port_number }
no end-point [ address ip_address ]
```

- **no**
  - Removes the ASP end-point association configuration from the PSP configuration.

**Important:** This command can not be used as long as the PSP and the ASP are associated. Use the no associate command when entering any form of this command, including no end-point. When the change is made, re-enter the ASP association with the association command.

```
port port_number
```

- Configures the M3UA’s SCTP port number for the end-point.
- **port_number:** Must be an integer from 1 to 65535.
- Default: 2905.

**Usage**

Use this command to manage the ASP end-point. At least one address needs to be configured for the ASP before the end-point can be associated with the PSP.

**Example**

Set the ASP end-point to IP address 192.168.1.1 with the following command:

```
end-point address 192.168.1.1
```
exchange-mode

Configures the exchange-mode for the PSP communication.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration
configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id
> psp instance psp_instance

Entering the above command sequence results in the following prompt:
[local]host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-psp-psp_instance)#

Syntax
exchange-mode [ double-ended | single-ended ]

Usage

**Important:** Before using this command to set a value or reset the default, you must disassociate the PSP instance with the `no associate` command. When you have modified your configuration with this command, then use the `associate` command to setup a new ASP association.

Use this command to toggle the exchange modes for the PSP to match the exchange mode supported by the ASP. The exchange mode specifies what type of ASP messages exchange is used in an IPSP communication. The `exchange-mode` must be configured for 'single-ended' if the `psp-mode` has been configured for 'client'.

Example
Change the exchange mode from the standard double-ended to single-ended:

```
exchage-mode single-ended
```
exit

Exits the current configuration mode and moves to the previous configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Return to the Peer-Service configuration mode.
psp-mode

Configures either client-mode or server-mode as the PSP’s operational mode.

Product
SGSN
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration
configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id > psp instance psp_instance

Entering the above command sequence results in the following prompt:

[local]host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-psp-psp_instance)#

Syntax

psp-mode { client | server }

client
The PSP operates as a client.

server
The PSP operates as a server.

Usage

Important: Before using this command to change the configuration, you must disassociate the PSP instance with the no associate command. When you have modified your configuration with this command, then use the associate command to setup a new ASP association.

Example

Instruct the peer-server process to operate in either client or server mode.

Configure the PSP to operate in server mode:

```bash
psp-mode server
```
routing-context

Configures the behavior of the routing context in M3UA messages.

**Important:** This keyword function is only available in releases 8.1 and higher.

**Product**
- SGSN
- HNB-GW

**Privilege**
- Security Administrator, Administrator

**Mode**

Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

```
configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id > psp instance psp_instance
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-psp-psp_instance)#
```

**Syntax**

```
routing-context { discard-inbound | process-inbound | m3ua-data { insert-outbound | suppress-outbound } }
```

**default routing-context**

```
  default
  Include this keyword with the command, to reset the configuration to the system default for routing-context which is a combination of process-inbound and insert-outbound.
```

```
discard-inbound
Sets the routing context received in M3UA messages to be discarded.
```

```
process-inbound
Sets the routing context received in M3UA messages to be processed.
```

```
m3ua-data
This keyword controls the insertion of routing context in outbound M3UA data messages. The default behavior is to insert routing context in management messages and suppress routing context in data messages.
```

```
insert-outbound
Sets the routing context so that it is added in the M3UA messages.
```

```
suppress-outbound
Sets the routing context so that it is suppressed in the M3UA messages.
```
Usage

**Important:** Before using this command to change the configuration or reset the default, you must disassociate the PSP instance with the `no associate` command. When you have modified your configuration with this command, then use the `associate` command to setup a new ASP association.

In PSP (singled-ended) configuration mode, the settings for both the local routing context (the SGSN’s routing context) and the peer routing context (the RNC’s routing context) should be the same. If the routing contexts created at the SGSN and on the peer are different then this can cause the M3UA link to fail. Routing context is an optional parameter when an M3UA association has only one associated peer-server.

Example

If the peer does not support routing context, then disable the routing context feature:

```
routing-context discard-inbound suppress-outbound
```
sctp-alpha

This stream control transmission protocol (SCTP) retransmission time out (RTO) parameter defines the RTO-Alpha value.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server_id id > psp_instance psp_instance

Entering the above command sequence results in the following prompt:

[local]host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-psp-psp_instance)#

Syntax

sctp-alpha value

default sctp-alpha

value

Defines a percentage (%) that represents the RTO portion of the round-trip time (RTT) calculation. This percentage value must be an integer between 0 and 65535.

default

 Resets the sctp-alpha to the default value of 5%.

Usage

sctp-alpha is used in conjunction with other commands, such as the sctp-beta command, to determine the round-trip time (RTT) calculations. The Alpha parameter is used to manage load balancing within the SS7 environment for multi-homed peers.

Important: Before using this command to set a value or reset the default, you must disassociate the PSP instance with the no associate command. When you have modified your configuration with this command, then use the associate command to setup a new ASP association.

Example

Set the SCTP RTO-Alpha value to 256% of the RTT calculation:

sctp-alpha 256
sctp-beta

This stream control transmission protocol (SCTP) retransmission time out (RTO) parameter defines the RTO-Beta value.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id
> psp instance psp_instance

Entering the above command sequence results in the following prompt:

[local]host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-psp-psp_instance)#

Syntax

sctp-beta value

default sctp-beta

value

Defines a percentage (%) that represents the RTO portion of the round-trip time (RTT) calculation. This percentage value must be an integer between 0 and 65535.

default

Resets the sctp-beta to the default value of 10%.

Usage

Use this command in conjunction with other commands, such as the sctp-alpha command, to determine the round-trip time (RTT) calculations. The Beta parameter is used to manage load balancing within the SS7 environment for multi-homed peers.

Important: Before using this command to set a value, you must disassociate the PSP instance with the no associate command. When you have set the value with this command, then use the associate command to setup a new association.

Example

Set the SCTP RTO-Alpha value to 512% of the RTT calculation:

sctp-beta 512
**sctp-checksum-type**

This command selects the type of checksum algorithm to be used.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

```
configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id
> psp instance psp_instance
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-psp-psp_instance)#
```

**Syntax**

```
sctp-checksum-type { adler32 | crc32 }
```

**default sctp-checksum-type**

- **adler32**
  Selects the Adler-32 type of algorithm as a faster checksum function.

- **crc32**
  Selects the CRC-32, a slower but more reliable 32-bit cyclic redundancy check.

- **default**
  Resets the `sctp-checksum-type` to the default of CRC-32.

**Usage**
Use this command to set which type of checksum algorithm the SGSN is to use to validate SCTP packets.

**Important:** Before using this command to set a value, you must disassociate the PSP instance with the `no associate` command. When you have set the value with this command, then use the `associate` command to setup a new association.

**Example**

Set the checksum type for CRC32:

```
sctp-checksum-type crc32
```
sctp-cookie-life

This command sets the SCTP valid cookie life.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

```
configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id > psp instance psp_instance
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-psp-psp_instance)#
```

**Syntax**

```
sctp-cookie-life value
```

**default sctp-cookie-life**

```
value
```

Sets the valid cookie life value in increments of 100 milliseconds. The range is 50 to 1200.

```
default
```

Resets the sctp-cookie-life value to the default, 600 (= .6 seconds).

**Usage**

Use this command to set the SCTP cookie life.

**Important:** Before using this command to set a value, you must disassociate the PSP instance with the no associate command. When you have set the value with this command, then use the associate command to setup a new association.

**Example**

Set the SCTP cookie life to 1 second (1000 milliseconds):

```
sctp-cookie-life 1000
```
**sctp-init-rwnd**

This command sets the size of the SCTP receiver window.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

```
configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id > psp instance psp_instance
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-psp-psp_instance)#
```

**Syntax**

```
sctp-init-rwnd window_size
```

**default sctp-init-rwnd**

```
window_size
```

Sets an integer to configure the window size. The range is 32768 to 1048576.

```
default
```

 Resets the **sctp-init-rwnd** window size to the default, 1048576.

**Usage**

Use this command to set the receiver window size in the configuration. Configuring this parameter enables the SCTP client to send configured ‘sctp-init_rwnd’ as a_rwnd parameter in the INIT message. For the SCTP server, the INIT ACK will be populated with sctp-init_rwnd as a_rwnd parameter per RFC 4960. The command enables the operator to configure a reduced priority for LinkManager Control messages, thereby giving Timer messages the highest priority. The Timer messages are retained at the highest priority and Data messages are kept at a lower priority.

**Important:** Before using this command to set a value, you must disassociate the PSP instance with the `no associate` command. When you have set the value with this command, then use the `associate` command to setup a new association.

**Example**

Use the following command to set the SCTP window size to **32768**:

```
sctp-init-rwnd 32768
```
**sctp-max-assoc-retx**

This command sets the maximum number of datagram retransmissions to be associated with this peer server configuration.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

```
configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id > psp instance psp_instance
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-psp-psp_instance)#
```

**Syntax**

```
sctp-max-assoc-retx value

default sctp-max-assoc-retx
```

**value**

Defines the maximum number of datagram retransmissions for an association. The value must be an integer between 0 and 255.

**default**

Resets the default for `sctp-max-assoc-retx` to 10.

**Usage**

Use this command to configure the maximum number of datagram retransmissions for an association. The endpoint will be declared unreachable after `sctp-max-assoc-retx` number of consecutive retransmissions to an endpoint on any transport address.

**Important:** Before using this command to set a value, you must disassociate the PSP instance with the `no associate` command. When you have set the value with this command, then use the `associate` command to setup a new association.

**Example**

Set the maximum number to 3 datagram retransmissions:

```
sctp-max-assoc-retx 3
```
sctp-max-data-chunks

This command sets the operator-preferred limit to the number of data chunks that can be bundled in an SCTP message.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration
configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id
> psp instance psp_instance

Entering the above command sequence results in the following prompt:

[local]host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-psp-psp_instance)#

Syntax

sctp-max-data-chunks ( limit max_chunks | mtu-limit )

default sctp-max-data-chunks

default
Resets the default for sctp-max-data-chunks to the limit set for the MTU with the sctp-max-mtu-size command.

limit max_chunks
Sets the operator-preferred maximum number of data chunks that can be bundled into SCTP messages. Enter an integer from 1 to 65535.

mtu-limit
Instructs the SGSN to bundle only as many data chunks for the SCTP streams as defined by for the maximum transmission unit (MTU) size configured with the sctp-max-mtu-size command.

Usage
Use this command to override the default MTU-limit for data chunk bundling and configure a preferred maximum number of data chunks that can be bundled into an SCTP message.

Important: Before using this command to set a value, you must disassociate the PSP instance with the no associate command. When you have set the value with this command, then use the associate command to setup a new association.

Example
Set 1024 as a maximum number of data chunks to bundled:

sctp-max-data-chunks limit 1024
sctp-max-in-strms

Configures the maximum number of incoming SCTP streams

Product
SGSN

Privilege
Administrator

Mode
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id > psp instance psp_instance

Entering the above command sequence results in the following prompt:

[local] host_name(config-ss7-ss7rd_id-ss7rd_id-ps-peer-server_id-psp-psp_instance)#

Syntax

sctp-max-in-strms value

default sctp-max-in-strms

default

Returns the configuration to the default of 16.

value

Default: 16.
Specifies the maximum number of incoming SCTP streams as an integer from 1 to 16. The SGSN restricts the allowable range to 2 to 16. If a value of 1 is entered, a value 2 will be applied for any SGSN service associated with this SCTP parameter template.

Usage

Use this command to configure the maximum number of incoming SCTP streams.

Example

The following command configures the maximum number of incoming SCTP streams to 5:
sctp-max-in-strms 5
**sctp-max-init-retx**

This command sets the maximum number of retries to send the INIT datagram.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

```
configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id > psp instance psp_instance
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-psp-psp_instance)#
```

**Syntax**

```
sctp-max-init-retx value
```

**default sctp-max-init-retx**

```
value

Sets the maximum number of retries. This value must be an integer between 0 and 255.

default

Resets the default for sctp-max-init-retx to 5.
```

**Usage**

Use this command to set the maximum number of retries the SCTP layer should make to send the INIT datagram to the peer to open an association.

**Important:** Before using this command to set a value, you must disassociate the PSP instance with the no associate command. When you have set the value with this command, then use the associate command to setup a new association.

**Example**

```
sctp-max-init-retx 3
```
sctp-max-mtu size

This command sets the number of bytes that comprise the maximum MTU size.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id > psp instance psp_instance

Entering the above command sequence results in the following prompt:

[local]host_name(config-ss7-ss7rd_id-ps-peer-server_id-psp-psp_instance)#

Syntax

sctp-max-mtu-size value

default sctp-max-mtu-size

value

Sets the maximum number of bytes for the SCTP MTU size. This value must be an integer between 508 and 65535.

default

Resets the default for sctp-max-mtu-size to 1500 bytes.

Usage

Use this command to configure the size of the MTU.

Important: Before using this command to set a value, you must disassociate the PSP instance with the no associate command. When you have set the value with this command, then use the associate command to setup a new association.

Example

Set the maximum size of the MTU to 3000 bytes:

sctp-max-mtu-size 3000
sctp-max-out-strms

This command sets the maximum number of outgoing streams through the PSP going towards the peer server.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration
configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id
> psp instance psp_instance

Entering the above command sequence results in the following prompt:

[local]host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-ps-peer-server_id-ps-psp-ps_psp_instance)#

Syntax

sctp-max-out-strms max#_out_streams

default sctp-max-out-strms

default

Resets the SGSN’s sctp-max-out-strms value to the default of 2.

max#_out_streams

The value must be an integer between 1 and 16. The value should match the peer node’s (STP/SG/RNC/HLR) number of in-bound streams.

Important: For releases prior to 14.0, the value range was 1 to 65535. However, the system always capped at 16 so in Release 14.0 the range has been decreased to reflect that fact.

Usage

Use this command to balance the stream throughput from the PSP to the peer server. The value for this command is used to validate the incoming packets in the SCTP layer.
If the user tries to configure the value of sctpmax-out-strms less than "2", a message is displayed and the default value is set.

Important: Before using this command to set a value, you must disassociate the PSP instance with the no associate command. When you have set the value with this command, then use the associate command to setup a new association.

Example

Set a maximum SCTP out streams to 12:

sctp-max-out-strms 12
Set a maximum SCTP out streams to the default of 2 streams:

```
default sctp-max-out-strms
```
**sctp-max-path-retx**

This command sets the maximum number of datagram retransmissions for this path.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

```
configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id > psp instance psp_instance
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-psp-psp_instance)#
```

**Syntax**

```
sctp-max-path-retx value

default sctp-max-path-retx
```

**Value**

Sets the maximum number of datagram retransmission to a destination transport address. This value must be an integer from 0 to 255.

**Default**

Resets the `sctp-max-path-retx` default to 5.

**Usage**

Use this command to set the maximum number of datagram retransmissions to a destination transport address. The destination transport address will be declared unreachable after the SGSN exhausts the `sctp-max-path-retx` number of consecutive retransmissions to a destination transport address. Depending upon network conditions, lower values typically means faster detection of SCTP-Path failure.

**Important:** Before using this command to set a value, you must disassociate the PSP instance with the `no associate` command. When you have set the value with this command, then use the `associate` command to setup a new association.

**Example**

```
sctp-max-path-retx 10
```
sctp-parameter

This command enables the SGSN administrator to alter the contents of the Optional Address Parameter IE.

**Product**
SGSN

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id
> psp instance psp_instance

Entering the above command sequence results in the following prompt:

[local]host_name(config-ss7-ss7rd_id-ps-peer-server_id-ps-psp-psp_instance)#

**Syntax**

```
[ default | no ] sctp-parameter ipv4-address suppress single-ended
```

Either command prefix resets the default behavior to repeat the source IP address in the IE.

**Usage**

In situations when the endpoint is uni-homed (that is, single transport layer address), this command enables the SGSN administrator to override the default behavior and to configure the SGSN to suppress (not repeat) the source IP address which is typically included as part of the Optional Address Parameter IE in the INIT/INIT-Ack chunk.

**Example**

Enable suppression of sending repeated IP address in the OAP IE with this command:

```
sctp-parameter ipv4-address suppress single-ended
```

Repeat sending the source IP address in the OAP IE with the following command:

```
no sctp-parameter ipv4-address suppress single-ended
```
**sctp-rto-initial**

This command sets the initial retransmission timeout for the SCTP.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

`configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id > psp instance psp_instance`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-psp-psp_instance)#
```

**Syntax**

```
sctp-rto-initial value
```

```
default sctp-rto-initial
```

- **default**
  
  Resets the system to the `sctp-rto-initial` default of 30 (3 seconds).

- **value**
  
  The value must be an integer between 1 and 50.

**Usage**

**Important:** Before using this command to set a value, you must disassociate the PSP instance with the `no associate` command. When you have set the value with this command, then use the `associate` command to setup a new association.

- Use this command to define the initial retransmission timer.
- The value set for `sctp-rto-initial` should be greater than or equal to the minimum value set with `sctp-rto-min (sctp-rto-initial => sctp-rto-min)`.  
- The value set for `sctp-rto-initial` should be less than or equal to the maximum value set with `sctp-rto-max (sctp-rto-initial <= sctp-rto-max)`.

**Example**

```
sctp-rto-initial 240
```
sctp-rto-max

This command sets the maximum retransmission timeout value for the SCTP.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id > psp instance psp_instance

Entering the above command sequence results in the following prompt:

[local]host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-psp-psp_instance)#

**Syntax**

```
sctp-rto-max value
```

**default sctp-rto-max**

```
default
```

Sets the system to the default of 600 (60 seconds).

```
value
```

Sets the maximum retransmission timeout value in increments of 100 milliseconds (0.1 seconds) and the value must be an integer between 5 and 1200.

**Usage**

**Important:** Before using this command to set a value, you must disassociate the PSP instance with the `no associate` command. When you have set the value with this command, then use the `associate` command to setup a new association.

Use this command to configure the maximum time for retransmissions. The value set for `sctp-rto-max` should be greater than or equal to the value set for `sctp-rto-initial`.

**Example**

The following sets the timeout for 45 seconds:

```
sctp-rto-max 450
```
sctp-rto-min

This command sets the minimum retransmission timeout (RTO) value for the SCTP.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration
configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id
> psp instance psp_instance

Entering the above command sequence results in the following prompt:
[local]host_name(config-ss7-ss7rd_id-ss7rd_ps-peer-server_id-ps Peer-server_id-psp-psp_instance)#

Syntax

sctp-rto-min [ units-10ms ] value
default sctp-rto-min

default

Resets the sctp-rto-min to the default of 10 (1 second).

units-10ms

Including this keyword, before entering a value, enables configuration with finer granularity - in 10 millisecond units.

value

If the units-10ms keyword is included, then set the timeout in increments of 10 milliseconds. The value must be an integer between 1 and 500.
If the units-10ms keyword is not included then set the timeout in increments of 100 milliseconds. The value must be an integer between 1 and 50.

Usage

⚠️ Important: Before using this command to set a value, you must disassociate the PSP instance with the no associate command. When you have set the value with this command, then use the associate command to setup a new association.

Use this command to set the minimum time for retransmission before timeout.
The value set for sctp-rto-min should be less than or equal to the value set for sctp-rto-initial
(sctp-rto-min <= sctp-rto-initial)

Example

The following sets the timeout for 2 seconds:
sctp-rto-min 20
**sctp-sack-frequency**

This command sets the frequency of transmission of SCTP selective acknowledgements (SACK).

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

```
configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id > psp instance psp_instance
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-psp-psp_instance)#
```

**Syntax**

```
sctp-sack-frequency [ units-10ms ] value
```

**default**

```
sack-frequency
```

Sets the maximum number of datagrams to be received prior to sending a SACK to the peer. The value must be an integer between 1 and 5.

```
default
```

Resets the `sctp-sack-frequency` default value of 2.

**Usage**

**Important:** Before using this command to set a value, you must disassociate the PSP instance with the `no associate` command. When you have set the value with this command, then use the `associate` command to setup a new association.

Use this command to set the maximum number of datagrams to be received before a SACK must be sent to the peer. The `sctp-sack-frequency` is used in conjunction with the `sctp-sack-period` to control the generation of SACK, depending on which one occurs first.

**Example**

```
sctp-sack-frequency 3
```
sctp-sack-period

This command sets the delay before sending an SCTP selective acknowledgement (SACK).

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id > psp instance psp_instance

Entering the above command sequence results in the following prompt:

[local]host_name(config-ss7-ss7rd_id-ps-peer-server_id-ps-psP_instance)#

Syntax

sctp-sack-period [ units-10ms ] value

default sack-period

units-10ms

Including this keyword, before entering a value, enables configuration with finer granularity - in 10 millisecond units.

value

If the units-10ms keyword is included, then set the timeout in increments of 10 milliseconds. The value must be an integer between 0 and 50.
If the units-10ms keyword is not included then set the timeout in increments of 100 milliseconds. The value must be an integer between 0 and 5.

default

Resets the system to the sctp-sack-period default value, 2 (=200 milliseconds).

Usage

Use this command to set the time the SCTP waits to send a SACK.

Important: Before using this command to set a value, you must disassociate the PSP instance with the no associate command. When you have set the value with this command, then use the associate command to setup a new association.

Example

sctp-sack-period 3
sctp-suppress-alarm

This command enables/disables the suppression of alarms for SCTP path failure between two peer endpoints.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration
configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id > psp instance psp_instance

Entering the above command sequence results in the following prompt:

[local] host_name(config-ss7-rd-ss7rd_id-ps-peer-server_id-psp-psp_instance)#

Syntax

[ no ] sctp-suppress-alarm path-failure self-end-point-address orig_IPV4_address peer-end-point-address peer_IPV4_address

no
Disables the pre-configured alarm suppression for SCTP path failure.

path-failure
This keyword specifies that the alarm suppression is for SCTP path failure between two peer nodes.

self-end-point-address orig_IPV4_address
This keyword specifies the IP address of the originating endpoint.
orig_IPV4_address is the IP address of originating endpoint in IPv4 dotted decimal notation.

peer-end-point-address peer_IPV4_address
This keyword specifies the IP address of the peer endpoint.
peer_IPV4_address is the IP address of peer endpoint in IPv4 dotted decimal notation.

Usage
Use this command to configure the path failure alarm suppression. This command ignores the alarms generated on SCTP path failure.

Important: Before using this command to set a value, you must disassociate the PSP instance with the no associate command. When you have set the value with this command, then use the associate command to setup a new association.

Example
The following command suppresses the path failure alarms occurred in SCTP path between originating peer address 1.2.3.4 and peer endpoint 6.7.8.9:

```
sctp-suppress-alarm path-failure self-end-point-address 1.2.3.4 peer-end-point-address 6.7.8.9
```
timeout

This command sets the times for various timeout timers.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SS7 Routing Domain Configuration > Peer-Server Configuration > PSP Configuration

configure > ss7-routing-domain routing_domain_id variant variant_type > peer-server id id > psp instance psp_instance

Entering the above command sequence results in the following prompt:

[local]host_name(config-ss7-ss7rd_id-ssrd_id-ps-peer-server_id-psp-psp_instance)#

Syntax

timeout { m3ua-periodic-dest-audit dest_timeout | sctp-bundle [ units-10ms ] timer | sctp-heart-beat hrt_bt_timeout }

[ default | no ] timeout { m3ua-periodic-dest-audit | sctp-bundle | sctp-heart-beat }

default

Resets the specified command to the default value.

no

Removes the selected configuration.

m3ua-periodic-dest-audit dest_timeout

Sets the period (in increments of seconds) between the DAUD messages while auditing a destination state.

dest_timeout: Must be an integer from 1 to 65535. Default is 2.

sctp-bundle [ units-10ms ] timer

Specifies that SCTP data chunks are to be queued until this timer expires at which time the data chunks are bundled and committed for transmission. SCTP bundling provides better bandwidth utilization and less traffic, however, there is a packet transmission delay.

timer is an integer from 1 through 65535, in 100ms increments (10 = 1000ms or 1 second).

[ units-10ms ]: Including this optional keyword specifies that the integer timer is to be calculated using 10ms increments (instead of 100ms increments) to allow for finer granularity.

Important: Peer end should also be configured to support SCTP bundling.

Default: SCTP bundling is disabled.
sctp-heart-beat hrt_bt_timeout
Sets the number of seconds in the SCTP heart-beat timer
hrt_bt_timeout: This value is an integer between 1 and 300. Default is 30.

Usage
Use this command to configure timers. Repeat the command with each of the keywords to set values for each.

Important: Before using this command to set a value, you must disassociate the PSP instance with the no associate command. When you have set the value with this command, then use the associate command to setup a new association.

Example

    timeout m3ua-periodic-dest-audit 120
Chapter 284
SGSN Service Configuration Mode Commands

The SGSN Service configuration mode is used within the global configuration mode to specify the 3G operations of the SGSN and the available SGSN services for a specific context.

SGSN Service works with MAP Service, SGTP Service, GTPP Group, and IuPS Service. All five of these services must be configured to enable a 3G SGSN to communicate with other elements within a UMTS network.

**Mode**

Exec > Global Configuration > Context Configuration > SGSN Service Configuration

`configure > context context_name > sgsn-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgsn-service)#
```

⚠️ **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
accounting

This command defines the accounting context name and enables/disables specific types of CDR generation for the accounting in the SGSN service.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGSN Service Configuration

```
configure > context context_name > sgsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgsn-service)#
```

**Syntax**

```
accounting ( cdr-types { mcdr | scdr | sms { mo-cdr | mt-cdr } | lcs { mt-cdr | mo-cdr } | smmscdr }+ | context cntx_name )
```

```
default accounting cdr-types
```

```
no accounting ( cdr-types | context )
```

<table>
<thead>
<tr>
<th>command</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Returns the system to default settings for the selected type of CDR.</td>
</tr>
<tr>
<td>no</td>
<td>Removes the pre-configured type of CDR generation for accounting from the SGSN service.</td>
</tr>
</tbody>
</table>

**cdr-types { mcdr | scdr | sms { mo-cdr | mt-cdr } | lcs { mt-cdr | mo-cdr } | smmscdr }**

Default: enabled

Defines the types of CDRs to be generated within the specified SGSN service for accounting:

- **mcdr**: Enables generation of M-CDRs.
- **scdr**: Enables generation of S-CDRs.
- **sms**: Enables generation of SMS-type CDRs based on one of the following:
  - **mo-cdr**: SMS CDRs originates from the mobile.
  - **mt-cdr**: SMS CDRs terminates at the mobile.
- **smmscdr**: This CDR type is currently under development and should not be included in configuration for this release.
- **lcs**: Enables the generation of LCS CDRs, based on:
  - **mt-cdr**: Mobile terminated location request CDR
  - **mo-cdr**: Mobile originated location request CDR
+ Specifies that the specified keywords with in the group can be entered multiple times with a single command.

`context cntx_name`

Specifies an accounting context to be associated with the SGSN service.

`cntx_name`: Define a string of 1 to 79 alphanumeric characters.

**Usage**

Use this command to define the type of CDRs to generate for SGSN service. By default all type of CDRs are generated. Note that change of this configuration will be applied to new call and/or to new PDP contexts only.

By default, the generation of all CDR types is enabled.

**Example**

The following command configures the system to generate CDRs of M-CDR type for accounting in the current SGSN service:

```
accounting cdr-types mcdr
```
admin-disconnect-behavior

This command defines some of the actions the SGSN will take during an Admin-Disconnect procedure.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > SGSN Service Configuration

```
configure > context context_name > sgsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgsn-service)#
```

Syntax

```
admin-disconnect-behavior { clear-subscription | detach-type { reattach-not-required | reattach-required } }
[ default | no ] admin-disconnect-behavior { clear-subscription | detach-type }
```

**clear-subscription**

Including this keyword in the configuration instructs the SGSN to clear subscriber contexts and the subscription data database whenever the `clear subscribers all` command is issued (from the Exec mode) for attached subscribers. As well, the SGSN will issue an appropriate Map-Purge-MS-Req to the HLR if needed.

Default: disabled

**detach-type**

Including this keyword defines which type of detach instruction to include in the Detach-Request message during an Admin-Disconnect procedure. One of the following options must be included when this command is entered:

- reattach-not-required
- reattach-required

Default: reattach-required

**default | no**

Including either `default` or `no` keyword in the command, instructs the SGSN to use the default value for the specified parameter.

**Usage**

Include the `clear-subscription` keyword with this command configuration to ensure that more than attached MM-context and active PDP-contexts are cleared when the `clear subscribers all` command is issued for attached subscribers.
To clear subscription data for detached subscribers, refer to the `sgsn clear-detached-subscriptions` command described in the *Exec* mode chapter. Including the `detach-type` keyword with this command instructs the SGSN to include either a ‘reattach-required’ or a ‘reattach-no-required’ instruction in the Detach-Request message.

**Example**

Configure the SGSN to clear data such as PTMSI allocated, auth-vectors received, and NGAF flag values stored in the subscriber database for attached subscribers:

```
admin-disconnect-behavior clear-subscription
```
associate

Associates or disassociates supportive services and policies, such as an Evolved GPRS Tunnelling Protocol (eGTP) service, an HSS peer service, or a MAP service.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > SGSN Service Configuration
configure > context context_name > sgsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgsn-service)#

Syntax

associate { { camel-service camel_svc_name [ context context_name ] | egtp-service egtp_svc_name [ context context_name ] | gs-service gs_svc_name [ context context_name ] | hss-peer-service hss_svc_name [ context context_name ] | map-service map_svc_name [ context context_name ] | network-global-mme-id-mgmt-db | sgtp-service sgtp_svc_name [ context context_name ] | tai-mgmt-db database_name } | no associate { camel-service | egtp-service | gs-service | hss-peer-service | map-service | network-global-mme-id-mgmt-db | sgtp-service | tai-mgmt-db database_name }

no

Disassociates a previously associated service with this SGSN service.

camel-service camel_svc_name

Associates a CAMEL service with SGSN service.
camel_svc_name specifies the name for a pre-configured CAMEL service to associate with the SGSN service.

egtp-service egtp_svc_name

Associates an eGTP service with SGSN service.
egtp_svc_name specifies the name for a pre-configured eGTP service to associate with the SGSN service.

For more information on the eGTP service, refer to the egtp-service command in the Context Configuration Mode Commands chapter.

Important: Only one eGTP service can be associated with a SGSN service. The eGTP service should be configured prior to issuing this command.

gs-service gs_svc_name

Associates a GS service with this SGSN service.
gs_svc_name specifies the name for a pre-configured GS service to associate with the SGSN service.
**Important:** Only one Gs service can be associated with a SGSN service. The Gs service should be configured prior to issuing this command.

```
associate
```

```
hss-peer-service  hss_svc_name

Associates an HSS peer service with this SGSN service.  
*hss_svc_name* specifies the name for a pre-configured HSS peer service to associate with the SGSN service as an alphanumeric string of 1 through 63 characters. For more information about the HSS peer service, refer to the hss-peer-service command in the Context Configuration Mode Commands chapter and the HSS Peer Service Configuration Mode Commands chapter.
```

**Important:** Only one HSS peer service can be associated to a service in this release. The HSS peer service should be configured prior to issuing this command.

```
map-service  map_svc_name

Associates a MAP service with this SGSN service.  
*map_svc_name* specifies the name for a pre-configured MAP service to associate with the SGSN service. The MAP service is created with the map-service command in the Context Configuration Mode Commands chapter. The MAP service provides Mobile Application Part (MAP) protocol support for the interface between the SGSN and the HLR. For more information on the MAP service, refer to the MAP Service Configuration Mode Commands chapter.
```

**Important:** Only one MAP service can be associated with a SGSN service. The MAP service should be configured prior to issuing this command.

```
network-global-mme-id-mgmt-db

On the S4-SGSN, associates a pre-configured network global MME ID management database with the SGSN service. This enables operators to associate a single custom list of MME Group IDs for use in UMTS to E-UTRAN handovers on the S4-SGSN. The global MME ID management database must be configured on the S4-SGSN using the the network-global-mme-id-mgmt-db command in LTE Policy Configuration Mode before it can be associated with an SGSN service. This command is available on the SGSN only if the SGSN S4 Interface license is enabled.
```

```
sgtp-service  sgtp_svc_name

Associates an SGTP service with this SGSN service.  
*sgtp_svc_name* specifies the name for a pre-configured SGTP service to associate with the SGSN service as an alphanumeric string of 1 through 64 characters. For more information on the SGTP service, refer to the sgtp-service command in the Context Configuration Mode Commands chapter and/or the SGTP Service Configuration Mode Commands chapter.
```

**Important:** The SGTP service should be configured prior to issuing this command. Only one SGTP service can be associated with an SGSN service. When co-locating an SGSN and an MME, the SGSN Service cannot be associated with the same SGTP Service that is used by the MME.
context ctx_name

Identifies a specific context name where the named service is configured. If this keyword is omitted, the named service must exist in the same context as the SGSN service.

ctx_name is name of the configured context of the named service expressed as an alphanumeric string of 1 through 63 characters that is case sensitive.

tai-mgmt-db database_name

Associates this SGSN service with a pre-configured TAI Management Database.

database_name specifies the name of a pre-configured TAI Management Database to associate with the SGSN service as alphanumeric string of 1 through 64 characters. For more information, refer to the tai-mgmt-db command in the LTE Policy Configuration Mode Commands chapter and the LTE TAI Management Database Configuration Mode Commands chapter.

This command is available on the SGSN only if the SGSN S4 Interface license is enabled.

Usage

Use this command to associate a pre-configured service or policy with an SGSN service.

The eGTP service provides eGTP-C protocol interface support between EPS nodes. For more information on the eGTP service and the supported interface type, refer to the eGTP Service Configuration Mode Commands chapter.

**Important:** Only one eGTP service can be associated with a service. The eGTP service should be configured prior to issuing this command.

The HSS peer service provides S6d and S13-prime interface support via the Diameter protocol between the SGSN and an HSS (S6d) or EIR (S13-prime). For more information on HSS peer service and other parameters, refer to the HSS Peer Service Configuration Mode Commands chapter.

**Important:** Only one HSS peer service can be associated to a service in this release. The HSS peer service should be configured prior to issuing this command.

**Caution:** This is a critical configuration. The SGSN service cannot be started without this configuration. Any change to this configuration would lead to restarting the SGSN service. Removing or disabling this configuration will stop the SGSN service.

Example

The following command associates a pre-configured eGTP service called egtp1 in the dst_ctx context to an SGSN service:

```plaintext
associate egtp-service egtp1 context dst_ctx
```

The following command associates a pre-configured HSS peer service called hssl in the same context as SGSN service to an SGSN service:

```plaintext
associate hss-peer-service hssl
```
cc profile

Configures the charging characteristic (CC) profile with the triggers for generating various types of CDR as defined with the accounting command.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGSN Service Configuration

```
configure > context context_name > sgsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgsn-service)#
```

**Syntax**

```
cc profile profile_bits [ buckets number | interval time | tariff time1 mins hours [ time2 mins hours ] [ time3 mins hours ] [ time4 mins hours ] | volume { downlink down_vol uplink up_vol | total total_vol } ] +
[ no | default ] cc profile profile_bits [ buckets | interval | tariff | volume ]
```

- **no**
  Removes a previously configured CC profile.

- **default**
  Returns the specified CC profile to the original default system settings.

**profile_bits**

Defines the value of the profile bits for the SGSN service.

**index** can be configured to any integer value from 0 to 15. Some of the values have been predefined according to 3GPP standard:

- 1 for hot billing
- 2 for flat billing
- 4 for prepaid billing
- 8 for normal billing

- **buckets number**
  Specifies the number of statistics container changes in the CDR due to QoS changes or tariff times that can occur before an accounting record (CDR) is closed
  Default: 4
  **number**: Must be integer from 1 to 4.
interval time
Specifies the normal time duration (in seconds) that must elapse before closing an accounting record (CDR) provided that any or all of the following conditions occur:

  time: Enter any integer from 60 to 40000000.

tariff time1 mins hours [ time2 mins hours time3 mins hours time4 mins hours ]
Specifies the time-of-day (based on a 24-hour clock) to close the current statistics container in the CDR, but not necessarily the CDR itself. One tariff time must be defined and up to four tariff times can be specified.

Important: The system assumes that the billing system uses the day/date to determine if the statistics container represents an actual tariff period.

  • mins: The minutes of the hour. Enter an integer from 0 to 59.
  • hours: The hour of the day. Enter an integer from 0 to 23.

volume { downlink down_vol uplink up_vol | total total_vol }
Specifies the downlink, uplink, and total volumes octet counts that must be met for the closure of the CDR.

  down_vol: Enter any integer from 100000 to 1345294336.
  up_vol: Enter any integer from 100000 to 400000000.
  total_vol: Enter any integer from 100000 to 400000000.

Usage
Charging characteristics consist of a profile index and behavior settings. This command configures the profile index for the SGSN’s charging characteristics. The SGSN supports up to 16 profile indexes.

Example
The following command configures a profile index of 10 with tariff times of 7:00 AM and 7:30 PM:

    cc profile 10  tariff time1 0 7 time2 30 19 time3 0 7 time4 30 19
check-imei

This command configures the action the SGSN will take if the route towards the EIR is down.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > SGSN Service Configuration

configure > context context_name > sgsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgsn-service)#

Syntax

check-imei { gf-failure-action | gf-timeout-action } { continue | reject }

default check-imei { gf-failure-action | gf-timeout-action }

default
Resets the default function to reject the Attach.

gf-failure-action
Coupled with either continue or reject, this keyword instructs the SGSN to take action if a valid EIR configuration exists under the MAP service and if the EIR is temporarily unreachable due to associated DPC/SSN inaccessible/out-of-service.

gf-timeout-action
Coupled with either continue or reject, this keyword instructs the SGSN to take action if a valid EIR configuration exists under the MAP service and the route to the EIR is available, but no response is received from the EIR.

continue
Instructs the SGSN to continue the Attach process.

reject
Instructs the SGSN to reject the Attach process.

Usage
Typically, the Attach process will be continued when there is an IMEI check timeout based on the configuration under the SGSN service configuration and/or the GPRS service configuration. But this works only if the route towards the EIR is UP and the IMEI request timer expires. This command configures the SGSN to allow the Attach process to continue in the case the route towards the EIR is down, that is the DPC / SSN is out-of-service.
Example

Use the following command to reset the default and reject Attach:

    default check-imei gf-failure-action
check-imei-timeout-action

In Releases 12.0 and higher, this command has been replaced with enhanced functionality in the `check-imei` command, also available in this configuration mode.
core-network

This command specifies the numeric ID for a core network to identify which CN is to be used by the SGSN service.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > SGSN Service Configuration

configure > context context_name > sgsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgsn-service)#

Syntax

core-network id cn_id

no core-network id

no

Removes the currently configured core network ID from the current SGSN configuration.

id cn_id

This number identifies the core network to connect the SGSN service.

* cn_id: Must be an integer from 0 through 4095.

Usage

Use this command to set a global ID to identify this SGSN in the core network.

Example

The following command sets the core network ID for the current SGSN service to 127:

    core-network id 127
disable/enable super-charger

This command has been deprecated and replaced by the super-charger command. For the commands to configure the SuperCharger feature, refer to the Call-Control Profile Configuration Mode chapter.
**dns israu-mcc-mnc-encoding**

Configures either decimal or hexadecimal format for the MCC and MNC values in the DNS query which is sent during the ISRAU.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGSN Service Configuration
`configure > context context_name > sgsn-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgsn-service)#
```

**Syntax**

```
dns israu-mcc-mnc-encoding { decimal | hexadecimal }
default dns israu-mcc-mnc-encoding
```

**default**
Resets the SGSN to send the MCC and MNC values in decimal format for DNS queries.

**decimal**
Default.
Instructs the SGSN to send the MCC and MNC in decimal format in the DNS query.

**hexadecimal**
Instructs the SGSN to send the MCC and MNC in hexadecimal format in the DNS query.

**Usage**
Use this command to determine the type of encoding for the MCC and MNC to be included in the DNS query sent during the inter-SGSN RAU (ISRAU). The choice must match the format of the DNS server. For example:

In decimal, the MNC/MCC in a DNS query would appear like:

```
rac0017.lac42e3.mnc310.mcc722.gprs
```

In hexadecimal, the MNC/MCC in a DNS query would appear like:

```
rac0017.lac42e3.mnc0136.mcc02d2.gprs
```

**Example**
Use hexadecimal values for the MCC/MNC in the DNS query.
dns israu-mcc-mnc-encoding

dns israu-mcc-mnc-encoding hexadecimal
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Return to the Exec mode.
**exit**

Exits the current configuration mode and returns to the context configuration mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**
```
exit
```

**Usage**
Return to the context configuration mode.
gmm

This command defines the GPRS mobility management parameters for the SGSN service.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > SGSN Service Configuration

configure > context context_name > sgsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgsn-service)#

Syntax

gmm { T3302-timeout t3302_dur | T3312-timeout t3312_dur | T3313-timeout initial t3313_init [ decrease t3313_decrement | increase t3313_increment ] | T3322-timeout t3322_dur | T3323-timeout T3323_dur | T3350-timeout t3350_dur | T3360-timeout t3360_dur | T3370-timeout t3370_dur | implicit-detach-timeout secs | max-auth-retransmission auth_retrans | max-identity-retransmission id_retrans | max-page-retransmission page_retrans | max-ptmsi-reloc-retransmission ptmsi_reloc_retrans | mobile-reachable-timeout ms_reach_dur | paging-failure-action downlink-data-lockout-timer seconds [ repeat number_repeats ] | perform-identity-on-auth-failure | purge-timeout minutes | t3346 min minimum max maximum | trau-timeout trau_dur }

no gmm { implicit-detach-timeout | max-auth-retransmission | max-identity-retransmission | perform-identity-on-auth-failure | t3346 }

default

Sets the default value for the specified parameter.

T3302-timeout t3302_dur

Default: 10

Specifies the retransmission timer value to guard the GPRS attach or RAU procedure on MS side.

t3302_dur is the waiting duration in minutes before retransmitting the specific message and must be an integer from 1 through 186.

T3312-timeout t3312_dur

Default: 54

Specifies the retransmission timer value to guard the RAU procedure initiation on network side.
t3312_dur is the waiting duration in minutes before retransmitting the specific message and must be an integer from 1 through 186.

T3313-timeout initial t3313_init [ decrease t3313_decrement | increase t3313_increment ]
Default: 5
Specifies the retransmission timer value to guard the for paging request procedure initiation on network side.
initial t3313_init - Specifies the initial waiting duration in seconds before retransmitting the specific message. t3313_init must be an integer from 1 through 60.
decrease t3313_decrement - Specifies the decrement of the initial timer value in seconds.
t3313_decrement must be an integer from 1 through 5.
increase t3313_increment - Specifies the increment of the initial timer value in seconds.
t3313_increment must be an integer from 1 through 5.

T3322-timeout t3322_dur
Default: 6
Specifies the retransmission timer value to guard the GPRS detach request procedure on network side. t3322_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.

T3323-timeout T3323_dur
Default: 54
Specifies that the S4-SGSN Idle Mode Signaling Reduction T3323-timeout deactivation timer will be sent to the UE in Attach Accept and Routing Area Update Accept Messages. T3323_dur specifies the amount of time, in minutes, that will expire before the UE deactivates the ISR feature if the UE is no longer in the UMTS coverage area and has not completed a Routing Area Update with the S4-SGSN within the specified time duration. Once the timer expires, the S4-SGSN waits an additional four minutes before beginning an Implicit Detach for the UE and sends a Detach Notification message (cause = local detach) to the MME across the S3 interface. The MME will then deactivate ISR for the UE since it now also is aware that the UE is no longer in the UMTS coverage area. Valid entry is an integer from 1 to 186.
This command is available only if the Idle Mode Signaling Reduction license is enabled on the S4-SGSN and the Idle Mode Signaling Reduction feature has been activated via the idle-mode-signaling-reduction command in Call Control Profile Configuration Mode.

T3350-timeout t3350_dur
Default: 6
Specifies the retransmission timer value to guard the GPRS attach accept/RAU accept/realloc request procedure sent with P-TMSI and/or TMSI on network side. t3350_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.

T3360-timeout t3360_dur
Default: 6
Specifies the retransmission timer value to guard the authentication and cipher request procedure on network side. t3360_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.
T3370-timeout  \texttt{t3370\_dur}

Default: 6  
Specifies the retransmission timer value to guard the identity request procedure on network side.  
\texttt{t3370\_dur} is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.

\textbf{implicit-detach-timeout  \texttt{secs}}

Default: 3600  
Specifies the implicit detach timer (IDT) timeout value for any 3G calls (not specific to ISR activated calls) as part of the implicit detach procedure on the network side. The IDT starts after expiry of the mobile reachable timer (MNR). Soon after IDT expiry, the subscriber is implicitly detached from the SGSN.  
\texttt{secs} value must be an integer from 1 to 86400.

\textbf{Important:} From R15.0 release onwards the lowest configurable limit of the IDT timeout is modified to “240” seconds.

\textbf{max-auth-retransmission  \texttt{auth\_retrans}}

Default: 4  
Specifies the maximum retransmission of authentication requests allowed.  
\texttt{auth\_retrans} is the number of retries before declaring the authentication failure and must be an integer from 1 through 10.

