[context_name]host_name(config-cscf-service)#

Syntax

```
nat-policy policy_name { private-address ( address ip_address_mask | default | range start_ip_address end_ip_address ) } | bridge-network { address ip_address_mask | range start_ip_address end_ip_address }

no nat-policy policy_name
```

no

Removes the specified NAT policy from the service.

`policy_name`

Specifies a name for the NAT policy.

`policy_name` must be from 1 to 79 alpha and/or numeric characters.

`private-address { address ip_address_mask | default | range start_ip_address end_ip_address }`

Specifies the private-address policy type for nat-pool.

`address ip_address_mask`: Address for nat-policy policy type for nat-pool. Specifies a combined IP address subnet mask bits to indicate what IP addresses the specific policy type applies to. `ip_address_mask` must be specified using the form “IP Address/Mask Bits” where the IP address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6, and the mask bits are a numeric value, which is the number of bits in the subnet mask.

`default`: Default for nat-policy policy type for nat-pool. Default is defined as the address range specified by rfc1918.

- 10.0.0.0 - 10.255.255.255 (10/8 prefix)
- 172.16.0.0 - 172.31.255.255 (172.16/12 prefix)
- 192.168.0.0 - 192.168.255.255 (192.168/16 prefix)
CSCF Service Configuration Mode Commands

**nat-policy**

**range start_ip_address end_ip_address**: Range for nat-policy policy type for nat-pool.
- **start_ip_address** specifies the beginning of the range of addresses.
- **end_ip_address** specifies the end of the range of addresses.
- **ip_address** must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

**bridge-network { address ip_address_mask | range start_ip_address end_ip_address }

Specifies the bridge-network policy type for S-CSCF bridging.
**address ip_address_mask**: Address for bridge-network policy type for S-CSCF bridging. Specifies a combined IP address subnet mask bits to indicate what IP addresses the specific policy type applies to.
**ip_address_mask** must be specified using the form “IP Address/Mask Bits” here the IP address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6, and the mask bits are a numeric value, which is the number of bits in the subnet mask.
**range start_ip_address end_ip_address**: Range for bridge-network policy type for S-CSCF bridging.
- **start_ip_address** specifies the beginning of the range of addresses.
- **end_ip_address** specifies the end of the range of addresses.
- **ip_address** must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

**Usage**

Generally, if a SIP packet has a VIA address (physical address that identifies where the service is located) different from the Source address, ALG functionality is invoked. Even if the VIA and Source addresses are the same, however, this command allows the ALG functionality to be started. For ALG to start, the VIA address should belong to one of the nat-policy address ranges.

**Example**

The following command identifies the NAT policy named **policy1** with a private-address policy type of 10.10.10.10 255.255.255.0:

```
  nat-policy policy1 private-address address 10.10.10.10 255.255.255.0
```

The following command identifies the NAT policy named **policy2** with a private-address range policy type of 172.162.23.23 172.162.23.230:

```
  nat-policy policy2 private-address address 172.162.23.23 172.162.23.230
```

The following command identifies the NAT policy named **policy3** with a default policy type:

```
  nat-policy policy3 private-address default
```
nat-pool

Configures a NAT (Network Address Translation) pool for the service if the CSCF service is performing one of the following functions:

- P-CSCF services are run in bridging (Back-to-Back User Agent) mode
- A-BG is an Application-level Gateway (ALG) for NAT

By default, no nat-pool name will be present.

Product

SCM (P-CSCF A-BG)

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > CSCF Service Configuration

configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)##

Syntax

nat-pool name pool_name [ signalling-pool signalling_pool_name ]

no nat-pool name pool_name

no

Removes the NAT pool from the service.

name pool_name

Specifies the name of an existing NAT pool.

pool_name must be from 1 to 32 alpha and/or numeric characters.

Important: NAT pools are created in Context Configuration Mode with the ip pool command.

signalling-pool signalling_pool_name

Specifies the name of an existing IP pool from where IP addresses will be used to fill in signalling headers only.

signalling_pool_name must be from 1 to 32 alpha and/or numeric characters.

Important: If signalling-pool is not specified, service IP:port will be filled in signalling headers.

Usage

Use this command to assign a NAT pool to the P-CSCF/A-BG service.
The following command identifies the NAT pool:

```bash
nat-pool name pool2
```
**policy**

Enables or disables early media support and IBCF capability in P-CSCF/A-BG. In addition, configures Interim-Interval value for CSCF accounting sessions, overload response, and the congestion control threshold and tolerance values that are to be monitored on this CSCF service.

**Product**

SCM (P-CSCF, A-BG)

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Service Configuration

configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
policy { accounting interim-interval value | allow-early-media | ibcf-capability domain domain/name | overload [ drop | redirect IPv4_address1 [ weight weight1 ] [ IPv4_address2 [ weight weight2 ] ] ... | reject ] | threshold congestion-control { system-cpu-utilization percent | tolerance percent } }

default policy { allow-early-media | overload | threshold congestion-control { system-cpu-utilization percent | tolerance percent } }

no policy { accounting interim-interval | allow-early-media | ibcf-capability domain domain/name | overload [ redirect IPv4_address1 ] [ IPv4_address2 ] ... | threshold congestion-control { system-cpu-utilization | tolerance } }
```

**default**

Returns the command to the default settings. See keywords above for specific defaults.

**no**

Disables the specified functionality.

**accounting interim-interval value**

Default: Disabled

Used to configure Interim-Interval value for CSCF accounting sessions.

*value* can be configured to any integer value from 50 to 7200. This value is sent in the “Acct-Interim-Interval” AVP of the accounting message. Based on the response message from accounting server, Interim-Interval timer is started.

**allow-early-media**

Default: Enabled

Allows early media by doing QoS commit during QoS Authorization (with PCRF) in P-CSCF.
**ibcf-capability domain domain/name**

Enables IBCF capability to support Mx reference point in CSCF. IBCF capability domain name must be entered using from 1 to 80 alpha and/or numeric characters.

*Important:* This CLI can be repeated to add/delete multiple entities to/from the ibcf-capability domain table. An ibcf-capability domain can be removed by using the `no` keyword; using the `no` keyword without giving any domain name will delete all entries from the list.

**overload [ drop | redirect IPv4_address1 [ weight weight1 ] [ IPv4_address2 [ weight weight2 ] ] ... | reject ]**

Configures the overload response for this policy. When the P-CSCF/A-BG becomes congested, this overload policy is used to drop/reject subsequent sessions or redirect them to another server.

- **drop**: Specifies that upon policy overload, the system will drop the session.
- **redirect**: Specifies that upon policy overload, the system will redirect the session to another CSCF.
  - **IPv4_address1** must be expressed in dotted decimal notation.
  - **weight weight1**: Defines the priority of the redirect address.
    - **weight1** must be an integer from 1 to 10. Default is 1.
- **reject**: Specifies that upon policy overload, the system will reject the session with 503 (Service Unavailable) SIP error response. This is the default setting.

**threshold congestion-control { system-cpu-utilization percent | tolerance percent}**

Enables congestion control. CSCF performs congestion control based on the memory usage inside every sessmgr at two levels.

- **Level 1**: For every new call/event received, the system checks if sessmgr memory-usage is above a threshold value (such as 95 percent). If it is, memory-congestion is triggered and new call messages are rejected with 500 SIP response. Memory congestion is disabled when memory usage drops by a tolerance value (default is 10 percent).
  - **Level 2**: If the sessmgr usage reaches 100 percent, all newly received SIP messages are dropped at the socket layer in that sessmgr except for the BYE message. The new SIP messages are not processed until the memory reaches the threshold value (95 percent).

A trap is also generated whenever sessmgr is in congestion state

**system-cpu-utilization percent**: The average percent utilization of a CPU in a PSC/PSC2/PSC3 running the CSCF service as measured in 10 second intervals.

**percent** can be configured to any integer value from 0 to 100. This value becomes the upper threshold for triggering the CPU-based congestion for CSCF services. Default is 80

**tolerance percent**: The percentage under a configured threshold that dictates the point at which the condition is cleared.

**percent** is an integer value from 1 to 25. Default is 5

**Usage**

Use this command to set the following policy for this CSCF service:

- **Configure Interim-Interval value for CSCF accounting sessions.**
- **Set QoS support during either the initial SDP response or the 200OK response to the INVITE. When allow-early-media is enabled, QoS commit is done during initial SDP answer. When disabled, QoS commit is done during 200OK INVITE. By default, this command is enabled.**
Enable or disable IBCF capability.

- Define the response to an overload condition.
- Set thresholds to dictate the conditions for which congestion control is to be enabled and establish limits for defining the state of the CSCF service (congested or clear). The tolerance parameter establishes the threshold at which the condition is cleared.

**Important:** When congestion is triggered, new CSCF calls are not rejected.

**Example**

The following command sets the upper threshold for CPU utilization for triggering congestion control at 90%.

```
policy threshold congestion-control system-cpu-utilization 90
```

The following command sets the tolerance to its default value of 5.

```
default policy threshold congestion-control tolerance
```
**policy-name**

Assigns a previously created service policy to this service.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

`configure > context context_name > cscf service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service) #
```

**Syntax**

```
policy-name name

no policy-name
```

- **no**
  Remove the assigned service policy from this service.

- **name**
  Specifies the name of the service policy being assigned to this service.
  *name* must be from 1 to 79 alpha and/or numeric characters and be an existing policy name in the system.
  Service policies are created and maintained in the CSCF Policy Configuration Mode.

**Usage**

Use this command to assign a service policy to this service. The policies defined in the service policy apply to all subscribers using this service. Service policies are created and maintained in the CSCF Policy Configuration Mode.

**Example**

The following command assigns a service policy named `serv_policy3` to this service:

```
policy-name serv_policy3
```
proxy-cscf

Enables the Proxy-CSCF for the service and enters the Proxy-CSCF Configuration Mode. Default is disabled.

Product
SCM (P-CSCF)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration
configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]hostname(config-cscf-service)#

Syntax

[ no ] proxy-cscf

no
Disables the P-CSCF for the service.

Usage
Use this command to enable the Proxy-CSCF feature and enter the Proxy-CSCF Configuration Mode. Entering this command results in the following prompt:

[context_name]hostname(config-cscf-service-proxy-cscf)#

Proxy-CSCF Configuration Mode commands are defined in the CSCF Proxy-CSCF Configuration Mode Commands chapter in this guide.

**Important:** The Proxy-CSCF is a license-enabled function of the Session Control Manager. Only one function (P-CSCF, S-CSCF, E-CSCF, SIP Proxy, or A-BG) can be enabled per service.
proxy-serving-cscf

This command is not supported in this release.
recurse-on-redirect-resp

Enables the 3xx recursion feature. If enabled, the service will send further invites to the contacts specified upon receiving a 3xx redirect response. Default is disabled.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration
configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Syntax

[ no ] recurse-on-redirect-resp

  no
  Disables the 3xx recursion feature.

Usage
When enabled and on receipt of a 3xx response, the service will collect the SIP URIs present in the Contact header(s) of 3xx and recursively contact each one of them until the call succeeds. The contacts are tried serially. There is a maximum implementation limit of 50 URIs. Each contact, in turn, can send a 3xx response. The service will honor them and append the new contacts. When disabled, the service treats a 3xx response as the final failure response and declares the call attempt “failed”. By default, this feature is disabled.

Example
Enable recursion on 3xx:

  recurse-on-redirect-resp

Disable recursion on 3xx:

  no recurse-on-redirect-resp
reject-on-cnsa-failure

Enables rejection of messages on Core Network Service Authorization failure. Default is disabled.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

```bash
configure > context context_name > cscf service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
[ no ] reject-on-cnsa-failure
```

- **no**
  
  Disables the rejection of messages on Core Network Service Authorization failure.

**Usage**

Enables rejection of messages on Core Network Service Authorization failure. By default, this feature is disabled.

In a mobile originating case, S-CSCF checks for the presence of P-Preferred-Service (PPS) header. If the header is present, media profile authentication is successful and if the incoming ICSI (IMS Communication Service Identifier) value also matches with one of the values in the service_id list, then the request will be forwarded after replacing the PPS header with PAS (P-Asserted-Service). If media profile authentication fails, S-CSCF will check reject-on-cnsa-failure. If enabled, then call is rejected with 403 message. If disabled, a default ICSI is selected from the service_id list and will be put into PAS while forwarding the request by the S-CSCF on service authentication failure.

In PPS is not received by the S-CSCF and media profile authentication is successful, an ICSI from the service_id list, if present, is selected and will be added in PAS header. If media profile authentication fails, reject-on-cnsa-failure is checked. If enabled, call is rejected with 403 message. If disabled, PAS header is added if service_id list is present with an ICSI value.

**Example**

Enable rejection of messages on Core Network Service Authorization failure:

```
reject-on-cnsa-failure
```

Disable rejection of messages on Core Network Service Authorization failure:

```
no reject-on-cnsa-failure
```
release-call-on-media-loss

Release call on detection of media loss.

Product
SCM (P-CSCF, A-BG)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

\[ configure > context context\_name > cscf service service\_name \]

Entering the above command sequence results in the following prompt:

\[ [context\_name]host\_name(config-cscf-service)# \]

Syntax

release-call-on-media-loss media-type audio [ timeout seconds ]

no release-call-on-media-loss

no
Disables the release of SIP calls upon the detection of media loss.

media-type audio
Enables the release of SIP calls upon the detection of media loss on media-type audio.

timeout seconds
Specifies the media loss timeout value; media loss after timeout value results in call release.

seconds must be an integer from 5 to 3600.
If timeout value is not configured, media loss after 5 seconds results in call release.

Usage
Use this command to enable the release of SIP calls upon the detection of media loss.

Example

Enables the release of SIP calls upon the detection of media loss:

\[ release-call-on-media-loss media-type audio \]

Enables the release of SIP calls upon the detection of media loss:

\[ no release-call-on-media-loss \]
**rfc3261-proxy**

Enables RFC3261 proxy (SIP Proxy) for this service and enters the SIP Proxy Configuration Mode. Default is disabled.

**Product**
SCM (SIP Proxy)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration
`configure > context context_name > cscf service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
[ default | no ] rfc3261-proxy
```

- **default**
  Disables RFC3261 proxy in this service.

**Usage**

Use this command to enable the Sip Proxy feature and enter the SIP Proxy Configuration Mode. Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-service-rfc3261-proxy)#
```

SIP Proxy Configuration Mode commands are defined in the **CSCF SIP Proxy Configuration Mode Commands** chapter in this guide.

![Important:](image)

**Important:** The SIP Proxy is a license-enabled function of the Session Control Manager. Only one function (P-CSCF, S-CSCF, E-CSCF, SIP Proxy, or A-BG) can be enabled per service.
server-header

This command determines the handling of the server header. This is applicable for B2BUA mode only; Proxy mode will forward the message as it is.

Product
SCM (P-CSCF, A-BG, S-CSCF, SIP Proxy)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Syntax

server-header { name header_name | pass-through }

[ default | no ] server-header

default
Sets the server header to the default server header. The default server name is “Cisco”.

no
Suppresses server header; no server header is forwarded or added.

name header_name
Sets the server header to the value specified by header_name. header_name must be from 1 to 63 alpha and/or numeric characters.

pass-through
S-CSCF forwards the server header received without any modification. If no server header is received, no server header is added.

Usage
Use this command to determine the handling of the server header, including forwarding, modifying, adding, or suppressing.

Example
The following command forwards the server header received without any modification:

    server-header pass-through
server-name

Enables/disables filling the server name AVP in MAR and SAR for Cx interface, and the From header in third party register request, with configured server name. In addition, it can be used by other CSCF service to fill From header while performing peer server monitoring using OPTIONS request. This command is disabled by default.

**Product**
SCM (S-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

```
configure > context context_name > cscf service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
server-name server_name

no server-name
```

**Usage**

Use this command to enable/disable filling the server name AVP in MAR and SAR for Cx interface, and the From header in third party register request, with configured server name. In addition, it can be used by other CSCF service to fill From header while performing peer server monitoring using OPTIONS request.

**Example**

The following command configures the CSCF server name as *stp-c-scscf1.cisco.co.kr*:

```
server-name stp-c-scscf1.cisco.co.kr
```
serving-cscf

Enables Serving-CSCF for the service and enters the Serving-CSCF Command Mode. Default is disabled.

**Product**
SCM (S-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration
configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
[ no ] serving-cscf
```

```
no
```

Disables S-CSCF for the service.

**Usage**

Use this command to enable the Serving-CSCF feature and enter the Serving-CSCF Configuration Mode. Entering this command results in the following prompt:

```
[context_name]host_name(config-cscf-service-serving-cscf)#
```

Serving-CSCF Configuration Mode commands are defined in the *CSCF Serving-CSCF Configuration Mode Commands* chapter in this guide.

**Important:** The Serving-CSCF is a license-enabled function of the Session Control Manager. Only one function (P-CSCF, S-CSCF, E-CSCF, SIP Proxy, or A-BG) can be enabled per service.
serving-cscf-list

Configure a list of Serving CSCFs and their capabilities.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Syntax

[ no ] serving-cscf-list server { address address | domain domain } { capability value | port num { capability value } }

no
Removes an entry from this list.

server { address address | domain domain }
Specifies the S-CSCF server.
address address: IP addresses must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
domain domain: Domain names must be entered using from 1 to 80 alpha and/or numeric characters.

capability value
Specifies the capability of the S-CSCF server. value is assigned by the Service Provider and may be an integer from 1 to 999999.

port num
Specifies the port at which service is provided by the S-CSCF server. num may be an integer from 1 to 65535.

Usage
Use this command to configure a list of Serving CSCFs and their capabilities.

Important: This command can be entered multiple times to identify multiple Serving CSCFs.

Example
The following command adds a S-CSCF with an IP address of 1.2.3.4 and a capability value of 75 to this service’s list:

serving-cscf-list server address 1.2.3.4 capability 75
session-timer

Configures the session expiry for sessions (Session will expire at the configured value unless refreshed.) and the minimum number of seconds in a session timer (session-expires) value the system will allow.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration
configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Syntax

```
session-timer { min-se sec [ session-expires sec ] | session-expires sec [ min-se sec ] }
default session-timer [ min-se ] [ session-expires ]
no session-timer

default
Returns the command to the default settings.

no
Disables the session timer.

min-se sec
Default: 90
Specifies the minimum number of seconds the system will allow a session-expires value in a session request. `sec` must be an integer value between 90 and the value of the `session-expires` command.

session-expires sec
Default: 1800 (30 minutes)
Specifies the number of seconds a session is allowed exist before it expires. `sec` must be an integer value between 90 and 18000.

Usage

Use this command to set a session expiry value for all invites generated by the SCM and a minimum value for a session request session timer the system will allow. If a session is requested with a timer of less than this command’s value, the system will reject the request with a “422 Session Interval Too Small” response code.

Example

The following command sets the session expiry for all sessions generated by the SCM to 60 minutes:
session-timer session-expires 3600
strict-check configured-aor-domain

Enables strict checking on default-aor-domain so S-CSCF will reject registration and invite if there is a mismatch between AoR in To/From and the configured default-aor-domain.

**Product**
SCM (S-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration
configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

**Syntax**

```
[ default | no ] strict-check configured-aor-domain
```

- **default | no**
  Disables strict checking on default-aor-domain. This is the default behavior.

**Usage**

Use this command to enable or disable strict checking on default-aor-domain. This allows support for registration of subscribers from multiple domains.
strict-outbound

When enabled, the CSCF rejects registration without outbound parameters from an already registered AoR (the AoR would have included outbound parameters in a previous registration). When disabled, the CSCF allows registration without outbound parameters from the previously registered AoR.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration
configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
[ no ] strict-outbound
```

- **no**
  - Disables the feature. This is the default behavior.

**Usage**

Use this command to reject registration from a previously registered AoR if the AoR fails to register with outbound parameters but included them in the previous registration.
subscriber-policy-override

Configures the system to allow the subscriber-based policy to override the service-based policy. Default is disabled.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Syntax

[ default | no ] subscriber-policy-override

default | no

Removes the subscriber policy override from the service.

Usage

By default, if a conflict occurs between the subscriber-based policy and the service-based policy, the service policy takes precedence. Use this command to override the default behavior of the system and allow the subscriber-based policy to overrule the service policy.
subscription

Enables the registration event package for the service and configures a system-wide subscription lifetime for all subscribers to the service.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration
configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Syntax

subscription package reg [ lifetime { default sec | max sec [ default sec ] | min sec [ max sec ] [ default sec ] } ]
[ default | no ] subscription package reg

---

default

Returns the command to the default settings.

---

no

Disables the registration event package for the service.

---

package reg [ lifetime { default sec | max sec } | min sec ]

default sec: Specifies the default amount of time that a subscription can exist on the system. sec must be an integer from 60 to max sec -1.
Default: 3761

---

Important: default sec must be < or = to max sec and > or = to min sec.

The following keywords are specific to the S-CSCF functionality:

max sec: Specifies the maximum amount of time that a subscription can exist on the system.
sec must be an integer from 60 to 2147483646.
Default: 86400

---

Important: max sec must be > or = to min sec.

min sec: Specifies the minimum amount of time that a subscription can exist on the system.
sec must be an integer from 60 to max sec -1.
Default: 60
**Important:** min sec must be < or = to max sec.

### Usage

Use this command to enable the registration event package for the service and control the amount of time subscriptions are allowed to exist on this service. The system responds to subscriptions in the following manner:

Using default values:
- If a subscription with an expiration value lower than the service’s minimum (60) is received, the service will respond with a 423 Interval Too Small message.
- If a subscription with an expiration value higher than the service’s maximum (2147483646) is received, the service will automatically reduce the expiration value to the default value.

If a subscription is received missing the “Expires” value, or the value is malformed, the service will automatically respond with 3761 in the 200OK message.

### Example

The following command configures the maximum subscription lifetime to 43200 (12 hours):

```
subscription package reg lifetime max 43200
```
support-content-type any

Validates Content-Type in this CSCF service.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

```
configure > context context_name > cscf service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
[ no ] support-content-type any
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Disables the feature. If disabled, CSCF service rejects unsupported Content-Type with “415 Unsupported Media Type”.</td>
</tr>
</tbody>
</table>

**Usage**
Use this command to either allow any type of Content-Type or reject unsupported Content-Type.

**Example**

Allows any type of Content-Type for the CSCF service:

```
support-content-type any
```

Rejects unsupported Content-Type for the CSCF service:

```
no support-content-type any
```
tcp-proxy

Enables SIP TCP proxy for the CSCF service.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Syntax

tcp-proxy [ port port_number ]

no tcp-proxy

no

Disables SIP TCP proxy for the CSCF service

port port_number

Default: 5062

Specifies the port used for SIP TCP proxy connections.

port_number must be an integer from 1 to 65534.

Usage

Use this command to enable SIP TCP proxy for the CSCF service.

Example

Enables SIP TCP proxy for the CSCF service on port 5062:

tcp-proxy port5062

Disables SIP TCP proxy for the CSCF service:

no tcp-proxy
threshold

Enables thresholds alerting and configuration of thresholds for CSCF Service.

Product: SCM
Privilege: Administrator
Mode: Exec > Global Configuration > Context Configuration > CSCF Service Configuration

configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Syntax:

[ default | no ] threshold monitoring

---

default

Returns the command to the default settings.

---

no

Disables thresholds alerting for CSCF Service.

---

{ call-setup-failures | call-total-active | error-no-resource | error-presence | error-reg-auth | error-tcp | invite-rcvd-rate | reg-rcvd-rate | reg-total-active | route-failures } high_thresh clear low_thresh

call-setup-failures: Number of CSCF call setup failures.
Default: 0

call-total-active: Number of total active CSCF calls.
Default: 0

error-no-resource: Number of CSCF call setup failures due to no-resource.
Default: 0

error-presence: Number of CSCF Presence errors.
Default: 0

error-reg-auth: Number of CSCF Registration Authentication failures.
Default: 0

error-tcp: Number of CSCF call setup failures due to TCP error.
Default: 0

invite-rcvd-rate: Number of CSCF calls per polling interval.
Default: 0

reg-rcvd-rate: Number of CSCF registrations per polling interval.
Default: 0
**threshold**

- **reg-total-active**: Number of total CSCF active registrations.
  Default: 0
- **route-failures**: Maximum number of route-failures, after which the alarm/alert will be raised. Default: 5
  **high_thresh**: The high threshold number that must be met or exceeded within the polling interval to generate an alert or alarm. Can be configured to any integer value between 0 and 2000000 (0 and 60000 for route-failures).
  **clear low_thresh**: The low threshold number that must be met or exceeded within the polling interval to clear an alert or alarm. Can be configured to any integer value between 0 and 2000000 (0 and 60000 for route-failures).

**Important**: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**monitoring**

Enables thresholds alerting for CSCF Service.

**Usage**

Use this command to:
- enable/disable thresholds alerting for CSCF Service
- set an alert or an alarm when a threshold exceeds the configured level

Alerts or alarms are triggered for the number of registration reply errors on the following rules:
- Enter condition: Actual number > High Threshold
- Clear condition: Actual number < Low Threshold

**Example**

The following command configures a route failures threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:

```
threshold route-failures 1000 clear 500
```
timeout

Sets timeout values for CSCF and SIP transactions.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

`configure > context context_name > cscf service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
timeout { hss-wait sec | map-slr-response sec | no-answer sec | policy-interface sec | sip { 3gpp-d sec | 3gpp-t1 msec | 3gpp-t2 sec | 3gpp-t4 sec | c sec | d sec | idle-tcp-connection msec [ cleanup-timer msec ] | invite-expiry sec | t1 msec | t2 sec | t4 sec } }

default timeout { hss-wait | map-slr-response | no-answer | policy-interface | sip { 3gpp-d | 3gpp-t1 | 3gpp-t2 | 3gpp-t4 | c | d | idle-tcp-connection | invite-expiry | t1 | t2 | t4 } }
```

**default**

Returns the command to the default settings. See keywords above for specific defaults.

**hss-wait sec**

Default: 5
This timer is used by S-CSCF with HSS interface for timeout.

`sec` must be an integer from 0 to 2147483646.

**map-slr-response sec**

Default: 15
This timer is used by the E-CSCF for MAP SLR response timeout.

`sec` must be an integer from 15 to 30.

**no-answer sec**

Default: 100
This timer is specially used for No-Answer Call Feature executed by S-CSCF. The timer will be started as soon as 180 Ringing response is received and No-Answer call feature is enabled. The value of this timer should be always less than INVITE Timeout used by DC-SIP.

`sec` must be an integer from 0 to 2147483646.
policy-interf ace  \textit{sec}  

Default: 5  

This timer is used by the P-CSCF/A-BG with Policy interface for timeout.  
\textit{sec} must be an integer from 0 to 2147483646.

\begin{verbatim}
sip \{ 3gpp-d \textit{sec} | 3gpp-t1 \textit{msec} | 3gpp-t2 \textit{sec} | 3gpp-t4 \textit{sec} | \textit{c sec} | \textit{d sec} | idle-tcp-connection \textit{msec} \} | cleanup-timer \textit{msec} \} | invite-expiry \textit{sec} | t1 \textit{msec} | t2 \textit{sec} | t4 \textit{sec} \}
\end{verbatim}

Sets transaction and expiry timers for SIP.

- \texttt{3gpp-d \textit{sec}}: This timer is used to control the retransmission of 200OK messages to INVITEs after an ACK is sent. The ACK transaction is cleared after this period. This timer is applicable only for unreliable transport.  \textit{sec} must be an integer from 0 to 2147483646.  
  Default: 64*T1 (128 seconds, recommended minimum).

- \texttt{3gpp-t1 \textit{msec}}: This timer is used to control the time interval between each retransmission. The interval doubles after each retransmission. This is used by P-CSCF/A-BG only when it sending message toward the UE. Example: T1, 2T1, 4T2, etc. This timer is applicable only for unreliable transport.  \textit{msec} must be an integer from 0 to 4294967294.  
  Default: 2000 ms (2 secs, recommended minimum).

- \texttt{3gpp-t2 \textit{sec}}: This timer is used to control the period for which the request continues to get retransmitted. This is used by P-CSCF/A-BG only when it sending message toward the UE. This timer is applicable both for reliable and unreliable transport.  \textit{sec} must be an integer from 0 to 2147483646.  
  Default: 16 seconds (recommended minimum).

- \texttt{3gpp-t4 \textit{sec}}: This timer is used to control the period for which the final response to non-invite transaction should be buffered. The buffered response for the retransmitted non-invite request should be sent within that interval. This timer is applicable only for unreliable transport.  \textit{sec} must be an integer from 0 to 2147483646.  
  Default: 17 seconds (recommended minimum).

- \texttt{c \textit{sec}}: This timer is used for an INVITE transaction; if the response is a provisional response with status codes 101 to 199 inclusive (anything but 100), the proxy must reset timer C for that client transaction. The timer may be reset to a different value, but this value must be greater than 3 minutes (180 seconds). When timer C in S-CSCF fires first, S-CSCF will send CANCEL request to Terminating P-CSCF and Terminating P-CSCF will send CANCEL request to UAS.  \textit{sec} must be an integer from 180 to 2147483646.  
  Default: 180 seconds.

- \texttt{d \textit{sec}}: This timer is used to control the retransmission of 200OK to INVITE after ACK is sent. The ACK transaction will be cleared after this interval. This timer is applicable only for unreliable transport.  \textit{sec} must be an integer from 0 to 2147483646.  
  Default: 64*T1 (32 seconds, recommended minimum).

- \texttt{idle-tcp-connection \textit{msec}}: This timer is used for closing idle TCP connections. If there is not activity in the TCP connection for the configuration duration, then the connection will be closed.  \textit{msec} must be an integer from 1000 (recommended minimum) to 4294967294.  
  Default: 42000 milliseconds.

- \texttt{cleanup-timer \textit{msec}}: This timer is used to control how often to check for idle TCP connections.  \textit{msec} must be an integer from 2000 to 2147483646.

- **invite-expiry sec**: This timer is used by SIP while acting as UA Role and no final response is received for the INVITE request sent. This timer is applicable for both reliable and unreliable transport. `sec` must be an integer from 0 to 2147483646.
  
  Default: 100 seconds (recommended minimum).

- **t1 msec**: Specifies the time interval (in microseconds) between each retransmission. The interval doubles after each retransmission, for example: T1, 2T1, 4T2, etc. This timer is applicable only for unreliable transport. `msec` must be an integer from 0 to 2147483646.
  
  Default: 500 milliseconds (recommended minimum).

- **t2 sec**: This timer is used to control the period for which the request keeps getting retransmitted. This timer is applicable both for reliable and unreliable transport. `sec` must be an integer from 0 to 2147483646. The recommended minimum value for this parameter is 4 seconds.
  
  Default: 64*T1 (32 seconds)

- **t4 sec**: This timer is used to control the period for which the final response to non-invite transaction should be buffered so as to send the buffered response for the retransmitted non-invite request within that interval. This timer is applicable only for unreliable transport. `sec` must be an integer from 0 to 2147483646.
  
  Default: 5 seconds (recommended minimum).

**Usage**

Use this command to configure SIP Stack timers and CSCF service specific timers.

**Example**

The following command sets the SIP d timer to 64 seconds:

```
timeout sip d 64
```
transport-switching

Sets the message size that triggers a transport protocol switch.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration
configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
transport-switching policy protocol tcp trigger msg-size size
```

default transport-switching policy protocol tcp trigger msg-size

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Returns the size of the SIP message beyond which transport changes to TCP to 1300 bytes.</td>
</tr>
<tr>
<td>policy protocol tcp trigger msg-size size</td>
<td>Specifies the size of the SIP message beyond which transport changes to TCP. The size can be configured to any integer value between 1300 and 65535.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to configure the size of the SIP message beyond which transport changes to TCP.

**Example**

Switch to TCP transport protocol when the SIP message size is 4000 bytes or more:

```
transport-switching policy protocol tcp trigger msg-size 4000
```
trusted-domain-entity

Adds trusted network nodes (or entities) to a table used by this service to identify those nodes that can be trusted with subscriber information.

Product
SCM (S-CSCF)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Syntax

trusted-domain-entity address [ foreign-network ] [ private-network ]

no trusted-domain-entity address

no

Removes an entry from this service’s trusted domain table.

address

Specifies the IP address of the network node identified as a trusted entity by this service. address must be either an IP address or a domain name. IP addresses must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6. Domain names must be entered using from 1 to 80 alpha and/or numeric characters.

foreign-network

Entity belongs to Foreign Network.

private-network

Entity belongs to Private Network.

Usage

Use this command to identify to the service the network entities that can be trusted with subscriber information by this service.

Important: This command can be entered multiple times to identify multiple trusted network entities. In StarOS v12.x and earlier, a maximum of 50 entries can be configured per CSCF service. In StarOS v14.0 and later, a maximum of 256 entries can be configured per CSCF service.
The following command adds a network node with an IP address of 1.2.3.4 to this service’s trusted domain table:

```
trusted-domain-entity 1.2.3.4
```
Chapter 97
CSCF Serving-CSCF Configuration Mode Commands

The Serving-CSCF Configuration Mode is used to set various commands supporting the role of the CSCF service as a Serving CSCF.

Mode

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration

configure > context context_name > cscf service service_name > serving-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-serving-cscf)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
3gpp

Enables/disables functionality related to 3GPP Release 8 support. This command is disabled by default.

Product
SCM (S-CSCF)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration

configure > context context_name > cscf service service_name > serving-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-serving-cscf)#

Syntax

3gpp Rel8 Cx { alias-indication | dynamic-password-change | ims-restoration | num-auth-vectors value }

[ default | no ] 3gpp Rel8 Cx { alias-indication | dynamic-password-change | ims-restoration | num-auth-vectors }

default | no

Disables specified 3GPP Release 8 support feature.

Rel8 Cx

Specifies functionality related to 3GPP Release 8 support.

alias-indication

Enables alias indication functionality, a collaborative information exchange between the S-CSCF and HSS. Use this command to display alias information from the HSS. If both the HSS and the S-CSCF support this feature, Alias Group IDs will be displayed in the output of the show subscribers cscf-only full command.

dynamic-password-change

Enables dynamic password change support on the S-CSCF service, as per 3GPP 33.203 release 8 version 8.8.0.

ims-restoration

Enables IMS restoration procedures on the S-CSCF service. Use this command to enable IMS REGISTER and INVITE restoration procedures defined in 3GPP TS 23.820.

num-auth-vectors value

Enables configurable value for SIP-Number-Auth-Items in MAR. value must be an integer from 1 to 3. Default is 1.
SCSCF can retrieve multiple authentication vectors from HSS by setting SIP-Number-Auth-Items to an appropriate value. Previously, S-CSCF always set this value to “1”. Using higher values helps to reduce MAR-MAA transactions.

### Usage

Use this command to configure the S-CSCF to support 3GPP Release 8 functionality.

The following command enables 3GPP Release 8 alias indication functionality on this service:

```
3gpp Rel8 Cx alias-indication
```

The following command disables 3GPP Release 8 dynamic password change support on this service:

```
no 3gpp Rel8 Cx dynamic-password-change
```
allow rfc3261-ua-interworking

Enables the function to allow IMS interworking with RFC3261 SIP User Agents.

**Product**
SCM (S-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration
configure > context context_name > cscf service service_name > serving-cscf

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-serving-cscf)#
```

**Syntax**

```
[ no ] allow rfc3261-ua-interworking
```

- **no**
  
  Disables the interworking capability.

**Usage**

Use this command to enable the S-CSCF to allow IMS interworking with RFC3261 SIP User Agents.
as-call invite-request-uri update

Enabling this command causes request-URIs in INVITE messages to be updated with the result of the translation before being passed to an Application Server (AS). This command is disabled by default.

Product
SCM (S-CSCF, SIP Proxy)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration

configure > context context_name > cscf service service_name > serving-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-serving-cscf)#

Syntax

[ default | no ] as-call invite-request-uri update

<table>
<thead>
<tr>
<th>default</th>
<th>no</th>
</tr>
</thead>
</table>

The translation result is ignored.

Usage
Use this command to update the request-URI in INVITE messages with the result of the translation before passing it to an AS.
authentication

Configures the authentication method used by the S-CSCF service.

Product
SCM (S-CSCF, SIP Proxy)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration

configure > context context_name > cscf service service_name > serving-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-serving-cscf)#

Syntax

```
authentication { aka-v1 value | allow-auth-rsp-failure re-register | allow-hss-failure re-register | allow-noauth [ invite | re-register| register ] | allow-noipauth [ invite | re-register| register ] | allow-skip-sar re-register | allow-unsecure | aor-auth | custom-md5 value | md5 value }

no authentication { aka-v1 | allow-auth-rsp-failure re-register | allow-hss-failure re-register | allow-noauth [ invite | re-register| register ] | allow-noipauth [ invite | re-register| register ] | allow-skip-sar re-register | allow-unsecure | aor-auth | custom-md5 | md5 }
```

no

Disables the specified authentication method for the S-CSCF service.

aka-v1 value

Specifies that AKA-v1 algorithm is used as the authentication type when accessing the CSCF service. `value` specifies a preference - the lower the value, the higher the preference. `value` must be an integer from 1 to 1000.

**Important:** In order to change a priority level, you must remove the original value and configure a new one.

allow-auth-rsp-failure re-register

Specifies that S-CSCF will not validate authorization received from UE for challenge re-register. If enabled, S-CSCF will send SAR without validating authentication; after receiving SAA, it will send 200 OK for register.

allow-hss-failure re-register

Specifies that S-CSCF should send 200 OK for re-register in case of HSS failure. When S-CSCF receives register, it sends MAR/SAR to HSS to authenticate the user when authentication is enabled and to get the subscriber profile. When S-CSCF fails to receive response MAA/SAA from HSS, it
sends 500 error response to UE. When allow-hss-failure is enabled, S-CSCF sends 200 OK for register instead of 500 response.

allow-noauth [ invite | re-register| register ]
Specifies that access to the S-CSCF service is allowed if authentication fails.
invite: Specifies that access to the S-CSCF service is allowed if authentication fails on INVITE requests only.
re-register: Specifies that access to the S-CSCF service is allowed if authentication fails on RE-REGISTER requests when the request is integrity-protected only.
registration: Specifies that access to the S-CSCF service is allowed if authentication fails on REGISTER requests only.

allow-noipauth [ invite | re-register| register ]
Specifies that access to the S-CSCF service is allowed if early IMS-based IP authentication fails.
invite: Specifies that access to the S-CSCF service is allowed if early IMS-based IP authentication fails on INVITE requests only.
re-register: Specifies that access to the S-CSCF service is allowed if authentication fails on RE-REGISTER requests when the request is integrity-protected only.
registration: Specifies that access to the S-CSCF service is allowed if early IMS-based IP authentication fails on REGISTER requests only.

allow-skip-sar re-register
Specifies that S-CSCF should skip SAR to HSS for re-register.
When S-CSCF receives re-register/challenge for re-register, it sends SAR to HSS to get subscriber profile. To avoid overloading HSS, enabling allow-skip-sar allows S-CSCF to skip SAR for re-register.

allow-unsecure
Specifies that un-secure access is allowed to the S-CSCF service.

aor-auth
Specifies that authentication is based on the AoR when accessing the S-CSCF service.

custom-md5 value
Specifies that custom algorithm HTTP-Digest-MD5 is used as the authentication type for accessing the S-CSCF service. value specifies a preference - the lower the value, the higher the preference. value must be an integer from 1 to 1000.

| Important: In order to change a priority level, you must remove the original value and configure a new one. |

md5 value
Specifies that the MD5 algorithm is used as the authentication type for accessing the S-CSCF service. value specifies a preference - the lower the value, the higher the preference. value must be an integer from 1 to 1000.

| Important: In order to change a priority level, you must remove the original value and configure a new one. |
### Usage

Use this command to configure the authentication method used by the S-CSCF service.

**Important:** The S-CSCF supports multiple authorization schemes, but this requires disabling all authorization configured in the S-CSCF service so that it will send “Unknown” in the Sip-Authorization-Scheme AVP. This allows the HSS to dictate authorization. The following commands disable all authorization configured in the S-CSCF service to allow HSS to control authorization:

- `authentication allow-noipauth`
- `allow rfc3261-ua-interworking`
- `no authentication aka-v1`
- `no authentication md5`

### Example

The following command configures the authentication method used by the S-CSCF service to MD5 with a preference of 3:

```
authentication md5 3
```
bgcf-proxy

Enables SIP BGCF proxy for the service.

Product
SCM (S-CSCF)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration

configure > context context_name > cscf service service_name > serving-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-serving-cscf)#

Syntax

bgcf-proxy [ port value | transport { tcp | udp } port value ] ]

[ default | no ] bgcf-proxy

default | no
Disables SIP BGCF proxy for the service.

port value
Configures port value for SIP BGCF proxy.
value must be an integer from 1 to 65534.

transport
Enables the specific transport protocol for BGCF proxy.
*tcp: Enables TCP transport protocol for BGCF proxy.
*udp: Enables UDP transport protocol for BGCF proxy.

Usage
Use this command to enable or disable SIP BGCF proxy for the service.

Example
The following command enables a SIP BGCF proxy on port 561 for this service:

bgcf-proxy port 561

The following command disables SIP BGCF proxy for this service:

no bgcf-proxy
diversion-info

Enabling this command prompts the service to add a diversion header (draft-levy-sip-diversion-08) when the call is diverted to a different endpoint due to a call feature. By default, diversion-info is disabled.

**Product**
SCM (S-CSCF, SIP Proxy)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration

`configure > context context_name > cscf service service_name > serving-cscf`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-serving-cscf)#
```

**Syntax**

```
[ default | no ] diversion-info
```

- **default**
  - The service will not add a diversion header.

**Usage**
Use this command to enable the service to add a diversion header to call setup packets when calls are diverted due to the application of call features.
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Use this command to return to the parent configuration mode.
forking

Controls the default-request forking-type in S-CSCF.

Product
SCM (S-CSCF)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration

configure > context context_name > cscf service service_name > serving-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-serving-cscf)#

Syntax

forking { parallel | serial }
[ default | no ] forking

---

default
Perform parallel forking of request.

no
Do not perform any forking of request.

---

parallel | serial
Defines the fork type for request forking.

• parallel: Perform parallel forking of request.
• serial: Perform serial forking of request.

Usage

Use this command to control the default-request forking-type in S-CSCF. This configuration will be effective in the absence of “Request-Disposition” header in the message.

Example

The following command enables serial forking of request:

forking serial

The following command disables any forking of request:

no forking
**interrogating-cscf-role**

Enables the function to also perform as an Interrogating-CSCF.

**Product**
SCM (S-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration

```
configure > context context_name > cscf service service_name > serving-cscf
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-serving-cscf)#
```

**Syntax**

```
[ no ] interrogating-cscf-role
```

```
no
```

Disables the Interrogating-CSCF role in this function.

**Usage**

Use this command to enable the S-CSCF to also perform as an Interrogating-CSCF.
lir-failure

This command allows you to define routes towards the target server for LIR failure case.

**Product**
SCM (S-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration

```bash
configure > context context_name > cscf service service_name > serving-cscf
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-serving-cscf)#
```

**Syntax**

```
lir-failure route-list route_list_name

no lir-failure route-list
```

- **no**
  
  Disables routing of register messages for this S-CSCF.

**Usage**

Use this command to route register messages based on the route table if LIR-LIA fails during HSS interaction.
local-call-features

Enables/disables local call features. This command is disabled by default.

**Product**
SCM (S-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration

configure > context context_name > cscf service service_name > serving-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-serving-cscf)#

**Syntax**

```
[ default | no ] local-call-features
```

<table>
<thead>
<tr>
<th>default</th>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disables local call features for this S-CSCF.</td>
<td></td>
</tr>
</tbody>
</table>

**Usage**

Use this command to enable local call features.
network-id

Configures the Network Identifier.

Product
SCM (S-CSCF)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration
configure > context context_name > cscf service service_name > serving-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-serving-cscf)#

Syntax

network-id id

no network-id

no

Removes the configured Network Identifier of the entity.

id

The Network Identifier of the entity.

id must be from 1 to 79 alpha and/or numeric characters in length.

Usage

The Network Identifier is used to compare with the P-Visited-Network-ID header received from P-CSCF to decide home or roaming subscriber at S-CSCF service.

Example

Sets the Network Identifier to pcscf01.company.com:

network-id pcscf01.company.com
npdb-client

Creates an NPDB (Number Portability Data Base) client under CSCF and enters the CSCF NPDB Client Configuration Mode.

**Product**
SCM (S-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration

```
configure > context context_name > cscf service service_name > serving-cscf
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-serving-cscf)#
```

**Syntax**

```
npdb-client client_name [ -noconfirm ]
```

```
no npdb-client
```

**no**

Deletes NPDB client under CSCF.

**client_name**

Specifies the name of the NPDB client.

*client_name* must be from 1 to 79 alpha and/or numeric characters.

**-noconfirm**

Indicates that the command is to execute without any additional prompt and confirmation from the user.

**Usage**

Use this command to enable the NPDB client feature and enter the NPDB Client Configuration Mode. Entering this command results in the following prompt:

```
[context_name]host_name(config-npdb-client)#
```

NPDB Client Configuration Mode commands are defined in the *CSCF NPDB Client Configuration Mode Commands* chapter in this guide.

**Example**

The following command creates an NPDB client named *npdb1* and enters NPDB Client Configuration Mode:

```
npdb-client npdb1
```
policy

Configures the policy for Served User Routing in this S-CSCF service.

Product
SCM (S-CSCF)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration

`configure > context context_name > cscf service service_name > serving-cscf`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-cscf-service-serving-cscf)#`

Syntax

```
[ default | no ] policy allow p-served-user-routing
```

- `default` | `no`
  Disables Served User Routing functionality for this S-CSCF.

- `allow p-served-user-routing`
  Enables Served User Routing functionality for this S-CSCF.

Usage

Use this command to enable/disable the policy for Served User Routing.

Example

The following command enables Served User Routing on this service:

```
policy allow p-served-user-routing
```

The following command disables Served User Routing on this service:

```
no policy allow p-served-user-routing
```

## registration lifetime

Configures a registration lifetime for all subscribers to the service.

### Product

SCM (S-CSCF, SIP Proxy)

### Privilege

Administrator

### Mode

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration

```
configure > context context_name > cscf service service_name > serving-cscf
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-serving-cscf)#
```

### Syntax

```
registration lifetime { default sec | implicit sec | max sec | min sec }
```

**default registration lifetime**

```
default
```

Returns the command to the default settings.

```
default sec | implicit sec | max sec | min sec
```

**default sec** Specifies the default amount of time that a registration can exist on the system. `sec` must be an integer from 60 to `max sec` -1.

Default: 3600

```
Important: default sec must be < or = to max sec and > or = to min sec.
```

**implicit sec** Specifies the implicit amount of time that a registration can exist on the system. `sec` must be an integer from 60 to 1209600.

Default: 0

**max sec** Specifies the maximum amount of time that a registration can exist on the system. `sec` must be an integer from 60 to 1209600.

Default: 86400

```
Important: max sec must be > or = to min sec.
```

**min sec** Specifies the minimum amount of time that a registration can exist on the system. `sec` must be an integer from 60 to `max sec` -1.

Default: 60

```
Important: min sec must be < or = to max sec.
```
Usage

Use this command to control the amount of time registrations are allowed to exist on this service.
The system responds to registrations in the following manner:
  If implicit-timer is configured (>0), and if UE expires time < min expires time, respond with 200 OK with
  Expires-header set to configured implicit-expires time.
  If implicit timer is not configured (=0), the service will respond with a 423 Interval Too Small message.
Using default values:
  • If a registration with an expiration value lower than the service’s minimum (60) is received, the service
    will respond with a 423 Interval Too Small message.
  • If a registration with an expiration value higher than the service’s maximum (2147483646) is received,
    the service will automatically reduce the expiration value to the default value.
  • If a registration is received missing the “Expires” value, or the value is malformed, the service will
    automatically respond with 3761 in the 200 OK message.

Example

The following command configures the maximum registration lifetime to 43200 (12 hours):

    registration lifetime max 43200
reliable-prov-resp

Enables/disables the reliability of provisional responses feature.

Product
SCM (S-CSCF, SIP Proxy)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration
configure > context context_name > cscf service service_name > serving-cscf

Entering the above command sequence results in the following prompt:
[context_name]host_name(config-cscf-service-serving-cscf)#

Syntax

reliable-prov-resp { mandatory | optional }

no reliable-prov-resp

Syntax

no

Disables the reliability of provisional responses feature.

mandatory | optional

mandatory: Both inbound and outbound will request reliability.
optional (default): Reliability is imposed by inbound side. Only if inbound call requests reliability will outbound also request reliability.

Usage
Use this command to enable/disable the reliability of provisional responses feature.

Example
The following command sets the reliability of provisional responses feature to mandatory:

reliable-prov-resp mandatory
server-name

Enables/disables filling the server name AVP in MAR and SAR for Cx interface with configured server name. This command is disabled by default.

**Important:** The `server-name` command has been moved to CSCF Service Configuration Mode in StarOS release 14.0 and later.

**Product**
SCM (S-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration

`configure > context context_name > cscf service service_name > serving-cscf`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-serving-cscf)#
```

**Syntax**

```
server-name server_name

no server-name
```

**Usage**

S-CSCF uses configured cscf-hostname or bind IP address to fill the server name AVP in MAR and SAR for Cx interface. This is the default CSCF behavior.

```
server_name
```

Configures the name that will be used to fill the server name AVP in MAR and SAR for Cx interface. `name` must be from 1 to 63 alpha and/or numeric characters.

**Example**

Use this command to enable/disable filling the server name AVP in MAR and SAR for Cx interface with configured server name.

The following command configures the CSCF server name as `stp-c-scscfl.cisco.co.kr`:

```
server-name stp-c-scscfl.cisco.co.kr
```
**sifc**

Enables Shared Initial Filter Criteria (SiFC) functionality. This command is disabled by default.

**Product**
SCM (S-CSCF, SIP Proxy)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration

```
configure > context context_name > cscf service service_name > serving-cscf
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-serving-cscf)#
```

**Syntax**

```
[ default | no ] sifc
```

<table>
<thead>
<tr>
<th>default</th>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disables shared iFC functionality for this S-CSCF.</td>
<td></td>
</tr>
</tbody>
</table>

**Usage**

Use this command to configure the S-CSCF to share iFC functionality.

**Important:** 48 SiFC IDs are supported per subscriber.

If both the HSS and the S-CSCF support this feature, subsets of iFC may be shared by several service profiles. The HSS downloads the unique identifiers of the shared iFC sets to the S-CSCF. The S-CSCF uses a locally administered database to map the downloaded identifiers onto the shared iFC sets.

If the S-CSCF does not support this feature, the HSS will not download identifiers of shared iFC sets.

**Important:** When using this feature option, the network operator is responsible for keeping the local databases in the S-CSCFs and HSSs consistent.
**sip-header insert**

Enable SIP header insertion for the S-CSCF service. SIP header insertion is disabled by default.

**Product**
SCM (S-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration

configure > context context_name > cscf service service_name > serving-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-serving-cscf)#

**Syntax**

```
[ no ] sip-header insert { p-cust1-prid-info | p-user-database }
```

- **no**
  Disables specific SIP header insertion for the S-CSCF service.

- **p-cust1-prid-info**
  Inserts a custom header, P-LGUPlus-PRID-Info, which contains the private user id of the user sending the REGISTER request, to be added in the REGISTER message toward AS during third party registration.

- **p-user-database**
  Inserts PUD header in SIP (REGISTER) message and Invite from I-CSCF to S-CSCF.

**Usage**
Enabling this command allows header insertion in SIP (REGISTER) message.

**Example**
The following command disables insertion of custom header, P-LGUPlus-PRID-Info, in SIP (REGISTER) message:

```
no sip-header insert p-cust1-prid-info 5
```

The following command enables insertion of PUD header in SIP (REGISTER) message and Invite from I-CSCF to S-CSCF:

```
sip-header insert p-user-database 5
```
sip-request

Configures SIP Request-related configuration in this S-CSCF service.

Product
SCM (S-CSCF, SIP Proxy)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration
configure > context context_name > cscf service service_name > serving-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-serving-cscf)#

Syntax

sip-request re-route { max-attempts attempts | response-code code }
default sip-request re-route max-attempts
no sip-request re-route response-code code

default
Specifies a maximum number of two re-route attempts that a S-CSCF should allow for a given call before passing the negative response upstream.

no
Disables the specified Response code.

re-route
Specify SIP Request re-route related configuration.

max-attempts attempts
Specifies the maximum number of re-route attempts that a S-CSCF should allow for a given call before passing the negative response upstream.

Attempts must be an integer from 1 to 10.
Default: 2

response-code code
Specifies the list of Response codes that will be considered as re-routable responses to a call attempt.

Code must be a three-digit integer from 400 to 699.

Important: You may configure a maximum of five response code values per S-CSCF service.
Usage
Use this command to configure:
- list of Response codes that will be considered as re-routable responses to a call attempt.
- the maximum number of re-route attempts that a S-CSCF should allow for a given call before passing the negative response upstream.

Example
The following command configures the maximum number of re-route attempts to 5:

    sip-request re-route max-attempts 5
tas

Configures the S-CSCF to perform Telephony Application Server (TAS) functions.

**Product**
SCM (S-CSCF, SIP Proxy)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration

```
configure > context context_name > cscf service service_name > serving-cscf
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-serving-cscf)#
```

**Syntax**

```
[ default | no ] tas
```

**Usage**
Use this command to configure the S-CSCF to perform TAS functions.
tas-service

Identifies the name of the service configured on the system performing Telephony Application Server (TAS) functions.

**Product**
SCM (S-CSCF, SIP Proxy)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration

```
configure > context context_name > cscf service service_name > serving-cscf
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-serving-cscf)#
```

**Syntax**

```
tas-service name

no tas-service
```

- **no**
  Removes the TAS name from the S-CSCF configuration.

- **name**
  Specifies the name of the service configured on the system performing TAS functions.
  **name** must be from 1 to 63 alpha and/or numeric characters and be an existing service.

**Usage**

Use this command to identify the name of the service configured on the system performing TAS functions.

**Example**

The following command identifies the TAS service name as **scscf3**:

```
tas-service scscf3
```
user-authorization

Enables sending user-authorization to HSS. User-authorization is disabled by default.

Product
SCM (S-CSCF, SIP Proxy)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration
configure > context context_name > cscf service service_name > serving-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-serving-cscf)#

Syntax

\[ default | no \] user-authorization

*default | no*

Disables sending user-authorization to HSS.

Usage

If this command is enabled, and I-CSCF role is enabled in S-CSCF, I-CSCF will send UAR/UAA diameter message to HSS.
Chapter 98
CSCF Session Template Configuration Mode Commands

The CSCF Session Template Configuration Mode is used to classify users and/or domains (AoRs) within the system.

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Session Template Configuration

```
configure > context context_name > cscf session-template { default | name template_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-session-template)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
inbound-cscf-acl

Configures the ACL to use for inbound sessions using this template.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Session Template Configuration  
`configure > context context_name > cscf session-template { default | name template_name }`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-session-template)#
```

**Syntax**

```
inbound-cscf-acl { default | name acl_name }

no inbound-cscf-acl name acl_name
```

**Usage**
Use this command to identify an ACL to use on inbound sessions using this template.

**Example**
The following command sets the inbound ACL for this template to an ACL named `acl_in22`:

```
inbound-cscf-acl name acl_in22
```
**outbound-cscf-acl**

Configures the ACL to use for outbound sessions using this template.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Session Template Configuration

```bash
configure > context context_name > cscf session-template { default | name template_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-session-template)#
```

**Syntax**

```
outbound-cscf-acl { default | name acl_name }

no outbound-cscf-acl name acl_name
```

<table>
<thead>
<tr>
<th>default</th>
<th>name acl_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>default: Specifies that the default ACL should be used for outbound sessions using this template.</td>
<td></td>
</tr>
<tr>
<td>name acl_name: Specifies an existing ACL to use for outbound sessions using this template. acl_name must be the name of an existing ACL.</td>
<td></td>
</tr>
</tbody>
</table>

```
no outbound-cscf-acl name acl_name
```

Removes the ACL from this template.

**Usage**

Use this command to identify an ACL to use on outbound sessions using this template.

**Example**

The following command sets the outbound ACL for this template to an ACL named acl_out22:

```
outbound-cscf-acl name acl_out22
```
policy-profile

Configures an AoR policy group to be used for sessions using this template.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Session Template Configuration

```
configure > context context_name > cscf session-template { default | name template_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-session-template)#
```

Syntax

```
policy-profile { default | name profile_name }

no policy-profile name profile_name
```

<table>
<thead>
<tr>
<th>default</th>
<th>name profile_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>default: Specifies that the default policy group will be used for sessions using this template.</td>

</tr>
<tr>
<td>name profile_name: Specifies an existing policy group. profile_name must be an existing CSCF policy group.</td>
<td></td>
</tr>
</tbody>
</table>

```
no policy-profile name profile_name
```

Removes the policy group from the template.

Usage

Use this command to specify a policy group for the template.

Example

The following command specifies that a policy group called aor_grp1 will be used for sessions using this template:

```
policy-profile name aor_grp1
```
route-list

Configures a route group to be used for sessions using this template.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Session Template Configuration
configure > context context_name > cscf session-template { default | name template_name }

[context_name]host_name(config-cscf-session-template)#

Syntax

route-list { default | name group_name }

no route-list name group_name

<table>
<thead>
<tr>
<th>default</th>
<th>name group_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>default: Specifies that the default route group will be used for sessions using this template.</td>
<td></td>
</tr>
<tr>
<td>name group_name: Specifies an existing route group. group_name must be an existing peer server group.</td>
<td></td>
</tr>
</tbody>
</table>

no route-list name group_name

Removes the route group from this template.

Usage

Use this command to specify a route group for the template.

Example

The following command specifies an accounting server group called route_grp2 that will be used for sessions using this template:

route-list name route_grp2
translation-list

Configures a translation list to be used for sessions using this template.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Session Template Configuration

```
configure > context context_name > cscf session-template { default | name template_name }

```
[context_name]host_name(config-cscf-session-template)#
```

**Syntax**

```
translation-list { default | name list_name }
no translation-list name list_name
```

- **default | name list_name**
  - default: Specifies that the default translation list will be used for sessions using this template.
  - name list_name: Specifies an existing translation list. list_name must be an existing translation list.

- **no translation-list name list_name**
  - Removes the translation list from this template.

**Usage**

Use this command to specify a translation list for the template.

**Example**

The following command specifies a translation list called trans_list6:

```
translation-list name trans_list6
```
urn-service-list

Configures an URN service list to be used for sessions using this template.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Session Template Configuration

configure > context context_name > cscf session-template { default | name template_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-session-template)#

Syntax

urn-service-list { default | name list_name }

no urn-service-list name list_name

---

default | name list_name

default: Specifies that the default URN service list will be used for sessions using this template.

name list_name: Specifies an existing URN service list name. list_name must be from 1 to 79 alpha
and/or numeric characters and be an existing URN service list.

---

no urn-service-list name list_name

Removes the service list from this template.

Usage

Use this command to specify a URN service list for this template. URN service lists are configured in the
URN Service List Configuration Mode.

Example

The following command specifies that a URN service list named urn_list5 will be used for sessions using
this template:

    urn-service-list name urn_list5
Chapter 99
CSCF Signalling Compression Configuration Mode Commands

The CSCF Signalling Compression Configuration Mode is used to set memory allocation parameters in support of SIP signalling compression. More information regarding signalling compression refer to the IETF RFC 3320 “Signaling Compression (SigComp)”.

Mode

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > SIP Proxy Configuration > Signaling Compression Configuration

configure > context context_name > cscf service service_name > rfc3261-proxy > sigcomp

—or—

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > Signaling Compression Configuration

configure > context context_name > cscf service service_name > proxy-cscf > sigcomp

Entering the above command sequences results in the following prompt:

[context_name]host_name(config-sigcomp)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**compression-mode**

Configures the dynamic compression mode to be used while sending a SigComp message. Simple dynamic mode is the default.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > SIP Proxy Configuration > Signaling Compression Configuration

**Syntax**

```
compression-mode { multiple-dynamic | simple-dynamic | static | update-dynamic }
```

**Example**
The following command sets the compression mode to multiple dynamic:

```
compression-mode multiple-dynamic
```
The following command completely disables the creation of dynamic states for compression:

```
compression-mode static
```
decompression-memory-size

Sets the amount of memory available for decompressing one SigComp message. A portion of the allocated memory is used to buffer the message before it is decompressed. The memory is allocated for each SigComp message and is reclaimed once decompression is completed.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > SIP Proxy Configuration > Signaling Compression Configuration

```
configure > context context_name > cscf service service_name > rfc3261-proxy > sigcomp
```

-or-

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > Signaling Compression Configuration

```
configure > context context_name > cscf service service_name > proxy-cscf > sigcomp
```

Entering the above command sequences results in the following prompt:

```
[context_name]host_name(config-sigcomp)#
```

**Syntax**

```
decompression-memory-size { 128k | 16k | 32k | 64k | 8k }
```

**Usage**

Use this command to set the memory size used to decompress a single SigComp message.

**Example**

The following command sets the memory size for decompressing SigComp messages to 16k:

```
decompression-memory-size 16k
```
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
**state-memory-size**

Sets the memory allocated to a compartment for the creation of state. Compartments are application-specific groupings of messages that relate to a peer endpoint. The system allocates memory per compartment. The memory is reclaimed when the system determines that the compartment is no longer required.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > SIP Proxy Configuration > Signaling Compression Configuration

```bash
configure > context context_name > cscf service service_name > rfc3261-proxy > sigcomp
```

-or-

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > Signaling Compression Configuration

```bash
configure > context context_name > cscf service service_name > proxy-cscf > sigcomp
```

Entering the above command sequences results in the following prompt:

```
[context_name]host_name(config-sigcomp)#
```

**Syntax**

```bash
state-memory-size { 4k | 8k }
```

**default state-memory-size**

<table>
<thead>
<tr>
<th>4k</th>
<th>8k</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 4k</td>
<td></td>
</tr>
<tr>
<td>Specifies the amount of memory to allocate to a compartment for the creation of state.</td>
<td></td>
</tr>
</tbody>
</table>

**Usage**

Use this command to specify a memory size allocated to message groupings for the creation of state.

**Example**

The following command sets the state memory size to 8k:

```bash
state-memory-size 8k
```
Chapter 100
CSCF SIP Proxy Configuration Mode Commands

The SIP Proxy Configuration Mode is used to set various commands supporting the role of the CSCF service as a RFC3261-compliant SIP proxy server.

Mode

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > SIP Proxy Configuration

configure > context context_name > cscf service service_name > rfc3261-proxy

Entering the above command sequences results in the following prompt:

[context_name]host_name(config-cscf-service-rfc3261-proxy)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
as-call

Enabling this command causes request-URIs in INVITE messages to be updated with the result of the translation before being passed to an Application Server. This command is disabled by default.

**Product**
SCM (S-CSCF, SIP Proxy)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > SIP Proxy Configuration

```
configure > context context_name > cscf service service_name > rfc3261-proxy
```

Entering the above command sequences results in the following prompt:

```
[context_name]host_name(config-cscf-service-rfc3261-proxy)#
```

**Syntax**
```
[ default | no ] as-call invite-request-uri update
```

```
  default | no

  The translation result is ignored.
```

**Usage**
Use this command to update the request-URI in INVITE messages with the result of the translation before passing it to an AS.
authentication

Configures the authentication method used by the CSCF service.

**Product**
SCM (S-CSCF, SIP Proxy)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > SIP Proxy Configuration

```bash
configure > context context_name > cscf service service_name > rfc3261-proxy
```

Entering the above command sequences results in the following prompt:

```
[context_name]host_name(config-cscf-service-rfc3261-proxy)#
```

**Syntax**

```bash
authentication { aka-v1 value | allow-noauth [ invite | re-register| register ] | allow-noipauth [ invite | re-register| register ] | allow-unsecure | aor-auth | md5 value }

no authentication { aka-v1 | allow-noauth [ invite | re-register| register ] | allow-noipauth [ invite | re-register| register ] | allow-unsecure | aor-auth | md5 }
```

**no**

Disables the specified authentication method for the CSCF service.

**aka-v1 value**

Specifies that AKA-v1 algorithm is used as the authentication type when accessing the CSCF service. `value` specifies a preference - the lower the value, the higher the preference. `value` must be an integer from 1 to 1000.

**Important:** In order to change a priority level, you must remove the original value and configure a new one.

**allow-noauth [ invite | re-register| register ]**

Specifies that access to the CSCF service is allowed if authentication fails.

- `invite`: Specifies that access to the CSCF service is allowed if authentication fails on INVITE requests only.
- `re-register`: Specifies that access to the CSCF service is allowed if authentication fails on RE-REGISTER requests when the request is integrity-protected only.
- `registration`: Specifies that access to the CSCF service is allowed if authentication fails on REGISTER requests only.

**allow-noipauth [ invite | re-register| register ]**

Specifies that access to the CSCF service is allowed if early IMS-based IP authentication fails.

- `invite`: Specifies that access to the CSCF service is allowed if early IMS-based IP authentication fails on INVITE requests only.
**re-register**: Specifies that access to the CSCF service is allowed if authentication fails on RE-REGISTER requests when the request is integrity-protected only.

**registration**: Specifies that access to the CSCF service is allowed if early IMS-based IP authentication fails on REGISTER requests only.

**allow-unsecure**

Specifies that un-secure access is allowed to the CSCF service.

**aor-auth**

Specifies that authentication is based on the AoR when accessing the CSCF service.

**md5 value**

Specifies that the MD5 algorithm is used as the authentication type for accessing the CSCF service. *value* specifies a preference - the lower the value, the higher the preference. *value* must be an integer from 1 to 1000.

**Important**: In order to change a priority level, you must remove the original value and configure a new one.

**Usage**

Use this command to configure the authentication method used by the CSCF service.

**Important**: The S-CSCF supports multiple authorization schemes, but this requires disabling all authorization configured in the S-CSCF service so that it will send “Unknown” in the Sip-Authorization-Scheme AVP. This allows the HSS to dictate authorization. The following commands disable all authorization configured in the S-CSCF service to allow HSS to control authorization:

- `authentication allow-noipauth`
- `allow rfc3261-ua-interworking`
- `no authentication aka-v1`
- `no authentication md5`

**Example**

The following command configures the authentication method used by the CSCF service to MD5 with a preference of 3:

`authentication md5 3`
**diversion-info**

Enabling this command prompts the service to add a diversion header (draft-levy-sip-diversion-08) when the call is diverted to a different endpoint due to a call feature. By default diversion-info is disabled.

**Product**
SCM (S-CSCF, SIP Proxy)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > SIP Proxy Configuration

```
configure > context context_name > cscf service service_name > rfc3261-proxy
```

Entering the above command sequences results in the following prompt:

```
[context_name]host_name(config-cscf-service-rfc3261-proxy)#
```

**Syntax**

```
[ default | no ] diversion-info
```

- `default`: The service will not add a diversion header.

**Usage**

Use this command to enable the service to add a diversion header to call setup packets when calls are diverted due to the application of call features.
**emergency**

Configures the function to allow or disallow the emergency-session or emergency-registration of a particular type.

**Product**

SCM (P-CSCF, A-BG, SIP Proxy)

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > SIP Proxy Configuration

```
configure > context context_name > cscf service service_name > rfc3261-proxy
```

Entering the above command sequences results in the following prompt:

```
[context_name]host_name(config-cscf-service/rfc3261-proxy)#
```

**Syntax**

```
[ default | no ] emergency { registration [ visited-ue ] | session [ 3gpp-ims-xml-body | anonymous | non-emergency-registered | sdp-cs-media | visited-ue ] }
```

---

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>default</strong></td>
<td>Specifies that the emergency-session or emergency-registration of a particular type can be allowed.</td>
</tr>
<tr>
<td><strong>no</strong></td>
<td>Disallows the emergency-session or emergency-registration of a particular type.</td>
</tr>
<tr>
<td><strong>registration [ visited-ue ]</strong></td>
<td>Allow emergency-registration. By default, it's allowed. <strong>visited-ue</strong>: Allow emergency-registration from a visited UE. By default, it's allowed.</td>
</tr>
<tr>
<td>**session [ 3gpp-ims-xml-body</td>
<td>anonymous</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to configure the function to allow or disallow the emergency-session or emergency-registration of a particular type.

**Example**

The following command configures the function to allow non-emergency registered subscribers to initiate emergency sessions:
emergency session non-emergency-registered
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

```
exit
```

Usage
Use this command to return to the parent configuration mode.
registration

Configures a registration lifetime for all subscribers to the service.

Product
SCM (S-CSCF, SIP Proxy)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > SIP Proxy Configuration
configure > context context_name > cscf service service_name > rfc3261-proxy
Entering the above command sequences results in the following prompt:

[context_name]host_name(config-cscf-service-rfc3261-proxy)#

Syntax

registration lifetime { default sec | max sec | min sec }

default registration lifetime

default

Returns the command to the default settings.

default sec | max sec | min sec

default sec: Specifies the default amount of time that a registration can exist on the system. sec must be an integer from 60 to max sec -1. Default is 3600. default sec must be < or = to max sec and > or = to min sec.

max sec: Specifies the maximum amount of time that a registration can exist on the system. sec must be an integer from 60 to 1209600. Default is 86400. max sec must be > or = to min sec.

min sec: Specifies the minimum amount of time that a registration can exist on the system. sec must be an integer from 60 to max sec -1. Default is 60. min sec must be < or = to max sec.

Usage

Use this command to control the amount of time registrations are allowed to exist on this service. The system responds to registrations in the following manner:
Using default values:
- If a registration with an expiration value lower than the service’s minimum (60) is received, the service will respond with a 423 Interval Too Small message.
- If a registration with an expiration value higher than the service’s maximum (2147483646) is received, the service will automatically reduce the expiration value to the default value.
- If a registration is received missing the “Expires” value, or the value is malformed, the service will automatically respond with 3761 in the 200OK message.

Example

The following command configures the maximum registration lifetime to 43200 (12 hours):
registration lifetime max 43200
reliable-prov-resp

Enables/disables the reliability of provisional responses feature.

**Product**

SCM (S-CSCF, SIP Proxy)

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > SIP Proxy Configuration

configure > context context_name > cscf service service_name > rfc3261-proxy

Entering the above command sequences results in the following prompt:

[context_name]host_name(config-cscf-service-rfc3261-proxy)#

**Syntax**

```
reliable-prov-resp { mandatory | optional }

no reliable-prov-resp
```

<table>
<thead>
<tr>
<th>no reliable-prov-resp</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disables the reliability of provisional responses feature.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>mandatory</th>
<th>optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>mandatory: Both inbound and outbound will request reliability.</td>
<td></td>
</tr>
<tr>
<td>optional (default): Reliability is imposed by inbound side. Only if inbound call requests reliability will outbound also request reliability.</td>
<td></td>
</tr>
</tbody>
</table>

**Usage**

Use this command to enable/disable the reliability of provisional responses feature.

**Example**

The following command sets the reliability of provisional responses feature to mandatory:

```
reliable-prov-resp mandatory
```

The following command disables the reliability of provisional responses feature:

```
no reliable-prov-resp
```
**sifc**

Enables Shared Initial Filter Criteria (SiFC) functionality. This command is disabled by default.

**Product**

SCM (S-CSCF, SIP Proxy)

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > SIP Proxy Configuration

```
configure > context context_name > cscf service service_name > rfc3261-proxy
```

Entering the above command sequences results in the following prompt:

```
[context_name]host_name(config-cscf-service-rfc3261-proxy)#
```

**Syntax**

```
[ default | no ] sifc
```

- **default | no**

  Disables shared iFC functionality for this SIP Proxy.

**Usage**

Use this command to configure the SIP Proxy to share iFC functionality. If both the HSS and the SIP Proxy support this feature, subsets of iFC may be shared by several service profiles. The HSS downloads the unique identifiers of the shared iFC sets to the SIP Proxy. The SIP Proxy uses a locally administered database to map the downloaded identifiers onto the shared iFC sets. If the SIP Proxy does not support this feature, the HSS will not download identifiers of shared iFC sets.

**Important:** When using this feature option, the network operator is responsible for keeping the local databases in the S-CSCFs and HSSs consistent.
sigcomp

Enables signaling compression for the SIP Proxy service and enters the Signaling Compression Configuration Mode.

Product
SCM (S-CSCF, SIP Proxy)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > SIP Proxy Configuration
configure > context context_name > cscf service service_name > rfc3261-proxy

Entering the above command sequences results in the following prompt:

[[context_name]host_name(config-cscf-service-rfc3261-proxy)#

Syntax

[ no ] sigcomp

no

Disables signaling compression for the CSCF service.

Usage

Use this command to enable signaling compression for the SIP Proxy service and enter the CSCF Signaling Compression Configuration Mode.

Entering this command results in the following prompt:

[[context_name]host_name(config-sigcomp)#

Signaling Compression Configuration Mode commands are defined in the CSCF Signaling Compression Configuration Mode Commands chapter in this guide.
tas

Configures the SIP Proxy to perform Telephony Application Server (TAS) functions.

**Product**
SCM (S-CSCF, SIP Proxy)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > SIP Proxy Configuration

```
configure > context context_name > cscf service service_name > rfc3261-proxy
```

Entering the above command sequences results in the following prompt:

```
[context_name]host_name(config-cscf-service-rfc3261-proxy)#
```

**Syntax**

```
[ default | no ] tas
```

- `default | no`
  - Disables the TAS feature for this SIP Proxy.

**Usage**

Use this command to configure the SIP Proxy to perform TAS functions.
tas-service

Identifies the name of the service configured on the system performing Telephony Application Server (TAS) functions.

**Product**
SCM (S-CSCF, SIP Proxy)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > SIP Proxy Configuration

configure > context context_name > cscf service service_name > rfc3261-proxy

Entering the above command sequences results in the following prompt:

```
[context_name]host_name(config-cscf-service-rfc3261-proxy)#
```

**Syntax**

```
tas-service name

[ default | no ] tas-service
```

**default**

Removes the TAS name from the SIP Proxy configuration.

**name**

Specifies the name of the service configured on the system performing TAS functions. *name* must be from 1 to 63 alpha and/or numeric characters and be an existing service.

**Usage**

Use this command to identify the name of the service configured on the system performing TAS functions. The ims-sh-service commands are defined in the Context Configuration Mode Commands chapter in this guide.

**Example**

The following command identifies the TAS service name as *scscf3*:

```
tas-service scscf3
```
Chapter 101
CSCF Subdomain-route List Configuration Mode
Commands

The CSCF Subdomain-route List Configuration Mode is used to configure the subdomain-routes for the I-CSCF. These subdomain-routes are used to send messages over the Ma-interface (I-CSCF interface toward AS).

Mode

Exec > Global Configuration > Context Configuration > CSCF Subdomain-routes List Configuration

configure > context context_name > cscf subdomain-routes

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-subdomain-route)#

⚠️ **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
after

Places the subdomain-route at the bottom or end of the subdomain-routes list. Use this command in conjunction with the `route` command.

**Product**
SCM (I-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Subdomain-routes List Configuration

```bash
configure > context context_name > cscf subdomain-routes
```

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-cscf-subdomain-route)#
```

**Syntax**

```bash
after
```

**Usage**

Add this command before the `route` command to place the route at the end of the subdomain-routes list.
before

Places the subdomain-route at the beginning or top of the subdomain-routes list. Use this command in conjunction with the `route` command.

**Product**
SCM (I-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Subdomain-routes List Configuration

```
configure > context context_name > cscf subdomain-routes
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-subdomain-route)#
```

**Syntax**
```
before
```

**Usage**
Add this command before the `route` command to place the route at the beginning of the subdomain-routes list.
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
route

Creates a route entry to be used in the subdomain-routes list for the I-CSCF.

**Product**
SCM (I-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Subdomain-routes List Configuration

```
configure > context context_name > cscf subdomain-routes
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-subdomain-route)#
```

**Syntax**

```
[ no ] route peer-servers name [ log ] base-criteria destination aor aor
```

- **no**
  Removes specified route entry.

- **peer-servers name**
  Specifies the name of a peer server group.
  `name` must be an existing peer server group from 1 to 79 alpha and/or numeric characters in length.

- **log**
  Enables logging for CSCF sessions meeting the criteria specified. The logs can be viewed by executing the `logging filter active facility cscf` command in the Exec mode.

- **base-criteria destination aor aor**
  Filters routes based on the destination AoR.
  `aor` must be an existing AoR from 1 to 79 alpha and/or numeric characters in length.

**Important**: AoR regular expressions are supported. Refer to the *SCM Engineering Rules* Appendix in the *Session Control Manager Administration Guide* for more information about regular expressions.

**Usage**

Use this command to create and order routes in the subdomain-routes list for the I-CSCF. I-CSCF, upon receiving the terminating request, checks the subdomain-route list for matches. If a match is found, the routing will happen based on it. Otherwise, I-CSCF performs a User Location Query (Location-Information-Request) before proceeding.

**Example**
The following command creates a route for the subdomain-routes list to peer server group `ps5` with a destination AoR of `$@abc123.com$`:

```
route peer-servers ps5 base-criteria destination aor $@abc123.com$
```
Chapter 102
CSCF Translation Configuration Mode Commands

The CSCF Translation Configuration Mode is used to configure session re-addressing within the system.

Mode

Exec > Global Configuration > Context Configuration > CSCF Translation Configuration
configure > context context_name > cscf translation name list_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-translation)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
after

Placements the CSCF translation entry at the bottom or end of the translation list. Use this command in conjunction with the `uri-readdress` command.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Translation Configuration

```
configure > context context_name > cscf translation name list_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-translation)#
```

**Syntax**
```
after
```

**Usage**
Add this command before the `uri-readdress` command to place the entry at the end of the translation list.
before

Places the CSCF translation entry at the top or beginning of the translation list. Use this command in conjunction with the `uri-readdress` command.

**Product**  
SCM

**Privilege**  
Administrator

**Mode**  
Exec > Global Configuration > Context Configuration > CSCF Translation Configuration

```bash
configure > context context_name > cscf translation name list_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-translation)#
```

**Syntax**

```
before
```

**Usage**

Add this command before the `uri-readdress` command to place the entry at the beginning of the translation list.
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
uri-readdress

Configures readdress criteria for URI translations.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Translation Configuration

```configure > context context_name > cscf translation name list_name```

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-cscf-translation)#`

**Syntax**

```uri-readdress type trans_type [ log ] { base-criteria criteria } [ filter-criteria criteria ] [ filter-criteria2 criteria ]
no uri-readdress type trans_type { base-criteria criteria } [ filter-criteria criteria ] [ filter-criteria2 criteria ]```

**no**
Remove the readdress configuration.

**type trans_type**

Specifies that the translation list (`trans_type`) entry is to be identified as one of the following:
- `blocking-cid`: Identifies the translation list entry type as “call ID blocking”.
- `cancel-blocking-cid`: Identifies the translation list entry type as “cancel call ID blocking”.
- `cancel-cid`: Identifies the translation list entry type as “cancel call ID display”.
- `cancel-cw`: Identifies the translation list entry type as “cancel call-waiting”.
- `cfbl-off`: Identifies the translation list entry type as “call forward busy line off”.
- `cfbl-on`: Identifies the translation list entry type as “call forward busy line on”.
- `cfna-off`: Identifies the translation list entry type as “call forward no answer off”.
- `cfna-on`: Identifies the translation list entry type as “call forward no answer on”.
- `cfu-off`: Identifies the translation list entry type as “call forward unconditional off”.
- `cfu-on`: Identifies the translation list entry type as “call forward unconditional on”.
- `cid`: Identifies the translation list entry type as “call ID display”.
- `cw-off`: Identifies the translation list entry type as “call-waiting off”.
- `cw-on`: Identifies the translation list entry type as “call-waiting on”.
- `directory-assistance`: Identifies the translation list entry type as “directory assistance”.
- `emergency`: Identifies the translation list entry type as “emergency”.
- `international`: Identifies the translation list entry type as “international”.
- `local`: Identifies the translation list entry type as “local”.
- `long-distance`: Identifies the translation list entry type as “long-distance”.
- `none`: Identifies the translation list entry type as “any”.
- `operator-assistance`: Identifies the translation list entry type as “operator assistance”.

---

Command Line Interface Reference, StarOS Release 17
**premium-service**: Identifies the translation list entry type as “premium service”.

**service**: Identifies the translation list entry type as “special service”.

**tollfree**: Identifies the translation list entry type as “toll free”.

**log**

Enables logging for CSCF sessions meeting the readdress criteria for URI translations.

**base-criteria criteria**

Specifies the base criteria that packets will be compared against. The following criteria is supported:

- **any**: Filters all CSCF sessions.

- **destination aor aor**: Filters sessions based on the destination AoR.
  
  `aor` must be an existing AoR from 1 to 79 characters in length.

**Important**: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

- **plmn-id mcc mcc_code mnc mnc_code**: Filters sessions based on the mobile country and network codes.
  
  `mcc_code` must be a three-digit integer from 200 to 999.

  `mnc_code` must be either a two or three-digit integer from 00 to 999 or **any** (any MNC code).

- **source address ip_address**: Filters sessions based on source IP address.
  
  `ip_address` must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

- **source aor aor**: Filters sessions based on the source AoR.
  
  `aor` must be an existing AoR from 1 to 79 characters in length.

**filter-criteria criteria**

Specifies the filter criteria that packets that have passed the base criteria will be compared against. The following criteria is supported:

- **any**: Filters all CSCF sessions.

- **destination aor aor**: Filters sessions based on the destination AoR.
  
  `aor` must be an existing AoR from 1 to 79 characters in length.

**Important**: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

- **plmn-id mcc mcc_code mnc mnc_code**: Filters sessions based on the mobile country and network codes.
  
  `mcc_code` must be a three-digit integer from 200 to 999.

  `mnc_code` must be either a two or three-digit integer from 00 to 999 or **any** (any MNC code).

- **source address ip_address**: Filters sessions based on source IP address.
  
  `ip_address` must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

- **source aor aor**: Filters sessions based on the source AoR.
**uri-readdress**

```
aor must be an existing AoR from 1 to 79 characters in length.
```

**filter-criteria2** `{criteria}`

Specifies the filter criteria that packets that have passed the base criteria and filter criteria1 will be compared against. The following criteria is supported:
- `any`: Filters all CSCF sessions.
- `destination aor aor`: Filters sessions based on the destination AoR.
  
  `aor` must be an existing AoR from 1 to 79 characters in length.

**Important**: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

- `plmn-id mcc mcc_code mnc mnc_code`: Filters sessions based on the mobile country and network codes.
  
  `mcc_code` must be a three-digit integer from 200 to 999.
  
  `mnc_code` must be either a two or three-digit integer from 00 to 999 or `any` (any MNC code).

- `source address ip_address`: Filters sessions based on source IP address.
  
  `ip_address` must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

- `source aor aor`: Filters sessions based on the source AoR.
  
  `aor` must be an existing AoR from 1 to 79 characters in length.

**Usage**

Use this command to readdress URIs based on specified criteria and enters the URI Readdress Configuration Mode. Readdressing can be used for:
- **Mobility**: When roaming in a visited domain.
- **Service Aliases**: Resolving well-known addresses via SIP-AS.
- **Number Translation**: Adding or deleting prefixes such as +1 to/from PSTN numbers.
- **Voice VPNs**: Using inter-office extensions to dial remote offices.

Entering this command results in the following prompt:

```
[context_name]hostname(config-uri-readdress)#
```

URI readdress commands are defined in the *CSCF URI Readdress Configuration Mode Commands* chapter of this reference.

**Example**

The following command readdresses sessions to a domain named `service.com`, filters sessions with a base criteria of the source address (1.2.3.4) and a filter criteria of the destination AoR ($.@test.com):

```
uri-readdress type service base-criteria source address 1.2.3.4 filter-criterial destination aor $.@test.com
```
Chapter 103
CSCF URI Readdress Configuration Mode Commands

The URI Readdress Configuration Mode is used to set URI translations.

Mode

Exec > Global Configuration > Context Configuration > CSCF Translation Configuration > URI Readdress Configuration

configure > context context_name > cscf translation name list_name > uri-readdress type readdress_type base-criteria base_criteria

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-uri-readdress)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
action

Adjusts a target address to route sessions to appropriate locations.

Product
SCM

Privilege
Administrator, Config-administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Translation Configuration > URI Readdress Configuration

```
configure > context context_name > cscf translation name list_name > uri-readdress type readdress_type base-criteria base_criteria
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-uri-readdress)#
```

Syntax

```
action { add string | delete num_chars | modify string } position num length length

target { destination | source } { aor | domain | user }
```

no action

```
add string | delete num_chars | modify string
```

**add string**: Adds a specified string to a location indicated by the **position** keyword for the targeted source or destination address component (aor, domain, or user). **string** must be from 1 to 79 alpha and/or numeric characters.

**delete num_chars**: Deletes a number of characters starting from a location specified by the **position** keyword for the targeted source or destination address component (aor, domain, or user). **num_chars** must be an integer from 1 to 79.

**modify string**: Modifies a specified string in a location starting with the **position** keyword for the targeted source or destination address component (aor, domain, or user). The number of characters in the **string** variable will replace the same number in the address. **string** must be from 1 to 79 alpha and/or numeric characters.

```
position num
```

Specifies the position in the target string where the action is to occur. **num** must be an integer from 1 to 79.

```
length length
```

Specifies the length of the target string where the action is to occur. **length** must be an integer from 1 to 79.

**Important**: The **length** keyword is only supported in **modify** actions.

```
target { destination | source }
```

Species that the action is to occur within the source or destination address.
**aor | domain | user**

**aor:** Specifies that the action is applied to AoRs in the targeted source or destination address.

**domain:** Specifies that the action is applied to domains in the targeted source or destination address.

**user:** Specifies that the action is applied to users in the targeted source or destination address.

---

**no**

Disables target address to route sessions.

---

### Usage

Use this command to manipulate SIP packets matching the criteria in the uri-readdress command.

### Example

The following command prepends a “+1” to a destination AoR:

```
action add +1 position 1 target destination aor
```

The following command removes the first two characters from the destination AoR:

```
action delete 2 position 1 target destination aor
```

The following command replaces characters 2 through 4 with the characters “abc” in the destination AoR:

```
action modify abc position 2 target destination aor
```
end

Exits the current configuration mode and returns to the Exec mode.

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
Chapter 104
CSCF URN List Configuration Mode Commands

The CSCF URN List Configuration Mode is used to map URNs to URIs for emergency and local call services.

Mode

Exec > Global Configuration > Context Configuration > CSCF URN List Configuration
configure > context context_name > cscf urn-service-list name list_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-urn)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**cscf-urn-service-mapping**

Adds an entry to the service URN mapping table that maps uniform resource names (URNs) to URIs in order to direct specific service-oriented identifiers to the proper location in a network. The table is used after CSCF translation if the result is a local service.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF URN List Configuration

```
configure > context context_name > cscf urn-service-list name list_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-urn)#
```

**Syntax**

```
[ no ] cscf-urn-service-mapping urn urn uri uri
```

- **no**
  Removes an entry from the service URN mapping table.

- **urn urn**
  Specifies the URN to be routed via a URL to the appropriate destination. `urn` must be from 1 to 79 alpha and/or numeric characters.

- **uri uri**
  Specifies the URI used to route the URN to the appropriate location. `uri` must be from 1 to 79 alpha and/or numeric characters.

**Usage**

Use this command to add an entry to the service URN mapping table that routes a translated URN to a URI for local services.

**Important:** Service URN mapping tables are limited to 30 URN to URI mapping entries.

**Example**

The following command map URN `business` to URI `corp@123.45.678.9:5020` and adds it to the service URN mapping table:

```
cscf-urn-service-mapping urn business uri corp@123.45.678.9:5020
```
end

Exits the current configuration mode and returns to the Exec mode.

Chapter 105
DDN APN Profile Configuration Mode Commands

DDN APN Profile Configuration Mode provides commands that support downlink data notification (DDN) access point name (APN) support on the S-GW and SAEGW. A Voice over LTE (VoLTE) license must be installed to access DDN APN Profile Configuration Mode.

Mode

Exec > Global Configuration > DDN APN Profile Configuration
configure > ddn-apn-profile ddn_apn_profile_name

Entering the above command sequence results in the following prompt:

[local] host_name (ddn-apn-profile profile_name)#

Important: The commands or keyword/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
**exit**

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
exit
```

**Usage**
Use this command to return to the parent configuration mode.
**isr-sequential-paging**

This command initiates paging first towards the last known RAT, then towards the other RAT for the Idle Mode Signaling Reduction (ISR) feature.

**Product**
- SGW
- SAEGW

**Privilege**
- Administrator, Security Administrator

**Mode**
- Exec > Global Configuration > DDN APN Profile Configuration

```bash
configure > ddn-apn-profile ddn_apn_profile_name
```

Entering the above command sequence results in the following prompt:

```
[local] host_name (ddn-apn-profile profile_name)#
```

**Syntax**

```bash
[remove] isr-sequential-paging
```

- **remove**
  
  Removes the ISR sequential paging configuration from the DDN APN Profile.

- **isr-sequential-paging**
  
  Enables the ISR sequential paging configuration for the DDN APN Profile.

**Usage**

```
usage
```

**Example**

Use the following example to enable ISR sequential paging on the SGW or SAEGW:

```bash
isr-sequential-paging
```
This command configures various DDN parameters for a quality of class identifier (QCI) in a DDN APN Profile.

**Product**
SGW

**Privilege**
Administrator, Security Administrator

**Mode**
Exec > Global Configuration > DDN APN Profile Configuration
configure > ddn-apn-profile ddn_apn_profile_name

Entering the above command sequence results in the following prompt:

[local] host_name (ddn-apn-profile profile_name)#

**Syntax**

```
qci qci_number ddn { failure-action pkt-drop-timer duration_seconds | ignore-ddn-timers | min-buf-size size_kb }
```

**[remove] qci qci_number**

Removes the DDN configuration for the specified QCI value.

---

**qci**

The quality of class identifier (QCI) to be configured. Valid entries are from 1 to 254. A maximum of 4 QCI values are supported for configuration per ddn-apn-profile.

---

**ddn**

Specifies a DDN parameter will be configured.

---

**failure-action pkt-drop-timer duration_seconds**

This is the time for which no data for UE is buffered. This timer activates the moment a DDN failure is received. This value supersedes the one configured at sgw-service level. When a DDN failure is received, the minimum of the pkt-drop-timer configured for all QCIs having data is started.

---

**ignore-ddn-timers**

If the DDN Delay timer is started and data arrives on a bearer with a QCI for which this flag is set, then the S-GW will stop that timer and send the DDN. The ignore-ddn-timers configuration is applicable only to the DDN delay timer. This helps to send DDN for preferential bearers immediately on receiving new data. This is '0' by default and does not affect any DDN timers.
**min-buf-size size_kb**

This is the buffer allocated for storing data packets for each bearer when the UE is in the idle state. This field is used to set higher buffer value for preferential bearers. Valid entries are from 2 to 4 KB. The default is 2 KB.

**Important:** Set this field to a value higher than 2Kb only for QCI values corresponding to preferential bearers (like VoLTE). If the default buffer size of all QCI values is increased, it would decrease the system performance due to higher memory consumption and such a configuration is NOT recommended.

**Usage**
Use this command to configure various DDN parameters for a specified QCI.

**Example**
The following example configures the minimum buffer size as 3 KB for QCI 3.

```
qci 3 ddn min-buf-size 3
```
The Dynamic Host Configuration Protocol (DHCP) Client Profile Configuration Mode is used to create and manage DHCP client profile parameters. DHCP client profiles are associated with APNs.

Mode

Exec > Global Configuration > Context Configuration > DHCP Client Profile Configuration

configure > context context_name > dhcp-client-profile profile_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcp-client-profile)#

⚠️ Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**client-identifier**

Configures the client-identifier which is sent to the external DHCP server.

**Product**

GGSN  
P-GW  
SAEGW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > DHCP Client Profile Configuration  
`configure > context context_name > dhcp-client-profile profile_name`

Entering the above command sequence results in the following prompt:  
`[context_name]host_name(config-dhcp-client-profile)#`

**Syntax**

```
client-identifier { imsi | msisdn }
```

**Usage**

Use this command to configure which information is included in the DHCP client-identifier option of DHCP messages to external DHCP servers.

**Example**

The following command specifies that a subscriber’s MSISDN be included in the DHCP client-identifier option of DHCP messages to external DHCP servers:

```
client-identifier msisdn
```
disable

Disables the specified options on the DHCP client.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
- Security Administrator, Administrator

**Mode**
```bash
Exec > Global Configuration > Context Configuration > DHCP Client Profile Configuration
```
```bash
configure > context context_name > dhcp-client-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dhcp-client-profile)#
```

**Syntax**

```
disable { dhcp-message-spray | rapid-commit-dhcpv4 | rapid-commit-dhcpv6 | user-class-option }
```

---

**dhcp-message-spray**

Disables DHCP client from spraying a DHCP message to all configured DHCP servers in the PDN.

---

**rapid-commit-dhcpv4**

Disables support of the rapid commit feature for DHCPv4 client functionality.

---

**rapid-commit-dhcpv6**

Disables support of the rapid commit feature for DHCPv6 client functionality.

---

**user-class-option**

Disables sending the “User_Class_Option” in the DHCPv6 messages from P-GW/GGSN to the external DHCPv6 server during DHCPv6 Prefix Delegation Setup.

---

**Usage**

Use this command to disable options on the DHCP client.

**Example**

The following command disables support of the rapid commit feature for DHCPv6 client functionality:

```
disable rapid-commit-dhcpv6
```
enable

Enables the specified options on the DHCP client.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
- Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > DHCP Client Profile Configuration

```configure > context context_name > dhcp-client-profile profile_name```

Entering the above command sequence results in the following prompt:

```[context_name]host_name(config-dhcp-client-profile)#```

**Syntax**
```
enable { dhcp-message-spray | rapid-commit-dhcpv4 | rapid-commit-dhcpv6 | user-class-option { imsi | msisdn } }
```

---

**dhcp-message-spray**
Enables DHCP client to spray a DHCP message to all configured DHCP servers in the PDN.
By default, this is disabled. With rapid commit, there can only be one server to which this can be sent.

**rapid-commit-dhcpv4**
Enables support of the rapid commit feature for DHCPv4 client functionality.
By default, this is enabled.

**rapid-commit-dhcpv6**
Enables support of the rapid commit feature for DHCPv6 client functionality.
By default, this is enabled.

**user-class-option { imsi | msisdn }**
Enables P-GW/GGSN to send USER_CLASS_OPTION in DHCPv6 messages to external DHCPv6 server during Prefix Delegation Setup.
**imsi**: Triggers sending the “User_Class_Option” with UE’s IMSI in the DHCPv6 Request message from P-GW to the external DHCPv6 server during DHCPv6 Prefix Setup (for network behind UE).
**msisdn**: Triggers sending the “User_Class_Option” with UE’s MSISDN in the DHCPv6 Request message from P-GW to the external DHCPv6 server during DHCPv6 Prefix Setup (for network behind UE).
By default, this is enabled.

**Usage**
Use this command to enable options on the DHCP client.

**Example**

Use this command to enable options on the DHCP client.
The following command enables support of the rapid commit feature for DHCPv6 client functionality:

```
enable rapid-commit-dhcpv6
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
request

Configures DHCP options which can be requested by the DHCP client.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > DHCP Client Profile Configuration
configure > context context_name > dhcp-client-profile profile_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dhcp-client-profile)#
```

**Syntax**

```
[ default ] request dhcp-option { dns-address | netbios-server-address | sip-server-address }
no { dns-address | netbios-server-address | sip-server-address }
```

**default**
Returns the command to its default setting.

**no**
Disables a DHCP option requested by the DHCP client.

```
dhcp-option { dns-address | netbios-server-address | sip-server-address }
```

The following DHCP options can be requested by the DHCP client:
- **dns-address**: request for DNS address
- **netbios-server-address**: request for NetBIOS server address
- **sip-server-address**: request for SIP server address

**Usage**
Use this command to enable/disable options which can be requested by the DHCP client.

**Example**
The following command enables the DHCP client to request DNS address:

```
request dhcp-option dns-address
```
Chapter 107
DHCP Server Profile Configuration Mode Commands

The Dynamic Host Configuration Protocol (DHCP) Server Profile Configuration Mode is used to create and manage DHCP server profile parameters. DHCP server profiles are associated with APNs.

Mode

Exec > Global Configuration > Context Configuration > DHCP Server Profile Configuration

configure > context context_name > dhcp-server-profile profile_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcp-server-profile)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**dhcpv6-server-preference**

Specifies the waiting time for DHCPv6 client before response.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
- Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > DHCP Server Profile Configuration

```bash
configure > context context_name > dhcp-server-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dhcp-server-profile)#
```

**Syntax**

```bash
dhcpv6-server-preference pref_value
```

**default dhcpv6-server-preference**

```bash
default
```

Returns the command to its default setting of 0.

```bash
pref_value
```

Specifies the DHCP server preference value as an integer from 1 through 255. If a DHCP server responds with a preference value of 255, DHCPv6 client need not wait any longer.

Default: 0

**Usage**

According to RFC-3315, DHCPv6 client should wait for a specified amount of time before considering responses to its queries from DHCPv6 servers. Use this command to specify the waiting time (DHCP server preference value) for DHCPv6 client before response.

**Example**

The following command sets the DHCP server preference value to **200**:

```bash
dhcpv6-server-preference 200
```
disable

Disables the specified options on the DHCP server.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
- Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > DHCP Server Profile Configuration

```bash
configure > context context_name > dhcp-server-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dhcp-server-profile)#
```

**Syntax**

```bash
disable { dhcpv6-server-reconf | dhcpv6-server-unicast | rapid-commit-dhcpv4 | rapid-commit-dhcpv6 }
```

- **dhcpv6-server-reconf**
  Disables support for reconfiguration messages from the DHCPv6 server.

- **dhcpv6-server-unicast**
  Disables server unicast option for DHCPv6 server.

- **rapid-commit-dhcpv4**
  Disables support of the rapid commit feature for DHCPv4 server functionality.

- **rapid-commit-dhcpv6**
  Disables support of the rapid commit feature for DHCPv6 server functionality.

**Usage**

Use this command to disable options on the DHCP server.

**Example**

The following command disables support of the rapid commit feature for DHCPv6 server functionality:

```bash
disable rapid-commit-dhcpv6
```
enable

Enables the specified options on the DHCP server.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
- Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > DHCP Server Profile Configuration

```
configure > context context_name > dhcp-server-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dhcp-server-profile)#
```

**Syntax**

```
enable { dhcpv6-server-reconf | dhcpv6-server-unicast | rapid-commit-dhcpv4 | rapid-commit-dhcpv6 }
```

---

**enable dhcpv6-server-reconf**

Enables support for reconfiguration messages from the DHCPv6 server.
By default, this is disabled.

**enable dhcpv6-server-unicast**

Disables server unicast option for DHCPv6 server.
By default, this is disabled.

**enable rapid-commit-dhcpv4**

Enables support of the rapid commit feature for DHCPv4 server functionality.
By default, this is disabled.

**enable rapid-commit-dhcpv6**

Enables support of the rapid commit feature for DHCPv6 server functionality.
By default, this is disabled; this is done to ensure that if there are multiple DHCPv6 servers in a network, with rapid-commit-option, they would all end up reserving resources for the UE.

**Usage**

Use this command to enable options on the DHCP server.

**Example**

The following command enables support of the rapid commit feature for DHCPv6 server functionality:

```
enable rapid-commit-dhcpv6
```
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Use this command to return to the parent configuration mode.
**process**

Configures what order the configuration options should be processed for a given client request.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > DHCP Server Profile Configuration

```bash
configure > context context_name > dhcp-server-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dhcp-server-profile)#
```

**Syntax**

```bash
process dhcp-option-from { AAA | LOCAL | PDN-DHCP } priority priority
```

**Example**

The following command sets configuration options from a PDN DHCP server at the highest priority of 1 for a given client request:

```bash
process dhcp-option-from PDN-DHCP priority 1
```
Chapter 108
DHCP Service Configuration Mode Commands

The Dynamic Host Control Protocol (DHCP) Configuration Mode is used to create and manage DHCP service instances for the current context.

**Mode**

Exec > Global Configuration > Context Configuration > DHCP Service Configuration

`configure > context context_name > dhcp-service service_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-dhcp-service)#`

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
allow

Allows the specified options on the DHCP service.

Product

P-GW
SAEGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > DHCP Service Configuration

configure > context context_name > dhcp-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcp-service)#

Syntax

[ no ] allow { dhcp-client rapid-commit | dhcp-inform | dhcp-parameter-request-list-option { router | subnet-mask } | dhcp-relay-agent-auth-suboption | dhcp-relay-agent-option | dhcp-server rapid-commit }

no

Disables an option on the DHCP service.

dhcp-client rapid-commit

Enables support of the rapid commit feature for DHCP client functionality, as defined in RFC 4039.

dhcp-inform

Enables the sending of DHCP inform after configuration for address recovery.

dhcp-parameter-request-list-option { router | subnet-mask }

Enables the sending of DHCP parameter request list option in all outgoing messages.
router: Send DHCP parameter request list option with router flag in all outgoing messages.
subnet-mask: Send DHCP parameter request list option with subnet mask flag in all outgoing messages.

dhcp-relay-agent-auth-suboption

Enables the sending of DHCP relay agent authentication suboption in all outgoing messages.

dhcp-relay-agent-option

Enables the sending of DHCP relay agent option in all outgoing messages.

dhcp-server rapid-commit

Enables support of the rapid commit feature for DHCP server functionality, as defined in RFC 4039.
Usage
Use this command to enable/disable options on the DHCP service.

Example
The following command enables support of the rapid commit feature for DHCP server functionality:

```
allow dhcp-server rapid-commit
```
bind

Binds the DHCP service to a logical IP interface facilitating the system’s connection to the DHCP server. This command also configures traffic from the specified DHCP service bind address to use the specified Multiple Protocol Label Switching (MPLS) labels.

**Product**
- ASN-GW
- eWAG
- GGSN
- HA
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > DHCP Service Configuration

```
configure > context context_name > dhcp-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dhcp-service)#
```

**Syntax**

```
bind address ip_address [ nexthop-forwarding-address nexthop_ip_address [ mpls-label input in_mpls_label_value output out_mpls_label_value1 [ out_mpls_label_value2 ] ] ]
no bind address ip_address
```

**no**

Removes a previously configured binding.

**address ip_address**

Specifies the IP address of an interface in the current context through which communication with the DHCP server occurs.

*ip_address* must be expressed in IPv4 dotted-decimal notation.

**Important:** In the case of DeWAG service, this IP address must be the same as the IP address configured with the *dhcp server* CLI command under the same DHCP Service Configuration mode. Also, this IP address must match the DeWAG service’s IP address so that the WLC can relay the DHCP unicast packets to the DeWAG service IP address and are processed by this DHCP service.

**nexthop-forwarding-address nexthop_ip_address**

Specifies the next hop gateway address for in MPLS network to which the packets with MPLS labels will be forwarded.
nexthop_ip_address must be expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**Important:** In the case of DeWAG service, this option must not be configured.

```
mpls-label input in_mpls_label_value
```

Specifies the MPLS label to identify inbound traffic destined for the configured DHCP service bind address ip_address.

*in_mpls_label_value* is the MPLS label that will identify inbound traffic destined for the configured DHCP service and must be an integer from 16 through 1048575.

**Important:** This keyword is license-enabled and available with valid MPLS feature license only.

**Caution:** For DHCP over MPLS feature to work in StarOS 9.0 onward the *dhcp ip vrf* command must be configured in DHCP service. Without *dhcp ip vrf* command the DHCP service using MPLS labels will not be started as a part of a DHCP over MPLS configuration. In release 9.0 onward this keyword is a critical parameter for the DHCP-service. Any change in its value will result in DHCP-service restart and clearing of the existing calls.

**Important:** In the case of DeWAG, this option must not be configured.

```
output out_mpls_label_value1 [ out_mpls_label_value2 ]
```

Adds the MPLS label to the outbound traffic sent from the configured DHCP service bind address ip_address. The labels *out_mpls_label_value1* and *out_mpls_label_value2* identify the MPLS labels to be added to packets sent from the specified dhcp service bind address.

*out_mpls_label_value1* is the inner output label and must be an integer from 16 through 1048575.

*out_mpls_label_value2* is the outer output label and must be an integer from 16 through 1048575.

**Important:** This keyword is license-enabled and available with valid MPLS feature license only.

**Important:** In the case of DeWAG, this option must not be configured.

**Usage**

Use this command to associate or tie the DHCP service to a specific logical IP address previously configured in the current context and bound to a port. Once bound, the logical IP address or interface is used in the giaddr field of the DHCP packets.

When this command is executed, the DHCP service is started and begins the process of requesting addresses from the DHCP server and storing them in cache memory for allocation to PDP contexts.
This command can also be used to configure MPLS labels for inbound and outbound traffic through this DHCP address. Only one interface can be bound to a service. For DHCP over MPLS feature to work in StarOS 9.0 onward `dhcp ip vrf` command must be configured in DHCP service. Without `dhcp ip vrf` command the DHCP service using MPLS labels will not be started.

![Caution:](image) As a part of DHCP over MPLS configuration, the `mpls-label input` keyword in the `bind address` command is also a critical parameter for the DHCP-Service. Any change in its value will result in DHCP-service restart and clearing of the existing calls.

**Example**

The following command binds the DHCP service to the interface with an IP address of `192.168.1.210`:

```bash
bind address 192.168.1.210
```
default

Restores DHCP service parameters to their factory default settings.

Product
GGSN
ASN-GW
HA
P-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > DHCP Service Configuration
configure > context context_name > dhcp-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcp-service)#

Syntax

```
default { T1-threshold | T2-threshold | dhcp { chaddr-validate | client-identifier |
deadtime | detect-dead-server { consecutive-failures } | server selection-algorithm } |
lease-duration | max-retransmissions | retransmission-timeout }
```

```
dhcp { deadtime | detect-dead-server { consecutive-failures } | server-selection-
algorithm }
```

Restores the following DHCP parameters to their respective default settings:

- **deadtime**: Default 10 minutes
- **detect-dead-server { consecutive-failures }**: Default 5
- **server-selection-algorithm**: Default First-server

```
lease-duration
```

Restores the lease-duration parameter to its default setting of 86400 seconds.

```
max-retransmissions
```

Restores the max-retransmissions parameter to its default setting of 5.

```
retransmission-timeout
```

Restores the retransmission-timeout parameter to its default setting of 3000 milli-seconds.

```
T1-threshold
```

Restores the T1-threshold parameter to its default setting of 50%.
**T2-threshold**

Restores the T2-threshold parameter to its default setting of 88%.

**Usage**

After system parameters have been modified, this command is used to set/restore specific parameters to their default values.

**Example**

The following command restores the DHCP deadtime parameter to its default setting of 10 minutes:

```
default dhcp deadtime
```
**dhcp chaddr-validate**

Configures the behavior of the client hardware address (chaddr) validation in DHCP messages.

**Product**
- GGSN
- HA
- P-GW
- SAEGW

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > DHCP Service Configuration
- configure > context context_name > dhcp-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dhcp-service)#
```

**Syntax**

```
[ default | no ] dhcp chaddr-validate
```

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Validates the chaddr value received in a DHCPACK message with the chaddr value sent in a DHCPREQUEST message.</td>
</tr>
<tr>
<td>no</td>
<td>Disables validation of the chaddr value received in DHCPACK message with the chaddr value sent in a DHCPREQUEST message.</td>
</tr>
</tbody>
</table>

**Important:** The chaddr information value in the DHCPACK message will be parsed but not be validated against the value maintained with client. The chaddr information value in DHCPACK will be ignored and not be stored internally.

**Usage**

Use this command to configure behavior relating to the validation of chaddr information validation in the DHCPACK messages.

**Example**

The following command specifies that the chaddr will not be validated in the DHCP messages:

```
no dhcp chaddr-validate
```
**dhcp client-identifier**

Configures the behavior relating to inclusion of a client identifier DHCP option in DHCP messages.

**Product**
- GGSN
- HA
- P-GW
- SAEGW
- HNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > DHCP Service Configuration

```
configure > context context_name > dhcp-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dhcp-service)#
```

**Syntax**

```
dhcp client-identifier { ike-id | link-layer-identifier | mac-address | msisdn | none }
default dhcp client-identifier
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Sets the behavior of DHCP client identifier to default – do not to include client identifier option in any DHCP message.</td>
</tr>
<tr>
<td>ike-id</td>
<td>Specifies the Internet Key Exchange Protocol version 2 id of HNB as the DHCP client-identifier option in any DHCP message to DHCP server in Discover and Request messages.</td>
</tr>
<tr>
<td>link-layer-identifier</td>
<td>Specifies the subscribers link-layer-identifier as the DHCP client-identifier option in the DHCP message,</td>
</tr>
<tr>
<td>mac-address</td>
<td>Specifies the subscribers mac-address as the DHCP client-identifier option in any DHCP message.</td>
</tr>
<tr>
<td>msisdn</td>
<td>Specifies that the subscriber’s MSISDN be included in the client-identifier option of the relevant DHCP messages. Default: disabled</td>
</tr>
</tbody>
</table>

**Important:** This keyword is HNB-GW license controlled.
**Important:** This keyword is GGSN and P-GW/SAEGW license controlled.

**none**

Specifies that DHCP client-identifier option would not be included in any DHCP messages. This is the default behavior. Default: enabled

**Usage**

Use this command to configure behavior relating to inclusion or exclusion of DHCP client identifier option from DHCP messages.

**Example**

The following command specifies that DHCP client-identifier option be excluded from DHCP messages:

```
dhcp client-identifier none
```
**dhcp deadtime**

Configures the amount of time that the system waits prior to re-communicating with a DHCP server that was previously marked as down.

**Product**

- GGSN
- ASN-GW
- HA
- P-GW
- SAEGW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > DHCP Service Configuration

`configure > context context_name > dhcp-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dhcp-service)#
```

**Syntax**

```
dhcp deadtime max_time
```

`max_time`

Specifies the maximum amount of time (in minutes) to wait before communicating with a DHCP server that was previously unreachable. `max_time` is an integer value from 1 through 65535. Default: 10

**Usage**

If the system is unable to communicate with a configured DHCP server, after a pre-configured number of failures the system marks the server as being down. This command specifies the amount of time that the system waits prior to attempting to communicate with the downed server.

**Important:** If all DHCP servers are down, the system will immediately treat all DHCP servers as active, regardless of the deadtime that is specified.

Refer to the `dhcp detect-dead-server` and `max-retransmissions` commands for additional information on the process the system uses to mark a server as down.

**Example**

The following command configures the system to wait 20 minutes before attempting to re-communicate with a dhcp server that was marked as down:

```
dhcp deadtime 20
```
**dhcp detect-dead-server**

Configures the number of consecutive communication failures that could occur before the system marks a DHCP server as down.

**Product**
- GGSN
- ASN-GW
- HA
- P-GW
- SAEGW

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > DHCP Service Configuration
- `configure > context context_name > dhcp-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dhcp-service)#
```

**Syntax**

```
dhcp detect-dead-server consecutive-failures max_number
```

```
consecutive-failures max_number
```

Specifies the number of failures that could occur before marking a DHCP server as down as an integer from 1 through 1000. Default: 5

**Usage**

This command works in conjunction with the `max-retransmissions` parameter to set a limit to the number of communication failures that can occur with a configured DHCP server. The `max-retransmissions` parameter limits the number of attempts to communicate with a server. Once that limit is reached, the system treats it as a single failure. This parameter limits the number of consecutive failures that can occur before the system marks the server as down and communicate with the server of next highest priority.

If all of the configured servers are down, the system ignores the detect-dead-server configuration and attempt to communicate with highest priority server again.

If the system receives a message from a DHCP server that was previously marked as down, the system immediately treats it as being active.

**Example**

The following command configures the system to allow 8 consecutive communication failures with a DHCP server before it marks it as down:

```
dhcp detect-dead-server consecutive-failures 8
```
**dhcp ip vrf**

Enables DHCP-over-MPLS support and associates the specific DHCP service with a pre-configured Virtual Routing and Forwarding (VRF) Context instance for virtual routing and forwarding.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > DHCP Service Configuration

```config
configure > context context_name > dhcp-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dhcp-service)#
```

**Syntax**

```
dhcp ip vrf vrf_name

no dhcp ip vrf
```

**no dhc ip vrf**

Removes/disassociates configured IP Virtual Routing and Forwarding (VRF) context instance.

**vrf_name**

Specifies the name of a pre-configured VRF context instance to be associated with a DHCP service. `vrf_name` is the name of a pre-configured VRF context configured in Context Configuration mode and associated with the IP Pool used by the DHCP service.

**Usage**

Use this command to enable the DHCP-over-MPLS support and to associate/disassociate a pre-configured VRF context to a DHCP service for this feature. By default the VRF is NULL, which means that DHCP service is bound with binding address given by `bind address` command only.

VRF is not a critical parameter for the DHCP Service but bind address is a critical parameter for DHCP Service, and while starting DHCP Service, if this command is configured, then the bind address should be present in that VRF, and if this command is not configured, bind address should be present in the context where DHCP Service is configured.

For the DHCP over MPLS feature to work in StarOS 9.0 onward this command must be configured in the DHCP service. Without this command the DHCP service using MPLS labels will not be started.

⚠️ **Caution:** As a part of this configuration the `mpls-label input` keyword in the `bind address` command is also a critical parameter for the DHCP-Service. Any change in its value will result in DHCP-service restart and clearing of the existing calls.

**Example**
Following command associates VRF context instance `dhcp_vrf1` with this DHCP service:

```
dhcp ip vrf dhcp_vrf1
```
**dhcp server**

Configures DHCP servers with which the DHCP service is to communicate.

**Product**

- ASN-GW
- eWAG
- GGSN
- HA
- P-GW
- SAEGW
- HNB-GW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > DHCP Service Configuration

```
configure > context context_name > dhcp-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dhcp-service)#
```

**Syntax**

```
dhcp server { ip_address | port port_num [ priority priority ]

no dhcp server ip_address

default dhcp port
```

---

**default**

Sets the default value of UDP port on DHCP server; 67 for DHCP messaging.

---

**no**

Deletes a previously configured DHCP server.

---

**ip_address**

Specifies the IP address of the DHCP server expressed in IPv4 dotted-decimal notation.

---

**Important:** In the case of DeWAG service, this IP address must be the same as the IP address configured with the bind address CLI command under the same DHCP Service Configuration mode.

---

**port port_num**

Specifies the port number to send DHCP messages to non-standard UDP ports of the server if multiple servers are configured.
port_num is an integer from 0 through 65535.

**Important:** While configuring HNB-GW for DHCP proxy support, operator must define 61610 as UDP port for DHCP server. The source port used by HNBGW will be standard DHCP port, irrespective of the server port that is configured.

```
priority priority
```

Specifies the priority of the server if multiple servers are configured. 

priority is an integer from 1 through 1000. 1 is the highest priority.

**Important:** In the case of DeWAG, this option must not be configured.

**Usage**

Use this command to configure the DHCP server(s) that the system is to communicate with. Multiple servers can be configured each with their own priority. Up to 20 DHCP servers can be configured.

All DHCP messages are sent/received on UDP port 67.

**Important:** If a server is removed, all calls having an IP address allocated from the server will be released.

**Example**

The following command configures a DHCP server with an IP address of 192.168.1.200 and a priority of 1:

```
dhcp server 192.168.1.200 priority 1
```
dhcp server selection-algorithm

Specifies the algorithm used to select DHCP servers with which to communicate when multiple servers are configured.

Product
GGSN
ASN-GW
HA
P-GW
SAEGW
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > DHCP Service Configuration

configure > context context_name > dhcp-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcp-service)#

Syntax

dhcp server selection-algorithm { first-server | round-robin | use-all }

---

first-server

Uses the first-server algorithm. This algorithm dictates that the system select the DHCP servers according to their priority starting with the highest priority server. The system communicates with the server of the next highest priority only when the previous server is unreachable. Default: Enabled

round-robin

Uses the round-robin algorithm. This algorithm dictates that the system communicates with the servers in a circular queue according to the server’s configured priority starting with the highest priority server. The next request is communicated with the next highest priority server, and so on until all of the servers have been used. At this point, the system starts from the highest priority server. Default: Disabled

use-all

Default: Disabled

This algorithm dictates that the system to communicate with the all the DHCP servers configured on system.

Usage

Use this command to determine how configured DHCP servers are utilized by the system.

Example

The following command configures the DHCP service to use the round-robin selection algorithm:

dhcp server selection-algorithm round-robin
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Use this command to return to the parent configuration mode.
lease-duration

Configures the minimum and maximum allowable lease times that are accepted in responses from DHCP servers.

Product
GGSN
ASN-GW
HA
P-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > DHCP Service Configuration

```
configure > context context_name > dhcp-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dhcp-service) #
```

Syntax

```
lease-duration min min_time max max_time
```

```
min min_time
```

Specifies the minimum acceptable lease time (in seconds) as an integer from 600 through 3600. Default: 600

```
max max_time
```

Specifies the maximum acceptable lease time (in seconds) as an integer from 10800 through 4294967295. Default: 86400

Usage

To reduce the call setup time, the system requests IP addresses from the DHCP server in blocks rather than on a call-by-call basis. Each address received has a corresponding lease time, or time that it is valid. The values configured by command represent the minimum and maximum times that the system allows and negotiates for the lease(s).

If the DHCP server responds with values that are out of the range specified by the min and max values, the system accumulates warning statistics. Responses that fall below the minimum value are rejected by the system and the system contacts the DHCP server with the next highest priority. Responses that are greater than the maximum value are accepted.

When half of the lease time has expired, the system automatically requests a lease renewal from the DHCP server. This is configured using the T1-threshold command.

Example

The following command configures the minimum allowable lease time for the system to be 1000 and the maximum to be 36000:
lease-duration min 1000 max 36000
lease-time

Configures the local DHCP Server lease time in seconds.

Product
ASN-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > DHCP Service Configuration

configure > context context_name > dhcp-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcp-service)#

Syntax

lease-time time

default lease-time

default

Returns the command to its default setting of 600.

time

Specifies the IP address lease time from the local DHCP server (in seconds) as an integer from 600 through 4294967295. Default: 600

Usage

Use this command to configure the lease time of the IP address from the local DHCP server

Example

The following command sets the lease time of the IP address from the local DHCP server to 20 minutes (1200 seconds):

 lease-time 1200
max-retransmissions

Configures the maximum number of times that the system attempts to communicate with an unresponsive DHCP server before it is considered a failure.

Product
- GGSN
- ASN-GW
- HA
- P-GW
- SAEGW

Privilege
- Security Administrator, Administrator

Mode
- Exec > Global Configuration > Context Configuration > DHCP Service Configuration
- configure > context context_name > dhcp-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcp-service)#

Syntax

```
max-retransmissions max_number
```

Specifies the maximum number of re-attempts the system tries when no response is received from a DHCP server. `max_number` is an integer from 1 through 20. Default: 5

Usage

This command works in conjunction with the `dhcp detect-dead-server` parameter to set a limit to the number of communication failures that can occur with a configured DHCP server. When the value specified by this parameter is met, a failure is logged. The `dhcp detect-dead-server` parameter specifies the number of consecutive failures that could occur before the server is marked as down. In addition, the `retransmission-timeout` command controls the amount of time between re-tries.

Example

The following command configures the maximum number of times the system re-attempts communication with a DHCP server that is unresponsive to 5:

```
max-retransmissions 5
```
retransmission-timeout

Configures the amount of time that must pass with no response before the system re-attempts to communicate with the DHCP server.

**Product**
- GGSN
- ASN-GW
- HA
- P-GW
- SAEGW

**Privilege**
- Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > DHCP Service Configuration

class > context context_name > dhcp-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dhcp-service)#
```

**Syntax**

```
retransmission-timeout time
```

`time`

Specifies the time that the system waits (in milliseconds) before reattempting communication with the DHCP server. `time` is an integer from 100 through 20000. Default: 10000

**Usage**

This command works in conjunction with the `max-retransmissions` command to establish a limit on the number of times that communication with a DHCP server is attempted before a failure is logged. This parameter specifies the time between retries.

**Example**

The following command configures a retry timeout of 1000 milliseconds:

```
retransmission-timeout 1000
```
T1-threshold

Configures the DHCP T1 timer as a percentage of the allocated IP address lease.

Product

GGSN
ASN-GW
HA
P-GW
SAEGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > DHCP Service Configuration

configure > context context_name > dhcp-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcp-service)#

Syntax

T1-threshold percentage

percentage

Specifies the percentage of the allocated IP address lease time at which the DHCP call-line state is changed to “RENEWING”. percentage is an integer from 40 through 66. Default: 50

Usage

This command is used to identify the time at which a subscriber must renew their DHCP lease as a percentage of the overall lease time. (Refer to the lease-duration command in this chapter for information on configuring the IP address lease period.)

For example, if the lease-duration was configured to have a maximum value of 12000 seconds, and this command is configured to 40%, then the subscriber would enter the RENEWING state after 4800 seconds.

Example

The following command configures the T1 threshold to 40%:

T1-threshold 40
**T2-threshold**

Configures the DHCP T2 timer as a percentage of the allocated IP address lease.

**Product**
- GGSN
- ASN-GW
- HA
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > DHCP Service Configuration
configure > context context_name > dhcp-service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dhcp-service)#
```

**Syntax**

```
T2-threshold percentage
```

Specifies the percentage of the allocated IP address lease time at which the DHCP call-line state is changed to "REBINDING". `percentage` is an integer from 67 through 99. Default: 88

**Usage**

This command is used to identify the time at which a subscriber re-binds their DHCP leased IP address as a percentage of the overall lease time. (Refer to the `lease-duration` command in this chapter for information on configuring the IP address lease period.)

For example, if the lease-duration was configured to have a maximum value of 12000 seconds, and this command is configured to 70%, then the subscriber would enter the REBINDING state after 8400 seconds.

**Example**

The following command configures the T2 threshold to 70%:

```
T2-threshold 70
```
Chapter 109
DHCPv6 Client Configuration Mode Commands

The Dynamic Host Configuration Protocol (DHCP) for Internet Protocol Version 6 (IPv6) Client Configuration Mode is used to create and manage DHCPv6 client parameters to support DHCPv6-based address assignment.

Mode

Exec > Global Configuration > Context Configuration > DHCPv6 Service Configuration > DHCPv6 Client Configuration

configure > context context_name > dhcpv6-service service_name > dhcpv6-client

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcpv6-client)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
max-retransmissions

Configures the maximum number of times that the system attempts to communicate with an unresponsive DHCPv6 server before it is considered a failure.

Product
GGSN
P-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > DHCPv6 Service Configuration > DHCPv6 Client Configuration

configure > context context_name > dhcpv6-service service_name > dhcpv6-client

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcpv6-client)#

Syntax

```
max-retransmissions max_number

default max-retransmissions
```

```
default

Returns the command to its default setting of 20.
```

```
max_number

Specifies the maximum number of re-attempts the system tries when no response is received from a DHCPv6 server. max_number is an integer from 1 through 20. Default: 20
```

Usage

This command works in conjunction with the detect-dead-server DHCPv6 service command to set a limit to the number of communication failures that can occur with a configured DHCPv6 service. When the value specified by this parameter is met, a failure is logged. The detect-dead-server DHCPv6 service parameter specifies the number of consecutive failures that could occur before the server is marked as down.

Example

The following command configures the maximum number of times the system re-attempts communication with a DHCPv6 server that is unresponsive to 5:

```
max-retransmissions 5
```
server-dead-time

Configures the amount of time that the client attempts to communicate with an unresponsive DHCPv6 server. DHCPv6 server is considered to be dead if it doesn't respond after given tries from client.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
- Security Administrator
- Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > DHCPv6 Service Configuration > DHCPv6 Client Configuration

`configure > context context_name > dhcpv6-service service_name > dhcpv6-client`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-dhcpv6-client)#`

**Syntax**

```
server-dead-time  dead_time

default server-dead-time
```

**default**

Returns the command to its default setting of 5.