\textbf{max-identity-retransmission  \texttt{id\_retrans}}

Default: 4  
Specifies the maximum retransmission of identity requests allowed.  
\texttt{id\_retrans} is the number of retries before declaring the identity failure and must be an integer from 1 through 10.

\textbf{max-page-retransmission  \texttt{page\_retrans}}

Default: 5  
Specifies the maximum retransmission of page requests allowed.  
\texttt{page\_retrans} is the number of retries before declaring the paging request failure and must be an integer from 1 through 5.

\textbf{max-ptmsi-reloc-retransmission  \texttt{ptmsi\_reloc\_retrans}}

Default: 5  
Specifies the maximum retransmission for P-TMSI relocation procedure allowed.  
\texttt{ptmsi\_reloc\_retrans} is the number of retries before declaring the P-TMSI relocation procedure failure and must be an integer from 1 through 10.

\textbf{mobile-reachable-timeout  \texttt{ms\_reach\_dur}}

Default: 58  
Specifies the timeout duration for the mobile reachable timer (MNR) for the mobile reachable procedure on network side.  
\texttt{impli\_detach\_dur} sets the waiting duration in minutes before retransmitting the specific message and must be an integer from 4 through 1440.
**paging-failure-action downlink-data-lockout-timer seconds [ repeat number_repeats ]**

Default: 1000 seconds.
Enables and configures the downlink data lockout timer, for the SGSN services, to reduce the frequency of mobile-initiated keep alive messages.

*seconds* set the number of seconds before timer expire, range of 0 to 10000.
*repeat number_repeats* optionally sets the number of times (1 to 10) that the timer restarts after paging failure. **Note:** If repeat is not configured then paging proceeds endlessly until the MR timer expires.

* [ default | no ] gmm paging-failure-action* disables the downlink data lockout timer.

**perform-identity-on-auth-failure**

Default: Enabled
Configures the SGSN service to perform an identity check to ascertain the IMSI after an authentication failure on a PTMSI-based message.

**purge-timeout minutes**

Default: 10080 (7 days)
The purge timer defines the MM-context lifetime, part of the MM-context procedure on the network side. The configured value sets the duration (number of minutes) the SGSN holds the detached subscriber’s MM-context profile. If the subscriber does not reattach to the SGSN during this time, then the SGSN purges this detached subscriber’s MM-context information from its database and sends a MAP purge request towards the HLR to indicate that the subscriber’s profile is gracefully purged from SGSN’s database.

*minutes* must be an integer from 1 through 20160.

**trau-timeout trau_dur**

This timer is available in releases 9.0 and higher.
Default: 30
Specifies the number of seconds the “old” 3G SGSN waits to purge the MS’s data. This timer is started by the “old” SGSN after completion of the inter-SGSN RAU.
*trau_dur*: Must be an integer from 5 to 60.

**Usage**
Repeat this command as needed to configure multiple parameters for GPRS mobility management in a UMTS network. This command provides the configuration of timers for mobility procedures and retries for different messages. GMM layer is defined in the 3GPP TS 24.008 (Release 7).

**Example**
Following command configures the timer to wait for 5 mins before retransmitting the message for GPRS attach or RAU procedure on MS side with maximum number of retries as 6 for authentication:

```
gmm T3302-timeout 5 max-auth-retransmission 6
```
gs-service

This command associates a previously defined Gs service configuration, for the Gs interface to an MSC/VLR, with this SGSN service.

**Important:** This command is used in Releases 12.0 and 12.2. For Release 14.0 refer to the `associate` command.

<table>
<thead>

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>configure &gt; context context_name &gt; sgsn-service service_name</code></td>
</tr>
</tbody>
</table>

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgsn-service)#
```

**Syntax**

```
gs-service gs_srvc_name context ctx_name

no gs-service gs_srvc_name
```

- **no**
  Removes/disassociates the named Gs service from this SGSN service.

- **gs_srvc_name**
  Specifies the name of a specific Gs service for which to display information.
  `svc_name` is the name of a configured Gs service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

- **context ctx_name**
  Specifies the specific context name where Gs service is configured. If this keyword is omitted, the named Gs service must be exist in the same context as the SGSN service.
  `ctx_name` is name of the configured context of Gs service. This can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

**Usage**

Use this command to associate a specific Gs service interface with this SGSN service instance.

**Important:** A single Gs service can be used with multiple SGSN and/or GPRS service.

**Example**

```
```

Cisco ASR 5x00 Command Line Interface Reference
Following command associates a Gs service instance named `stargs1`, which is configured in context named `star_ctx`, with an SGSN service:

```
gs-service stargs1 context star_ctx
```
lac

This command defines the location area code (LAC) in hexadecimal format.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > SGSN Service Configuration
configure > context context_name > sgsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgsn-service)#

Syntax

lac hex

no lac

no

Erases the lac configuration statement.

hex

Enter a hexadecimal number between 0x0 and 0xFFFF
**max-pdp-contexts**

Configures the maximum number of PDP contexts for a MS (mobile station) that will be supported on this SGSN service.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGSN Service Configuration

```bash
configure > context context_name > sgsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgsn-service)#
```

**Syntax**

```
max-pdp-contexts per-ms number
```

**default max-pdp-contexts per-ms**

- **default**
  
  Resets the maximum number of PDP contexts per mobile station to the default of 11 for the Gs service configuration.

- **per-ms number**
  
    Default: 11
    
    Defines the combined total number of primary and secondary PDP contexts for the SGSN service.
    
    `number` can be an integer from 2 to 11.

**Usage**

The following example defines 5 as the maximum number of primary and secondary PDP contexts that this SGSN will support for any connected MS.

**Example**

```
max-pdp-contexts per-ms 5
```
mobile-application-part

This command identifies an already defined MAP service (Mobile Application Part service) to associate with the SGSN service. Although the MAP service does not need to be defined in the same context as the SGSN service, there is a one-to-one relationship between a MAP service and an SGSN service.

**Important:** This command is used in Releases 12.0 and 12.2. For Release 14.0 refer to the `associate` command.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGSN Service Configuration

```
configure > context context_name > sgsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgsn-service)#
```

**Syntax**

```
mobile-application-part service map_svc [ context ctx_name ]
```

no mobile-application-part service

- **no**
  Remove the MAP service association from the SGSN service configuration.

- **service map_svc**
  Specifies the name of the MAP service to be associated with this SGSN service.
  `map_svc` must be the name of a MAP service previously configured on the system.

- **context ctx_name**
  Specifies the name of the context where the MAP service is configured. If the MAP service is not configured in the current context, then the context where it is configured must be specified to enable the SGSN to reach the MAP service.
  If this keyword is not specified, the current context is used.
  `ctxt_name`: Must be the name of the context where the specified MAP service is configured.

**Usage**

Use this command to identify the MAP service configuration to be used by the SGSN service configuration. Also use this command to specify the context in which the MAP service configuration was created.
If the MAP service is not identified or if the correct context is not identified, then the SGSN service will not START.

**Example**
The following command specifies a MAP service named map1 that is configured in the same context as the current SGSN service:

```
mobile-application-part service map1
```
network-sharing cs-ps-coordination

Enables/disables the SGSN service to perform a CS-PS coordination check.

**Important:** This command is no longer available in all 12.0 and 12.2 releases. If you do not see this command in your release, look for the `network-sharing cs-ps-coordination` command in the IuPS Service configuration mode to accomplish the same task. Configuring in the IuPS Service configuration mode allows for the possibility of multiple IuPS services with network-sharing and differing CS-PS coordination requirements.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGSN Service Configuration

```bash
configure > context context_name > sgsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgsn-service)#
```

**Syntax**

```
network-sharing cs-ps-coordination

default network-sharing cs-ps-coordination

no network-sharing cs-ps-coordination
```

- **default**
  Including this keyword resets the SGSN service to allow the check to be performed.

- **no**
  Disables this feature for the SGSN service.

**Usage**

Use this command to facilitate the network sharing functionality. With this command, the SGSN can be instructed to perform a check to determine if CS-PS coordination is needed.

3GPP TS 25.231 section 4.2.5 describes the functionality of the SGSN to handle CS-PS (circuit-switching/packet-switching) coordination for attached networks not having a Gs-interface. In compliance with the standard, the SGSN rejects an Attach in a MOCN configuration with cause 'CS-PS coordination required', after learning the IMSI, to facilitate the RNC choosing the same operator for both CS and PS domains.

**Example**

Use the following syntax to disable the CS-PS coordination check:

```
no network-sharing cs-ps-coordination
```
nri length

This command defines the Network Resource Identifier (NRI) of the SGSN that is stored in the P-TMSI (bits 23 to 18).

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > SGSN Service Configuration

configure > context context_name > sgsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgsn-service)#

Syntax

nri length  nri_length [ nri-value nri_value | null-nri-value null_nri_value non-broadcast mcc mcc mnc mnc lac lac_id rac rac_id nri-value value ]

default nri

no nri

default

Release 14.0 and higher.
Resets the nri configuration to nri length 6 and nri-value 0.

no

Deprecated in Release 14.0
Releases prior to 14.0, this command removes the configured NRI value and location information in the P-TMSI that would be retrieved by this SGSN.

nri length  nri_length

Specifies the number of bits to be used in the P-TMSI, bits 23 to 18, to define the network resource identifier (NRI). The NRI length configuration also sets the maximum size of the pool. If not configured, the NRI length will be of zero length.
nri_length: Must be an integer from 1 to 6 to identify the number of bits.

null-nri-value  null_nri_value

This keyword is only available in releases 8.1 and higher.
Configures the null NRI value which must be unique across the pool areas. This keyword is used for the offloading procedure for SGSN pooling (enabled with the sgsn offloading command, see the Exec Mode chapter).
null_nri_value is an integer 0 (zero) to 63 which identifies the SGSN to be used for the offloading procedure for SGSN pooling. There is no default value for this parameter.
**nri length**

This keyword set is only available in releases 8.1 and higher. Defines the non-broadcast LAC/RAC to be used in combination with the null-NRI for the offloading procedure. Including the MCC and MNC to specify the PLMN because the Iu-Flex feature supports multiple IuPS Services.

- **mcc** identifies the mobile country code, the first part of the PLMN ID. Must be an integer between 100 and 999.
- **mnc** identifies the mobile network code portion of the PLMN ID. Must be a 2- or 3-digit integer between 01 and 999.
- **lac_id** defines a location area code associated with an RNC. Must be an integer between 1 and 65535.
- **rac_id** defines the remote area code to be associated with an RNC. Must be an integer between 1 and 255.

**nri-value nri_value**

Specifies the MS-assigned value of the NRI to retrieve from the P-TMSI. This value must not exceed the maximum possible value specified by the NRI length. The NRI value must be unique across the pool or across all overlapping pools.

- **nri_value** must be an integer from 1 to 63 to identify a specific SGSN in a pool. Use of 0 (zero) value is not recommended.

Multiple NRI values can be identified by providing multiple nri-values separated by a blank space for example: `nri length 6 nri-value 29 43 61`

**Usage**

Use this command to identify the SGSN identified with the NRI in the MS generated P-TMSI. This command adds or removes the Iu Flex configuration for this SGSN service. When using Iu Flex, all keywords must be defined. The command can be repeated to specify different values for any of the keyword parameters. If more than one NRI is configured, the SGSN service will round-robin between the available NRIs when new subscribers (re)connect.

Use this command to retrieve the NRI (identity of an SGSN) stored in in bits 23 to 18 of the packet-temporary mobile subscriber identity (P-TMSI). If more than one NRI value is configured, the SGSN service will round-robin between the available NRIs when new subscribers (re)connect.

When using MOCN mode for network sharing without SGSN pooling, the NRI length and the NRI value should both be used.

**Important:** In Releases prior to 14.0, selection of one of the keywords (**nri-value** or **null-nri-value**) was mandatory. With Release 14.0 use of the keywords is optional.

**Example**

The following command specifies the the NRI length as 5 bits, identifies SGSN 23 with MCC 123 and MNC 22 and LAC 222 and RAC 12 for offloading procedure with NRIs 6 and 41:

```
nri length 5 null-nri-value 34 non-broadcast mcc 123 mnc 22 lac 222 rac 12 nri-value 6 41
```
override-lac-li

Refer to the *ASR 5000 Lawful Intercept Guide* for a description of this command.
override-rac-li

Refer to the *ASR 5000 Lawful Intercept Configuration Guide* for a description of this command.
rac

Refer to the *ASR 5000 Lawful Intercept Configuration Guide* for a description of this command.
qos-modification

This command provides the operator the flexibility to control RAB setup and negotiations based on the RNC.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > SGSN Service Configuration
configure > context context_name > sgsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgsn-service) #

Syntax

qos-modification { inform-rnc-before-ue | allow-s4-rab-negotiation }

no qos-modification [ inform-rnc-before-ue | allow-s4-rab-negotiation ]

no

The SGSN uses the default behavior

• to inform the UE before the RNC or

• to reject PDP Context Activation (in compliance with TS 23.00 section 9.2.2.1A), if the RNC negotiates QoS in the RAB assignment response when the S4 interface is used for the PDP context.

inform-rnc-before-ue

When this keyword is used the SGSN informs the RNC of new QoS before informing the UE. On execution of the command with this keyword, the SGSN initiates a RAB assignment to inform the RNC followed by UPCQ towards the GGSN / Modify towards the UE based on whether or not the RNC downgrades the QoS.

allow-s4-rab-negotiation

With this keyword used as part of the configuration, if the S4 interface is used for PDP activation then the SGSN locally accepts what the RNC sends as QoS in the RAB Assignment Response and sends that QoS in the Activate Response.

This CLI is applicable only for PDP activation. For any other scenario, if the RNC negotiates the QoS then the SGSN ignores this configuration and locally accepts the change and continues with the call.

Usage

This command enables the operator the flexibility to accommodate legacy RNCs that don’t meet the parameters set by TS 23.060.

With allow-s4-rab-negotiation, this keyword is needed for activation cases only as the default behaviour, per 3GPP spec, is to reject activation, which is service impacting. Hence to avoid such service impacts a configuration is added to control the behavior.

Example
Use this command to override the SGSN default behavior during the PDP modification procedure.

```
qos-modification inform-rnc-before-ue
```

Use this command to override the SGSN default behavior and accept PDP activation with legacy RNCs using the S4 interface for context activation:

```
qos-modification allow-s4-rab-negotiation
```
**ran-protocol**

This command specifies the IuPS service for the SGSN service to use for communication with the RAN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGSN Service Configuration

configure > context context_name > sgsn-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgsn-service)#
```

**Syntax**

```
ran-protocol iups-service iups_srvc [ context ctx_name ]

no ran-protocol iups-service

no

Removes the IuPS service information from the SGSN service configuration.

---

**iups-service iups_srvc**

Specifies the name of an IuPS service already configured on the system.

**iups_srvc**: Enter an alphanumeric string of 1 to 63 characters.

---

**ctx_name**

**ctx_name**: Enter the name of the IuPS context, an alphanumeric string of 1 to 63 characters.

---

**Usage**

Use this command to configure the IuPS service context that the current SGSN service will use to communicate with the RAN. Up to 8 definitions can be defined for a single SGSN service to allow for multiple PLMNs support.

**Example**

The following command configures the SGSN service to use an IuPS service named **iups1** that has been configured, in the same context as the SGSN service:

```
ran-protocol iups-service iups1
```
**reporting-action event-record**

This command enables the SGSN to log GMM/SM events in EDR files for 3G services.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGSN Service Configuration

```bash
configure > context context_name > sgsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgsn-service)#
```

**Syntax**

```
reporting-action event-record

[ default | no ] reporting-action event-record
```

- **default**
  Disables the logging function.

- **no**
  Removes the logging function from the configuration file.

**Usage**

This command is one of the steps needed to enable the SGSN to create a log for events such as Attach, RAU, and Activations. The log is an EDR (event data record) in CSV format. For details about how this feature works, refer to the *GMM-SM Event Logging* chapter in the *SGSN Administration Guide*.

**Related Commands:**
- To enable GMM/SM event logging for 2G services, the `reporting-action event-record` command must be configured in the GPRS service configuration.
- To enable a log to be generated in an EDR file, the `edr-module active-charging-service` command must be enabled in the Context configuration mode.
- To configure parameters for the logging file characteristics and for file transfer, use the commands in the EDR Module Configuration Mode.

**Example**

Enable GMM/SM event logging for 3G services:

```
reporting-action event-record
```
**sgsn-number**

This command defines the E.164 number that identifies this particular SGSN service context.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGSN Service Configuration

```
configure > context context_name > sgsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgsn-service)#
```

**Syntax**

```
sgsn-number  E.164_number

no sgsn-number
```

**no**

Removes the SGSN number configuration from the SGSN service configuration.

**E.164_number**

Enter a maximum of 15 digits to define the ‘phone’ number associated with this SGSN service in the specified context.

**Usage**
The SGSN supports multiple SGSN numbers – different numbers in the 2G GPRS service configuration and the 3G SGSN service configuration. If an HLR-initiated dialog is received, the SGSN will perform a lookup based on the IMSI and find the correct SGSN number with which the MS is associated. Subsequent messaging will use this address.

**Example**
To delete the sgsn-number associated with this SGSN service context, enter:

```
no sgsn-number
```
sgtp-service

This command creates an instance of an SGTP service and associates the SGTP service instance with this SGSN service.

⚠️ Important: This command is used in Releases 12.0 and 12.2. For Release 14.0 refer to the associate command.

Product
SGSN
PDG/TTG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > SGSN Service Configuration

configure > context context_name > sgsn-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgsn-service)#

Syntax

sgtp-service sgtp_srvc_name

no sgtp-service

sgtp_srvc_name

Enter the name of an SGTP service that will be used by this SGSN service

sgtp_srvc_name: Enter a string of 1 to 63 alphanumeric characters.

Usage

Use this command to access the SGTP Service configuration mode to configure SGTP parameters.

Example

sgtp-service sgtp1
This command configures session management parameters for this SGSN service. This command can be repeated multiple times to configure each parameter individually.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGSN Service Configuration

```
configure > context context_name > sgsn-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgsn-service)#
```

**Syntax**

```
sm { T3385-timeout time | T3386-timeout time | T3395-timeout time | guard-timer guard_seconds | ignore-asi | max-actv-retransmission number | max-deactv-retransmission number | max-modf-retransmission number | t3396 min minimum max maximum cause cause_code}
```

```
default sm { T3385-timeout | T3386-timeout | T3395-timeout | guard-timer | max-actv-retransmission | max-deactv-retransmission | max-modf-retransmission }
```

**default**

Resets the selected timer to the system default value.

**T3385-timeout**

Retransmission timer for network-initiated Activate Request.
Default is 8 sec

**T3386-timeout**

Retransmission timer for network-initiated Modify Request.
Default is 8 sec

**T3395-timeout**

Retransmission timer for network-initiated Deactivate Request.
Default is 8 sec

**guard-timer guard_seconds**

Sets the number of seconds before the session manager resources are cleared.

guard_seconds is an integer from 30 to 150.
Default: 80 seconds
**ignore-asi**
Enables the operator to modify the SGSN service default configuration and instructs the SGSN to ignore the ASI bit in the SGSN Context Response during RAU-based handovers over Gn interfaces and to ignore establishing a RAB for any PDPs.

**max-actv-retransmission**
Configures maximum retries for activate PDP ctxt request.
Default is 4

**max-deactv-retransmission**
Configures maximum retries for deactivate PDP ctxt request.
Default is 4

**max-modf-retransmission**
Configures maximum retries for modify PDP ctxt request.
Default is 4

**Usage**
Repeat the command to configure multiple session management parameters for the SGSN service.

**Example**
Use a command similar to the following to set the expiry for 5 seconds for the session manager’s T3385-timeout:

```
sm T3385-timeout 5
```
Chapter 285
SGTP Service Configuration Mode Commands

The SGSN GPRS Tunneling Protocol (SGTP) Service configuration mode provides the configuration of GTP-C and GTP-U related parameters.

**Mode**

Exec > Global Configuration > Context Configuration > SGTP Service Configuration

```
configure > context context_name > sgtp-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgtp-service)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
direct-tunnel-disabled-ggsn

This command makes it possible for the operator to disable direct tunneling on the basis of a GGSN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGTP Service Configuration
configure > context context_name > sgtp-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgtp-service)#

**Syntax**

```
direct-tunnel-disabled-ggsn ipv4/ipv6_address

no direct-tunnel-disabled-ggsn [ ipv4/ipv6_address ]
```

- **no**
  Deletes the direct-tunnel-disabled-ggsn configuration which results in re-enabling direct tunneling to the GGSN.
  - Including an IPv4 or IPv6 address for a specific GGSN, re-enables direct tunneling for that specific GGSN.
  - Excluding any IPv4 or IPv6 address from this command removes all direct-tunnel-disabled-ggsn definitions from the SGTP service configuration.

**Usage**

By default, GGSNs and RNCs are assumed to be capable of direct tunneling. This command disables direct tunneling for a specified GGSN. The command can be repeated to disable direct tunneling for multiple GGSNs, thereby creating a ’disabled GGSN’ list. Checking for a direct-tunnel-disabled GGSN is actually the last step in the PDP Activation procedure.

Restricting direct tunneling by a GGSN for an entire APN would be configured with the appropriate command in the APN profile configuration mode.

Restricting direct tunneling at the RNC level would be configured with the appropriate command in the IuPS service configuration mode.

This command can only be used if:
- The Direct Tunnel license has been purchased and applied.
- The Direct Tunnel feature is appropriately enabled via configurations of the IMEI profile and/or the Call-Control and APN profiles.
- The RNC does not restrict direct tunnel.
- The subscriber is not requesting CAMEL services.

**Example**

Use the following command to disable direct tunnel for the GGSN with the IP address of 141.21.4.20:
direct-tunnel-disabled-ggsn 141.21.4.20
disable-remote-restart-counter-verification

This command disables the SGSN’s default behavior for verification of the remote peer’s (GGSN) restart counter change values.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGTP Service Configuration

configure > context context_name > sgtp-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgtp-service)#

**Syntax**

```
[ default | no ] disable-remote-restart-counter-verification
```

- **default**
  Enables the default behavior for verification of the GGSN’s restart counter change values.

- **no**
  Disables the command configuration and enables the default behavior of verification.

**Usage**

This command disables the default behavior used to minimize PDP deactivations resulting from path failure detection due to erroneous restart counter change messages.

With the execution of this command, the SGSN stops verifying restart counters received in Create PDP Context Response or Update PDP Context Response or Update PDP Context Request (CPCR, CPCR, and UPCQ) messages. When the SGSN detects GTP-C path failure between the SGSN and the GGSN, the SGSN assumes PDP sessions at the GGSN are lost and the SGSN deactivates those PDP sessions towards the UE with an indication that the UE should activate the PDP session again. Potentially, this scenario could cause unnecessary traffic increases within the operator’s network.

The SGSN default behavior provides the ability to manage GTP-C path failures detected as a result of spurious restart counter change value messages received from the GGSN. With the default behavior, path failure detection is based on receipt of restart counter change values in CPCR, CPCR, and UPCQ messages. The session manager informs the SGTPC manager about a changed restart counter value. The SGTPC manager verifies the PDP context status by performing an echo request and echo response with the GGSN. Only then is the path failure confirmed if the echo response contains a new restart counter value. Then the SGTPC manager informs all session managers about the path failure and the session managers begin deactivation of the PDP contexts.

**Related commands:**

- **max-remote-restart-counter-change**, also part of the SGTP service configuration mode, allows the operator to set a maximum variance between stored and received values for restart counter changes coming from the GGSN.
**Example**

Disable the default behavior and stop verification with echo request/response process:

```
   disable-remote-restart-counter-verification
```

Use either of the following commands to enable the default verification behavior:

```
   no disable-remote-restart-counter-verification
   default disable-remote-restart-counter-verification
```
end

Exits the configuration mode and returns to the Exec mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

end

**Usage**

Changes the mode to the Exec mode.
exit

Exits the SGTP Service configuration mode and returns to the Context configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Return to the previous mode.
**ggsn-fail-retry-timer**

This command sets the amount of time that a GGSN will be unavailable.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGTP Service Configuration

```bash
configure > context context_name > sgtp-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgtp-service)#
```

**Syntax**

```bash

ggsn-fail-retry-timer value

no ggsn-fail-retry-timer

no

Removes the timer setting and disables the Local DNS feature.

value

Defines the amount of time, in seconds, that the GGSN is to be considered unavailable. Enter an integer from 60 to 600. Default is 300.
```

**Usage**

Setting this timer to a valid value enables the Local DNS feature - described in the *SGSN Administration Guide*. Setting this timer marks a GGSN in the primary GGSN pool as unavailable for PDP context creation and causes the SGSN to forward a PDP Context Activation Request to a remote pool GGSN, identified via a local (on the SGSN) DNS check. Marking a GGSN unavailable can be done if there is a reason to believe the GGSN is unavailable; for example, lack of response to GTP messages. Marking a GGSN as unavailable is usually done for a limited period to allow the GGSN time to recover.

**Example**

Enable the Local DNS feature and mark the GGSNs in the primary pool as unavailable for 4 minutes (240 seconds):

```bash

ggsn-fail-retry-timer 240
```
gn-delay-monitoring

This command configures monitoring of Gn/Gp interface to check for the delay of packets between the SGSN and the GGSN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGTP Service Configuration

configure > context context_name > sgtp-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgtp-service)#

**Syntax**

```
gn-delay-monitoring [ num-delay number_delayed | num-no-delay-for-clear number_normal | tolerance-seconds number_seconds ]
default gn-delay-monitoring [ num-delay | num-no-delay-for-clear | tolerance-seconds ]
no gn-delay-monitoring
```

---

**default**

Resets the specified parameter to the default value.

---

**no**

Disables Gn/Gp monitoring for delayed GTP-C packets.

---

**num-delay number_delayed**

Defines the number of response messages, coming from the GGSN, that can be delayed (delay time defined by tolerance-seconds parameter) before the delay is flagged to generate an SNMP trap.

`number_delayed`: Enter an integer from 1 to 500, default is 30.

---

**num-no-delay-for-clear number_normal**

Defines the number of consecutive response messages, coming from the GGSN, that must be received without delay (in normal response time) to clear the flag towards the GGSN.

`number_normal`: Enter an integer from 1 to 500, default is 15.

---

**tolerance-seconds number_seconds**

Defines the 'normal' number of seconds the SGSN should wait for a response from the GGSN. After this time, the response would be considered 'delayed'.

`number_seconds`: Enter an integer from 1 to 20, default is 4 seconds.
**Important:** The value for this parameter should be less than the value set for the `retransmission-timeout` parameter of the `gtpc` command, also in this configuration mode.

**Usage**

With this command, the SGSN can monitor the control plane packet delay for GTP-C signaling messages on the SGSN’s Gn/Gp interface towards the GGSN. If the delay crosses this configurable threshold, an alarm will be generated to prompt the operator.

A delay trap is generated when the GGSN response to an ECHO message request is delayed more than a configured amount of time and for a configured number of consecutive responses. When this occurs, the GGSN will be flagged as experiencing delay.

A clear delay trap is generated when successive ECHO Response (number of successive responses to detect a delay clearance is configurable), are received from a GGSN previously flagged as experiencing delay.

This functionality can assist with network maintenance, troubleshooting, and early fault discovery.

**Example**

Enable Gn/Gp monitoring for GTP-C packets that arrive from the GGSN with a delay greater than 5 seconds:

```
    gn-delay-monitoring tolerance-secs 5
```
**gtpc**

Configure the GPRS Tunneling Protocol Control (GTP-C) settings for the SGTP service.

**Product**
- eWAG
- MME
- PDG/TTG
- SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGTP Service Configuration

```bash
configure > context context_name > sgtp-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgtp-service)#
```

**Syntax**

```bash
gtpc { bind address ipv4_address | dns-sgsn context context_name | echo-interval interval_seconds | echo-retransmission { exponential-backoff [ [ min-timeout timeout_seconds ] [ smooth-factor smooth_factor ] + ] | timeout timeout_seconds } | guard-interval interval_seconds | ignore response-port-validation | ip qos-dscp dscp_marking | max-retransmissions max_retransmissions | retransmission-timeout timeout_seconds | send { common_flags | rab-context | target-identification-preamble } | sync-echo-with-peer } 
```

```bash
no gtpc { bind address | dns-sgsn context | echo-interval | send { common_flags | rab-context | target-identification-preamble } | sync-echo-with-peer }
```

```bash
default gtpc { echo-interval | echo-retransmission | guard-interval | ignore response-port-validation | ip qos-dscp | max-retransmissions | retransmission-timeout | send { common_flags | rab-context | target-identification-preamble } | sync-echo-with-peer }
```

---

**no**

Disables the configured GTP-C setting.

---

**default**

Resets the specified parameter to its default value.

---

**bind address ipv4_address**

Binds SGTP service to the IP address of the interface.

The bind address for the `gtpc` and `gtpu` commands should be the same.

`ipv4_address` must be a standard IPv4 address.
**gtpc**

---

**SGTP Service Configuration Mode Commands**

---

**dns-sgsn context context_name**

Identify the context where the DNS client is configured to send the DNS query to get the peer SGSN address. If nothing is configured, the system assumes the DNS client is configured in the same context where the SGTP service is configured.

*context_name:* Enter a string of 1 to 79 alphanumeric characters to identify the context.

There is a `dns-sgsn` command option in the call-control profile, which, if configured, would override the configuration in this SGTP service configuration.

---

**echo-interval interval_seconds**

Configures the duration between echoes.

seconds Enter an integer from 0 through 3600.

Default: 60

---

**echo-retransmission { exponential-backoff [ [ min-timeout timeout_seconds ] [ smooth-factor smooth_factor ] + ] | timeout timeout_seconds }**

Configures the retransmission parameters for GTP-C echo messages. The operator can choose to use either an “exponential-backoff” timers or a “fixed-retransmission” timer:

- **The exponential-backoff** timer uses an exponential backoff algorithm to better manage the GTP-C path during periods of network congestion and to perform exponential-backoff echo timing. The exponential-backoff timer uses a calculated round-trip time (RTT), as well as a configurable factor or a multiplier to be applied to the RTT statistic. Different paths can each have a different RTT, so the exponential-backoff timer can be configured for multiple paths. One or both of the following parameters can be configured to refine the exponential-backoff timer configuration:
  - **min-timeout timeout_seconds:** Specifies the minimum time period (in seconds) for the exponential-backoff echo timer. If the RTT multiplied by the smooth factor is less than this minimum timeout value, then the node uses the value set with this keyword. Range is 1-20. Default is 5.
  - **smooth-factor smooth_factor:** Specifies the multiplier that the exponential-backoff echo timer uses when calculating the time to wait to send retries, when the gateway has not received a response from the peer within value defined for the path echo interval. Range is 1-5. Default is 2.
  - **timeout timeout_seconds:** Configures the number of seconds for the fixed retransmission timeout value for GTP-C echo messages. Range from 1 to 20. Default is 5.

---

**guard-interval interval_seconds**

Configures the interval (in seconds) for which the SGTP maintains responses sent to gateway. This optimizes the handling of retransmitted messages. This value should be configured to be greater than the gateway’s configuration for max-retries multiple by retry-interval.

*interval_seconds:* Enter an integer from 10 to 3600.

Default: 100

---

**ignore response-port-validation**

This keyword instructs the gateway to ignore the response port validation.

For the gateway to process incoming GTP responses to an incorrect port, this keyword must be entered, and the same *bind address* must be configured for GTPC and GTPU in the SGTP service.

Default: Disabled. To reset the default for this parameter, you must enter the following command: `no gtpc ignore response-port-validation`.
ip qos-dscp dscp_marking

Configures theDiffServ code point marking to be used per hop behavior (PHB) when sending GTP-C messages originating from the session manager and SGTPC manager.

Note that CS (class selector) mode options below are provided to support backward compatibility with the IP precedence field used by some network devices. CS maps one-to-one to IP precedence, i.e., CS1 is IP precedence value 1. If a packet is received from a non-DSCP aware router, that used IP precedence markings, then the DSCP router can still understand the encoding as a Class Selector code point.

dscp_marking: Enter one of the following values:

- **af11**: Marks traffic as Assured Forwarding 11 PHB (high throughput data)
- **af12**: Marks traffic as Assured Forwarding 12 PHB (high throughput data)
- **af13**: Marks traffic as Assured Forwarding 13 PHB (high throughput data)
- **af21**: Marks traffic as Assured Forwarding 21 PHB (low latency data)
- **af22**: Marks traffic as Assured Forwarding 22 PHB (low latency data)
- **af23**: Marks traffic as Assured Forwarding 23 PHB (low latency data)
- **af31**: Marks traffic as Assured Forwarding 31 PHB (multimedia streaming)
- **af32**: Marks traffic as Assured Forwarding 32 PHB (multimedia streaming)
- **af33**: Marks traffic as Assured Forwarding 33 PHB (multimedia streaming)
- **af41**: Marks traffic as Assured Forwarding 41 PHB (multimedia conferencing)
- **af42**: Marks traffic as Assured Forwarding 42 PHB (multimedia conferencing)
- **af43**: Marks traffic as Assured Forwarding 43 PHB (multimedia conferencing)
- **be**: Designates use of Best Effort forwarding PHB. This is the default value.
- **cs0**: Designates use of class selector mode 0 PHB.
- **cs1**: Designates use of class selector mode 1 PHB.
- **cs2**: Designates use of class selector mode 2 PHB.
- **cs3**: Designates use of class selector mode 3 PHB.
- **cs4**: Designates use of class selector mode 4 PHB.
- **cs5**: Designates use of class selector mode 5 PHB.
- **cs6**: Designates use of class selector mode 6 PHB.
- **cs7**: Designates use of class selector mode 7 PHB.
- **ef**: Designates use of Expedited Forwarding PHB

Default: be (best effort)

max-retransmissions max_retransmissions

Configures the maximum number of retries for packets.

max_retransmissions: Enter an integer from 0 to 15.

Default: 4

retransmission-timeout timeout_seconds

Configures the control packet retransmission timeout in GTP, in seconds.

timeout_seconds: Enter an integer value from 1 through 20.

Default: 5
SGTP Service Configuration Mode Commands

```
gtpc send { common-flags | rab-context | target-identification-preamble }
```

- **common-flags**: This option configures the SGTP service to include or exclude the common flags IE during an Inter-SGSN RAU. When selected, the default is to send the common flags IE.

**Important**: Sending of common flags must be enabled to configure dual PDP type (IPv4v6) addressing with the `dual-address-pdp` command in the SGSN global configuration mode.

- **rab-context**: This option configures the SGTP service to include/exclude the radio access bearer (RAB) context IE in SGSN ‘context response’ message during Inter-SGSN Routing Area Update procedure. Default is to send the RAB context IE.

- **target-identification-preamble**: This option configures the SGTP service to include the Target Identification IE preamble byte in the target-id of Relocation Requests that it sends. By default, the preamble is not included. In accordance with 3GPP TS 29.060, v9.2.0, if the preamble is included then multiple optional parameters, such as Extended RNC ID, are encoded. Extended RNC ID expands the ID range from 4095 to 65535.

  In situations of MME interaction with the SGSN during SRNS procedures via GTPv1, the SGSN can use this Extended RNC ID field to indicate the Target RNC ID associated with the MME and vice versa.

  Default: sending RAB context IE.

**sync-echo-with-peer**

This keyword is applicable to the SGSN only.

This keyword enables the SGSN to synchronize path management procedures with the peer after a GTP service restart recovery.

After GTP service recovery, the SGSN restarts the timers for GTP echo transmission, hence a drift in echo request transmission time (from the pre-recovery time) can occur causing the SGSN to be out of sync with the peer. By using this keyword, when the SGSN receives the first Echo Request (GTPC or GTPU) from the peer after the GTP service restart, in addition to replying with an ECHO Response, the SGSN transmits an ECHO Request to the peer and the SGSN restarts the timers associated with the path management procedures. This causes the path management procedure at SGSN to synchronize with the peer node.

Default: Enabled

**Usage**

Use this command to configure GTP-C settings for the current SGTP service. Repeat the command as needed to configure all required GTP-C parameters.

**Example**

Following command excludes the radio access bearer (RAB) context IE in the SGSN Context Response message during the inter-SGSN RAU procedure:

```
no gtpc send rab-context
```

Configure the SGSN to send `common flags` with all GTP-C messages:

```
gtpc send common-flags
```

Set the SGSN to use GTPC echo-retransmission with exponential-backoff and both filters set for default:

```
gtpc echo-retransmission exponential-backoff
```
**gtpu**

This command configures the GPRS Tunneling Protocol user data plane parameters (GTP-U) for this SGTP service.

**Product**
eWAG  
PDG/TTG  
SGSN  

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGTP Service Configuration
configure > context context_name > sgtp-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgtp-service)#
```

**Syntax**

```plaintext
gtpu { bind address ipv4_address | echo-interval interval_seconds | echo-retransmission { exponential-backoff { [ min-timeout timeout_seconds ] [ smooth-factor smooth_factor ] + } | timeout timeout_seconds } | max-retransmissions max_retransmissions | retransmission-timeout timeout_seconds | sync-echo-with-peer

no gtpu { bind address ipv4_address | echo-interval | sync-echo-with-peer}

default gtpu { echo-interval | echo-retransmission | max-retransmissions | retransmission-timeout | sync-echo-with-peer }
```

**no**
Removes the configuration for the specified parameter from the current SGTP service configuration.

**default**
 Resets the specified GTP-U parameter to its factory default.

**bind address ipv4_address**
Defines the GTP-U Gn' interface IP address that binds to this SGTP service. The gtpu and the gtpc commands should be configured with the same bind address.
ipv4_address: Enter a standard dotted-quad IPv4 address.

**echo-interval interval_seconds**
Configures the echo interval.
interval_seconds: Enter an integer from 60 through 3600.
Default: 60
echo-retransmission { exponential-backoff [ [ min-timeout timeout_seconds ] [ smooth-factor smooth_factor ] + ] | timeout timeout_seconds

Configures the retransmission parameters for GTP-U echo messages. The operator can choose to use either an “exponential-backoff” timers or a “fixed-retransmission” timer:

- **exponential-backoff** timer uses an exponential backoff algorithm to better manage the GTP-U path during periods of network congestion and to perform exponential-backoff echo timing. The exponential-backoff timer uses a calculated round-trip time (RTT), as well as a configurable factor or a multiplier to be applied to the RTT statistic. Different paths can each have a different RTT, so the exponential-backoff timer can be configured for multiple paths. One or both of the following parameters can be configured to refine the exponential-backoff timer configuration:
  - **min-timeout timeout_seconds**: Specifies the minimum time period (in seconds) for the exponential-backoff echo timer. If the RTT multiplied by the smooth factor is less than this minimum timeout value, then the node uses the value set with this keyword. Range is 1-20. Default is 5.
  - **smooth-factor smooth_factor**: Specifies the multiplier that the exponential-backoff echo timer uses when calculating the time to wait to send retries, when the gateway has not received a response from the peer within value defined for the path echo interval. Range is 1-5. Default is 2.

- **timeout timeout_seconds** Configures the number of seconds for the fixed retransmission timeout value for GTP-U echo messages. Range from 1 to 20. Default is 5.

max-retransmissions max_retransmissions

Configures the maximum number of retries for retransmitting packets.

**max_retransmissions**: Must be an integer from 0 through 15.

Default: 4

retransmission-timeout timeout_seconds

Configures the retransmission timeout of packets, in seconds.

**timeout_seconds**: Must be an integer from 1 through 20.

Default: 5

sync-echo-with-peer

This keyword is applicable to the SGSN only.

This keyword enables the SGSN to synchronize path management procedures with the peer after a GTP service restart recovery.

After GTP service recovery, the SGSN restarts the timers for GTP echo transmission, hence a drift in echo request transmission time (from the pre-recovery time) can occur causing the SGSN to be out of sync with the peer. By using this keyword, when the SGSN receives the first Echo Request (GTPC or GTPU) from the peer after the GTP service restart, in addition to replying with an ECHO Response, the SGSN transmits an ECHO Request to the peer and the SGSN restarts the timers associated with the path management procedures. This causes the path management procedure at SGSN to synchronize with the peer node.

Default: Enabled

Usage

Use this command to configure the GTP-U settings for the SGTP service.

Example

Set the GTPU echo-interval for 5 seconds:
gtpu echo-interval 5

Set the gateway to use GTP-U echo-retransmission with exponential-backoff and the smooth-factor set for 4:

gtpc echo-retransmission exponential-backoff smooth-factor 4
ignore-remote-restart-counter-change

With the inclusion of the `disable-remote-restart-counter-verification` command, this command has been deprecated.
max-remote-restart-counter-change

Use this command to set a restart counter change window to avoid service deactivations and activations that could cause large bursts of network traffic if the restart counter change messages from the GGSN are erroneous.

**Product**
eWAG
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGTP Service Configuration

```
configure > context context_name > sgtp-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ugtp-service)#
```

**Syntax**

```
max-remote-restart-counter-change variance

default max-remote-restart-counter-change
```

**Syntax**

<table>
<thead>
<tr>
<th>default</th>
<th>If this keyword is used or if a variance window is not configured, then the default value will be 255 and the default behavior will be to detect a restart on any change.</th>
</tr>
</thead>
</table>

**Syntax**

<table>
<thead>
<tr>
<th>variance</th>
<th>Set a number (an 8-bit value) that will define the variance range for restart counter change values compared between the gateway's stored value and the value received in messages from the GGSN. Valid entry is an integer from 1 to 255; default is 255. Value of 32 is recommended as it provides a sufficient window to allow the gateway to handle delayed messages with old restart counters.</th>
</tr>
</thead>
</table>

**Usage**

When the gateway detects GTP-C path failure between the gateway and the GGSN, the gateway assumes PDP sessions at the GGSN are lost and the gateway deactivates corresponding PDP sessions towards the UE with an indication that the UE should activate the PDP session again. Detection is based on receipt of restart counter change values in Create PDP Context Response or Update PDP Context Response or Update PDP Context Request (CPCR/UPCR/UPCQ) messages. Potentially, this scenario can cause major traffic increases within the operator's network. It is possible that the messages received from the GGSN are spurious. The gateway default behavior provides the ability to verify possible GTP-C path failures detected as a result of spurious restart counter change messages received from the GGSN. With the default behavior, the session manager informs the SGTPC manager about a changed restart counter value. The SGTPC manager responds by verifying the PDP context status by performing an Echo Request / Echo Response with the GGSN. If the Echo Response includes a new restart counter change value, then the session manager considers the path failure confirmed and begins the PDP context deactivation sequence.
Use this command to avoid unnecessary path failures and deactivations by setting a restart counter change value 'window' or range of values. With this window, the gateway only accepts linearly increasing values for restart counter change values that are within the specified range of accepted changes before the SGTPC manager verifies. For example, if the allowed window for restart counter change value is set to 32 and the last learnt restart counter change value from the GGSN is 15, then the gateway should detect a restart only if the new restart counter value is between 16 and 47 (range of 32) and then the gateway would verify with the Echo Request/Response. If the received restart counter change value was 200 and the current learnt value was 15 with a window of 32, then the 200 would be ignored as a spurious value.

Also, use this command to set a restart counter change values window to avoid possible 'race conditions' (as defined in 3GPP TS 23.007 v8.7.0) where a new message arrives prior to an older message. This 'race condition' occurs when the gateway's stored restart counter value for the GGSN is larger than the restart counter value received in the messages received from the GGSN.

Related commands:

- disable-remote-restart-counter-verification - also part of the SGTP service configuration mode, this command allows the operator to disable the default behavior.

- pdp-deactivation-rate, in the SGSN Global configuration mode, this allows the operator to modify the rate the gateway deactivates PDP connections when GPT-C path failure is detected.

- ignore-remote-restart-counter, also part of the SGTP service configuration mode.

Example

Use the following command to configure an allowed restart counter change value window of 32:

```
max-remote-restart-counter-change 32
```
mbms

Enables / disables the Multimedia Broadcast Multicast Service.

**Important:** The mbms command and parameter-configuring keywords are under development for future release and should not be used or included in your configuration at this time.
path-failure

This command specifies the method for determining if path failure has occurred.

Product

eWAG
SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > SGTP Service Configuration
configure > context context_name > sgtp-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgtp-service)#

Syntax

path-failure detection-policy gtp { echo | non-echo } +
{ default | no } path-failure detection-policy

- default
  Resets the specified path failure parameter to default.
  Default: echo (for both GTPC and GTPU)

- no
  Deletes the path-failure definition from the configuration.

- echo
  Path failure is detected when the retries of echo messages time out.

- non-echo
  Path failure is detected when the retries of non-echo messages time out.

Usage

Use this command to define the policy to detect gtp path failure.

Example

Set echo as the policy detection type:

    path-failure detection-policy gtp echo
pool

This command enables the default SGSN functionality for (flex) pooling and enables inclusion of the configured pool hop-counter count in new SGSN context/identify request messages.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SGTP Service Configuration

configure > context context_name > sgtp-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgtp-service)#
```

**Syntax**

```
pool { default-sgsn | hop-counter count }
no pool { default-sgsn | hop-counter }

default pool hop-counter
```

**no**

Disables the default SGSN pooling functionality or removes the SGSN pool hop-counter IE from the GTP Identity/context requests.

**default**

Removes the SGSN pool hop-counter IE from the GTP Identity/context requests.

**default-sgsn**

Enables default SGSN pooling functionality.

**hop-counter count**

Enables and configures the SGSN pool hop-counter to set the number of hops and to include the configured count in the new SGSN Context Requests or the new SGSN Identify Requests.

If `default-sgsn` is enabled, then any messages relayed will have the default value of 4 for the counter if the message does not include this hop-counter ID.

`count`: Enter an integer from 1 to 255.

Default: 4

**Usage**

Use this command to enable the default flex functionality without exposing the pool (flex) structure. This functionality provides a means for SGSNs outside of the pool to reach a pooled SGSN on the basis of its NRI. Once the pooling has been enabled. Repeat the command using the `hop-counter` keyword to enable inclusion of the hop-counter IE in SGSN context/identify request messages and to configure the count for the
pooling hop-counter. If the SGSN is behaving as the ‘default SGSN’, this SGSN will forward (relay) requests with the hop-count included to the target SGSN.

Example

Enable the default pooling functionality which allows an outside SGSN to reach a pooled SGSN:

```
pool default-sgsn
```

Set the hop-count to be included in messages to 25:

```
pool hop-count
```
Chapter 286
S-GW Service Configuration Mode Commands

The S-GW (Serving Gateway) Service Configuration Mode is used to create and manage the relationship between an eGTP service used for either ingress or egress control plane and user data plane network traffic.

Mode

Exec > Global Configuration > Context Configuration > S-GW Service Configuration

configure > context context_name > sgw-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgw-service)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
accounting context

Configures the GTPP accounting context and group selection for S-GW service.

Product
S-GW
SAEGW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > S-GW Service Configuration

configure > context context_name > sgw-service service_name

Entering the above command sequence results in the following prompt:

[context_name] host_name(config-sgw-service)#

Syntax

accounting context name [ gtpp group name ]

no accounting context

no

Removes the configured accounting context from this service.

context name

Specifies the context where GTPP accounting is performed.

name must be an existing context configured on the system expressed as an alphanumeric string of 1 through 79 characters.

If an accounting context name is not configured in the S-GW service, the context where the S-GW service resides is considered the accounting context and the default GTPP group is used.

gtpp group name

Specifies a GTPP group used to perform GTPP accounting.

name must be an existing GTPP group configured on the system expressed as an alphanumeric string of 1 through 79 characters.

If a GTPP group is not configured, the system will use the default GTPP group in the specified accounting context. If the accounting context is not specified, the system will use default GTPP group in the context where the S-GW service resides.

Usage

Use this command to specify the accounting context and/or GTPP accounting group the S-GW service will use to perform GTPP accounting.

Example

The following command specifies a GTPP accounting context named acct-2 and a GTPP accounting group named gtpp-grp-3 as the context and group the S-GW service will use:
accounting context acct-2 gtp-p group gtpp-grp-3
accounting mode

Configures the mode to be used for accounting – GTPP (default), RADIUS/Diameter or None for S-GW service.

Product
S-GW
SAEGW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > S-GW Service Configuration

configure > context context_name > sgw-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgw-service)#

Syntax

[ default ] accounting mode { gtpp | none | radius-diameter }

default
Sets the accounting mode to GTPP.

gtpp
Specifies that GTPP accounting is performed. This is the default mode.

none
Specifies that no accounting will be performed for the S-GW service.

radius-diameter
Specifies that RADIUS/Diameter will be performed for the S-GW service.

Usage
Use this command to specify the accounting mode for the S-GW service. However, an accounting mode configured for the call-control profile will override this setting. For additional information on accounting mode and its relationship to operator policy, refer to the Serving Gateway Administration Guide.

Example
The following command specifies that RADIUS/Diameter accounting will be used for the S-GW service:

    accounting mode radius-diameter
accounting stop-trigger

Configures the trigger point for accounting stop CDR. Default is on session deletion request.

Product
S-GW
SAEGW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > S-GW Service Configuration

configure > context context_name > sgw-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgw-service)#

Syntax

accounting stop-trigger custom

default accounting stop-trigger

default

Accounting stop CDR triggered once Delete Session/Delete Bearer Request is received at S-GW.

custom

Synchronizes the timestamp in the SGWRECORD CDR and PGWRECORD CDR if the MME cannot reach the UE. When configured, the SGW will also trigger the Accounting stop CDR after receiving the answer (accept for Delete session request) from the MME.

Usage

Use this command to specify the trigger point for accounting stop CDR for this S-GW service.

Example

The following command specifies that accounting stop trigger would be at response of session deletion:

    accounting stop-trigger custom
associate

Associates the S-GW service with QoS and policy control and charging configurations.

Product

S-GW
SAEGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > S-GW Service Configuration

configure > context context_name > sgw-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgw-service)#

Syntax

associate { access-peer-map | accounting-policy name | egress-proto { gtp | gtp-pmip | pmip } [ egress-context name ] [ egtp-service name ] [ mag-service name ] } | ims-auth-service name | ingress egtp-service name | qci-qos-mapping name | subscriber-map name

no associate { access-peer-map | accounting-policy | egress-proto [ egress-context [ egtp-service ] [ mag-service ] ] | ims-auth-service | ingress egtp-service | peer-map | qci-qos-mapping | subscriber-map }

no

Removes the specified association form the S-GW service.

access-peer-map name

Associates the access/ingress side of the peer-map to the configured S-GW service.

name must be an existing peer-map expressed as an alphanumeric string of 1 through 63 characters.

accounting-policy name

Associates the S-GW service with an accounting policy configured in the same context.

name must be an existing accounting policy expressed as an alphanumeric string of 1 through 63 characters.

Accounting policies are configured through the policy accounting command in the Context Configuration Mode.

egress-proto { gtp | gtp-pmip | pmip } [ egress-context name ] [ egtp-service name ] [ mag-service name ]

Associates and configures the egress protocol for this S-GW service.

gtp: Specifies that GTP is to be used for the S-GW service egress.
gtp-pmip: Specifies that either GTP or PMIP is to be used for the S-GW service egress.

pmip: Specifies that PMIP is to be used for the S-GW service egress.
egress-context name: Specifies that the context in this keyword is to be used for the S-GW service egress.
name must be an existing context on this system expressed as an alphanumeric string of 1 through 63 characters.

egtp-service name: Specifies that the service in this keyword is to be used for the S-GW service egress.
name must be an existing eGTP service on this system expressed as an alphanumeric string of 1 through 63 characters.

mag-service name: Specifies that the service in this keyword is to be used for the S-GW service egress.
name must be an existing MAG service on this system expressed as an alphanumeric string of 1 through 63 characters.

ims-auth-service name
Associates the S-GW service with an IMS authorization service configured in the same context.
name must be an existing IMS auth service and be from 1 to 63 alphanumeric characters.
IMS authorization services are configured through the ims-auth-service command in the Context Configuration Mode.

ingress egtp-service name
Associates and configures the eGTP service ingress for this S-GW service.
name must be an existing eGTP service on this system expressed as an alphanumeric string of 1 through 63 characters.

peer-map name
Associates the access/ingress side of the peer-map to the configured S-GW service
name must be an existing peer-map configuration expressed as an alphanumeric string of 1 through 63 characters.

qci-qos-mapping name
Associates the S-GW service with QCI to QoS mapping parameters.
name must be an existing QCI-QoS mapping configuration expressed as an alphanumeric string of 1 through 63 characters.
QCI-QoS mapping is configured through the qci-qos-mapping command in the Global Configuration Mode.

subscriber-map name
Associates the S-GW service with subscriber map parameters.
name must be an existing subscriber map configuration expressed as an alphanumeric string of 1 through 63 characters.
Subscriber maps are configured through the subscriber-map command in the LTE Policy Configuration Mode.

Usage
Use this command to select a pre-configured QoS mapping and/or policy control and charging configuration to be used by the S-GW service.

Example
The following command associates the S-GW service with an IMS authorization service named ims-23:

```
associate ims-auth-service ims-23
```
**ddn failure-action**

Configures a timer value to delay paging for this UE when the S-GW has initiated a Downlink Data Notification (DDN) to the MME and has received back a DDN failure.

**Product**

S-GW
SAEGW

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > S-GW Service Configuration

```
configure > context context_name > sgw-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgw-service)#
```

**Syntax**

```

ddn failure-action pkt-drop-time seconds

default ddn failure-action pkt-drop-time
```

**ddn failure-action pkt-drop-time**

```
default
```

Sets the command to its default setting of 300 seconds.

```
failure-action pkt-drop-time seconds
```

Default: 300

Configures a timer that determines how long the S-GW will discard downlink data packets so the MME has enough time to receive the Modify Bearer Request and prevent further errors being sent to the S-GW in the DDN Ack message.

`seconds` must be an integer value from 1 to 300.

**Usage**

Use this command to set a timer value to delay the sending of excessive Downlink Data Notification messages to the MME (and receiving excessive DDN Ack message with errors from the MME) in cases when downlink data is arriving before the Modify Bearer Request is received. During the delay, downlink data packets are discarded until the timer has expired. This timer is triggered upon receiving the first error in a DDN Ack message from the MME.

**Related Functionality**

DDN Delay: By default, the S-GW supports the delay value IE included in a DDN acknowledgement message. The S-GW automatically multiplies this value by 50 ms, then applies the calculated delay for DDN for the UE.

**Example**

---

---
The following command configures the S-GW to discard downlink data packets for 200 seconds after the S-GW receives an error in a DDN Ack message from the MME:

```
.ddn failure-action pkt-drop-time 200
```
ddn isr-sequential-paging

Configures the delay time in 100 millisecond increments between paging of different RAT types in support of the Intelligent Paging for ISR feature.

Product
S-GW
SAEGW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > S-GW Service Configuration

Syntax

ddn isr-sequential-paging delay-time delay

default ddn isr-sequential-paging

default
Returns the delay time to its default value of 10 (10 * 100 ms = 1 second).

delay-time delay
Configures delay between paging of different RAT types.
delay must be an integer from 1 to 255, representing increments of 100 milliseconds (delay = 1-255 * 100 ms).
Default: 10 (10 * 100 ms = 1 second)

Usage
Use this command to configure the delay time in (100 millisecond increments) between paging of different RAT types in support of the Intelligent Paging for ISR feature.

Example
The following command configures the delay timer to 5 seconds

ddn isr-sequential-paging delay-timer 50
**ddn throttle**

Configures Downlink Data Notification throttle parameters.

**Product**
S-GW
SAEGW

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > S-GW Service Configuration
configure > context context_name > sgw-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgw-service)#
```

**Syntax**

```
ddn throttle arp-watermark arp_value [ rate-limit limit time-factor seconds throttle-factor percent increment-factor percent [ poll-interval seconds ] throttle-time-sec seconds [ throttle-time-min minutes ] [ throttle-time-hour hour ] stab-time-sec seconds [ stab-time-min minutes ] [ stab-time-hour hour ]
```

```
no ddn-throttle
```

**no**

Disables the DDN throttling feature.

```
throttle arp-watermark arp_value
```

If ARP watermark is configured and if an MME/SGSN sends the throttling factor and delay in a DDN ACK message, all the DDNs which have an ARP value greater than the configured value will be throttled by the throttle factor for the specified delay.

`arp_value` is an integer from 1 through 15.

```
rate-limit limit
```

Configures the rate limit (Use this and subsequent tokens to rate-limit only if the MME is a Non-Release 10 MME).

`limit` is an integer from 1 through 999999999.

```
time-factor seconds
```

Configures the time duration during which the S-GW makes throttling decisions.

`seconds` is an integer from 1 to 300.

```
throttle-factor percent
```

Configures the DDN throttling factor. Enter the percentage of the DDN to be dropped upon detecting a DDN surge.

`percent` is an integer from 1 through 100.
**increment-factor** `percent`

Configures the DDN throttling increment factor. Enter the percentage by which the DDN throttling should be increased.

`percent` is an integer from 1 through 100.

**poll-interval** `seconds`

Configures the polling interval in DDN throttling.

`seconds` is an integer from 2 through 999999999.

**throttle-time-sec** `seconds`

Configures the DDN throttling time in seconds. Enter time period in seconds over which DDN are throttled at the S-GW.

`seconds` is an integer from 0 through 59.

**throttle-time-min** `minutes`

Configures the DDN throttling time in minutes. Enter time period in minutes over which DDN are throttled at the S-GW.

`minutes` is an integer from 0 through 59.

**throttle-time-hour** `hour`

Configures the DDN throttling time in hours. Enter time period in hours over which DDN are throttled at the S-GW.

`hour` is an integer from 0 through 310.

**stab-time-sec** `seconds`

Configures the DDN throttling stabilization time in seconds. Enter a time period in seconds over which if the system is stabilized, throttling will be disabled.

`seconds` is an integer from 0 through 59.

**stab-time-min** `minutes`

Configures the DDN throttling stabilization time in minutes. Enter a time period in minutes over which if the system is stabilized, throttling will be disabled.

`minutes` is an integer from 0 through 59.

**stab-time-hour** `hour`

Configures the DDN throttling stabilization time in hours. Enter a time period in hours over which if the system is stabilized, throttling will be disabled.

`hour` is an integer from 0 through 310.

**Usage**

Use this command to throttle DDNs to allow for the creation of the tunnel and avoid unnecessary DDNs.

For a UE in idle mode, S1U bearers are not established. In such a case, if a downlink packet arrives for the UE, the S-GW initiates a paging procedure towards the MME. The MME in turn pages the UE in its tracking area to search for the UE. Upon receiving the paging request, the UE establishes S1U bearers. Too many DDN requests towards the MME from the S-GW could overload the MME. To reduce this load, the MME
can dynamically request S-GW to reduce a certain percentage of DDN messages sent towards it for a given period time.
The S-GW supports the following IEs for this feature:

- ARP IE in Downlink Data Notification
- DL Low Priority Traffic Throttling IE in DDN Acknowledge Message

More information is available in Release 10 of 3GPP 29.274, section 5.3.4.3.
The S-GW supports DDN throttling for up to 24 MMEs. DDNs for additional MMEs (25+) will be sent as normal and will not be throttled.
Throttling statistics can be viewed by issuing the Exec mode command:

`show sgw-service statistics all`

**Example**

The following command sets the ARP watermark lowest priority to 10 seconds:

```
.ddn throttle arp-watermark 10
```

If the ARP value provided is 10, all bearers with ARP value between 10-15 are treated as low priority bearers and are given throttling treatment. Throttling would not be enabled if the ARP value is not provided through S-GW service configuration. Also, the ARP IE in DDN message towards MME would not be included unless DDN throttling is configured in S-GW service.
egtp-service

Configures an eGTP service to use as either an ingress (S1-U) or egress (S5/S8) service for the S-GW.

Product
S-GW
SAEGW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > S-GW Service Configuration
configure > context context_name > sgw-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgw-service)#

Syntax

egtp-service { egress { context name | service name } | ingress service name }

no egtp-service { egress { context | service } | ingress service }

no

Removes the selected EGTP service from this service.

egress { context name | service name }

Specifies the egtp-service to be used as the egress eGTP service on a GTP-based S5/S8 interface.
context name: Specifies the name of the context where the eGTP service resides.
name must be an existing context name where an eGTP service resides expressed as an alphanumeric string of 1 through 63 characters.

service name: Specifies the name of the egress eGTP service.
name must be an existing eGTP service name expressed as an alphanumeric string of 1 through 63 characters.

ingress service name

Specifies the egtp-service to be used as the ingress eGTP service on the S11 interface.
name must be an existing eGTP service name expressed as an alphanumeric string of 1 through 63 characters.

Usage
Use this command to configure the eGTP service to use with this S-GW service. The eGTP service must be existing and be configured with the appropriate parameters supporting the intended service type.

Example
The following command configures the S-GW service to use an eGTP service named slu-egtp as its ingress service:

    egtp-service ingress service slu-egtp
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Use this command to return to the Exec mode.
**exit**

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
gtpu-error-ind

Configures the actions to be taken upon receiving a GTP-U error indication from an RNC, eNodeB, SGSN, or P-GW.

**Product**

S-GW  
SAEGW

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > S-GW Service Configuration

```bash
configure > context context_name > sgw-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgw-service)#
```

**Syntax**

```bash
 gtpu-error-ind { { s12 | s1u } { local-purge | page-ue [ custom1-behavior ] } | { s4u | s5u } { local-purge | signal-peer } }

default gtpu-error-ind { s12 | s1u | s4u | s5u }
```

**default**

Resets the command to the default action for the specified interface. For S12 and S1-U, `page-ue` is the default action. For S4-U and S5-U, `local-purge` is the default action.

```bash
{ s12 | s1u } { local-purge | page-ue [ custom1-behavior ] } 
```

Specifies the action to take when a GTP-U error indication is received from a Radio Network Controller (RNC) over an S12 interface or from an eNodeB over the S1-U interface.

**local-purge:** The S-GW clears the affected bearer (or PDN if error-indication is received on default bearer) locally without informing peer.

**page-ue [ custom1-behavior ]:** The S-GW moves the complete UE state to S1-Idle and starts paging for this UE. If the custom1-behavior option is specified, the S-GW will guard the paging attempt with a timer of 60 seconds. Within this time the bearer must have the eNodeB TEID refreshed by an MME. Otherwise, the S-GW will clear the affected bearer with signaling. This is the default action for GTP-U error indication messages received on the S12 and S1-U interfaces.

```bash
{ s4u | s5u } { local-purge | signal-peer }
```

Specifies the action to take when a GTP-U error indication is received from an SGSN over an S4-U interface or from a P-GW over the S5-U interface.

**local-purge:** The S-GW clears the affected bearer (or PDN if error-indication is received on a default bearer) locally without informing the peer. This is the default action for GTP-U error indication messages received on the S4-U and S5-U interfaces.

**signal-peer:** The S-GW initiates control signalling towards the peer MME and P-GW. When signalling:

- For a bearer deletion, the S-GW sends a Delete-Bearer-Command message to the P-GW and a Delete-Bearer-Request (with EBI) message to the MME.
For PDN deletion, the S-GW sends a Delete-Session-Request message to the P-GW and a Delete-Bearer-Request (with LBI) message to the MME.

The S-GW will not wait for Delete replies from the peer. The request will be sent only once and local resources will be reset.

**Usage**

Use this command to specify the action to taken upon receiving a GTP-U error indication from an RNC over an S12 interface, an eNodeB across an S1-U interface, an SGSN over an S4-U interface, or from a P-GW across an S5-U interface.

**Example**

The following command sets the action to take upon receipt of a GTP-U error indication from the eNodeB to clear affected bearer:

```
gtpu-error-ind s1u local-purge
```
**mag-service**

Identifies the Mobile Access Gateway (MAG) egress service through which calls are to be routed for this S-GW service.

**Product**

S-GW

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > S-GW Service Configuration

```bash
configure > context context_name > sgw-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgw-service)#
```

**Syntax**

```bash
mag-service egress service name
no mag-service egress service
```

**no**

Removes the configured MAG egress service from this service.

```bash
egress service name
```

Specifies the MAG service name to be used as the egress MAG service on a Proxy Mobile IPv6 (PMIP) based S5/S8 interface.

`name` must be an existing MAG service expressed as an alphanumeric string of 1 through 63 characters.

**Usage**

Use this command to specify the name of the MAG service where calls are to be routed.

**Example**

The following command specifies that an existing MAG service named `mag3` is to be used to route call through for this S-GW service:

```bash
mag-service egress service mag3
```
ntsr session-hold timeout

Configures a timer to hold the session after path failure is detected at the MME (for Network Triggered Service Restoration).

Product
S-GW

Privilege
Administrator, Security Administrator

Mode
Exec > Global Configuration > Context Configuration > S-GW Service Configuration

`configure > context context_name > sgw-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-sgw-service)#
```

Syntax

```
[ no ] ntsr session-hold timeout seconds
```

`no`

Disables the NTSR session-hold timeout.

```
ntsr session-hold timeout seconds
```

Configures the timer duration, in seconds, that determines how long the session will be held after path failure is detected during MME restoration. Valid entries are from 1 to 3600 seconds.

Usage

Use this command to configure the timer duration, in seconds, that determines how long the session will be held after path failure is detected during MME restoration.

Example

To configure the ntsr session-hold timeout for 10 seconds.

```
ntsr session-hold timeout 10
```
page-ue

Allows the S-GW to page the UE for P-GW-initiated procedures (Create Bearer Request (CBR)/Modify Bearer Request (MBR)/Update Bearer Request (UBR)) when the UE is idle, and sends a failure response to the P-GW with the cause code 110 (Temporary Failure) when the UE is idle or a collision is detected at the S-GW.

Product
S-GW
SAEGW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > S-GW Service Configuration
configure > context context_name > sgw-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgw-service)#

Syntax

[ default | no ] page-ue pgw-initiated-proc

- **default**
  Returns the command to its default setting of disabled.

- **no**
  Disables the feature.

- **pgw-initiated-proc**
  Sets the command to page the UE for P-GW initiated MBR, UBR, and CBR procedures.

Usage

Use this command to allow the S-GW to page a UE for P-GW-initiated procedures (CBR/MBR/UBR) when the UE is idle, and sends a failure response to the P-GW with the cause code 110 (Temporary Failure) when the UE is idle or a collision is detected at the S-GW.

Example

The following command enable the S-GW to page the UE
path-failure

Configures the action to take upon the occurrence of a path failure between the S-GW and the MME, P-GW, RNC, SGSN, or eNodeB.

**Product**
S-GW
SAEGW

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > S-GW Service Configuration

```
configure > context context_name > sgw-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgw-service)#
```

**Syntax**

```
path-failure { s11 | s12 | s1u | s4 | s4u | s5 | s5u } ( local-purge | signal-peer )
```

```
default path-failure { s11 | s12 | s1u | s4 | s4u | s5 | s5u }
```

**default**

Returns the command to the default setting of “local purge” for the selected interface.

```
{ s11 | s12 | s1u | s4 | s4u | s5 | s5u }
```

Specifies the interface to which the action will be applied.

- **s11**: Applies the path failure action to the S11 interface between the S-GW and the MME.
- **s12**: Applies the path failure action to the S12 interface between the S-GW and the RNC.
- **s1u**: Applies the path failure action to the S1-U interface between the S-GW and the eNodeB.
- **s4**: Applies the path failure action to the S4 control plane interface between the S-GW and the SGSN.
- **s4u**: Applies the path failure action to the S4-U user plane interface between the S-GW and the SGSN.
- **s5**: Applies the path failure action to the S5 interface between the S-GW and the P-GW.
- **s5u**: Applies the path failure action to the S5-U user plane interface between the S-GW and the P-GW.

```
{ local-purge | signal-peer }
```

Specifies the action to apply to the selected interface.

- **local-purge**: The S-GW clears the affected bearer (or PDN if path failure is received on a default bearer) locally without informing the peer. This is the default action for all interface.
- **signal-peer**: The S-GW initiates control signalling towards the peer MME and P-GW. When signalling:
  - For a bearer deletion, the S-GW sends a Delete-Bearer-Command message to the P-GW and a Delete-Bearer-Request (with EBI) message to the MME.
  - For PDN deletion, the S-GW sends a Delete-Session-Request message to the P-GW and a Delete-Bearer-Request (with LBI) message to the MME.
The S-GW will not wait for Delete replies from the peer. The request will be sent only once and local resources will be reset.

**Usage**

Use this command to specify the type of action to take when a path failure occurs on one of the supported interfaces.

**Example**

The following command sets the path failure action for the S5 interface to “signal peer”:

```
path-failure s5 signal-peer
```
pgw-fteid-in-relocation-cs-rsp

Controls the sending of the PGW Fully Qualified Tunnel Endpoint Identifier (FTEID) for relocation Create Session Response procedures with an S-GW change.

**Product**
S-GW

**Privilege**
Administrator, Security Administrator

**Mode**
Exec > Global Configuration > Context Configuration > S-GW Service Configuration

```plaintext
configure > context context_name > sgw-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgw-service)#
```

**Syntax**

```plaintext
[no] pgw-fteid-in-relocation-cs-rsp
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Disables the sending of the P-GW FTEID in Create Session Response procedures where there is an S-GW relocation change. This is the default setting.</td>
</tr>
<tr>
<td><code>pgw-fteid-in-relocation-cs-rsp</code></td>
<td>Enables the sending of the P-GW FTEID in Create Session Response procedures where there is an S-GW relocation change.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to control the sending of the PGW Fully Qualified Tunnel Endpoint Identifier (FTEID) for relocation Create Session Response procedures with an S-GW change. For backward compatibility with earlier 3GPP release peer nodes requiring the P-GW FTEID in the Create Session Response procedures, this configurable can be enabled.

**Example**

To enable the sending of the FTEID for relocation Create Session REsponse procedures with an S-GW change..

```plaintext
pgw-fteid-in-relocation-cs-rsp
```
plmn

Configures the public land mobile network (PLMN) identifiers for this S-GW service.

**Product**
S-GW
SAEGW

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > S-GW Service Configuration

```
configure > context context_name > sgw-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-sgw-service)#
```

**Syntax**

```
plmn id mcc number mnc number [ primary ]
no plmn id mcc number mnc number
```

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
</table>
| Removes the configured PLMN ID for this S-GW service.

<table>
<thead>
<tr>
<th>mcc number</th>
</tr>
</thead>
</table>
| Configures the Mobile Country Code for this PLMN ID.  
*number* must be an integer from 100 through 999.

<table>
<thead>
<tr>
<th>mnc number</th>
</tr>
</thead>
</table>
| Configures the Mobile Network Code for this PLMN ID.  
*number* must be a 2- or 3-digit integer from 00 through 999.

<table>
<thead>
<tr>
<th>primary</th>
</tr>
</thead>
</table>
| Specifies that this is the primary PLMN ID for this S-GW service.

**Usage**

The PLMN identifier is used by the S-GW service to determine whether or not a mobile station is visiting, roaming, or home. Multiple S-GW services can be configured with the same PLMN identifier. Up to five PLMN IDs can be configured for each S-GW Service. In Release 15.0 and later, up to 15 PLMN IDs can be configured.

**Example**

The following command configures a “primary” PLMN ID for this S-GW service with an MCC of 123 and an MNC of 12:

```
plmn id mcc 123 mnc 12 primary
```
reporting-action

Configures the system to start reporting session events.

Product
S-GW
SAEGW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > S-GW Service Configuration

configure > context context_name > sgw-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgw-service)#

Syntax

[ no ] reporting-action event-record [ trigger active-idle ]

default reporting-action event-record

default

Returns the command to its default setting of disabled.

no

Disables session event reporting.

trigger active-idle

Specifies that the event is only to be reported upon the going from active to idle.

Usage

Use this command to enable the session event reporting feature on the S-GW.

Example

The following command enables event reporting but does not limit it to events triggered by going active to idle:

reporting-action event-record
timeout idle

This command removes S-GW sessions that remain idle for longer than the configured time limit.

Product
S-GW
SAE-GW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > S-GW Service Configuration

configure > context context_name > sgw-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-sgw-service)#

Syntax

timeoutidle dur_seconds

timeout idle

 Enables the S-GW session idle timer.

dur_seconds

 Specifies the time limit, in seconds, after which the SGW session will be torn down. Valid entries are from 0 to 4294967295.

Usage

The S-GW session idle timer removes stale sessions in those cases where the session is removed on the other nodes but due to some issue remains on the S-GW. Once configured, the session idle timer will tear down such sessions that remain idle for longer than the configured time limit. The implementation of the session idle timer allows the S-GW to more effectively utilize system capacity.

Example

The following example configures the S-GW session idle timer 3600 seconds (one minute).

timeout idle 3600
Chapter 287
SMS Service Configuration Mode Commands

The SMS (short message service) Service configuration mode is used to create and manage properties of the SMS Service configuration.

The SGSN uses the SMS Service component to communicate via the Gd interface with a gateway message service controller (GMSC) to send short text messages (up to 140 octets in length) to a mobile (SMS-MT) and/or receive messages from a mobile (SMS-MO).

**Mode**

Exec > Global Configuration > Context Configuration > MAP Service Configuration > SMS Service Configuration

```
configure > context context_name > map-service service_name > short-message-service
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-map-service-service_name-sms-service)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**cp-data**

Enables the SGSN to send and/or receive cp-data (text messages).

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MAP Service Configuration > SMS Service Configuration

configure > context context_name > map-service service_name > short-message-service

Entering the above command sequence results in the following prompt:

```plaintext
[context_name]host_name(config-map-service-service_name-sms-service)#
```

**Syntax**

```plaintext
cp-data max-retransmission retries_num

default cp-data max-retransmissions
```

- **default**
  
  This keyword resets the SGSN’s max-retransmission to the default number of retries.

- **max-retransmission retries_num**
  
  ```plaintext
  retries_num: enter an integer from 1 to 3.
  ```

**Usage**

Use this command to configure the number of times the SGSN will attempt to retransmit a message.

**Example**

```plaintext
cp-data max-retransmission 2
```
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ext
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
mo-message-forwarding-destination

This command defines the SGSN’s handling policy for MO (mobile originating) message.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MAP Service Configuration > SMS Service Configuration
configure > context context_name > map-service service_name > short-message-service

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-map-service-service_name-sms-service)#`

**Syntax**

```
[ default ] mo-message-forwarding-destination { gmsc-selected-from-imsi | smsc-supplied-by-subscriber }
```

---

**default**

Resets the SMS service configuration to the default message forwarding technique.

---

**gmsc-selected-from-imsi**

Entering this keyword enables SMS-MO messages to be forwarded on the basis of their IMSI prefix.

---

**smsc-supplied-by-subscriber**

Entering this keyword enables SMS-MO messages to be forwarded on the basis of the SMSC (SMS controller) address provided by the subscriber.

---

**Usage**

Use this command to define how the mobile originated SMS are to be routed.

**Example**

```
mo-message-forwarding-destination gmsc-selected-from-imsi
```
smsc-address-restriction-list

Define the list of SMS-C addresses to be screened.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MAP Service Configuration > SMS Service Configuration

```
configure > context context_name > map-service service_name > short-message-service
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-map-service-service_name-sms-service)#
```

**Syntax**

```
smisc-address-restriction-list isdn-no +

no smisc-address-restriction-list isdn-no
```

- **no**
  - Delete an SMS-C address (ISDN number) from the list.

  ```
isdn-no +
  ```

- **isdn-no +**
  - Enter up to 10 ISDN numbers, each up to 15 digits. Put a single space, without a comma, between each ISDN number being added to the list with one command.

**Usage**

Use this command to identify a list of SMS-C that are to be screened and restricted from receiving forwarded SMS. This list is part of the SMS-C address denial mechanism. For the mechanism to actually function, a second command must be configured, the `smsc-address-restriction-list` command.

**Example**

Add 3 ISDN numbers to the list of restricted SMS-C addresses.

```
smsc-address-restriction-list 443719933751427 422311198977765 901231445513131
```

Remove an ISDN number from the list of restricted SMS-C addresses.

```
no smisc-address-restriction-list 443719933751427
```
smsc-address-restriction-type

Define the list of SMS-C addresses to be screened.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > MAP Service Configuration > SMS Service Configuration
configure > context context_name > map-service service_name > short-message-service

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-map-service-service_name-sms-service)#

Syntax

smsc-address-restriction-type { mo-mt-sms | mo-sms | mt-sms }

default smsc-address-restriction-type

default
Resets the restriction type to the default of both MT and MO types.

mo-mt-sms
Sets the restriction for both types of messages - mobile-originated (MO-SMS) and mobile-terminated (MT-SMS).

mo-sms
Sets the restriction for the mobile-originated (MO-SMS) messages.

mo-mt-sms
Sets the restriction for the mobile-terminated (MT-SMS) messages.

Usage

Use this command to identify the types of messages that are to be denied to the SMS-C identified in the
smsc-address-restriction-type. Both commands must be configured for the SMS-C address denial
mechanism to function.

Example

Restrict MO-SMS messages from being forwarded to the SMS-C listed in the restriction list:

smsc-address-restriction-type mo-sms

Reset the restriction to both types of messages:

default smsc-address-restriction-type
**smsc-address-selection-prioritization**

Define the routing selection priority for the SMSC (short message service center) address to be used for all MO-SMS.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MAP Service Configuration > SMS Service Configuration
configure > context context_name > map-service service_name > short-message-service

Entering the above command sequence results in the following prompt:

```
<context_name>host_name(config-map-service-service_name-sms-service)#
```

**Syntax**

```plaintext
smsc-address-selection-prioritization from-ms priority imsi-prefix priority msisdn-prefix priority

default smsc-address-selection-prioritization
```

**from-ms priority**

Configures a priority for the SMSC address send from the MS.

**priority** : Value must be a single digit, range 1-3.

**imsi-prefix priority**

Configures a priority for the SMSC address that is based on the IMSI-prefix.

**priority** : Value must be a single digit, range 1-3.

**msisdn-prefix priority**

Configures a priority for the SMSC address that is based on the MSISDN-prefix.

**priority** : Value must be a single digit, range 1-3.

**default**

By including the `default` keyword with the command, the SGSN knows to use the encoded default priorities for SMSC address selection for SMSC routing:

- `from-ms` priority 1,
- `imsi-prefix` priority 2,
- `msisdn-prefix` priority 3.

**Usage**

Use this command to define SMSC address routing priorities. Priorities must be defined for all parameters, all keywords, but they can be entered in any order. The addresses for the SMSCs are defined with the `smsc-routing` command.
An operator can use this configuration to prevent subscribers from using unauthorized SMSC addresses, for example, an unauthorized international SMSC.

**Example**

The keywords can be entered in any order but all keywords must be included in the command:

```
smisc-address-selection-prioritization msisdn-prefix 3 from-ms 1 imsi-prefix 2
```
smsc-routing

This command configures the routing to the short message service center (SMSC).

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MAP Service Configuration > SMS Service Configuration

**Syntax**

```
[ no ] smsc-routing { { any | imsi-starts-with | msisdn-starts-with } { isdn isdn_number | mobile-global-title mgt_number [ max-gt-address-len max_gt_length ] | point-code pt_code } }
```

- **any**
  Configures routing according to any IMSI prefix.

- **imsi-starts-with** **IMSI_prefix**
  Defines the IMSI prefix. Enter a string of up to 15 digits.

- **msisdn-starts-with** **msisdn_prefix**
  Defines the MSISDN prefix. Enter a string of up to 15 digits.

- **isdn** **isdn_number**
  Defines the ISDN E.164 number (up to 15 digits) of the SMSC.

- **mobile-global-title** **mgt_number** [ **max-gt-address-len** max_gt_length ]
  Defines the mobile global title (MGT) E.214 address to be used for IMSI conversion. Optionally, the maximum length of the GT address can be defined. If the length of the MGT string is greater than the defined max, then the least significant digits will be omitted. **mgt_number** is a string of digits, up to 18 digits. **max_gt_address** is an integer from 1 to 32.

- **point-code** **pt_code**
  Defines the point code for the SMSC. Enter a string of up to 11 digits in SS7 dotted decimal or decimal format.
Usage

This command defines the address format (IMSI, point code, mobile global title) and the address for SMSC routing.

Example

Use this command to define routing to the SMSC based on any point code.

```
smsc-routing any point-code 1.222.1
```
timeout

This command defines the SMS service timers.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > MAP Service Configuration > SMS Service Configuration

`configure > context context_name > map-service service_name > short-message-service`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-map-service-service_name-sms-service)#
```

**Syntax**

```
timeout { tcln-timer time | trl1n-timer time | tr2n timer time }
```

```
default timeout { tcln-timer | trl1n-timer | tr2n timer }
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>default</code></td>
<td>Resets the configuration to the default value for the specified timer.</td>
</tr>
</tbody>
</table>
| `tcln-timer time` | Configures the TC1N timer in seconds.  
  `time`: Must an integer from 1 to 255. The default is 5 seconds. |
| `trl1n-timer time` | Configures the TR1N timer in seconds.  
  `time`: Must an integer from 1 to 255. The default is 30 seconds. |
| `tr2n-timer time` | Configures the TR2N timer in seconds.  
  `time`: Must an integer from 1 to 255. The default is 30 seconds. |

**Usage**

Use this command to set SMS service timers. The command can be repeated to set all of the timers, one-at-a-time.

**Example**

```
trl1n-timer 25
```
The SS7 Routing Domain configuration mode is used to configure Signaling System 7 (SS7) parameters. For convenience in configuration management, all SS7 parameters have been collected into a proprietary grouping called an SS7 routing domains.

Mode

Exec > Global Configuration > SS7 Routing Domain Configuration

configure > ss7-routing-domain routing_domain_id variant variant_type

Entering the above command sequence results in the following prompt:

[local]host_name(config-ss7-routing-domain-ss7rd_id)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
asp

This command creates or removes an M3UA Application Server Process (ASP) instance and enters the ASP configuration mode. See the SGSN ASP Configuration Mode chapter in the Command Line Interface Reference for command details.

Product
SGSN
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SS7 Routing Domain Configuration
configure > ss7-routing-domain routing_domain_id variant variant_type

Entering the above command sequence results in the following prompt:

[local]host_name(config-ss7-routing-domain-ss7rd_id)#

Syntax

asp instance asp_inst
no asp instance asp_inst

default asp instance asp_inst end-point port

no
Deletes the ASP instance for the SS7 routing domain configuration.

default
Sets the ASP instance parameters to the end-point port value of 2905.

instance asp_inst
Identifies a specific ASP configuration. Up to four ASP instances can be configured for a single SS7 routing domain.

asp_inst: instance must be an integer from 1 through 4. For SGSN with release 15.0, the instance must be an integer from 1 to 12.

Usage
Use this command to create an ASP instance or enter the ASP configuration mode.

Example
The following command enters the ASP configuration mode for a specific ASP.

asp instance 1
**description**

This command defines an alphanumeric string that describes the current SS7 routing domain. This is used for operator reference only.

**Product**
- SGSN
- HNB-GW

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > SS7 Routing Domain Configuration

```
configure > ss7-routing-domain routing_domain_id variant variant_type
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ss7-routing-domain-ss7rd_id)#
```

**Syntax**

```
description string

no description
```

- **no**
  - Removes the description string from the current SS7 routing domain configuration.

- **string**
  - Specifies the alphanumeric string that is stored. Strings with spaces must be enclosed in double-quotes (see the example below).
  - **string**: Must be from 1 to 255 alphanumeric characters.

**Usage**

Use this command to set a description for reference by operators.

**Example**

The following command sets the description to identify a routing domain for messages transmitted within a national boundary.

```
description "National Service Routing Domain"
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
inbound-asp-identifier validate

This command enables validation of ASP identifiers inbound to the SGSN via routes defined with this SS7 routing domain.

**Important:** This command is only available in Release 8.1 and higher releases.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SS7 Routing Domain Configuration

```
configure > ss7-routing-domain routing_domain_id variant variant_type
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ss7-routing-domain-ss7rd_id)#
```

**Syntax**

- `inbound-asp-identifier validate`
- `default inbound-asp-identifier validate`
- `no inbound-asp-identifier validate`

**Usage**

The standard is to validate the ASP Id. However, in some circumstances it is necessary to skip such validation. For example, if the same ASP Id is assigned to more than one RNC (peer-server).

**Example**

Use the following command to skip validation of inbound ASP IDs:

```
no inbound-asp-identifier validate
```

Use either of the following commands to enable validation if it has been disabled:

```
default inbound-asp-identifier validate
inbound-asp-identifier validate
```
linkset

This command creates an instance of an MTP3 linkset and enters the Linkset configuration mode. See the Linkset configuration mode chapter for the commands to configure the linkset.

Product
SGSN
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SS7 Routing Domain Configuration
`configure > ss7-routing-domain routing_domain_id variant variant_type`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ss7-routing-domain-ss7rd_id)#
```

Syntax

```
linkset id id
no linkset id id
```

`no`

Removes the identified linkset definition from the system configuration.

`id`

This value uniquely identifies a linkset for the specific SS7 routing domain.

`id`: Must be an integer of 1 to 49.

Usage

This command creates instances of linkset configurations and provides access to the linkset configuration mode.

Example

Use the following command to create the 12th linkset:

```
linkset id 12
```
MTU-size

This command has been deprecated.
peer-server

This command creates a peer-server instance to setup a SIGTRAN peer for sending and receiving M3UA traffic. Completing the command automatically enters the peer-server configuration mode. To define 1 or more (up to 145) peer servers, use the commands documented in the Peer-Server Configuration Mode chapter in this reference.

configure > ss7-routing-domain routing_domain_id variant variant_type

Entering the above command sequence results in the following prompt:

[local]host_name(config-ss7-routing-domain-ss7rd_id)#

Syntax

peer-server id srvr_id

no peer-server id srvr_id

no

Removes the identified peer-server definition from the system configuration.

srvr_id

srvr_id uniquely identifies a peer-server. The id must be an integer from 1 to 144. For SGSN Release 15.0, the id must be an integer from 1 to 256.

Usage
Use the following command to create a definition for peer-server 2 and enter the configuration mode to configure the communication parameters for peer-server 12.

Example

peer-server id 12
route

This command configures SS7 routes for the current SS7 routing domain.

Product
SGSN
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SS7 Routing Domain Configuration
configure > ss7-routing-domain routing_domain_id variant variant_type

Entering the above command sequence results in the following prompt:

[local]host_name(config-ss7-routing-domain-ss7rd_id)#

Syntax

route destination-point-code dp_code { linkset id id [ priority pri_value ] | peer-server-id srvr_id }

no route destination-point-code dp_code { linkset id id | peer-server-id srvr_id }

no

Removes the SS7 route from the current SS7 routing domain configuration.

destination-point-code dp_code

Specifies the SS7 destination point code for this route.
Reminder: the point-code structure must match the variant defined for the SS7 routing domain when the SS7RD was configured in the global configuration mode.

linkset id id

This keyword identifies a linkset instance, created and configured with the linkset command.
This keyword identifies a linkset instance, created and configured with the linkset command.
id: Must be an integer from 1 to 49.

peer-server-id srvr_id

This keyword identifies a peer-server configuration instance, created and configured with the peer-server command.
srvr_id must be an integer from 1 to 49.

Usage

This command associates the previously configured linksets and peer servers and the destination point codes with a specified SS7 route.

Example

Define a route setting an ITU-type destination point-code address for the linkset Id 12:
route destination-point-code 6.211.6 linkset id 12
routing-context

Identifies the routing context for this SS7 routing domain.

Product
SGSN
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SS7 Routing Domain Configuration
configure > ss7-routing-domain routing_domain_id variant variant_type

Entering the above command sequence results in the following prompt:
[local]host_name(config-ss7-routing-domain-ss7rd_id)#

Syntax
routing-context value
default routing-context

default
Resets the local routing context value to the index (instance ID) for this SS7 routing domain.

value
An integer that uniquely identifies the routing context for this SS7 routing domain.
value: Must be integers from 1 to 65535 (for releases 8.0) or 1 to 4294967295 (for releases 8.1 to 17.0) or 0 to 4294967295 (for releases 17.1 and higher).

Usage
Use this command to set the routing context IDs for a specific SS7 routing domain configuration.

Example
routing-context 2355
This command sets the network indicator in the subservice field for SS7 message signal units (MSUs).

**Product**
SGSN
HNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SS7 Routing Domain Configuration

`configure > ss7-routing-domain routing_domain_id variant variant_type`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-ss7-routing-domain-ss7rd_id)#
```

**Syntax**

```
ssf ( international | national | reserved | spare )
```

---

**international**
The network indicator identifies the message as international with a point code structure that does not match the national point code structure.

---

**national**
The network indicator identifies the messages as having a national point code structure.

---

**reserved**
Provides an alternate network indicator for national messages.

---

**spare**
Provides an alternate network indicator for international messages.

**Usage**
In SS7 signaling, the Message Transfer Part (MTP) Level 2 message signal units (MSUs) contain a service information octet (SIO). The SIO field in an MSU contains a 4-bit subservice field (SSF) followed by a 4-bit service indicator. The indicator carried in the message’s routing information typically identifies the structure of the point code as a message from within a nation or as a message coming from outside the nation - international. As well, the 4-bit SSF determines the point code structure of the messages transmitted from the SGSN.

**Example**
For messages being transmitted within a country, set the indicator to national with the following command.

```
ssf national
```
Chapter 289
SSH Configuration Mode Commands

The Secure Shell Configuration Mode is used to manage the SSH server options for the current context.

**Important:** You must use the `ssh generate key` command in Context Configuration Mode to generate the sshd keys before you can configure the sshd server.

**Mode**

Exec > Global Configuration > Context Configuration > SSH Configuration

`configure > context context_name > server sshd`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-sshd)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**authorized-key**

Sets or removes a user name having authorized keys for access to the sshd server in the current context.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SSH Configuration

```
configure > context context_name > server sshd
```

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-sshd)#
```

**Syntax**

```
authorized-key username user_name host host_name [ type { v2-dsa | v2-rsa } ]
```

- **default**
  Resets the parameter to the default value.

- **username**
  Sets a username as having authorized keys for access to the sshd server.

- **user_name**
  Specifies the username entered as an alphanumeric string of 1 through 255 characters.