**dead_time**

Specifies the maximum amount of time (in seconds) that the client attempts to communicate with an unresponsive DHCPv6 server.

`dead_time` must be an integer value from 1 through 1932100.

Default: 5

**Usage**

Use this command to specify the maximum amount of time (in seconds) that the client attempts to communicate with an unresponsive DHCPv6 server.

This command works in conjunction with the `max-retransmissions` command to set a limit to the number of times that the system attempts to communicate with an unresponsive DHCPv6 server before it is considered a failure.

**Example**

The following command configures the client to continue trying to communicate with an unresponsive DHCPv6 server for no more than 10 seconds:

```
server-dead-time 10
```
server-ipv6-address

Configures DHCPv6 server(s) with which the DHCPv6 client is to communicate.

Product

GGSN
P-GW
SAEGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > DHCPv6 Service Configuration > DHCPv6 Client Configuration

configure > context context_name > dhcpv6-service service_name > dhcpv6-client

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcpv6-client)#

Syntax

server-ipv6-address ipv6_address [ port port_number ] [ priority priority ] [ -noconfirm ]

no server-ipv6-address ipv6_address

no

Deletes a previously configured DHCPv6 server.

ipv6_address

Specifies the IP address of the DHCPv6 server expressed in IPv6 colon-separated-hexadecimal notation. Default: FF02::1:2

port port_number

Specifies the port used for communicating with the DHCPv6 server. port_number must be an integer from 1 through 65535. If unspecified, the default port is 547.

priority priority

Specifies the priority of the server if multiple servers are configured. priority is an integer from 1 through 1000. 1 is the highest priority.

-noconfirm

Executes the command without prompting for further input from the user.
Usage

Use this command to configure the DHCPv6 server(s) that the client is to communicate with. Multiple servers can be configured, each with their own priority.

Example

The following command configures a DHCPv6 server with an IP address of 1234:245:3456:4567:5678:6789:7890:8901, a port of 300, and a priority of 1:

```
server-ipv6-address 1234:245:3456:4567:5678:6789:7890:8901 port 300 priority 1
```
server-resurrect-time

Configures the amount of time that a DHCPv6 client waits before considering a dead DHCPv6 server alive again.

Product
GGSN

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcpv6-client)#

Syntax

server-resurrect-time revive_time

default server-resurrect-time

default

Returns the command to its default setting of 20.

revive_time

Specifies the maximum amount of time (in seconds) that a DHCPv6 client waits before considering a dead DHCPv6 server alive again.

Default: 20

Usage

Use this command to specify the amount of time that a DHCPv6 client waits before considering a dead DHCPv6 server alive again.

Example

The following command configures the client to wait 25 seconds before considering a dead DHCPv6 server alive again:

server-resurrect-time 25
Chapter 110

configure > context context_name > dhcpv6-service service_name > dhcpv6-server

Entering the above command sequence results in the following prompt:

[context_name] host_name(config-dhcpv6-server)#

Syntax

ipv6 nd { managed-config-flag | other-config-flag }

managed-config-flag: Configure M flag.
other-config-flag: Configure O flag.

Usage

Use this command to specify the M/O flag for neighbor discovery protocol.

Example

The following command configures the M flag for neighbor discovery protocol:

ipv6 nd managed-config-flag
preferred-lifetime

Configures the preferred lifetime for prefixes assigned by the DHCPv6 service.

Product

- P-GW
- SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > DHCPv6 Service Configuration > DHCPv6 Server Configuration

configure > context context_name > dhcpv6-service service_name > dhcpv6-server

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcpv6-server)#

Syntax

preferred-lifetime pref_lifetime

default preferred-lifetime

default

Returns the command to its default setting of 900.

pref_lifetime

Specifies the preferred lifetime (in seconds) for prefixes assigned by the DHCPv6 service.

pref_lifetime must be an integer value from 1 through 1932100.

Default: 900

Usage

Use this command to specify the preferred lifetime for prefixes assigned by the DHCPv6 service.

Example

The following command configures the preferred lifetime for 1001 seconds:

preferred-lifetime 1001
prefix-delegation

Configures the lifetime parameters that can be used by a particular DHCPv6 service to allocate delegated prefixes.

Product
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > DHCPv6 Service Configuration > DHCPv6 Server Configuration

configure > context context_name > dhcpv6-service service_name > dhcpv6-server

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcpv6-server)#

Syntax

prefix-delegation valid-lifetime valid_lifetime preferred-lifetime pref_lifetime

- **valid-lifetime valid_lifetime**
  Specifies the valid lifetime (in seconds) for prefixes for which the delegated prefix is valid. After this is exhausted, delegated prefix is deemed invalid.
  *pref_lifetime* must be an integer value from 1 through 1932100.
  Default: 900

- **preferred-lifetime pref_lifetime**
  Specifies the preferred lifetime (in seconds) for which new connections can be established by these delegated prefixes. Once it is exhausted, no new connections can be made.
  *pref_lifetime* must be an integer value from 1 through 1932100.
  Default: 900

Usage

Use this command to specify the valid and preferred lifetime for prefixes assigned by the DHCPv6 service for prefix delegation.

Example

The following command configures the valid lifetime to 1500 seconds and preferred lifetime to 1200 seconds for prefix delegation:

```
prefix-delegation valid-lifetime 1500 preferred-lifetime 1200
```
rebind-time

Configures the rebind time for prefixes assigned by the DHCPv6 service.

```
[context_name]host_name(config-dhcpv6-server)#
```

**Syntax**

```
renew-time renewal_time

default renew-time
```

**default**

Returns the command to its default setting of 900.

**renewal_time**

Specifies the renewal time (in seconds) for prefixes assigned by the DHCPv6 service. `renewal_time` must be an integer value from 1 through 1932100.

Default: 900

**Usage**

Use this command to specify the renewal time for prefixes assigned by the DHCPv6 service.

**Example**

The following command configures the renewal time for **1001** seconds:

```
renew-time 1001
```
valid-lifetime

Configures the valid lifetime for prefixes assigned by the DHCPv6 service.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
- Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > DHCPv6 Service Configuration > DHCPv6 Server Configuration

configure > context context_name > dhcpv6-service service_name > dhcpv6-server

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcpv6-server)#

**Syntax**

- `valid-lifetime valid_lifetime`
- `default valid-lifetime`

**default valid-lifetime**

- `default`
  - Returns the command to its default setting of 900.

**valid_lifetime**

- Specifies the valid lifetime (in seconds) for prefixes assigned by the DHCPv6 service.
- `valid_lifetime` must be an integer value from 1 through 1932100.
- Default: 900

**Usage**

Use this command to specify the valid lifetime for prefixes assigned by the DHCPv6 service.

**Example**

The following command configures the valid lifetime for 1001 seconds:

```
valid-lifetime 1001
```
Chapter 111
DHCPv6 Service Configuration Mode Commands

The Dynamic Host Configuration Protocol (DHCP) for Internet Protocol Version 6 (IPv6) Service Configuration Mode is used to create and manage DHCPv6 service instances for the current context.

Mode
Exec > Global Configuration > Context Configuration > DHCPv6 Service Configuration

configure > context context_name > dhcpv6-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcpv6-service)#

**Important**: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**bind**

Binds the DHCPv6 service to a logical IP interface facilitating the system’s connection to the DHCPv6 server.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > DHCPv6 Service Configuration

```
configure > context context_name > dhcpv6-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dhcpv6-service)#
```

**Syntax**

```
bind address ipv6_address [ port port_number ]
```

```
no bind address
```

**no**
Removes a previously configured binding.

```
address ipv6_address
```

Specifies the IP address of an interface in the current context through which the communication with the DHCPv6 server occurs. `ipv6_address` must be expressed in IPv6 colon-separated-hexadecimal notation.

```
port port_number
```

Specifies the listen port and is used to start the DHCPv6 server bound to it.
`port_number` must be an integer from 1 through 65535. If unspecified, the default port is 547.

**Usage**

Use this command to associate or tie the DHCPv6 service to a specific logical IP address previously configured in the current context and bound to a port.

When this command is executed, the DHCPv6 service is started and begins the process of requesting addresses from the DHCPv6 server and storing them in cache memory for allocation to PDP contexts. Only one interface can be bound to a service.

**Example**

The following command binds the DHCPv6 service to the interface with an IP address of 1234:245:3456:4567:5678:6789:7890:8901:

```
```
deadtime

Configures the amount of time that the system waits prior to re-communicating with a DHCPv6 server that was previously marked as down.

Product
GGSN
P-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > DHCPv6 Service Configuration
configure > context context_name > dhcpv6-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcpv6-service)#

Syntax

deadtime max_time

default deadtime

default
Returns the command to its default setting of 120.

max_time
Specifies the maximum amount of time (in seconds) to wait before communicating with a DHCPv6 server that was previously unreachable.
max_time must be an integer value from 1 through 1932100.
Default: 120

Usage
If the system is unable to communicate with a configured DHCPv6 server, after a pre-configured number of failures the system marks the server as being down.
This command specifies the amount of time that the system waits prior to attempting to communicate with the downed server.

Important: If all DHCPv6 servers are down, the system will immediately treat all DHCPv6 servers as active, regardless of the deadtime that is specified.

Refer to the detect-dead-server and max-retransmissions commands for additional information on the process the system uses to mark a server as down.
The following command configures the system to wait 600 seconds before attempting to re-communicate with a DHCPv6 server that was marked as down:

```
deadtime 600
```
detect-dead-server

Configures the number of consecutive communication failures that could occur before the system marks a DHCPv6 server as down.

Product
- GGSN
- P-GW
- SAEGW

Privilege
- Security Administrator, Administrator

Mode
- Exec > Global Configuration > Context Configuration > DHCPv6 Service Configuration
- configure > context context_name > dhcpv6-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcpv6-service)#

Syntax

detect-dead-server consecutive-failures max_number

default detect-dead-server consecutive-failures

default

Returns the command to its default setting of 5.

consecutive-failures max_number

Specifies the number of failures that could occur before marking a DHCPv6 server as down.

max_number must be an integer from 1 through 1000.
Default: 5

Usage

This command works in conjunction with the max-retransmissions DHCPv6 client command to set a limit to the number of communication failures that can occur with a configured DHCPv6 server. The max-retransmissions DHCPv6 client parameter limits the number of attempts to communicate with a server. Once that limit is reached, the system treats it as a single failure. This parameter limits the number of consecutive failures that can occur before the system marks the server as down and communicate with the server of next highest priority.

If all of the configured servers are down, the system ignores the detect-dead-server configuration and attempts to communicate with the highest priority server again.

If the system receives a message from a DHCPv6 server that was previously marked as down, the system immediately treats it as being active.

Example

The following command configures the system to allow 8 consecutive communication failures with a DHCPv6 server before it marks it as down:
detect-dead-server consecutive-failures 8
dhcpv6-client

Enters the DHCPv6 Client Configuration Mode.

Product
GGSN
P-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > DHCPv6 Service Configuration
configure > context context_name > dhcpv6-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcpv6-service)#

Syntax

dhcpv6-client

Usage
Use this command to cause the system to enter the DHCPv6 Client Configuration Mode where parameters are configured for the DHCPv6 client.

Entering this command results in the following prompt:

[context_name]host_name(config-dhcpv6-client)#

DHCPv6 Client Configuration Mode commands are defined in the DHCPv6 Client Configuration Mode Commands chapter.
**dhcpv6-server**

Enters the DHCPv6 Server Configuration Mode.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > DHCPv6 Service Configuration

```
configure > context context_name > dhcpv6-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dhcpv6-service)#
```

**Syntax**

```
dhcpv6-server
```

**Usage**
Use this command to cause the system to enter the DHCPv6 Server Configuration Mode where parameters are configured for the DHCPv6 server.

Entering this command results in the following prompt:

```
[context_name]host_name(config-dhcpv6-service)#
```

DHCPv6 Server Configuration Mode commands are defined in the **DHCPv6 Server Configuration Mode Commands** chapter.

**Important:** Multiple DHCPv6 servers can be configured by entering the `dhcpv6-server` command multiple times. A maximum of 3 DHCPv6 servers can be configured.
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Use this command to return to the parent configuration mode.
server

Configures DHCPv6 servers with which the DHCPv6 service is to communicate and specifies the algorithm used to select DHCPv6 servers with which to communicate when multiple servers are configured.

Product

GGSN
P-GW
SAEGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > DHCPv6 Service Configuration

configure > context context_name > dhcpv6-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dhcpv6-service)#

Syntax

server { ipv6_address [ priority priority ] | selection-algorithm { first-server | round-robin } }

default server selection-algorithm

no server ipv6_address

default

Uses the first-server algorithm.

no

Deletes a previously configured DHCPv6 server.

ipv6_address

Specifies the IP address of the DHCPv6 server expressed in IPv6 colon-separated-hexadecimal notation.

priority priority

Specifies the priority of the server if multiple servers are configured.

priority is an integer from 1 through 1000. 1 is the highest priority.

selection-algorithm { first-server | round-robin }

Specifies the algorithm used to select DHCPv6 servers with which to communicate when multiple servers are configured.

first-server: Uses the first-server algorithm. This algorithm dictates that the system select the DHCPv6 servers according to their priority, starting with the highest priority server. The system communicates with the server of the next highest priority only when the previous server is unreachable.
DHCPv6 Service Configuration Mode Commands

server

Default: Enabled

round-robin: Uses the round-robin algorithm. This algorithm dictates that the system communicates with the servers in a circular queue according to the server’s configured priority, starting with the highest priority server. The next request is communicated with the next highest priority server, and so on until all of the servers have been used. At this point, the system starts from the highest priority server.

Default: Disabled

Usage

Use this command to configure the DHCPv6 server(s) that the system is to communicate with. Multiple servers can be configured, each with their own priority. Up to 20 DHCPv6 servers can be configured. In addition, use this command to determine how configured DHCPv6 servers are utilized by the system.

Important: If a server is removed, all calls having an IP address allocated from the server will be released.

Example

The following command configures a DHCPv6 server with an IP address of 1234:245:3456:4567:5678:6789:7890:8901 and a priority of 1:

    server 1234:245:3456:4567:5678:6789:7890:8901 priority 1
Chapter 112
Diameter Endpoint Configuration Mode Commands

Diameter Endpoint Configuration Mode is accessed from the Context Configuration Mode. The base Diameter protocol operation is configured in this mode.

Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

configure > context context_name > diameter endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-diameter)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
app-level-retransmission

This command enables/disables setting “T” bit and retaining the same End-to-End Identifier (E2E ID) for application-level retransmissions.

**Product**
eHRPD
GGSN
P-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

configure > context context_name > diameter endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-diameter)>

**Syntax**

[ default | no ] app-level-retransmission { retain-e2e | set-retransmission-bit }

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Configures this command with the default setting.</td>
</tr>
<tr>
<td></td>
<td>The default behavior is not to set the retransmission bit for a retried Diameter message.</td>
</tr>
<tr>
<td>retain-e2e</td>
<td>Sends the same End-to-End Identifier for a retried Diameter message.</td>
</tr>
<tr>
<td>set-retransmission-bit</td>
<td>Sets the retransmission bit for retried Diameter messages.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to enable application-level transmission with “T” bit set.
'T' bit setting is done only for DIABASE protocol-based rerouting and not for application-based retransmissions. In order to identify such retransmissions, the server expects the T bit to be set at all levels (both DIABASE and application) of retransmission, which can be achieved with this CLI command.

In addition to using this CLI command for setting the T-bit in a retried message, it is also possible to retain the same End-to-End ID. With this feature turned on, the server can detect any duplicate/re-transmitted messages sent by Diameter clients or agents. Note that this feature is applicable to Gy and Rf messages as well.

Similar CLI command for setting T-bit is also present under Credit Control Group configuration mode, which when configured will take effect for Gy messages else endpoint configuration will be used.

**Example**

The following command specifies to set retransmission bit and retain e2e:
app-level-retransmission set-retransmission-bit retain-e2e
associate

This command associates/disassociates a Stream Control Transmission Protocol (SCTP) parameter template with the Diameter endpoint.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

```
configure > context context_name > diameter endpoint endpoint_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-diameter)#
```

**Syntax**

```
associate sctp-parameters-template template_name
```

```
no associate sctp-parameters-template
```

**Usage**

Use this command to associate a configured SCTP parameter template with the Diameter endpoint. The SCTP parameter template allows for SCTP timer values to be configured for the interface using the Diameter endpoint configuration. For more information on SCTP parameters, refer to the *SCTP Parameter Template Configuration Mode Commands* chapter.

**Important:** Only one SCTP parameter template can be associated with the Diameter endpoint configuration. The SCTP parameter template should be configured prior to issuing this command.

Only the following parameters from the template will be associated with the endpoint. When no SCTP parameter template is associated with the endpoint, the following default values are used:

- `sctp-cookie-life` 60000 (default for the parameter template as well)
- `sctp-max-init-retx` 5 (default for the parameter template as well)
- `sctp-max-path-retx` 10 (default in the parameter template is 5)
- `sctp-rto-initial` 3000 (default for the parameter template as well)
- `sctp-rto-max` 60000 (default for the parameter template as well)
associate sctp-parameters-template sctp1

Example

The following command associates a pre-configured SCTP parameter template called *sctp1* to the Diameter endpoint:

```
associate sctp-parameters-template sctp1
```
**cea-timeout**

This command configures the Capabilities-Exchange-Answer (CEA) message timeout duration for Diameter sessions.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

```
configure > context context_name > diameter endpoint endpoint_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-diameter)#
```

**Syntax**

```
cea-timeout timeout

default cea-timeout
```

- **default**
  - Configures this command with the default setting.
  - Default: 30 seconds

- **timeout**
  - Specifies the timeout duration (in seconds) to make the system wait for this duration for a CEA message.
  - `timeout` must be an integer from 1 through 120.

**Usage**

Use this command to configure the CEA timer, i.e., how long to wait for the Capabilities-Exchange-Answer message.

**Example**

The following command sets the Diameter CEA timeout to 16 seconds:

```
cea-timeout 16
```
connection retry-timeout

This command configures the Diameter Connection Retry Timeout parameter.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration
configure > context context_name > diameter endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-diameter)#

Syntax

connection retry-timeout timeout

default connection retry-timeout

default

Configures this command with the default setting.
Default: 30 seconds

timeout

Specifies the connection retry timeout duration in seconds, and must be an integer from 1 through 3600.

Usage

Use this command to configure the Diameter Connection Retry Timeout parameter.

Example

The following command sets the Diameter Connection Retry Timer to 120 seconds:

connection retry-timeout 120
connection timeout

This command configures the Diameter Connection Timeout parameter.

Product

Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

configure > context context_name > diameter endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-diameter)#

Syntax

collection timeout timeout

default connection timeout

default
default

Configures this command with the default setting.
Default: 30 seconds

timeout
timeout

Specifies the connection timeout duration (in seconds) as an integer from 1 through 30.

Usage
Use this command to configure the Diameter Connection Timeout parameter.

Example
The following command sets Diameter connection timeout to 16 seconds:

connection timeout 16
description

Allows you to enter descriptive text for this configuration.

Product
All

Privilege
Security Administrator, Administrator

Syntax

description text

no description

no

Clears the description for this configuration.

text

Enter descriptive text as an alphanumeric string of 1 to 63 characters. If you include spaces between words in the description, you must enclose the text within double quotation marks (" "), for example, “AAA BBBB”.

Usage

The description should provide useful information about this configuration.
**destination-host-avp**

This command controls encoding of the Destination-Host AVP in initial/retried requests.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

```command
configure > context context_name > diameter endpoint endpoint_name
```

Entering the above command sequence results in the following prompt:

```prompt
[context_name]host_name(config-ctx-diameter)>
```

**Syntax**

```command
destination-host-avp { session-binding | always | initial-request | retried-request }
dondefalt destination-host-avp
```

- **default**
  Configures this command with the default setting. Default: session-binding

- **session-binding**
  Includes the Destination-Host AVP when the Diameter session is bound with a host.

- **always**
  Includes the Destination-Host AVP in all types of request messages.

- **initial-request**
  Includes the Destination-Host AVP in an initial request but not in a retried request.

- **retried-request**
  Includes the Destination-Host AVP in a retried request but not in an initial request.

**Usage**

Use this command to control encoding of the Destination-Host AVP in initial/retried requests. This command has been introduced in release 12.0, in earlier releases, the Destination-Host AVP is not sent in session-setup/initial request (first message sent on that interface for that subscriber. The message will vary with different interfaces. For example, CCR-Initial for Gy, ACR-start for Rf, and so on). Also, Destination-Host AVP was not sent in retried requests. For example, CCR-Update failed to be responded by server. The message was retransmitted to alternate server.

In both these scenarios, it is not known which server will respond to the initial/retried message, so the Destination-Realm is encoded but not the Destination-Host. Only after a response for this message is received...
from one of the hosts present in that realm, the session is considered to be BOUND with that server. Any message sent after this binding will have the Destination-Host AVP encoded.
If the application has selected one of the servers using application-level commands like the `peer-select` command for credit-control or the `diameter authentication or accounting server` command in a AAA group, encoding of this AVP in initial/retried request is configurable.

Example

The following command specifies to include the Destination-Host AVP in initial request but not in retried request:

```
destination-host-avp initial-request
```
device-watchdog-request

This command manages the transport failure algorithm and configures the number of Device Watchdog Requests (DWRs) that will be sent before a connection is closed.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

```
configure > context context_name > diameter endpoint endpoint_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-diameter)#
```

**Syntax**

```
device-watchdog-request max-retries retry_count
```

```
default device-watchdog-request max-retries
```

<table>
<thead>
<tr>
<th>default</th>
<th>Configures this command with the default setting. Default: 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>retry_count</td>
<td>Specifies the maximum number of DWRs, and must be an integer from 1 through 10.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to configure the number of DWRs to be sent before closing the connection from a Diameter endpoint.

**Example**

The following command sets the DWRs to 3:

```
device-watchdog-request max-retries 3
```
dpa-timeout

This command configures the Disconnect-Peer-Answer (DPA) message timeout duration for Diameter sessions.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

```
configure > context context_name > diameter endpoint endpoint_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-diameter)>
```

**Syntax**

```
dpa-timeout  timeout
```

```
default dpa-timeout
```

```
default

Configures this command with the default setting.
Default: 30 seconds
```

**Usage**

Use this command to set the timer for DPA message timeout during Diameter connection session. This makes the system wait for this duration for DPA message.

**Example**

The following command sets the Diameter DPA timeout to 16 seconds:

```
dpa-timeout 16
```
**dscp**

This command sets the Differential Services Code Point (DSCP) value in the IP header of the Diameter messages sent from the Diameter endpoint.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

configure > context context_name > diameter endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-diameter)#

**Syntax**

```
dscp { value | af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | cs1 | cs2 | cs3 | cs4 | cs5 | cs6 | cs7 | ef }
```

**default dscp**

- **value**
  Specifies to configure a unique DSCP as an integer in the range of 0 through 63.

- **af xx**
  Specifies the use of an assured forwarding xx per hop behavior (PHB).

- **be**
  Specifies the use of best effort forwarding PHB. This is the default.

- **csx**
  Specifies the use of class selector x per PHB.

- **ef**
  Specifies the use of expedited forwarding PHB.

**Usage**

Use this command to set the DSCP in the IP header of the diameter messages sent from the diameter endpoint. In addition to the recommended PHBs the user may configure their own DSCP as an integer in the range of 0 through 63.

**Example**

The following command sets the DSCP to be:

```
dscp be
```
**dynamic-peer-discovery**

This command configures the system to dynamically locate peer Diameter servers by means of DNS.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

```bash
configure > context context_name > diameter endpoint endpoint_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-diameter) #
```

**Syntax**

```
dynamic-peer-discovery [ protocol { sctp | tcp } ]
{ default | no } dynamic-peer-discovery
```

- **default**
  
  Configures this command with the default setting.
  Default: disabled

- **no**
  
  Removes the configuration.

- **protocol { sctp | tcp }**
  
  Configures peer discovery to use a specific protocol. Default: TCP
  
  - **sctp**: Uses Streaming Control Transmission Protocol (SCTP) for peer discovery.
  
  - **tcp**: Uses Transmission Control Protocol (TCP) for peer discovery.

**Usage**

Use this command to configure the system to dynamically locate peer Diameter servers by means of DNS. Configure the `dynamic-peer-realm` command to locate Diameter servers using Naming Authority Pointer (NAPTR) queries. If the peer realm command is not configured, configuring this command will still allow applications to trigger an NAPTR query on their chosen realms. The preferred transport protocol is TCP to resolve instances were multiple NAPTR responses with the same priority are received. The one using the TCP transport protocol will be chosen. If the transport protocol is configured through the CLI, then the configured protocol is given preference. The IP address version will be the same as that of the origin host address configured for the endpoint. For IPv4 endpoints, A-type DNS queries will be sent to resolve Fully Qualified Domain Names (FQDNs). For IPv6 endpoints, AAAA-type queries are sent.

**Example**

The following command configures the system to dynamically locate peer Diameter servers using SCTP:
dynamic-peer-discovery protocol sctp
**dynamic-peer-failure-retry-count**

This command configures the number of times the system will attempt to connect to a dynamically discovered Diameter peer.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

configure > context context_name > diameter endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-diameter)#

**Syntax**

```
dynamic-peer-failure-retry-count no_of_retries
```

**default dynamic-peer-failure-retry-count**

```
default

Configures this command with the default setting.
Default: 8
```

```
no_of_retries

Specifies the number of retry attempts to connect to a dynamically discovered Diameter peer. The value must be an integer from 0 through 255.
```

**Usage**
Use this command to configure the number of times the system attempts to connect to a dynamically discovered Diameter peer.

After the specified number of attempts if the peer is still not open, the peer is moved into blacklist and other peers are tried. The blacklisted peer will be retried after a time period of one hour.

**Example**

The following command sets the retry attempts to **10**:

```
dynamic-peer-failure-retry-count 10
```
dynamic-peer-realm

This command configures the name of the realm where peer Diameter servers can be dynamically discovered.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration
configure > context context_name > diameter endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[[context_name]host_name(config-ctx-diameter)]#

**Syntax**

[ no ] dynamic-peer-realm realm_name

- **no**
  Removes the specified dynamic peer realm name from this endpoint configuration.

- **realm_name**
  Specifies the name of the peer realm where peer Diameter server are to be dynamically discovered.
  realm_name must be an existing realm, and must be an alphanumeric string of 1 through 127 characters.

**Usage**
Use this command to locate Diameter servers using Naming Authority Pointer (NAPTR) queries.
Multiple realms can be configured. Even if the dynamic-peer-discovery command is not enabled, the realm configuration(s) will trigger dynamic peer discovery on all diabase instances.

**Example**
The following command configures a peer realm, used for dynamic peer discovery, with a name of service-provider.com:

dynamic-peer-realm service-provider.com
**dynamic-route**

This command configures the expiration time for dynamic routes created after a Diameter destination host is reached.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

configure > context context_name > diameter endpoint endpoint_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-diameter)#
```

**Syntax**

```
dynamic-route expiry-timeout value

default dynamic-route expiry-timeout
```

---

**default**

Configures this command with the default setting. Default: 86400 seconds (1 day)

**value**

Specifies the time (in seconds) that a dynamic route to a Diameter host will expire. The value must be an integer from 1 through 86400000.

---

**Usage**

Use this command to set expiration times for dynamic routes that are set up after a Diameter host has been reached.

**Example**

The following command sets the dynamic route expiration to 43200 seconds:

```
dynamic-route expiry-timeout 43200
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
**exit**

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
load-balancing-algorithm

This command configures the behavior for load balancing Diameters peers in the event of a failure of an active server.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

configure > context context_name > diameter endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-diameter)#

Syntax

load-balancing-algorithm { highest-weight | lowest-weight-borrowing min-active-servers number }

default load-balancing-algorithm

default
Configures this command with the default setting.
Default: highest-weight

highest-weight
Selects an idle server with the highest weight in failure scenarios. If multiple servers have the same high weight, load balancing is performed among those servers.

lowest-weight-borrowing min-active-servers number
Borrows an idle server with the lowest weight and adds it to the group of servers where load balancing is performed. number specifies the number of servers that must always be available as active for load balancing. number must be an integer from 2 through 4000.

Usage
Use this command to configure the behavior for load balancing Diameter peers in the event of a failure of an active server.

Example
The following command configures the load balancing behavior for Diameter peers to borrowing minimally active servers (lower weight) and maintaining an active server group of 30 servers:

    load-balancing-algorithm lowest-weight-borrowing min-active-servers 30
max-outstanding

This command configures the maximum number of Diameter messages that any application can send to any one peer, while awaiting responses.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration
configure > context context_name > diameter endpoint endpoint_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-diameter)#
```

**Syntax**

```
max-outstanding messages

{ default | no } max-outstanding
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Disables the maximum outstanding messages configuration.</td>
</tr>
<tr>
<td><code>default</code></td>
<td>Configures this command with the default setting. Default: 256</td>
</tr>
<tr>
<td><code>messages</code></td>
<td>Specifies the maximum outstanding peer transmit window size setting. The input must be an integer from 1 through 4096. Note that, in StarOS 14.1 and later releases, though the configuration allows up to 4K Diameter messages, it is restricted to queue up to 512 Diameter messages per peer to avoid any delay in the recovery of Diameter sessions.</td>
</tr>
</tbody>
</table>

**Usage**
Use this command to set the unanswered Diameter messages that any application may send to any one peer, while awaiting responses. An application will not send any more Diameter messages to that peer until it has disposed of at least one of those queued messages. It disposes a message by either receiving a valid response or by discarding the message due to no response.

**Example**
The following command sets the Diameter maximum outstanding messages setting to **1024**:

```
max-outstanding 1024
```
origin address

This command has been deprecated. See the origin host and origin realm commands.
origin host

This command sets the origin host for the Diameter endpoint.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration
configure > context context_name > diameter endpoint endpoint_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-diameter)#
```

**Syntax**

```
origin host host_name address ipv4_address | ipv6_address [ port port_number ] [ accept-incoming-connections ] [ address ipv4_address_secondary | ipv6_address_secondary ]
```

```
no origin host host_name address ipv4_address | ipv6_address [ port port_number ]
```

**Important:** Currently if multi-homing is configured, then the specified port is used instead of randomly chosen port. This is done so that application knows which port is used by the kernel as it will have to use the same port while
adding/removing IP address from the association. Nevertheless, configuring port number in origin host for client mode is not supported.

### accept-incoming-connections

Accepts inbound connection requests for the specified host (enables server mode).

**Important:** MME only: This keyword is not supported. The MME acts only in client mode; setting the S6a (HSS) endpoint to ‘accept-incoming-connections’ will prevent the initialization of the S6a connection to the HSS.

### address ipv4_address_secondary | ipv6_address_secondary

Specifies the secondary bind address for the Diameter endpoint in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation. This address must be one of the addresses of a chassis interface configured within the context in which Diameter is configured.

In 12.3 and earlier releases, when an SCTP association is established and secondary IP addresses are dynamically added or removed, the SCTP connection will be terminated.

However, in release 14.0 and later, whenever a secondary IP address is dynamically added or removed from an SCTP association, the affected host notifies its peer of the change in configuration using the Address Configuration Change Chunk (ASCONF) chunk without terminating the SCTP connection.

**Usage**

Use this command to set the bind address for the Diameter endpoint.

Diameter agent on the chassis listens to standard TCP port 3868 and also supports the acceptance of any incoming TCP connection from external server.

The command `origin host host-name` must be entered exactly once. Alternatively, the `origin host host-name address ipv4/ipv6_address [ port port_number ]` command may be entered one or more times.

In 12.3 and earlier releases, when two (or more) Diameter endpoints are configured with origin hosts having same origin host name, a failure message “Failure: FAILED due to duplicate entry” is displayed on the CLI console.

In 14.0 and later releases, this restriction will no longer be present as it will now allow the user to configure multiple endpoints with the same origin host name. Thus, it allows multiple endpoints (specifically that are used under S6a, S13 and SLg) to share the same Origin Host/Origin Realm.

**Important:** Please be noted it is not possible to associate/map origin-host across endpoints to a specific diamproxy instance or maintain a constant origin host–instance mapping. Origin hosts are a pool of host entries and will be assigned on need basis. Endpoint in itself is an independent encapsulated entity.

**Example**

The following command sets the origin host name to `test` and the IP address to `10.1.1.1`:

```
origin host test address 10.1.1.1
```
origin realm

This command configures the realm to use in conjunction with the origin host.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

configure > context context_name > diameter endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-diameter)#

Syntax

[ no ] origin realm realm_name

Syntax

no

Removes the origin realm configuration.

realm_name

Specifies the realm to bind the Diameter endpoint. The realm_name must be an alphanumeric string of 1 through 127 characters. The realm is the Diameter identity. The originator’s realm must be present in all Diameter messages. The origin realm can typically be a company or service name.

Usage

Use this command to set the realm for the Diameter endpoint.

Diameter agent on the chassis listens to standard TCP port 3868 and also supports the acceptance of any incoming TCP connection from external server.

Example

The following command sets the origin realm to companyx:

    origin realm companyx
**peer**

This command specifies a peer address for the Diameter endpoint.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

```
configure > context context_name > diameter endpoint endpoint_name
```

Entering the above command sequence results in the following prompt:
```
[context_name]host_name(config-ctx-diameter) #
```

**Syntax**

```
peer [*] peer_name [*] [ realm realm_name ] [ destination-host-name host_name ] { address ipv4/ipv6_address [ [ port port_number ] [ connect-on-application-access ] [ send-dpr-before-disconnect disconnect-cause disconnect_cause ] [ sctp ] ] + | fqdn fqdn [ [ port port_number ] [ send-dpr-before-disconnect disconnect-cause disconnect_cause ] [ rlf-template rlf_template_name ] ] ]
```

```
no peer peer_name [ realm realm_name ]
```

*no*

Removes the specified peer configuration.

```
[*] peer_name [*]
```

Specifies the peer’s name as an alphanumeric string of 1 through 63 characters that allows punctuation characters. The Diameter server endpoint can now be a wildcarded peer name (with * as a valid wildcard character). Client peers which satisfy the wild-carded pattern are treated as valid peers and the connection will be accepted. The wildcarded token indicates that the peer name is wildcarded and any ‘*’ in the preceding string is treated as a wildcard.

```
realm realm_name
```

Specifies the realm of this peer as an alphanumeric string of 1 through 127 characters. The realm name can be a company or service name.

```
destination-host-name host_name
```

Specifies the destination host name as an alphanumeric string of 1 through 63 characters. Note that this is an optional keyword. If a peer is selected by Diameter base protocol to forward an application request, then the host name specified through the “destination-host-name” option will be used to encode the Destination-Host AVP. This keyword “destination-host-name” is made optional for backward compatibility. That means, if the destination-host-name is not specified in the CLI, the peer name itself is copied to the destination-host-name for backward compatibility.
In releases prior to 17.0, the endpoint configuration allows each SCTP association to be uniquely identified by a Diameter peer name. But there was a requirement where two SCTP associations are identified with the same peer name. This kind of reused peer-name was used by HSS peers which act as Active and Standby HSS nodes. The SCTP associations in HSS behave in a manner such that one association is always SCTP active (for the active HSS) while the other SCTP association with the standby HSS would be closed and would keep flapping. To avoid this scenario and address customer’s requirement, in 17.0 and later releases, this optional keyword “destination-host-name” has been introduced in the peer CLI command to allow multiple unique peers (Diameter HSS servers) to be configured with the same host name.

With this enhancement, MME will be capable of provisioning multiple Diameter SCTP associations to reach the same HSS peer name. This configuration will also ensure that all the Diameter messages are exchanged properly with the configured destination host.

Internally the peers are identified with unique peer-name. But the Origin-host AVP provided by the server (in CER/CEA/App-msgs) is validated against both peer-name and destination-host-name provided in the CLI. Even if multiple peers are responding with same Origin-Host, this can be validated and accepted based on the CLI configuration.

<table>
<thead>

</tr>
<tr>
<td>rlf-template rlf_template_name</td>
<td>Specifies the RLF template to be associated with this Diameter peer.</td>
</tr>
</tbody>
</table>

**Important:** Rate Limiting Function (RLF) is a license-controlled feature. A valid feature license must be installed prior to configuring this feature. Contact your Cisco account representative for more information.
**Important:** Peer level RLF template takes precedence over the endpoint level template.

**sctp**

Uses Stream Control Transmission Protocol (SCTP) for this peer.

**+**

Indicates that more than one of the previous keywords can be entered within a single command.

**Usage**

Use this command to add a peer to the Diameter endpoint.

If the Diameter server side endpoint is catering to multiple peers, there has to be an entry for each peer in the peer list for that endpoint.

In cases where the client like GGSN does not use a diameter proxy, the peer list can be as large as the number of session managers on a GGSN. This might lead to a very complex configuration at the Diameter server endpoint.

To simplify the configurations, the Diameter server endpoint accepts a wildcarded peer name (with * as a valid wildcard character).

The client peers which satisfy the wild-carded pattern are treated as valid peers and the connection will be accepted. The new token ‘wildcarded*’ indicates that the peer name is wildcarded and any ‘*’ in the preceding string should be treated as a wildcard.

For example, if the peer name is prefixed and suffixed with *ggsn* (* wildcard character) and an exact match is not found for the peer name portions peers like 0001-sessmgr.ggsn-gx, 0002-sessmgr.ggsn-gx, will be treated as valid peers at the Diameter server endpoint.

**Example**

The following command adds the peer named test with IP address 10.1.1.1 using port 126:

```
peer test address 10.1.1.1 port 126
```
**peer-backoff-timer**

This command configures the time interval after which the Diameter peer will resume sending CCR-I messages to the PCRF server.

**Product**

GGSN

HA

P-GW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

```
configure > context context_name > diameter endpoint endpoint_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-diameter)#
```

**Syntax**

```
peer-backoff-timer timeout [ send-app-level-term-req ]
```

{ default | no } peer-backoff-timer

---

**Default | no**

Removes the configured peer backoff timer from Diameter endpoint configuration.

Default value of peer-backoff-timer is 7 seconds.

---

**timeout**

Specifies the peer backoff timeout duration in seconds, and must be an integer from 1 through 3600.

---

**send-app-level-term-req**

Sends termination request from application irrespective of whether or not the peer-backoff-timer is running.

**Usage**

Use this command to configure a peer backoff timer which will be started when the server (primary or secondary PCRF) is busy. That is, the backoff-timer is started when the result code DIAMETER_TOO_BUSY (3004) is received from the PCRF. This PCRF is then marked as unavailable for the period configured by the backoff timer.

No CCR-I messages will be sent to the server until this timer expires. This timer will be per session manager level and will be applicable only to that instance.

**Example**

The following command sets the peer backoff timeout to 20 seconds:

```
peer-backoff-timer 20
```
reconnect-timeout

This command configures the time interval after which the Diameter peer will be reconnected automatically when DO_NOT_WANT_TO_TALK_TO_YOU disconnect cause is received.

Product
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration
configure > context context_name > diameter endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-diameter)#

Syntax

reconnect-timeout timeout

no reconnect-timeout

no

Disables auto reconnect of peer after receiving the disconnect cause "DO_NOT_WANT_TO_TALK_TO_YOU".
The default configuration is no reconnect-timeout. The connection to peer will not be retried until it is enabled by the administrator using the diameter enable endpoint command in the Exec mode.

timeout

Specifies the reconnect timeout duration in seconds, and must be an integer from 30 through 86400.

Usage

Use this command to configure a timer which is started at the reception of the "DO_NOT_WANT_TO_TALK_TO_YOU" disconnect cause from the Diameter peer in Disconnect-Peer-Request message. After the timer expiry, the Diameter endpoint will automatically try to reconnect to the disconnected peer.

Currently in the system, the "DO_NOT_WANT_TO_TALK_TO_YOU" in the disconnect peer request is treated as an admin disable. Hence when the system gets into this state the connection will not be retried and the connection must be enabled by the administrator using the diameter enable endpoint command in the Exec mode.

Example

The following command sets the reconnect timeout to 100 seconds:

reconnect-timeout 100
**response-timeout**

This command configures the Response Timeout parameter. Response timeout specifies the maximum allowed response time for request messages sent from Diameter applications to Diameter server. On failure of reception of response for those request message within this specified time, this will be handled as failure by the corresponding applications and appropriate failure action will be initiated.

**Product**
All

**Privilege**
Security Administrator, Administrator

Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration
```
configure > context context_name > diameter endpoint endpoint_name
```

Entering the above command sequence results in the following prompt:
```
[context_name]host_name(config-ctx-diameter)#
```

**Syntax**
```
response-timeout timeout

default response-timeout
```

**default response-timeout**
```
default

Configures this command with the default setting.
Default: 60 seconds
```

**timeout**
```
Specifies the response timeout duration in seconds, and must be an integer from 1 through 300.
```

**Usage**
Use this command to configure the Response Timeout parameter.

**Example**
The following command sets the response timeout to 100 seconds:
```
response-timeout 100
```
rlf-template

This command configures the RLF template to be used for the Diameter endpoint for throttling and rate control.

**Important:** RLF template cannot be deleted if it is bound to any application (peers/endpoints).

**Product**
GGSN
P-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

configure > context context_name > diameter endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[[context_name]host_name](config-ctx-diameter)#

**Syntax**

```
[ no ] rlf-template rlf_template_name
```

- **no**
  - Remove the specified RLF template from global configuration.

**Important:** Do not use “no rlf-template rlf_template_name” in endpoint configuration mode. This CLI attempts to delete the specified RLF template. This CLI is part of global configuration, and not endpoint configuration.

**rlf_template_name**

The name of the RLF template to be used for Diameter endpoint configuration. *rlf_template_name* must be an alphanumeric string of 1 through 127 characters.

**Usage**

Use this command to configure the RLF Template to be used for the Diameter endpoint for throttling and rate control. This CLI command should be defined in the Diameter endpoint application to enable RLF module.

**Important:** Rate Limiting Function (RLF) is a license-controlled feature. A valid feature license must be installed prior to configuring this feature. Contact your Cisco account representative for more information.

**Important:** This CLI command takes effect only if the RLF template is defined in the Global Configuration mode and the connection to the peer is open.
Currently in the deployment of the Diameter applications (Gx, Gy, etc.), many operators make use of “`max-outstanding <number>`” as a means of achieving some rate-limiting on the outgoing control traffic. With RLF in place, this is no longer required since RLF takes care of rate-limiting in all cases. If RLF is used and `max-outstanding` is also used, there might be undesirable results.

**Important:** If RLF is being used with an "diameter endpoint", then set the `max-outstanding` value of the peer to be 255.

RLF provides only the framework to perform the rate limiting at the configured Transactions Per Second (TPS). The applications (like Diameter) should perform the configuration specific to each application. For more information on this feature, refer to the `rlf-template` command in the Global Configuration Mode Commands chapter. For more information on RLF template configuration commands, refer to the RLF Template Configuration Mode Commands chapter.

**Example**

The following command configures an RLF template named `rlf_1` for Diameter endpoint:

```
rlf-template rlf_1
```
route-entry

This command creates an entry in the route table for Diameter peer.

Product  
All

Privilege  
Security Administrator, Administrator

Mode  
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration
configure > context context_name > diameter endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-diameter)#

Syntax

route-entry { [ host host_name ] [ peer peer_id [ weight priority ] ] [ realm realm_name [ application credit-control peer peer_id ] [ weight value ] | peer peer_id [ weight value ] ] }

no route-entry { [ host host_name ] [ peer peer_id ] [ realm realm_name { application credit-control peer peer_id | peer peer_id } ] }

no
Disables the specified route-entry table configuration.

host host_name
Specifies the Diameter server’s host name as an alphanumerical string of 1 through 63 characters.

realm realm_name
Specifies the realm name as an alphanumerical string of 1 through 127 characters. The realm may typically be a company or service name.

application credit-control
Specifies the credit control application — DCCA or RADIUS.

peer peer_id
Specifies the peer ID of the Diameter endpoint route as an alphanumerical string of 1 through 63 characters.

weight priority
Specifies the priority for a peer in the route table as an integer from 0 through 255. Default: 10
The peer with the highest weight is used. If multiple peers have the highest weight, selection is by round-robin mechanism.
Usage

Use this command to create a route table for Diameter application. When a Diameter client starts to establish a session with a realm/application, the system searches the route table for the best match. If an entry has no host specified, the entry is considered to match the requested value. Similarly, if an entry has no realm or application specified, the entry is considered to match any such requested value. The best match algorithm is to prefer specific matches for whatever was requested, either realm/application or host/realm/application. If there are no such matches, then system looks for route table entries that have wildcards.

If the message’s destination realm is abc.com then the message will be routed to peer1. If the message’s destination realm is def.com then the message will be routed to peer2. If the destination realm is xyz.com then the message will be routed to “peer-default”.

Example

The following command creates a route entry with the host name dcca_host1 and peer ID dcca_peer with priority weight of 10:

```plaintext
route-entry host dcca_host1 peer dcca_peer weight 10
```
route-failure

This command controls what action is performed for the route table after failure or recovery after failure.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

```bash
configure > context context_name > diameter endpoint endpoint_name
```

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-ctx-diameter) #
```

**Syntax**

```bash
route-failure { deadtime seconds | recovery-threshold percent percentage | result-code result_code | threshold counter }

default route-failure { deadtime | recovery-threshold | threshold }

no route-failure result-code result_code
```

- **no**
  Disables the route-failure configuration.

- **default**
  Configures the default setting for the specified parameter.

- **deadtime seconds**
  Specifies the time duration (in seconds) for which the system keeps the route in FAILED status. When this time expires, the system changes the status to AVAILABLE.
  *seconds* must be an integer from 1 through 86400. Default: 60

- **recovery-threshold percent percentage**
  Specifies the percentage value at which the failure counter is reset when provisionally changing the status from FAILED to AVAILABLE.
  For example, if a failure counter of 16 caused the status to change to FAILED. After the configured deadtime expires, the status changes to AVAILABLE. If this keyword is configured with 75 percent, the failure counter will be reset to 12 (75 percent of 16).
  *percentage* must be an integer from 1 through 99. Default: 90

- **result-code result_code**
  Configures which answer messages are to be treated as failures, in addition to requests that time out. Up to 16 different result codes can be specified.
  *result_code* must be an integer from 0 through 4294967295.
threshold counter

Confirms the number of errors that causes the status to become FAILED. The counter value must be an integer from 0 through 4294967295. Default: 16

The error counter begins at zero, and whenever there is a good response it decrements (but not below zero) or increments (but not above this threshold).

Usage

Use this command to control how failure/recovery is performed for the route table. After a session is established, it is possible for the session to encounter errors or Diameter redirection messages that cause the Diameter protocol to re-use the route table to switch to a different route.

Each Diameter client within the chassis maintains counters relating to the status of each of its connections to different hosts (when the destination is realm/application without a specific host, the host name is kept as “”, i.e., blank).

Moreover, those counters are further divided according to which peer is used to reach each host. Each Diameter client maintains a status of each peer-to-host combination. Under normal good conditions the status will be AVAILABLE, while error conditions might cause the status to be FAILED.

Only combinations that are AVAILABLE will be used. If none are AVAILABLE, then system attempts the secondary peer if failover is configured and system can find an AVAILABLE combination there. If nothing is AVAILABLE, the system uses a FAILED combination.

Example

The following command configures the time duration for route failure to 90 seconds:

```
route-failure deadtime 90
```
server-mode

This command configures the Diameter endpoint to establish the system as the server side endpoint of the connection.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

configure > context context_name > diameter endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-diameter)#

Syntax

server-mode [ demux-mode ]

demux-mode

Specifies that the Diameter proxy is to use the demux manager to identify the appropriate session manager. If this keyword is not enabled, the proxy will route the request directly to a session manager.

Usage

Use this command to configure the Diameter endpoint to establish this system as the server side endpoint of the connection. When the Diameter proxy receives an incoming request, the proxy identifies the endpoint for the request. If the system is in client mode, the proxy extracts the instance ID of the session manager which serves as the session-ID of the request. If this command is enabled, the extraction of the instance ID is disabled.

Example

The following command sets the system as the server side of the Diameter endpoint and instructs the Diameter proxy to use the demux manager to identify the appropriate session manager where the request is to be routed:

server-mode demux-mode
**tls**

This command enables/disables the Transport Layer Security (TLS) support between a Diameter client and Diameter server node.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

configure > context context_name > diameter endpoint endpoint_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-diameter)#
```

**Syntax**

```
tls { certificate certificate | password password | privatekey private_key }
```

**default tls**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Disables the TLS support at Diameter endpoint.</td>
</tr>
<tr>
<td>certificate certificate</td>
<td>Specifies the certificate for TLS support. The certificate must appear encrypted, and must be an alphanumeric string of 700 through 900 characters.</td>
</tr>
<tr>
<td>password password</td>
<td>Specifies the password for TLS support. The password must be encrypted, and must be an alphanumeric string of 6 through 50 characters.</td>
</tr>
<tr>
<td>privatekey private_key</td>
<td>Specifies the private key for TLS support. The private key must be encrypted, and must be an alphanumeric string of 900 through 1500 characters.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to configure TLS support between a Diameter client and Diameter server node. By default, TLS is disabled.

**Important:** Both the Diameter client and server must be configured with TLS enabled or TLS disabled; otherwise, the Diameter connection will be rejected.

**Example**

The following commands enable the TLS between a Diameter client and Diameter server node:
Diameter Endpoint Configuration Mode Commands

tls certificate "-----BEGIN CERTIFICATE-----

MIICGDCCAYECAgEBMA0GCSqGSIb3DQEBAQUAA4GNADCBiQKBgQCI9

**use-proxy**

This command enables/disables Diameter proxy for the Diameter endpoint. By default this command is disabled.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

```
configure > context context_name > diameter endpoint endpoint_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-diameter)#
```

**Syntax**

```
use-proxy [ server-mode [ demux-mode ] ]
```

```
no use-proxy
```

```
no
```

Disables Diameter proxy for the current endpoint. This command at endpoint level will equip an application to use Diameter proxy to route all its messages to an external peer.

```
server-mode
```

Specifies that the Diameter endpoint to establish the Diameter proxy as the server side endpoint of the connection.

```
demux-mode
```

Specifies that the Diameter endpoint to establish the Diameter proxy to use the Demux manager to identify the appropriate session manager. If this keyword is not enabled, the proxy will route the request directly to a session manager.

IPCF uses BindMux as a Demux manager to help distribute new incoming sessions across available Sessmgrs on the system.

All the incoming Diameter requests/responses land on Diamproxy. Diamproxy checks if a Sessmgr is already serving this session based on parameters like session-id and peer-id of the request/response. If no Sessmgr is allocated to the request and the Demux mode is ON, the DiamProxy forwards the new request to Demux/Bindmux for sessmgr allocation. Demux/Bindmux has updated information about the load
on all the Sessmgrs and assigns the optimal Sessmgr to the Diameter session. Once a Sessmgr is allocated for the session, a mapping of session-id to Sessmgr is added at Diamproxy. All further requests for this session will be directly routed to Sessmgr.

Each proxy task will automatically select one of the host names configured with the `origin host` command. Multiple proxy tasks will not use the same host names, so there should be at least as many host names as proxy tasks. Otherwise, some proxy tasks will not be able to perform Diameter functionality. The chassis automatically selects which proxy tasks are used by which managers (i.e., ACSMgrs, Sessmgrs), without verifying whether the proxy task is able to perform Diameter functionality.

To be able to run this command, the Diameter proxy must be enabled. In the `Global Configuration Mode Commands` chapter, see the description of the `require diameter-proxy` command.

In 17.0 and later releases, when a PCEF is connected to OCS via multiple Diameter proxies, PCEF will choose the same Diameter proxy for the subsequent messages as long as it is available. Any subsequent messages (CCR-U/CCR-T) to the same host are sent via the same peer. Once the next-hop is chosen via round-robin method, the subsequent message for the session is sent to the same next-hop (peer).

**Example**

The following command enables Diameter proxy for the current endpoint:

```
use-proxy
```

The following command disables Diameter proxy for the current endpoint:

```
no use-proxy
```
vsa-support

This command allows DIABASE to use vendor IDs configured in the dictionary for negotiation of the Diameter peers’ capabilities regardless of the supported vendor IDs received in Capabilities-Exchange-Answer (CEA) messages.

Product
GGSN
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration
configure > context context_name > diameter endpoint endpoint_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx-diameter)#

Syntax

vsa-support { all-from-dictionary | negotiated-vendor-ids }

default vsa-support

default

Configures this command with the default setting.
Default: negotiated-vendor-ids

all-from-dictionary

Allows DIABASE to use the vendor IDs from the dictionary as indicated in the Capabilities-Exchange-Request (CER) messages from Diameter peers.

negotiated-vendor-ids

Allows DIABASE to use the supported vendor IDs satisfying capability negotiation.

Usage

Use this command to set DIABASE to use the vendor IDs from the dictionary or use the vendor IDs satisfying the capabilities negotiation.

Example

The following command enables DIABASE to use the vendor IDs specified in the dictionary:

vsa-support all-from-dictionary
**watchdog-timeout**

This command configures the Watchdog Timeout parameter.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Diameter Endpoint Configuration

```
configure > context context_name > diameter endpoint endpoint_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx-diameter)#
```

**Syntax**

```
watchdog-timeout timeout

{ default | no } watchdog-timeout
```

- **no**
  Disables the watchdog timeout configuration.

- **default**
  Configures this command with the default setting.
  Default: 30 seconds

- **timeout**
  Specifies the timeout duration (in seconds) as an integer from 6 through 30.

**Usage**

Use this command to configure the Watchdog Timeout parameter for the Diameter endpoint. If this timer expires before getting a response from the destination, other route to the same destination is tried, as long as the retry count setting has not exceeded (see the `device-watchdog-request` CLI command) and as long as the response timer has not expired (see the `response-timeout` CLI command).

If the watchdog timer expires, the gateway sends the heartbeat message to Diameter endpoint. The timer is allowed to have the value up to a maximum of +2 or -2 seconds from the configured value.

**Example**

The following command sets the watchdog timeout setting to 15 seconds:

```
watchdog-timeout 15
```
Diameter Failure Handling Template Configuration Mode Commands

Diameter Failure Handling Template Configuration Mode is accessed from the Global Configuration Mode. This mode allows an operator to configure failure handling template that can be associated to different Diameter services.

```
Exec > Global Configuration > Failure Handling Template Configuration
configure > failure-handling-template template_name

[local]host_name(config-fh-template)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
msg-type

This command specifies the failure handling behavior in the event of a communication failure with the prepaid server.

Product

Mode
Exec > Global Configuration > Failure Handling Template Configuration
configure > failure-handling-template template_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-fh-template)#

Syntax

don msg-type { any | authentication info request | authorization-request | check-identity-request | credit-control-initial | credit-control-terminate | credit-control-update | eap-request | eap-termination-request | notify-request | profile-update-request | purge-ue-request | update-location-request | user-data-request } failure-type { any | diabase-error | diameter result-code { any-error | result-code [ to end-result-code ] } | diameter exp-result-code { any-error | result-code [ to end-result-code ] } | resp-timeout | tx-expiry }

no

Removes the configuration associated with the failure handling template.
| Diameter Failure Handling Template Configuration Mode Commands

msg-type

{ any | authentication info request | authorization-request | check-identity-request | credit-control-initial | credit-control-terminate | credit-control-update | eap-request | eap-termination-request | notify-request | profile-update-request | purge-ue-request | update-location-request | user-data-request }

Defines the failure handling behavior based on the failures in the following request messages:

- Any request
- Authentication-Information Request through S6a or S13 Diameter interface
- Authorization Request through PDIF-EAP, STa, S6b, or Wm interface
- Check-Identity-Information-Request through S6a or S13 interface
- Credit-Control-Initial-Request (CCR-I) through Gx, Gy or Ty interface
- Credit-Control-Terminate-Request (CCR-T) through Gx, Gy or Ty interface
- Credit-Control-Update-Request (CCR-U) through Gx, Gy or Ty interface
- EAP request through Cx, PDIF-EAP, STa, S6b, or Wm interface
- EAP Termination request through Cx, PDIF-EAP, STa, S6b, or Wm interface
- Notify-Request through S6a or S13 interface
- Profile-Update-Request through Sh interface
- Purge-UE-Request through S6a or S13 interface
- Update-Location-Request through S6a or S13 interface
- User-Data-Request through Sh interface

failure-type { any | diabase-error | diameter result-code { any-error | result-code [ to end-result-code ] } | diameter exp-result-code { any-error | result-code [ to end-result-code ] } | resp-timeout | tx-expiry }

Defines the failure handling behavior based on the different types of failure, for example, Diabase error or any error due to expiry of response timeout or Tx timer, etc.

result-code [ to end-result-code ]: result-code specifies the result code number, must be an integer from 3000 through 9999. end-result-code specifies the upper limit of a range of result codes. end-result-code must be greater than result-code.

Configures the action to be taken in the event of a communication failure with the server from one of the following:

- **continue** – In the event of a failure the user session continues. DCCA/Diameter will make periodic request and/or connection retry attempts and/or will attempt to communicate with a secondary peer depending on the peer configuration and session-binding setting.
- **local-fallback** – Continue the session with the PCC rules defined in the local policy.
- **retry-server-on-event** – Reconnects to PCRF server on update and termination requests or re-authorization from server, for failure-handling CONTINUE sessions.

**Important:** This option is valid only for credit-control-update request though it is allowed to configure for all the requests.
Diameter Failure Handling Template Configuration Mode Commands

*send-c crt-on-call-termination* – Sends CCR-T to PCRF on call termination for failure-handling CONTINUE.

**Important**: This option is valid only for credit-control-update request though it is allowed to configure for all the requests.

*without-retry* – Continue the session without retrying the secondary PCRF.

*retry-and-terminate* – In the event of a failure the user session continues for the duration of one retry attempt with the server. If this retry attempt also fails, the session is terminated.

*max-transmissions number-of-retries*: Specifies the maximum number of retries to the server. The maximum server retries that can be configured is 5 and the default value for retries is 1. When max-retries are exhausted, session termination happens.

CCR-U is retried for a maximum of number of retries configured in the failure handling template when experimental result code (4198 - DIAMETER_PENDING_TRANSACTION) is received from PCRF in CCA-U.

*without-term-req* – Terminate the session without sending the termination request (CCR-T).

*terminate* – In the event of a failure the user session is terminated.

*without-term-req* – Terminate the session without sending the termination request (CCR-T).

**Usage**

Use this command to specify the behavior in the event of a communication failure with the prepaid server. If there are different failure handling configurations present within the template for the same message type, the action is applied as per the latest error encountered.

Lookup is done first to identify if there is an exact match for message-type and failure-type. If not present, lookup is done for 'any' match for message and failure type.

That is, when there are multiple matches, it is preferred to find a match to a specifically configured value over a match to something configured with msg-type any or any-error. If there are multiple best matches, the one with a specifically configured msg-type over a match to msg-type any is preferred.

There are two levels of possible communication failure:

- The TCP connection failed
- DIAMETER routing failed to deliver a request or failed to receive a response.

The specified behavior is used for sessions when no behavior is specified by the server, such as by the CC-Failure-Handling AVP in DIAMETER messages. This command may be entered once for each type of message.

The following are the default action for Diameter result codes:

- For all protocol error codes 3000 to 3999, the default action is terminate. For all transient error codes 4000, 4001, 4004 to 4180, and 4182 to 4999, the default action is continue.
- For transient error codes 4002, 4003, and 4181, the default action is retry-and-terminate.
- For error code 4001, the default action is terminate.
- For permanent error codes 5000 to 5999, the default action is terminate.

**Example**

The following command configures to terminate the session when the Diameter application encounters a failure due to Diabase error in the Credit-Control Initial Request (CCR-I) message:

```
```
msg-type credit-control-initial failure-type diabase-error action terminate
Chapter 114
Diameter Host Select Configuration Mode Commands

Diameter Host Select Configuration Mode is accessed from the Global Configuration Mode. This mode allows an operator to configure Diameter host tables of peer servers that can be shared by different services.

Exec > Global Configuration > Diameter Host Select Configuration

configure > diameter-host-template template_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-host-template)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Diameter Host Select Configuration
configure > diameter-host-template template_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-host-template)#

Syntax

In StarOS 14.1 and earlier releases:

```
host-select row-precedence precedence table { 1 | 2 } host host_name [ realm realm_id ] [ secondary host sec_host_name realm sec_realm_id ] [ -noconfirm ]

host-select row-precedence precedence table prefix-table { 1 | 2 } msisdn-prefix-from msisdn-prefix-to msisdn_prefix_to host host_name [ realm realm_id ] [ secondary host sec_host_name realm sec_realm_id ] [ -noconfirm ]

no host-select row-precedence precedence table { 1 | 2 | prefix-table { 1 | 2 } } [-noconfirm]
```

In StarOS 15.0 and later releases:

```
host-select row-precedence precedence table { 1 | 2 } host host_name [ realm realm_id ] [ secondary host sec_host_name realm sec_realm_id ] [ -noconfirm ]

host-select row-precedence precedence table { { range-table { 1 | 2 } { imsi-based { [ prefix | suffix ] imsi-value [ to imsi-value ] } | msisdn-based { [ prefix | suffix ] msisdn-value [ to msisdn-value ] } } host host_name [ realm realm_id ] [ secondary host sec_host_name realm sec_realm_id ] algorithm { active-standby | round-robin } } } [ -noconfirm ]
```
Diameter Host Select Configuration Mode Commands

**Commands**

```plaintext
no host-select row-precedence precedence table { 1 | 2 | range-table { 1 | 2 } } [ -noconfirm ]
```

- **no**
  - Removes the specified row from the primary or secondary table or primary/secondary MSISDN prefix table for 14.0 and earlier releases, or IMSI/MSISDN range table for 15.0 and later releases.

- **row-precedence precedence**
  - Specifies the row in the table as an integer from 1 through 128. Note that the row precedence number in IMSI/MSISDN configuration must be unique.

**Important:** In StarOS release 14.0 and later, `precedence` may be an integer from 1 through 256 for SCM.

```plaintext
table { 1 | 2 }
```

- Specifies the Diameter host table that will be edited.
  - **1**: Specifies the primary table
  - **2**: Specifies the secondary table

```plaintext
table prefix-table { 1 | 2 } msisdn-prefix-from msisdn_prefix_from msisdn-prefix-to msisdn_prefix_to host host_name [ realm realm_id ] [ secondary host sec_host_name realm sec_realm_id ]
```

**Important:** This command syntax is applicable to StarOS release 14.1 and earlier.

- **prefix-table { 1 | 2 }**: Specifies a primary or secondary table containing ranges of MSISDN prefixes.
- **msisdn-prefix-from msisdn_prefix_from msisdn-prefix-to msisdn_prefix_to**: Specifies the starting and ending Mobile Station International Subscriber Directory Number (MSISDN) prefixes for a row in the prefix-table.
- **host host_name**: Identifies the primary Diameter peer server to be added to this row by its host name.
  - `host_name` can be entered as an IP address or a DNS hostname (1 through 128 alphanumeric characters).
- **secondary host sec_host_name**: Identifies the secondary Diameter peer server to be added to this row by its host name.
  - `host_name` can be entered as an IP address or a DNS hostname (1 through 128 alphanumeric characters).
- **realm realm_id**: Specifies an optional realm ID as an alphanumeric string of 1 through 128 characters.

```plaintext
table { { range-table { 1 | 2 } { imsi-based { [ prefix | suffix ] imsi-value [ to imsi-value ] } | msisdn-based { [ prefix | suffix ] msisdn-value [ to msisdn-value ] } } host host_name [ realm realm_id ] [ secondary host sec_host_name realm sec_realm_id ] algorithm { active-standby | round-robin } ] }
```

**Important:** This command syntax is applicable to StarOS release 15.0 and later.

- **range-table { 1 | 2 }**: Specifies a primary or secondary table containing ranges of IMSI or MSISDN prefix/suffix.
- **imsi-based { [ prefix | suffix ] imsi-value [ to imsi-value ] }** or **msisdn-based { [ prefix | suffix ] msisdn-value [ to msisdn-value ] }**
  - Specifies to use the prefix/suffix/range values of IMSI of the subscriber for Diameter peer selection.
**msisdn-based** { [ prefix | suffix ] msisdn-value [ to msisdn-value]: Specifies to use the prefix/suffix/range values of MSISDN of the subscriber for Diameter peer selection.

**host** host_name: Identifies the primary Diameter peer server to be added to this row by its host name.

**host_name** can be entered as an IP address or a DNS hostname (1 through 128 alphanumeric characters).

**secondary host** host_name: Identifies the secondary Diameter peer server to be added to this row by its host name. **host_name** can be entered as an IP address or a DNS hostname (1 through 128 alphanumeric characters).

**realm** realm_id: Specifies an optional realm ID as an alphanumeric string of 1 through 128 characters.

**algorithm** { active-standby | round-robin }: Specifies to select the algorithm to pick the primary and the secondary hosts either in an active standby mode or in round robin fashion.

[ -noconfirm ] Executes the command without prompting for further input from the user.

**Usage**

Use this command to add or modify individual rows in Diameter host server tables. Each table may contain up to 256 rows.

In Releases 15.0 and later, the existing CLI command “host-select row-precedence” in the Diameter Host Template Configuration mode is modified to enable the selection of Diameter peer based on the configured prefix/suffix/range values of IMSI or MSISDN of subscriber. This configuration change allows the overlapping range of IMSI or MSISDN values.

PCRF peer selection is based on the first match of prefix/suffix/range on row precedence priorities. If the subscriber's IMSI/MSISDN does not match with any configured IMSI/MSISDN range, then IMS Authorization application selects the default peer.

**Important:** The length of IMSI or MSISDN range is same in any IMSI or MSISDN host template configuration list.

Once a row is selected the failure handling for the subscriber is done based on this configuration. With this feature being turned on, the primary and the secondary hosts configured can be picked up in an active standby mode or in round robin fashion.

**Example**

The following command adds a row to a Diameter peer server table with the following parameters:

- row (precedence) = 1
- table = 1 (primary)
- Diameter peer server hostname = minid
- realm = namerica

```
host-select row-precedence 1 table 1 host minid realm namerica
```
**host-select table**

This command configures a table of peer servers associated with the Diameter host template.

**Product**
- GGSN
- HA
- HSGW
- IPSG
- PDSN
- P-GW
- SCM
- SAEGW
- S-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Diameter Host Select Configuration

```bash
configure > diameter-host-template template_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-host-template)#
```

**Syntax**

In StarOS 14.1 and earlier releases:

```bash
host-select table { 1 | 2 | prefix-table { 1 | 2 } } algorithm { ip-address-modulus [ prefer-ipv4 | prefer-ipv6 ] | msisdn-modulus | round-robin }
```

```bash
no host-select table
```

In StarOS 15.0 and later releases:

```bash
host-select table { 1 | 2 | range-table { 1 | 2 } } algorithm { ip-address-modulus [ prefer-ipv4 | prefer-ipv6 ] | msisdn-modulus | round-robin }
```

```bash
no host-select table
```

```bash
no
```

Removes the table associated with the Diameter host template.

```bash
table { 1 | 2 | prefix-table { 1 | 2 } }
```

**Important:** This command syntax is applicable to StarOS release 14.1 and earlier.
Specifies the Diameter host table that will be edited.

- **1**: Specifies the primary table
- **2**: Specifies the secondary table
- **prefix-table { 1 | 2 }**: Specifies a primary or secondary table containing ranges of MSISDN prefixes.

This keyword option enables activating the configured table.

```
table { 1 | 2 | range-table { 1 | 2 } }
```

**Important**: This command syntax is applicable to StarOS release 15.0 and later.

Specifies the Diameter host table that will be edited.

- **1**: Specifies the primary table
- **2**: Specifies the secondary table
- **range-table { 1 | 2 }**: Specifies a primary or secondary table containing ranges of IMSI or MSISDN prefix/suffix.

This keyword option enables activating the configured table.

```
algorithm { ip-address-modulus [ prefer-ipv4 | prefer-ipv6 ] | msisdn-modulus | round-robin }
```

Specifies the algorithm to be used when selecting a row in this table.

- **ip-address-modulus**: Use an IP address (in binary) to select a row.
  - **prefer-ipv4**: If both IPv4 and IPv6 addresses are available, use the IPv4 address.
  - **prefer-ipv6**: If both IPv4 and IPv6 addresses are available, use the IPv6 address.

- **msisdn-modulus**: Use an MSISDN (without leading “+”) to select a row.
- **round-robin**: Select a row in round-robin manner for each new session.

**Important**: The Round Robin algorithm is effective only over a large number of selections, and not at a granular level.

**Usage**

Use this command to add or modify a Diameter host server table associated with a Diameter host template.

**Example**

The following command adds a primary table that uses the `ip-address-modulus` algorithm for selecting a row:

```
host-select table 1 algorithm ip-address-modulus
```
Chapter 115
DLCI Configuration Mode Commands

The DLCI configuration mode provides the commands to configure, bind and manage the DLCI associated with a specific port defined in the parent configuration mode, Channelized Port configuration mode.

**Mode**

Exec > Global Configuration > Channelized Port Configuration > DLCI Configuration

`configure > port channelized slot_number/port_number > dlci path path_id { ds1 | e1 } num_con dlci dlci_id`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number-dlci-path_id/framing- timeslot/dlci_id)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
bind link

This command configures an association (binds) between an IP interface or a pre-configured routing SS7/Frame Relay link and the specific port being configured with the Channelized Port configuration commands.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Channelized Port Configuration > DLCI Configuration

configure > port channelized slot_number/port_number > dlci path path_id { dsl | e1 }
num_con dlci dlci_id

Entering the above command sequence results in the following prompt:

[local] host_name(config-port-slot_number/port_number-dlci-path_id/framing-timeslot/dlci_id)#

Syntax

[ no ] bind link peer-nsei nse_id ns-vci ns-vc_id

peer-nsei nse_id
Defines the end-point network service entity identifier (NSEI). The NSEI must be an integer from 0 to 65535.

ns-vc-id ns-vc_id
Defines the network service virtual circuit identifier (NSVCI). The NSVCI must be an integer from 0 to 65535.

no
Deletes the bind configuration from the Operator Policy.

Usage

Bind this port to network service entity 2 and network service VC 234.

Example

bind link peer-nsei 2 ns-vci 234
end

Exits this sub-configuration mode and returns to the Exec mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

`end`

**Usage**
Change the mode and return to the Exec mode.
exit

Exits the this sub-configuration mode and returns to the parent configuration mode.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Return to the previous configuration mode.
shaping

Defines egress traffic shaping to control flow for this DLCI.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Channelized Port Configuration > DLCI Configuration

configure > port channelized slot_number/port_number > dlci path path_id { ds1 | e1 }

num_con dlci dlci_id

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number-dlci-path_id/framing-
timeslot/dlci_id)#

Syntax

shaping type

default shaping

shaping type

The following types of shaping provide flow management:

• cir: Committed Info Rate
• cir-eir: Committed Info Rate with Excess Rate
• ppr: Peak Packet Rate
• wfq: Weighted Fair Queuing

default

Resets the DLCI configuration to the system default.

Usage

Use this command to identify the type of signal shaping to be used on the DLCI.

Example

shaping cir
shutdown

Terminates all processes supporting the port or blocks the shutting down of the port. Conversely, this command with the no keyword enables the port.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Channelized Port Configuration > DLCI Configuration

configure > port channelized slot_number/port_number > dlci path path_id { dsl | e1 }
num_con dlci dlci_id

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number-dlci-path_id/framing-timeslot/dlci_id)#

Syntax

[ no ] shutdown

no

Enables the port’s administrative state. When omitted the card is shutdown (removed from service).

Usage
Shut down a port prior to re-cabling and/or other maintenance activities. This command with the no keyword is required to bring a port into service.

Example
Use the following command to disable the DLCI:

no shutdown
Chapter 116
DNS Client Configuration Mode Commands

The DNS Client Configuration Mode is used to manage the system’s DNS interface and caching parameters.

Mode
Exec > Global Configuration > Context Configuration > DNS Client Configuration
configure > context context_name > dns-client client_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dns-client)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
bind

Binds the DNS client to a pre-configured logical IP interface.

**Product**
- MME
- SCM
- SGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > DNS Client Configuration
```
configure > context context_name > dns-client client_name
```

Entering the above command sequence results in the following prompt:
```
[context_name] host_name(config-dns-client)#
```

**Syntax**
```
bind { address ip_address [ port number ] | query-over-gtp }
no bind address
```

**Usage**
Use this command to associated the client with a specific logical IP address.

**Example**
The following command binds the DNS client to a logical interface with an IP address of 10.2.3.4 and a port number of 6000:
```
bind address 10.2.3.4 port 6000
```
cache algorithm

Configures the method of use for the DNS VPN and session cache.

Product
MME
SCM
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > DNS Client Configuration

Syntax

```
cache algorithm { central | local } { FIFO | LRU | LFU }
default cache algorithm { central | local }
```

Usage
Use this command to configure the method by which entries are added and removed from the DNS cache.

Example

The following command configures the cache algorithm for the central proclet to least frequently used (LFU):

```
cache algorithm central lfu
```
cache size

Configures the maximum number of entries allowed in the DNS cache.

Product

MME
SCM
SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > DNS Client Configuration

configure > context context_name > dns-client client_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dns-client)#

Syntax

```
cache size { central | local } max_size

default cache size { central | local }
```

default

Sets the maximum number of entries allowed in the DNS cache to default setting.

```
{ central | local } max_size

central max_size: Specifies the maximum number of entries allowed in the central proclet cache as an integer from 100 through 65535. Default: 50000.
local max_size: Specifies the maximum number of entries allowed in the local proclet cache as an integer from 100 through 65535. Default: 1000.
```

Usage

Use this command to configure the maximum number of entries allowed in the DNS cache.

Example

The following command configures the cache size of the central proclet to 20000:

```
cache size central 20000
```
cache ttl

Configures the DNS cache time to live (TTL) for positive and negative responses.

**Product**
- MME
- SCM
- SGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > DNS Client Configuration
```
configure > context context_name > dns-client client_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dns-client)#
```

**Syntax**
```
cache ttl { negative | positive } seconds
default cache ttl { negative | positive }
no cache [ ttl { negative | positive } ]
```

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disables any or all configured DNS cache parameters.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sets the DNS cache time to live for positive and negative responses to the default setting.</td>
</tr>
</tbody>
</table>

```
{ negative | positive } seconds
negative seconds: Specifies the time to live for negative responses as an integer from 60 through 86400. Default: 60.
positive seconds: Specifies the time to live for positive responses. as an integer from 60 through 86400. Default: 86400 (1 day).
```

**Usage**
Use this command to adjust the DNS cache time to live.

**Example**
The following commands set the TTL DNS cache to 90 seconds for negative responses and 43200 seconds for positive responses:
```
cache ttl negative 90
```
```
cache ttl positive 43200
```
**case-sensitive**

Configures the case sensitivity requirement for responses to DNS requests.

**Product**

MME  
SCM  
SGSN

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > DNS Client Configuration  
*configure > context context_name > dns-client client_name*

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-dns-client)#
```

**Syntax**

```
[ default | no ] case-sensitive response
```

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns the command to its default setting of disabled.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disables the requirement for case sensitivity in DNS responses.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>case-sensitive response</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enables the requirement for case sensitivity in DNS responses.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to require case sensitivity (identical case usage between request and response) on all responses to DNS request messages.
description

Allows you to enter descriptive text for this configuration.

Product
All

Privilege
Security Administrator, Administrator

Syntax

description text

no description

no

Clears the description for this configuration.

text

Enter descriptive text as an alphanumeric string of 1 to 63 characters. If you include spaces between words in the description, you must enclose the text within double quotation marks (" "), for example, "AAA BBBB".

Usage

The description should provide useful information about this configuration.
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
resolver

Configures the number of DNS query retries and the retransmission interval once the response timer expires.

Product
MME
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > DNS Client Configuration
configure > context context_name > dns-client client_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-dns-client)#

Syntax
resolv ery { number-of-retries retries | retransmission-interval time }
default { number-of-retries | retransmission-interval }

default
Resets the specified resolver configuration to the default.

number-of-retries retries
Configures the number of DNS query retries on DNS response timeout as an integer from 0 through 4. Default: 2.

retransmission-interval time
Configures the initial retransmission interval (in seconds) for retransmission after the DNS response timeout as an integer from 2 to 5. Default is 3 seconds. The retransmission interval doubles after each retry when only one server is configured. In case both primary and secondary servers are configured, the retransmission time is doubled for the last retry.

Usage
Set the DNS retransmission retries or the retransmission interval. Issue the command twice to configure both parameters, one-at-a-time.

Example
The following command sets the DNS resolver retries to 4:

    resolver number-of-retries 4
**round-robin answers**

Configures the DNS client to return the DNS results in round-robin fashion if multiple results are available for a DNS query.

**Product**

MME
SGSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > DNS Client Configuration

```
configure > context context_name > dns-client client_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-dns-client)#
```

**Syntax**

```
[ no | default ] round-robin-answers
```

- **no**
  Removes the configured round robin method for DNS answer.

- **default**
  Disables the round robin method for DNS answer.

- **round-robin-answers**
  Enables the round robin method for DNS answer.

**Usage**

Use this command to configure the DNS client to return the DNS results in round-robin fashion if multiple results are available for a DNS query.

**Example**

The following command configures the DNS client to use round robin method for DNS query answers:

```
default ] round-robin-answers
```
The DSCP Template Configuration Mode provides the commands to configure DSCP marking for control packets and data packets for Gb over IP. Any number of DSCP templates can be generated in the SGSN Global configuration mode and then a template can be associated with one or more GPRS Services via the commands in the GPRS Service configuration mode.

**Mode**

Exec > Global Configuration > SGSN Global Configuration > DSCP Template Configuration

configure > context context_name > sgsn-global > dscp-template template_name

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dscp-template-template_name)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
control-packet

Configures the different code point marking (DSCP) value for 3GPP quality of service (QoS) class downlink control packets.

Product

SGSN
HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > SGSN Global Configuration > DSCP Template Configuration

configure > context context_name > sgsn-global > dscp-template template_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-dscp-template-template_name)#

Syntax

control-packet qos-dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | cs1 | cs2 | cs3 | cs4 | cs5 | cs6 | cs7 | ef }

default control-packet

default

Resets the quality of service (QoS) DSCP setting to the ‘BE’ (best effort) default value.

DSCP marking option

Select one of the following downlink DSCP options for the control packets:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>af11</strong>: Assured Forwarding 11 per-hop-behavior (PHB)</td>
<td><strong>be</strong>: Best Effort for Forwarding</td>
</tr>
<tr>
<td><strong>af12</strong>: Assured Forwarding 12 PHB</td>
<td><strong>cs1</strong>: Class Selector 1 PHB</td>
</tr>
<tr>
<td><strong>af13</strong>: Assured Forwarding 13 PHB</td>
<td><strong>cs2</strong>: Class Selector 2 PHB</td>
</tr>
<tr>
<td><strong>af21</strong>: Assured Forwarding 21 PHB</td>
<td><strong>cs3</strong>: Class Selector 3 PHB</td>
</tr>
<tr>
<td><strong>af22</strong>: Assured Forwarding 22 PHB</td>
<td><strong>cs4</strong>: Class Selector 4 PHB</td>
</tr>
<tr>
<td><strong>af23</strong>: Assured Forwarding 23 PHB</td>
<td><strong>cs5</strong>: Class Selector 5 PHB</td>
</tr>
<tr>
<td><strong>af31</strong>: Assured Forwarding 31 PHB</td>
<td><strong>cs6</strong>: Class Selector 6 PHB</td>
</tr>
<tr>
<td><strong>af32</strong>: Assured Forwarding 32 PHB</td>
<td><strong>cs7</strong>: Class Selector 7 PHB</td>
</tr>
<tr>
<td><strong>af33</strong>: Assured Forwarding 33 PHB</td>
<td><strong>ef</strong>: Expedited forwarding PHB</td>
</tr>
</tbody>
</table>
**DSCP Template Configuration Mode Commands**

- **af41:** Assured Forwarding 41 PHB
- **af42:** Assured Forwarding 42 PHB
- **af43:** Assured Forwarding 43 PHB

**Usage**

This command configures the QoS DSCP marking type for downlink control packets.

**Related commands for SGSN:**

- To create/delete a DSCP template, use the `dscp-template` in the SGSN Global configuration mode (see the *SGSN Global Configuration Mode Commands* section).
- To associate a specific DSCP template with a specific GPRS service configuration, use the `associate-dscp-template downlink` documented in the *GPRS Service Configuration Mode Commands* section.
- To check values configured for DSCP templates, use the `show sgsn-mode` command documented in the *Exec Mode Commands* section.

**Related commands for HNB-GW:**

- To create/delete a DSCP template, use the `dscp-template` in the *SGSN Global Configuration Mode*.
- To associate a specific DSCP template with a system for a PSP instance in SS7 routing domain, use `associate-dscp-template downlink` documented in the *SGSN PSP Configuration Mode Commands* section.

**Example**

Use a command similar to the following to set expedited forward per-hop behavior for the downlink control packets:

```
control-packet qos-dscp ef
```

Use the following command to reset the default best effort per-hop behavior:

```
default control-packet
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```text
exit
```

**Usage**

Use this command to return to the parent configuration mode.
data-packet

Configures the diffserv code point marking (DSCP) value for 3GPP quality of service (QoS) class downlink data packets.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SGSN Global Configuration > DSCP Template Configuration

`configure > context context_name > sgsn-global > dscp-template template_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dscp-template-template_name)#
```

**Syntax**

```
control-packet { background | conversationa | interactive { priority1 | priority2 | priority3 } | streaming } qos-dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | cs1 | cs2 | cs3 | cs4 | cs5 | cs6 | cs7 | ef }

default data-packet { background | conversationa | interactive { priority1 | priority2 | priority3 } | streaming }
```

default

Resets the quality of service (QoS) DSCP setting to the be (best effort) default value.

**Background | Conversationa | Interactive | Streaming**

Select the QoS traffic class of service for the downlink data packets.

**Priority1 | Priority2 | Priority3**

Select the traffic handling priority to be applied to the specified traffic class.

**DSCP Option**

Select one of the following DSCP settings for the selected traffic class. Default is best effort (be) for all traffic classes settings.

<table>
<thead>
<tr>
<th>DSCP Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>af11: Assured Forwarding 11 per-hop-behavior (PHB)</td>
<td>• be: Best Effort for Forwarding</td>
</tr>
<tr>
<td>af12: Assured Forwarding 12 PHB</td>
<td>• cs1: Class Selector 1 PHB</td>
</tr>
<tr>
<td>af13: Assured Forwarding 13 PHB</td>
<td>• cs2: Class Selector 2 PHB</td>
</tr>
<tr>
<td>af21: Assured Forwarding 21 PHB</td>
<td>• cs3: Class Selector 3 PHB</td>
</tr>
<tr>
<td>af22: Assured Forwarding 22 PHB</td>
<td>• cs4: Class Selector 4 PHB</td>
</tr>
</tbody>
</table>
## Usage

This command configures the QoS DSCP marking type for downlink data packets. DSCP levels indicate how packets are to be handled.

**Related commands:**
- To create/delete a DSCP template, use the `dscp-template` in the SGSN Global configuration mode (see the *SGSN Global Configuration Mode Commands* section).
- To associate a specific DSCP template with a specific GPRS service configuration, use the `associate-dscp-template downlink` documented in the *GPRS Service Configuration Mode Commands* section.
- To check values configured for DSCP templates, use the `show sgsn-mode` command documented in the *Exec Mode Commands* section.

**Example**

Use a command similar to the following to set expedited forward per-hop behavior for the downlink control packets:

```
control-packet qos-dscp ef
```

Use the following command to reset the default best effort per-hop behavior:

```
default control-packet
```
Chapter 118
EAP Authentication Configuration Mode Commands

The EAP Authentication Configuration Mode is used to configure the Extensible Authentication Protocol (EAP) authentication methods for the crypto template.

Mode

Exec > Global Configuration > Context Configuration > Crypto Template Configuration > EAP Authentication Configuration

configure > context context_name > crypto template template_name ikev2-dynamic > authentication eap-profile profile_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(cfg-crypto-tmpl-ikev2-tunnel)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
eap-aka

Configures shared key values for the Extensible Authentication Protocol-Authentication and Key Agreement (EAP-AKA) authentication method used by subscribers using this crypto template.

**Product**
PDIF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Crypto Template Configuration > EAP Authentication Configuration

```
configure > context context_name > crypto template template_name ikev2-dynamic >
authentication eap-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(cfg-crypto-tmpl-ikev2-tunnel)#
```

**Syntax**

```
eap-aka { encrypted key hex | key hex }
```

- **encrypted key hex**
  Specifies that the shared key is to be encrypted as a 16-character alphanumeric string or a hexadecimal number beginning with “0x”.

- **key hex**
  Specifies that the shared key is to be transmitted in clear text as a 16-character alphanumeric string or a hexadecimal number beginning with “0x”.

**Usage**
Use this command to set shared key parameters for subscribers using the EAP-AKA authentication method.

**Example**
The following command configures a clear-text shared key value for the EAP-AKA method:

```
eap-aka key a1223344556677
```
eap-gtc

Configures shared key values for the EAP-GTC authentication method used by subscribers using this crypto template.

**Product**

PDIF
ASN-GW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Crypto Template Configuration > EAP Authentication Configuration

```bash
configure > context context_name > crypto template template_name ikev2-dynamic > authentication eap-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(cfg-crypto-tmpl-ikev2-tunnel)>
```

**Syntax**

```bash
eap-gtc { encrypted key value | key value }
```

- **encrypted key value**
  Specifies that the shared key is to be encrypted as a 16-character alphanumeric string.

- **key value**
  Specifies that the shared key is to be transmitted in clear text as a 16-character alphanumeric string.

**Usage**

Use this command to set shared key parameters for subscribers using the EAP-GTC authentication method.

**Example**

The following command configures a clear-text shared key value for the EAP-GTC method:

```bash
eap-GTC key aa12345678
```
eap-md5

Configures shared key values for the EAP-MD5 authentication method used by subscribers using this crypto template.

Product

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Crypto Template Configuration > EAP Authentication
Configuration

configure > context context_name > crypto template template_nameikev2-dynamic >
authentication eap-profile profile_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(cfg-crypto-tmpl-ikev2-tunnel)#

Syntax

eap-md5 { encrypted key value | key value }

encrypted key value
Specifies that the shared key is to be encrypted as a 16-character alphanumeric string.

key value
Specifies that the shared key is to be transmitted in clear text as a 16-character alphanumeric string.

Usage
Use this command to set shared key parameters for subscribers using the EAP-MD5 authentication method.

Example
The following command configures a clear-text shared key value for the EAP-MD5 method:

eap-md5 key aa11223344556677
**end**

Exits the current configuration mode and returns to the Exec mode.

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
max-retry

Configures the maximum number of times the system will retry communicating with another EAP device.

Product
PDIF
ASN-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > EAP Profile Configuration
configure > context context_name > eap-profile profile_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(cfg-ctx-eap-profile)#

Syntax

max-retry num

default max-retry

max-retry num

Specifies the number of times to retry EAP communication with another device as an integer from 1 to 65535. Default: 16

Usage
Use this command to set a maximum retry number for communicating with other EAP devices.

Example

The following command sets the maximum number of retries to 50:

max-retry 50
mode

Configures the system as one of three types of EAP devices: authenticator pass-through, authenticator server, or peer.

Product
PDIF
ASN-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > EAP Profile Configuration
configure > context context_name > eap-profile profile_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(cfg-ctx-eap-profile)#

Syntax

mode { authenticator-pass-through | authenticator-server | peer }

default mode

default
Configures the default mode of Authenticator-pass-through.

authenticator-pass-through
Configures the system as an authenticator pass-through allowing EAP authentication to be performed by another server.
This is the default setting for this command.

authenticator-server
Configures the system as an authenticator server. This allows the system to respond to EAP requests.

peer
Configures the system as a peer device requiring it to make EAP requests of another server or pass-through device.

Usage
Use this command to configure the system to perform as one of three types of EAP devices and configure settings in an EAP mode.
EAP Mode Configuration Mode commands are defined in the EAP Mode Configuration Mode Commands chapter.

Example
The following command configures the system to perform as an authenticator pass-through:

    mode authenticator-pass-through
Chapter 120
EAP Mode Configuration Mode Commands

The EAP Mode Configuration Mode is used to configure the Extensible Authentication Protocol (EAP) authentication method supported by the system.

Mode

Exec > Global Configuration > Context Configuration > EAP Profile Configuration

configure > context context_name > eap-profile profile_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(cfg-ctx-eap-profile)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
method

Configures the EAP method used for authentication.

Product
PDIF
ASN-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > EAP Profile Configuration

configure > context context_name > eap-profile profile_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(cfg-ctx-eap-profile)#

Syntax

method { eap-aka | eap-gtc | eap-md5 } [ priority num ]

eap-aka | eap-gtc | eap-md5

Specifies one of the following methods:

• **eap-aka**: Specifies that the EAP-AKA method is to be used for authentication.

• **eap-gtc**: Specifies that the EAP-GTC method is to be used for authentication.

• **eap-md5**: Specifies that the EAP-MD5 method is to be used for authentication.

priority num

Specifies a priority order for a specific EAP authentication method an integer from 1 though 65535.

Usage

Use this command to specify the EAP authentication method(s) to use and to place multiple methods in priority order.

Example

The following command sets EAP-AKA as one of the EAP authentication methods and places it as priority of 3:

```bash
method eap-aka priority 3
```
Chapter 121
EDR Format Configuration Mode Commands

The EDR Format Configuration Mode enables configuring Event Data Record (EDR) formats.

**Mode**

Exec > ACS Configuration > EDR Format Configuration

`active-charging service service_name > edr-format format_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-acs-edr)#`

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
attribute

This command allows you to specify the fields and their order in EDRs.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > ACS Configuration > EDR Format Configuration

active-charging service service_name > edr-format format_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-acs-edr)#

Syntax

downlink | uplink } ] priority priority ]

no attribute attribute [ { ip | tcp } { bytes | pkts } { downlink | uplink } ] [ priority 
priority ]

If added previously, removes the specified attribute from the EDR format.

attribute

Specifies the attribute. attribute must be one of the following:

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bandwidth-policy</td>
<td>This attribute reports the bandwidth policy name of subscriber. Bandwidth</td>

| sn-cf-category-classification-used | For Category-based Content Filtering, this attribute reports the last classification used by system for the flow, or blank if classification was never successfully performed.  
|                                  | For URL Blacklisting, specifies category of the blacklisted URL in the Blacklist database.                                                   |
| sn-cf-category-flow-action       | For Category-based Content Filtering, this attribute reports the last action taken for the flow, or blank if content filtering was never performed. The following are the possible values:  
|                                  | • allow  
|                                  | • content-insert  
|                                  | • discard  
|                                  | • redirect-url  
|                                  | • terminate-flow  
|                                  | For URL Blacklisting, this attribute reports the last action taken for the flow, or blank if Blacklist matching was never performed. The following are the possible values:  
|                                  | • discard  
|                                  | • terminate-flow  
|                                  | • redirect-url  
|                                  | • www-reply-code-terminate-flow  |
| sn-cf-category-policy            | For Category-based Content Filtering, this attribute reports the category policy identifier that was used for the flow, or blank if content filtering was never attempted for the flow. |
| sn-cf-category-rating-type       | For Category-based Content Filtering, this attribute reports the type, either “static” or “dynamic” that was last successfully performed for the flow, or blank if content filtering was never successful for the flow.  
|                                  | For URL Blacklisting, specifies “blacklisting”.                                                                                           |
| sn-cf-category-unknown-url       | This attribute reports the identifier for unknown URL under content filtering action. It holds either “1” for unknown URLs or “0” for the URLs having static rating in its database. |
| sn-charge-volume                 | This attribute reports the total charge volume excluding bytes/packets dropped/retransmitted by ECS.  
<p>|                                  | This behavior can be changed by configuring to allow dropped/retransmitted bytes/packets to be included in the net volume. See the edr sn-charge-volume command in the ACS Rulebase Configuration Mode Commands chapter. |</p>

<td>This attribute reports IP address of the Foreign Agent (FA).</td>
</tr>
<tr>
<td>sn-filler-blank</td>
<td>This attribute inserts a blank filler field, generates an empty EDR field.</td>
</tr>
<tr>
<td>sn-filler-zero</td>
<td>This attribute inserts a “0” in the EDR field.</td>
</tr>
<tr>
<td>Attributes</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>sn-flow-end-time</td>
<td>This attribute reports the time of flow-end EDR generation—when EDRs are generated at hagr, session-end, timeout, or normal-end-signaling conditions. sn-start-time and sn-end-time fields of flow end-condition EDRs cannot be used to determine the duration of the flow if intermediate EDRs are generated (rule-match or transaction-complete or any other intermediate EDR). sn-start-time field in an EDR gives the time the first packet was received after the last EDR was generated. So, whenever an EDR is generated, this field is reset to the time the EDR gets generated. So the sn-start-time field in flow end-condition EDRs may not have the time of the first packet received on that flow. It will have the time at which the last EDR was generated or the first packet time if no EDR was generated for that flow. sn-end-time field gives the time at which the last packet on the flow was received. Flow end-condition EDRs may not be generated immediately after receiving the last packet. For example, in case of session-end or timeout EDRs, last packet time and EDR generation time may be different. sn-flow-start-time gives the time of the first packet of the flow (irrespective of whether intermediate EDRs were generated), and sn-flow-end-time gives the time when EDRs are generated at haigr, session-end, timeout or normal-end-signaling conditions. The values of these fields will be populated in EDRs only for haigr, session-end, timeout and normal-end-signaling EDRs.</td>
</tr>
<tr>
<td>sn-flow-id</td>
<td>This attribute reports the flow-id assigned internally by the ECS module to each flow.</td>
</tr>
<tr>
<td>sn-flow-start-time</td>
<td>This attribute reports the time of the first packet of the flow (irrespective of whether intermediate EDRs were generated). Also see, sn-flow-end-time.</td>
</tr>
<tr>
<td>sn-format-name</td>
<td>This attribute reports the name of the EDR/UDR format used.</td>
</tr>
<tr>
<td>sn-group-id</td>
<td>This attribute reports the sequence group ID of the record.</td>
</tr>
<tr>
<td>sn-ha-ip-address</td>
<td>This attribute reports IP address of the Home Agent (HA).</td>
</tr>
<tr>
<td>sn-ip-protocol-name</td>
<td>This attribute reports the IP protocol name for the flow. For IANA registered IP Protocol (Layer 4 Protocol) name, like TCP, UDP, AH, ESP, ICMP, etc.</td>
</tr>
<tr>
<td>sn-nat-binding-timer</td>
<td>For Network Address Translation (NAT) in-line service, this attribute reports the port chunk hold timer.</td>
</tr>
<tr>
<td>sn-nat-gmt-offset</td>
<td>For NAT in-line service, this attribute reports the GMT offset of the node generating NAT bind record.</td>
</tr>
<tr>
<td>sn-nat-ip</td>
<td>For NAT in-line service, this attribute reports the NAT IP address of the port chunk.</td>
</tr>
<tr>
<td>sn-nat-last-activity-time-gmt</td>
<td>For NAT in-line service, this attribute reports the time when the last flow in a specific NAT set of flows was seen.</td>
</tr>
<tr>
<td>sn-nat-no-port-packet-dropped</td>
<td>For NAT in-line service, this attribute reports the number of packets dropped because of no NAT IP/port.</td>
</tr>
<tr>
<td>sn-nat-port-block-end</td>
<td>For NAT in-line service, this attribute reports the last port number of the port chunk.</td>
</tr>
<tr>
<td>sn-nat-port-block-start</td>
<td>For NAT in-line service, this attribute reports the starting port number of the port chunk.</td>
</tr>
<tr>
<td>sn-nat-port-chunk-alloc-dealloc-flag</td>
<td>For NAT in-line service, this attribute reports whether the port chunk is allocated or released.</td>
</tr>
<tr>
<td>sn-nat-port-chunk-alloc-time-gmt</td>
<td>For NAT in-line service, this attribute reports when the port chunk was allocated.</td>

## Attributes

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn-nat-port-chunk-dealloc-time-gmt</td>
<td>For NAT in-line service, this attribute reports when the port chunk was released.</td>
</tr>
<tr>
<td>sn-nat-realm-name</td>
<td>For NAT in-line service, this attribute reports the name of the NAT realm.</td>
</tr>
<tr>
<td>sn-nat-subscribers-per-ip-address</td>
<td>For NAT in-line service, this attribute reports the subscriber(s) per NAT IP address.</td>
</tr>
</tbody>
</table>
| sn-ocs-server-reachable | This attribute indicates the state of the OCS server. This attribute supports the following values:  
  - OCS_SERVER_NOT_APPLICABLE = 0  
  - OCS_SERVER_UNREACHABLE = 0 + 1  
  - OCS_SERVER_REACHABLE = 0 + 2 |
| sn-parent-protocol | This attribute reports the parent protocol of the flow.  
An integer value like in sn-app-protocol; for RTCP/RTP flows, the parent protocol may be RTSP or SIP; for GRE flows, the parent protocol will be PPTP, and so on. |
<p>| sn-port-service-name | This attribute reports the registered name for the server port. For IANA registered/Well Known Transport Port name mapping for the Server Port like SSL, HTTP, DNS, FTP, TELNET, SSH, Diablo, Rainbow six, UnReal_UT etc. This port service name mapping is done based on the Server port, which means if the flow is &quot;FromMobile&quot;, the sn-server-port is mapped as the service name port. If the flow is &quot;ToMobile&quot;, the sn-subscriber-port is mapped as the service name. |
| sn-rulebase | This attribute reports the name of the ECS rulebase applied. |
| sn-rating-group | This attribute reports the rating group corresponding to last charging action matched. |
| <strong>Important</strong>: This attribute configuration currently supports only static and predefined rules and ruledefs. It will NOT be supported for dynamic rules installed by PCRF. |
| sn-sequence-no | This attribute reports the unique sequence number (per sn-sequence-group and radius-nas-ip-address) of EDR identifier and linearly increasing in EDR file. |
| sn-server-port | This attribute reports the TCP/UDP port number of the server in a subscriber’s data flow. |
| sn-service-id | This attribute reports the Service ID corresponding to last charging action matched. |
| <strong>Important</strong>: This attribute configuration currently supports only static and predefined rules and ruledefs. It will NOT be supported for dynamic rules installed by PCRF. |
| sn-start-time [ format format ] localtime | This attribute reports the timestamp for last packet of flow in UTC. |
| sn-subscriber-imsi | This attribute reports the IMSI number of the subscriber. |
| sn-subscriber-nat-flow-ip | For NAT in-line service, this attribute reports the NAT IP address of NAT-enabled subscriber. |</p>
<table>
<thead>
<tr>

<td>For NAT in-line service, this attribute generates the subscriber IPv6 prefix in the NBR.</td>
</tr>
<tr>
<td>transaction-downlink-bytes</td>
<td>This attribute reports the total downlink bytes for the transaction.</td>
</tr>
<tr>
<td>transaction-downlink-packets</td>
<td>This attribute reports the total downlink packets for the transaction.</td>
</tr>
<tr>
<td>transaction-uplink-bytes</td>
<td>This attribute reports the total uplink bytes for the transaction.</td>
</tr>
<tr>
<td>transaction-uplink-packets</td>
<td>This attribute reports the total uplink packets for the transaction.</td>
</tr>
</tbody>
</table>

Specifies the timestamp format.

**localtime**

Specifies timestamps with the local time. By default, timestamps are displayed in GMT/UTC.

{ ip | tcp } { bytes | pkts } { downlink | uplink }

Specifies bytes/packets sent/received from/by mobile.
priority priority

Specifies the position priority of the value within the EDR record. Lower numbered priorities (across all attribute, event-label, and rule-variable) occur first. priority must be an integer from 1 through 65535. Up to 50 position priorities (across all attribute, event-label, and rule-variable) can be configured.

Usage

Use this command to set the attributes and priority for EDR file format. A particular field in EDR format can be entered multiple times at different priorities. While removing the EDR field using the no attribute command either you can remove all occurrences of a particular field by specifying the field name or a single occurrence by additionally specifying the optional priority keyword.

Example

The following is an example of this command:

    attribute radius-user-name priority 12
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Use this command to return to the Exec mode.
event-label

This command allows you to specify an optional event label/identifier to be used as an attribute in the EDRs.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > ACS Configuration > EDR Format Configuration

active-charging service service_name > edr-format format_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-acs-edr)#

Syntax

event-label event_label priority priority

no event-label

no

If previously configured, removes the event label configuration.

event_label

Specifies the event label/identifier to be used as EDR attribute.

event_label must be an alphanumeric string of 1 through 63 characters.

priority priority

Specifies the Comma Separated Value (CSV) position of the attribute (label/identifier) in the EDR.

priority must be an integer from 1 through 65535.

Usage

Use this command to configure an optional event label/identifier as an attribute in the EDR and its position in the EDR.

Example

The following is an example of this command:

   event-label radius_csv1 priority 23
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
**rule-variable**

This command allows you to specify fields and their order in EDRs.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > ACS Configuration > EDR Format Configuration

`active-charging service service_name > edr-format format_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-acs-edr)#
```

**Syntax**

```
rule-variable rule_variable priority priority [ in-quotes ]

no rule-variable rule_variable [ priority priority ]
```

If previously configured, removes the specified rule variable configuration.

```
rule_variable
```

Specifies the rule variable for the EDR format.

**rule_variable** must be one of the following options:

- **bearer 3gpp**: 3GPP bearer-related fields:
  - **charging-id**: Charging ID of the bearer flow
  - **imei**: IMEI or IMEISV (depending on the case) associated with the bearer flow. Only available in StarOS 8.1 and later releases.
  - **imsi**: Specific Mobile Station Identification number.
  - **rat-type**: RAT type associated with the bearer flow. Only available in StarOS 8.1 and later releases.
  - **sgsn-address**: SGSN associated with the bearer flow. Only available in StarOS 8.1 and later releases. For MIPv6 calls, sgsn-address field is populated with HSGW address.
  - **user-location-information**: User location information associated with the bearer flow. Only available in StarOS 8.1 and later releases.

- **bearer 3gpp2**: 3GPP2 bearer-related fields:
  - **always-on**: 3GPP2 always on indicator
  - **bsid**: 3GPP2 BSID
  - **esn**: 3GPP2 ESN
  - **ip-qos**: 3GPP2 IP QoS
• **ip-technology**: 3GPP2 IP technology
• **release-indicator**: 3GPP2 release indicator
• **service-option**: 3GPP2 service option
• **session-begin**: 3GPP2 session begin indicator
• **session-continue**: 3GPP2 session continue indicator

- **bearer ggsn-address**: GGSN IP address field. For MIPv6 calls, ggsn-address field in EDR will be populated with PGW address.

- **dns**: Domain Name System (DNS) related fields:
  - **answer-name**: DNS answer name. This depends upon query type.
  - **previous-state**: DNS previous state information
  - **query-name**: DNS query name
  - **return-code**: DNS query response code
  - **state**: DNS current state information
  - **tid**: DNS Transaction Identifier

- **file-transfer**: File Transfer related fields:
  - **chunk-number**: Number of chunks
  - **current-chunk-length**: Length of current chunk
  - **declared-chunk-length**: Declared size of the chunk
  - **declared-file-size**: Declared size of the file
  - **filename**: Name of the file being transferred
  - **previous-state**: Previous state of session
  - **state**: Current state of session
  - **transferred-file-size**: Transferred size of the file

- **flow**: Flow related fields:
  - **tethered**: Tethering detected on flow. Enables/disables tethering detection result field in EDRs sent to MUR.

- **ftp**: File Transfer Protocol (FTP) related fields:
  - **client-ip-address**
  - **client-port**
  - **command name**: Command sent
  - **connection-type**
  - **filename**: File name being transferred in any of the FTP-related FTP command
  - **pdu-length**: FTP PDU length
  - **pdu-type**
  - **previous-state**: Previous state of FTP session
  - **reply code**
  - **server-ip-address**
- `server-port`
- `session-length`: Total length of FTP session
- `state`: Current state of FTP session
- `url`: URL of file
- `user`: User identifier

**http**: Hypertext Transport Protocol (HTTP) related fields:
- `attribute-in-data`: dynamic header field in application payload
- `attribute-in-url`: dynamic header field in URL
- `content disposition`
- `content length`
- `content type`
- `cookie`: HTTP cookie header
- `domain`
- `header-length`: HTTP header length
- `host`
- `payload-length`: Payload length
- `pdu-length`
- `previous-state`: Previous state of session
- `referer`
- `reply code`: HTTP response
- `request method`: HTTP request method
- `session-length`: Total length of HTTP session
- `state`: Current state of session
- `transaction-length`: Total length of HTTP transaction
- `transfer-encoding`: Transfer encoding
- `uri`: Uniform Resource Identifier
- `url`: Uniform Resource Locator

**length size**: This optional filter allows the user to configure the HTTP URL length from 1 to 4095. The EDR rule-variable “HTTP URL” supports the maximum length of 4095. That is, any URL greater than the maximum length is truncated and then written to EDR.

In 17.0 and later releases: The length of HTTP URL is from 1 to 4095.
In 15.0 and 16.0 releases: The length of HTTP URL is from 1 to 255.
In releases prior to 15.0: The length of HTTP URL is from 1 to 127.

**user-agent**

**length size**: This optional filter allows the user to configure the HTTP User-Agent length from 1 to 255. In releases prior to 15.0, the EDR rule-variable “HTTP User-Agent” supports the maximum length of 127. That is, any user-agent greater than 127 is truncated and then written to EDR.
- **version**
- **x-header**: extension header

**icmp**: Internet Control Message Protocol (ICMP) related fields:
- **code**: ICMP code
- **type**: ICMP type

**icmpv6**: Internet Control Message Protocol Version 6 (ICMPv6) related fields:
- **code**: ICMPv6 code
- **type**: ICMPv6 type

**imap**: Internet Message Access Protocol (IMAP) related fields:
- **cc**: IMAP e-mail CC field
- **command**: IMAP command
- **content**
- **date**: IMAP e-mail Date field
- **final-reply**: IMAP final reply
- **from**: IMAP e-mail From field
- **mail-size**: IMAP size of e-mail in RFC822 format
- **mailbox-size**: IMAP number of e-mails in the mailbox
- **message-type**: IMAP message type
- **previous-state**: IMAP session previous state
- **session-length**: IMAP session length
- **session-previous-state**: IMAP session previous state
- **session-state**: IMAP session state
- **state**: IMAP state
- **subject**: IMAP e-mail Subject field
- **to**: IMAP e-mail To field

**ip**: Internet Protocol (IP) related fields:
- **dst-address**: destination IP address
- **protocol**: Protocol being transported by IP packet
- **server-ip-address**: IP address of server. This field in EDR contains either the IPv4 or IPv6 address of the server for a particular flow (flow level). The maximum length of this field is 48 characters. For an IPv6 address, the maximum length is 45 characters; for an IPv4 address, the maximum length is 15 characters.
- **src-address**: Source IP address
- **subscriber-ip-address**: IP address of subscriber. This field in EDR contains either the IPv4 or IPv6 address of the client/subscriber for a particular call (subscriber level). The value of this field does not change for a particular call. The maximum length of this field is 48 characters. For an IPv6 address, the maximum length is 45 characters. For an IPv4 address, the maximum length is 15 characters.
- **total-length**: Total length of packet, including payload
•version: IP version

•mms: Multimedia Message Service (MMS) related fields:
  •bcc
  •cc
  •content location
  •content type
  •date [ format { MM/DD/YYYY-HH:MM:SS | YYYY/MM/DD-HH:MM:SS } ]
  •from
  •message-size
  •previous-state
  •response status
  •state
  •subject
  •tid
  •to

•p2p: Peer-to-peer protocol related fields:
  •duration: Peer-to-peer protocol duration
  •protocol: Peer-to-peer protocol
  •protocol-group: Associated protocol group of the specific peer-to-peer protocol/application

•pop3: Post Office Protocol version 3 (POP3) related fields:
  •command name: Command of POP3 session
  •mail-size: Mail size
  •pdu-length: Length of POP3 PDU
  •pdu-type: Type of packet
  •previous-state: Previous state of POP3 session
  •reply status: Reply for the POP3 command
  •session-length: Total length of POP3 session
  •state: Current state of POP3 session
  •user-name: User of POP3 session

•rtcp: RTP Control Protocol (RTCP) related fields:
  •control-session-flow-id: Flow ID of the controlling RTSP/SIP session
  •jitter: RTCP interarrival jitter
  •rtsp-id: RTSP ID of the RTCP flow
  •uri: URI of the control protocol related to the RTCP flow

•rtp: Real-time Transfer Protocol (RTP) related fields:
  •control-session-flow-id: Flow ID of the controlling RTSP/SIP session
  •pdu-length: Length of RTP PDU
• rtsp-id: RTSP ID of the flow
• session-length: Total length of RTP session
• uri: URI of the control protocol related to the RTP flow

• rtsp: Real Time Streaming Protocol (RTSP) related fields:
  • command-id: RTSP command ID
  • content type
  • date: RTSP Date field
  • previous-state: RTSP previous state
  • reply code
  • request method 1: play method
  • request method 2: setup method
  • request method 3: pause method
  • request method 4: record method
  • request method 5: options method
  • request method 6: redirect method
  • request method 7: describe method
  • request method 8: announce method
  • request method 9: teardown method
  • request method 10: get-parameter method
  • request method 11: set-parameter method
  • request packet
  • rtp-uri: RTSP RTP-Info stream-uri field
  • session-id: RTSP session-id field
  • session-length: Total number of bytes passed through the RTSP data session
  • state: RTSP state
  • uri: RTSP uri field
  • uri sub-part
  • user-agent: RTSP user-agent field

• sdp: Session Description Protocol (SDP) related fields:
  • connection-ip-address: IP address in SDP connection field
  • media-audio-port: Port used for audio media
  • media-video-port: Port used for video media

• secure-http: HTTPS related field.
• sip: Session Initiation Protocol (SIP) related fields:
  • call-id: SIP call-id field
  • content type
  • from: SIP From field
• **previous-state**: SIP previous state
• **reply code**
• **request method**
• **request packet**
• **state**: SIP state
• **to**: SIP To field
• **uri**: SIP URI field
• **uri sub-part**

• **smtp**: Simple Mail Transfer Protocol (SMTP) related fields:
  • **command name**: Command of SMTP session
  • **mail-size**: Size of given mail
  • **pdu-length**: Length of SMTP PDU
  • **previous-state**: Previous state of SMTP session
  • **recipient**: SMTP e-mail Recipient field
  • **reply status**: Response for the SMTP command
  • **sender**: SMTP e-mail Sender field
  • **session-length**: Total length of SMTP session
  • **state**: Current state of SMTP session

• **tcp**: Transmission Control Protocol (TCP) related fields:
  • **dst-port**: TCP destination port
  • **duplicate**: TCP retransmitted/duplicate packet
  • **flag**: Current packet TCP flag
  • **os-signature**: OS signature string for IPv4 TCP flow. Enables/disables OS Signature field in EDRs sent to MUR.
  • **out-of-order**: TCP out of order packet analyzed
  • **payload-length**: TCP payload length
  • **previous-state**: Previous state of MS
  • **src-port**: TCP source port
  • **state**: Current state of MS

• **traffic-type**: Traffic type of flow (voice or non-voice depending upon flow type).

• **udp**: User Datagram Protocol (UDP) related fields:
  • **dst-port**: UDP destination port
  • **src-port**: UDP source port

• **voice-duration**: Duration of voice call, in seconds. For a flow in which voice call end is detected, output will be a non-zero value. For other flows it will be zero.

  This is no longer supported for P2P in 14.0 and later releases.

• **wsp**: Wireless Session Protocol (WSP) related fields:
**content type**
- **domain**: WSP domain name
- **host**: WSP host name
- **pdu-length**: WSP PDU length
- **pdu-type**: WSP PDU type
- **reply code**
- **session-length**: WSP total packet length
- **tid**: WSP transaction identifier
- **total-length**: WSP total packet length
- **url**: WSP URL
- **user-agent**: WSP user agent

**wtp**: Wireless Transaction Protocol (WTP) related fields:
- **gtr**: Group Transmission Flag
- **pdu-length**: PDU length of the WTP packet
- **pdu-type**: WTP protocol data unit information
- **previous-state**: WTP previous state information
- **state**: WTP current state information
- **tid**: WTP transaction identifier
- **transaction class**: WTP transaction class
- **ttr**: WTP Trailer Transmission flag

---

**Important**: For more information on protocol-based rules, see the *ACS Ruledef Configuration Mode Commands* chapter.

```
priority priority
```

Specifies the CSV position of the field (protocol rule) in the EDR.

**priority** must be an integer from 1 through 65535.

```
in-quotes
```

Specifies placing double quotes (" " ) around the specified field in the EDR.

---

**Important**: In this release, this keyword is only valid for the MMS protocol **to** and **subject** fields.

```
rule-variable mms to priority priority [in-quotes] rule-variable mms subject priority priority [in-quotes]
```

---

**Usage**

Use this command to specify what field appears in which order in the EDR.

A particular field in an EDR format can be entered multiple times with different priorities. While removing the EDR field using the **no rule-variable** command you can remove all occurrences of a particular field.
by specifying the field name or a single occurrence by additionally specifying the optional `priority` keyword.

**Example**

The following is an example of this command:

```
rule-variable tcp dst-port priority 36
```
Chapter 122
EDR Module Configuration Mode Commands

The EDR Module Configuration Mode allows you to configure Event Data Record (EDR) file transfer parameters.

Mode

Exec > Global Configuration > Context Configuration > EDR Module Configuration
configure > context context_name > edr-module active-charging-service

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-edr)#

⚠️ Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
cdr

This command allows you to configure EDR/UDR file transfer parameters.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > EDR Module Configuration

configure > context context_name > edr-module active-charging-service

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-edr)#

Syntax

cdr { purge { storage-limit storage_limit | time-limit time_limit } [ max-files max_records_to_purge ] | push-interval push_interval | push-trigger space-usage-percent trigger_percentage | remove-file-after-transfer | transfer-mode { pull [ module-only ] | push primary { encrypted-url encrypted_url | url url } [ max-files max_records ] [ max-tasks task_num ] [ module-only ] [ secondary { encrypted-secondary-url encrypted_secondary_url } [ secondary-url secondary_url ] ] [ via local-context ] + ] | use-harddisk }

default cdr [ purge | push-interval | push-trigger space-usage-percent | remove-file-after-transfer | transfer-mode [ module-only | push via ] | use-harddisk ] +

no cdr [ purge | remove-file-after-transfer | use-harddisk ] +

default

Configures the default setting for the specified keyword(s):

- **purge**: Disabled
- **push-interval**: 300 seconds
- **push-trigger**: 80 percent
- **remove-file-after-transfer**: Disabled
- **transfer mode**: Pull
- **push via**: LC is used for push
- **use-harddisk**: Disabled

**Important**: The use-harddisk keyword is available only on the ASR 5000 and ASR 5500 chassis.

no

If previously configured, disables the specified configuration:

- **purge**: Disables purging of records.
**remove-file-after-transfer**: Retains a copy of the file even after it has been pushed or pulled to another server.

**use-harddisk**: Disables data storage on the ASR 5000 SMC hard disk or ASR 5500 hard disk array.

---

**Important**: The **use-harddisk** keyword is available only on the ASR 5000 and ASR 5500 chassis.

```plaintext
purge { storage-limit storage_limit | time-limit time_limit } [ max-files max_records_to_purge ]
```

Specifies to purge/delete the EDR records based on "time" or "volume" limit. When the configured threshold limit is reached on the hard disk drive, the records that are created dynamically in the `/mnt/hd-raid/data/records/` directory are automatically deleted. Files that are manually created should be deleted manually.

- **storage-limit storage_limit**: Specifies to start deleting files when the specified megabytes of space is used for storage. `storage_limit` specifies the volume limit for the record files, in megabytes, and must be an integer from 10 through 143360.
- **time-limit time_limit**: Specifies to start deleting files older than the specified time limit. `time_limit` specifies the time limit for the record files, and must be an integer from 600 through 2592000.
- **max-files max_records_to_purge**: Specifies the maximum number of records to purge.

`max_records_to_purge` can be 0, or an integer from 1000 through 10000. If the value is set to 0, during each cycle, the records will be deleted until the purge condition is satisfied. If the value is set between 1000 and 10000, during each cycle, the records will be deleted until either the purge condition is satisfied or the number of records deleted equals the configured `max-files` value.

Default: 0

**push-interval push_interval**

Specifies the transfer interval (in seconds) to push EDR and UDR files to an external file server. `push_interval` must be an integer from 60 through 3600.

Default: 300

**push-trigger space-usage-percent trigger_percentage**

Specifies the EDR/UDR disk space utilization percentage, upon reaching which an automatic push is triggered and files are transferred to the configured external server. `trigger_percentage` specifies the EDR/UDR disk utilization percentage for triggering push, and must be an integer from 10 through 80.

Default: 80

**remove-file-after-transfer**

Specifies that the system must delete EDR/UDR files after they are transferred to the external file server.

Default: Disabled
transfer-mode { pull [ module-only ] | push primary { encrypted-url encrypted_url | url url } [ [ max-files max_records ] [ max-tasks task_num ] [ module-only ] [ secondary { encrypted-secondary-url encrypted_secondary_url | secondary-url secondary_url } ] [ via local-context ] + ]

Specifies the EDR/UDR file transfer mode—how the EDR and UDR files are transferred to an external file server.

- **pull**: Specifies that the L-ESS (for ASR 5000) or external server (for ASR 5500) is to pull the EDR files.
- **push**: Specifies that the system is to push EDR files to the configured L-ESS (for ASR 5000) or external server (for ASR 5500).
- **max-files max_records**: Specifies the maximum number of files sent per iteration based on configured file size.
  Default: 4000
- **max-tasks task_num**: Specifies the maximum number of tasks (child processes) that will be spawned to push the files to the remote server. The task_num must be an integer from 4 through 8.
  Default: 4

**Important**: Note that increasing the number of child processes will improve the record transfer rate. However, spawning more child will consume additional resource. So, this option needs to be used with proper resource analysis.

- **module-only**: Specifies that the transfer-mode is only applicable to the EDR module; if not configured it is applicable to both EDR and UDR modules. This enables to support individual record transfer-mode configuration for each module.

- **primary encrypted-url encrypted_url**: Specifies the primary URL location in encrypted format to which the system pushes the EDR files.
  encrypted_url must be the location in an encrypted format, and must be an alphanumeric string of 1 through 1024 characters.

- **primary url url**: Specifies the primary URL location to which the system pushes the EDR files.
  url must be the location, and must be an alphanumeric string of 1 through 1024 characters in the “://user:password@host:[port]/directory” format.

- **secondary encrypted-secondary-url encrypted_secondary_url**: Specifies the secondary URL location in encrypted format to which the system pushes the EDR files when the primary location is unreachable or fails.
  encrypted_secondary_url must be the secondary location in an encrypted format, and must be an alphanumeric string of 1 through 1024 characters in the “://user:password@host:[port]/directory” format.

- **secondary secondary-url secondary_url**: Specifies the secondary location to which the system pushes the EDR files when the primary location is unreachable or fails.
  secondary_url must be the secondary location, and must be an alphanumeric string of 1 through 1024 characters in the “://user:password@host:[port]/directory” format.

- **via local-context**: Configuration to select LC/SPIO for transfer of EDRs. The system pushes the EDR files via SPIO in the local context.
**use-harddisk**

**Important:** The **use-harddisk** keyword is available only on the ASR 5000 and ASR 5500 chassis.

**ASR 5000:** Specifies that on the ASR 5000 chassis the hard disk on the SMC be used to store EDR/UDR files. On configuring to use the hard disk for EDR/UDR storage, EDR/UDR files are transferred from packet processing cards to the hard disk on the SMC. Default: Disabled

**ASR 5500:** Specifies that on the ASR 5500 chassis the hard disk the FSC hard disk array be used to store EDR/UDR files. On configuring to use the hard disk for EDR/UDR storage, EDR/UDR files are transferred from DPCs to the hard disk array. Default: Disabled

+ Indicates that more than one of the previous keywords can be entered within a single command.

**Usage**

Use this command to configure how the EDRs are moved and stored. On the ASR 5000 or ASR 5500 chassis, you must run this command only from the local context. If you run this command in any other context it will fail and result in an error message.

If PUSH transfer mode is configured, the L-ESS (for ASR 5000) or external server (for ASR 5500) URL to which the EDR files need to be transferred to must be specified. The configuration allows a primary and a secondary server to be configured. Configuring the secondary server is optional. Whenever a file transfer to the primary server fails for four consecutive times, the files will be transferred to the secondary server. The transfer will switch back to the original primary server when:

- Four consecutive transfer failures to the secondary server occur.
- After switching from the primary server, 30 minutes elapses.

When changing the transfer-mode from pull to push, disable the PULL from the L-ESS (for ASR 5000) or external server (for ASR 5500) and then change the transfer mode to push. Make sure that the push server URL configured is accessible from the local context. Also, make sure that the base directory that is mentioned contains udr directory created within it.

When changing the transfer mode from push to pull, after changing, enable PULL on the L-ESS (for ASR 5000) or external server (for ASR 5500). Any of the ongoing PUSH activity will continue till all the scheduled file transfers are completed. If there is no PUSH activity going on at the time of this configuration change, all the PUSH related configuration is nullified immediately.

The **cdr use-harddisk** command is available only on the ASR 5000 and ASR 5500 chassis. This command can be run only in a context where CDRMOD is running. Configuring in any other context will result in failure with the message “Failure: Please Check if CDRMOD is running in this context or not.”

The **cdr use-harddisk** command can be configured either in the EDR or UDR module, but will be applicable to both record types. Configuring in one of the modules will prevent the configuration to be applied in the other module. Any change to this configuration must be done in the module in which it was configured, the change will be applied to both record types.

The VPNMgr can send a maximum of 4000 files to the remote server per iteration. However if the individual file size is big (say when compression is not enabled), then while transferring 4000 files SFTP operation takes a lot of time. To prevent this, the **cdr transfer-mode push** command can be configured with the keyword **max-files**, which allows operators to configure the maximum number of files sent per iteration based on configured file size.

**Example**

The following command retains a copy of the data file after it has been transferred to the storage location:
no cdr remove-file-after-transfer
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
**file**

This command allows you to configure EDR file parameters.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > EDR Module Configuration

`configure > context context_name > edr-module active-charging-service`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-edr)#
```

**Syntax**

```plaintext
file [ charging-service-name { include | omit } ] [ compression { gzip | none } ] [ current-prefix string ] [ delete-timeout seconds ] [ directory directory_name ] [ edr-format-name ] [ exclude-checksum-record ] [ field-separator { hyphen | omit | underscore } ] [ file-sequence-number rulebase-seq-num ] [ headers ] [ name file_name ] [ reset-indicator ] [ rotation [ num-records number | tariff-time minute minute_value hour hour_value | time seconds | volume bytes ] ] [ sequence-number { length | omit | padded | padded-six-length | unpadded } ] [ storage-limit limit ] [ single-edr-format ] [ time-stamp { expanded-format | rotated-format | unix-format } ] [ trailing-text string ] [ trap-on-file-delete ] [ unique-seq-num ] [ xor-final-record ] +
```

default file [ charging-service-name ] [ compression ] [ current-prefix ] [ delete-timeout ] [ directory ] [ edr-format-name ] [ field-separator ] [ file-sequence-number ] [ headers ] [ name ] [ reset-indicator ] [ rotation { num-records | tariff-time | time | volume } ] [ sequence-number ] [ storage-limit ] [ time-stamp ] [ trailing-text ] [ unique-seq-num ] +

---

**default**

Configures the default setting for the specified keyword(s).

**charging-service-name { include | omit }**

Specifies to include/exclude name of the charging service in the file name.

- **include**: Include name of the charging service in the EDR file name.
- **omit**: Exclude name of the charging service in EDR file name.

**compression { gzip | none }**

Specifies compression of EDR files.