- **host**
  Associates an SSH host having the authorization keys for the username.

- **host_name**
  Specifies the host name entered as an alphanumeric string of 1 through 255 characters.

  [ type { v2-dsa | v2-rsa } ]

  Specifies which type of SSH authorization key will be accepted instead of all key types. The options are: `v2-dsa` (SSHv2 Digital Signature Algorithm), or `v2-rsa` (SSHv2 Rivest, Shamir and Adleman).

**Usage**

Use this command to set a username with authorized keys for access to the sshd server within the current context.

**Important:** Only 10 sshd authorization-keys can be configured per context.
Example

The following command specifies that username *dbailey* with authorization keys at *sshserver* can access the system with all types of authorization keys:

```
authorized-key username dbailey host sshserver
```
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
exit
```

Usage
Use this command to return to the parent configuration mode.
listen

Configures the SSH server in the current context to only listen for connections from the interface with the specified IP address. The default behavior is to listen on all interfaces.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > SSH Configuration

configure > context context_name > server sshd

Entering the above command sequence results in the following prompt:

[local]host_name(config-sshd)#

**Syntax**

```plaintext
listen ip_address

no listen

no

Disable listening for a specific interface address and enable listening on all interfaces.

ip_address

Enables listening only on the interface with the specified IP address. ip_address must be entered using IPv4 dotted-decimal notation.
```

**Usage**

Use this command to configure the SSH server for the current context to only listen for connections from the interface with the specified IP address. Only one IP address may be set for listening.

**Example**

The following command specifies that the Server should only listen for connections in the interface with the IP address of 192.168.0.10:

```plaintext
listen 192.168.0.10
```
max servers

Configures the maximum number of SSH servers that can be started within any 60-second interval. If this limit is reached, the system waits two minutes before trying to start any more servers.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > SSH Configuration

configure > context context_name > server sshd

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-sshd)#
```

**Syntax**

```
max servers number
```

- **number**

  Default: 40

  Specifies the maximum number of servers that can be spawned in any 60-second interval. *number* must be an integer from 1 through 100.

**Usage**

Set the number of servers to tune the system response as a heavily loaded system may need more servers to support the incoming requests.

The converse would be true as well in that a system can benefit by reducing the number of servers such that telnet services do not cause excessive system impact to other services.

**Example**

```
max servers 50
```
subsystem

Configures the system to perform file transfers using Secure FTP (SFTP) over ssh v2. Administrators must be configured with the FTP attribute privilege to issue this command.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > SSH Configuration
configure > context context_name > server sshd

Entering the above command sequence results in the following prompt:

[local]host_name(config-sshd)#

Syntax

subsystem { cli | sftp }

no subsystem { cli | sftp }

no

Disables the SFTP ssh file transfer method or access to the CLI via ssh.

cli

Default: Enabled
Configures the SSH system for the current context to allow access to the CLI.

sftp

Default: Disabled
Enables the SSH system for the current context to perform file transfers using Secure FTP (SFTP) over ssh v2.

Usage

Use this command to enable or disable file transfers using SFTP over an ssh v2 tunnel. Also use this command to enable or disable access to the CLI over an SSH connection.

Example

The following command enables SFTP for the current context:

subsystem sftp

The following command disables access to the CLI through an SSH session for the current context:

no subsystem cli
Chapter 290
Subscriber Configuration Mode Commands

The Subscriber Configuration Mode is used to create local subscribers as well as to set default subscriber options for the current context.

Mode

Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
aaa

This command configures authentication, authorization and accounting (AAA) functionality at the subscriber level.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

[ no ] aaa { accounting interim { interval-timeout interval_timeout | normal | suppress } | group aaa_group_name | secondary-group aaa_secondary_group_name }

default aaa { accounting interim [ interval-timeout ] | group | secondary-group }

no aaa { accounting interim [ interval-timeout ] | group [ aaa_group_name ] | secondary-group }

default

Configures the default setting for the specified parameter.

• accounting: Enables AAA accounting for subscribers.

• group: Uses the default AAA group—the one specified at the context level or in the default subscriber profile.

• secondary-group: Removes the secondary AAA group from the subscriber configuration.

no

• accounting: Disables AAA accounting for subscribers.

• group: Uses the default AAA group—the one specified at the context level or in the default subscriber profile.

• secondary-group: Removes the secondary AAA group from the subscriber configuration.

accounting interim { interval-timeout interval_timeout | normal | suppress }

Specifies when system should send an interim accounting record to the server.

• interval-timeout: Specifies the time interval (in seconds) at which to send an interim accounting record.

  interval_timeout must be an integer from 50 through 40000000.

• normal: If RADIUS accounting is enabled, send this Acct-Status-Type message when normally required by operation.

• suppress: If RADIUS accounting is enabled, suppress the sending of Acct-Status-Type message.
group aaa_group_name
Specifies the AAA server group for the subscriber for authentication and/or accounting.
aaa_group_name must be an alphanumeric string of 1 through 63 characters.

secondary-group aaa_secondary_group_name
Specifies the secondary AAA server group for the subscriber.
aaa_secondary_group_name must be an alphanumeric string of 1 through 63 characters.

Usage
Use this command to configure AAA functionality at the subscriber level.
Instead of having a single list of servers per context, this feature configures multiple server groups within a context and applies individual server group for subscribers in that context. Each server group consists of a list of AAA servers for each AAA function (accounting, authentication, charging, etc.).
The AAA secondary server group supports the No-ACK RADIUS Targets feature in conjunction with PDSN/HA for secondary accounting (with different RADIUS accounting group configuration) to the RADIUS servers without expecting the acknowledgement from the server, in addition to standard RADIUS accounting. This secondary accounting will be an exact copy of all the standard RADIUS accounting message (RADIUS Start/Interim/Stop) sent to the standard AAA RADIUS server.
If the same AAA group is configured with both the aaa group aaa_group_name and the aaa secondary-group aaa_group_name commands, then this configuration will have no effect and secondary accounting will not happen.
The AAA secondary server group configuration takes effect only when used with subscriber accounting-mode set to radius-diameter. The RADIUS accounting triggers for both standard RADIUS accounting and secondary accounting will be taken from the AAA group configured with the aaa group aaa_group_name command. On the fly change of this configuration is not supported. Any change to the configuration will have effect only for new calls.

Example
The following command applies the AAA server group star1 to subscribers:

    aaa group star1
**access-link ip-fragmentation**

Configures IP fragmentation processing over the Access-link.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration
```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:
```
[context_name]host_name(config-subscriber)#
```

**Syntax**
```
access-link ip-fragmentation { normal | df-ignore | df-fragment-and-icmp-notify }
```

---

**df-ignore**
Default: Enabled
Ignores the DF (Don’t Fragment) bit setting. Fragments and forwards the packet over the access link.

---

**df-fragment-and-icmp-notify**
Default: Disabled
Partially ignores the DF bit. Fragments and forwards the packet, but also returns an ICMP error message to the source of the packet. The number of ICMP errors sent like this is rate-limited to one ICMP error packet per second per session.

---

**normal**
Default: Disabled
Normal processing. Drops the packet and sends an ICMP unreachable message to the source of packet. This is the default behavior.

---

**Usage**
If the IP packet to be forwarded is larger than the access-link MTU and if the DF (Don't Fragment) bit is set for the packet, then the fragmentation behavior configured by this command is applied. Use this command to fragment packets even if they are larger than the access-link MTU.

**Example**
Set fragmentation so that the DF bit is ignored and the packet is forwarded anyway by entering the following command:
```
access-link ip-fragmentation df-ignore
```
accounting-mode

Sets the accounting mode for the current local subscriber configuration.

Product
PDSN
HA
ASN-GW
SAEGW
S-GW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

accounting-mode { flow-based | gtp [ radius-diameter ] | none | radius-diameter [ gtp ] | rf-style }

default accounting-mode

---

Sets the type of accounting to be performed for the current local subscriber to the default setting.
Default: radius-diameter

---

flow-based

Diameter flow-based accounting is enabled for the current local subscriber.

---

gtp [ radius-diameter ]

GTPP CDR RADIUS accounting is enabled for the current local subscriber. The radius-diameter keyword is available if both GTPP RADIUS and RADIUS-Diameter accounting are to be used.

---

none

Accounting is disabled for the current local subscriber and no charging records will be generated.

---

radius-diameter [ gtp ]

RADIUS-Diameter accounting is enabled for the current local subscriber. The gtp keyword is available if both GTPP RADIUS and RADIUS-Diameter accounting are to be used.
rf-style
Diameter Rf interface accounting is enabled for the current local subscriber.

Usage
This command specifies which protocol, if any, will be used to provide accounting for PDP contexts accessing the APN profile.
Use this command to enable or disable RADIUS/Diameter accounting for any subscribers that use the current local subscriber configuration.
If the gtpp option is used, then GTPP RADIUS is used as configured in the Context Configuration mode or the AAA Server Group Configuration mode and GTPP charging records will be enabled.
If the radius-diameter option is used, either the RADIUS or the Diameter protocol is used as configured in the Context Configuration mode or the AAA Server Group Configuration mode.
RADIUS accounting can also be enabled and disabled at the context level with the aaa accounting command in the Context Configuration Mode. If RADIUS accounting is enabled at the context level, the accounting-mode command can be used to disable RADIUS accounting for individual local subscriber configurations.
If the accounting mode is set to rf-style, then BM will generate accounting records corresponding to AIMS RF.

Example
To disable accounting for the current subscriber, enter the following command:

    accounting-mode none
active-charging bandwidth-policy

Configures the bandwidth policy to be used for the subscriber.

**Product**  
ACS

**Privilege**  
Security Administrator, Administrator

**Mode**  
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
active-charging bandwidth-policy bandwidth_policy_name
{ default | no } active-charging bandwidth-policy
```

---

**default**

Specifies that the default bandwidth policy configured in the rulebase be used for this subscriber.

---

**no**

Disables bandwidth control for this subscriber.

---

```
active-charging bandwidth-policy bandwidth_policy_name
```

Specifies name of the bandwidth policy.

*bandwidth_policy_name* must be an alphanumeric string of 1 through 63 characters.

---

**Usage**

Use this command to configure bandwidth policy to be used for subscribers.

**Example**

The following command configures a bandwidth policy named *standard* for the subscriber:

```
active-charging bandwidth-policy standard
```
active-charging link-monitor tcp

Enables the TCP link monitoring feature on the Mobile Video Gateway. This command can be configured in either APN Configuration Mode or Subscriber Configuration Mode.

Product
MVG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

default
Sets TCP link monitoring to its default value, which is the same as [ no ].

no
Deletes the TCP link monitoring settings and disables TCP link monitoring if previously configured.

active-charging link-monitor tcp

Enables the TCP link monitoring feature on the Mobile Video Gateway. Note that TCP link monitoring is not enabled by default. Also note that when this command is configured without the log option, TCP link monitoring is enabled without logging, and the output from TCP link monitoring is only used by the dynamic translating feature.

log [ rtt [ histogram | time-series ] ] [ bitrate [ histogram | time-series ] ] [ rtt [ histogram | time-series ] ]

This option enables statistical logging for TCP link monitoring.
The rtt option can be used to enable either histogram or time-series logging for round-trip time (RTT).
Similarly, the bitrate option can be used to enable either histogram or time-series logging for bit rate.
When rtt and bitrate options are used without additional options, histogram and time-series logging are enabled for round-trip time (RTT) and/or bit rate respectively.

-noconfirm
Specifies that the command must execute without prompting for confirmation.
Usage

Use this command to enable TCP link monitoring on the Mobile Video Gateway.

Examples

The following command enables TCP link monitoring with statistical logging, with histogram and time-series logging enabled for both RTT and bit rate:

```
active-charging link-monitor tcp log
```

The following command enables TCP link monitoring with statistical logging, with histogram and time-series logging enabled for RTT:

```
active-charging link-monitor tcp log rtt
```

The following command enables TCP link monitoring with statistical logging, with histogram logging enabled for RTT:

```
active-charging link-monitor tcp log rtt histogram
```

The following command enables TCP link monitoring with statistical logging, with histogram logging enabled for RTT and time-series logging enabled for bit rate:

```
active-charging link-monitor tcp log rtt histogram bitrate time-series
```
active-charging rulebase

Specifies the rulebase to be used for this subscriber.

**Product**
ACS

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

- `active-charging rulebase rulebase_name`
- `no active-charging rulebase`
- `no

  Removes the previously configured rulebase for the subscriber.

  `active-charging rulebase rulebase_name`

  Specifies name of the ACS rulebase.

  `rulebase_name` must be the name of an ACS rulebase expressed as an alphanumeric string of 1 through 63 characters.

**Usage**

This command specifies the name of the rulebase for specific subscriber (reals).
If the specified rulebase does not exist in the Active Charging service, the call will be rejected.

**Example**

The following command configures the ACS rulebase named `rule1` for the subscriber:

```
active-charging rulebase rule1
```
always-on

Once the idle timeout limit is reached, keeps the current subscriber session connected as long as the subscriber is reachable.

⚠️ Caution: When always-on is enabled, the subscriber must have an idle time-out period configured (default is 0, no time-out). Failure to configure an idle time-out results in a subscriber session that is indefinite.

Two timers and a counter are associated with this feature. Refer to the `timeout` command in this chapter and the `ppp echo-retransmit-timeout msec` and `ppp echo-max-retransmissions num_retries` commands.

Default: Disabled.

**Product**
PDSN
ASN-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration
`configure > context context_name > subscriber { default | name subscriber_name }`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
always-on
no always-on
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>always-on</td>
<td>Specifies that the user will remain connected after the idle time expires.</td>
</tr>
<tr>
<td>no always-on</td>
<td>Disables always-on. The user is disconnected after the idle time expires.</td>
</tr>
</tbody>
</table>

**Usage**

If this parameter is enabled for a subscriber, when the idle time-out limit is reached the subscribers IP/PPP session remains connected as long as the subscriber is reachable. This is true even if the airlink between the mobile device and the RN (Radio Node) is moved from active to dormant (inactive) status. When the idle timeout limit is reached, the PDSN determines availability using link control protocol (LCP) keepalive messages. A response to these messages indicates that the “always-on” status should be maintained. Failure to respond to a predetermined number of LCP keepalive messages causes the PDSN to tear-down (disconnect) the subscriber session.

**Example**

Enable always on for the current subscriber by entering the following command:
always-on

always-on
asn-header-compression-rohc

Negotiates Robust Header Compression (ROHC) support for subscriber calls with AAA and WiMAX. This configuration indicates the type of header compression supported and enabled on the ASN.

Product
ASN-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

[ no | default ] asn-header-compression rohc

---
no

Removes or disables the configured identifiers for ROHC in ASN-GW service.

---
default

The default is disabled.

Usage

Network Attached Storage (NAS) uses this configuration to indicate and pack ROHC support the subscriber TLV in the WiMAX-capability attribute in the Access Request. The ROHC header compression is applied only when the ROHC is supported on the ASNGW and ROHC support is indicated by the AAA.
**asn nspid**

Specifies the network service provider (NSP) associated with a WiMAX subscriber in an ASN-GW service. When configured, the NSP ID is sent in the Access-Request and Accounting messages.

**Product**
ASN-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
[ no ] asn nspid nsp_id
```

**no**
Removes or disables the configured identifiers for this network service provider in ASN-GW service.

```
asn nspid nsp_id
```

Specifies the network service provider for this subscriber. This enables the MS to discover all accessible NSPs, and to indicate the NSP selection during connectivity to the ASN.

**Usage**

Use this command to specify the NSP associated with a subscriber in an ASN-GW service.

`nsp_id` is three bytes in hexadecimal format. For example: FF-EE-01

**Example**

The following command specifies the NSP for a subscriber in an ASN service:

```
asn nspid 0F-01-FE
```
## asn-pdfid

Configures the identifiers for packet data flow, service data flow, and service profile in an ASN-GW service.

### Product
ASN-GW

### Privilege
Security Administrator, Administrator

### Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

### Syntax

```
[ no ] asn-pdfid pdf_id asn-service-profile-id svc_profile_id asn-sdfid sdf_id
```

- **no**
  - Removes/disables the configured identifiers for this subscriber in ASN-GW service.

- **asn-pdfid pdf_id**
  - Specifies the an unique ASN Packet Data Flow identifier for this subscriber.
    - `pdf_id` must be an integer from 1 through 65535.

- **asn-service-profile-id svc_profile_id**
  - Specifies a unique ASN Service Profile Identifier for this subscriber.
    - `svc_profile_id` is a Service Profile Identifier configured in the Context Configuration Mode.

- **asn-sdfid sdf_id**
  - Specifies the an unique ASN Service Data Flow identifier for this subscriber.
    - `sdf_id` must be an integer from 1 through 65535.

### Usage

Use this command to configure subscriber profile for QoS parameters in an ASN-GW service. A maximum of four QoS profiles can be configured for a subscriber.

### Example

The following command configures the QoS profile for a subscriber as PDF id 1, Service Profile id 3, and Service Data Flow id 2:

```
asn-pdfid 1 asn-service-profile-id 3 asn-sdfid 2
```
asn-policy

Configures the identifiers for packet data flow, service data flow, and service profile in an ASN-GW service.

**Product**

ASN-GW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Subscriber Configuration

```bash
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```bash
[context_name]host_name(config-subscriber)#
```

**Syntax**

```bash
asn-policy [classifiers downlink { strict | loose} | idle-mode { allow | disallow } | notification-idle-mode {allow | disallow} | notification-handoff { allow | disallow } | auth-only {allow | disallow } | ms-requested-classifiers {allow | dissalow}]
[ default ] asn-policy classifiers downlink idle-mode
no
```

- Removes or disables the configured policy for this subscriber in ASN-GW service.
- **default**
  
  Sets the ASN policy to default for this subscriber.
  For downlink traffic classifier default policy is “loos” and for idle mode policy the default action is to allow idle mode operation in an ASN-GW service.

- **idle-mode**
  
  Sets the idle mode policy for this subscriber in an ASN-GW service. If enabled, Interim-Update is sent with the BSID and WiMAX-Idle_Mode_Transition as Idle. If disabled, the Interim can be sent when the call is in the idle mode based on the interim timer. At this point, the last known BSID is reported to the RADIUS server.

- **notification-idle-mode**
  
  Default: allow
  Use to enable or disable Idle-Mode-Notification capabilities. When you enable this command, when the call moves from active to idle, or idle to active, Accounting Interim is sent.

- **notification-handoff**
  
  Default: allow
  If enabled, the Interim-Update is sent with the BSID and SN-Handoff-Indicator as Active Handoff.
allow
Default: enabled
Enables the policy for this subscriber to allow idle mode operation in an ASN-GW service.

disallow
Default: disabled
Enable the policy for this subscriber to disallow idle mode operation in an ASN-GW service.

classifiers downlink
Sets the classifier policy for all service flows coming from HA to FA for this subscriber’s matching classifier.

strict
Default: disabled
This option discards all the service flows coming from HA to FA and any other packets not matching to any of the classifiers set for this subscriber.

loose
Default: enabled
This option allows all the service flows coming from HA to FA and any other packet does not matching to any of the classifiers set for this subscriber and sent to the BS/MS over downlink flow

auth-only
Specifies whether the call is Auth only or not.

allow
Enables the policy for this subscriber to allow auth-only in an ASN-GW service.

disallow
Default
Disables the policy for this subscriber to allow auth-only in an ASN-GW service.

ms-requested classifiers
Default: allow
By default ASNGW allows dynamic addition of classifiers by the MS during MS-initiated service flow creation or modification.

Usage
Use this command to configure subscriber policy to allow/disallow the idle mode operation or the downlink traffic flow for a subscriber in an ASN-GW service.
For authentication configuration, the ASN-GW supports the Initial Network Entry (INE) for Ethernet CS calls. The base station supports Ethernet CS traffic to the network. The INE procedure includes the Authentication of the service flows and IP-Address allocation through DHCP. Authentication is based on the Extensible Authentication Protocol (EAP).
This command allows MS to transition to idle mode with an ASN-GW.

Example
The following command configures the policy to allow the idle mode for an MS with an ASN-GW:
default asn-policy idle-mode
associate accounting-policy

Associates the subscriber with specific pre-configured policies configured in the same context.

Product
- P-GW
- SAEGW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber) #
```

Syntax

```
[ no ] associate accounting-policy name
```

- **no**
  - Removes the selected association from this subscriber.

- **name**
  - Associates the subscriber with an accounting policy configured in the same context.
  
  *name* must be an existing accounting policy expressed as a string of 1 through 63 characters.

  Accounting policies are configured through the `policy accounting` command in the Context Configuration mode.

Usage

Use this command to associate the subscriber with an accounting policy configured in this context.

Example

The following command associates this subscriber with an accounting policy called `acct1`:

```
associate accounting-policy acct1
```
authorized-flow-profile-id

When a profile ID is requested by the Mobile Node (MN), this command sets the value that is authorized by the Access Gateway (AGW).

Product
- PDSN
- ASN-GW

Privilege
Security Administrator, Administrator

Mode
- Exec > Global Configuration > Context Configuration > Subscriber Configuration
- configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

authorized-flow-profile-id profile_id direction { bidirectional | forward | reverse }

no authorized-flow-profile-id profile_id

no

Removes the existing profile ID setting specified by profile_id.profile_id must be an integer from 0 through 65535.

authorized-flow-profile-id profile_id

The profile ID number that is authorized for the current subscriber. profile_id must be an integer from 0 through 65535.

direction { bidirectional | forward | reverse }

This specifies in which data direction the profile ID should be applied.

- bidirectional: This profile ID pertains to both the forward and reverse directions.
- forward: This profile ID pertains to data going to the MN.
- reverse: This profile ID pertains to data coming from the MN.

Usage
Use this command to set the profile ID that the AGW will authorize for a subscriber.

Example
Set the profile ID for both directions to 3 for the current subscriber by entering the following command:

authorized-flow-profile-id 3 direction bidirectional
content-filtering category

Enables or disables the specified preconfigured Category Policy Identifier for policy-based Content Filtering support to the subscriber.

**Product**
CF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
content-filtering category policy-id cf_policy_id

no content-filtering category policy-id
```

**no**
Disables the configured category policy ID for content filtering support to the subscriber. This is the default setting.

**content-filtering category policy-id cf_policy_id**

Applies the content filtering category policy ID, configured in ACS Configuration Mode, to this subscriber. *cf_policy_id* must be a category policy ID expressed as an integer from 1 through 4294967295.
If the specified category policy ID is not configured in the ACS Configuration Mode, all packets will be passed regardless of the categories determined for such packets.

**Important:** Category Policy ID configured through this mode overrides the Category Policy ID configured using the `content-filtering category policy-id` command in the ACS Rulebase Configuration Mode.

**Usage**
Use this command to enter the Content Filtering Policy Configuration Mode and enable or disable the Content Filtering Category Policy ID for a subscriber.

**Important:** If Content Filtering Category Policy ID is not specified here, the similar command in the ACS Rulebase Configuration Mode determines the policy.

**Example**
Up to 64 different policy identifier can be defined in a Content Filtering support service.

The following command enters the Content filtering Policy Configuration Mode and enables the Category Policy ID 101 for Content Filtering support:
content-filtering category policy-id 101
credit-control-client

Configures the credit-control client parameters for the subscriber.

Product
- GGSN
- HA
- IPSG
- PDSN
- P-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name } 

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax
credit-control-client { event-based-charging | override session-mode { per-sub-session | per-subscriber } } 

no credit-control-client { event-based-charging | override session-mode }

default credit-control-client event-based-charging

no
Disables the configured setting.

default
Resets the command to its default setting of disabled.

event-based-charging
Enables event-based charging.

override session-mode { per-sub-session | per-subscriber }

Overrides the session-mode configured through the CLI command “require ecs credit-control session-mode per-subscriber” in Global Configuration mode so that different subscriber groups can operate in different modes. For example, one subscriber group can be configured to work in per-subscriber mode, while another in per-sub-session mode. This keyword is used to switch between subscriber level Gy and sub-session level Gy.
**Important:** This CLI can be changed on the fly. The modified values will be reflected only in the new subscriber session.

The `no` command removes the override CLI and makes the subscriber group fall back to the configuration specified through the CLI command “`require ecs credit-control session-mode per-subscriber`”.

**Usage**

Use this command to configure the credit-control client parameters for the subscriber. This configuration should be enabled to report UE’s PLMN, timezone and ULI changes through Event-based-Gy session. In the event that both Gy Online charging and Gy event reporting are enabled, the P-GW shall send only CCR-Update requests to the OCS and shall not send CCR-Event requests.

With the inclusion of this keyword `override session-mode` ... in 14.1 release, it is possible to seamlessly change the configuration from bearer level to subscriber level and vice-versa without requiring a system reboot.

**Example**

The following command enables event-based Gy support for the subscriber:

```
credit-control-client event-based-charging
```
credit-control-group

Configures the credit-control group for this subscriber.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

credit-control-group cc_group_name

no credit-control-group

_____________________________

no

Removes the credit-control group from the subscriber configuration, if configured.

_____________________________

credit-control-group cc_group_name

Specifies name of the credit-control group.

cc_group_name must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the credit-control group for the subscriber.

Example

The following command configures the credit-control group named test12 for the subscriber:

    credit-control-group test12
credit-control-service

Configures the credit-control service for this subscriber.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

[ no ] credit-control-service cc_service_name

__no__
Disables the credit-control service, if configured.

credit-control-service cc_service_name
Specifies the name of the credit-control service.
cc_service_name must be an alphanumeric string of 1 through 63 characters.

Usage
Use this command to configure the credit-control service for subscribers.

Example
The following command configures the credit-control service named test12 for the subscriber:

credit-control-service test12
cscf core-service

CSCF/A-BG core service that maps to the current domain.

Product
SCM (CSCF, A-BG)

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

```
cscf core-service name name

no cscf core-service
```

```
cscf core-service name name

Specifies the name of the CSCF/A-BG core service.
name must be an alphanumeric string of 1 through 63 characters.

no cscf core-service

Removes the CSCF/A-BG core service from the domain.
```

Usage

Use this command to map a CSCF/A-BG core service to the current domain.

Example

The following command creates a CSCF core service named cs1:

```
cscf core-service name cs1
```

The following command removes the CSCF core service from this domain:

```
o cscf core-service
```
cscf county-name

Assigns a Last Routing Option (LRO) profile county name to the subscriber for finding the correct Public Safety Answering Point (PSAP) during emergency calls.

Product
SCM (S-CSCF)

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

[ no ] cscf county-name name

---

cscf county-name name

Specifies the LRO profile county name of the subscriber.

name must be an existing LRO profile county name expressed as an alphanumeric string of 1 through 127 characters.

no

Removes the LRO profile county name from the subscriber.

---

Usage

Use this command to assign an LRO profile county name to the subscriber.

Example

The following command assigns county name norfolk to the subscriber:

    cscf county-name norfolk

The following command removes county name norfolk from the subscriber:

    no cscf county-name norfolk
cscf nat-applicable

Indicates if NAT (Network Address Translation) processing is required for this domain.

Product
SCM (CSCF/A-SBC)

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

**configure > context context_name > subscriber { default | name subscriber_name }**

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

Syntax

```
[ no ] cscf nat-applicable
```

---

no

Disables NAT processing for this domain.

---

cscf nat-applicable

Enables NAT processing for this domain.

---

Usage

Use this command to indicate whether NAT processing is required for this domain.

Example

The following command indicates NAT processing is required for this domain:

```
cscf nat-applicable
```

The following command disables NAT processing for this domain:

```
no cscf nat-applicable
```
cscf private-user-id

Assigns a private user identity to the subscriber.

**Product**
SCM (P-CSCF, S-CSCF, SIP Proxy)

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-subscriber)#
```

**Syntax**

```
[ no ] cscf private-user-id user_id
```

- **no**
  Removed the private user identity of the subscriber.

- **cscf private-user-id user_id**
  Specifies the private user identity of the subscriber.
  *user_id* must be an alphanumeric string of 1 through 127 characters.

**Usage**

Use this command to assign a private user identity to the subscriber.

**Example**

The following command assigns a private user identity named *user007* to the subscriber:

```
cscf private-user-id user007
```

The following command removes private user identity named *user007* from the subscriber:

```
no cscf private-user-id user007
```
cscf session-template

Assigns a CSCF session template to the subscriber profile.

**Product**
SCM (P-CSCF, S-CSCF, SIP Proxy)

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```plaintext
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```plaintext
cscf session-template name name

no cscf session-template
```

**Usage**

Use this command to bind a CSCF session template to a subscriber profile.

**Example**

The following command assigns a CSCF session template named `template4` to the subscriber profile:

```
cscf session-template name template4
```

The following command removes the assignment of a session template to the subscriber profile:

```
no cscf session-template
```
data-tunneling ignore df-bit

Controls the handling of the DF (Don't Fragment) bit present in the user IPv4/IPv6 packet for GRE, IP-in-IP tunneling used for the MIP data path. If this feature is enabled, and fragmentation is required for the tunneled user IPv4/IPv6 packet, then the DF bit is ignored and the packet is fragmented. Also the DF bit is not copied to the outer header. Default is enabled.

Product
PDSN
HA
FA
ASN-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

data-tunneling ignore df-bit

no data-tunneling ignore df-bit

no

Disables this option. The DF bit in the tunneled IP packet header is not ignored during tunneling.

data-tunneling ignore df-bit

Ignores the DF bit in the tunneled IP packet header.

Usage

Use this command to configure a user so that during Mobile IP tunneling the DF bit is not ignored and packets are not fragmented.

Example

To disable fragmentation of a subscribers packets over a MIP tunnel even when the DF bit is present, enter the following command:

no data-tunneling ignore df-bit
**dcca origin host**

This command is obsolete. Refer to the `dcca origin endpoint` command.
dcca origin endpoint

This command is obsolete. To configure the Diameter Credit Control Origin Endpoint, in the Credit Control Configuration Mode, use the diameter origin endpoint command.
dcca peer-select

Specifies the Diameter credit control primary and secondary peer for credit control.

**Product:**
ACS

**Privilege:**
Security Administrator, Administrator

**Mode:**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```cpp
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```plaintext
[context_name]host_name(config-subscriber)#
```

**Syntax**

```cpp
dcca peer-select peer host_name [ realm realm_name ] [ secondary-peer host_name [ realm realm_name ] ]
```

```cpp
no dcca peer-select
```

- **no**
  Removes the previously configured Diameter credit control peer selection.

- **peer host_name**
  Specifies a unique name for the peer. `peer_name` must be an alphanumeric string of 1 through 63 characters that allows punctuation marks.

- **secondary-peer host_name**
  Specifies a back-up host that is used for fail-over processing. When the route-table does not find an available route, the secondary host performs a fail-over processing. `host_name` must be an alphanumeric string of 1 through 63 characters that allows punctuation marks.

- **realm realm_name**
  The `realm_name` must be an alphanumeric string of 1 through 63 characters that allows punctuation marks. The realm may typically be a company or service name.

**Usage**

Use this command to select a Diameter credit control peer and realm.

⚠️ **Caution:** This configuration completely overrides all instances of `diameter peer-select` that have been configured with in the Credit Control Configuration Mode for an Active Charging service.

**Example**

The following command selects a Diameter credit control peer named `test` and a realm of `companyx:`

```plaintext
```
dcca peer-select peer test realm companyx
default

Restores the default value for the option specified for the current subscriber.

[context_name]host_name(config-subscriber)#
```

Syntax

```bash
```

---

**access-link ip-fragmentation**

Sets the method for fragmenting packets over the MN access link to its default of normal. Drop the packet and send ICMP unreachable to the source of packet.

---

**accounting-mode**

Enables Radius accounting for the current local subscriber configuration.

---

**data-tunneling ignore df-bit**

Sets this option to the default behavior, which is to send an ICMP unreachable - need to frag message back to the sender and drop the packet, in the case that fragmentation is required but the DF bit is set.

---

**idle-timeout-activity dormant-downlink-data**

Sets this option to the default behavior. When downlink data packets are transmitted to the Mobile node and the session is in dormant mode the session idle timer is reset.

---

**inter-pdsn-handoff**

During a handoff from one PDSN to another, if the Mobile requests an IP address of 0.0.0.0 or a mismatched IP address the PDSN will not disconnect the session immediately. The PDSN tries to assign the proposed address of the session in the IPCP configuration NAK.
ip { allowed-dscp | dhcp-relay | header-compression | hide-service-address | multicast discard | qos-dscp | source-validation | user-datagram-tos copy }

**allowed-dscp**: resets the allowed DSCP parameters to the system defaults: class none, max-class be.

**hide-service-address**: specifies the default setting for hide the ip-address of the service from the subscriber. Default is Disabled

**dhcp-relay**: Configured with the DHCP server address during MS authentication. The AAA server sends the address of the DHCP server in the Access-Accept message. The DHCP relay uses this address to relay the DHCP messages from the MS to the DHCP server.

**multicast discard**: Configures the default multicast settings which is to discard PDUs

**qos-dscp**: Sets the quality of service setting to the system default.

**source-validation**: Specifies the default IP source validation. Default is Enabled.

**user-datagram-tos copy**: Disables copying of the IP TOS octet value to all tunnel encapsulation IP headers.

loadbalance-tunnel-peers
Sets the tunnel load balancing algorithm to the system default.

long-duration-action
Sets the action that is taken when the long duration timer expires to the default: detection.

mobile-ip { home-agent | mn-aaa-removal-indication | mn-ha-hash-algorithm | reverse-tunnel | security-level | send { dns-address | terminal-verification } }

**allow-aaa-address-assignment**: Disables the FA from accepting a home address assigned by an AAA server.

**home-agent**: Sets home agent IP address to its default of 0.0.0.0.

**match-aaa-assigned-address**: Disables the FA validating the home address in the RRQ against the one assigned by AAA server.

**mn-aaa-removal-indication**: Sets this parameter to its default of disabled.

**mn-ha-hash-algorithm**: Sets the encryption algorithm to the default of hmac-md5.

**reverse-tunnel**: Sets this parameter to its default of enabled.

**security-level**: Sets this parameter to its default of none.

**send dns-address**: Disables the HA from sending the DNS address NVSE in the RRP.

**send terminal-verification**: Disables the FA from sending the terminal verification NVSE in the RRQ.

permission
Restores the subscriber’s service usage defaults.

ppp { always-on-vse-packet | data-compression { mode | protocols } | ip-header-compression negotiation | keepalive | min-compression-size | mtu }

Sets the point-to-point protocol option defaults.

**always-on-vse-packet**: Re-enables the PDSN to send special 3GPP2 VSE PPP packets to the Mobile Node with a max inactivity timer value for always on sessions. This configuration is applicable only for PDSN sessions.

**data-compression { mode | protocols }**: restores the default value for either the data compression mode or compression protocols as follows:

- mode stateless
all protocols enabled

**ip-header-compression negotiation** : Sets the IP header compressions negotiation to the system default: force.

**keepalive** : sets the subscriber’s PPP keep alive option to the system default: 30 seconds.

**min-compression-size** : Restores the PPP minimum packet size for compression: 128 octets.

**mtu** : Sets the maximum message transfer unit packet size to the system default: 1500 octets.

---

**radius accounting interim interval-timeout**

Disables the RADIUS accounting interim interval for the current subscriber.

---

**timeout [ absolute | idle | long-duration ]**

When a keyword is entered, this command resets the specified timeout to the system default: 0. When no keyword is specified, all timeouts are reset to the system defaults: 0.

---

**Usage**

Use this keyword to reset subscriber data to the system defaults. This is useful in setting the subscriber back to the basic values to possibly aid in trouble shooting or tuning a subscriber’s access and options.

**Example**

```
default ip qos-dscp
default permission
default data-compression mode
```
dhcp dhcv6

Specifies the DHCPv6 service to be used for this subscriber.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration
`configure > context context_name > subscriber { default | name subscriber_name }`

Entering the above command sequence results in the following prompt:
```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
dhcp dhcv6 service-name service_name
```

```
no dhcp dhcv6 service-name
```

Removes the DHCPv6 service for the subscriber.

```
dhcv6 service-name service_name
```

Specifies the name of an existing DHCPv6 service to be used for this subscriber.
`service_name` must be the name of a DHCPv6 service expressed as an alphanumeric string of 1 through 63 characters.

**Usage**
Use this command to apply or remove an existing DHCPv6 service to a subscriber template.

**Example**
The following command applies a previously configured DHCPv6 service named `dhcv6_1` to a subscriber template:
```
dhcp dhcv6 service-name dhcv6_1
```
**dhcp options**

Specifies the DHCP options which can be sent from the DHCP server for this subscriber.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

[context_name]host_name(config-subscriber)#
```

**Syntax**

```bash
dhcp options code 43 hex-values hex_values
```

**Usage**
Use this command to specify the DHCP options which can be sent from the DHCP server for this subscriber.

**Example**
The following command applies hex values ff-fe for DHCP option 43:

```bash
dhcp options code 43 hex-values ff-fe
```
**dhcp parameter-request-list-option**

Enables the sending of DHCP parameter request list option(s) in all outgoing messages for this subscriber.

**Product**

- P-GW
- SAEGW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Subscriber Configuration

```bash
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
[ no ] dhcp parameter-request-list-option [ options ]
```

**no**

Disables the sending of DHCP parameter request list option(s) in all outgoing messages.

**options**

Specifies the value of particular DHCP parameter request list option(s).

`options` must be an integer from 1 through 254.

**Important:** Multiple options may be selected in the same command.

**Usage**

Use this command to enable or disable the sending of DHCP parameter request list option(s) in all outgoing messages for this subscriber.

**Example**

The following command enables DHCP parameter request list option inclusion in outgoing messages:

```
dhcp parameter-request-list-option
```
**dhcp service**

Enables DHCP service configuration accessible to the Se-GW context for subscriber. The specified DHCP service will be used for performing DHCP procedures between HNB-GW and HMS.

**Product**

HNB-GW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
dhcp service dhcp_svc_name context ctxt_name
```

```
no dhcp service
```

**no**

Removes the specified DHCP service from the subscriber template configuration.

**dhcp_svc_name**

Specifies name of the DHCP service configured in Context configuration mode for DHCP proxy support on HNB-GW.

dhcp_svc_name must be an alphanumeric string of 1 through 63 characters preconfigured within the same context of this subscriber.

**context ctxt_name**

Specifies the name of the context where DHCP service is configured for HNB-GW subscribers. ctxt_name must be an alphanumeric string of 1 trough 79 characters.

**Usage**

This command associates the subscriber template with pre-configured DHCP service configuration to provide accessibility to Se-GW with HNB-GW.

**Example**

Following command applies a previously configured DHCP service named dhcp_hnb1 to a subscriber template within the context named femto_hnb.

```
dhcp service dhcp_hnb1 context femto_hnb
```
dns

Configures the domain name servers for the current subscriber.

Product

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

[ no ] dns { primary | secondary } ip_address

no
Indicates the IP address is to be removed as either a primary or secondary domain name server.

dns primary | secondary
dns primary: Updates the primary domain name server for the subscriber.
dns secondary: Updates the secondary domain name server for the subscriber.

ip_address
Specifies the IP address of the domain name server using IPv4 dotted-decimal notation.

Usage
Set the subscriber DNS server lists as not all users will have the same set of servers.

Example

dns primary 10.2.3.4
no dns primary 10.2.3.4
dns secondary 10.2.5.6
no dns secondary 10.2.5.6
eap

Specifies the lifetime for a master session key (MSK) for extensible authentication protocol (EAP) authentication.

**Product**
ASN-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
[ default ] eap msk-lifetime dur
```

**default**
Sets the lifetime duration to default value of 3600 seconds for master session key.

**msk-lifetime dur**
Specifies the lifetime duration (in seconds) on Master Session Key (MSK) in seconds for a WiMAX subscriber EAP authentication. 

*dur* is an integer from 60 through 65535.

**Usage**

This command is used to set the lifetime for MSK in EAP authentication for WiMAX subscriber.

**Example**

The following command sets the lifetime for MSK key to 4800 seconds for a WiMAX subscriber through EAP authentication:

```
eap msk-lifetime 4800
```
encrypted password

Designates use of password encryption.

Exec > Global Configuration > Context Configuration > Subscriber Configuration

```bash
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
encrypted password password
```

- `encrypted password password`
- `password` is the encrypted password and must be an alphanumeric string of 1 through 132 characters.

**Usage**

This command is normally used only inside configuration files.

**Example**

The following command sets an encrypted password of `qsdf12d4`:

```
encrypted password qsdf12d4
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
external-inline-server

This is a restricted command.
### firewall policy

**Important:** This command is only available in StarOS 8.0. In StarOS 8.1 and later releases, this configuration is available in the ACS Rulebase Configuration Mode.

This command enables or disables Stateful Firewall support for the subscriber.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Subscriber Configuration

```bash
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
firewall policy firewall-required

{ default | no } firewall policy
```

- **no**
  
  Disables Stateful Firewall support for this subscriber.

- **default**

  Configures the default setting for Stateful Firewall support.

  Default: Disabled

- **firewall-required**

  Enables Stateful Firewall support for this subscriber.

**Usage**

Use this command to enable or disable Stateful Firewall support for this subscriber.

**Important:** Unless Stateful Firewall support for this subscriber is enabled using this command, firewall processing for this subscriber is disabled.

**Important:** If firewall is enabled, and the rulebase has no firewall configuration, Stateful Firewall will cause all packets to be discarded.

**Example**
The following command enables Stateful Firewall support for this subscriber:

```
firewall policy firewall-required
```

The following command disables Stateful Firewall support for this subscriber:

```
no firewall policy
```
fw-and-nat policy

**Important:** This command is only available in StarOS 8.1. This customer-specific command must be used to configure the Policy-based Firewall-and-NAT feature.

**Product**
PSF
NAT

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
fw-and-nat policy fw_nat_policy
{ default | no } fw-and-nat policy
```

- **default**
  Specifies that the default Firewall-and-NAT policy configured in the rulebase be used for the subscriber.

- **no**
  Disables Firewall and NAT processing for the subscriber.

- **fw_nat_policy**
  Specifies the Firewall-and-NAT policy for the subscriber.
  `fw_nat_policy` must be an alphanumeric string of 1 through 63 characters. Note that this policy will override the default Firewall-and-NAT policy configured in the ACS rulebase.

**Usage**

Use this command to configure the Firewall-and-NAT policy for subscribers. Note that the policy configured in the subscriber mode will override the default policy configured in the ACS rulebase. If a policy is not configured in the subscriber mode, the default policy configured in the ACS rulebase will be applied.

**Example**

The following command configures a Firewall-and-NAT policy named `standard` for the subscriber:

```
fw-and-nat policy standard
```
**gtpp group**

This command enables/disables eG-CDR generation for CDMA subscribers.

**Product**
IPSG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
gtpp group group_name
```

**Usage**

Use this command to enable or disable the generation of eG-CDRs for CDMA traffic observed in customer network during IPSG deployment.
idle-timeout-activity

Defines whether downlink (towards Mobile Node) data packets transmitted when the session is dormant are treated as activity for the idle-timer (inactivity timer).

By default, downlink data transmitted over a dormant session restarts the idle-timer for that session; it is treated as activity for the session.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

[ no ] idle-timeout-activity dormant-downlink-data

no
Dormant mode downlink data is not treated as activity for the session idle-timer. The session idle timer is not reset.

idle-timeout-activity dormant-downlink-data
Treats dormant mode downlink data as activity for the session idle-timer. The session idle timer is reset.

Usage
Use this command to disable or re-enable restarting the session idle timer when downlink data packets are transmitted to the Mobile Node when the session is in dormant mode.

Example
Use the following command to disable restarting the session idle timer when downlink data packets are transmitted to the Mobile Node when the session is in dormant mode:

no idle-timeout-activity dormant-downlink-data

Use the following command to re-enable restarting the session idle timer when downlink data packets are transmitted to the Mobile Node when the session is in dormant mode:

idle-timeout-activity dormant-downlink-data
ikev2 tsr

Configures the Traffic Selector responder (TSr) negotiation behavior during IKEv2 Security Association (SA) establishment.

**Product**
PDG/TTG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
[ default ] ikev2 tsr { wildcard | user-specified }
```

- **default**
  Specifies the default behavior, which is wildcard TSr negotiation.

- **ikev2 tsr**
  Specifies ???.

- **wildcard**
  Specifies that during TSr negotiation, the PDG/TTG always returns an any-to-any IP address range, an any-to-any port range, and allows any protocol, irrespective of the traffic selector ranges received from the UE. This is the default behavior.

- **user-specified**
  Specifies that during TSr negotiation, the PDG/TTG responds to each UE request with the UE-specified IP address ranges. This enables split tunneling on the PDG/TTG, and enables the UE to tunnel only a specified traffic range to the PDG/TTG and send other traffic directly out the WLAN.

**Usage**

Use this command to specify the TSr negotiation behavior on the PDG/TTG.

**Example**

The following command enables user-specified TSr negotiation on the PDG/TTG:

```
ikev2 tsr user-specified
```

**ims application-manager**

Specifies the IP Multimedia Subsystem (IMS) application manager for the subscriber.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
[ no ] ims application-manager { domain-name domain-name | ipv4-address ipv4_address }
```

- **no**
  
  Disables the IMS application manager for this subscriber.

- **ims application-manager**
  
  Enables the IMS application manager for this subscriber.

- **domain-name domain-name**
  
  Specifies the domain name of the application manager.
  
  **domain-name** must be an alphanumeric string of 1 through 63 characters.

- **ipv4-address ipv4_address**
  
  Specifies the IP address of the application manager using IPv4 dotted-decimal notation.

**Usage**

The IMS application manager address is returned by HA to MN in DHCP Ack when it receives the DHCP inform from an AIMS subscriber.

**Example**

```
ims application-manager domain-name domain23
ims application-manager ipv4-address 192.168.23.1
```
ims-auth-service

Enables IP Multimedia Subsystem (IMS) authorization support for subscriber. The specified IMSA service will be used for performing IMS authorization and flow-based charging procedures.

Product
PDSN
GGSN
P-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

[ default | no ] ims-auth-service auth_svc_name

- **default**
  - Configures default setting.
  - Default: Disabled or as specified at the context or network access service level or in subscriber template.

- **no**
  - Removes the specified IMS authorization service from the subscriber configuration.

- **ims-auth-service auth_svc_name**
  - Specifies name of the IMS authorization service.
  - auth_svc_name must be an alphanumeric string of 1 through 63 characters preconfigured within the same context of this subscriber.

Usage
This feature provides the IMS authorization service configuration for Gx interface in IMS service node.

Example
Following command applies a previously configured IMS authorization service named ims_interface1 to a subscriber within the specific context.

```plaintext
ims-auth-service ims_interface1
```
inter-pdsn-handoff

Configure the system to force the MN to use its assigned IP address during Internet Protocol Control Protocol (IPCP) negotiations resulting from inter-PDSN handoffs.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

[ no ] inter-pdsn-handoff require ip-address

no
Disables the rejecting of sessions when the MN uses a non-allocated IP address during IPCP re-negotiations.

inter-pdsn-handoff require ip-address
Rejects sessions when the MN uses a non-allocated IP address during IPCP re-negotiations.

Usage
This command is used to configure the system to reject sessions that are re-negotiating IPCP after an inter-PDSN handoff if the IP address they propose does not match the one initially provided by the PDSN. The session would be rejected even if the proposed address was 0.0.0.0.
If this parameter is disabled, the PDSN will attempt to re-assign the IP address initially provided.

Example
To set the PDSN to not allow a mismatched IP address during a PDSN to PDSN handoff of a MIP call, use the following command:

inter-pdsn-handoff require ip-address

To set the PDSN so that it will not disconnect the session immediately, if the Mobile requests an IP address of 0.0.0.0 or a mismatched IP address after inter-pdsn handoff, use the following command:

no inter-pdsn-handoff require ip-address
ip access-group

Configures IP access group for the current subscriber.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

[ no ] ip access-group group_name [ in | out ]

no
Indicates the access group specified is to be cleared from the subscribers configuration.

ip access-group group_name
Specifies the name of the IPv4/IPv6 access group. acl_group_name is a configured ACL group expressed as an alphanumeric string of 1 through 79 characters.

in | out
Default: both (in and out)
Specifies the access-group as either inbound or outbound by the keywords in and out, respectively. If neither of these key words is specified, the command associates the group_name access group with the current subscriber for both inbound and outbound access.

Usage
Set the subscriber access group to manage the access control for subscribers as a logical group.

Example
The following command associates the sampleGroup access group with the current subscriber for both inbound and outbound access:

    ip access-group sampleGroup

The following removes the outbound access group flag for sampleGroup:

    no ip access-group sampleGroup out
ip address

Configures a static IPv4 address for use by the subscriber.

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

[ no ] ip address ip_address netmask

no
Removes a previously configured IP address assignment.

ip address ip_address
Specifies the IP address assigned to the subscriber using IPv4 dotted-decimal notation.

netmask
The subnet mask that corresponds to the assigned IPv4 address.

Usage
Use this command to assign a static IPv4 address to the subscriber. This address will be used each time the subscriber establishes data sessions.

Example
The following command configures a static IP address of 192.168.1.15 with a subnet mask of 255.255.255.0 to the subscriber:

ip address 192.168.1.15 255.255.255.0
ip address pool

Configures IP address pool properties for the subscriber.

**Product**
PDSN
GGSN

SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
[ no ] ip address pool name pool_name
```

- **no**
  
  Removes a previously configured static address.

- **ip address pool name pool_name**

  Specifies the IP address pool or IP address pool group from which the subscribers IP address is assigned. 
  `pool name` must be the name of an existing IP pool or IP pool group expressed as an alphanumeric string of 1 through 31 characters.

**Usage**

Use this command to specify the name of an IP address pool configured on the system from which IP addresses are to be dynamically assigned to sessions from this subscriber.

This command can be issued multiple times to specify multiple address pools for the subscriber. If multiple pools are specified, addresses are assigned for subscriber sessions from the pools based on the order in which the pools were configured.

If an address cannot be provided from the first-specified pool for whatever reason, the system attempts to assign an address from the second-specified pool, and so on. This operation is independent of the priorities configured for the pools. For example, if pool1 was specified for the subscriber first, and pool2 second, the system always attempts to assign addresses from pool1. If an address can not be assigned from pool1 (i.e. all addresses are in use), the system then attempts to assign an address from pool2.

**Example**
The following command configures the subscriber to receive IP addresses from an IP address pool named `public1`:

```
  ip address pool name public1
```
ip address secondary-pool

Configures secondary IP address pool properties for the subscriber to provide multiple IP host configuration behind one WiMAX Customer Premise Equipment (CPE).

Product
ASN-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }  

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

[ no ] ip address secondary-pool name aux_pool_name

- no
  Remove a previously configured auxiliary pool named aux_pool_name for multiple host support in ASN-GW service.

- ip address secondary-pool name aux_pool_name
  Specifies the secondary/auxiliary IP address pool or IP address pool group from which the IP address is assigned to host behind a WiMAX CPE having primary IP address. pool_name must be the name of an existing IP pool or IP pool group expressed as an alphanumeric string of 1 through 31 characters.

Usage
Use this command to specify the name of an IP address pool configured on the system from which IP addresses are to be dynamically assigned to host behind a WiMAX CPE for multiple host session support. This command designates the IP address to secondary hosts from locally configured secondary IP address pool. To enable multiple host support behind a WiMAX CPE and configure maximum number of supported hosts use secondary-ip-host command in ASN Gateway Service Configuration mode.

Example
The following command configures the subscriber to receive IP addresses from a secondary IP address pool named auxiliary1 for secondary hosts behind the WiMAX CPE:

  ip address secondary-pool name auxiliary1
ip allowed-dscp

Sets the Quality of Service (QoS) Differentiated Services (DiffServ) marking that a subscriber session is allowed. The DSCP is disabled by default.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

`configure > context context_name > subscriber { default | name subscriber_name }`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-subscriber)#`

Syntax

```
ip allowed-dscp class class max-class maxclass [ rt-marking marking ]

no ip allowed-dscp class
```

---

**ip allowed-dscp class class**

Specifies the Differentiated Services Codepoint (DSCP) class with which the subscriber session may mark its packets. If the subscriber sessions packets request a code point class higher than the code point class specified, the PDSN service re-marks the packets with the QoS-DSCP value specified by the `ip qos-dscp` command.

Default: none

*class* must be one of the following:

- **a**: allow packets with AF DSCPs
- **e**: allow packets with EF DSCP
- **o**: allow packets for experimental or local use
- **ae**: allow packets with AF and EF DSCPs
- **ao**: allow packets with AF DSCPs or packets for experimental or local use
- **eo**: allow packets with EF DSCPs or packets for experimental or local use
- **aeo**: allow packets with AF or EF DSCPs or packets for experimental or local use
- **none**: allow only the **be** and **sc1** through **sc7** code points

---

**max-class maxclass**

This parameter specifies the maximum code point with which a subscriber session may mark its packets. The subscriber sessions packets must be marked with a code point equal to or less than the code point specified. If the subscriber sessions packets request a code point higher than the code point specified, the PDSN service re-marks the packets with the QoS-DSCP value specified by the lower of the max-class and the `ip qos-dscp` command.
The list below identifies the code points from lowest to highest precedence. For example, if the `maxclass` is set to `af22`, that becomes the maximum code point that the subscriber session may mark its packets with and only `be`, `af13`, `af12`, `af11`, `af23`, and `af22` are allowed. If a subscriber session marks its packets with anything after `af22` in this list, the PDSN service re-marks the packets with the QOS-DSCP value specified by the lower of the maxclass and the `ip qos-dscp` command.

If class is set to none only the `be` and `sc1` through `sc7` codepoints are allowed. For example; if `class` is set to none and you set `max-class` to `sc1`, only the `sc1` and `be` codepoints are allowed.

Default: `be`

The `maxclass` must be one of the following:
- `be`: best effort forwarding
- `af13`: assured Forwarding 13
- `af12`: assured Forwarding 12
- `af11`: assured Forwarding 11
- `af23`: assured Forwarding 23
- `af22`: assured Forwarding 22
- `af21`: assured Forwarding 21
- `af31`: assured Forwarding 31
- `af32`: assured Forwarding 32
- `af33`: assured Forwarding 33
- `af41`: assured Forwarding 41
- `af42`: assured Forwarding 42
- `af43`: assured Forwarding 43
- `ef`: expedited forwarding
- `sc1`: selector class 1
- `sc2`: selector class 2
- `sc3`: selector class 3
- `sc4`: selector class 4
- `sc5`: selector class 5
- `sc6`: selector class 6
- `sc7`: selector class 7

The `rt-marking marking` parameter is used for Mobile IP (MIP) reverse tunnels. When MIP session packets do not have a DSCP marking, the Foreign Agent (FA) marks the packets with the value specified by `rt-marking marking`. If MIP session packets have a DSCP marking, the marking is subjected to the conformance rules for the values of class and max-class; the final DSCP marking is then copied from the inner IP header to the outer IP header.

Default: `be`

The `marking` must be one of the following:
- `be`: best effort forwarding
- `af11`: assured Forwarding 11
- `af12`: assured Forwarding 12
- `af13`: assured Forwarding 13
- `af21`: assured Forwarding 21
- `af22`: assured Forwarding 22
- `af23`: assured Forwarding 23
- `af31`: assured Forwarding 31
- `af32`: assured Forwarding 32
- `af33`: assured Forwarding 33
- `af41`: assured Forwarding 41
- `af42`: assured Forwarding 42
**af43**: assured Forwarding 43  
**ef**: expedited forwarding  
**sc1**: selector class 1  
**sc2**: selector class 2  
**sc3**: selector class 3  
**sc4**: selector class 4  
**sc5**: selector class 5  
**sc6**: selector class 6  
**sc7**: selector class 7

**Usage**

Use this command to configure Quality of Service (QoS) for a subscriber session to allow a Differentiated Services (DiffServ) Code Point (DSCP) marker in the header of each IP packet that prompts network routers to apply differentiated grades of service to various packet streams.

This command uses `class` and type of marker (rt-marking for reverse tunnels) for configuration with `max-class` maximum code point that a subscriber session may mark its packets with.

**Example**

The following command will allow 0 packets for experimental or local use with best effort forwarding `be`:

```
ip allowed-dscp class 0 max-class be
```
ip context-name

Configures the context to which the subscriber is assigned upon authentication. The assigned context is considered the destination context that provides the configuration options for the services the subscriber is allowed to access.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

`configure > context context_name > subscriber { default | name subscriber_name }`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-subscriber)#`

**Syntax**

```
[ no ] ip context-name  name
```

- **no**
  Removes the current assigned context from the subscriber’s data.

- **ip context-name  name**
  Specifies the name of the context to assign the subscriber to once authenticated. `name` must be an alphanumeric string of 1 trough 79 characters.

**Usage**
Set the subscriber IP context to a common context when all subscribers from one or more contexts will use the same egress context.

**Example**

```
ip context-name sampleName

no ip context-name sampleName
```
ip header-compression

Configures the IP packet header compression options for the current subscriber. Although this command configures IP header compression algorithms, the Internet Protocol Control Protocol (IPCP) negotiations determine when the header compression algorithm is applied.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```bash
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

Syntax

```bash
ip header-compression { rohc [ any [ mode { optimistic | reliable | unidirectional } ] ] | cid-mode { { large | small } [ marked-flows-only | max-cid | max-hdr value | mrru value ] } | marked flows-only | max-hdr value | mrru value | downlink | uplink ] | vj } +
```

```bash
[ default | no ] ip header-compression
```

- **default**
  Restores this command’s default setting to the Van Jacobsen (VJ) header compression algorithm.

- **no**
  Disables all IP header compression.

```bash
ip header-compression { rohc [ any [ mode { optimistic | reliable | unidirectional } ] ] | cid-mode { { large | small } [ marked-flows-only | max-cid | max-hdr value | mrru value ] } | marked flows-only | max-hdr value | mrru value | downlink | uplink ] | vj }
```

Specifies that the Robust Header Compression (ROHC) algorithms is used for data.

**Important:** ROHC is only supported for use with the PDSN.

- **any:** Apply ROHC header compression in both the uplink and downlink directions.
- **mode { optimistic | reliable | unidirectional }**:
  - **optimistic:** Sets the ROHC mode to Bidirectional Optimistic mode (O-mode). In this mode packets are sent in both directions. A feedback channel is used to send error recovery requests and (optionally) acknowledgments of significant context updates from decompressor to compressor. Periodic refreshes are not used in the Bidirectional Optimistic mode.
  - **reliable:** Sets the ROHC mode to Bidirectional Reliable mode (R-mode). This mode applies an intensive usage of a feedback channel and a strict logic at both the compressor and the decompressor.
that prevents loss of context synchronization between the compressor and the decompressor. Feedback is sent to acknowledge all context updates, including updates of the sequence number field.

- **unidirectional**: Sets the ROHC mode to Unidirectional mode (U-mode). With this mode packets are sent in one direction only, from the compressor to the decompressor. This mode therefore makes ROHC usable over links where a return path from the decompressor to the compressor is unavailable or undesirable.

```
cid-mode { { large | small } [ marked-flows-only | dm | max-hdr value | mrru value ] } : Specifies the ROHC packet type to be used.
  * large | small [ marked-flows-only | max-cid | max-hdr value | mrru value ] : Defines the ROHC packet type as large or small and optionally sets the following parameters for the packet type selected:
  * marked-flows-only: Specifies that ROHC is to be applied only to marked flows.
  * max-cid integer: Default: 0 The highest context ID number to be used by the compressor. integer must be an integer from 0 through 15 when small packet size is selected and must be an integer from 0 through 31 when large packet size is selected.
  * max-hdr value: Specifies the maximum header size to use. Default: 168. value must be an Integer from 0 through 65535.
  * mrru value: Specifies the maximum reconstructed reception unit to use. Default: 65535. value must be an Integer from 0 through 65535.
```

- **downlink**: Apply the ROHC algorithm only in the downlink direction.
- **uplink**: Apply the ROHC algorithm only in the uplink direction.

**Important**: When ROHC is enabled for downlink or uplink only the operational mode is Unidirectional.

```
vj
```

Specifies that the VJ algorithm is used for header compression.

```
+
```

Either one or both of the keywords may be entered in a single command. If both vj and rohc are specified, vj must be specified first.

**Important**: If both VJ and ROHC header compression are specified, the optimum header compression algorithm for the type of data being transferred is used for data in the downlink direction.

**Usage**

Header compression can be used to provide a higher level of security in IP traffic enhance bandwidth usage and lower bit errors. By default the header compression algorithm is set to vj.

**Example**
The following command disables all IP packet header compression:

   no ip header-compression

The following command sets IP header compression to default vj algorithm:

   default ip header-compression

The following command also sets the IP header compression to the vj algorithm:

   ip header-compression vj

The following command enables the Internet Protocol Control Protocol (IPCP) to determine which protocol is the optimum algorithm for data in the downlink direction and use either VJ or ROHC as needed:

   ip header-compression vj rohc

The following command enables ROHC for the downlink direction only:

   ip header-compression rohc downlink

The following command enables ROHC in any direction using Bidirectional Optimistic mode:

   ip header-compression rohc any mode Optimistic
ip hide-service-address

Hide the IP address of the service from the subscriber.

Product

```
ip local-address ip_address
no ip local-address
```

- **no**
  
  Removes a previously configured IP local-address.

```
ip_address ip_address
```

- Specifies an IP address configured in a destination context on the system through which a packet data network can be accessed. *ip_address* is entered using IPv4 dotted-decimal notation.

**Usage**

This parameter specifies the IPv4 address on the system that the MS uses as the remote-end of the PPP connection. If no local address is configured, the system uses an "unnumbered" scheme for local-side addresses.

**Example**

The following command configures a local address of 192.168.1.23 for the MS:

```
local-address 192.168.1.23
```
ip multicast discard

Configures the IP multicast discard packet behavior.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
[ no ] ip multicast discard
```

- **no**
  
  Does not discard IP multicast packets.

- **ip multicast discard**
  
  Discards IP multicast packets.

**Usage**

This command specifies if IP multicast packets will be discarded.
ip qos-dscp

Configures quality of service (QoS) options for the current subscriber using the differentiated services code point (DSCP) method. This functionality is disabled by default.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
ip qos-dscp option

no ip qos-dscp
```

Sets the quality of service option to its default value.

```
ip qos-dscp option

Default: be (Best Effort)
```

Specifies the subscriber’s per hop quality of service setting as one of:

- **af11**: assured Forwarding 11
- **af12**: assured Forwarding 12
- **af13**: assured Forwarding 13
- **af21**: assured Forwarding 21
- **af22**: assured Forwarding 22
- **af23**: assured Forwarding 23
- **af31**: assured Forwarding 31
- **af32**: assured Forwarding 32
- **af33**: assured Forwarding 33
- **af41**: assured Forwarding 41
- **af42**: assured Forwarding 42
- **af43**: assured Forwarding 43
- **be**: best effort forwarding
- **ef**: expedited forwarding
**Usage**

Set the quality of service for a subscriber based upon the service level agreements.

**Example**

```
ip qos-dscp ef
no ip qos-dscp
```
**ip route**

Configures the static route to use to reach the subscriber’s network.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

`configure > context context_name > subscriber { default | name subscriber_name }`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
[ no ] ip route ip_address ip_mask [ gateway_address ]
```

- **no**
  Removes the configured route information from the subscriber data.

- **ip route ip_address**
  Specifies the target IP address for which the route information applies using IPv4 dotted-decimal notation.

- **ip_mask**
  Specifies the networking mask for the route.
  1 bits in the `ip_mask` indicate that bit position in the `ip_address` must also have a value of 1.
  0 bits in the `ip_mask` indicate that bit position in the `ip_address` does not need to match, such as the bit can be either a 0 or a 1.
  For example, if the IP address and mask were specified as 172.168.10.0 and 255.255.255.224, respectively, the network mask will be 172.168.0.0 (obtained by logically ANDing the IP address with the IP mask).

- **gateway_address**
  Default: assigned remote IP address will be used as the gateway address.
  Specifies the IP address of the next hop gateway for the route using IPv4 dotted-decimal notation.

**Usage**
The static routes are also known as framed IP routes for subscribers. Static routes are typically applicable for subscribers connecting via other networks or when the mobile device acts as a gateway to a network on the far side of the device.

For example, if the mobile device is assigned IP address 10.2.3.4 and it acts as a gateway for the network 10.2.3.0 (with a network mask of 255.255.255.0) a static route would be configured with the `ip_address` being 10.2.3.0, `ip_mask` being 255.255.255.0, and `gateway_address` being 10.2.3.4.

**Example**

```
no ip route 10.2.3.4 255.255.255.0
```
ip source-validation

Enables or disables packet source validation for the current subscriber. Source validation requires that the source address of the received packets match the IP address assigned to the subscriber (either statically or dynamically) during the session.

If an incorrect source address is received from the mobile node, the system attempts to renegotiate the PPP session. The parameters for IP source validation can be set by the `ip source-violation` command.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
[ no ] ip source-validation
```

- `no`
  Disables source validation.

- `ip source-validation`
  Enables source validation.

**Usage**

Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

**Example**

The following command enables IP source validation:

```
ip source-validation
```

The following command disables IP source validation:

```
no ip source-validation
```
ip user-datagram-tos copy

Controls copying of the IP TOS octet value from IPv4/IPv6 datagrams to the IP header in tunnel encapsulation. This is disabled by default.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

ip user-datagram-tos copy [ access-link-tunnel | both | data-tunnel ]

no ip user-datagram-tos copy

no
Disable copying of the IP TOS octet value to all tunnel encapsulation IP headers.

ip user-datagram-tos copy
Enables copying of the IP TOS octet value to all tunnel encapsulation IP headers.

access-link-tunnel
Copies the IP TOS octet value to the tunnel encapsulation IP header on the access side (RP) tunnel.

both
Uses both the access-link-tunnel and data-tunnel.

data-tunnel
Copies the IP TOS octet value to the tunnel encapsulation IP header on the MIP data tunnel or L3 tunnel (IP-in-IP, GRE).

Usage
Use this command to enable the copying of the IP TOS octet value to the tunnel encapsulation IP header. This functionality allows PCF to detect special TOS marking in the outer IP header of A11 packets and to identify certain packets as QChat control messages. The Base Station Controller/Packet Control Function (BSC/PCF) must give higher priority to QChat control messages.

Example
The following command enables copying of the IP TOS octet value to the tunnel encapsulation IP header for the access side tunnel:

```
ip user-datagram-tos copy access-link-tunnel
```

The following command disables copying of the IP TOS octet value to all tunnel encapsulation IP headers:

```
no ip user-datagram-tos copy
```
**ip vlan**

Configures subscriber-to-Virtual LAN (VLAN) associations.

**Product**
- PDSN
- HA

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
ip vlan vlan-id
[ default | no ] ip vlan
```

- **default**
  - Resets the VLAN ID to the default setting.

- **no**
  - Disables the VLAN ID for the subscriber.

```
ip vlan vlan-id
```

- Specifies the VLAN ID that is associated with the IP address for that session. `vlan-id` is an integer from 1 through 4094.

**Usage**

This command configures the subscriber vlan ID which is used with the assigned address for the subscriber session to receive packets. If the IP pool from which the address is assigned is configured with a VLAN ID, this subscriber configured VLAN ID overrides it.

Subscriber traffic can be routed to specific VLANs based on the configuration of their user profile. Using this functionality provides a mechanism for routing all traffic from a subscriber over the specified VLAN. All packets destined for the subscriber must also be sent using only IP addresses valid on the VLAN or they will be dropped.

**Example**

Set the vlan ID to the default setting by entering the following command:

```
default ip vlan
```
ipv6 access-group

Configures the IPv6 access group for a subscriber.

Product
PDSN
GGSN
ASN-GW
P-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax
ipv6 access-group name [ in | out ]

ipv6 access-group name
Defines the access group name. name is an alphanumeric string of 1 through 47 characters.
in
Defines the access group as inbound.
out
Defines the access group as outbound.

Usage
Used to create an access group for a subscriber.

Example
The following command provides an example of an IPv6 access group with the name list_1:

ipv6 access-group list_1
ipv6 address

Configures a static IP address for use by the subscriber.

Product
PDSN
GGSN
ASN-GW
P-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax
[ no ] ipv6 address { prefix address | prefix-pool name }

no
Deletes a previously configured ipv6 address.

ipv6 address address
Specifies an IPv6 address. address is entered using IPv6 colon-separated-hexadecimal notation.

prefix
Specifies a static IPv6 address.

prefix-pool name
Specifies an IPv6 prefix pool name. name is an alphanumeric string of 1 through 31 characters.

Usage
Use this command to assign a static IPv6 address to the subscriber. This address will be used each time the subscriber establishes data sessions.

Example
The following command configures a static IP address of 2001:4A2B::1f3F with a mask length of 24 to the subscriber:

ipv6 address 2001:4A2B::1f3F/24
**ipv6 dns**

Configures the IPv6 Domain Name Service (DNS) servers.

**Product**

- PDSN
- GGSN
- ASN-GW
- P-GW
- SAEGW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
[ no ] ipv6 dns { primary | secondary } { ipv6_dns_address }
```

- **no**
  
  Deletes a previously configured DNS server.

- **ipv6 dns ipv6_dns_address**

  Specifies an IP address for the DNS server. `ipv6_dns_address` is entered using IPv6 colon-separated-hexadecimal notation.

- **primary**

  Configures the primary DNS server for the subscriber.

- **secondary**

  Configures the secondary DNS server for the subscriber. Only one secondary DNS server can be configured.

- **ipv6_dns_address**

  Configures the IP address of the DNS server.

**Usage**

DNS servers are configured on a per subscriber basis. This allows each subscriber to use specific servers.

**Example**

The following command provides an example of setting the primary IPv6 DNS server:
ipv6 dns primary fe80::c0a8:a04
**ipv6 dns-proxy**

Configures the system to act as a domain name server proxy for the current subscriber.

**Product**
- PDSN
- GGSN
- ASN-GW
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
**Exec > Global Configuration > Context Configuration > Subscriber Configuration**
```sh
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:
```
[context_name]host_name(config-subscriber)#
```

**Syntax**
```
[ default | no ] ipv6 dns-proxy
```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Disables IPv6 DNS proxy functionality for a subscriber.</td>
</tr>
<tr>
<td>no</td>
<td>Removes the pre-enabled functionality of IPv6 DNS proxy for a subscriber.</td>
</tr>
<tr>
<td>ipv6 dns-proxy</td>
<td>Enables IPv6 DNS proxy functionality for a subscriber. If enabled, the system will act as proxy DNS server. Default: disabled.</td>
</tr>
</tbody>
</table>

**Usage**
Used to enable or disable IPv6 DNS proxy for the subscriber. When enabled, the PDSN acts as a proxy DNS server for DNS IPv6 queries coming from the mobile station to the PDSN’s local PPP link address.

**Example**
The following command disables the IPv6 DNS proxy function for the subscriber:
```
no ipv6 dns-proxy
```
ipv6 egress-address-filtering

Configures the system to perform egress address filtering for the subscriber.

Product
- PDSN
- GGSN
- ASN-GW
- P-GW
- SAEGW

Privilege
- Security Administrator, Administrator

Mode
- Exec > Global Configuration > Context Configuration > Subscriber Configuration
- configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

[ no ] ipv6 egress-address-filtering

- no
  - Disables IPv6 egress address filtering.

- ipv6 egress-address-filtering
  - Enables IPv6 egress address filtering.

Usage

Used to enable the filtering of packets that arrive from the Internet to a particular site.

Example

The following command disables egress address filtering:

  no ipv6 egress-address-filtering
**ipv6 initial-router-advt**

Creates an IPv6 initial router advertisement interval for the subscriber.

**Product**

- PDSN
- GGSN
- ASN-GW
- HSGW
- P-GW
- SAEGW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
ipv6 initial-router-advt { interval value | num-advts value | router-solicit-wait-timeout value }
```

```
default ipv6 initial-router-advt { interval | num-advts | router-solicit-wait-timeout }
```

```
no ipv6 initial-router-advt router-solicit-wait-timeout
```

---

**default**

Resets the command to its default settings.

---

**no ipv6 initial-router-advt router-solicit-wait-timeout**

Disables running timer to wait for router solicit and sends the initial router advertisement immediately once session is up.

---

**ipv6 initial-router-advt**

Enables an initial router advertisement interval in milliseconds.

---

**interval value**

Default: 3000

The time interval the initial IPv6 router advertisement is sent to the mobile node in milliseconds.

`value` is an integer between 100 and 16000 milliseconds.
num-advts value value
Default: 3
The number of initial IPv6 router advertisements sent to the mobile node. value is an integer between 1 to 16.

router-solicit-wait-timeout value
Default: 3000
The time interval to wait for router solicit before sending the initial IPv6 router advertisement. value is an integer between 1 and 30000 milliseconds.

Usage
This command is used to set the advertisement interval and the number of advertisements. Using a smaller advertisement interval increases the likelihood of router being discovered more quickly when it first becomes available.
If timer is enabled and router solicit is received before timeout, then RA will be sent in response to RS and no further RA will be sent. If timer is enabled and no router solicit is received after timeout, initial RAs will be sent as configured and IPv6 capability indication will be sent in S2a to P-GW to indicate that P-GW should drop any IPv6 traffic for this PDN.

Example
The following command specifies the initial ipv6 router interval to be 2000ms:
```
ipv6 initial-router-advt interval 2000
```
**ipv6 interface-id**

Provides an IPv6 interface identifier for the subscriber.

**Product**

- PDSN
- GGSN
- ASN-GW
- P-GW
- SAEGW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
ipv6 interface-id ifid

[ default | no ] ipv6 interface-id

default
No interface ID set for IPv6CP negotiation to subscriber.

no
Deletes a previously configured IPv6 interface ID.

interface-id ifid
Specifies the interface ID assigned to the Mobile during IPv6 Control Protocol (IPv6CP) negotiation. *ifid* is a 64-bit unsigned integer.
```

**Usage**

Used to provide a IPv6 ifid for the subscriber when using IPv6-to-IPv4 (6to4) routing.

**Example**

The following command provides an example of assigning an IPv6 interface ID of `00-00-00-05-47-00-37-44` to the subscriber:

```
ipv6 interface-id 00-00-00-05-47-00-37-44
```
**ipv6 minimum-link-mtu**

Configures the IPv6 minimum link maximum transmission unit (MTU) value.

**Product**
- PDSN
- GGSN
- ASN-GW
- P-GW
- SAEGW

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > Subscriber Configuration
- configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
ipv6 minimum-link-mtu value
```

```
default ipv6 minimum-link-mtu
```

---

**default ipv6 minimum-link-mtu**

- **default**

  Resets minimum link MTU to its default setting: 1280.

---

```
ipv6 minimum-link-mtu value
```

**value** specifies the MTU (in bytes) as a minimum link value. `value` is an integer between 100 and 2000.

---

**Usage**

Used to override the IPv6 minimum link MTU values recommended by the standard.

**Example**

The following command provides an example of assigning an IPv6 minimum link MTU to 1580 to the subscriber:

```
ipv6 minimum-link-mtu 1580
```
**ipv6 secondary-address**

Configures additional IPv6 4-bit prefixes to the subscriber session.

**Product**
- PDSN
- GGSN
- ASN-GW
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
[ no ] ipv6 secondary-address { prefix ipv6_address_prefix | prefix-pool pool_name }
```

- **no**
  Deletes a previously configured ipv6 secondary address.

- **ipv6 secondary-address ipv6_address_pref**
  Specified the secondary IPv6 address using IPv6 colon-separated-hexadecimal notation.

- **pool_name**
  Specifies the name given to the secondary address prefix pool as an alphanumeric string of of 1 through 31 characters.

**Usage**

An IPv6 prefix pool name may be configured for a dynamic prefix, while the prefix is static. This command may be executed multiple times to configure multiple prefixes.

**Example**

The following command assigns an IPv6 secondary address prefix-pool name of `eastcoast` to the subscriber:

```
ipv6 secondary-address prefix-pool eastcoast
```
l2tp send accounting-correlation-info

Enables the sending of accounting correlation information (Correlation-Id, NAS-IP-Address and NAS-ID) by the L 2TP Access Concentrator (LAC) in L2TP control messages (ICRQ) during session setup to an L2TP Network Server (LNS).

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

[ no | default ] l2tp send accounting-correlation-info

no
Disables the sending of accounting correlation information by the LAC.

default
Sets the setting to default mode: disable.

l2tp send accounting-correlation-info

Enables the sending of accounting correlation information by the LAC.

Usage

Use this command to enable the LAC to send accounting correlation information (Correlation-Id, NAS-IP-Address and NAS-ID) in L2TP control message (ICRQ) during session setup to LNS for this subscriber. LNS can be configured to include this information in ACS billing records, so that billing servers can easily correlate accounting records from PDSN/LAC and LNS.

By default, this mode is disabled.

Example

The following command disables the inclusion of accounting correlation information in control messages during session setup to an LNS for a subscriber:

    default l2tp send accounting-correlation-info
I3-to-l2-tunnel address-policy

Configure the subscriber address allocation/validation policy, when subscriber Layer 3 (IPv4) sessions are tunneled using Layer 2 tunneling protocol (L2TP).

Product
HA
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Syntax
l3-to-l2-tunnel address-policy { alloc-only | alloc-validate | no-alloc-validate }

default l3-to-l2-tunnel address-policy

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Restores the default value for Layer 3-to-Layer 2 tunnel addressing: no-alloc-validate.</td>
</tr>
<tr>
<td>l3-to-l2-tunnel address-policy</td>
<td>Sets the policy for Layer 3-to-Layer 2 sessions to one of the following options.</td>
</tr>
<tr>
<td>alloc-only</td>
<td>Only allocates an address in the case of dynamic address assignment. Does not validate static addresses.</td>
</tr>
<tr>
<td>alloc-validate</td>
<td>Locally allocates and validates the subscriber addresses.</td>
</tr>
<tr>
<td>no-alloc-validate</td>
<td>Does not allocate or validate subscriber addresses locally for current subscribers sessions. Passes the address between the remote tunnel terminator and the Mobile Node. This is the default behavior.</td>
</tr>
</tbody>
</table>

Usage
Use this command to configure the L3 to L2 tunnel address policy for MIP HA sessions tunneled from the system using L2TP tunnels or for GGSN IP Context sessions tunneled using L2TP to a remote LNS. Also refer to the resource keyword of the Context Configuration mode ip pool command.

Example
the following command sets the L3-to-L2 tunnel address policy so that the current subscriber must have IP addresses allocated and validated locally on the system:
13-to-12-tunnel address-policy alloc-validate
loadbalance-tunnel-peers

Configures the load balancing of traffic bound for L2TP tunnels configured on the system for the selected subscriber.

**Product**
L2TP

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
loadbalance-tunnel-peers { balanced | prioritized | random }
```

- **loadbalance-tunnel-peers**
  Enables load balancing of L2TP traffic using one of the methods described below.

- **balanced**
  Enables the equal use of all configured tunnel peers (LNSs) for the selected subscriber.

- **prioritized**
  Enables the use of all configured tunnel peers (LNSs) for the selected subscriber based on the preference number assigned to the peer address.

- **random**
  Default: Enabled
  Enables the random use of all configured tunnel peers (LNSs) for the selected subscriber.

**Usage**

Use to manage traffic loads on L2TP Access Concentrator (LAC) ports and their respective L2TP Network Servers (LNSs).

**Example**

Use the following command to randomly use all configured tunnel peers (LNSs):

```
loadbalance-tunnel peers random
```
long-duration-action

Specifies what action is taken when the long duration timer expires.

**Product**
All

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

**Syntax**

```
long-duration-action { detection | disconnection [ dormant-only ] [ suppress-notification ] }
```

- **detection**
  Default: Enabled
  Detects long duration sessions and sends SNMP TRAP and CORBA notification. This is the default behavior. Use this command to detect a session exceeding the limit set by the long duration timer.

- **disconnection [ dormant-only ] [ suppress-notification ]**
  Default: Disabled
  Detects a long duration session and disconnects the session after sending SNMP trap and CORBA notification.
  
  **suppress-notification**: Suppresses the SNMP trap and CORBA notification after detecting and disconnecting a long duration session. Default: Disabled
  
  **dormant only**: Disconnects the dormant sessions after long duration timer and inactivity time with idle time-out duration expires. If the long duration timeout is fired and the call is not dormant, the call is disconnected when the call later moves to dormancy.

**Important**: For HA calls, the inactivity-time is considered as gauge for dormancy.

It sends the SNMP trap and CORBA notification after disconnecting a long duration session. Default: Disabled

**Usage**
Use this command to determine what action is taken when a session exceeds the limit set by the long duration timer.

**Example**
Use the following command to enable disconnecting sessions that exceed the long duration timer:

```
long-duration-action disconnection
```
Use the following command to disconnect the session that exceed the long duration timer without sending SNMP trap and CORBA notification:

```
long-duration-action disconnection suppress-notification
```

Use the following command to disconnect the session that is in dormant and exceed the long duration timer and send SNMP trap and CORBA notification:

```
long-duration-action disconnection dormant-only
```

Note that in case of HA calls, the inactivity-time is considered as gauge for dormancy.
max-pdn-connections

Specifies the maximum number of connections to packet data networks (PDNs) supported per eHRPD session.

Product
HSGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

max-pdn-connections eHRPD_PDNs

default max-pdn-connections

default

Resets the maximum number of PDN connections supported per eHRPD session to 3.

max-pdn-connections eHRPD_PDNs

Specifies the maximum number of PDN conceivedness allowed per eHRPD session. eHRPD_PDNs must be an
integer from 1 to 14. Default is 3.

Usage
This command is used to specify the maximum number of PDN connections supported per eHRPD session.

Example
The following command specifies a maximum of 5 PDNs per eHRPD session:

max-pdn-connections 5
mediation-device

Enables the use of a mediation device for subscribers, and specifies the system context to use for communicating with the device. A mediation device can be the initial point of contact for all IT systems that need to receive Charging Data Records (CDRs). Mediation devices can also be deep-packet inspection servers or transaction control servers.

Product

- GGSN
- P-GW
- PDG/TTG
- SAEGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

Syntax

```
mediation-device context-name <context-name> [ no interims ]
[ no | default ] mediation-device
```

---

no

Deletes the mediation-device configuration.

---

default

Changes the mediation device to no context-name configured and restores the mediation device’s default properties.

---

```
mediation-device context-name context-name
```

Default: The subscriber’s destination context.
Configures the mediation VPN context for the subscriber.
`context-name` must be an alphanumeric string of 1 through 79 characters that is case sensitive. If not specified, the mediation context is same as the destination context of the subscriber.

---

no-interims

Disables sending of Interim messages to the mediation device.
Default: Disabled
**Usage**

This command is used to enable mediation device support for subscribers. Keywords to this command can be used in combination to each other, depending on configuration requirements.

**Example**

The following command enables mediation device support for the subscriber and uses the protocol configuration located in an system context called `ggsn1`:

```
mediation-device context-name ggsn1
```
mobile-ip

Enables or disables access to mobile IP services by the subscriber.

Product
HA
FA

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

class > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

[ no ] mobile-ip { allow-aaa-address-assignment | dns-address source-priority { aaa | home-agent } | gratuitous-arp aggressive | home-agent ip_address [alternate] | match-aaa-assigned-address | min-reg-lifetime-override [value | infinit] | mn-aaa-removal-indication | mn-ha-hash-algorithm { hmac-md5 | md5 | rfc2002-md5 } | mn-ha-shared-key key | mn-ha-spi spi_num | reverse-tunnel | security-level { ipsec | none } | send {access-technology | accounting-correlation-info bsid | dns-address | host-config | imsi | terminal-verification } }

no

Disables the mobile IP option specified.

allow-aaa-address-assignment

Default: Disabled.

Enables the FA to accept a home address assigned by an AAA server. This should only be configured on the FA side.

dns-address source-priority { aaa | home-agent }

Sets the priority behavior on the FA to use either the DNS IP address information from the HA or the AAA server to include in the RRP to the MN.

When the no keyword is used in conjunction with the dns-address keyword, information received from both the home-agent and the AAA server is sent if available.

DNS IP address information from the HA comes from the DNS Normal Vendor/Organization Specific Extension (NVSE) in the Registry Registrar Protocol (RRP).

DNS IP address information from the AAA server is in the access accept message.

home-agent: If the DNS address is received from the home-agent only that information is sent to the MN.

Otherwise the DNS address received from the AAA server is sent.

aaa: If the DNS address is received from the AAA server only that information is sent to MN. Otherwise the DNS address received from the home-agent is sent.
gratuitous-arp aggressive

Default: Disabled.
When enabled, this mode will cause the HA to send out gratuitous ARP (Address Resolution Protocol) messages for all Mobile IP (MIP) registration renewals and handoffs.
To disable this mode, use the no form of this command.

Important: This mode will only work for IP addresses that have been assigned from a static IP address pool.

home-agent ip_address [alternate]

Specifies the IP address of the mobile IP user’s home agent. ip_address must be entered using IPv4 dotted-decimal or IPv6 colon-separated notation.
alternate - Specifies the secondary, or alternate, Home Agent to use when Proxy Mobile IP HA Failover is enabled.

match-aaa-assigned-address

Default: Disabled.
Enables the FA to validate the home address in the RRQ against the one assigned by AAA server. This should only be configured on the FA side.

min-reg-lifetime-override [value | infinit ]

Default: 0.
Configures the subscriber for minimum registration lifetime parameter on HA service. By default it uses the value configured on HA service where value must be the minimum registration lifetime that the HA service allows in any Registration Request message from the mobile node. An infinite registration lifetime can be configured by setting the value as “infinite”.
value is a minimum registration lifetime value in seconds and must be an integer between 1 through 65534.

mn-aaa-removal-indication

Default: Disabled.
When enabled, the MN-FA challenge and MN-AAA Authentication extensions are removed when relaying a Registration Request (RRQ) to the Home Agent (HA)

mn-ha-hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }

Specifies the encryption algorithm to use.
Default: hmac-md5
hmac-md5: Uses HMAC-MD5 hash algorithm, as defined in RFC-2002bis. This is the default algorithm.
md5: Uses the MD-5 hash algorithm.
rfc2002-md5: Uses the MD-5 hash algorithm variant as defined in RFC-2002.

mn-ha-shared-key key

Verifies the MN-HA Authentication for a local subscriber in the current context. key is an alphanumeric string or a hexadecimal number beginning with "0x" up to 127 bytes

mn-ha-spi spi_num

Specifies the Security Parameter Index (SPI) number. spi_num must be an integer from 256 through 4294967295.
### reverse-tunnel

Default: enabled.
All the mobile IP user to use reverse IP tunnels. The `no` keyword disables this option.

### security-level \{ ipsec | none \}

Default: none
Configures the security level needed for the subscriber's traffic.
- `ipsec`: secures both MIP control and data traffic with IPsec.
- `none`: none of the traffic is secured

**Important**: This keyword corresponds to the 3GPP2-Security-Level RADIUS attribute. This attribute indicates the type of security that the home network mandates on the visited network.

**Important**: For this attribute, the integer value “3” enables IPsec for tunnels and registration messages, “4“ Disables IPsec

### send \{ access-technology | accounting-correlation-info bsid | dns-address | host-config | imsi | terminal-verification \}

- `access-technology`: Configures FA to sends the access-technology type extension in the RRQ, by default it is disabled.
- `accounting-correlation-info`: Configures whether the FA sends the correlation info to the NVSE in the RRQ. Default is disabled.
- `dns-address`: Enables the HA to send the DNS address NVSE in the RRP. Default is disabled. This should only be enabled on the HA side.
- `host-config`: Configures by sending the Host Config NVSE in RRQ. By default it is disabled.
- `imsi`: Configures sending the IMSI NVSE in the RRQ. Default is sending IMSI in custom-1 format.
- `terminal-verification`: Enables the FA to send the terminal verification NVSE in the RRQ. Default is disabled. This should only be enabled on the FA side.

**Important**: `send dns-address` is a proprietary feature developed for a specific purpose and requires the MN to be able to renegotiate IPCP for DNS addresses and reregister MIP if necessary. Since this feature needs the MN to support certain PPP/MIP behavior, and not all MNs support that particular behavior, `send dns-address` should be enabled only after careful consideration.

### Usage

Use as subscriber service contracts change.

### Example

```plaintext
  mobile-ip home-agent 10.2.3.4

  no mobile-ip reverse-tunnel
```
**mobile-ip ha**

Accommodates two Mobile IP (MIP) Home Agent (HA) options in subscriber mode.

**Product**
- PDSN
- HA
- ASN-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
[ no ] mobile-ip ha { assignment-table name | ignore-unknown-ha-addr-error }
```

- **no**
  Disables the mobile IP HA option specified.

  **assignment-table name**
  Specifies the name of an existing MIP HA Assignment table. *name* must be an alphanumeric string of 1 through 63 characters.

  **ignore-unknown-ha-addr-error**
  Default is disabled.
  Enables or disables the HA to accept or reject the RRQ from a particular subscriber.

**Usage**

Use this command to assign a MIP HA Assignment table to the current subscriber.

Use this command to disable or enable the HA to accept or reject the RRQ from a particular subscriber when the HA address in the incoming MIP RRQ is not the same as the HA service address. The feature is off by default which causes the RRQ to be rejected with the error code UNKNOWN_HOME_AGENT.

**Example**

The following command assigns the MIP HA Assignment table named *Atable1* to the current subscriber:

```
mobile-ip ha assignment-table Atable1
```

The following command sets *ignore-unknown-ha-addr-error* to its default disabled state:

```
no mobile-ip ha ignore-unknown-ha-addr-error
```
mobile-ip reg-lifetime-override

Overrides the Mobile IP (MIP) registration lifetime from HA with value configured for subscriber.

Product
- PDSN
- HA
- ASN-GW

Privilege
- Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

mobile-ip reg-lifetime-override [ dur | infinite ]

[ default | no ] mobile-ip reg-lifetime-override

---

mobile-ip reg-lifetime-override dur

Default: 100 seconds.
Overrides the MIP registration lifetime from HA for the specified period of time in seconds. dur must be an integer from 1 through 65534.

---

infinite

Sets the MIP registration lifetime override value to infinite for a particular subscriber.

---

default

Sets the value of mobile IP registration lifetime override option to 100 seconds.

---

no

Disables the MIP registration lifetime override option.

Usage

Use this command to configure MIP registration-lifetime per realm/domain. This value overrides the default lifetime configured under HA service.

Example

The following command overrides the MIP registration lifetime value from HA service and defaults the MIP registration lifetime to 100 seconds for the current subscriber:

default mobile-ip reg-lifetime-override
**mobile-ip send access-technology**

Enables the sending of the RAT (Radio Access Technology) of the MS to the HA in a PMIP RRQ (Proxy MIP Register Request) message.

**Product**
PDIF
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
[ default | no ] mobile-ip send access-technology
```

### default

Disables the support for sending the RAT to the HA in a PMIP RRQ.
This is the default mode.