- **gzip**: Enables GNU zip compression of the EDR file at approximately 10:1 ratio.
- **none**: Disables Gzip compression.
current-prefix string
Specifies a string to add to the beginning of the EDR file that is currently being used to store EDR records.
string must be an alphanumeric string of 1 through 31 characters.
Default: curr

delete-timeout seconds
Specifies a timeout period (in seconds) when completed EDR files are deleted. By default, files are never deleted.
seconds must be an integer from 3600 through 31536000.
Default: Disabled

directory directory_name
Specifies a subdirectory in the default directory in which to store EDR files.
directory_name must be an alphanumeric string of 1 through 191 characters.
Default: /records/edr

edr-format-name
Specifies creation of separate files for EDRs that have different formats. Name of the EDR format is included in the file name.

exclude-checksum-record
When entered, this keyword excludes the final record containing #CHECKSUM followed by the 32-bit Cyclic redundancy check (CRC) of all preceding records from the EDR file.
Default: Disabled (inserts checksum record into the EDR file header)

field-separator [ hyphen | omit | underscore ]
Specifies the field inclusion/exclusion type of separators between two fields of EDR file name:
  • hyphen: Specifies to use “-” (hyphen) as the field separator.
  • omit: Excludes the field separator.
  • underscore: Specifies to use “_” (underscore) as the field separator.

file-sequence-number rulebase-seq-num
Specifies that the file name sequence numbers must be unique per rulebase and EDR format name combination.

headers
Includes a file header summarizing the record layout.

name file_name
Specifies a string to be used as the base file name for EDR files.
Default: edr
file_name must be an alphanumeric string of 1 through 31 characters. The file name format is as follows:
base_rulebase_format_sequencenum_timestamp
  • base: Specifies the type of record in file or contains the operator-specified string.
  • Default: edr
• **rulebase**: Specifies the name of the ACS rulebase. EDRs from different rulebases go into different EDR files.

• **format**: Specifies the name of the EDR format if **single-edr-format** is specified, else the format field (and the trailing underscore) is omitted from the file name.

• **sequencenum**: This is a 5-digit sequence number to detect the missing file sequence. It is unique among all EDR files on the system.

• **timestamp**: Contains a timestamp based on file creation time in UTC time in MMDDYYYYHHMMSS format.

EDR files that have not been closed have a string added to the beginning of their filenames.

Filename for an EDR file in CSV format that contains information for rulebase named `rulebase1` and an EDR schema named `edr_schema1` appears as follows:

```
edr_rulebase1_edr_schema1_00005_01302006143409
```

If the file name is not configured the system will create files for EDRs/UDRs/FDRs (xDRs) using the following template with limits to 256 characters:

```
basename_ChargSvcName_timestamp_SeqNumResetIndicator_FileSeqNumber
```

• **basename**: A global-based configurable text string that is unique per system that uniquely identifies the global location of the system running ACS.

• **ChargSvcName**: A system context-based configurable text string that uniquely identifies a specific context-based charging service

• **timestamp**: Date and time at the instance of file creation. Date and time in the form of “MMDDYYYYHHmmSS” where HH is a 24-hour value from 00-23

• **SeqNumResetIndicator**: A one-byte counter used to discern the potential for duplicated FileSeqNumber with a range of 0 to 255, which is incremented by a value of 1 for the following conditions:

  • Failure of an ACS software process on an individual PSC.
  • Failure of the system such that a second system takes over. For example, a backup or standby system put in place according to Interchassis Session Recovery.
  • File Sequence Number (FileSeqNumber) rollover from 999999999 to 0

• **FileSeqNumber**: Unique file sequence number for the file with 9 digit integer having range from 000000000 to 999999999. It is unique on each system.

File name for a closed xDR file in CSV format that contains information for ACS system `xyz_city1` and charging service name `prepaid2` with timestamp `12311969190000`, and file sequence number counter reset indicator to `002` for file sequence number `034939002` appears as follows:

```
xzy_city1_prepaid2_12311969190000_002_034939002
```

File name for a running xDR file, not closed, in CSV format that contains information for the same parameters for file sequence number `034939003` prefixed with `curr_` and appears as follows:

```
curr_xyz_city1_prepaid2_12311969190000_002_034939002
```

---

**Important**: When the "rulebase name" and "edr-format-name" options are enabled through this **file** command, if the "field-separator" value is "underscore" (default value) then, in the filename, the fields Rulebase name and EDR format name will be separated by "hyphen". If the "field-separator" value is "hyphen" then, in the filename, the fields Rulebase name and EDR format name will be separated by "underscore". This will ensure that the number of the fields in the filename is not increased and does not affect the backend billing system.
**reset-indicator**

Specifies inclusion of the reset indicator counter value, from 0 through 255, in the EDR file name, and is incremented (by one) whenever any of the following conditions occur:

- An ACSMgr/SessMgr process fails.
- A peer chassis has taken over in compliance with our Interchassis Session Recovery feature.
- The sequence number, see the *sequence-number* keyword, has rolled over to zero.

**rotation**

```
rotation { num-records number | tariff-time minute minute_value hour hour_value |
            time seconds | volume bytes }
```

Specifies when to close an EDR file and create a new one.

- **num-records number**: Specifies the number of records that should be added to the file. When the number of records in the file reaches the specified value, the file is complete.
  
  *number* must be an integer from 100 through 10240.
  
  Default: 1024

- **time seconds**: Specifies the period of time (in seconds) to wait before closing the EDR file and creating a new one.
  
  *seconds* must be an integer from 30 through 86400.
  
  Default: 3600

- **tariff-time minute minute_value hour hour_value**: Specifies the time of day (hour and minute) at which the files are rotated once per day.
  
  *minute_value* is an integer value from “0” up to “59”.
  
  *hour_value* is an integer value from “0” up to “23”.

  **Important**: The options *time* and *tariff-time* are mutually exclusive and only any one of them can be configured. Other file rotation options can be used with either of them.

- **volume bytes**: Specifies the maximum size (in bytes) of the EDR file before closing it and creating a new one.
  
  *bytes* must be an integer from 51200 through 62914560.
  
  Note that a higher setting may improve the compression ratio when the compression keyword is set to gzip.

**sequence-number**

```
sequence-number { length length | omit | padded | padded-six-length | unpadded }
```

Specifies including/excluding sequence number in the file name.

- **length length**: Includes the sequence number with the specified length.
  
  *length* must be the length of the file sequence number, with preceding zeroes, in the file name, and must be an integer from 1 through 9.

  **Important**: The *length* keyword is applicable in both EDR and UDR modules. When applied in both modules without the *file udr-seq-num* configuration, the minimum among the two values will come into effect for both the modules. With the *file udr-seq-num* keyword, each module will use its own value of length.
- **omit**: Excludes the sequence number from the file name.
- **padded**: Includes the padded sequence number with preceding zeros in the file name. This is the default setting.
- **padded-six-length**: Includes the padded sequence number with six preceding zeros in the file name.
- **unpadded**: Includes the unpadded sequence number in the file name.

**single-edr-format**

Creates separate files for EDRs having different formats.
Default: Disabled

**storage-limit limit**

Specifies deleting files when the specified amount of space (in bytes) is used up for EDR/UDR file storage RAM on packet processing cards.

**Important:**

**ASR 5000 and ASR 5500**: `limit` must be an integer from 10485760 through 536870912. Default: 33554432

**Important:** The total storage limit is 536870912 bytes (512 MB). This limit is for both UDR and EDR files combined.

**time-stamp { expanded-format | rotated-format | unix-format }**

Specifies the timestamp of when the file was created be included in the file name.
- **expanded-format**: Specifies the UTC MMDDYYYYHHMMSS format.
- **rotated-format**: Specifies the time stamp format to YYYYMMDDHHMMSS format.
- **unix-format**: Specifies the UNIX format of `x.y`, where `x` is the number of seconds since 1/1/1970 and `y` is the fractional portion of the current second that has elapsed.

**trailing-text string**

Specifies the inclusion of an arbitrary text string in the file name.
`string` must be an alphanumeric string of 1 through 30 characters.

**trap-on-file-delete**

Instructs the system to send an SNMP notification (starCDRFileRemoved) when an EDR/UDR file is deleted due to lack of space.
Default: Disabled

**unique-seq-num**

Specifies that the file sequence numbers that are part of the EDR file names be independently generated. If disabled, a single set of sequence numbers are shared by both UDR and EDR files.
Default: Disabled
**xor-final-record**

Specifies inserting an XOR checksum (in place of the CRC checksum) into the EDR file header if the exclude-checksum-record is left at its default setting.

Default: Disabled

+ 

Indicates that more than one of the keywords can be entered in a single command.

---

**Usage**

Use this command to configure EDR file characteristics.

**Example**

The following command sets the prefix of the current active EDR file to `Current`:

```
file current-prefix Current
```

The following command sets the base file name to `EDRfile`:

```
file name EDRfile
```
Chapter 123
eGTP Service Configuration Mode Commands

The eGTP Service Configuration Mode is used to create and manage Evolved GPRS Tunneling Protocol (eGTP) interface types and associated parameters.

Mode

Exec > Global Configuration > Context Configuration > eGTP Service Configuration

configure > context context_name > egtp-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-egtp-service)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
associate

Configures an association with a GTP-U service where parameters are applied to the GTP-U data flow. For an SGSN being configured for S4 functionality, this command associates a configured GTP-U service that will enable communication with the SGW over the S4 interface.

Product
- ePDG
- P-GW
- SAEGW
- SGSN

**Important:** For StarOS releases prior to 16, the ePDG and SGSN are only supported on the ASR 5500 platform.

Privilege
- Administrator

Mode
- Exec > Global Configuration > Context Configuration > eGTP Service Configuration

```
configure > context context_name > egtp-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-egtp-service)#
```

Syntax

```
associate gtpu-service name

no associate gtpu-service
```

```
no
```

Removes the association to the configured GTP-U service from this service.

```
gtpu-service name
```

Associates a GTP-U service with this eGTP service. *name* must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to associate a GTP-U service with this eGTP service.

Example

The following command associates this eGTP service with a GTP-U service named *gtpu3*:

```
associate gtpu-service gtpu3
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
gtpc

Configure the GPRS Tunneling Protocol Control (GTP-C) plane settings for this service.

Product
- ePDG
- MME
- P-GW
- SAEGW
- S-GW
- SGSN

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > eGTP Service Configuration
configure > context context_name > egtp-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-egtp-service)＃

Syntax

gtpc { allow-on-congestion { apn-name apn_name | arp priority_level } | bind { ipv4-address ipv4_address | ipv6-address ipv6_address | ipv6-address ipv4_address } | echo-interval seconds | echo-retransmission-timeout seconds | error-response-handling | ip qos-dscp { forwarding_type } | max-retransmissions num | node-feature { network-triggered-service-restoration | pgw-restart-notification } | path-failure detection-policy echo | private-extension overcharge-protection | retransmission-timeout seconds | retransmission-timeout-ms milliseconds }

no gtpc { allow-on-congestion { apn-name apn_name | arp priority_level } | bind { ipv4-address ipv4_address | ipv6-address ipv6_address | ipv6-address ipv4_address } | echo-interval | error-response-handling | node-feature { network-triggered-service-restoration | pgw-restart-notification } | path-failure detection-policy | private-extension overcharge-protection }

default gtpc { echo-interval | echo-max-retransmissions | echo-retransmission-timeout | ip qos-dscp | max-retransmissions | node-feature { network-triggered-service-restoration | pgw-restart-notification } | path-failure detection-policy | retransmission-timeout | retransmission-timeout-ms }

no

Disables or removes the configured GTP-C setting.
default

Resets the specified parameter to its default value.

allow-on-congestion { apn-name apn_name | arp priority_level }

**Important:** P-GW, SAEGW, and S-GW only. This functionality requires that a valid VoLTE license key be installed. Contact your Cisco account representative for information on how to obtain a license.

Enables the prioritized handling for calls under congestion conditions for the specified APN/ARP(s).

- If prioritized APN/ARP handling is enabled, and if the APN/ARP received in a CSReq at the EGTP demux matches any of the configured prioritized APN/ARP values, any valid CSReq will not be rejected at EGTP demux because of congestion control.

- This feature impacts only CSReq handling for new incoming calls.

- P-GW initiated dedicated bearer creation/updating is not changed due to this configuration.

**apn-name apn_name:** Configures the gateway to allow calls for this Access Point Name (APN), even under congestion.

**arp priority_level:** Configures the gateway to allow calls for this ARP, even under congestion.

**priority_level** sets the priority value as an integer from 1 through 15. A maximum of 3 ARP values can be configured.

**Important:** There is no APN-to-ARP mapping.

bind { ipv4-address ipv4_address [ ipv6-address ipv6_address ] | ipv6-address ipv6_address [ ipv4-address ipv4_address ] }

Binds the service to an interface with an IPv4 address, IPv6 address or both.

**ipv4-address ipv4_address [ ipv6-address ipv6_address ]:** Binds this service to the IPv4 address of a configured interface. Optionally, bind the service to a configured interface with an IPv6 address.

**ipv4_address** must be entered using IPv4 dotted-decimal notation.

**ipv6_address** must be entered using IPv6 colon-separated-hexadecimal notation.

**ipv6-address ipv6_address [ ipv4-address ipv4_address ]:** Binds this service to the IPv6 address of a configured interface. Optionally, bind the service to a configured interface with an IPv4 address.

**ipv6_address** must be entered using IPv6 colon-separated-hexadecimal notation.

**ipv4_address** must be entered using IPv4 dotted-decimal notation.

**Important:** For binding GTP-C service on S2b interface; either IPv6 or IPv4 bind address shall be used; binding both v4 and v6 address is not supported on ePDG The **ipv6-address ipv6_address [ ipv4-address ipv4_address ]** option is not currently supported on the SGSN.

echo-interval seconds [ dynamic [ smooth-factor multiplier ] ]

Configures the duration (in seconds) between the sending of echo request messages as an integer from 60 through 3600. Default: 60

**dynamic:** Enables the dynamic echo timer for the eGTP service. The dynamic echo timer uses a calculated round trip timer (RTT) to support variances in different paths to peer nodes.
**smooth-factor multiplier**: Introduces a multiplier into the dynamic echo timer as an integer from 1 through 5. Default: 2

**echo-max-retransmissions number**

Default: 4
Configures the maximum retries for GTP Echo requests. This option must be an integer from 0 to 15. The default is 4. If **echo-max-retransmissions** configuration option is not configured, then the **max-retransmissions** configuration will be used for maximum number of echo retries.

**echo-retransmission-timeout seconds**

Default: 3
Configures the echo retransmission timeout, in seconds, for the eGTP service as an integer ranging from 1 to 20.
If dynamic echo is enabled (**gtpc echo-interval dynamic**) the value set in this command serves as the dynamic minimum (if the RTT multiplied by the smooth factor is less than the value set in this command, the service uses this value).

**error-response-handling**

Enables error-response-handling on the S-GW. If this command is enabled in the egtp-service, then on receiving a bad response from the peer instead of dropping the message while doing validation eGTP-C informs the S-GW about the bad response received. The S-GW uses this notification from eGTP-C that a bad response is received to send a proper response to the other peer.

**ip qos-dscp { forwarding_type }**

Specifies the IP QoS DSCP per-hop behavior (PHB) to be marked on the outer header of signalling packets originating from the LTE component. This is a standards-based feature (RFC 2597 and RFC 2474).
Note that CS (class selector) mode options below are provided to support backward compatibility with the IP precedence field used by some network devices. CS maps one-to-one to IP precedence, where CS1 is IP precedence value 1. If a packet is received from a non-DSCP aware router that used IP precedence markings, then the DSCP router can still understand the encoding as a Class Selector code point.
The following forwarding types are supported:

- **af11**: Designates the use of Assured Forwarding 11 PHB.
  This is the default setting.
- **af12**: Designates the use of Assured Forwarding 12 PHB.
- **af13**: Designates the use of Assured Forwarding 13 PHB.
- **af21**: Designates the use of Assured Forwarding 21 PHB.
- **af22**: Designates the use of Assured Forwarding 22 PHB.
- **af23**: Designates the use of Assured Forwarding 23 PHB.
- **af31**: Designates the use of Assured Forwarding 31 PHB.
- **af32**: Designates the use of Assured Forwarding 32 PHB.
- **af33**: Designates the use of Assured Forwarding 33 PHB.
- **af41**: Designates the use of Assured Forwarding 41 PHB.
- **af42**: Designates the use of Assured Forwarding 42 PHB.
- **af43**: Designates the use of Assured Forwarding 43 PHB.
- **be**: Designates the use of Best Effort forwarding PHB.
- **cs1**: Designates the use of Class Selector code point “CS1”.
- **cs2**: Designates the use of Class Selector code point “CS2”.
- **cs3**: Designates the use of Class Selector code point “CS3”.
- **cs4**: Designates the use of Class Selector code point “CS4”.
- **cs5**: Designates the use of Class Selector code point “CS5”.
- **cs6**: Designates the use of Class Selector code point “CS6”.
- **cs7**: Designates the use of Class Selector code point “CS7”.
- **ef**: Designates the use of Expedited Forwarding PHB typically dedicated to low-loss, low-latency traffic.

The assured forwarding behavior groups are listed in the table below.

<table>
<thead>
<tr>
<th></th>
<th>Class 1</th>
<th>Class 2</th>
<th>Class 3</th>
<th>Class 4</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Low Drop</strong></td>
<td>AF11</td>
<td>AF21</td>
<td>AF31</td>
<td>AF41</td>
</tr>
<tr>
<td><strong>Medium Drop</strong></td>
<td>AF12</td>
<td>AF22</td>
<td>AF32</td>
<td>AF42</td>
</tr>
<tr>
<td><strong>High Drop</strong></td>
<td>AF13</td>
<td>AF23</td>
<td>AF33</td>
<td>AF43</td>
</tr>
</tbody>
</table>

Traffic marked with a higher class is given priority during congestion periods. If congestion occurs to traffic with the same class, the packets with the higher AF value are dropped first.

```
max-retransmissions num
```

Configures the maximum number of retries for packets as an integer from 0 through 15. Default: 4

After max retransmissions is reached, the path is considered to be failed.

```
node-feature pgw-restart-notification
```

Enables P-GW Restart Notification functionality. Node will start announcement of new supported features to peer nodes in echo as soon as configuration is added.

From release 17.0 onwards the S4-SGSN and MME support receiving/advertising the P-GW Restart Notification (PRN). This command option must be configured in order to inform S-GW that S4-SGSN and/or MME supports receiving/advertising the PRN in EGTPC echo request/response messages.

Default: Disabled

```
node-feature network-triggered-service-restoration
```

This keyword applies to the MME and S-GW only.

Enables Network Triggered Service Restoration (NTSR) functionality as per 3GPP TS 23.007 Release 11 for this EGTP service.

Upon receipt of a Downlink Data Notification (DDN) message including an IMSI, the MME will accept the request and initiate paging including the IMSI in order to force the UE to re-attach. IMSI-based DDN requests contain a zero TEID. Since the UE is not attached, the UE will be paged over the whole MME coverage area.

A different MME may be selected by the eNodeB to service the attach request. Since the MME that serviced the DDN will not be aware that the UE has responded with the attach request, it will stop paging upon a timeout.
### path-failure detection-policy echo

Enables session cleanup upon path failure detected via ECHO timeout toward a peer.  
Default: Enabled  
If disabled, there is no session cleanup upon path failure detected via ECHO timeout toward a peer; however, SNMP trap/logs will continue to indicate path failure.

### private-extension overcharge-protection

**Important:** From StarOS 19.0 and later releases, this command is obsolete.

**Important:** Use of Overcharging Protection requires that a valid license key be installed. Contact your Cisco account representative for information on how to obtain a license.

Controls whether the PDU will contain overcharge-protection related data in the Indication information element or in the private extension.

- If this keyword is enabled in the eGTP service, then eGTP-C will encode/decode overcharge-protection related data in/from the private extension instead of the Indication IE.
- If this option is disabled in the eGTP service, then the eGTP-C layer will encode/decode overcharge-protection related data in the Indication IE.
- By default, this option is disabled.

### retransmission-timeout seconds

**Important:** In 17.3 and later releases, this option has been deprecated. Use `retransmission-timeout-ms`.

Configures GTPv2 control packets (non-echo) retransmission timeout (in seconds) as an integer from 1 through 20.  
Default: 5

### retransmission-timeout-ms milliseconds

Configures the control packet retransmission timeout in GTP, in milliseconds <in steps of 100>, ranging from 1000 to 20000.  
Default: 5000

### Usage

Use this command to configure GTP-C settings for the current service.  
This interface assumes the characteristics of an S11 reference point on the S-GW or MME.  
For communication between the S4-SGSN and the LTE S-GW, the interface assumes the characteristics of an S4 reference point on the S4-SGSN.  
Before using the `gtpc` command on the S4-SGSN, a new or existing service must be created or entered using the `egtp-service` command in Context Configuration Mode.  
Once the eGTP service is configured, the service must be associated with the configured 2G and/or 3G services on the S4-SGSN using the `associate` command in SGSN Service Configuration Mode and/or GPRS Service Configuration Mode.
Important: For ePDG, IPv6 bind address should be used as ePDG supports IPv6 as transport on S2b interface.

Example

The following command binds the service to a GTP-C interface with an IPv4 address of 112.104.215.177:

```
gtpc bind ipv4-address 112.104.215.177
```
**interface-type**

Configures the interface type used by this service.

**Product**
- ePDG
- MME
- P-GW
- SAEGW
- S-GW
- SaMOG
- SGSN

**Important:** Prior to release 16, the SGSN only supported this command on the ASR 5000 platform.

**Privilege**
- Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > eGTP Service Configuration
- `configure > context context_name > egtp-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-egtp-service)#
```

**Syntax**

```
interface-type { interface-cgw-egress | interface-epdg-egress | interface-mme | interface-pgw-ingress | interface-sgsn | interface-sgw-egress | interface-sgw-ingress }
```

- `interface-cgw-egress`: Specifies the SaMOG Gateway's EGTP interface for egress.
- `interface-epdg-egress`: Specifies that the interface has the characteristics of an ePDG's egress EGTP interface.
- `interface-mme`: Specifies that the interface has the characteristics of an eGTP MME S11 reference point to/from an S-GW or an eGTP MME Sv reference point to/from a Mobile Switching Center (MSC).
- `interface-pgw-ingress`: Specifies that the interface has the characteristics of an eGTP P-GW S5/S8 reference point from an S-GW. The interface assumes the characteristics of either a GTP-C (control Plane) or GTP-U (user plane) reference point.
- `interface-sgsn`: Specifies that the interface has the characteristics of an eGTP S-GW S4 reference point to/from an SGSN. On an S4-SGSN, this option specifies that the eGTP service is used for an S4-SGSN and gives the service the characteristics required for messaging towards an SGW (S4) / MME (S3) / S4-SGSN (S16).
- `interface-sgw-egress`: Specifies that the interface has the characteristics of an eGTP S-GW S5/S8 reference point to an eGTP P-GW. The interface assumes the characteristics of either a GTP-C (control Plane) or GTP-U (user plane) reference point.
interface-type

interface-sgw-ingress: Specifies that the interface has the characteristics of:

• an eGTP-C S-GW S11 reference point from the MME.
• an eGTP-U S-GW S1-U reference point from the eNodeB.

Usage

Use this command to specify the type of interface this service uses. By configuring this command, the interface takes on the characteristics of the selected type.

Disable specific interface support for P-GW by entering the following command:

    interface-type interface-pgw-ingress

Example

The following command configures the interface bound to this service to maintain the characteristics of an eGTP-C S-GW S11 reference point from an MME:

    interface-type interface-sgw-ingress

The following command accepts or rejects Create Session Request (CSR) on GTP based S2a interface.

    interface-type interface-pgw-ingress s2a
pool

This command enables the default S4-SGSN functionality for (flex) pooling and enables inclusion of the configured pool hop-counter count in new SGSN context/identity request messages. This command supports S4-SGSN pooling across the S16 interface. The S16 interface provides a GTPv2 path to a peer S4-SGSN. Support for this interface is provided as part of the S4 interface license. This command sets the S4-SGSN as the default SGSN within a pool. If the default S4-SGSN receives an inbound SGSN context request, it forwards it to the right SGSN in the pool based on the NRI bits of the P-TMSI.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > eGTP Service Configuration

configure > context context_name > egtp-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-egtp-service)#

Syntax

pool { default-sgsn | hop-counter count }

no pool default-sgsn

no
Disables the default SGSN pooling functionality or removes the SGSN pool hop-counter IE from the GTP Identity/context requests.

default-sgsn
Enables default SGSN pooling functionality.

hop-counter count

Enables and configures the SGSN pool hop-counter to set the number of hops and to include the configured count in the new SGSN Context Requests or the new SGSN Identity Requests.
If default-sgsn is enabled, then any messages relayed will have the default value of 4 for the counter if the message does not include this hop-counter ID.

count: Enter an integer from 1 to 255.
Default: 4

Usage
Use this command to enable the default flex functionality without exposing the pool (flex) structure. This functionality provides a means for SGSNs outside of the pool to reach a pooled SGSN on the basis of its NRI. Once the pooling has been enabled, repeat the command using the hop-counter keyword to enable inclusion of the hop-counter IE in SGSN context/identity request messages and to configure the count for the
pooling hop-counter. If the SGSN is behaving as the ‘default SGSN’, this SGSN will forward (relay) requests with the hop-count included to the target SGSN.

**Example**

Enable the default pooling functionality which allows an outside SGSN to reach a pooled SGSN:

```
pool default-sgsn
```

Set the hop-count to be included in messages to 25:

```
pool hop-count
```
**validation-mode**

Configures the type of validation to be performed on messages received by this service.

**Product**
- ePDG
- P-GW
- SAEGW
- SGSN

**Important:** The ePDG and SGSN are not currently supported on the ASR 5500 platform.

**Privilege**
Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > eGTP Service Configuration
- `configure > context context_name > egtp-service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-egtp-service)#
```

**Syntax**

```
validation-mode { custom1 | standard }
default validation-mode
```

**Usage**

Use this command to specify the type of validation performed on messages received by this service. The information elements contained in messages have mandatory elements and conditional elements. The standard set of elements, as defined by 3GPP 29.274 is checked if this command is set to “standard”. The `custom1` setting is for a vendor-specific set of mandatory elements.

**Example**

The following command sets the validation mode for incoming messages to `standard`:

```
validation-mode standard
```
Chapter 124
EIR Profile Configuration Mode Commands

The EIR Profile configuration mode provides the commands to define Equipment Identify Register (EIR) parameters that can be used by the SGSN on a global level. The SGSN supports a total of 16 instances of the EIR profile.

The EIR is used for authentication and authorization of a subscriber’s equipment during an Attach. The EIR database includes information about the subscriber’s equipment (UE), such as the International Mobile Equipment Identity (IMEI) and the UE manufacturer’s software version number (SV) which is usually paired with the IMEI. The IMEI(SV) can be in one of three lists in the EIR:

- white list - the subscriber equipment is permitted access
- black list - the subscriber equipment is not permitted access
- grey list - the subscriber equipment is being tracked for evaluation or other purposes

To view the configured values of the EIR profile, use the Exec mode `show sgsn-mode` command.

To associate the EIR profile with call control profile, see the call control profile mode’s `eir-profile` command.

Mode

Exec > Global Configuration > SGSN Global Configuration > EIR Profile Configuration

`configure > sgsn-global > eir-profile eir_profile_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-eir-profile-eir_profile_name)#
```

⚠️ **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
check-imei-every-n-events

Configures the frequency that ‘check IMEI’ is performed.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SGSN Global Configuration > EIR Profile Configuration
configure > sgsn-global > eir-profile eir_profile_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-eir-profile-eir_profile_name)#
```

**Syntax**

```
check-imei-every-n-events  check_frequency

no  check-imei-every-n-events
```

- **no**
  - Removes the check-imei-every-n-events definition from the EIR profile configuration.

- **check_frequency**
  - The frequency must be an integer from 1 to 15.
  - When a value is configured, the SGSN skips sending the ‘check IMEI’ message for the first N-1 where IMDI/IMEISV is received.

**Usage**

If a value is not defined for this parameter, then by default, the SGSN sends a ‘check IMEI’ message for every event.

**Example**

Use a command similar to the following to remove the check frequency configuration from the EIR profile:

```
no  check-imei-every-n-events
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
eir-address

Configures the address of the equipment identify register (EIR).

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SGSN Global Configuration > EIR Profile Configuration
configure > sgsn-global > eir-profile eir_profile_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-eir-profile-eir_profile_name)#
```

**Syntax**

```bash
eir-address { isdn isdn_address | point-code point_code } [ source-ssn source_ssn ]
```

**no eir-address**

```
no
Erases the address of the EIR from this EIR profile.
```

**isdn isdn_address**

`isdn_address` enter a standard ISDN E.164 address of 1 to 15 digits to identify the EIR.

**point-code point_code**

`point_code` enter a standard SS7 formatted point-code address, a string of dotted decimal format of 1 to 11 digits, to identify the EIR. Format options include:

- 0.0.1 to 7.255.7 for point-code in the ITU range.
- 0.0.1 to 255.255.255 for point-code in the ANSI range.
- 0.0.1 to 15.31.255 for point-code in the TTC Range.
- a string of 1 to 11 digits in dotted-decimal to represent a point-code in a different range.

**source-ssn source_ssn**

`source_ssn` enter 1 to 3 digits to define the subsystem number of the element being identified. The default is 149 (SGSN).

**Usage**

Define a single EIR address to be used for multiple EIRs when this EIR profile is associated with a call control profile.

**Example**

Delete the EIR address definition from the EIR profile:
no eir-address
exit

Exits the current mode and returns to the parent configuration mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
include-imsi

Enables inclusion of the IMSI in the TCAP message.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > SGSN Global Configuration > EIR Profile Configuration

configure > sgsn-global > eir-profile eir_profile_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-eir-profile-eir_profile_name)#

Syntax

[ no ] include-imsi

no
Disables inclusion of the IMSI in the message sent to initiate the ‘check IMEI’ procedure.

Usage
This command enables/disables inclusion of the IMSI in the message to enable IMSI checking during the IMEI check procedure. By default, IMSI checking is not included.

Example
Configure IMSI checking during the ‘check IMEI’ procedure:

check-imsi
map-include-imsi

Enables adding IMSI in MAP message.

Product
SGSN

Privilege
privilege

Mode
Exec > Global Configuration > SGSN Global Configuration > EIR Profile Configuration
configure > sgsn-global > eir-profile eir_profile_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-eir-profile-eir_profile_name)#

Syntax

[ no ] map-include-imsi

no

Disables inclusion of IMSI in the MAP message.

Usage
This command enables/disables inclusion of IMSI checking during the check IMEI procedure. By default, IMSI checking is not part of the IMEI check procedure.

Example
Add IMSI to the MAP message to enable IMSI checking during check IMEI procedure:

map-include-imsi
Chapter 125
EPDG Service Configuration Mode Commands

Creates Evolved Packet Data GateWay service and enters EPDГ service configuration mode.

Mode

Exec > Global Configuration > Context > EPDG Service Configuration

configure > context context_name > epdg service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-epdg-service)#
aaa

This command configures aaa parameters for ePDG service.

Product
ePDG

Privilege
Security Administrator, Administrator

Syntax

aaa send framed-mtu value
aaa send framed-mtu

no
Disables aaa parameters for ePDG service.

send
Configures AVP to be send to AAA server.

framed-mtu value
This is the framed-MTU AVP value to be sent in DER, which is an integer between 64 through 1500.

Usage

Use this command to configure aaa parameters for ePDG service.

Example

The following command is used to configures aaa parameters framed-MTU AVP value 100 to be send to AAA for ePDG service.

aaa send framed-mtu 100
allow

This command allows duplicate precedence in a TFT for a S2b ePDG session.

Product
ePDG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context > EPDG Service Configuration

configure > context context_name > epdg service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-epdg-service)#

Syntax

[ no ] allow { | duplicate-prec-in-tft }

no
Disables allowing exception.

custom-swm-swu-error-mapping
Customises mapping of SWm errors with SWu Notify Error Type.

duplicate-prec-in-tft
The duplicate precedence is allowed in a tft for a S2b ePDG session.

Usage

Use this command to allow exception with Spec or RFC.

Example

The following command is used to allow duplicate precedence in a tft for a S2b ePDG session.

allow duplicate-prec-in-tft
associate

This command associates configuration of ePDG service to qci-qos mapping and EGTP service.

**Product**
ePDG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context > EPDG Service Configuration

configure > context context_name > epdg service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-epdg-service)#
```

**Syntax**

```plaintext
associate { egtp-service egtp_service_name | gtpc-load-control-profile gtpc_load_control_profile_name | gtpc-overload-control-profile gtpc_overload_control_profile_name | qci-qos-mapping qci_qos_mapping | subscriber-map subscriber_map_name }

no associate { egtp-service | gtpc-load-control-profile gtpc_load_control_profile_name | gtpc-overload-control-profile gtpc_overload_control_profile_name | qci-qos-mapping qci_qos_mapping | subscriber-map }
```

**no**
Disables association.

**egtp-service egtp_service_name**
The eGTP service should be configured before associating the same with ePDG service. `egtp_service_name` is a string and the value must be between 1 and 63.

**gtpc-load-control-profile gtpc_load_control_profile_name**
Associates GTPC-load-control-profile for the epdg service.
1 and 64.

**gtpc-overload-control-profile gtpc_overload_control_profile_name**
Associates GTPC-overload-control-profile for the ePDG service.
1 and 64.

**qci-qos-mapping qci_qos_mapping**
The associated qci-qos mapping table should be configured prior to associating the same with ePDG service. `qci_qos_mapping` is a string and the value must be between 1 and 63.
associate

**subscriber-map**  *subscriber_map_name*

Configures subscriber map association to get PGW address locally.

*subscriber_map_name* is a string and the size must be between 1 and 64.

---

**Usage**

Use this command to associate the ePDG service to egtp service or QCI to QoS mapping.

**Example**

The following command removes the association of epdg service to egtp service.

```
no associate  egtp-service
```
bind

This command binds the services.

**Product**
ePDG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context > EPDG Service Configuration

```
configure > context context_name > epdg service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-epdg-service)#
```

**Syntax**

```
bind address bind_address crypto-template crypto_template_service_name
no bind address
```

- **no**
  - Disables binding.

- **address bind_address**
  - Specifies the address of the EPDG service. This must be followed by an IPv4 address, using dotted-decimal notation or an IPv6 address, using xx::yy::zz format.

- **crypto-template crypto_template_service_name**
  - Specifies the crypto template to use, this is a string of size between 0 and 127.

**Usage**

Use this command to bind the ePDG service.

**Example**

The following command binds the ePDG Service to the IPv4 address 12.32.44.56.

```
bind address 12.32.44.56
```
**dns-pgw**

Configures context of dns-client.

**Product**
ePDG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context > EPDG Service Configuration

```text
configure > context context_name > epdg service service_name
```

Entering the above command sequence results in the following prompt:
```
[context_name]host_name(config-epdg-service)#
```

**Syntax**

```text
dns-pgw { context dns_client_context_name | selection { topology [ weight ] | weight } }
```

```text
{ no | default } dns-pgw { context | selection { topology [ weight ] | weight } }
```

---

**default**

Configures context of dns-client to its default value.

**no**

Disables dns-client's context.

**context dns_client_context_name**

Specifies the dns-client's context name, which is a string and should be between 1 and 79.

**selection { topology [ weight ] | weight }**

Specifies the pgw dns selection criteria.

- **topology**: Enables topology selection.
- **topology weight**: Enables topology with weight.
- **weight**: Enables selection with weight-only, disables topology selection.

**Usage**

Enable/disable PGW Selection based on topology and load-balancing of PGWs on weight's from DNS. Use this command to configure the source in which dns-client is configured, dns-pgw selection topology/weight will be used to enable/disable PGW Selection based on topology and load-balancing of PGWs.

**Example**

Use the following command to configure dns-client context.

```text
dns-pgw context 21
```
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
fqdn

Designates ePDG fully qualified domain name.

**Product**
ePDG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context > EPDG Service Configuration

```
configure > context context_name > epdg service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-epdg-service)#
```

**Syntax**

```
fqdn epdg_fqdn
{ no | default } fqdn
```

- **default**
  
  Resets the ePDG fully qualified domain name to its default setting.
  
  ```
  no
  ```
  
  Disables ePDG fqdn.

- **fqdn epdg_fqdn**
  
  Designates EPDG with fully qualified domain name, name is a string between 1 and 256 alphanumeric characters.

**Usage**

Use this command to configure ePDG FQDN under ePDG service which will be used for longest suffix match during dynamic allocation.

**Example**

Use the following command to disable ePDG a FQDN:

```
no fqdn
```
**ip**

This command configures Internet Protocol (IP) parameters.

**Product**
ePDG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context > EPDG Service Configuration

```
configure > context context_name > epdg service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-epdg-service)#
```

**Syntax**

```
ip fragment-chain { max-ooo-fragment fragments | timeout secs }
default ip fragment-chain { max-ooo-fragment | timeout }
```

- **default**
  Resets the ePDG Internet Protocol (IP) parameters to default values.

- **fragment-chain**
  This option configures ip fragment chain settings during TFT handling.

- **max-ooo-fragment fragments**
  This is the number of fragments to buffer per fragment chain for out-of-order reception before receiving first fragment (for L4 packet filtering).
  *fragments* is an integer value between 0 through 300.
  The default value is 45.
  0 represents no buffering is done for out-of-order fragments, correct bearer will be selected with first fragment.

- **timeout secs**
  This is the time to hold an ip fragment chain.
  *secs* is an integer value between 1 through 10.
  The default value is 5.

**Usage**

Use this command to configure ePDG Internet Protocol (IP) parameters.

**Example**

Use the following command to configure ePDG IP parameter timeout to 6 seconds:

```
ip fragment-chain timeout 6
```
max-sessions

This command configures the approximate maximum number of sessions ePDG service can support, ranging from 0 to 1000000. Default is 1000000.

Product
ePDG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context > EPDG Service Configuration

configure > context context_name > epdg service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-epdg-service)#

Syntax

max-sessions value

default max-sessions

default

Resets the approximate maximum number of sessions that ePDG service can support to default value (1000000).

value

This is the approximate maximum number of sessions that ePDG service can support, ranging from 0 to 1000000.

The default value is 1000000.

Usage

Use this command to configure the approximate maximum number of sessions that ePDG service can support.

Example

Use the following command to configure the approximate maximum number of sessions that ePDG service can support to 10.

max-sessions 10
**mobile-access-gateway**

Configures MAG context within epdg service.

**Product**
ePDG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context > EPDG Service Configuration

```
configure > context context_name > epdg service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-epdg-service)#
```

**Syntax**

```
mobile-access-gateway context context_name [ mag-service mag_service_name ]
```

```
no mobile-access-gateway context
```

- **no**
  
  Disables MAG context.

```
mobile-access-gateway context context_name [ mag-service mag_service_name ]
```

- **context**
  
  designates the name of the context in which the MAG service is configured. This must be followed by `context_name` of MAG service of size 1 to 79 characters.

- **mag-service**
  
  designates the name of the MAG service. This must be followed by `mag_service_name` of size 1 to 63 characters.

**Usage**

Use this command to specify where MIPv6 sessions are routed through this service.

**Example**

Use the following command to configure MAG context with context name `fg`.

```
mobile-access-gateway context fg
```
pgw-selection

Configures pgw-selection related parameters for the EPDG service.

Product
epDG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context > EPDG Service Configuration
configure > context context_name > epdg service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-epdg-service)#

Syntax

[ no ] pgw-selection { agent-info error-terminate | local-configuration-preferred }

no
Disables pgw-selection related parameters for the EPDG service.

pgw-selection agent-info error-terminate
agent-info specifies the action to be taken when MIP6-agent-info is expected but not received from AAA/HSS.
error-terminate terminates the pgw-selection and rejects the call.

local-configuration-preferred
Configures local PGW selection as the preferred mechanism. Applicable for initial attach. Default is AAA/DNS based selection.

Usage
Use this command to terminate the pgw-selection and reject the call MIP6-agent-info is expected but not received from AAA/HSS.

Example
Use the following command to terminate pgw-selection and reject the call.

pgw-selection agent-info error-terminate

**plmn**

Configures PLMN related parameters for the EPDG service.

**Product**

ePDG

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context > EPDG Service Configuration

```plaintext
configure > context context_name > epdg service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-epdg-service)#
```

**Syntax**

```plaintext
plmn id mcc mcc_plmn_id mnc mnc_plmn_id

no plmn id
```

**Usage**

Disables PLMN related parameters for the EPDG service.

```plaintext
plmn id mcc mcc_plmn_id mnc mnc_plmn_id

plmn id mcc mcc_plmn_id configures MCC part of PLMN ID for the EPDG service and prompts as “Enter a number, ranging from 200...999 - string of size 3 to 3”.
mcc_plmn_id is a string of three characters, entered as number between 200 and 999.

mnc mnc_plmn_id configures MNC part of PLMN ID for the EPDG service and prompts as “Enter a number, ranging from 00...999 - string of size 2 to 3”.
mnc_plmn_id is a string of two to three characters, entered as number between 00 and 999.
```

**Example**

Use this command to configure PLMN identifier (MCC and MNC Values) for ePDG Service.

Use the following command to configure PLMN identifier MCC 456 and MNC 64 for ePDG service.

```plaintext
plmn id mcc 456 mnc 64
```
**setup-timeout**

Maximum time allowed for session setup in seconds.

**Product**
ePDG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context > EPDG Service Configuration

`configure > context context_name > epdg service service_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-epdg-service)#
```

**Syntax**

```
setup-timeout time
```

**Default**

```
default setup-timeout
```

*default*

Sets up the maximum time allowed for a session to default value (as 60 seconds).

```
setup-timeout time
```

*time* is an integer value between 2 and 300.

**Usage**

Use this command to configure maximum time allowed for session setup in seconds.

**Example**

Use the following command to configure maximum session time as 120 seconds:

```
setup-timeout 120
```
subscriber

Configures a subscriber with a given name.

Product
ePDG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context > EPDG Service Configuration
configure > context context_name > epdg service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-epdg-service)#

Syntax

[ default ] subscriber name

no subscriber

default
Configures a subscriber with a given default name.

no
Cancels the subscriber configuration.

subscriber name
Configures a subscriber with a given name, which is a string of size between 1 and 127.

Usage

Use this command to configure the subscriber with a given name.

Example

Use the following command to configure the subscriber as sss.

    subscriber sss
username

Sets the options related to username received from mobile.

**Product**
ePDG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context > EPDG Service Configuration

```
configure > context context_name > epdg service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-epdg-service) #
```

**Syntax**

```
username  {  check-mac-address  [  failure-handling  {  continue  |  terminate  }  ]  }  [  mac-address-delimiter  {  NAI-label  |  colon  |  colon-or-NAI-label  }  ]  [  mac-address-stripping  ]
```

```
no username  {  check-mac-address  |  mac-address-stripping  }
```

**Usage**

This command is used to set the options (Validate Mac address / mac-address-delimiter / mac-address-stripping) related to username received from mobile.

```
Usage
```

```
Use this command to set the options (Validate Mac address / mac-address-delimiter / mac-address-stripping) related to username received from mobile.
```

**Example**

```
Example
```

```
Use the following command to set the options related to username received from mobile.
```
username check-mac-address failure-handling terminate
vendor-specific-attr

Configures the vendor-specific-attributes values on PMIP based S2b interface.

**Product**
ePDG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context > EPDG Service Configuration

```
configure > context context_name > epdg service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-epdg-service)#
```

**Syntax**

```
vendor-specific-attr { dns-server-req { apco | pco } | pcscf-server-req { apco | private-extn } }

default vendor-specific-attr { dns-server-req | pcscf-server-req }
```

**default**

Configures vendor-specific-attributes to default the value. Default setting is to use APCO IE for DNS Server Address and PrivateExtension IE for PCSCF Server Address.

**dns-server-req**

Configures the DNS Server Address to be present in PCO/APCO IE.

**apco**

Configures to use APCO IE to carry information over PMIP based S2b.

**pco**

Configures to use PCO IE to carry information over PMIP based S2b.

**pcscf-server-req**

Configures the PCSCF Server Address to be present in APCO/PrivateExtn IE.

**apco**

Configures to use APCO IE to carry information over GTP based S2b.

**private-extn**

Configures to use PrivateExtension IE to carry information over GTP based S2b.
Usage

Use this command to configure the vendor-specific-attributes values on PMIP based S2b interface.

Example

Use the following command to configure the vendor-specific-attributes values on PMIP based S2b interface to pco.

```
vendor-specific-attr dns-server-req pco
```
Chapter 126
Ethernet Interface Configuration Mode Commands

The Ethernet Interface Configuration Mode is used to create and manage Ethernet IP interface parameters within a specified context.

Mode

Exec > Global Configuration > Context Configuration > Ethernet Interface Configuration
configure > context context_name > interface interface_name broadcast

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-if-eth)#

Important: Available commands or keywords/variables vary based on platform type, product version, and installed license(s).
bdf

Configures Bidirectional Forwarding Detection (BFD) interface parameters.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Ethernet Interface Configuration

`configure > context context_name > interface interface_name broadcast`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-if-eth)#`

**Syntax**

```
[no] bfd { echo | interval interval_num } min_rx milliseconds multiplier value
```

- **no**
  Disables the specified option on this interface.

- **echo**
  Enables BFD echo mode.
  BFD echo mode works with asynchronous BFD. Echo packets are sent by the forwarding engine and forwarded back along the same path in order to perform detection—the BFD session at the other end does not participate in the actual forwarding of the echo packets. The echo function and the forwarding engine are responsible for the detection process, therefore the number of BFD control packets that are sent out between two BFD neighbors is reduced.
  Since the forwarding engine is testing the forwarding path on the remote (neighbor) system without involving the remote system, there is an opportunity to improve the interpacket delay variance, thereby achieving quicker failure detection times than when using BFD Version 0 with BFD control packets for the BFD session.

- **interval interval_num**
  Specifies the transmit interval (in milliseconds) between BFD packets.
  
  - *For releases prior to 17.0, interval_num is an integer from 50 through 999. (Default 50)*
  
  - *For release 17.0 onwards, interval_num is an integer from 50 through 10000. (Default 50)*

- **min_rx milliseconds**
  Specifies the receive interval in milliseconds for control packets.
  
  - *For releases prior to 17.0, milliseconds is an integer from 50 through 999. (Default 50)*
  
  - *For release 17.0 onwards, milliseconds is an integer from 50 through 10000. (Default 50)*
multiplier value

Specifies the value used to compute the hold-down time as a number from 3 to 50.

Usage

Specify BFD parameters including echo mode and the transmit interval between BFD packets.

Example

To apply enable echo mode on this interface, use the following command:

    bfd echo

The following command sets BFD interval parameters:

    bfd interval 3000 min_rx 300 multiplier 3
crypto-map

Applies the specified IPSec crypto-map to this interface.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
crypto-map map_name [ secondary-address sec_ip_addr ]
```

```
no crypto-map map_name
```

- **no**
  
  Deletes the application of the crypto map on this interface.

- **map_name**
  
  Specifies the name of the crypto map being applied as an alphanumeric string of 1 through 127 characters that is case sensitive.

- **secondary-address sec_ip_addr**
  
  Applies the crypto map to the secondary address for this interface. `sec_ip_addr` must be specified using the IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**Usage**

In order for ISAKMP and/or manual crypto maps to work, they must be applied to a specific interface using this command. Dynamic crypto maps should **not** be applied to interfaces. The crypto map must be configured in the same context as the interface.

**Example**

To apply the IPSec crypto map named cmap1 to this interface, use the following command:

```
crypto-map cmap1
```
**description**

Sets the descriptive text for the current interface.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
description text
```

```
no description
```

Sets the descriptive text as an alphanumeric string of 0 through 79 characters.

**Usage**

Set the description to provide useful information on the interface’s primary function, services, end users, etc. Any information useful may be provided.

**Example**

```
description sampleInterfaceDescriptiveText
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Use this command to return to the parent configuration mode.
**ip access-group**

Specifies the name of the Access Control List (ACL) group to assign to the interface.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

\[
\text{[ no ] ip access-group} \quad \text{group_name} \quad \{ \text{in | out} \} \quad \text{priority}
\]

- **no**
  Removes the ACL group from this interface.

- **group_name**
  Specifies the name of an existing ACL group as an alphanumeric string of 1 through 47 characters.

- **{ in | out }**
  Specifies whether the ACL group will apply to inbound or outbound traffic.

- **priority**
  If more than one ACL group is applied, `priority-value` specifies the priority in which they will be compared against the packet. If not specified, the priority is set to 0. `priority-value` must be an integer from 0 through 4294967295. If access groups in the list have the same priority, the last one entered is used first.

**Important:** Up to eight ACLs can be applied to a group provided that the number of rules configured within the ACL(s) does not exceed the 128-rule limit for the interface.

**Usage**

Specify the name of the Access Control List (ACL) group to assign to the interface along with its directionality and priority.

**Example**

\[
ip \text{access-group acl-101 in 56}
\]
**ip address**

Specifies the primary and optional secondary IPv4 addresses and subnets for this interface.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ip address ip_address { mask | /mask } [ secondary ip_address ] [ srp-activate ]
```

```
no ip address ip_address
```

**no**
Removes the IPv4 address from this interface.

```
ip_address{ mask | /mask } 
```

Configures the IPv4 address and mask for the interface. `ip_address` must be entered using IPv4 dotted-decimal notation. IPv4 dotted-decimal or CIDR notation is accepted for the mask.

**Important:** For IPv4 addresses, 31-bit subnet masks are supported per RFC 3021.

```
secondary ip_address
```

Configures a secondary IPv4 address on the interface.

**Important:** You must configure the primary IPv4 address before you will be allowed to configure a secondary address.

```
srp-activate
```

Activates the IP address for Interchassis Session Recovery (ICSR). Enable this IPv4 address when the Service Redundancy Protocol (SRP) determines that this chassis is ACTIVE. Requires an ICSR license on the chassis to activate.

**Usage**
The following command specifies the primary IP address and subnets for this interface.

**Example**
The following example configures an IPv4 address for this interface:

```
ip address 192.154.3.5/24
```
**ip igmp profile**

Associates an Internet Group Management Protocol (IGMP) profile with this interface.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] ip igmp profile profile_name
```

- **no**
  Remothe IGMP profile from this interface.

- **profile_name**
  Specifies the name of an existing IGMP profile as an alphanumeric string of 1 through 63 characters. If the name is not for an existing profile, you are prompted to create a new profile. You are then moved to the IGMP Profile Configuration mode.

**Usage**
Associates an Internet Group Management Protocol (IGMP) profile with this interface.

**Example**

```
ip igmp profile default
```
**ip mtu**

Configures the Maximum Transmission Unit (MTU) for this interface.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] ip mtu mtu-size
```

- **no**

  Removes the MTU value.

- **mtu-size**

  Specifies the MTU in bytes as an integer from 576 though 2048.

**Usage**

IP MTU is supported for a normal interface and point-to-point interface (OLC ports). The maximum MTU size allowed with an OLC port is 1600.
The maximum MTU size allowed with an Ethernet port is 2048. The default MTU size is 1500.
The maximum sizes for ethernet MTUs are:

- **Untagged traffic** (non-VLAN) – ip MPU mtu-size + ethernet header (20 bytes)
- **VLAN traffic** – ip MPU mtu-size + ethernet header (20 bytes) + vlan header (4 bytes)

**Example**

The following command sets the MTU value to 2048.

```
ip mtu 2048
```
ip ospf authentication-key

Configures the password for authentication with neighboring Open Shortest Path First (OSPF) routers.

Product
- PDSN
- HA
- GGSN

Privilege
- Security Administrator, Administrator

Syntax

```
ip ospf authentication-key [ encrypted ] password auth_key
```

```
no ip ospf authentication-key
```

- no
  Deletes the authentication key.

- encrypted
  Use this keyword if you are pasting a previously encrypted authentication key into the CLI command.

- password auth_key
  Specifies the password to use for authentication as an alphanumeric string of 1 through 16 characters entered in clear text format.

Usage

Use this command to set the authentication key used when authenticating with neighboring routers.

Example

To set the authentication key to 123abc, use the following command;

```
  ip ospf authentication-key password 123abc
```

Use the following command to delete the authentication key;

```
  no ip ospf authentication-key
```
ip ospf authentication-type

Configures the OSPF authentication method to be used with OSPF neighbors over the logical interface.

Product
- PDSN
- HA
- GGSN

Privilege
Security Administrator, Administrator

Syntax

```
ip ospf authentication-type { message-digest | null | text }
no ip ospf authentication-type { message-digest | null | text }
```

- **no**
  Disable this function.

- **message-digest**
  Uses the message digest (MD) authentication method.

- **null**
  Uses no authentication, thus disabling either MD or clear text methods.

- **text**
  Uses the clear text authentication method.

Usage
Use this command to set the type of authentication to use when authenticating with neighboring routers.

Example
To set the authentication type to use clear text, enter the following command;

```
ip ospf authentication-type text
```
ip ospf bfd

Enables or disables OSPF Bidirectional Forwarding Detection (BFD) on this interface.

Product
- PDSN
- HA
- GGSN

Privilege
- Security Administrator, Administrator

Syntax
```
ip ospf bfd [ disable ]
no ip ospf cost
```

Usage
Enable or disable OSPF Bidirectional Forwarding Detection (BFD) on this interface.

Example
Use the following command to enable OSPF BFD;
```
ip ospf bfd
```
**ip ospf cost**

Configures the cost associated with sending a packet over the OSPF logical interface.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Syntax**

```
ip ospf cost value
no ip ospf cost
```

- **value**
  Specifies the cost to assign to OSPF packets as an integer from 1 through 65535. Default: 10

**Usage**

Use this command to set the cost associated with routes from the interface.

**Example**

Use the following command to set the cost to 20;

```
   ip ospf cost 20
```

Use the following command to disable the cost setting;

```
   no ip ospf cost
```
**ip ospf dead-interval**

Configures the interval that the router should wait, during which time no packets are received and after which the router considers a neighboring router to be off-line.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Syntax**

```
[ no ] ip ospf dead-interval seconds
```

*no*

Returns the value to its default of 40 seconds.

*seconds*

Specifies the interval (in seconds) as an integer from 1 through 65535. This number is typical four times the hello-interval. Default: 40

**Usage**

Use this command to set the dead intervals for OSPF communications.

**Example**

To set the dead-interval to 100, use the following command:

```
ip ospf dead-interval 100
```
ip ospf hello-interval

Configures the interval (in seconds) between sending OSPF hello packets.

**Product**
PDSN
HA
GGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ip ospf hello-interval seconds
no ip ospf hello-interval
```

- **no**
  Returns the value to its default of 10 seconds.

- **seconds**
  Specifies the number of seconds between sending hello packets as an integer from 1 through 65535. Default: 10

**Usage**
Specify the interval (in seconds) between sending OSPF hello packets.

**Example**
To set the hello-interval to 25, use the following command;

```
ip ospf hello-interval 25
```
**ip ospf message-digest-key**

Enables or disables the use of MD5-based OSPF authentication.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Syntax**

```
ip ospf message-digest-key key_id md5 [ encrypted ] password authentication_key
no ip ospf message-digest-key key_id
```

- **message-digest-key key_id**
  Specifies the key identifier number as an integer from 1 through 255.

- **encrypted**
  Use this if you are pasting a previously encrypted authentication key into the CLI command.

- **password authentication_key**
  Specifies the password to use for authentication as an alphanumeric string of 1 through 16 characters entered in clear text format.

**Usage**

Use this command to create an authentication key that uses MD5-based OSPF authentication.

**Example**

To create a key with the ID of 25 and a password of `123abc`, use the following command:

```
ip ospf message-digest-key 25 md5 password 123abc
```

To delete the same key, enter the following command:

```
no ip ospf message-digest-key 25
```
ip ospf network

Configures the Open Shortest path First (OSPF) network type.

Product
PDSN
HA
GGSN

Privilege
Security Administrator, Administrator

Syntax

ip ospf network { broadcast | non-broadcast | point-to-multipoint | point-to-point }

no ip ospf network

Usage
Use this command to specify the OSPF network type.

Example
To set the OSPF network type to broadcast, enter the following command;

    ip ospf network broadcast

To disable the OSPF network type, enter the following command;

    no ip ospf network
ip ospf priority

Designates the OSPF router priority.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Syntax**

```
ip ospf priority value
no ip ospf priority value
```

- **no**
  - Disable this function.

- **value**
  - Sets the priority value as an integer from 0 through 255.

**Usage**

Use this command to set the OSPF router priority.

**Example**

To set the priority to 25, enter the following command:

```
ip ospf priority 25
```

To disable the priority, enter the following command:

```
no ip ospf priority
```
ip ospf retransmit-interval

Configures the interval in (seconds) between LSA (Link State Advertisement) retransmissions.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Syntax**

```plaintext
ip ospf retransmit-interval seconds
no ip ospf retransmit-interval
```

- **no**
  Returns the value to its default of 5 seconds.

- **seconds**
  Specifies the number of seconds between LSA (Link State Advertisement) retransmissions as an integer from 1 through 65535. Default: 5

**Usage**

Configure the interval in (seconds) between LSA (Link State Advertisement) retransmissions.

**Example**

To set the retransmit-interval to 10, use the following command;

```
ip ospf retransmit-interval 10
```
ip ospf transmit-delay

Configures the interval (in seconds) that the router should wait before transmitting an OSPF packet.

Product
PDSN
HA
GGSN

Privilege
Security Administrator, Administrator

Syntax

ip ospf transmit-delay seconds

no ip ospf transmit-delay

seconds
Specifies the number of seconds that the router should wait before transmitting a packet as an integer from 1 through 65535. Default: 1

Usage
Configure the interval (in seconds) that the router should wait before transmitting an OSPF packet.

Example
To set the transmit-delay to 5, use the following command;

    ip ospf transmit-delay 5
**ipv6 access-group**

Specifies the name of the access control list (ACL) group to assign to this interface. You can filter for either inbound or outbound traffic.

**Product**
PDSN
HA

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Ethernet Interface Configuration

```plaintext
configure > context context_name > interface interface_name broadcast
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-if-eth)#
```

**Syntax**

```plaintext
[ no ] ipv6 access-group group name { in | out } { priority-value priority_value }
```

- **no**
  Removes a previously configured access group association.

- **group_name**
  Specifies the name of the access group as an alphanumeric string of 1 to 79 characters.

- **in**
  Applies the filter to the inbound traffic.

- **out**
  Applies the filter to the outbound traffic.

- **priority-value**
  Specifies the priority of the access group as an integer from 0 to 4294967295. 0 is the highest priority. If `priority-value` is not specified, the priority is set to 0. If access groups in the list have the same priority, the last one entered is used first.

**Usage**

Use this command to specify the ACL group to assign the interface to. Specify an ACL group name with this command.

**Important:** Up to eight ACLs can be applied to a group provided that the number of rules configured within the ACL(s) does not exceed the 128-rule limit for the interface.
Example

Use the following command to associate the `group_1` access group with the current IPv6 profile for inbound access:

```
ipv6 access-group group_1 in 1
```
**ipv6 address**

Specifies an IPv6 address and subnet mask.

**Product**
- PDSN
- HA

**Privilege**
- Security Administrator, Administrator

**Syntax**

```
[ no ] ipv6 address ipv6_address/mask
```

- **no**
  - Removes the IPv6 address from this interface.

- **ipv6_address/mask**
  - Specifies an individual host IP address to add to this host pool in IPv6 colon-separated-hexadecimal CIDR notation.

**Important:** On the ASR 5000, routes with IPv6 prefix lengths less than /12 and between the range of /64 and /128 are not supported.

**Usage**

Configures the IPv6 address and subnet mask for a specific interface.

**Example**

The following example configures an IPv6 address for this interface:

```
ipv6 address 2002::0:0:0::0:c014:101/128
```
**ipv6 ospf**

Enables Open Shortest Path First Version 3 (OSPFv3) functionality on this IPv6 a interface.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Syntax**

```
[ no ] ipv6 ospf [ area { integer | ipv4-address } | cost cost-value | dead-interval dead-intrv | hello-interval hello-intrvl | priority p-value | retransmit-interval retx-interval ]
```

- **no**
  Removes a previously configured access group association.

- **area { integer | ipv4-address**
  Specifies an OSPFv3 area.
  - **decimal_value**: Specifies the identification number of the area as an integer from 0 through 4294967295.
  - **ipv4address**: Specifies the IP address of the area in IPv4 dotted-decimal notation.

- **cost cost-value**
  Specifies a link cost as an integer from 1 through 65535. The link cost is carried in the LSA updates for each link. The cost is an arbitrary number.

- **dead-interval dead-intrv**
  Specifies the interval (in seconds) after which a neighbor is declared dead when no hello packets as an integer from 1 through 65535.

- **hello-interval hello-intrvl**
  Specifies the interval (in seconds) between hello packets that OSPFv3 sends on an interface as an integer from 1 through 65535.

- **priority p-value**
  Specifies the of the interface as an integer from 0 through 255.

- **retransmit-interval retx-interval**
  Specifies the time (in seconds) between link-state advertisement (LSA) retransmissions for adjacencies belonging to the OSPFv3 interface as an integer from 1 through 65535.
**transmit-delay td-interval**

Specifies the estimated time (in seconds) required to send a link-state update packet on the interface as an integer from 1 through 65535.

**Usage**

Configure an OSPFv3 interface in this context.

**Example**

```
ipv6 ospf area 334 cost 555 dead-interval 40 hello-interval 10 priority 10 retransmit-interval 5 transmit-delay 10
```
ipv6 router advertisement

Enables or disables the system to send IPv6 router advertisements.

Product

PDSN
HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Ethernet Interface Configuration
configure > context context_name > interface interface_name broadcast

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-if-eth)#

Syntax

[ no ] ipv6 router advertisement

Usage

Enables sending of router advertisements on the interface. All of the pool prefixes in the context (belonging to the interface) will be advertised in the router advertisement.

The router-lifetime in the advertisement is sent as 0 to indicate to the receiver that the sender cannot be a default-router. For all the prefixes (pools), the valid and preferred lifetime are sent as default. The router-advertisement is sent every 600 seconds.

If the pool-prefix is deleted, then an router-advertisement is sent for that particular prefix with the valid and preferred time set to 0.
**logical-port-statistics**

Enables or disables the collection of logical port (VLAN and NPU) bulk statistics for the first 32 configured Ethernet or PVC interface types.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Ethernet Interface Configuration

```bash
configure > context context_name > interface interface_name broadcast
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-if-eth)#
```

**Syntax**

```
[ no ] logical-port-statistics
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>no</strong></td>
<td>Stops the collection of logical port statistics on this interface.</td>
</tr>
</tbody>
</table>

**Usage**

Starts or stops the collection of logical port bulkstats. Default: This feature is not enabled. Statistics are collected for up to 32 logical ports. The system collects statistics on a per minute basis and maintains samples for the last 5-minute and 15-minute intervals when this feature is enabled.

**Example**

To start collection of logical port statistics on this interface, enter the following command:

```
logical-port-statistics
```
**mpls ip**

Enables or disables dynamic Multiprotocol Label Switching (MPLS) distribution and forwarding of IP packets on this interface.

**Product**
- GGSN
- HA
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Ethernet Interface Configuration

```
configure > context context_name > interface interface_name broadcast
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-if-eth)#
```

**Syntax**

```
[ no ] mpls ip
```

- **no**
  Stops dynamic label distribution and forwarding on this interface.

**Usage**

Starts label distribution and forwarding over an interface for a context that has MPLS enabled. For additional information, refer to the *Context Configuration Mode Commands* chapter. Default: This feature is not enabled.

**Example**

To start dynamic MPLS distribution and forwarding on this interface, enter the following command:

```
mpls ip
```
**policy-forward**

This command supports downlink IPv4 data packets received from the SGi that are forwarded/redirected to a configured next-hop address if the subscriber session does not exist in the P-GW.

**Product**
- PDSN
- P-GW

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > Ethernet Interface Configuration
  
  
  `configure > context context_name > interface interface_name broadcast`

  Entering the above command sequence results in the following prompt:
  
  `[context_name]host_name(config-if-eth)#`

**Syntax**

```
policy-forward { icmp unreachable next-hop ip address | unconnected-address next-system ip_address }  
no policy-forward unconnected-address
```

- `no`
  
  Deletes the policy forwarding configuration for unconnected address for the current interface.

- `icmp unreachable next-hop ip address`
  
  Specifies routing of Internet Control Message Protocol (ICMP) unreachable is required in overlapping pool configuration. `ip_address` must be expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

- `unconnected-address next-system ip address`
  
  Specifies the IP address of the next system P-GW to handle processing during P-GW upgrade. `ip_address` must be an IP address expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**Important:** The `unconnected-address next-system ip address` keyword enables IPv4 downlink data packet forwarding/redirection.

**Usage**

Use this command to set the redirecting policy for IP packets from an existing P-GW to a new P-GW during upgrade. To configure this command both keywords will be in separate interface.

**Important:** This is a customer specific command.
Example

To configure existing P-GW system for redirecting the P-GW packets to new P-GW during existing P-GW upgrade enter the following commands:

```
policy-forward unconnected-address next-system ip_address

policy-forward icmp unreachable next-hop ip_address
```
pool-share-protocol

Configures the primary or secondary system for the IP pool sharing protocol and enter IPSP configuration mode.

Product
PDSN
HA

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Ethernet Interface Configuration
configure > context context_name > interface interface_name broadcast

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-if-eth)##

Syntax

```
pool-share-protocol { primary ip_address | secondary ip_address } [ mode { active | inactive | check-config } ]
```

```
no pool-share-protocol
```

no

Deletes the IP pool sharing protocol information from the current interface.

```
primary ip_address
```

On the secondary system, defines the IP address of an interface on the primary system that has identical IP pools configured for use with the IP pool sharing protocol. `ip_address` must be expressed in IP v4 dotted-decimal notation.

```
secondary ip_address
```

On the primary system, define the IP address of an interface on the secondary system that has identical IP pools configured for use with the IP pool sharing protocol. `ip_address` must be expressed in IP v4 dotted-decimal notation.

```
mode {active | inactive | check-config}
```

This is an optional command to manage the mode for IP pool sharing protocol for primary or secondary HA. `active`: Activates the IP pool sharing protocol mode. `inactive`: Inactivates the IP pool sharing protocol mode. `check-config`: Verifies the IP pool sharing protocol configuration.

Usage

Use this command to set the IP address of the primary or secondary system for use with the IP pool sharing protocol and enter ipsp configuration mode. This command must be configured for an interface in each
context that has IP pools configured. Refer to the System Administration and Configuration Guide for information on configuring and using the IP pool sharing protocol.

**Important:** Both the primary and secondary systems must be in the same subnet.

**Important:** For information on configuring and using IP Pool Sharing Protocol (IPSP), refer to the *Packet Data Serving Node Administration Guide*.

**Important:** Reserve free addresses on the primary HA for this command via the `reserved-free-percentage` command as described in the *IPSP Configuration Mode Commands* chapter of this guide.

**Example**

To configure a secondary system with an IP address of 192.168.100.10 for use with the IP pool sharing protocol, enter the following command:

```
pool-share-protocol secondary 192.168.100.10
```

To inactivate a secondary system with an IP address of 192.168.100.10 for use with the IP pool sharing protocol, enter the following command:

```
pool-share-protocol secondary 192.168.100.10 mode inactive
```
port-switch-on-L3-fail

Causes the ASR 5000 line card port or the ASR 5500 MIO port to which the current interface is bound to switch over to the port on the redundant line card or MIO when connectivity to the specified IP address is lost.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Ethernet Interface Configuration

configure > context context_name > interface interface_name broadcast

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-if-eth)#

Syntax

port-switch-on-L3-fail address { ip_address | ipv6_address } [ minimum-switchover-period switch_time ] [ interval int_time ] [ timeout time_out ] [ num-retry number ]

no port-switch-on-L3-fail

no

Disable port switchover on failure.

ip_address

The IP address to monitor for connectivity, entered in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

minimum-switchover-period switch_time

After a switchover occurs, another switchover cannot occur until the specified amount of time (in seconds) has elapsed. switch_time must be an integer from 1 through 3600. Default: 120

interval int_time

Specifies how often (in seconds) monitoring packets are sent to the IP address being monitored. int_time must be an integer from 1 through 3600. Default: 60

timeout time_out

Specifies how long to wait (in seconds) without a reply before resending monitoring packets to the IP address being monitored. time_out must be an integer from 1 through 10. Default: 3

num-retry number

Specifies how many times to retry sending monitor packets to the IP address being monitored before performing the switchover. number must be an integer from 1 through 100. Default: 5
**Usage**

Use this command to monitor a destination in your network to test for L3 connectivity. The destination being monitored should be reachable from both the active and standby line cards.

**Example**

The following command enables port switchover on connectivity failure to the IP address 192.168.10.100 using default values:

```
port-switch-on-L3-fail address 192.168.10.100
```

The following command disables port switchover on connectivity failure:

```
no port-switch-on-L3-fail
```
**vlan-map**

Sets a single next-hop IP address so that multiple VLANs can use a single next-hop gateway. The vlan-map is associated with a specific interface.

**Product**
- PDSN
- HA
- SGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Ethernet Interface Configuration

```plaintext
configure > context context_name > interface interface_name broadcast
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-if-eth)#
```

**Syntax**

```
vlan-map next-hop ip_address
```

**Usage**

Specifies the IP address for the next-hop gateway in IPv4 dotted-decimal notation.

**Example**

The following command sets an IPv4 address for a next-hop gateway.

```
vlan-map next-hop 123.123.123.1
```
Chapter 127
Ethernet Port Configuration Mode Commands

The Ethernet Port Configuration Mode is used to create and manage Ethernet ports and their bindings between contexts.

Execute Mode:

```
Exec > Global Configuration > Ethernet Port Configuration
configure > port ethernet slot_number/port_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
bind interface

Configures an association (binds) between a virtual IP interface, an SS7 or Frame Relay link to a specific context.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Ethernet Port Configuration

`configure > port ethernet slot_number/port_number`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**

```
[ no ] bind interface interface_name context_name
```

- **no**
  Indicates the virtual interface specified is to be unbound from the context.

- **interface_name**
  Specifies the name of an existing virtual interface to be bound to the context as an alphanumeric string of 1 through 79 characters. The interface must be previously defined using the Context Configuration mode `interface` command.

- **context_name**
  Specifies the name of the context to be bound to the virtual port. `context_name` must refer to a previously configured context.

**Usage**

Bind an interface to a context to allow the context to provide service.

**Example**

The following command binds the `ethernet10` interface with the `allstar4` context:

```
bind interface ethernet10 allstar4
```
boxertap

Binds a physical port to a named interface for debugging purposes.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Ethernet Port Configuration
configure > port ethernet slot_number/port_number

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**

```
[ no ] boxertap interface_name
```

<table>
<thead>
<tr>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unbinds the physical port to the interface.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>interface_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the name of the virtual interface to be bound to the physical port as an alphanumeric string of 1 through 79 characters.</td>
</tr>
</tbody>
</table>

**Example**

Bind a physical port to a named interface for debugging purposes.

The following command binds the `ggsn01` interface to the boxertap port.

```
boxertap ggsn01
```
description

Allows you to enter descriptive text for this configuration.

Product
All

Privilege
Security Administrator, Administrator

Syntax

description text

no description

no

Clears the description for this configuration.

text

Enter descriptive text as an alphanumeric string of 1 to 63 characters. If you include spaces between words in the description, you must enclose the text within double quotation marks (" "), for example, “AAA BBBB”.

Usage

The description should provide useful information about this configuration.
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Use this command to return to the parent configuration mode.
fault-unidirect-mode

Configures the unidirectional mode that generates fault messages for the connection's peer when local faults are detected and remote faults are received.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Ethernet Port Configuration
```
configure > port ethernet slot_number/port_number
```
Entering the above command sequence results in the following prompt:
```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**
```
[ no ] fault-unidirect-mode ( clause-46 | clause-66 )
```

- **no fault-unidirect-mode**
  Disables fault message generation.

- **( clause-46 | clause-66 )**
  - **clause-46**: On local fault reception, continuous remote faults are sent. On remote fault reception, continuous idles are sent. [IEEE 802.3, Clause 46, Reconciliation Sublayer (RS) and 10 Gigabit Media Independent Interface (XGMII)]
  - **clause-66**: On local fault reception, frame transmit is continued, remote fault indication is sent during Inter-Frame Gap (IFG). On remote fault reception, frame transmit is continued. [IEEE 802.3, Clause 66, Extensions of the 10 Gb/s Reconciliation Sublayer (RS), 100BASE-X PHY, and 1000BASE-X PHY for unidirectional transport]

**Usage**
Configure the unidirectional mode that generates fault messages for the connection's peer when local faults are detected and remote faults are received.

**Example**
After flow control has been disabled, use the following command to enable flow control:
```
fault-unidirect-mode clause-46
```
flow-control

Enables and disables flow control on the ASR 5000 Quad Gig-E line card (QGLC) and 10-Gig-E line card (XGLC).

**Product**
- PDSN
- SGSN
- GGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Ethernet Port Configuration

```
configure > port ethernet slot_number/port_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**

```
[ no ] flow-control
```

- **no**

  Disables flow control on the specified port.

**Usage**

Flow control is enabled by default on the QGLC and can be disabled using the **no** command on a per-port basis. This command does not work on the Fast Ethernet Line Card (FELC) and Gigabit Ethernet Line Card (GELC/GLC2) which do not support flow control.

**Important:** Flow control **must** be enabled on all XGLCs in the chassis. To prevent XGLC shutdowns, you should also enable flow control at 6Gbps on the peer ports of all routers in your network that connect with the ASR 5000.

**Example**

After flow control has been disabled, use the following command to enable flow control:

```
flow-control
```
ingress-mode

Labels this port as an ingress port (incoming traffic).

**Product**
IPSG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Ethernet Port Configuration

`configure > port ethernet slot_number/port_number`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**

```
[ no ] ingress-mode
```

- **no**
  Disables ingress port tag.

**Usage**

Use this command to label this port in order for the session manager to recognize the interface from which IP data packets are being received. This command should be used in single context configurations. In single context configurations, the ingress port can only be identified if labeled.

**Important:** It is recommended to enable the `ingress-mode` configuration for IPv6 traffic to avoid packet drops.
**link-aggregation**

Aggregates ports on an ASR 5000 Quad Gig-E line card (QGLC), or 10 Gig-E line cards (XGLCs), or an ASR 5500 Management Input/Output (MIO) card and sets related parameters in accordance with IEEE 802.3ad.

**Product**
- WiMAX
- PDSN
- HA
- FA
- GGSN
- SGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Ethernet Port Configuration

```bash
configure > port ethernet slot_number/port_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**

```bash
link-aggregation { distribution { block | random | rotate | simple } | lacp { active | passive } [ rate { auto | fast | slow } ] [ timeout { long | short } ] | master { global group group_number | group group_number | local group group_number } | member { global group group_number | group group_number | local group group_number } | redundancy { standard | switched } [ hold-time sec ] [ preferred slot { card_number | none } ] } | toggle-link }

no link-aggregation [ toggle-link ]

default link-aggregation { distribution | lacp | redundancy | toggle-link }

distribution { block | random | rotate | simple }
```

**Important:** The distribution keyword is not supported on the ASR 5500.

Configures link aggregation distribution and controls how a Link Aggregation Group (LAG) hash map is generated. This method is required for Equal Cost Multi-Path (ECMP) routing over LAG. Set this option on the master port for use with the whole group. The following list defines the distribution options (assuming port index 0,1,2,3 were selected).

- **block**: Blocks of the same port index (Example: 0000111122223333)
- **random**: Based on pseudo random number
- **rotate**: Repetition of rotated port index (Example: 0123123023013012…)
- **simple**: Repetition of all selected port indexes (Example: 0123012301230123…)
lACP { active | passive }

Configures the Link Aggregation Control Protocol (LACP). Set this option on the master port for use with the whole group.
active mode sends out LACP packets periodically. (Default)
passive mode only responds to LACP packets received.

rate { auto | fast | slow }

Configures the rate at which the LACP sends packets.
auto: rate is controlled by the peer
fast: 1 seconds
slow: 30 seconds (Default) [ASR 5000 only]

timeout { long | short }

Configures LACP timeout events. Set this option on the master port for use with the whole group.
long: Set LACP to long timeout
short: Set LACP to short timeout

master { global group group_number | group group_number | local group group_number }

This command creates the Master port for the aggregated group.
global: Set group global across slots.
group group_number: Set link aggregation group number. group_number must be an integer between 1 and 1023.
local: Set group local within same slot.

member { global group group_number | group group_number | local group group_number }

This command makes the port a member of the aggregated group.
global: Set group global across slots.
group group_number: Set link aggregation group number. group_number must be an integer from 1 through 1023.
local: Set group local within same slot.

redundancy { standard | switched } [ hold-time sec ] [ preferred slot { card_number | none } ]

Connects top and bottom QGLCs, side-by-side XGLCs, or MIO cards, to different Ethernet switches. The master port must be set to make this effective for the group.
standard: Treats all cards in the group as one group. (Default)
switched: Assumes cards are connected to different switches. [ASR 5000 only]
hold-time sec: Sets the amount of time to hold (in seconds) before switching between cards. Applies to standard and switched modes. sec must be an integer from 0 through 3600. Default: 10
preferred slot { card_number | none }: Specifies the preferred behavior for a LAG using two Ethernet switches. Applies to standard and switched modes. card_number is an integer between 1 and 48 on an ASR 5000, or 5 or 6 on an ASR 5500.
When a card number is specified, system behavior varies based on the card type.

*QGLC (ASR 5000) – the preferred slot is selected only when both the top and bottom slots have the same number of active LACP ports.
- **XGLC (ASR 5000)** – the preferred slot is selected for the initial timeout period to make the selection of an Ethernet switch less random.
- **MIO (ASR 5500)** – the preferred slot is selected for the initial timeout period to make the selection of an Ethernet switch less random.

**none**: Specifies no preferred slot.

---

**toggle-link**

---

**Important**: The **toggle-link** keyword is not supported on the ASR 5500.

Set to toggle link on port switch.

**default**

Restores the default values.

**no**

This command deletes the Ethernet port from any group it might be in. If the port was the Master of a group, the whole group would be deleted.

---

**Usage**

Configure from one to four ports on a QGLC (vertical aggregation) or the single port on XGLCs (horizontal aggregation), or traffic ports on an MIO card to be in an aggregation group that links to an aggregation group on a remote Ethernet switch. Very large files can be downloaded across all ports in a group, which makes for a faster download when compared to serial downloads over a single link.

Related **link-aggregation** commands are described in the *Card Configuration Mode Commands* and *Global Configuration Mode Commands* chapters of this guide. For additional information, also refer to the *System Administration Guide*.

---

**Example**

The following example configures the port to be part of Master Group 2:

```
link aggregation master group 2
```
media

Configures the port interface type. (ASR 5000 only)

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Ethernet Port Configuration

configure > port ethernet slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Syntax

```plaintext
media { rj45 | sfp }
```

---

**rj45**

- **rj45**: Sets the physical interface to a copper RJ-45 connector.

---

**sfp**

- **sfp**: Sets the physical interface connection to optical Small Form Factor (SFP) gigabit via an SFP transceiver.

---

Usage

Set the media option when the physical cabling interface is changed.

Example

The following command sets the physical interface to RJ-45:

```plaintext
media rj45
```
medium

Configures the port speed and communication mode. (ASR 5000 only)

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Ethernet Port Configuration

counture > port ethernet slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Syntax

medium { auto | speed { 10 | 100 | 1000 | 10000 } duplex { full | half } }

{ auto | speed { 10 | 100 | 1000 | 10000 } duplex { full | half } }

Default: auto
Optionally sets the speed of the interface and the communication mode.

auto: configures the interface to auto negotiate the interface speed.
speed { 10 | 100 | 1000 | 10000 }: specifies the speed to use at all times.
duplex { full | half }: sets the communication mode of the interface to either full or half duplex.

Important: Ethernet networking rules dictate that if a device whose interface is configured to auto-negotiate is communicating with a device that is manually configured to support full duplex, the first device will negotiate to the manually configured speed of the second device but will only communicate in half duplex mode.

Usage
Set the medium options when the physical interface changes.

Important: The speed keyword for the medium command is not supported on the ASR 5500.

Example
The following configures the port’s speed and communication mode to be auto negotiated.

    medium auto

The following command configures the port’s interface speed to gigabit with full duplex communication.

    medium speed 1000 duplex full
preferred slot

Assigns revertive or non-revertive control to port redundancy auto-recovery. (ASR 5x00 only)
Default: non-revertive operation

Product
PDSN
FA
HA
SGSN
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Ethernet Port Configuration
configure > port ethernet slot_number/port_number

Entering the above command sequence results in the following prompt:
[local]host_name(config-port-slot_number/port_number)#

Syntax

[ no ] preferred slot slot_number

no
Disables revertive or auto-recovery operation for the selected port.

preferred slot slot_number
Identifies the physical chassis slot where the ASR 5000 line card or SPIO card, or the ASR 5500 MIO card is installed.

Usage
This command enables or disables revertive port redundancy, wherein after a port failover, when the original port is restored to service (such as link up) the system will return service to that port automatically. Disabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue an Exec mode link-aggregation port switch to command to return service to the original port.
This command must be issued on a per port basis, allowing you to configure specific ports to be used on individual line card, SPIO, or an MIO card.

Important: This command is not supported on all platforms.

Example
For ASR 5000:
preferred slot 17

For ASR 5500:

preferred slot 5
**shutdown**

Terminates all processes supporting the port or blocks the shutting down of the port. Conversely, the port is enabled with the use of the `no` keyword.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Ethernet Port Configuration

`configure > port ethernet slot_number/port_number`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**

```
[ no ] shutdown
```

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enables the port and places it in service.</td>
</tr>
</tbody>
</table>

**Usage**

Shut down a port prior to re-cabling and/or other maintenance activities.

For Release 15.0 and higher, this command powers down the port on FELC, GELC and QGLC line cards (ASR 5000). This command already powers down the ports on MIO/UMIO cards (ASR 5500).

To enable a port (bring it into service) use the `no` keyword.

**Example**

Use the following command to disable the port:

```
shutdown
```

Use the following command to enable the port for service:

```
no shutdown
```
snmp trap link-status

Enables or disables the generation of an SNMP trap for link status changes.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Ethernet Port Configuration

configure > port ethernet slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Syntax

[ no ] snmp trap link-status

no

Disables the sending of traps for link status changes.

Usage
Enable link status change traps when a monitoring facility can use the information or if there are troubleshooting activities in progress.

Example
Use the following command to disable sending of traps:

no snmp trap link-status
srp virtual-mac-address

Configures the Standby Router Protocol (SRP) virtual MAC address for the port on an ICSR chassis.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Ethernet Port Configuration

```
configure > port ethernet slot_number/port_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**

```
srp virtual-mac-address mac_address

no srp virtual-mac-address
```

---

**no**

Disables the SRP virtual MAC addressing for Ethernet ports. The block of virtual MAC addresses is not saved.

```
no
```

**mac_address**

Enables SRP virtual addressing for the specified MAC address. The MAC address should be specified as six groups of two hexadecimal digits separated by hyphens. For example, 01-23-45-67-89-ab.

```
mac_address
```

---

**Usage**

The SRP virtual MAC address is applied to the port when the chassis is in SRP ACTIVE state. The default is **no srp virtual-mac-address**.

---

**Important:** This command is not supported on all platforms.

---

**Example**

Use the following command to enable the SRP’s virtual MAC addressing:

```
srp virtual-mac-address 09-33-48-67-99-ae
```
threshold high-activity

Configures thresholds for high port activity for the port.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Ethernet Port Configuration

```
configure > port ethernet slot_number/port_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**

```
threshold high-activity high_thresh [ clear low_thresh ]
```

- **high_thresh**
  
  Specifies the high threshold high port activity percentage that must be met or exceeded within the polling interval to generate an alert or alarm. The percentage is expressed as an integer from 0 through 100. Default: 50

- **clear**
  
  Allows the configuration of the low threshold.

- **low_thresh**
  
  Specifies the low threshold high port activity percentage that maintains a previously generated alarm condition. If the activity percentage falls below the low threshold within the polling interval, a clear alarm will be generated. The percentage is expressed as an integer from 0 through 100. Default: 50

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

High port activity thresholds generate alerts or alarms based on the utilization percentage of each configured port during the specified polling interval. This threshold is configured on a per-port basis. Alerts or alarms are triggered for high port activity based on the following rules:

- **Enter condition**: Actual percent utilization of a port is greater than High Threshold.
- **Clear condition**: Actual percent utilization of a port is less than Low Threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command in the *Global Configuration Mode Commands* chapter to configure the polling interval and the `threshold monitoring` command in this chapter to enable thresholding for this value.

**Example**

The following command configures a high port utilization threshold percent of 70 and a low threshold percent of 50 for a system using the Alarm thresholding model:

```
threshold high-activity 70 clear 50
```
threshold monitoring

Enables or disables thresholding for port-level values.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Ethernet Port Configuration

```
configure > port ethernet slot_number/port_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**

```
[ no ] threshold monitoring
```

```
no
```

Disables threshold monitoring for port-level values. This is the default setting.

**Usage**

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (such as high-activity) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. Thresholding helps identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps**: SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the starentMIB(8164).starentTraps(2) section of the SNMP MIB Reference. The generation of specific SNMP traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs**: The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of WARNING.

- **Alarm System**: High threshold alarms generated within the specified polling interval are considered “outstanding” until a the condition no longer exists and/or a condition clear alarm is generated. “Outstanding” alarms are reported to through the system’s alarm subsystem and are viewable through the system’s CLI.

The following table indicates the reporting mechanisms supported by each of the above models.

<table>
<thead>
<tr>
<th>Model</th>
<th>SNMP Traps</th>
<th>Logs</th>
<th>Alarm System</th>
</tr>
</thead>
</table>

3742
This command enables thresholding for port-level values. Refer to the `threshold high-activity`, `threshold rx-utilization`, and `threshold tx-utilization` commands in this chapter for information on configuring these values. In addition, refer to the `threshold poll` command in the *Global Configuration Mode Commands* chapter for information on configuring the polling interval over which these values are monitored.
threshold rx-utilization

Configures thresholds for receive port utilization.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Ethernet Port Configuration
  configure > port ethernet slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Syntax

threshold rx-utilization high_thresh [ clear low_thresh ]

<table>
<thead>
<tr>
<th>high_thresh</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the high threshold receive port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm. The percentage is expressed as an integer from 0 through 100. Default: 80</td>
</tr>
</tbody>
</table>

| clear |
| Allows the configuration of the low threshold. |

| low_thresh |
| specifies the low threshold receive port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a Clear Alarm will be generated. The percentage is expressed as an integer from 0 through 100. Default: 80 |

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Receive port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data received during the specified polling interval. This threshold is configured on a per-port basis.

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive or transmit utilization threshold be configured.
Alerts or alarms are triggered for receive port utilization based on the following rules:

- **Enter condition**: Actual percent utilization of a port for received data is greater than High Threshold
- **Clear condition**: Actual percent utilization of a port for received data is less than Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command in the *Global Configuration Mode Commands* chapter to configure the polling interval and the `threshold monitoring` command in this chapter to enable thresholding for this value.

**Example**

The following command configures a receive port high utilization threshold percent of 70 and a low threshold percent of 50 for a system using the Alarm thresholding model:

```
threshold rx-utilization 70 clear 50
```
threshold tx-utilization

Configures thresholds for transmit port utilization.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Ethernet Port Configuration

configure > port ethernet slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Syntax

threshold tx-utilization  high_thresh [ clear  low_thresh ]

high_thresh
The high threshold transmit port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm. The percentage is expressed as an integer from 0 through 100. Default: 80

clear
Allows the configuration of the low threshold.

low_thresh
The low threshold transmit port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated. The percentage is expressed as an integer from 0 through 100. Default: 80

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
Transmit port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data transmitted during the specified polling interval. This threshold is configured on a per-port basis.

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive or transmit utilization threshold be configured.

Alerts or alarms are triggered for transmit port utilization based on the following rules:
• **Enter condition**: Actual percent utilization of a port for transmit data is greater than High Threshold

• **Clear condition**: Actual percent utilization of a port for transmit data is less than Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval. Refer to the `threshold poll` command in the *Global Configuration Mode Commands* chapter to configure the polling interval and the `threshold monitoring` command in this chapter to enable thresholding for this value.

Example

The following command configures a transmit port high utilization threshold percent of 70 and a low threshold of 50 for a system using the Alarm thresholding model:

```
threshold tx-utilization 70 clear 50
```
**vlan**

Enters VLAN Configuration mode. Creates VLAN if necessary.

**Product**

HA
HSGW
PDSN
P-GW
SAEGW
SGSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Ethernet Port Configuration

`configure > port ethernet slot_number/port_number`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**

```bash
vlan vlan_id [ inline-process | subscriber-vlan ] [ -noconfirm ]
```

- **vlan_id**
  Specifies a VLAN identifier as an integer from 1 through 4094. If this identifier does not already exist you are prompted to confirm the identifier an a new one is created.

- **inline-process**
  Specifies that this VLAN will be used for inline processing.

- **subscriber-vlan**
  Specifies that this VLAN will be used for subscriber-based processing.

- **-noconfirm**
  Specifies that the command must execute without any prompts and confirmation from the user.

**Usage**

Use this command to specify an existing VLAN ID or create a new VLAN ID and enter the VLAN Configuration mode.

For additional information, refer to the *VLAN Configuration Mode Commands* chapter.

**Example**

The following command creates the VLAN ID 234.
```
vlan 234

Are you sure? [Yes|No]: y
```
Chapter 128
Exec Mode Commands (A-C)

This section includes the commands `aaa test` through `crypto-group`.
The Exec Mode is the initial entry point into the command line interface system. Exec mode commands are useful in troubleshooting and basic system monitoring.

Mode

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
aaa test

Tests Authentication, Authorization and Accounting (AAA) functionality between this system and a remote server.

**Product**

PDSN  
HA  
GGSN  
SGSN  
ASN-GW

**Privilege**

Security Administrator, Administrator, Operator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
aaa test { accounting username user_name | authenticate user_name password | session user_name password }
```

- **accounting username user_name**
  
  Tests RADIUS or GTPP accounting functionality for the specified user.  
  `user_name` must be the name of a user configured on the RADIUS or CFG server.

  **Important:** GTPP is used only in conjunction with the GGSN or SGSN product.

- **authenticate user_name password**
  
  Tests RADIUS authentication functionality for the specified user.  
  `user_name` is the name of a user configured on the RADIUS server. `password` is the user’s password.

- **session user_name password**
  
  Tests both RADIUS authentication and RADIUS or GTPP accounting functionality for the specified user.  
  `user_name` is the name of a user configured on the RADIUS server. `password` is the user’s password.

  **Important:** GTPP is used only in conjunction with the GGSN or SGSN product.

**Usage**

This command is used to test RADIUS-based authentication and RADIUS or GTPP accounting. This command may be useful for diagnosing problems with subscribers and access to the system and/or billing data.
Example

The following command verifies accounting for a user named user1:

    aaa test accounting username user1

The following command tests authentication for a user named user1 with the password abc123:

    aaa test authentication user1 abc123

The following command tests both accounting and authentication for the user named user1 with the password abc123:

    aaa test session user1 abc123
**abort**

Stops software patch or upgrade process.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
abort { patch | upgrade } [ -noconfirm ]
```

- **patch**
  Stops a running software patch process.

- **upgrade**
  Stops a running software upgrade process.

**Important:** The **abort upgrade** command can only be used during Stage 1 (busy-out) of an on-line software upgrade.

- **-noconfirm**
  Executes the command without any additional prompt and confirmation from the user.

**Usage**

Use this command to stop a running StarOS patch or upgrade process. For additional information on software patches and upgrades, refer to the *System Administration Guide*.

**Example**

The following command stops an in-progress StarOS upgrade:

```
abort upgrade
```
active-charging service

Creates an active charging service (ACS).

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```plaintext
active-charging service ecs_service_name [ -noconfirm ]
```

- `ecs_service_name`
  Specifies name of the active charging service.
  `ecs_service_name` must be an alphanumeric string of 1 through 15 characters.
  If the named service does not exist, it is created and the CLI mode changes to the ACS Configuration Mode wherein the service can be configured.
  If the named service already exists, the CLI mode changes to the ACS Configuration mode wherein the specified active charging service can be configured.

- `-noconfirm`
  Executes the command without any additional prompt and confirmation from the user.

Usage

Use this command to create an active charging service in the system. This command can be used directly in Exec Mode after issuing the `require active-charging` command in the Global Configuration Mode.
This command allows an operator (rather than security administrators and administrators) to configure the ACS functionality only.
On entering this command, the CLI prompt changes to:

```plaintext
[context_name]hostname(config-accs)#
```

**Important:** Operators need special CLI privilege for ACS functionality to be able to use this CLI command.

Example

The following command creates an active charging service named `test`:

```plaintext
active-charging service test
```
alarm

Disables the internal audible alarm on the system management card.

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

alarm cutoff

Usage

Alarm cutoff disables the audible alarm. The alarm may be enabled following this command if an event within the system results in the audible alarm being enabled.

Example

alarm cutoff
### Exec Mode Commands (A-C)

**aps**

Allows the operator to perform SONET Automatic Protection Switching (APS) administrative operations.

![Important:](image) Use of this command is limited to the OLC2 and the CLC2 line cards.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator, Operator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```plaintext
aps { clear slot#/port# | exercise slot#/port# | lockout slot#/port# | switch { force | manual } slot#/port# }
```

- **clear slot#/port#**
  
  Clears the last switch command on the specified channelized port.
  
  *slot#/port#* is the CLC2/OLC2 slot number (valid range is 17 - 48) and appropriate port number (CLC2 valid range is 1 - 4; OLC2 valid value is 1).

- **exercise slot#/port#**
  
  Tests the APS protocol on line connected to port.
  
  *slot#/port#* is the CLC2/OLC2 slot number (valid range is 17 - 48) and appropriate port number (CLC2 valid range is 1 - 4; OLC2 valid value is 1)

- **lockout slot#/port#**
  
  Prevents the working port from switching to the protection port.
  
  *slot#/port#* is the CLC2/OLC2 slot number (valid range is 17 - 48) and appropriate port number (CLC2 valid range is 1 - 4; OLC2 valid value is 1)

- **switch { force | manual } slot#/port#**
  
  Switch to either the working port or the protection port:
  
  - **force**: Forces a switch of ports, even if there is an active alarm state.
  - **manual**: Implements a switch of ports if there are no active alarms.
  
  *slot#/port#* is the CLC2/OLC2 slot number (valid range is 17 - 48) and appropriate port number (CLC2 valid range is 1 - 4; OLC2 valid value is 1)
Usage

This command allows an operator to perform administrative/maintenance APS tasks such as testing the APS protocol, switching the working port to the protection port, and locking out the switching function.

Example

The following command starts an APS protocol test on port 2 of card 27:

```
aps exercise 27/2
```
**autoconfirm**

Enables or disables confirmation for certain commands. This command affects the current CLI session only.

---

**Important:** Use the `autoconfirm` command in the Global Configuration Mode to change the behavior for all future CLI sessions.

---

**Product**

All

**Privilege**

Security Administrator, Administrator, Operator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

- `autoconfirm`
- `no autoconfirm`

**Usage**

When `autoconfirm` is enabled, certain commands ask you to answer yes or no to confirm that you want to execute the command. When `autoconfirm` is disabled, the confirmation questions never appear. Disabling `autoconfirm` is active for the current session only. By default `autoconfirm` is enabled.

**Example**

The following command enables command confirmation:

```
autoconfirm
```

The following command disables command confirmation for the duration of the current CLI session:

```
no autoconfirm
```
bulkstats force

Manages the collection and delivery of system statistics (bulkstats) to the configured server.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
bulkstats force { gather | transfer }
```

---

**gather**
Immediately collects the system statistics.

---

**transfer**
Immediately sends the currently collected statistics to the configured server.

---

**Usage**

When the current system statistics are desired immediately as opposed to the normal scheduled collection and delivery intervals issue this command. Troubleshooting the system may require the review of statistics at times when the scheduled delivery is not timely.

**Example**
The following causes the chassis to immediately collect system statistics. This would be in anticipation of a transfer command.

```
bulkstats force gather
```

The following command causes the chassis to immediately send all collected statistics to the configured server.

```
bulkstats force transfer
```
**call-home send**

Manages how Cisco Smart Call Home messages are sent to alert groups.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
call-home send alert-group { configuration profile profile name | inventory profile profile name }
```

- **configuration profile profile name**
  Sends configuration messages to the previously defined profile, expressed as an alphanumeric string of 1 through 31 characters.

- **inventory profile profile name**
  Sends inventory messages to the previously defined profile, expressed as an alphanumeric string of 1 through 31 characters.

**Usage**

Use this command to send specified alert-group call-home message from the CLI to all profiles subscribed to the specified alert group, or to a specified profile which does not need to be subscribed to the specified alert-group. For additional information, refer to the *Call-Home Configuration Mode Commands* and *Call-Home Profile Configuration Mode Commands* chapters.

**Example**

The following command sets the system to send configuration related call-home messages to the profile named *Profile1*.

```
call-home send alert-group configuration profile Profile1
```
call-home test

Sends a test Smart Call Home event message to a specified profile.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
call-home test message { test_message_content | profile profile name }
```

- **call-home test message message**
  test_message_content
  
  Defines the message to send to the defined profile as an alphanumeric string of 1 through 128 characters.

- **profile profile_name**
  
  Specifies the previously defined profile to which the message will be sent, expressed as an alphanumeric string of 1 through 31 characters.

**Usage**

Use this command to send test call-home messages from the CLI to a specified profile. If a message is not specified, the system sends out a default message.

**Example**

The following command sets the system to send a test call-home message *Test_Message_1* to the profile named *Profile1*.

```
call-home test message Test_Message_1 profile Profile1
```
card busy-out

Moves processes from the source packet processing card to the destination packet processing card, or disables the packet processing card from accepting any new calls. When busy-out is enabled, the packet processing card stops receiving new calls but continues to process calls until they are completed. The command prompt is returned once the command is initiated. The busy-out procedure is completed in background. (ASR 5x00 only)

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

card busy-out { migrate from src_slot to dst_slot } [ -noconfirm ]

no card busy-out

- no
Disables busy-out. The packet processing card is re-enabled to accept new calls.

migrate from src_slot to dst_slot
Moves processes from the specified source packet processing card to the specified destination packet processing card. The command prompt is returned once the command is initiated. The card migration is completed in background.

src_slot indicates the source slot number of the card from which processes will be migrated.
dst_slot indicates the destination slot number of the card to which processes will be migrated.

- noconfirm
Executes the command without any additional prompt and confirmation from the user.

Usage

Migrating a packet processing card changes the active/standby status of a packet processing card. This results in the active sessions/processes being moved to the newly active card. This is useful when there is a maintenance activity on the active card which requires removing the card from service.
The destination slot specified must contain a packet processing card which is in the standby state for the command to complete successfully.

Caution: Be cautious when executing this command. Depending on the number of active sessions being migrated, some subscribers may experience service interruptions.
Using busy-out to refuse new calls on a packet processing card allows you to take a card out of service without any interruptions to the end user. An individual system can be taken completely out of service gracefully by enabling busy-out on all packet processing cards and waiting for current calls to complete. The `show card info` command shows if busy-out is enabled.

**Important:** When a packet processing card fails, is migrated, or is restarted for any reason, busy-out is reset to disabled, the default behavior.

**Important:** This command is not supported on all platforms.

**Example**

The following command migrates the active processes from the packet processing card in slot 12 to the card in slot 14. This command executes after you provide confirmation of the request.

```
card migrate from 12 to 14
```

The following command migrates the active processes from the packet processing card in slot 1 to the card in slot 8. This command executes after you provide confirmation of the request.

```
card migrate from 1 to 8
```

The following command sets the packet processing card in slot 1 to stop accepting new calls:

```
card busy-out 1
```
card halt

Halts all StarOS processes on a card. A card reboot command must be issued to bring the card back into service after it is halted. (ASR 5x00 only)

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:
[local]host_name#

Syntax

```
    card halt slot_num [ -force ] [ -noconfirm ]
```

**slot_num**
Indicates the slot number of the card of interest.

**-force**
Over-rides any warnings to force the card to be halted.

**-noconfirm**
Executes the command without any additional prompt and confirmation from the user.

Usage
Halt a card to stop the card for maintenance or emergency situations.

**Caution:** Caution should be taken in using this command. Halting a card which has no redundant card available may cause a service interruption and loss of active sessions.

**Important:** On the ASR 5500, do not initiate a card halt for an active FSC if there are less than two active FSCs in the system. The system returns an error message if there are less than four active FSCs.

**Caution:** The -force and -noconfirm options should only be used concurrently by experienced users as this will cause an immediate halt regardless of warnings and no confirmation from the user.

**Important:** This command is not supported on all platforms.

Example
The following command temporarily stops the card in slot 1.
card halt

The following commands force the card to halt and indicate no confirmation is to take place, respectively.

    card halt 1 -force -noconfirm

    card halt 1 -noconfirm
**card migrate**

Migrates StarOS processes from an active packet processing card to a standby packet processing card. (ASR 5x00 only)

**Product**

All

**Privilege**

Security Administrator, Administrator, Operator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
card migrate from src_slot to dst_slot [ -noconfirm ]
```

* src_slot
  Indicates the slot number of the packet processing card from which processes will be migrated. The packet processing card in this slot must be in Active mode.

* dst_slot
  Indicates the slot number of the packet processing card to which processes will be migrated.

* -noconfirm
  Executes the command without any additional prompt and confirmation from the user.

**Usage**

This command allows an operator to move processes from an active to a standby packet processing card.

**Example**

The following will cause processes currently running on the card in slot 8 to migrate to the standby card in slot 9. The migration will not occur if any warnings are generated.

```
card migrate from 8 to 9
```
card reboot

Resets of the target card. For ASR 5000, rebooting a packet processing or line card will result in the card downloading the image from the active system management card. For ASR 5500, rebooting a card will result in the card downloading the image from the active MIO card.

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
card reboot target_slot [ -force ] [ -noconfirm ]
```

target_slot
Initiates a reboot of the card in the specified the slot number.

-force
Indicates that the reboot is to take place ignoring any state or usage warnings that might be generated.

-noconfirm
Executes the command without any additional prompt and confirmation from the user.

Usage

A reboot is used to reset the card and receive a new download. This may be useful when a card is not responding or when it is necessary to cause the card to reload its image and restart.

⚠️ Caution: Caution should be taken in using this command. Rebooting a card which has no redundant card available may cause a service interruption and loss of active sessions.

💡 Important: On the ASR 5500, do not initiate a card reboot for an active FSC if there are less than four active FSCs in the system. The system returns an error message if there are less than four active FSCs.

⚠️ Caution: The -force and -noconfirm options should only be used concurrently by experienced users as this will cause an immediate reboot regardless of warnings and no confirmation from the user.

💡 Important: This command is not supported on all platforms.
Example

The following will cause the card in slot 8 to reboot without any confirmation from the user. The card will not reboot if there are any warnings generated.

```
card reboot 8 -noconfirm
```

The following command will cause the card in slot 8 to reboot regardless of any warnings. The user must provide confirmation prior to this command executing.

```
card reboot 8 -force
```

The following command will cause the card in slot 8 to reboot regardless of any warnings with no additional user confirmation.

```
card reboot 8 -force -noconfirm
```
card restart

Performs a soft-reset of the target card causing all application processes to restart. (ASR 5x00 only)

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

`card restart target_slot [ -force ] [ -noconfirm ]`

target_slot

Initiates a restart of the card in the specified slot number.

-force

Indicates the restart is to take place ignoring any state or usage warnings that might be generated.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

Usage

Restarting a card may be useful when a card is not performing as expected (performance drop, increased response delays, etc.). A restart may be preferred to a reboot as the card becomes available in less time than a reboot.

When this command is issued for an active card, the user is prompted for confirmation unless the -force and/or -noconfirm keywords are used. Because the reboot of standby or redundant cards is non-service impacting, the reboot proceeds immediately after the command execution without user confirmation.

⚠️ Caution: Caution should be taken in using this command. Restarting a card which has no redundant card available may cause a service interruption and loss of active sessions.

ℹ️ Important: This command is not supported on all platforms.

⚠️ Caution: The -force and -noconfirm options should only be used concurrently by experienced users as this will cause an immediate restart regardless of warnings and no confirmation from the user.

Example
The following will cause the card in slot 8 to restart without any confirmation from the user. The card will not reboot if there are any warnings generated.

```
card restart 8 -noconfirm
```

The following command will cause the card in slot 8 to restart regardless of any warnings. The user must provide confirmation prior to this command executing.

```
card restart 8 -force
```

The following command will cause the card in slot 8 to restart regardless of any warnings with no additional user confirmation.

```
card restart 8 -force -noconfirm
```
card switch

Manages card pairs and their active/standby status. (ASR 5x00 only)

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

card switch { from target_slot | to target_slot } [ -noconfirm ]

from target_slot
Spefies the slot number of a currently active card that is to be switched. The slot number must be valid and contain a card in active mode.

to target_slot
Spefies the slot number of a standby card which is to become the active card. The slot number must be valid and contain a card in standby.

-noconfirm
Executes the command without any additional prompt and confirmation from the user.

Usage
Card switch-overs change the active/standby status of a card. This is useful when there is a maintenance activity on the active card which requires removing the card from service.

⚠️ Caution: Caution should be taken in using this command. Depending on the amount of bandwidth/traffic being switched, some subscribers may experience service interruptions.

🚀 Important: This command is not supported on all platforms.

Example

The following command switches the active/standby status of the line cards in slots 17 and 18. This command only executes after you provide confirmation of the request.

    card switch from 17 to 18

The following command switches the active/standby status of the cards in slots 1 and 2. This command executes immediately with no additional user confirmation.
card switch from 1 to 2 -noconfirm
card upgrade

Upgrades the programmable memory on a card. (ASR 5x00 only)

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

card upgrade slot_number[ -noconfirm ]

| slot_number |
The slot number of the card to be upgraded, for ASR 5000: from 1 through 16, and for ASR 5500: from 1 through 10.

| -noconfirm |
Executes the command without any additional prompt and confirmation from the user.

⚠️ Caution: Use this command only if instructed by or working with Technical Assistance Center personnel.

ℹ️ Important: On the ASR 5500, do not initiate a card upgrade for an active FSC if there are less than four active FSCs in the system. The system returns an error message if there are less than four active FSCs.

Usage

You can only initiate an upgrade if:
• there is no migration occurring,
• the card is active or standby,
• there is no online upgrade in progress.

ℹ️ Important: The following operations are not allowed while a card is upgrading: change edc requirement (config), change card [no] shutdown (config), change card active (config), change card redundancy (config), card halt (exec), card reboot (exec), start an online upgrade.

ℹ️ Important: Level unlock operations are ignored while a card is upgrading.
Important: This command is not supported on all platforms.

Example

The following command initiates a packet processing card upgrade on slot number 10:

```
card upgrade 10
```
**cdr-push**

Initiates a manual push of CDR files to a configured URL or Local - External Storage System (L-ESS).

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
cdr-push { all | local-filename file_name }
```

- **all**
  
  Pushes all CDR files to the configured URL.

- **local-filename file_name**
  
  Pushes only the specified file to the configured URL.
  
  *file_name* must be the absolute path of the local file to push, and must be an alphanumeric string of 1 through 1023 characters.

**Usage**

Use this command to manually push CDR files to the configured URL or L-ESS.

For information on configuring the L-ESS, see the `cdr` command in the *EDR Module Configuration Mode Commands* and the *UDR Module Configuration Mode Commands* chapters.

**ASR 5000**: Run this command only from the local context. If you are in any other context, you will see this failure message: “Failure: Manual PUSH of CDRs supported only in the local context”

**ASR 5500**: Run this command only from the local context. If you are in any other context, you will see this failure message: “Failure: Manual PUSH of CDRs supported only in the local context”

**Example**

The following command pushes all CDR files to the URL:

```
cdr-push all
```
chassis

Identifies the chassis that can encrypt and decrypt encrypted passwords in the configuration file. If two or more chassis are configured with the same chassis key value, the encrypted passwords can be decrypted by any of the chassis sharing the same chassis key value. As a corollary to this, a chassis key value will not be able to decrypt the passwords that were encrypted using a different chassis key value.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name$

Syntax

[ no ] chassis { key value key_string | keycheck key_string }

no
Resets the chassis key to the factory default value. The factory default value is unique to the chassis. Once this command is executed, the chassis key value command can be used to change the default chassis key.

key value key_string
Specifies the chassis key value as an alphanumeric string of 1 through 16 characters.

The chassis key value is stored as a one-way encrypted value, much like a password. It is never displayed in its plaintext form.

keycheck key_string
Generates a one-way encrypted key value based on the entered alphanumeric string of 1 through 16 characters.

The generated encrypted key value is compared against the encrypted key value of the previously entered chassis key value. If the encrypted values match, then the command succeeds and key check passes. If the comparison fails, a message is displayed indicating that the key check has failed. Note that if the default chassis key (no chassis key) is currently being used, this key check will always fail since there will be no chassis key value to compare against.

Usage
Establish multiple, unique chassis keys to encrypt and decrypt passwords in configuration files.

Example
The following command generates a one-way encrypted key based on the string tewks367.

chassis key value tewks367
clear aaa

Clears all Authentication, Authorization, and Accounting (AAA) statistics for the current context.

**Product**

- PDSN
- GGSN
- ASN-GW
- P-GW
- SAEGW

**Privilege**

Security Administrator, Administrator, Operator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```  

**Syntax**

`clear aaa local counters`

**Usage**

Clearing the AAA statistics may be useful when monitoring the statistics manually. Clearing resets the counters to zero.

The keyword `local` is not intended to imply the local context defined for all systems. Rather, it indicates the statistics within the current context are to be cleared.

**Example**

The following command zeroes out all the AAA statistics in the current context.

```
clear aaa local counters
```
clear active-charging analyzer statistics

Clears protocol analyzer statistics.

Product
ACS

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear active-charging analyzer statistics [ name protocol_name ] [ | { grep grep_options | more } ]

name protocol_name
Clears statistics for the specified protocol analyzer.
If this keyword is not specified all statistics are cleared.
protocol_name must be one of the following:
* cdp
* dns
* file-transfer
* ftp
* http
* icmp
* icmpv6
* imap
* ip
* ipv6
* mms
* p2p [ application p2p_list | protocol-group group_list ]: Peer-to-peer analyzer.
  p2p application p2p_list: The supported applications are:
  * actionvoip
  * actsync
  * adobeconnect
  * aimini
  * amazoncloud
  * amazonmusic

grep grep_options | more

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to clear ACS analyzer statistics.

Example

The following command clears active charging service analyzer information for TCP analyzer:

```
clear active-charging analyzer statistics name tcp
```
clear active-charging charging-action statistics

Clears ACS charging action statistics.

**Product**
ACS

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear active-charging charging-action statistics [ name charging_acion_name ] [ | { grep grep_options | more } ]
```

- `name charging_acion_name`
  Clears statistics for the specified charging action. `charging_acion_name` must be the name of a charging action, and must be an alphanumeric string of 1 through 63 characters.

- `grep grep_options | more`
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to clear active charging action statistics.

**Example**

The following command clears active charging action statistics information for charging action named *pre-paid*:

```
clear active-charging charging-action statistics name pre-paid
```
clear active-charging content-filtering server-group statistics

Clears statistics for all/a specific CF server group.

Product
CF

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

clear active-charging content-filtering server-group statistics [ name cf_server_group_name ] [ | { grep grep_options | more } ]

name cf_server_group_name

Clears statistics for the specified CF server group.

_**cf_server_group_name**_ must be the name of a CF server group, and must be an alphanumeric string of 1 through 15 characters.

grep grep_options | more

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of _**grep**_ and _**more**_, refer to the _Regulating a Command’s Output_ section of the _Command Line Interface Overview_ chapter.

Usage

Use this command to clear content filtering statistics for CF server groups.

Example

The following command clears category-based content filtering statistics information for Rulebase named _**cf_rule1**:

```
clear active-charging content-filtering category statistics rulebase name cf_rule1
```
clear active-charging credit-control statistics

Clears credit control statistics.

Product
ACS

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

```
clear active-charging credit-control statistics [ group cc_group_name | server { all | ip-address ip_address | name cc_group_name } ]
```

**clear active-charging credit-control statistics**

Clears statistics for all credit control groups.

**group cc_group_name**

Clears statistics for the specified credit control group.

*cc_group_name* must be an alphanumeric string of 1 through 63 characters.

**server { all | ip-address ip_address | name cc_group_name }**

Clears statistics for the credit control server specified as:

- **all**: for all the Diameter peers and hosts
- **ip-address**: an IP address for the credit control group entered in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation
- **cc_group_name**: name of the credit control group server entered as an alphanumeric string of 1 through 127 characters.

**Usage**

Use this command to clear credit control statistics.

**Example**

The following command clears statistics information for credit control:

```
clear active-charging credit-control statistics
```
clear active-charging dns-learnt-ip-addresses

Clears DNS learnt IP address statistics for the DNS Snooping feature.

Product
ACS

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

`clear active-charging dns-learnt-ip-addresses statistics sessmgr { all | instance sessmgr_instance } [ | { grep grep_options | more } ]`

`sessmgr { all | instance sessmgr_instance }`

Clears statistics for all or the specified Session Manager (SessMgr) instance.

• `all`: Clears statistics for all SessMgr instances.
• `instance sessmgr_instance`: Clears statistics for the specified SessMgr instance.
  
  `sessmgr_instance` must be an integer from 1 through 65535.

`grep grep_options | more`

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the "Command Line Interface Overview" chapter.

Usage

Use this command to clear DNS learnt IP address statistics for the DNS Snooping feature.

On clearing the statistics using this command, only the entries-flushed, entries-replaced, and IP-Overflows statistics are cleared as these are cumulative statistics. Total-entries will not be cleared as it is an instantaneous statistic of the current total entries in that rule line.

Example

The following command clears all DNS learnt IP address statistics:

`clear active-charging dns-learnt-ip-addresses statistics sessmgr all`
clear active-charging edr-format statistics

Clears ACS statistics for all or a specific Event Data Record (EDR) format.

**Product**  
ACS

**Privilege**  
Security Administrator, Administrator, Operator

**Mode**  
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear active-charging edr-format statistics [ name edr_format_name ]
```

- `name edr_format_name`  
  Clears statistics for the specified EDR format.  
  `edr_format_name` must be the name of an EDR format, and must be an alphanumeric string of 1 through 63 characters.

---

**Important:**  
If an EDR format name is not specified, statistics for all EDR formats are cleared.

**Usage**

Use this command to clear the accumulated statistics for the specified EDR format.

**Example**

The following command clears the statistics for all EDR formats:

```
clear active-charging edr-format statistics
```
clear active-charging edr-udr-file statistics

Clears Event Data Record (EDR) and Usage Data Record (UDR) file related statistics.

Product
ACS

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear active-charging edr-udr-file statistics

Usage
Use this command to clear EDR and UDR file statistics.

Example
The following command clears statistical information for EDR and UDR files:

    clear active-charging edr-udr-file statistics
clear active-charging firewall statistics

Clears Stateful Firewall statistics.

Product
PSF

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear active-charging firewall statistics [ callid call_id | domain-name domain_name | nat-realm nat_realm_name | protocol { icmp | icmpv6 | ip | ipv6 | other | tcp | udp } | username user_name ] [ acsmgr instance instance_id ] [ | { grep grep_options | more } ]

acsmgr instance instance_id

Specifies an ACS Manager instance ID as an integer from 1 through 65535.

callid call_id

Specifies a call identification number as an eight-byte hexadecimal number.

domain-name domain_name

Specifies the domain name.
domain_name must be an alphanumeric string of 1 through 127 characters.

nat-realm nat_realm_name

Specifies the NAT realm.
nat_realm_name must be an alphanumeric string of 1 through 31 characters.

protocol { icmp | ip | other | tcp | udp }

Specifies a protocol for the statistics.

*icmp: ICMPv4
*icmpv6
*ip: IPv4
*ipv6
*other: Protocols other than TCP, UDP, and ICMPv4/ICMPv6
*tcp
*udp
username user_name

Specifies the user name.
user_name must be an alphanumeric string of 1 through 127 characters.

grep grep_options | more

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to clear Stateful Firewall statistics.

Example

The following command clears all Stateful Firewall statistics:

    clear active-charging firewall statistics
clear active-charging firewall track-list

Clears the list of servers being tracked for involvement in any Denial-of-Service (DOS) attacks.

Product
PSF

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear active-charging firewall track-list attacking-servers

Usage
Use this command to clear the list of servers being tracked for involvement in any DOS attacks.

Example
The following command clears the list of servers being tracked for involvement in any DOS attacks:

clear active-charging firewall track-list attacking-servers
clear active-charging fw-and-nat policy statistics

Clears statistics for all or a specific Firewall-and-NAT policy.

Product
PSF
NAT

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear active-charging fw-and-nat policy statistics { all | name policy_name } [ | { grep grep_options | more } ]

all
Clears information for all Firewall-and-NAT policies.

name policy_name
Clears information for the specified Firewall-and-NAT policy.  
(policy_name must be the name of a Firewall-and-NAT policy, and must be an alphanumeric string of 1 through 63 characters.

grep grep_options | more
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.  
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to clear statistics for all or a specific firewall-and-NAT policy.

Example
The following command clears statistics for the firewall-and-NAT policy named test123:

clear active-charging fw-and-nat policy statistics name test123
clear active-charging group-of-ruledefs statistics

Clears ACS group of ruledefs statistics.

**Product**
ACS

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name# 
```

**Syntax**

```
clear active-charging group-of-ruledefs statistics [ name group_of_ruledefs ] [ | { grep grep_options | more } ]
```

<table>
<thead>
<tr>
<th>name group_of_ruledefs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clears statistics for the specified group of ruledefs.</td>
</tr>
<tr>
<td>group_of_ruledefs must be the name of a group of ruledefs, and must be an alphanumeric string of 1 through 63 characters.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>grep grep_options</th>
<th>more</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.</td>
<td></td>
</tr>
<tr>
<td>For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.</td>
<td></td>
</tr>
</tbody>
</table>

**Usage**

Use this command to clear statistical information related to all or specified Active Charging Service group of ruledefs.

**Example**

The following command clears statistical information related to the group of ruledefs named `ruledef_group12`:

```
clear active-charging group-of-ruledefs statistics name ruledef_group12
```
clear active-charging nat statistics

Clears NAT realm statistics.

Product
NAT

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear active-charging nat statistics [ nat-realm nat_realm_name ] [ | { grep grep_options | more } ]
```

**clear active-charging nat statistics**

This command when issued in the local context clears statistics for all NAT realms in all contexts. When issued within a specific context, this command clears statistics for all NAT realms in that context.

**nat-realm nat_realm_name**

This command when issued in the local context clears statistics for the specified NAT realm in all contexts. When issued in a specific context, this command clears statistics for the specified NAT realm in that context.

`nat_realm_name`: Specifies name of the NAT realm as an alphanumeric string of 1 through 31 characters.

**grep grep_options | more**

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear NAT realm statistics.

Example

The following command when issued in the local context, clears NAT realm statistics for NAT realms named **test135** in all contexts:

```
clear active-charging nat statistics nat-realm test135
```
clear active-charging regex statistics

Clears regular expression (regex) related statistics.

Product
ACS

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear active-charging regex statistics ruledef { all | instance instance_number }
```

- `all`
  Clears all regex-related statistics.

- `instance instance_number`
  Clears regex-related statistics for specified Session Manager instance.
  `instance_number` must be an integer from 1 through 65535.

Usage

Use this command to clear regular expression (regex) related statistics.

Example

The following command clears all regex-related statistics:

```
clear active-charging regex statistics ruledef all
```
clear active-charging rulebase statistics

Clears ACS rulebase statistics.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```plaintext
clear active-charging rulebase statistics [ name rulebase_name ] [ | { grep grep_options | more } ]
```

- `rulebase_name`
  Clears statistics for the specified ACS rulebase.
  `rulebase_name` must be the name of a rulebase, and must be an alphanumeric string of 1 through 15 characters.

- `grep grep_options | more`
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear ACS rulebase statistics.

Example

The following command clears statistics for the ACS rulebase named `postpaid`:

```plaintext
clear active-charging rulebase statistics name postpaid
```
clear active-charging ruledef statistics

Clears statistics for rule definitions configured in the Active Charging Service (ACS).

**Product**
ACS

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
clear active-charging ruledef statistics [ charging | firewall | name ruledef_name ] [ | { grep grep_options | more } ]
```

- `charging`
  Clears statistics for all charging ruledefs.

- `firewall`
  Clears statistics for all Stateful Firewall ruledefs.

- `name ruledef_name`
  Clears statistics for the specified ruledef. `ruledef_name` must be the name of a ruledef, and must be an alphanumeric string of 1 through 63 characters.

- `grep grep_options | more`
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. For details on the usage of `grep` and `more`, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to clear ACS ruledef statistics.

**Example**

The following command clears all ruledef statistics:

```
clear active-charging ruledef statistics
```
clear active-charging subsystem

Clears all ACS subsystem information.

**Product**
ACS

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name# 
```

**Syntax**

```
clear active-charging subsystem
```

**Usage**

Use this command to clear all ACS subsystem information.

**Example**

The following command clears all ACS subsystem information:

```
clear active-charging subsystem
```
clear active-charging tcp-proxy statistics

Clears ACS TCP Proxy statistics.

Product
ACS

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear active-charging tcp-proxy statistics [ all | ip-layer | proxy-fac | rulebase rulebase_name | socket-migration | tcp-layer ]
```

- **all**
  Clears all TCP Proxy statistics.

- **ip-layer**
  Clears TCP Proxy statistics for IP layer.

- **proxy-fac**
  Clears TCP Proxy Flow Admission Control statistics.

- **rulebase rulebase_name**
  Clears TCP Proxy statistics for the specified rulebase.
  `rulebase_name` must be the name of a rulebase, and must be an alphanumeric string of 1 through 63 characters.

- **socket-migration**
  Clears TCP Proxy Socket Migration related statistics.

- **tcp-layer**
  Clears TCP Proxy statistics for TCP layer.

Usage
Use this command to clear TCP Proxy statistics.

Example
The following command clears TCP Proxy statistics for the rulebase named test14:

```
clear active-charging tcp-proxy statistics rulebase test14
```
clear active-charging tethering-detection statistics

Clears statistics pertaining to the Tethering Detection feature.

Product
ACS

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear active-charging tethering-detection statistics

Usage
Use this command to clear statistics pertaining to the Tethering Detection feature.
clear active-charging url-blacklisting statistics

Clears URL Blacklisting feature related statistics.

Product
CF

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear active-charging url-blacklisting statistics [ rulebase name rulebase_name ] [ | { grep grep_options | more } ]

rulebase name rulebase_name

Clears URL Blacklisting information for the specified rulebase.

rulebase_name must be the name of a rulebase, and must be an alphanumeric string of 1 through 63 characters.

grep grep_options | more

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of grep and more, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter.

Usage

Use this command to clear URL Blacklisting feature related statistics, optionally for a specific rulebase.

Example

The following command clears URL Blacklisting feature related statistics for rulebase12:

clear active-charging url-blacklisting statistics rulebase name rulebase12
clear active-charging video detailed-statistics

Resets the detailed statistics for TCP video flows.

**Product**
MVG

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear active-charging video detailed-statistics
```

**Usage**

Use this command to reset the detailed statistics for TCP video flows.

**Example**

The following command resets the detailed statistics for TCP video flows:

```
clear active-charging video detailed-statistics
```
clear administrator

Ends the session of an administrative user specified by either user name or session ID.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

`clear administrator { name user_name | session id id_num }`

- `name user_name`
  Identifies the user name of the administrative user.

- `session id id_num`
  Identifies the ID number of the administrative user session as displayed in the output of the `show administrators session id` command.