### no

Removes the configured support for sending the RAT to the HA in a PMIP RRQ.

**Usage**

Use this command to send the RAT to the HA in a PMIP RRQ.

**Example**

The following command enables sending the RAT to the HA in a PMIP RRQ:

```
mobile-ip send access-technology
```
**mobile-ip send accounting-correlation-info**

Enables the sending call correlation information Normal Vendor/Organization Specific Extensions (NVSEs) to the HA in the MIP Registry Registrar Protocol (RRP).

**Product**  
PDSN

**Privilege**  
Security Administrator, Administrator

**Mode**  
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
[ default | no ] mobile-ip send accounting-correlation-info
```

**default**  
Disables the support for sending call correlation information NVSEs to the HA in MIP RRQ. This is the default mode.

**no**  
Removes the configured support for sending call correlation information.

**Usage**  
Use this command to support PDSN-Correlation-ID VSE and send the call correlation information.

**Example**  
The following command enables sending call correlation information NVSEs to the HA in MIP RRQ

```
mobile-ip send accounting-correlation-info
```
mobile-ip send bsid

Enables the sending of the BSID (Base Station Identifier) of the WiFi access point/Radio Access Network (RAN) to the HA in a PMIP RRQ (Register Request) message.

Product
PDIF
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

[ default | no ] mobile-ip send bsid

---

**default**

Disables the support for sending the BSID to the HA in a PMIP RRQ.
This is the default mode.

**no**

Removes the configured support for sending the BSID to the HA in a PMIP RRQ.

---

Usage

Use this command to send the BSID to the HA in a PMIP RRQ.

Example

The following command enables sending the BSID to the HA in a PMIP RRQ:

```plaintext
mobile-ip send bsid
```
mobile-ipv6

Configures Mobile IPv6 related parameters for a subscriber.

**Product**

PDSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
[ default | no ] mobile-ipv6 { home-address ipv6_address | home-agent ipv6_address | home-link-prefix ipv6_address | tunnel mtu value }
```

---

**default**

Disables the support for sending call correlation information NVSEs to the HA in MIP RRQ. This is the default mode.

---

**no**

Removes the configured support for sending call correlation information.

---

**home-address ipv6_address**

Specifies the home address for the subscriber. `ipv6_address` must be entered using IPv6 colon-separated-hexadecimal notation.

---

**home-agent ipv6_address**

Specifies the IPv6 address of the mobile IP user’s home agent. `ipv6_address` must be entered using IPv6 colon-separated-hexadecimal notation.

---

**home-link-prefix ipv6_address**

Specifies the IPv6 address of the mobile IP user’s home link. `ipv6_address` must be entered using IPv6 colon-separated-hexadecimal notation.

---

**tunnel mtu value**

Configures the tunnel MTU (in bytes) for the IPv6 tunnel between the HA and the mobile node. `value` must be an integer from 1024 through 2000. The default is 1500.
Usage
This command sets the mobile-ipv6 parameters for a subscriber. Use this command to set the home-address, home-agent, and home-link prefix.

Example
Use the following command to set the tunnel MTU value to 1800:

```
mobile-ipv6 tunnel mtu 1800
```
nai-construction-domain

After authentication, the domain name specified by this command replaces the Network Access Identifier (NAI) constructed for the subscriber.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

nai-construction-domain domain_name

no nai-construction-domain

Define or delete a domain name to use to replace the NAI constructed domain name after authentication. The following command sets the domain name to privatel:

nai-construction-domain privatel

To delete the previously configured domain name, use the following command:

no nai-construction-domain
nbns

Configures and enables use of NetBIOS Name Service for the subscriber.

Product
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

\texttt{configure > context context\_name > subscriber \{ default | name subscriber\_name \}}

Entering the above command sequence results in the following prompt:

\texttt{[context\_name]host\_name(config-subscriber)\#}

Syntax

\texttt{nbns \{ primary \ IPv4\-address | secondary \ IPv4\-address \}}

\texttt{no nbns \{ primary \ IPv4\-address | secondary \ IPv4\-address \}}

\texttt{nbns primary}

Designates primary NBNS server. Must be followed with IPv4 address in dotted-decimal notation.

\texttt{nbns secondary}

Designates secondary/failover NBNS server. Must be followed with IPv4 address in dotted-decimal notation.

\texttt{IPv4\-address}

Specifies the IP address used for this service using IPv4 dotted-decimal notation.

\texttt{no}

Removes/disables use of a previously configured NetBios Name Service.

Usage

This command specifies NBNS parameters. The NBNS option is present for both PDP type IP and PDP type PPP for GGSN.

The system can be configured to use of NetBIOS Name Service for the Access Point Name (APN).

Example

The following command configures the subscriber’s NetBIOS Name Service to primary IP 192.168.1.15:

\texttt{nbns primary 192.168.1.15}
nexthop-forwarding-address

Configures the next hop forwarding address for the subscriber.

**Product**
- PDSN
- GGSN
- ASN-GW
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
nexthop-forwarding-address ip_address

no nexthop-forwarding-address
```

```
nexthop-forwarding-address ip_address

Configures the IP address of the nexthop forwarding address. ip_address must be entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

no

Disables this function. This is the default setting.
```

**Usage**

Use this command to configure the next hop forwarding address for the subscriber.

**Example**

The following command configures the next hop forwarding address to 10.1.1.1 (IPv4):

```
nexthop-forwarding-address 10.1.1.1
```
npu qos

Configures an Network Processing Unit (NPU) QoS priority queue for packets from the subscriber.

**Product**

- PDSN
- GGSN
- ASN-GW
- P-GW
- SAEGW

**Privilege**

- Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
npu qos traffic priority { best-effort | bronze | derive-from-packet-dscp | gold | silver }
```

- **best-effort**
  
  Assigns the best-effort queue priority. This is the lowest priority.

- **bronze**
  
  Assigns the bronze queue priority. This is the third-highest priority.

- **derive-from-packet-dscp**
  
  Default: Enabled
  
  Specifies that the priority is to be determined from the DS field in the packet's TOS octet.

- **gold**
  
  Assigns the gold queue priority. This is the highest priority.

- **silver**
  
  Assigns the silver queue priority. This is the second-highest priority.

**Usage**

This command is used in conjunction with the Network Processing Unit (NPU) Quality of Service (QoS) functionality.
The system can be configured to determine the priority of a subscriber packet either based on the configuration of the subscriber, or from the differentiated service (DS) field in the packet's TOS octet (representing the differentiated service code point (DSCP) value). Refer to the *System Administration Guide* for additional information on NPU QoS functionality.

**Important:** This functionality is not supported for use with the PDSN at this time.

**Example**

The following command configures the subscriber’s priority queue to be gold:

```
npu qos traffic priority gold
```
nw-reachability-server

Binds the name of a configured network reachability server to the current subscriber and enables network reachability detection.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
w
t-reachability server server_name

no nw-reachability server
```

- **nw-reachability server** server_name
  - Specifies the name of a network reachability server that has been defined in the current context.
  - server_name is an alphanumeric string of 1 through 16 characters.

- **no nw-reachability server**
  - Deletes the name of the network reachability server from the current subscriber’s configuration and disable network reachability failure detection for the current subscriber.

**Usage**

Use this command to define the network reachability server for the current subscriber and enable network reachability failure detection for the current subscriber. If a network reachability server is defined in an IP pool, that setting takes precedence over this command.

**Important:** Refer to the HA configuration mode command **policy nw-reachability-fail** to configure the action that should be taken when network reachability fails.

**Important:** Refer to the context configuration mode command **nw-reachability server** to configure network reachability servers.

**Important:** Refer to the **nw-reachability server server_name** keyword of the **ip pool** command in the Context Configuration Mode Commands chapter to bind the network reachability server to an IP pool.

**Example**

Cisco ASR 5x00 Command Line Interface Reference
To bind a network reachability server named *InternetDevice* to the current subscriber, enter the following command:

```
nw-reachability server InternetDevice
```
**outbound**

Configures the subscriber host password for use when authenticating PPP sessions.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```bash
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
outbound [ encrypted ] password pwd

no outbound password
```

```
[ outbound encrypted ] password pwd
```

Specifies the password to use for point-to-point protocol session host authentication. The `encrypted` keyword indicates the password specified uses encryption. The password specified as `pwd` must be an alphanumeric string of 1 through 63 characters without encryption, or 1 through 127 characters with encryption. The `encrypted` keyword is intended only for use by the chassis while saving configuration scripts. The system displays the `encrypted` keyword in the configuration file as a flag that the variable following the `password` keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

```
no outbound password
```

Clears the outbound password configuration from the subscriber data.

**Usage**

Sets the outbound (egress) password for increased security.

**Example**

```
outbound password secretPwd

outbound encrypted password scrambledPwd

no outbound password
```
overload-disconnect

Sets the threshold parameter for overload disconnect.

**Product**
ASN-GW
HA
PDIF
PDSN
PHSGW
PDG/TTG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```plaintext
overload-disconnect [ threshold { inactivity-time inactivity_time_threshold | connect-time connect_time_threshold } ]

[ default | no ] overload-disconnect [ threshold { inactivity-time | threshold connect-time } ]
```

---

**threshold inactivity-time inactivity_time_threshold**

Sets the inactivity time threshold (in seconds) as an integer from 0 through 4294967295. The default value of zero disables this feature. If inactivity-time for the subscriber’s session is greater than inactivity_time_threshold, the session becomes a candidate for disconnection.

---

**threshold connect-time connect_time_threshold**

Sets the connection time threshold (in seconds) as an integer from 0 through 4294967295. A value of zero disables this feature. If connect-time for the subscriber’s session is greater than connect_time_threshold, the session becomes a candidate for disconnection.

---

**default**

Enables the default condition for this subscriber.

---

**no**

Disables the overload disconnect feature for this subscriber. This is the default condition for PDIF.
**overload-disconnect**

**Usage**

Set a subscriber’s overload disconnect threshold in seconds, based on either inactivity or connection time. When this threshold is exceeded during a session, the subscriber’s session becomes a candidate for disconnection. To set overload-disconnect policies for the entire chassis, see `congestion-control overload-disconnect` in the *Global Configuration Mode Commands* chapter.

**Example**

```plaintext
overload-disconnect threshold inactivity-time 120
default overload disconnect threshold connect-time
no overload-disconnect threshold connect-time
no overload disconnect
```
password

Configures the subscribers password for the current context.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

[ encrypted ] password pwd

no password

encrypted

Indicates the password provided is encrypted.
The encrypted keyword is intended only for use by the chassis while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the password keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

pwd

Specifies the user’s password for authentication. pwd must be an alphanumeric string of 1 through 63 characters without encryption, or from 1 through 127 characters with encryption. A “null” password is allowed and is entered as consecutive double quotes (" "). See Example(s) for correct syntax.

Important: Subscribers configured with a null password will be authenticated using PAP and CHAP (MD5) only. Subscribers configured without a password (no password) will only be able to access services if the service is configured to allow no authentication.

no

Used to clear the subscriber password configuration from the subscriber data.

Important: Subscribers with no password will only be able to access services if the service is configured to grant access with no authentication.
Password management is critical to system security and all precautions should be taken to ensure passwords are not shared or to easily deciphered.

**Example**

```
password secretPwd

password ""

no password
```
pdif mobile-ip

Configures PDIF subscriber call setup parameters.

Product
PDIF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

[ default | no ] pdif mobile-ip { release-tia | required | simple-ip-fallback }

- [ default | no ]
  Disables the option specified.

- release-tia
  Specifies that after subscriber call setup is complete, the tunnel inner address (TIA) is released. If Simple IP is enabled, the TIA becomes the principal communications tunnel and the restriction that it is only to be used to set up a Mobile-IP call is lifted. This parameter is disabled by default.

- required
  Specifies that Mobile IP is required for this subscriber whenever a call is set up. This parameter is disabled by default.

- simple-ip-fallback
  Specifies that Simple IP should be used when Mobile IP could not be established. This parameter is disabled by default.

Usage

Use this command to configure specific behavior for the PDIF subscriber during call setup.

Example

The following command enables the system to fall back to Simple IP when Mobile IP fails for this subscriber during call setup:

    pdif mobile-ip simple-ip-fallback
permission

Enables or disables the subscriber’s ability to access wireless data services.

Product

- PDSN
- HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

[ no ] permission { ha-mobile-ip | pdsn-mobile-ip | pdsn-simple-ip }

default permission

| no | default
|---|---
| Disables the usage of the specified service.

| ha-mobile-ip | pdsn-mobile-ip | pdsn-simple-ip
|---|---|---
| ha-mobile-ip: Enables or disables the Home Agent (HA) support for Mobile IP (MIP) service.
| pdsn-mobile-ip: Enables or disables packet data and Foreign Agent (FA) support for MIP service.
| pdsn-simple-ip: Enables or disables packet data support for simple IP service.

Usage

Grants the subscriber access to services in the current context.

Example

```
permission pdsn-mobile-ip
no permission ha-mobile-ip
```
policy ipv6 tunnel

Sets maximum transmission unit (MTU) behavior for the IPv6 tunnel between the HA and Mobile Node.

Product
PDSN
HA

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

policy ipv6 tunnel mtu exceed { fragment | notify-sender }

mtu exceed { fragment | notify-sender }
fragment: Adjusts tunnel MTU and fragment packets
notify-sender: Sends an ICMPv6 Packet Too Big message to the original sender

Usage
Use this command to configure MTU behavior for an IPv6 tunnel between the HA and Mobile Node.

Example

policy ipv6 tunnel mtu exceed fragment
policy-group

Assigns or removes a flow-based traffic policy group to a subscriber.

Product

[context_name]host_name(config-subscriber)#

Syntax

[ no ] policy-group policy_group_name direction { in | out }

| no |

Removes assigned policy group from a subscriber configuration.

| policy-group policy_group_name |

Specifies the traffic policy group name for a subscriber session flow pre-configured within a destination context. policy_group_name is an alphanumeric string of 1 through 15 characters that is case sensitive.

direction { in | out }

Specifies the direction of flow in which the traffic policies need to be applied.

• in: specifies the incoming traffic
• out: specifies the outgoing traffic

Usage

Use this command to assign a traffic policy group to a subscriber for traffic policing.

Example

policy-group traffic_policy_group1 direction in
ppp

Configures the point-to-point protocol (PPP) options for the current subscriber.

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

ppp { accept-peer-ipv6-ifid | always-on-vse-packet | data-compression { mode { normal | stateless } | protocols { protocols [ protocols ] } | ip-header-compression negotiation { detect | force | vj compress-slot-id { both | none | receive | transmit } } | ipv4 { disable | enable | passive } | ipv6 { disable | enable | passive } | keepalive seconds | min-compression-size min_octets | mtu max_octets | remote-renegotiation disconnect { always | nai-prefix-msid-mismatch } )

default ppp { accept-peer-ipv6-ifid | always-on-vse-packet | data-compression { mode | protocols } | ip-header-compression negotiation [ vj compress-slot-id ] | ipv4 | ipv6 | keepalive | min-compression-size | mtu | remote-renegotiation disconnect }

no ppp { accept-peer-ipv6-ifid | always-on-vse-packet | data-compression protocols | ipv4 | ipv6 | keepalive | mtu | remote-renegotiation disconnect }

default

Restores the default value for the option specified.

no

Resets the option specified to its default.

always-on-vse-packet

Default: Enabled
If this feature is enabled, the PDSN sends special 3GPP2 VSE PPP packets to the Mobile Node with a maximum inactivity timer value. This configuration is applicable only for PDSN sessions.

accept-ipv6-peer-ifield

Default: None
Configures an IPv6-to-IPv4 (6to4) tunnel and controls the behavior of IPv6CP negotiation for the Interface ID. If enabled, PDSN will accept a valid interface-id proposed by the peer.

```
data-compression { mode { normal | stateless } | protocols { protocols } }
```

Default: all protocols enabled. Specifies the subscriber’s mode of data compression or the compression protocol to use.

- **mode**: sets the mode of compression where *modes* must be one of:
  - `normal`: Packets are compressed using the packet history for automatic adjustment for best compression.
  - `stateless`: Each packet is compressed individually.

- **protocols**: sets the compression protocol where *protocols* must be one of:
  - `deflate`: DEFLATE algorithm
  - `mppc`: Microsoft PPP algorithm
  - `stac`: STAC algorithm

```
ip-header-compression negotiation { detect | force | vj compress-slot-id { both | none | receive | transmit } }
```

Default: `force`

- **detect**: The local side does not include the Van Jacobson (VJ) Compression option in its IPCP configuration request unless the peer sends an Internet Protocol Control Protocol (IPCP) NAK including a VJ compression option. If the peer requests the VJ compression option in its IPCP request the local side will ACK/NAK.

- **force**: The IP header compression negotiation in IPCP happens normally. The local side requests the VJ compression option in its IPCP configure request. If the peer side requests VJ compression in its IPCP request, the local side will ACK/NAK the option.

- **vj compress-slot-id**: Configures the direction in which VJ slotid compression should be negotiated.
  - `both`: If the client proposes VJ slotid compression, accept it and propose slotid compression for the downlink and uplink.
  - `none`: If the client proposes VJ slotid compression, NAK the offer, do not propose slotid compression for the downlink.
  - `receive`: (Default) If the client proposes VJ slotid compression in the uplink direction accept the configuration.
  - `transmit`: Propose VJ slotid compression for uplink.

```
ipv4 { disable | enable | passive }
```

Default: `enable`

Controls IPCP negotiation during PPP negotiation.

- **disable**: The PDSN does not negotiate IPCP with the mobile.
- **enable**: The PDSN negotiates IPCP with the mobile.
- **passive**: The PDSN initiates IPCP only when the mobile sends an IPCP request.

```
ipv6 { disable | enable | passive }
```

Default: `enable`

Controls IPv6CP negotiation during PPP negotiation.

- **disable**: The PDSN does not negotiate IPCP with the mobile.
enable: The PDSN negotiates IPCP with the mobile.
passive: The PDSN initiates IPCP only when the mobile sends an IPCP request.

```
keepalive seconds
```

Default: 30
Specifies the frequency of sending the Link Control Protocol keepalive messages. *seconds* must be either 0 or an integer from 5 through 14400. The special value 0 disables the keepalive messages entirely.

```
min-compression-size min_octets
```

Default: 128
Specifies the smallest packet (in octets) to which compression may be applied. *min_octets* must be an integer from 0 through 2000.

```
mtu max_octets
```

Default: 1500
Specifies the maximum transmission unit (MTU) [in octets] for packets. *max_octets* must be an integer from 100 through 2000.

```
remote-renegotiation disconnect { always | nai-prefix-msid-mismatch }
```

Default: Disabled
Terminates the already established PPP sessions if they are renegotiated by the remote side by sending LCP Conf-req/nak/ack. The following termination conditions are available:

- **always**: Automatically disconnects the session.
- **nai-prefix-msid-mismatch**: Disconnects the session only if the MSID of the session does not match NAI-Prefix (prefix before “@” for the NAI). The configuration of the renegotiated (new) NAI is used for the matching process.

**Usage**

Adjust packet sizes and compression to improve bandwidth utilization. Each network may have unique characteristics such that determining the best packet size and compression options may require system monitoring over an extended period of time.

**Example**

```
ppp data-compression protocols mode stateless
ppp mtu 500
no ppp data-compression protocols
no ppp keepalive
```
prepaid 3gpp2

Enables 3GPP2 compliant prepaid billing support for a subscriber to be configured by 3GPP2 attributes sent from a RADIUS server. If not enabled, prepaid attributes received from the RADIUS server are ignored.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

prepaid 3gpp2 { accounting [ no-final-access-request ] | duration-quota final-duration-algorithm { current-time | last-airlink-activity-time | last-user-layer3-activity-time } | preference { duration | volume } }

default prepaid 3gpp2 { duration-quota final-duration-algorithm | preference }

no prepaid 3gpp2 accounting

default prepaid 3gpp2 { duration-quota final-duration-algorithm | preference }

Sets the 3GPP2 Pre-paid settings to the default values.

duration-quota final-duration-algorithm: Resets the end of billing duration quota algorithm to the default of current-time.

preference: Resets the preference to duration, If both duration and volume attributes are present.

no prepaid 3gpp2 accounting

Disables 3GPP2 prepaid accounting. All 3GPP2 Prepaid attributes received from a RADIUS server are ignored.

accounting [ no-final-access-request ]

Default: Disabled

Enables 3GPP2 prepaid accounting behavior.

Sets the low-watermark for remaining byte credits. percentage is a percentage of the subscriber sessions total credits. When the low-watermark is reached a new RADIUS access-request is sent to the RADIUS server to retrieve more credits. percentage must be an integer from 1 through 99.

no-final-access-request: Stops sending final online access-request on termination of 3GPP2 prepaid sessions. By default, this option is disabled.
duration-quota final-duration-algorithm { current-time | last-airlink-activity-time | last-user-layer3-activity-time }

Defines what behavior marks the end of the billing duration for duration-based quota usage accounting. The default behavior sets the duration quota algorithm to current-time.
Default: current-time

- **current-time**: Selects the duration quota as the difference between the session termination timestamp and the session setup timestamp.
- **last-airlink-activity-time**: Selects the duration quota as the difference between the last-user-activity timestamp (G17) and the session setup timestamp.
- **last-user-layer3-activity-time**: Selects the duration quota as the difference between the timestamp of the last layer-3 packet sent to or received from the user and the session setup timestamp.

preference { duration | volume }

If both duration and volume RADIUS attributes are present this keyword specifies which attribute has precedence.
Default: duration

- **duration**: The duration attribute takes precedence.
- **volume**: The volume attribute takes precedence

Usage

Use this command to enable prepaid support for a default user or for the default user of a domain alias.

Example

The following command enables 3GPP2 prepaid support for the default user:

```
prepaid 3gpp2 accounting
```
prepaid custom

Enables custom prepaid billing support for a subscriber to be configured by attributes sent from a RADIUS server. If not enabled, prepaid attributes received from the RADIUS server are ignored. The keywords set prepaid values that are used if the corresponding RADIUS attribute is not present. If the RADIUS attribute is present, it takes precedence over these values.

Product

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

prepaid custom { accounting | byte-count compressed | low-watermark percent percentage | renewal interval seconds } | preference { duration | volume }

default prepaid custom { byte-count | low-watermark }

no prepaid custom { accounting | byte-count compressed | low-watermark | renewal }

default prepaid custom { byte-count | low-watermark }

Resets custom prepaid settings to the default values.

byte-count: Resets the default of basing the prepaid byte credits on the flow of uncompressed traffic.

low-watermark: Disables sending an access request to retrieve more credits when a low watermark is reached.

no prepaid custom { accounting | byte-count compressed | low-watermark | renewal }

byte-count compressed: The prepaid byte credits are based on the flow of uncompressed traffic. This is the default.

low-watermark: Disables the low watermark feature. An access-request is not sent to the RADIUS server until the credits granted for the subscriber session are depleted.

renewal: Disables time-based renewals for prepaid accounting.

accounting
Default: Disabled
Enables custom prepaid accounting behavior.

byte-count compressed
Default: uncompressed.
When compression is used, the prepaid byte credits are based on the flow of compressed traffic. The default is to base the prepaid byte credits on the flow of uncompressed traffic.

**low-watermark percent percentage**

Default: Disabled.
Sets the low-watermark for remaining byte credits. *percentage* is a percentage of the subscriber sessions total credits. When the low-watermark is reached a new RADIUS access-request is sent to the RADIUS server to retrieve more credits. *percentage* must be an integer from 1 through 99.

**renewal interval seconds**

Default: The time in seconds to wait before sending a new RADIUS access-request to the RADIUS server to retrieve more credits. *seconds* must be an integer from 60 through 65535.

**preference { duration | volume }**

If both duration and volume RADIUS attributes are present this keyword specifies which attribute has precedence.
Default: duration
duration: The duration attribute takes precedence.
volume: The volume attribute takes precedence

**Usage**

Use this command to enable prepaid support for a default user or for the default user of a domain alias.

**Example**

The following command enables custom prepaid support for the default user:

```
prepaid custom accounting
```
prepaid unclassify

This command provides customer specific functionality.
prepaid voice-push

This command provides customer specific functionality.
**prepaid wimax**

Enables WiMAX prepaid accounting for this subscriber. This feature is disabled by default.

```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
[ no ] prepaid wimax accounting
```

no

Disables WiMAX prepaid accounting for this subscriber.

**Usage**

Use this command to enable WiMAX prepaid accounting for this subscriber.
proxy-dns intercept list-name

Identifies a proxy DNS intercept rules list for the selected subscriber.

Product
HA

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

[ no ] proxy-dns intercept list-name name

no

Removes the intercept list from the subscribers profile.

proxy-dns intercept list-name name

Specifies a name of a proxy DNS intercept list used for the selected subscriber.

name is the name of the intercept list expressed as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to identify a proxy DNS rules list for the selected subscriber. For a more detailed explanation of the HA Proxy DNS Intercept feature, see the proxy-dns intercept-list command in the Context Configuration Mode Commands chapter.
proxy-mip

Configures support for Proxy Mobile IP for the subscriber.

**Product**
- PDSN
- GGSN
- ASN-GW
- PDIF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
[ no ] proxy-mip required
```

- `no`
  Disables support for Proxy Mobile IP.

- `required`
  Enables support for Proxy Mobile IP.

**Usage**
When enabled through the session license and feature use key, the system supports Proxy Mobile IP to provide a mobility solution for subscribers with mobile nodes (MNs) capable of supporting only Simple IP. For subscriber sessions using Proxy Mobile IP, R-P and PPP sessions are established as they would for a Simple IP session. However, the AGW/FA performs Mobile IP operations with an HA (identified by information stored in the subscriber’s profile) on behalf of the MN while the MN performs only Simple IP processes.

**Example**
The following command enables proxy mobile IP for the current subscriber:

```
proxy-mip required
```
qos apn-ambr

Configures the rate limit according to the APN-AMBR to do the session level bandwidth control per direction, according to the QoS information provided by the PCRF on the Gx interface.

Important: This command is customer specific. For more information contact your Cisco account representative.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configuration > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

qos apn-ambr rate-limit { downlink | uplink } [ burst-size bytes ] [ violate-action { drop | lower-ip-precedence | transmit } ]

no qos apn-ambr rate-limit

no

Disables the QoS data rate limit configuration for the subscriber.

downlink

Applies the specified limits and actions to the downlink (to the data coming from the GGSN over the Gn’ interface).

uplink

Applies the specified limits and actions to the uplink (to the data coming from the UE over the IPSec tunnel).

Important: If this keyword is omitted, the same values are used for all classes.

burst-size bytes

Default: See the Usage section for this command
The burst size allowed (in bytes) for peak data rate and committed data rate.
bytes must be an integer from 1 through 6000000.

Important: The minimum value of this parameter should be configured to the greater of the following two values: 1) three times greater than the packet MTU for the subscriber connection, OR 2) three seconds worth of token
accumulation within the “bucket” for the configured peak-data-rate. If the committed-data-rate parameter is specified, the burst-size is applied to both the committed and peak rates.

violate-action { drop | lower-ip-precedence | transmit }

Default: See the Usage section for this command
Specifies the action to take on packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:
• drop: Drops the packets.
• lower-ip-precedence: Transmits the packets after lowering the IP precedence.
• transmit: Transmits the packet.

Usage
This command configures the rate limit according to the APN-AMBR to do the session level bandwidth control per direction, according to the QoS information provided by the PCRF on the Gx interface. This command specifies the actions to take on subscriber flows exceeding or violating allowed peak or committed data rates.

Example
The following example configures the rate limit and burst size according to the APN-AMBR for the uplink direction. Policing is done for the traffic based on PCRF value received and traffic is dropped as the violate action is specified as drop.

    qos apn-ambr rate-limit direction uplink burstsize 1 violate-action drop
**qos rate-limit**

Configure the action on subscriber traffic flow that violates or exceeds the peak/committed data rate under traffic policing functionality. When configured, the PDG/TTG performs traffic policing for the subscriber session. If the GGSN changes the QoS via an Update PDP Context Request, the PDG/TTG uses the new QoS values for traffic policing.

**Product**

PDG/TTG

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
qos rate-limit { downlink | uplink } [ qci qci_val ] [ burst-size { bytes | auto-readjust [ duration dur ] } ] [ exceed-action { drop | lower-ip-precedence | transmit } ] [ violate-action { drop | lower-ip-precedence | shape [ transmit-when-buffer-full ] | transmit } ] [ violate-action { drop | lower-ip-precedence | shape [ transmit-when-buffer-full ] | transmit } ] [ exceed-action { drop | lower-ip-precedence | transmit } ] [ violate-action { drop | lower-ip-precedence | shape [ transmit-when-buffer-full ] | transmit } ] [ violate-action { drop | lower-ip-precedence | shape [ transmit-when-buffer-full ] | transmit } ]
```

Disables the QoS data rate limit configuration for the subscriber.

```
no qos rate-limit direction { downlink | uplink } [ qci qci_val ]
```

**Important:** If this keyword is omitted, the same values are used for all classes.

```
qci qci_val
```

$qci_val$ is the QoS Class identifier (QCI) for which the negotiate limit is being set expressed as an integer from 1 through 9. If no qci-val is configured, it will be taken as undefined-qci (same as undefined-qos class).

```
burst-size { bytes | auto-readjust [ duration dur ] }
```

Default: See the Usage section for this command

The burst size allowed (in bytes) for peak data rate and committed data rate.
bytes must be an integer from 1 through 6000000.

**Important:** The minimum value of this parameter should be configured to the greater of the following two values: 1) three times greater than the packet MTU for the subscriber connection, OR 2) three seconds worth of token accumulation within the “bucket” for the configured peak-data-rate. If the committed-data-rate parameter is specified, the burst-size is applied to both the committed and peak rates.

auto-readjust [ duration dur ] provides the option to calculate the Burst size dynamically while configuring rate-limit. When enabled, the system calculates the burst size using the GGSN QoS-negotiated rate that will be enforced.

Every time there is a change in the rates (due to an updated QoS), the burst sizes will be updated accordingly. This keyword also provides two different burst sizes. One burst size for peak rate and another for committed rate.

By default this keyword is disabled.

duration dur specifies the duration of burst in seconds. If the duration is not specified, the default is 1 second. dur must be an integer from 1 through 30.

**exceed-action { drop | lower-ip-precedence | transmit }**

Default: See the Usage section for this command

Specifies the action to take on packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:

- drop: Drops the packets.
- lower-ip-precedence: Transmits the packets after lowering the ip-precedence.
- transmit: Transmits the packets.

**violate-action { drop | lower-ip-precedence | transmit }**

Default: See the Usage section for this command

Specifies the action to take on packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:

- drop: Drops the packets.
- lower-ip-precedence: Transmits the packets after lowering the IP precedence.
- transmit: Transmits the packet after lowering the IP precedence.

**shape [transmit-when-buffer-full]:** Enables traffic shaping and buffers user packets when subscriber traffic violates the allowed peak/committed data rate. The [transmit-when-buffer-full] keyword allows the packets to be transmitted when buffer memory is full.

transmit: Transmits the packet

**Usage**

This command configures APN quality of service (QoS) data rate shaping through traffic policing. This command specifies the actions to take on subscriber flows exceeding or violating allowed peak or committed data rates. The shaping function also provides an enhanced function to buffer the excessive user packets and send them to the subscriber when subscriber traffic drops below the committed or peak data rate limit.

**Important:** The buffering of user packets in traffic shaping does not apply for real-time traffic.
**Important:** If the exceed/violate action is set to “lower-ip-precedence”, this command may override the configuration of the `ip qos-dscp` command in the GGSN service Configuration mode for packets from the GGSN to the PDG/TTG. In addition, the GGSN service `ip qos-dscp` command configuration can override the APN setting for packets from the GGSN to the Internet. Therefore, it is recommended that this command not be used in conjunction with this action.

The command can be entered multiple times to specify different combinations of direction and class. If this command is not configured at all, the GGSN does not perform traffic policing or QoS negotiation with the PDG/TTG; it accepts all of the PDG/TTG-provided values for the PDP context.

**Important:** This command should be used in conjunction with the `max-contexts` command to limit the maximum possible bandwidth consumption by the APN.

For additional information on QoS traffic shaping and policing, see the *System Administration Guide*.

### Default Values

</table>
Subscriber Configuration Mode Commands

Usage

This command configures the APN quality of service (QoS) data rate shaping through traffic policing/shaping. This command specifies the actions to take on subscriber flows exceeding or violating allowed peak/committed data rates. The shaping function also provides an enhanced function to buffer the excessive user packets and send them to the subscriber when subscriber traffic drops below the committed or peak data rate limit.

**Important:** The buffering of user packets in traffic shaping does not apply for real-time traffic.

**Important:** If the exceed/violate action is set to “lower-ip-precedence”, this command may override the configuration of the `ip qos-dscp` command in the GGSN service configuration mode for packets from the GGSN to the SGSN. In addition, the GGSN service `ip qos-dscp` command configuration can override the APN setting for packets from the GGSN to the Internet. Therefore, it is recommended that command not be used in conjunction with this action.

The command can be entered multiple times to specify different combinations of direction and class. If this command is not configured at all, the GGSN does not perform traffic policing or QoS negotiation with the SGSN (i.e. it accepts all of the SGSN-provided values for the PDP context.

**Important:** This command should be used in conjunction with the `max-contexts` command to limit the maximum possible bandwidth consumption by the APN.

Default Values:

To calculate the burst size dynamically a new optional keyword `auto-readjust [ duration dur ]` is provided with `burst-size` keyword. By default the burst size is fixed if defined in bytes with this command. In other words irrespective of the rate being enforced, burst-size fixed as given in the `burst-size bytes` parameter.

For the need of variable burst size depending on the rate being enforced this new keyword `auto-readjust [ duration dur ]` is provided. Use of this keyword enables the calculation of burst size as per token bucket algorithm calculation as T=B/R, where T is the time interval, B is the burst size and R is the Rate being enforced.

It also provides different burst size for Peak and Committed data rate-limiting.

If `auto-readjust` keyword is not used a fixed burst size must be defined which will be applicable for peak data rate and committed data rate irrespective of rate being enforced.

If `auto-readjust` keyword is provided without specifying the duration a default duration of 1 second will be taken for burst size calculation.
Example

The following command lowers the IP precedence when the committed-data-rate and the peak-data-rate are violated in uplink direction:

```bash
qos rate-limit direction uplink violate-action lower-ip-precedence
```

The following command buffers the excess user packets when the subscriber traffic violates the configured peak or committed data-rate bps in uplink direction. Once the peak/committed data rate for that subscriber goes below the configured limit it transmit them. It also transmits them if buffer memory is full:

```bash
qos rate-limit direction uplink violate-action shape transmit-when-buffer-full
```
qos traffic-police

Enables and configures traffic policing through bandwidth limitations and action for the subscriber traffic if it exceeds or violates the peak or committed data rate. Uplink and downlink limits are configured separately.

- Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
qos traffic-police direction { downlink | uplink } [ burst-size bytes ] [ committed-data-rate bps ] [ exceed-action { drop | lower-ip-precedence | transmit } ] [ peak-data-rate bps ] [ violate-action { drop | lower-ip-precedence | transmit } ]
```

```
no qos traffic-police direction { downlink | uplink }
```

- **downlink**
  - Applies the specified limits and actions to the downlink (data to the subscriber).

- **uplink**
  - Apply the specified limits and actions to the uplink (data from the subscriber).

- **burst-size bytes**
  - Default: 3000
  - Specifies the allowed peak burst size allowed in bytes.
  - `bytes` must be an integer from 0 through 4294967295.

**Important:** This parameter should be configured to at least the greater of the following two values: 1) three times greater than packet MTU for the subscriber connection, OR 2) three seconds worth of token accumulation within the “bucket” for the configured peak-data-rate.

- **committed-data-rate bps**
  - Default: 144000
  - Specifies the committed data rate (guaranteed-data-rate) in bits per second (bps).
  - `bps` must be an integer from 0 through 4294967295.
```
exceed-action { drop | lower-ip-precedence | transmit }
```

Default: lower-ip-precedence
Specifies the action to take on packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:
- `drop`: Drops the packet
- `lower-ip-precedence`: Transmits the packet after lowering the IP precedence
- `transmit`: Transmits the packet

```
peak-data-rate bps
```

Default: 256000
Specifies the peak data-rate for the subscriber in bits per second (bps).
`bps` must be an integer from 0 through 4294967295).

```
violate-action { drop | lower-ip-precedence | transmit }
```

Default: drop
Specifies the action to take on packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:
- `drop`: Drops the packet
- `lower-ip-precedence`: Transmits the packet after lowering the IP precedence
- `transmit`: Transmits the packet

```
no
```

Disables traffic policing in the specified direction for the current subscriber.

## Usage

Use this command to limit the bandwidth a subscriber uses in the uplink and downlink directions.

**Important:** If the exceed/violate action is set to “lower-ip-precedence”, the TOS value for the outer packet becomes “best effort” for packets that exceed/violate the traffic limits regardless of what the `ip user-datagram-tos copy` command is configured to. In addition, the “lower-ip-precedence” option may also override the configuration of the `ip qos-dscp` command. Therefore, it is recommended that command not be used when specifying this option.

## Example

Details on the QoS traffic policing can be found in the *System Administration Guide*.

The following command sets an uplink peak data rate of 128000 bps and lowers the IP precedence when the committed-data-rate and the peak-data-rate are exceeded:

```
qos traffic-police direction uplink peak-data-rate 128000 violate-action lower-ip-precedence
```

The following command sets a downlink peak data rate of 256000 bps and drops packets when the committed-data-rate and the peak-data-rate are exceeded:

```
qos traffic-police direction downlink peak-data-rate 256000 violate-action drop
```
qos traffic-shape

Enables and configures traffic shaping functionality when buffering the data packets during congestion or when the subscriber exceeds the configured peak or committed data rate limit. The system buffers the data packets during an instantaneous burst and deliver them to the subscriber when traffic flow drops below the peak or committed data rate. Uplink and downlink traffic shaping are configured separately.

Important: This feature is NOT supported for real-time traffic.

Product
PDSN
HA
GGSN
ASN-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:
[context_name]host_name(config-subscriber)#

Syntax
qos traffic-shape direction { downlink | uplink } [ burst-size bytes ] [ committed-data-rate bps ] [ exceed-action { drop | lower-ip-precedence | transmit } ] [ peak-data-rate bps ] [ violate-action { drop | lower-ip-precedence | buffer [ transmit-when-buffer-full ] | transmit } ] +

no qos traffic-shape direction { downlink | uplink }

downlink
Applies the specified limits and actions to the downlink (data to the subscriber).

uplink
Applies the specified limits and actions to the uplink (data from the subscriber).

burst-size bytes
Default: 3000
Specifies the allowed peak burst size in bytes.
bytes must be an integer from 0 through 4294967295.
**Important:** It is recommended that this parameter be configured to at least the greater of the following two values: 1) three times greater than packet MTU for the subscriber connection, OR 2) three seconds worth of token accumulation within the “bucket” for the configured peak-data-rate.

*committed-data-rate*  
Default: 144000  
Specifies the committed data rate (guaranteed-data-rate) in bits per second (bps).  
*bps* must be an integer from 0 through 4294967295).

*exceed-action*  
Default: lower-ip-precedence  
Specifies the action to take on packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:  
drop: Drops the packet  
lower-ip-precedence: Transmits the packet after lowering the ip-precedence  
transmit: Transmits the packet

*peak-data-rate*  
Default: 256000  
Specifies the peak data-rate for the subscriber in bits per second (bps).  
*bps* must be an integer from 0 through 4294967295).

*violate-action*  
Default: See the Usage section for this command  
The action to take on the packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:  
drop: Drops the packet  
lower-ip-precedence: Transmits the packet after lowering the IP precedence  
buffer [transmit-when-buffer-full]: Enables traffic shaping and buffers user packets when subscriber traffic violates the allowed peak/committed data rate. The [transmit-when-buffer-full] keyword allows the packet to be transmitted when buffer memory is full.  
transmit: Transmits the packet

+  
More than one of the above keywords can be entered within a single command.

*no*  
Disables traffic policing for the specified direction for the current subscriber.

**Usage**

Use this command to provide the traffic shaping function to a subscriber in the uplink and downlink directions. This feature is providing a traffic flow control different to QoS traffic policing. When a subscriber violates or exceeds the peak data rate instead of dropping the packets, as in QoS traffic policing, this feature buffers subscriber data packets and sends the buffered data when the traffic flow is low or not in congestion state.
**Important:** If the exceed or violate action is set to “lower-ip-precedence”, the TOS value for the outer packet becomes “best effort” for packets that exceed or violate the traffic limits regardless how the `ip user-datagram-tos copy` command is configured. In addition, the “lower-ip-precedence” option may also override the configuration of the `ip qos-dscp` command. Therefore, this command should not be used when specifying this option.

**Example**

Details on the QoS traffic policing functionality is located in the System Administration Guide.

The following command sets an uplink peak data rate of 128000 bps and lowers the IP precedence when the committed-data-rate and the peak-data-rate are exceeded:

```bash
qos traffic-shape direction uplink peak-data-rate 128000 violate-action lower-ip-precedence
```

The following command buffers the excess user packets when the subscriber traffic violates the configured peak-data-rate 256000 bps in downlink direction. Once the peakcommitted data rate for that subscriber goes below the configured limit it transmit them. It also transmits them if buffer memory is full:

```bash
qos traffic-shape direction downlink peak-data-rate 256000 violate-action buffer transmit-when-buffer-full
```
radius accounting

Sets the RADIUS accounting parameters for the subscriber or domain. This command takes precedence over the similar Context Configuration command and is disabled by default.

Product
All

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

radius accounting { interim { interval-timeout timeout | normal | suppress } | ip remote-address list-id list_id | mode { session-based | access-flow-based { none | auxiliary-flows | all-flows | main-a10-only } } | start { normal | suppress } | stop { normal | suppress } }

no radius accounting { ip remote-address list-id list_id | interim { interval-timeout } }

interim { interval-timeout timeout | normal | suppress }

interval-timeout timeout: Indicates the time (in seconds) between updates to session counters (log file on RADIUS or AAA event log) during the session. timeout must be an integer from 50 to 4000000.

Caution: Interim interval settings received from the RADIUS server take precedence over this setting on the system. While the low limit of this setting on the system is a minimum of 50 seconds, the low limit setting on the RADIUS server can be as little as 1 second. To avoid increasing network traffic unnecessarily and potentially reducing network and system performance, do not set this parameter to a value less than 50 on the RADIUS server.

normal: If RADIUS accounting is enabled, sends this Acct-Status-Type message when required by normal operation
suppress: If RADIUS accounting is enabled, suppresses the sending of this Acct-Status-Type message.

ip remote-address list-id list_id

Specifies the identification number of the IP address list to use for the subscriber for remote address-based accounting.

list_id: Specifies the RADIUS accounting remote IP address list identifier for remote-address accounting for the subscriber. list_id must be an integer from 1 through 65535.

This command is used as part of the Remote Address-based accounting feature and associates the subscriber with a list of remote addresses. Remote address accounting data is collected each time the subscriber communicates with any of the addresses specified in the list.
Remote address lists are configured using the list keyword in the radius accounting ip remote-address command in the Context Configuration mode.
mode { session-based | access-flow-based { none | auxillary-flows | all-flows | main-a10-only } }

Default: session-based

Specifies if the radius accounting mode is either session-based or access-flow-based.

- **session-based**: configures session-based RADIUS accounting behavior for the subscriber - which means a single radius accounting message generated for the subscriber session not separate accounting messages for individual A10 connections or flows.
- **access-flow-based**: configures access-flow-based RADIUS accounting behavior for the subscriber. This offers flexibility by generating separate accounting messages for flows and A10 sessions.
  - **all-flows**: Generates separate RADIUS accounting messages per access flow. Separate accounting messages are not generated for data path connections. (For example, separate messages are not sent for the main A10 or auxiliary connections.).
  - **auxillary-flows**: Generates RADIUS accounting records for the main data path connection and for access-flows for all auxiliary data connections. (For example, separate RADIUS accounting messages are generated for the main A10 session and for access-flows within auxiliary A10 connections. The main A10 session accounting does not include octets or other accounting information from the auxiliary flows.)
  - **main-a10-only**: Configures access-flow-based single accounting messages (for example only single start/interim/stop) are generated for the main A-10 flows only.
  - **none**: Generates separate RADIUS accounting messages for all data path connections (for example, PDSN main or auxiliary A10 connections) but not for individual access-flows. This is essentially A10 connection-based accounting.

**start** { normal | suppress }

- **normal**: If RADIUS accounting is enabled, sends this Acct-Status-Type message when required by normal operation
- **suppress**: If RADIUS accounting is enabled, suppresses the sending of this Acct-Status-Type message.

**stop** { normal | suppress }

- **normal**: If RADIUS accounting is enabled, sends this Acct-Status-Type message when required by normal operation
- **suppress**: If RADIUS accounting is enabled, suppresses the sending of this Acct-Status-Type message.

**no**

ip remote-address list-id list_id: Deletes the entry for the specified list_id.
interim [ interval-timeout ]: Disables the interim interval setting.

**Usage**

Use this command to allow a per-domain setting for the RADIUS accounting.

**Example**

Set the accounting interim interval to one minute (60 seconds) for all sessions that use the current subscriber configuration:

```
radius accounting interim interval-timeout 60
```

Do not send RADIUS interim accounting messages:

```
radius accounting interim suppress
```
Sets the accounting message start normal for main A-10 flows only.

```
radius accounting mode main-a10-only start normal
```
radius group

Applies a RADIUS server group at the subscriber level for AAA functionality.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

radius group group_name

{ default | no } radius group

radius group_name

Specifies the name of the server group that is used for authentication and/or accounting for the specific subscriber. group_name must be an alphanumeric string of 1 through 63 characters. It must have been preconfigured within the same context of subscriber.

default

Sets or restores the default RADIUS server group specified at the context level or in the default subscriber profile.

no

Disables the applied RADIUS group for specific subscriber.

Usage

This feature provides the RADIUS configurables under radius group node. Instead of having a single list of servers per context, this feature configures multiple server groups within a context and applies individual RADIUS server group for subscriber in that context. Each server group consists of a list of AAA servers. IF no RADIUS group is applied for this subscriber or the default subscriber profile, the default server group available at context level is used for accounting and authentication of the subscriber.

Example

Following command applies a previously configured RADIUS server group named starl to a subscriber within the specific context:

    radius group starl

Following command disables the applied RADIUS server group for the specific subscriber.

    no radius group
radius returned-framed-ip-address

Sets the policy whether or not to reject a call when the RADIUS server supplies 255.255.255.255 as the framed IP address and the MS does not supply an address.

**Product**
- GGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
radius returned-framed-ip-address 255.255.255.255-policy { accept-call-when-ms-ip-not-supplied | reject-call-when-ms-ip-not-supplied }

default radius returned-framed-ip-address 255.255.255.255-policy
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accept-call-when-ms-ip-not-supplied</td>
<td>Accepts calls when the RADIUS server does not supply a framed IP address and the MS does not supply an address.</td>
</tr>
<tr>
<td>reject-call-when-ms-ip-not-supplied</td>
<td>Rejects calls when the RADIUS server does not supply a framed IP address and the MS does not supply an address.</td>
</tr>
<tr>
<td>default</td>
<td>Sets the policy to its default of rejecting calls when the RADIUS server does not supply a framed IP address and the MS does not supply an address.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to set the behavior for the current subscriber when the RADIUS server supplies 255.255.255.255 as the framed IP address and the MS does not supply an address.

**Example**

The following command sets the subscriber profile to reject calls when the RADIUS server does not supply a framed IP address and the MS does not supply an address:

```
radius returned-framed-ip-address 255.255.255.255-policy reject-call-when-ms-ip-not-supplied
```
**rohc-profile-name**

Identifies the robust header compression (RoHC) profile configuration that will be applied to bearer sessions belonging to this subscriber.

**Product**
- HSGW
- PDSN

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
rohc-profile-name name
```

*name*

Specifies the name of the RoHC profile that the system will use to apply header compression and decompression parameters to bearer session data for this subscriber. *name* must be an existing RoHC profile expressed as an alphanumeric string of 1 through 63 characters.

**Usage**

Use this command to specify a RoHC configuration profile to be applied to bearer sessions belonging to this subscriber. RoHC profiles are configured through the Global Configuration Mode using the `rohc-profile` command.

**Example**

The following command specifies that the RoHC profile named `rohc-cfg1` is to be applied to all bearer sessions belonging to this subscriber:

```
rohc-profile-name rohc-cfg1
```
secondary ip pool

Specifies a secondary IP pool to be used as backup pool for Network Address Translation (NAT).

**Important:** This command requires the purchase and installation of a license. Please contact your Cisco sales representative for more information.

**Product**
NAT

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#!
```

**Syntax**

```
secondary ip pool pool_name

no secondary ip pool
```

- **no**
  Removes the previous secondary IP pool configuration.

- **secondary ip pool pool_name**
  Specifies the secondary IP pool name. 
  *pool_name* must be an alphanumeric string of 1 through 31 characters.

**Usage**

Use this command to configure a secondary IP pool for NAT subscribers, which is not overwritten by the RADIUS supplied list. The secondary pool will be appended to the RADIUS supplied IP pool list or subscriber template provided IP pool list, as applicable, during call setup.

**Example**

The following command configures a secondary IP pool named test123:

```
secondary ip pool test123
```
send-destination-pgw

Configures how the HSGW selects a P-GW address for the “Destination-PGW” AVP.

**Product**
HSGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

**Syntax**

```
send-destination-pgw { all | explicit-only | implicit-only }
```

```
no send-destination-pgw
```

- **no**
  Removes the configuration for this command.

- **all**
  P-GW address is obtained either by explicit or implicit mechanism.

- **explicit-only**
  The UE performs LCP/PPP procedures, and attaches with a specific APN. The HSGW queries the AAA over the STa interface and receives a MIP6-Agent-Info AVP that includes a sub AVP of Destination-Host. The HSGW copies the value of the Destination-Host AVP in the Destination-PGW AVP which is sent in the CCR-I to the PCRF.

- **implicit-only**
  The UE performs LCP/PPP procedures, and attaches with a specific APN. The AAA does not return the P-GW to use, so the HSGW performs NAPTR procedures to determine the P-GW which will be used.

**Usage**
Use this command to configure how the HSGW selects a P-GW address for the “Destination-PGW” AVP. This AVP is sent over Gxa to the PCRF.

**Example**

Configures the HSGW to select either implicit or explicit selection method.

```
send-destination-pgw all
```
simultaneous

Enables or disables the simultaneous use of both Mobile and Simple IP services.

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)#
```

**Syntax**

```
[ no ] simultaneous simple-and-mobile-ip
```

- **no**
  
  Disables the simultaneous use.

**Usage**

Subscribers with mobile devices that concurrently support mobile and simple IP services require this option to be set.

**Example**

```
no simultaneous simple-and-mobile-ip
simultaneous simple-and-mobile-ip
```
timeout absolute

Configures the maximum duration of the session before the system automatically terminates the session.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

timeout absolute seconds

{ default | no } timeout absolute

default | no
Indicates the timeout specified is to be returned to its default behavior. If a timeout value is not specified, all timeouts are set to their default values.

timeout absolute
Default: 0
Specifies the absolute maximum time a session may exist (in seconds) in any state (active or dormant).

seconds
Specifies the maximum amount of time (in seconds) before the specified timeout action is activated.
seconds must be an integer from 0 through 4294967295. The special value 0 disables the timeout specified.

Usage
Use this command to set the absolute maximum time a session may exist in any state.

Example

timeout absolute 18000
timeout idle

Configures the idle timeout duration for the long duration timer associated with a subscriber session.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

timeout idle idle_dur

{ default | no } timeout idle

default | no

Indicates the timeout specified is to be returned to its default behavior. If no specific timeout is specified, then all are set to their default behavior.

timeout idle

Default: 0

Specifies the maximum duration of the session (in seconds) can remain idle before the system automatically terminates the session due to inactivity.

idle_dur

Specifies the maximum amount of time (in seconds) before the specified timeout action is activated. idle_dur must be an integer from 0 through 2147483647. The special value 0 disables the timeout specified.
timeout long-duration

Configures the long duration timeout and optionally the inactivity duration of HA subscriber session.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-subscriber)>
```

**Syntax**

```
timeout long-duration ldt_timeout [ inactivity-time inact_timeout ]
```

[ no | default ]timeout long-duration

- **no**
  Indicates the timeout specified is to be returned to its default behavior. If no specific timeout is specified then all are set to their default behavior.

- **long-duration ldt_timeout**
  Default: 0
  Designates the maximum duration of the session (in seconds) before the system automatically reports/terminates the session.
  *ldt_timeout* must be a value in the range from 0 through 4294967295. The special value 0 disables the timer.

- **inactivity-time inact_timeout**
  Specifies the maximum amount of time (in seconds) before the specified session is marked as dormant.
  *inact_timeout* must be a value in the range from 0 through 4294967295. The special value 0 disables the inactivity time specified.

**Usage**

Use this command to set the long duration timeout period and inactivity timer for subscriber sessions. Reduce the idle timeout to free session resources faster for use by new requests.
Refer to the `long-duration-action detection` and `long-duration-action disconnection` commands for more information.

**Example**

The following command sets the long duration timeout duration to 300 seconds and inactivity timer for subscriber session to 45 seconds:
timeout long-duration 300 inactivity-time 45
tpo policy

The Traffic Performance Optimization (TPO) in-line service is not supported in this release.
tunnel address-policy

Specifies the policy for address allocation and validation for all tunneled calls (IP-IP, IP-GRE) except L2TP calls. With this command enabled, GGSN IP address validation could be disabled for specified incoming calls.

For GGSN systems, this command can also be specified in the APN Configuration mode (tunnel address-policy) which would mean the system defers to the old l3-to-l2-tunnel address policy command for calls coming through L2TP tunnels.

Product
PDSN
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

tunnel address-policy { alloc-only | alloc-validate | no-alloc-validate }

default tunnel address-policy

 alloc-only
Allocates IP addresses locally without validation.

 alloc-validate
Default.
The VPN Manager allocates and validates all incoming IP addresses from a static pool of IP addresses.

 no-alloc-validate
No IP address assignment or validation is done for calls coming in via L3 tunnels. Incoming static IP addresses are passed. This option allows for the greatest flexibility.

 default
Resets the tunnel address-policy to alloc-validate.

Usage
This command supports scalable solutions for Corporate APN deployment as many corporations handle their own IP address assignments. In some cases this is done to relieve the customer or the mobile operators from the necessity of reconfiguring the range of IP addresses for the IP pools at the GGSN.
The following command resets the IP address validation policy to validate against a static pool of address:

```
default tunnel address-policy
```

The following command disables IP address validation for calls coming through tunnels:

```
tunnel address-policy no-alloc-validate
```
tunnel ipip

Configures IP-in-IP tunnelling parameters for the current subscriber.

Product
PDSN
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration
configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

tunnel ipip peer-address peer_address local-address local_addr ]

no tunnel ipip

<table>
<thead>
<tr>
<th>peer-address peer_address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the IP address of the external gateway terminating the IP-in-IP tunnel.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>local-address local_addr</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the IP address of the interface in the destination context originating the IP-in-IP tunnel.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disables IP-in-IP tunneling for the current subscriber.</td>
</tr>
</tbody>
</table>

Usage
Subscriber IP payloads are encapsulated with IP-in-IP headers and tunneled by the GGSN or PDSN to an external gateway.

Example
The following command configures the system to encapsulate subscriber traffic using IP-in-IP and tunnel it from a local address of 192.168.1.100 to a gateway with an IP address of 192.168.1.225:

tunnel ipip peer-address 192.168.1.225 local-address 192.168.1.100 preference 1
tunnel ipsec

Configures sessions for the current subscriber to use an IPSec tunnel based on the IP pool corresponding to the subscriber’s assigned IP address.

Product
PDSN
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

Syntax

```plaintext
tunnel ipsec use-policy-matching-ip-pooler-address
no tunnel ipsec use-policy-matching-ip-pooler-address
```

Usage
Use this command to set the current subscribers sessions to use an IPSec policy that is assigned to the IP pool that the subscribers assigned IP address relates to.

Example
The following command enables the use of the policy that matches the IP pool address:

```plaintext
tunnel ipsec use-policy-matching-ip-pooler-address
```
tunnel l2tp

Configures L2TP tunnel parameters for the subscriber.

Product
All products supporting L2TP

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Subscriber Configuration

configure > context context_name > subscriber { default | name subscriber_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-subscriber)#

Syntax

```
tunnel l2tp [ peer-address ip_address [ [ encrypted ] [secret secret] ] [ preference number ] [ tunnel-context context ] [ local-address ip_address ] [ crypto-map map_name [ [ encrypted ] isakmp-secret secret ] ] ]
no tunnel l2tp [ peer-address ip_address ]
```

**peер-address ip_address**

A peer L2TP Network Server (LNS) associated with this LAC (L2TP Access Concentrator). *ip_address* must be an IP address entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal format.

```
[ encrypted ] secret secret
```

Specifies the shared key (secret) between the L2TP Network Server (LNS) associated with this LAC (L2TP Access Concentrator). *secret* must be an alphanumeric string of 1 through 63 characters that is case sensitive.

**encrypted**: Specifies the encrypted shared key between the L2TP Network Server (LNS) associated with this LAC (L2TP Access Concentrator). *secret* must be an alphanumeric string of 1 through 128 characters that is case sensitive.

The *encrypted* keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the *secret* keyword is the encrypted version of the plain text secret. Only the encrypted secret is saved as part of the configuration file.

**preference number**

Default: 1

Specifies the order in which a group of tunnels configured for this subscriber will be tried. *number* must be an integer from 1 through 65535.

**tunnel-context context**

Specifies the name of the context containing ports through which this subscriber’s data traffic is to be communicated between this LAC and the LNS. *context* must be an alphanumeric string of 1 through 79 characters.
tunnel l2tp

local-address ip_address

Specifies a LAC service bind address which is given as a hint that is used to select a particular LAC service.

ip_address must be an IP address entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

crypto-map map_name { [encrypted] isakmp-secret secret }

Specifies the name of a crypto map that has been configured in the current context. map_name must be an alphanumeric string from 1 to 127 alphanumeric characters.

isakmp-secret secret: Specifies the pre-shared key for the Internet Key Exchange (IKE). secret must be an alphanumeric string of 1 through 127 characters.

encrypted isakmp-secret secret: Specifies the pre-shared key for IKE. Encryption must be used when sending the key. secret must be an alphanumeric string of 1 through 127 characters.

no

Disables tunneling for the current subscriber. When peer-address is included, the tunneling for that specific L2TP Network Server (LNS) is disabled but tunneling to other configured LNSs is still enabled.

Usage

Use this command to configure specific L2TP tunneling parameters for the current subscriber.

Example

To specify L2tp tunneling to the LNS peer at the IP address 198.162.10.100 with a shared secret of bigco and preference of 1, enter the following command:

```
tunnel l2tp peer-address 198.162.10.100 secret bigco preference 1
```
w-apn

This command allows you to configure the default APN to be used for the UE connections when the AAA server does not return the subscriber APN name in the service-selection AVP in RADIUS Access-Accept message.

**Product**
eWAG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Subscriber Configuration

```bash
configure > context context_name > subscriber { default | name subscriber_name }
```

Entering the above command sequence results in the following prompt:

```bash
[context_name]host_name(config-subscriber)#
```

**Syntax**

```bash
w-apn apn_name

no w-apn
```

---

**Usage**

If previously configured, removes the specified configuration.

```bash
apn-name apn_name
```

Specifies the APN name.

*apn_name* must be the name of an APN and must be a string of 1 to 62 characters in length consisting of alphabetic characters (A-Z and a-z), digits (0-9), dot(.) and the dash (-).

**Example**

The following command configures an APN named *apn123*:

```bash
w-apn apn123
```
Chapter 291
TACACS+ Configuration Mode Commands

This chapter describes all commands available in the TACACS+ Configuration Mode. TACACS+ (Terminal Access Controller Access-Control System Plus) is a secure, encrypted protocol. By remotely accessing TACACS+ servers that are provisioned with the administrative user account database, the ASR 5000 and ASR 5500 support TACACS+ accounting and authentication services for system administrative users.

**Important:** TACACS Configuration Mode is available in releases 11.0 and later.

**Mode**

Exec > Global Configuration > TACACS+ Configuration

`configure > tacacs mode`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-tacacs)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
accounting

Enables the recording of the start and the stop time each command issued during a TACACS+-authenticated CLI session.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > TACACS+ Configuration  
configure > tacacs mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-tacacs)#

Syntax

[ no ] accounting { start-stop | command }

no

Disables a configured TACACS+ accounting setting (either accounting start-stop or accounting command).

{start-stop | command}

Specifies the type of accounting records to be recorded.

•start-stop: Records the time at which the session starts (the time at which the user passes authentication) and the time at which the user exits. If a user exits before passing authentication, only a stop time is recorded.

•command: Enables accounting on a command-by-command basis. The TACACS+ server is contacted prior to the execution of the command and the command which is about to be executed is recorded. Only commands which are valid for the user privilege and context (mode) in which they are about to be executed will be recorded. StarOS does not record whether the command itself succeeded or failed. For security reasons, some secure or restricted commands are not recorded. In such cases, the accounting record will record the command as three asterisks (“***”).

Usage

Use this command to configure the accounting method for TACACS+-based CLI sessions.

Important: For releases after 15.0 MR4, TACACS+ accounting (CLI event logging) will not be generated for Lawful Intercept users with privilege level set to 15 and 13.

Example

The following command enables TACACS+ accounting for commands:

accounting command
authorization

Enables the authorization of TACACS+ CLI users on a command-by-command, command + command argument, or command prompt basis. If the user is not authorized to execute the command, the command will fail.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > TACACS+ Configuration

configure > tacacs mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-tacacs)#

Syntax

[ no ] authorization { command | prompt | arguments }

no

Disables a configured TACACS+ authorization command, prompt, or arguments setting.

{ command | prompt | arguments }

Specifies the type of authorization behavior to enforce:

•command: Enables per-command authorization. The TACACS+ server is contacted for each command and each command is authorized for the user. If the user is not authorized to execute the command, then the command fails. If the user is authorized for the command, the command is executed.

•prompt: Enables per-command authorization, as described for the command option above. However, since commands may be duplicated in different CLI modes, this version of the command authorization also passes the command prompt string to the server. The TACACS+ server is contacted for each prompt and command and must have a matching string for the prompt/command combination. Enabling prompt authorization supersedes command authorization, since the prompt and command must be authorized together.

•arguments: Enables per-command and command + argument authorization. The TACACS+ server authorizes each command and its arguments for the user. If the user is not authorized to execute the command and the corresponding arguments, the command fails. If the command does not contain any arguments, then the command only is passed to the authorization server.

Usage

Use this command to configure the authorization method for TACACS+-based CLI sessions.

Example

The following command requires per-command TACACS+ authorization:

authorization command
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
on-authen-fail

Defines system behavior when an administrative login fails due to a TACACS+ authentication failure. This command also can be used to configure system behavior separately for TACACS+ authentication failures for administrative users accessing the system via the StarOS Console port.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > TACACS+ Configuration
configure > tacacs mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-tacacs)#

Syntax

on-authen-fail { continue | stop } [ tty console ]

{ continue | stop }
Specifies the type of authentication behavior to enforce:

• continue: After a TACACS+ authentication failure, the system will continue with authentication using non-TACACS+ authentication services.
• stop: After a TACACS+ authentication failure, the system forces the failed TACACS+ user to exit.

tty console

Release 12 and later systems only: Used after the stop or continue parameters to specify system behavior for users being authenticated via the StarOS Console port:

• stop tty console: Forces the failed TACACS+ user to exit.
• continue tty console: The system will continue with authentication using non-TACACS+ authentication services.

Usage

Use this command to configure system behavior for users that fail TACACS+ authentication.

Example

The following command instructs the system to stop upon TACACS+ authentication failure:

on-authen-fail stop
on-network-error

Configures StarOS behavior when a TACACS+ login fails due to a network error. This command also can be used to configure system behavior separately for TACACS+ network error login failures for administrative users accessing the system via the Console port.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > TACACS+ Configuration  
configure > tacacs mode

Entering the above command sequence results in the following prompt:

> [local]host_name(config-tacacs)#

**Syntax**

on-network-error { continue | stop } [ tty console ]

**continue**

The system will continue with authentication using non-TACACS+ authentication services.

**stop**

The system forces the failed TACACS+ user to exit.

**tty console**

*Release 12 and later systems only*: Can be used after the continue or stop options to specify system behavior for TACACS+ CLI users being authenticated via the StarOS Console port:

- **stop tty console**: Forces the failed user to exit when authentication fails.
- **continue tty console**: The system will continue with authentication using non-TACACS+ authentication services.

**Usage**

Use this command to configure system behavior for users who fail TACACS+ authentication due to a network error.

**Example**

The following command configures the system to stop when a TACACS+ login fails due to a network error:

```
on-network-error stop
```
on-unknown-user

Configures StarOS behavior when a TACACS+ server cannot authenticate a given user name. This command also can be used to configure system behavior separately for TACACS+ unknown user login failures for administrative users accessing the system via the StarOS console port.

⚠️ Important: Some TACACS+ server implementations will not send a Reply message indicating that the user name is invalid. Instead, these types of implementations will accept the username, whether valid or not, and then examine the username and password in combination before sending a Reply message indicating a failed TACACS+ login. In these cases, specifying on-unknown-user will not enforce the desired system behavior. To avoid this scenario, determine the method the configured TACACS+ servers will use to validate user names before deciding whether specifying the on-unknown-user command will provide the desired result.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > TACACS+ Configuration
configure > tacacs mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-tacacs)#

Syntax

on-unknown-user { continue | stop } [ tty console ]

{ continue | stop }

Specifies the particular behavior to enforce:

- **continue**: The system continues with authentication using non-TACACS+ authentication services.
- **stop**: The system forces the failed TACACS+ user to exit.

[ ]

**tty console**

*Release 12 and later systems only*: Can be used after the continue or stop options to specify the behavior of the system for TACACS+ CLI users being authenticated via the StarOS console port.

- **stop tty console**: The system forces the failed user to exit when authentication fails.
- **continue tty console**: The system will continue with authentication using non-TACACS+ authentication services.

Usage

Use this command to configure StarOS behavior for users who fail TACACS+ user name authentication.
Example

The following command forces users who fail TACACS+ user name authentication to exit StarOS:

```
on-unknown-user stop```

rem_addr client-ip

Sends a remote client IPv4 address field in the TACACS+ protocol for use by a Cisco Secure ACS server.

**Product**
All products

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > TACACS+ Configuration
configure > tacacs mode

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-tacacs)#
```

**Syntax**

```
rem_addr client-ip

no rem_addr client-ip

default rem_addr client-ip

no
```

Disables the sending of a remote client IP address field to a Cisco Secure ACS server for a TACACS+ login request.

```
default
```

Disables the sending of a remote client IP address field to a Cisco Secure ACS server for a TACACS+ login request.

**Usage**

A Cisco Secure ACS server can be configured to explicitly check the NAS source address for TACACS+ connections. StarOS may not properly set the rem_addr field in the TACACS+ protocol packet when initiating a connection with the Cisco Secure ACS server. This may cause the Cisco Secure ACS server to reject the TACACS+ login request.

*Important:* The default behavior is to not fill in the rem_addr field.

This CLI command enables the setting and sending of the remote address to the IPv4 address associated with the local context management interface for customers who require this field to be verified via the Cisco Secure ACS server.

When enabled the rem_addr field contains the ssh client IP address in ASCII form. If the IP address cannot be retrieved, the length is set to zero.

**Example**

The following command enables the sending of the rem_addr field to a Cisco Secure ACS server for a TACACS+ login request:
rem_addr client-ip arg1
server

Configures TACACS+ AAA service-related parameters for use in authenticating StarOS administrative users via a TACACS+ server.

**Important:** Once a TACACS+ server is configured with the `server` command, TACACS+ AAA services for StarOS must be enabled using the `aaa tacacs+` command in Global Configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > TACACS+ Configuration
`configure > tacacs mode`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-tacacs)#
```

**Syntax**

```plaintext
server priority priority_number ip-address ip_address [ service { authentication | authorization | accounting } ] [ port port_number ] [ { encrypted password shared_secret | password text_password | key text_password } ] [ timeout seconds ] [ retries num_retries ] [ nas-source-address ip_address ]
```

no server priority priority_number

Removes a specified server (by priority number) from the TACACS+ server list.

**priority priority_number**

Specifies the order in which TACACS+ servers are to be tried. The priority number corresponds to a configured TACACS+ server.

*For releases prior to 18.2,* `priority_number` can be an integer from 1 (highest priority) to 3 (lowest priority).

*For releases 18.2+,* `priority_number` can be an integer from 1 (highest priority) to 4 (lowest priority).

If no server with priority 1 is specified, the next highest priority is used. If the specified priority matches that of a TACACS+ server already configured, any previously defined server configuration parameter(s) for that priority are returned to the default setting(s).

**ip-address**

Specifies the IP address of the TACACS+ server in IPv4 dotted-decimal notation. Only one IP address can be defined for a given `server priority`
[ service { authentication | authorization | accounting } ]

**service**: *Release 12 and later systems only*: Specifies one or more of the AAA services that the specified TACACS+ server will provide. Use of the `service` keyword requires that at least one of the available services be specified. If the `service` keyword is not used, StarOS will use the TACACS+ server for all AAA service types. The default is to use authentication, authorization and accounting. Available service types are:

- **authentication**: The specified TACACS+ server should be used for authentication. If a TACACS+ authentication server is not available, TACACS+ will not be used for authorization or accounting.
- **authorization**: The specified TACACS+ server should be used for authorization. If TACACS+ authentication is not used, TACACS+ authorization will not be used. If no authorization server is specified and the user is authenticated, the user will remain logged in with minimum privileges (Inspector level).
- **accounting**: The specified TACACS+ server should be used for accounting. If TACACS+ authentication is not used, TACACS+ accounting will not be used. If no accounting server is specified and the user is authenticated, no accounting will be performed for the user.

**port**

Specifies the TCP port number to use for communication with the TACACS+ server. `port_number` can be an integer from 1 through 65535. If a port is not specified, StarOS will use port 49.

[ { encrypted password shared_secret | password text_password | key text_password } ]

Specify the encrypted or plain-text password:

- **encrypted password shared_secret**: Specifies the encrypted value of the shared secret key. The server-side configuration must match the decrypted value for the protocol to work correctly. If `encrypted password` is specified, specifying `password` is invalid. No encryption is used if this value is null (""). The encrypted password can be an alphanumeric string of 1 through 100 characters. If neither an `encrypted password` or `password` is specified, StarOS will not use encryption.

- **password plain_text_password**: *Release 12.0 and later systems*. Instead of using an encrypted password value, the user can specify a plain-text value for the password. If the `password` keyword is specified, specifying `encrypted password` is invalid. A null string ("") represents no encryption. The password can be an alphanumeric string of 1 through 32 characters. If neither an `encrypted password` or `password` is specified, then StarOS will not use encryption.

- **key plain_text_password**: *Release 11.0 systems only*. Instead of using an encrypted password value, the user can specify a plain-text key value for the password. If the `key` keyword is specified, then specifying `encrypted password` is invalid. A null string represents no encryption. The password can be from 1 to 32 alphanumeric characters in length. If neither an `encrypted password` or `key` is specified, then StarOS will not use encryption.

[ timeout seconds ]

Specifies the number of seconds to wait for a connection timeout from the TACACS+ server. `seconds` can be an integer from 1 through 1000. If no timeout is specified, StarOS will use the default value of 10 seconds.
Server Configuration Mode Commands

retries number

**Release 12 and later systems only:** Specifies the number of retry attempts at establishing a connection to the TACACS+ server if the initial attempt fails. `retries number` can be an integer from 0 through 100. The default is 3. Specifying 0 (zero) retries results in StarOS trying only once to establish a connection. No further retries will be attempted.

```
server priority 2 ip-address 192.156.1.1 authentication
```

Usage

Use this command to specify TACACS+ service parameters for a specified TACACS+ server.

Example

The following command configures a priority 2, TACACS+ authentication server at IP address 192.156.1.1:

```
server priority 2 ip-address 192.156.1.1 authentication
```
Chapter 292
Telnet Configuration Mode Commands

The Telnet Configuration Mode is used to manage the telnet server options for the current context.

**Mode**

Exec > Global Configuration > Context Configuration > Telnet Configuration

```
classic > context context_name > server telnet
```

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-telnetd) #
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

dend

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
max servers

Configures the maximum number of telnet servers that can be started within any 60-second interval. If this limit is reached, the system waits two minutes before trying to start any more servers.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Telnet Configuration
    configure > context context_name > server telnet

Entering the above command sequence results in the following prompt:

[local]host_name(config-telnetd)#

Syntax

max servers count

    count

Default: 40
Specifies the maximum number of servers that can be spawned in any 6-second interval. count must be an integer from 1 through 100.

Usage
Set the number of servers to tune the system response as a heavily loaded system may need more servers to support the incoming requests.
The converse would be true as well in that a system can benefit by reducing the number of servers such that telnet services do not cause excessive system impact to other services.

Example

max servers 50
Chapter 293
TFTP Configuration Mode Commands

The TFTP configuration mode is used to manage the TFTP (Trivial File Transfer Protocol) servers for the current context.

Mode

Exec > Global Configuration > Context Configuration > Tunnel TFTP Configuration

configure > context context_name > server tftpd

Entering the above command sequence results in the following prompt:

[local]host_name(config-tftpd)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

```
configure > context context_name > policy-group name group_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-policy-group)#
```

Syntax

```
[ no ] policy policy_map_name precedence value direction [ in | out ]
```

- **no**
  
  Disables/removes configured policy for traffic policing.

- **direction [ in | out ]**
  
  Specifies the direction in which the policies need to be applied.

- **policy policy_map_name**
  
  Specifies the policy name as an alphanumeric string of 1 through 15 characters.

- **precedence value**
  
  Specifies the precedence of traffic policies to resolve.
  *value* is an integer from 1 through 16. If a session flow matches multiple policies, this keyword resolves them.

Usage

Use this command to form a policy-group with a set of pre-configured Policy-Maps.

Example

The following commands assigns the traffic policy *policymap1* with precedence 2.
policy policymap1 precedence 2
Chapter 295  
Traffic Policy-Map Configuration Mode Commands

A Policy-Map imposes a flow-based traffic policy for Traffic Policy feature within a destination context. It designates the flow treatment based on the classification rules configured in Class-Map mode for a subscriber session flow.

Mode

Exec > Global Configuration > Context Configuration > Traffic Policy Map Configuration

`configure > context context_name > policy-map name map_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-policy-map)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
3gpp2 data-over-signaling

Configures 3GPP2-related flow treatment policy for the flow-based traffic policing of subscriber sessions.

**Product**
- HA
- HSGW
- PDSN
- P-GW
- SAEGW
- SCM

**Privilege**
- Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Traffic Policy Map Configuration

`configure > context context_name > policy-map name map_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-policy-map)#`

**Syntax**

3gpp2 data-over-signaling marking [ class-map class_name ]

no 3gpp2 data-over-signaling marking

- **no**
  
  Disables configured 3GPP2-related flow treatment policy.

- **class-map class_name**
  
  Associates class map to be used for selective data over signaling (DOS) marking. `class_name` is an alphanumeric string of 1 through 15 characters.

- **marking**
  
  Indicates 3GPP2-related traffic flow for data over signaling channel.

**Usage**

Use this command to mark traffic flows for 3GPP2-related policy.

**Example**

```
3gpp2 data-over-signaling marking
```
access-control

Configures the access control action for traffic flows matching the Class-Map rules.

SAEGW

SCM

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Traffic Policy Map Configuration

```
configure > context context_name > policy-map name map_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-policy-map)#
```

**Syntax**

```
[ no ] accounting suppress
```

- **no**

Removes the suppression of accounting for traffic flow matching this policy map.

**Usage**

Use this command to suppress accounting action on traffic flow matching this policy map. Policy maps configured for accounting suppression are used to implement the QChat Billing Suppression feature that selectively starts and terminates accounting sessions based on the categorization of traffic as being interesting or non-interesting. See the `accounting trigger` command.

**Example**

The following command configures suppression of accounting on traffic flows matching this policy map:

```
accounting suppress
```
accounting trigger

Configures an accounting trigger policy map to selectively start and terminate accounting sessions based on the categorization of traffic as being interesting or non-interesting. This command supports the QCHAT Billing Suppression feature.

Product

P-GW
SAEGW
SCM

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Traffic Policy Map Configuration
configure > context context_name > policy-map name map_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-policy-map)#

Syntax

[ no | default ] accounting trigger { inactivity-timeout | interesting-traffic | intra-service-handoff }

default
Sets or restores the default value assigned for specified parameter.

no
Disables previously configured triggers.

inactivity-timeout
Generates an accounting Stop message if there has been no data activity on the session for the interim accounting timeout interval.
Default: disabled

interesting-traffic
Generates an accounting Start message upon arrival of interesting traffic.
Default: disabled

intra-service-handoff
Generates accounting Start and Stop messages during intra-service handoffs.
Default: enabled
If disabled, the messages are suppressed during the handoffs. The current accounting session continues and no Stop or Start messages are generated during the intra-service handoff.

Usage

Use this command to configure an accounting trigger policy map (ATPM) to selectively start and terminate accounting sessions based on the categorization of traffic as being interesting or non-interesting. This command supports the QChat Billing Suppression feature.

Interesting traffic is identified as traffic that does not match any of the other Accounting Policy Maps (APMs) configured for accounting suppression. See the `accounting suppress` command.

An ATPM is similar to an APM, but without the class map rules. The ATPM is configured as of type accounting using the `type accounting` command.

Optionally, timeout can be triggered when there is no data traffic for the interim accounting timeout interval using the `accounting trigger inactivity-timeout stop` command. On timeout, the accounting session is terminated and an Accounting Stop message is sent. A new accounting session is created if interesting traffic resumes.

In the ATPM, the trigger to start accounting for interesting traffic is configured using the `accounting trigger interesting-traffic` command. Accounting Start is triggered on arrival of interesting traffic, or change in airlink parameters conveyed through active-start airlink record. If an active-start record was included in the initial connection setup, Accounting Start is not triggered. But if the active-start comes separately and is the first one for the session, it is treated as airlink change and an Accounting Start is sent.

The ATPM should have the lowest precedence among the APMs.

As the airlink events are generated on the ingress side, the ATPM must be included in a policy group that is applied to the ingress direction in the subscriber profile. The configuration is applicable only for standard trigger policy and session based accounting mode.

Example

The following command sets the trigger to generate accounting start message upon arrival of interesting traffic:

```
accounting trigger interesting-traffic
```
class-map

Assigns a traffic classification rule (Class-Map) to the policy map.

**Product**

Exec > Global Configuration > Context Configuration > Traffic Policy Map Configuration

```
configure > context context_name > policy-map name map_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-policy-map)#
```

**Syntax**

```
[ no ] class-map name
```

- **no**
  Enables or disables `class-map`

- **name**
  Specifies the name of the class map assigned for this policy map. The class map should have been preconfigured via the Class Map Configuration Mode.
  `name` must be an alphanumeric a string of 1 through 15 characters.

**Usage**

Use this command to assign a class map to the policy map for traffic policing. The class map is configured in the Class Map Configuration Mode.

**Example**

The following command assigns the class map `classification1` to the current policy map:

```
class classification1
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**

```
[context_name]host_name(config-policy-map)#
```

**Syntax**

```
flow-tp-trigger volume traffic_volume_threshold

no flow-tp-trigger volume

traffic_volume_threshold
```

Specifies the volume threshold to trigger traffic policing. `volume` must be an integer from 1 through 4294967295.

**Usage**

This command is available if you have purchased and installed the Intelligent Traffic Control License on your system. Use this command to calculate the traffic volume based on the traffic on the flow.

**Example**

```
flow-tp-trigger volume 500
```
ip header-compression

Enables the system to mark IP flows for Robust Header Compression (RoHC).

Syntax

[ no ] ip header-compression rohc flow-marking

no

Disables the setting.

rohc flow-marking

Marks the IP flow for SO67 and PPP RoHC.

Usage

Use this command to mark IP flows for SO67 and PPP RoHC.

Example

ip header-compression rohc flow-marking
qos encaps-header

Enables and configures Quality of Service (QoS) policy to use Differentiated Service Code Point (DSCP) marking in IP header fields for the flow-based traffic policing to subscriber session flow.

Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Traffic Policy Map Configuration

configure > context context_name > policy-map name map_name

Entering the above command sequence results in the following prompt:

[context_name] host_name(config-policy-map) #

Syntax

qos encaps-header dscp-marking { dscp_code | copy-from-user-datagram [ ignore-pcf-signaled-dscp ] | user-datagram }

no qos encaps-header dscp-marking { dscp_code | copy-from-user-datagram [ ignore-pcf-signaled-dscp ] }

no
Enables/Disables the qos encaps-header.
The value must be expressed as a hexadecimal value from 0x00 through 0x3F.

dscp-marking dscp_code
Uses the DSCP code value marked in the IP header of packet/flow to determine the QoS for traffic policing.
dscp_code must be expressed as a hexadecimal number from 0x00 through 0x3F.

copy-from-user-datagram
Uses the DSCP code value from the user datagram (UDP header) to determine the QoS for traffic policing.

ignore-pcf-signaled-dscp
Overrides the highest priority DSCP value signaled by the PCF.
user-datatype

Uses the DSCP value copied from the user datagram.

Usage

Use this command to apply the QoS policy based on the DSCP value encapsulated in the IP packet header to police subscriber session traffic flows.

Important: For more information on the QoS traffic policing, see the System Administration Guide.

Example

The following command sets QoS policy with DSCP code value to 0x0C for Class 1, silver (AF12):

```
qos encaps-header dscp-marking 0x0c
```
qos traffic-police

Enables and configures Quality of Service (QoS) policy for flow-based traffic policing of subscriber session flows on a per-flow basis.

Product

ASN-GW
HA
HSGW
PDSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Traffic Policy Map Configuration
configure > context context_name > policy-map name map_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-policy-map)#

Syntax

qos traffic-police committed bps peak bps burst-size byte exceed-action { drop | lower-ip-precedence | allow } violate-action { drop | lower-ip-precedence | allow }

no qos traffic-police

no

Enables/Disables the qos traffic-police

Important: This parameter should be configured to be greater than the following two values: 1) three times greater than packet MTU for the subscriber connection, OR 2) three seconds worth of token accumulation within the “bucket” for the configured peak-data-rate.

burst-size bytes

Default: 3000
Specifies the allowed peak burst size in bytes. bytes must be an integer from 0 through 4294967295.

Important: This parameter should be configured to be greater than the following two values: 1) three times greater than the packet MTU for the subscriber connection, OR 2) three seconds worth of token accumulation within the “bucket” for the configured peak-data-rate.
Traffic Policy-Map Configuration Mode Commands

**qos traffic-police**

---

**committed bps**
Default: 144000
Specifies the committed data rate (guaranteed-data-rate) in bits per second (bps). 
*bps* must be an integer from 0 through 4294967295.

**exceed-action { drop | lower-ip-precedence | allow }**
Default: *lower-ip-precedence*
Specifies the action to take on packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:
*drop*: Drops the packet
*lower-ip-precedence*: Transmits the packet after lowering the *ip-precedence*
*allow*: Transmits the packet

**peak bps**
Default: 256000
Specifies the peak data-rate for the subscriber in bits per second (bps). 
*bps* must be an integer from 0 through 4294967295.

**violate-action { drop | lower-ip-precedence | allow }**
Default: *drop*
Specifies the action to take on the packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:
*drop*: Drops the packet
*lower-ip-precedence*: Transmits the packet after lowering the *IP precedence*
*allow*: Transmits the packet

---

**Usage**

Use this command to apply the QoS policy to a subscriber session flow for flow-based traffic policing.

---

**Important:** For additional information on the QoS traffic policing, see the *System Administration Guide*.

---

**Example**

The following command sets the committed data rate to 102400 bps with a peak data rate of 128000 bps and a burst size of 2048 bytes. This lowers the IP precedence when the committed-data-rate is exceeded and drops the packets when the peak-data-rate are violated:

```
qos traffic-police committed 102400 peak 128000 burst-size 2048 exceed-
action lower-ip-precedence violate-action drop
```
qos user-datagram dscp-marking

Enables and configures Quality of Service (QoS) policy related to differentiated service code point (DSCP) marking in the user datagrams of subscriber session flows on a per-flow basis.

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-policy-map)#

Syntax

qos user-datagram dscp-marking dscp_code

no qos user-datagram dscp-marking

---

dscp_code

Specifies the use of the DSCP code value marked in the IP header of packet/flow to determine the QoS for traffic policing. dscp_code must be expressed as a hexadecimal number from 0x00 through 0x3F.

Usage

Use this command to apply the QoS policy to subscriber session flow by DSCP marking in user datagram.

Example

The following command sets DSCP marking for user datagram as 0x01 for QoS to subscriber session flow:

qos user-datagram dscp-marking 0x01
**sess-tp-trigger**

Configures the trigger for traffic policing based on the traffic volume for a subscriber session.

**Product**
- ASN-GW
- HA
- HSGW
- PDSN
- P-GW
- SAEGW
- SCM

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Traffic Policy Map Configuration
`configure > context context_name > policy-map name map_name`

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-policy-map)#
```

**Syntax**

```
(sess-tp-trigger volume volume direction { both | downlink | uplink })
no sess-tp-trigger
```

**Usage**
Use this command to trigger traffic control based on the traffic volume for a subscriber session. This command requires the purchase and installation of a license.

**Example**
```
sess-tp-trigger 500
```
**type**

Specifies the type of traffic policy within a specific Policy-Map.

**Product**

- ASN-GW
- HA
- HSGW
- PDSN
- P-GW
- SAEGW
- SCM

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Traffic Policy Map Configuration

`configure > context context_name > policy-map name map_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-policy-map)#`

**Syntax**

```
type { accounting | dynamic { three-gpp2 rev-A profile-id { any | id profile_id | range low_value to high_value } flow-id { any | id flow_id | range low_value to high_value } | pre-provisioned wimax asn-service-profile-id { any | id service_id } asn-pdfid { any | id pdf_id } | static | template }
```

---

**accounting**

Specifies the type of traffic policing as accounting for this specific policy map. This configuration is used for enabling/disabling the accounting of different flows matching conditions within this Policy-Map.

---

**dynamic**

Identifies the type of policy map as dynamic.

---

**three-gpp2 rev-A**

Configures the dynamic policy map type for CDMA2000-3GPP2 RevA service.

---

**profile-id { any | id profile_id | range low_hex to high_hex }**

Specifies the profile id matching within this policy map.

- `any`: allows any profile identifier matching this policy map.
- `id profile_id`: allows specific profile identifier matching with in this policy map. `profile_id` must be a hexadecimal number from 0x0 to 0xFFFF.
**range low_value to high_value:** identifies a range in which a profile identifier must fall within to be considered a match. `low_value` and `high_value` must be either a hexadecimal number from 0x0 to 0xFFFF, or an integer from 0 through 65535 characters.

**flow-id { any | id flow_id | range low_hex to high_hex }**

Specifies the flow id matching in this policy map.

- **any** allows any flow identifier matching within this policy map.
- **id flow_id** allows specific flow identifier matching within this policy map. `flow_id` must be either a hexadecimal number from 0x0 to 0xFFFF, or an integer from 0 to 65535.
- **range low_value to high_value** identifies a range in which a flow identifier must fall within to be considered a match. `low_value` and `high_value` must be either a hexadecimal number from 0x0 to 0xFFFF, or an integer from 0 to 65535.

**pre-provisioned**

Identifies the type of policy map as pre-provisioned.

**wimax**

Configures WiMAX service policy map in an ASN-GW service.

**asn-service-profile { any | id service_id }**

Specifies the ASN Service profile identifier to match within this policy map.

- **any** Allows any ASN Service Profile Identifier matching within this policy map.
- **id service_id** Allows specific Service Profile matching to a specified identifier. `service_id` must be an integer from 1 to 65535 that matches a service ID that was configured in the Subscriber Configuration Mode.

**asn-pdfid { any | id pdf_id }**

Specifies the ASN Packet Data Flow Identifier to match within this policy map.

- **any** Allows any ASN Packet Data Flow Identifier matching within this policy map.
- **id pdf_id** Allows specific Packet Data Flow matching to a specified identifier. `pdf_id` must be an integer from 1 to 255 that matches a PDF ID that was configured in the Subscriber Configuration Mode.

**static**

Specifies the type of traffic policing as static for this specific Policy Map. In this type of policy, the traffic flow classification and flow treatment is pre-defined with classification rules through Class-Map configuration.

This is the detailed type of policy map.

**template**

Specifies the type of traffic policy to as a template to all subscribers associated with this policy map.

**Usage**

**Example**

The following commands configures the traffic policy for this Policy-Map as static:

```
  type static
```
The following commands configure the traffic policy for this Policy-Map as pre-provisioned for WiMAX service requiring a match of any service profile and PDF id of 3:

```
  type pre-provisioned wimax asn-service-profile any asn-pdfid id 3
```
The Tunnel Interface Configuration Mode is used to create and manage the IP interfaces for various types of tunnels including associated parameters, such as addresses and address resolution options.

Mode

Exec > Global Configuration > Context Configuration > Tunnel Interface Configuration

configure > context context_name > interface interface_name tunnel

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-if-tunnel)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
description

Enters descriptive text for the current interface.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Tunnel Interface Configuration

configure > context context_name > interface interface_name tunnel

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-if-tunnel)#

Syntax

description text

no description

no

Clears the description for the interface.

text

Contains the descriptive text for this interface. text must be an alphanumeric string of 0 through 79 characters. If spaces are required, the string must be bracketed with double quotation marks (""). The interface description is case sensitive.

Usage

Set the description to provide useful information regarding the interface’s primary function, services, end users, etc.

Example

The following command describes this interface:

    description sampleInterfaceDescriptiveText
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
dend

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Syntax

exit

Usage
Use this command to return to the parent configuration mode.
ip address

Configures the IPv4 address for this tunnel interface.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Tunnel Interface Configuration

```
configure > context context_name > interface interface_name tunnel
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-if-tunnel)#
```

**Syntax**

```
ip address [ip_address/ip_mask | ip_address ip_mask]
no ip address ip_address
```

- **no**
  - Removes the configured IPv4 address bound to a tunnel interface.