Usage

This command is used to terminate command line interface sessions for other administrative users.

Example

The following command ends the session of the administrative user identified as `user1`:

`clear administrator name user1`

The following command ends the session of the administrative user with the session ID of 3:

`clear administrator session id 3`
clear alarm

Clears outstanding alarm conditions

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

clear alarm { all | chassis | id num | port slot/port | slot slot }

all
Clear all outstanding alarms

chassis
Clears chassis-wide and fan tray alarms

id num
Clears a specific alarm by its internal alarm ID. num is the internal alarm identification number.

port slot/port
Clears alarms for the specified port. slot/port is the card slot and port on the card for which to clear alarms.

slot slot
Clears alarms for the specified slot. slot is the card slot for which to clear alarms.

Usage
Use this command to clear outstanding alarm conditions.

Example
To clear all outstanding alarms, use the following command:

clear alarm all

To clear all alarms for slot 7, enter the following command:

clear alarm slot 7
clear alcap

Clears the Access Link Control Application Part (ALCAP) session statistics of an ALCAP service associated with a Home-NodeB Gateway (HNB-GW) service instance configured and running on a system.

Product

HNB-GW

Privilege

Operator

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear alcap statistics [ alcap-service alcap_svc_name [ aal2-node aal2_node_name [ aal2-path aal2_path_id ] ] ]
```

alcap-service alcap_svc_name

Specifies the name of the ALCAP service for which statistics are to be cleared.

aal2-node aal2-node

Specifies the name of the ATM Adaptation Layer 2 (AAL2) node for which ALCAP service statistics will be cleared.

aal2-path aal2_path_id

Specifies the identity number of the AAL2 path on a specific ATM Adaptation Layer 2 (AAL2) node for which ALCAP service statistics will be cleared.

Usage

This command is used to clear the sessions statistics and counters for ALCAP service.

Example

The following command clears the service session statistics of ALCAP service named as `alcap_hnb_svc1`:

```
clear alcap statistics alcap-service alcap_svc1
```

Command Line Interface Reference, StarOS Release 17

3810
clear asngw-service

Clears the service session statistics for an Access Service Network Gateway (ASN-GW) service specified by either service name or trusted peer address.

Product
ANS-GW

Privilege
Security Administrator, Administrator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear asngw-service statistics [ name svc_name | peer-address ip_address ]

- **name svc_name**: Identifies the name of the ASN-GW service for which statistics will be cleared. *svc_name* must be an alphanumeric string of 1 through 63 characters.

- **peer-address ip_address**: Identifies the IP address of the ASN-GW peer for which service statistics will be cleared. *ip_address* must be entered in IPv4 dotted-decimal notation.

Usage
This command is used to terminate command line interface sessions for ASN GW services.

Example
The following command clears the service session statistics of the ASN-GW service named *aasn_svc1*:

```
clear asngw-service statistics name aasn_svc1
```
clear asnpc-service

Clears the service session statistics of an ASN paging controller service specified by either ASN PC service name or trusted paging controller peer address.

**Product**
ANS-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
clear asnpc-service statistics [ name svc_name | peer-address ip_address ]
```

- **name svc_name**
  Identifies the name of the ASN PC service for which session statistics will be cleared. `svc_name` must be an alphanumeric string of 1 through 63 characters.

- **peer-address ip_address**
  Identifies the IP address of the ASN PC peer for which all service statistics will be cleared. `ip_address` must be entered in IPv4 dotted-decimal notation.

**Usage**

This command is used to terminate command line interface sessions for ASN PC services.

**Example**

The following command clears the service session statistics of ASN PC service named as `asnpc_svc1`:

```
clear asnpc-service statistics name asnpc_svc1
```
clear apn statistics

Deletes all previously gathered statistics for either a specific Access Point Name (APN) or all APNs configured with the given context.

Product
- GGSN
- P-GW
- SAEGW

Privilege
- Security Administrator
- Administrator
- Operator

Mode
- Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear apn statistics [ name apn_name | smgr-instance instance ] [ | { grep grep_options | more } ]
```

**name apn_name**

Specifies the name of a specific APN configured in the context for which to clear statistics. `apn_name` is the name of the APN expressed as an alphanumeric string of 1 through 63 characters that is case sensitive.

**smgr-instance instance**

Specifies a particular Sessmgr instance in the context for which to clear APN statistics. `instance` must be an integer from 1 to 4294967295.

**grep grep_options | more**

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

Usage

Statistics for a single APN can be cleared using the `name` keyword. Statistics for all APNs in the context can be deleted by entering the command with no keywords.

If this command is executed from within the local context with no keywords, statistics will be cleared for every APN configured on the system regardless of context. In addition, if the `name` keyword is used when executing from within the local context, statistics for all APNs configured with the specified name will be cleared regardless of context.

Example

The following command clears statistics for an APN called `isp1`:

```
clear apn statistics name isp1
```
clear bcmcs statistics

Clears Broadcast Multicast Service (BCMCS) statistics.

**Product**

PDSN

**Privilege**

Security Administrator, Administrator, Operator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear bcmcs statistics [ pdsn-service service_name ]
```

**pdsn-service service_name**

Specifies a specific PDSN service for which to clear BCMCS-specific statistics. This value must be an alphanumeric string of 1 through 63 characters.

**Usage**

Use this command to clear accumulated BCMCS statistics. You may specify an individual PDSN or peer to selectively clear statistics.

**Example**

```
clear bcmcs statistics

clear bcmcs statistics pdsn-service service_name
```
**clear blacklisted-gtpu-bind-address**

Clears the GTP-U loopback address blacklisted by a specific radio network controller (RNC) as defined for a specific IuPS Service configuration.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear blacklisted-gtpu-bind-address ip_address rnc-id rnc_id mcc mcc_num mnc mnc_num iups-service name
```

**ip_address**

Specifies the IP loopback address that has been blacklisted in IPv4 dotted-decimal notation. This loopback address was originally defined with the `associate-gtpu-bind-address` command in the Radio-Network-Controller Configuration mode of the IuPS Service.

**Usage**

This command enables this loopback address to be used for future RAB-assignment requests.

**Example**

```
clear blacklisted-gtpu-bind-address 1.1.1.1 rnc-id 2 mcc 123 mnc 321 iups-service iups1
```
clear bssap+ statistics

Clears the BSSAP+ protocol (base station subsystem GPRS protocol) statistics collected for the Gs interface between the SGSN and the MSC/VLR.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear bssap+ statistics [ gs-service gs_svc_name ] [ vlr { isdn-number ISDN_Num| name vlr_name } ] [ | { grep grep_options | more } ]
```

gs-service gs_svc_name
Specifies the name of a preconfigured Gs service handling BSSAP+ information as an alphanumeric string of 1 through 63 characters that is case sensitive.

vlr { isdn-number ISDN_Num| name vlr_name }
Specifies a VLR (by ISDN number or name) handling BSSAP+ information.

- `isdn-number ISDN_Num` is the configured E.164-type ISDN number for the VLR. Enter a numerical string of 1 to 15 digits.
- `name vlr_name` is the configured name of the VLR entered as an alphanumeric string of 1 through 63 characters.

Usage
Use this command to delete or clear collected BSSAP+ protocol statistics for the entire SGSN or for a specified Gs interface. Using the keywords of this command, the interface can be identified by defining a specific VLR connected to the SGSN or by identifying the Gs service to which the interface has been configured.

Example
The following command clears the BSSAP+ statistics collected for the Gs interface configured for the Gs service named `gssvc1`.

```
clear bssap+ statistics gs-service gssvc1
```
clear bssgp statistics

Clears collected BSSGP protocol (base station subsystem GPRS protocol) statistics for traffic between the base station subsystem (BSS) and the SGSN.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear bssgp statistics { gprs-service gprs_svc_name | nse nse_id [ bvc bvc_id ] [ | { grep grep_options | more } ]

  gprs-service gprs_svc_name
  Specifies the name of a preconfigured GPRS service for which the BSSGP statistics have been collected as an alphanumeric string of 1 through 63 characters that is case sensitive.

  nse nse_ID
  Clears the BSSGP statistics collected for the network service entity (NSE) specified as an integer from 0 through 65535.

  bvc bvc_ID
  Enter this keyword to clear the BSSGP statistics collected for the identified BSSGP virtual connection (BVC) specified as an integer from 0 through 65000.

| { grep grep_options | more }

  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to clear the BSSGP statistics for a particular GPRS service or NSEI.

Example
The following command deletes the collected BSSGP statistics for the GPRS service named gprs1.

clear bssgp statistics gprs-service gprs1
**clear bulkstats**

Clears counters and accumulated bulk statistics related information.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear bulkstats { counters | data }
```

- **counters**
  Clears the counters maintained by the system’s “bulkstats” facility.

- **data**
  Clears any accumulated data that has not been transferred. This includes any “completed” files that have not been successfully transferred.

**Usage**

Once bulk statistics collection is enabled, the system stores the information until the specified transfer criteria is met or until a manual transfer is initiated. The system maintains counters for the “bulkstats” software facility. (Refer to the **data** keyword for the **show bulkstats** command for information on viewing the counters.)

This command can be used to delete bulk statistics information that has been collected but not transferred and/or to clear the counters that have been maintained.

**Example**

The following command clears bulk statistics-related counters:

```
clear bulkstats counters
```
clear cae-group statistics server

This command resets the discardable statistics, which are the Hit Count, Timeout Consecutive (Cumulative), and Last Failure statistics, for all CAEs or for a specific CAE. The CAE (Content Adaptation Engine) is an optional component of the Mobile Videoscape.

Product
MVG

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

clear cae-group statistics server { all | name cae_name }

Syntax

clear cae-group statistics server { all | name cae_name }

Syntax

clear cae-group statistics server { all | name cae_name }

Usage
Use this command to reset the discardable statistics for all CAEs or for a specific CAE. This command must be issued in the same context in which the associated CAE group is defined.

Example
The following command clears the discardable statistics for the CAE named server_1:

    clear cae-group statistics server name server_1
clear call-home statistics

Clears Cisco Call Home feature statistics.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec
The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear call-home statistics
```

**Usage**
Use this command to reset the statistics for all Call Home events.

**Example**
The following command clears the discardable statistics for the Call Home feature:

```
clear call-home statistics
```
clear cdr statistics

Clears statistics related to charging data records (CDRMOD).

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear cdr statistics

Usage
Use this command to reset the statistics for charging data records.

Example

The following command clears the discardable statistics related to CDRs:

    clear cdr statistics
clear cli history

Clears the tracking history of command line interface (CLI) command usage.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear cli history
```

**Usage**
Use this command to clear the tracking history of CLI command usage.

**Example**

The following command clears the CLI history:

```
clear cli history
```
clear cmp cert-name

Clears information stored for the specified IPSec Certificate Management Protocol v2 (CMPv2) certificate.

Product
All products supporting IPSec CMPv2 features

Important: This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

Privilege
Security Administrator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear cmp cert-name cert_name
```

cert-name cert_name
Specifies the CMP certificate name as an alphanumeric string of 1 through 129 characters.

Usage
Use this command to clear the information for the specified CMP certificate.

Example
The following command clears information for the specified CMP certificate:

```
clear cmp cert-name certificate01
```
clear cmp statistics

**Product**
All products supporting IPSec CMPv2 features

---

**Important:** This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

**Privilege**
Security Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear cmp statistics
```

**Usage**

Use this command to clear statistics for IPSec CMPv2 certificates.

**Example**

The following command clears CMPv2 certificates:

```
clear cmp statistics
```
clear config

Replaces the active configuration source file with an empty configuration where possible.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear config [ -noconfirm ]
```

- `noconfirm`

Executes the command without any additional prompt and confirmation from the user.

Usage

This command clears the current configuration when a complete overwrite is desired or if it is necessary to start from an empty configuration.

> **Important**: Clearing the configuration will cause the active configuration source file to be empty and of no use in configuring the system to an active state providing service.

> **Important**: This command should only be performed on configurations that have been previously backed up for easy restoration.

Example

The following command clears the active configuration after the user provides confirmation of the request.

```
clear config
```

The following command clears the active configuration source file immediately with no user confirmation.

```
clear config -noconfirm
```
clear congestion-control statistics

Clears the congestion control statistics for all instances of the specified manager type.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
clear congestion-control statistics { allmgr | asngwmgr | asnpcmgr | bindmux | gtpcmgr | hamgr | hnbmgr | imsimgr | ipsecmgr | ipsgmgr | imsimgr | l2tpmgr }
```

---

**allmgr**
Clears the statistics for all A11 Manager instances.

---

**asngwmgr**
Clears the statistics for all ASN GW Manager instances

---

**asnpcmgr**
Clears the statistics for all ASN PC-LR Manager instances

---

**bindmux**
Clears the statistics for all IPCF BindMux-Demux Manager instances.

---

**gtpcmgr**
Clears the statistics for all GTPC Manager instances.

---

**hamgr**
Clears the statistics for all HA Manager instances.

---

**hnbmgr**
Clears the statistics for all HNB Manager instances.

---

**imsimgr**
Clears the statistics for all IMSI Manager instances.

---

**ipsecmgr**
Clears the statistics for all IPSEC Manager instances.
ipsgmgr
Clears the statistics for all IPSG Manager instances.

l2tpmgr
Clears the statistics for all L2TP Manager instances.

Usage
Use this command to statistics for all instances of the specified manager.

Important: When this command is issued in any context other than the local context, only instances of the specified manager for the current context have the statistics cleared. When the current context is the local context, all instances of the specified manager type in all contexts have the statistics cleared.

Example
Clear the statistics for all instances of the A11 manger, by entering the following command:

```
clear congestion-control statistics allmgr
```
clear content-filtering category statistics

Clears the Category-based Content Filtering application statistics.

**Product**
CF

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear content-filtering category statistics [ facility srdbmgr instance instance_value ]
```

- `facility srdbmgr instance instance_value`
  - Clears logged events for the specified SRDB Manager instance.
  - `instance_value` must be an integer from 1 through 8.
  - In release 9.0 and later, `instance_value` must be an integer from 1 through 10000.

**Usage**

Use this command to clear all Category-based Content Filtering application statistics, or statistics for a specific SRDB Manager instance.

**Example**

The following command clears all Category-based Content Filtering application statistics:

```
clear content-filtering category statistics
```
clear crash

Removes a specific crash file or all crash files.

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear crash [ list | number crash_num ]

list | number crash_num
list: removes all crash files.
number crash_num: removes only the crash file specified as an integer from 1 through 30.

Usage
Clear crashes for general maintenance activities in cleaning out old, unused, or files which are of no importance.

Example
The following will remove all crash files.

clear crash list

The following command will remove only crash file 27.

clear crash number 27
clear credit-control statistics

Clears credit control statistics.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
clear credit-control statistics cc-service cc_service_name
```

- `cc-service cc_service_name`
  Specifies an existing Credit Control service name as an alphanumeric string of 1 through 63 characters.

**Usage**

Use this command to clear active credit control statistics.

**Example**

The following command clears the configured credit control statistics for a service named *service1*:

```
clear credit-control statistics cc-service service1
```
clear crypto

Clears crypto associations or crypto statistics.

Product
- ePDG
- PDSN
- HA
- GGSN
- PDG/TTG
- PDIF
- SCM

Privilege
- Security Administrator, Administrator, Operator

Mode
- Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear crypto { isakmp [ tag map_name | peer peer_ip ] | security-association { counters tag map_name [ tx | rx ] | tag map_name | peer peer_ip[ sa-index numbr ] } | statistics { ikev2 | ipsec-3gpp-cscf | srtp } [service-ip-address ip-address | service-name name ] }
```

**isakmp [ tag map_name | peer peer_ip ]**

When no keywords are specified, this command clears all of the ISAKMP security associations for the current context.
- **tag map_name**: Clears the ISAKMP SAs for the specified crypto map. *map_name* is the name of an existing crypto map.
- **peer peer_ip**: Deletes the ISAKMP SAs for the specified peer. *peer_ip* must be entered in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**security-association { counters map map_name [ tx | rx ] | tag map_name | peer peer_ip[ sa-index numbr ] }**

- **counters tag map_name [ tx | rx ]**: Resets the counters for the specified crypto map. *map_name* is the name of an existing crypto map. *tx* specifies that only the transmit SA counters are reset. *rx* specifies that only the receive SA counters are reset. If neither *tx* or *rx* are specified, both transmit and receive SA counters are reset.
- **tag map_name**: Tears down a Security Association (SA) for the specified crypto map. *map_name* is the name of an existing crypto map.
- **peer peer_ip**: Clears the SAs for all tunnels who have the peer at the specified IP address. *peer_ip* must be entered in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
- **[ sa-index numbr ]**: Clears a specified security association. *numbr* is an integer from 1 to 4 for releases prior to 15.0, or 1 to 5 for release 15.0 and higher.
Caution: Modification(s) to an existing crypto map and/or ISAKMP policy configuration will not take effect until the related security association has been cleared.

```
statistics { ikev2 | ipsec-3gpp-cscf | srtp } [ service-ip-address ip-address | service-name name ]
ikev2: Clears global IKEv2 statistics for the current context.
ipsec-3gpp-cscf: Clears global CSCF IPSec statistics for the current context.
srtp: Clears global CSCF SRTP (Secure Real-time Transport Protocol) statistics for the current context.
service-ip-address ip-address: Clears statistics for the specified service-ip address. service-name name: Clears statistics for the specified service name.
```

Usage
Clear SAs and apply changes to the crypto map or clear the crypto statistics for this context.

Example
The following clears all IKEv2 crypto statistics for the current context:

```
clear crypto statistics ikev2
```
clear cs-network statistics

Clears the HNB-Circuit Switched (CS) network service associated for an HNB-GW service instance.

Product
HNB-GW

Privilege
Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear cs-network statistics [ name cs_svc_name | ranap-only | rtp-only | sccp-only ]

name cs_svc_name
Clears the session statistics for an HNB-CS Network service name configured and running on this system. cs_svc_name must be an alphanumeric string of 1 through 63 characters.

ranap-only
Clears the session statistics limited to Radio Access Network Application Protocol (RANAP) traffic only for the specified HNB-CS Network service.

rtp-only
Clears the session statistics limited to Real Time Protocol (RTP) traffic only for the specified HNB-CS Network service.

sccp-only
Clears the session statistics limited to Signaling Connection Control Part (SCCP) traffic only for the specified HNB-CS Network service.

Usage
Use this command to clear the session statistics for overall session or in selected part of user session for HNB-CS Network services configured and running on a system.

Example
The following command clears the session statistics for RANAP part of session for the HNB-CS Network service hnb_CS_1:

clear cs-network statistics name hnb_CS_1 ranap-only
clear cscf service

Resets statistics counters for a specific Call/Session Control Function (CSCF) service, all CSCF services, or for all services within a specified context (VPN).

**Product**
SCM

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name# 
```

**Syntax**

```
clear cscf service { diameter { location-info | policy-control } statistics [ service-name service_name | vpn-name name ] | li-packet-cable statistics [service-name service_name] | performance-counters name service_name | statistics name service_name { all | atcf | calls | eatf | ip-security | message | npdb | package-name { message-summary | presence | reg | winfo } | registrations | sigcomp | tcp { msrp | sip } | vpn-name name { all | calls | ip-security | message | package-name { message-summary | presence | reg | winfo } | registrations | sigcomp | tcp { msrp | sip } } }
```

**diameter { location-info | policy-control } statistics [ service-name service_name | vpn-name name ]**

Clears Diameter (DPECA) statistics on the CSCF Rx interface with the configuration information.

- **service-name service_name**: Specifies the name of an existing CSCF service for which the statistics will be reset as an alphanumeric string of 1 through 63 characters.
- **vpn-name name**: Specifies the name of an existing context in which all statistics for all services will be reset as an alphanumeric string of 1 through 79 characters.

**li-packet-cable statistics [service-name service_name]**

Refer to the *Lawful Intercept Configuration Guide* for a description of this command.

**performance-counters name service_name**

Clears all CSCF performance counters for an existing CSCF service specified as an alphanumeric string of 1 through 63 characters.

**statistics name service_name { all | atcf | calls | eatf | ip-security | message | npdb | package-name { message-summary | presence | reg | winfo } | registrations | sigcomp | tcp { msrp | sip } | vpn-name name { all | calls | ip-security | message | package-name { message-summary | presence | reg | winfo } | registrations | sigcomp | tcp { msrp | sip } } }**

Clears service statistics for an existing CSCF service specified as an alphanumeric string of 1 through 63 characters.

- **all**: Clears all CSCF service statistics.
atcf: Clears statistics related to ATCF access transfers.
calls: Clears statistics related to CSCF calls.
eatf: Clears statistics related to emergency access transfers.
ip-security: Clears statistics related to CSCF IPSec.
message: Clears statistics for the SIP method MESSAGE.
npdb: Clears statistics related to NPDB.
package-name: Clears statistics for the associated event package.
  • message-summary: Clears statistics for the “message-summary” event package.
  • presence: Clears statistics for the “presence” event package.
  • reg: Clears statistics for the “reg” event package.
  • winfo: Clears statistics for the “watcher-info” event package.
registrations: Clears statistics related to CSCF registrations, re-registrations, and de-registrations.
sigcomp: Clears statistics related to CSCF sigcomp.
tcp: Displays session statistics related to CSCF TCP.
  • msrp: Clears statistics related to CSCF MSRP TCP.
  • sip: Clears statistics related to CSCF SIP TCP.
vpn-name name: Clears statistics for a specific CSCF service configured in a specific context on this system. name must be an existing context expressed as an alphanumeric string of 1 through 79 characters.

⚠️ Important: This keyword must be followed by another statistics-related keyword.

Usage
Use this command to reset statistics counters for CSCF services. This command will reset the counters in the output of the show cscf service statistics command.

⚠️ Important: This command will not clear current registered users and current CSCF sessions.

Example
The following command resets all statistics for a service named cscf1:

    clear cscf service statistics name cscf1 all
clear cscf sessions

Clears statistics for Call/Session Control Function (CSCF) sessions on this system.

Product
SCM

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

\texttt{clear cscf sessions \{ counters \{ calls | subscription \} service service\_name | service service\_name \{ all | aor aor | session-id id \}}

\texttt{counters \{ calls | subscription \} service service\_name}
Clears counters for all CSCF sessions matching the filter criteria.

\texttt{calls:} Counters associated with calls in CSCF service.

\texttt{subscription:} Counters associated with subscriptions in CSCF service.

\texttt{service service\_name:} Counters on specific CSCF service. \texttt{service\_name} must be an existing CSCF service expressed as an alphanumeric string of 1 through 63 alphanumeric characters.

\texttt{service service\_name \{ all | aor aor | session-id id \}}
Clears session information for all CSCF sessions matching the filter criteria.

\texttt{service service\_name:} Session statistics on specific CSCF service. \texttt{service\_name} must be an existing CSCF service expressed as an alphanumeric string of 1 through 63 alphanumeric characters.

- \texttt{all:} Specifies that session statistics are to be cleared for all sessions on this service.
- \texttt{aor aor:} Specifies that session statistics are to be cleared for sessions at this specific AoR. \texttt{aor} must be an existing AoR expressed as an alphanumeric string of 1 through 79 characters.
- \texttt{session-id id:} Specifies that session statistics are to be cleared for sessions with this ID. \texttt{id} must be an existing session ID expressed as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to clear session information for CSCF sessions.

Example

The following command resets all session statistics for a service named \texttt{cscfl}:

\begin{verbatim}
clear cscf sessions service cscfl all
\end{verbatim}
clear cscf sip

Resets SIP statistics counters for a specific CSCF service, all CSCF services, or for all services within a specified context (VPN) or interface.

**Product**
SCM

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear cscf sip statistics [ name service_name [ interface { domain name domain_name | ip address ip_address } | vpn-name name ]
```

- **name service_name**
  Specifies the name of an existing CSCF service for which the SIP statistics will be reset as an alphanumeric string of 1 through 63 characters.

- **interface { domain name domain_name | ip address ip_address }**
  SIP statistics will be reset in this interface.
  - **domain name domain_name**: Specifies an existing domain associated with the CSCF service as an alphanumeric string of 1 through 64 characters.
  - **ip address ip_address**: Specifies the destination or source ip address associated with the CSCF service.

- **vpn-name name**
  Specifies the name of an existing context in which all SIP statistics for all services will be reset as an alphanumeric string of 1 through 79 characters.

**Usage**

Use this command to reset SIP counters found in the output of the `show cscf sip` command.

**Example**

The following command resets the SIP statistics for a service named `cscf1`:

```
clear cscf sip statistics name cscf1
```
clear cscf subscription

Clears all subscriptions for a named service or for individual subscribers within the service.

Product
SCM

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear cscf subscription service service_name { all | from-aor subscriber_aor to-aor resource_aor }

service service_name
Specifies the name of an existing CSCF service for which the subscription(s) will be cleared as an alphanumeric string of 1 through 63 characters.

all | from-aor subscriber_aor to-aor resource_aor
all: Removes all CSCF subscriptions for the specified service.
from-aor subscriber_aor: Removes all CSCF subscriptions for a specified subscriber in a specified service.
subscribed-to resource_aor: Removes all CSCF subscriptions for a specified subscriber in a specified service with a specified subscribed-to resource AoR.

Usage
Use this command to clear subscriptions to enforce policies. This command initiates a SUBSCRIBE request with Expires as 0 in the corresponding subscription dialog.

Example
The following command clear all subscriptions for a CSCF service named cscf1:

    clear cscf subscription service cscf1 all
clear dhcp statistics

Deletes all previously gathered statistics for either a specific or all DHCP IPv4 servers configured within the given context.

Product
GGSN
ASN-GW
P-GW
SAEGW

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear dhcp statistics [ dhcp-service svc_name | server ip_address ]
```

dhcp-service svc_name

Specifies the name of a specific DHCP service for which to clear statistics as an alphanumeric string of 1 through 63 characters that is case sensitive.

server ip_address

Specifies the IP address of a DHCP server in IPv4 dotted-decimal notation as configured in the context for which to clear statistics.

Usage

Statistics for a single server can be cleared using the server keyword. Statistics for all DHCP servers in the context can be deleted by entering the command with no keywords.
This command can be executed from any context configured on the system.
If this command is executed from within the local context with no keywords, statistics will be cleared for every DHCP server configured on the system regardless of context. In addition, if the server keyword is used when executing from within the local context, statistics for all DHCP servers configured with the specified name will be cleared regardless of context.

Example

The following command clears statistics for all configured DHCP servers within the context:

```
clear dhcp statistics
```
clear dhcpv6 statistics

Deletes all previously gathered statistics for either a specific or all DHCP IPv6 (DHCPv6) servers configured within the given context.

Product
GGSN

P-GW
SAEGW

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

```
clear dhcpv6 statistics [ server ipv6_address | service svc_name ]
```

**server ipv6_address**
Specifies the IP address of a DHCP server in IPv6 colon-separated-hexadecimal notation as configured in the context for which to clear statistics.

**service svc_name**
Specifies the name of a specific DHCPv6 service for which to clear statistics as an alphanumeric string of 1 through 63 characters that is case sensitive.

Usage
Statistics for a single server can be cleared using the `server` keyword. Statistics for all DHCPv6 servers in the context can be deleted by entering the command with no keywords.
This command can be executed from any context configured on the system.
If this command is executed from within the local context with no keywords, statistics will be cleared for every DHCPv6 server configured on the system regardless of context. In addition, if the server keyword is used when executing from within the local context, statistics for all DHCPv6 servers configured with the specified name will be cleared regardless of context.

Example
The following command clears statistics for all configured DHCPv6 servers within the context:

```
clear dhcpv6 statistics
```
clear diameter aaa-statistics

Clears Diameter AAA statistics.

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:
[local]host_name#

Syntax

```
clear diameter aaa-statistics [ all | [ group aaa_group ] server diameter_server ] [ | { grep grep_options | more } ]
```

---

**all**
Clears all Diameter server statistics.

---

**group aaa_group**
Clears Diameter server statistics for the specified AAA group.
`aaa_group` must be the name of a AAA server group, and must be an alphanumeric string of 1 through 64 characters.

---

**server diameter_server**
Clears Diameter server statistics for the specified Diameter server.
`diameter_server` must be an alphanumeric string of 1 through 64 characters.

---

| | { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to clear Diameter AAA statistics.

Example
The following command clears Diameter server statistics for the specified AAA group:

```
clear diameter aaa-statistics group aaagroup3
```
clear diameter route

Clears the Diameter routes in the Diabase.

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear diameter route dynamic [ endpoint endpoint_name | peer peer_name | facility { aaamgr | sessmgr } [ instance instance_number ] ] [ | { grep grep_options | more } ]
```

dynamic
Clears all dynamic routes under all the Diameter endpoints.

endpoint endpoint_name
Clears the dynamic routes for the specified endpoint.
endpoint_name must be the name of a Diameter endpoint, and must be an alphanumeric string of 1 through 63 characters.

peer peer_name
Clears the dynamic routes for the specified peer.
peer_name must be an alphanumeric string of 1 through 63 characters.
clear diameter route

facility { aaamgr | sessmgr } [ instance instance_number ]

Clears the dynamic routes for the specified facility – AAA Manager or Session Manager. Specify the instance number to clear the dynamic routes for a particular facility’s instance. The instance_number must be an integer from 1 through 99999.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to clear the Diameter routing tables that gets added in the system whenever messages are routed through the Diameter proxy/Diabase. These messages remain in the system for a long period. The user has the flexibility to clear the route based on any combination of these keyword options. Running the command clear diameter route dynamic endpoint endpoint-name peer peer-name will result in flushing of the routes that match both endpoint and peer value. Similarly, with this CLI command "clear diameter route dynamic endpoint endpoint-name peer peer-name facility { aaamgr | sessmgr } instance instance_number," the routes in a particular facility with the specified endpoint and peer name can be deleted.

Example

The following command clears all dynamic Diameter routes for the specified peer:

    clear diameter route dynamic peer p1
clear diameter statistics

Clears Diameter statistics.

Product
All

Privilege

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear diameter statistics [ [ proxy ] endpoint endpoint_name [ peer-host host_id [ peer-realm realm_id ] ] ] [ | { grep grep_options | more } ]

endpoint endpoint_name
Clears statistics for the specified endpoint.
*endpoint_name* must be the name of a diameter endpoint, and must be an alphanumeric string of 1 through 63 characters.

proxy
Clears proxy related statistics.

peer-host host_id
Clears statistics for the specified Diameter peer host ID.
*host_id* must be an alphanumeric string of 1 through 255 characters.

peer-realm realm_id
Clears statistics for the specified Diameter peer realm.
*realm_id* must be an alphanumeric string of 1 through 127 characters.

| { grep grep_options | more }
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of *grep* and *more*, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

Usage
Use this command to clear Diameter statistics.

Example
The following command clears all Diameter statistics for the specified endpoint:
clear diameter statistics endpoint endpt345
clear diameter-service

Clears information pertaining to configured Diameter services.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name# 
```

**Syntax**

```
clear diameter-service { eap { all | session-id session_id } | lte-s6b { all | session-id session_id } | lte-sta { all | session-id session_id } | mbms { bearer-contexts { all | bmsc-bearer-service name service_name } | ue-context { all | bmsc-bearer-service name service_name } } | statistics name service_name [ vpn-name vpn context_name ] }
```

- **eap { all | session-id session_id }**
  Clear subscribers from the EAP interface.
  - all: Clears all subscribers.
  - session-id session_id: Clears a call for the session ID specified as an alphanumeric string of 1 through 63 characters.

- **lte-s6b { all | session-id session_id }**
  Clear subscribers from the S6b interface.
  - all: Clears all subscribers.
  - session-id session_id: Clears a call for the session ID specified as an alphanumeric string of 1 through 63 characters.

- **lte-sta { all | session-id session_id }**
  Clear subscribers from STA interface.
  - all: Clears all subscribers.
  - session-id session_id: Clears a call for the session ID specified as an alphanumeric string of 1 through 63 characters.

- **mbms { bearer-contexts { all | bmsc-bearer-service name service_name } | ue-context { all | bmsc-bearer-service name service_name } }**
  Clear information from the SGSN-APP interface.
  - bearer-contexts { all | bmsc-bearer-service name service_name }: Clears information from the bearer-context gmb-interface.
  - all: Clears all subscribers.
  - bmsc-bearer-service name service_name: Specifies the name of a bmsc-bearer-service as an alphanumeric string of 1 through 63 characters.
**clear diameter-service**

**ue-context** \{ **all** | **bmsc-bearer-service name** service_name \}: Clear information UE context for gmb-interface.
- **all**: Clears all subscribers.
- **bmsc-bearer-service name** service_name \}: Specifies the name of a bmsc-bearer-service as an alphanumeric string of 1 through 63 characters.

- service_name

- service_name must be a name of a Diameter service expressed as an alphanumeric string of 1 through 63 characters.

- **statistics name** service_name \{ **vpn-name** vpn context_name \}

Clears the Diameter service associated with the specified statistics.
- **name** service_name: Specifies the name of a Diameter service as an alphanumeric string of 1 through 63 characters.
- **vpn-name** vpn context_name: Clears statistics for the vpn-context name specified as an alphanumeric string of 1 through 63 characters.

---

**Usage**

Use this command to clear information pertaining to configured Diameter services.

**Example**

The following command clears Diameter service information for all subscribers associated with EAP interface:

```
clear diameter-service eap all
```
clear dns-client

Clears DNS cache and/or statistics for a specified DNS client.

Product
SCM

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

clear dns-client name { cache [ query-name name | query-type { A | AAAA | NAPTR | SRV } ] | statistics }

Example

The following command clears statistics for a DNS client named domain1.com:

clear dns-client domain1.com statistics
clear dns-proxy statistics

Clears all DNS proxy statistics.

Product
SCM

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear dns-proxy statistics

Usage
Use this command to clear all DNS proxy statistics.

Example
The following command clears DNS proxy statistics:

    clear dns-proxy statistics
clear dynamic-policy statistics

Clears policy control and charging (PCC) statistics from the interface communicating with the Policy and Charging Rules Function (PCRF) via Gx(x).

Product

HSGW
PDSN
SAEGW
S-GW

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

clear dynamic-policy statistics { hsgw-service name | pdsn-service name | sgw-service name }

hsgw-service name
Clears policy control and charging statistics from the Gxa interface communicating with the PCRF. name must be an existing HSGW service name and be from 1 to 63 alphanumeric characters.

pdsn-service name
Clears policy control and charging statistics from the Gx interface communicating with the PCRF. name must be an existing PDSN service name and be from 1 to 63 alphanumeric characters.

sgw-service name
Clears policy control and charging statistics from the Gxc interface communicating with the PCRF. name must be an existing S-GW service name and be from 1 to 63 alphanumeric characters.

Usage
Use this command to clear PCC statistics for the specified service and its Gx interface communicating with the PCRF.

Example

The following command clears HSGW statistics for an HSGW service named hsgw4:

    clear dynamic-policy statistics hsgw-service hsgw4

The following command clears PCC statistics for a PDSN service named cdma4:

    clear dynamic-policy statistics pdsn-service cdma4
The following command clears S-GW statistics for an S-GW service named `sgw4`:

```
clear dynamic-policy statistics sgw-service sgw4
```
clear egtpc

Clears enhanced GPRS Tunneling Protocol control plane (eGTP-C) statistics and counters found in show command outputs and bulk statistics associated with all eGTP-C-related services or those defined by the parameters in this command.

Product
MME
P-GW
S-GW
SAEGW

Privilege
Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

```
clear egtpc statistics [ egtp-service name | interface-type { interface-mme | interface-pgw-ingress | interface-sgsn | interface-sgw-egress | interface-sgw-ingress } | mme-address ip_address | pgw-address ip_address | sgsn-address ip_address | sgw-address ip_address ]
```

**egtp-service name**
Clears all statistics and counters associated with an existing eGTP service name specified as an alphanumeric string of 1 through 63 characters.

**interface-type { interface-mme | interface-pgw-ingress | interface-sgw-egress | interface-sgw-ingress }**

**interface-mme**: Clears statistics and counters derived from all MME interface types associated with this system.
**interface-pgw-ingress**: Clears statistics and counters derived from all P-GW ingress interface types associated with this system.
**interface-sgw-egress**: Clears statistics and counters derived from all S-GW egress interface types associated with this system.
**interface-sgsn**: Clears statistics and counters derived from all SGSN S4 interface types associated with this system.
**interface-sgw-ingress**: Clears statistics and counters derived from all S-GW ingress interface types associated with this system.

**mme-address ip_address**
Clears all statistics and counters derived from an existing MME IP address specified in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
**pgw-address ip_address**

Clears all statistics and counters derived from an existing P-GW IP address specified in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**sgw-address ip_address**

Clears all statistics and counters derived from an existing S-GW IP address specified in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**sgsn-address ip_address**

Clears all statistics and counters derived from an existing SGSN S4 IP address specified in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**Usage**

Use this command to clear running statistics and counters found in show command and bulk statistics outputs for all eGTP-C-related services or for specific interfaces, services, or IP addresses as specified by parameters in this command.

**Example**

The following command clears eGTP-C statistics and counter associated with all P-GW ingress interfaces configured on this system:

```
clear egtpc statistics interface-type interface-pgw-ingress
```

The following command clears eGTP-C statistics and counter associated with all MME interfaces configured on this system:

```
clear egtpc statistics interface-type interface-mme
```
clear event-notif statistics

Clears the statistical information collected over a configured Event Notification (SNMP) interface based on specific criteria.

**Product**
All

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
clear event-notif statistics
```

**Usage**

Use this command to clear the statistical information collected over configured Event Notification interface based on specific criteria.

**Example**

The following command clears the counter information for all Event Notification collection servers configured in a context:

```
clear event-notif server all
```
clear firewall

This command is obsolete.
clear fng-service statistics

Deletes all previously gathered statistics for a specific Femto Network Gateway (FNG) service or all FNG services configured within a context.

Product
FNG

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear fng-service statistics {name service_name}
```

**name service_name**
Specifies the name of a specific FNG service configured in the context for which to clear statistics as an alphanumeric string of 1 through 63 characters that is case sensitive.

Usage
Statistics for a single FNG service can be cleared using the **name** keyword. Statistics for all FNG services in the context can be deleted by entering the command with no keywords. If this command is executed from within the local context with no keywords, statistics will be cleared for every FNG service configured on the system regardless of context. In addition, if the **name** keyword is used when executing from within the local context, statistics for all FNG services configured with the specified name will be cleared regardless of context.

Example
The following command clears statistics for an FNG service named fng1:

```
clear fng-service statistics name fng1
```
clear gmb statistics

Deletes the collected statistics for the Gmb reference point. Gmb handles broadcast multicast service center (BM-SC) related signaling, which includes the user specific and bearer service messages for Multimedia Broadcast/Multicast Service (MBMS) service.

Product
GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear gmb statistics [ apn name | bmsc-profile profile_name ]
```

- **apn name**
  Deletes only the Gmb information for the specified Access Point Name (APN) specified as an alphanumeric string of 1 through 62 characters.

- **bmsc-profile profile_name**
  Deletes only the Gmb information for the specified BM-SC profile specified as an alphanumeric string of 1 through 79 characters.

Usage
Use this command to delete usage statistics for the Gmb reference point.

Example
The following command deletes all Gmb statistics:

```
clear gmb statistics
```
clear gmm-sm statistics

Deletes the collected statistics for the GPRS Mobility Management and Session Management (GMM/SM) configurations for various SGSN services.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear gmm-sm statistics [ gmm-only | gprs-service service_name | iups-service service_name | plmn-id mcc mcc mnc mnc | recovered-values | sgsn-service service_name | sm-only ]
```

**gmm-only**

Deletes only GPRS mobility management (GMM) information for the specified filter. Filter options include:

- `gprs-service service_name`
- `iups-service service_name`
- `plmn-id`
- `recovered values`
- `sgsn-service service_name`

**gprs-service srvc_name**

Deletes the statistics for a 2.5G GPRS service specified as an alphanumeric string of 1 through 63 characters that uniquely identifies a preconfigured GPRS service. The delete request can be narrowed by adding either the `nsei` or `routing-area` keywords.

**iups-service srvc_name**

Deletes the statistics for an IuPS service specified as an alphanumeric string of 1 through 63 characters that uniquely identifies a preconfigured IuPS service. The delete request can be narrowed by adding either the `rnc` or `routing-area` keywords.

**plmn-id mcc mcc mnc mnc [ access-type { gprs | umts } ]**

Deletes the statistics for services within a specified PLMN.
- `mcc` Specifies the mobile country code (MCC) as part of the identification of the RNC or RA. `mcc_id` must be an integer from 100 to 999.
- `mnc` Specifies the mobile network code (MNC) as part of the identification of the RNC or RA. `mnc_id` must be a 2- or 3-digit integer from 00 to 999.
access-type keyword fine-tunes the delete procedure and only deletes GMM/SM statistics for the IuPS (access-type UMTS) and/or the GPRS (access-type GPRS) services belonging to the PLMN.

recovered-values
Deletes only the recovered values for the backed-up key KPI counters. The delete request can be narrowed by adding one of three filters:

• gprs-service service_name
• iups-service service_name
• sgsn-service service_name

sgsn-service src_name
Deletes the statistics for a 3G SGSN service specified as an alphanumeric string of 1 to 63 characters that uniquely identifies the SGSN service. The delete request can be narrowed by adding either the rnc or routing-area keywords.

sm-only
Deletes only session management (SM) information for the specified keyword parameters.

mcc
mcc Specifies the mobile country code (MCC) as part of the identification of the RNC or RA. mcc_id must be an integer from 100 to 999.

mnc
mnc Specifies the mobile network code (MNC) as part of the identification of the RNC or RA. mnc_id must be a 2- or 3-digit integer from 00 to 999.

lac lac_id
Specifies the location area code (LAC) as part of the identification of the RNC or RA. lac_id must be an integer from 1 to 65535.

nsei nsei_id
Deletes the GMM/SM session statistics for the identified network service entity (NSEI). nsei_id must be an integer from 0 to 65535 that uniquely identifies a configured NSEI.

rnc rnc_id
Fine-tunes the deletion of GMM/SM session statistics just for the specified radio network controller (RNC). rnc_id must be an integer from 0 to 4095.

rac rac_id
Specifies the routing area code (RAC) as part of the identification of the RNC or RA. rac_id must be an integer from 1 to 255.

routing-area mcc mcc_id mnc mnc_id lac lac_id rac rac_id
Enter the routing-area keyword to fine-tune the clearing of the GMM/SM statistics for a specified routing area (RA) identified by the MCC, MNC, LAC and RAC.
clear gmm-sm statistics

Usage
Use this command to delete usage statistics for the GMM/SM session configurations for SGSN services, including BSC attaches, activations, and throughput.

Example
The following command deletes GMM/SM statistics for a specific routing area defined for the SGSN’s GPRS service:

    clear gmm-sm statistics gprs-service gprs1 routing-area mcc 123 mcc 131 lac 24 rac 11

The following command displays all possible information for GMM/SM statistics:

    show gmm-sm statistics verbose

Important: Output descriptions for show commands are available in the Statistics and Counters Reference.
clear gprsns statistics

Deletes collected statistics for the 2.5G SGSN’s General Packet Radio Service (GPRS) Network Service (NS) layer (link level).

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear gprsns statistics { msg-stats nse nse_id | sns-msg-stats }[ | { grep grep_options | more } ]
```

**msg-stats**
Deletes collected transmit (tx) and receive (rx) message statistics for the NS layer.

```
consolidated nse nse_id
```

_nse_id_: Enter an integer from 0 to 65535.

```
nse nse_id
```

Deletes statistics for an NSE specified as an integer from 0 to 65535.

```
sns-msg-stats
```

Deletes subnetwork service (SNS) sublayer message statistics.

```
| { grep grep_options | more } |
```

You must specify a command to which the output of this command will be sent.

For details on the usage of _grep_ and _more_, refer to the _Regulating a Command’s Output_ section of the _Command Line Interface Overview_ chapter.

Usage

This command is used to display Frame Relay statistics configured for the NSE/NSVC with the commands documented in the _Network Service Entity - Peer NSEI Configuration Mode_ chapter. Collected statistics are cleared (deleted) with the _clear gprsns statistics_ described in the _Exec Mode Commands (A-C)_ chapter.

Example

The following command displays the collected message statistics for NSEI _1422_:

```
show gprsns statistics msg-stats nse 1422
```
Important: Output descriptions for `show` commands are available in the *Statistics and Counters Reference*. 
clear gprsssf statistics

Deletes all Customized Applications for Mobile networks Enhanced Logic (CAMEL) service gprsSSF (GPRS Service Switching Function) statistics collected since the last reset or clear command.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear gprsssf statistics [ camel-service srvc_name | gprs [ 2g-sgsn-app | 3g-sgsn-app ] | gsmscf-address { address | all } | sms ] [ | { grep | more } ]
```

**camel-service srvc_name**
Clears only CAMEL service statistics for the configured CAMEL service specified as an alphanumeric string of 1 through 63 characters.

**gprs [ 2g-sgsn-app | 3g-sgsn-app ]**
Clears only CAMEL service statistics for either a 2.5G or 3G SGSN.

**gsmscf-address { address | all }**
Filters the command to only clear CAMEL service statistics for specified GSM service control function (gsmSCF) addresses. *address* is a standard ISDN E.164 address of 1 to 15 digits.

**sms**
Filters the command to only clear CAMEL service statistics for SMS protocol information.

| { grep grep_options | more } |

For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
This command instructs the SGSN to delete collected CAMEL service statistics for either specified CAMEL services, or for SMS or GPRS applications in all contexts.

Example
The following command will delete gprsSSF statistics collected for the CAMEL service residing at SCP identified by the gsmSCF address:

```
clear gprsssf statistics gsmscf-address 412211411151
```
clear gtpc statistics

Deletes all previously gathered GTPC (GTPv0, GTPv1-C, GTPv1-U) statistics within the given context based on the specified criteria.

Product
GGSN

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

`clear gtpc statistics [ [ custom1 | gtpcmgr-instance gtpcmgr_instance_number | smgr-instance sessmgr_instance_number ] [ apn apn_name | ggsn-service ggsn_service_name | mseg-service mseg_service_name | sgsn-address sgsn_ipv4_address ] ]`

- **custom1**
  Clears the statistics of GTP-C messages for preservation mode and free of charge service.
  This keyword is a customer-specific function used for Preservation-Mode and Free-of-Charge Service that is enabled under customer-specific license. For more information on this support, contact your Cisco account representative.

- **gtpcmgr-instance gtpcmgr_instance_number**
  Clears GTP-C statistics for a GTPC Manager instance specified as an integer from 1 through 4294967295.

- **smgr-instance sessmgr_instance_number**
  Clears GTP-C statistics for a Session Manager instance specified as an integer from 1 through 4294967295.

- **apn apn_name**
  Clears GTP-C statistics for an existing APN specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

- **ggsn-service ggsn_service_name**
  Clears GTP-C statistics for an existing GGSN service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

- **mseg-service mseg_service_name**

**Important:** This keyword is not supported in this release.
clear gtpc statistics

sgsn-address sgsn_ipv4_address

Cleans GTP-C statistics for an existing SGSN specified by IP address in IPv4 dotted-decimal notation.

Usage

GTPC statistics can be cleared for a single APN, GGSN service, or SGSN. All GTPC statistics in the context can be deleted by entering the command with no keywords.
This command can be executed from any context configured on the system.
If this command is executed from within the local context with no keywords, all GTPC statistics will be cleared regardless of context.
GTPP statistics are not affected by this command.

Example

The following command clears all GTPC statistics context:

    clear gtpc statistics
clear gtpp statistics

Deletes all previously gathered GTPP statistics within the given context based for either single or all charging gateway functions (CGFs).

Product
GGSN

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear gtpp statistics [ cgf-address ip-address ]
```

**cgf-address cgf_address**

Deletes statistics for a CGF identified by its IP address entered in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

Usage

Statistics for a single CGF can be cleared using the **cgf-address** keyword. Statistics for all CGFs in the context can be deleted by entering the command with no keywords. This command can be executed from any context configured on the system. If this command is executed from within the local context with no keywords, statistics will be cleared for every CGF configured on the system regardless of context. In addition, if the cgf-address keyword is used when executing from within the local context, statistics for all CGFs configured with the specified name will be cleared regardless of context.

Example

The following command deletes all GTPP statistics for a CGF with an IP address of 192.168.1.42:

```
clear gtpp statistics cgf-address 192.168.1.42
```
clear gtpp storage-server local file statistics

Clears AAA proxy GTTP group level statistics for CDRs stored on the local hard disk.

**Product**
- GGSN
- SGSN

**Privilege**
- Security Administrator, Administrator, Operator

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear gtpp storage-server local file statistics [ group name name ]
```

**Usage**

If executed from the local context, this command clears statistics for all GTTP groups configured on the system. If executed from the context within which the storage servers (hard disk) is configured, statistics are deleted for only that context.
clear gtpp storage-server statistics

Clears statistics for configured GTTP storage servers (GSS).

**Product**
GGSN

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
clear gtpp storage-server statistics
```

**Usage**

If executed from the local context, this command clears statistics for all GTTP storage servers configured on the system. If executed from the context within which the servers are configured, statistics are deleted for only those servers.
clear gtpu statistics

Clears enhanced GPRS Tunneling Protocol user plane statistics and counters found in show command outputs and bulk statistics associated with all GTP-U-related services or those defined by the parameters in this command.

Product

<tbody>
<tr>
<td>Clears GTP-U statistics for an existing peer IP address entered in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.</td>
</tr>
</tbody>
</table>

Usage

Use this command to clear running statistics and counters found in show command and bulk statistics outputs for all GTP-U-related services or for specific services or IP addresses as specified by parameters in this command.

Example

The following command clears GTP-U statistics and counter associated with a GTP-U service name `gtpu-12` configured on this system:

```
clear gtpu statistics gtpu-service gtpu-12
```
clear hd-storage-policy

Clears statistic information for HD storage policies configured on the system.

[local]host_name#

Syntax

clear henbgw-access-service statistics [ henbgw-access-service henbgw_acc_svc_name | miscellaneous | peer-id peer_id_value | slap | sctp ] [ | { grep grep_options | more } ]

henbgw-access-service henbgw_acc_svc_name

Clear statistics per specified HENBGW ACCESS service.
henbgw_acc_svc_name is a string of size 1 to 63.

miscellaneous

Clears Miscellaneous statistics.

peer-id

Clears information about HENB associations for the specified peer.
peer_id_value is an integer value ranging from 0 to 4294967295.

slap

Clears S1AP statistics.

sctp

Clears SCTP statistics.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to clear HENBGW ACCESS service statistics
The following command clears S1AP statistics:

```
clear henbgw-access-service statistics slap
```
clear henbgw-network-service statistics

Clears HENBGW NETWORK service statistics.

Product
HeNB-GW

Privilege
Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```execute

clear henbgw-network-service statistics [ henbgw-network-service henbgw_net_svc_name | peer-id peer_id_value | slap | sctp ] [ | { grep grep_options | more } ]
```

| henbgw-network-service henbgw_net_svc_name |
| Clear statistics per specified HENBGW NETWORK service. henbgw_net_svc_name is a string of size 1 to 63.

| peer-id |
| Clears information about MME associations for the specified peer. peer_id_value is an integer value ranging from 0 to 4294967295.

| slap |
| Clears S1AP statistics.

| sctp |
| Clears SCTP statistics.

| | { grep grep_options | more } |
| Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to clear HENBGW NETWORK service statistics

Example

The following command clears S1AP statistics:

```execute

clear henbgw-network-service statistics slap
```
clear hnbgw sessions

Clears the active/dormant session information about registered Nabs) on Home-NodeB Gateway (HNB-GW) service instances configured and running on this system based on different filter criteria.

Product
HNB-GW

Privilege
Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear hnbgw sessions { all | cell-id cell_id | hnb-address hnb_ip_address | hnb-local-id hnb_id | hnbgw-service hnbgw_svc_name | hnbid hnb_glbl_id | mcc mcc mnc mnc [ -noconfirm ] [ lac lac | rac rac ] }
```

**all**
Clears the summarized or full information for all registered HNB sessions on an HNB-GW service instance running on system. Clearing the statistics can be filtered based on given filtering.

**cell-id cell_id**
Clears HNB session statistics for a registered cell ID on an HNB-GW service instance. `cell_id` is the identification number of the Femto cell where the user/subscriber is geographically located expressed as an integer from 0 through 268435455.

**hnb-address hnb_ip_address**
Clears the session statistics for HNB session(s) based on a registered HNB IP address entered in IPv4 dotted-decimal notation.

**hnb-local-id hnb_id**
Clears the session statistics of HNB session(s) for a registered local id of HNB specified as an integer from 1 through 255.

**hnbgw-service hnbgw_svc_name**
Clears the session statistics for registered HNB session(s) on an existing HNB-GW service name specified as an alphanumeric string of 1 through 63 characters.

**hnbid hnb_glbl_id**
Clears the statistics for HNB session(s) based on the registered HNB global id specified as an integer from 1 through 255.
**mcc mcc**
Clears statistics for HNB session(s) based on the registered Mobile Country Code (MCC) identification number of the UE. `mcc` must be an integer from 101 through 999.

**mnc mnc**
Clears the statistics for HNB session(s) based on the registered Mobile Network Code (MNC) identification number of the UE. `mnc` must be a 2- or 3-digit integer from 00 through 999.

**lac lac**
Clears the statistics for HNB session(s) based on the registered Location Area Code (LAC) identification number of the UE. `lac` must be an integer from 1 through 65535.

**rac rac**
Clears the statistics for HNB session(s) based on the registered Radio Access Code (RAC) identification number of the UE. `rac` must be an integer from 1 through 255.

**rnc rnc**
Clears the statistics for HNB session(s) based on the registered Radio Network Code (RAC) identification number of the HNB. `rnc` must be an integer from 1 through 65535.

**-noconfirm**
Executes the command without any additional prompt and confirmation from the user.

**Important:** The Operator privilege does not have access to this keyword.

**Usage**
Use this command to clear the session statistics of all or specific registered HNB session(s) or in selected part of user session for HNB-GW services configured and running on this system.

**Example**
The following command clears the session statistics for all registered HNBs on the HNB-GW service named `hnbgw1`:

```
clear hnbgw sessions hnbgw-service hnbgw1
```
clear hnbgw statistics

Clears the HNB-GW service and HNB related statistics from an HNB-GW node.

Product
HNB-GW

Privilege
Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear hnbgw statistics [ gtpu-only ] [ hnb-access-mode { closed | hybrid | open } ] [ hnbap-only ] [ hnbgw-service hnbgw_svc_name [ gtpu-only | hnb-access-mode { closed | hybrid | open } ] | hnbap-only | ipne-only | ranap-only | rtp-only | rua-only | sabp-only | sctp-only ] ] [ hnbid hnb_identifier ] [ hnbap-only | ranap-only | rtp-only | rua-only ] ] [ hnbid | ipne-only | ranap-only | rtp-only | rua-only | sabp-only | sctp-only ]

gtpu-only
Clears the statistics for GTP-U traffic only for the selected HNB/HNB-GW service.

hnb-access-mode { closed | hybrid | open }
Clears the session statistics of an existing HNB-GW service based on access mode filters.

• closed: clears the statistics of only those UEs which are connected through Closed HNBs to the HNB-GW services on a chassis. This command applies to all Closed HNB sessions on a chassis. If any other criteria specified it will filter the statistics based on given criteria.

• hybrid: clears the statistics of only those UEs which are connected through Hybrid HNBs to the HNB-GW services on a chassis. This command applies to all Hybrid HNB sessions on a chassis. If any other criteria specified it will filter the statistics based on given criteria.

• open: clears the statistics of only those UEs which are connected through Open HNBs to the HNB-GW services on a chassis. This command applies to all Open HNB sessions on a chassis. If any other criteria specified it will filter the statistics based on given criteria.

hnbap-only
Clears the statistics for Home NodeB Application Part (HNBAP) traffic only for the selected HNB/HNB-GW service.

hnbgw-service hnbgw_svc_name
Clears the session statistics for an existing HNB-GW service name specified as an alphanumeric string of 1 through 63 characters.
hnbid hnb_identifier
Clears the session statistics for an existing Home-NodeB identifier specified as an alphanumerical string of 1 through 255 characters.

ipne-only
Clears IPNE statistics for selected HNBGW Service.

ranap-only
Clears the session statistics for Radio Access Network Application Protocol (RANAP) traffic only for the selected HNB/HNB-GW service.

rtp-only
Clears the session statistics for Real Time Protocol (RTP) traffic only for the selected HNB/HNB-GW service.

rua-only
Clears the session statistics for RANAP User Adaptation (RUA) traffic only for the selected HNB/HNB-GW service.

sabp-only
Clears the session statistics for Signaling Connection Control Part (SCCP) traffic only for the selected HNB-GW service.

sctp-only
Filters the session statistics to display only Stream Control Transmission Protocol (SCTP) traffic for the selected HNB-GW service.

Usage
Use this command to clear the session statistics for an overall session or in a selected part of a user session for HNB-GW services and/or HNBs configured and running on this system.

Example
The following command clears the session statistics for the HNBAP portion of session details for the HNB-GW service named hnbgw1:

    clear hnbgw statistics hnbgw-service hnbgw1 hnbap-only

The following command clears the session statistics for the RANAP portion of session details for the HNB identified as 102:

    clear hnbgw statistics hnb 102 ranap-only
clear hsgw-service

Clears HRPD Serving Gateway (HSGW) statistics and counters found in `show` command outputs and bulk statistics associated with all HSGW services or a specific service defined by the parameter in this command.

**Product**
HSGW

**Privilege**
Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear hsgw-service statistics [ dns-stats | name service_name [ dns-stats ] ] [ | { grep grep_options | more } ]
```

- **dns-stats**
  Clears DNS-related statistics.

- **name name**
  Clears statistics and counters for an existing HSGW service name specified as an alphanumeric string of 1 through 63 characters.

- **grep grep_options | more**
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**

Use this command to clear statistics for HSGW services configured on the system.

**Example**

The following command clears statistics for an HSGW service named `hsgw3`:

```
clear hsgw-service statistics name hsgw3
```
clear hss-peer-service

Clears statistic information for Home Subscriber Service (HSS) peer services configured on the system.

**Product**
MME

**Privilege**
Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear hss-peer-service statistics [ service name ]
```

<table>
<thead>
<tr>
<th>statistics [ service name ]</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>statistics</strong>: Clears HSS peer service statistical information for all HSS peer services configured on the system.</td>
</tr>
<tr>
<td><strong>service name</strong>: Clears HSS peer service statistic information for an existing HSS peer service specified as an alphanumeric string of 1 through 64 characters.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to clear statistics for HSS peer services configured on the system.

**Example**

The following command clears statistics for an HSS peer service named *hss4*:

```
clear hss-peer-servicey statistics service name hss4
```
clear ims-authorization

Clears statistics for all or for a specified IP Multimedia System (IMS) Authorization Service.

Product
GGSN
SCM

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

clear ims-authorization { policy-control statistics [ ims-auth-service service_name ] | service statistics [ name service_name ] } [ | { grep grep_options | more } ]

ims-auth-service service_name

Clears statistics for the specified IMSA service.

service_name must be an alphanumeric string of 1 through 64 characters.

grep grep_options | more

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to clear IMSA Service statistics.

Example

The following command clears IMSA policy-control statistics for an IMSA service named test_service:

    clear ims-authorization policy-control statistics ims-auth-service test_service
clear ims-sh-service statistics

Clears all IP Multimedia System (IMS) Sh interface (Diameter) statistics for a specific or all services using the Sh interface.

**Product**
PDIF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear ims-sh-service statistics [ service service_name ]
```

**service service_name**
Clears statistics for the specified existing IMS service.
`service_name` must be an alphanumeric string of 1 through 64 characters.

**Usage**
Use this command to clear interface Sh interface statistics for a specified or all IMS services.

**Example**
The following command clears all Sh interface statistics:

```
clear ims-sh-service statistics
```
clear ip access-group statistics

Clears all interface access control list (ACL) statistics and the context level ACL statistics that have been configured in the current context. Be aware that updating an access list also causes all ip access-groups utilizing the list to be cleared.

Product
PDSN
GGSN
ASN-GW

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

clear ip access-group statistics

Usage
Use this command to clear all interface ACL statistics and the context level ACL statistics that have been configured in the current context.

Example
The following command clears the ACL statistics:

    clear ip access-group statistics
clear ip arp

Clears the address resolution protocol (ARP) cache for a given IP address.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear ip arp ip_address
```

*ip_address*

Specifies the IP address for which to clear the ARP cache in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**Usage**

Clear the ARP cache when network changes have occurred for the case where the cached data may cause undue overhead in routing packets.

**Example**

The following command clears the ARP cache for the IP address 10.2.3.4:

```
clear ip arp 10.2.3.4
```
clear ip bgp peer

Resets Border Gateway Protocol (BGP) connections for all peers or for specified peers in the current context.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear ip bgp peer { ip_address | all | as as_num } [ in | out | soft | vpnv4 | vpn6 | vrf vrf_name [ in | out | soft ] ]
```

- **ip_address**
  Specifies the IP address of the neighbor for which BGP connections should be reset in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

- **all**
  Resets BGP connections for all peers.

- **as as_num**
  Resets BGP connections for all peers in the specified autonomous system (AS). `as_num` must be an integer from 1 through 65535.

- **in**
  Softly reconfigures inbound updates.

- **out**
  Softly reconfigures outbound updates.

- **soft**
  Softly reconfigures inbound and outbound updates.

- **vpnv4**
  Clears BGP sessions within the VPNv4 address family.

- **vpnv6**
  Clears BGP sessions within the VPNv6 address family.
clear ip bgp peer

```
vrf vrf_name
```

Clears BGP sessions within the specified VRF. `vrf_name` is an alphanumeric string of 1 through 63 characters.

### Usage

Use this command to BGP information for the current context.

### Example

The following command resets BGP connections for all neighbors:

```
clear ip bgp peer all
```
clear ip localhosts

Removes the host specified from the current context’s local host list for IP address mappings.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

clear ip localhosts [ host_name ]

host_name
Specifies the name of the host to be removed as an alphanumeric string of 1 through 127 characters. When omitted, all local host name mappings will be removed.

Usage
Clears a host name when it is no longer valid for the current context to access. The host name specified will be unrecognized by the current context once the command is performed.

Example

clear ip localhosts

clear ip localhosts 10.2.3.4

clear ip localhosts remoteABC
clear ip ospf process

Clears Open Shortest Path First (OSPF) database information for the current context and re-establishes neighbor adjacency.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear ip ospf process

Usage
Use this command to clear the OSPF database information for the current context and re-establishes neighbor adjacency.

Example
The following command clears the OSPF database information for the current context and re-establishes neighbor adjacency:

  clear ip ospf process
**clear ipne statistics**

Clears IP Network Enabler (IPNE) statistics for a specified or all IPNE services.

**Product**
MINE

**Privilege**
Administrator, Security Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

**Syntax**

```
clear ipne statistics [ service service_name ]
```

**service service_name**

Specifies the name of an existing IPNE service for which statistics will be cleared as an alphanumeric string of 1 through 64 characters.

**Usage**
Clears IPNE statistics for a specified or all IPNE services.

**Example**
The following example clears all IPNE statistics:

```
clear ipne statistics
```
clear ipsg statistics

Clears IP Services Gateway (IPSG) statistics for a specified or all IPSG services.

Product

eWAG

IPSG

Privilege

Administrator, Security Administrator

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear ipsg statistics [ service service_name ]
```

```
<table>
<thead>
<tr>
<th>service service_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the name of an IPSG service for which statistics will be cleared.</td>
</tr>
<tr>
<td>service_name must be an alphanumeric string of 1 through 64 characters.</td>
</tr>
</tbody>
</table>
```

Usage

Clears IPSG service statistics for a specified or all IPSG services.

Example

The following command clears statistics for all IPSG services:

```
clear ipsg statistics
```
clear ipv6 neighbors

Clears an IPv6 address from the neighbor cache.

**Product**
PDIF

**Privilege**
Administrator, Security Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear ipv6 neighbors ip_address
```

**Usage**

Specifies the IP address in IPv6 colon-separated-hexadecimal notation.

**Example**

Clears a specific address from the neighbor cache.

Use the following example to clear `3ffe:ffff:101::230:6eff:fe04:d9aa/48`:

```
```
clear ipv6 ospf process

Restarts Open Shortest Path First Version 3 (OSPFv3) with available configuration.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
Administrator, Security Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear ipv6 ospf process
```

**Usage**
Force a restart of OSPFv3 process using the available configuration.

**Example**

```
clear ipv6 ospf process
```
clear l2tp

Clears all or specific Layer 2 Tunnelling Protocol (L2TP) statistics or clears and disconnects all or specified sessions or tunnels.

Product
PDSN
GGSN
LNS

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear l2tp { statistics [ lac-service service_name | lns-service service_name | peer-address ip_address ] | tunnels { all [ clear-sa ] | callid call_id | lac-service service_name [ clear-sa ] | lns-service service_name | peer-address ip_address [ clear-sa ] } } 
```

**statistics [ lac-service service_name | lns-service service_name | peer-address ip_address ]**

With no optional keywords specified, this command clears all L2TP statistics for the current context.

- **lac-service service_name**: Clears all L2TP statistics for the specified LAC service in the current context.
- **lns-service service_name**: Clears all L2TP statistics for the specified LNS service in the current context.
- **peer-address ip_address**: Clears all L2TP statistics for the destination (peer LNS) at the specified IP address. The IP address is entered using IPv4 dotted-decimal notation.

**tunnels { all [ clear-sa ] | callid call_id | lac-service service_name [ clear-sa ] | lns-service service_name | peer-address ip_address [ clear-sa ] }**

- **all**: Clears all tunnels in the current context.
- **lac-service service_name**: Clears all tunnels in the current context that belong to the specified LAC service and closes the tunnels.
- **lns-service service_name**: Clears all tunnels in the current context that belong to the specified LNS service and closes the tunnels.
- **peer-address ip_address**: Clears all tunnels in the current context whose destination (peer LNS) is the system at the specified IP address. The IP address is specified using IPv4 dotted-decimal notation.
- **callid call_id**: Uses the unique identifier that specifies a particular tunnel in the system to clear that tunnel and disconnect it. The output of the command `show l2tp tunnels` contains a field labeled Callid Hint which lists the call id information to use with this command. This is an 8-byte hexadecimal number.
- **clear-sa**: If any security associations have been established they are cleared.
Usage
Clear L2TP all or specific L2TP statistics or clear sessions in a tunnel and disconnect the tunnel.

Example
To clear all L2TP statistics for the current context, use the following command:

```
clear l2tp statistics
```

To clear all L2TP statistics for the LAC service named `lac1`, use the following command:

```
clear l2tp statistics lac-service lac1
```

Use the following command to clear L2TP statistics for the LNS peer at the IP address `10.10.10.100`:

```
clear l2tp statistics peer-address 10.10.10.100
```

The following command clears and closes all tunnels in the current context:

```
clear l2tp tunnels all
```

The following command clears and closes all tunnels for the LAC service named `lac2`:

```
clear l2tp tunnels lac-service lac2
```

The following command clears and closes all tunnels the peer at the IP address `10.10.10.110`:

```
clear l2tp tunnels peer-address 10.10.10.110
```
clear lawful-intercept

Refer to the Lawful Intercept Configuration Guide for a description of this command.
**clear llc statistics**

Deletes collected traffic statistics for the GPRS logical link-control (LLC) layer.

**Product**
SGSN

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear llc statistics { gprs-service srvc_name } [ | { grep grep_options | more } ]
```

- **gprs-service srvc_name**
  
  Clears the collected statistics for an existing GPRS service specified as an alphanumeric string of 1 through 63 characters.

- **grep grep_options | more**
  
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

  For more information on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Reference*.

**Usage**

This command deletes statistics collected for the traffic that has gone through the LLC layer for either all GPRS services or for a specified GPRS service.

**Example**

The following command deletes all LLC statistics for GPRS service `gprs1`:

```
clear llc statistics gprs-service gprs1
```
clear lma-service statistics

Clears Local Mobility Anchor (LMA) statistics and counters found in `show` command outputs and bulk statistics associated with all LMA services or a specific service defined by the parameter in this command.

**Product**
P-GW
SAEGW

**Privilege**
Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear lma-service statistics [ name service_name ]
```

- `name service_name`
  
  Clears statistics and counters for an existing LMA service name specified as an alphanumeric string of 1 through 63 characters.

**Usage**

Use this command to clear statistics and counters in show command outputs and bulk statistics for all LMA services or for a specific LMA service.

**Example**

The following command clears statistics and counters for an LMA service named `lma3`:

```
clear lma-service statistics name lma3
```
clear local-policy

Clears local Quality of Service (QoS) policy service statistics and counters found in show command outputs and bulk statistics associated with all local QoS policy services or a specific service defined by the parameter in this command.

**Product**

P-GW
SAEGW

**Privilege**

Operator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```plaintext
clear local-policy statistics [ service service_name ]
```

**Usage**

Clears statistics and counters for an existing local policy service name specified as an alphanumeric string of 1 through 64 characters.

**Example**

The following command clears statistics and counters for a local QoS policy service named lp3:

```plaintext
clear local-policy statistics service lp3
```
clear local-user

Clears information pertaining to local-user administrative accounts.

**Product**
All

**Privilege**
Security Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear local-user { database [ -noconfirm ] | statistics | username name lockout }
```

- `clear local-user database`
  Clears the local-user database by deleting all information for all local-user accounts.

⚠️ **Caution:** Use this command only in the event of security concerns or to address concerns of the local-user account database integrity.

- `-noconfirm`
  Executes the command without any additional prompt and confirmation from the user.

- `clear local-user statistics`
  Clears statistics pertaining to local-user accounts.

- `clear local-user username name lockout`
  Removes lockouts associated with the local-user account expressed as an alphanumeric string of 3 through 16 characters that is case sensitive.

**Usage**

This command can be used to remove local-user account lockouts, reset local-user-related statistics to 0, or to delete the local-user database.

**Example**

The following command removes the lockout placed on a local-user account named SecureAdmin:

```
clear local-user username SecureAdmin lockout
```
clear location-service

Clears collected statistics and information pertaining to Location Services.

**Product**
MME  
SGSN

**Privilege**

**Syntax**

```
clear location-services statistics [ service location_svc_name ]
```

- **statistics**
  Clears all location service statistics.

- **service location_svc_name**
  Clears statistics only for the specified location service.

**Usage**
Use this command to clear location service statistics.

**Example**

The following command clears the Location service statistics only for the location service named `location_service1`:

```
clear location-service statistics service location_service1
```
clear mag-service statistics

Clears Mobile Access Gateway (MAG) statistics and counters found in `show` command outputs and bulk statistics associated with all MAG services or a specific service defined by the parameter in this command.

**Product**
- HSGW
- S-GW
- SAEGW

**Privilege**

**Syntax**

```
clear mag-service statistics [ name service_name ]
```

`name service_name`

Clears statistics and counters for an existing MAG service name specified as an alphanumeric string of 1 through 63 characters.

**Usage**

Use this command to clears statistics and counters in show command outputs and bulk statistics for all MAG services or for a specific MAG service.

**Example**

The following command clears statistics and counters for a MAG service named `mag1`

```
clear mag-service statistics name mag1
```
clear map statistics

Clears Mobile Application Part (MAP) statistics (SS7) for a specified service or all services.

```

**name service_name**
Clears statistics and counters for an existing MAP service name specified as an alphanumeric string of 1 through 63 characters.

**recovered-values**
Clears only recovered values for key MAP KPI counters that were backed-up.

Usage
Delete MAP statistics for a single or all GGSN/SGSN services.

Example
The following command deletes all MAP statistics.

```
clear map statistics
```
clear maximum-temperatures

Clears information pertaining to component maximum temperatures. (ASR 5x00 only)

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
``` 

**Syntax**

```
clear maximum-temperatures
``` 

**Usage**
Reset the timestamp to the current time and clear previous maximum temperatures for all temperature monitored components. This may be useful when preparing to study system performance, monitor usage, or trouble shoot the administrative interfaces.

**Example**

The following command resets the maximum temperature statistics for all monitored chassis components.

```
clear maximum-temperatures
```
clear mipfa statistics

Clears the statistics for the mobile IP foreign agent (MIPFA). The statistics for a specific foreign agent service may be cleared by an explicit command.

Product

- PDSN
- GGSN
- ASN-GW

Privilege

Security Administrator, Administrator, Operator

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear mipfa statistics [ fa-service name | peer-address ip_address ]
```

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>fa-service name</strong></td>
<td><strong>peer-address ip_address</strong></td>
</tr>
<tr>
<td><strong>fa-service name</strong>: Clears the statistics for an existing FA service specified as an alphanumeric string of 1 through 63 characters. “Total sessions” counters for all peers associated with the service are also reset.</td>
<td><strong>peer-address ip_address</strong>: Clears the statistics for the peer IP address specified in IPv4 dotted-decimal notation. “Total sessions” counter for the specified peer is also reset.</td>
</tr>
</tbody>
</table>

Usage

Clear all statistics for the MIP foreign agent or for a specific service. This may be useful in monitoring performance and troubleshooting as the statistics may be cleared at a well known time and then collected and transferred for review.

Example

The following clears all statistics for the mobile IP foreign agent.

```
clear mipfa statistics
```

The following commands clear the statistics for the example service only.

```
clear mipfa statistics fa-service sampleService

clear mipfa statistics peer-address 10.2.3.4
```
clear mipha statistics

Clears the statistics for the mobile IP home agent (MIPHA). The statistics for a home agent service may be cleared by explicit command.

Product
PDSN
HA

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear mipha statistics [ ha-service name | peer-address ip_address ]
```

- **ha-service name**: Clears the statistics for an existing HA service name specified as an alphanumeric string of 1 through 63 characters. “Total sessions” counters for all peers associated with the service are also reset.
- **peer-address ip_address**: Clears the statistics for an IP address specified using IPv4 dotted-decimal notation. “Total sessions” counter for the specified peer is also reset.

Usage

Clear all statistics for the MIP home agent or for a specific service. This may be useful in monitoring performance and troubleshooting as the statistics may be cleared at a well known time and then collected and transferred for review.

Example

The following clears all statistics for the mobile IP foreign agent.

```
clear mipha statistics
```

The following command clears the statistics for the example service only.

```
clear mipha statistics ha-service sampleService
```

```
clear mipha statistics peer-address 10.2.3.4
```

clear mipmn statistics

Clears the statistics for mobile IP mobile node (MIPMN).

Product
PDSN
HA

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear mipmn statistics

Usage
Clear all statistics for MIP mobile node. This may be useful in monitoring performance and troubleshooting as the statistics may be cleared at a well known time and then collected and transferred for review.

Example
The following clears all statistics for MIP mobile node:

    clear mipmn statistics
clear mipv6ha statistics

Clears the statistics for mobile IP IPv6 home agent (MIPv6HA).

Product
PDSN
HA

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

clear mipv6ha statistics

Usage
Clear all statistics for a MIPv6 home agent. This may be useful in monitoring performance and troubleshooting as the statistics may be cleared at a well known time and then collected and transferred for review.

Example
The following clears all statistics for MIPv6 home agent:

    clear mipv6ha statistics
clear mme-service db record

Clears the MME database records all instances of session manager running for an MME service filtered with IMSI or GUTI as criteria.

**Product**
MME

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear mme-service db record { all | guti plmn plmn_id group-id mme_grp_id code mme_code m-tmsi mtmsi_value | imsi imsi_identifier | instance instance_id }
```

- **all**
  Clears all detached database records.

- **guti plmn plmn_id group-id mme_grp_id code mme_code m-tmsi mtmsi_value**
  This set of keywords specifies the filter criteria as a Globally Unique Temporary Identifier (GUTI) to clear the database records for MME service.
  The GUTI is constructed from the GUMMEI and the M-TMSI where GUMMEI is constructed from PLMN (MMC and MNC) `plmn_id` and MME Identifier is constructed from an MME Group ID (MMEGI) `mme_grp_id` and an MME Code (MMEC) `mme_code`.
  Within the MME, the mobile is identified by the M-TMSI `mtmsi_value`.

- **imsi imsi_identifier**
  Specifies the filter criteria as International Mobile Subscriber Identity (IMSI) to clear the database records of a session instance. `imsi_identifier` is a 15-character IMSI field that identifies the subscriber’s home country and carrier.

- **instance instance_id**
  Clears all detached database records in an existing session manager instance specified as an integer from 1 through 4294967295.

**Usage**

Use this command to clear/remove database records for all or a particular instance of session manager for MME services on this system.

**Example**

The following command clears the summary database records of a session instance for subscriber having IMSI as 123455432112345 in the MME service:
clear mme-service db record

clear mme-service db record imsi 123455432112345
clear mme-service db statistics

Clears the MME database statistics for MME sessions for all or specific session instances on this system.

**Product**
MME

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
clear mme-service db statistics [ instance smgr_instance ]
```

**instance smgr_instance**

Specifies that MME database statistics for a specific instance of session manager running for MME service are to be remove. The instance ID expressed is an integer from 0 through 4294967295. If an instance is not specified, database statistics of all instances will be removed.

**Usage**

Use this command to clear/remove database statistics for all or a particular instance of session manager for MME services on this system.

**Example**

The following command removes/clears the database statistics of all instances of the MME service on a system:

```
clear mme-service db statistics
```
clear mme-service statistics

Clears MME service statistics based on various criteria.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
clear mme-service statistics [ mmm-only | esm-only | handover | mme-service mme_svc_name
| [ mmm-only | esm-only | handover | offload | slap | sctp | offload | peer-id
peer_identifier [ mmm-only | esm-only | handover | offload | slap | sctp | recovered-values | slap | sctp | tai all | taib db_name ] [ | | grep grep_options | more ]
```

---

**emm-only**
Clears EPS mobility management (EMM) related statistics for all MME services, or clears these statistics for a specific MME service name or a specific eNodeB association peer identifier.

---

**esm-only**
Clears EPS session management (ESM) related statistics for all MME services, or clears these statistics for a specific MME service name or a specific eNodeB association peer identifier.

---

**handover**
Clears handover related statistics (such as Intra-MME, EUTRAN<>EUTRAN via S10, EUTRAN<>UTRAN via GnGp, EUTRAN<>GERAN via GnGp, and EUTRAN<>UTRAN via S3) for all MME services, or clears these statistics for a specific MME service name or a specific eNodeB association peer identifier.

---

**mme-service mme_svc_name**
Clears all statistics for the specified MME service name.

---

**offload**
Clears all load rebalancing (UE offload) statistics for all MME services, or clears these statistics for a specific MME service name or a specific eNodeB association peer identifier.

---

**peer-id peer_identifier**
Clears all statistics for the specified eNodeB association peer identifier.
**exec mode commands (a-c)**

**clear mme-service statistics**

---

**recovered-values**

Clears all recovered statistics if the *Backup and Recovery of Key KPI Statistics* feature has been enabled. For details, refer to the `statistics-backup` command in the Global Configuration mode and the feature chapter in the *MME Administration Guide*.

---

**slap**

Clears all S1-AP statistics for all MME services, or clears these statistics for a specific MME service name or a specific eNodeB association peer identifier.

---

**sctp**

Clears all SCTP statistics for all MME services, or clears these statistics for a specific MME service name or a specific eNodeB association peer identifier.

---

**tai all**

Clears statistics stored for all TAIs in all TAI management databases.

---

**taidb db_name**

Clears statistics stored for all TAIs in the specified TAI management database.

---

**grep grep_options | more**

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the Command Line Interface Overview chapter.

---

**usage**

This command is used to clear the statistical information of an MME service based on various filter criteria.

---

**example**

The following command clears the service statistics of all MME service on a system:

```
clear mme-service statistics
```
clear multicast-sessions

Disconnects broadcast-multicast sessions based on specified criteria.

**Product**
- PDSN
- SGSN

**Privilege**
- Security Administrator
- Operator

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
clearmulticast-sessions [ -noconfirm ] [ keywords ] [ verbose ]
```

- **-noconfirm**
  - Executes the command without any additional prompt and confirmation from the user.

- **all**
  - Disconnects all multicast sessions.

- **callid call_id**
  - Clears the call specified by call_id. The call ID is as an 8-byte hexadecimal number.

- **card-num slot_num**
  - Specifies the slot number of the packet processing card by which the multicast session is processed as a number from 1 through 7 or 10 through 16 (for the ASR 5000) or from 1 through 3 or 6 through 10 (for the ASR 5500).

- **flowid id**
  - Clears calls for a specific Broadcast/Multicast Service (BCMCS) flow id, specified as a hexadecimal number.

- **flowid-type [ flow | program ]**
  - Clears multicast sessions according to the type of flow.
    - **flow**: Clears all multicast sessions for the flow ID type “flow”.
    - **program**: Clears all multicast sessions for the flow ID type “program”.

- **mcast-address ipv4_address**
  - Clears multicast sessions for a specific multicast address. Must be followed by the IP address of an interface in IPv4 dotted-decimal notation.
Exec Mode Commands (A-C)

Clear multicast sessions connected via the packet control function defined by an IP address in IPv4 dotted-decimal notation.

Clears multicast sessions connected to an existing packet data service name.

Displays information for multicast sessions connected to an existing SGSN service name.

Displays as much information as possible. If this option is not specified, the output is the standard level which is the concise mode.

Usage

Clear multicast sessions to aid in troubleshooting the system when no additional subscribers may connect or when a specific service or remote address may be having connection problems. This command may also be useful when preparing for maintenance activities such that connects may be cleared to perform any necessary procedures.

The keywords are filters that modify or filter the criteria for deciding which sessions to clear and are described below. Multiple keywords can be entered on a command line. When multiple keywords are specified, the multicast sessions deleted must meet the specifications of all of the keywords.

Example

The following command clears the broadcast-multicast sessions having multicast address 10.2.3.4:

```
clear multicast-sessions mcast-address 10.2.3.4
```

The following command clears the broadcast-multicast session(s) having call id 00004e22:

```
clear multicast-sessions callid 00004e22
```
clear orbem statistics

Clears the interface statistics for the object request broker element manager (ORBEM) interface.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#  
```

**Syntax**

```
clear orbem statistics  
```

**Usage**

Clear the statistics to reset them to zero for the ORBEM interface. This may be useful when preparing to study system performance, monitor usage, or troubleshoot the administrative interfaces.

**Example**

The following command resets the statistics for the ORB element manager.

```
clear orbem statistics  
```
clear pcc-policy service statistics

Clears statistical information of all or a specific policy control and charging (PCC) service configured in a context.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear pcc-policy statistics [ name pcc_plcy_svc_name ]
```

**Usage**
Use this command to clears the statistical information of all or an specific PCC-Policy services configured in a context.
Clearing of statistics can further be filtered for specific PCC-Policy service name as well.

**Example**
The following command clears the statistical information for the PCC-Policy service named `pcc_policy1` in summarized output:

```
clear pcc-policy service statistics name pcc_policy1
```
clear pcc-policy session

Clears the active/dormant session information about PCC-Policy service instances configured and running on this system based on different filter criteria.

Product
IPCF

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear pcc-policy sessions [ all] [apn | call-id call_id | imsi imsi_id | ip-address pcc_pcef_ip_address | service pcc_plcy_svc_name ] [ local-purge ]

all
Clears the session information of all registered IP-CAN session(s) on a PCC-Policy service instance running on the system. The display can be filtered based on given filtering criteria.

apn apn_name
Clears the session information for PCC-Policy service sessions connected via an existing APN.

imsi imsi_id
Clears the session information of IP-CAN session(s) based on the IMSI identifier of a subscriber on a PCC-Policy service instance. imsi_id is the International Mobile Subscriber Identity (IMSI) and must be a 15-character field which identifies the subscriber’s home country and carrier.

ip-address pcc_pcef_ip_address
Clears the session statistics of IP-CAN session(s) based on the registered PCEF (Policy and Charging Enforcement Function) node IP address expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

call-id call_id
Clears the session statistics of IP-CAN session(s) based on the existing registered call id of an IP-CAN session subscriber specified in eight-byte hexadecimal format.

pcc-policy-service pcc_plcy_svc_name
Clears the session statistics of registered IP-CAN session(s) based on an existing PCC-Policy service name, expressed as an alphanumeric string of 1 through 63 characters.

local-purge
Clears the session information for PCC-Policy service sessions locally only.
Usage

Use this command to clear the session statistics of all or specific registered IP-CAN session(s) or in selected part of user session for PCC-Policy services configured and running on this system.

Example

The following command clears the session statistics for all registered PCC-Policy service instances on a system/context locally only:

```
clear pcc-policy sessions all local-purge
```
clear pcc-sp-endpoint statistics

Clears the statistical information of all or specific PCC-Sp-Endpoint instance configured in a context.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear pcc-sp-endpoint statistics [ name sp_endpt_name ]
```

- **name sp_endpt_name**
  
  Clears information only for an existing PCC-Sp-Endpoint instance specified as an alphanumeric string of 1 through 79 characters.

**Usage**

Use this command to clears the statistical information of all or specific PCC-Sp-Endpoint interface configured in a context.

Clearing of statistics can further be filtered for specific PCC-Sp-Endpoint instance name as well.

**Example**

The following command clears the statistical information for the PCC-Sp-Endpoint instance named *sp1* in summarized output:

```
clear pcc-sp-endpoint statistics name sp1
```
clear pdg-service statistics

Deletes all previously gathered statistics for a specific Packet Data Gateway (PDG) service or all PDG services configured within a context.

Product
PDG/TTG

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear pdg-service statistics [ name service_name ]

name service_name
Cleans the statistics for the PDG service name configured in the context, expressed as an alphanumeric string of 1 through 63 characters that is case sensitive.

Usage
Usage Statistics for a single PDG service can be cleared using the name keyword. Statistics for all PDG services in the context can be deleted by entering the command with no keywords.
If this command is executed from within the local context with no keywords, statistics will be cleared for every PDG service configured on the system regardless of context. In addition, if the name keyword is used when executing from within the local context, statistics for all PDG services configured with the specified name will be cleared regardless of context.

Example
Example(s) The following command cleans statistics for a PDG service named pdg1:

clear pdg-service statistics pdg1
clear pgw-service

Clears PDN Gateway (P-GW) statistics and counters found in show command outputs and bulk statistics associated with all P-GW services or a specific service defined by the parameter in this command.

Product
- P-GW
- SAEGW

Privilege
- Operator

Mode
- Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

`clear pgw-service statistics [ name service_name ] [ | { grep grep_options | more } ]`

`name service_name`
Clears statistics and counters for an existing P-GW service name, expressed as an alphanumeric string of 1 through 63 characters.

`grep grep_options | more`
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to clear statistics and counters in show command outputs and bulk statistics for all P-GW services or for a specific P-GW service.

Example
The following command clears statistics and counters for a P-GW service named `pgw5`:

`clear pgw-service statistics name pgw5`
clear port

Clears port related statistics.

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear port { datalink counters { all | slot/port } | npu counters { all | slot/port [ untagged | vlan tag_id ] } }

clear port datalink counters
Clears data link port statistics.

clear port npu counters
Clears statistics for the network processing unit(s).

all
Clears counters for all datalink or NPU ports.

slot/port
Clears the statistics for the specified slot and port number.

untagged
Clears NPU statistics for all ports that do not have a VLAN tag.

vlan tag_id
Clears NPU statistics for the port that has a previously configured VLAN tag ID.

Usage
Manually clear the statistics for a specified port. This is useful when preparing to trouble shoot or monitor the system.

Example
The following command clears the data link related statistics for port 1 in slot 17.

    clear port datalink counters 17/1

The following command clears the network processing unit related statistics for port 1 in slot 17.
clear port npu counters 17/1

The following command clears the network processing unit related statistics for port 10 in slot 5.

clear port npu counters 5/10
clear ppp statistics

Clears point-to-point protocol (PPP) related statistics. All PPP statistics may be cleared or just those for a specific packet data service may be cleared.

Product
PDSN
GGSN

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear ppp statistics [ ggsn-service ggsn_name | lns-service lns_name | pcf-address [ pcf_ip_addr | all ] | pdsn-service pdsn_name ]
```

- **ggsn-service ggsn_name**
  Clears statistics only for the time the session is connected to the named GGSN service.

- **lns-service lns_name**
  Clears statistics only for the time the session is connected to the named LNS service.

- **pcf-address [ pcf_ip_addr | all ]**
  Clears statistics only for the time the session is connected to the specified PCF (Packet Control Function) or for all PCFs. `pcf_ip_addr` must be entered using IPv4 dotted-decimal notation.

- **pdsn-service pdsn_name**
  Clears statistics only for the named PDSN service.

Usage
Allows you to manually reset PPP statistics when it is desired to have counts begin again from a specific point in time.

Example
The following clears the statistics for all PPP counters and services.

```
clear ppp statistics
```

The following clears only the point-to-point protocol statistics for the service named `sampleService`.

```
clear ppp statistics pdsn-service sampleService
```
clear prepaid 3gpp2 statistics

Clears all of the statistics counters for 3GPP2 Pre-paid accounting. Statistics may be cleared for all services or for an individual service.

Product
   PDSN
   GGSN

Privilege
   Security Administrator, Administrator, Operator

Mode
   Exec
   The following prompt is displayed in the Exec mode:
   [local]host_name#

Syntax

```
clear prepaid 3gpp2 statistics { all | { ggsn-service | ha-service | lns-service | pdsn-service | pdsnclereaert-service } { all | name service_name } }
```

- **all**
  Clears prepaid statistics for all services.

- **ggsn-service**
  Clears statistics for GGSN service(s).

- **ha-service**
  Clears statistics for HA service(s).

- **lns-service**
  Clears statistics for LNS service(s).

- **pdsn-service**
  Clears statistics for PDSN service(s).

- `{ all | name service_name }`
  - **all**: Clears statistics for all services of the specified type.
  - **name service_name**: Clears statistics for the named service of the specified service type.

Usage

Use this command to clear Pre-paid statistics for a particular named service or for all services.

Example

To clear statistics for a PDSN service name `PDSN1`, enter the following command:
clear prepaid 3gpp2 statistics pdsn-service name PDSN1
clear prepaid wimax

Clears all of the statistical counters for WiMAX prepaid accounting. Statistics may be cleared for all services or for an individual service.

Product
ASN-GW

Privilege
Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear prepaid wimax statistics { all | asngw-service { all | name service_name } | ha-service { all | name service_name } }
```

all
Clears prepaid statistics for all services.

asngw-service
Clears prepaid statistics for ASN-GW service(s).

ha-service
Clears prepaid accounting statistics for HA service(s).

{ all | name service_name }

all: Clears statistics for all services of the specified type.
name service_name: Clears statistics for the named service of the specified service type.

Usage

Use this command to clear prepaid WiMAX accounting statistics for named service or for all services.

Example

The following command clears prepaid WiMAX accounting statistics for an ASN-GW service name asnl:

```
clear prepaid wimax statistics asngw-service name asnl
```
clear ps-network statistics

Clears the HNB-Packet Switched (PS) network service associated with an HNB-GW service instance.

**Product**
HNB-GW

**Privilege**
Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear ps-network statistics [ name cs_svc_name | gtpu-only | ranap-only | rtp-only | sccp-only ]
```

- **name ps_svc_name**
  Clears the session statistics based on an existing HNB-PS network service name, expressed as an alphanumeric string of from 1 through 63 characters.

- **gtpu-only**
  Clears the session statistics for GTP-U traffic only for the specified HNB-PS Network service.

- **ranap-only**
  Clears the session statistics for Radio Access Network Application Protocol (RANAP) traffic only for the specified HNB-PS Network service.

- **sccp-only**
  Clears the session statistics for Signaling Connection Control Part (SCCP) traffic only for the specified HNB-PS Network service.

**Usage**

Use this command to clear the session statistics for overall session or in selected part of user session for HNB-CS Network services configured and running on a system.

**Example**

The following command clears the session statistics for RANAP part of session for the HNB-PS Network service `hnb_PS_1`:

```
clear ps-network statistics name hnb_PS_1 ranap-only
```
clear qos npu stats

Clears information pertaining to NPU QoS priority queue bandwidth allocation and sharing.

Product
GGSN

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear qos npu stats inter-subscriber traffic slot slot_num
```

**inter-subscriber traffic slot slot_num**

Clears inter-subscriber traffic statistics for the ASR 5000 application or line card or the ASR 5500 DPC or MIO card installed in the specified slot.

*slot_num* indicates the number of the chassis slot in which the card is installed and can be configured to an integer value from 1 through 48 (for the ASR 5000) or 1 through 10 (for the ASR 5500).

Usage
Allows you to manually reset statistics pertaining to NPU QoS priority queue bandwidth allocation.

Example

The following command clears statistics for a card installed in chassis slot 3:

```
clear qos npu stats inter-subscriber traffic slot 3
```
clear radius accounting archive

Clears archived RADIUS accounting messages associated with an AAA group, or all the archived RADIUS accounting messages in the context in which the command is executed depending on the option chosen. The scope of the command is limited to the context in which it is executed (including the local context).

**Important:** This command is only available in StarOS 8.3 and later. For more information, please contact your local service representative.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec
The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear radius accounting archive { all | radius group group_name } [ -noconfirm ]
```

- **all**
  Clears all archived RADIUS accounting messages in the context.

- **radius group group_name**
  Clears all archived RADIUS accounting messages for the specified RADIUS group.
  `group_name` must be the name of a RADIUS server group, and must be an alphanumeric string of 0 through 64 characters.

- **-noconfirm**
  Executes the command without any additional prompt and confirmation from the user.

**Usage**
Use this command to clear the archived RADIUS accounting messages associated with an AAA group, or all the archived RADIUS accounting messages in the context in which the command is executed.

**Example**

Use the following command to clear all archived RADIUS accounting messages for the group named test12.

```
clear radius accounting archive radius group test12
```
clear radius counters

Clears statistics for RADIUS servers or a server group. The statistics for all RADIUS servers or a server group may be cleared.

Product
- PDSN
- GGSN
- ASN-GW
- P-GW
- SAEGW

Privilege
- Security Administrator
- Administrator
- Operator

Mode
- Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear radius counters { all | radius group group_name | server ip_address [ port number ] }  
```

- **all | radius group group_name | server ip_address [ port number ]**
  - `all`: Clears statistics for all servers.
  - `radius group group_name`: Clears all configured authentication/accounting servers in the specified RADIUS group. `group_name` must be the name of server group configured in a specific context for authentication/accounting, expressed as an alphanumeric string of 1 through 63 characters.
  - `server ip_address [ port number ]`: Clears statistics only for the server specified using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation. Optionally, you can specify the port which is to have its RADIUS statistics cleared as an integer from 0 through 65535.

Usage

Clears all the configured RADIUS servers’ statistics to reset them to zero prior to logging or monitoring the system for troubleshooting, performance measurements, etc.

Note that this CLI command will clear all the statistics associated with the configured RADIUS accounting and authentication servers except these two counters –

- Access Request current consecutive failures in a mgr
- Accounting-Request Current Consecutive Failures in a mgr

Example

The following command clears the statistics for all RADIUS servers.

```
clear radius counters all
```

The following command resets the statistics only for the server `10.2.3.4`. 
clear radius counters server 10.2.3.4

The following command resets the statistics only for the server group named star1.

clear radius counters radius group star1
clear rlf-context-statistics

Clears the statistics for all active Rate Limiting Function (RLF) contexts.

**Product**
- GGSN
- P-GW

**Privilege**
- Security Administrator, Administrator, Operator, Inspector

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear rlf-context-statistics { diamproxy [ endpoint endpoint_name [ peer-realm realm_name [ peer-host host_name ] ] ] grep_options] ingress } [ | { grep [ grep_options ] | more } ]
```

- **endpoint endpoint_name**
  - Clears the context information only for the endpoint specified as a string of size ranging from 1 through 63 characters.

- **realm realm_name**
  - Clears the context information only for the realm specified as a string of size ranging from 1 through 127 characters.

- **peer-host host_name**
  - Clears the context information only for the host specified as a string of size ranging from 1 through 63 characters.

| { grep [ grep_options ] | more } |

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the `grep` and `more` commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to clear the statistics for all active RLF contexts.

**Example**

The following command clears the statistics for all active RLF contexts:

```
clear rlf-context-statistics diamproxy
```
clear rohc statistics

Clears statistics and counters collected since the last reload or clear command was issued for RObust Header Compression (ROHC) [RFC 3095].

Product
- PDSN
- ASN-GW
- HSGW

Privilege
Administrator, Config-administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear rohc statistics [ pdsn-service pdsnsvc_name | asngw-service asngwsvc_name ]
```

- **pdsn-service pdsnsvc_name**
  Clears ROHC statistics and counters for the specified PDSN service.

- **asngw-service asngwsvc_name**
  Clears ROHC statistics and counters for the specified ASN-GW service.

Usage
Use this command to clear ROHC statistics for all services or for a specific PDSN or ASNGW service.

Example
The following command clears ROHC statistics and counters for the PDSN service named `pdsn1`:

```
clear rohc statistics pdsn-service pdsn1
```
clear rp service-option

Clears the radio-packet (R-P) interface service option statistics.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear rp service-option statistics [ number option_num | pdsn-service pdsn_name ]
```

number option_num | pdsn-service pdsn_name

Default: clears the statistics for all service options and all packet data services.

number option_num: Specifies the R-P service option number for which the statistics are to be cleared as an integer from 0 through 1000.

pdsn-service pdsn_name: Specifies the PDSN service name for which statistics will be cleared.

Usage
Clear the R-P service option statistics prior to monitoring the system for benchmarking or for detecting areas of further research.

Example
The following resets the service option statistics for service option 23 and packet data service sampleService, respectively.

```
clear rp service-option statistics number 23

clear rp service-option statistics pdsn-service sampleService
```
clear rp statistics

Clears the radio-packet (R-P) interface statistics. The statistics for a specific packet data server or peer node may be cleared if specified.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear rp statistics [ pdsn-service name | peer-address [ peer_address | all ] ]
```

- **pdsn-service name | peer-address [ peer_address | all ]**
  - Default: clears all R-P associated statistics.
  - **pdsn-service name**: Specifies the packet data service name that is to have its statistics reset.
  - **peer-address [ ip_address | all ]**: Specifies that statistics for the specified peer, or all peers, are to be cleared. The *ip_address* must be specified using IPv4 dotted-decimal notation.

**Usage**

Clear the statistics to prepare for monitoring the system.

**Example**

The following command resets all the associated statistics for the R-P interfaces.

```
clear rp statistics
```

The following command clears the statistics for the packet data service *sampleService*.

```
clear rp statistics pdsn-service sampleService
```

The following command resets the statistics associated with peer node with IP address 10.2.3.4.

```
clear rp statistics peer-address 10.2.3.4
```
clear rsvp statistics

Clears the Resource Reservation Protocol (RSVP) statistics.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

**Syntax**

clear rsvp statistics

**Usage**
Clear RSVP statistics.

**Example**
The following command resets all RSVP statistics.

    clear rsvp statistics

    The following command resets the statistics associated with peer node with IP address
clear saegw-service

Clears System Architecture Evolution Gateway (SAEGW) statistics and counters found in show command outputs and bulk statistics associated with all SAEGW services or a specific service defined by the parameter in this command.

Product
SAEGW

Privilege
Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear saegw-service statistics { all | name service_name } [ | { grep grep_options | more } ]

all
Clears all SAEGW node-level statistics.

name service_name
Clears statistics and counters for an existing SAEGW service name, expressed as an alphanumeric string of 1 through 63 characters.

grep grep_options | more
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to clear statistics and counters in show command outputs and bulk statistics for all SAEGW services or for a specific SAEGW service.

Example
The following command clears statistics and counters for an SAEGW service named saegw5:

    clear saegw-service statistics name saegw5
clear samog-service statistics

Clear statistics associated with S2a Mobility Over GTP (SaMOG) services.

**Product**
SAMOG

**Privilege**
Inspector

**Syntax**

```
clear samog-service statistics samog_service_name
```

Clears SaMOG service-related statistical information. Service name should be between 1 and 63.

**Usage**
Use this command to clear statistics and counters in show command outputs and bulk statistics for all SaMOG services or for a specific SaMOG service.

**Example**

Below command clears SaMOG Statistics 21:

```
clear samog-service statistics 21
```
clear sbc statistics

Clears SBc service statistics based on various criteria.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear sbc statistics { all | peer-id peer_id | sbc-service-name sbc_svc_name } | { | grep grep_options | more } ]
```

- **all**
  Clears statistics for all SBs services.

- **peer-id peer_id**
  Clears statistics for a Cell Broadcast Center (CBC) peer association specified as an integer value from 0 through 4294967295.
  Use the `show sbc-service cbc-associations all` command to display the available CBC association peer IDs.

- **sbc-service-name sbc_svc_name**
  Clears all statistics for an existing SBc service specified as an alphanumeric string of 1 through 63 characters.

- **grep grep_options | more**
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to clear the statistical information of an SBc service based on various filter criteria.

**Example**

The following command clears all statistics for the SBc service named `sbc1`

```
clear sbc statistics sbc-service-name sbc1
```
clear sccp statistics

Clears SS7 Signaling Connection Control Part (SCCP) statistics collected for services that use the SCCP protocol.

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear sccp statistics [ iups-service iups_srvc_name | map-service map_srvc_name | sccp-network ntwk_index [ dpc dpc [ ssn ssn ] | global-title-translation { address-map instance add_map_inst | association instance assoc_inst } [ sessmgr instance sessmgr_inst ] ] [ | { grep grep_options | more } ]

iups-service iups_srvc_name
Deletes collected SCCP protocol statistics for an existing Iu-PS service in the current context specified as an alphanumeric string of 1 through 63 characters.

map-service map_srvc_name
Deletes collected SCCP protocol statistics for an existing MAP service specified as an alphanumeric string of 1 through 63 characters.

sccp-network ntwk_index
Deletes collected SCCP protocol statistics for the SSCP network configuration with the a network index specified as an integer from 1 through 12.

The following filters can be added to limit the clearing of SCCP network statistics:

• dpc dpc: Specifies a differentiated pointcode address to limit the deletion of collected SCCP network statistics to those for the identified destination.

• ssn ssn: Specifies a subsystem number as an integer from 1 to 255 to limit the deletion of collected SCCP network statistics.

• global-title-translation address-map instance add_map_inst: Specifies an identified GTT address-map as an integer from 1 to 4096 to limit the deletion of collected SCCP network statistics.

• global-title-translation association instance assoc_inst: Specifies an identified GTT association as an integer from 1 to 16 to limit the deletion of collected SCCP network statistics.

• sessmgr instance sessmgr_inst: Specifies an identified session manager instance as an integer from 1 to 384 to limit the deletion of collected SCCP network statistics.
Usage

Use this command to delete all collected SCCP statistics or to delete SCCP statistics for a specified service, SCCP network, or session manager.

Example

The following command deletes all collected SCCP statistics:

```
clear sccp statistics
```

The following command clears all collected SCCP statistics for the IuPS service named `iups-serv1`:

```
clear sccp statistics iups-service iups-serv1
```
clear session disconnect-reasons

Clears the session disconnect reason statistics for all sessions on the system.

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

clear session disconnect-reasons

Usage
Sets the counters for session disconnect reasons to zero (0) in preparation for a monitoring or troubleshooting session.

Example

    clear session disconnect-reasons
clear session-event-record statistics

Clears statistics collected during session event module transfers.

**Product**
- S-GW
- SAEGW

**Privilege**
- Operator

**Mode**
- Exec
  The following prompt is displayed in the Exec mode:

  ```
  [local]host_name#
  ```

**Syntax**

```
clear session-event-record statistics
```

**Usage**

Use this command to delete all collected session event record statistics.
clear session setuptime

Clears the session setup time statistics for Packet Control Functions (PCFs) or SGSNs. If no keyword is specified the summary statistics displayed by the `show session setuptime` command are cleared.

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

Syntax

```
clear session setuptime [ pcf [ pcf_addr | all ] | sgsn-address [ sgsn_addr | all ]
```

- `pcf [ pcf_addr | all ]`
  - `pcf_addr`: Clears the setup time counters for the PCF at the IP address specified in IPv4 dotted-decimal notation.
  - `all`: Clears the setup time counters for all PCFs.

- `sgsn-address [ sgsn_addr | all ]`
  - `sgsn_addr`: Clears the setup time counters for the SGSN at the IP address specified in IPv4 dotted-decimal notation.
  - `all`: Clears the setup time counters for all SGSNs.

Usage

Sets the counters for session disconnect reasons to zero (0) in preparation for a monitoring or troubleshooting session.

Example

To clear the statistics for the PCF at IP address 192.168.100.10, enter the following command:

```
clear session setuptime pcf 192.168.100.10
```
clear session subsystem

Clears all session subsystem statistics for the current context.

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear session subsystem

Usage
Clear the statistics in preparation for a troubleshooting or monitoring session so that the counters are at a well known values.

Example

    clear session subsystem
clear sgsn-fast-path statistics

Clears information related to SGSN fast-path.

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show sgsn-fast-path statistics [ all | smgr-instance smgr_inst ] [ | { grep grep_options | more } ]

  all
  Deletes collected fast-path statistics for all session managers.

  smgr-instance smgr_inst
  Clears collected fast-path statistics for a session manager instance specified as an integer from 1 to 65535.

  | grep grep_options | more
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. Please refer to the Regulating the Command Output section in this reference for details on the usage of `grep` and `more`.

Usage

Use this command to clear all statistics for SGSN fast-path configurations.

Example

The following command deletes all collected fast-path statistics for all SGSN session managers:

  clear sgsn-fast-path statistics
clear sgsn-map-app

Deletes collected statistics for the SGSN Mobile Application Part (MAP).

Product
SGSN

Privilege
Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear sgsn-map-app statistics [ | { grep grep_options | more } ]
```

```
clear sgsn-map-app statistics

Clears all collected statistics for the SGSN MAP application.
```

```
| grep grep_options | more

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. Please refer to the Regulating the Command Output section in this reference for details on the usage of grep and more.
```

Usage
Use this command to deleted collected statistics for the SGSN MAP application.

Example
The following command clears all collected SGSN MAP statistics:

```
clear sgsn-map-app statistics
```
clear sgsn rlf-context-statistics

Clears the Paging throttle RLF context statistics.

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

```
clear sgsn rlf-context-stats sessmgr { all | instance <instance_value> } [ peer-nsei-id <NSE_identifier> | peer-rnc-id <RNC_identifier> ] [ | { grep grep_options | more } ]
```

**sessmgr**
Clears the RLF statistics specific to Session Managers.

**all**
Clears the RLF context statistics for all the Session Managers.

**instance**
Clears the RLF context statistics for the specified Session Manager.

**instance_value**
The Session Manager instance specified as an integer from 1 to 384.

**peer-nsei-id**
Specifies the Peer NSEI ID for which RLF context statistics need to be cleared.

**NSE_identifier**
The Peer NSEI identifier specified as an integer from 0 to 65535.

**peer-rnc-id**
Specifies the Peer RNC ID for which RLF context statistics need to be cleared.

**RNC_identifier**
The Peer RNC identifier specified as an integer from 0 to 65535.
clear sgsn rlf-context-statistics

| grep grep_options | more |

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. Please refer to the Regulating the Command Output section in this reference for details on the usage of `grep` and `more`.

Usage

This command can be configured to clear the Paging throttle RLF context statistics for:

- All the Session Managers.
- The specified Session Manager.
- The specified Peer NSEI.
- The specified Peer RNC.

The keyword `sessmgr` is a mandatory keyword. Specifying the `peer-nsei-id` or `peer-rnc-id` is optional. When the `peer-nsei-id` or `peer-rnc-id` is not specified the global statistics are cleared. If the Session Manager instance is specified, the RLF context statistics for that Session Manager are cleared. If the keyword `all` is configured the RLF statistics for all the Session Managers are cleared.

Example

The following command clears the Paging throttle RLF context statistics for all the Session Managers:

```
clear sgsn rlf-context-statistics sessmgr all
```
clear sgs-service

Clears SGs interface statistics associated with a Visitor Location Register (VLR).

Product
MME

Privilege
Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

```
clear sgs-service { statistics [ name name ] | vlr-status [ service-name name ] [ vlr-name name ] }
```

- **statistics [ name name ]**
  Clears statistics for all SGs services or a specific SGs service.
  - `name name`: Clears the statistics for an existing SGs service specified as an alphanumeric string of 1 through 63 characters.

- **vlr-status [ service-name name ] [ vlr-name name ]**
  Clears statistics for all VLRs, a VLR related to a SGs service, or a specific VLR.
  - `service-name name`: Clears the SGs statistics for an existing VLR specified as an alphanumeric string of 1 through 63 characters.

Usage
Use this command to clear statistics for all SGs services, Visitor Location Registers (VLRS), or a specific SGs service or VLR name.

Example
The following command clears statistics for an SGs service named `sgs2`:

```
clear sgs-service statistics name sgs2
```
clear sgtpc statistics

Clears all SGSN GTP-C (SGTPC) interface statistics for the current context.

**Product**
MME
SGSN

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear sgtpc statistics [ gsn-address ipv4_address | sgtp-service sgtp_srvc_name ]
```

- **gsn-address ipv4_address**
  Clears GTPC packet statistics for the interface specified as an IP address in IPv4 dotted-decimal notation.

- **sgtp-service sgtp_srvc_name**
  Clears GTPC packet statistics for an existing SGTP service specified as an alphanumeric string of 1 through 63 characters.

**Usage**

Use this command to clear the statistics in preparation for a troubleshooting or monitoring session.

**Important:** Statistics are vital for troubleshooting. We recommend that you check with your Cisco support personnel prior to clearing these statistics.

**Example**

```
clear sgtpc statistics sgtp-service SGSN1sgtp12
```
clear sgtpu statistics

Clears all SGSN GTP-U (SGTPU) statistics for the current context.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

`clear sgtpu statistics [ ggsn-address ipv4_address | gprs-service gprs_svc_name nsei nse_id | iups-bind-address ipv4_address | iups-service iups_svc_name | recovered-values | rnc-address ipv4_address | sgtp-service sgtp_svc_name ]`

**ggsn-address ipv4_address**
Cleans GTPU packet statistics for a specific GGSN specified as an IP address in IPv4 dotted-decimal notation.

**gprs-service gprs_svc_name nsei nse_id**
**gprs-service gprs_svc_name**: Cleans GTPU packet statistics for the interface for a specific GPRS service specified as an alphanumeric string of 1 through 63 characters.

**nsei nse_id**: Specifies a network service entity (NSEI) as an integer from 0 through 65535.

**iups-bind-address ipv4_address**
Cleans GTPU packet statistics for the bind address of an IuPS interface specified as an IP address in IPv4 dotted-decimal notation.

**iups-service iups_svc_name**
Cleans GTPU packet statistics for an active IuPS service interface specified as an alphanumeric string of 1 through 63 characters.

**recovered-values**
Cleans only recovered values for key SGTP KPI counters that were backed-up.

To narrow the results, this keyword can be combined with either the **iups-service** or the **sgtp-service** keywords.

**rnc-address ipv4_address**
Cleans GTPU packet statistics for an RNC specified as an IP address in IPv4 dotted-decimal notation.
**clear sgtpu statistics**

**sgtp-service sgtp_svc_name**

Clears GTPU packet statistics for an active SGTP service interface specified as an alphanumeric string of 1 through 63 characters.

**Usage**

Use this command to clear the statistics in preparation for a troubleshooting or monitoring session.

**Important:** Statistics are vital for troubleshooting. We recommend that you check with your Cisco support personnel prior to clearing these statistics.

**Example**

Use this command to clear collected SGTPU statistics for a specific NSEI of a configured GPRS service:

```
clear sgtpu statistics gprs-service SGSN1Gprs1 nsei 2445
```
clear sgw-service statistics

Clears Serving Gateway (S-GW) statistics and counters found in show command outputs and bulk statistics associated with all S-GW services or a specific service defined by the parameter in this command.

Product
S-GW
SAEGW

Privilege
Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear sgw-service statistics { all | name service_name }
```

- **all**
  Clears statistics and counters for all S-GW services configured on the system.

- **name service_name**
  Clears statistics and counters for an existing S-GW service name specified as an alphanumeric string of 1 through 63 characters.

Usage
Use this command to clear statistics and counters in show command outputs and bulk statistics for all S-GW services or for a specific S-GW service.

Example
The following command clears statistics and counters for an S-GW service named `sgw3`:

```
clear sgw-service statistics name sgw3
```
clear sls-service statistics

Clears SLs service statistics based on various criteria.

Product
MME

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear sls-service statistics [ name svc_name ] [ sls | sctp ] [ esmlc-id esmlc-id ] [ | { grep grep_options | more } ]
```

**name svc_name**
Clears all statistics for an existing SLs service specified as an alphanumeric string of 1 through 63 characters

**sls**
Clears only SLs interface related statistics.

**sctp**
Clears only SCTP related statistics.

**esmlc-id esmlc-id**
Clears all statistics for an existing E-SMLC peer specified as an integer value from 0 through 255.

**grep grep_options | more**
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

Usage

This command is used to clear the statistical information of an SLs service based on various filter criteria.

Example

The following command clears only the SCTP statistics for the SLs service named sls1:

```
clear sls-service statistics name sls1 sctp
```
clear sms statistics

Deletes collected traffic statistics for the Short Message Service (SMS).

Product
SGSN

Privilege
Administrator, Security Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear sms statistics [ name map_srvc ] [ recovered-values ] [ | { grep grep_options | more } ]

- **name map_srvc**
  Specifies a MAP Service as an alphanumeric string of 1 to 63 characters.

- **[ recovered-values ]**
  Clears only recovered values for key SMS KPI counters that were backed-up.

- **| { grep grep_options | more }**
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of the `grep` and `more` commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to delete collected traffic statistics for SMS. It is possible to clear the statistics of a specific MAP service associated with the SMS by including the `name` filter.

Example

Use the following command to clear SMS statistics for MAP service MAP-LONDON1:

```
clear sms statistics name MAP-LONDON1
```
clear sndcp statistics

Deletes all collected statistics for the packet traffic going through the Subnetwork Dependent Convergence Protocol (SNDCP) layer.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear sndcp statistics [ gprs-service srvc_name ] [ | { grep grep_options | more } ]
```

- `gprs-service srvc_name`

  Specifies a GPRS service as an alphanumeric string of 1 through 63 characters.

- `| { grep grep_options | more }`

  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

  For details on the usage of the `grep` and `more` commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**

Use this command to delete all collected SNDCP traffic statistics. Include the `gprs-service` keyword to filter the clearing action to only deleted statistics for one GPRS service.

**Example**

Use the following command to clear all collected SNDCP layer traffic statistics:

```
clear sndcp statistics
```

Use the following command to delete SNDCP layer traffic statistics for the `test1` GPRS service:

```
clear sndcp statistics gprs-service test1
```
clear snmp trap

Clears all SNMP event trap notifications from the buffer.

**Product**

All

**Privilege**

Security Administrator, Administrator, Operator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

**Syntax**

```markdown
clear snmp trap { history | statistics }
```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>history</strong></td>
<td>Clears all SNMP historical trap information from the system buffer.</td>
</tr>
<tr>
<td><strong>statistics</strong></td>
<td>Clears all SNMP event trap information from the system buffer.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to empty the buffer of all SNMP trap notifications.

**Example**

The following command clears the all historical SNMP traps from the system buffer:

```bash
clear snmp trap history
```
clear srp

Clears system Service Redundancy Protocol (SRP) statistics.

**Product**
All products that support Interchassis Session Recovery (ICSR)

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec
The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear srp { audit-statistics | call-loss statistics | checkpoint statistics | statistics }
```

- **audit-statistics**
  Clears SRP audit statistics.

- **call-loss statistics**
  Clears SRP call loss history.

- **checkpoint statistics**
  Clears SRP checkpoint interface statistics.

- **statistics**
  Clears SRP statistics.

**Usage**

Clears the SRP statistics to prepare the system for SRP monitoring.

**Example**

The following command resets all the associated statistics for SRP checkpoints.

```
clear srp checkpoint statistics
```

The following command resets all the associated statistics for SRP.

```
clear srp statistics
```
clear ss7-routing-domain

Deletes specified statistics for an SS7 routing domain.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
clear ss7-routing-domain domain_index { asp | mtp2 | mtp3 | qsaal | sscf }
```

- `domain_index` Specifies the index number of the SS7 routing domain as an integer from 1 through 12.

- `asp`
Clears statistics and status information for the SS7 Application Service Part (ASP) in the specified SS7 routing domain.

- `m3ua`
Clears statistics and status information for the SS7 MTP3 User Adaptation Layer (M3UA) in the specified SS7 routing domain.

- `mtp2`
Clears statistics and status information for the SS7 Message Transfer Part-2 (MTP2) in the specified SS7 routing domain.

- `mtp3`
Clears statistics and status information for the SS7 Message Transfer Part-3 (MTP3) in the specified SS7 routing domain.

- `qsaal`
Clears statistics and status information for the Service Specific Connection-Oriented Protocol (SSCOP) sub-layer of the Quasi Signaling Application Adaptation Layer (QSAAL) in the specified SS7 routing domain.

- `sscf`
Clears statistics and status information for the Service Specific Coordination Function (SSCF [q.2140]) in the specified SS7 routing domain.
Usage

Deletes statistics for the specified SS7 routing domain.

Example

The following command clears SS7 ASP routing statistics for domain index 4:

```
clear ss7-routing-domain 4 asp
```
clear ssl statistics

Deletes all previously gathered Secure Sockets Layer (SSL) statistics for a specific P-CSCF service or all P-CSCF services, either system-wide or within a context.

**Product**
SCM (P-CSCF, A-BG)

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
clear ssl statistics [ service-name name ]
```

**service-name name**

Specifies the name of a P-CSCF service for which to clear SSL statistics as an alphanumeric string of 1 through 63 characters that is case sensitive.

**Usage**

SSL statistics for a single P-CSCF service can be cleared using the `service-name` keyword. SSL statistics for all P-CSCF services can be deleted by entering the command with no keywords.

If this command is executed from within the local context with no keywords, SSL statistics will be cleared for every P-CSCF service configured on the system regardless of context. In addition, if the `service-name` keyword is used when executing from within the local context, SSL statistics for all P-CSCF services configured with the specified name will be cleared regardless of context.

**Example**

The following command clears SSL statistics for the P-CSCF service `pcscf_service_1`:

```
clear ssl statistics service-name pcscf_service_1
```
clear subscribers

Disconnects subscribers based on specified criteria.

**Product**

All

**Privilege**

Security Administrator, Administrator, Operator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
clear subscribers [ keywords ] [ verbose ] [ -noconfirm ]
```

The keywords are filters that modify or filter the criteria for deciding which subscriber sessions to clear and are described below. Multiple keywords can be entered on a command line. When multiple keywords are specified, the subscriber sessions deleted must meet the specifications of all of the keywords.

For example; if you enter the following command:

```
clear subscribers ip-pool pool1 card-num 1
```

Only subscriber sessions that were assigned an IP address from the IP pool named `pool1` and are also being processed by the processing card in slot 1 are cleared. All other subscriber sessions that do not meet these criteria remain and are not cleared.

**-noconfirm**

Executes the command without any additional prompt and confirmation from the user.

---

**Important:** The Operator privilege does not have access to this keyword.

---

**active**

Only disconnects subscribers who currently have active sessions.

**active-charging-service** `ecs_service_name`

Cleans information for subscribers using the Active charging Service. `ecs_service_name` must be the name of the Active Charging Service, expressed as an alphanumeric string of 1 through 15 characters.

**all**

Disconnects all subscribers.
**Important:** The Operator privilege does not have access to this keyword.

```
apn  apn_name
Clears all PDP contexts accessing a specific access point name (APN).
apn_name is the name of the APN expressed as an alphanumeric string of 1 through 63 characters that is case sensitive.
```

```
asn-peer-address  ip_address
Clears information for subscribers on an ASN-GW trusted peer.
ip_address is the address of the ASN-GW peer server entered using IPv4 dotted-decimal notation.
```

```
asngw-service  service_name
Clears counters for subscribers accessing the ASN-GW service.
service_name must be an existing service expressed as an alphanumeric string of 1 through 63 characters.
```

```
asnpc-service  service_name
Clears counters for subscribers accessing the ASN PC service.
service_name must be an existing service expressed as an alphanumeric string of 1 through 63 characters.
```

```
bandwidth-policy  bandwidth_policy_name
Clears information for subscribers using the specified bandwidth policy.
bandwidth_policy_name must be the name for an existing bandwidth policy, expressed as an alphanumeric string of 1 through 63 characters.
```

```
bearer-establishment { direct-tunnel | normal | pending }
Clears all subscribers from the specified bearer establishment type.
direct-tunnel: Select subscribers having direct tunnel established with the RNC.
normal: Select subscribers having bearer established with SGSN.
pending: Select subscribers for whom bearer is not fully established.
```

```
bng-only
Clears information related to BNG calls only.
```

```
bng-service  service_name
Clears all subscribers from the specified BNG service.
service_name must be an existing service expressed as an alphanumeric string of 1 through 63 characters.
```

```
callid  id
Clears the call specified by call_id. The call ID must be specified as a 4-byte hexadecimal number.
```

```
card-num  card_num
The slot number of the processing card by which the subscriber session is processed. card_num is a slot number from 1 through 7 or 10 through 16 (for the ASR 5000) or from 1 through 4 or 7 through 10 (for the ASR 5500).
```
### Exec Mode Commands (A-C)

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>clear subscribers</strong></td>
<td>Clears information for subscribers using the specified CBB policy. <strong>cbb_policy</strong> must be the name for an existing CBB policy expressed as an alphanumeric string of 1 through 63 characters.</td>
</tr>
<tr>
<td><strong>ccoa-only</strong></td>
<td>This option clears the subscribers that registered a MIP co-located COA directly with the HA. This option is only valid when MIPHA session license is enabled.</td>
</tr>
<tr>
<td><strong>cgw-only</strong></td>
<td>Clears information related to CGW calls only.</td>
</tr>
<tr>
<td>**configured-idle-timeout [ &lt;</td>
<td>&gt;</td>
</tr>
<tr>
<td>**connected-time [ &lt;</td>
<td>&gt;</td>
</tr>
<tr>
<td><strong>cscf-service service_name</strong></td>
<td>Clears all subscribers from the specified CSCF service. <strong>service_name</strong> must be an existing service expressed as an alphanumeric string of 1 through 63 characters.</td>
</tr>
<tr>
<td><strong>css-delivery-sequence name</strong></td>
<td><strong>Important</strong>: This is a restricted keyword. In StarOS 9.0 and later, this keyword is obsoleted.</td>
</tr>
<tr>
<td>**del-cause { none</td>
<td>reactiv-req }**</td>
</tr>
</tbody>
</table>
**clear subscribers**

none: Omit GTP “Cause-IE” in DBR/DPC generated for default bearer.
reactiv-req: The DBR/DPC will include “Cause-IE” with GTP cause code “Reactivation Requested”. The behavior for “Cause-IE” will be effective only if the clear subscribers command results in the sending of a Delete Bearer Request for default bearer, or Delete PDP Context is sent to delete the PDN connection or its last PDP context.
The behavior for “Cause-IE” specified in this CLI shall override the cause-code set by existing features.

---

**Important:** This option is only valid when Cause IE Enhancement for Delete Bearer Request license is enabled. Contact your Cisco account representative for more information.

dhcp-server address
Clears all PDP contexts that currently possess an IP address assigned from a specific DHCP server. dhcp_address is the IP address of the DHCP server expressed in IPv4 dotted-decimal notation.

dormant
Only disconnects subscriber sessions that are dormant (not transmitting or receiving data).

ebi number
Clears subscribers based on an EPS bearer identity (EBI). number must be a valid EBI and an integer value from 5 to 15.

enodeb-address ip_address
Clears subscribers based on the eNodeB to which they are attached. ip_address must be a valid IP address of an existing eNodeB entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

epdg-address ip_address
Clears subscribers based on the ePDG to which they are attached. ip_address must be a valid IP address of an existing ePDG entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation. The following filter keywords are valid with this command:

```plaintext
epdg-address, epdg-service,
```

epdg-service service_name
Clears subscribers of a configured ePDG service. service_name must be a valid string of size 1 to 63. The following filter keywords are valid with this command:

```plaintext
epdg-address, epdg-service,
```

fa ip_address
Disconnects all subscribers connected to the foreign agent specified by the IP address in IPv4 dotted-decimal notation.

fa-service fa_name
Disconnects all subscribers connected to an existing foreign agent name.
clear subscribers

firewall { not-required | required }
Clears all subscriber information for the specified subscribers:
not-required: Subscribers for whom firewall processing is not-required.
required: Subscribers for whom firewall processing is required.

firewall-policy fw_policy_name
This keyword is obsolete.
/fw-and-nat policy fw&nat_policy_name
Clears information for subscribers using the specified Firewall-and-NAT policy.
fw&nat_policy_name must be the name of an existing Firewall-and-NAT policy expressed as an alphanumeric string of 1 through 63 characters.

fng-service service_name
Clears subscriber sessions connected to the FNG service. service_name must be an existing service expressed as an alphanumeric string of 1 through 63 characters.

ggsn-service name
Clears all PDP contexts accessing an existing GGSN service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

gprs-service name
Clears all PDP contexts associated with the 2G SGSN. This keyword can be used with filtering keywords that are part of the clear subscriber command set.
Using this keyword can trigger a network-initiated service request (paging) procedure.
name identifies a specific GPRS service configuration expressed as an alphanumeric string of 1 through 63 characters.

gsm-traffic-class { background | conversational | interactive { priority } | streaming }
Subscribers whose traffic matches the specified 3GPP traffic class.
  • background: 3GPP QoS background class.
  • conversational: 3GPP QoS conversational class.
  • interactive: 3GPP QoS interactive class. Must be followed by a traffic priority. priority can be configured to any integer value from 1 to 3.
  • streaming: 3GPP QoS streaming class.

gtpu-bind-address ip_address
Disconnects all subscribers connected to the GTP-U service bind address.
ip_address must be specified in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

gtpu-service service_name
Disconnects all subscribers and erase subscriber information based on the GTP-U service name.
service_name must be an existing GTP-U service expressed as an alphanumeric string of 1 through 63 characters.
**clear subscribers**

Displays the specific GTP version number. Must be followed by one of the supported GTP versions (0 or 1). The following filter keywords are valid with this command:
- active-charging-service
- apn
- asngw-service
- asnpc-service
- asn-peer-address
- bearer-establishment
- callid
- card-num
- coaa-only
- configured-idle-timeout
- connected-time
- csf-service
- dhcp-server
- fa
- fa-service
- firewall
- ggsn-service
- gprs-service
- gsm-traffic-class
- gtp-version
- ha
- ha-ipsec-service
- ha-service
- idle-time
- ims-auth-service
- imsi
- ip-address
- ip-alloc-method
- ip-pool
- ipv6-address
- ipv6-prefix
- l3-tunnel-local-addr
- lac
- lns
- lns-service
- long-duration-time-left
- mip-udp-tunnel-only
- mipv6ha-service
- msid
- msisdn
- network-requested
- network-type
- pcf
- pdg-service
- pdif-service
- pdsn-service
- plmn-type
- rulebase
- rx-data
- session-time-left
- sgsn-address
- sgsn-service
- tx-data
- username
- grep
- more

**ha address**

Disconnects all subscribers connected to the home agent. **ha_address** must be specified using IPv4 dotted-decimal notation.

**ha-ipsec-only**

Disconnects all MIP HA sessions with IPSec tunnels.

**ha-service name**

Disconnects all subscribers connected to the home agent specified by **ha_name** must have been previously defined.

**hnbgw-service svc_name**

Disconnects all subscribers and erase subscriber information based on the HNB-GW service name. **svc_name** must be an existing HNB-GW service expressed as an alphanumeric string of 1 through 63 characters.

**hsgw-only**

Disconnects subscribers emerging from a HRPD Serving Gateway (HSGW) service configured on this system.

**hsgw-service name**

Disconnects subscribers using this HRPD Serving Gateway (HSGW) service configured on this system. **name** must be an existing HSGW service expressed as an alphanumeric string of 1 through 63 characters.

**idle-time [ < | > | greater-than | less-than ] value**

Disconnects subscribers whose idle time matches the specified length of time.
- <: Filters output so that only information less than the specified value is cleared.
- >: Filters output so that only information greater than the specified value is cleared.
- greater-than: Filters output so that only information greater than the specified value is cleared.
- less-than: Filters output so that only information less than the specified value is cleared.
- value: If no other filtering options are specified only output matching **value** is cleared. If **value** is not specified all data is cleared. **value** must be an integer from 0 through 4294967295.

**imei imei**

SGSN only.
**clear subscribers**

Disconnects one or more subscribers based on the international mobile equipment identity (IMEI or IMEI-SV) of the subscriber’s mobile equipment.

- **imei**: Enter 14 to 16 digits to match the first 14 digits of a retrieved IMEI/IMEISV for a single subscriber. To match a range of subscribers, the string may be shorter and include ‘$’ as a wildcard for a single digit or ‘*’ as a wildcard for multiple digits.

**ims-auth-service  imsa_service_name**

Disconnects subscribers using this IMS Authorization Service configured on this system. `imsa_service_name` must be an existing IMS Authorization Service expressed as an alphanumeric string of 1 through 63 characters.

**imsi  id**

Disconnects the subscriber with the specified id. The IMSI (International Mobile Subscriber Identity) ID is a 50-bit field which identifies the subscriber’s home country and carrier. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘ ’). For example; ‘$’.

**interface-type  { S2bGTP | S5S8GTP }**

Disconnects subscribers based on their interface type.

- **S2bGTP**: Indicates that the GTP protocol is used on the S2b interface for the subscribers being disconnected.
- **S5S8GTP**: Indicates that the GTP protocol is used on the S5/S8 interface for the subscribers being disconnected.

**ip-address  address**

Disconnects all subscribers connected to the specified `ip_address`. The address must be specified using IPv4 dotted-decimal notation.

**Note**: This keyword is not supported for use with the MME or SGSN.

**ip-alloc-method  { aaa-assigned | dhcp [ relay-agent | proxy-client ] | dynamic-pool | l2tp-lns-assigned | mip-ha-assigned | ms-provided-static | not-ms-provided-static | static pool }**

Displays the specific IP Allocation Method. Must be followed by one of the IP Allocation Methods:

- **aaa-assigned**: Selects subscribers whose IP Addresses were assigned by AAA.
- **dhcp**: Selects subscribers whose IP Addresses were assigned by DHCP.
- **dynamic-pool**: Selects subscribers whose IP Addresses were assigned from a dynamic IP address pool.
- **l2tp-lns-assigned**: Selects subscribers whose IP Addresses were assigned by the Layer 2 Tunneling Protocol Network Server.
- **mip-ha-assigned**: Selects subscribers whose IP Addresses were assigned by the Mobile IP Home Agent.
- **ms-provided-static**: Selects subscribers whose IP Addresses were provided by the Mobile Station.
- **not-ms-provided-static**: Selects subscribers whose IP Addresses were not provided by the Mobile Station.
- **proxy-client**: Selects subscribers whose IP Addresses were assigned by the DHCP Proxy Client.
- **relay-agent**: Selects subscribers whose IP Addresses were assigned by the DHCP Relay Agent.

- **static-pool**: Selects subscribers whose IP Addresses were assigned from a static IP address pool.

```plaintext
ip-pool name
```
Disconnects all subscribers assigned addresses from the IP address pool. `pool_name`. `pool_name` must be the name of an existing IP pool or IP pool group.

```plaintext
ipv4
```
Clears all subscribers with IPv4 Firewall enabled/disabled.

```plaintext
ipv6
```
Clears all subscribers with IPv6 Firewall enabled/disabled.

```plaintext
ipv6-address ipv6_address
```
Clears all subscribers connected to the specified IPv6 `ipv6_address` must be specified in IPv6 colon-separated-hexadecimal notation.

**Note**: This keyword is not supported for use with the MME or SGSN.

```plaintext
ipv6-prefix prefix
```
Clears subscribers from a specific IPv6 address prefix.

```plaintext
l3-tunnel-local-addr ip_address
```
Disconnects all calls for this Layer 3 tunneling interface. `ip_address` must be specified in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

```plaintext
l3-tunnel-remote-addr ip_address
```
Disconnects all calls for this Layer 3 tunneling peer. `ip_address` must be specified in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

```plaintext
lac ip_address
```
Disconnects all calls to the peer LAC (L2TP access concentrator). `ip_address` must be specified using IPv4 dotted-decimal notation.

```plaintext
lac-service service_name
```
Disconnects all calls for this LAC service. `service_name` is an alphanumeric string of 1 through 63 characters.

```plaintext
lma-service lma_name
```
Disconnects subscribers using this LMA service configured on this system. `lma_name` must be an existing LMA service expressed as an alphanumeric string of 1 through 63 characters.

```plaintext
lns ip_address
```
Disconnects calls to the peer LNS (L2TP network server) specified by `ip_address` must be specified using IPv4 dotted-decimal notation.
clear subscribers

**lns-service name**
Disconnects calls associated with the LNS service named *name*. *name* is an alphanumeric string of 1 through 63 characters.

**long-duration-time-left [ < | > | greater-than | less-than ] value**
Disconnects subscriber sessions whose time left for the maximum duration of their session matches the length of time specified.

- `<`: Filters output so that only information less than the specified value is cleared.
- `>`: Filters output so that only information greater than the specified value is cleared.
- **greater-than**: Filters output so that only information greater than the specified value is cleared.
- **less-than**: Filters output so that only information less than the specified value is cleared.

*value*: If no other filtering options are specified only output matching *value* is cleared. If *value* is not specified all data is cleared. *value* must be an integer from 0 through 4294967295.

**mag-service name**
Disconnects subscribers using this Mobile Access Gateway (MAG) service configured on this system. *name* must be an existing MAG service and be from 1 to 63 alphanumeric characters.

**max-subscribers max_count [ uniform ]**
The maximum number of subscribers to be cleared.

- *max_count* must be an integer from 0 through 20000000.
- **uniform**: Subscribers will be cleared uniformly.

**mip-udp-tunnel-only**
This option clears the subscribers that negotiated MIP-UDP tunneling with the HA. This option is only valid when MIP NAT Traversal license is enabled.

**mipv6ha-service service_name**
Disconnects subscribers using this MIPV6 Home Agent service configured on this system. *service_name* must be an existing MIPV6 HA service and be from 1 to 63 alphanumeric characters.

**mme-address ipv4_addr**
Disconnects subscribers using this peer Mobility Management Entity (MME). *ipv4_addr* must be an existing peer MME IP address entered using IPv4 dotted-decimal notation.

**mme-only**
Disconnects all MME subscriber sessions on the system.

**mme-service name**
Disconnects subscribers using this MME service configured on this system. *name* must be an existing MME service expressed as an alphanumeric string 1 through 63 characters.

**mseg-only**

---

**Important:** This keyword is not supported in this release.
clear subscribers

```cython
mseg-service mseg_service_name
```

**Important:** This keyword is not supported in this release.

```cython
msid id
```

Disconnects the mobile user identified by `ms_id.ms_id` must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘‘). For example; ‘$’.

In case of enforce imsi-min equivalence is enabled on the chassis and MIN or IMSI numbers supplied, this filter will clear subscribers with a corresponding MSID (MIN or IMSI) whose lower 10 digits matches to lower 10 digits of the supplied MSID.

```cython
clear subscribers msid 111110123456789 or
clear subscribers msid 0123456789
```

will clear any subscriber with a MSID that match the lower 10 digits of MSID supplied, i.e. 0123456789.

```cython
msisdn msisdn
```

Clears information for the mobile user identified by Mobile Subscriber ISDN Number (MSISDN). `msisdn` must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

```cython
nat { not-required | required [ nat-ip nat_ip_address | nat-realm nat_realm_name ] }
```

Clears all subscriber information for the specified subscribers:
- `not-required`: Subscribers for whom NAT processing is not required.
- `required`: Subscribers for whom NAT processing is required.

**Important:** The `nat-ip` keyword is only available in StarOS 8.3 and later.

```cython
nat-ip nat_ip_address`: Subscribers for whom NAT processing is enabled and are using the specified NAT IP address. `nat_ip_address` specifies the NAT IP address using IPv4 dotted-decimal notation.
`nat-realm nat_realm_name`: Subscribers for whom NAT processing is enabled and are using the specified NAT realm. `nat_realm_name` specifies the NAT realm name expressed as an alphanumeric string of 1 through 63 characters.
```

```cython
network-requested
```

Disconnect subscriber sessions that were initiated by the GGSN network requested create PDP context procedure.

```cython
network-type { gre | ipv4 | ipv6 | ipip | l2tp | mobile-ip | proxy-mobile-ip }
```

Disconnects subscriber sessions based on the network type. The following network types can be selected:
- `gre`: Generic Routing Encapsulation (GRE) per RFC 2784
- `ipv4`: Internet Protocol version 4 (IPv4)
- `ipv6`: Internet Protocol version 6 (IPv6)
- `ipip`: IP-in-IP encapsulation per RFC 2003
- `l2tp`: Layer 2 Tunneling Protocol encryption per RFC 2661
**mobile-ip**: Mobile IP

**proxy-mobile-ip**: Proxy Mobile IP

`clear subscribers`  
Disconnects PDN connections that do not have an active voice call. This keyword is available for APN and chassis maintenance for P-GW, S-GW, SAEGW, GGSN, and ePDG.  
`auto-delete`: Clears the PDN/call when the last VoLTE dedicated bearer goes down for P-GW, S-GW, SAEGW, GGSN, and ePDG.  
Calls will not be cleared when one of the calls in a multiple PDN scenario is a VoLTE PDN. When the VoLTE PDN goes down, all of the other PDNs found for the same IMSI are brought down, which will bring down the call automatically.

`pcf [ < | > | less-than | greater-than ] ipv4_address [ [ < | > | less-than | greater-than ] ipv4_address ]`  
Displays information for subscribers connected via the packet control function with a specific or range of IP address `ipv4_address`. The address must be specified using IPv4 dotted-decimal notation.  
• `<`: Filters output so that only information less than the specified IPv4 address value is displayed.  
• `>`: Filters output so that only information greater than the specified IPv4 address value is displayed.  
• `less-than`: Filters output so that only information less than the specified IPv4 address value is displayed.  
• `greater-than`: Filters output so that only information greater than the specified IPv4 address value is displayed.  
Note: It is possible to define a limited range of IP addresses by using the less-than and greater-than options to define minimum and maximum values.

`pcp { not-required | required }`  
Clears all subscriber information for the specified subscribers:  
`not-required`: Subscribers for whom PCP processing is not required.  
`required`: Subscribers for whom PCP processing is required.

`pdsn-service name`  
Disconnects all subscribers connected to the packet data service `pdsn_name`. The packet data service must have been previously configured.

`pdg-service service_name`  
Disconnects subscriber sessions that are using the PDG service. `service_name` must be an existing service expressed as an alphanumeric string of 1 through 63 characters.

`pdif-service service_name`  
Clears counters for subscribers accessing the Packet Data Interworking Function (PDIF) service. `service_name` must be an existing service expressed as an alphanumeric string of 1 through 63 characters.

`pgw-address ip_address`  
Clears specific P-GW interface.
**clear subscribers**

ip_address must be followed by IP address of interface, using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
The following filter keywords are valid with this command:

- epdg-address, epdg-service,

```
pgw-only { all [ del-cause { none | reactiv-req } ] [ max-subscribers max_count ] | imsi id ebi id | mag-address ip_addr | pgw-service name | sgw-address ip_addr }
```

**all**: Disconnects all subscribers for all P-GW services on this system.

**imsi id**: Disconnects subscribers based on their International Mobile Subscriber Identification (IMSI). id must be the 3-digit MCC (Mobile Country Code), follow by the 2 or 3 digits of the MNC (Mobile Network Code) and the MSIN (Mobile Subscriber Identification Number).

id should not exceed 15 digits.
Example: 123-45-678910234 must be entered as 12345678910234

**ebi id**: The EBI (EPS Bearer Identity)
id must be a valid EBI and be an integer value from 5 to 15.

**mag-service ip_addr**: Disconnects all subscribers using this MAG address.

**pgw-service name**: Disconnects all subscribers using this P-GW service.

name must be an existing P-GW service expressed as an alphanumeric string of 1 through 63 characters.

**sgw-address ip_addr**: Disconnects all subscribers using this S-GW IP address.

ip_addr must be an existing IP address entered using IPv4 dotted-decimal notation or IPv6 colon-separated-hexadecimal notation.

**plmn-type { home | roaming | visiting }**
For GGSN, disconnects subscribers whose subscriber type matches the specified type.

**profile-id id**
Clears information for subscribers using the granted profile-id for the flow.

id must be an integer from 0 to 4294967295.

**profile-name name**
Clears information for subscribers using the specified policy profile name.

name must be name of an existing profile expressed as an alphanumeric string of 1 through 63 characters.

**qci number**
Disconnects subscribers based on their QCI identity.

number must be an integer from 0 to 9.

**rulebase rulebase_name**
Clears information for subscribers using the specified rulebase.

rulebase_name must be name of an existing rulebase expressed as an alphanumeric string of 1 through 63 characters.

**rx-data [ < | > | greater-than | less-than ] value**
Disconnects subscribers who have received the specified number of bytes of data.

<: Filters output so that only information less than the specified value is cleared.

>: Filters output so that only information greater than the specified value is cleared.
greater-than: Filters output so that only information greater than the specified value is cleared.
less-than: Filters output so that only information less than the specified value is cleared.
value: If no other filtering options are specified only output matching value is cleared. If value is not specified all data is cleared. value must be an integer from 0 through 18446744073709551615.

slu-state { active | idle | idle-active }
Disconnects subscribers based on their S1-User Plane Protocol State.
active: Selects subscribers having S1-U state set to active.
idle: Selects subscribers having S1-U state set to idle.
idle-active: Selects subscribers having S1-U state set to idle-active.

s5-proto { gtp | pmip }
Disconnects subscribers based on their S5 interface protocol type.
gtp: Indicates that the GTP protocol is used on the S5 interface for the subscribers being disconnected.
pmip: Indicates that the PMIP protocol is used on the S5 interface for the subscribers being disconnected.

saegw-only { all [ max-subscribers max_count ] | co-located | imsi id ebi id | pgw-anchored | saegw-service name | sgw-address ip_addr | sgw-anchored }
all: Disconnects all subscribers for all SAEGW services on this system.
co-located: Disconnects only co-located subscribers which have both S-GW and P-GW functions.
imsi id: Disconnects subscribers based on their International Mobile Subscriber Identification (IMSI). id must be the 3-digit MCC (Mobile Country Code), follow by the 2 or 3 digits of the MNC (Mobile Network Code) and the MSIN (Mobile Subscriber Identification Number). id should not exceed 15 digits.
Example: 123-45-678910234 must be entered as 12345678910234
ebi id: The EBI (EPS Bearer Identity)
id must be a valid EBI and be an integer value from 5 to 15.
pgw-anchored: Disconnects only PGW-anchored subscribers.
saegw-service name: Disconnects all subscribers using this SAEGW service.
name must be an existing SAEGW service expressed as an alphanumeric string of 1 through 63 characters.
sgw-address ip_addr: Disconnects all subscribers using this S-GW IP address.
ip_addr must be an existing IP address entered using IPv4 dotted-decimal notation or IPv6 colon-separated-hexadecimal notation.
sgw-anchored: Disconnects only SGW-anchored subscribers.

session-time-left [ < | > | greater-than | less-than ] value
The amount of time left for the subscriber session.
<: Filters output so that only information less than the specified value is cleared.
>: Filters output so that only information greater than the specified value is cleared.
greater-than: Filters output so that only information greater than the specified value is cleared.
less-than: Filters output so that only information less than the specified value is cleared.
value: If no other filtering options are specified only output matching value is cleared. If value is not specified all data is cleared. value must be an integer from 0 through 4294967295.
clear subscribers

**sgsn-address ip_address**
Clears all PDP contexts currently being facilitated by a specific SGSN.
*ip_address* is the IP address of the SGSN entered using IPv4 dotted-decimal notation.

**sgsn-service name**
Clears all PDP contexts associated with SGSN. This keyword can be used with filtering keywords that are part of the clear subscriber command set.
Using this keyword can trigger a network-initiated service request (paging) procedure.
*name* identifies a specific SGSN-service configuration expressed as an alphanumeric string of 1 through 63 characters.

**sgw-address ip_address**
Disconnects subscribers using the Serving Gateway (S-GW) IP address.
*ip_address* must be specified in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**sgw-only all [ max-subscribers max_count [ uniform ] ] [ verbose ]**
Disconnects all S-GW subscriber sessions on the system.

**sgw-service name**
Disconnects subscribers using this Serving Gateway (S-GW) service configured on this system. *name* must be an existing S-GW service expressed as an alphanumeric string of 1 through 63 characters.

**smgr-instance sessmgr_instance_number**
Disconnects subscribers on the specified sessmgr instance.
*sessmgr_instance_number* must be an integer from 1 to 4294967295.

**tx-data [ < | > | greater-than | less-than ] value**
Disconnects subscribers who have transmitted the specified number of bytes of data.
*<*: Filters output so that only information less than the specified value is cleared.
*>: Filters output so that only information greater than the specified value is cleared.
*greater-than*: Filters output so that only information greater than the specified value is cleared.
*less-than*: Filters output so that only information less than the specified value is cleared.
*value*: If no other filtering options are specified only output matching *value* is cleared. If *value* is not specified all data is cleared. *value* must be an integer from 0 through 18446744073709551615.

**username name**
Disconnect the subscriber with the specified username
*name* is the username of the subscriber to be cleared. *name* must be a sequence of characters and/or wildcard characters (‘$’ and ‘*’) from 1 to 127 characters. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as wildcard enclose them in single quotes (‘ ’). For example; ‘$’.

**verbose**
Indicates the output should provide as much information as possible. If this option is not specified then the output is the standard level which is the concise mode.
**wsg-service name**

Disconnects subscribers using this WSG service configured on this ASR 9000 VSM. `name` must be an existing WSG (SecGW) service expressed as an alphanumeric string of 1 through 63 characters.

**grep grep_options | more**

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

### Usage

Clear subscribers sessions to aid in troubleshooting the system when no additional subscribers may connect or when a specific service or remote address may be having connection problems. This command may also be used to clear connections when preparing for maintenance activities.

Related commands to clear subscription data - *for SGSN use only*

- For a 2G SGSN, the `admin-disconnect-behavior clear-subscription` command in the GPRS Service Configuration mode enables the SGSN to clear subscription data after the administrative disconnect - `clear subscribers all` has been issued.

- For a 3G SGSN, the `admin-disconnect-behavior clear-subscription` command in the SGSN Service Configuration mode enables the SGSN to clear subscription data after the administrative disconnect - `clear subscribers all` has been issued.

### Example

The following examples illustrate the basic command usage as well as the redirection of the command output. Not all options are exemplified as all options follow the same basic constructs.

The following are basic subscriber clearing examples.

```
clear subscribers username ser1
```

```
clear subscribers ha sampleService
```

```
clear subscribers ip-pool pool2 verbose
```

The following command disconnects users connected to the foreign agent with IP address 10.2.3.4.

```
clear subscribers fa 10.2.3.4
```
clear super-charger

Deletes the subscriber’s backed-up subscription data with an SGSN supercharger subscription configuration (3GPP, TS.23.116).

Product
SGSN

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:
[local]host_name#

Syntax

```
clear super-charger { imsi | all }
```

**imsi**

Specifies a subscriber’s international mobile subscriber identity (IMSI) number. This 15-digit number includes the MCC (mobile country code), the MNC (mobile network code) and the MSIN (mobile station identification number).

**all**

Instructs the SGSN to delete subscription data for all super charger subscribers.

Usage

Use this command to clear (delete) the subscription data records for one or all subscribers within a supercharger subscription configuration.

Example

The following command deletes the backed up records for the subscriber identified by the IMSI 90121882144672.

```
clear super-charger imsi 90121882144672
```
clear supplementary-service statistics

Clears the statistics for Supplementary Service Information.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

clear supplementary-service statistics

**Usage**

Use this command to clear the Supplementary Service Information.

**Example**

The following command clears the Supplementary Service Information:

clear supplementary-service statistics
clear task resources

Deletes the collected resource statistics for system tasks.

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear task resources { card card_num { facility facility { all | instance id max } | facility facility { all | instance id max } | max }
```

card card_num
Default: all powered on cards.
Specifies a single card for which task information is to be cleared where card_num must be from 1 to 48 for the ASR 5000 and 1 through 20 for the ASR 5500.

facility facility { all | instance id max }
Default: all facilities.
Specifies the list of facilities for which task information will be cleared. A specific instance of the facility may be cleared as specified by ID or all instances may be cleared. The value of id must be an integer from 0 through 10000000. facility must be one of:
- **a11mgr**: A11 Interface Manager facility
- **aaamgr**: AAA Manager Facility
- **aaaprox**: AAA Proxy manager Facility
- **acscotr**: Active Charging Service (ACS) Controller Facility [Release 11.0 and earlier versions only]
- **acs mgr**: Active Charging Service (ACS) Manager Facility
- **afctrl**: Fabric Manager [ASR 5500 only]
- **afmgr**: Fabric Manager [ASR 5500 only]
- **alcapmgr**: Access Link Control Application Part (ALCAP) Manager
- **asngwmgr**: ASN Gateway Manager
- **asnpmgr**: ASN Paging/Location-Registry (ASN-PC) Manager
- **bfd**: Bidirectional Forwarding Detection
- **bgp**: Border Gateway Protocol (BGP) Facility
- **bngmgr**: Broadband Network Gateway (BNG) Manager
- **bulkstat**: Bulk Statistics Manager Facility
• **callhome**: Call Home Controller
• **cbsmgr**: Cell Broadcasting Service (CBS) Manager
• **cdfctrl**: Charging Data Function (CDF) Controller
• **cdfmgr**: CDF Manager
• **cdrmod**: Charging Detail Record (CDR) Module
• **cli**: Command Line Interface (CLI) Facility
• **connproxy**: Proxy for connections from same card/chassis
• **cscfcpmgr**: CSCFCPMGR Logging Facility
• **cscfmgr**: SIP Call Session Control Function (CSCF) Manager
• **cscfttmgr**: SIP CSCFTT Manager
• **cspctrl**: Card Slot Port controller Facility
• **cssctrl**: Content Service Steering Controller
• **dcardctrl**: IPSec Daughter-card Controller Logging Facility
• **dcardmgr**: IPSec Daughter-card Manager Logging Facility
• **dgmbmgr**: Diameter Gmb Application Manager
• **dhmgr**: Distributed Host Manager
• **diamproxy**: Diameter Proxy
• **drvctrl**: Driver Controller Facility
• **egtpegmgr**: EGTP Egress Demux Manager
• **egtpinmgr**: EGTP Ingress Demux Manager
• **evlogd**: Event Log Daemon Facility
• **famgr**: Foreign Agent Manager Facility
• **gtpcmgr**: GTP-C Protocol Logging facility (GGSN product only)
• **gtpumgr**: GTP-U Demux Manager
• **h248prt**: H.248 Protocol Task [Release 11.0 and earlier versions only]
• **hamgr**: Home Agent Manager Facility
• **hatcpu**: High Availability Task CPU Facility
• **hatsystem**: High Availability Task Facility
• **hdcctrl**: Hard Disk Controller
• **henbgwdemux**: Home eNodeB Gateway demux manager
• **henbgwmg**: Home eNodeB Gateway Manager
• **hnbgmgr**: HNBGW HNB Manager
• **hwctrl**: Hardware Monitor Controller
• **hwmgr**: Hardware Monitor Manager
• **imsimgr**: SGSN IMSI Manager
• **ipsecctrl**: IP Security Controller Facility
• **ipsecmgr**: IP Security Manager Facility

- **vpnctrl**: Virtual Private Network Controller Facility
- **vpnmgmt**: VPN Manager Facility
- **zebos**: ZEBOS™ OSPF Message Facility

- **all**: Clears information for all instances of the specified facility.
- **instance** <id>: Clears information for the facility instance specified as an integer from 0 through 1000000.
- **max**: Default: current usage levels are cleared.

C clears just the maximum usage levels for tasks as opposed to all current usage levels.

**Usage**
Use this command to clear (delete) the collected resource statistics for system tasks.

**Example**
The following command deletes the Switch Fabric Monitoring Task statistics for instance 100 running on card 2.

```
clear task resources card 2 facility sft instance 100 max
```
clear tcap statistics

Deletes the collected statistics for traffic that has passed through the SS7 TCAP (Transaction Capabilities Application Part) layer.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

clear tcap statistics [ camel-service [ all | name camel_srvc ] | map-service [ all | name map_srvc ] ] [ | { grep grep_options | more } ]

camel-service [ all | name camel_srvc ]

Deletes TCAP statistics for either all CAMEL (Customized Applications for Mobile Network Enhanced Logic, GSM 09.78) services or only for the named CAMEL service.

map-service [ all | name map1_srvc ]

Deletes TCAP statistics for either all MAP services or only for the named MAP service.

grep grep_options | more

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to clear (delete) the collected TCAP statistics for MAP or CAMEL services.

Example
The following command deletes the collected statistics for a MAP service named MAP-Tewk.

clear tcap statistics map-service name MAP-Tewk
clear wsg-service statistics

Deletes statistics collected for a Wireless Security Gateway (WSG) service.

Privilege
Security Administrator, Administrator, Operator

Product
SecGW (WSG)

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clear wsg-service statistics [ name srvc_name ]
```

name srvc_name

Specifies the name of a WSG service for which statistics will be deleted.

Usage

Deletes statistics for all WSG services or for a specified WSG service.

Example

The following command deletes statistics for all WSG services:

```
clear wsg-service
```
cli

Specifies command line interface (CLI) session behavior.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

[ no ] cli { history | stop-on-first-error | test-commands [encrypted] password password_string }

no
Disables the specified keyword functionality.

history
Enables command line history for the current command line session. Default: Enabled

stop-on-first-error
When enabled and a configuration file is loaded, the system stops loading the configuration file on the first syntax error. Default: Disabled

test-commands [encrypted] password password_string
If you are logged in as a Security Administrator or Administrator enabling this command displays diagnostic commands and supplemental keywords to existing commands. The cli hidden command in Global Configuration mode must be enabled to grant access to this keyword. Default: Disabled

⚠️ Caution: CLI test-commands are intended for diagnostic use only. Access to these commands is not required during normal system operation. These command are intended for use only by Cisco TAC personnel. Some of these commands can slow system performance, drop subscribers, and/or render the system inoperable.

[encrypted] password password_string: Password must be entered to access the CLI test-commands. This password must have been previously configured by a Security Administrator via the Global Configuration mode tech-support test-commands password command. The password is an alphanumeric string of 1 through 64 characters (plain text password) or 1 through 524 characters (encrypted password).
If the password keyword is not entered, the user is prompted (no-echo) to enter the password. If tech-support test-commands password has not been enabled, you will be unable to execute cli test-commands.
**Important:** An SNMP trap is generated whenever a user enables `cli test-commands` (`starTestModeEntered`). Refer to the *SNMP MIB Reference* for additional information.

**Usage**

This command controls CLI settings pertaining to the maintenance of a per-session command history and syntax error monitoring during configuration file loading. By default, the system maintains a list of commands executed during each CLI session. This list is referred to as a history. In addition, the system can be configured to stop loading a configuration if a syntax error is detected. By default, the system identifies the error but continues to process the configuration file.

**Example**

The following command disables the keeping of a CLI history for the current session:

```
no cli history
```
clock set

Sets the system time.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
clock set date_time
```

date_time

Specifies the date and time to set the system clock in the format YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss. Where:

- YYYY = 4-digit year
- MM = 2-digit month in the range 01 through 12
- DD = 2-digit day in the range 01 through 31
- HH = 2-digit hour in the range 00 through 23
- mm = 2-digit minute in the range 00 through 59
- ss = 2-digit second in the range 00 through 59

Usage

Set the clock to adjust the system clock for such things as timing drift, day-light savings adjustment, etc. New settings are immediately applied to all CPUs in the system.

**Important:** This command should only be used if there is no NTP server enabled for any context. If NTP is running on the system, this command returns a failure.

Example

The following commands set the system clock where one sets the exact second as well.

```
clock set 2011:08:05:02:30

clock set 2011:08:05:02:31:30
```
cmp enroll current-cert

Triggers a Certification Request (CR) after generating a public and private key pair, as well as an X.509 certificate to be included in the CR for a second certificate from the same Certificate Authority (CA). This is a Certificate Management Protocol v2 command.

**Product**

All products supporting IPSec CMPv2 features

![Important:](image) This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

**Privilege**

Security Administrator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```bash
cmp enroll current-cert old-cert-name modulus mod_type subject-name "subject_string"
cert-name name ca-root ca_name ca-url url
```

<table>
<thead>
<tr>
<th><code>current-cert old-cert-name</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies a valid security gateway certificate as an alphanumeric string of 1 through 129 characters.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><code>modulus mod_type</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the modulus of the generated certificate. <code>mod_type</code> is one of the following integers: 1024, 2048, 4096 or 512.</td>

</tbody>
</table>

<table>
<thead>
<tr>
<th><code>subject-name &quot;subject_string&quot;</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the subject string of the certificate in double quotation marks. &quot;subject_string&quot; is an alphanumeric string of 1 through 256 characters.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><code>cert-name name</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the name of the newly obtained certificate which also serves as the filename to be stored on /flash disk. <code>name</code> is an alphanumeric string of 1 through 129 characters.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><code>ca-root ca_name</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the root certificate of the CA server. <code>ca_name</code> is an alphanumeric string of 1 through 129 characters.</td>
</tr>
</tbody>
</table>
ca-url url

Specifies the URL to which the CA server listens. url is in the format:
http://<host>[:<port>][/<directory>]/<filename>.

Usage

Use this command to trigger a certification request for a second certificate from the same CA.

Example

The following command requests a second certificate from the same CA:

```
cmp enroll current-cert aqaw12345 modulus 1024 subject-name "test_certificate" cert-name cert01 ca-root ca001 ca-url http://excel:2033/certificates/aqaw12345
```
cmp fetch cert-name

This command is only applicable for the ASR 9000 running VPC-SI on a Virtualized Services Module (VSM). CMPv2 operations are performed only on one VSM in the chassis. The certificates along with the private key file and the root certificate are stored on the supervisor card. When invoked on other VSMs in the chassis, this command reads the certificate, private key and the root certificate from the supervisor card.

Product
All products supporting IPSec CMPv2 features

Important: This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

Privilege
Security Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

cmp fetch current-cert old-cert-name ca-root ca_name

<table>
<thead>
<tr>
<th>current-cert old-cert-name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies a valid security gateway certificate as an alphanumeric string of 1 through 129 characters.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>ca-root ca_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the root certificate of the CA server. ca_name is an alphanumeric string of 1 through 129 characters.</td>
</tr>
</tbody>
</table>

Usage
Use this command to read the certificate, private key and the root certificate from the supervisor card in an ASR 9000.

Example
The following command fetches a certificate from a specified CA:

    cmp fetch current-cert aqaw12345 ca-root ca001
cmp initialize

Triggers an Initial Certification Request (CR) after generating a public and private key pair, as well as an X.509 certificate to be included in the CR. This is a Certificate Management Protocol v2 command.

**Product**

All products supporting IPSec CMPv2 features

**Important:** This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

**Privilege**

Security Administrator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
cmp initialize modulus mod_type cert-name name subject-name "subject_string" ca-psk key ca-root ca_name ca-url url
```

**modulus mod_type**

Specifies the modulus of the generated certificate. `mod_type` is one of the following integers: 1024, 2048, 4096 or 512.

**cert-name name**

Specifies the name of the newly obtained certificate which also serves as the filename to be stored on /flash disk. `name` is an alphanumeric string of 1 through 129 characters.

**subject-name "subject_string"**

Specifies the subject string of the certificate in double quotation marks. "subject_string" is an alphanumeric string of 1 through 256 characters.

**ca-psk key**

Specifies the Pre-Shard Key provided by the CA server for CMPv2 operation. `key` is an alphanumeric string of 1 through 129 characters.

**ca-root ca_name**

Specifies the root certificate of the CA server. `ca_name` is an alphanumeric string of 1 through 129 characters.
**Usage**
Use this command to trigger an initial certification request from the CA.

**Example**
The following command sends an Initial Certification Request to a specified CA:

```
cmp initialize modulus 1024 cert-name cert001 subject-name "test" ca-psk AB33569 ca-root cert1 ca-url http://excel:2033/certificates/aqaw12345
```
cmp poll

Triggers a pollReq for the specified certificate. This is a Certificate Management Protocol v2 command.

**Product**
All products supporting IPSec CMPv2 features

⚠️ **Important:** This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

**Privilege**
Security Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**
```
cmp poll current-cert old-cert-name
```

- **current-cert** `old-cert-name`
  Specifies a valid security gateway certificate as an alphanumeric string of 1 through 129 characters.

**Usage**
Use this command to poll the current certificate.

**Example**
The following command polls the current certificate:

```
cmp poll current-cert aqw12345
```
cmp update

Triggers a Key Update Request after generating a public and private key pair, as well an X.509 certificate to be included in the Key Update Request for a certificate that is about to expire. This is a Certificate Management Protocol v2 command.

**Product**

All products supporting IPSec CMPv2 features

---

**Important:** This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

**Privilege**

Security Administrator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
cmp update current-cert old-cert-name modulus mod_type ca-root ca_name ca-url url
```

- **modular mod_type**
  Specifies the modulus of the generated certificate. `mod_type` is one of the following integers: 1024, 2048, 4096 or 512.

- **current-cert old-cert-name**
  Specifies a valid security gateway certificate as an alphanumeric string of 1 through 129 characters.

- **ca-root ca_name**
  Specifies the root certificate of the CA server. `ca_name` is an alphanumeric string of 1 through 129 characters.

- **ca-root ca_name**
  Specifies the root certificate of the CA server. `ca_name` is an alphanumeric string of 1 through 129 characters.

- **ca-url url**
  Specifies the URL to which the CA server listens. `url` is in the format: http://<host>[:<port>]/<directory>/<filename>.

**Usage**

Use this command to initiate a manual update of the current certificate.

**Example**

Use this command to initiate a manual update of the current certificate.
The following command requests a second certificate from the same CA:

```
cmp update modulus 1024 current-cert aqaw12345 ca-root ca001 ca-url http://excel:2033/certificates/aqaw12345
```
commandguard

Enable / disable Commandguard feature to prevent operators from accidentally entering configuration modes by presenting yes/no confirmation prompts.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

commandguard

[ default | no ] commandguard

[ default | no ]
Restores the default behavior for confirmation prompting and disables the Commandguard feature.

Usage

When commandguard is enabled it affects the configure and autoconfirm CLI commands by causing them to prompt (Y/N) for confirmation. This feature protects operators from accidentally entering configuration mode via CLI or file replay.

Important: When autoconfirm is enabled, commandguard has no affect.

Example

The following command enables the Commandguard feature:

commandguard

The following command restores system default confirmation prompts:

default commandguard

The following command instructs the SGSN to ignore Commandguard when enabled:

autoconfirm
configure

Sets the mode to the global configure mode. May also be used to set the mode to the configure mode and pre-load the configuration referred to by the options.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

`configure [ url [ verbose ] ]`

url

Specifies the location of a configuration file to pre-load. `url` may refer to a local or a remote file. `url` must be entered using the following format:

For the ASR 5000:

- `[ file: ]{ /flash | /pcmcia1 | /hd } [ /directory ]/file_name`
- `tftp://{ host[ :port# ] } [ /directory ]/file_name`
- `http: | ftp: | sftp: // [ username [ :password ] @ ] { host } [ :port# ] [ /directory ]/file_name`

For the ASR 5500:

- `[ file: ]{ /flash | /usb1 | /hd } [ /directory ]/file_name`
- `tftp://{ host[ :port# ] } [ /directory ]/file_name`
- `http: | ftp: | sftp: // [ username [ :password ] @ ] { host } [ :port# ] [ /directory ]/file_name`

**Important:** Use of the SMC hard drive is not supported in this release.

**Important:** Do not use the following characters when entering a string for the field names below: “/” (forward slash), “:” (colon) or “@” (at sign).

directory is the directory name.
filename is the actual file of interest.
username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.
**Verbose**
Displays the line number and actual line content from the configuration as it is processed.

**Usage**
If no URL is specified, executing this command causes the CLI to enter the Global Configuration Mode. If a URL is specified, executing this command loads the specified configuration file.

**Example**
The following simply changes the mode to the command line interface global configuration mode.

```
configure
```

The following command loads a configuration file from the node `sampleNode` given the path specified and a local file, respectively.

```
configure ftp://sampleNode/pub/glob.cfg
```

For the ASR 5000:

```
configure /pcmcia1/pub/glob.cfg verbose
```

For the ASR 5500:

```
configure /usb1/pub/glob.cfg verbose
```
context

Sets the current context to the context specified.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

context name

name

Specifies the context of interest as an alphanumeric string of 1 through 79 characters. Must be a previously defined context.

Usage

Change the current context when it is desired to configure and/or manage a specific context.

Example

The following sets the current context to the sampleContext context.

context sampleContext
**copy**

Copies files from one location to another. Allows files to be copied to/from locally, as well as from one remote location to another.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
copy from_url to_url [ passive ] [ -noconfirm ]
```

`from_url`

Specifies the source of the copy. `url` may refer to a local or a remote file. `url` must be entered using the following format:

For the ASR 5000:

- `*[ file: ]{ /flash | /pcmcia1 | /hd-raid }[ /directory ]/file_name`
- `tftp:// { host[ :port# ] }[ /directory ]/file_name`
- `*[ http: | ftp: | sftp: ]// { username [ :password ]@ } { host }[ :port# ]{ /directory }/file_name`

For the ASR 5500:

- `*[ file: ]{ /flash | /usb1 | /hd-raid }[ /directory ]/file_name`
- `tftp:// { host[ :port# ] }[ /directory ]/file_name`
- `*[ http: | ftp: | sftp: ]// { username [ :password ]@ } { host }[ :port# ]{ /directory }/file_name`

For VPC:

- `*[ file: ]{ /flash | /hd-raid | /usb1 | /usb2 | /cdrom1 }[ /directory ]/file_name`
- `tftp:// { host[ :port# ] }[ /directory ]/file_name`
- `*[ http: | ftp: | sftp: ]// { username [ :password ]@ } { host }[ :port# ]{ /directory }/file_name`

---

**Important:** The USB ports and CD-ROM must be configured via the hypervisor to be accessible.

- `tftp:// { host[ :port# ] }[ /directory ]/file_name`
- `*[ http: | ftp: | sftp: ]// { username [ :password ]@ } { host }[ :port# ]{ /directory }/file_name`

---

**Important:** Use of the ASR 5000 SMC hard drive is not supported in this release.
**Important:** Do not use the following characters when entering a string for the field names below: “/” (forward slash), “;” (colon) or “@” (at sign).

- **directory** is the directory name.
- **filename** is the actual file of interest.
- **username** is the user to be authenticated.
- **password** is the password to use for authentication.
- **host** is the IP address or host name of the server.
- **port#** is the logical port number that the communication protocol is to use.

**to_url**

Specifies the destination of the copy. url may refer to a local or a remote file. url must be entered using the following format:

For the ASR 5000:

- `file: {} [ /flash | /pcmcia1 | /hd-raid ] [ /directory ] /file_name`
- `tftp:// { host[ :port# ] } [ /directory ] /file_name`
- `[ ftp: | sftp: ] / [ username [ :password ] @ ] { host } [ :port# ] [ /directory ] /file_name`

For the ASR 5500:

- `file: {} [ /flash | /usb1 | /hd-raid ] [ /directory ] /file_name`
- `tftp:// { host[ :port# ] } [ /directory ] /file_name`
- `[ ftp: | sftp: ] / [ username [ :password ] @ ] { host } [ :port# ] [ /directory ] /file_name`

For VPC:

- `file: {} [ /flash | /hd-raid | /usb1 | /usb2 | /cdrom1 ] [ /directory ] /file_name`
- `tftp:// { host[ :port# ] } [ /directory ] /file_name`

**Important:** The USB ports and CD-ROM must be configured via the hypervisor to be accessible.

- `tftp:// { host[ :port# ] } [ /directory ] /file_name`

**Important:** Use of the SMC hard drive is not supported in this release.
passive
Indicates the file copy is to use the passive mode FTP.

-noconfirm
Executes the command without any additional prompt and confirmation from the user.

Important: Use of the -noconfirm option allows the over writing of an existing file if the destination file already exists.

Usage
Copy configuration files, log files, etc., to provide backups of data through the network.

Example
For the ASR 5000, the following copies files from the local /flash/pub directory to remote node remoteABC’s /pcmcia2/pub directory with and without confirmation respectively.

    copy http://remoteABC/pub/june.cfg /flash/pub/june.cfg
    copy tftp://remoteABC/pub/june.cfg /pcmcia2/pub/june.cfg -noconfirm

For the ASR 5500, the following copies files from the local /flash/pub directory to remote node remoteABC’s /flash/pub directory with and without confirmation respectively.

    copy http://remoteABC/pub/june.cfg /flash/pub/june.cfg
    copy tftp://remoteABC/pub/june.cfg /flash/pub/june.cfg -noconfirm

The following copies files from remote node remoteABC to remote node remote123.

    copy ftp://remoteABC/pub/may.cfg ftp://remote123/pub/may.cfg
crash copy

Copies individual crash files (one-at-a-time) and optionally the core dump file from the stored crash records on the chassis to a user-specified location.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
crash copy number number url to_url [ core ]
```

`number number`

Specifies the identification number of the crash record as an integer representing a valid record number from 1 through 120. To determine the numeric identity of a specific crash file, use the `show crash list` command in Exec mode.

`url to_url`

Specifies the destination of the copy. `url` may refer to a local or a remote file and must be entered using the following format:

For the ASR 5000:

- `[ file: ] [ /flash | /pcmcia1 | /hd ] [ /directory ] /
- tftp://[ host [ :port ] ] [ /directory ] /
- [ ftp: | sftp: ] [ /directory ] /

For the ASR 5500:

- `[ file: ] [ /flash | /usb1 | /hd ] [ /directory ] /
- tftp://[ host [ :port ] ] [ /directory ] /
- [ ftp: | sftp: ] [ /directory ] /

For VPC:

- `[ file: ] [ /flash | /hd-raid | /usb1 | /usb2 | /cdrom1 ] [ /directory ] /file_name
- tftp://[ host [ :port ] ] [ /directory ] /file_name

**Important:** The USB ports and CD-ROM must be configured via the hypervisor to be accessible.
Exec Mode Commands (A-C)

crash copy

- [http: | ftp: | sftp://[ username [ :password ]@ ] [ host ] [ :port ] ][ /directory ] /file_name

Important: Use of the SMC hard drive is not supported in this release.

directory: the name of the target directory.
username: the username to be authenticated to provide access to targeted server.
password: the username’s password to be authenticated.
host: the IP address or host name of the targeted server.
port#: the number of the target server’s logical port used for the selected communication protocol.

Important: Do not specify a target filename as this will prevent the file from writing to the target server. The system generates and provides a timestamp-based filename that appears at the destination when the copy command completes.

core

Copies the core dump to the targeted storage server. The core cannot be copied alone; it must be part of a crash copy action included when copying a crash file.

Usage

Copy crash files of core dump to another location for backup or analysis.

Example

The following uses FTP to copy stored record number 5 and the core dump from the crash record list to a targeted remote node directory called crasharchive through port 22 of the targeted server remoteABC with access through user homeboy whose password is secret.7.word.

    crash copy number 5 url ftp://homeboy:secret.7.word@remoteABC:22/crasharchive/ core
crypto blacklist file update

Updates the blacklist (access denied) file using the path specified when the blacklist was enabled.

Product
All products supporting IPSec crypto blacklisting

Important: This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

Privilege
Security Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

crypto blacklist file update

Usage
Update the blacklist file. For additional information on blacklisting, refer to the System Administration Guide.

Example
The following command updates the blacklist file:

crypto blacklist file update
crypto rsa-keygen modulus

Generates an RSA key pair and Certificate Signing Request (CSR) using information to authenticate the site.

Product
All products that support IPSec

⚠️ Important: This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

Privilege
Security Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

crypto rsa-keygen modulus { 1024 | 2048 | 4096 | 512 }

Usage

Generate an RSA key pair and Certificate Signing Request (CSR) using information to authenticate the site. You can specify the modulus (key size of the generated certificate) as 512, 1024, 2048 or 4096 bits. A CSR is a message sent to a Certification Authority (CA) to request a public key certificate for an entity, where the entity is the subject of the certificate. The software creating the CSR must first generate an RSA key pair; the key pair comprises a public and private key. The public key is bundled with the subject's name, and other information to form the CSR.

Example

The following command generates a CSR for a certificate with a modulus of 2048 bits:

```
crypto rsa-keygen modulus 2048
```
crypto whitelist file update

Updates the whitelist (access granted) file using the path specified when the whitelist was enabled.

Product
All products supporting IPSec crypto whitelisting

**Important:** This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

Privilege
Security Administrator

Mode
Exec
The following prompt is displayed in the Exec mode:

```
[local] host_name#  
```

Syntax

```
crypto whitelist file update  
```

Usage
Update the whitelist file. For additional information on whitelisting, refer to the System Administration Guide.

Example
The following command updates the whitelist file:

```
crypto whitelist file update  
```
crypto-group

Allows the manual switchover of redundant IPSec tunnels belonging to a specific crypto group.

Product
PDSN
GGSN

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

crypto-group name group_name activate { primary | secondary }

name group_name
Specifies the name of an existing crypto group with which the tunnels to be switched are associated.

activate { primary | secondary }
Allows you to specify which tunnel to activate:
  *primary*: Switches traffic to the primary tunnel in the group.
  *secondary*: Switches traffic to the secondary tunnel in the group.

Usage
This command is used in conjunction with the Redundant IPSec Tunnel Fail-over feature.
Use this command to manually switch traffic to a specific tunnel in a crypto group if the automatic switchover options have been disabled. Refer to the switchover command in the Crypto Group configuration mode for more information.

Example
The following command manually switches user traffic to the secondary tunnel in the crypto group called group1:

    crypto-group group1 activate secondary
Chapter 129
Exec Mode Commands (D-S)

This chapter contains the commands in the Exec Mode from debug to system.
The Exec Mode is the initial entry point into the command line interface system. Exec mode commands are useful in troubleshooting and basic system monitoring.

**Mode**

**Exec**
The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

---

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
debug

The following commands send information to the logging facility for review:

- debug bfd
- debug ip
- debug ip bgp
- debug ip ospf all
- debug ip ospf event
- debug ip ospf ism
- debug ip ospf lsa
- debug ip ospf nsm
- debug ip ospf packet
- debug ip ospf route
- debug ip ospf router
- debug ipv6 ospf all (OSPFv3)
- debug ipv6 ospf event (OSPFv3)
- debug ipv6 ospf ism (OSPFv3)
- debug ipv6 ospf lsa (OSPFv3)
- debug ipv6 ospf nsm (OSPFv3)
- debug ipv6 ospf packet (OSPFv3)
- debug ipv6 ospf route (OSPFv3)
debug bfd

Enables or disables the debug options for Bidirectional Forwarding Detection (BFD) debugging. If logging is enabled, results are sent to the logging system.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name# 
```

**Syntax**

```
[ no ] debug bfd { all | events ipc-error | ipc-events | nsm | packet | session }
```

- **no**
  Indicates the IP debugging is to be disabled for the IP interfaces/function specified.

- **bfd | interface name | route**
  Specifies which IP interfaces/function to debug.
  - **all**: enables debug for all BFD items.
  - **events**: enables debug for BFD events.
  - **ipc-error**: enables debug for BFD Inter-process communication (IPC) errors.
  - **ipc-events**: enables debug for BFD Inter-process communication (IPC) events.
  - **nsm**: enables debug for BFD Network Service Manager messages.
  - **packet**: enables debug for BFD packets.
  - **session**: enables debug for BFD sessions.

**Usage**
The debug bfd command is valuable when troubleshooting network problems with BFD-enabled BGP routers. The debugging is stopped by using the **no** keyword.

⚠️ **Caution:** Issuing this command could negatively impact system performance depending on system configuration and/or loading.

**Example**
The following commands enable/disable debugging for BFD.

```
debug bfd
no debug bfd
```
**debug ip**

Enables or disables the debug options for IP debugging. If logging is enabled, results are sent to the logging system.

**Product**

All

**Privilege**

Security Administrator, Administrator, Operator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
[ no ] debug ip { arp | interface | route }
```

- **no**
  
  Indicates the IP debugging is to be disabled for the IP interfaces/function specified.

- **arp | interface name | route**
  
  Specifies which IP interfaces/function to debug.
  - **arp**: indicates debug is to be enabled for the address resolution protocol.
  - **interface**: indicates debug is to be enabled for the IP interfaces.
  - **route**: indicates debug is to be enabled for the route selection and updates.

**Usage**

The debug IP command is valuable when troubleshooting network problems between nodes. The debugging is stopped by using the **no** keyword.

⚠️ **Caution**: Issuing this command could negatively impact system performance depending on system configuration and/or loading.

**Example**

The following commands enable/disable debugging for ARP.

```
depug ip arp
no debug ip arp
```

The following enables/disables debugging for IP interfaces.

```
depug ip interface
no debug ip interface
```

The following enables/disables debugging for routing.

```
depug ip routeno debug ip route
```
**debug ip bgp**

Enables or disables BGP (Border Gateway Protocol) debug flags. If logging is enabled, results are sent to the logging system.

**Product**

HA

**Privilege**

Security Administrator, Administrator, Operator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
[ no ] debug ip bgp { all | event | filters | fsm | keepalives | updates { inbound | outbound } }
```

- **no**
  
  Disables the specified BGP debug flags.

- **all**
  
  Enables all BGP debug flags.

- **event**
  
  Enables debugging of all BGP protocol events.

- **filters**
  
  Enables debugging of all BGP filters.

- **fsm**
  
  Enables debugging of BGP Finite State Machine

- **keepalives**
  
  Enables debugging of all BGP keepalives.

- **updates { inbound | outbound }**
  
  Enables debugging of BGP updates.
  
  **inbound**: Debug all BGP inbound updates.
  
  **outbound**: Debug all BGP outbound updates.

**Usage**

Use this command to enable or disable BGP debug flags.
Example

The following command disables all BGP debug flags enabled by any of the `debug ip bgp` commands:

```
no debug ip bgp all
```

The following command enables all BGP debug flags:

```
ddebug ip bgp all
```
**debug ip ospf all**

Enables or disables all OSPF (Open Shortest Path First) debug flags. If logging is enabled, results are sent to the logging system.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
[ no ] debug ip ospf all
```

- **no**
  Disable all OSPF debug flags.

**Usage**
Use this command to enable or disable all OSPF debug flags.

**Example**

The following command disables all OPSF debug flags enabled by any of the `debug ip ospf` commands:

```
no debug ip ospf all
```

The following command enables all OSPF debug flags:

```
d Debug ip ospf all
```
**debug ip ospf event**

Enables or disables debugging of OSPF protocol events. If logging is enabled, results are sent to the logging system. If no keywords are specified, all events are enabled for debugging.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator, Operator

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
[ no ] debug ip ospf event [ abr | asbr | vl | lsa | os | router ]
```

- **no**
  Disables debugging the specified OSPF event. If no keywords are specified, all events are disabled.

- **abr**
  Enables debugging of Area Border Router (ABR) events.

- **asbr**
  Enables debugging of Autonomous System Boundary Router (ASBR) events.

- **vl**
  Enables debugging of Virtual Link (VL) events.

- **lsa**
  Enables debugging of link state advertisement (LSA) events.

- **os**
  Enables debugging of operating system (OS) events.

- **router**
  Enables debugging of router events.

**Usage**

Use this command to output debug information for OSPF events.
Example

To enable all event debug information, enter the following command:

```
debug ip ospf event
```

To disable all event debug information, enter the following command:

```
no debug ip ospf event
```
**debug ip ospf ism**

Enables or disables OSPF Interface State Machine (ISM) troubleshooting, based on ISM information type. If no keywords are specified all ISM information types are enabled. If logging is enabled, results are sent to the logging system.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator, Operator

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
[ no ] debug ip ospf ism [ events | status | timers ]
```

- **no**
  - Disables debugging the specified ISM information. If no keywords are specified, all information is disabled.

- **events**
  - Enables debugging ISM event information.

- **status**
  - Enables debugging ISM status information.

- **timers**
  - Enables debugging ISM timer information.

**Usage**

Use this command to output ISM debug information.

**Example**

To enable all ISM debug information, enter the following command;

```
debug ip ospf ism
```

To disable all ISM debug information, enter the following command;

```
no debug ip ospf ism
```
debug ip ospf lsa

Enables or disables troubleshooting on OSPF Link State Advertisements (LSAs), based on the specific LSA option. If no keywords are specified, all options are enabled. If logging is enabled, results are sent to the logging system.

Product

PDSN
HA
GGSN

Privilege

Security Administrator, Administrator, Operator

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

[ no ] debug ip ospf lsa [ flooding | generate | install | refresh | maxage | refresh ]

no
Disables the specified LSA debug information. If no keyword is specified, all LSA debug information is disabled.

flooding
Enables LSA flooding information.

generate
Enables LSA generation information.

install
Enables LSA install information.

maxage
Enables LSA maximum age information in seconds. The maximum age is 3600 seconds.

refresh
Enables LSA refresh information.

Usage

Use this command to output debug information for LSAs.

Example

To enable all LSA debug information, enter the following command;
debug ip ospf lsa

To disable all LSA debug information, enter the following command:

no debug ip ospf lsa
debug ip ospf nsm

Enables or disables troubleshooting OSPF Neighbor State Machines (NSMs), based on the specific NSM information type. If no keyword is specified, all NSM information types are enabled. If logging is enabled, results are sent to the logging system.

Product
PDSN
HA
GGSN

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

[ no ] debug ip ospf nsm [ status | events | timers ]

- **no**
  Disables the debugging the specified NSM information type. If no keyword is specified, all information types are disabled.

- **events**
  Enables debugging NSM event information.

- **status**
  Enables debugging NSM status information.

- **timers**
  Enables debugging NSM timer information.

Usage

Use this command to output debug information for OSPF NSMs

Example

To enable all NSM debug information, enter the following command;

```plaintext
debbug ip ospf nsm
```

To disable all NSM debug information, enter the following command;

```plaintext
no debug ip ospf nsm
```
**debug ip ospf packet**

Enables or disables troubleshooting of specific OSPF packet information. If logging is enabled, results are sent to the logging system.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator, Operator

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
[ no ] debug ip ospf packet { all | dd | hello | ls-ack | ls-request | ls-update } [ send | recv ] [ detail ]
```

- **no**
  
  Disable debugging of the specified packet information.

- **all**
  
  Enables debugging all OSPF packet information.

- **dd**
  
  Enables debugging database descriptions.

- **hello**
  
  Enables debugging hello packets.

- **ls-ack**
  
  Enables debugging link state acknowledgements.

- **ls-request**
  
  Enables debugging link state requests.

- **ls-update**
  
  Enables debugging link state updates.

- **send**
  
  Enables debugging only on sent packets.
recv
Enables debugging only on received packets.

detail
Enables detailed information in the debug output.

Usage
Use this command to output specific OSPF packet information.

Example
To enable all packet debug information, enter the following command;

    debug ip ospf packet all

To disable all route debug information, enter the following command;

    no debug ip ospf packet all
debug ip ospf route

Sets the route calculation method to use in debugging OSPF routes. If no route calculation method is specified, all methods are enabled. If logging is enabled, results are sent to the logging system.

Product
PDSN
HA
GGSN

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

[ no ] debug ip ospf route [ ase | ia | install | spf ]

no
Disables debugging of route information. If no keyword is specified all information types are disabled.

ase
Enables debugging information on autonomous system external (ASE) route calculations.

ia
Enables debugging information on Inter-Area route calculations.

install
Enables debugging information on route installation.

spf
Enables debugging information on Shortest Path First (SPF) route calculations.

Usage
Use this command to output debug information for OSPF routes.

Example
To enable all route debug information, enter the following command;

    debug ip ospf route

To disable all route debug information, enter the following command;

    no debug ip ospf route
debug ip ospf router

Sets the debug option for OSPF router information. If no keyword is specified, all router information is enabled. If logging is enabled, results are sent to the logging system.

Product
- PDSN
- HA
- GGSN

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

[ no ] debug ip ospf router [ interface | redistribute ]

no
Disables the specified router debug information. If no keyword is specified, all router information is disabled.

interface
Enables router interface information.

redistribute
Enables router redistribute information.

Usage
Use this command to output debug information for the OSPF router.

Example
To enable all router debug information, enter the following command;

ddebug ip ospf router

To disable all router debug information, enter the following command;

no debug ip ospf router
**debug ipv6 ospf all**

Enables or disables all OSPFv3 (Open Shortest Path First Version 3) debug flags. If logging is enabled, results are sent to the logging system.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator, Operator

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
[ no ] debug ipv6 ospf all
```

- **no**
  Disable all OSPFv3 debug flags.

**Usage**

Use this command to enable or disable all OSPFv3 debug flags.

**Example**

The following command disables all OSPFv3 debug flags enabled by any of the `debug ip ospf` commands:

```
no debug ipv6 ospf all
```

The following command enables all OSPFv3 debug flags:

```
ddebug ipv6 ospf all
```
**debug ipv6 ospf event**

Enables or disables debugging of OSPFv3 protocol events. If logging is enabled, results are sent to the logging system. If no keywords are specified, all events are enabled for debugging.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
[ no ] debug ipv6 ospf event [ abr | asbr | os | router ]
```

- **no**
  
  Disables debugging the specified OSPFv3 event. If no keywords are specified, all events are disabled.

- **abr**
  
  Enables debugging of Area Border Router (ABR) events.

- **asbr**
  
  Enables debugging of Autonomous System Boundary Router (ASBR) events.

- **os**
  
  Enables debugging of operating system (OS) events.

- **router**
  
  Enables debugging of router events.

**Usage**

Use this command to output debug information for OSPFv3 events.

**Example**

To enable all event debug information, enter the following command:

```
debug ipv6 ospf event
```

To disable all event debug information, enter the following command:

```
no debug ipv6 ospf event
```
**debug ipv6 ospf ifsm**

Enables or disables OSPFv3 Interface State Machine (ISM) troubleshooting, based on ISM information type. If no keywords are specified all ISM information types are enabled. If logging is enabled, results are sent to the logging system.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator
- Administrator
- Operator

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name# 
```

**Syntax**

```
[ no ] debug ipv6 ospf ism [ events | status | timers ]
```

- **no**
  - Disables debugging the specified ISM information. If no keywords are specified, all information is disabled.

- **events**
  - Enables debugging ISM event information.

- **status**
  - Enables debugging ISM status information.

- **timers**
  - Enables debugging ISM timer information.

**Usage**

Use this command to output ISM debug information.

**Example**

To enable all ISM debug information, enter the following command;

```
dump ipv6 ospf ism
```

To disable all ISM debug information, enter the following command;

```
no debug ipv6 ospf ism
```
debug ipv6 ospf lsa

Enables or disables troubleshooting on OSPFv3 Link State Advertisements (LSAs), based on the specific LSA option. If no keywords are specified, all options are enabled. If logging is enabled, results are sent to the logging system.

**Product**

PDSN
HA
GGSN

**Privilege**

Security Administrator, Administrator, Operator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
[ no ] debug ip ospf lsa [ flooding | generate | install | maxage | refresh ]
```

- **no**
  
  Disables the specified LSA debug information. If no keyword is specified, all LSA debug information is disabled.

- **flooding**
  
  Enables LSA flooding information.

- **generate**
  
  Enables LSA generation information.

- **install**
  
  Enables LSA install information.

- **maxage**
  
  Enables LSA maximum age information in seconds. The maximum age is 3600 seconds.

- **refresh**
  
  Enables LSA refresh information.

**Usage**

Use this command to output debug information for LSAs.

**Example**

To enable all LSA debug information, enter the following command;
debug ipv6 ospf lsa

To disable all LSA debug information, enter the following command:

no debug ipv6 ospf lsa
**debug ipv6 ospf nsm**

Enables or disables troubleshooting OSPFv3 Neighbor State Machines (NSMs), based on the specific NSM information type. If no keyword is specified, all NSM information types are enabled. If logging is enabled, results are sent to the logging system.

**Product**

PDSN  
HA  
GGSN

**Privilege**

Security Administrator, Administrator, Operator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
[ no ] debug ipv6 ospf nsm [ interface | redistribute ]
```

- **no**
  Disables the debugging the specified NSM information type. If no keyword is specified, all information types are disabled.

- **interface**
  Enables debugging NSM on this interface.

- **redistribute**
  Enables debugging NSM redistribution information.

**Usage**

Use this command to output debug information for OSPFv3 NSMs

**Example**

To enable all NSM debug information, enter the following command;

```
dump ipv6 ospf nsm
```

To disable all NSM debug information, enter the following command;

```
no debug ipv6 ospf nsm
```
**debug ipv6 ospf packet**

Enables or disables troubleshooting of specific OSPFv3 packet information. If logging is enabled, results are sent to the logging system.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator, Operator

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
[ no ] debug ipv6 ospf packet { dd | hello | ls-ack | ls-request | ls-update } [ recv | send ] [ detail ]
```

- **no**
  
  Disable debugging of the specified packet information.

- **dd**
  
  Enables debugging database descriptions.

- **hello**
  
  Enables debugging hello packets.

- **ls-ack**
  
  Enables debugging link state acknowledgements.

- **ls-request**
  
  Enables debugging link state requests.

- **ls-update**
  
  Enables debugging link state updates.

- **recv**
  
  Enables debugging only on received packets.

- **send**
  
  Enables debugging only on sent packets.
debug ipv6 ospf packet

**detail**

Enables detailed information in the debug output.

**Usage**

Use this command to output specific OSPFv3 packet information.

**Example**

To enable all packet debug information, enter the following command;

```
detail
```

To disable all route debug information, enter the following command;

```
no detail
```
debug ipv6 ospf route

Sets the route calculation method to use in debugging OSPFv3 routes. If no route calculation method is specified, all methods are enabled. If logging is enabled, results are sent to the logging system.

Product
- PDSN
- HA
- GGSN

Privilege
- Security Administrator, Administrator, Operator

Mode
- Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

[ no ] debug ipv6 ospf route [ ase | ia | install | spf ]

**no**
- Disables debugging of route information. If no keyword is specified all information types are disabled.

**ase**
- Enables debugging information on autonomous system external (ASE) route calculations.

**ia**
- Enables debugging information on Inter-Area route calculations.

**install**
- Enables debugging information on route installation.

**spf**
- Enables debugging information on Shortest Path First (SPF) route calculations.

Usage

Use this command to output debug information for OSPF routes.

Example

To enable all route debug information, enter the following command;

```
d debug ipv6 ospf route
```

To disable all route debug information, enter the following command;

```
no debug ipv6 ospf route
```
**default terminal**

Restores the system default value for the terminal options.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
default terminal { length | width }
```

- **length | width**
  - **length**: Resets the terminal length to the system default.
  - **width**: Resets the system default terminal width.

**Usage**

Restore the default terminal settings when the current paging and display wraps inappropriately or pages to soon.

**Example**

The following sets the default length then width in two commands.

```
default terminal length

default terminal width
```
delete

Removes the specified file(s) permanently from the local.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

delete filepath [ -noconfirm ]

filepath

Specifies the location of the file to rename. The path must be formatted as follows:

For the ASR 5000:

[ file: ]{ /flash | /pcmcia1 | /hd-raid }[ /directory ]/file_name

Important: Use of the ASR 5000 SMC hard drive is not supported in this release.

For the ASR 5500:

[ file: ]{ /flash | /usb1 | /hd-raid }[ /directory ]/file_name

For VPC:

[ file: ]{ /flash | /hd-raid / usb1 | usb2 | /cdrom1 }[ /directory ]/file_name

Important: The USB ports and CD-ROM must be configured via the hypervisor to be accessible.

Important: Do not use the following characters when entering a string for the field names below: “/” (forward slash), “:” (colon) or “@” (at sign).

directory is the directory name
filename is the actual file of interest

-noconfirm

Executes the command without any additional prompt and confirmation from the user.
**Important:** Use of the `-noconfirm` option should be done with extra care to ensure the file is specified accurately as there is no method of recovering a file that has been deleted.

**Usage**
Deleting files is a maintenance activity which may be part of periodic routine procedures to reduce system space utilization.

**Example**
The following removes files from the local `/flash/pub` directory.

```
delete /flash/pub/june03.cfg
```
delete support record

Removes a Support Data Record (SDR) with s specified record-id or all SDRs in the specified range of record-ids.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

```
delete support record <record-id> [ to <record-id> ]
```

- **record-id**
  Specifies a single SDR as an integer from 0 to 65536.
  Each SDR is identified by a time index called the record-id. For example, the most recent record is always record-id 0 (filename = sdr.0.gz). The next older record is record-id 1 (filename = sdr.1.gz), and so on.

- **to record-id**
  Specifies the endpoint record-id when deleting a range of SDRs.

Usage

Use this command to delete one or more SDRs stored on the system. For additional information on the Support Data Collector feature, refer to the System Administration Guide.

Example

The following command deletes the SDR with a record-id of 5 (filename = sdr.5.gz):

```
delete support record 5
```
**dhcp force**

Tests the lease-renewal for DHCP-assigned IP addresses for a particular subscriber.

**Product**
- GGSN
- ASN-GW
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
dhcp force lease-renewal { callid id | imsi imsi [ nsapi nsapi ] | msid msid }
```

---

**callid id**

Clears the call ID specified as a 4-byte hexadecimal number.

---

**imsi msid**

Disconnects the subscriber with the specified msid. The IMSI (International Mobile Subscriber Identity) ID is a 50-bit field which identifies the subscriber’s home country and carrier. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘ ’). For example; ‘$’.

---

**nsapi nsapi**

Specifies a Network Service Access Point Identifier (NSAPI) an integer from 5 to 15.

---

**msid id**

Disconnects the mobile user identified by *ms_id.ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘ ’). For example; ‘$’.

---

**Usage**

Use this command tests a forced IP address lease renewal for a specific subscriber.

**Example**

The following command tests DHCP lease renewal for a subscriber with an MSID of 1234567:

```
dhcp force lease-renewal msid 1234567
```
**dhcp test**

Tests DHCP (Dynamic Host Configuration Protocol) functions for a particular DHCP service.

**Product**
- GGSN
- ASN-GW
- P-GW
- SAEGW

**Privilege**
- Security Administrator, Administrator, Operator

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
dhcp test dhcp-service svc_name [ all | server ip_address ]
```

- **dhcp-service svc_name**
  Specifies the name of the DHCP service as an alphanumeric string of 1 through 63 characters that is case sensitive.

- **all**
  Tests DHCP functionality for all servers.

- **server ip_address**
  Tests DHCP functionality for the server specified by an IP address entered using IPv4 dotted-decimal notation.

**Usage**

Once DHCP functionality is configured on the system, this command can be used to verify that it is configured properly and that it can successfully communicate with the DHCP server. Executing this command causes the system to request and allocate an IP address and then release it. If a specific DHCP server is not specified, then each server configured in the service is tested.

**Example**

The following command tests the systems ability to get an IP address from all servers a DHCP service called `DHCP-Gi` is configured to communicate with:

```
dhcp test dhcp-service DHCP-Gi all
```
diameter disable endpoint

Disables a Diameter endpoint without removing the peer’s configuration.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

diameter disable endpoint endpoint_name peer peer_id

endpoint_name
Specifies the endpoint in which the peer is configured as an alphanumeric string of 1 through 63 characters.

peer peer_id
Specifies the Diameter peer host name to be disabled as an alphanumeric string of 1 through 63 characters.

Usage
Use this command to administratively disable a Diameter peer without removing the peer configuration. This command will tear down all connections on the specified peer (by sending a DPR if the configuration demands the same at peer level configuration). The peer will remain in disabled state until it is enabled again. Also see the diameter enable endpoint command.

Example
This command disables the Diameter peer peer12:

diameter disable endpoint endpoint1 peer peer12
**diameter enable endpoint**

Enables a Diameter endpoint that is disabled.

**Product**  
All

**Privilege**  
Security Administrator, Administrator

**Mode**  
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
diameter enable endpoint endpoint_name peer peer_id
```

- **endpoint_name**
  Specifies the endpoint in which the peer is configured as an alphanumeric string of 1 through 63 characters.

- **peer peer_id**
  Specifies the Diameter peer host name to be enabled as an alphanumeric string of 1 through 63 characters.

**Usage**

Use this command to administratively enable a Diameter peer. Also see the `diameter disable endpoint` command.

**Example**

This command enables the Diameter peer `peer12`:

```
diameter enable endpoint endpoint1 peer peer12
```
diameter reset connection

Resets individual TCP/SCTP connections for a specified Diameter endpoint.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

diameter reset connection { endpoint endpoint_name peer peer_id }

endpoint endpoint_name
Resets connection to the endpoint specified as an alphanumeric string of 1 through 63 characters.

peer peer_id
Resets connection to the Diameter peer host name specified as an alphanumeric string of 1 through 63 characters.

Usage
Use this command to reset the TCP/SCTP connections for the specified endpoint/peer. With this command, the connection will be closed temporarily after DPR/DPA. If there is any traffic to be sent to the particular peer, then the connection will be re-established. This command overrides the endpoint configured in any other configuration mode. This command is applicable only when the specified peer is enabled.

Example
This command resets connection to the endpoint named test123:

diameter reset connection endpoint test123
diameter reset route failure

Resets the failed route status of a Diameter destination-host combination via peer to AVAILABLE status.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name# 
```

**Syntax**

```
diameter reset route failure [ endpoint endpoint_name ] [ host host_name ] [ peer peer_id ]
```

- **endpoint endpoint_name**
  Resets paths to the endpoint specified as an alphanumeric string of 1 through 63 characters.

- **host host_name**
  Resets the FAILED status of all Diameter destination-host combination routes via peer for every Diameter client within the chassis having a specific host name to AVAILABLE. Specifies the Diameter host name as an alphanumeric string of 1 through 63 characters.

- **peer peer_id**
  Resets the FAILED status of all Diameter destination-host combination routes via a peer having specific peer-id for every Diameter client within the chassis to AVAILABLE. Specifies the Diameter peer host name as an alphanumeric string of 1 through 63 characters.

**Usage**

Use this command to reset the FAILED status of all Diameter destination-host combination routes via peer for every Diameter client within the chassis to AVAILABLE status. This command also resets the failure counts used to determine the AVAILABLE/FAILED status of a destination-host combination.

When executed from local context, this command matches all contexts. If an optional keyword is not supplied, a wildcard is used for the value.

The status of every matching combination of destination-host via peer for every matching Diameter client within the chassis will be reset to AVAILABLE. The failure counts that are used to determine AVAILABLE/FAILED status will also be reset.

Also see the **route-entry** and **route-failure** commands in the *Diameter Endpoint Configuration Mode Commands* chapter.

Default value: N/A

**Example**

N/A
The following command resets the FAILED status of all Diameter destination-host combination routes via peer for every Diameter client within the chassis for specified endpoint name to AVAILABLE.

```
diameter reset route failure endpoint endpoint123
```
**directory**

Lists the files in a specified location.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
directory filepath [ -size ] [ -reverse ] [ -time ]
```

*filepath*

Specifies the directory path to list the contained files using the following format:

For the ASR 5000:

```
[ file: ]{ /flash | /pcmcia1 | /hd }[/directory ]/file_name
```

**Important:** Use of the ASR 5000 SMC hard drive is not supported in this release.

For the ASR 5500:

```
[ file: ]{ /flash | /usb1 | /hd }[/directory ]/file_name
```

For VPC:

```
[ file: ]{ /flash | /hd-raid | /usb1 | /usb2 | cdrom1 }[/directory ]/file_name
```

**Important:** The USB ports and CD-ROM must be configured via the hypervisor to be accessible.

**Important:** Do not use the following characters when entering a string for the field names below: “/” (forward slash), “:” (colon) or “@” (at sign).

- `directory` is the directory name
- `filename` is the actual file of interest

- `size`

Indicates the size of each file should be displayed in the output.
-reverse
Indicates the order of files listed should be in descending order (z-aZ-A9-0). Default is to sort in ascending order (0-9A-Za-z).

-time
Indicates the last modification timestamp of each file should be displayed in the output.

Usage
Lists such things as log and crash files from multiple nodes within the network. The optional arguments may be specified individually or in any combination.

Example
The following command will list the files in the local /flash/pub directory sorted in reverse order.

   directory /flash/pub -reverse
**disable radius**

Prevents the system from making requests of a selected RADIUS server.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
disable radius { [ charging ] [ accounting ] server ipv4/ipv6_address [ group group_name | port port_number + ] }
```

- **[ charging ] [ accounting ]**
  Specifies the type of RADIUS server to disable.
  - accounting: Specifies accounting servers
  - charging: Specifies charging servers
  - charging accounting: Specifies charging accounting servers

- **server ipv4/ipv6_address**
  Specifies the RADIUS server by IP address entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

- **port port_number**
  Specifies the port number of the RADIUS server being disabled an integer from 0 through 65535. Default: 1812 (authentication) 1813 (accounting)

- **group group_name**
  Specifies the RADIUS group to which the server belongs as an alphanumeric string of 1 through 63 characters. Use this option in the event that the RADIUS server belongs to multiple groups and you only want to disable the server within the specific group. Default: default

**Usage**

Use this command to gracefully stop the system from making requests of a specific RADIUS server.

**Example**

The following command disables a RADIUS accounting server with an IP address of 10.2.3.4, the default accounting server port number, and that resides in the Group5 server group:

```
disable radius accounting server 10.2.3.4 group Group5
```
**dns-client**

Performs DNS (Domain Name System) query on the basis of specified DNS client name, DNS query domain name, and type of query criteria.

**Product**  
All

**Privilege**  
Security Administrator, Administrator, Operator, Inspector

**Mode**  
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
dns-client dns_client_name [ query-type { A | AAAA | NAPTR | SRV } ] query-name query_domain_name
```

- **dns-client**  
  Specifies the name of the DNS client whose cache and/or statistics are to be queried. It must be an existing DNS client expressed as an alphanumeric string of 1 through 64 characters.

- **query-type { A | AAAA | NAPTR | SRV }**  
  Specifies that the type of query to perform for the defined DNS client is to be displayed.
  - **A**: Filters DNS results based on domain IPv4 address records (A records). This is the default query type.
  - **AAAA**: Filters DNS results based on domain IPv6 address records (AAAA records).
  - **NAPTR**: Filters DNS results based on Naming Authority Pointer records (NAPTR).
  - **SRV**: Filters DNS results based on service host records (SRV records).

- **query-name query_domain_name**  
  Filters the DNS results based on the query domain name expressed as an alphanumeric string of 1 through 255 characters.

  *query_domain_name* is the domain name used to perform the DNS query and is different from the actual domain name which is resolved. For example, to resolve the SIP server for service.com, the query name is `_sip._udp.service.com` and the query type is **SRV**.

**Usage**

Use this command to perform DNS query on the basis of DNS Client name and filters the query results based on query type and query name. This command also populates the result into DNS Cache. This command used the current context to DNS request.

**Example**

The following command displays statistics for a DNS client named `test_dns` with query type for IP address as **A** and query name as `domain1.com`:
dns-client test_dns query-type A query-name domain1.com
egtpc test echo

Tests the ability of a GGSN/P-GW service to exchange GTP-C echo request messages with specified peer(s).

Product
GGSN
P-GW
SAEGW

Privilege
Operator, Config-Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

egtpc test echo gtp-version version src-address ip_address { all | peer-address ip_address }

<table>
<thead>
<tr>
<th>gtp-version version</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies version number for sending Echo request message.</td>
</tr>
<tr>
<td>version must be an integer from 0 through 2.</td>
</tr>
</tbody>
</table>

**Important:** If peer is not a new peer for service bind to src-address, then echo request is sent with the last known highest version of the peer.

<table>
<thead>
<tr>
<th>src-address ip_address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the IP address of a Gn interface configured on the system.</td>
</tr>
<tr>
<td>ip_address must be entered using IPv4 dotted-decimal notation or IPV6 colon-separated-hexadecimal notation.</td>
</tr>
</tbody>
</table>

**Important:** The IP address of the system’s Gn interface must be bound to a configured GGSN/P-GW service prior to executing this command.

<table>
<thead>
<tr>
<th>all</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sends GTP-C echo requests to first 100 peers that currently have sessions with the GGSN/P-GW service.</td>
</tr>
</tbody>
</table>

**Important:** If this keyword is selected, additional confirmation is required after the following message, “Warning: Due to possibility of huge number of connected peers, considering system performance impacts, issue echo request to only 100 peers”.
**peer-address ip_address**

Specifies that GTP-C echo requests will be sent to a specific peer.

`ip_address` must be entered using IPv4 dotted-decimal notation or IPv6 colon-separated-hexadecimal notation.

**Usage**

This command tests the GGSN’s or P-GW’s ability to exchange GPRS Tunneling Protocol control plane (GTP-C) packets with the specified peer. This command is useful for troubleshooting and/or monitoring. This command must be executed from within the context in which the GGSN/P-GW service is configured.

**Important:** In StarOS v14.0 and later, this command replaces the `gtpv0 test echo` and `gtpc test echo` commands.

**Example**

The following command issues GTP-C echo packets from a GGSN service bound to address 192.168.157.43 to an SGSN with an address of 192.168.1.52:

```
egtpc test echo gtp-version 1 src-address 192.168.157.43 peer-address 192.168.1.52
```
enable radius

Enables the system to start making requests of a specific RADIUS server.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
enable radius { [ charging ] [ accounting ] server ipv4/ipv6_address [ group group_name | port port_number + ] }
```

- `[ charging ] [ accounting ]`
  Specifies the type of RADIUS server to enable.
  - `accounting`: Specifies accounting servers
  - `charging`: Specifies charging servers
  - `charging accounting`: Specifies charging accounting servers

- `server ipv4/ipv6_address`
  Specifies the RADIUS server by an IP address entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

- `port port_number`
  Specifies the port number of the RADIUS server being enabled as an integer from 0 through 65535. Default: 1812 (authentication) 1813 (accounting)

- `group group_name`
  Specifies the RADIUS group to which the server belongs as an alphanumeric string of 1 through 63 characters. Use this option in the event that the RADIUS server belongs to multiple groups and you only want to disable the server within the specific group. Default: `default`

**Usage**

Use this command to allow the system to start making requests of a specific RADIUS server.

**Example**

The following command enables a RADIUS accounting server with the IP address `10.2.3.4`, the default accounting server port number, and in the `Group5` server group:

```
enable radius accounting server 10.2.3.4 group Group5
```
exit

Terminates the current CLI session.

Product  
All  

Privilege  
Any

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

For the ASR 5000:

```
filesystem { check | format | repair | synchronize } { /flash | /pcmcia1 | /hd-raid } [ card slot_num ]
```

For the ASR 5500:

```
filesystem { check | format | repair | synchronize } { /flash | /usb1 | /hd-raid } [ card slot_num ]
```

For VPC:

```
filesystem { check | format | repair | synchronize | update } { /flash | /hd-raid | /usb1 | /usb2 | cdrom1 }
```

The following devices are supported based on platform type:

- `/flash` – ASR 5x00, VPC
- `/hd-raid` – ASR 5x00, VPC
- `/pcmcia1` – ASR 5000 only
- `/usb1` – ASR 5500, VPC (if configured via hypervisor)
- `/usb2` – VPC (if configured via hypervisor)
- `/cdrom1` – VPC (if configured via hypervisor)

**Important:** For VPC, the USB ports and CD-ROM must be configured via the hypervisor to be accessible by the Control Function (CF) virtual machine.

**check**

Checks for filesystem corruption.
format
Reformats file system.

⚠️ **Caution:** This keyword erases all data on the device.

Formatting /flash will remove all boot configurations and the ASR 5x00 chassis-ID. Before running format, be sure to review or save the output of the **show boot** command. After running **format**, be sure to restore boot entries as needed, generate a new chassis-ID, and execute **save configuration** to save the running configuration.

repair
Repairs file system corruption.

synchronize
See the description of the **filesystem synchronize** command for detailed information. **Not supported on VPC-SI.**

update
Updates the boot code on the file system. **Supported on VPC-SI only.**

**Usage**
Check, format, or repair all directories and files from on an internal or external storage device and re-establish the file system.

**Example**
The following command formats the PCMCIA card located in slot 1 on the SMC (ASR 5000):

```
filesystem format /pcmcia1
```
filesystem synchronize

Use this command to synchronize the file systems of active and standby storage devices on management cards or VPC-DI Control Function (CF) virtual machines.

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

For the ASR 5000:

`filesystem synchronize [ /flash | /pcmcia1 | all ] [ checkonly ] [ from card_num | to card_num ] [-noconfirm]`

For the ASR 5500:

`filesystem synchronize [ /flash | /usb1 | all ] [ checkonly ] [ from card_num | to card_num ] [-noconfirm]`

For VPC:

`filesystem synchronize [ /flash | /usb1 | /usb2 | cdrom1 | all ] [ checkonly ] [ from card_num | to card_num ] [-noconfirm]`

The following devices are supported based on platform type:

- `flash` – ASR 5x00, VPC
- `hd-raid` – ASR 5x00, VPC
- `pcmcia1` – ASR 5000 only
- `usb1` – ASR 5500, VPC (if configured via hypervisor)
- `usb2` – VPC (if configured via hypervisor)
- `cdrom1` – VPC (if configured via hypervisor)
- `all` – Selects all file systems

`checkonly`
Checks for file system corruption; does not modify file systems.

`[ from card_num | to card_num ]`
Copies files from a source card to a destination card specified by slot numbers.
Exec Mode Commands (D-S)

-filesystem synchronize

Executes the command without displaying “are you sure” prompts.

Usage

Synchronize the file systems between active and standby storage devices.

Example

The following command all file systems on system management cards:

```
filesystem synchronize all
```

The following command sequence appears when `filesystem synchronize /flash` is run after `save configuration /flash/filename-redundant` is executed and a change has been made to the configuration:

```
filesystem synchronize /flash
  2 to be updated on card 2
    /flash/oam.cfg
    /flash/service.cfg
  0 to be updated (but are newer) on card 2
  0 to be deleted on card 2

Are you sure? [Yes|No]:
```

You must confirm the synchronization before it will be initiated.
If “No files to update” appears, you are returned to the CLI prompt.
gtpc test echo

Tests the ability of a GGSN service to exchange GTP-C echo request messages with the specified SGSN(s).

Product
GGSN

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

gtpc test echo src-address gn_address { all | sgsn-address ip_address }

src-address gn_address
Specifies the IP address of a Gn interface configured on the system in IPv4 dotted-decimal notation.

**Important:** The IP address of the system’s Gn interface must be bound to a configured GGSN service prior to executing this command.

all
Specifies that GTP-C echo requests will be sent to all SGSNs that currently have sessions with the GGSN service.

sgsn-address ip_address
Specifies that GTP-C echo requests will be sent to a SGSN specified by an IP address in IPv4 dotted-decimal notation.

Usage
This command tests the GGSN’s ability to exchange GPRS Tunneling Protocol control plane (GTP-C) packets with the specified SGSNs. This command is useful for troubleshooting and/or monitoring. This command must be executed from within the context in which the GGSN service is configured.

Refer also to the gtpu test command.

**Important:** In StarOS v14.0 and later, this command has been replaced by the egtpc test echo command.

Example

The following command issues GTP-C echo packets from a GGSN service bound to address 192.168.157.32 to an SGSN with an address of 192.168.157.2:

gtpc test echo src-address 192.168.157.32 sgsn-address 192.168.157.2
gtpp interim now

Check points current GTPP accounting messages and identifies which types of interim CDRs are to be generated and sent to the external charging/storage servers (for example, a CFG or a GSS). The impact of this command is immediate.

Product
- GGSN
- SGSN

Privilege
- Security Administrator, Administrator, Operator

Mode
- Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
gtpp interim now [ active-charging egcdr | apn apn_name | callid call_id | cdr-types { gcdr | mcdr | scdr } | dhcp-server ip_address | gprs-service svc_name | ggsn-address gsn_ip_addr | ggsn-service svc_name | imsi imsi [ ip-address sub_address [ username name ] ] | ip-address sub-address | nsapi nsapi [ ip-address sub-address [ username name ] ] | ip-pool pool_name | mcc mcc_number mnc mnc_number | msisdn msisdn_num | sgsn-address ip_address | sgsn-service svc_name | username name ] +
```

active-charging
This feature is specific to the GGSN and is documented separately.

apn apn_name
Initiates GTPP interim accounting for all PDP contexts accessing the APN specified as an alphanumeric string of 1 through 62 characters that is case sensitive.

callid call_id
Identifies a specific call id as an 8-digit hexadecimal number.

cdr-types { mcdr | scdr }
Specifies the CDR types to be generated by the SGSN:
- gcdr - Instructs the GGSN to only generate G-CDRs.
- mcdr - Instructs the SGSN to only generate M-CDRs
- scdr - Instructs the SGSN to only generate S-CDRs.

This keyword is specific to the SGSN.

dhcp-server ip_address
Identifies the DHCP server where the IP address (defined with the ip address keyword) was allocated by the IP address of the DHCP server entered using IPv4 dotted-decimal notation.
### Exec Mode Commands (D-S)

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>gtpp interim now</strong></td>
<td>Initiates GTPP interim accounting for all PDP contexts currently being facilitated by the GGSN service or an existing GPRS service.</td>
</tr>
</tbody>
</table>

#### ggsn-address ggsn_ip_addr
Specifies the IP address of the interface to the GGSN using IPv4 dotted-decimal notation. This keyword is specific to the GGSN.

#### ggsn-service svc_name
Initiates GTPP interim accounting for all PDP contexts currently being facilitated by the GGSN service specified as an alphanumeric string of 1 through 63 characters that is case sensitive. This keyword is specific to the GGSN.

#### gprs-service svc_name
Initiates GTPP interim accounting for all PDP contexts currently being facilitated by an existing GPRS service specified as an alphanumeric string of 1 through 63 characters that is case sensitive. This keyword is specific to the SGSN.

#### imsi [ ip-address sub_address [ username name ] | nsapi nsapi [ ip-address sub-address [ username name ] | username name ] ]
Initiates GTPP interim accounting for a specific International Mobile Subscriber Identity (IMSI) number. The request could be further filtered using any of the following keywords:
- **ip-address**: Interim accounting will be performed for the IP address specified by `sub_address`. The command can be further filtered by specifying a specific username with that address.
- **nsapi**: Interim accounting will be performed for a Network Service Access Point Identifier (NSAPI) specified as an integer from 5 to 15. The command can be further filtered by specifying a specific IP address and/or a username with that address, or just a specific username.

#### ip-address sub_address [ username name ]
Initiates GTPP interim accounting for the IP address of the subscriber specified in IPv4 dotted-decimal notation. The command can be further filtered by specifying a username with that address. The name is the subscriber’s name and can be a sequence of characters and/or wildcard characters ('$' and '*') from 1 to 127 characters. The '*' wildcard matches multiple characters and the '$' wildcard matches a single character. If you do not want the wildcard characters interpreted as wildcard enclose them in single quotes (' '). For example; `*'$'`.

#### ip-pool pool_name
Initiates GTPP interim accounting for all PDP contexts that were allocated IP addresses from an existing pool specified as an alphanumeric string of 1 through 31 characters that is case sensitive. This keyword is applicable to the GGSN only.

#### mcc mcc_number mnc mnc_number
- **mcc_number**: Specifies the mobile country code (MCC) portion of the PLMN identifier and can be configured to any 3-digit integer value between 100 and 999.
- **mnc_number**: Specifies the mobile network code (MNC) portion of the PLMN identifier and can be configured to any 2- or 3-digit integer between 00 and 999.

#### msisdn msisdn_num
Configures the SGSN to include the Mobile Subscribers Integrated Services Digital Network identifier in generated CDRs (M-CDRs and/or the S-CDRs). This keyword is applicable for SGSN only.
msisdn_number must be followed by a valid MSISDN number, consisting of 1 to 15 digits.

sgsn-address ip_address
Initiates GTPP interim accounting for all PDP contexts currently being facilitated by the SGSN specified by an IP address in IPv4 dotted-decimal notation. This keyword is specific to the GGSN.

sgsn-service svc_name
Initiates GTPP interim accounting for all PDP contexts currently being facilitated by an existing SGSN service specified an alphanumeric string of 1 through 63 characters that is case sensitive. This keyword is specific to the SGSN.

username name
Initiates GTPP interim accounting for all PDP contexts for the subscriber name specified as an alphanumeric string of 1 through 127 characters that is case sensitive.

+ 
More than one of the above keywords can be entered within a single command.

Usage
This command causes GTPP accounting CDRs to immediately be generated for all active sessions that are in the current context. If executed within the local context, CDRs will be generated for all active sessions regardless of context. This command generates only certain types of CDRs including GCDRs, SGWCDRs, and SCDRs.
The sending of the CDRs is paced so as not to overload the accounting server.

Example
The following command causes CDRs to immediately be generated:

    gtpp interim now
**gtpp interim now active-charging egcdr**

Check points current GTPP accounting messages for active charging immediately.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
gtpp interim now active-charging egcdr [ callid call_id | imsi imsi | msid msid | rulebase rbase_name | session-id sess_id | username name ]
```

**callid call_id**

Initiates GTPP interim accounting for a session for the call ID specified as an 8-digit hexadecimal number.

**imsi imsi**

Initiates GTPP interim accounting for a International Mobile Subscriber Identity (IMSI) number, specified as a sequence of hexadecimal digits and wildcard characters - $ matches a single character and * matches multiple characters

**msid msid**

Initiates GTPP interim accounting for a Mobile Station Identifier (MSID) number specified as a sequence of up to 24 digits and wildcard characters - $ matches a single character and * matches multiple characters

**rulebase rbase_name**

Initiates GTPP interim accounting for sessions that use the named active charging rulebase specified as an alphanumeric string of 1 through 24 characters.

**session-id sess_id**

Initiates GTPP interim accounting for a current active charging session.

**username name**

Initiates GTPP interim accounting for all PDP contexts for the subscriber name specified as an alphanumeric string of 1 through 127 characters that is case sensitive.

**Usage**

This command causes GTPP accounting eG-CDRs to immediately be generated for active charging sessions that meet the specified criteria.
The sending of the CDRs is paced so as not to overload the accounting server.

```
username name
```

Initiates GTPP interim accounting for all PDP contexts for the subscriber name specified as an alphanumeric string of 1 through 127 characters that is case sensitive.
Example

The following command causes eG-CDRs to immediately be generated for active charging sessions using the rulebase named rulebase1:

```
gtpp interim now active-charging egcdr rulebase rulebase1
```
gtpp storage-server commit

Causes the GTPP storage server to archive all buffered packets.

Product
GGSN
P-GW
SAEGW

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
gtpp storage-server commit now [ group name group_name ]
```

`group name group_name`
Commits Storage Server for an existing group name expressed as an alphanumeric string of 1 through 63 characters.

Usage
This command sends a request to the GTPP Storage Server to archive all buffered packets. It also deletes all CDRs that have been acknowledged by the charging gateway function (CGF). The deleted CDRs are saved in a separate file.
Note that this command must be executed from within the context in which the GTPP Storage Server is configured.
Refer to the `gtpp storage-server` command in the `Context Configuration Mode Commands` chapter for more information.
gtpp storage-server streaming start

This command enables to start streaming of the copied CDR files from active chassis when the ICSR switchover occurs.

**Important:** This command is obsolete in release 16.0. In 16.0 and later releases, use the “gtpp push-to-active url” CLI command in global configuration mode to enable the automatic transfer of stranded CDRs to active chassis.

**Product**
- GGSN
- P-GW
- S-GW
- SGSN

**Privilege**
- Security Administrator, Administrator, Operator

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
gtpp storage-server streaming start [ group name group_name ]
```

**group name group_name**

Specifies the name of a GTPP group configured in the current context as an alphanumeric string of 1 through 63 characters.

Note that, if the group name is not specified, then all the GTPP groups in the current context will be considered. If the group name is specified, then only the group provided in this CLI command will be considered.

**Usage**

This command is used to resynchronize the CDRs left on local HDD with the active GTPP' streaming feed to transfer the CDRs from active chassis to IT mediation device during ICSR switchover.

Note that this CLI command must be executed from within the context in which the GTPP Storage Server is configured.

In the event of ICSR switchover, to transfer the copied CDRs from active chassis to IT mediation device, follows these steps:

1. Manually copy files from old active chassis to new active chassis.
2. Issue this CLI command “gtpp storage-server streaming start” to start streaming of the copied files from active chassis.
3. If the streaming is in progress, then wait till the current file is fully streamed out. After the current file is fully streamed out, then rebuild the file list (to get the copied CDR files) and start streaming based on the timestamp.
4. If the streaming is not in progress then rebuild the file list (to get the copied CDR files) and start streaming.
gtpp test

Tests communication with configured charging gateway function (CGF) servers or a GTPP Storage-Server.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
- Operator, Config-Administrator, Administrator

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
gtpp test { accounting { all | cgf-server cgf_address | group name group_name } | storage-server [ address ip-addr port udp-port | group name group_name ] }
```

- **all**
  Tests all CGFs configured within the given context.

- **cgf-server cgf_address**
  Tests a CGF configured within the given context and specified by the IP address of the CGF entered using IPv4 dotted-decimal notation.

- **group name group_name**
  Tests the storage server for an existing group name specified as an alphanumeric string of 1 through 63 characters.

- **storage-server [ address ip-address port udp-port]**
  Tests the connectivity and provides round trip time for the echo request sent to the GTPP Storage-Server configured in the requested context. The IP address of the GSS is entered using IPv4 dotted-decimal notation and the UPD port is the one defined for the GTPP Storage Server.

**Usage**

This command is used to verify the configuration of and test the system’s ability to communicate with one or all configured GSS/CGFs for monitoring or troubleshooting purposes. When executed, this command causes the system to send GTPP echo packets to the specified GSS/CGF(s). The command’s response will display whether the GSS/CGF is active or unreachable.

**Example**

The following command tests communication with a CGF having an IP address of 192.168.1.5:
gtpp test accounting config-server 192.168.1.5

The following command tests communication with a GSS configured in requested context

gtpp test storage-server

The following command verify communication with a GSS, having IP address 192.156.12.10 and port 50000, without configuring it in a context

  gtpp test storage-server address 192.156.12.10 port 50000
**gtpu test echo**

Tests the ability of a GGSN/P-GW/SAEGW/SGSN/S-GW service to exchange GTP-U echo request messages with specified peer(s).

**Product**
- GGSN
- P-GW
- SAEGW
- SGSN
- S-GW

**Privilege**
Operator, Config-Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

StarOS v12.x and earlier:

```
gtpu test echo src-address gn_address { all | sgsn-address ip_address }
```

StarOS v14.0 and later:

```
gtpu test echo gtpu-service service_name { all | peer-address ip_address } [ gtpu-version { 0 | 1 } ]
```

```
src-address gn_address
```

Specifies the IP address of a Gn interface configured on the system using IPv4 dotted-decimal notation.

**Important:** The IP address of the system’s Gn interface must be bound to a configured GGSN service prior to executing this command.

- **all**
  Sends GTP-U echo requests to all SGSNs that currently have sessions with the GGSN service.

- **sgsn-address ip_address**
  Sends GTP-U echo requests to an SGSN specified by its IP address in IPv4 dotted-decimal notation.

- **gtpu-service service_name**
  Specifies an existing GTP-U service.  
  service_name is an alphanumeric string of 1 through 63 characters.
**gtpu test echo**

all

Sends GTP-U echo requests to first 100 peers that currently have sessions with the GTP-U service.

---

**Important:** If this keyword is selected, additional confirmation is required after the following message, “Warning: Due to possibility of huge number of connected peers, considering system performance impacts, issue echo request to only 100 peers”.

peer-address ip_address

Specifies that GTP-U echo requests will be sent to a specific peer. ip_address must be entered using IPv4 dotted-decimal notation or IPV6 colon-separated-hexadecimal notation.

gtpu-version { 0 | 1 }

Optional. Specifies the GTP-U version in which the test echo will be sent. 0 Specifies GTP-U version 0, and 1 specifies GTP-U version 1.

- If the GTP-U version of the peer is unknown, the GGSN/P-GW/SAEGW/SGSN/S-GW will use the user-configured GTP-U version.
- If the GTPU version of peer node is already known, the test echo is sent in the known GTP-U version.
- If the GTP-U version is not configured, and the peer version is unknown, the test echo is sent in GTP-U version 0.

---

**Usage**

This command tests the GGSN/P-GW/SAEGW/SGSN/S-GW’s ability to exchange GPRS Tunneling Protocol user plane (GTP-U) packets with the specified SGSNs/peer(s). This command is useful for troubleshooting and/or monitoring. Refer also to the gtpc test command.

**Example**

The following command issues GTP-U echo packets from a GGSN service bound to address 192.168.157.43 to an SGSN with an address of 192.168.1.52:

```
gtpu test echo src-address 192.168.157.43 sgsn-address 192.168.1.52
```

The following command issues GTP-U echo packets from a GTP-U service named gtpu_1 to the first 100 connected peers:

```
gtpu test echo gtpu-service gtpu_1 all
```
**gtpv0 test echo**

Tests the ability of a GGSN service to exchange GTPv0 echo request messages with the specified SGSN(s).

**Product**
GGSN

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
gtpv0 test echo src-address gn_address { all | sgsn-address ip_address }
```

<table>
<thead>
<tr>
<th>src-address</th>
<th>gn_address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the IP address of a Gn interface configured on the system using IPv4 dotted-decimal notation.</td>
<td></td>
</tr>
</tbody>
</table>

**Important:** The IP address of the system’s Gn interface must be bound to a configured GGSN service prior to executing this command.

<table>
<thead>
<tr>
<th>all</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sends GTPv0 echo requests to all SGSNs that currently have sessions with the GGSN service.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>sgsn-address</th>
<th>ip_address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sends GTPv0 echo requests to an SGSN specified by its IP address in IPv4 dotted-decimal notation.</td>
<td></td>
</tr>
</tbody>
</table>

**Usage**

This command tests the GGSN’s ability to exchange GPRS Tunneling Protocol version 0 (GTPv0) packets with the specified SGSNs which can be useful troubleshooting and/or monitoring. This command must be executed from within the context in which the GGSN service is configured. Refer also to the **gtpc test** and **gtpu test** commands.

**Important:** In StarOS v14.0 and later, this command has been replaced by the **egtpc test echo** command.

**Example**

The following command issues GTPv0 echo packets from a GGSN service bound to address **192.168.1.33** to an SGSN with an address of **192.168.1.42**:

```
gtpv0 test echo src-address 192.168.1.33 sgsn-address 192.168.1.42
```
**hd raid**

Performs RAID management operations on the platform’s hard disk drives.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#  
```

**Syntax**

For the ASR 5000:

```
hd raid { check | create | insert | overwrite | quarantine { directory pathname | limit number_files | mtime minutes } | remove } local1 | remotel } [ -force ] [ -noconfirm ]
```

For the ASR 5500:

```
hd raid { check | create | insert | overwrite | quarantine { directory pathname | limit number_files | mtime minutes } | remove } hd_num [ -force ] [ -noconfirm ]
```

For VPC:

```
hd raid { check | create | insert | overwrite | quarantine { directory pathname | limit number_files | mtime minutes } | remove } { local1 | local2 } [ -force ] [ -noconfirm ]
```

---

**check**

Starts a background check on RAID disks unless the RAID is running in degraded mode.

---

**create local1 | remotel**

On the ASR 5000, creates a new RAID that could run in degraded mode on the specified drive:

- `local1` specifies the RAID is to be established on the primary SMC.
- `remotel` specifies the RAID is to be established on the backup SMC.

---

**create hd_num**

On the ASR 5500, creates a new RAID that could run in degraded mode on the hard drive array of a specific FSC.

- `hd_num` specifies the RAID is to be established on the FSC in slot numbers 13 through 18 (hd13, hd14, ..., hd18).

---

**create { | local1 | local2 }**

On VPC, creates a new virtual RAID as vHD Local1 or vHD Local2.
**insert local1 | remotel**

On the ASR 5000, inserts the specified disk to the running RAID causing it to recover from degraded mode.  
*local1*: specifies the primary SMC is to be inserted into the RAID.  *remotel*: specifies the backup SMC is to be inserted into the RAID.

**insert hd_num**

On the ASR 5500, inserts the specified FSC disk array into the running RAID causing it to recover from degraded mode.  
*hd_num*: specifies the RAID is to be established on the FSC in slot numbers 13 through 18 (hd13, hd14, ... hd18).

**insert { | local1 | local2 }**

On VPC, inserts the specified vHD into the running RAID causing it to recover from degraded mode.

**overwrite local1 | remotel**

On the ASR 5000, overwrites the specified disk and adds it to the current running RAID to construct a fully mirrored array.  
*local1*: specifies the primary SMC is to be added to the current RAID.  *remotel*: specifies the backup SMC is to be added to the current RAID.

**overwrite hd_num**

On the ASR 5500, overwrites the specified FSC disk array and adds it to the current running RAID to construct a fully mirrored array.  
*hd_num*: specifies the RAID is to be established on the FSC in slot numbers 13 through 18 (hd13, hd14, ... hd18).

**overwrite { local1 | local2 }**

On VPC, overwrites the specified vHD and adds it to the current running RAID to construct a fully mirrored array.

**quarantine [ directory pathname | limit number_files | mtime minutes**

Recovers and quarantines dirty-degraded RAID files.  
*directory*: specifies the pathname where files are to be quarantined.  *pathname*: is expressed as an alphanumeric string of 1 through 29 characters.  
*limit*: sets the maximum number of files to quarantine.  *number_files*: is an integer from 0 to 1000000.  
*mtime*: specifies the number of minutes ago during which modified files will be quarantined.  *minutes*: is an integer from 0 through 1440.

**remove local1 | remotel**

On the ASR 5000, removes the specified disk from the running RAID causing it to run in degraded mode or to fail.  
*local1*: specifies the primary SMC is to be removed from the RAID.  *remotel*: specifies the backup SMC is to be removed from the RAID.

**remove hd_num**

On the ASR 5500, removes the specified FSC disk array from the running RAID causing it to run in degraded mode or to fail.
`hd_num` specifies the RAID is to be established on the FSC in slot numbers 13 through 18 (hd13, hd14, ... hd18).

```
remove { | local1 | local2 }
```

On the VPC, removes the specified vHD from the running RAID causing it to run in degraded mode or to fail.

```
-noconfirm
```

Executes the command without displaying “are you sure” prompts.

```
-force
```

Executes the command and overrides warnings.

**Usage**

All commands need confirmation unless the `-noconfirm` is included in the command. If the result will bring down a running RAID, you have to force the command using `-force`.

RAID commands are needed to intervene in the following situations:

- the hard disk controller task can not determine the correct operation,
- administrator action is required by policy
- the administrator wants to wipe out an unused disk.

In an automated system, the policies created with this CLI address the possibility of a manually partitioned disk, a disk resulting from a different version of software, a partially constructed disk, or the case of two unrelated disks in the system.

To reduce administrator intervention, a set of policies can be configured to set the default action using the commands in the HD RAID configuration mode. These commands are described in the *HD Storage Policy Configuration Mode Commands* chapter of this guide.

**Example**

The following instructs the system to setup a RAID on the primary ASR 5000 SMC hard drive.

```
    hd raid create local1 -force
```
**host**

Used to resolve the IP address or logical host name information via a DNS query.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
host { host_name | host_ip_address }
```

* host_name | host_ip_address

Specifies the host for which IP information is to be displayed.

* host_name: Specifies the logical host name for which the IP address is to be displayed (via DNS lookup).
  
  This is an alphanumeric string of 1 through 127 characters.

* host_ip_address: Specifies the IP address for which the associated logical host name(s) are to be displayed (via reverse DNS lookup) using IPv4 dotted-decimal notation.

**Usage**

Verify DNS information which affects connections and packet routing.

**Example**

The following commands will resolve the host information for remoteABC and 10.2.3.4 respectively.

```
host remoteABC
host 10.2.3.4
```
install plugin

Unpacks the contents of a patch kit for a specific plugin module. This function is associated with the patch process for accommodating dynamic software upgrades.

**Product**
ADC

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
install plugin plugin_name patch_file_name
```

**plugin_name**
Specifies the name of a plugin that has been already copied onto the system as an alphanumeric string of 1 through 16 characters.

**patch_file_name**
Specifies the file name of the patch (.tgz extension) that was copied onto the system. Ensure that the full file path is copied.

**Usage**
Unpacks the contents of a patch kit intended for a specific plugin module. After unpacking the patch you must configure the plugin using the `plugin` command in the Global Configuration mode.

For additional information, refer to the *Plugin Configuration Mode Commands* chapter.

**Example**
To unpack the plugin module named `p2p` with the patch file name `libp2p-1.2.0.tgz` onto the system enter the following command:

```
install plugin p2p libp2p-1.2.0.tgz
```
interface

Configures the system to generate gratuitous ARP (G-ARP) requests in case of a failure during an inter-node online upgrade. If the chassis is not active, an error message displays.

Product
All

Privilege
Security Administrator, Administrator, Operator, or Inspector with li-administrator permissions

Mode
Exec
The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

interface name send gratuitous-arp ip-address

Usage
This command generates a G-ARP for the IP address specified and sends it over the interface.

Example
The following generate a G-ARP for IP address 192.168.100.10.

interface interface_1 send gratuitous-arp 192.168.100.10
lawful-intercept

Refer to the *Lawful Intercept Configuration Guide* for a description of this command.
lawful-intercept packet-cable

Refer to the *Lawful Intercept Configuration Guide* for a description of this command.
lawful-intercept ssdf

Refer to the Lawful Intercept Guide for a description of this command.
link-aggregation port switch to

When a link aggregation group (LAG) contains two sets of ports with each connecting to a different Ethernet switch, this command allows you to change the status of the active distributing ports. (ASR 5x00 only)

Default: none.

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

link-aggregation port switch to slot# / port#

slot#
Identifies the physical chassis slot where the line card or MIO card is installed.

port#
Identifies the physical port on the line card or MIO card to automatically switch to.

Usage
This command is subject to the following restrictions:

• slot#/port# must support LAG.
• slot#/port# must be configured with LAG.
• slot#/port# must not be actively distributing.
• slot#/port# must have negotiated a partner while in standard mode.
• slot#/port#’s partner must have a priority equal to or greater than itself.
• slot#/port#’s partner bundle must have bandwidth in standard mode equal to or greater than itself.
• Switching to slot#/port# must not violate preference within hold-time in standard mode.

Example

link-aggregation port switch to 17/2

link-aggregation port switch to 5/12
logging active

Enables or disables logging for active internal log files.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
logging active [ copy runtime filters ] [ event-verbosity event_level ] [ pdu-data format ] [ pdu-verbosity pdu_level ]
```

```
no logging active
```

**no**

Indicates the internal logging is to be disabled.

**copy runtime filters**

Copies the runtime filters and uses that copy to filter the current logging session.

**event-verbosity event_level**

Specifies the level of verboseness to use in logging of events as one of:

- **min**: Displays minimal information about the event. Information includes event name, facility, event ID, severity level, date, and time.
- **concise**: Displays detailed information about the event, but does not provide the event source within the system.
- **full**: Displays detailed information about event, including source information, identifying where within the system the event was generated.

**pdu-data format**

Specifies output format for packet data units when logged as one of:

- **none**: raw format (unformatted).
- **hex**: hexadecimal format.
- **hex-ascii**: hexadecimal and ASCII similar to a main-frame dump.

**pdu-verbosity pdu_level**

Specifies the level of verboseness to use in logging of packet data units as an integer from 1 through 5, where 5 is the most detailed.
**Usage**

Adjust the active logging levels when excessive log file sizes are being generated or, conversely, not enough information is being sent to the active log files for adequate troubleshooting support. The `no` keyword is used to disable internal logging.

**Important:** A maximum of 50,000 events may be stored in each log. Enabling more events for logging may cause the log to be filled in a much shorter time period. This may reduce the effectiveness of the log data as a shorter time period of event data may make troubleshooting more difficult.

**Important:** Once a log has reached the 50,000 event limit the oldest events will be discarded as new log entries are created.

**Example**

The following sets the active logging for events to the maximum.

```
logging active event-verbosity full
```

The following command sets the active logging for packet data units to level 3 and sets the output format to the main-frame style `hex-ascii`.

```
logging active pdu-data hex-ascii pdu-verbosity 3
```

The following disables internal logging.

```
no logging active
```
logging filter

Sets the logging filtering options for all or individual facilities.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
logging filter active facility facility level severity_level [ critical-info | no-critical-info ]
```

- **active**
  Indicates only active processes are to have logging options set.

**facility facility**

Specifies the facility to modify the filtering of logged information. Valid facilities for this command are:
- **a10**: A10 interface facility
- **a11**: A11 interface facility
- **a11mgr**: A11 Manager facility
- **aaa-client**: Authentication, Authorization and Accounting (AAA) client facility
- **aaamgr**: AAA manager logging facility
- **aaaprox**: AAA Proxy facility
- **aal2**: ATM Adaptation Layer 2 (AAL2) protocol logging facility
- **acl-log**: Access Control List (ACL) logging facility
- **acsctrl**: Active Charging Service (ACS) Controller facility
- **acsmgr**: ACS Manager facility
- **afctrl**: Fabric Controller facility [ASR 5500 only]
- **afmgr**: Fabric Manager logging facility [ASR 5500 only]
- **alarmctrl**: Alarm Controller facility
- **alcap**: Access Link Control Application Part (ALCAP) protocol logging facility
- **alcapmgr**: ALCAP manager logging facility
- **all**: All facilities
- **asngwmggr**: Access Service Network (ASN) Gateway Manager facility
- **asnpeclmgr**: ASN Paging Controller Manager facility
• **bfd**: Bidirectional Forwarding Detection (BFD) protocol logging facility
• **bgp**: Border Gateway Protocol (BGP) facility
• **bindmux**: IPCF BindMux-Demux Manager logging facility
• **bngmgr**: Broadband Network Gateway (BNG) Demux Manager logging facility
• **bssap**: Base Station Sub-system Application Part protocol facility for the login interface between the SGSN and the MSC/VLR (2.5G and 3G)
• **bssgp**: Base Station Sub-system GPRS Protocol logging facility handles exchange information between the SGSN and the BSS (2.5G only)
• **callhome**: Call Home application logging facility
• **cap**: CAMEL Application Part (CAP) logging facility for protocol used in prepaid applications (2.5G and 3G)
• **cbmgr**: Cell Broadcasting Service (CBS) logging facility [HNBGW]
• **cdigr**: Charging Data Function (CDF) logging facility
• **cgw**: Converged Access Gateway (CGW) logging facility
• **cli**: Command Line Interface (CLI) logging facility
• **cmp**: Certificate Management Protocol (IPSec) logging facility
• **connectedapps**: SecGW ASR 9000 oneP communication protocol
• **conproxy**: Controller Proxy logging facility
• **credit-control**: Credit Control (CC) facility
• **cscf**: IMS/MMD Call Session Control Function (CSCF)
• **cscfpmgr**: CSCFCPMGR logging facility
• **cscfnmgr**: SIP CSCF Manager facility
• **cscfnpdb**: CSCF Number Portability Database (NPDB) logging facility
• **cscfrtcp**: IMS/MMD CSCF RTCP log facility
• **cscfrtp**: IMS/MMD CSCF RTP log facility
• **cscfttmgr**: SIP CSCF Tunnel and Transport Manager facility
• **csp**: Card/Slot/Port controller facility
• **css**: Content Service Selection (CSS) facility
• **css-sig**: CSS RADIUS Signaling facility
• **cx-diameter**: Cx Diameter Messages facility [CSCF <--> HSS]
• **data-mgr**: Data Manager Framework logging facility
• **dcardctrl**: IPSec Daughter Card Controller logging facility
• **dcardmgr**: IPSec Daughter Card Manager logging facility
• **demuxmgr**: Demux Manager API facility
• **dgmbmgr**: Diameter Gmb Application Manager logging facility
• **dhcp**: Dynamic Host Configuration Protocol (DHCP) logging facility
• **dhcpp6**: DHCPv6
• **dhost**: Distributed Host logging facility
• diabase: Diabase messages facility
• diameter: Diameter endpoint logging facility
• diameter-act: Diameter Accounting
• diameter-auth: Diameter Authentication
• diameter-dns: Diameter DNS subsystem
• diameter-ecs: ACS Diameter signaling facility
• diameter-hdd: Diameter Horizontal Directional Drilling (HDD) Interface facility
• diameter-svc: Diameter Service
• diamproxy: DiamProxy logging facility
• dpath: IPSec Data Path facility
• drvctrl: Driver Controller facility
• dpath: IPSec Data Path logging facility
• drvctrl: Driver Controller logging facility
• doulosuemgr: Doulos (IMS-IPSec-Tool) user equipment manager
• eap-diameter: Extensible Authentication Protocol (EAP) IPSec facility
• eap-ipsec: Extensible Authentication Protocol (EAP) IPSec facility
• eap-sta-s6a-s13-s6b-diameter: EAP/STA/S6A/S13/S6B Diameter messages facility
• ecs-css: ACSMGR <-> Session Manager Signalling Interface facility
• egtpc: eGTP-C logging facility
• egtpmgr: enhanced GPRS Tunneling Protocol (eGTP) manager logging facility
• egtpu: eGTP-U logging facility
• embms: evolved Multimedia Broadcast Multicast Services Gateway facility
• embms: eMBMS Gateway Demux facility
• epdg: evolved Packet Data (ePDG) gateway logging facility
• event-notif: Event Notification Interface logging facility
• evlog: Event log facility
• famgr: Foreign Agent manager logging facility
• firewall: Firewall logging facility
• fng: Femto Network Gateway (FNG) logging facility
• gbmgr: SGSN Gb Interface Manager facility
• gmm:
  • For 2.5G: Logs the GPRS Mobility Management (GMM) layer (above LLC layer)
  • For 3G: Logs the access application layer (above the RANAP layer)
• gprs-app: GPRS Application logging facility
• gprs-ns: GPRS Network Service Protocol (layer between SGSN and the BSS) logging facility
• gq-rx-tx-diameter: Gq/Rx/Tx Diameter messages facility
• gss-gcdr: GTPP Storage Server GCDR facility
• **gtpc**: GTP-C protocol logging facility
• **gtpcmgr**: GTP-C protocol manager logging facility
• **gtp**: GTP-prime protocol logging facility
• **gtpu**: GTP-U protocol logging facility
• **gtpumgr**: GTP-U Demux manager
• **gx-ty-diameter**: Gx/Ty Diameter messages facility
• **gy-diameter**: Gy Diameter messages facility
• **h248pdr**: H.248 port manager facility
• **hamgr**: Home Agent manager logging facility
• **hat**: High Availability Task (HAT) process facility
• **hdctrl**: HD Controller logging facility
• **henbapp**: Home Evolved NodeB (HENB) App facility
• **henbgw**: HENB-GW facility
• **henbgw-pws**: HENB-GW Public Warning System logging facility
• **henbgw-sctp-acs**: HENB-GW access Stream Control Transmission Protocol (SCTP) facility
• **henbgw-sctp-nw**: HENBGW network SCTP facility
• **henbgwdemux**: HENB-GW Demux facility
• **henbgwmg**: HENB-GW Manager facility
• **hnb-gw**: HNB-GW (3G Femto GW) logging facility
• **hnbmg**: HNB-GW Demux Manager logging facility
• **hss-peer-service**: Home Subscriber Server (HSS) Peer Service facility
• **igmp**: Internet Group Management Protocol (IGMP)
• **ikev2**: Internet Key Exchange version 2 (IKEv2)
• **ims-authoriztn**: IP Multimedia Subsystem (IMS) Authorization Service facility
• **ims-sh**: HSS Diameter Sh Interface Service facility
• **imsimgr**: SGSN IMSI Manager facility
• **imsue**: IMS User Equipment (IMSUE) facility
• **ip-arp**: IP Address Resolution Protocol facility
• **ip-interface**: IP interface facility
• **ip-route**: IP route facility
• **ipms**: Intelligent Packet Monitoring System (IPMS) logging facility
• **ipne**: IP Network Enabler (IPNE) facility
• **ipsec**: IP Security logging facility
• **ipsecdemux**: IPSec demux logging facility
• **ips**: IP Service Gateway interface logging facility
• **ipsmg**: IP Services Gateway facility
• **ipsp**: IP Pool Sharing Protocol logging facility
• **kvstore**: Key/Value Store (KVSTORE) Store facility
• **l2tp-control**: Layer 2 Tunneling Precool (L2TP) control logging facility
• **l2tp-data**: L2TP data logging facility
• **l2tpdemux**: L2TP Demux Manager logging facility
• **l2tpmgr**: L2TP Manager logging facility
• **lagmgr**: Link Aggregation Group (LAG) manager logging facility
• **lcs**: Location Services (LCS) logging facility
• **ldap**: Lightweight Directory Access Protocol (LDAP) messages logging facility
• **li**: Refer to the *Lawful Intercept Interface Reference* for a description of this command.
• **linkmgr**: SGSN/BSS SS7 Link Manager logging facility (2.5G only)
• **llc**: Logical Link Control (LLC) Protocol logging facility; for SGSN: logs the LLC layer between the GMM and the BSSGP layers for logical links between the MS and the SGSN
• **local-policy**: Local Policy Service facility
• **location-service**: Location Services facility
• **m3ua**: M3UA Protocol logging facility
• **magmgr**: Mobile Access Gateway manager logging facility
• **map**: Mobile Application Part (MAP) protocol logging facility
• **megadiammgr**: MegaDiameter Manager (SLF Service) logging facility
• **mme-app**: Mobility Management Entity (MME) Application logging facility
• **mme-misc**: MME miscellaneous logging facility
• **mmedemux**: MME Demux Manager logging facility
• **mmemgr**: MME Manager facility
• **mmgr**: Master Manager logging facility
• **mobile-ip**: Mobile IP processes
• **mobile-ip-data**: Mobile IP data facility
• **mobile-ipv6**: Mobile IPv6 logging facility
• **mpls**: Multiprotocol Label Switching (MPLS) protocol logging facility
• **mrme**: Multi Radio Mobility Entity (MRME) logging facility
• **mseg-app**: Mobile Services Edge Gateway (MSEG) application logging facility (This option is not supported in this release.)
• **mseg-gtpc**: MSEG GTP-C application logging facility (This option is not supported in this release.)
• **mseg-gtpu**: MSEG GTP-U application logging facility (This option is not supported in this release.)
• **msegmgr**: MSEG Demux Manager logging facility (This option is not supported in this release.)
• **mtp2**: Message Transfer Part 2 (MTP2) Service logging facility
• **mtp3**: Message Transfer Part 3 (MTP3) Protocol logging facility
• **multicast-proxy**: Multicast Proxy logging facility
• **nas**: Non-Access Stratum (NAS) protocol logging facility [MME 4G]
• netwstrg: Network Storage facility
• npuctrl: Network Processor Unit Control facility
• npudrv: Network Processor Unit Driver facility [ASR 5500 only]
• npumgr: Network Processor Unit Manager facility
• npumgr-acl: NPUMGR ACL logging facility
• npumgr-driv: NPUMGR DRV logging facility
• npumgr-flow: NPUMGR FLOW logging facility
• npumgr-fwd: NPUMGR FWD logging facility
• npumgr-init: NPUMGR INIT logging facility
• npumgr-lc: NPUMGR LC logging facility
• npumgr-port: NPUMGR PORT logging facility
• npumgr-recovery: NPUMGR RECOVERY logging facility
• npumgr-rii: NPUMGR RRI (Reverse Route Injection) logging facility
• npumgr-vpn: NPUMGR VPN logging facility
• npusim: NPUSIM logging facility [ASR 5500 only]
• ntfy-intf: Notification Interface logging facility [Release 12.0 and earlier versions only]
• ocsp: Online Certificate Status Protocol logging facility.
• orbs: Object Request Broker System logging facility
• ospf: OSPF protocol logging facility
• ospfV3: OSPFv3 protocol logging facility
• p2p: Peer-to-Peer Detection logging facility
• pagingmgr: PAGINGMGR logging facility
• pccmgr: Intelligent Policy Control Function (IPCF) Policy Charging and Control (PCC) Manager library
• pdg: Packet Data Gateway (PDG) logging facility
• pdgdmgdr: PDG Demux Manager logging facility
• pdif: Packet Data Interworking Function (PDIF) logging facility
• pgw: Packet Data Network Gateway (PGW) logging facility
• pmm-app: Packet Mobility Management (PMM) application logging facility
• ppp: Point-To-Point Protocol (PPP) link and packet facilities
• ppoe: PPP over Ethernet logging facility
• push: VPNMGR CDR push logging facility
• radius-acct: RADIUS accounting logging facility
• radius-auth: RADIUS authentication logging facility
• radius-coa: RADIUS change of authorization and radius disconnect
• ranap: Radio Access Network Application Part (RANAP) Protocol facility logging info flow between SGSN and RNS (3G)
• **rct**: Recovery Control Task logging facility
• **rdt**: Redirect Task logging facility
• **resmgr**: Resource Manager logging facility
• **rf-diameter**: Diameter Rf interface messages facility
• **rip**: Routing Information Protocol (RIP) logging facility [RIP is not supported at this time.]
• **rlf**: Rate Limiting Function (RLF) logging facility
• **rohc**: Robust Header Compression (RoHC) facility
• **rsvp**: Reservation Protocol logging facility
• **rua**: RANAP User Adaptation (RUA) [3G Femto GW - RUA messages] logging facility
• **s1ap**: S1 Application Protocol (S1AP) Protocol logging facility
• **sabp**: Service Area Broadcast Protocol (SABP) logging facility
• **saegw**: System Architecture Evolution (SAE) Gateway facility
• **sbc**: SBc protocol logging facility
• **sctp**: Stream Control Transmission Protocol (SCTP) Protocol logging facility
• **sef_ecs**: Severely Errored Frames (SEF) APIs printing facility
• **sess-gr**: SM GR facility
• **sessctrl**: Session Controller logging facility
• **sessmgr**: Session Manager logging facility
• **sesstrc**: session trace logging facility
• **sft**: Switch Fabric Task logging facility
• **sgs**: SGs interface protocol logging facility
• **sgsn-app**: SGSN-APP logging various SGSN “glue” interfaces (for example, between PMM, MAP, GPRS-FSM, SMS).
• **sgsn-failures**: SGSN call failures (attach/activate rejects) logging facility (2.5G)
• **sgsn-gtpe**: SGSN GTP-C Protocol logging control messages between the SGSN and the GGSN
• **sgsn-gtpu**: SGSN GTP-U Protocol logging user data messages between the SGSN and GGSN
• **sgsn-mbms-bearer**: SGSN Multimedia Broadcast/Multicast Service (MBMS) Bearer app (SMGR) logging facility
• **sgsn-misc**: Used by stack manager to log binding and removing between layers
• **sgsn-system**: SGSN System Components logging facility (used infrequently)
• **sgsn-test**: SGSN Tests logging facility; used infrequently
• **sgtpcmgr**: SGSN GTP-C Manager logging information exchange through SGTPC and the GGSN
• **sgw**: Serving Gateway facility
• **sh-diameter**: Sh Diameter messages facility
• **sitmain**: System Initialization Task main logging facility
• **sls**: Service Level Specification (SLS) protocol logging facility
• **sm-app**: SM Protocol logging facility
• **sms**: Short Message Service (SMS) logging messages between the MS and the SMSC
• **sndcp**: Sub Network Dependent Convergence Protocol (SNDCP) logging facility
• **snmp**: SNMP logging facility
• **sprmgr**: IPCF Subscriber Policy Register (SPR) manager logging facility
• **srdb**: Static Rating Database
• **srp**: Service Redundancy Protocol (SRP) logging facility
• **sscfnni**: Service-Specific Coordination Function for Signaling at the Network Node Interface (SSCF-NNI) logging facility
• **sscop**: Service-Specific Connection-Oriented Protocol (SSCOP) logging facility
• **ssh-ipsec**: Secure Shell (SSH) IP Security logging facility
• **ssl**: Secure Socket Layer (SSL) message logging facility
• **stat**: Statistics logging facility
• **supserv**: Supplementary Services logging facility [H.323]
• **system**: System logging facility
• **tacacsplus**: TACACS+ Protocol logging facility
• **tcap**: TCAP Protocol logging facility
• **testctrl**: Test Controller logging facility
• **testmgr**: Test Manager logging facility
• **threshold**: threshold logging facility
• **ttg**: Tunnel Termination Gateway (TTG) logging facility
• **tucl**: TCP/UDP Convergence Layer (TUCL) logging facility
• **udr**: User Data Record (UDR) facility (used with the Charging Service)
• **user-data**: User data logging facility
• **user-l3tunnel**: User Layer 3 tunnel logging facility
• **usertcp-stack**: User TCP Stack
• **vim**: Voice Instant Messaging (VIM) logging facility
• **vinfo**: VINFO logging facility
• **vmgctrl**: Virtual Media Gateway (VMG) controller facility
• **vmgctrl**: VMG Content Manager facility
• **vpn**: Virtual Private Network logging facility
• **wimax-data**: WiMAX DATA
• **wimax-r6**: WiMAX R6
• **wsg**: Wireless Security Gateway (ASR 9000 Security Gateway)
level severity_level

Specifies the level of information to be logged from the following list which is ordered from highest to lowest:

- critical - display critical events
- error - display error events and all events with a higher severity level
- warning - display warning events and all events with a higher severity level
- unusual - display unusual events and all events with a higher severity level
- info - display info events and all events with a higher severity level
- trace - display trace events and all events with a higher severity level
- debug - display all events

important: A maximum of 50,000 events may be stored in each log. Enabling more events for logging may cause the log to be filled in a much shorter time period. This may reduce the effectiveness of the log data as a shorter time period of event data may make troubleshooting more difficult.

Important: Once a log has reached the 50,000 event limit the oldest events will be discarded as new log entries are created.

Caution: Issuing this command could negatively impact system performance depending on the amount of system activity at the time of execution and/or the type of facility(ies) being logged.

Example

The following are selected examples used to illustrate the various options. Not all facilities will be explicitly shown as each follows the same syntax for options.

The following sets the level to log only warning information for all facilities.

logging filter active facility all level warning

The following enables the logging of critical information for the SNMP facility while setting the level to error.

logging filter active facility snmp level error critical-info
logging trace

Enables or disables the logging of trace information for specific calls, mobiles, or network addresses.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
[ no ] logging trace { callid call_id | ipaddr ip_address | msid ms_id | username user_name }
```

- **no**
  Indicates the logging of trace information is to be disabled.