```
ip_address/ip_mask | ip_address ip_mask
```

- Specifies a destination IP address or group of addresses that will use this route.
  - `ip_address/ip_mask`: Specifies a combined IP address subnet mask bits to indicate what IP addresses to which the route applies. `ip_address/ip_mask` must be specified using IPv4 dotted-decimal and CIDR notation. `ip_mask` is an integer which is the number of bits in the subnet mask.
  - `ip_address ip_mask`: Specifies an IP address and the networking (subnet) mask pair which is used to identify the set of IP addresses to which the route applies. `ip_address` must be specified using the IPv4 dotted-decimal notation. `ip_mask` must be specified using the IPv4 dotted-decimal notation as network mask for subnets.

The mask as specified by `ip_mask` or resulting from `ip_address/ip_mask` is used to determine the network for packet routing.

- Zeros (“0”) in the resulting mask indicate that the corresponding bit in the IP address is not significant in determining the network for packet routing.
- Ones (“1”) in the resulting mask indicate the corresponding bit in the IP address is significant in determining the network.

**Usage**

Use this command to bind the IPv4 address to a tunnel interface. This address does not affect the encapsulation of packets going out on the tunnel interface.

**Example**

The following command will assign the 10.2.3.4 as IPv4 address to this tunnel interface:

```
ip address 10.2.3.4
```
ipv6 address

Configures the IPv6 address for the specific tunnel interface.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Tunnel Interface Configuration
configure > context context_name > interface interface_name tunnel

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-if-tunnel)#

Syntax

ipv6 address ipv6_address/ipv6_mask

no ipv6 address ipv6_address

no

Removes the configured IPv6 address bound to a tunnel interface.

ipv6_address/ipv6_mask

Specifies a destination IP address or group of addresses that will use this route.
ipv6_address/ipv6_mask: Specifies a combined IP address subnet mask bits to indicate what IP addresses to which the route applies. ipv6_address/ipv6_mask must be specified using IPv6 colon-separated-hexadecimal and CIDR notation. ipv6_mask is a numeric value which is the number of bits in the subnet mask.

Usage

Use this command to bind the IPv6 address to a tunnel interface. This address does not affect the encapsulation of packets going out on the tunnel interface.

Example

The following command will assign the 1001::2:010:1234 as IPv6 address to this tunnel interface:

ipv6 address 1001::2:010:1234
tunnel-mode

Configures the tunnel mode type for this tunnel interface. It also enters the specific tunnel configuration mode, if required.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Tunnel Interface Configuration

```bash
configure > context context_name > interface interface_name tunnel
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-if-tunnel)#
```

**Syntax**

```bash
tunnel-mode { gre | ipv6ip }
```

**default tunnel-mode**

---

**default**

Sets the default tunnel mode for this interface. By default, the tunnel mode is set to IPv6-to-IPv4 type.

---

**gre**

Default: Disabled

Sets the tunnel interface mode to Generic Routing Encapsulation (GRE) type and enters the GRE Tunnel Configuration mode, if required.

---

**ipv6ip**

Default: Enabled

Sets the tunnel interface mode to IPv6-to-IPv4 type and creates the IPv6-to-IPv4 Tunnel Configuration mode, if required.

---

**Usage**

Use this command to set the tunnel mode type of GRE or IPv6-to-IPv4 for the tunneling interface.

**Example**

The following command sets the tunnel mode to GRE for specific interface:

```bash
tunnel-mode gre
```
Chapter 297
UDR Format Configuration Mode Commands

The UDR Format Configuration Mode enables configuring User Detail Record (UDR) formats.

Mode

Exec > ACS Configuration > UDR Format Configuration

`active-charging service service_name > udr-format format_name`

Entering the above command sequence results in the following prompt:

`[local]host_name(config-acs-udr)#`

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
attribute

This command allows you to specify the fields and their order in UDRs.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > ACS Configuration > UDR Format Configuration

```
active-charging service service_name > udr-format format_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-acs-udr)#
```

**Syntax**

```
```

**no attribute attribute [ priority priority ]**

- `no`
  - If added previously, removes the specified attribute from the UDR format.

**attribute attribute**

Specifies the attribute.

- `attribute` must be one of the following:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diameter-session-id</td>
<td>This attribute reports Diameter session identifier.</td>

<tr>
<td>sn-fa-correlation-id</td>
<td>This attribute reports the RADIUS Correlation Identifier of the Foreign Agent (FA).</td>
</tr>
<tr>
<td>sn-fa-ip-address</td>
<td>This attribute reports IP address of the FA.</td>
</tr>
<tr>
<td>sn-filler-blank</td>
<td>This attribute inserts a blank filler field, generates an empty UDR field.</td>
</tr>
<tr>
<td>sn-filler-zero</td>
<td>This attribute inserts a “0” in the UDR field.</td>
</tr>
<tr>
<td>sn-format-name</td>
<td>This attribute reports name of the UDR format used.</td>
</tr>
<tr>
<td>sn-group-id</td>
<td>This attribute reports the sequence group identifier for the records.</td>
</tr>
<tr>
<td>sn-ha-ip-address</td>
<td>This attribute reports IP address of the Home Agent (HA).</td>
</tr>
<tr>
<td></td>
<td><strong>Important:</strong> This attribute is customer specific, and is only available in 8.3 and later releases.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>sn-local-seq-no</strong></td>
<td>This attribute reports unique local sequence number of UDR identifier per ACSMgr/SessMgr and linearly increasing in UDR file.</td>
</tr>
<tr>
<td><strong>sn-ocs-ip-address</strong></td>
<td>This attribute reports IP address of the Online Charging Server. <strong>Important:</strong> This attribute is customer specific, and is only available in 8.3 and later releases.</td>
</tr>
<tr>
<td><strong>sn-rulebase</strong></td>
<td>This attribute reports name of the ACS rulebase used.</td>
</tr>
<tr>
<td><strong>sn-sequence-no</strong></td>
<td>This attribute reports unique sequence number (per <strong>sn-sequence-group</strong> and <strong>radius-nas-ip-address</strong>) of UDR identifier and linearly increasing in UDR file.</td>
</tr>
<tr>
<td><strong>sn-served-bsa-addr</strong></td>
<td>This attribute reports address of Base Station Area being served.</td>
</tr>
<tr>
<td><strong>sn-service-name</strong></td>
<td>This attribute reports name of the ACS service.</td>
</tr>
<tr>
<td><strong>sn-st16-ip-addr</strong></td>
<td>This option has been deprecated.</td>
</tr>
<tr>
<td><strong>sn-start-time [format format]</strong></td>
<td>This attribute reports timestamp for first packet of flow in UTC. <strong>Important:</strong> This attribute is customer specific, and is only available in 8.3 and later releases.</td>
</tr>
<tr>
<td><strong>sn-stream-number</strong></td>
<td>This attribute reports unique UDR billing record identifier. <strong>Important:</strong> This attribute is customer specific, and is only available in 8.3 and later releases.</td>
</tr>
<tr>
<td><strong>sn-subscriber-id</strong></td>
<td>This attribute reports subscriber ID.</td>
</tr>
<tr>
<td><strong>sn-subscriber-nat-flow-ip</strong></td>
<td>This attribute reports NAT IP address(es) of NAT-enabled subscriber.</td>
</tr>
<tr>
<td><strong>sn-timestamp</strong></td>
<td>This attribute reports timestamp when the UDR is actually generated. <strong>Important:</strong> This attribute is customer specific, and is only available in 8.3 and later releases.</td>
</tr>
</tbody>
</table>

Specifies the timestamp format.

**localtime**

Specifies the local time. By default, timestamps are displayed in Coordinated Universal Time (UTC).
attribute

( bytes | pkts ) { downlink | uplink }
Specifies bytes/packets sent/received from/by mobile.

priority priority
Specifies the position priority of the field within the UDR. Lower numbered priorities (across all attribute, event-label, and rule-variable) occur first. priority must be an integer from 1 through 65535. Up to 50 position priorities (across all attribute, event-label, and rule-variable) can be configured.

Usage
Use this command to set the attributes and priority for UDR file format. A particular field in UDR format can be entered multiple times at different priorities. While removing the UDR field using the no attribute command, you can either remove all occurrences of a particular field by specifying the field name or remove a single occurrence by additionally specifying the optional priority keyword.

Consider the following scenario. If the volume/time threshold interval is large enough (or disabled). At time t=0, 10 ICMP packets are sent, which takes 9 seconds. There is nothing for the next 100 seconds, and then again 10 ICMP packets are sent which takes 10 seconds, and then again nothing for next the 60 seconds and then the session is terminated.

In this scenario:

- sn-start-time should be t = 0.
- sn-end-time should be t = 0+9+100+10 (sn-end-time would be the last ICMP packet sent).
- sn-duration should be sn-end-time minus sn-start-time, i.e. 0+9+100+10 – 0 = 119 seconds (since the ICMP flow would exist between the two intervals of sending ICMP packets, the sn-start-time would be that of the first packet of the flow and sn-end-time of the last packet (20th packet). Hence, sn-duration would take into account all the seconds between the first and last packet of the flow).

Example
The following is an example of this command:

    attribute radius-user-name priority 12
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
end
```

**Usage**
Use this command to return to the Exec mode.
event-label

This command allows you to specify an optional event label/identifier to be used as an attribute in the UDRs.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > ACS Configuration > UDR Format Configuration

active-charging service service_name > udr-format format_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-acs-udr)#

Syntax

event-label event_label priority priority

no event-label

no
If previously configured, removes the event label configuration.

event_label
Specifies the event label/identifier to be used as UDR attribute.

event_label must be an alphanumeric string of 1 through 63 characters.

priority priority
Specifies the Comma Separated Value (CSV) position of the attribute (label/identifier) in the UDR.

priority must be an integer from 1 through 65535.

Usage
Use this command to configure an optional event label/identifier as an attribute in the UDR and its position in the UDR.

Example
The following is an example of this command:

    event-label radius_csv1 priority 23
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
**rule-variable**

This command allows you to specify fields and their order in UDRs.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > ACS Configuration > UDR Format Configuration

```
active-charging service service_name > udr-format format_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-acsc-udr)#
```

**Syntax**

```text
rule-variable rule_variable priority priority
no rule-variable rule_variable [ priority priority ]
```

- **no**
  If previously configured, removes the specified rule variable configuration.

```
rule-variable rule_variable
```

Specifies the rule variable for the UDR format.

**rule_variable** must be one of the following options:

- **bearer 3gpp2**: Bearer-related configuration:
  - *always-on*
  - *bsid*
  - *carrier-id*
  - *esn*
  - *ip-qos*
  - *ip-technology*
  - *meid*
  - *release-indicator*
  - *serv-MDN*
  - *service-option*
  - *session-begin*
  - *session-continue*
**Important:** For more information on protocol-based rules see the *ACS Ruledef Configuration Mode Commands* chapter.

```plaintext
priority priority
```

Specifies the CSV position of the field (protocol rule) in the UDR.

*priority* must be an integer from 1 through 65535.

**Usage**

Use this command to specify what field appears in which order in the UDR.
A particular field in UDR format can be entered multiple times at different priorities. While removing the UDR field using the `no rule-variable` command, you can either remove all occurrences of a particular field by specifying the field name, or remove a single occurrence by additionally specifying the optional priority keyword.

**Example**

The following is an example of this command:

```
rule-variable bearer 3gpp2 bsid priority 36
```
Chapter 298
UDR Module Configuration Mode Commands

The UDR Module Configuration Mode allows you to configure Usage Data Record (UDR) file transfer parameters.

**Mode**

Exec > Global Configuration > Context Configuration > UDR Module Configuration

```bash
configure > context context_name > udr-module active-charging-service
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-udr)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

**cdr**

This command allows you to configure EDR/UDR file transfer parameters.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > UDR Module Configuration

```
configure > context context_name > udr-module active-charging-service
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-udr)#
```

**Syntax**

```
cdr { purge { storage-limit storage_limit | time-limit time_limit } [ max-files max_records_to_purge ] | push-interval push_interval | push-trigger space-usage-percent trigger_percentage | remove-file-after-transfer | transfer-mode { pull [ module-only ] | push primary { encrypted-url encrypted_url | url url } [ [ max-files max_records ] [ max-tasks task_num ] [ module-only ] [ secondary { encrypted-secondary-url encrypted_secondary_url | secondary-url secondary_url } ] [ via local-context ] + ] | use-harddisk }

default cdr [ purge | push-interval | push-trigger space-usage-percent | remove-file-after-transfer | transfer-mode { module-only | push via } | use-harddisk ] +

no cdr [ purge | remove-file-after-transfer | use-harddisk ] +
```

**default**

Configures the default setting for the specified keyword(s):

- **purge**: Disabled
- **push-interval**: 300 seconds
- **push-trigger**: 80 percent
- **remove-file-after-transfer**: Disabled
- **transfer mode**: Pull
- **push via**: line cardMIO is used for push
- **use-harddisk**: Disabled

**Important:** The **use-harddisk** keyword is only available on ASR 5000 chassis.

**no**

If previously configured, disables the specified configuration:

- **purge**: Disables purging of records.
UDR Module Configuration Mode Commands

• **remove-file-after-transfer**: Retains a copy of the file even after it has been pushed or pulled to another server.

• **use-harddisk**: Disables data storage on the SMC hard disk.

---

**Important**: The **use-harddisk** keyword is available only on the ASR 5000 chassis.

```plaintext
purge { storage-limit storage_limit | time-limit time_limit } [ max-files
max_records_to_purge ]
```

Specifies to purge/delete the UDR records based on "time" or "volume" limit. When the configured threshold limit is reached on the hard disk drive, the records that are created dynamically in the `/mnt/hd-raid/data/records/` directory are automatically deleted. Files that are manually created should be deleted manually.

• **storage-limit storage_limit**: Specifies to start deleting files when the specified megabytes of space is used for storage.
  
  `storage_limit` specifies the volume limit for the record files, in megabytes, and must be an integer from 10 through 143360.

• **time-limit time_limit**: Specifies to start deleting files older than the specified time limit.
  
  `time_limit` specifies the time limit for the record files, and must be an integer from 600 through 2592000.

• **max-files max_records_to_purge**: Specifies the maximum number of records to purge.
  
  `max_records_to_purge` can be 0, or an integer from 1000 through 10000. If the value is set to 0, during each cycle, the records will be deleted until the purge condition is satisfied. If the value is set between 1000 and 10000, during each cycle, the records will be deleted until either the purge condition is satisfied or the number of records deleted equals the configured `max-files` value.

  Default: 0

```plaintext
push-interval value
```

Specifies the transfer interval (in seconds) to push UDR/EDR files to an external file server. `value` must be an integer from 60 through 3600.

Default: 300

```plaintext
push-trigger space-usage-percent trigger_percentage
```

Specifies the UDR/EDR disk space utilization percentage, upon reaching which an automatic push is triggered and files are transferred to the configured external server.

`trigger_percentage` specifies the UDR/EDR disk utilization percentage for triggering push, and must be an integer from 10 through 80.

Default: 80%

```plaintext
remove-file-after-transfer
```

Specifies that the system must delete UDR/EDR files after they are transferred to the external file server.

Default: Disabled

Specifies the UDR/EDR file transfer mode.

- **pull**: Specifies that the L-ESS is to pull the UDR files.
- **push**: Specifies that the system is to push UDR files to the configured L-ESS.
- **max-files max_records**: Specifies the maximum number of files sent per iteration based on configured file size.
  Default: 4000
- **max-tasks task_num**: Specifies the maximum number of tasks (child processes) that will be spawned to push the files to the remote server. The `task_num` must be an integer from 4 through 8.
  Default: 4

**Important**: Note that increasing the number of child processes will improve the record transfer rate. However, spawning more child will consume additional resource. So, this option needs to be used with proper resource analysis.

- **module-only**: Specifies that the transfer-mode is only applicable to the UDR module; if not configured it is applicable to both EDR and UDR modules. This enables support for individual record transfer-mode configuration for each module.

- **primary encrypted-url encrypted_url**: Specifies the primary location in encrypted format to which the system pushes the UDR files.
  `encrypted_url` must be the primary location name in an encrypted format, and must be an alphanumeric string of 1 through 1024 characters.

- **primary url url**: Specifies the primary location to which the system pushes the UDR files.
  `url` must be the primary location, and must be an alphanumeric string of 1 through 1024 characters in the format: `//user:password@host:[port]/directory`.

- **secondary encrypted-secondary-url encrypted_secondary_url**: Specifies the secondary location in encrypted format to which the system pushes the UDR files when the primary location is unreachable or fails.
  `encrypted_secondary_url` must be the location in an encrypted format, and must be an alphanumeric string of 1 through 1024 characters.

- **secondary secondary-url secondary_url**: Specifies the secondary location to which the system pushes the UDR files when the primary location is unreachable or fails.
  `secondary_url` must be the secondary location, and must be an alphanumeric string of 1 through 1024 characters in the format: `//user:password@host:[port]/directory`.

- **via local-context**: Selects the LC/SPIO for transfer of UDRs. The system pushes the UDR files via SPIO in the local context.

- **via local-context**: Selects the MIO for transfer of UDRs. The system pushes the UDR files via the MIO in the local context.
### use-harddisk

**Important:** The `use-harddisk` keyword is available only on the ASR 5000 chassis.

Specifies that on an ASR 5000 chassis, the hard disk on the SMC will be used to store UDR/EDR files. When configured to use the hard disk for UDR/EDR storage, UDR/EDR files are transferred from packet processing cards to the hard disk on the SMC.

Specifies that on an ASR 5500 chassis, the hard disk array on the FSCs will be used to store UDR/EDR files. On configuring to use the array for UDR/EDR storage, UDR/EDR files are transferred from DPCs to the array.

Default: Disabled

+ Indicates that more than one of the previous keywords can be entered within a single command.

### Usage

Use this command to configure how UDRs are moved and stored.

On the ASR 5000/ASR 5500 chassis, run this command only from the local context. Running in any other context would fail and deliver an error message.

If PUSH transfer mode is configured, the L-ESS server URL to which the UDR files need to be transferred must be specified. The configuration allows a primary and a secondary server to be configured. Configuring the secondary server is optional. Whenever a file transfer to the primary server fails for four consecutive times, the files will be transferred to the secondary server. The transfer will switch back to the original primary server when:

- Four consecutive transfer failures to the secondary server occur
- After switching from the primary server, 30 minutes elapses

When changing the transfer-mode from pull to push, disable the PULL from L-ESS and then change the transfer mode to push. Make sure that the push server URL configured is accessible from the local context. Also, make sure that the base directory that is mentioned contains udr directory created within it.

When changing the transfer-mode from push to pull, after changing, enable PULL on the L-ESS. Any of the ongoing PUSH activity will continue till all the scheduled file transfers are completed. If there is no PUSH activity going on at the time of this configuration change, all the PUSH related configuration is nullified immediately.

The `cdr use-harddisk` command is available only on the ASR 5000/ASR 5500 chassis. This command can be run only in a context where CDRMOD is running. Configuring in any other context will result in failure with the message “Failure: Please Check if CDRMOD is running in this context or not.”

The `cdr use-harddisk` command can be configured either in the UDR or EDR module, but will be applicable to both record types. Configuring in one of the modules will prevent the configuration to be applied in the other module. Any change to this configuration must be done in the module in which it was configured, the change will be applied to both record types.

The VPNMgr can send a maximum of 4000 files to the remote server per iteration. However if the individual file size is big (say when compression is not enabled), then while transferring 4000 files SFTP operation takes a lot of time. To prevent this, the `cdr transfer-mode push` command can be configured with the keyword `max-files`, which allows operators to configure the maximum number of files sent per iteration based on configured file size.

### Example

The following command configures the system to retain a copy of the data file after it has been transferred to the storage location:
no cdr remove-file-after-transfer
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
file

This command allows you to configure UDR file parameters.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > UDR Module Configuration

configure > context context_name > udr-module active-charging-service

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-udr)#

Syntax

file [ charging-service-name { include | omit } ] [ compression { gzip | none } ] [ current-prefix string ] [ delete-timeout seconds ] [ directory directory_name ] [ exclude-checksum-record ] [ field-separator { hyphen | omit | underscore } ] [ file-sequence-number rulebase-seq-num ] [ headers ] [ name file_name ] [ reset-indicator ] [ rotation [ num-records number | time seconds | volume bytes ] ] [ sequence-number { length length | omit | padded | padded-six-length | unpadded } ] [ storage-limit limit ] [ time-stamp { expanded-format | rotated-format | unix-format } ] [ trailing-text string ] [ trap-on-file-delete ] [ udr-seq-num ] [ xor-final-record ] +

default file [ charging-service-name ] [ compression ] [ current-prefix ] [ delete-timeout ] [ directory ] [ field-separator ] [ file-sequence-number ] [ headers ] [ name ] [ reset-indicator ] [ rotation [ num-records | time | volume ] ] [ sequence-number ] [ storage-limit ] [ time-stamp ] [ trailing-text ] [ udr-seq-num ]

default

Configures the default setting for the specified keyword(s). Using the default file command will reset some but not all keyword parameters to their default values. To ensure that the default is reset for a specific parameter, include the corresponding keyword in the command.

charging-service-name { include | omit }

Specifies to include/exclude name of the charging service in the file name.

• include: Includes name of the charging service in the UDR file name.
• omit: Excludes name of the charging service in the UDR file name.

Default: include

compression { gzip | none }

Configures gzip compression of the UDR file.

• gzip: Enables GNU zip compression of the UDR file at approximately 10:1 ratio.
• none: Disables Gzip compression.
Current-prefix string

Specifies a string to add to the beginning of the UDR file that is currently being used to store UDR records. string must be an alphanumeric string of 1 through 31 characters.
Default: curr

delete-timeout seconds

Specifies a timeout period (in seconds) when completed UDR files are deleted. By default, files are never deleted.
seconds must be an integer from 3600 through 31536000.
Default: Disabled

directory directory_name

Specifies a subdirectory in the default directory in which to store UDR files.
directory_name must be an alphanumeric string of 1 through 191 characters.
Default: /records/udr

exclude-checksum-record

When entered, this keyword excludes the final record containing #CHECKSUM followed by the 32-bit Cyclic Redundancy Check (CRC) of all preceding records from the UDR file.
Default: Disabled, inserts checksum record into the UDR file header.

field-separator { hyphen | omit | underscore }

Specifies the field separators to be used between two fields of a UDR file name.

- **hyphen**: Specifies to use ‘-’ (hyphen) as the field separator.
- **omit**: Excludes the field separator.
- **underscore**: Specifies to use ‘_’ (underscore) as the field separator.

Default: underscore

file-sequence-number rulebase-seq-num

Generates unique file sequence numbers for different rulebase-format-name combinations.

headers

Includes a file header summarizing the record layout.

name file_name

Default: udr

Specifies a string to use as the base file name for UDR files.
file_name must be an alphanumeric string of 1 through 31 characters. The file name format is as follows:
base_rulebase_format_sequence_num_timestamp

- **base**: Specifies type of record in file or contains the operator-specified string. Default: udr
- **rulebase**: Specifies the name of the ACS rulebase. UDRs from different rulebases go into different UDR files.
- **format**: Specifies the name of the UDR format if single-udr-format is specified, else the format field (and the trailing underscore) is omitted from the file name.
• **sequencenum**: This is a 5-digit sequence number to detect the missing file sequence. It is unique among all UDR files on the system.

• **timestamp**: Contains a timestamp based on file creation time in UTC formatted as: MMDDYYYYHHMMSS.

UDR files that have not been closed have a string added to the beginning of their file names. File name for a UDR file in CSV format that contains information for a rulebase named `rulebase1` and a UDR schema named `udr_sch1` appears as follows: `udr_rulebase1_udr_sch1_00005_01302006143409`

If file name is not configured, the system creates files for EDRs/UDRs/FDRs (xDRs) using the following name template with limits to 256 characters:

```
basename_ChargSvcName_timestamp_SeqNumResetIndicator_FileSeqNumber
```

• **basename**: A global-based configurable text string that is unique per system that uniquely identifies the global location of the system running ACS.

• **ChargSvcName**: A system context-based configurable text string that uniquely identifies a specific context-based charging service.

• **timestamp**: Date and time at the instance of file creation. Date and time in the format: “MMDDYYYYHHmmSS”, where HH is a 24-hour value from 00-23.

• **SeqNumResetIndicator**: A one-byte counter used to discern the potential for duplicated FileSeqNumber with a range of 0 through 255, which is incremented by a value of 1 for the following conditions:

  • Failure of an ACS software process on an individual packet processing card
  • Failure of the system such that a second system takes over (for example, a standby or backup chassis put in place according to Inter-chassis Session Recovery)
  • File Sequence Number (FileSeqNumber) rollover from 999999999 to 0

• **FileSeqNumber**: unique file sequence number for the file is a 9-digit integer from 000000000 through 999999999. It is unique on each chassis.

File name for a closed xDR file in CSV format that contains information for ACS `xyz_city1` and charging service name `preapaid2` with timestamp `12311969190000`, and file sequence number counter reset indicator to `002` for file sequence number `0349390002` appears as follows: `xyz_city1_preapaid2_12311969190000_002_034939002`

File name for a running xDR file in CSV format that contains information for the same parameters for file sequence number `034939003` prefixed with `curr_` and appears as follows: `curr_xyz_city1_preapaid2_12311969190000_002_034939002`

---

**Important**: When the "rulebase name" and "edr-format-name" options are enabled through this `file` command, if the "field-separator" value is "underscore" (default value) then, in the filename, the fields Rulebase name and EDR format name will be separated by "hyphen". If the "field-separator" value is "hyphen" then, in the filename, the fields Rulebase name and EDR format name will be separated by "underscore". This will ensure that the number of the fields in the filename is not increased and does not affect the backend billing system.

**reset-indicator**

Specifies to include the reset indicator counter value, from 0 to 255, in the UDR file name and is incremented (by one) whenever any of the following conditions occur:

• An ACSMgr/SessMgr process fails.

• An Inter-chassis Session Recovery (ICSR) peer chassis has transitioned from standby to active.

• The sequence number in sequence-number keyword has rolled over to zero.
UDR Module Configuration Mode Commands

---

**rotation** { num-records records | time seconds | volume bytes }

Specifies when to close a UDR file and create a new one.

- **num-records records**: Specifies the number of records that should be added to the file. When the number of records in the file reaches this specified value, the file is complete.
  - *records* must be an integer from 100 through 10240.
  - Default: 1024

- **time seconds**: Specifies the period of time to wait before closing the UDR file and creating a new one.
  - *seconds* must be an integer from 30 through 86400.
  - Default: 3600 seconds

- **volume bytes**: Specifies the maximum size of the UDR file before closing it and creating a new one.
  - *bytes* must be an integer from 51200 through 62914560.
  - Default: 102400 bytes

  Note that higher settings may provide the best compression ratio when the **compression** keyword is set to gzip.

---

**sequence-number** { length length | omit | padded | padded-six-length | unpadded }

Specifies including or excluding the sequence number in the file name.

- **length length**: Includes the sequence number with the specified length.
  - *length* must be the length of the file sequence number with preceding zeroes in the file name, and must be an integer from 1 through 9.

  *Important*: The length configuration is applicable in both UDR and EDR modules. When applied in both modules without the file udr-seq-num configuration, the minimum among the two values will come into effect for both modules. With the file udr-seq-num config, each module will use its own value of length.

- **omit**: Excludes the sequence number from the file name.

- **padded**: Includes the padded sequence number with preceding zeros in the file name. This is the default setting.

- **padded-six-length**: Includes the padded sequence number with six preceding zeros in the file name.

- **unpadded**: Includes the unpadded sequence number in the file name.

  Default: padded

---

**storage-limit limit**

Specifies deleting files when the specified amount of space, in bytes, is used up for UDR/EDR file storage on packet processing card RAM.

On an ASR 5000/ASR 5500 chassis, *limit* must be an integer from 10485760 through 536870912.

Default: 33554432

*Important*: On the ASR 5000 chassis, the total storage limit is 536870912 bytes (512 MB). This limit is for both UDR and EDR files combined.
time-stamp { expanded-format | rotated-format | unix-format }

Specifies the timestamp of when the file was created be included in the file name.

- **expanded-format**: Specifies the UTC MMDDYYYYHHMMSS format.
- **rotated-format**: Specifies the YYYYMMDDHHMMSS format.
- **unix-format**: Specifies the UNIX format of \( x.y \), where \( x \) is the number of seconds since 1/1/1970 and \( y \) is the fractional portion of the current second that has elapsed.

trailing-text string

Specifies the inclusion of arbitrary text string in the file name. 
string must be an alphanumeric string of 1 through 30 characters.

trap-on-file-delete

Instructs the system to send an SNMP notification (starCDRFileRemoved) when an UDR/EDR file is deleted due to lack of space.
Default: Disabled

udr-seq-num

Specifies that the file sequence numbers that are part of the UDR file names be independently generated. If disabled, a single set of sequence numbers are shared by both UDR and EDR files.
Default: Disabled

xor-final-record

Specifies inserting an XOR checksum (in place of the CRC checksum) into the UDR file header if the exclude-checksum-record keyword is left at its default setting.
Default: Disabled

More than one of the previous keywords can be entered within a single command.

Usage

Use this command to configure UDR file characteristics.

Example

The following command sets the prefix of the current active UDR file to **current**:

`file current-prefix current`

The following command sets the base file name to **UDRfile**:

`file name UDRfile`

Cisco ASR 5x00 Command Line Interface Reference
Chapter 299
Video Group Configuration Mode

The Video Group Configuration Mode is used to add CAEs to a CAE group and configure the CAEs for load balancing and health-check monitoring. The CAE (Content Adaptation Engine) is an optional component of the Mobile Videoscape. For additional information, refer to the Mobile Video Gateway Administration Guide.

Mode

Exec > Global Configuration > Context Configuration > Video Group Configuration

`configure > context context_name > cae-group group_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-vgroup)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
keepalive-server

Specifies keep-alive messaging information for Content Adaptation Engine (CAE) health-check monitoring, which is part of CAE load balancing on the Mobile Video Gateway. Note that this command and its options configure settings that apply to all CAEs in the CAE group, not to an individual CAE.

Product

MVG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Video Group Configuration

configure > context context_name > cae-group group_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-vgroup)#

Syntax

[ default ] keepalive-server
deadtime seconds interval seconds num-retry num-retries port
port_number timeout seconds [ -noconfirm ]

default keepalive-server

Sets the CAE keep-alive settings to their default values.

keepalive-server
deadtime seconds interval seconds num-retry num-retries port
port_number timeout seconds [ -noconfirm ]

Specifies keep-alive messaging information for CAE health-check monitoring.

deadtime seconds

Specifies the periodic retry interval (in seconds) after a CAE is detected down. seconds is an integer from 1 through 1800. The default value is 120 seconds.

interval seconds

Specifies the interval (in seconds) for how often the Mobile Video Gateway sends a keep-alive message to the CAEs. seconds is an integer from 0 through 120. The default value is 10 seconds. A value of 0 turns off keep-alive detection and marks the state of all CAEs to Up.

num-retry num_retries

Specifies the number of keepalive retries after a CAE does not respond. num_retries is an integer from 1 through 20. The default value is 3 retries.

port port_number

Specifies the TCP port number for health-check monitoring, which is an integer from 1 through 65535. The default value is 5100.
timeout seconds
Specifies the keep-alive timeout (in seconds) which is an integer from 1 through 30. The default value is 3 seconds.

-noconfirm
Specifies that the command must execute without prompting for confirmation.

Usage
Use this command to specify keep-alive messaging information for CAE health-check monitoring, which is part of CAE load balancing on the Mobile Video Gateway.

Example
The following command specifies keep-alive messaging information for the CAEs in the CAE group:

    keepalive-server deadtime 120 interval 10 num-retry 3 port 5100 timeout 3
local-address

Specifies the local IPv4 address on the Mobile Video Gateway for the keepalive TCP connection used for Content Adaptation Engine (CAE) load balancing.

Product
MVG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Video Group Configuration
configure > context context_name > cae-group group_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-vgroup)#

Syntax

[ no ] local-address IPv4_address [ -noconfirm ]

no local-address IPv4_address
Deletes the local IPv4 address if previously specified.

local-address IPv4_address
Specifies the local IPv4 address on the Mobile Video Gateway for the keep-live TCP connection used for CAE load balancing. IPv4_address must be in dotted decimal notation.

-noconfirm
Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to specify the local IPv4 address on the Mobile Video Gateway, in dotted-decimal notation.

Example

The following command specifies the local IPv4 address on the Mobile Video Gateway:

local-address 10.2.3.4
server

Adds a CAE (Content Adaptation Engine) and its IPv4 address and port number to the associated CAE group. The Mobile Video Gateway uses this information for CAE load balancing. The Mobile Video Gateway has a system limit of 64 CAEs.

Product
MVG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Video Group Configuration
configure > context context_name > cae-group group_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-vgroup)#

Syntax

[ no ] server cae_name address IPv4_address port port_number [ -noconfirm ]

no server cae_name

Deletes the CAE from the CAE group if previously configured.

server cae_name address IPv4_address port port_number

Adds a CAE and its IPv4 address and port number to the associated CAE group. cae_name is an alphanumeric string of 1 through 15 characters. IPv4_address must be in dotted-decimal notation. port_number is an integer from 1 through 65535. The default value is 80.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to add a CAE and its IPv4 address and port number to the associated CAE group.

Example

The following command adds a CAE named cae_1 and its IPv4 address and port number to the associated CAE group:

server cae_1 address 10.2.3.4 port 80
Chapter 300
VLAN Configuration Mode Commands

The VLAN Configuration Mode is used to create and manage Virtual LANs and their bindings with contexts.

Mode

Exec > Global Configuration > Port Configuration > VLAN Configuration

configure > port ethernet slot_number/port_number > vlan vlan_tag_id

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number-vlan-vlan-id)#

Important: Available commands or keywords/variables vary based on platform type, product version, and installed license(s).
bind interface

Associates a VLAN interface with a context.

Product
HA
HSGW
PDSN
P-GW
SAEGW
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Port Configuration > VLAN Configuration

configure > port ethernet slot_number/port_number > vlan vlan_tag_id

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number-vlan-vlan-id)#

Syntax
[ no ] bind interface interface_name context_name

no
Disasscoiates the VLAN interface from the context.

interface_name context_name

Specifies the name of the virtual interface and the context to which it will be bound.
interface_name must be an alphanumeric string of 1 through 79 characters.
context_name must refer to a previously configured context expressed as an alphanumeric string of 1 through 79 characters.

Usage
Bind a VLAN interface to a context to suport VLAN service.

Example
bind interface sampleVirtual sampleContext

no bind interface sampleVirtual sampleContext
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
ingress-mode

Enables or disables port ingress (incoming) mode for this VLAN ID on this port.

**Product**
- HA
- HSGW
- PDSN
- P-GW
- SAEGW
- SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Port Configuration > VLAN Configuration

```plaintext
configure > port ethernet slot_number/port_number > vlan vlan_tag_id
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number-vlan-vlan-id)#
```

**Syntax**

```
[ no ] ingress-mode
```

- **no**
  Disables the port ingress mode.

**Usage**

Use this command to enable or disable the VLAN ingress mode for this port.

**Example**

```
ingress-mode
```
priority

Sets the 802.1p VLAN priority bit.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Port Configuration > VLAN Configuration

configure > port ethernet slot_number/port_number > vlan vlan_tag_id

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number-vlan-vlan-id)#

Syntax

priority value

no priority

no
Disables the setting of the 802.1p priority bit.

value
Sets the value of the 802.1p priority bit as an integer from 0 through 7, with 7 being the highest priority.

Usage
Set a value for the VLAN priority bit.

Example
To set a VLAN priority bit value, use the following command:

    priority 3

To disable the use of a VLAN priority bit, use the following command:

    no priority
shutdown

Disables or enables traffic over this VLAN.

Product
HA
HSGW
PDSN
P-GW
SAEGW
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Port Configuration > VLAN Configuration

configure > port ethernet slot_number/port_number > vlan vlan_tag_id

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number-vlan-vlan-id)#

Syntax

[ no ] shutdown

no

Enables the VLAN. When omitted the VLAN is shutdown.

Usage
Shut down a VLAN.
To bring a VLAN into service, execute this command using the no keyword.

Example
To disable a VLAN from sending or receiving network traffic use the following command:

shutdown

To enable a VLAN use the following command:

no shutdown
vlan-map

Associates an IP interface having a VLAN ID with a context.

Product
HA
HSGW
PDSN
P-GW
SAEGW
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Port Configuration > VLAN Configuration

configure > port ethernet slot_number/port_number > vlan vlan_tag_id

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number-vlan-vlan-id)#

Syntax

vlan-map interface if_name context_name

interface if_name context_name

Associates the specified VLAN interface with a context.
if_name is an existing interface name specified as an alphanumeric string of 1 through 79 characters.
context_name is an existing context name specified as an alphanumeric string of 1 through 79 characters.

Usage
Use vlan-map to associate multiple VLAN interfaces with a single context. This feature is used in conjunction with nexthop forwarding and overlapping IP pools.

Example

vlan-map interface vlan234 ingress
Chapter 301
WSG Lookup Priority List Configuration Mode Commands

The Wireless Security Gateway Lookup Priority List Configuration Mode is used to set the priority of subnet components for site-to-site tunnels. This is a Security Gateway (SecGW) feature [VPC-VSM only].

Mode

Exec > Global Configuration > WSG-Lookup Priority List Configuration

cconfigure >> wsg-lookup

Entering the above command sequence results in the following prompt:

host_name(config-wsg-lookup)#

⚠️ **Important**: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

`exit`

**Usage**

Use this command to return to the parent configuration mode.
priority

Sets the priority level for a WSG subnet combination (source and destination netmasks). It also disables an existing priority for a specified subnet combination. (VPC-VSM only).

Product
SecGW

Privilege
Security Administrator

Mode
Exec > Global Configuration > WSG-Lookup Priority List Configuration

configure >> wsg-lookup

Entering the above command sequence results in the following prompt:

Syntax

priority priority_level source-netmask subnet_size destination netmask subnet_size

no priority priority_level source-netmask subnet_size destination netmask subnet_size

no
Disables the priority for the specified subnet combination.

priority priority_level
Specifies the priority level for the subnet combination as an integer from 1 through 6.

source-netmask subnet_size
Specifies the subnet size for the source netmask as an integer from 1 through 128.

destination netmask subnet_size
Specifies the subnet size for the destination netmask as an integer from 1 through 128.

Usage
Use this command to set the priority level for a WSG subnet combination (source and destination netmasks). It can also be used to disable an existing priority for a specified subnet combination.

Example
The following command sets a priority of 2 for a subnet combination with a /32 subnet size.

priority 2 source-netmask 32 destination-netmask 32
Chapter 302
WSG Service Configuration Mode Commands

The Wireless Security Gateway Configuration Mode is used to define the operating parameters for IPSec-based access control and handling of Encapsulating Security Payload (ESP) packets.

Mode

Exec > Global Configuration > Context Configuration > WSG-Service Configuration

configure > context context_name > wsg-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-wsg-service)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

**Important:** Any changes made to a WSG service require that the service be restarted to apply any changed parameters. You restart the service by unbinding and binding the IP address to the service context.
**bind address**

Binds the WSG service to the specified IPv4 or IPv6 address and crypto template (VPC only).

**Product**
SecGW (WSG)

**Privilege**
Security Administrator

**Mode**
Exec > Global Configuration > Context Configuration > WSG-Service Configuration
configure > context context_name > wsg-service service_name

Entering the above command sequence results in the following prompt:

```
/context_name/host_name(config-wsg-service)#
```

**Syntax**

```
bind address ip_address crypto-template template_name

no bind address
```

**Usage**

Unbinds the WSG service from the IP address.

**Example**

The following command binds the WSG service to 10.1.1.1.

```
bind address 10.1.1.1 crypto template tplt01
```
deployment-mode

Specifies the deployment mode for the WSG service (VPC only).

Product
SecGW (WSG)

Privilege
Security Administrator

Mode
Exec > Global Configuration > Context Configuration > WSG-Service Configuration
configure > context context_name > wsg-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-wsg-service)#

Syntax

deployment-mode { remote-access | site-to-site }

no deployment-mode

no

Deletes deployment mode from the configuration.

{ remote-access | site-to-site }

Specifies the deployment mode as either:

- remote-access – support direct user communication with this WSG
- site-to-site – support bidirectional communication with two or more WSGs

Usage
Specifying remote access or site-to-site communication as the deployment mode for this WSG.

Example
This command deploys this WSG for remote access:

deployment-mode remote-access
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Use this command to return to the parent configuration mode.
ip

Specifies the IPv4 access group and address allocation method for this WSG service (VPC only).

Product
SecGW (WSG)

Privilege
Security Administrator

Mode
Exec > Global Configuration > Context Configuration > WSG-Service Configuration
 configure > context context_name > wsg-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-wsg-service)#

Syntax

ip { access-group group_name | address { alloc-method { dhcp-proxy | local } | pool name pool_name }

no ip access-group group_name

no ip address alloc-method pool_name

no ip address pool name pool_name

Usage

Use this command to specify the IPv4 access group and IPv4 address allocation method for this WSG service. This command and its keywords are subject to the following limitations:
• The WSG service configuration takes precedence over the equivalent configuration in Subscriber mode or the template payload.

• The WSG service must be restarted to apply the parameters. You restart the service by doing an unbind and bind.

• Up to 16 named IPv4 pools can be configured. The list is sorted, and the addresses are allocated from the first pool in the list with available addresses.

• One IPv4 ACL can be configured.

• The IPv4 pools will only be used for IPv4 calls.

**Example**

This command specifies the IPv4 address pool named *pool401*:

```
ip address pool name pool401
```

This command specifies the use of a previously configure DHCPv4 service to allocate IPv4 addresses:

```
ip address alloc-method dhcp-proxy
```
ipv6

Specifies the IPv6 access group and prefix pool for this WSG service (VPC only).

Product
SecGW (WSG)

Privilege
Security Administrator

Mode
Exec > Global Configuration > Context Configuration > WSG-Service Configuration
configure > context context_name > wsg-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-wsg-service) #

Syntax

ipv6 { access-group group_name | address prefix-pool pool_name }
no ipv6 access-group group_name
no ipv6 address prefix-pool

no

Deletes the specified parameter.

access-group group_name

Specifies an existing IPv6 ACL access group as an alphanumeric string of 1 through 47 characters. For additional information, see IPv6 ACL Configuration Mode Commands.

address prefix-pool pool_name

Specifies an existing IPv6 prefix pool as an alphanumeric string of 1 through 31 characters. For additional information, see Subscriber Configuration Mode Commands.

Usage

Specify the IPv6 access group and prefix pool for this WSG service.
This command and its keywords are subject to the following limitations:
• The WSG service configuration takes precedence over the equivalent configuration in Subscriber mode or the template payload.
• The WSG service must be restarted to apply the parameters. You restart the service by doing an unbind and bind.
• One named IPv6 pool can be configured.
• One named IPv6 ACL can be configured.
• The IPv6 pools will only be used for IPv6 calls.

Example
This command specifies the IPv6 prefix pool named pool601:

```
ipv6 prefix-pool name pool601
```
pre_fragment mtu

Specifies the Maximum Transmission Unit (MTU) size which when exceeded initiates pre-tunnel (before encryption) fragmentation of IPSec Encapsulated Security Payload (ESP) packets within this WSG service (VPC only).

Product
SecGW (WSG)

Privilege
Security Administrator

Mode
Exec > Global Configuration > Context Configuration > WSG-Service Configuration
configure > context context_name > wsg-service service_name

Entering the above command sequence results in the following prompt:

[context_name] host_name(config-wsg-service)#

Syntax

pre_fragment mtu size

no pre_fragment size

default pre_fragment size

Usage
Disables this function.

Sets the MTU size to the default value of 1400 bytes.

Specifies the MTU size in bytes as an integer from 576 through 2048. Default = 1400

Example
The following command sets MTU size to 2048 bytes.

pre_fragment mtu 2048