- **callid call_id | ipaddr ip_address | msid ms_id | username user_name**
  - **callid call_id**: Specifies the exact call instance ID which is to have trace data logged as a 4-byte hexadecimal number.
  - **ipaddr ip_address**: Specifies the IP address in IPv4 dotted-decimal notation for which trace information is to be logged.
  - **msid ms_id**: Specifies the mobile subscriber ID for which trace information is to be logged as 7 to 16 digits of an IMSI, MIN, or RMI.
  - **username user_name**: Specifies a previously configured user who is to have trace information logged.

**Usage**

A trace log is useful in troubleshooting subscriber problems as well as for system verification by using a test subscriber. The **no** keyword is used to stop the logging of trace information.

**Important**: A maximum of 50,000 events may be stored in each log. Enabling more events for logging may cause the log to be filled in a much shorter time period. This may reduce the effectiveness of the log data as a shorter time period of event data may make troubleshooting more difficult.

**Important**: Once a log has reached the 50,000 event limit the oldest events will be discarded as new log entries are created.

**Caution**: Issuing this command could negatively impact system performance depending on the number of subscribers connected and the amount of data being passed.
Example

The following commands enables/disables trace information for user user1.

```
logging trace username user1
no logging trace username user1
```

The following commands will enable/disable trace information logging for the user assigned IP address 10.2.3.4.

```
logging trace ipaddr 10.2.3.4
no logging trace ipaddr 10.2.3.4
```

The following enables/disables logging of trace information for call ID fe80AA12.

```
logging trace callid fe80AA12
no logging trace callid fe80AA12
```
exec checkpoint

Performs check pointing operations on log data. Check pointing identifies logged data as previously viewed or marked. Check pointing results in only the log information since the last check point being displayed; check pointed log data is not available for viewing.

Individual logs may have up to 50,000 events in the active log. Check pointing the logs will then result in at most 50,000 events being in the inactive log files. This gives a maximum of 100,000 events in total which are available for each facility logged.

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax
logs checkpoint

Usage
Check point log data to a set the log contents to a well know point prior to special activities taking place. This command may also be a part of periodic regular maintenance to manage log data.

The check pointing of logs moves the current log data to the inactive logs. Only the most recently check pointed data is retained in the inactive logs. A subsequent check pointing of the logs will result in the prior check pointed inactive log data being cleared and replaced with the newly check pointed data.

The check pointing of log data moves the active log data to be retained as the inactive log data. This results in the active log data, if displayed, having no data earlier than the point in time when the check pointing occurred.

Important: Check pointing of logs should be done periodically to avoid the logs becoming full. Logs which have 50,000 events logged will discard the oldest events first when new events are to be logged.

Example

logs checkpoint
**lsp-ping**

Checks Multi Protocol Label Switching (MPLS) label switch path (LSP) connectivity for the specified IPv4 forwarding equivalence class (FEC). It must be followed by an IPv4 FEC prefix.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
lsp-ping ip_prefix_FEC [ count ping_packets ] [ | verbose ] [ | grep grep_options ]
```

<table>
<thead>
<tr>
<th>ip_prefix_FEC</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies an IP prefix FEC with or without subnet mask entered using IPv4 dotted-decimal CIDR notation.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>count ping_packets</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sets the number of ping packets to be sent as an integer from 1 through 16. Default: 4.</td>
</tr>
</tbody>
</table>

**Important:** The timeout interval for the packets is 5 seconds by default.

<table>
<thead>
<tr>
<th>verbose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sets the verbose (detailed) output mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>grep grep_options</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pipes (sends) the output of this command to the <strong>grep</strong> command.</td>
</tr>
</tbody>
</table>

**Usage**

This command is used to verify the MPLS LSP connectivity for the specified FEC.

**Example**

Following are the examples for using this command with all possible options for IPv4 address 13.13.13.1 and mask 32 (CIDR notation):

```
lsp-ping 13.13.13.1/32
lsp-ping 13.13.13.1/32 count 15
lsp-ping 13.13.13.1/32 verbose
```
**lsp-traceroute**

Discovers MPLS LSP routes that packets actually take when traveling to their destinations. It must be followed by an IPv4 or IPv6 FEC prefix.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
lsp-traceroute ip_prefix_FEC [ maxttl time_to_live ] [ | verbose ] [ | grep grep_options ]
```

- `ip_prefix_FEC`
  Specifies the destination IP address in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal with or without mask (CIDR notation).

- `maxttl time_to_live`
  Sets the maximum time to live in hops. TTL is an integer from 1 through 255. Default: 30.

- `verbose`
  Sets the verbose (detailed) output mode.

- `grep grep_options`
  Pipes (sends) the output of this command to the `grep` command.

**Usage**

This command is used or the router to discover the MPLS LSP routes through which the packets will travel to their IPv4 or IPv6 destinations.

**Example**

The following command specifies the destination IP address `13.13.13.13` for which the MPLS routes will be discovered for packets to traverse:

```
lsp-traceroute 13.13.13.13/32
```
mkdir

Creates a new directory in the local file system or in remote locations as specified.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

`mkdir filepath`

`filepath`

Specifies the directory path to create. The path must be formatted as follows:

For the ASR 5000:

```
[ file: ]{ /flash | /pcmcia1 | /hd-raid }[ /directory ]/file_name
```

![Important:](danger)

Use of the ASR 5000 SMC hard drive is not supported in this release.

For the ASR 5500:

```
[ file: ]{ /flash | /usb1 | /hd-raid }[ /directory ]/file_name
```

For VPC:

```
[ file: ]{ /flash | /hd-raid | /usb1 | /usb2 | /cdrom1 }[ /directory ]/file_name
```

![Important:](danger)

The USB ports and CDROM must be configured via the hypervisor to be accessible.

![Important:](danger)

Do not use the following characters when entering a string for the field names below: “/” (forward slash), “:” (colon) or “@” (at sign).

directory is the directory name
filename is the actual file of interest
Usage
Create new directories as part of periodic maintenance activities to better organize stored files.

Example
The following creates the directory `/flash/pub` in the local flash storage.

```
mkdir /flash/pub
```
mme disconnect

Performs a graceful/ungraceful disconnection of an SCTP peer.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
mme disconnect s1-peer peer_ID  [ graceful ] [ -noconfirm ]
```

- **s1-peer peer-ID**
  Specifies the eNodeB peer ID which has to be disconnected. `peer-ID` is an integer from 1 through 4294967295.

- **graceful**
  Specifies that the SCTP connection to the S1 peer will be terminated with a complete handshake. By default (without this keyword), SCTP connections are aborted.

- **-noconfirm**
  Executes the command without any additional prompts or confirmation from the user.

**Usage**

Use this command to disconnect the SCTP connection to the specified peer eNodeB. This command can be used to remove stale eNodeB connections from the MME, even when no active SCTP connection exists.

**Example**

The following gracefully disconnects the SCTP connection with the eNodeB with a peer ID of 22315734:

```
mme disconnect s1-peer 22315734 graceful -noconfirm
```
**mme offload**

Initiates or stops the offload of UEs associated with a specified MME service.

**Product**

MME

**Privilege**

Security Administrator, Administrator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#  
```

**Syntax**

The following command syntax is available in Release 12.2 and earlier.

```
mme offload mme-service mme_svc_name { start mme-init-release-timeout seconds paging-init-timeout seconds | stop }  
```

The following command syntax is available in Release 14.0 and higher.

```
mme offload mme-service mme_svc_name { time-duration minutes offload-percentage percent [ disable-implicit-detach ] | stop } [ -noconfirm ]  
```

**mme-service name**

Specifies the name of an existing MME service from which UEs will be offloaded as an alphanumeric string of 1 through 63 characters.

**start mme-init-release-timeout seconds paging-init-timeout seconds**

These keywords are available in Release 12.2 and earlier.

Sets the timeout for the initial release procedure and the paging procedure.

**start mme-init-release-timeout seconds**: Configures the timeout (in seconds) for triggering the IDLE MODE ENTRY procedure for UEs that are in the ECM_CONNECTED state as an integer from 1 to 120. The cause of the IDLE MODE ENTRY will be “Load balancing TAU required”.

**paging-init-timeout seconds**: Configures the timeout (in seconds) for triggering the PAGING procedure for UEs in the ECM_IDLE state as an integer from 1 to 120. After returning the UEs to the ECM_CONNECTED state, the IDLE MODE ENTRY procedure is triggered with the “Load balancing TAU required” cause.

**time-duration minutes offload-percentage percent**

**time-duration** specifies the maximum allowed time for the UE offload procedure to complete.

**minutes** can be any value 1 through 1000 minutes.

**offload-percentage** specifies the percentage of total subscribers on this mme-service to offload.

**percent** can be any value 0 through 100.
disable-implicit-detach
By default, if the UE context is not transferred to another MME within 5 minutes, the UE will be implicitly detached. This option disables this implicit detach timer.

stop
Ends the offload process.

-noconfirm
Executes the command without any additional prompts or confirmation from the user.

Usage
Use this command to initiate or stop the offloading of UEs associated with a specified MME service. Prior to initiating this command, you can set the relative-capacity command in the MME Service Configuration Mode to zero (0). This prevents this MME from accepting any new calls, and redirects them to other MMEs in the pool while existing UEs on this MME are removed.

Important: Emergency attached UEs in Connected or Idle mode are not considered for offloading.

Example
This example applies to Release 12.2 and earlier.
The following command sets the trigger to start off-loading UEs from a service named mme3 at 60 seconds and the paging trigger at 90 seconds:

    mme offload mme-service mme3 start mme-init-release-timeout 60 paging-init-timeout 90

Example
This example applies to Release 14.0 and higher.
The following example command rebalances (offloads) 30 percent of all UEs from the specified mme-service (to other mme-services in the MME pool) over the course of 10 minutes.

    mme offload mme-service mme_svc time-duration 10 offload-percentage 30 -noconfirm
mme paging cache clear

Enables the operator to clear the paging cache for either a specific SessMgr instance or for all SessMgrs.

Product
MME.

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

mme paging cache clear { all | instance sessmgr_instance }

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Instructs the MME to clear the paging cache for all Session Managers.</td>
</tr>
<tr>
<td>instance sessmgr_instance</td>
<td>Enter an integer from 0 to 4294967295 to specify a single Session Manager.</td>
</tr>
</tbody>
</table>

Usage

This command clears the cache. It is important to clear the cache after the mme paging cache size is set to zero (0) to stop caching. This clear command needs to be used to reset the cache after caching is stopped.

Example

Use the following command to clear the paging cache for all SessMgrs:

mme paging cache clear all
mme relocate-ue imsi

This command enables the operator to detach a UE from the current MME and cause it to reattach to another MME in the pool.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
mme relocate-ue imsi imsi new-guti mme-group-id grp_id mme-code mme_code m-tmsi mtmsi
```

- **imsi imsi**
  Specifies the Mobile Station Identifier of the UE to be relocated. This UE must be registered or connected to this MME.

- **new-guti mme-group-id group_id**
  The group to which the target MME belongs.
  `grp_id`:
  - Beginning with Releases 16.5, 17.4, and 18.2 and forward, the valid range for mme group id value is from 0 through 65536.
  - Previous releases, the valid range for mme group id value is from 32768 through 65536.

- **mme-code mme_code**
  The target MME to which this UE should be attached.
  `mme_code`: The unique identifier for the target MME; must be value from 0 through 255.

- **m-tmsi mtmsi**
  The new GUTI MME-TMSI for this UE.
  `mtmsi`: A value from 0 through 4294967295.

**Usage**

MME uses this configuration to relocate UEs to a different MME using IMSI, mme-group-id, mme-code and m-tmsi.
mme reset

Sends an S1 RESET message to a designated eNodeB to reset all UE-associated S1 connections.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
mme reset s1-peer peer_ID
```

- **s1-peer peer-ID**
  Specifies an existing eNodeB peer ID to which the REST message is to be sent as an integer from 1 through 4294967295.

**Usage**

Use this command to send an S1 RESET message to a designated eNodeB to reset all UE-associated S1 connections.

The S1 peer ID for an eNodeB can be identified by executing the `show mme-service enodeb-association` command available in this mode. The peer ID is presented in the “Peerid” field.

**Example**

The following command initiates the sending of an S1-peer reset message to an eNodeB with a peer ID of 22315734:

```
   mme reset s1-peer 22315734
```
monitor interface

Enables monitoring of traffic on a particular interface.

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

monitor interface if_name

if_name

Specifies the name of the interface to be monitored as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to monitor the traffic on a specified interface.

Example

This command monitors the traffic on the interface named if1001:

monitor interface if1001
monitor protocol

Enters the system’s protocol monitoring utility.

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

monitor protocol

Usage
Useful for troubleshooting, this command provides a tool for monitoring protocol transactions between the system and other network nodes including the mobile station(s).
The following protocols can be monitored:

- SNMP
- RADIUS Authentication
- RADIUS Accounting
- A11 (R-P Interface) (PDSN only)
- Mobile IPv4
- A11MGR
- PPP
- A10
- User L3 (User Layer 3 protocols)
- USERTCP STACK
- L2TP
- L2TPMGR
- L2TP Data
- GTPC
- GTPCMGR
- GTPU
- GTPP
If the hard disk drive (HDD) is used for CDR storage, the CDR option must be used and not GTPP option (27).

- DHCP (GGSN only)
- CDR
- DHCPV6
- RADIUS COA
- MIP Tunnel
- L3 Tunnel (Layer 3 Tunnel Protocols)
- CSS Data
- CSS Signaling

In StarOS 9.0 and later releases the CSS Data Signaling option is not supported.

- EC Diameter (Diameter Enhanced Charging)
- SIP (IMS)
- IPSec IKE Inter-Node
- IPSec IKE Subscriber
- IPSG RADIUS Signal
- ROHC (Robust Header Compression)
- WiMAX R6
- WiMAX Data
- SRP
- BCMCS SERV AUTH
- RSVP
- Mobile IPv6
- ASNGWMGR
- STUN
- SCTP: Enabling this option will display the SCTP protocol message packets on HNB-GW node.
- M3UA
- SCCP
- TCAP
- MAP
- RANAP
- GMM
- GPRS-NS
- BSSGP
• CAP
• SSCOP
• SSCFNNI
• MTP3
• LLC
• SNDCP
• BSSAP+
• SMS
• PHS-Control (Payload Header Compression)
• PHS-Data
• DNS Client
• MTP2
• HNBAP: Enabling this option will display the HNB Application Part (HNBAP) protocol packets.
• RUA: Enabling this option will display the RANAP User Adaptation (RUA) protocol packets.
• EGTPC
• App Specific Diameter: Enabling this option will display the following sub-options —
  • 1 - DIABASE (OFF)
  • 2 - DIAMETER Gy (OFF)
  • 3 - DIAMETER Gx/Ty/Gxx (OFF)
  • 4 - DIAMETER Gq/Rx/Tx (OFF)
  • 5 - DIAMETER Cx (OFF)
  • 6 - DIAMETER Sh (OFF)
  • 7 - DIAMETER Rf (OFF)
  • 8 - DIAMETER EAP/Sta/S6a/S6d/S6b/S13/SWm (OFF)
  • 9 - DIAMETER HDD (OFF)
• PHS-EAPOL
• ICAP
• Micro-Tunnel
• ALCAP: Enabling this option will display the Access Link Control Application Part (ALCAP) protocol message packets on HNB-GW node.
• SSL
• S1-AP
• NAS
• LDAP
• SGS
• AAL2: Enabling this option will display the ATM Adaptation Layer 2 (AAL2) protocol message packets on HNB-GW node.
• PHS (Payload Header Suppression)
• PPPOE
• RTP (IMS)
• RTCP (IMS)
• LMI
• NPDB (IMS)
• SABP (Femto-UMTS)
• OCSP (X.509)

Once the protocol has been selected by entering its associated number, the utility monitors and displays every relative protocol message transaction.
Protocol monitoring is performed on a context-by-context-basis. Therefore, the messages displayed are only those that are transmitted/received within the system context from which the utility was executed.
For additional information on using the monitor utility, refer to the System Administration Guide.

⚠️ Caution: Protocol monitoring can be intrusive to subscriber sessions and could impact system performance. Therefore, it should only be used as a troubleshooting tool.

Example

The following command opens the protocol monitoring utility for SIP (IMS) = 37:

```
monitor protocol 37
```
monitor subscriber

Enables the system’s subscriber monitoring utility. Available keywords vary based on the licenses installed on the system.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
monitor subscriber [ asn-peer-address bs_peer_address | callid call_id | fng-peer-address ipv4_address | global-enb-id global-enb-id | imei imei_value | imsi imsi_value | ipaddr ip_address | ipv6addr ipv6_address | ipsg-peer-address ipsg_peer_address | msid ms_id | msisdn msisdn | next-call | pcf pcf_address | pdif-peer-address pdif_peer_address | peer-fa peer_fa_address | peer-lac lac_peer_address | sgsn-address sgsn_address | type { 1xrtt | asngw | asnpc | closedrp | evdorev0 | evdoreva | interrogating-cscf | ggsn [ Next-Call By APN ] | ha | ipv6 | ipsg | lns | mme | pdif | proxy-cscf | rfc3261-proxy | serving-cscf } next-call | type bcmcs { next-call | next-service-request } | username user_name | Next-Call By APN ]
```

**asn-peer-address bs_peer_address**

Specifies the peer ASN Base Station IP address in IPv4 address in dotted-decimal notation.

**callid call_id**

Specifies the call identification number assigned to the subscriber session by the system to be monitored as a 4-byte hexadecimal number.

**fng-peer-address ipv4_address**

Specifies the specific FNG WLAN IP address in IPv4 dotted-decimal notation.

**global-enb-id global-enb-id**

Specifies the Global eNodeB ID. This must be followed by MCC-MNC-eNBType-eNBID. MCC consists of 3 digits. MNC consists of 2 or 3 digits. eNBType is 0 for Macro and 1 for Home. eNBID has max 1048575 for MACRO eNB and max 268435456 for Home eNB.
**imei imei_value**

International Mobile Equipment Identification (IMEI). Must be followed by 8 digits of TAC (Type Allocation Code) and 6 digits of SNR (Serial Number). Only the first 14 digit of IMEI/IMEISV is used to find the equipment ID.

**imsi imsi_value**

Specifies the International Mobile Subscriber Identity (IMSI) of the subscriber session to be monitored an integer from 1 though 15 characters.

**ipaddr ip_address**

Specifies the IP address of the subscriber session to be monitored in IPv4 dotted-decimal notation.

**ipv6addr ipv6_address**

Specifies the IPv6 address of the subscriber session to be monitored in IPv6 colon-separated-hexadecimal notation.

**ipsg-peer-address ipsg_peer_address**

Specifies the peer IPSG IP address. Must be followed by an IPv4 address in dotted -decimal notation.

**msid ms_id**

Specifies the mobile subscriber identification number to be monitored as 7 to 16 digits of an IMSI, MIN, or RMI.

**msisdn msisdn**

Specifies the Mobile Subscriber ISDN number to be monitored as 7 to 16 digits of an IMSI, MIN, or RMI.

**next-call**

Specifies that the system will monitor the next incoming subscriber session. Entering this keyword will display the available options of protocols to select. For a list of supported protocols with this keyword, refer to the `monitor protocol` command.

**pcf pcf_address**

Specifies the PCF IP address in IPv4 dotted-decimal notation.

**pdif-peer-address pdif_peer_address**

Specifies the peer PDIF IP address in IPV4 dotted-decimal notation.

**peer-fa peer_fa_address**

Specifies the peer FA IP address in IPv4 dotted-decimal notation.

**peer-lac lac_peer_address**

Specifies the peer LAC IP address in IPv4 dotted-decimal notation.

**sgsn-address sgsn_address**

Specifies the SGSN IP address in IPv4 dotted-decimal notation.
type { 1xrtt | asngw | asnpc | bcmcs { next-call | next-service-request } | evdorev0 | evdoreva | | fng | interrogating-cscf | ggsn [ Next-Call By APN ] | ha | ipsg | lns | mme | openrp | pdif | pgw | proxy-cscf | rfc3261-proxy | saegw | serving-cscf } next-call [ apn apn ]

Allows monitoring for specific subscriber types established in the system when next call occurs.

- **1xrtt**: Displays logs for cdma2000 1xRTT call session subscriber
- **asngw**: Displays logs for ASN-GW call session subscriber
- **asnpc**: Displays logs for ASN PC/LR call session subscriber
- **bcmcs**: Displays logs for Broadcast and Multicast Service
- **evdorev0**: Displays logs for cdma2000 EVDO Rev0 call session subscriber
- **evdoreva**: Displays logs for cdma2000 EVDO RevA call session subscriber
- **fng**: Displays logs for the FNG session subscriber
- **interrogating-cscf**: Displays logs for Interrogating CSCF subscriber
- **ggsn**: Displays logs for UMTS GGSN call session subscriber
- **Next-Call By APN**: Display logs for next call on APN basis, where APN name can be any Gi or Gn APN.
- **ha**: Displays logs for Home Agent call session subscriber
- **ipsg**: Displays logs for IPSG call session subscriber
- **lns**: Displays logs for LNS call session subscriber
- **mme**: Displays logs for MME session subscribers.
- **pgw**: Displays logs for P-GW call session subscriber
- **pdif**: Displays logs for PDIF call session subscriber
- **proxy-cscf**: Displays logs for Proxy CSCF subscriber
- **rfc3261-proxy-cscf**: Displays logs for non-ims-proxy (RFC-3261 proxy) subscriber
- **saegw**: Displays logs for SAEGW call session subscriber
- **serving-cscf**: Displays logs for Serving CSCF subscriber

```
username user_name
```

Specifies the username of an existing subscriber to be monitored.

**Usage**

The monitor subscriber utility provides a useful tool for monitoring information about and the activity of either a single subscriber or all subscribers with active sessions within a given context.

⚠️ **Caution:** The `monitor subscriber` command is intended for *system debugging only*. This command is complementary to external tracing systems and not meant as a replacement for ongoing external system monitoring.

The following items can be monitored:

- Control events
- Data events
- Event ID information
- Inbound events
- Outbound events
- Protocols (identical to those monitored by command)

Once the criteria has been selected, the utility will monitor and display every relative piece of information on the subscriber(s).

For additional information on using the monitor utility, refer to the System Administration Guide.

**Important:** Option Y for performing multi-call traces is only supported for use with the GGSN. This option is available when monitoring is performed using the “Next-Call” option. It allows you to monitor up to 11 primary PDP contexts for a single subscriber.

Subscriber monitoring is performed on a context-by-context-basis. Therefore, the information displayed will be only that which is collected within the system context from which the utility was executed.

**Caution:** Subscriber monitoring can be intrusive to subscriber sessions and could impact system performance; therefore, it should only be used as a troubleshooting tool.

**Example**

The following command enables monitoring for user user1.

```
monitor subscriber username user1
```

The following command will enable monitoring for the user assigned IP address 10.2.3.4.

```
monitor subscriber ip-address 10.2.3.4
```

The following enables monitoring for call ID FE80AA12.

```
monitor subscriber callid fe80aa12
```
newcall policy

Configures new call policies for busy-out conditions.

no newcall policy ggsn-service { apn apn_name | all | name service_name }
no newcall policy { ha-service | pdsn-service } { all | name service_name } redirect
target_ip_address [ weight weight_num ] [ target_ip_address2 [ weight weight_num ] ... target_ip_address16 [ weight weight_num ]
no newcall policy hnbgw-service { all | name service_name }
no newcall policy mme-service { all | name service_name }
no newcall policy { pcc-af-service | pcc-policy-service } { all | name service_name }
no newcall policy pgw-service { all | apn name apn_name | name service_name }
no newcall policy saegw-service { all | name service_name }
no newcall policy sgw-service { all | name service_name }

no
Disables the new call policy for all or specified service of a service type.

no newcall policy { ha-service | pdsn-service } { all | name service_name } redirect
target_ip_address [ weight weight_num ] [ target_ip_address2 [ weight weight_num ] ... target_ip_address16 [ weight weight_num ]
Deletes up to 16 IP addresses from the redirect policy. The IP addresses must be expressed in IPv4 dotted-decimal notation

newcall policy { asngw-service | asnpc-service | epDG-service } { all | name service_name } reject
Creates a new call policy to reject the calls based on the specified ASN-GW or ASN PC/LR service name or all services of this type.
asngw-service: Specifies the type of service as ASN GW for which new call policy is configured.
asnp-service: Specifies the type of service as ASN PC/LR for which new call policy is configured.epDG-service: Specifies the type of service as ePDG for which new call policy is configured.
**name service_name**: Specifies the name of the service for which new call policy is configured. 

**service_name** is name of a configured ASN GW or ASN PC/LR service.

**reject**: Specifies that the policy rejects new incoming calls. Depending on the type of service that the policy is applied to, the reason codes are reported as part of the reply to indicate the rejection. For ASN-GW and ASN PC/LR service rejection code is 81H (Registration Denied - administratively prohibited).

**newcall policy** { cscf-service | fa-service | lma-service | lns-service | mipv6ha-service } { all | name service_name } reject

Creates a new call policy that rejects calls based on the specified access point name.

**cscf-service | fa-service | ha-service | lma-service | lns-service | mipv6ha-service | mme-service | pdsn-service | pdsnclosedrp-service**

Specifies the type of service for which to configure a new call policy. The following services are supported:

- **cscf-service**: A Call/Session Control Function service
- **fa-service**: A Foreign Agent service
- **ha-service**: A Home Agent service
- **lma-service**: A Local Mobility Anchor (LMA) service
- **lns-service**: An L2TP Network Server service
- **mipv6ha-service**: A Mobile IPv6 Home Agent service
- **pdsn-service**: A Packet Data Serving Node service

{ all | name service_name }

Specifies a filter for the new call policy. Whether the new call policy will be applied to all configured services or a specific one.

- **all**: Specifies that the new call policy will be applied to all instances of the selected service type.
- **name.service_name**: Specifies the name of a specific instance of the selected service type as an alphanumeric string of 1 through 63 characters that is case sensitive.

**redirect target_ip_address [ weight weight_num ] [ target_ip_address2 [ weight weight_num ] ... target_ip_address16 [ weight weight_num ]**

Configures the busy-out action. When a redirect policy is invoked, the service rejects new sessions and provides the IP address of an alternate destination. This command can be issued multiple times.

**target_ip_address** is the IP address of an alternate destination expressed in IPv4 dotted-decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.

**weight weight_num**: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. **weight_num** must be an integer from 1 through 10.

Depending on the type of service that the policy is applied to, the following reason codes are reported as part of the reply:

- **ha service**: 88H (Registration Denied - unknown home agent address)
- **pdsn service**: 88H (Registration Denied - unknown PDSN address)
**Important:** The redirect option is not supported for use with FA and GGSN services.

**reject**

Specifies that the policy rejects new incoming calls. Depending on the type of service that the policy is applied to, the following reason codes are reported as part of the reply to indicate the rejection:

- **asngw service:** 81H (Registration Denied - administratively prohibited)
- **fa service:** 41H (administratively prohibited)

**Important:** When newcall policy is set to reject for the FA service, the Busy Bit is set in the Agent Advertisement. Any further RRQs will be rejected with this code value.

- **ggsn service:** C7H (Rejected - no resources available)
- **ha service:** 81H (Registration Denied - administratively prohibited)
- **mipv6ha-service:** 81H (Registration Denied - administratively prohibited)
- **mme service:** 81H (Registration Denied - administratively prohibited)
- **pdsn service:** 81H (Registration Denied - administratively prohibited)

**newcall policy hnbgw-service { all | name service_name } reject**

Creates a new call policy to reject the calls in a specified HNB-GW service name instance or all HNB-GW services on the system.

**name service_name:** Specifies the name of the HNB-GW service for which new call policy is configured.

**reject:** Specifies that the policy rejects all new incoming calls. Depending on the type of service that the policy is applied to, the reason codes are reported as part of the reply to indicate the rejection. For HNB-GW service rejection code is 81H (Registration Denied - administratively prohibited).

**newcall policy mme-service { all | name service_name } reject**

Creates a new call policy to reject the calls based on the specified MME service name or all MME services on the system.

**name service_name:** Specifies the name of the MME service for which new call policy is configured.

**reject:** Specifies that the policy rejects new incoming calls. Depending on the type of service that the policy is applied to, the reason codes are reported as part of the reply to indicate the rejection. For MME service rejection code is 0x16 (Registration Denied - administratively prohibited).

**newcall policy { pcc-af-service | pcc-policy-service | pcc-quota-service} { all | name service_name } reject**

Creates a new call policy to reject the calls for PCC services on the system for any of the following PCC services:

- **pcc-af-service name service_name:** Specifies the Policy and Charging Control-Application Function (PCC-AF) service for which new call policy is to be configured on the system.
  
  **name service_name:** Specifies the name of an existing PCC-AF service for which new call policy is configured.

- **pcc-policy-service name service_name:** Specifies the Policy and Charging Control-Policy (PCC-Policy) service for which new call policy is to be configure on the system.
name service_name: Specifies the name of an existing PCC-Policy service for which new call policy is configured.

reject: Specifies that the policy rejects new incoming calls. Depending on the type of service that the policy is applied to, the reason codes are reported as part of the reply to indicate the rejection. For PCC services rejection code is 81H (Registration Denied - administratively prohibited).

newcall policy pgw-service { all | apn name apn_name | name service_name } reject
Creates a new call policy to reject the calls based on the specified P-GW service name, APN name, or all P-GW services (and any SAEGW service associated with the P-GW service) in this context.
all: Rejects all P-GW services on the system. Specifies that the new call policy will be applied to all instances of the P-GW service, and any associated SAEGW service, in this context.
apn apn_name: Specifies the name of the APN, and any associated P-GW/SAEGW service, for which new call policy is configured.
name service_name: Specifies the name of the P-GW service, and any SAEGW service associated with this P-GW service, for which new call policy is configured.
reject: Specifies that the policy rejects new incoming calls. Depending on the type of service that the policy is applied to, the reason codes are reported as part of the reply to indicate the rejection.

Usage
This command is used to busy-out specific system services prior to planned maintenance or for troubleshooting. This is required when operator find out that the system is somehow overloaded, or needs some kind of maintenances or so.

Example
The following command creates a new call policy to re-direct all new calls for all PDSN services to a device having an IP address of 192.168.1.23:

    newcall policy psdn-service all redirect 192.168.1.23

The following command creates a new call policy to reject all new calls for a GGSN service called ggsn1:

    newcall policy ggsn-service name ggsn1 reject

The following command creates a new call policy to reject all new calls for an MME service called MME1:

    newcall policy mme-service name MME1 reject
The following command creates a new call policy to reject all new calls for an HNB-GW service called *hnbgw1*:

```
newcall policy hnbgw-service name hnbgw1 reject
```

The following command creates a new call policy to reject all new calls for a PCC Policy service called *pcrf1*:

```
newcall policy pcc-policy-service name pcrf1 reject
```
password change

Provides a mechanism for local-user administrative users to change their passwords.

Product
All

Privilege
All local-user administrative levels except as noted below

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

password change [ local-user name ]

local-user name

Specifies the name of an existing local-user administrative user for which to change the password as an alphanumeric string of 3 through 144 characters that is case sensitive.

Important: This keyword is only available to local-users with an authorization level of security-administrator.

Usage

This command provides a mechanism for local-user administrative users to change their passwords. In addition, it also provides a mechanism for security-administrator local-users to change the password for other local-user accounts.

If the local-user keyword is not entered, the system prompts the user for their current password and for the new password. New passwords take effect at the next login. Users that have had their password changed by a security-administrator are prompted to change their passwords at their next login.

New passwords must meet the criteria dictated by the local-user password command options in the Global Configuration Mode.

Important: The system does not allow the changing of passwords unless the time limit specified by the local-user password min-change-interval has been reached.

Example

The following command, executed by a security-administrator, resets the password for a local-user name operator12:

password change local-user operator12
patch plugin

Copies a patch intended for a specific plugin module onto the system. This function is associated with the patch process for accommodating dynamic software upgrades.

Product
ADC

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
patch plugin plugin_name filepath certificate filepath
```

<table>
<thead>
<tr>
<th>plugin_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the name of an existing plugin that will be copied onto the system as an alphanumeric string of 1 through 16 characters.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>certificate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the name of a certificate associated with the plugin that will be copied onto the system as an alphanumeric string of 1 through 16 characters.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>filepath</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the location of the file to copy. The path must be formatted as follows: For the ASR 5000:</td>
</tr>
<tr>
<td>[ file: ]{ /flash</td>
</tr>
<tr>
<td>For the ASR 5500:</td>
</tr>
<tr>
<td>[ file: ]{ /flash</td>
</tr>
<tr>
<td>For VPC:</td>
</tr>
<tr>
<td>[ file: ]{ /flash</td>
</tr>
</tbody>
</table>

**Important:** Use of the ASR 5000 SMC hard drive is not supported in this release.

**Important:** The USB ports and CDROM must be configured via the hypervisor to be accessible.
**Important:** Do not use the following characters when entering a string for the field names below: “/” (forward slash), “:” (colon) or “@” (at sign).

- directory is the directory name.
- filename is the actual file of interest.

**Usage**

Use this command to verify and copy a patch onto the system. After the patch has been copied onto the system, you must run the `install plugin` command to unpack the kit and validate its contents.

**Example**

To copy the plugin module named `p2p` onto the system enter the following command:

```
patch plugin p2p http://192.168.1.2/tmp/libp2p-1.2.0.tgz certificate http://192.168.1.2/tmp/1.2.0.cert
```

When the patch has been successfully copied the following message appears:

```
New patch for plugin p2p available for installation
```
**ping**

Verifies ability to communicate with a remote node in the network by passing data packets between and measuring the response. This is accomplished by sending IPv4 Internet Control Message Protocol (ICMP) echo request packets to the target node (pinging) and waiting for an ICMP response.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Important:** Inspector privileges are granted for all variables except count. To initiate a ping count, you must have a minimum privilege level of Operator.

**Syntax**

```
ping ( hostname | ip_address ) [ broadcast ] [ count num_packets ] [ pattern packet_pattern ] [ size octet_count ] [ src { src_host_name | src_host_ip_address } ]
```

- **hostname**
  Sends ICMP echo request packets to the remote node specified the node’s name (up to 127 alphanumeric characters) or assigned IPv4 address in dotted-decimal notation.

- **ip_address**
  IPv4 address of host to be pinged in dotted-decimal notation.

- **broadcast**
  Sends ping packets to broadcast addresses.

- **count num_packets**
  Specifies the number of packets to send to the remote host for verification as an integer from 1 through 10000. Default: 5

- **pattern packet_pattern**
  Specifies a pattern to use to fill the internet control message protocol packets in hexadecimal format with a value in the range of 0x0000 through 0xFFFF. By default each octet of the packet is encoded with the octet number of the packet.

- **size octet_count**
  Specifies the number of bytes in each IP datagram as an integer from 40 through 18432. Default: 56
**src host_ip_address**

Specifies the source IP address in IPv4 dotted-decimal notation. Default: originating system’s IP address

**Usage**

This command is useful in verifying network routing and if a remote node is able to respond at the IPv4 layer.

**Example**

The following command is the most basic and will report the results of trying to communicate with remote node `remoteABC`.

```
ping remoteABC
```

The following command verifies communication with the remote node `10.2.3.4` using 1000 packets.

```
ping 10.2.3.4 count 1000
```

The following command verifies communication with remote node `remoteABC` while making it appears as though the source is remote node with IP address `10.2.3.4`.

```
ping remoteABC src 10.2.3.4
```

**Important:** The responses from the remote host to the ping packets will be rerouted to the host specified as the source.
ping6

Verifies ability to communicate with a remote node in the network by passing data packets between and measuring the response. This is accomplished by sending IPv6 Internet Control Message Protocol (ICMP) echo request packets to the target node (pinging) and waiting for an ICMP response.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

ping6 { hostname | ipv6_address } [ count num ] [ flood ] [ pattern val ] [ size val ] [ src ip_address ] [ interface string ] [ vrf vrf_name ]

host_name
Name of the host to be pinged.

ipv6_address
IPv6 address of host to be pinged in colon-separated-hexadecimal notation.

count.num
Sets the number of ping packets to be sent as an integer from 1 through 10000.

flood
Configures ping6 to send packets as quickly as possible, or 100 per second, whichever is faster.

pattern val
Specifies the hexadecimal pattern to fill ICMP packets as a hexadecimal number from 0x0 through 0xffff

size val
Specifies the size of ICMP datagram (in bytes) as an integer from 40 through 18432. Default: 56.

src ip_address
Specifies the source IP address in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation. Default: originating system’s IP address

vrf name
Specifies the name of an existing VFR as an alphanumeric string of 1 through 63 characters.
Usage
This command is useful in verifying network routing and if a remote node is able to respond at the IPv6 layer.

Example
Use this command to ping the IPv6 address 2001:0db8:85a3:0000:0000:8a2e:0370:7334

```
ping6 2001:0db8:85a3:0000:0000:8a2e:0370:7334
```
**port switch to**

Performs a manual switchover to an available redundant/standby line card, SPIO port, or MIO port.

Default: none.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
port switch to slot#/port#
```

- **slot#**
  Identifies the physical chassis slot where the line card, SPIO, or MIO card is installed.

- **port#**
  Identifies the physical port on the line card, SPIO, or MIO to automatically switch to.

**Usage**
This command is used to specify the redundant port on a Line Card (LC) or MIO. When port redundancy is enabled, if an external network device or cable failure occurs that causes a link down failure on the port, then the redundant port is used.

**Important:** This command is not supported on all platforms.

**Example**

```
port switch to 17/1
port switch to 6/11
```
ppp echo-test

Sends link control protocol (LCP) keep-alive echo packet to the peer point-to-point protocol (PPP) connection to verify proper communication between PPP connections, and awaits a response.

Product
- PDSN
- GGSN

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
ppp echo-test { callid call_id | imsi imsi_id | ipaddr ip_address | msid ms_id | username user_name } [ num_packets ] [ | { grep grep_options | more } ]
```

- **callid call_id**
  Specifies the call instance ID for which the PPP link must be verified as a 4-byte hexadecimal number.

- **imsi imsi_id**
  Specifies the International Mobile Subscriber Identifier (IMSI) for which the PPP link must be verified.

- **ipaddr ip_address**
  Specifies the IP address for which the PPP link must be verified in IPv4 dotted-decimal notation.

- **msid ms_id**
  Specifies the mobile subscriber ID for which the PPP link must be verified as 7 to 16 digits of an MIN, or RMI.

- **username user_name**
  Specifies an existing user for which the PPP link must be verified as an alphanumeric string of 1 through 127 characters.

- **num_packets**
  Specifies the number of test packets to generate an integer from 1 through 1000000. Default: 1

- **grep grep_options | more**
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in Command Line Interface Reference.
Usage

Use this command to verify the point-to-point protocol communications. This command sends LCP keep-alive echo packet to the peer PPP connection to verify proper communication between PPP connections. The `ppp echo` command waits for LCP echo response for configured numbers of tries, if response is not received it will retry configured no of times with an interval of 5 seconds. This command accepts the parameters call ID, IMSI, IP address, MSID, and user name to specify which active PPP session to consider. The `ppp echo-test` command makes the dormant session active.

⚠️ Caution: Issuing this command could negatively impact system performance depending on the number of subscribers using the same name and/or if the number of packets used in the test is large.

LCP includes Echo-Request and Echo-Reply codes in order to provide a Data Link Layer loopback mechanism for use in exercising both directions of the link. This is useful as an aid in debugging, link quality determination, performance testing, and for numerous other functions. Upon reception of an Echo-Request in the LCP Opened state, an Echo-Reply is transmitted.

Example

The following command tests the PPP link to user `user1`.

```bash
ppp echo-test username user1
```

The following command tests the PPP link to the user assigned IP address `10.2.3.4`.

```bash
ppp echo-test ipaddr 10.2.3.4
```

The following tests the PPP link associated with call ID `fe80aa12`.

```bash
ppp echo-test callid fe80aa12
```
**radius interim accounting now**

Check points current RADIUS accounting messages immediately.

**Product**

PDSN  
GGSN  
ASN-GW

**Privilege**

Security Administrator, Administrator, Operator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name# 
```

**Syntax**

```
radius interim accounting now 
```

**Usage**

The interim command may be part of a regiment of periodic activities to maintain the chassis. This command may also be useful in preparation for system monitoring or troubleshooting to set the list of messages to be displayed at a well known time.
radius test

Verifies the RADIUS servers functions for accounting and authentication.

**Product**
- PDSN
- GGSN
- ASN-GW

**Privilege**
- Security Administrator, Administrator, Operator

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
radius test \{ accounting | admin authentication | authentication | probe authentication \} \{ all | [ on ] | off \} | radius group group_name user_name | server server_name port server_port \} 
```

- **accounting**
  Tests accounting server functionality.

- **admin authentication name_admin admin_password**
  Tests the RADIUS admin authentication.
  - `name_admin`: Specifies the name of the administrator as an alphanumeric string of 1 through 127 characters.
  - `admin_password`: Specifies the password for the administrator as an alphanumeric string of 1 through 63 characters.

- **authentication**
  Tests authentication server functionality.

- **all | radius group group_name user_name | server server_name port server_port**
  - **all**: Tests all configured servers.
  - **server server_name port server_port**: Tests only the server specified by `server_name` and `server_port`. The server must have been previously configured.
  - **radius group group_name user_name**: Tests all configured authentication servers in a specific RADIUS group for a specific user. Must be followed by the RADIUS group name and user name.
    - `group_name` is an alphanumeric string of 1 through 63 characters that specifies the name of server group configured in the specific context for authentication/accounting.

- **on/off**
  Allows the user to turn RADIUS test accounting on or off.
radius test

user_name
Specifications the RADIUS user who is to be verified. The user must have been previously configured.

password
Specifications the RADIUS user who is to have authentication verified. password is only applicable when the authentication keyword is specified.

Usage
Test the RADIUS accounting for troubleshooting the system for specific users or to verify all the system RADIUS accounting functions.

Example
The following verifies all RADIUS servers.

radius test accounting all
radius test authentication all

The following verifies the RADIUS accounting and authentication for user user1 for the sampleServer.

radius test accounting server sampleServer port 5000 user1
radius test authentication server sampleServer port 5000 user1 dummyPwd

The following commands will verify the RADIUS accounting and authentication for RADIUS server group star1 for the current context:

radius test accounting server sampleServer port 5000 user1
radius test authentication server sampleServer port 5000 user1 dummyPwd
radius test authentication all

The following verifies the RADIUS authentication server group star1 for user user1.

radius test authentication radius group star1 user1
**reload**

Invokes a full system reboot. All processes are terminated and the system initiates a hardware reset (reboot). This command is identical to the `shutdown` command.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name# 
```

**Syntax**

```
reload [ -noconfirm ]
```

- `-noconfirm`
  
  Executes the command without any additional prompts or confirmation from the user.

**Usage**

The system performs a hardware reset and reloads the highest priority boot image and configuration file specified in the boot.sys file. Refer to the `boot system priority` command in the Global Configuration Mode for additional information on configuring boot images, configuration files and priorities.

**Important:** To avoid the abrupt termination of subscriber sessions, it is recommended that a new call policy be configured and executed prior to invoking the `reload` command. This policy sets busy-out conditions for the system and allows active sessions to terminate gracefully. Refer to the `newcall` command in the Exec Mode for additional information.

**Caution:** Issuing this command causes the system to become unavailable for session processing until the reboot process is complete.

**Example**

The following command performs a hardware reset on the system:

```
reload
```
rename

Changes the name of an existing local file.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
rename from_filepath to_filepath [ -noconfirm ]
```

*from_filepath*

Specifies the path to the file/directory to be renamed. The path must be formatted according to the following format:

For the ASR 5000:

```
[ file: ]{ /flash | /pcmcia1 | /hd-raid }[ /directory ]/file_name
```

For the ASR 5500:

```
[ file: ]{ /flash | /usb1 | /hd-raid }[ /directory ]/file_name
```

**Important:** Use of the SMC hard drive is not supported in this release.

**Important:** Do not use the following characters when entering a string for the field names below: “/” (forward slash), “:” (colon) or “@” (at sign).

*directory* is the directory name

*filename* is the actual file of interest

*to_filepath*

Specifies the path to the file/directory to be renamed. The path must be formatted according to the following format:

For the ASR 5000:

```
[ file: ]{ /flash | /pcmcia1 | /hd }[ /directory ]/file_name
```

For the ASR 5500:
**Exec Mode Commands (D-S)**

**rename**

```
[ file: ]{ /flash | /usb1 | /hd }[ /directory ]/file_name
```

**Important:** Use of the SMC hard drive is not supported in this release.

- **directory** is the directory name
- **filename** is the actual file of interest

**-noconfirm**

Executes the command without any additional prompt and confirmation from the user.

**Caution:** Extreme caution should be taken when using the `-noconfirm` option. The paths to the source and the destination should be verified prior to performing the command.

**Usage**

Rename files as part of regular system maintenance in conjunction with the delete command.

**Example**

The following renames the directory `/pub` in the local PCMCIA1 device.

```
rename /pcmcia1/pub /pcmcia1/pub_old
```

The following renames the directory `/pub` in the local USB device.

```
rename /usb1/pub /usb1/pub_old
```
reset active-charging

This command resets the active charging services.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name# 
```

**Syntax**

```
reset active-charging credit-control misc-info max-backpressure { all | facility sessmgr instance instance_number }
```

- **all**
  Displays the maximum backpressure information among all the active session manager instances.

- **facility sessmgr instance instance_number**
  Specifies the facility session manager instance as an integer ranging from 1 through 65535 characters.

**Usage**

Use this CLI command to get or reset the maximum back-pressure hit and the timestamp it reached the maximum value. This helps to reset the gauge value for all/specific session manager instance to zero.

**Example**

The following command resets the maximum backpressure value for all active session manager instances:

```
reset active-charging credit-control misc-info max-backpressure all
```
reset alcap-service

Resets a named Access Link Control Application Part (ALCAP) protocol service. ALCAP is the protocol used for the control plane of the UMTS transport layer. It manages and multiplexes users into ATM AAL2 virtual connections.

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

reset alcap-service srvc_name aal2 node node_name aal2-path { path_name | all }

*srvc_name*

Specifies the name of an existing ALCAP service as an alphanumeric string of 1 through 63 characters.

*aal2 node node_name*

Specifies the name of an existing ATM Adaptation Layer 2 (AAL2) node as an alphanumeric string of 1 through 64 characters.

Usage

Reset a named ALCAP service for a specified AAL2 node.

Example

The following command resets the ALCAP service *alcap_01* for the AAL2 node *aal2_1001*, all paths:

```
reset alcap-service alcap_01 aal2-node aal2_1001 aal2-path all
```
**reset diameter**

This command clears the Diameter statistics.

**Product**

All

**Privilege**

Security Administrator, Administrator, Operator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
reset diameter aaa-statistics misc-data
```

**Usage**

Resets the Diameter statistics (highest backpressure statistics).

**Example**

The following command resets the Diameter related miscellaneous statistics:

```
reset diameter aaa-statistics misc-data
```
reset ims-authorization

Resets the maximum backpressure related information associated with the IMS authorization services.

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

reset ims-authorization policy-control misc-info max-backpressure { all | facility sessmgr instance instance_number }

all
Displays the maximum backpressure information among all the active session manager instances.

facility sessmgr instance instance_number
Specifies the facility session manager instance as a integer from 0 through 1000000 characters.

Usage
Use this command to reset the values of maximum backpressure related information.

Example
The following command resets all the backpressure related information:

reset ims-authorization policy-control misc-info max-backpressure all
reveal disabled commands

Enables or disables the input of commands for features that do not have license keys installed. The output of the command `show cli` indicates when this feature is enabled. This command effects the current CLI session only and is disabled by default.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
[ no ] reveal disabled commands
```

- **no**
  Does not show disabled commands.

**Usage**

When this command is enabled and a disabled command is entered, a message is displayed that informs you that the required feature is not enabled and also lists the name of the feature that you need to support the command.

When this command is disabled and a disabled command is entered, the CLI does not acknowledge the existence of the command and displays a message that the keyword is unrecognized.

**Example**

The following command sets the CLI to accept disabled commands and display the required feature for the current CLI session with the following command:

```
reveal disabled commands
```

The following command sets the CLI to reject disabled commands and return an error message for the current CLI session:

```
no reveal disabled commands
```
rlogin

Attempts to connect to a remote host.

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

rlogin { host_name | host_ip_address } [ user user_name ]

host_name | host_ip_address

Identifies the remote node with which to attempt connection.
host_name: Specifies the remote node using the node’s logical host name which must be resolved via DNS lookup.
host_ip_address: Specifies the remote node using its assigned IP address in IPv4 dotted-decimal notation.

user user_name

Specifies a user name attempting connection as an alphanumeric string of 1 through 1023 characters.

Usage

Connect to remote network elements using rlogin.

Important: rlogin is not a secure method of connecting to a remote host. ssh should be used whenever possible for security reasons.

Example

The following connects to remote host remoteABC as user user1.

rlogin remoteABC user user1

The following connects to remote host 10.2.3.4 without any default user.

rlogin 10.2.3.4
rmdir

Removes (deletes) a local directory.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

rmdir path [ force ]

path

Specifies the directory path to remove. The must be formatted according as follows:

For the ASR 5000:

[ file: ]{ /flash | /pcmcia1 | /hd-raid }[ /directory ]/file_name

For the ASR 5500:

[ file: ]{ /flash | /usb1 | /hd-raid }[ /directory ]/file_name

For VPC:

[ file: ]{ /flash | /hd-raid | /usb1 | /usb2 | /cdrom1 }[ /directory ]/file_name

Important: Do not use the following characters when entering a string for the field names below: “/” (forward slash), “:” (colon) or “@” (at sign).

directory is the directory name
filename is the actual file of interest

force

Over-rides any warnings to force deletion of the directory and any files contained therein.

Important: Use of the force keyword should be done with care to ensure the directory is specified accurately as there is no method to recover a directory which has been removed.

Usage

Remove old directories as part of regular maintenance.
Example

The following removes the local directory `/pcmcia1/pub`.

```
rmdir /pcmcia1/pub
```
rollback module

Loads a specified software plugin module from the Version Priority List (VPL) with the next higher priority number. This function is associated with the patch process for accommodating dynamic software upgrades.

Product
ADC

Privilege
Security Administrator, Administrator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax
rollback module plugin_name

plugin_name
Specifies the name of an existing plugin module that you want to downgrade as an alphanumeric string of 1 through 16 characters. If the named module is not known to the system, an error message is displayed.

Usage
Use this command to initiate a rollback of a previously loaded software plugin module. If it fails to load, the module with next highest priority will be loaded. If none of the modules are installed, the default patch which comes along with the ASR 5000 build is automatically loaded. The specified module must have been previously unpacked/verified and configured via the install plugin and plugin commands respectively. For additional information, refer to the Plugin Configuration Mode Commands chapter.

Example
To load the next plugin module named p2p enter the following command:

rollback module p2p
rotate-hd-file

Rotates the Diameter files stored on the hard disk drive.

Product
HSGW
P-GW
SAEGW
S-GW

Privilege
Security Administrator, Administrator

Mode
Exec
The following prompt is displayed in the Exec mode:
[local]host_name#

Syntax

rotate-hd-file diameter [ name policy_name ]

name policy_name
Specifies the hd-storage policy name of an existing HD Storage Policy as an alphanumeric string of 0 through 63 characters.

Usage
Use this command to manually rotate the Diameter HD stored files.

Example
The following command rotates Diameter files that were stored using the HD storage policy named CDR1:

rotate-hd-file diameter name CDR1
save configuration

Saves the configuration of current contexts to a local or remote location. The configuration contains the sequence of CLI commands that define system parameters and ends with the .cfg extension.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
save configuration url [ obsolete-encryption | showsecrets | verbose ] [ -redundant ] [ -noconfirm ]
```

**url**

Default: saves to the location of the active configuration currently loaded. Specifies the location in which to store the configuration file. *url* may refer to a local or a remote file and must be entered in the following format:

For the ASR 5000:

```
```

```
tftp:// { host [ : port# ] } [ /directory ] /file_name
```

```
```

For the ASR 5500:

```
```

```
tftp:// { host [ : port# ] } [ /directory ] /file_name
```

```
```

For VPC:

```
[ file: ] { /flash | /hd-raid | /usb1 | usb2 | cdrom1 } [ /directory ] /file_name
```

```
tftp:// { host [ : port# ] } [ /directory ] /file_name
```

```
```
**Important:** Do not use the following characters when entering a string for the field names below: “/” (forward slash), “:” (colon) or “@” (at sign).

- **directory** is the directory name.
- **filename** is the actual file of interest.
- **username** is the user to be authenticated.
- **password** is the password to use for authentication.
- **host** is the IP address or host name of the server.

**Important:** **host** can only be used if the **networkconfig** parameter is configured for DHCP and the DHCP server returns a valid nameserver.

The following file transfer protocols are supported on all platforms to save the configuration to a destination on the network (off box):

- **tftp** – Trivial File Transfer Protocol [no username/password required]
- **ftp** – File Transfer Protocol [username/password required]
- **sftp** – SSH File Transfer Protocol [SSH username/password required]

**port#** is the logical port number that the communication protocol is to use.

```
[ obsolete-encryption | showsecrets | verbose ]
```

Specifies options when saving the configuration file.

- **obsolete-encryption**: Saves the configuration with encrypted values generated via an obsolete encryption method. This option may be required to preserve a configuration for a possible downgrade.
- **showsecrets**: Saves the CLI configuration file with all passwords in plain text, rather than their default encrypted format.
- **verbose**: Saves as much information as possible, including default values. If this option is not specified, the configuration will not include default values.

**-redundant**

Saves the configuration file to the local device on the management card, defined by the **url** variable, and then automatically copies that same file to the like device on the standby management card, if available.

The management card can be any of the following:

- ASR 5000 – System Management Card (SMC) [/flash or pcmcia1]
- ASR 5500 – Management Input/Output (MIO) card [/flash, usb1, usb2]
- VPC-DI – Control Function (CF) virtual machine

Use the **-redundant** keyword if you have only made changes to the configuration, but not to the boot order or after installing a new boot image. Changes to the boot order or installing a new image requires filesystem synchronization via the **filesystem synchronize** command.

**Important:** This keyword will only work for local devices that are located on both the active and standby management cards. Otherwise, a failure message is displayed. When saving the file to an external network (non-local) device, the system disregards this keyword.
### Important:
This keyword does **not** synchronize the local file system. If you have added, modified, or deleted other files or directories to or from a local device for the active management card, then you must synchronize the local file system on both cards.

- **-noconfirm**
  
  Executes the command without any additional prompt and confirmation from the user.

### Caution:
Exercise caution when using the **-noconfirm** option as this will overwrite data if the URL targets an existing file.

### Usage
Backup the current configuration as part of periodic maintenance activities for emergency recovery.

### Important:
Saving a configuration does **not** save the boot options as configured via the Global Configuration mode `boot` commands.

### Example
The following saves the configuration data to the local file `/flash/pub/juneconfig.cfg` with no confirmation from the user:

```
save configuration /flash/pub/juneconfig.cfg -noconfirm
```

The following saves the configuration data to remote host `remoteABC` at `/pub/juneconfig.cfg`:

```
save configuration tftp://remoteABC/pub/juneconfig.cfg
```
save logs

Saves the current log file to a local or remote location.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```bash
save logs { url } [ active ] [ inactive ] [ callid call_id ] [ event-verbosity evt_verboseness ] [ facility facility ] [ level severity_level ] [ pdu-data pdu_format ] [ pdu-verbosity pdu_verboseness ] [ since from_date_time [ until to_date_time ] ] [ | { grep grep_options | more } ]
```

**url**

Specifies the location to store the log file(s). `url` may refer to a local or a remote file and must be entered in the following format.

For the ASR 5000:

```
tftp:// { host [ : port# ] } [ /directory ] /file_name
```

For the ASR 5500:

```
tftp:// { host [ : port# ] } [ /directory ] /file_name
```

For VPC:

```
tftp:// { host [ : port# ] } [ /directory ] /file_name
```

**Important:** Use of the SMC hard drive is not supported in this release.
save logs

[ftp: | sftp:] // [ username[:password] @ ] [ host ] [ : port# ] [ /directory ] / file_name

**Important:** The USB ports and CDROM must be configured via the hypervisor to be accessible.

**Important:** Do not use the following characters when entering a string for the field names below: “/” (forward slash), “:” (colon) or “@” (at sign).

- directory is the directory name.
- filename is the actual file of interest.
- username is the user to be authenticated.
- password is the password to use for authentication.
- host is the IP address or host name of the server.

**Important:** hostname can only be used if the networkconfig parameter is configured for DHCP and the DHCP server returns a valid nameserver.

- port# is the logical port number that the communication protocol is to use.

**active**
Saves data from active logs.

**inactive**
Saves data from inactive logs.

**callid** call_id
Specifies a call ID for which log information is to be saved as a 4-byte hexadecimal number.

**event-verbosity** evt_verbosity
Specifies the level of verbosity to use in displaying of event data as one of:

- **min:** Logs minimal information about the event. Information includes event name, facility, event ID, severity level, date, and time.

- **concise:** Logs detailed information about the event, but does not provide the event source within the system.

- **full:** Logs detailed information about event, including source information, identifying where within the system the event was generated.

**facility** facility
Specifies the facility to modify the filtering of logged information. Valid facilities for this command are:

- **a10:** A10 interface facility
- **a11:** A11 interface facility
- **a11mgr:** A11 Manager facility
- **aaa-client:** Authentication, Authorization and Accounting (AAA) client facility
 Exec Mode Commands (D-S)

• aaamgr: AAA manager logging facility
• aaaproxy: AAA Proxy facility
• aal2: ATM Adaptation Layer 2 (AAL2) protocol logging facility
• acl-log: Access Control List (ACL) logging facility
• acsctrl: Active Charging Service (ACS) Controller facility
• acsmgr: ACS Manager facility
• afctrl: Fabric Controller facility [ASR 5500 only]
• afmgr: Fabric Manager logging facility [ASR 5500 only]
• alarmctrl: Alarm Controller facility
• alcap: Access Link Control Application Part (ALCAP) protocol logging facility
• alcapmgr: ALCAP manager logging facility
• all: All facilities
• asngwmg: Access Service Network (ASN) Gateway Manager facility
• asnpemgr: ASN Paging Controller Manager facility
• bfd: Bidirectional Forwarding Detection (BFD) protocol logging facility
• bgp: Border Gateway Protocol (BGP) facility
• bindmux: IPCF BindMux-Demux Manager logging facility
• bngmgr: Broadband Network Gateway (BNG) Demux Manager logging facility
• bssap+: Base Station Sub-system Application Part+ protocol facility for the login interface between the SGSN and the MSC/VLR (2.5G and 3G)
• bssgp: Base Station Sub-system GPRS Protocol logging facility handles exchange information between the SGSN and the BSS (2.5G only)
• callhome: Call Home application logging facility
• cap: CAMEL Application Part (CAP) logging facility for protocol used in prepaid applications (2.5G and 3G)
• cbmsmgr: Cell Broadcasting Service (CBS) logging facility [HNBGW]
• cdf: Charging Data Function (CDF) logging facility
• cgw: Converged Access Gateway (CGW) logging facility
• cli: Command Line Interface (CLI) logging facility
• cmp: Certificate Management Protocol (IPSec) logging facility
• connectedapps: SecGW ASR 9000 oneP communication protocol
• connproxy: Controller Proxy logging facility
• credit-control: Credit Control (CC) facility
• csf: IMS/MMD Call Session Control Function (CSF)
• csfcpmgr: CSCFCPMGR logging facility
• csfmg: SIP CSF Manager facility
• csfnpdb: CSF Number Portability Database (NPDB) logging facility
• csfrtcp: IMS/MMD CSF RTCP log facility
- **csefrtp**: IMS/MMD CSCF RTP log facility
- **cscftmgr**: SIP CSCF Tunnel and Transport Manager facility
- **esp**: Card/Slot/Port controller facility
- **css**: Content Service Selection (CSS) facility
- **css-sig**: CSS RADIUS Signaling facility
- **cx-diameter**: Cx Diameter Messages facility [CSCF <--> HSS]
- **data-mgr**: Data Manager Framework logging facility
- **dcardctrl**: IPSec Daughter Card Controller logging facility
- **dcardmgr**: IPSec Daughter Card Manager logging facility
- **demuxmgr**: Demux Manager API facility
- **dgmbmgr**: Diameter Gmb Application Manager logging facility
- **dhcp**: Dynamic Host Configuration Protocol (DHCP) logging facility
- **dhcpv6**: DHCPv6
- **dhost**: Distributed Host logging facility
- **diabase**: Diabase messages facility
- **diameter**: Diameter endpoint logging facility
- **diameter-acct**: Diameter Accounting
- **diameter-auth**: Diameter Authentication
- **diameter-dns**: Diameter DNS subsystem
- **diameter-ecs**: ACS Diameter signaling facility
- **diameter-hdd**: Diameter Horizontal Directional Drilling (HDD) Interface facility
- **diameter-svc**: Diameter Service
- **diamproxy**: DiamProxy logging facility
- **dpath**: IPSec Data Path facility
- **drvctrl**: Driver Controller facility
- **drvctrl**: Driver Controller logging facility
- **doulosuemgr**: Doulos (IMS-IPSec-Tool) user equipment manager
- **eap-diameter**: Extensible Authentication Protocol (EAP) IP Security facility
- **eap-ipsec**: Extensible Authentication Protocol (EAP) IPSec facility
- **eap-sta-s6a-s13-s6b-diameter**: EAP/STA/S6A/S13/S6B Diameter messages facility
- **ecs-css**: ACSMGR <--> Session Manager Signalling Interface facility
- **egtpc**: eGTP-C logging facility
- **egtpmgr**: enhanced GPRS Tunneling Protocol (eGTP) manager logging facility
- **egtpu**: eGTP-U logging facility
- **embms**: evolved Multimedia Broadcast Multicast Services Gateway facility
- **embms**: eMBMS Gateway Demux facility
• **epdg**: evolved Packet Data (ePDG) gateway logging facility
• **event-notif**: Event Notification Interface logging facility
• **evlog**: Event log facility
• **famgr**: Foreign Agent manager logging facility
• **firewall**: Firewall logging facility
• **fng**: Femto Network Gateway (FNG) logging facility
• **gbmgr**: SGSN Gb Interface Manager facility
• **gmm**:
  • For 2.5G: Logs the GPRS Mobility Management (GMM) layer (above LLC layer)
  • For 3G: Logs the access application layer (above the RANAP layer)
• **gprs-app**: GPRS Application logging facility
• **gprs-ns**: GPRS Network Service Protocol (layer between SGSN and the BSS) logging facility
• **gq-rx-tx-diameter**: Gq/Rx/Tx Diameter messages facility
• **gss-gcdr**: GTPP Storage Server GCDR facility
• **gtp**: GTP-C protocol logging facility
• **gtpcmgr**: GTP-C protocol manager logging facility
• **gtpu**: GTP-U protocol logging facility
• **gtpumgr**: GTP-U Demux manager
• **gx-ty-diameter**: Gx/Ty Diameter messages facility
• **gy-diameter**: Gy Diameter messages facility
• **h248prt**: H.248 port manager facility
• **hamgr**: Home Agent manager logging facility
• **hat**: High Availability Task (HAT) process facility
• **hdctrl**: HD Controller logging facility
• **henbapp**: Home Evolved NodeB (HENB) App facility
• **henbgw**: HENB-GW facility
• **henbgw-pws**: HENB-GW Public Warning System logging facility
• **henbgw-sctp-acs**: HENB-GW access Stream Control Transmission Protocol (SCTP) facility
• **henbgw-sctp-nw**: HENBGW network SCTP facility
• **henbgwdemux**: HENB-GW Demux facility
• **henbgwmg**: HENB-GW Manager facility
• **hnb-gw**: HNB-GW (3G Femto GW) logging facility
• **hnbmgr**: HNB-GW Demux Manager logging facility
• **hss-peer-service**: Home Subscriber Server (HSS) Peer Service facility
• **igmp**: Internet Group Management Protocol (IGMP)
• **ikev2**: Internet Key Exchange version 2 (IKEv2)
• **ims-authoriztn**: IP Multimedia Subsystem (IMS) Authorization Service facility
• **ims-sh**: HSS Diameter Sh Interface Service facility
• **imsimgr**: SGSN IMSI Manager facility
• **imsue**: IMS User Equipment (IMSUE) facility
• **ip-arp**: IP Address Resolution Protocol facility
• **ip-interface**: IP interface facility
• **ip-route**: IP route facility
• **ipms**: Intelligent Packet Monitoring System (IPMS) logging facility
• **ipne**: IP Network Enabler (IPNE) facility
• **ipsec**: IP Security logging facility
• **ipsecdemux**: IPSec demux logging facility
• **ipsg**: IP Service Gateway interface logging facility
• **ipsgmgr**: IP Services Gateway facility
• **ipsp**: IP Pool Sharing Protocol logging facility
• **kvstore**: Key/Value Store (KVSTORE) Store facility
• **l2tp-control**: Layer 2 Tunneling Precool (L2TP) control logging facility
• **l2tp-data**: L2TP data logging facility
• **l2tpdemux**: L2TP Demux Manager logging facility
• **l2tpmgr**: L2TP Manager logging facility
• **lagmgr**: Link Aggregation Group (LAG) manager logging facility
• **lcs**: Location Services (LCS) logging facility
• **ldap**: Lightweight Directory Access Protocol (LDAP) messages logging facility
• **li**: Refer to the *Lawful Intercept Interface Reference* for a description of this command.
• **linkmgr**: SGSN/BSS SS7 Link Manager logging facility (2.5G only)
• **llc**: Logical Link Control (LLC) Protocol logging facility; for SGSN: logs the LLC layer between the GMM and the BSSGP layers for logical links between the MS and the SGSN
• **local-policy**: Local Policy Service facility
• **location-service**: Location Services facility
• **m3ua**: M3UA Protocol logging facility
• **magmgr**: Mobile Access Gateway manager logging facility
• **map**: Mobile Application Part (MAP) protocol logging facility
• **megadiammgr**: MegaDiameter Manager (SLF Service) logging facility
• **mme-app**: Mobility Management Entity (MME) Application logging facility
• **mme-misc**: MME miscellaneous logging facility
• **mmedemux**: MME Demux Manager logging facility
• **mmemgr**: MME Manager facility
• **mmgr**: Master Manager logging facility
- **mobile-ip**: Mobile IP processes
- **mobile-ip-data**: Mobile IP data facility
- **mobile-ipv6**: Mobile IPv6 logging facility
- **mpls**: Multiprotocol Label Switching (MPLS) protocol logging facility
- **mrme**: Multi Radio Mobility Entity (MRME) logging facility
- **mseg-app**: Mobile Services Edge Gateway (MSEG) application logging facility (This option is not supported in this release.)
- **mseg-gtpc**: MSEG GTP-C application logging facility (This option is not supported in this release.)
- **mseg-gtpu**: MSEG GTP-U application logging facility (This option is not supported in this release.)
- **msegmgr**: MSEG Demux Manager logging facility (This option is not supported in this release.)
- **mtp2**: Message Transfer Part 2 (MTP2) Service logging facility
- **mtp3**: Message Transfer Part 3 (MTP3) Protocol logging facility
- **multicast-proxy**: Multicast Proxy logging facility
- **nas**: Non-Access Stratum (NAS) protocol logging facility [MME 4G]
- **netwstrg**: Network Storage facility
- **npctrl**: Network Processor Unit Control facility
- **npudrv**: Network Processor Unit Driver facility [ASR 5500 only]
- **npumgr**: Network Processor Unit Manager facility
- **npumgr-act**: NPUMGR ACL logging facility
- **npumgr-drv**: NPUMGR DRV logging facility
- **npumgr-flow**: NPUMGR FLOW logging facility
- **npumgr-fwd**: NPUMGR FWD logging facility
- **npumgr-init**: NPUMGR INIT logging facility
- **npumgr-lc**: NPUMGR LC logging facility
- **npumgr-port**: NPUMGR PORT logging facility
- **npumgr-recovery**: NPUMGR RECOVERY logging facility
- **npumgr-rrl**: NPUMGR RRI (Reverse Route Injection) logging facility
- **npumgr-vpn**: NPUMGR VPN logging facility
- **npusim**: NPUSIM logging facility [ASR 5500 only]
- **ntf-intf**: Notification Interface logging facility [Release 12.0 and earlier versions only]
- **ocsp**: Online Certificate Status Protocol logging facility.
- **orbs**: Object Request Broker System logging facility
- **ospf**: OSPF protocol logging facility
- **ospfv3**: OSPFv3 protocol logging facility
- **p2p**: Peer-to-Peer Detection logging facility
- **pagingmgr**: PAGINGMGR logging facility
• **pccmgr**: Intelligent Policy Control Function (IPCF) Policy Charging and Control (PCC) Manager library
• **pdg**: Packet Data Gateway (PDG) logging facility
• **pdgdmgr**: PDG Demux Manager logging facility
• **pdif**: Packet Data Interworking Function (PDIF) logging facility
• **pgw**: Packet Data Network Gateway (PGW) logging facility
• **pmm-app**: Packet Mobility Management (PMM) application logging facility
• **ppp**: Point-To-Point Protocol (PPP) link and packet facilities
• **ppoe**: PPP over Ethernet logging facility
• **push**: VPNMGR CDR push logging facility
• **radius-acct**: RADIUS accounting logging facility
• **radius-auth**: RADIUS authentication logging facility
• **radius-coa**: RADIUS change of authorization and radius disconnect
• **ranap**: Radio Access Network Application Part (RANAP) Protocol facility logging info flow between SGSN and RNS (3G)
• **rct**: Recovery Control Task logging facility
• **rdt**: Redirect Task logging facility
• **resmgr**: Resource Manager logging facility
• **rf-diameter**: Diameter Rf interface messages facility
• **rip**: Routing Information Protocol (RIP) logging facility [RIP is **not** supported at this time.]
• **rlf**: Rate Limiting Function (RLF) logging facility
• **rohc**: Robust Header Compression (RoHC) facility
• **rsvp**: Reservation Protocol logging facility
• **rua**: RANAP User Adaptation (RUA) [3G Femto GW - RUA messages] logging facility
• **s1ap**: S1 Application Protocol (S1AP) Protocol logging facility
• **sabp**: Service Area Broadcast Protocol (SABP) logging facility
• **saegw**: System Architecture Evolution (SAE) Gateway facility
• **sbc**: SBC protocol logging facility
• **sccp**: Signalling Connection Control Part (SCCP) Protocol logging (connection-oriented messages between RANAP and TCAP layers).
• **sct**: Shared Configuration Task logging facility
• **sctp**: Stream Control Transmission Protocol (SCTP) Protocol logging facility
• **sef ecs**: Severely Errored Frames (SEF) APIs printing facility
• **sess-gr**: SM GR facility
• **sessctrl**: Session Controller logging facility
• **sessmgr**: Session Manager logging facility
• **sesstrc**: session trace logging facility
• **sft**: Switch Fabric Task logging facility
• sgs: SGs interface protocol logging facility
• sgsp-app: SGS-APP logging various SGSN “glue” interfaces (for example, between PMM, MAP, GPRS-FSM, SMS).
• sgsp-failures: SGSN call failures (attach/activate rejects) logging facility (2.5G)
• sgsp-gtpc: SGSN GTP-C Protocol logging control messages between the SGSN and the GGSN
• sgsp-gtpu: SGSN GTP-U Protocol logging user data messages between the SGSN and GGSN
• sgsp-mbms-bearer: SGSN Multimedia Broadcast/Multicast Service (MBMS) Bearer app (SMGR) logging facility
• sgsp-misc: Used by stack manager to log binding and removing between layers
• sgsp-system: SGSN System Components logging facility (used infrequently)
• sgsp-test: SGSN Tests logging facility; used infrequently
• sgtpcmgr: SGSN GTP-C Manager logging information exchange through SGTPC and the GGSN
• sgsw: Serving Gateway facility
• sh-diameter: Sh Diameter messages facility
• sitmain: System Initialization Task main logging facility
• sls: Service Level Specification (SLS) protocol logging facility
• sm-app: SM Protocol logging facility
• sms: Short Message Service (SMS) logging messages between the MS and the SMSC
• sndcp: Sub Network Dependent Convergence Protocol (SNDCP) logging facility
• snmp: SNMP logging facility
• sprmgr: IPCF Subscriber Policy Register (SPR) manager logging facility
• srdb: Static Rating Database
• srp: Service Redundancy Protocol (SRP) logging facility
• ssccfini: Service-Specific Coordination Function for Signaling at the Network Node Interface (SSCF-NNI) logging facility
• ssccop: Service-Specific Connection-Oriented Protocol (SSCOP) logging facility
• ssh-ipsec: Secure Shell (SSH) IP Security logging facility
• ssl: Secure Socket Layer (SSL) message logging facility
• stat: Statistics logging facility
• superserv: Supplementary Services logging facility [H.323]
• system: System logging facility
• tacacsplus: TACACS+ Protocol logging facility
• tcap: TCAP Protocol logging facility
• testctrl: Test Controller logging facility
• testmgr: Test Manager logging facility
• threshold: threshold logging facility
• ttg: Tunnel Termination Gateway (TTG) logging facility
• tucl: TCP/UDP Convergence Layer (TUCL) logging facility
Exec Mode Commands (D-S)

- **save logs**: Logs all events
- **udr**: User Data Record (UDR) facility (used with the Charging Service)
- **user-data**: User data logging facility
- **user-l3tunnel**: User Layer 3 tunnel logging facility
- **usertcp-stack**: User TCP Stack
- **vim**: Voice Instant Messaging (VIM) logging facility
- **vinfo**: VINFO logging facility
- **vmgctrl**: Virtual Media Gateway (VMG) controller facility
- **vmgctrl**: VMG Content Manager facility
- **vps**: Virtual Private Network logging facility
- **wimax-data**: WiMAX DATA
- **wimax-r6**: WiMAX R6
- **wsg**: Wireless Security Gateway (ASR 9000 Security Gateway)

### level severity_level
Specifies the level of information to be logged from the following list which is ordered from highest to lowest:

- **critical**: Logs critical events
- **error**: Logs error events and all events with a higher severity level
- **warning**: Logs warning events and all events with a higher severity level
- **unusual**: Logs unusual events and all events with a higher severity level
- **info**: Logs info events and all events with a higher severity level
- **trace**: Logs trace events and all events with a higher severity level
- **debug**: Logs all events

### pdu-data pdu_format
Specifies output format for the display of packet data units as one of:

- **none**: Raw format (unformatted).
- **hex**: Hexadecimal format.
- **hex-ascii**: Hexadecimal and ASCII similar to a main-frame dump.

### pdu-verbosity pdu_verboseness
Specifies the level of verboseness to use in displaying of packet data units as a value from 1 to 5, where 5 is the most detailed.

### since from_date_time [ until to_date_time ]
Default: no limit.

**since from_date_time**: Saves only the log information which has been collected more recently than from_date_time.

**until to_date_time**: Saves no log information more recent than to_date_time. Defaults to current time when omitted.
from_date_time and to_date_time must be formatted as YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss. Where:

- YYYY = 4-digit year
- MM = 2-digit month in the range 01 through 12
- DD = 2-digit day in the range 01 through 31
- HH = 2-digit hour in the range 00 through 23
- mm = 2-digit minute in the range 00 through 59
- ss = 2-digit second in the range 00 through 59

to_date_time must be a time which is more recent than from_date_time.

Using the until keyword allows for a time range of log information; using only the since keyword will display all information up to the current time.

**grep grep_options | more**

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in Command Line Interface Reference.
session trace

Enable or disables the subscriber session trace functionality based on a specified subscriber device or ID on one or all instance of session on a specified UMTS/EPS network element. It also clears/resets the statistics collected for subscriber session trace on a system.

Product
GGSN
MME
P-GW
SAEGW
S-GW

Privilege
Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
session trace { reset statistics | subscriber network-element { mme | pgw | sgw | ggsn saegw [func-pgw | func-sgw] [ imei id | imsi id | interface { all | interface } | target-all-ne | target-ne { enb [ target-interface { all | interface } ] | pgw [ target-interface { all | interface } ] | sgw [ target-interface { all | interface } ] } trace-ref id collection-entity ip_address

no session trace subscriber network-element [ mme | pgw | sgw | ggsn ] [ trace-ref id ]
```

no

Disables the entire session trace or for a specific network element and/or trace reference.

reset statistics

Clears/resets the entire session trace statistical data collected on a system.

⚠️ Caution: This is a system wide command that affects all statistical data.

```
session trace subscriber network-element { mme | pgw | sgw | ggsn }
```

Identifies the network element that, in turn, identifies the interfaces where the session trace is to occur.

Specific interfaces can be specified using the interface keyword described below.

**ggsn**: Specifies that the session trace is to occur on one or all interfaces on the GGSN.

**mme**: Specifies that the session trace is to occur on one or all interfaces on the MME.

**pgw**: Specifies that the session trace is to occur on one or all interfaces on the P-GW.

**sgw**: Specifies that the session trace is to occur on one or all interfaces on the S-GW.
### Exec Mode Commands (D-S)

#### session trace

**imei id**

Specifies the International Mobile Equipment Identification number of the subscriber UE. `id` must be the 8-digit TAC (Type Allocation Code) and 6-digit serial number. Only the first 14 digits of the IMEI/IMEISV are used to find the equipment ID.

**imsi id**

Specifies the International Mobile Subscriber Identification (IMSI). `id` must be the 3-digit MCC (Mobile Country Code), 2- or 3-digit MNC (Mobile Network Code), and the MSIN (Mobile Subscriber Identification Number). The total should not exceed 15 digits.

**interface { all | interface }**

Specifies the interfaces where the session trace application will collect data.

- `all`: Specifies all interfaces associated with the selected network element
- `interface`: Specifies the interface type where the session trace application will collect trace data. The following interfaces are applicable for each network element type:
  - **GGSN:**
    - `gi`: Specifies that the interface where the trace will be performed is the Gi interface between the GGSN and RADIUS server.
    - `gmb`: Specifies that the interface where the trace will be performed is the Gmb interface between the GGSN and BM-SC.
    - `gn`: Specifies that the interface where the trace will be performed is the Gn interface between the GGSN and the SGSN.
    - `gx`: Specifies that the interface where the trace will be performed is the Gx interface between the GGSN and PCRF.
    - `gy`: Specifies that the interface where the trace will be performed is the Gy interface between the GGSN and OCS.
  - **MME:**
    - `s1mme`: Specifies that the interface where the trace will be performed is the S1-MME interface between the MME and the eNodeB.
    - `s3`: Specifies that the interface where the trace will be performed is the S3 interface between the MME and an SGSN.
    - `s6a`: Specifies that the interface where the trace will be performed is the S6a interface between the MME and the HSS.
    - `s10`: Specifies that the interface where the trace will be performed is the S10 interface between the MME and another MME.
    - `s11`: Specifies that the interface where the trace will be performed is the S11 interface between the MME and the S-GW.
    - `s13`: Specifies that the interface where the trace will be performed is the S13 interface between the MME and the EIR.
  - **P-GW:**
    - `gx`: Specifies that the interface where the trace will be performed is the Gx interface between the P-GW and the PCRF.
    - `gy`: Specifies that the interface where the trace will be performed is the Gy interface between the P-GW and OCS.
**s2a**: Specifies that the interface where the trace will be performed is the S2a interface between the P-GW and the HSGW.

**s2b**: Specifies that the interface where the trace will be performed is the S2b interface between the P-GW and an ePDG.

**s2c**: Specifies that the interface where the trace will be performed is the S2c interface between the P-GW and a trusted, non-3GPP access device.

**s5**: Specifies that the interface where the trace will be performed is the S5 interface between the P-GW and the S-GW.

**s6b**: Specifies that the interface where the trace will be performed is the S6b interface between the P-GW and the 3GPP AAA server.

**s8b**: Specifies that the interface where the trace will be performed is the S8b interface between the P-GW and the S-GW.

**sgi**: Specifies that the interface where the trace will be performed is the SGi interface between the P-GW and the PDN.

**S-GW:**

**gxc**: Specifies that the interface where the trace will be performed is the Gxc interface between the S-GW and the PCRF.

**gy**: Specifies that the interface where the trace will be performed is the Gy interface between the S-GW and OCS.

**s11**: Specifies that the interface where the trace will be performed is the S11 interface between the S-GW and the MME.

**s4**: Specifies that the interface where the trace will be performed is the S4 interface between the S-GW and an SGSN.

**s5**: Specifies that the interface where the trace will be performed is the S5 interface between the S-GW and the P-GW.

**s8b**: Specifies that the interface where the trace will be performed is the S8b interface between the S-GW and the P-GW.

---

**target-all-ne**

This option is applicable for MME only. Specifies that the trace be propagated to neighboring Network Elements (NEs) including the eNodeB, P-GW and S-GW. With this option, tracing will occur on all applicable interfaces on the respective NEs.

```plaintext
target-ne { enb [ target-interface { all | interface } ] | pgw [ target-interface { all | interface } ] | sgw [ target-interface { all | interface } ] }
```

This option is applicable for MME only. The `target-ne { enb | pgw | sgw }` keyword specifies that the trace be propagated to the specified neighboring Network Elements (NE). More than one `target-ne` can be configured in the same command. The `target-interface { all | interface }` keyword specifies the interface on the target NE where the trace will be performed. Multiple target-interfaces can be defined within the same command.

**trace-ref id**

Specifies the trace reference for the trace being initiated. `id` must be the MCC (3 digits), followed by the MNC (3 digits), then the trace ID number (3-byte octet string).
**collection-entity ip_address**

Specifies the IP address of the collection entity where session trace data is pushed in IPv4 dotted-decimal notation.

**Usage**

Use this command to initiate a session trace for a specified subscriber device or ID on one or all interfaces on a specified network element.

**Important:** Session trace configuration is performed in the *Global Configuration Mode* using the `session trace` command. Refer to the *Global Configuration Mode Commands* chapter for more information.

**Example**

The following command initiates a session trace on a P-GW S5 interface for a subscriber with an IMSI of 322233123456789 and sets the trace reference as 322233987654 and the collection entity IP address as 10.2.3.4:

```
  session trace subscriber network-element pgw imsi 322233123456789
  interface s5 trace-ref 322233987654 collection-entity 10.2.3.4
```

The following command initiates a session trace on an MME S6a interface for a subscriber with an IMSI of 322233123456789 and sets the trace reference as 322233987654 and the collection entity IP address as 10.2.3.4:

```
  session trace subscriber network-element mme imsi 322233123456789
  interface s6a trace-ref 322233987654 collection-entity 10.2.3.4
```

The following command initiates a session trace on a Gn interface on GGSN between GGSN and SGSN for a subscriber with an IMSI of 322233123456789 and sets the trace reference as 322233987654 and the collection entity IP address as 10.2.3.4:

```
  session trace subscriber network-element ggsn imsi 322233123456789
  interface gn trace-ref 322233987654 collection-entity 10.2.3.4
```

**MME Only:** The following command activates a session trace on S-GW for S5 interface from the MME:

```
  session trace subscriber network-element mme imsi 0000012345 target-ne
  sgw target-interface s5
```
session trace signaling

Enable or disables the subscriber session trace functionality based on signaling information on one or all instance of session on a specified UMTS/EPS network element. It also clears/resets the statistics collected for subscriber session trace on a system.

Product
GGSN
P-GW

Privilege
Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

[no] session trace signaling network-element {ggsn | pgw}

no
Disables the entire session trace based on signaling information for a specific network element and/or trace reference.

session trace signaling network-element {pgw | ggsn}

Identifies the network element that where the session trace based on signaling information for a subscriber session is to occur. Specific network element GPRS/EPS can be specified for this session trace.

ggsn: Specifies that the session trace based on signaling is to occur on one or all interfaces on the GGSN.
pgw: Specifies that the session trace based on signaling is to occur on one or all interfaces on the P-GW.

Usage

Use this command to initiate a session trace for a specified subscriber based on signaling information on a specified network element.

Important: Session trace configuration is performed in the Global Configuration Mode using the session trace command. Refer to the Global Configuration Mode Commands chapter for more information.

Example

The following command initiates a session trace on a GGSN for a subscriber based on signaling information.

    session trace signaling network-element ggsn
session trace random

Enable or disables the subscriber session trace functionality based on a the random trace on the network element. If enabled, the subscriber selection will be based on random logic all instance of session on a specified UMTS/EPS network element. It also clears/resets the statistics collected for subscriber session trace on a system.

Product
GGSN
P-GW

Privilege
Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

[no] session trace random random_num network-element {ggsn | pgw} [interface {all | interface}]

no
Disables the entire random subscriber session trace or for a specific network element and/or interface.

session trace random random_num

Configures the number of random subscriber sessions where the session trace is to occur.
random_num is an integer between 1 to 1000 identified the number of subscribers to be selected by random logic.

network-element {ggsn | pgw}

Identifies the network element that, in turn, identifies the interfaces where the random session trace is to occur. Specific interfaces can be specified using the interface keyword described below.
ggsn: Specifies that the random session trace is to occur on one or all interfaces on the GGSN.
pgw: Specifies that the random session trace is to occur on one or all interfaces on the P-GW.

interface { all | interface }

Specifies the interfaces where the random session trace application will collect data.
all: Specifies all interfaces associated with the selected network element
interface: Specifies the interface type where the random session trace application will collect trace data.
The following interfaces are applicable for the network element type:

● GGSN:
  • gi: Specifies that the interface where the trace will be performed is the Gi interface between the GGSN and RADIUS server.
  • gmb: Specifies that the interface where the trace will be performed is the Gmb interface between the GGSN and BM-SC.
• **gn**: Specifies that the interface where the trace will be performed is the Gn interface between the GGSN and the SGSN.

• **gx**: Specifies that the interface where the trace will be performed is the Gx interface between the GGSN and PCRF.

• **gy**: Specifies that the interface where the trace will be performed is the Gy interface between the GGSN and Diameter.

• **P-GW**:

  • **gx**: Specifies that the interface where the trace will be performed is the Gx interface between the P-GW and the PCRF.

  • **gy**: Specifies that the interface where the trace will be performed is the Gy interface between the GGSN and Diameter.

  • **s2a**: Specifies that the interface where the trace will be performed is the S2a interface between the P-GW and the HSGW.

  • **s2b**: Specifies that the interface where the trace will be performed is the S2b interface between the P-GW and an ePDG.

  • **s2c**: Specifies that the interface where the trace will be performed is the S2c interface between the P-GW and a trusted, non-3GPP access device.

  • **s5**: Specifies that the interface where the trace will be performed is the S5 interface between the P-GW and the S-GW.

  • **s6b**: Specifies that the interface where the trace will be performed is the S6b interface between the P-GW and the 3GPP AAA server.

  • **s8b**: Specifies that the interface where the trace will be performed is the S8b interface between the P-GW and the S-GW.

  • **sgi**: Specifies that the interface where the trace will be performed is the SGi interface between the P-GW and the PDN.

**Usage**

Use this command to initiate the session trace for a specified subscriber sessions selected on random logic on one or all interfaces on a specified network element.

**Important**: Session trace configuration is performed in the *Global Configuration Mode* using the **session trace** command. Refer to the *Global Configuration Mode Commands* chapter for more information.

**Example**

The following command initiates a session trace on a GGSN Gx interface for **1000** subscriber session selected on random logic:

```
session trace random 1000 network-element ggsn interface gx
```
setup

Enters the system setup wizard which guides the user through a series of questions regarding the system basic configuration options, such as initial context-level administrative users, host name, etc.

**Product**
All

**Privilege**
Security Administrator, Administrator

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
setup
```

**Usage**
The setup wizard provides a user friendly interface for initial system configuration.

***Important:*** If the configuration script generated by the setup wizard is applied when an existing configuration is in use, the options which are common to both are updated and all remaining options are left unchanged.

**Example**

```
setup
```
**sgs offload**

Enables or disables offloading of UEs associated with a VLR which has become unavailable. This enables the MME to preemptively move subscribers away from a VLR which is scheduled to be put in maintenance mode.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
sgs offload sgs-service sgs_svc_name vlr vlr_name { start time-duration minutes | stop } [-noconfirm ]
```

**sgs-service sgs_svc_name**

Specifies the SGs service to which the VLR belongs. 

`s gs_svc_name` specifies the name of a pre-configured SGs service. For more information on the SGs service, refer to the `sgs-service` command in the Context Configuration Mode Commands chapter and refer to the MME SGs Service Configuration Mode Commands chapter.

**vlr vlr_name**

Specifies the VLR service which must have its UEs offloaded.

`vlr_name` specifies the name for a pre-configured VLR and must be an alphanumeric string of 1 through 63 characters. For more information, refer to the `vlr` command in the MME SGs Service Configuration Mode Commands chapter.

**start time-duration minutes**

Specifies that the UE offloading should be started for the specified the VLR.

`time-duration` defines the period in minutes over which all qualifying subscribers will be offloaded. 

`minutes` must be an integer from 0 to 3000.

A value of 0 enables only Passive VLR Offloading, where the MME marks all affected sessions with the “VLR Offload” flag. During the next UE activity, the MME requires each UE to perform a combined TAU/LAU. This flag is not affected by the removal of the “offload” state by the operator. Even though the VLR state may later change from “offloaded” to “not-offloaded”, the subscriber’s state will not change to “not-offloaded”.

A value of 1-3000 enables Active VLR Offloading and Passive VLR Offloading. The MME splits this time-duration into n intervals, 5 seconds apart. A maximum of 50 subscribers will be actively detached per interval. For example, a setting of 120 minutes with 60000 subscribers would process all subscribers in 100 minutes. Any subscribers remaining at the expiry of the time-duration will not be detached.

**Note:** For Release 12.2, only Passive VLR Offloading is supported. While the `time-duration` value is not used in Release 12.2 or earlier, it is required for completion of the `start` command.
**stop**

Specifies that the offload state should no longer be set for the specified VLR.

**-noconfirm**

Indicates that the command is to execute without additional prompt and confirmation from the user.

**Usage**

This command enables the MME to preemptively move subscribers away from a VLR which is scheduled to be put in maintenance mode. When this offload command is set on the MME, all sessions matching this VLR are marked with an “offload” flag. If the time-duration keyword is set to 1-3000, sessions are also detached and required to reattach.

The behavior of SGs with respect to “Location Updates” towards the MSC is similar to the behavior when the “VLR Reliable” flag is set to “false”. In other words, for offloaded subscribers, normal Combined TAsUs (without IMSI Attach) and periodic TAsUs will trigger a LU towards the MSC.

When issuing the command, the MME notifies the operator if this is the last available VLR in a pool.

More than one VLR may be offloaded at the same time.

VLR Offloading and MME offloading cannot be performed at the same time.

**Important:** This is a licensed feature and is unavailable unless the proper licensed is installed.

**Related Commands:**

- To display VLR offload information and statistics for a specified SGs service name, refer to the `show sgs-service offload-status service-name sgs_svc_name` command.

- To clear the counters displayed by the previous command, issue the `clear sgs-service statistics service-name sgs_svc_name` command.

**Example**

The following command starts offloading the subscribers associated with `vlrl` over the next 60 minutes.

```
sgs offload sgs-service sgs1 vlr vlrl start time-duration 60 -noconfirm
```
**sgs vlr-failure**

This command configures the MME to monitor all VLRs and perform a controlled release (detach) of affected UEs when any VLR becomes unavailable.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
[no] sgs vlr-failure sgs-service sgs_svc_name duration minutes backoff-timer seconds [ -noconfirm ]
```

- **no**
  Resets the command to its default setting of disabled.

  `sgs-service sgs_svc_name`

  Specifies the SGs service to which the VLR belongs.
  `sgs_svc_name` specifies the name of a pre-configured SGs service.

  `duration minutes`

  Specifies the amount of time in minutes during which all qualifying UEs will be detached. The MME splits this duration into \( n \) intervals, 5 seconds apart. A maximum of 50 subscribers are processed per interval. For example, a setting of 2 minutes with 100 subscribers would result in the MME processing all subscribers in the first 2 intervals (10 seconds). Any subscribers remaining at the expiry of the duration will not be processed.
  `minutes` must be an integer from 1 through 3000.

  `backoff-timer seconds`

  Specifies the period of time the MME will wait following the detection of a VLR condition before starting the controlled release of affected UEs.
  `seconds` must be an integer from 1 to 3000.

  `-noconfirm`

  Indicates that the command is to execute without additional prompt and confirmation from the user.
Usage

When this command is issued, the MME monitors the availability of all VLRs. If one or more VLRs become unavailable, the MME performs a controlled release (EPS IMSI detach) for all UEs associated with that VLR. If another VLR is available, the MME sends a combined TA/LA Update with IMSI attach. This command remains active until it is disabled with the `no sgs vlr-failure` command.

**Important:** This is a licensed feature and is unavailable unless the proper licensed is installed.

Related Commands:
- To display VLR failure information and statistics, refer to the `show sgs-service vlr-status full` command.

Example

The following enables the monitoring and automatic detach of UEs when any VLR becomes unavailable. The MME will wait 2 minutes (120 seconds) after detecting a VLR condition before starting the controlled release of the affected UEs. The MME will process the UEs over a span of 60 minutes.

```
sgs vlr-failure sgs-service sgs1 duration 60 backoff-timer 120 -noconfirm
```
sgs vlr-recover

This command enables active recovery of Circuit Switched Fall Back (SMS-only) UEs when a failed VLR becomes responsive again.

Usage
When this command is issued, the MME monitors the availability of all VLRs. If a failed VLRs become available again, the MME attempts to recover CSFB (SMS-only) UEs that failed while the VLR was unavailable with an EPS Detach.

Important: This is a licensed feature and is unavailable unless the proper licensed is installed.

Related Commands:
- To display VLR recovery information and statistics, refer to the `show sgs-service vlr-status full` command.

Example
The following enables the active recovery of Circuit Switched Fall Back (SMS-only) UEs when a failed VLR becomes responsive again. The MME will wait 2 minutes (120 seconds) after detecting a recovered VLR before starting the recovery of the affected UEs. The MME will process the UEs over a span of 60 minutes.

```
sgs vlr-recover sgs-service sgsl duration 60 backoff-timer 120 -noconfirm
```
**sgsn clear-congestion**

This command clears (terminates) congestion triggered using the `sgsn trigger-congestion` command.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
sgsn clear-congestion
```

**Usage**
This command is only used if the `sgsn trigger-congestion` command has been issued in an O&M scenario. This `sgsn clear-congestion` command causes the GSN to resume normal operations and does not apply any congestion control policy.

**Example**
Clear the triggered congestion on the SGSN.

```
sgsn clear-congestion
```
sgsn clear-detached-subscriptions

Clears subscription data belonging to a subscriber who has already detached.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

sgsn clear-detached-subscriptions imsi imsi

imsi imsi

Specifies the international mobile subscriber identity (IMSI) of the subscriber session identifying the subscription data to be cleared.

Usage

This command can be issued on either a 2G or 3G SGSN to clear subscription data (including subscription information, and information for P-TMSI allocated, received authorization vectors, and NGAF flag values). This command is only effective if the subscriber has already detached.

After the data is purged, the SGSN sends an appropriate message to the HLR.

Related Commands:

- To clear subscription data for subscribers that are currently attached, refer to the admin-disconnect-behavior clear-subscription commands described in the chapters for GPRS Service Configuration Mode or the SGSN Service Configuration Mode.

Example

sgsn clear-detached-subscriptions imsi 040501414199978
sgsn imsimgr

Initiates an audit for managing the SGSN’s IMSI manager’s (IMSIMgr) IMSI table.

**Important:** These commands are used primarily for troubleshooting purposes and are intended for the use of specially trained service representatives.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#  
```

**Syntax**

```
sgsn imsimgr { add-record imsi sessmgr instance sessmgr# | audit-with sessmgr { all | instance sessmgr# } | remove-record imsi }
```

- **add-record** *imsi*
  Adds a record for an IMSI to the IMSI manager’s table and associates a specific session manager (SessMgr) with the IMSI.
  
  *imsi:* Enter up to 15 digits. An IMSI consists of the 3-digit MCC (mobile country code) + the 2- or 3-digit MNC (mobile network code) + the MSIN (mobile station identification number) for the remaining 10 or 9 digits (depending on the length of the MNC).

- **audit-with**
  Initiates an IMSI audit with all SessMgrs or a Session Manager (SessMgr) instance specified.

- **remove-record** *imsi*
  Deletes a specific IMSI from the IMSI table.
  
  *imsi:* Enter up to 15 digits. An IMSI consists of the 3-digit MCC (mobile country code) + the 2- or 3-digit MNC (mobile network code) + the MSIN (mobile station identification number) for the remaining 10 or 9 digits (depending on the length of the MNC).

- **sessmgr instance sessmgr#**
  For releases prior to 14.0, this keyword specifies a Session Manager (SessMgr) instance associated with the IMSI as an integer from 0 through 4095.
  
  For releases 14.0 and later, this keyword specifies a Session Manager (SessMgr) instance associated with the IMSI as an integer from 0 through 384.
Usage
Use this command to manage the IMSIMgr’s IMSI table, and to initiate an audit of one or more SessMgrs with the IMSIMgr so that the IMSI table has the correct IMSI-SessMgr association. After this audit, any IMSI in the IMSIMGR which is not found in any Sessmgr is deleted and similarly any missing entries at the IMSIMgr are created.

Example
Delete IMSI 044133255524211 from the audit table:

    sgsn imsimgr remove-record 044133255524211
Instructs the SGSN to begin the offloading procedure and actually starts and stops the offloading of subscribers which is part of the SGSN Gb (2G) or Iu (3G) Flex load redistribution functionality.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name# 
```

**Syntax**

```
```

**gprs-service svc_name**

Specifies a unique alphanumeric string of 1 through 63 characters that identifies a GPRS service that has already been defined for the 2G SGSN configuration.

**sgsn-service svc_name**

Specifies a unique alphanumeric string of 1 through 63 characters that identifies an SGSN service that has already been defined for the 3G SGSN configuration.

**activating**

Instructs the SGSN to off load any subscribers sending an “activate request” message.

**connecting**

Instructs the SGSN to off load any subscribers sending either an Attach Request or a RAU Request message. Including this keyword without adding the target-nri and target-count keywords activates local offloading.

**imsi imsi**

Identifies a subscriber by the international mobile subscriber ID (IMSI) which consists of the 3-digit MCC (mobile country code) + the 2- or 3-digit MNC (mobile network code) + the MSIN (mobile station identification number) for the remaining 10 or 9 digits (depending on the length of the MNC).

*imsi*- enter an integer comprising up to 15 digits.
Exec Mode Commands (D-S)

sgsn offload

**nri-value** _nri-value_

Sets the local NRI. Including this keyword in the configuration instructs the SGSN to check the P-TMSI and use the SGSN matching the configured NRI value to off load subscribers.

**Important:** _nri-value_ and **target-nri** are mutually exclusive.

_nri-value_ is an integer from 1 through 63 that identifies a specific, already defined, SGSN in a pool. (NRI defined in the service configuration.)

Use of 0 (zero) value is not recommended.

**stop**

Instructs the SGSN to stop offloading subscribers from the pool area.

**target-nri** _target_nri_

Instructs the SGSN to begin dynamically load balancing across a network of pooled SGSNs.

_target_nri_ is an integer from 0 through 63 that identifies an already defined target NRI (SGSN) to which the subscribers are to be offloaded. (NRI previously defined in the service configuration.)

Use of 0 (zero) value is not recommended.

**target-count** _target_count_

Identifies the number of subscribers to be offloaded as an integer from 0 through 4000000. Instructs the SGSN to begin target count-based offloading.

**t3312-timeout** _seconds_

Sets the timer (in seconds) for sending period RAUs to the MS as an integer from 2 through 60. Default: 4

**Usage**

Use this command to configure the offloading of subscribers which is a part of the SGSN’s load redistribution operation. This command can be used anytime an SGSN is to be taken out of service. Commands, with different NRI values, are repeated to expand/contract the radius of the offloading. Target count-based offloading and local offloading can not run simultaneously. When target count offloading is to be used, you should choose an algorithm to control offloading from the perspective of the IMSIMGR and SESSMGR. This is done with the **target-offloading** command in the SGSN-Global configuration mode.

**Example**

The following is a series of two commands to initiate **local offloading**.

Command 1: The following command instructs the SGSN to begin local offloading for the local NRI id 1 included in the **gprs1** GPRS service configuration:

```
sgsn offload gprs-service gprs1 connecting nri-value 1
```

Command 2: Enter this second command to add offloading for NRI 2 to the offloading already occurring for NRI 1:

```
sgsn offload gprs-service gprs1 connecting nri-value 2
```

The following is a series of commands to discontinue local offloading and to initiate **target count-based offloading**.
Command 1: The following command instructs the SGSN to discontinue local offloading for NRIs 5 included in the sgsnserv4 SGSN service configuration:

\[
\text{sgsn offload sgsn-service sgsnserv4 connecting stop nri 5}
\]

**Important:** The next command is an example of provision configuration for multiple NRI with a single command.

Command 2: The following command instructs the SGSN to initiate target count-based offloading for target NRI 5 to a target count of 10000 and target NRI 6 to count of 300000:

\[
\text{sgsn offload sgsn-service sgsnserv4 connecting target-nri 5 target-count 100000 target-nri 6 target-count 300000}
\]
sgsn op

Instructs the SGSN to begin specific operations or functions.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

sgsn op { auth-ptmsi-counters imsi imsi | convert | nse { fr | ip | sgsn-invoke-trace } | show | ss7-rd ss7-rd_id { destination | link | linkset | peer } }

auth-ptmsi-counters imsi imsi
Displays the authentication, P-TMSI reallocation, and P-TMSI signature reallocation counters for the specified IMSI.

imsi: Enter a unique 15-digit number associated with a mobile phone.

convert point-code pt_code variant variant
Converts SS7 point codes, according to identified variants, from dotted-decimal format to decimal format and vice versa.

point-code pt_code: Enters an SS7 point code in either dotted-decimal format or decimal format.

variant variant: Identifies the appropriate variant for the point code:

• ansi
• itu
• ttc

nse { fr operation | ip operation | sgsn-invoke-trace nse-id nse_id }
Enables the operator to perform a range of live control functions (for example, reset, block, unblock) for various types of virtual connections based on the signalling type of the NSE:

fr: Identifies a Frame Relay NSE.

ip: Identifies an IP NSE.

operation: Identifies the operation to be performed for the NSE connection (if available for the selected signalling type):

• block nse-id nse_id: Blocks signal flow through all network service virtual connections (NSVC) for the specified NSE:

  • nse_id: an integer from 0 to 65535.

• bvc-flc-limit rate rate bvc-id bvc_id nse-id nse_id: SGSN initiates flow control at the defined percentage rate to limit the flow through the BSSGP virtual connection (BVC) for the specified NSE and optionally for a specified BVC.
•rate: an integer from 0 to 100.
•bvc_id: an integer from 0 to 65000.
•nse_id: an integer from 0 to 65535.

•bvc-reset  bvc_id bvc_id nse_id nse_id: SGSN initiates a BVC-Reset on the specified BVC and NSE:
  •bvc_id: an integer from 0 through 65000.
  •nse_id: an integer from 0 through 65535.

•nsvc nsvc_id { block | enable | disable | unblock } nse_id: SGSN initiates NS-Block or NS-Unblock for the specified NSVC of the specified NSE:
  •nsvc_id: an integer from 0 through 65535.
  •nse_id: an integer from 0 through 65535.

•reset nse-id nse_id: SGSN initiates NS-Reset for all NSVC configured in the NSE. nse_id is an integer from 0 through 65535.

•unblock nse-id nse_id: SGSN initiates NS-Unblock for all NSVC configured for the specified NSE. nse_id is an integer from 0 through 65535.

sgsn-invoke-trace nse-id nse_id record-type record_type trace-reference reference [ mobile-id type id_type | trace-transaction-id trace_id ]:

**Important:** This command can be used for troubleshooting/debugging purposes and is primarily intended for the use of specially trained service representatives.

Instructs the SGSN (1) to send the BSSGP message SGSN-INVOKE-TRACE to the BSC to initiate a BSC trace of a particular MS and (2) to define the type and triggering of the trace.

•nse_id: Identifies the peer NSE, enter an integer from 0 to 65535.

•record_type: Specifies the type of trace to be performed:
  •basic
  •handover
  •no-bss-trace
  •radio

•trace-reference reference: Specifies the trace reference ID as an integer from 0 to 65535.

•mobile-id type id_type: Select the appropriate mobile ID type for the MS that is to be traced:
  •imei value value: Specifies the mobile ID type as the unique International Mobile Equipment Identity.
    value: 15-digit IMEI value.
  •imeisv value value: Specifies the mobile ID type as the unique International Mobile Equipment Identity with the two-digit software version number.
    value: 16-digit IMEISV value.
  •imsi value value: Specifies the mobile ID type as a network unique International Mobile Subscriber Identity as a 15-digit IMSI value.

•trace-transaction-id trace_id: Specifies the trace transaction ID as an integer from 0 through 65535.
Show PLMN-List Smgr-Inst Sessmgr# 

**Important:** This function is only available in release 8.1.

SGSN displays the configured PLMN list for the specified session manager (SessMgr):

```
show plmn-list smgr-inst sessmgr#
```

The `ss7-rd` commands assist with troubleshooting connections between the SGSN and the peer server.

```
ss7-rd ss7-rd_id { destination | link | linkset | peer }
```

- `ss7-rd_id`: Specifies the configured SS7 routing domain as an integer from 1 through 12.

**destination audit asp-instance asp_id peer-server-id peer_id psp-instance-id psp_id**

Initiates destination audit (DAUD) messages for all point codes reachable via the identified peer server, which is in restricted/unavailable/congested state due to DRST/DUNA/SCON messages respectively from the far end.

- `asp_id`: Specifies the relevant ASP configuration ID as an integer from 1 through 4.
- `peer_id`: Specifies the relevant peer server configuration ID as an integer from 1 through 144.
- `psp_id`: Specifies the relevant PSP configuration ID as an integer from 1 through 4

**link procedure linkset-id linkset_id link-id link_id**

Initiates MTP3 network link management procedures for the specified link:

- `activate`: Activates the deactivated link.
- `deactivate`: Deactivates specified link.
- `deactivate-12-only`: Deactivates the link only at the MTP3 layer.
- `inhibit`: Inhibits the link only if it does not make any destination unreachable.
- `uninhibit`: Uninhibits the inhibited link.
- `linkset_id`: an integer between 1 and 144.
- `link_id`: an integer between 1 and 16.

**linkset-id procedure linkset-id linkset_id**

Initiates MTP3 network link management procedures for all the links in the specified linkset:

- `activate`: Activates the deactivated linkset.
- `deactivate`: Deactivates the linkset.
- `deactivate-12-only`: Deactivates the linkset only at MTP3 layer.
- `linkset_id`: an integer between 1 and 144.

**peer message asp-instance asp_id peer-server-id peer_id psp-instance-id psp_id**

Initiates one of the following SCTP/M3UA management messages from the identified link:

- `abort`: Sends an SCTP Abort message which aborts the SCTP association ungracefully.
- `activate`: Sends an M3UA ASP Active message to activate the link.
- `down`: Sends an M3UA ASP Down message to bring down the M3UA link.
- `establish`: Sends an SCTP INIT message to start the SCTP association establishment.
• **inactivate**: Sends an M3UA ASP Inactive message to deactivate the link.
• **inhibit**: Inhibits the M3UA link locally when the operator wants to lockout the link.
• **terminate**: Sends SCTP Shutdown message which closes the SCTP association gracefully.
• **un-inhibit**: Uninhibits the M3UA link.
• **up**: Sends an M3UA ASP UP message to bring up the M3UA link.
• **asp_id**: Specifies a relevant ASP configuration ID as an integer from 1 through 4.
• **peer_id**: Specifies the relevant peer server configuration ID as an integer from 1 through 144.
• **psp_id**: Specifies the relevant PSP configuration ID as an integer from 1 through 4

**Usage**

In most cases, an operator will block/unblock/reset from the BSC-side. The nse commands cause the SGSN to initiate actions, usually for one of the following reasons:
• to resolve issues on the BSC-side,
• as part of an upgrade to the BSC,
• as part of link expansion,
• to resolve NSVC/BVC status mismatches observed between the SGSN and BSC.

The **sgsn-invoke-trace** command initiates the trace procedure where the BSC begins a trace record on a specified MS.

**Example**

The following command instructs the SGSN to initiate an NS-Block for all NSVC associated with Frame Relay NSE ID 2422:

```
sgsn op nse fr unblock nse-id 2422
```

Activate linkset 1 configured in SS7 routing domain 1:

```
sgsn op ss7-rd 1 linkset activate linkset-id 1
```
sgsn retry-unavailable-ggsn

 Marks the GGSN as available for further activation.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

sgsn retry-unavailable-ggsn ip_address

  ip_address

  Specifies the IP address of a GGSN in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

Usage

This command allows the operator to directly inform both the session manager and the SGTPC manager that the GGSN has been removed from a blacklist and is now available for activations. This action would override the GGSN blacklist timer configuration with ggsn-fail-retry-timer in the SGTP service configuration mode.

Example

The following command indicates that the GGSN identified by its IP address is now available for activation:

  sgsn retry-unavailable-ggsn 198.168.128.8
**sgsn trigger-congestion**

This command triggers a congestion state for the entire SGSN for operations and maintenance purposes (e.g., testing).

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
sgsn trigger-congestion level { critical | major | minor }
```

- **critical | major | minor**
  Select one of the three congestion severity levels. Each level is associated with congestion threshold settings and a congestion-action-profile.

**Usage**

Use the `sgsn clear congestion` to disable congestion simulation and return to normal operations. Use the `show congestion-control configuration` command to display the SGSN’s congestion-control policy with the congestion-action-profile name association with the level of congestion severity.

**Example**

Enable critical congestion control response testing with the following command:

```
sgsn trigger-congestion level critical
```
sgtpc test echo sgsn-address

Initiates SGTPC echo test procedure.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
sgtpc test echo sgsn-address

sgsn-address sgsn_ip_address { all | ggsn-address ggsn_ip_address }
```

- **sgsn-address sgsn_ip_address**
  Identifies the IP address of the SGSN issuing the test in IPv4 dotted-decimal notation.

- **all**
  Sends GTPC echo requests to all GGSNs having current sessions with the SGTP service.

- **ggsn-address ggsn_ip_address**
  Sends a GTPC echo request to the specified GGSN whether or not the GGSN has active sessions with the SGTP service. `ggsn_ip_address` is entered using IPv4 dotted-decimal notation.

Usage

This command initiates a test for the GTPC echo procedure -- echo from the specified SGSN to a specified GGSN or to all GGSNs that have sessions with the SGTP service. Issue the command from the Exec Mode within the context in which the SGTP service is configured. Note that if the GGSN does not respond to the initial echo request, the echo requests will be retried for the max-retransmissions times.

Example

This SGSN with IP address of 10.1.1.1 sends an echo test to all GGSNs attached to the SGTP service:

```
sgtpc test echo sgsn-address 10.1.1.1 all
```
**shutdown**

Terminates all processes within the chassis. After all processes are terminated, the system initiates a hardware reset (reboot). This command is identical to the `reload` command.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
shutdown [ -noconfirm ]
```

- `-noconfirm` executes the command without any additional prompts or confirmation from the user.

**Usage**

The system performs a hardware reset and reloads the highest priority boot image and configuration file specified in the boot.sys file. Refer to the `boot system priority` command in the Global Configuration Mode for additional information on configuring boot images, configuration files and priorities.

**Important:** To avoid the abrupt termination of subscriber sessions, it is recommended that a new call policy be configured and executed prior to invoking the `shutdown` command. This policy sets busy-out conditions for the system and allows active sessions to terminate gracefully. Refer to the `newcall` command in the Exec Mode for additional information.

**Caution:** Issuing this command causes the system to become unavailable for session processing until the reboot process is complete.

**Example**

The following command performs a hardware reset on the system:

```
shutdown
```
sleep

Pauses the command line interface (CLI).

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

sleep seconds

sleep seconds
Specifies the number of seconds to pause as an integer from 1 through 3600.

Usage
Sleep is a command delay which is only useful when creating command line interface scripts such as predefined configuration files/scripts.

Example
The following will cause the CLI to pause for 30 seconds.

sleep 30
srp initiate-audit

Initiates an SRP audit between active and standby ICSR chassis.

**Product**
All products that support ICSR

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec
The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
srp initiate-audit manual-with-sync
```

**Usage**
When issued from the active chassis, this command initiates a forced audit between ICSR chassis. This audit ensures that two ICSR peers are synchronized and identifies any discrepancies prior to scheduled or unscheduled switchover events.

**Example**
The following command initiates a forced audit between ICSR chassis.

```
srp initiate-audit manual-with-sync
```
srp initiate-switchover

Changes the device status on the primary and backup chassis configured for Interchassis Session Recovery (ICSR) support employing Service Redundancy Protocol (SRP).

Product
All products that support ICSR

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

srp initiate-switchover [ force | post-processing-timeout | reset-route-modifier | timeout seconds ] [ -noconfirm ]

force
Switchover by force, without any validating checks.

post-processing-timeout
Specifies the timeout value (in seconds) to initiate the post-switchover process as an integer from 0 through 3600.

reset-route-modifier
During a switchover, resets the route-modifier to the initial value.

timeout seconds
Specifies the number of seconds before a forced switchover occurs as an integer from 0 through 65535. Default: 300

-noconfirm
Executes the command without any additional prompt and confirmation from the user.

Usage
This command executes a forced switchover from active to inactive. The command must be executed on the active system and switches the active chassis to the inactive state and the standby system to an active state.

Example
The following initiates a switchover in 30 seconds.

    srp initiate-switchover timeout 30
srp reset-auth-probe-fail

Resets Service Redundancy Protocol (SRP) authentication probe monitor failure information.

Product
All products that support Interchassis Session Recovery (ICSR)

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

srp reset-auth-probe-fail

Usage

This command resets the auth probe monitor failure information to 0.
srp reset-diameter-fail

Resets Service Redundancy Protocol (SRP) Diameter monitor failure information.

**Product**
All products that support Interchassis Session Recovery (ICSR)

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec
The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
srp reset-diameter-fail
```

**Usage**
This command resets the Diameter monitor failure information to 0.
srp terminate-post-process

Forcibly terminates post-switchover processing by primary and backup chassis configured for Interchassis Session Recovery (ICSR) support employing Service Redundancy Protocol (SRP).

Product
All products that support ICSR

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

srp terminate-post-process [ -noconfirm ]

- noconfirm
Executes the command without any additional prompt and confirmation from the user.

Usage
Use this command to force the termination of post-switchover processing.

Example

srp terminate-post-process
srp validate-configuration

Initiates a configuration validation check from the active chassis via Service Redundancy Protocol (SRP).

Product
All products that support Interchassis Session Recovery (ICSR)

Privilege
Security Administrator, Administrator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

srp validate-configuration

Usage
Validates the configuration for an active chassis.
srp validate-switchover

Validates that both the active and standby chassis are ready for a planned Service Redundancy Protocol (SRP) switchover.

Product
All products that support Interchassis Session Recovery (ICSR)

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

srp validate-switchover

Usage
Validates that both the active and standby chassis are ready for a planned SRP switchover.
**ssh**

Connects to a remote host using a secure shell (SSH) interface.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
ssh { host_name | host_ip_address } [ port port_num ] [ user user_name ]
```

- **host_name | host_ip_address**
  Identifies the remote node with which to attempt connection.
  - **host_name**: specifies the remote node using its logical host name which must be resolved via DNS lookup.
  - **host_ip_address**: specifies the remote node using its assigned IP address in IPv4 dotted-decimal notation.

- **port port_num**
  Specifies a specific port for connection as an integer from 1025 through 10000.

- **user user_name**
  Specifies the user name attempting connection.

**Usage**

SSH connects to a remote network element using a secure interface.

**Example**

The following connects to remote host `remoteABC` as user `user1`.

```
ssh remoteABC user user1
```

The following connects to remote host `10.2.3.4` without any default user.

```
ssh 10.2.3.4
```

The following connects to remote host `10.2.3.4` via port `2047` without any default user.

```
ssh 10.2.3.4 port 2047
```
start crypto security-association

Starts Internet Key Exchange (IKE) negotiations.

Product
- PDSN
- HA
- GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

start crypto security-association cryptomap

Syntax Description:

 cryptomap
      Specifies the name of an existing crypto map policy to use when starting the IKE negotiations as an alphanumeric string of 1 through 127 characters.

Usage
Use this command to start IKE negotiations for IPSEC.

Example
The following command starts the IKE negotiations using the parameters set in the crypto map named cryptomap1:

    start crypto security-association cryptomap1
**system**

Configures information about the system that will be accessible by the SNMP agent.

**Product**
P-GW  
SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
system { carrier-id mcc mcc_num mnc mnc_num | contact name | description description | hostname name | location location }

default system { contact | description | hostname | location }

no system carrier-id
```

---

`carrier-id mcc mcc_num mnc mnc_num`

Specifies the system’s Carrier ID via the three-digit MCC (mobile country code) and three-digit MNC (mobile network code).

---

`contact name`

Specifies the system’s contact name as an alphanumeric string from 0 through 255 characters.

---

`description description`

Defines description text that as an alphanumeric string from 1 through 255 characters that includes text and some parameters, including:

- `%version%` - software version
- `%build%` - software build number
- `%chassis%` - chassis type (“asr5000”)
- `%staros%` - ID of the kernel revision
- `%ostype%` - os type
- `%hostname%` - system name
- `%release%` - release
- `%kerver%` - kernel version
- `%machine%` - machine hardware name

Default: “%ostype% %hostname% %release% %kerver% %machine%”

After replacing the parameters with values, the string will be truncated if the length is greater than 255.
hostname name
Specifies the system’s host name (name of system) as an alphanumeric string of 1 through 63 characters.

location location
Specifies the system’s geographic or referenced location as an alphanumeric string of 0 through 255 characters.

default system { contact | description | hostname | location }
Sets/restores the default value assigned for specified parameter.

no system carrier-id
Removes the Carrier ID established for the system.

Usage
Use this command to configure information about the system that is accessible by the SNMP agent.

Example
The following command identifies the system’s location as boston:

    system location boston
Chapter 130
Exec Mode Commands (T-Z)

This section includes the commands `telnet` through `upgrade url-blacklisting database`.

The Exec Mode is the initial entry point into the command line interface system. Exec mode commands are useful in troubleshooting and basic system monitoring.

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

---

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
tcpdump kernel

Runs the tcpdump packet analyzer and prints out a description of the contents of packets on a specified network interface that match the boolean expression.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
tcpdump kernel string
```

`string`

Specifies an existing interface match string as an alphanumeric string of 0 through 80 characters.

**Usage**

Runs the tcpdump packet analyzer and prints out a description of the contents of packets on a specified network interface that match the boolean expression. This analyzer performs a sniff operation at the mcdma0 interface using the kernel BIA (Bump-in-the-API) as a filter. This allows sniffing of kernel traffic complete with midplane header.
**telnet**

Connects to a remote host using the terminal-remote host protocol and a hostname or IPv4 address and port number.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
telnet { host_name | host_ipv4_address } [ port port_num ]
```

- `host_name | host_ipv4_address`
  
  Identifies the remote node with which to attempt connection.

  - `host_name`: specifies the remote node using its logical host name which must be resolved via DNS lookup.
  - `host_ipv4_address`: specifies the remote node using its assigned IP address entered using the IPv4 dotted-decimal notation.

- `port port_num`
  
  Specifies a specific port for connection as an integer from 1025 through 10000.

**Usage**

Telnet to a remote node for maintenance activities and/or troubleshooting when unable to do so directly.

**Important:** `telnet` is not a secure method of connecting between two hosts. `ssh` should be used whenever possible for security reasons.

**Example**

The following connects to remote host `remoteABC`.

```
telnet remoteABC
```

The following connects to remote host `10.2.3.4 port 2047`.

```
telnet 10.2.3.4 port 2047
```
**telnet6**

Connects to a remote host using the terminal-remote host protocol and a hostname or an IPv6 address and port number.

**Product**

All

**Privilege**

Security Administrator, Administrator, Operator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
telnet6 { host_name | host_ipv6_address } [ port port_num ]
```

- **host_name | host_ipv6_address**
  
  Identifies the remote node with which to attempt connection.
  
  - **host_name**: specifies the remote node using its logical host name which must be resolved via DNS lookup.
  
  - **host_ipv6_address**: specifies the remote node using its assigned IP address entered using the IPv6 colon-separated-hexadecimal notation.

- **port port_num**

  Specifies a specific port for connection as an integer from 1025 through 10000.

**Usage**

Telnet to a remote node for maintenance activities and/or troubleshooting when unable to do so directly.

**Important**: `telnet6` is not a secure method of connecting between two hosts. `ssh` should be used whenever possible for security reasons.

**Example**

The following connects to remote host `remoteABC`:

```
telnet6 remoteABC
```

The following connects to remote host `FE80::172.30.67.89` port `2047`.

```
telnet6 FE80::172.30.67.89 port 2047
```
terminal

Sets the number of rows or columns for display output.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
terminal { length lines | width characters }
```

<table>
<thead>
<tr>
<th>length lines</th>
<th>width characters</th>
</tr>
</thead>
<tbody>
<tr>
<td>length lines: sets the terminal length in number of lines (rows) of text from 5 to 4294967295 lines or the special value of 0 (zero). The value 0 sets the terminal length to infinity.</td>
<td></td>
</tr>
<tr>
<td>width characters: sets the terminal width in number of characters from 5 to 512 characters.</td>
<td></td>
</tr>
</tbody>
</table>

Usage

Set the length to 0 (infinite) when collecting the output of a command line interface session which is part of a scripted interface.

Example

The following sets the length then width in two commands.

```
terminal length 66
terminal width 160
```

The following command sets the number of rows of the terminal to infinity.

```
terminal length 0
```
test alarm
Tests the alarm capabilities of the chassis.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

\texttt{test alarm \{ audible | central-office \{ critical | major | minor \} \}}

| audible | central-office \{ critical | major | minor \} |
|---------|-----------------------------------------|
| \texttt{audible}: Tests the internal alarm on the ASR 5000 System Management Card (SMC) or the ASR 5500 System Status Card (SSC) for 10 seconds. The alarm status is returned to its prior state, such as if the audible alarm was enabled prior to the test, the alarm will again be enabled following the test. |
| \texttt{central-office \{ critical | major | minor \}}: Tests the specified central office alarm type. |

Usage
Test the alarm capabilities of the chassis as periodic maintenance to verify the hardware for generation of the internal audible alarms is functional.

\textbf{Caution:} The use of test commands could adversely affect the operation of your system. It is recommended that they only be used under the guidance and supervision of qualified support representative.

Example

\texttt{test alarm audible}

\texttt{test alarm central-office critical}

\texttt{test alarm central-office major}

\texttt{test alarm central-office minor}

**test ipcf bindmux**

Tests the status of the Intelligent Policy Control Function (IPCF) BindMux Manager instance and also starts or stops the BindMux Manager instance on the chassis.

**Product**

IPCF

**Privilege**

Security Administrator, Administrator, Operator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
test ipcf bindmux [ start | stop ]
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>start</strong></td>
<td>Starts the IPCF BindMux Manager on the chassis. If already an instance of IPCF BindMux Manager is running it prompts accordingly.</td>
</tr>
<tr>
<td><strong>stop</strong></td>
<td>Stops the IPCF BindMux Manager instance running on the chassis.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to test the status of IPCF BindMux Manager instance and also to start or stop the BindMux Manager instance on the chassis.

⚠️ **Caution:** The use of test commands could adversely affect the operation of your system. It is recommended that they only be used under the guidance and supervision of qualified support representative.

**Example**

The following command stops the BindMux Manager instance running on the chassis:

```
test ipcf bindmux stop
```
test ipsec tunnel ip-pool

Tests a specified IPSec tunnel associated with an IP pool name.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
test ipsec tunnel ip pool pool_name destination-ip ip_address }
```

- `pool_name destination-ip ip_address`
  - `ip pool pool_name`: Specifies the name of an existing IP pool as an alphanumeric string of 1 through 32 characters.
  - `destination-ip ip_address`: Specifies a destination IP address in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation

**Usage**

Use this command to test a specified IPSec tunnel.

⚠️ **Caution:** The use of test commands could adversely affect the operation of your system. It is recommended that they only be used under the guidance and supervision of qualified support representative.

**Example**

```
test ipsec tunnel ip pool pool3 destination-ip 10.2.3.4
```
test mobile tunnel

Tests for the existence of a specified mobile tunnel.

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
test mobile tunnel { callid call_id | imsi imsi_value | ipaddr ip_address | msid msid_num | nai nai_value }
```

callid call_id
Specifies the exact call instance ID which is to have trace data logged as a 4-byte hexadecimal number.

imsi imsi_value
Specifies the International Mobile Subscriber Identity (IMSI) of the subscriber session to be monitored an integer from 1 though 15 characters.

ipaddr ip_address
Specifies the IP address of the subscriber session to be monitored in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

msid msid_num
Specifies the mobile subscriber identification number to be monitored as 7 to 16 digits of an IMSI, MIN, or RMI.

nai nai_value
Specifies the mobile session Network Access Identifier as an alphanumeric string of 1 through 256 characters. The NAI is the user identity submitted by the client during network access authentication.

Usage

Use this command to test a specified mobile tunnel.

⚠️ Caution: The use of test commands could adversely affect the operation of your system. It is recommended that they only be used under the guidance and supervision of qualified support representative.

Example
test mobile tunnel ipaddr 192.64.66.9
timestamps

Enables or disables the generation of a timestamp in response to each command entered. The timestamp does not appear in any logs as it is a CLI output only. This command affects the current CLI session only. Use the `timestamps` command in the Global Configuration Mode to change the behavior for all future CLI sessions.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
[ no ] timestamps
```

- `no`

  Disables generation of timestamp output for each command entered. When omitted, the output of a timestamp for each entered command is enabled.

**Usage**

Enable timestamps when logging a CLI session on a remote terminal such that each command will have a line of text indicating the time when the command was entered.
traceroute

Collects information on the route data will take to a specified IPv4 host.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

---

**Important:** Inspector privileges are granted for all variables except **count** and **port**. To initiate a traceroute count or to target a specific port for a traceroute, you must have a minimum privilege level of Operator.

**Syntax**

```
traceroute { host_name | host_ip_address } [ count packets ] [ df ] [ maxttl max_ttl ] [ minttl min_ttl ] [ port port_num ] [ size octet_count ] [ src { src_host_name | src_host_ip_address } ] [ timeout seconds ] [ vrf vrf_name ] | { grep grep_options | more }
```

**host_name | host_ip_address**

Identifies the remote node to trace the route to.

- **host_name**: specifies the remote node using its logical host name which must be resolved via DNS lookup.
- **host_ip_address**: specifies the remote node using its assigned IP address entered using the IPv4 dotted-decimal notation.

**count packets**

Specifies the number of UDP probe packets to send. Default: 3

**df**

Indicates the packets for the tracing of the route should not be fragmented. If a packet requires fragmenting, it is dropped and the result is the ICMP response “Unreachable, Needs Fragmentation” is received.

**maxttl max_ttl**

Specifies the maximum time to live for the route tracing packets as an integer from 1 through 255. **max_ttl** must be greater than **min_ttl** whether **min_ttl** is specified or defaulted. Default: 30

The time to live (TTL) is the number of hops through the network; it is not a measure of time.

**minttl min_ttl**

Specifies the minimum time to live for the route tracing packets as an integer from 1 through 255. **min_ttl** must be less than **max_ttl** whether **max_ttl** is specified or defaulted. Default: 1

The time to live (TTL) is the number of hops through the network; it is not a measure of time.
port port_num
Specifies a specific port for connection as an integer from 1 through 65535. Default: 33434

size octet_count
Specifies the number of bytes for each packet as an integer from 40 through 32768. Default: 40

src { src_host_name | src_host_ip_address }
Specifies an IP address to use in the packets as the source node. Default: originating system’s IP address
src_host_name: specifies the remote node using its logical host name which must be resolved via a DNS lookup.
src_host_ip_address: specifies the remote node using its assigned IP address specified entered using IPv4 dotted-decimal notation.

timeout seconds
Specifies the maximum time (in seconds) to wait for a response from each route tracing packet as an integer from 2 through 100. Default: 5

vrf vrf_name
Specifies the name of an existing virtual routing and forwarding (VRF) context associated with this route as an alphanumeric string of 1 through 63 characters. Associates a Virtual Routing and Forwarding (VRF) context with this static ARP entry.

grep grep_options | more
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in this guide.

Usage
Trace an IPv4 route when troubleshooting network problems where certain nodes are having significant packet delays or packet loss. This can also be used to identify bottlenecks in the routing of data within the network.

Example
The following command traces the route to remote host remoteABC and sends the output to the more command.

    traceroute remoteABC | more

The following command traces the route to remote host 10.2.3.4’s port 2047 waiting a maximum of 2 seconds for responses.

    traceroute 10.2.3.4 port 2047 timeout 2
tracert6

Collects information on the route data will take to a specified IPv6 host.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Important:** Inspector privileges are granted for all variables except count and port. To initiate a tracert count or to target a specific port for a tracert, you must have a minimum privilege level of Operator.

Syntax

```
tracert6 { host_name | host_ipv6_address } [ count packets ] [ maxttl max_ttl ] [ port port_num ] [ size octet_count ] [ src { src_host_name | src_host_ipv6_address } ] [ timeout seconds ] [ vrf vrf_name ] [ | { grep grep_options | more } ]
```

**host_name | host_ipv6_address**

Identifies the remote node to trace the route to.

**host_name:** specifies the remote node using its logical host name which must be resolved via DNS lookup.

**host_ipv6_address:** specifies the remote node using its assigned IP address entered using the IPv6 colon-separated-hexadecimal notation.

**count packets**

Specifies the number of UDP probe packets to send. Default: 3

**maxttl max_ttl**

Specifies the maximum time to live for the route tracing packets as an integer from 1 through 255. max_ttl must be greater than min_ttl whether min_ttl is specified or defaulted. Default: 30

The time to live (TTL) is the number of hops through the network; it is not a measure of time.

**port port_num**

Specifies a specific port for connection as an integer from 1 through 65535. Default: 33434

**size octet_count**

Specifies the number of bytes for each packet as an integer from 40 through 32768. Default: 40

**src { src_host_name | src_host_ipv6_address }**

Specifies an IP address to use in the packets as the source node. Default: originating system’s IP address
**traceroute6**

`src_host_name`: specifies the remote node using its logical host name which must be resolved via a DNS lookup.

`src_host_ipv6_address`: specifies the remote node using its assigned IP address specified entered using IPv6 colon-separated-hexadecimal notation.

**timeout seconds**

Specifies the maximum time (in seconds) to wait for a response from each route tracing packet as an integer from 2 through 100. Default: 5

`vrf vrf_name`

Specifies the name of an existing virtual routing and forwarding (VRF) context associated with this route as an alphanumeric string of 1 through 63 characters.

`grep grep_options | more`

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in this guide.

**Usage**

Trace an IPv6 route when troubleshooting network problems where certain nodes are having significant packet delays or packet loss. This can also be used to identify bottlenecks in the routing of data within the network.

**Example**

The following command traces the route to remote host `remoteABC` and sends the output to the `more` command.

```
traceroute6 remoteABC | more
```

The following command traces the route to remote host `2000:4A2B::1f3F`’s port 2047 waiting a maximum of 2 seconds for responses.

```
traceroute6 2000:4A2B::1f3F port 2047 timeout 2
```
update active-charging

Updates specified active charging option(s) for the matching sessions.

Product
ACS
PSF
NAT

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

update active-charging { override-control rulebase-config | switch-to-fw-and-nat-policy
fw_nat_policy_name | switch-to-rulebase rulebase_name } { all | callid call_id | fw-and-nat-policy fw_nat_policy_name | imsi imsi | ip-address ip_address | msid msid | rulebase rulebase_name | username user_name } [ -noconfirm ] [ | { grep grep_options | more } ]

 override-control rulebase-config

This keyword initiates batch processing of all active calls to apply Override Control (OC) or Inheritance after any rulebase changes, charging action changes and/or addition/deletion of ruledefs for all subscribers having OC or Inheritance feature enabled. Since this is the batch processing of all active calls, the command execution will be in the background even after the CLI command returns to the CLI prompt.

Important: Override Control is a license-controlled feature. A valid feature license must be installed prior to configuring this feature. For more information on the licensing requirements, contact your Cisco account representative. For more information on the command to enable this feature, refer to ACS Rulebase Configuration Mode Commands chapter in the Command Line Interface Reference.

Important: In this release, both Inheritance and the Override Control features are supported. Note that these two features should not be enabled simultaneously. If by mistake, these two features are enabled, only Override Control is applied.

In 17 and later releases, this CLI command is used to apply the overridden or inherited values after any ruledef, charging action and rulebase changes performed through the CLI commands in the respective configuration modes. This CLI command is necessary because the configuration changes are reflected immediately on any new PDN session that gets established. However, for the existing PDN sessions established before the configuration change, explicit execution of this CLI command is necessary. This will get all the PDN sessions in system in sync with respect to the required configuration changes.
**Important:** It is recommended that this CLI command is executed after all rulebase/charging action/ruledef changes are complete. So, this will help in one-time execution of the CLI to get all PDN sessions in sync.

Typically, this command is used whenever any rulebase, charging action or ruledef modification happens. Once this CLI command is executed, each subscriber will read the configuration and incorporate the rulebase or ruledef changes for Override Control. Until this CLI execution is complete, Inheritance or Override Control values will not be applied to the changes done in configuration for all existing calls. Charging and policy parameters configured at P-GW will apply during this period. Please follow recommended upgrade procedures to avoid this. For the upgrade procedure, contact your Cisco account representative.

In release 17, the batch processing will complete in 15 to 20 minutes depending on the call load in the system. If the `override-control rulebase-config` command has been issued multiple times, batch processing will be restarted and the latest rulebase/charging action/ruledef changes will be applied to all the active calls.

**Important:** In release 17, there was no restriction on the usage of the CLI command “**update active-charging override-control rulebase-config**” on a standby chassis. In release 18 and later, this CLI command is not allowed to be executed on the standby chassis.

```script
switch-to-fw-and-nat-policy fw_nat_policy_name
```

Specifies an existing Firewall-and-NAT policy to switch to as an alphanumeric string of 1 through 63 characters.

```script
switch-to-rulebase rulebase_name
```

Specifies an existing rulebase to switch to as an alphanumeric string of 1 through 63 characters.

```script
all
```

Updates rulebase/policy for all subscribers.

```script
callid call_id
```

Updates rulebase/policy for the Call Identification number specified as an eight-digit hexadecimal number.

```script
fw-and-nat-policy fw_nat_policy_name
```

Updates the rulebase/policy for sessions matching an existing Firewall-and-NAT policy specified as an alphanumeric string of 1 through 63 characters.

```script
imsi imsi
```

Updates rulebase/policy for International Mobile Subscriber Identification (IMSI) specified here. `imsi` must be 3 digits of MCC (Mobile Country Code), 2 or 3 digits of MNC (Mobile Network Code), and the rest with MSIN (Mobile Subscriber Identification Number). The total should not exceed 15 digits. For example, 123-45-678910234 can be entered as 12345678910234.

```script
ip-address iP_address
```

Updates rulebase/policy for the IP address specified in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

```script
msid msid
```

Updates rulebase/policy for an MSID specified as a string of 1 through 24 characters.
**update active-charging**

**rulebase rulebase_name**
Updates rulebase/policy for sessions matching an existing rulebase specified as an alphanumeric string of 1 through 63 characters.

**username user_name**
Updates rulebase/policy for user specified as a an alphanumeric string of characters and/or wildcard characters ('$' and '*') of 1 through 127 characters.

**-noconfirm**
Executes the command without any additional prompt and confirmation from the user.

| { grep grep_options | more } |
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

**Usage**
Use this command to change specified active charging option(s) for the matching sessions.

**Example**
The following command changes the rulebase for sessions using the rulebase named `standard` to use the rulebase named `super`:

```
update active-charging switch-to-rulebase super rulebase standard
```
update cscf

Causes a NOTIFY to be triggered from Call Session Control Function (CSCF) based on registration state and event and indicating the expiry timer value for each contact as “reauthentication-time” provided from the CLI. The subscriber is supposed to send a fresh REGISTER message within “reauthentication-time”, which will be challenged by CSCF as part of reauthentication. If reauthentication fails, the subscriber will be cleared after “reauthentication-time”.

Product
SCM (P-CSCF, S-CSCF)

Privilege
Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

update cscf subscriber { all | username user_name } cscf-service service_name { { [ contact contact_address ] reg-state { active event { refreshed | shortened } time sec } | terminated event { deactivated | expired | rejected | unregistered } } | reauthentication-time sec } [ verbose ]

subscriber { all | username user_name }

Updates CSCF subscriber data.

all: Updates data for all subscribers within a specified CSCF service.

username user_name: Specifies the name of a user within the current context as an alphanumeric string of 1 through 127 characters that is case sensitive.

cscf-service service_name

Specifies a configured CSCF service as an alphanumeric string of 1 and 63 characters that is case sensitive.

contact contact_address

Specifies the contact address of the subscriber as an alphanumeric string of 1 through 255 characters.

reg-state

Specifies the registration state of the subscriber.

active event { refreshed | shortened } time sec

Specifies the registration state active event type.

*refreshed: Specifies registration state active event as refreshed.
*shortened: Specifies registration state active event as shortened.

time sec: Specifies the time (in seconds) within which subscriber is expected to re-authenticate as an integer from 1 to 86400.
**terminated event { deactivated | expired | rejected | unregistered }**

Specifies the registration state terminated event type.

- **deactivated**: Specifies registration state terminated event as deactivated.
- **expired**: Specifies registration state terminated event as expired.
- **rejected**: Specifies registration state terminated event as rejected.
- **unregistered**: Specifies registration state terminated event as unregistered.

**reauthentication-time** *sec*

Specifies the time (in seconds) within which the subscriber is expected to re-authenticate as an integer from 1 to 86400.

**verbose**

Show detailed information.

**Usage**

This command is only applicable for a P-CSCF and S-CSCF service. When optional contact ID is not specified, all the contact IDs associated with specified user or all users will be updated and trigger NOTIFY.

**Important**: reauthentication-time should be greater than the current expiry time of the contact so that CSCF will initiate the NOTIFY message.

**Example**

The following command sets the re authentication time for all CSCF subscribers in the scscf1 S-CSCF service to 500 seconds:

```
update cscf subscriber all cscf-service scscf1 reauthentication-time 500
```
update firewall policy

This command is obsolete.
update ip access-list

When you update an IP Access list, this command forces the new version of the access list to be applied to any subscriber sessions that are currently using that list.

Product

PDSN
GGSN
ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

update ipv6 access-list list_name subscribers [ command_keyword ] [ filter_keywords ] [ -noconfirm ] [ verbose ]

list_name

Specifies the name of an existing IP Access list that you want to apply to the subscriber as an alphanumeric string of 1 through 47 characters.

[ command_keyword ] [ filter_keywords ]

These are the same command keywords and filter keywords available for the show subscribers command.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

verbose

Show detailed information.

Usage

Use this command to force existing subscriber sessions that are already using a specific IP Access list to have that IP Access list reapplied. This is useful when you edit an IP Access list and want to make sure that even existing subscriber sessions have the new changes applied.

Example

To apply the IP Access list named ACLlist11 to all existing subscribers that are already using that IP Access list, enter the following command:

update ip access-list ACLlist11 subscribers all
**update ipv6 access-list**

When you update an IP Access list, this command forces the new version of the access list to be applied to any subscriber sessions that are currently using that list.

**Product**
- PDSN
- GGSN
- ASN-GW

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
update ipv6 access-list list_name subscribers [ command_keyword ] [ filter_keywords ] [ -noconfirm ] [ verbose ]
```

- `list_name`
  Specifies the name of an existing IPv6 Access list that you want to apply to the subscriber as an alphanumeric string of 1 through 47 characters.

- `[ command_keyword ] [ filter_keywords ]`
  These are the same command keywords and filter keywords available for the `show subscribers` command.

- `-noconfirm`
  Executes the command without any additional prompt and confirmation from the user.

- `verbose`
  Show detailed information.

**Usage**

Use this command to force existing subscriber sessions that are already using a specific IPv6 Access list to have that IPv6 Access list reapplied. This is useful when you edit an IPv6 Access list and want to make sure that even existing subscriber sessions have the new changes applied.

**Example**

To apply the IPv6 Access list named `ACLv6List1` to all existing subscribers that are already using that IP Access list, enter the following command:

```
update ipv6 access-list ACLv6List1 subscribers all
```
update local-user database

Updates the local user (administrative) database with current user information. Run this command immediately after creating, removing or editing administrative users.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

update local-user database

Usage

Use this command to update the local-user database with current information.

Example

The following command updates the local-user database:

    update local-user database
update module

Loads a specified plugin module from the Module Priority List with the lowest priority number. This will also copy the Module priority list onto the Version priority list. This function is associated with the patch process for accommodating dynamic software upgrades.

Product
ADC

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

update module plugin_name

plugin_name

Specifies the name of an existing plugin module that you want to update as an alphanumeric string of 1 through 16 characters. If the named module is not known to the system, an error message is displayed.

Usage

Use this command to initiate an update of a new software plugin module. If it fails to load, the module with next highest priority will be loaded. If none of the modules are installed, the default patch which comes along with the ASR 5000 build is automatically loaded. The specified module must have been previously unpacked/verified and configured via the install plugin and plugin commands respectively. For additional information, refer to the Plugin Configuration Mode Commands chapter.

Example

The following command updates the plugin module named p2p:

update module p2p
update qos policy map

Updates QoS profile information based on specific subscriber policy maps.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
update qos policy-map map_name use-granted-profile-id id1 [ id2 ] [ id3 ] subscribers [ command_keyword ] [ filter_keywords ] [ -noconfirm ] [ verbose ] [ match-requested-profile-id ] [ | { grep grep_options | more } ]
```

**map_name**
Specifies the name of an existing policy map as an alphanumeric string of 1 through 15 characters.

**use-granted-profile-id id1 [ id2 ] [ id3 ]**
Specifies the profile IDs to update. Up to three different profile IDs can be specified. Each profile ID is specified as a hexadecimal value from 0x0 and 0xFFFF.

**subscribers [ command_keyword ] [ filter_keywords ]**
These are the same command keywords and filter keywords available for the show subscribers command.

[ -noconfirm ]
Updates matching subscribers without prompting for confirmation.

[ verbose ]
Displays details for the profile updates.

[ match-requested-profile-id ]
Sends session-updates only to profile-ids matching the profile-ids in the requested list.

**grep grep_options | more**
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in this guide.
Usage

Use this command to update subscriber session profile IDs based on the specified criteria.

Example

The following command updates profile IDs 0x3E and 0x4C for all subscriber sessions and sends session updates with the IDs:

```
update qos policy-map test use-granted-profile-id 0x3E 0x4C subscribers all match-requested-profile-id
```
update qos tft

Updates the subscriber traffic flow template (TFT) associated with the flow ID and direction.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

update qos tft flow-id flow-id flow-dir { forward | reverse } use-granted-profile-id id1 [ id2 ] [ id3 ] subscribers [ command_keyword ] [ filter_keywords ] [ -noconfirm ] [ verbose ] [ match-requested-profile-id ] [ | { grep grep_options | more } flow-id flow-id

Sends session updates only when the flow ID matches the flow-id and flow-direction. flow-id must be specified as an integer from 1 through 255.

flow-dir { forward | reverse }

Specifies the direction of the TFT flow.

subscribers [ command_keyword ] [ filter_keywords ]

These are the same command keywords and filter keywords available for the show subscribers command.

Usage
Supports QoS updates based on subscriber TFTs.

Example

update qos tft flow-id 0 flow-dir reverse use-granted-profile-id 0x0 subscribers all -noconfirm
upgrade

Installs major software releases to the system.

Product
All

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

upgrade { online | patch } image_url config cfg_url [ -noconfirm ]

<table>
<thead>
<tr>
<th>online</th>
</tr>
</thead>
<tbody>
<tr>
<td>Perform a software upgrade from one release version to another. The online upgrade is only available for software release 3.5 and higher.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>patch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Install an interim, or patch, software release.</td>
</tr>
</tbody>
</table>

Important: Software Patch Upgrades are not supported in this release.

image_url

Specifies the location of a image file to use for system startup. The URL may refer to a local or a remote file. The URL must be formatted as follows:

For the ASR 5000:

[ file: ] { /flash | /pcmcia1 | /hd } [ /directory ]/file_name

[ http: | tftp: ]///{ host[ :port# ] } [ /directory ]/file_name

For the ASR 5500:

[ file: ] { /flash | /usb1 | /hd } [ /directory ]/file_name

[ http: | tftp: ]///{ host[ :port# ] } [ /directory ]/file_name

Important: Do not use the following characters when entering a string for the field names below: “/” (forward slash), “:” (colon) or “@” (at sign).

directory is the directory name.
filename is the actual file of interest.
**host** is the IP address or host name of the server.

**port#** is the logical port number that the communication protocol is to use.

---

**Important:** A file intended for use on an ASR 5000 uses the convention xxxxx.ASR5000.bin, where xxxxx is the software build information.

**Important:** When using the TFTP, you should use a server that supports large blocks, per RFC 2348. This can be implemented by using the “block size option” to ensure that the TFTP service does not restrict the file size of the transfer to 32MB.

---

```sh
config config_path
```

Specifies the location of a configuration file to use for system startup. This must be formatted as follows:

For the ASR 5000:

```
[ file: ]{ /flash | /pcmcia | /hd }[ /path ]/filename
```

For the ASR 5500:

```
[ file: ]{ /flash | /usb1 | /hd }[ /path ]/filename
```

Where **path** is the directory structure to the file of interest, and **filename** is the name of the configuration file. This file typically has a `.cfg` extension.

---

**-noconfirm**

Executes the command without any additional prompt and confirmation from the user.

---

**Usage**

Use the **upgrade online** command to perform a software upgrade when upgrading from one software release version to another, providing that both versions support this feature. For example, you can use this method to upgrade from release version 3.5 (any build number) to version 4.0 (any build number), but you cannot use this method to upgrade from release version 3.0 to version 3.5 since version 3.0 does not support the feature.

---

**Important:** Software Patch Upgrades are not supported in this release.

---

**Important:** This command is not supported on all platforms.

---

**Example**

The following command performs a major software release upgrade from an older version to a newer version. In this example the new software image file is in a subdirectory on a tftp server, and the configuration file is in a subdirectory on the local flash at tftp://host[/path]/filename.

```
upgrade online tftp://imageserver/images/image.bin config
/flash/configurations/localconfig.cfg
```
upgrade content-filtering

Upgrades the Static Rating Database (SRDB) for Category-based Content Filtering application.

Product
CF

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

upgrade content-filtering category { database | rater-pkg }

upgrade content-filtering category database
Triggers the upgrade of the Category-based Content Filtering Static Rating Database (SRDB).

upgrade content-filtering category rater-pkg
Triggers manual upgrade of the Dynamic Content-Filtering Rater Package (rater.pkg file).
The rater.pkg file contains the models and feature counters that are used to return the dynamic content rating. The upgrade will trigger distribution of the rater.pkg to all the SRDBs.

Important: This command is customer specific. For more information, please contact your local sales representative.

Usage

Use this command to load the Static Rating Database (SRDB) into memory for Category-based Content Filtering application, and/or to load the rater.pkg file. If the default directory of /cf does not exist on the flash, it will create the same. It also locates the recent full database and loads it into memory. This command also clears the old and excess incremental databases.

Important: This command is not supported on all platforms.

Example

The following command upgrades the SRDB for the Category-based Content Filtering application:

upgrade content-filtering category database
upgrade tethering-detection

Upgrades the Tethering Detection feature’s database(s).

**Product**
ACS

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
upgrade tethering-detection database { all | os-signature | tac | ua-signature } [ -noconfirm ]
```

<table>
<thead>
<tr>
<th>all</th>
<th>Upgrades all Tethering Detection databases—OS, TAC and UA.</th>
</tr>
</thead>
<tbody>
<tr>
<td>os-signature</td>
<td>Upgrades only the OS database.</td>
</tr>
<tr>
<td>tac</td>
<td>Upgrades only the TAC database.</td>
</tr>
<tr>
<td>ua-signature</td>
<td>Upgrades only the UA database.</td>
</tr>
<tr>
<td>- noconfirm</td>
<td>Executes the command without any prompts and confirmation from the user.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to upgrade the database(s) used by the Tethering Detection feature. This command upgrades the database(s) from file(s) kept in designated path. The name of the existing source file is prefixed with the word “new-”. For example for OS DB, if the existing file name is “os-db”, the upgrade file name is “new-os-db”. If there is a file named “new-xxx-db”, it is verified that it is a valid Tethering Detection database and then loaded it into memory. If successful, the files is renamed “xxx-db” to “xxx-db-<number>” and then renamed “new-xxx-db” to “new-xxx-db”. For example, the command `upgrade tethering-database ua-signature -noconfirm` results in loading the file by name “new-ua-db” if it is present in the designated directory. In case of a successful upgrade, the previous version of the database is stored as backup in a file named “ua-db-1”. Also, the newly uploaded database file is renamed as “ua-db”. 
Also see the `tethering-database` command in the *ACS Configuration Mode Commands* chapter.

The following command upgrades all Tethering Detection databases:

```
upgrade tethering-detection database all -noconfirm
```
upgrade url-blacklisting database

Upgrades the URL blacklisting database.

**Product**
CF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
upgrade url-blacklisting database [ -noconfirm ]
```

- `noconfirm`

  Executes the command without any additional prompt and confirmation from the user.

**Usage**

Use this command to upgrade and load a URL blacklisting database whenever required.

**Example**

```
upgrade url-blacklisting database
```
Chapter 131
Exec Mode show Commands (A-C)

This section includes the commands `show aaa` through `show css service`.

The Exec Mode is the initial entry point into the command line interface system. Exec mode `show` commands are useful in troubleshooting and basic system monitoring.

Mode

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
show aaa

Displays AAA (Authentication Authorization and Accounting) statistics for the current context.

Product

PDSN
GGSN
SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show aaa { group { all | name aaa_group_name } | local counters } [ | { grep grep_options | more } ]

- group { all | name aaa_group_name }
  Displays AAA information.
  - all: If the exec context is local, information for all the default AAA groups, and the AAA groups configured in all the contexts are displayed. If the exec context is not local, information for only the context-specific AAA groups are displayed.
  - name aaa_group_name: Displays information for an existing AAA group specified as an alphanumeric string of 0 through 64 characters.

- local counters
  Displays information for current context.

  | { grep grep_options | more }
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of grep and more, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter.

Usage

This command is used to view accounting and authentication statistics for the current context.

Example

The following command displays AAA statistics for the current context:

show aaa local counters

The following command displays AAA statistics for the AAA group aaa_group1:
show aaa

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show active-charging analyzer statistics

Displays statistical information for protocol analyzers.

Product
ACS

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show active-charging analyzer statistics [ name protocol_name [ instance instance_number ] [ verbose ] ] [ | { grep grep_options | more } ]

name protocol_name

Displays detailed information for the specified protocol analyzer:

• cdp
• dns
• file-transfer
• ftp
• h323
• http
• icmp
• icmpv6
• imap
• ip
• ipv6
• mms
• p2p [ application p2p_list | protocol-group group_list ] [ duration [ audio { application p2p_audio_duration_list } | video { application p2p_video_duration_list } ] ] [ wide [ all ] ]: Peer-to-peer analyzer.

p2p application p2p_list: The supported applications are:

• actionvoip
• actsync
• adobeconnect
• aimini
• amazoncloud
show active-charging analyzer statistics

**[ instance instance_number ]**
Displays the ACS/Session Manager information for specific instances. 
*instance_number* must be an integer from 1 through 65535.

**verbose**
Specifies to display detailed (all available) information. If not specified, concise information is displayed.

| { grep grep_options | more } |
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.
**Usage**

Use this command to display statistic information for active charging protocol analyzers.

**Example**

The following command displays detailed statistic information for all P2P protocol analyzers:

```
show active-charging analyzer statistics name p2p verbose
```

The following command displays detailed statistic information for all TCP protocol analyzers:

```
show active-charging analyzer statistics name tcp verbose
```

---

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show active-charging bandwidth-policy

Displays information on bandwidth policies configured in a service.

**Product**

ACS

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
show active-charging bandwidth-policy { all | name bandwidth_policy_name } [ | { grep grep_options | more } ]
```

- **all**
  Displays information for all bandwidth policies configured in the service.

- **name bandwidth_policy_name**
  Displays detailed information for an existing bandwidth policy specified as an alphanumeric string of 1 through 63 characters.

  | { grep grep_options | more } |
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to view information on bandwidth policies configured in a service.

**Example**

The following command displays detailed information for the bandwidth policy named `standard`:

```
show active-charging bandwidth-policy name standard
```
show active-charging charging-action

Displays information for charging actions configured in the Active Charging Service (ACS).

Product
ACS

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show active-charging charging-action { ( { all | name charging_action_name } [ service name acs_service_name ] } | statistics [ name charging_action_name ] ) [ | { grep grep_options | more } ]

| all
| Displays information for each configured charging action.

| name charging_action_name
| Displays detailed information for an existing charging action specified as an alphanumeric string of 1 through 63 characters.

| statistics
| Displays statistical information for all configured charging actions.

| service name acs_service_name
| Displays information for all or a specific charging action in the specified ACS. acs_service_name is an alphanumeric string of 1 through 15 characters.

| { grep grep_options | more }
| Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display information for charging actions configured in a service.

Example

The following command displays a detailed information for all charging actions:

    show active-charging charging-action all
Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show active-charging content-filtering category policy-id

Displays Content Filtering (CF) category policy definitions. This command is not available on StarOS 8.0 and earlier releases.

Product
CF

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show active-charging content-filtering category policy-id { all | id policy_id } [ | { grep grep_options | more } ]

| all
| Displays definitions of all Content Filtering category policies.

| id policy_id
| Displays definitions of an existing Content Filtering category policy specified as an integer from 1 through 4294967295.

| { grep grep_options | more }
| Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
| For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to view Content Filtering category definitions for a specific/all Policy IDs.

Example
The following command displays Content Filtering category definitions for policy ID 3:

show active-charging content-filtering category policy-id id 3

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show active-charging content-filtering category statistics

Displays category-based content filtering statistics.

Product
CF

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show active-charging content-filtering category statistics [ rulebase { name rulebase_name | all } ] [ verbose ] [ | { grep grep_options | more } ]

rulebase { name rulebase_name | all }
Displays category-based content filtering statistics, either for all or for a specific rulebase.

• name rulebase_name: Specifies an existing rulebase as an alphanumeric string of 1 through 63 characters.

• all: Displays category-based content filtering statistics for each rulebase in the ACS.

verbose
Specifies to display detailed (all available) information. If not specified, concise information is displayed.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to view category-based content filtering statistics for a specific rulebase, or cumulative statistics for all rulebases in the ACS.

Example

The following command displays category-based content filtering statistics for the rulebase named consumer:

show active-charging content-filtering category statistics rulebase name consumer

The following command displays cumulative category-based content filtering statistics for all rulebases in verbose mode:
show active-charging content-filtering category statistics verbose

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show active-charging content-filtering server-group

Displays information for Content Filtering Server Group (CFSG) configured in the service.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show active-charging content-filtering server-group [ name cfsq_name | statistics [ name cfsq_name [ acsmgr instance instance_number [ priority priority ] ] | verbose ] [ | { grep grep_options | more } ]

name cfsq_name

Specifies name of an existing CFSG as an alphanumeric string of 1 through 63 characters.

acsmgr instance instance_number

Specifies the manager instance as an integer from 1 through 65535.

priority priority

Specifies the priority of the server for which statistics has to be displayed as an integer from 1 through 65535.

verbose

Specifies to display detailed (all available) information, for each ICAP server connection at each instance. If not specified, concise information is displayed.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to view CFSG information/statistics.

show active-charging content-filtering server-group name cfsq_name: The output of this command displays detailed information for the specified CFSG.

show active-charging content-filtering server-group statistics name cfsq_name: The output of this command displays cumulative statistics for the specified CFSG. This will include all the instances and all the servers configured in the CFSG.
show active-charging content-filtering server-group statistics name cfsg_name
acsmgr instance instance_number: The output of this command displays the cumulative statistics of all the ICAP server connections on the specified manager instance.
show active-charging content-filtering server-group statistics name cfsg_name
acsmgr instance instance_number priority priority: The output of this command displays the statistics for the specified ICAP server connection on the specified manager instance.
show active-charging content-filtering server-group statistics verbose: The output of this command displays statistics of each ICAP server connection at each instance.

Example

The following command displays information for the CFSG named test12:

    show active-charging content-filtering server-group name test12

The following command displays detailed information for all CFSGs:

    show active-charging content-filtering server-group statistics verbose

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show active-charging credit-control

Displays statistics for Diameter/RADIUS Prepaid Credit Control Service in the Active Charging Service (ACS).

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show active-charging credit-control { misc-info max-backpressure [ all | facility sessmgr instance instance_number ] | statistics [ group group_name | server { all | ip-address ip_address [ port port_num ] | name server_name } ] | session-states [ rulebase rulebase_name ] [ content-id content_id ] } [ | { grep grep_options | more } ]

misc-info max-backpressure [ all | facility sessmgr instance instance_number ]

Displays miscellaneous information including the maximum backpressure hit count for all active session managers.

• all: Displays the max-backpressure count from all session manager instances.

• facility sessmgr instance instance_number: Displays logged events for specific facility. That is, it will display the maximum backpressure count on that specific session manager instance. The session manager instance number must be an integer ranging from 1 through 65535 characters.

statistics [ group group_name | server { all | ip-address ip_address [ port port_num ] | name server_name } ]

Displays prepaid credit control statistics.

• group group_name: Displays statistics for an existing credit control group specified as an alphanumeric string of 1 through 63 characters.

• server { all | ip-address ip_address [ port port_num ] | name server_name } : Displays statistics for the specified credit control server.

• all: Displays all available statistics including host statistics.

• ip-address ip_address: Displays available statistics for the specified server’s address.

• port port_num: Displays available statistics for the specified server’s port number.

• name server_name: Displays the credit control statistics for the specified server.

session-states [ rulebase rulebase_name ] [ content-id content_id ]

Displays prepaid CCA session status based on rulebase and/or content ID.
show active-charging credit-control

• **rulebase rulebase_name**: Displays the Credit Control Application (CCA) session state counts for an existing rulebase specified as an alphanumeric string of 1 through 63 characters.

• **content-id content_id**: Displays CCA session state counts for a content ID of a credit control service specified as an integer from 1 through 65535.

| { grep grep_options | more } |

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent. 

For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to view statistics for Diameter/RADIUS prepaid credit control service in the ACS.

**Example**

The following command shows ACS statistics of configured Diameter or RADIUS Credit Control Application:

```
show active-charging credit-control statistics
```

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show active-charging dns-learnt-ip-addresses

Displays DNS learnt IP address statistics for the DNS Snooping feature.

Product
ACS

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```bash
show active-charging dns-learnt-ip-addresses statistics { sessmgr { all | instance sessmgr_instance_number } [ verbose ] | summary } [ | { grep grep_options | more } ]
```

`sessmgr { all | instance sessmgr_instance_number } [ verbose ]`
Displays information for all or the specified Session Manager (SessMgr) instance.
- `all`: Displays information for all SessMgr instances.
- `instance sessmgr_instance_number`: Displays information for a SessMgr instance specified as an integer from 1 through 65535.
- `verbose`: Displays detailed statistics for specified criteria. Use this keyword to view the learnt IP addresses.

`summary`
Displays summary information.

`| { grep grep_options | more }`
Specifies that the output of this command is to be piped (sent) to the command specified. You must specify a command to which the output will be sent.
For details on the usage of `grep` and `more`, refer to the `Regulating a Command’s Output` section of the `Command Line Interface Overview` chapter.

Usage

Use this command to view statistics for the DNS Snooping feature related DNS learnt-ip-addresses.
This command displays the number of learnt IP entries per rule line. It displays on a service level the number of resolved (learnt) IP addresses per rule line per rulebase (once if a rule line is used multiple times in the same rulebase as it is shared across rulebase) per destination context per SessMgr instance. It also displays the number of entries flushed due to TTL expiry. The field `entries_replaced` gives the number of entries replaced (same IP returned again) in the pool due to a DNS response by same/another subscriber for same domain-name, wherein the TTL of the entry will be replaced.
IPv4-overflows will start incrementing when the maximum limit of 51200 across system is reached OR limit of 200 per pattern is reached.
Ipv6-overflows will start incrementing when maximum limit of 25600 across system is reached OR limit of 100 per pattern is reached.

Limits are:

- Maximum of 51,200 IPv4 entries per instance shared across IPv4 all pools.
- Maximum of 200 IPv4 entries per pool (pool is same as discussed before (per rule-line pattern)).
- Maximum of 25,600 IPv6 entries per instance shared across all IPv6 pools.
- Maximum of 100 IPv6 entries per pool.

In releases prior to 14.0, this CLI command `show active-charging dns-learnt-ip statistics sessmgr all` displayed all the configured patterns and rulebase names for each of the pattern entry, even though the pattern has not learnt any IP address. When a large number of DNS snooping ruledefs are configured (configured as ip server-domain name under ruledef configuration), the memory allocated for sending this information exceeded the message size limit for messenger calls and hence the crash was observed.

To avoid the crash occurring, in 14.0 and later releases, the output of the CLI command `show active-charging dns-learnt-ip statistics sessmgr all` is modified to display only the patterns for which at least one IPv4/IPv6 address is learnt as all other information is available from the configuration. Also for each of the patterns this CLI command will not be displaying rulebase name as it can be printed once.

**Example**

The following command displays summary statistics for DNS learnt IP addresses:

```
show active-charging dns-learnt-ip-addresses statistics summary
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 

---

**Exec Mode show Commands (A-C)**

**show active-charging dns-learnt-ip-addresses**
show active-charging edr-format

Displays information about Event Data Record (EDR) formats configured in the Active Charging Service (ACS).

Product
ACS

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax
show active-charging edr-format [ statistics ] [ all | name edr_format_name ] [ | { grep grep_options | more } ]

all
Displays information for all EDR formats.

statistics
Displays statistics for all or an existing EDR format.
If neither all nor name is specified, summarized statistics over all EDR formats is displayed.

name edr_format_name
Displays information for an existing EDR format specified as an alphanumeric string of 1 through 63 characters.

| { grep grep_options | more }
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to display information for EDR format(s) in the ACS.

Example
The following command displays all configured EDR formats in the ACS.

    show active-charging edr-format all

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show active-charging edr-udr-file

Displays CDR flow control information. This command also displays the Event Data Record (EDR) and Usage Data Record (UDR) file information.

Product
ACS

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:
[local]host_name#

Syntax

```
show active-charging edr-udr-file { flow-control-counters [ verbose ] | statistics } [ | { grep grep_options | more } ]
```

| flow-control-counters [ verbose ]
|---|
| Displays the counters for dropped EDR/UDR records. These counters are for when CDRMOD uses flow control to stop ACS/Session Managers from sending the records.
| verbose displays detailed information.

| statistics
|---|
| Displays EDR and UDR file statistics.

| { grep grep_options | more }
|---|
| Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
| For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to view CDR flow control information.

Example
The following command displays EDR and UDR files statistics:

```
show active-charging edr-udr-file statistics
```

The following command displays CDR flow control information:

```
show active-charging edr-udr-file flow-control-counters
```
**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show active-charging file-space-usage

Displays the file space used by Charging Data Record (CDR) and Event Data Record (EDR) files.

Product
ACS

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show active-charging file-space-usage [ | { grep grep_options | more } ]

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to view CDR/EDR file space usage information. The context in which this command is used is not relevant.
show active-charging firewall dos-protection

Displays the list of servers involved in any IP Sweep attacks.

Product
PSF

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show active-charging firewall dos-protection ip-sweep server-list { all | instance instance_num } [ | { grep grep_options | more }]

all
Displays the IP Sweep server list for all instances.

instance instance_num
Displays statistics for the specified ACS Manager instance.
instance_num must be an integer from 1 through 65535.

| { grep grep_options | more }
Pipes (sends) the output of this command to the specified command. You must specify a command to which
the output will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the
Command Line Interface Overview chapter.

Usage

Use this command to display the list of servers involved in any IP Sweep attacks.

Example

The following command displays the IP Sweep server list for all instances:

show active-charging firewall dos-protection ip-sweep server-list all

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show active-charging firewall statistics

Displays Active Charging Stateful Firewall statistics.

Product
PSF

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show active-charging firewall statistics [ callid call_id | domain-name domain_name | nat-realm nat_realm_name | protocol { icmp | icmpv6 | ip | ipv6 | other | tcp | udp } | username user_name ] [ acsmgr instance instance_number ] [ verbose ] [ wide ] [ | { grep grep_options | more } ]

acsmgr instance instance_number
Specifies the ACS/Session Manager instance ID as an integer from 1 through 65535.

callid call_id
Specifies the call identification number as an 8-digit hexadecimal number.

domain-name domain_name
Specifies the domain name as an alphanumeric string of 1 through 127 characters.

nat-realm nat_realm_name
Specifies the NAT realm name as an alphanumeric string of 1 through 31 characters.

protocol { icmp | ip | other | tcp | udp }
Specifies the protocol:

• icmp: ICMPv4
• icmpv6
• ip: IPv4
• ipv6
• other: Protocols other than TCP, UDP, and ICMPv4/ICMPv6.
• tcp
• udp
## show active-charging firewall statistics

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>username user_name</td>
<td>Specifies the user name as an alphanumeric string of 1 through 127 characters.</td>
</tr>
<tr>
<td>verbose</td>
<td>Specifies to display detailed (all available) information. If not specified, concise information is displayed.</td>
</tr>
<tr>
<td>wide</td>
<td>Displays all available information in a single wide line.</td>
</tr>
</tbody>
</table>

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent. For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

### Usage

Use this command to view Stateful Firewall statistics. If you are in the local context, statistics for all contexts are displayed. Otherwise, only statistics of your current context are displayed.

### Example

The following command displays Stateful Firewall statistics:

```bash
show active-charging firewall statistics
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 

---

Command Line Interface Reference, StarOS Release 17
show active-charging firewall track-list

Displays the list of servers being tracked for involvement in any Denial-of-Service (DOS) attacks.

**Product**
PSF

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```text
show active-charging firewall track-list attacking-servers [ | { grep grep_options | more } ]
```

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
</table>
| Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent. For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**
Use this command to view details of servers being tracked for involvement in any DOS attack.

**Example**

The following command displays the list of servers being tracked for involvement in any DOS attacks:

```text
show active-charging firewall track-list attacking-servers
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
**show active-charging flow-control-counters**

Displays information for dropped EDR and UDR records.

**Product**
ACS

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
show active-charging flow-control-counters [ verbose ] [ | { grep grep_options | more } ]
```

- **verbose**
  Specifies to display detailed (all available) information. If not specified, concise information is displayed.

- | { grep grep_options | more }
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to view EDR-UDR flow control information—for dropped EDR and UDR records.

**Example**

The following command displays detailed EDR-UDR flow control information:

```
show active-charging flow-control-counters verbose
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show active-charging flow-mappings

Displays information about all the active flow mappings based on the applied filters.

Product
PSF
NAT

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show active-charging flow-mappings [ all | call-id call_id | [ nat { not-required | required [ nat-realm nat_realm_name ] } | trans-proto { tcp | udp } ] + [ | { grep grep_options | more } ]

all
Displays all the available active charging flow-mapping information.

call-id call_id
Displays detailed information for a call ID specified as an 8-digit hexadecimal number.

nat { required [ nat-realm string ] not-required }
Displays the active charging flow mappings for which NAT is enabled or disabled.

trans-proto { tcp | udp }
Displays the transport layer.

| { grep grep_options | more }
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to view the Active Charging flow-mapping details.

Example
The following command displays the total number of Active Charging flow-mappings:

```
show active-charging flow-mappings all
```
The following command displays the flow-mappings for which NAT is enabled and the NAT-realm used is `natpool3`:

```
show active-charging flow-mappings nat required nat-realm natpool3
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show active-charging flows

Displays information for active charging flows.

Product
ACS

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show active-charging flows { all | [ callid call_id ] [ connected-time [ < | > | greater-than | less-than ] seconds ] [ control-connection { ftp | pptp | rtsp | sip | tftp } ] [ flow-id flow_id ] [ full ] [ idle-time [ < | > | greater-than | less-than ] seconds ] [ firewall { not-required | required } ] [ imsi imsi_value ] [ ip-address [ server | subscriber ] [ < | > | IPv4 | greater-than | less-than ] address ] [ msisdn msisdn_num ] [ nat { not-required | required [ nat-ip nat_ip_address ] [ binding-info ] } ] [ pacing-bitrate [ < | > | = | greater-than | less-than ] equal-to number ] [ port-number [ server | subscriber ] [ < | > | IPv4 | greater-than | less-than ] number ] [ rx-bytes [ < | > | greater-than | less-than ] number ] [ rx-packets [ < | > | greater-than | less-than ] number ] [ session-id session_id ] [ summary ] [ trans,proto { icmp | tcp | udp } ] [ tx-bytes [ < | > | greater-than | less-than ] number ] [ tx-packets [ < | > | greater-than | less-than ] number ] [ type flow_type ] [ username user_name ] } [ | { grep grep_options | more } ]

all
Displays information for all active charging flows.

callid call_id
Displays the specific Call Identification Number. call_id must be an eight digit hexadecimal number.

connected-time [ < | > | greater-than | less-than ] seconds
Displays information for flows filtered by connected time period.

● < seconds: Displays flows that have been connected less than the specified number of seconds.
● > seconds: Displays flows that have been connected more than the specified number of seconds.
● greater-than seconds: Displays flows that have been connected more than the specified number of seconds.
● less-than seconds: Displays flows that have been connected less than the specified number of seconds.

seconds is an integer from 0 through 4294967295.

</tr>
<tr>
<td>• greater-than address: Specifies an IPv4 IP address that is greater than address.</td>
<td></td>
</tr>
<tr>
<td>• less-than address: Specifies an IPv4 IP address that is less than address.</td>
<td></td>
</tr>
<tr>
<td><strong>address</strong> is an IP address expressed in IPV4 dotted-decimal notation.</td>
<td></td>
</tr>
</tbody>
</table>
**msisdn** *msisdn_num*

Displays information for the mobile user identified by the Mobile Subscriber ISDN Number (MSISDN). *msisdn_num* must be a numeric string of 1 to 15 digits.

**nat** { not-required | required [ nat-ip *nat_ip_address* [ nat-port *nat_port* ] ] [ binding-info ] }

**Important:** The *nat* keyword and options are only available in StarOS 8.3 and later releases.

Displays information for flows filtered by Network Address Translation (NAT) required or not required setting:

- **not-required**: Sessions with NAT processing are not required.
- **required**: Sessions with NAT processing are required.
- **nat-ip** *nat_ip_address*: Sessions using the NAT IP address expressed in IPv4 dotted-decimal notation.
- **nat-port** *nat_port*: Sessions using the specified NAT IP address and NAT port number specified as an integer from 0 through 65535.
- **binding-info**: Displays the NAT binding information of the NATed flow.

**pacing-bitrate** [ < | > | = | greater-than | less-than | equal-to ] *number*

Displays information on video flows filtered by a video pacing bit rate specified an integer from 1 to 256000000.

- **< number**: Specifies a number that is less than the specified video pacing bit rate.
- **> number**: Specifies a number that is greater than the specified video pacing bit rate.
- **= number**: Specifies a number that is equal to the specified video pacing bit rate.
- **greater-than number**: Specifies a number that is greater than the specified video pacing bit rate.
- **less-than number**: Specifies a number that is less than the specified video pacing bit rate
- **equal-to number**: Specifies a number that is equal to the specified video pacing bit rate.

**port-number** [ server | subscriber ] [ < | > | IPv4 | greater-than | less-than ] *number_

Displays information on flows filtered by port number.

- **server**: Specifies the port-number for a specific server.
- **subscriber**: Specifies subscriber details for this port-number, and must be an integer from 0 through 65535.

- **< number**: Specifies a port number that is less than the specified port-number.
- **> number**: Specifies a port number that is greater than the specified port-number.
- **greater-than number**: Specifies a port number that is greater than the specified port-number.
- **less-than number**: Specifies a port number that is less than the specified port-number.

**rx-bytes** [ < | > | greater-than | less-than ] *number_

Displays information on flows filtered by the number of bytes received in the flow.

- **< number**: Specifies the number of bytes that is less than the specified rx-bytes.
Exec Mode show Commands (A-C)

show active-charging flows

- `number`: Specifies number of bytes that is greater than the specified rx-bytes.
- `greater-than number`: Specifies number of bytes that is greater than the specified rx-bytes.
- `less-than number`: Specifies number of bytes that is less than the specified rx-bytes.

`number` must be an integer from 0 through 18446744073709551615.

rx-packets [ < | > | greater-than | less-than ] number

Displays information on flows filtered by the number of packets received in the flow.
- `greater-than number`: Specifies the number of packets that is greater than the specified rx-packets.
- `less-than number`: Specifies the number of packets that is less than the specified rx-packets.

`number` must be an integer from 0 through 18446744073709551615.

session-id session_id

Displays detailed information for specific active charging session ID.

summary

Displays summary information for defined sessions, based on defined parameters.

trans,proto { icmp | tcp | udp }

Displays information on flows filtered by the transport protocol.
- `icmp`: ICMP protocol type flow
- `tcp`: TCP protocol type flow
- `udp`: User Datagram Protocol (UDP) flows

tx-bytes [ < | > | greater-than | less-than ] number

Displays information on flows filtered by the number of bytes received in the flow.
- `< number`: Specifies the number of bytes that is less than the specified tx-bytes.
- `> number`: Specifies number of bytes that is greater than the specified tx-bytes.
- `greater-than number`: Specifies number of bytes that is greater than the specified tx-bytes.
- `less-than number`: Specifies number of bytes that is less than the specified tx-bytes.

`number` must be an integer from 0 through 18446744073709551615.

tx-packets [ < | > | greater-than | less-than ] number

Displays information on flows filtered by the number of packets received in the flow.
- `greater-than number`: Specifies the number of packets that is greater than the specified tx-packets.
- `less-than number`: Specifies the number of packets that is less than the specified tx-packets.

`number` must be an integer from 0 through 18446744073709551615.

type flow_type

Displays information on flows filtered by flow type of application protocol.
`flow_type` must be one of the following:
- `dns`
- `ftp`
• http
• icmp
• icmpv6
• imap
• ip
• ipv6
• mms

• p2p [ application p2p_list [ traffic-type traffic_type ] | protocol-group group_list ]: Peer-to-peer analyzer.

  p2p application p2p_list: P2P protocol type flows include one or more of the following applications:
  • actionvoip
  • actsync
  • adobeconnect
  • aimini
  • amazoncloud
  • amazonmusic
  • antsp2p
  • apple-push
  • apple-store
  • applejuice
  • applemaps

**username user_name**

Specifies the user name as a sequence of characters and/or wildcard characters ($ and *). `user_name` must be an alphanumeric string of 1 through 127 characters.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.

For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**

Use this command to display charging flow type information.

**Example**

The following command displays a detailed flow information for a session ID of `test`:

```
show active-charging flows session-id test
```
The following command displays a detailed flow information for a P2P type session:

```
show active-charging flows full type p2p
```

The following command displays a detailed information for a P2P type flow:

```
show active-charging flows type p2p
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show active-charging fw-and-nat policy

Displays Firewall-and-NAT Policy information.

Important: This command is only available in StarOS 8.1, and in StarOS 9.0 and later. For more information on this command please contact your local service representative.

Product
- ACS
- PSF
- NAT

Privilege
- Security Administrator, Administrator, Operator, Inspector

Mode
- Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show active-charging fw-and-nat policy [ { { all | name fw_nat_policy_name } [ service name acs_service_name ] } | { statistics { all | name fw_nat_policy_name } } ] [ | { grep grep_options | more } ]

all
Displays information for all Firewall-and-NAT policies configured, optionally all in a specified service.

name fw_nat_policy_name
Displays detailed information for an existing Firewall-and-NAT policy specified as an alphanumeric string of 1 through 63 characters.

service name acs_service_name
Displays information for all or the specified Firewall-and-NAT policy in the specified ACS. acs_service_name must be the name of the active-charging service, and must be an alphanumeric string of 1 through 15 characters.

statistics
Displays statistics for all or the specified Firewall-and-NAT policy.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.
Usage

Use this command to view Firewall-and-NAT Policy information.

Example

The following command displays detailed information for the Firewall-and-NAT policy named standard:

```
show active-charging fw-and-nat policy name standard
```
show active-charging group-of-objects

Displays information for ACS group-of-objects.

Product
ACS

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show active-charging group-of-objects { all | name group_of_objects_name } [ | { grep grep_options | more } ]
```

- all
  Displays details of all group-of-objects configured in the system.

- name group_of_objects_name
  Displays details for the specified group-of-objects.
  `group_of_objects_name` must be the name of a group-of-objects, and must be an alphanumeric string of 1 through 63 characters.

  `| { grep grep_options | more }`
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
  For details on the usage of `grep` and `more`, refer to the `Regulating a Command’s Output` section of the `Command Line Interface Overview` chapter.

Usage

Use this command to view information for all/specific group-of-objects.

Example

The following command displays information for a group-of-objects named `test`.

```
show active-charging group-of-objects name test
```

**Important:** Output descriptions for commands are available in the `Statistics and Counters Reference`.
**show active-charging group-of-prefixed-urls**

D displays information on group of prefixed URLs configured in an Active Charging Service (ACS).

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show active-charging group-of-prefixed-urls { all | name prefixed_url_group } [ service name acs_service_name ] [ | { grep grep_options | more } ]
```

- **all**
  Displays information for all group of prefixed URLs configured in an ACS.

- **name prefixed_url_group**
  Displays detailed information for the group of prefixed URLs specified as an alphanumeric string of 1 through 63 characters.

- **service name acs_service_name**
  Displays information for all or the specified group of prefixed URLs in the specified ACS.
  `acs_service_name` must be the name of the ACS expressed as alphanumeric string of 1 through 15 characters.

- **| { grep grep_options | more }**
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter

**Usage**

Use this command to view information on group of prefixed URLs configured in the ACS.

**Example**

The following command displays for the group of prefixed URLs named `test123`:

```
show active-charging group-of-prefixed-urls name test123
```
show active-charging group-of-ruledefs

Displays information for all groups or a specified group of ruledefs configured in the Active Charging Service (ACS).

**Product**
ACS

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show active-charging group-of-ruledefs { { all | name group_of_ruledefs_name } [ service name acs_service_name ] | statistics name group_of_ruledefs_name } [ | { grep grep_options | more } ]
```

- **all**
  Displays information for all groups of ruledefs configured, optionally all in a specified ACS.

- **name group_of_ruledefs_name**
  Displays detailed information for an existing group of ruledefs specified as an alphanumeric string of 1 through 63 characters.

- **service name acs_service_name**
  Displays information for all groups or the specified group of ruledefs within the ACS. `acs_service_name` must be the name of the ACS, and must be an alphanumeric string of 1 through 15 characters.

- **statistics name group_of_ruledefs_name**
  Displays statistics for an existing group of ruledefs specified as an alphanumeric string of 1 through 63 characters.

  | { grep grep_options | more } |
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.

  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to view information on group of ruledefs configured in a ACS.

**Example**

The following command displays information on all groups of ruledefs configured:
show active-charging group-of-ruledefs all
show active-charging nat statistics

Displays Network Address Translation (NAT) realm statistics.

**Product**
NAT

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show active-charging nat statistics [ instance instance_number | nat-realm nat_realm_name [ summary ] | unsolicited-pkts-server-list [ instance instance_number ] ] [ | { grep grep_options | more } ]
```

**show active-charging nat statistics**

When issued in the local context, this command displays statistics for all NAT realms in all contexts. When issued in a specific context, this command displays statistics for all NAT realms in that context.

**show active-charging nat statistics instance instance_number**

When issued in the local context, this command displays statistics for the specified ACS/Session Manager instance in all contexts. When issued in a specific context, this command displays statistics for the specified ACS/Session Manager instance in that context.

**show active-charging nat statistics nat-realm nat_realm_name**

When issued in the local context, this command displays statistics for the specified NAT realm in all contexts. When issued in a specific context, this command displays statistics for the specified NAT realm in that context.

**show active-charging nat statistics unsolicited-pkts-server-list instance instance_number**

When issued in the local context, this command displays statistics for unsolicited packets in all contexts. When issued in a specific context, this command displays statistics for unsolicited packets that context. `instance_number` must be an integer from 1 through 65535.

**nat-realm nat_realm_name**

Specifies the NAT realm’s / NAT realm group’s name. `nat_realm_name` must be an alphanumeric string of 1 through 31 characters.

**instance instance_number**

Displays statistics for the specified ACS/Session Manager instance. `instance_number` must be an integer from 1 through 65535.
show active-charging nat statistics

summary

When the `nat_realm_name` specified is a “pool group” and the `summary` option is used, summary statistics of all pools in the pool group are displayed.

When the `nat_realm_name` specified is a pool and the `summary` option is *not* used, all available statistics for the specified pool are displayed.

When the `nat_realm_name` specified is a “pool group” and the `summary` option is *not* used, all available statistics of each pool in the specified “pool group” are displayed.

unsolicited-pkts-server-list

Displays statistics with the list of servers from where most number of unsolicited packets are received for the specified ACS/Session Manager instance.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.

For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to view NAT realm statistics.

Example

The following command when issued in the local context, displays NAT realm statistics for NAT realms named `test135` in all contexts:

```
show active-charging nat statistics nat-realm test135
```
show active-charging packet-filter

Displays information on packet filters configured in an Active Charging Service (ACS).

**Product**
ACS

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show active-charging packet-filter { all | name packet_filter_name } [ service name acs_service_name ] [ | { grep grep_options | more } ]
```

- **all**
  Displays information for all packet filters configured, optionally all configured in an ACS.

- **name packet_filter_name**
  Displays detailed information for an existing packet filter specified as an alphanumeric string of 1 through 63 characters.

- **service name acs_service_name**
  Displays information for all filters or the specified packet filter in the specified ACS. `acs_service_name` must be the name of the ACS, and must be an alphanumeric string of 1 through 15 characters.

  | { grep grep_options | more } |
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.

  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to view information on packet filters configured in an ACS.

**Example**

The following command displays information for the packet filter `filter12`:

```
show active-charging packet-filter name filter12
```
show active-charging pcp-service

Displays statistics for Port Control Protocol (PCP) service in the Active Charging Service (ACS).

Important: This command is customer specific. For more information contact your Cisco account representative.

Product
ACS
NAT
PSF

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show active-charging pcp-service { all | name pcp_service_name | statistics [ instance instance_number | name pcp_service_name | wide ] } [ | { grep grep_options | more } ]
```

- **all**: Displays information for all PCP services configured in the service.
- **name pcp_service_name**: Displays information for an existing PCP service specified as an alphanumeric string of 1 through 63 characters.
- **statistics [ instance instance_number | name pcp_service_name | wide ]**: Displays statistical information for all configured PCP services.
  - **instance instance_number**: Displays statistics for the specified ACS/Session Manager instance.
  - **name pcp_service_name**: Displays statistics for the specified PCP service.
  - **wide**: Displays all available information in a single wide line.

| { grep grep_options | more } |

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to view statistics for PCP service in the ACS.
**show active-charging pcp-service statistics**: The output of this command displays statistics for all PCP services in all contexts when issued in the local context. When issued in a specific context, this command displays statistics for all PCP services in that context.

**show active-charging pcp-service instance instance_number**: When issued in the local context, this command displays statistics for the specified ACS/Session Manager instance in all contexts. When issued in a specific context, this command displays statistics for the specified ACS/Session Manager instance in that context.

**show active-charging pcp-service name pcp_service_name**: The output of this command displays the statistics for the specified PCP service.

**Example**

The following command displays PCP service statistics for a PCP service named *pcp1*:

```
show active-charging pcp-service statistics name pcp1
```

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show active-charging qos-group-of-ruledefs

Displays information for ACS QoS-group-of-ruledefs.

Product
ACS

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show active-charging qos-group-of-ruledefs { all | name qos_group_of_ruledefs_name } [ | { grep grep_options | more } ]

- **all**
  Displays details of all qos-group-of-ruledefs configured in the system.

- **name qos_group_of_ruledefs_name**
  Displays details for the specified qos-group-of-ruledefs.
  
  *qos_group_of_ruledefs_name* must be the name of a qos-group-of-ruledefs, and must be an alphanumeric string of 1 through 63 characters.

  | { grep grep_options | more }
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
  For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view details of all/specific qos-group-of-ruledefs.

Example

The following command displays of a qos-group-of-ruledefs named *test*.

```
show active-charging qos-group-of-ruledefs name test
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show active-charging regex

Displays regular expression (regex) related statistics and information.

Product
ACS

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show active-charging regex { statistics { memory | ruledef } { all | instance instance_number | summary } | status { all | instance instance_number } } [ | { grep grep_options | more }]

statistics { memory | ruledef } { all | instance instance_number | summary }
Displays regex-related statistics.
• memory: Displays regex memory related statistics.
• ruledef: Displays regex ruledef related statistics.
• all: Displays specified statistics for all Session Manager instances.
• instance instance_number: Displays specified statistics for specified Session Manager instance.
  • instance_number must be an integer from 1 through 65535.
• summary: Displays summary information for specified parameter.

status { all | instance instance_number }
Displays status information of regex engines.
• all: Displays status for all regex engines.
• instance instance_number: Displays status of regex engine for specified Session Manager instance.
  • instance_number must be an integer from 1 through 65535.

| { grep grep_options | more }
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to view regular expression (regex) related statistics and status of regex engines.
Example

The following command displays status information of all regex engines:

```
show active-charging regex status all
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show active-charging rulebase

Displays information for ACS rulebases.

**Product**
ACS

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

`[local]host_name#`

**Syntax**

```
show active-charging rulebase { { all | name rulebase_name } [ service name acs_service_name ] } [ statistics [ name rulebase_name ] ] [ | { grep grep_options | more } ]
```

- **all**
  Displays details of all rulebases configured in the system.

- **name rulebase_name**
  Displays details of an existing rulebase specified as an alphanumeric string of 1 through 63 characters.

- **service name acs_service_name**
  Displays details of all or the specified rulebase configured in the specified ACS. `acs_service_name` must be the name of the ACS, and must be an alphanumeric string of 1 through 15 characters.

- **statistics**
  Displays statistical information for all or the specified rulebase.

  | { grep grep_options | more } |
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**

Use this command to view various statistics for a specific charging rulebase.

**Example**

The following command displays active charging rulebase statistics.

```
show active-charging rulebase statistics
```

The following command displays configurations and statistics for a rulebase named `rulebase_1`.
show active-charging rulebase name rulebase_1

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show active-charging ruledef

Displays information for ACS ruledefs.

**Product**

ACS
PSF

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]\hname#
```

**Syntax**

```
show active-charging ruledef { all | charging | firewall | name ruledef_name | post-processing | routing | statistics [ all { charging | firewall [ wide ] | post-processing } | name ruledef_name [ wide ] ] } [ | { grep grep_options | more } ]
```

---

**all**

Displays information for all ruledefs configured in the ACS.

---

**charging**

Displays information for all Charging ruledefs configured in the ACS.

---

**firewall**

Displays information for all Stateful Firewall ruledefs configured in the ACS.

---

**name ruledef_name**

Displays detailed information for an existing ruledef specified as an alphanumeric string of 1 through 63 characters.

---

**post-processing**

**Important:** This keyword is only available in StarOS 8.3 and later.

Displays information for all post-processing ruledefs configured in the ACS.

---

**routing**

Displays information for all Routing ruledefs configured in the ACS.

---

**service service_name**

This keyword is obsolete.
statistics [ all { charging | firewall [ wide ] | post-processing } | name ruledef_name [ wide ] ]

Displays statistical information for all/specified ruledefs configured in the ACS. If none of the optional arguments are supplied, statistics totaled for all ruledefs will be displayed.

- **all**: Displays statistics for all ruledefs of the specified type configured in the ACS.
- **charging**: Displays statistics for all Charging ruledefs configured in the ACS.
- **firewall**: Displays statistics for all Firewall ruledefs configured in the service.
- **post-processing**: Displays statistics for all Post-processing ruledefs configured in the ACS.

**Important**: The `post-processing` keyword is available only in StarOS 8.3 and later releases.

- **name ruledef_name**: Displays statistics for an existing ruledef specified as an alphanumeric string of 1 through 63 characters.
- **wide**: Displays all available information in a single wide line.

Pipe (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.

For details on the usage of `grep` and `more`, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter.

**Usage**

Use this command to view information for ruledefs configured in the ACS.

**Example**

The following command displays ACS ruledef statistics.

```
show active-charging ruledef statistics
```

**Important**: Output descriptions for commands are available in the Statistics and Counters Reference.
show active-charging service

Displays detailed information about an Active Charging Service (ACS).

Product
ACS

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show active-charging service { all | name acs_service_name } [ | { grep grep_options | more } ]

- **all**
  Displays information for all configured ACSs.

- **name acs_service_name**
  Displays detailed information for the ACS specified as an alphanumeric string of 1 through 15 characters.

- **| { grep grep_options | more }**
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
  For details on the usage of `grep` and `more`, refer to the `Regulating a Command’s Output` section of the `Command Line Interface Overview` chapter.

Usage

Use this command to view ACS details.

Example

The following command displays details for the ACS named `test1`.

```
show active-charging service name test1
```

**Important:** Output descriptions for commands are available in the `Statistics and Counters Reference`. 
show active-charging sessions

Displays statistics for Active Charging Service (ACS) sessions.

**Product**
ACS

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```plaintext
show active-charging sessions [ full [ wide ] | wfl | summary ] [ filter_keyword + ] + [ all ] [ | { grep grep_options | more } ]
```

- **full [ wide ]**
  Displays all available information for the specified session. Optionally all available information can be displayed in a single wide line.

- **summary**
  Displays active sessions count and packet and bytes statistics.

- **wfl**
  Displays all available information including MSISDN and rulebase in a single wide line.

- **display-dynamic-charging-rules**
  Displays information for the dynamic charging rules configured per session under Gx interface support.

- **dynamic-charging**
  Displays information for dynamic charging sessions.

- **filter_keyword**
  The following keywords are filters that modify or filter the output of the Command Keywords. Not all filters are available for all command keywords. Multiple filter keywords can be entered on a command line. When multiple filter keywords are specified, the output conforms to all of the filter keywords specifications. For example, if you enter the following command:
  ```plaintext
  show active-charging sessions full active-charging-service acs_!
  ```
  Counters for active charging sessions active in ACS `acs_1` with full details is displayed. Information for all other services is not displayed.

- **acsmgr instance instance_number**
  Displays session information for a specific ACS/Session Manager instance.
**active-charging-service**  `acs_service_name`
Displays session information for the ACS specified as an alphanumeric string of 1 through 15 characters.

**all**
Displays session information for all active charging sessions.

**cae-readdressing**
Displays the Content Adaptation Engine (CAE) re-addressing session information for active charging sessions.

**callid**
Specifies the call identification number.

**display-dynamic-charging-rules**
Displays dynamic charging rules configured.

**dynamic-charging**
Displays session information for all dynamic charging sessions.

**firewall** `{ not-required | required }`
Displays session information for sessions with Firewall Processing required or not required, as specified.

**flows** `{active | idle | total} [ < | = | > | equal-to | greater-than | less-than ] { bytes }`
Displays information for all active charging flows filtered by all information, active, or idle sessions.

- `< bytes` or `less-than bytes`: Specifies filtering of flows that is less than the specified number of bytes.
- `> bytes` or `greater-than bytes`: Specifies filtering of flows that is greater than the specified number of bytes.
- `= bytes` or `equal-to bytes`: Specifies filtering of flows that is equal to the specified number of bytes.

`bytes` must be an integer from 0 through 18446744073709551615.

**fw-and-nat policy**  `fw_nat_policy_name`
Displays information for the Firewall-and-NAT Policy specified as an alphanumeric string of 1 through 63 characters.

**imsi**
Specifies the International Mobile Subscriber Identity (IMSI) of the subscriber session.

**ip-address**
Specifies the IP address for the specific charging service.

**max-flows** `{ < | = | > | equal-to | greater-than | less-than } { bytes }`
Displays information for the maximum flows made by the session.

- `< bytes` or `less-than bytes`: Specifies filtering of maximum flows that is less than the specified number of bytes.
show active-charging sessions

- **> bytes**or **greater-than bytes:** Specifies filtering of maximum flows that is greater than the specified number of bytes.
- **= bytes**or **equal-to bytes:** Specifies filtering of maximum flows that is equal to the specified number of bytes.

*bytes* must be an integer from 0 through 18446744073709551615.

**msid**
Displays active charging session information for a specific subscriber’s Mobile Station Identification (MSID) number.

**msisdn msisdn_number**
Displays active charging session information for a specific subscriber’s Mobile Station Integrated Services Digital Network (MSISDN) number. *msisdn_number* must be an integer with a maximum of 15 digits.

**ipv4**
Displays active charging session information with IPv4 Firewall enabled/disabled.

**ipv6**
Displays active charging session information with IPv6 Firewall enabled/disabled.

**nat { not-required | required [ nat-realm nat_realm_name ] } [ ipv4 | ipv6 ]**
Displays session information for sessions with NAT required or not required, as specified. *nat-realm nat_realm_name* specifies the name of a NAT realm as an alphanumeric string of 1 through 63 characters. *ipv4:* Displays active-charging sessions for which NAT44 processing is required. *ipv6:* Displays active-charging sessions for which NAT64 processing is required.

**rulebase**
Displays information for a rulebase that is configured in an active charging session.

**rx-data**
Displays the bytes received in the session.

**session-id**
Displays detailed session information for a specific session identification.

**transrating**
Displays the transrating sessions.

**tx-data**
Displays the bytes sent in the session.

**type**
Displays session information for specified DNS application type(s).

• **dns**

**username**
Displays session information for a specific user name.

**dynamic-charging**
Displays all the sessions having received at least one Gx message from Session Manager/IMS Authorization.

```
| ( grep grep_options | more )
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.

For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**
Use this command to display the configuration information for an active charging session.

**Example**
The following command displays full information of an active charging session.

```
show active-charging sessions full all
```
The following command displays an active charging session summary.

```
show active-charging sessions summary
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show active-charging sessions credit-control server-unreachable

Displays the details of sessions that are currently in server-unreachable state i.e. Gy Assume Positive state.

Product
ACS

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show active-charging sessions credit-control server-unreachable [ filter_keyword + ] [ | { grep grep_options | more } ]

filter_keyword

The following keywords are filters that modify or filter the output of the Command Keywords. Not all filters are available for all command keywords. Multiple filter keywords can be entered on a command line. When multiple filter keywords are specified, the output conforms to all of the filter keywords specifications. For example, if you enter the following command:

show active-charging sessions credit-control server-unreachable active-charging-service acs_!

Counters for active charging sessions active in ACS acs_1 are displayed. Information for all other services is not displayed.

acsmgr instance_number

Displays session information for a specific ACS/Session Manager instance.

active-charging-service acs_service_name

Displays session information for the ACS specified as an alphanumeric string of 1 through 15 characters.

callid

Specifies the call identification number.

credit-control

Displays credit control information.

dynamic-charging

Displays session information for all dynamic charging sessions.
**Exec Mode show Commands (A-C)**

---

**firewall { not-required | required }**

Displays session information for sessions with Firewall Processing required or not required, as specified.

**flows { active | idle | total} [ < | = | > | equal-to | greater-than | less-than ] { bytes }**

Displays information for all active charging flows filtered by all information, active, or idle sessions.
- $$<< \text{bytes}$$ or $$\text{less-than bytes}$$: Specifies filtering of flows that is less than the specified number of bytes.
- $$>> \text{bytes}$$ or $$\text{greater-than bytes}$$: Specifies filtering of flows that is greater than the specified number of bytes.
- $$== \text{bytes}$$ or $$\text{equal-to bytes}$$: Specifies filtering of flows that is equal to the specified number of bytes.

`bytes` must be an integer from 0 through 18446744073709551615.

**fw-and-nat policy fw_nat_policy_name**

Displays information for the Firewall-and-NAT Policy specified as an alphanumeric string of 1 through 63 characters.

**imsi**

Specifies the International Mobile Subscriber Identity (IMSI) of the subscriber session.

**ip-address**

Specifies the IP address for the specific charging service.

**max-flows { < | = | > | equal-to | greater-than | less-than } { bytes }**

Displays information for the maximum flows made by the session.
- $$<< \text{bytes}$$ or $$\text{less-than bytes}$$: Specifies filtering of maximum flows that is less than the specified number of bytes.
- $$>> \text{bytes}$$ or $$\text{greater-than bytes}$$: Specifies filtering of maximum flows that is greater than the specified number of bytes.
- $$== \text{bytes}$$ or $$\text{equal-to bytes}$$: Specifies filtering of maximum flows that is equal to the specified number of bytes.

`bytes` must be an integer from 0 through 18446744073709551615.

**msid**

Displays active charging session information for a specific subscriber’s Mobile Station Identification (MSID) number.

**rulebase**

Displays information for a rulebase that is configured in an active charging session.

**rx-data**

Displays the bytes received in the session.
session-id
Displays detailed session information for a specific session identification.

tax-data
Displays the bytes sent in the session.

type
Displays session information for specified DNS application type(s).

* dns
* ftp
* h323
* http
* icmp
* icmpv6
* imap
* ip
* ipv6
* mms

* p2p [ application p2p_list [ traffic-type traffic_type ] | protocol-group group_list ]: Displays session information for a P2P application type and P2P protocol group.

  p2p application p2p_list: The supported P2P applications are:

  * actionvoip
  * actsync
  * adobeconnect
  * aimini
  * amazoncloud
  * amazonmusic
  * antsp2p
  * apple-push
  * apple-store
  * applejuice
  * applemaps
  * ares
  * armagettron
  * avi
  * badoo
  * baidumovie
  * battlefd
Exec Mode show Commands (A-C):

• rtsp
• secure-http
• sip
• smtp
• tcp
• tftp
• udp
• unknown
• wsp-connection-less
• wsp-connection-oriented

username

Displays session information for a specific user name.

|  { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.

For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display the configuration information for an active charging session.

Example

The following command displays full information of an active charging session.

```
show active-charging sessions full all
```

The following command displays an active charging session summary.

```
show active-charging sessions summary
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show active-charging subscribers

Displays statistics and information on active subscribers.

Product
ACS

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show active-charging subscribers callid call_id charging-updates [ statistics ] [ charging-action [ name charging_action_name ] | qos-group [ name qos_group_of_ruledefs_name ] | session ] [ | { grep grep_options | more } ]

callid call_id

Specifies a call identification number.
call_id must be an eight digit HEX number.

charging-updates [ statistics ] [ charging-action [ name charging_action_name ] | qos-group [ name qos_group_of_ruledefs_name ] | session ]

Displays charging-update statistics for subscriber.

• statistics: Displays statistics related to dynamic updates to charging parameters.

• charging-action [ name charging_action_name ]: Displays charging-updates for activated charging-actions or specified charging action.

  charging_action_name must be the name of a charging action, and must be an alphanumeric string of 1 through 63 characters in length.

• qos-group [ name qos_group_of_ruledefs_name ]: Displays charging-updates for activated QoS groups or the specified QoS-group-of-ruledefs.

  qos_group_of_ruledefs_name must be the name of a QoS-group-of-ruledefs, and must be an alphanumeric string of 1 through 63 characters in length.

• session: Displays charging-updates for the session.

| { grep grep_options | more } |

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.
Usage
Use this command to view subscriber statistics and information on dynamic updates to charging parameters per call ID.

Example
The following command displays all statistics related to dynamic updates to charging parameters for call ID ca50ea54:

```
show active-charging subscribers callid ca50ea54 charging-updates statistics
```

The following command displays information on charging updates for call ID ca50ea54 and ACS charging action named test12:

```
show active-charging subscribers callid ca50ea54 charging-updates charging-action name test12
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show active-charging subsystem

Displays service and configuration counters for the ACS.

**Product**
ACS

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show active-charging subsystem { all | facility acsmgr { all | instance instance_number } [ rulebase name rulebase_name ] | sip } [ | { grep grep_options | more } ]
```

- **all**
  Displays ACS subsystem information.

- **facility acsmgr { all | instance instance_number }**
  Displays logged events for all ACS/Session Managers or for a specific instance.
  *instance_number* must be an integer from 1 through 65535.

- **rulebase name rulebase_name**
  Displays rulebase statistics for the specified rulebase.
  *rulebase_name* must be the name of a rulebase, and must be an alphanumeric string of 1 through 63 characters.

- **sip**
  Displays SIP related statistics.

  | { grep grep_options | more } |
  
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
  For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to view ACS/Session Manager information.

**Example**

The following command displays ACS subsystem information:

```
show active-charging subsystem all
```
**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show active-charging tcp-proxy statistics

Displays TCP Proxy statistics.

Product
ACS

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show active-charging tcp-proxy statistics [ all | dynamic-disable | ip-layer | proxy-fac | rulebase rulebase_name | socket-migration | tcp-layer ] [ verbose ] [ | { grep grep_options | more } ]

- **all**
  Displays all TCP Proxy statistics aggregated over all rulebases, including for both IP and TCP layers.

- **dynamic-disable**
  Displays statistics for dynamic disabling of TCP Proxy.

- **ip-layer**
  Displays TCP Proxy statistics for IP layer.

- **proxy-fac**
  Displays TCP Proxy Flow Admission Control statistics.

- **rulebase rulebase_name**
  Displays TCP Proxy statistics for the rulebase specified as an alphanumeric string of 1 through 63 characters.

- **socket-migration**
  Displays TCP Proxy statistics for socket migration.

- **tcp-layer**
  Displays TCP Proxy statistics for TCP layer.

- **verbose**
  Displays detailed TCP Proxy statistics.
| { grep grep_options | more }

Specifies that the output of this command is to be piped (sent) to the command specified. You must specify a command to which the output will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**

Use this command to view TCP Proxy statistics.

**Example**

The following command displays detailed TCP proxy statistics for the rulebase named test14:

```
show active-charging tcp-proxy statistics rulebase test14 verbose
```
**show active-charging tethering-detection**

Displays information/statistics pertaining to Tethering Detection databases.

**Product**
ACS

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
show active-charging tethering-detection { database [ os-signature | tac | ua-signature ]+ [ sessmgr { all | instance instance_number } ] [ | { grep grep_options | more } | statistics }
```

Displays information pertaining to the specified Tethering Detection database(s).
- **os-signature**: Displays Tethering Detection OS (Operating System) database information.
- **tac**: Displays Tethering Detection TAC (Transaction Authorization Code) database information.
- **ua-signature**: Displays Tethering Detection UA (User Agent) database information.
- **+**: Indicates that more than one of the preceding keywords can be entered in a single command.
- **sessmgr { all | instance instance_number }**: Displays SessMgr Tethering Detection database status.
  - **all**: Displays status for all SessMgr instances.
  - **instance instance_number**: Displays status for the SessMgr instance specified as an integer from 1 through 10000.

**statistics**

Displays Tethering Detection related statistics.

| { grep grep_options | more } |

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**

Use this command to view information/statistics pertaining to Tethering Detection databases.
The following command displays information pertaining to Tethering Detection UA and OS databases:

```
show active-charging tethering-detection database ua-signature os-signature
```

The following command displays information pertaining to all Tethering Detection databases:

```
show active-charging tethering-detection database
```
show active-charging timedef

Displays the details of timeslots configured in specified time definition(s).

**Important:** This command is only available in StarOS 8.1 and in StarOS 9.0 and later.

**Product**
ACS

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show active-charging timedef { all | name timedef_name } [ service name acs_service_name ] [ | { grep grep_options | more } ]
```

- `all`
  Displays information for all timedefs configured in the service.

- `name timedef_name`
  Displays detailed information for the timedef specified as an alphanumeric string of 1 through 63 characters.

- `service name acs_service_name`
  Displays information for all or a specific timedef configured in the specified ACS. `acs_service_name` must be the name of the active-charging service, and must be an alphanumeric string of 1 through 15 characters.

- `| { grep grep_options | more }`
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to view details of timeslots configured in specified timedef(s) that have been configured for the Time-of-Day Activation/Deactivation of Rules feature.

**Example**

The following command displays timeslot details of all timedefs configured in the ACS:

```
show active-charging timedef all
```
show active-charging udr-format

Displays information about UDR formats configured in an Active charging Service (ACS).

**Product**
ACS

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
show active-charging udr-format \{ all | name udr_format_name \} [ | \{ grep grep_options | more \} ]
```

- **all**
  Displays information for all UDR formats.

- **name udr_format_name**
  Displays information for an existing UDR format specified as an alphanumeric string of 1 through 63 characters.

- | \{ grep grep_options | more \}
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**
Use this command to display information for UDR format(s) in an ACS.

**Example**
The following command displays all configured UDR formats in an ACS.

```
show active-charging udr-format all
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
**show active-charging url-blacklisting statistics**

Displays URL Blacklisting statistics.

**Product**

CF

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
show active-charging url-blacklisting statistics [ rulebase { all | name rulebase_name } ] [ verbose ] [ | { grep grep_options | more } ]
```

- `rulebase { all | name rulebase_name }`
  
  Displays URL Blacklisting statistics for all or a specific rulebase.
  
  - `all`: Displays URL Blacklisting statistics for all configured rulebases.
  
  - `name rulebase_name`: Displays URL Blacklisting statistics for the rulebase specified as an alphanumeric string of 1 through 63 characters.

- `verbose`

  Displays detailed URL Blacklisting statistics.

- `| { grep grep_options | more }

  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.

  For details on the usage of **grep** and **more**, refer to the **Regulating a Command’s Output** section of the **Command Line Interface Overview** chapter.

**Usage**

Use this command to view URL Blacklisting hits and misses statistics.

**Example**

The following command displays cumulative URL Blacklisting statistics:

```
show active-charging url-blacklisting statistics
```

The following command displays URL Blacklisting statistics for the rulebase `rulebase_1`:

```
show active-charging url-blacklisting statistics rulebase name rulebase_1
```

**Important:** Output descriptions for commands are available in the **Statistics and Counters Reference**.
show active-charging video detailed-statistics

Displays detailed statistics for TCP video flows. The command options enable you to collect statistical data for video per UE device type, per radio access type, and per video container type.

Product
MVG

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show active-charging video detailed-statistics [ container { flv | mp4 | others } | rat { cdma | gprs | hspa | lte | others | umts | wlan } | ue { android | ios | laptop | others } ]

container { flv | mp4 | others }
Displays detailed statistics for TCP video flows based on the specified container file format.

rat { cdma | gprs | hspa | lte | others | umts | wlan }
Displays detailed statistics for TCP video flows based on the specified radio access type.

ue { android | ios | laptop | others }
Displays detailed statistics for TCP video flows based on the specified UE device type.

Usage

Use this command to display detailed statistics about video usage. Use the command options to display detailed statistics based on the UE device type, radio access type, or container file format.

Example

The following command displays detailed statistics about video usage based on the UE device type ios:

    show active-charging video detailed-statistics ue ios
show active-charging xheader-format

Displays x-header format configurations for an Active Charging Service (ACS).

Important: This is a customer-specific command. Please contact your local sales representative for more information.

Product
ACS

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show active-charging xheader-format { all | name xheader_format } [ | { grep grep_options | more } ]

- **all**
  Displays information for all x-header formats configured.

- **name xheader_format**
  Displays information for the x-header format specified as an alphanumeric string of 1 through 63 characters.

- | { grep grep_options | more }
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
  For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to view details of x-header formats configured in an ACS.

Example
The following command displays information for the x-header format named **test12**:

    show active-charging xheader-format test12
show administrators

Displays information regarding all CLI users currently connected to the system.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

`show administrators [ session id ] [ | { grep grep_options | more } ]`

**session id**
Indicates the output is to contain additional information about the CLI user session including the assigned session ID.

`| { grep grep_options | more }`
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

Usage
This command displays a list of administrative users that have command line interface sessions active.

Example

`show administrators` `show administrators session id`

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show alarm

Displays alarm information.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show alarm { all | audible | central-office | facility | outstanding [ all | chassis | port slot/port | slot slot ] [ verbose ] | statistics } [ | { grep grep_options | more } ]
```

- **all**: Displays the state of all alarms in one screen.
- **audible**: Displays the state of the internal audible alarm on the SMC (ASR 5000) or SSC (ASR 5500).
- **central-office**: Displays the state of the CO Alarm contacts on the SPIO (ASR 5000) or SSC (ASR 5500).
- **facility**: Displays the state of the facility (audible and CO) alarms.
- **outstanding [ all | chassis | port slot/port | slot slot ] [ verbose ]**: Displays information on currently outstanding alarms.
  - **all**: Displays all alarm information.
  - **chassis**: Displays chassis/power/fan alarms.
  - **port slot/port**: Shows the alarm information for the specified port.
  - **slot slot**: Shows the alarm information for the card in the specified slot.
  - **verbose**: Displays more verbose output, including the internal alarm ID
- **statistics**: Displays basic statistics on the alarming subsystem, including the current number of outstanding alarms of different severities and a cumulative total of alarms generated.
show alarm

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of `grep` and `more`, refer to the Regulating a Command Output section of the Command Line Interface Overview chapter.

Usage
View alarms to verify system status or to periodically check the general health of the system.

Important: This command is not supported on all platforms.

Example
The following command displays all alarms that are currently outstanding:

```
show alarm outstanding all
```

The following command displays more detailed information on all alarms that are currently outstanding:

```
show alarm outstanding all verbose
```

The following command displays alarm statistics:

```
show alarm statistics
```

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
**show alcap counters**

Displays the Access Link Control Application Part (ALCAP) protocol message counters related to ALCAP protocol sessions associated with a Home-NodeB Gateway (HNB-GW) service instance configured and running on a system.

**Product**
HNB-GW

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show alcap counters [ alcap-service alcap_svc_name [ aal2-node aal2_node_name [ aal2-path aal2_path_id ] ] ] [ | { grep grep_options | more } ]
```

- **name alcap_svc_name**
  Specifies the name of the ALCAP service for which ALCAP protocol session counters are to be displayed.

- **aal2-node aal2-node**
  Specifies the name of the ATM Adaptation Layer 2 (AAL2) node for which protocol session counters will be filtered.

- **aal2-path aal2_path_id**
  Specifies the identity number of the AAL2 path on a specific ATM Adaptation Layer 2 (AAL2) node for which ALCAP protocol counters will be filtered.

| { grep grep_options | more } |

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of the `grep` and `more` commands, refer to the *Regulating a Command’s Output* section in the *Command Line Interface Overview* chapter.

**Usage**

This command is used to display the sessions statistics and counters for ALCAP service.

**Example**

The following command displays the ALCAP protocol session counters for ALCAP service named as `alcap_hnb_svc1`:

```
show alcap counters alcap-service alcap_hnb_svc1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 

---

4348

Command Line Interface Reference, StarOS Release 17
show alcap-service

Displays the Access Link Control Application Part (ALCAP) session statistics of an ALCAP service associated with a Home-NodeB Gateway (HNB-GW) service instance configured and running on a system.

**Product**
HNB-GW

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show alcap-service { all | name alcap_svc_name [ aal2-node aal2_node_name [ aal2-path aal2_path_id [ aal2-channel aal2_channel_num ] ] | endpoint aal2_endpoint_name ] } [ | { grep grep_options | more } ]
```

- **name alcap_svc_name**
  Specifies the name of the ALCAP service for which service statistics are to be displayed.

- **aal2-node aal2-node**
  Specifies the name of the ATM Adaptation Layer 2 (AAL2) node that will be used to filter the display of the ALCAP service statistics.

- **aal2-path aal2_path_id**
  Specifies the identity number of the AAL2 path on a specific ATM Adaptation Layer 2 (AAL2) node that will be used to filter the display of the ALCAP service statistics.

- **aal2-channel aal2_channel_num**
  Specifies the AAL2 channel number of the AAL2 path on a specific ATM Adaptation Layer 2 (AAL2) node that will be used to filter the display of the ALCAP service statistics.

- **endpoint atm_endpoint_name**
  Specifies the ATM endpoint name that will be used to filter the display of the ALCAP service statistics for a specific ATM endpoint.

**Usage**

This command is used to clear the sessions statistics and counters for ALCAP service.

**Example**

The following command displays the service statistics of ALCAP service named as `alcap_hnb_svc1`:

```
show alcap-service name alcap_hnb_svc1
```
**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*.
show alcap statistics

Displays the session statistics related to Access Link Control Application Part (ALCAP) protocol sessions associated with a Home-NodeB Gateway (HNB-GW) service instance configured and running on a system.

**Product**

HNB-GW

**Privilege**

Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show alcap statistics [ alcap-service alcap_svc_name [ aal2-node aal2_node_name [ aal2-path aal2_path_id ] ] ] [ verbose ] [ | { grep grep_options | more } ]
```

- **name alcap_svc_name**
  Specifies the name of the ALCAP service for which statistics are to be displayed.

- **aal2-node aal2-node**
  Specifies the name of the ATM Adaptation Layer 2 (AAL2) node for which ALCAP service related statistics will be displayed.

- **aal2-path aal2_path_id**
  Specifies the identity number of the AAL2 path on a specific ATM Adaptation Layer 2 (AAL2) node for which ALCAP service statistics counters will be displayed.

- `| { grep grep_options | more }
` Piping (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section in Command Line Interface Overview chapter of the Command Line Interface Reference.

**Usage**

This command is used to display the sessions statistics and counters for ALCAP service.

**Example**

The following command displays the service session statistics counters for ALCAP service named as `alcap_hnb_svc1`:

```
show alcap counters alcap-service alcap_hnb_svc1
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show apn

Displays configuration information for either a specific or all configured Access Point Names (APNs).

Product
GGSN
P-GW
SAEGW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show apn { all | name apn_name } [ | { grep grep_options | more } ]

<table>
<thead>
<tr>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
</tr>
<tr>
<td>Displays information on all APNs configured on the system.</td>
</tr>
<tr>
<td>name apn_name</td>
</tr>
<tr>
<td>Displays information for an APN specified as an alphanumeric string of 1 through 62 characters that is case sensitive.</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. For details on the usage of grep and more options, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.</td>
</tr>
</tbody>
</table>

Usage
This command is used to verify the configuration of one or all APNs for monitoring or troubleshooting purposes. The output is a concise listing of APN parameter settings. If this command is executed from within the local context with the all keyword, information for all APNs configured on the system will be displayed.

Example
The following command displays configuration information for all APNs:

show apn all

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show apn counters ip-allocation

Displays cumulative statistics of IP allocation method for calls set up so far, per Access Point Name (APN) basis.

Product
GGSN
P-GW
SAEGW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show apn counters ip-allocation [ all | name apn_name ] [ | { grep grep_options | more } ]

all
Displays statistics for all APNs.

name apn_name
Displays statistics for the APN specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

| { grep grep_options | more }
pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
This command is used to display the cumulative IP allocation counters on a per APN basis. Output of this command gives the user clear idea of how many sessions in each APN have used a particular type of ip-allocation method.
If this command is issued from within the local context, the statistics displayed will be cumulative for all APNs configured on the system regardless of context. If no APN name is specified and the command is executed from a context with multiple APNs configured, the output will be cumulative for all APNs in the context.

Example
The following command displays statistics for all APN on a system:

show apn counter ip-allocation all
show apn counters ip-allocation

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show apn statistics

Displays statistics for either a specific Access Point Name (APN) or all configured APNs.

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show apn statistics [ all | name apn_name ] [ | { grep grep_options | more } ]
```

- **all**
  Displays statistics for all APNs.

- **name apn_name**
  Displays statistics for the APN specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

- **| { grep grep_options | more }**
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

This command is used to view statistics for one or all APNs within a context for monitoring or troubleshooting purposes.
If this command is issued from within the local context, the statistics displayed will be cumulative for all APNs configured on the system regardless of context. If no APN name is specified and the command is executed from a context with multiple APNs configured, the output will be cumulative for all APNs in the context.

Example

The following command displays statistics for an APN named `isp2`:

```
show apn statistics name isp2
```

**Important**: Output descriptions for commands are available in the Statistics and Counters Reference.
show apn-profile

Displays information for configured Access Point Name (APN) profiles.

Product

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show apn-profile { all | full { all | name apn_name } | name apn_name } [ | { grep grep_options | more } ]
```

- **all**
  - Lists all APN profiles configured on the system.

- **full { all | name apn_name }**
  - **full**: Displays all information in the APN profile(s).
  - **all**: Displays full information for all APN profiles configured on the system.
  - **name apn_name**: Displays full information for an APN profile specified as an alphanumeric string of 1 through 64 characters.

- **name apn_name**
  - Displays information for an APN profile specified as an alphanumeric string of 1 through 64 characters.

- **| { grep grep_options | more }**
  - Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  - For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information for APN profiles configured on the system. APN profiles are configured through the global configuration mode and in the APN profile configuration mode. For more information regarding APN profile commands, refer to the *APN Profile Configuration Mode Commands* chapter.

Example

The following command displays all available information for an APN profile named *apn-prof3*:

```
show apn-profile full name apn-prof3
```
show apn-remap-table

Displays information for Access Point Name (APN) remap tables configured on the system.

Syntax

show apn-remap-table { all | full { all | name remap_table_name } | name remap_table_name } [ | { grep grep_options | more }]

- **all**
  - Lists all APN remap tables configured on the system.

- **full { all | name remap_table_name }**
  - Displays a full set (all) of available information for the configured APN remap table(s).
  - **all**: Displays the full set of available information for all APN remap tables configured on the system.
  - **name remap_table_name**: Displays the full set of available information for an existing APN remap table specified as an alphanumeric string of 1 through 64 characters.

- **name remap_table_name**
  - Displays information for an existing APN remap table specified as an alphanumeric string of 1 through 64 characters.
  - [ | { grep grep_options | more }]

  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display information for APN remap tables configured on the system. APN remap tables are configured through the Global Configuration mode and in the APN remap table configuration mode. For more information regarding APN remap table commands, refer to the APN Remap Table Configuration Mode Commands chapter.

Example

The following command displays all available information for an APN remap table named **remap-table12**:
show apn-remap-table full name remap-table12
show aps

Displays information for configured Automatic Protection Switching (APS) parameters.

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show aps { all | card-stats slot_number [ clear ] | info slot_number/port_number | port-stats slot_number/port_number [ clear ] | port-status } [ | { grep grep_options | more } ]

**all**
Lists APS information for all cards configured with APS.

**card-stats slot_number [ clear ]**
Displays the APS statistics for the identified card. If the **clear** keyword is included with the command, the APS statistics for the specified card are cleared (reset to zero).

*slot_number* is an integer that identifies the chassis slot holding the card.

**info slot_number/port_number**
Displays APS information for a specific port.

*slot_number/port_number*: The first number must be an integer that identifies the chassis slot holding the specified card. The slot number must be followed by a slash ‘/’, which must be followed immediately by the port number - an integer from 1 to 4 depending upon the type of card.

**port-stats slot_number/port_number [ clear ]**
Displays APS statistics for a specific port. If the **clear** keyword is included with the command then the APS statistics for the specified port are cleared (reset to zero).

*slot_number/port_number*: The first number must be an integer from 1 to 48 to identify the chassis slot holding the specified card. The slot number must be followed by a slash ‘/’, which must be followed immediately by the port number - an integer from 1 to 4 depending upon the type of card.

**port-status slot_number/port_number**
Displays APS status information for a specific port.

*slot_number/port_number*: The first number must be an integer from 1 to 48 to identify the chassis slot holding the specified card. The slot number must be followed by a slash ‘/’, which must be followed immediately by the port number - an integer from 1 to 4 depending upon the type of card.
show aps

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to display APS redundancy configuration, APS card and port status, and APS card and port statistics. APS is configured at the card level. For details on configuring APS, refer to the Card Configuration Mode Commands chapter in this reference.

Important: APS is only relevant for the CLC2 and OLC2 line cards supporting SONET/SDH.

Example
The following command displays all available APS configuration information for a specific port 1 on the line card in slot 27:

```
show aps info 27/1
```
show asngw-service

Displays information about selected Access Service Network Gateway (ASN-GW) calls/services.

**Product**
ASN-GW

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show asngw-service { all | name service_name | session | statistics } [ bs-status { address ip_address | filter { all | icmp-monitored | no-calls | summary | up } } [ | { grep grep_options | more } ]
```

- **all**
  Displays information for all configured ASN-GW services.

- **name service_name**
  Displays information only for an existing ASN-GW service in the current context specified as an alphanumeric string of 1 through 63 characters.

- **session**
  Displays information about configured ASN-GW sessions. See the `show asngw-service session` command.

- **statistics**
  Total of collected information for specific protocol since the last `restart` or `clear` command.

- **bs-status { address ip_address | filter { all | icmp-monitored | no-calls | summary | up } }**
  Displays the ASN base station (BS) status based on IP address and various filters.
  - **address ip_address** specifies the IP address of ASN base station whose status is requested. `ip_address` must be entered in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
  - **filter { all | icmp-monitored | no-calls | summary | up }**: Filters the requested BS’s status on the basis of following criteria:
    - **all**: Displays the status of all ASN base stations.
    - **icmp-monitored**: Displays the status of ASN base stations that are monitored through ICMP ping messages.
    - **no-calls**: Displays the status of an ASN base station that has no active calls.
    - **summary**: Displays a summary of the status of requested ASN base stations.
show asngw-service

- **up**: Displays the status of ASN base stations that are in an active state.

  ```
  $ (grep grep_options | more)
  ```

  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to view information for selected configured ASN-GW services.

**Example**

The following command displays available information for all active ASN-GW services.

```
show asngw-service all
```

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show asngw-service session

Displays statistics for specific Access Service Network Gateway (ASN-GW) sessions.

Product
ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show asngw-service session [ all | anchor-only [ full ] | callid call_id | counters | full | ip-address ipv4_address | msid msid_number | non-anchor-only [ full ] | peer-address ipv4_address | summary | username user_name ] [ | { grep grep_options | more } ]

all
Displays all related information for all active ASN-GW service sessions.

anchor-only
Displays all available information for all active ASN-GW service sessions on an anchor ASN-GW only.

callid call_id
Displays available information for the call identification number specified as an 8-digit hexadecimal number.

full
Displays all available information for the associated display or filter keyword.

ip-address ipv4_address
Specifies the IP address of the subscriber in IPv4 dotted-decimal notation.

msid msid_number
Displays available information for the specific mobile station identification number (MSID).

non-anchor-only
Displays all available information for all active ASN-GW service sessions on a non-anchor ASN-GW only.

peer-address ipv4_address
Specifies the IP address of an IP peer in dotted-decimal notation.
show asngw-service session

summary
Displays summary of available information for associated display or filter keyword (previous keyword).

username user_name
Specifies the name of a user within current context as an alphanumeric string of 1 through 127 characters.

| { grep grep_options | more }
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to view configuration information for an ASN-GW session.

Example
The following command displays all available ASN-GW sessions.

    show asngw-service session all

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show asngw-service session counters

Displays statistics for specific Access Service Network Gateway (ASN-GW) sessions.

Product
ASN-GW

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show asngw-service session counters [ [ function-type { auth-relay | context-transfer | data-path | handoff | im-operation | ms-state-change | paging | qos } ] | [ anchor-only | callid call_id | ip-address ipv4_address | msid msid_number | non-anchor-only | peer-address ipv4_address | username user_name ] [ r4-only | r6-only | verbose ] ] [ | { grep grep_options | more } ]

anchor-only
Displays all available information for all active anchor sessions in an ASN-GW service.

callid call_id
Displays available information for the call identification number specified as an 8-digit hexadecimal number.

function-type { auth-relay | context-transfer | data-path | handoff | im-operation | ms-state-change | paging | qos }
Displays the counters for specific type of functions in an ASN-GW session.
auth-relay: Displays information about authentication relay messages.
context-transfer: Displays information about context-transfer messages.
data-path: Displays information about data-path registration messages.
handoff: Displays information about hand-off messages.
im-operation: Displays information about idle mode state operation messages.
ms-state-change: Displays information about MS state change messages.
paging: Displays information about paging messages.
qos: Displays information about RR messages.

ip-address ipv4_address
Specifies the IP address of the subscriber in IPv4 dotted-decimal notation.

msid msid_number
Displays available information for the specific mobile station identification (MSID) number.
**non-anchor-only**
Displays all available information for all active non-anchor sessions in an ASN-GW service.

**peer-address ipv4-address**
Specifies the IP address of an IP peer in IPv4 dotted-decimal notation.

**r6-only**
Displays all available counters for R6 interface in an ASN-GW session.

**r4-only**
Displays all available counters for R4 interface in an ASN-GW session.

**username user_name**
Displays available session information for the specific WiMAX user in ASN-GW service session. *user_name* is an alphanumeric string of 1 through 127 characters.

**verbose**
Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

```
| { grep grep_options | more }
```
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of *grep* and *more*, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**
Use this command to view the counters of an ASN-GW session.

**Example**
The following command displays the counters for data path type function.

```
show asngw-service session counters function-type data-path
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*.  

---

**Command Line Interface Reference, StarOS Release 17**

**4366**
show asngw-service statistics

Displays statistics for all Access Service Network Gateway (ASN-GW) sessions.

Product
ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show asngw-service statistics [ function-type { auth-relay | context-transfer | data-path | handoff | im-operations | ms-state-change | paging | qos | capability }] [ name service_name | r4-only | r6-only | verbose | peer-address ipv4_address | peer-id id ] [ { grep grep_options | more }]

function-type
Displays information about selected function type on R4 or R6 interface.

function-type { auth-relay | context-transfer | data-path | handoff | im-operations | ms-state-change | paging | qos | capability } [ r4-only | r6-only ]
Displays the counters for specific type of functions in an ASN-GW session.
auth-relay: Displays information about authentication relay messages.
context-transfer: Displays information about context-transfer messages.
data-path: Displays information about data-path registration messages.
handoff: Displays information about hand-off messages.
im-operations: Displays information about idle mode state operation messages.
ms-state-change: Displays information about MS state change messages.
paging: Displays information about paging messages.
qos: Displays information about RR messages.
capability: Displays the capability negotiation between the ASNGW and the base station.
r4-only: Displays information about selected function on R4 interface.
r6-only: Displays information about selected function on R6 interface.

name service_name
Displays information for an existing service specified as an alphanumeric string of 1 through 63 characters.

r4-only
Displays statistics of R4 interface in ASN-GW services.

r6-only
Displays statistics of R6 interface in ASN-GW services.
**Peer Address**

peer-address ipv4_address

Specifies the IP address of an IP Peer in IPv4 dotted-decimal notation.

**Peer ID**

peer-id < id >

Display the statistics based on the 6-byte BSID or ASNGW ID in addition to the IPv4 address.

**Verbose**

verbose

Specifies that the output should display all available information. If this option is not specified then the output will be the standard level which is the concise mode.

| { grep grep_options | more } |

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of grep and more, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

### Usage

Use this command to display ASN-GW statistics.

### Example

The following command displays information about selected MS-State-Change function.

```
show asngw-service statistics function-type ms-state-change
```

*Important:* Output descriptions for commands are available in the *Statistics and Counters Reference*. 
# show asnpc-service

Displays information about selected Access Service Network Paging Controller and Location Registry (ASN PC/LR) services.

## Product
ASN-GW

## Mode
Exec

The following prompt is displayed in the Exec mode:

```plaintext
[local]host_name#
```

## Syntax

```
show asnpc-service { all | id | name service_name | session | statistics } [ | { grep grep_options | more } ]
```

- **all**
  Displays information for all configured ASN PC services.

- **paging-group**
  Displays all the configured paging-groups and associated paging nodes, and the offset count. For a specific paging group, enter the paging group id number.

- **name service_name**
  Displays information only for an existing ASN PC service specified as an alphanumeric string of 1 through 63 characters.

- **session**
  Displays information about configured ASN PC sessions.

- **statistics**
  Total of collected information for specific protocol since last restart or clear command.

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

## Usage
Use this command to view information for selected configured ASN PC services.

## Example

Use this command to view information for selected configured ASN PC services.
The following command displays available information for all active ASN PC services.

```
show asnpc-service all

show asnpc-service session counters verbose [ function-type { context-transfer | im-operations | ms-state-change | paging } ] [ all | callid call_id | msid msid_number | peer-address ipv4_address ] [ | { grep grep_options | more } ]

all
Displays all available counters for all ASN PC service sessions in verbose mode.

callid call_id
Displays full information for the call identification number specified as an 8-digit hexadecimal number.

function-type { context-transfer | im-operations | ms-state-change | paging }
Displays the counters for specific type of functions in an ASN-GW session.
context-transfer: Displays information about context-transfer messages.
im-operations: Displays information about idle mode state operation messages.
ms-state-change: Displays information about MS state change messages.
paging: Displays information about paging messages.

msid msid_number
Displays full information for the specific mobile station identification (MSID) number.

peer-address ipv4_address
Specifies the IP address of an IP peer IPv4 dotted-decimal notation.

r4-only
Displays statistics of R4 interface in ASN PC services in verbose mode.

r6-only
Displays statistics of R6 interface in ASN PC services in verbose mode.
show asnpc-service session counters verbose

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to view the counters of an ASN PC session in verbose mode.

**Example**

The following command displays the counters for data path type function.

```
show asnpc-service session counters verbose
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show asnpc-service statistics

Displays statistics for all ASN PC service sessions.

**Product**
ASN-GW

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show asnpc-service statistics [ name service_name | peer-address ipv4_address | verbose ] [ r4-only | r6-only [ | { grep grep_options | more } ] ]
```

- **name service_name**
  Specifies an existing service name as an alphanumeric string of 1 through 63 characters.

- **peer-address ipv4_address**
  Specifies the IP address of an IP peer in IPv4 dotted-decimal notation.

- **verbose**
  Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

- **| { grep grep_options | more }**
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to display ASN PC statistics.

**Example**

The following command displays information about ASN PC service in verbose mode.

```
show asnpc-service statistics verbose
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show asnpc-service statistics verbose

Displays statistics for all Access Service Network Paging Controller (ASN PC) service in verbose mode.

**Product**
ASN-GW

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name# 
```

**Syntax**

```
show asnpc-service statistics verbose [ function-type { context-transfer | im-operations | ms-state-change | paging } ] | all | r4-only | r6-only ] [ | { grep grep_options | more }
```

- **function-type { context-transfer | ms-state-change | paging }**
  - Displays the statistics for specific type of functions in an ASN PC service in verbose mode.

- **context-transfer**
  - Displays information about context-transfer messages.

- **im-operations**
  - Displays information about idle mode state operation messages.

- **ms-state-change**
  - Displays information about MS state change messages.

- **paging**
  - Displays information about paging messages.

- **all**
  - Displays statistics of all ASN PC services in verbose mode.

- **r4-only**
  - Displays statistics of R4 interface in ASN PC services.

- **r6-only**
  - Displays statistics of R6 interface in ASN PC services.

- **| { grep grep_options | more }**
  - Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**
Use this command to display ASN PC service statistics in verbose mode.

**Example**

The following command displays information about selected MS-State-Change function.
show asnpc-service statistics verbose function-type ms-state-change

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show banner

Displays the configured banner message for the current context.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show banner { all | charging-service | motd | lawful-intercept | pre-login } [ | { grep grep_options | more } ]

- **all**
  Displays all banners configured for a service in a system including the enhanced charging service (ECS).

- **charging-service**
  Displays banner message configured for an enhanced charging service in the current context.

- **motd**
  Display the banner message that is configured for the current context.

- **lawful-intercept**
  Refer to the **Lawful Intercept Configuration Guide** for a description of this command.

| { grep grep_options | more } |

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of **grep** and **more**, refer to the **Regulating a Command’s Output** section of the **Command Line Interface Overview** chapter.

Usage
Show the configured banner to verify the message of the day contents for possible change

Example

show banner
show bcmcs counters

Displays Broadcast and Multicast Service (BCMCS)-specific counters and statistics.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec
The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show bcmcs counters { all | callid call_id | flow-id flow_id }
```

- **all**
  - Displays BCMCS-specific counters and statistics for all multicast sessions.

- **callid call_id**
  - Displays BCMCS-specific counters and statistics for a specific call ID.

- **flow_id flow_id**
  - Displays BCMCS-specific counters and statistics for a specific BCMCS flow, defined by a flow ID.

**Usage**
Use this command to view BCMCS-specific statistics. You may narrow the results of the command output by specifying a specific call ID or flow ID.

**Example**

```
show bcmcs counters all
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show bcmcs statistics

Displays Broadcast and Multicast Service (BCMCS)-specific statistics for the current PDSN-service.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

```
show bcmcs statistics [ pdsn-service service_name ]
```

**pdns-service service_name**

Defines a specific PDSN service from which to gather BCMCS-specific statistics.

Usage
Shows several sets of BCMCS-specific statistics, and may be configured to show statistics only for a certain PDSN service.

Example

```
show bcmcs statistics pdsn-service service_name
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show boot

Displays information on the current boot image in use.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show boot [ initial-config | { grep grep_options | more } ]

initial-config
Identifies the OS image, configuration file, and boot priority used during the initial start up of the system.

| { grep grep_options | more } |
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Show the boot information in preparing for maintenance activities by verifying current boot data. The boot image in use may not be the same as the boot image stored on the SMC due to upgrades and pending reboots. 
show boot initial-config displays the actual boot image and configuration file loaded during boot. This may or may not be the highest priority image and makes this command useful when comparing the loaded image to the priority list.

Important: This command is not supported on all platforms.

Example
The following command displays the boot system configuration priority list:

    show boot

The following command displays the initial configuration after a system boot:

    show boot initial-config
show bssap+ statistics

Displays Base Station system Application Part (BSSAP+) protocol statistics for the Gs interface between the SGSN and the Mobile services Switching Centre, Visitor Location Register (MSC/VLR).

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show bssap+ statistics [ gs-service gs_svc_name ] [ vlr { isdn-number ISDN_Num| name vlr_name } ] [ verbose ] [ | { grep grep_options | more } ]

---

gs-service gs_svc_name

Specifies the name of a specific Gs service to filter the BSSAP+ information as an alphanumeric string of 1 through 63 characters that is case sensitive.

vlr { isdn-number ISDN_Num| name vlr_name }

Identifies a specific VLR (by name or ISDN number) to filter BSSAP+ information.

vlr_name is the configured name of the VLR expressed.

VLR_num is the configured E.164-type ISDN number for the VLR. Enter a numerical string of 1 to 15 digits.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output will be limited to a concise summary.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display the BSSAP+ statistics for the SGSN’s Gs interface(s). Based on how the command is entered, this command displays collected BSSAP+ protocol statistics for the entire SGSN or for a specified Gs interface. Using the keywords of this command, the interface can be identified by defining a specific VLR connected to the SGSN or by identifying the Gs service to which the interface has been configured.

Example
The following command displays all BSSAP+ information for the Gs interface configured for the Gs service named *gssvcl*.

```
show bssap+ statistics gs-service gssvcl verbose
```

**Important:** Descriptions for show command outputs are available in the *Statistics and Counters Reference*. 
show bssgp statistics

Displays base station subsystem GPRS protocol statistics for traffic between the base station subsystem (BSS) and the SGSN over the Gb interface.

**Product**
SGSN

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
show bssgp statistics [ gprs-service gprs_svc_name | nse nse_id | bvc bvc_id | sessmgr | verbose ] | [ verbose ] | { grep grep_options | more }
```

- **gprs-service gprs_svc_name**
  Specifies the name of an existing GPRS service for which the BSSGP information will be filtered as an alphanumeric string of 1 through 63 characters that is case-sensitive.

- **nse nse_ID**
  Enter this keyword to display the BSSGP statistics for the network service entity (NSE) specified as an integer from 0 through 65535.

- **bvc bvc_ID**
  Enter this keyword to display the BSSGP statistics for the BSSGP virtual connection (BVC) specified as an integer from 0 through 6500.

- **sessmgr instance sessmgr_instance_number**
  Enter this keyword to display the BSSGP statistics for a session manager instance specified as an integer from 1 through 4294967295.

- **verbose**
  Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

- **| { grep grep_options | more }**
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.
Usage

Use this command to display the BBSGP statistics for a particular GPRS service or NSEI.

Example

The following command displays BSSGP statistics for the GPRS service named gprs1.

\[ \text{show bssgp statistics gprs-service gprs1} \]

Important: Descriptions for show command outputs are available in the Statistics and Counters Reference.
show bssgp status

Displays the traffic status through the BSSGP (base station subsystem GPRS protocol) layer between the base station subsystem (BSS) and the SGSN over the Gb interface.

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show bssgp status { bvc-bucket nsei nse_id bvci bvc_id | bvc-stat nsei nse_id bvci bvc_id } [ | { grep grep_options | more } ]

bvc-bucket nsei nse_id bvci bvc_id
Displays traffic status for a specific BVC bucket identified by the NSEI (network service entity ID) and BVCI (BSSGP virtual connection ID).

nsei_ID is an integer from 0 through 65535.
bvc_ID is an integer from 0 through 65000.

bvc-stat nsei nse_id bvci bvc_id
Displays traffic status for a BVC identified by the NSEI (network service entity ID) and BVCI (BSSGP virtual connection ID).

nsei_ID is an integer from 0 through 65535.
bvc_ID is an integer from 0 through 65000.

| { grep grep_options | more }
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display BVC status of the BBSGP layer for specified NSEI and BVCI.

Example

The following command displays BSSGP traffic status for the BVC bucket for NSEI 2556 BVCI 241.

show bssgp status bvc-bucket nsei 2556 bvci 241

Important: Descriptions for show command outputs are available in the Statistics and Counters Reference.
show bulkstats

Displays the information on bulk statistics.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show bulkstats [ [ data ] | [ schemas ] | [ variables [ schema_name ] [ obsolete ] ] [ | { grep grep_options | more } ] ]

data
Displays collected bulk statistical data.

schema
Displays the configuration of the statistics to be collected on a per-schema basis.

Important: For information on available schemas, refer to the Bulk Statistics Configuration Mode Commands chapter.

variables schema_name
Displays all valid bulkstat schema statistics, or only the statistics for the specified schema.

schema_name specifies the name of the schemas available on system. The following is the list of available schemas in this release.

• aal2
• alcap
• apn
• asngw
• asnpc
• bcmcs
• card
• closedrp
• common
• context

obsolete

This keyword shows the obsolete (but still available) schema variables. An asterisk (*) is displayed next to schema variables that have been obsoleted.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For information on usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

This command is used to display information on bulk statistics supported by the system. The `variable` keyword can be used to list statistics supported by the system either for all schemas, or for an individual schema. The `schema` keyword can be used to display the configuration of settings for bulk statistics, including the schema. The `data` keyword can be used to display bulk statistic data collected up to that point.

Example

The following command displays the bulk statistics data:

```
show bulkstats data
```

The following command displays the bulk statistics schema configuration:

```
show bulkstats data schemas
```

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show ca-certificate

Displays information for Certificate Authority (CA) digital certificates configured on this system.

Product
All

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show ca-certificate { all | name name }

all

Displays information about all the configured CA certificates.

name name

Displays information about an existing configured CA certificate name specified as n alphanumeric string of 1 through 128 characters.

Usage
View information for CA certificates configured on this system.

Example

The following command displays information for a CA certificate named cert-1:

   show ca-certificate name cert-1

Important: Output descriptions for some commands are available in the Statistics and Counters Reference.
**show ca-crl**

Displays information for Certificate Authority (CA) Certificate Revocation List (CRL) configured on this system.

**Product**
All

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
show ca-crl { all | name name }
```

- **all**
  Displays information about all the configured CA-CRLs.

- **name name**
  Displays information about an existing CA-CRL name specified as an alphanumeric string of 1 through 128 characters.

**Usage**

View information for CA-CRLs on this system.

**Example**

The following command displays information for a CA-CRL named `crl-5`:

```
show ca-crl name crl-5
```

**Important:** Output descriptions for some commands are available in the *Statistics and Counters Reference.*
show cae-group server

Displays configuration information, including the name of the associated CAE group, for all CAEs or for a specific CAE. The CAE (Content Adaptation Engine) is an optional component of the Mobile Videoscape.

Product
MVG

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show cae-group server { all | name cae_name }

**all**
Shows the configuration information, including the associated CAE group, for all CAEs.

**name cae_name**
Shows the configuration information for a specific CAE.

Usage
Use this command to display configuration information for all CAEs or for a specific CAE. This command can be issued from either the local context or the context in which the associated CAE group is defined.

Example
The following command displays configuration information for the CAE named *server_1*:

```plaintext
show cae-group server name server_1
```
show call-control-profile

Displays information for call control profiles configured on the system.

Product
MME
SGSN

Privilege
Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show call-control-profile { all | full { all | name profile_name } | name profile_name } [ | { grep grep_options | more } ]

all
Lists all call-control profiles configured on the system.

full { all | name profile_name }
full: Displays a full set (all) of available information in the call-control profile.
all: Displays a full set of available information for all call-control profiles configured on the system.
name profile_name: Displays full information for an existing call-control profile specified as an alphanumeric string of 1 through 64 characters.

name profile_name
Displays information for an existing call-control profile specified as an alphanumeric string of 1 through 64 characters.

| { grep grep_options | more }
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to display information for call-control profiles configured on the system. Call-control profiles are configured through the global configuration mode and in the call–control profile configuration mode. For more information regarding call-control profile commands, refer to the Call-Control Profile Configuration Mode Commands chapter.

Example
The following command displays all available information for a call-control profile named call-prof2:
show call-control-profile full name call-prof2
show call-home

Displays information for Smart Call Home settings configured on the system.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show call-home [ alert-group | detail | mail-server status | profile { all | name profile_name } | statistics [ | { grep grep_options | more } ] ]

alert-group
Displays information for all alert groups configured on the system. It also indicates if an alert-group has been disabled by the user.

detail
Displays general information and alert-group settings for all configured call-home profiles.

mail-server status
Displays status information for call-home mail servers that are configured on the system.

profile { all | name profile_name }
Displays all available information for all call-home profiles on the system or a specified call-home profile.
all: Displays all available information for all call-home profiles configured on the system.
name profile_name: Displays all available information for an existing call-home profile specified as an alphanumeric string of 1 through 31 characters.

name profile_name
Displays information for a call-home profile specified as an alphanumeric string of 1 through 31 characters.

statistics
Displays statistical information for call-home statistics configured on the system.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.
Usage
Use this command to display profile and notification policy information associated with the call-home profiles configured on the system. Call-home profiles are configured through the Context Configuration Mode and in the Call-home Configuration Mode. For more information regarding call-home commands, refer to the Call Control Profile Configuration Mode Commands chapter.

Example
The following command displays all available information for a call-home profile named call-home-profil:

```
show call-home profile name call-home-profil
```
show camel-service

Displays configuration details for Customized Applications for Mobile networks Enhanced Logic (CAMEL) services configured for this SGSN.

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show camel-service { all | name service_name } [ | grep grep_options | more ]

| all
| Displays the configuration details for all configured CAMEL services.

| name
| Displays the configuration details for an existing CAMEL service specified as an alphanumeric string of 1 through 63 characters.

| grep grep_options | more |
| Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

View configuration information for CAMEL services.

Example

The following command displays the configuration information for a CAMEL service identified as camel4sgsnTO:

show camel-service name camel4sgsnTO

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show card

Displays various types of information for a card or all cards in the system.

Product
All

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show card { diag [ slot# ] | hardware [ slot# ] | info [ slot# ] | mappings | table [ all ] } | { grep grep_options | more }

diag
Displays diagnostic results for a specific card or all cards.

hardware
Displays information about installed hardware.

info
Displays detailed information for a specific card or all cards

mappings
Displays mappings between front-installed application cards and rear-installed interface cards.

Important: This keyword is only supported on the ASR 5000.

table [all]
Displays information about each card in tabular output. The all option includes empty slots in the output.

slot#
Specifies the slot number for a card as an integer from 1 through 48.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.
Usage
Use this command to view various types of information for all cards or a specified card.

Example
The following command displays diagnostic information for the card in slot 1:

```
show card diag 1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show cbs counters

This command displays the counters for CBS service.

Product
HNBGW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show cbs counters [ cbs-service Service_Name ] [ | { grep grep_options | more } ]
```

- `cbs-service Service_Name`  
  Displays information for specific CBS service. `Service_Name` is a string of size 1 through 63.

- `| { grep grep_options | more }`
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

Refer to `Regulating a Command’s Output` section of the `Command Line Interface Overview` chapter for details on the usage of `grep` and `more`.

Usage

Use this command to display the counters for CBS service

Example

The following command displays the counters for CBS with `cbs-service` as `my_service`:

```
show cbs counters cbc-service my_service
```
**show cbs sessions**

This command displays the information for CBS sessions.

**Product**

HNBGW

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```

**Usage**

Use this command to display the information for CBS sessions.

**Example**

The following command displays the full sessions for CBS with `cbc-address` as `101.102.109.211`: 

```
show cbs sessions cbc-address 101.102.109.211
```
show cbs sessions full cbc-address 101.102.109.211
show cbs statistics

This command displays the statistics for CB service.

Product
HNBGW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show cbs statistics [ cbc-address cbc_address | cbs-service cbs_service_name ] [ sabp-only | tcp-only | verbose ] [ | { grep grep_options | more } ]
```

**cbc-address cbc_address**

Designates address of CBC. This must be followed by `cbc_address`, IPv4 address, using dotted-decimal notation.

**cbs-service cbs_service_name**

Displays information for specific CBS service. `cbs_service_name` is a string of size 1 through 63.

**sabp-only**

Displays SABP statistics for selected CBS Service.

**tcp-only**

Displays TCP statistics for selected CBS Service.

**verbose**

Displays CBS statistics with more detailed statistics breakup.

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

Refer to *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter for details on the usage of `grep` and `more`.

Usage

Use this command to display the statistics for CB service.

Example

The following command displays the SABP statistics for CBS with `cbc-address` as 101.102.109.211:

```
show cbs statistics cbc-address 101.102.109.211
```
show cbs statistics cbc-address 101.102.109.211 sabp-only
show cbs-service

This command displays the information for all / specific CBS service.

**Product**
HNBGW

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec
The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show cbs-service { all | name cbs_service_name } [ status ] [ | { grep grep_options | more } ]
```

- **all**
  Displays all CBS services.

- **name cbs_service_name**
  Displays information for specific CBS service name. `cbs_service_name` is a string of size 1 through 63.

- **status**
  Display detailed status.

  ```
  | { grep grep_options | more }
  ```

  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. Refer to Regulating a Command’s Output section of the Command Line Interface Overview chapter for details on the usage of `grep` and `more`.

**Usage**

Use this command to display the information for all / specific CBS service.

**Example**

The following command displays the detailed status of a CBS service with name `my_service`:

```
show cbs-service name my_service status
```
show cdr

Displays files space used by the Event Data Record (EDR) and Usage Data Record (UDR) and their file information.

Product
ACS

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show cdr { file-space-usage | statistics } [ | { grep grep_options | more } ]

file-space-usage
Displays the file space used by Charging Data Record (CDR) and Event Data Record (EDR) files.

statistics
Displays EDR and UDR file statistics.

| { grep grep_options | more }
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to view CDR flow control information.

Example

The following command displays EDR and UDR files statistics:

   show cdr statistics

The following command displays the file space used by the EDR and UDR files:

   show cdr file-space-usage

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show certificate

Displays information of certificates configured on this system.

Product
All

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show certificate { all | name name }

- all
  Displays information about all the configured certificates on this system.

- name name
  Displays information of a specified certificate configured.
  name must be the name of an existing certificate, and must be an alphanumeric string of 1 through 128 characters.

Usage

View information for local node certificates on this system.

Example

The following command displays information for a node certificate named certificate-3:

```plaintext
show certificate name certificate-3
```

**Important**: Output descriptions for some commands are available in the Statistics and Counters Reference.
show cgw-service

Displays configuration and/or statistical information for CGW services on this system.

Product
SaMOG

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show cgw-service { all | name name | statistics { all [ verbose ] [ | { grep grep_options | more } ] | name name} } [ | { grep grep_options | more } ]
```

- **all**
  Displays all CGW services.

- **name name**
  Displays information for specific CGW service name.
  `name` is a string of size 1 to 63.

- **statistics**
  Displays Node level Statistics for CGW.

- **verbose**
  Specifies Detailed statistics.

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the `Regulating a Command's Output` section of the Command Line Interface Overview chapter.

Usage
Use this command to displays configuration and/or statistical information for CGW services on this system.

Example

```
show cgw-service all
```
show cli

Displays current command line interface (CLI) users and associated session information.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show cli { configuration-monitor | history | session } [ | { grep grep_options | more } ]

classification-monitor
Displays information related to the cli configuration-monitor command, including the number of seconds remaining until the next configuration monitor check is performed.

history
Displays CLI command history for this CLI session.

session
Displays information about the current CLI session.

| { grep grep_options | more }
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Show current command line interface sessions when there is some unexpected output from a chassis and a check of current CLI users may reveal other activities in progress.

Example

show cli
**show clock**

Displays the current system data and time.

**Product**

All

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show clock [ universal ] [ | { grep grep_options | more } ]
```

- **universal**
  Displays the date and time in universal coordinated time (UTC/GMT) format.

- **| { grep grep_options | more }**
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of **grep** and **more**, refer to the *Regulating a Command Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Check the current time of a chassis to compare with network wide time or for logging purposes if network accounting and/or event records appear to have inconsistent timestamps.

**Important:** This command is not supported on all platforms.

**Example**

The following displays the system time in local time and UTC, respectively.

```
show clock

show clock universal
```
show cmp history

Displays historical information for the last 100 Certificate Management Protocol v2 transactions.

Product
All products supporting IPSec CMPv2 features

Important: This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

Privilege
Security Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show cmp history

Usage
Display historical information for the last 100 Certificate Management Protocol v2 transactions.

Example

The following command displays CMPv2 transaction history:

    show cmp history
show cmp outstanding-req

**Product**
All products supporting IPSec CMPv2 features

**Important:** This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

**Privilege**
Security Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**
```
show cmp outstanding-req
```

**Usage**

**Example**
The following command displays outstanding CMPv2 requests:

```
show cmp outstanding-req
```
show cmp statistics

**Product**
All products supporting IPSec CMPv2 features

**Important:** This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

**Privilege**
Security Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show cmp statistics
```

**Usage**

**Example**
The following command displays CMPv2 statistics:

```
show cmp statistics
```
show configuration

Displays current configuration information for various subcomponents of the system.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```plaintext
show configuration [ apn apn_name | card card_num | checksum | context name | link-aggregation group group_number | obsolete-encryption | port slot/port | rohc | showsecrets | srp | url url | verbose ] [ | { grep grep_options | more } ]
show configuration apn apn_name [ obsolete-encryption | showsecrets | verbose ]
show configuration card card_num [ obsolete-encryption | showsecrets | verbose ]
show configuration checksum [ obsolete-encryption | showsecrets | verbose ]
show configuration context name [ obsolete-encryption | radius | showsecrets | verbose ]
show configuration link-aggregation group group_number

show configuration obsolete-encryption

show configuration port slot/port [ obsolete-encryption | showsecrets | verbose ]
show configuration rohc [ all | profile-name name ] [ verbose ]
show configuration showsecrets [ obsolete-encryption ]

show configuration srp [ checksum | obsolete-encryption ] | showsecrets [ obsolete-encryption ] | verbose ]

show configuration url url

show configuration verbose [ obsolete-encryption | showsecrets [ obsolete-encryption ] ]
```

**apn apn_name**

Specifies an APN to display the configuration information for the requested APN. All contexts are searched for this APN, and if a match found, the system returns configuration of this APN.
show configuration

**card**  *card_num*

Specifies a card for which configuration information is to be displayed as an integer from 1 through 48 for the ASR 5000 or 1 through 20 for the ASR 5500.

**checksum**

Generates and displays a checksum value for the configuration data.

**context**  *name*

Specifies an existing context for which configuration information is to be displayed as an alphanumeric string of 1 through 79 characters.

**show configuration link-aggregation group**  *group_number*

Displays the current configuration of the LAG specified as an integer from 1 through 1023.

**obsolete-encryption**

Shows encrypted values using a weaker, obsolete encryption method (prior to release 12.2).

**port**  *slot/port*

Displays configuration information for a port identified by its slot and port numbers.

**rohc**  [ all | profile-name ]  *name*

Specifies that information for all robust header compression (RoHC) profiles or the named profile is to be displayed.

**showsecrets**

Displays encrypted and unencrypted secret keys saved in the configuration. If this keyword is not specified, secret keys are not displayed.

---

**Important:** The **showsecrets** keyword is restricted to Administrator privilege or higher.

**srp**

Shows the Service Redundancy Protocol (SRP) configuration used for Interchassis Session Recovery (ICSR) deployments.

**url**  *url*

Default: configuration which is currently in use.

This keyword is not available to users with Operator level permissions. Specifies the location of the configuration data to use for information display. The *url* may refer to a local or a remote file and must be entered in the following format:

For the ASR 5000:

```
[ file: ]{ /flash | /pcmcia | /hd }[ /directory ]/file_name

tftp://{ host[ :port# ] }[ /directory ]/file_name

```
For the ASR 5500:

```
[ file: ]{ /flash | /usb1 | /hd }[ /directory ]/file_name

tftp://{ host[ :port# ] }[ /directory ]/file_name

```

**Important:** Do not use the following characters when entering a string for the field names below: “/” (forward slash), “.” (colon) or “@” (at sign).

- **directory** is the directory name.
- **filename** is the actual file of interest.

**Important:** Configuration files should be named with a .cfg extension.

- **username** is the user to be authenticated.
- **password** is the password to use for authentication.
- **host** is the IP address or host name of the server.
- **port#** is the logical port number that the communication protocol is to use.

**verbose**

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

View the current configuration to analyze recent changes. For additional information, refer to the Administration Guides for products installed on your ASR 5x00 system.

**Example**

The following command displays the local in-use port configuration information for port 24/1 in verbose mode.

```
show configuration port 24/1 verbose
```

The following command displays the local in-use port configuration information for port 5/11 in verbose mode.

```
show configuration port 5/11 verbose
```

The following command displays the card configuration for card 17 on host remoteABC stored in the configuration file in /pub/config.cfg.
show configuration card 17

The following command displays the card configuration for card 5 on host remoteABC stored in the configuration file in /pub/config.cfg.

show configuration card 5

The following command displays the configuration of all RADIUS server groups configured in context local.

show configuration context local radius group all

The following command shows the configuration for a context named PDIF.

show configuration context pdif

The following command shows the configuration for a context named PGW.

show configuration context pgw
show configuration errors

Displays current configuration errors and warning information for the target configuration file as specified for a service.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show configuration errors [ section section_name ] [ verbose ] [ | { grep grep_options | more } ]
```

**section {section_name}**

Specifies the services and section for which to display and validate a configuration.

The following services and sections are supported:

- **aaa-config**: Displays configuration errors/warnings for the AAA service(s) configured on the system.
- **active-charging**: Displays configuration errors/warnings for the Enhanced Charging Service(s) and the Personal Stateful Firewall service(s) configured on the system.
- **alcap-service**: Displays configuration errors/warnings for Access Link Control Application Part (ALCAP) on HNB-GW for IuCS-over-ATM support towards CS core network.
- **apn**: Displays configuration errors/warnings for the APN configuration(s) on the system.
- **apn-profile**: Displays configuration errors/warnings for the APN Profile configuration(s) on the system.
- **apn-remap-table**: Displays configuration errors/warnings for the APN Remap Table configuration(s) on the system.
- **asngw-service**: Displays configuration errors/warnings for the Access Service Network Gateway (ASN-GW) Service configured in a specific context for which configuration errors/warnings is to be displayed.
- **asnpc-service**: Displays configuration errors/warnings for the ASN Paging Controller and Location Registry (ASN PC-LR) Service(s) configured on the system.
- **call-control-profile**: Displays configuration errors/warnings for the Call Control Profile configuration(s) on the system.
- **camel-service**: Displays configuration errors/warnings for the Customised Applications for Mobile networks Enhanced Logic (CAMEL) Service configuration(s) on the system.
- **cs-network**: Displays configuration errors/warnings for the circuit switched (CS) network configuration(s) on the system.
Exec Mode show Commands (A-C)

show configuration errors

- **cscf-service**: Displays configuration errors/warnings for the Call Session Control Function (CSCF) service(s) configured on the system.
- **diameter**: Displays configuration errors/warnings for the Diameter configuration(s) on the system.
- **dns-client**: Displays configuration errors/warnings for the DNS client configuration(s) on the system.
- **egtp-service**: Displays configuration errors/warnings for the evolved GPRS Tunneling Protocol (eGTP) service configuration(s) on the system.
- **event-notif**: Displays configuration errors/warnings for the event notification (SNMP) interface client.
- **fa-service**: Displays configuration errors/warnings for the Foreign Agent (FA) service(s) configured on the system.
- **fng-service**: Displays configuration errors/warnings for the Femto Network Gateway (FNG) configuration(s) on the system.
- **ggsn-service**: Displays configuration errors/warnings for the Gateway GPRS Support Node (GGSN) service(s) configured on the system.
- **gprs-service**: Displays configuration errors/warnings for the General Packet Radio Service (GPRS) service(s) configured on the system.
- **gs-service**: Displays configuration errors/warnings for the Gs service(s) configured on the system. The Gs interface between the SGSN and the MSC (VLR) uses the BSSAP+ protocol.
- **ha-service**: Displays configuration errors/warnings for the Home Agent (HA) service(s) configured on the system.
- **hnbgw-network-service**: Displays configuration errors/warnings for the Home Evolved Node B Gateway (HNB-GW) network service configuration(s) on the system.
- **hnbgw-service**: Displays configuration errors/warnings for the Home Evolved Node B Gateway (HNB-GW) Service configuration(s) on the system.
- **hsgw-service**: Displays configuration errors/warnings for the HRPD Serving Gateway (HSGW) service(s) configured on the system.
- **imei-profile**: Displays configuration errors/warnings for the International Mobile Equipment Identity (IMEI) Profile configuration(s) on the system.
- **imsa-config**: Displays configuration errors/warnings for the IMS Authorization (IMSA) configuration(s) on the system.

**Important**: In 16.0 and later releases, error message will be displayed in the output of `show configuration errors` command when the user tries to configure an endpoint which is already configured in other IMSA service.

- **imssh-service**: Displays configuration errors/warnings for the IMS Sh (IMSSh) service(s) configured on the system.
- **imsue-service**: Displays configuration errors/warnings for the IMS UE service(s) configured on the system.
- **ipms**: Displays configuration errors/warnings for the Intelligent Packet Monitoring System (IPMS) service(s) configured on the system.
• **ipne**: Displays configuration errors/warnings for the IP Network Enabler (IPNE) facility configured on the system.

• **ipsg-service**: Displays configuration errors/warnings for the IP Security Gateway (IPSG) service(s) configured on the system.

• **iups-service**: Displays configuration errors/warnings for the IuPS service(s) configured on the system.

• **lac-service**: Displays configuration errors/warnings for the Layer 2 Tunneling Protocol (L2TP) Access Concentrator (LAC) service(s) configured on the system.

• **lns-service**: Displays configuration errors/warnings for the L2TP Network Server (LNS) service(s) configured on the system.

• **local-policy**: Displays configuration errors/warnings for the Local Policy configuration(s) on the system.

• **map-service**: Displays configuration errors/warnings for the SS7 Mobile Application Part (MAP) service(s) configured on the system.

• **mme-service**: Specifies the configuration errors for a Mobility Management Entity (MME) service configured in a specific context for which configuration errors/warnings are to be displayed.

• **operator-policy**: Displays configuration errors/warnings for the Operator Policy configuration(s) on the system.

• **pcc-policy-service**: Displays configuration errors/warnings for the Policy and Charging Control (PCC) Policy Service configuration(s) on the system.

• **pcc-service**: Displays configuration errors/warnings for the PCC Service configuration(s) on the system.

• **pdg-service**: Displays configuration errors/warnings for the Packet Data Gateway (PDG) Service configuration(s) on the system.

• **pdif-service**: Displays configuration errors/warnings for the Packet Data Interworking Function (PDIF) service(s) configured on the system.

• **pdsn-service**: Displays configuration errors/warnings for the Packet Data Serving Node (PDSN) service(s) configured on the system.

• **pgw-service**: Displays configuration errors/warnings for the PDN-Gateway (P-GW) service configuration(s) on the system.

• **phsgw-service**: Displays configuration errors/warnings for the Payload Header Suppression (PHS) Gateway service(s) configured on the system.

• **policy-grp-config**: Displays configuration errors/warnings for the Policy Group configuration(s) on the system.

• **ps-network**: Displays configuration errors/warnings for the packet switched (PS) network configuration(s) on the system.

• **saegw-service**: Displays configuration errors/warnings for the System Architecture Evolution Gateway (SAE-GW) Service configuration(s) on the system.

• **sccp-network**: Displays configuration errors/warnings for the Signaling Connection Control Part (SCCP) network configuration(s) on the system.

• **sgs-service**: Displays configuration errors/warnings for the SGs Service configuration(s) on the system. The SGs interface connects the databases in the VLR and the MME.
show configuration errors

- **sgsn-mode**: Displays configuration errors/warnings for the Serving GPRS Support Node (SGSN) mode configuration(s) on the system.
- **sgsn-service**: Displays configuration errors/warnings for the SGSN service(s) configured on the system.
- **sgtp-service**: Displays configuration errors/warnings for the SGSN GPRS Tunneling Protocol (SGTP) service(s) configured on the system.
- **sgw-service**: Displays configuration errors/warnings for the Serving Gateway (S-GW) service configuration(s) on the system.
- **subscriber-config**: Displays configuration errors/warnings for the subscriber configuration(s) on the system.
- **subscriber-map**: Displays configuration errors/warnings for the Subscriber Map configuration(s) on the system.

**verbose**

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For more information on the usage of `grep` and `more`, refer to the `Regulating a Command’s Output` section of the `Command Line Interface Overview` chapter.

**Usage**

Use this command to view the current configuration errors and warning to review recent changes. For additional information, refer to the Administration Guides for products installed on your ASR 5x00 system.

**Example**

The following command displays configuration errors and warnings for all services configured in a context/system:

```
show configuration errors verbose | more
```

The following command displays configuration errors and warnings for Active Charging service and Personal Stateful Firewall service configured in a context:

```
show configuration errors section active-charging verbose
```

The following command displays configuration errors and warnings for QoS-configuration in a context:

```
show configuration errors section qos-marking verbose
```
show congestion-control

Displays information pertaining to congestion control functionality on the system.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
show congestion-control { configuration | statistics { manager [ all | instance task_instance ] } [ | { grep grep_options | more } ]
```

```
show congestion-control statistics mme { critical | full | major | minor } [ | { grep grep_options | more } ]
```

**configuration**

Displays congestion control configuration information including threshold parameters and policy settings for the configured services.

**statistics**

Displays congestion control statistics for manager services.

**manager**

Specifies the name of the service/session manager for which statistics are displayed. The following types of manager services are supported:

- **allmgr**: Specifies that statistics are displayed for PDSN services.
- **asngwmg**: Specifies that statistics are displayed for ASN-GW services.
- **asnpcmgr**: Specifies that statistics are displayed for ASN PC-LR services.
- **bindmux**: Specifies that statistics are displayed for Bindmux Manager used by PCC service.
- **egtpinmgr**: Specifies that statistics are displayed for EGTP ingress demuxmgr.
- **gtpcmgr**: Specifies that statistics are displayed for GGSN services.
- **hamgr**: Specifies that statistics are displayed for HA services.
- **hnbmg**: Specifies that statistics are displayed for HNB Manager used by HNB-GW service.
- **imsimgr**: Specifies that statistics are displayed for IMSI managers.
- **ipsecmg**: Specifies that statistics are displayed for IPSec managers.
- **ipsmg**: Specifies that statistics are displayed for IPSG managers.
**l2tpmgr**: Specifies that statistics are displayed for L2TP managers.

```
show congestion control statistics l2tpmgr
```

---

**statistics mme { critical | full | major | minor }**

Displays the statistics based on the current state of all instances of the specified task.

- **critical**: Specifies that statistics are displayed for the critical congestion policy for MME services.
- **full**: Specifies that statistics are displayed for all congestion policies for MME services.
- **major**: Specifies that statistics are displayed for the major congestion policy for MME services.
- **minor**: Specifies that statistics are displayed for the minor congestion policy for MME services.

---

**all**

Displays the statistics based on the current state of all instances of the specified task.

---

**instance task_instance**

Displays statistics for a specified software task instance. `task_instance` can be configured to an integer from 1 to 128.

---

**Important**: The `inst` column of the `show task table` command output displays the instance of a particular task.

---

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

---

**Usage**

This command displays congestion control configuration information or statistics for a particular service type. When the all keyword is used, the system compares the current state of all instances of the specified task. The state is based on whether or not any congestion control thresholds have been exceeded. If one or more instances are experiencing congestion, the state is displayed as “Applied”, and the various thresholds that have been crossed are indicated.

---

**Example**

The following command displays congestion control statistics for a PDSN service using an `allmgr` task with an instance of 2:

```
show congestion-control statistics allmgr instance 2
```

The following command displays congestion control statistics for an ASN-GW service using an `asngwmgr` task with an instance of 2:

```
show congestion-control statistics asngwmgr instance 2
```

The following command displays congestion control statistics for an ASN PC-LR service using an `asnpcmgr` task with an instance of 2:

```
show congestion-control statistics asnpcmgr instance 2
```
**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show connectedapps

Displays information about the current Connected Apps (CA) configuration.

Product
SecGW (WSG)

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show connectedapps

Usage
Displays information about the current Connected Apps (CA) configuration between the CA client on the ASR 9000 VSM and IOS-XR.

Example

This command displays Connected Apps configuration information:

    show connected apps
show content-filtering category database

Displays details of the specified category based content filtering database for content filtering application configured in a system/service.

Product
CF

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show content-filtering category database [ active | all | facility srdbmgr { all | instance instance_number } | url url_string ] [ verbose ] [ | { grep grep_options | more } ]
```

**active**
Displays the information about all active databases, for example databases in memory. This is the default setting for category database information.

**all**
Displays the information about all active databases, for example, databases in memory and all saved databases on a system.

**facility**
Displays logged events for a specific facility.

**srdbmgr { all | instance instance_number }**
Displays logged events for all static rating database managers or for all or for a specific instance.
- **all**: Displays the logged events for all Static Rating Database (SRDB) Manager instances.
- **instance instance_number**: Displays events logged for a specific SRDB Manager instance specified as an integer from 1 through 8.

**url url_string**
Displays the information of the database located at the URL that specifies the name/location of the category database from which to retrieve information as an alphanumeric string of 1 through 512 characters.

**verbose**
This option enables the detailed mode for additional information display for specific database.
Pipes (sends) the output of this command to the specified command. You must specify a command to which
the output will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the
Command Line Interface Overview chapter.

Usage
Use this command to display information of database for category based content filtering application in a
service.

Example
The following command displays a detailed information for all active databases in memory.

    show content-filtering category database active all

The following command displays the CF database status of all running SRDB managers.

    show content-filtering category database facility srdbmgr all

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show content-filtering category policy-id

Displays Content Filtering category policy definitions.

Product
CF

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show content-filtering category policy-id { all | id cf_policy_id } [ | { grep grep_options | more } ]
```

- **all**
  Displays definitions of all Content Filtering category policies.

- **id cf_policy_id**
  Displays definitions of an existing Content Filtering category policy ID specified as an integer from 1 through 4294967295.

  | { grep grep_options | more } |
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
For details on the usage of `grep` and `more`, refer to the `Regulating a Command’s Output` section of the `Command Line Interface Overview` chapter.

Usage
Use this command to view Content-Filtering Category definitions for a specific/all Policy IDs.

Example
The following command displays Content Filtering category definitions for policy ID 3:

```
show content-filtering category policy-id id 3
```

**Important**: Output descriptions for commands are available in the `Statistics and Counters Reference`. 
show content-filtering category statistics

Displays statistics for the category-based Content Filtering application configured in a system/service.

Product
CF

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show content-filtering category statistics [ facility srdbmgr { all | instance instance_number } ] [ | { grep grep_options | more } ]

facility
Displays logged events for a specific facility.

srdbmgr { all | instance instance_number }
Displays logged events for all Static Rating Database (SRDB) Manager instances or for the specified instance.
- all: Displays events logged for all SRDB Manager instances.
- instance instance_number: Displays events logged for the SRDB Manager instance specified as an integer from 1 through 8.

| { grep grep_options | more }
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to view the statistics of Category Based Content Filtering application in a service. This command’s output also indicates capability of the system to perform Content Filtering and Dynamic Content Filtering if configured.

Important: Content filtering cannot be performed if less than two PSCs are activated. Dynamic Content Filtering cannot be performed if less than three PSCs are activated.

Example
The following command displays the detailed statistics of configured category based content filtering application:
show content-filtering category statistics

The following command displays the detailed statistics of configured category based content filtering application based on running SRDB Manager `instance1`.

`show content-filtering category statistics facility srdbmgr instance instance1`

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show content-filtering category url

Displays the information about the categories of the database at the specific URL configured for the category-based content filtering application in a system/service.

Product
CF

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show content-filtering category url url_string [ policy-id cf_policy_id | rulebase rulebase_name ] [ verbose ] [ | { grep grep_options | more } ]

url url_string
Displays the category information of the URL specified as an alphanumeric string of 1 through 512 characters.

policy-id cf_policy_id
Displays the category information of a URL configured with an existing content filtering category policy ID specified as an integer from 0 through 65535.

rulebase rulebase_name
Displays the category information of a URL configured in ACS Configuration Mode for category-based content filtering in specific rulebase. rulebase_name must be the name of an existing rulebase, and must be an alphanumeric string of 1 through 15 characters.

verbose
Enables the detailed mode for additional information display for a specific database.

| { grep grep_options | more } |
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to display information of a database URL for category based content filtering application in a service.
Example

The following command displays a detailed information for all active databases in memory.

```
show content-filtering category url /cf_server/cf/optcmd.bin verbose
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show content-filtering server-group

Displays information for Content Filtering Server Group (CFSG) configured in the service.

Product
CF

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show content-filtering server-group [ name cfsg_name | statistics ] [ | { grep grep_options | more } ]

| name cfsg_name |
| Displays information for an existing CFSG specified as an alphanumeric string of 1 through 63 characters. |

| statistics |
| Displays statistical information for all configured CFSGs. |

| | { grep grep_options | more } |
| Pipes (sends) the output of this command to the specified command. You must specify a command to which the output will be sent. |
| For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter. |

Usage

Use this command to display information for Content Filtering Server Group configured in a service.

Example

The following command displays a detailed information for all charging actions:

```
show content-filtering server-group statistics
```

The following command displays a details of a specific charging action:

```
show content-filtering server-group name test123
```

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
# show context

Displays information for currently configured contexts.

## Product
All

## Privilege
Security Administrator, Administrator, Operator, Inspector

## Mode
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

## Syntax

```
show context [ all | name context_name ] [ | { grep grep_options | more } ]
```

**all | name context_name**

- **all**: Displays information for all currently configured contexts.
- **name context_name**: Displays information for an existing context specified as an alphanumeric string of 1 through 79 characters.

**| { grep grep_options | more }**

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

## Usage

View configured contexts. This may be useful in verifying configuration or troubleshooting the system.

## Example

The following command displays information for the configured context named `sampleContext`:

```
show context name sampleContext
```

The following command displays information for all contexts:

```
show context all
```

## Important:
Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show cpu

Displays information on system CPUs.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show cpu { info [ card card_num [ cpu cpu_num ] ] [ graphs ] [ verbose ] | table } [ | { grep grep_options | more } ]

info [ card card_num [ cpu cpu_num ] ] [ graphs ] [ verbose ]
Displays information for an entire card or a specific CPU.

- card card_num: Specifies the card for which to display associated information. card_num must be a value in the range 1 through 48 on the ASR 5000 or 1 through 20 on the ASR 5500 and must refer to an installed card.
- cpu cpu_num: Optionally selects a specific CPU on the card of interest to display specific information. cpu_num must be a value in the range 0 through 3 and must refer to an installed CPU.

The output of show cpu info card n verbose also includes usage details for individual cores within each CPU.

- graphs: In addition to textual CPU information display CPU utilization information in graphs.
- verbose: Output is to display all information available.

| [ grep grep_options | more ]

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

View CPU statistics to aid in diagnosing service problems for the case of overload conditions.

Important: This command is not supported on all platforms.

Example
The following command displays the CPU information in tabular format for all CPUs on all installed cards:

```
show cpu table
```

The following command displays CPU information for card 8 in verbose mode:

```
show cpu info card 8 verbose
```

The following command displays information for CPU 0 on card 1:

```
show cpu info card 1 cpu 0
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show crash

Displays software crash events records and associated dump files (minicore, NPU or kernel) for all crashes or a specified crash event.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name# 
```

**Syntax**

```
show crash

  all | list | number crash_num

  all: Displays the dump files for all crash event records in the crash log.
  list: Displays a list of recent crash event records. this is the contents of the crashlog2 file.
  number crash_num displays the dump file for an existing crash number. The crash number can be displayed using the list keyword.

  | { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**

View the crash list to determine frequency of crashes or if crashes occur at some specific time of day. To aid in troubleshooting, this command may also be used to view the dump file for a specific crash.

For additional information refer to the System Logs section of the System Administration Guide.

**Example**

The following displays the list of crash event records on the active management card.

```
show crash list
```

The following command will display the dump file for crash number 11.

```
show crash number 11
```
show credit-control sessions

Displays credit control sessions information.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show credit-control sessions [ all | callid | full | mdn | nai | summary ] [ | { grep grep_options | more } ]

session [ all | callid | full | mdn | nai | summary ]
Displays the credit control session status based on the following keywords:
all: Displays all available information for Credit Control sessions
callid: Displays the Credit Control Session Call ID
full: Displays All available information for the associated display or the filter keyword
mdn: Displays the Credit Control Message Delivery Notification (MDN) information.
nai: Displays the Credit Control NI
summary: Displays the summary of Credit Control session information

| { grep grep_options | more }
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
Please refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter for details on the usage of grep and more.

Usage

Use this command to show active credit control application for service sessions.

Example

The following command shows the configured Credit Control application sessions:

    show credit-control sessions
show credit-control statistics

Displays credit control statistics.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show credit-control statistics cc-service name[ | { grep grep_options | more } ]
```

<table>
<thead>
<tr>
<th>cc-service</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the Credit Control Service.</td>
</tr>
<tr>
<td><code>name</code> must be the name of a Credit Control Service, and must be an alphanumeric string of 1 through 63 characters.</td>
</tr>
</tbody>
</table>

| | { grep grep_options | more } |
|---|
| Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. |
| Please refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter for details on the usage of `grep` and `more`. |

Usage

Use this command to show active credit control statistics.

Example

The following command shows the configured credit control statistics for a service named `service1`:

```
show credit-control statistics cc-service service1
```
show crypto blacklist file

Displays the contents of the blacklist (access denied) file.

**Product**
All products supporting IPSec blacklisting

---

**Important:** This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

**Privilege**
Security Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
show crypto blacklist file
```

**Usage**

Use this command to display the current contents of the blacklist file.

**Example**

The following command displays the contents of the blacklist file:

```
show crypto blacklist file
```
show crypto group

Displays information pertaining to configured crypto groups.

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show crypto group [ name group_name | summary ]

name group_name
Displays information for an existing crypto group specified as an alphanumeric string of 1 through 127 characters.

summary
Displays state and statistical information for configured crypto groups in this context.

Usage

Use this command to display information and statistics pertaining to one or all configured crypto groups within the current context.
show crypto group

If the `summary` keyword is not used, detailed information is displayed.

Example

The following command displays detailed information for a crypto group called `group1`:

```
show crypto group name group1
```
show crypto ikev1

Displays pre-shared key information for peer security gateways configured within the context.

<tbody>
<tr>
<td>Displays configuration information for the Internet Exchange Key (IKE) policy priority specified as an integer from 1 through 100. If no preference is specified, information will be displayed for all configured policies.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>security-associations [ summary ]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays information for established IPSec security associations (SAs).</td>
</tr>
</tbody>
</table>
Usage
Use this command to:

- Display pre-shared key information. This information can be used to verify configuration and/or for troubleshooting.
- Verify the configuration of IKE policies within the context.
- Display established IPSec SA information. This information can be used for troubleshooting.

Example
The following command lists the pre-shared keys received from peer security gateways as part of the Diffie-Hellman exchange:

```
show crypto ikev1 keys
```

The following command displays information for an IKE policy with a preference of 1:

```
show crypto ikev1 policy 1
```

The following command displays the currently established SAs:

```
show crypto ikev1 security-associations summary
```
show crypto ikev2-ikesa security-associations

Displays a summary view of Internet Key Exchange v2 (IKEv2) IKE Security Associations (IKE SAs).

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show crypto ikev2-ikesa security-associations peer ipv4/v6_address [ | { grep grep_options | more } ]

show crypto ikev2-ikesa security-associations summary [ cookies ] [ distribution ] [ | { dpd ipsecmgr instance instance_value } [ natt [ remote-gw ipv4/v6_address ] [ spi ] [ | { grep grep_options | more } ]

show crypto ikev2-ikesa security-associations tag crypto_map [ | { grep grep_options | more } ]

peer ipv4/v6_address

Specifies the crypto map peer IP address in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
**summary**

Displays SA summary information only. This information can be one of the following:

- **cookies**: Display IKE cookies for connections.

**Important**: The **cookies** keyword has been deprecated for release 17.0 and above.

- **distribution**: Display summary distribution.
- **dpd**: Display DPD (Dead Peer Detection) information for connections.
- **ipsecmgr instance instance_value**: Display ipsecmgr instance information. `instance_value` is an integer from 177 through 352.
- **natt [[ remote-gw ipv4/v6_address ]**: Display NAT-T information for connections or a specified remote gateway.
- **spi**: Display IKE Security Parameter Index.

**tag** **tag_name**

Specifies a crypto map name as an alphanumeric string of 1 through 127 characters.

| `{ grep grep_options | more }` |

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. Refer to `Regulating a Command’s Output` section of the Command Line Interface Overview chapter for details on the usage of `grep` and `more`.

**Usage**

Shows the information of the of the SAs configured for a crypto template. It shows the total configured SA lifetime in seconds and the number of seconds left on the timer.

**Example**

Use this command to display the SA summary:

```
show crypto ikev2-ikesa security-associations summary
```

**Important**: Output descriptions for commands are available in the Statistics and Counters Reference.
show crypto ikev2-ikesa transform-set

Displays IKEv2/IKESA (Internet Key Exchange v2/IKE Security Association) transform set configuration information.

**Product**

```

**Syntax**

```
show crypto ikev2-ikesa transform-set transform_set_name [ | { grep grep_options | more }]
```

```
show crypto ikev2-ikesa transform-set transform_set_name
```

Specifies the name of an existing IKEv2/IKSA transform set for which to display information as an alphanumeric string of 1 through 127 characters that is case sensitive.

```
|{ grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

Refer to *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter for details on the usage of *grep* and *more.*
show crypto ikev2-ikesa transform-set

Usage
Use this command to verify the configuration of IKEv2/IKESA transform sets within the context. If no keyword is specified, information will be displayed for all IKEv2/IKESA transform sets configured within the context.

Example
The following command displays information for an IKEv2/IKESA transform set named `test1`:

```
show crypto ikev2-ikesa transform-set test1
```
show crypto ipsec security-associations

Displays IPSec security associations (SAs) configured within or facilitated by the context and can optionally display statistics for them.

Mode
- Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show crypto ipsec security-associations [ map-type { ikev2-ipv4-cfg | ikev2-ipv4-node | ikev2-ipv6-cfg | ikev2-ipv6-node | ipsec-dynamic | ipsec-ikev1 | ipsec-ikev2-subscriber | ipsec-l2tp | ipsec-manual | ipsec-mobile-ip } | summary [ distribution | ipsecmgr | map-type ] ] [ | { grep grep_options | more } ] [ | { tag tag_name } ] [ | { grep grep_options | more } ]

map-type { ikev2-ipv4-cfg | ikev2-ipv4-node | ikev2-ipv6-cfg | ikev2-ipv6-node | ipsec-dynamic | ipsec-ikev1 | ipsec-ikev2-subscriber | ipsec-l2tp | ipsec-manual | ipsec-mobile-ip }

Specifies that information for all crypto maps of a specific type configured within the context will be displayed. The following types can be specified:

- ikev2-ipv4-cfg: IKEv2 IPv4 IPSec configured (ACL) Tunnel
Exec Mode show Commands (A-C)

show crypto ipsec security

- show crypto ipsec security associations

summary [ distribution | ipsecmgr | map-type ]
Displays only security association summary information.

distribution: Show IPSec Manager SA distribution information.
ipsecmgr ipsec_mgr_id: Displays summary SA information for the IPSec manager instance ID specified as an integer from 1 through 200.

map-type map_type: Displays summary SA information for the specified type of crypto map. The following types can be specified:
  - ikev2-ipv4-cfg: IKEv2 IPv4 IPSec configured (ACL) Tunnel
  - ikev2-ipv4-node: IKEv2 IPv4 IPSec spawned node Tunnel
  - ikev2-ipv6-cfg: IKEv2 IPv6 IPSec configured (ACL) Tunnel
  - ikev2-ipv6-node: IKEv2 IPv6 IPSec spawned node Tunnel
  - ipsec-dynamic: Dynamic IPSec Tunnel
  - ipsec-ikev1: IKEv1 IPSec Tunnel
  - ipsec-ikev2-subscriber: IKEv2 Subscriber Tunnel
  - ipsec-l2tp: L2TP IPSec Tunnel
  - ipsec-manual: Manual (Static) IPSec Tunnel
  - ipsec-mobile-ip: Mobile IP IPSec Tunnel

tag tag_name
Displays the SAs for an existing crypto map specified as an alphanumeric string of 1 through 127 characters that is case sensitive.

|{ grep grep_options | more }
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
Refer to Regulating a Command’s Output section of the Command Line Interface Overview chapter for details on the usage of grep and more.

Usage

Use this command to display IPSec SA information and statistics. This information can be used for performance monitoring and/or troubleshooting.
The displayed information categorizes control signal and data statistics. Data statistics are further categorized according to the encapsulation method, either GRE or IP-in-IP.

**Example**

The following command displays summary SA statistics for all IPSec managers.

```
show crypto ipsec security-associations summary
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show crypto ipsec transform-set

Displays IPSec transform set configuration information.

**Syntax**

```
show crypto ipsec transform-set [ transform_name ]
```

- `transform_name`
  Displays information for the IPSec transform set specified as an alphanumeric string of 1 through 127 characters that is case sensitive.

**Usage**

Use this command to verify the configuration of IPSec transform sets within the context.
If no keyword is specified, information will be displayed for all IPSec transform sets configured within the context.
show crypto ipsec transform-set

**Important:** This command is used in PDIF Release 8.3 only.

**Example**

The following command displays information for an IPSec transform set named *test1*:

```
show crypto ipsec transform-set test1
```
show crypto isakmp keys

Displays pre-shared key information (Internet Security Association and Key Management Protocol, ISAKMP) for peer security gateways configured within the context.

**Product**
- PDSN
- GGSN

**Privilege**
- Security Administrator, Administrator, Operator, Inspector

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```

**Syntax**

```
show crypto isakmp keys
```

**Usage**

Use this command to display pre-shared key information based on the peer security gateway. This information can be used to verify configuration and/or for troubleshooting.

**Example**

The following command lists the pre-shared keys received from peer security gateways as part of the Diffie-Hellman exchange:

```
show crypto isakmp keys
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show crypto isakmp policy

Displays Internet Security Association and Key Management Protocol (ISAKMP) policy configuration information.

**Product**
- PDSN
- GGSN

**Privilege**
- Security Administrator, Administrator, Operator, Inspector

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show crypto isakmp policy [ preference ]
```

- **preference**
  
  Displays configuration information for the ISAKMP policy priority specified as an integer from 1 through 100.

**Usage**

Use this command to verify the configuration of ISAKMP policies within the context.

If no `preference` is specified, information will be displayed for all configured policies.

**Example**

The following command displays information for an ISAKMP policy with a preference of 1:

```
show crypto isakmp policy 1
```
show crypto isakmp security-associations

Displays currently established Internet key Exchange (IKE) security associations (SAs) facilitated by the context.

Product

Syntax

```
show crypto managers [ context context_id | crypto-map map_name | instance instance_num | summary [ distribution | ike-stats | ikev2-stats | ipsec-sa-stats | npu-stats ] | | { grep grep_options | more } ]
```

---

**context context_id**

Displays IPSec manager statistics for an existing context specified as a alphanumeric string of 1 through 80 characters.

---

**crypto-map map_name**

Displays IPSec Managers for an existing crypto map specified as an alphanumeric string of 1 through 128 characters.
show crypto managers

instance instance_num

Displays statistics for the IPSec manager instance specified as an integer from 1 through 366.

summary [ distribution | ike-stats | ipsec-3gpp-cscf-stats | ikev2-stats [ demux-stats ] | ipsec-sa-stats | npu-stats ]

Shows statistics per service IP address for each manager.

distribution: Displays a summary list of IPSec manager distribution.
ike-stats: Displays a summary list of IPSec IKE statistics for each IPSec manager.
ipsec-3gpp-cscf-stats: Displays CSCF IPSec Statistics on each IPSec Manager.
ikev2-stats: Displays IKEv2 Statistics on each IPSec Manager.
demux-stats: Displays session demux statistics on each IPSec Manager.
ipsec-sa-stats: Displays a summary list of IPSec Security Association (SA) statistics for each IPSec Manager.
npu-stats: Displays NPU statistics on each IPSec Manager.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
Refer to Regulating a Command’s Output section of the Command Line Interface Overview chapter for details on the usage of grep and more.

Usage

Use this command to view statistics relating to IPSec managers.

Example

The following command displays summary information for all IPSec managers:

show crypto managers summary

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show crypto map

Displays crypto map configuration information.

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show crypto map [ map-type [ ikev2-ipv4 cfg | ikev2-ipv4-node | ikev2-ipv6 cfg | ikev2-ipv6-node | ipsec-ikev1 | ipsec-ikev2-subscriber | ipsec-l2tp | ipsec-manual | ipsec-mobile-ip | | { grep grep_options | more } | | [ summary ] | | [ tag tag_name ] | | { grep grep_options | more } ]

map-type [ ikev2-ipv4 cfg | ikev2-ipv4-node | ikev2-ipv6 cfg | ikev2-ipv6-node | ipsec-ikev1 | ipsec-l2tp | ipsec-manual | ipsec-mobile-ip | | { grep grep_options | more } ]

Specifies that information for all crypto maps of a specific type configured within the context will be displayed. The following types can be specified:
- ikev2-ipv4-cfg: IKEv2 IPv4 IPSec configured (ACL) Tunnel
- ikev2-ipv4-node: IKEv2 IPv4 IPSec spawned node Tunnel
- ikev2-ipv6-cfg: IKEv2 IPv6 IPSec configured (ACL) Tunnel
show crypto map

- **ikev2-ipv6-node**: IKEv2 IPv6 IPSec spawned node Tunnel
- **ipsec-ikev1**: IKEv1 IPSec Tunnel
- **ipsec-ikev2-subscriber**: IKEv2 Subscriber Tunnel
- **ipsec-l2tp**: L2TP IPSec Tunnel
- **ipsec-manual**: Manual (Static) IPSec Tunnel
- **ipsec-mobile-ip**: Mobile IP IPSec Tunnel

**summary**
Displays summary information for all crypto maps configured in the context.

**tag** *map_name*
Specifies the name of an existing crypto map in the current context for which to display configuration information as an alphanumeric string of 1 through 127 characters that is case sensitive.

```
| { grep grep_options | more }
```
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
Refer to *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter for details on the usage of *grep* and *more*.

**Usage**
Use this command to verify the configuration of crypto maps within the context.
If no keyword is specified, information will be displayed for all maps configured within the context regardless of type.

**Example**
The following command displays configuration information for a dynamic crypto map named *test_map3*:

```
show crypto map tag test_map3
```
show crypto statistics

Displays Internet Protocol Security (IPSec) statistics.

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show crypto statistics [ ikev1 | ikev2 [ service-ip-address ip-address ] [ service-name name ] | srtsp [ service-ip-address ip-address ] [ service-name name ] | [ | { grep grep_options | more } ]

ikev1

Displays global ikev1 statistics for this context.

ikev2 [ service-ip-address ip-address ] [ service-name name ]

Displays global ikev2 statistics for this context.

service-ip-address ip-address: Specifies the Packet Data Interworking Function (PDIF) service IP address in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

service-name name: Specified PDIF service name, a string of size 1 through 63.
show crypto statistics

```
srtp [ service-ip-address ip-address ] [ service-name name ]
```

Displays global SRTP (Secure Real-time Transport Protocol) statistics for this context.

- **service-ip-address ip-address**: Specifies the CSCF service IP address in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
- **service-name name**: Specifies the CSCF service name, a string of size 1 through 63.

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

Refer to *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter for details on the usage of `grep` and `more`.

**Usage**

Use this command to display statistics for IPSec tunnels facilitated by the context. This information can be used for performance monitoring and/or troubleshooting.

**Example**

The following command displays cumulative IPSec statistics for the current context:

```
show crypto statistics
```

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*. 

---

**Command Line Interface Reference, StarOS Release 17**

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show crypto template [ map-type [ ikev2-dynamic | ipsec-dynamic ] | summary | tag map_name ] [ | { grep grep_options | more }
```

**map-type [ ikev2-dynamic | ipsec-dynamic ]**

Specifies a specific map type.

**summary**

Displays summary information for all templates.

**tag map_name**

Specifies a crypto map name as an alphanumeric string of 1 through 127 characters.
| { grep grep_options | more } |

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. Refer to Regulating a Command’s Output section of the Command Line Interface Overview chapter for details on the usage of `grep` and `more`.

Usage

Use this command to display statistics for crypto templates. This information can be used for performance monitoring and/or troubleshooting.

Example

The following command displays summary information for all crypto templates:

```
show crypto template summary
```
show crypto whitelist file

Displays the contents of the whitelist (access granted) file.

Product
All products supporting IPSec whitelisting

Important: This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

Privilege
Security Administrator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show crypto blacklist file

Usage
Use this command to display the current contents of the whitelist file.

Example
The following command displays the contents of the whitelist file:

show crypto whitelist file
show cs-network

Displays statistics for the Circuit Switched (CS)-network(s) instance configured on a chassis for HNB-GW service sessions.

Product
HNB-GW

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show cs-network { all | name cs_name } [ status ] [ | { grep grep_options | more }]

all
Displays status counters for all CS (circuit switched) networks configured for HNB-GW service sessions on a chassis.

name cs_name
Displays status counters for a CS network configured for HNB-GW service specified as an alphanumeric string of 1 through 127 characters that is case sensitive

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. Refer to Regulating a Command’s Output section of the Command Line Interface Overview chapter for details on the usage of grep and more.

Usage

Use this command to display the status of any or all CS-network(s) instance configured on a chassis for HNB-GW service sessions.

Example

The following command displays the output for CS network instance status named cs_1_hnb:

```
show cs-network name cs_1_hnb status
```

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show cs-network counters

Displays the session counter information for an HNB-CS Network associated with Home-NodeB Gateway (HNB-GW) services configured and running on a system.

Product
HNB-GW

Privilege
Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show cs-network counters [ name cs_svc_name [ msc msc_point_code ] ] [ | { grep grep_options | more } ]

**name cs_svc_name**
Filters the counter display based on an existing HNB-CS Network service name associated with an HNB-GW service running on system. cs_svc_name is an alphanumeric string of 1 through 63 characters.

**msc msc_point_code**
Filters the counter display filtered on the basis of MSC address provided in the SS7 point code that is connected to a particular HNB-CS Network service. msc_point_code must be the address of an MSC in SS7 point code notation.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command’s Output section in Command Line Interface Overview chapter.

Usage
Use this command to view the session counter information for HNB-CS Network services configured and MSCs connected on a system.

Example
The following command displays the counters for the HNB-CS Network service named hnb_cs_svc1:

```plaintext
show cs-network counters name hnb_cs_svc1
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show cs-network statistics

Displays the Circuit Switched session statistics for Home-NodeB Gateway (HNB-GW) services configured and running on this system.

**Product**

HNB-GW

**Privilege**

Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show cs-network statistics [ name cs_svc_name [ msc msc_point_code]] [ ranap-only | rtp-only | sccp-only ] [ | { grep grep_options | more } ]
```

**name cs_svc_name**

Filters the session statistics display based on an existing HNB-CS Network service name that is associated with an HNB-GW service running on this system. `cs_svc_name` is an alphanumeric string of 1 through 63 characters.

**msc msc_point_code**

Filters the counter display filtered on the basis of MSC address provided in the SS7 point code that is connected to a particular HNB-CS Network service. `msc_point_code` must be the address of an MSC in SS7 point code notation.

**ranap-only**

Filters the session statistics to display only Radio Access Network Application Protocol (RANAP) traffic for an HNB-CS Network service which is configured and associated with an HNB-GW service running on this system.

**rtp-only**

Filters the session statistics to display only Realtime Streaming Protocol (RTP) and Realtime Streaming Control Protocol (RTCP) traffic for the specified HNB-CS Network service which is configured and associated with an HNB-GW service running on this system.

**sccp-only**

Filters the session statistics to display only Signaling Connection Control Part (SCCP) traffic for the specified HNB-CS Network service which is configured and associated with an HNB-GW service running on this system.
| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of the `grep` and `more` commands, refer to the `Regulating a Command’s Output` section in `Command Line Interface Overview` chapter of the `Command Line Interface Reference`.

### Usage

Use this command to view the session statistics for overall session or in selected part of user session for HNB-GW services configured and running on this system.

### Example

The following command displays the session statistics for RTP and RTCP part of session for the HNB-CS Network service named `hnb_cs1`:

```
show cs-network statistics name hnbcs1 rtp-only
```

**Important:** Output descriptions for commands are available in the `Statistics and Counters Reference`. 
show cscf ifc

Displays the Initial Filter Criteria (iFC) for shared iFC functionality.

Product
SCM (S-CSCF, SIP Proxy)

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show cscf ifc { all | id fc_id } [ | { grep grep_options | more } ]
```

- `all`: Displays all iFC.
- `id fc_id`: Displays information for an existing iFC specified as an alphanumeric string of 1 through 200 characters.

| pipes (sends) the output of this command to the specified command. You must specify a command to which
| the output of this command will be sent.
| Refer to `Regulating a Command's Output` section of the `Command Line Interface Overview` chapter for
| details on the usage of `grep` and `more`.

Usage

Use this command to display configuration information for any or all iFC on this system.

Example

The following command displays the configuration information for all iFC on this system:

```
show cscf ifc all
```

*Important*: Output descriptions for commands are available in the `Statistics and Counters Reference`. 
show cscf nat

Displays the Call Session Control Function (CSCF) mapping created for each of the media streams present in an established dialog.

Product
SCM (P-CSCF, A-BG)

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show cscf nat media mapping { all | aor aor } [ | { grep grep_options | more } ]
```

**media mapping { all | aor aor }**

- **all**: Displays the UE/Network origins and destinations, including their IP addresses/port numbers and associated contexts.
- **aor aor**: Displays information for an Address of Record (AoR) specified as an alphanumeric string of 1 through 79 characters.

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

Refer to **Regulating a Command’s Output** section of the **Command Line Interface Overview** chapter for details on the usage of **grep** and **more**.

**Usage**

Use this command to display the status of configured Network Address Translation (NAT) support.

**Example**

The following command displays the status of the mapping created for each of the media streams present on this system:

```
show cscf nat media mapping all
```

**Important**: Output descriptions for commands are available in the **Statistics and Counters Reference**.
show cscf npdb-servers

Displays the connection status of NPDB (Number Portability Data Base) servers in S-CSCF service.

Product
SCM (S-CSCF)

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show cscf npdb-servers service service_name [ | { grep grep_options | more } ]

- service service_name
  Specifies the name of an existing CSCF service for which the statistics will be displayed as an alphanumeric string of 1 through 63 characters.

  | { grep grep_options | more }
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  Refer to Regulating a Command’s Output section of the Command Line Interface Overview chapter for details on the usage of grep and more.

Usage

Use this command to display the connection status of NPDB servers in S-CSCF service.

Example

The following command displays the connection status of NPDB servers for the S-CSCF service named scscf1:

  show cscf npdb-servers service scscf1

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show cscf peer-servers

Displays name, IP address, and status of configured Call Session Control Function (CSCF) peer servers visible to the system.

Product
SCM

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show cscf peer-servers { all | full | name service_name [ server-name server_name ] } [ | { grep grep_options | more } ]

all | full | name service_name [ server-name server_name ]

all: Displays the peer server list names and the servers within those lists including their IP addresses/port numbers and domain names.

full: Displays additional details regarding the peer servers within the configured lists on the system.

name service_name [ server-name server_name ]: Displays the same information as the full keyword output, but for a peer server list or an existing peer server specified as an alphanumeric string of 1 through 80 characters.

| { grep grep_options | more } |

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. Refer to Regulating a Command’s Output section of the Command Line Interface Overview chapter for details on the usage of grep and more.

Usage

Use this command to display the status of configured peer servers.

Example

The following command displays the status of a peer server named icscf3 that is a member of peer server list cscf-main:

    show cscf peer-servers name cscf-main server-name icscf3

The following command displays the status of all peer servers in configured peer server groups in this context:

    show cscf peer-servers full
show cscf peer-servers

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 

---
show cscf peer-servers-group

Displays the status of peer-servers-lists inside peer-servers groups.

Product
SCM

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show cscf peer-servers-group { all | full | name group_name [ servers-list-name list_name ] } [ | { grep grep_options | more } ]

all | full | name service_name [ server-name server_name ]

all: Displays information for all peer-servers-groups.
full: Displays all available peer servers.
name group_name [ servers-list-name list_name ]: Displays information for peer-server-list (Active/Standby) in the peer-servers-group.
group_name must be an existing peer-servers-group specified as an alphanumeric string of 1 through 80 characters.
[ servers-list-name list_name ] must be an existing peer-server-list specified as an alphanumeric string of 1 through 80 characters.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
Refer to Regulating a Command’s Output section of the Command Line Interface Overview chapter for details on the usage of grep and more.

Usage

Use this command to display the status of peer-servers-lists inside peer-servers groups.

Example

The following command displays the status of a peer-server-list named psl3 that is a member of peer-servers-group psg2:

    show cscf peer-servers-group name psg2 servers-list-name psl3

The following command displays the status of all peer-servers-groups in this context:

    show cscf peer-servers-groups all
show cscf service

Displays configuration and/or statistical information for Call Session Control Function (CSCF) services on this system.

**Product**
SCM

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show cscf service { all [ counters ] | diameter { location-info statistics service-name service_name [ vpn-name name ] | policy-control statistics service-name service_name [ vpn-name name ] } | grey-list name name | li-packet-cable statistics service-name service_name | performance-counters name service-name | statistics name service-name [ all | atcf | calls | eatf equip-id | eatf-statistics | ip-security | message | npdb [ all | instance id ] | package-name { message-summary | presence | reg | winfo } | registrations | sigcomp | tcp { msrp | sip } | subscription name service-name } [ | { grep grep_options | more }]
```

- **all [ counters ]**
  Displays configuration information for all CSCF services configured on this system.
  **counters**: Displays statistics with the configuration information for all CSCF services configured on the system.

- **diameter { location-info statistics service-name service_name [ vpn-name name ] | policy-control statistics service-name service_name [ vpn-name name ] }
  **location-info statistics**: Displays Diameter statistics on the E2 interface with the location information.
  **policy-control statistics**: Displays Diameter (DPECA) statistics on the CSCF Rx interface with the configuration information.
  **service-name service_name**: Specifies the name of an existing CSCF service for which the statistics will be displayed as an alphanumeric string of 1 through 63 characters.
  **vpn-name name**: Specifies the name of an existing context in which all statistics for all services will be displayed as an alphanumeric string of 1 through 79 characters.

- **grey-list name name**
  Displays an existing list of run-time grey-listed users and their remaining barred period for the specified CSCF service as an alphanumeric string of 1 through 63 characters.

- **li-packet-cable statistics service-name service_name**
  Refer to the *Lawful Intercept Configuration Guide* for a description of this command.
name service_name [ counters ]
Displays configuration information for an existing CSCF service specified as an alphanumeric string of 1 through 63 characters.

counters: Displays statistics with the configuration information for the specific CSCF service.

performance-counters name service_name
Displays performance counters (3GPP TS 32.409) for an existing CSCF service specified as an alphanumeric string of 1 through 63 characters.

statistics name service_name [ all | atcf | calls | eatf equip-id | eatf-statistics | ip-security | message | npdb [ all | instance id ]] | package-name { message-summary | presence | reg | winfo } | registrations | sigcomp | tcp { msrp | sip }
Displays service statistics for an existing CSCF service specified as an alphanumeric string of 1 through 63 characters.

aall: Displays all CSCF service statistics.
atcf: Displays statistics related to ATCF access transfers.
calls: Displays session statistics related to CSCF calls.
eatf equip-id: Displays the list of all equipment IDs under an E-CSCF service.
ip-security: Displays session statistics related to CSCF IPSec.
message: Displays session statistics for the SIP method MESSAGE.
npdb: Displays NPDB message statistics for the specific S-CSCF service. These statistics are associated with the various messages in the NPDB call flow, such as BIND, PING_PONG, REL_REQ, and ERRREP.
  • all: Displays statistics related to NPDB across all instances.
  • instance id: Displays NPDB statistics for an existing instance. id must be an integer from 1 through 65454.

package-name: Displays session statistics for the associated event package.
  • message-summary: Displays session statistics for the “message-summary” event package.
  • presence: Displays session statistics for the “presence” event package.
  • reg: Displays session statistics for the “reg” event package.
  • winfo: Displays session statistics for the “watcher-info” event package.
registrations: Displays session statistics related to CSCF registrations, re-registrations, and de-registrations.
sigcomp: Displays session statistics related to CSCF sigcomp.
tcp: Displays session statistics related to CSCF TCP.
  • msrp: Displays statistics related to CSCF TCP MSRP statistics.
  • sip: Displays statistics related to CSCF TCP SIP statistics.

Important: This keyword must be followed by another statistics-related keyword.

subscription name service_name
Displays service level subscription information for an existing CSCF service specified as an alphanumeric string of 1 through 63 characters.
show cscf service

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display configuration information and/or statistics for any or all CSCF services on this system.

Example

The following command displays service statistics for the CSCF service named cscf1:

```plaintext
show cscf service statistics name cscf1
```

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show cscf sessions

Displays statistics for Call Session Control Function (CSCF) sessions on this system.

Product
SCM

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show cscf sessions { counters { calls { duration | first-response-time | invite-processing-time | post-answer-delay | post-dial-delay | service service_name | session-release-delay | session-setup-delay } service service_name | subscription { duration | service service_name | setup-time } service service_name } | duration | full } [ callleg-id id | from-aor aor | service service_name | session-id id | to-aor aor ] [ [ media-type type ] | summary [ from-aor aor | service service_name | session-id id | to-aor aor | ] [ [ grep grep_options | more ] ]

counters { calls { duration | first-response-time | invite-processing-time | post-answer-delay | post-dial-delay | service service_name | session-release-delay | session-setup-delay } service service_name | subscription { duration | service service_name | setup-time } service service_name }

Displays counters for all CSCF sessions matching the filter criteria.

calls: Counters associated with calls in CSCF service.

•duration: Displays the call duration time.
•first-response-time: Displays the time interval for the first response received for INVITE.
•invite-processing-time: Displays the INVITE message processing time in CSCF.
•post-answer-delay: Displays the time interval for post answer delay.
•post-dial-delay: Displays the time interval for the ringing or success response for INVITE.
•service service_name: Displays counters for an existing CSCF service specified as an alphanumeric string of 1 through 63 characters.

Important: This keyword may be used alone with the counters keyword or following any other counters-specific keyword.

•session-release-delay: Displays the time interval for releasing the call.
•session-setup-delay: Displays the time interval for session setup.
•subscription: Counters associated with subscriptions in CSCF service.
  •duration: Displays the SIP Subscription duration time.
• **service service_name**: Displays specific service. *service_name* must be an existing CSCF service and be from 1 to 63 alphanumeric characters.

**Important**: This keyword may be used alone with the *subscription* keyword or following any other subscription-specific keyword.

• **setup-time**: Displays the SIP Subscription setup time.

**duration**
Displays the call duration for all CSCF sessions.

**full**
Displays all the session information for the active CSCF sessions matching the filter criteria.

- **callleg-id id**: Displays session statistics for an existing call-leg ID, and must be an alphanumeric string of 1 through 63 characters.
- **from-aor aor**: Displays session statistics for sessions originating from an existing Address of Record (AoR) specified as an alphanumeric string of 1 through 79 characters.
- **service service_name**: Displays session statistics for sessions using an existing CSCF service specified as an alphanumeric string of 1 through 63 characters.
- **session-id id**: Displays session statistics for sessions with an existing ID specified as an alphanumeric string of 1 through 63 characters.
- **to-aor aor**: Displays session statistics for sessions sent to an existing AoR specified as an alphanumeric string of 1 through 79 characters.
- **media-type type**: Displays information about an existing media type specified as an alphanumeric string of 1 through 9 characters.

**summary**
Displays session summary information for sessions matching the filter criteria.

- **from-aor aor**: Displays session statistics for sessions originating from an existing AoR specified as an alphanumeric string of 1 through 79 characters.
- **service service_name**: Displays session statistics for sessions using an existing CSCF service specified as an alphanumeric string of 1 through 63 characters.
- **session-id id**: Displays session statistics for sessions with an existing ID specified as an alphanumeric string of 1 through 63 characters.
- **to-aor aor**: Displays session statistics for sessions sent to an existing AoR specified as an alphanumeric string of 1 through 79 characters.

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. Refer to *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter for details on the usage of *grep* and *more*.

**Usage**
Use this command to display session information for any or all CSCF sessions.

**Example**
The following command displays the output for CSCF session duration:
show cscf sessions duration

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*.
show cscf sip

Displays Session Initiation Protocol (SIP) statistics for a specific Call Session Control Function (CSCF) service configured on this system.

Product
SCM

Privilege
Security Administrator, Administrator, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show cscf sip statistics name service_name [ interface { domain { list | name domain_name } | ip { address ip_address | list } } | vpn-name name ] [ | { grep grep_options | more } ]

statistics name service_name

Specifies the name of an existing CSCF service as an alphanumeric string of 1 through 63 characters.

[ interface { domain { list | name domain_name } | ip { address ip_address | list } } ]

SIP statistics will be displayed for this interface.

domain list: Displays list of interfaces associated with the CSCF service.

domain name domain_name: Specifies an existing domain associated with the CSCF service as an alphanumeric string of 1 through 80 characters.

ip address ip_address: Specifies the destination or source IP address associated with the CSCF service in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

ip list: Displays a list of interfaces associated with the CSCF service.

vpn-name name

Specifies the name of an existing VPN as an alphanumeric string of 1 through 79 characters.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

Refer to Regulating a Command’s Output section of the Command Line Interface Overview chapter for details on the usage of grep and more.

Usage

Use this command to display SIP statistics for a specific CSCF service.
**Important:** This command displays counters for SIP statistics for a specified CSCF service. Counters are incriminated when SIP messages are sent (Tx) or received (Rx). SIP Request, Response, and Error counters are maintained at various levels in the SIP stack. These values are dependent on the packet flow. For example, if packets are dropped at an initial stage of parsing and error detection, the counters may not increment. All 2xx Response counters for individual requests are maintain outside the SIP layer and will not track re-transmissions and erroneous packets that are dropped. All other counters do keep track of re-transmissions.

**Example**

The following command displays SIP statistics for the CSCF service named *cscf1*:

```
show cscf sip statistics name cscf1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
**show cscf tcp**

Displays TCP connection information for a specific Call Session Control Function (CSCF) service configured on this system.

**Product**
SCM

**Privilege**
Security Administrator, Administrator, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show cscf tcp connections service service_name [ facility { cscfmgr | sessmgr } ] [ full ] [ msrp ] [ remote-ip ip_address ] [ remote-port port_number ] [ sip ] [ | { grep grep_options | more } ]
```

- **connections service service_name**
  Specifies the name of an existing CSCF service as an alphanumeric string of 1 through 63 characters.

- **facility { cscfmgr | sessmgr }**
  Facility type for which connection details have to be retrieved.
  - **cscfmgr**: Facility type cscfmgr.
  - **sessmgr**: Facility type sessmgr.

- **full**
  Displays detailed information related to each connection.

- **msrp**
  Displays statistics related to CSCF TCP Message Session Relay Protocol (MSRP) statistics.

- **remote-ip ip_address**
  Specifies the remote IP address to match the connection in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

- **remote-port port_number**
  Specifies the remote port to match the connection an integer from 1 through 65534.

- **sip**
  Displays statistics related to CSCF TCP SIP statistics.
Commands (A–C)

| show cscf tcp |

| { grep grep_options | more } |

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. Refer to Regulating a Command’s Output section of the Command Line Interface Overview chapter for details on the usage of `grep` and `more`.

**Usage**

Use this command to display TCP connection information for a specific CSCF service.

**Important**: More than one optional keyword may be used per command.

**Example**

The following command displays TCP connections for the CSCF service named `cscf1`:

```plaintext
show cscf tcp connections service cscf1
```

**Important**: Output descriptions for commands are available in the Statistics and Counters Reference.
show css delivery-sequence

In StarOS 9.0 and later releases, this command is deprecated.
show css server

In StarOS 9.0 and later releases, this command is deprecated.
show css service

In StarOS 9.0 and later releases, this command is deprecated.
Chapter 132
Exec Mode show Commands (D-G)

This section includes the commands `show dhcp` through `show gtpu-service`.
The Exec Mode is the initial entry point into the command line interface system. Exec mode `show` commands are useful in troubleshooting and basic system monitoring.

Mode

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Important**: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
show dhcp

Displays counter information pertaining to Dynamic Host Configuration Protocol IPv4 (DHCP) functionality based on specific criteria.

Product
GGSN
ASN-GW
P-GW
SAEGW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show dhcp [ counters | full | summary ] [ all | apn apn_name | callid id | chaddr mac_address | dhcp-service svc_name | imsi imsi | msid msid | server server_address | statistics [ dhcp-service svc_name | server server_address ] | status [ dhcp-service svc_name | server server_address ] | user-address address | username name ] [wf1] [ | { grep grep_options | more } ]

counters
Displays DHCP counter information.

full
Displays all available information pertaining to the criteria specified.

summary
Displays a summary of the DHCP statistics.

all
Displays counter information for each active PDP context.

apn apn_name
Displays information based on an existing Access Point Name (APN) specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

callid id
Displays information for an existing call identification number specified as a 4-digit hexadecimal number.
**Exec Mode show Commands (D-G)**

**show dhcp**

- **chaddr mac_address**
  Displays information for a mobile node specified by its MAC address.

- **dhcp-service svc_name**
  Displays information for an existing DHCP service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

- **imsi imsi**
  Displays information for an International Mobile Subscriber Identity (IMSI) specified as a string of 1 to 15 digits.

- **msid msid**
  Displays information for a Mobile Subscriber Identity (MSID) specified as a string of 1 to 15 digits.

- **server server_address**
  Displays information for a DHCP server specified by its IP address in IPv4 dotted-decimal notation.

- **statistics [ dhcp-service svc_name | server server_address ]**
  Displays DHCP statistics for either a specific or for all DHCP services and servers configured.
  - **dhcp-service svc_name**: Displays statistics for a DHCP service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.
  - **server server_address**: Displays statistics for a DHCP server specified by its IP address in IPv4 dotted-decimal notation.

- **status [ dhcp-service svc_name | server server_address ]**
  Displays configuration information for either a specific or for all DHCP services and servers configured.
  - **dhcp-service svc_name**: Displays statistics for a DHCP service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.
  - **server server_address**: Displays statistics for a DHCP server specified by its IP address in IPv4 dotted-decimal notation.

- **user-address address**
  Displays information for a DHCP-assigned user IP address specified in IPv4 dotted-decimal notation.

- **username name**
  Displays information for a subscriber specified as an alphanumeric string of 1 through 127 characters (including wildcards “$” and “*”) that is case sensitive.

- **wfl**
  Displays all available information for associated filter keyword in wide-format number 1.

  | { grep grep_options | more } |

  Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.
Usage
Counters pertaining to DHCP functionality can be displayed as cumulative values or for specific APNs, PDP contexts, servers, or DHCP services.

Example
The following command displays DHCP counter information for a DHCP service called DHCP-Gi:

```
show dhcp dhcp-service DHCP-Gi
```

The following command displays DHCP counter information for a DHCP Call ID 01ca11a2:

```
show dhcp call-id DHCP-Gi
```

The following command displays DHCP information for the specified mobile node:

```
show dhcp chaddr 00:05:47:00:37:44
```

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show dhcp-service

Displays information for either a specific or for all Dynamic Host Configuration Protocol IPv4 (DHCP) services.

Product

GGSN
ASN-GW
P-GW
SAEGW

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show dhcp-service { all | name svc_name } [ | { grep grep_options | more } ]
```

- **all**
  Displays information for all configured DHCP services.

- **name svc_name**
  Displays information for a DHCP service name specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

- `| { grep grep_options | more }`
  Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

This command is used to verify the configuration of one or all DHCP services for monitoring or troubleshooting purposes. The output is a concise listing of DHCP service parameter settings.

If this command is executed from within the local context with the all keyword, information for all DHCP services configured on the system will be displayed.

Example

The following command displays configuration information for a DHCP service called dhcp1:

```
show dhcp-service name dhcp1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show dhcpv6

Displays counter information pertaining to Dynamic Host Configuration Protocol IPv6 (DHCPv6) functionality based on specific criteria.

Product

  GGSN
  ASN-GW
  P-GW
  SAEGW

Privilege

  Security Administrator, Administrator, Operator, Inspector

Mode

  Exec

The following prompt is displayed in the Exec mode:

    [local]host_name#

Syntax

    show dhcpv6 [ counters | full | summary ] [ all | callid id | server server_address | service svc_name| statistics [ dhcp-service svc_name | server server_address ] | status [ dhcp-service svc_name | server server_address ] [ | | grep grep_options | more ] ]

  counters
    Displays DHCPv6 counter information.

  full
    Displays all available information pertaining to the criteria specified.

  summary
    Displays a summary of the DHCPv6 statistics.

  all
    Displays counter information for each active PDP context.

  callid id
    Displays information for an existing call identification number specified as an 8-digit hexadecimal number.

  server server_address
    Displays information for a DHCPv6 server specified by its IP address in IPv6 colon-separated-hexadecimal notation.

Important: In StarOS 15.0 and later releases, this option is deprecated
statistics [ dhcp-service svc_name ]
Displays DHCPv6 statistics for either a specific or for all DHCPv6 services.

**Important:** In StarOS 15.0 and later releases, this option is deprecated

```
dhcp-service svc_name: Displays statistics for a DHCPv6 service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.
server server_address: Displays statistics for a DHCPv6 server specified by its IP address in IPv6 colon-separated-hexadecimal notation.
```

```
status [ dhcp-service svc_name ]
Displays configuration information for either a specific or for all DHCPv6 services and servers configured.

**Important:** In StarOS 15.0 and later releases, this option is deprecated

```
dhcp-service svc_name: Displays statistics for a DHCPv6 service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.
server server_address: Displays statistics for a DHCPv6 server specified by its IP address in IPv6 colon-separated-hexadecimal notation.
```

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

### Usage

Counters pertaining to DHCP IPv6 functionality can be displayed as cumulative values or for specific APNs, PDP contexts or DHCPv6 services.

### Example

The following command displays DHCPv6 status information for a DHCPv6 service called `DHCPv6-G1`:

```
show dhcpv6 status service DHCPv6-G1
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show dhcpv6-client-profile

Displays configuration information for a specific or all Dynamic Host Configuration Protocol IPv6 (DHCPv6) client profiles.

**Product**
- GGSN
- ASN-GW
- P-GW
- SAEGW

**Privilege**
- Security Administrator, Administrator, Operator, Inspector

**Mode**
- Exec
  
  The following prompt is displayed in the Exec mode:

  [local]host_name#

**Syntax**

```
show dhcpv6-client-profile [ all | name profile_name ] | { grep grep_options | more }
```

- **all**
  Displays configuration information for all DHCPv6 client profiles.

- **name profile_name**
  Displays profile configuration information for an existing DHCPv6 client profile specified as an alphanumeric string of 1 through 63 characters.

  | { grep grep_options | more }

  Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.

  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

**Usage**

Use this command to display configuration information for one or all DHCPv6 client profiles.

**Example**

The following command displays all DHCPv6 client profiles:

```
show dhcpv6-client-profile all
```
show dhcpv6-server-profile

Displays configuration information for a specific or all Dynamic Host Configuration Protocol IPv6 (DHCPv6) server profiles.

Product

GGSN
ASN-GW
P-GW
SAEGW

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show dhcpv6-server-profile [ all | name profile_name ] | { grep grep_options | more }

Syntax Description:

- `all`
  - Displays configuration information for all DHCPv6 server profiles.

- `name profile_name`
  - Displays profile configuration information for an existing DHCPv6 server profile specified as an alphanumeric string of 1 through 63 characters.

- `| { grep grep_options | more }`
  - Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
  - For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to display configuration information for one or all DHCPv6 server profiles.

Example

The following command displays all DHCPv6 server profiles:

```
show dhcpv6-server-profile all
```
show dhcpv6-service

Displays service information and configuration counters for a specific or all Dynamic Host Configuration Protocol IPv6 (DHCPv6) services.

Product
- GGSN
- ASN-GW
- P-GW
- SAEGW

Privilege
- Security Administrator
- Administrator
- Operator
- Inspector

Mode
- Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show dhcpv6-service [ all | name svc_name ] | { grep grep_options | more }

- all
  - Displays configuration information and counters for all DHCPv6 services.

- name svc_name
  - Displays configuration information and counters for an existing DHCPv6 service specified as an alphanumeric string of 1 through 63 characters.

  | { grep grep_options | more }

  Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent. For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to display configuration information and counters for one or all DHCPv6 services.

Example

The following command displays all DHCPv6 services:

    show dhcpv6-service all
show diameter aaa-statistics

Displays Diameter Authentication, Authorization and Accounting (AAA) statistics.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show diameter aaa-statistics [ all | group group_name [ server server_name ] | misc-data [ instance instance_number ] | server server_name ] [ | { grep grep_options | more } ]

all
Displays all available Diameter server statistics.

group group_name [ server server_name ]
Displays all Diameter server statistics within an existing AAA group specified as an alphanumeric string of 1 through 64 characters.
server_name must be the name of a Diameter server, expressed as an alphanumeric string of 1 through 64 characters.

misc-data instance instance-number
Displays Diameter specific miscellaneous statistics among all AAA manager instances. This display also includes the maximum backpressure statistics and the time at which it was seen.
instance instance_number: Displays the maximum backpressure statistics at a specified AAA manager instance. The instance number must be an integer from 1 through 385 characters.

server server_name
Displays Diameter server statistics for the Diameter server name specified as an alphanumeric string of 1 through 64 characters.

| { grep grep_options | more }

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to view Diameter AAA statistics.
Example

The following command displays all available Diameter server statistics:

```
show diameter aaa-statistics all
```
show diameter accounting servers aaa-group

Displays Diameter accounting server information for an Authentication, Authorization and Accounting (AAA) group.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show diameter accounting servers [ aaa-group group_name ] [ | { grep grep_options | more } ]
```

**aaa-group group_name**

Specifies the name of an existing AAA group as an alphanumeric string of 0 through 64 characters.

**| { grep grep_options | more }**

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**

Use this command to view Diameter accounting server information for an AAA group.

**Example**

The following command displays Diameter accounting server information for an AAA group named in `group12`:

```
show diameter accounting servers aaa-group group12
```
show diameter authentication servers aaa-group

Displays Diameter Authentication server information for a specified AAA group.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
show diameter authentication servers [ aaa-group group_name ]
```

- **aaa-group group_name**
  Specifies the name of an existing AAA group as an alphanumeric string of 0 through 64 characters.

**Usage**

Use this command to view Diameter authentication server information for an AAA group.

**Example**

The following command displays Diameter authentication server information for an AAA group named `group12`:

```
show diameter authentication servers aaa-group group12
```
show diameter dynamic-dictionary

Displays the contents of Diameter dictionary that is loaded dynamically at run time.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show diameter dynamic-dictionary { { all [ contents ] } | { name dict_name [ contents | { full facility { aaamgr | diamproxy | sessmgr instance instance_no } ] } } | { grep grep_options | more } }

- **all**
  Displays, in text format, the information for all dynamically loaded dictionaries configured in the Global Configuration mode. Displays up to 10KB buffered text from each dictionary file.

- **name dict_name**
  Displays detailed information for an existing dynamically loaded dictionary specified as an alphanumeric string of 1 through 15 characters. Displays up to 10KB buffered text from the specified dictionary file.

- **full facility { aaamgr | diamproxy | sessmgr }**
  Displays all available information for the specified instance associated with one of the following facilities:
  - aaamgr — Accounting and authentication Manager
  - diamproxy — Diameter Proxy
  - sessmgr — Session Manager

- **instance instance_no**
  Specifies the instance number from which dynamic dictionary details to be fetched, is an integer value between 0 through 4294967295.

- **| { grep grep_options | more }**
  Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.
show diameter dynamic-dictionary

Usage
Use this command to view the contents of dynamically loaded Diameter dictionaries.
For more details on the dynamic configuration of Diameter dictionary, refer to the `diameter dynamic-dictionary` command in the Global Configuration Mode Commands chapter.

Example
The following command displays the contents of dynamically loaded Diameter dictionary file named `dyn1`:

```
show diameter dynamic-dictionary name dyn1
```
show diameter endpoint

This command has been deprecated, and is replaced by the show diameter endpoints command.
show diameter endpoints

This command displays the status of Diameter client endpoint(s).

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show diameter endpoints { all | endpoint endpoint_name } [ | { grep grep_options | more } ]
```

- **all**
  Displays status of all Diameter client endpoints.

- **endpoint endpoint_name**
  Displays status of an existing Diameter client endpoint specified as an alphanumeric string of 1 through 63 characters.

- **| { grep grep_options | more }**
  Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

**Usage**

Use this command to view the status of Diameter client endpoints.

If you are in the local context, then all contexts are searched for the specified endpoint(s). Specify `all` to see all endpoints; otherwise, just the named endpoint will be displayed. If no argument is provided, a summary of all endpoints is displayed.

Default value: N/A

**Example**

The following command displays status of all Diameter client endpoints.

```
show diameter endpoints all
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
### show diameter message-queue

Displays Diameter message queue statistics.

**Product**
All

** Privilege**
Security Administrator, Administrator, Operator, Inspector

** Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show diameter message-queue counters { inbound | outbound } [ endpoint endpoint_name [ peer-host peer_id [ peer-realm realm_id ] ] | session-id session_id ] [ | { grep grep_options | more } ]
```

- **counters { inbound | outbound }**
  Specifies the message counters:
  - **inbound**: Specifies Diameter inbound messages
  - **outbound**: Specifies Diameter outbound messages

- **endpoint endpoint_name**
  Specifies the Diameter endpoint as an alphanumeric string of 1 through 63 characters.

- **peer-host peer_id**
  Specifies the Diameter peer host as an alphanumeric string of 1 through 63 characters.

- **peer-realm realm_id**
  Specifies the Diameter peer realm as an alphanumeric string of 1 through 127 characters.

- **session-id session_id**
  Specifies the session ID as an alphanumeric string of 1 through 127 characters.

  | { grep grep_options | more } |

  Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.

  For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

**Usage**

Use this command to view the count of the messages in the Diameter message queue for specific counter type, session ID, or endpoint, peer host, and peer realm.
Example

The following command displays message queue statistics for outbound messages specific to the Diameter endpoint named asr5k.testnetwork.com:

```
show diameter message-queue counters outbound endpoint asr5k.testnetwork.com
```

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
**show diameter peers**

Displays Diameter peer information.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec
The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show diameter peers [ full | summary ] [ all | [ endpoint endpoint_name ] [ peer-host peer_id ] [ peer-realm realm_id ] ] [ | { grep grep_options | more } ]
```

- **full**
  Displays full details of all or specified Diameter peers.

- **summary**
  Displays summary details of all or specified Diameter peer(s).

- **all**
  Displays details of all Diameter peers.

- **endpoint endpoint_name**
  Displays details of the origin Diameter endpoint specified as an alphanumeric string of 1 through 255 characters.

- **peer-host peer_id**
  Displays details of the Diameter peer host specified as an alphanumeric string of 1 through to 63 characters.

- **peer-realm realm_id**
  Displays details of the Diameter peer realm ID specified as an alphanumeric string of 1 through 127 characters.

| \ | { grep grep_options | more } |
|---|---|
| Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent. |
| For details on the usage of `grep` and `more`, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*. |
show diameter peers

**Usage**

Use this command to view the details of Diameter peers.
If you are in the local context, then all contexts are searched for the specified peer(s).
This is similar to the **show subscribers** CLI command and supports multiple filter options specified at the same time.
If filter options are specified (e.g., **all**, **endpoint**, etc.), the default is for one line of output to be displayed per peer. Use **full** to get detailed information per peer, or **summary** to get summarized information about all matching peers.
If no filter options are specified, a summary output for all peers is displayed. Use the **full** option to get detailed information about every peer.
Default value: N/A

**Example**

The following command details of the Diameter endpoint named **endpoint12**:

```
show diameter peers endpoint endpoint12
```

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*. 

---

---
show diameter route status

Displays Diameter route health status information.

Important: In 17.0 and later releases, this command has been deprecated.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show diameter route status [ endpoint endpoint_name | full [ endpoint endpoint_name ] ] [ host host_name [ peer peer_id ] ] [ | { grep grep_options | more } ]

full
Displays information about which Diameter clients are using which peer/host combinations.

deploy endpoint endpoint_name
Displays detailed information for the Diameter client endpoint specified as an alphanumeric string of 1 through 63 characters.

host host_name
Displays information for the Diameter host specified as an alphanumeric string of 1 through 63 characters.

peer peer_id
Displays information for the Diameter peer host specified as an alphanumeric string of 1 through 63 characters.

| { grep grep_options | more }

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
Use this command to view the Diameter route health status.
The route status displays status of peer/host combinations. Refer to the route-failure CLI command in Diameter Endpoint Configuration mode. When no options are specified, the display will give one line per
peer/host combination, indicating how many Diameter clients are using each combination, and for how many clients the combination is available or failed. Specify `full` to see which Diameter clients are using which peer/host combinations. Specify `host` or `peer` to see just combinations with the named host or peer. Specify `endpoint` to see detailed information about the named Diameter client.

Default value: N/A

Example

The following command displays route health status details of the Diameter client endpoint named `endpoint12`:

```
show diameter route status endpoint endpoint12
```
show diameter route table

Displays the Diameter routing table.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show diameter route table [ wide ] [ endpoint endpoint_name ] [ | { grep grep_options | more } ]

**wide**
Displays the route table information in wide-format.

**endpoint endpoint_name**
Displays the Diameter routing table for the Diameter endpoint specified as an alphanumeric string of 1 through 63 characters.

| { grep grep_options | more } |
Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of *grep* and *more*, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to view the status of Diameter client endpoints.
If you are in the local context, then the route information used by Diameter endpoints in all chassis contexts will be used in the display.
The route table displays all static and dynamic routes. Refer to the route-entry CLI command in Diameter Endpoint Configuration Mode.
Default value: N/A

Example
The following command displays status of the Diameter client endpoint named `endpoint12`.

```
show diameter route table endpoint endpoint12
```
show diameter statistics

Displays Diameter peer statistics.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
show diameter statistics [ [ proxy ] endpoint endpoint_name [ peer-host peer_id [ peer-realm realm_id ] ] [ | { grep grep_options | more } ] ]
```

- **endpoint endpoint_name**
  Displays statistics for the Diameter endpoint specified as an alphanumeric string of 1 through 63 characters.

- **peer-host peer_id**
  Displays statistics for the Diameter host peer specified as an alphanumeric string of 1 through 255 characters.

- **peer-realm realm_id**
  Displays statistics for the Diameter peer realm specified as an alphanumeric string of 1 through 127 characters.

- **proxy**
  Displays proxy related statistics.

- `| { grep grep_options | more }`
  Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.

  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

**Usage**
Use this command to view Diameter statistics for the specified endpoint or proxy.

**Example**
The following command displays Diameter peer statistics for the endpoint named `endpoint12`:

```
show diameter statistics endpoint endpoint12
```
show diameter-service

Displays information about configured Diameter services.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
show diameter-service { all | lte-s6a trace-id { all | user-name user_name } | name service_name | statistics name service_name [ vpn-name vpn_context_name ] } [ | { grep grep_options | more } ]
```

---

**all**
Displays full information for all configured Diameter services.

---

**lte-s6a trace-id { all | user-name user_name }**
Displays user trace ID information for an LTE/S6a application.

- `all`: Displays full information.
- `user-name user_name`: Displays information for the user specified an alphanumeric string of 1 through 79 characters.

---

**name service_name**
Displays information for the Diameter service name specified as an alphanumeric string of 1 through 79 characters.

---

**statistics name service_name [ vpn-name vpn_context_name ]**
Displays statistics for the Diameter service name specified as an alphanumeric string of 1 through 79 characters.

- `vpn-name vpn_context_name`: Specifies the name of VPN context as an alphanumeric string of 1 through 79 characters.

---

| { grep grep_options | more } |
Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.
Usage

Use this command to view information on configured Diameter services.

Example

The following command displays statistics for the Diameter service named ggsn12:

```
show diameter-service name ggsn2
```
show dns-client

Displays cache and/or statistics for a specified Domain Name System (DNS) client.

**Product**
ePDG
P-CSCF, SIP Proxy
SGSN
HSGW
MME
P-GW
SAEGW

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec
The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show dns-client { cache client name [ query-name name | query-type { A | AAAA | NAPTR | SRV } ] | statistics client name } [ | { grep grep_options | more } ]
```

cache client name [ query-name name | query-type { A | AAAA | NAPTR | SRV } ] displays statistics for the cache of an existing DNS client specified as an alphanumeric string of 1 through 255 characters.

query-name name: Filters DNS results based on the domain name specified as an alphanumeric string of 1 through 255 characters. name is the domain name used to perform the DNS query. It is different from the actual domain name which is resolved. For example, to resolve the SIP server for service.com, the query name is _sip._udp.service.com and the query type is SRV.

query-type:
- A: Filters DNS results based on 32-bit domain IPv4 address records (A records).
- AAAA: Filters DNS results based on 128-bit domain IPv6 address records (AAAA resource records).
- NAPTR: Filters DNS results based on Naming Authority Pointer records.
- SRV: Filters DNS results based on service locator records (SRV records).

statistics client name
Displays statistics for an existing DNS client specified as an alphanumeric string of 1 through 255 characters.

| { grep grep_options | more } |
Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
show dns-client

For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**

Use this command to display DNS cache and/or statistics for a specified DNS client.

**Example**

The following command displays statistics for a DNS client named `domain1.com`:

```
show dns-client statistics client domain1.com
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show dynamic-policy statistics

Displays policy control and charging (PCC) statistics from the interface communicating with the Policy and Charging Rules Function (PCRF) via Gx(x).

**Product**
- HSGW
- PDSN
- SAEGW
- S-GW

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```show dynamic-policy statistics { hsgw-service name | pdsn-service name | sgw-service name }
```

- **hsgw-service name**
  Displays policy control and charging statistics from the Gxa interface communicating with the PCRF. `name` must be an existing HSGW service name and be from 1 to 63 alphanumeric characters.

- **pdsn-service name**
  Displays policy control and charging statistics from the Gx interface communicating with the PCRF. `name` must be an existing PDSN service name and be from 1 to 63 alphanumeric characters.

- **sgw-service name**
  Displays policy control and charging statistics from the Gxc interface communicating with the PCRF. `name` must be an existing S-GW service name and be from 1 to 63 alphanumeric characters.

**Usage**
Use this command to display PCC statistics for the specified service and its Gx interface communicating with the PCRF.

**Example**

The following command displays HSGW statistics for an HSGW service named `hsgw4`:

```
show dynamic-policy statistics hsgw-service hsgw4
```

The following command displays PCC statistics for a PDSN service named `cdma4`:

```
show dynamic-policy statistics pdsn-service cdma4
```
The following command displays S-GW statistics for an S-GW service named sgw4:

```
show dynamic-policy statistics sgw-service sgw4
```
show egtpc peers

Displays information about eGTP-C peers.

Product
- ePDG
- MME
- P-GW
- SAEGW
- S-GW

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show egtpc peers [ address ip_address | egtp-service name ] | interface { epdg-egress | mme | pgw-ingress | sgsn | sgw-egress | sgw-ingress } [ address ip_address ] [ wfl ] } ] [ | { grep grep_options | more } ]
```

**address ip_address**
Displays information about a eGTP-C peer specified by its IP address in IPv4 dotted-decimal notation or IPv6 colon-separated-hexadecimal notation.

**egtp-service name [ address ip_address ]**
Displays information about eGTP-C peers associated with an existing egtp-service name specified as an alphanumeric string of 1 through 63 characters.

**address ip_address:** Additionally, the results can be filtered based on the IP address associated with an existing eGTP-C peer service specified in IPv4 dotted-decimal notation or IPv6 colon-separated-hexadecimal notation.

**interface { epdg-egress | mme | pgw-ingress | sgsn | sgw-egress | sgw-ingress } [ address ip_address ] [ wfl ]**
Displays information about eGTP-C peers associated with the service interface configured on this system.

**epdg-egress:** Displays ePDG's egress EGTP interface.

**mme:** Displays information about eGTP-C MME peers associated with the service interface configured on this system. Additionally, the results can be filtered based on the IP address associated with the MME peer.

**pgw-ingress:** Displays information about eGTP-C P-GW ingress peers associated with the service interface configured on this system. Additionally, the results can be filtered based on the IP address associated with the P-GW ingress peer.

**sgsn:** Displays information about eGTP-C SGSN peers associated with the S4 service interface configured on this system. Additionally, the results can be filtered based on the IP address associated with the SGSN peer.
**show egtpc peers**

**sgw-egress**: Displays information about eGTP-C S-GW egress peers associated with the service interface configured on this system. Additionally, the results can be filtered based on the IP address associated with the S-GW egress peer.

**sgw-ingress**: Displays information about eGTP-C S-GW ingress peers associated with the service interface configured on this system. Additionally, the results can be filtered based on the IP address associated with the S-GW ingress peer.

**address ip_address**: Specifies the IP address of the selected peer in IPv4 dotted-decimal notation or IPv6 colon-separated-hexadecimal notation.

**wf1**: Specifies that the output is to be displayed in wide format number 1.

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.

For details on using the `grep` and `more` commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**

Use this command to display information about eGTP-C peers associated with the service interface configured on this system. The output contains the following information about the peer:
- Status of the peer
- Echo status
- Restart counter status
- Peer restart counter knowledge
- Service ID
- Peer IP address
- Current sessions
- Maximum sessions

---

**Important**: The primary command, `show egtpc peers`, when entered without additional keywords, displays information for all peers associated with the service operating on this system.

**Example**

The following command returns an output for an eGTP-C S-GW egress peers associated with the service interface configured on this system with an IP address of 10.2.3.4:

```
show egtpc peers interface sgw-egress address 10.2.3.4
```

The following command returns an output for an eGTP-C MME peer associated with the service interface configured on this system with an IP address of 10.2.3.4:

```
show egtpc peers interface mme address 10.2.3.4
```
show egtpc sessions

Displays eGTP-C session information.

Product
- ePDG
- MME
- P-GW
- SAEGW
- S-GW

Privilege
Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show egtpc sessions [ egtp-service name | interface { epdg-egress | mme | pgw-ingress | sgsn | sgw-egress | sgw-ingress } ] [ | { grep grep_options | more } ]

egtp-service name
Displays information about eGTP-C sessions associated with an existing egtp-service specified as an alphanumeric string of 1 through 63 characters.

interface { epdg-egress | mme | pgw-ingress | sgsn | sgw-egress | sgw-ingress }
Displays information about eGTP-C sessions associated with the service interface configured on this system.
epdg-egress: Displays information about ePDG egress associated with EGTP interface.
mme: Displays information about eGTP-C sessions associated with the MME interface configured on this system.
pgw-ingress: Displays information about eGTP-C sessions associated with the P-GW ingress interface configured on this system.
sgsn: Displays information about eGTP-C sessions associated with the SGSN eGTP-C S4 interface configured on this system.
sgw-egress: Displays information about eGTP-C sessions associated with the S-GW egress interface configured on this system.
sgw-ingress: Displays information about eGTP-C sessions associated with the S-GW ingress interface configured on this system.

| { grep grep_options | more }
Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For details on using the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.
Usage

Use this command to display session information for a specific eGTP service or for sessions associated with an interface type configured on this system.

Example

The following command displays eGTP-C session information for sessions associated with all P-GW ingress interfaces configured on this system:

```
show egtpc sessions interface pgw-ingress
```

The following command displays eGTP-C session information for sessions associated with all MME interfaces configured on this system:

```
show egtpc sessions interface mme
```
show egtpc statistics

Displays evolved GPRS Tunneling Protocol Control (eGTP-C) plane statistics for a specific service name or interface type.

Product
- ePDG
- MME
- P-GW
- SAEGW
- S-GW

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show egtpc statistics [ demux-only | egtp-service name | epdg-address ip_address | event-statistics | header-decoder-errors | interface { epdg-egress | mme | pgw-ingress | sgsn | sgw-egress | sgw-ingress } | mme-address ip_address | path-failure-reasons | pgw-address ip_address | piggybacking-statistics | sessmgr-only | sgsn-address ip_address | sgw-address ip_address ] [ verbose ] [ | { grep grep_options | more } ]

**demux-only**
Displays entry point statistics at demux manager.

**egtp-service name**
Displays statistics for an existing eGTP service specified as an alphanumeric string of 1 through 63 characters.

**epdg-address ip_address**
Displays eGTP-C statistics for an existing ePDG IP address expressed in IPv6 colon-separated-hexadecimal notation.

**event-statistics**
Displays total eGTP-C events sent/received.

**header-decoder-errors**
Displays header decoding errors of incoming packets at eGTP-C stack/demux manager.
interface { epdg-egress | mme | pgw-ingress | sgw-egress | sgw-ingress }

epdg-egress: Displays eGTP-C statistics for all ePDG egress interfaces.
mme: Displays eGTP-C statistics for all MME interfaces.
pgw-ingress: Displays eGTP-C statistics for all eGTP P-GW ingress interfaces.
sgsn: Displays eGTP-C statistics for all eGTP S4 SGSN interfaces.
sgw-egress: Displays eGTP-C statistics for all eGTP S-GW egress interfaces.
sgw-ingress: Displays eGTP-C statistics for all eGTP S-GW ingress interfaces.

mme-address ip_address
Displays eGTP-C statistics for an existing MME IP address expressed in IPv4 dotted-decimal notation or IPv6 colon-separated-hexadecimal notation.

path-failure-reasons
Displays breakup of reasons for path failure.

pgw-address ip_address
Displays eGTP-C statistics for an existing P-GW IP address expressed in IPv4 dotted-decimal notation or IPv6 colon-separated-hexadecimal notation.

piggybacking-statistics
Displays total piggybacked messages sent/received at eGTP-C stack.

sessmgr-only
Displays entry point statistics at sessmgr.

sgsn-address ip_address
Displays eGTP-C statistics for an existing SGSN S4 IP address expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

sgw-address ip_address
Displays eGTP-C statistics for an existing S-GW IP address expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

verbose
Displays the maximum amount of detail available for this commands output. If this option is not specified, the output is truncated to a more concise level.

| { grep grep_options | more }
Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For details on using the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.
Usage

Use this command to display evolved GPRS Tunneling Protocol Control (eGTP-C) plane statistics for a specific service name or interface type.

Example

The following command displays eGTP-C statistics for interfaces configured as S-GW ingress interfaces:

```
show egtpc statistics interface sgw-ingess
```

The following command displays eGTP-C session information for sessions associated with all MME interfaces configured on this system:

```
show egtpc sessions interface mme
```
show egtp-service

Displays configuration information for evolved GPRS Tunneling Protocol (eGTP) services on this system.

Product
- ePDG
- MME
- P-GW
- SAEGW
- S-GW

Privilege

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show egtp-service { all | name service_name } [ | { grep grep_options | more } ]
```

- **all**
  Displays configuration information for all eGTP services configured on this system.

- **name service_name**
  Displays configuration information for an existing eGTP service specified as an alphanumeric string of 1 through 63 characters.

  | { grep grep_options | more } |
  Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command’s Output section of the Command Line Interface Reference Guide.

Usage

Use this command to view configuration information for eGTP services on this system.

Example

The following command displays service statistics for the eGTP service named *egtp1*:

```
show egtp-service name egtp1
```
show epdg-service

Displays information about selected EPDG calls/services.

**Product**
ePDG

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show epdg-service { all [ counters [ | { grep grep_options | more } ] ] | name epdg_service_name [ counters [ | { grep grep_options | more } ] ] | session { all | callid call_id [ counters ] | { full | ip-address { < ip_address | > ip_address | IP-ADDRESS | greater-than ip_address | less-than ip_address } | peer-address peer_address [ | summary ] | username user_name [ | { grep grep_options | more } ] | statistics [ dns-stats ] [ name service_name ] [ peer-address peer_address ] [ | { grep grep_options | more } ] ]]

---

**all**
Displays information for all configured services.

**counters**
Displays counters associated with EPDG service.

**name epdg_service_name**
Displays specific service. This must be followed by service name `epdg_service_name`, which is a string of size between 1 and 63.

**session**
Displays information about configured EPDG sessions.

**callid call_id**
Specific Call Identification Number. This must be followed by `call_id`, an eight digit HEX number.

**full**
Displays all available information for associated display or filter keyword (previous keyword).

**ip-address**
Displays IP address of the subscriber. Must be followed by IPv4 address, in dotted decimal notation.
show epdg-service

```
< ip_address | less-than ip_address
Specifies Less Than. Must be followed by IPv4 / IPV6address, in dotted / (:) / (::) decimal notation.

> ip_address | greater-than ip_address
Specifies Greater Than. Must be followed by an IP address of IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

peer-address peer_address
Address of specific IP Peer. This must be followed by IPv4 address in dotted decimal notation or IPv6 address in colon-separated-hexadecimal notation.

summary
Displays the summary of available information for associated display or filter keyword (previous keyword).

username user_name
Displays the name of specific user within current context. This must be followed by user_name, which is a string between 1 and 127.

statistics
Displays the total of collected information for specific protocol since last restart or clear command.

dns-stats
Displays information related to DNS PGW selection.

name service_name
Displays specific service. Must be followed by service_name, which is a string of size between 1 and 63.
```

| { grep grep_options | more }
Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For details on using the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to display information about selected EPDG calls/services.

Example
The following command displays ePDG counter information:

```
show epdg-service all counters | grep 21
```
show event-notif server

Displays the counter information of configured Event Notification servers based on specific criteria.

**Product**
All

**Privilege**
Inspector

**Mode**
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
show event-notif server all [ | { grep grep_options | more }]
```

- **all**
  Displays counter information for each active Event Notification server in this context.

- **| { grep grep_options | more }**
  Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
  For details on using the `grep` and `more` commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to display the counters pertaining to the Event Notification collection servers configured in a context.

**Example**

The following command displays the counter information for all Event Notification collection servers configured in a context:

```
show event-notif server all
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show event-notif statistics

Displays the statistical information collected over configured Event Notification interface based on specific criteria.

**Product**
All

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
show event-notif statistics [ | {grep grep_options | more }]
```

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.

For details on using the `grep` and `more` commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to display the statistical information collected over configured Event Notification interface based on specific criteria.

**Example**

The following command displays the counter information for all Event Notification collection servers configured in a context:

```
show event-notif statistics
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show external-inline-servers

This command is obsolete.
show fa-service

Displays information on configured foreign agent (FA) services.

Product
PDSN
GGSN
ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax
show fa-service { all | name fa_name } [ | { grep grep_options | more } ]

<table>
<thead>
<tr>
<th>all</th>
<th>name fa_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>all: indicates information on all foreign agent services is to be displayed.</td>
<td></td>
</tr>
<tr>
<td>name fa_name: indicates only the information for the named FA service is to be displayed.</td>
<td></td>
</tr>
</tbody>
</table>

| | { grep grep_options | more } |
|---|------------------|
| Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent. |
| For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference. |

Usage
Display foreign agent service configuration information.

Example
The following commands display information on the FA service sampleService and all services, respectively.

show fa-service name sampleService

show fa-service all

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show fa-spi-list

Displays Security Parameter Indices (FA-SPIs) for configured foreign agent (FA) services.

Product
PDSN
GGSN
ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show fa-spi-list \{ all | name fa_name \} [ | \{ grep grep_options | more \} ]

**all** | **name fa_name**

*all*: indicates information on all foreign agent services is to be displayed.
*name fa_name*: indicates only the information for the named FA service is to be displayed.

| \{ grep grep_options | more \}

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of *grep* and *more*, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage
Display foreign agent SPI information.

Example
The following command displays SPI information for the FA service *sampleService*.

```
show fa-spi-list name sampleService
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show fans

Displays the current control status, speed, and temperature for the upper and lower fans in the system chassis.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show fans [ verbose ] [ | { grep grep_options | more } ]

verbose

$ASR 5500 only$: Displays additional information regarding the state of the fan trays.

| { grep grep_options | more }

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

View the fan information to verify system hardware status as necessary.

Example

The following command displays information regarding the cooling fans in the system:

show fans

$Important$: Output descriptions for commands are available in the Statistics and Counters Reference.
show file

Displays the contents of the file specified. The contents are paginated as if it were normal ASCII output.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show file url url [ | { grep grep_options | more } ]
```

- **url**
  Specifies the location of a file to display. `url` may refer to a local or a remote file. `url` must be entered using the following format:
  For the ASR 5000:

  ```
  [ file: ]{ /flash | /pcmcia | /hd }[ /directory ]/file_name
  tftp://[ host[ :port# ] ][ /directory ]/file_name
  ```

  For the ASR 5500:

  ```
  [ file: ]{ /flash | /usb1 | /hd }[ /directory ]/file_name
  tftp://[ host[ :port# ] ][ /directory ]/file_name
  ```

**Important:** Use of the SMC hard drive is not supported in this release.

**Important:** Do not use the following characters when entering a string for the field names below: “/” (forward slash), “:” (colon) or “@” (at sign).

- `directory` is the directory name.
- `filename` is the actual file of interest.
- `username` is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.

| { grep grep_options | more }

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Display the contents of files to view such information as log data, trace information, etc.

Example
The following will display the contents of the local file /pub/log.txt.

    show file //pcmcia1/pub/log.txt

The following command will display the contents of the file /pub/log.txt on remote host remoteABC.

    show file ftp://remoteABC/pub/log.txt
show firewall flows

This command is obsolete.
show firewall ruledef

This command is obsolete.
show firewall statistics

This command is obsolete.
show fng-service

Displays information about specified Femto Network Gateway (FNG) service configuration, status, and counters, and includes information about all the sessions currently maintained by the FNG.

Product
FNG

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show fng-service { all [ counters ] | name service_name | session | statistics }

| { grep grep_options | more }

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of grep and more, refer to the section Regulating a Command’s Output in the chapter Command Line Interface Overview in the Command Line Interface Reference.
Usage
Use this command to view information for selected configured FNG services.

Example
The following command displays available information for all active FNG services.

```
show fng-service all
```

**Important:** Command output descriptions are available in the *Statistics and Counters Reference.*
show fng-service session

Displays statistics for specific Femto Network Gateway (FNG) sessions.

**Product**
FNG

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```bash
show fng-service session [ all | callid call_id | counters | full [ all | callid call_id | ip-address ip-address | peer-address ip-address | username name ] | ip-address ip-address | peer-address ip-address | summary [ all | callid call_id | ip-address ip-address | peer-address ip-address | username name ] | username name ]
```

- **all**
  Displays all related information for all active FNG sessions.

- **callid**
  Displays PPP information for the call ID specified as a 4-digit hexadecimal number.

- **counters**
  Displays counters for the configured FNG sessions.

- **full**
  Displays all available information for the associated display or filter keyword.

- **ip-address ipv4_address**
  Displays information for the subscriber IP address specified in IPv4 dotted-decimal notation.

- **peer-address ipv4_address**
  Displays information for the IP peer specified by its IP address in IPv4 dotted-decimal notation.

- **summary**
  Displays summary information for FNG sessions.

- **username user_name**
  Displays information for a username within the current context specified as an alphanumeric string of 1 through 127 characters.
| { grep grep_options | more }

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent. For details on the usage of `grep` and `more`, refer to the section *Regulating a Command’s Output* in the *Command Line Interface Overview* chapter.

Usage

Use this command to view configuration information for an FNG session.

Example

The following command displays all available FNG sessions.

```
show fng-service session all
```

**Important:** Command output descriptions are available in the *Statistics and Counters Reference*. 
show fng-service statistics

Displays statistics for the FNG since the last restart or clear command. The output includes the number of each type of protocol message. For example, the output includes the various types of EAP messages.

Product
FNG

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show fng-service statistics [ name service_name | peer-address ipv4_address ]

name service_name
Displays statistics for an existing service name specified as an alphanumeric string of 1 through 63 characters.

peer-address ipv4_address
Displays statistics for an IP peer specified by its IP address in IPv4 dotted-decimal notation.

| { grep grep_options | more }

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the section Regulating a Command’s Output in the Command Line Interface Overview chapter.

Usage
Use this command to display FNG statistics.

Important: You may use more than one keyword per command line.

Example

The following command displays information about the FNG service.

    show fng-service statistics

Important: Command output descriptions are available in the Statistics and Counters Reference.
show freeze-ptmsi imsi

Displays the P-TMSI (packet-temporary mobile subscriber identify) corresponding to the IMSI (international mobile subscriber identity) that has entered a frozen state after the purge timeout timer expires.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show freeze-ptmsi imsi imsi_num
```

- `imsi imsi_num`
  Specifies the IMSI that has been frozen as a sequence of up to 15 digits. The first three digits are the MCC (mobile country code). The next two or three digits are the MNC (mobile network code). The remaining digits are the MSIN (mobile station identification number).

**Usage**

This command enables the operator to know whether a frozen IMSI has an associated P-TMSI.

**Example**

The following command displays the P-TMSI corresponding to a frozen IMSI:

```
show freeze-ptmsi imsi 262090426000194
```
show ggsn sessmgr

Displays session manager (SessMGR) statistics specific to the gGSN service.

Product
GGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ggsn sessmgr { all | instance smgr_inst }

all
Displays all SessMGR statistics specific to the system’s GGSN services.

instance smgr_inst
Displays the statistics for a session manager instance of the GGSN service specified as an integer between 1 and 10000000.

Usage
Use this command to display information for GGSN services.

Example
The following command displays GGSN SessMGR statistics for all GGSN services on the system:

    show ggsn sessmgr all
show ggsn-service

Displays configuration information for Gateway GPRS Support Node (GGSN) services on the system.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
show ggsn-service { all | name ggsn_svc_name } [ | { grep grep_options | more }]
```

- **all**
  Displays information for all GGSN services configured with the given context.

- **name ggsn_svc_name**
  Displays information for an existing GGSN service name specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

  | { grep grep_options | more }

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.

For more information on the usage of `grep` and more, refer to the Regulating a Command’s Output section of the Command Line Interface Reference.

**Usage**

This command is used to verify the configuration of one or all GGSN services for monitoring or troubleshooting purposes. The output is a concise listing of GGSN service parameter settings.

If this command is executed from within the local context with the all keyword, information for all GGSN services configured on the system will be displayed.

**Example**

The following command displays configuration information for a GGSN service called *ggsn1*:

```
show ggsn-service name ggsn1
```
show ggsn-service sgsn-table

Lists all Serving GPRS Support Nodes (SGSNs) by IP addresses and shows the current number of subscribers to each SGSN.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
show ggsn-service sgsn-table
```

**Usage**
While there are existing commands to show SGSN subscriber information, this command is the only way to list all SGSNs by IP address and show the current number of subscribers to each SGSN.

**Example**

The following command will bring up a table showing the current active/inactive status, IP address, reboots/restarts and SGSN users.

```
show ggsn-service sgsn-table
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show global-title-translation

Displays configuration information for Global Title Translation (GTT).

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show global-title-translation { address-map { all | instance instance } | association { all | instance instance } }

address-map { all | instance }
Displays configuration information for either the entire GTT address map database or for a specific instance of an address map. instance is an integer from 1 to 4096 which uniquely identifies the address map configuration.

association { all | instance }
Displays configuration information for either the entire database of GTT association lists for a specific instance of GTT association configuration. instance is an integer from 1 to 16 which uniquely identifies the GTT association configuration.

Usage

This command displays the configuration for the GTT address maps and associations.

Example

The following command displays the address map 2047.

show global-title-translation address-map 2047
show gmb statistics

Displays the collected statistics for the Gmb reference point. Gmb handles broadcast multicast service center (BM-SC) related signaling, which includes the user specific and bearer service messages for Multimedia Broadcast/Multicast Service (MBMS) service.

Product
GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show gmb statistics [ apn name | bmsc-profile profile_name ] [ | { grep grep_options | more }]

apn name
Displays only the Gmb information for the specified Access Point Name (APN) specified as an alphanumeric string of 1 through 62 characters.

bmsc-profile profile_name
Displays only the Gmb information for the specified BM-SC profile specified as an alphanumeric string of 1 through 79 characters.

| { grep grep_options | more }

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For more information on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Reference.

Usage
Use this command to display usage statistics for the Gmb reference point.

Example

The following command displays all Gmb statistics:

    show gmb statistics
show gmm-sm statistics

Displays statistics for the GPRS Mobility Management and Session Management (GMM/SM) configuration of the system’s SGSN service. GMM/SM supports mobility to allow the SGSN to know the location of a Mobile Station (MS) at any time and to activate, modify and deactivate the PDP sessions required by the MS for user data transfer.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show gmm-sm statistics [ gmm-only | gprs-service srvc_name | iups-service srvc_name | plmn-id mcc mcc mnc mnc [ access-type { gprs | umts } ] | recovered-values | sgsn-service srvc_name | sm-only ] [ verbose ] [ | { grep grep_options | more } ]
```

Keywords are presented below. Primary keywords are listed in the order of selection as shown in the syntax. Secondary or filtering keywords are presented alphabetically after the description of the primary keywords.

---

**gmm-only**

Displays only GPRS mobility management (GMM) information for other specified keyword parameters for the current context.

**gprs-service srvc_name**

Displays the statistics for an existing 2.5G GPRS service name specified as an alphanumeric string of 1 through 63 characters.

The display request can be narrowed by adding either the `nsei` or `routing-area` filter keywords.

**iups-service srvc_name**

Displays the statistics for an existing IuPS service specified as an alphanumeric string of 1 through 63 characters.

The display request can be narrowed by adding either the `rnc` or `routing-area` filter keywords.

**plmn-id mcc mcc mnc mnc [ access-type { gprs | umts } ]**

Filters the statistics display per PLMN.

Enter the `access-type` keyword to fine-tune the display of the GMM/SM statistics to an aggregate of the IuPS (select access-type UMTS) and/or the GPRS (select access-type GPRS) services belonging to the PLMN.
**show gmm-sm statistics**

**recovered-values**
Only displays recovered values for key KPI counters that were backed-up.

**sgsn-service srvc_name**
Displays the statistics for an existing 3G SGSN service specified as an alphanumeric string of 1 through 63 characters.
The display request can be narrowed by adding either the rnc or routing-area filter keywords.

**sm-only**
Displays only session management (SM) information for other specified keyword parameters for the current context.

**access-type type**
Filters the display of service statistics by 2.5G GPRS services or 3G IuPS services for UMTS:

- gprs
- umts

If this keyword is not included, then statistics for both access types are displayed.

**lac lac_id**
Specifies the location area code (LAC) as part of the identification of the RNC or RA as an integer from 1 through 65535.

**mcc mcc_id**
Specifies the mobile country code (MCC) as part of the identification of the RNC or RA an integer from 100 through 999.

**mnc mnc_id**
Specifies the mobile network code (MNC) as part of the identification of the RNC or RA as a 2- or 3-digit integer from 00 through 999.

**nsei nse_id**
Displays the GMM/SM session statistics for an existing network service entity (NSEI) specified as an integer from 0 to 65535.

**rac rac_id**
Specifies the routing area code (RAC) as part of the identification of the RNC or RA as an integer from 1 through 255.

**rnc rnc_id**
Enter this keyword to fine-tune the display of the GMM/SM session statistics just for the radio network controller (RNC) specified as an integer from 0 through 4095.

**routing-area mcc mcc_id mnc mnc_id lac lac_id rac rac_id**
Enter the routing-area keyword to fine-tune the display of the GMM/SM statistics for a specified routing area (RA) identified by the MCC, MNC, LAC and RAC.
**Verbose**

Displays all possible statistics for specified command or keyword.

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.

For more information on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to display usage statistics for the GMM/SM session configurations for SGSN services, including a BSC attaches, activations, and throughput.

**Example**

The following command displays GMM/SM statistics for a specific routing area defined for the 2.5G SGSN’s GPRS service:

```
show gmm-sm statistics gprs-service gprs1 routing-area mcc 123 mcc 131
lac 24 rac 11
```

The following command displays all possible information for GMM/SM statistics:

```
show gmm-sm statistics verbose
```

---

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 

show gprsns statistics

Displays the statistics for the 2.5G SGSN’s GPRS NS layer (link level).

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show gprsns statistics { msg-stats { consolidated nse nse_id | nse nse_id } | sns-msg-stats } | { grep grep_options | more }

msg-stats
Displays the transmit (Tx) and receive (Rx) message statistics (except for SNS messages) in the statistics output.

consolidated nse nse_id
nse_id: Enter an integer from 0 to 65535.

nse nse_id
Display statistics for a NSE specified as an integer from 0 to 65535.

sns-msg-stats
Display subnetwork service (SNS) sublayer message statistics.

| { grep grep_options | more }

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

This command is used to display Frame Relay statistics configured for the NSE/NSVC with the commands documented in the Network Service Entity - Peer NSEI Configuration Mode Commands chapter.
Collected statistics are cleared (deleted) with the clear gprsns statistics described in the Exec Mode Commands (A-C) chapter.

Example

Use the following command to display the collected message statistics for NSEI 1422:
show gprsns statistics msg-stats nse 1422

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show gprsns status

Displays the status of the network service virtual circuits (NSVC) for the GPRS NS layer (link level).

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

```
show gprsns status { nsvc-status-all nse nse_id | nsvc-status-consolidated nse nse_id |
                        nsvc-status-per-bvci bvci bvc_id nse nse_id } | { grep grep_options | more }
```

```
nsvc-status-all nse { all | nsense_id }
```
Displays status information for all NSVCs included in the NSE specified as an integer from 0 to 65535.

```
nsvc-status-consolidated nse nse_id
```

```
nsvc-status-per-bvci bvci bvc_id nse nse_id
```

`bvc_id` is an integer from 0 to 65535.
`nse_id` is an integer from 0 to 65535.

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

This command is used to display the status of the NSVC.

Example

Use the following command to display status of all NSVC for NSE 1422:

```
show gprsns status nsvc-status-all nse 1422
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show gprs-service

Displays the statistics for GPRS services.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show gprs-service { all | name gprs_srvc_name } [ nsei { all | id nse_id } | { grep grep_options | more } ]

all
Instructs the SGSN to display information for all GPRS services configured with this context.

name gprs_srvc_name
Instructs the SGSN to display information for the specified GPRS service.
gprs_srvc_name is a case-sensitive string of 1 to 63 characters, any combination of letters, digits, dots (.) and dashes (-) that identifies a specific GPRS service.

nsei { all | id }nse_id
Instructs the SGSN to display network service entity information for either a specific NSEI or for all NSEI configured for the specified GPRS service(s).
nse_id is an integer from 0 to 65535.

| { grep grep_options | more } |
Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For more information on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Reference.

Usage
This command is used to verify the configuration of one or all GPRS services for monitoring or troubleshooting purposes. The output is a concise listing of GPRS service parameter settings.
If this command is executed from within the local context with the all keyword, information for all GPRS services configured on the system will be displayed.

Example
The following command displays configuration information for all GPRS services configured in this context:

    show gprs-service all
Use a command similar to the following to display statistics for NSEI 4257 for the GPRS service named London2:

```
show gprs-service name London2 nsei id 4257
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show gprsssf

Displays statistics for various 3GPP Customised Applications for Mobile network Enhanced Logic (CAMEL) service GPRS Service Switching Function (gprsSSF) entities.

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show gprsssf { counters | statistics } [ camel-service srvc_name | gprs [ 2g-sgsn-app | 3g-sgsn-app ] | gsmscf-address { address | all } | sms ] [ | { grep | more } ]

counters
Displays collected status counter information for CAMEL service entities.

statistics
Displays collected statistics for CAMEL service entities.

camel-service srvc_name
Filters the display of counters and statistics for an existing CAMEL service name in the SGSN configuration specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

gprs [ 2g-sgsn-app | 3g-sgsn-app ]
Filters the counter/statistic output to display GPRS protocol information specific to either the 2.5G or 3G SGSN.

gsmscf-address { address | all }
The GSM service control function (gsmSCF) address is the ISDN address of the SCP where the CAMEL service resides. It is possible to display information for one or all of the configured CAMEL services. address is a standard ISDN E.164 address of 1 to 15 digits.

sms
Filters the display of counters and statistics for SMS protocol information.

| { grep grep_options | more }
Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

### Usage

Use this command to display CAMEL service status counter information and statistics collected since the last restart or clear command. If filters are not included with the command, then all statistics or counters are displayed for all CAMEL services in all contexts in which CAMEL services have been defined.

Collected statistics are cleared (deleted) with the `clear gprssf statistics` command described in the chapter *Exec Mode Commands (A-C)*.

### Example

Use the following command to display the status counter totals of the GPRS Dialogue parameters for a 3G SGSN:

```
show gprssf counter gprs 3g-sgsn-app
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show gs-service

Displays configuration information and statistics for Gs services configured on system.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show gs-service { all | name svc_name } [ | { grep grep_options | more } ]

| all
| Displays information for all Gs services configured with in the given context.

| name svc_name
| Displays information for an existing Gs service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

| { grep grep_options | more }
| Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For more information on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Reference.

Usage

This command is used to verify the configuration of one or all Gs services for monitoring or troubleshooting purposes.
If this command is executed from within the local context with the all keyword, information for all Gs services configured on the system will be displayed.

Example

The following command displays configuration information for all Gs services configured on a system:

    show gs-service all

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show gtpc

Displays GPRS Tunnelling Protocol-Control (GTPC) information for GTPv0, GTPv1-C, GTPv1-U with filtering options.

Product
GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show gtpc [ full | counters | summary ] { all | apn apn_name | imsi imsi_value [ nsapi nsapi_value ] | callid callid | sgsn-address ip_address | ggsn-service ggsn_name | user-address ip_address | username username }

[ full | counters | summary ]

Specifies the level of information to be displayed. The following levels can be used:

• full: Indicates detailed information is to be displayed.
• counters: Indicates the output is to include the statistical counters.
• summary: Indicates only summary information is to be displayed.

{ all | apn apn_name | imsi imsi_value [ nsapi nsapi_value ] | callid callid | sgsn-address ip_address | ggsn-service ggsn_name | user-address ip_address | username username }

Specifies the filter criteria used when displaying GTP information. The following filters can be used:

• all: Specifies that all available information is to be displayed.
• apn apn_name: Specifies that GTP information for an APN specified as an alphanumeric string of 1 through 63 characters that is case sensitive.
• imsi imsi_value [ nsapi nsapi_value ]: Displays GTP information for an International Mobile Subscriber Identity (IMSI) specified as an integer from 1 through 15 characters. Optionally, the IMSI could be further filtered by specifying a particular PDP context using the Network Service Access Point Identifier (NSAPI) expressed as an integer from 5 through 15.
• callid callid: Displays GTP information for a call identification number specified as a 4-digit hexadecimal number.

Important: In release 18.2 and later, this command option has been deprecated.

Important: In release 18.2 and later, this command option has been deprecated.
**sgsn-address ip_address**: Displays GTP information for an SGSN specified by its IP address in IPv4 dotted-decimal notation.

**ggsn-service ggsn_name**: Displays GTP information for an existing GGSN service specified an alphanumeric string of 1 through 63 characters that is case sensitive.

**user-address ip_address**: Displays GTP information for a user PDP context specified as an IP address in IPv4 dotted-decimal notation.

**Important**: In release 18.2 and later, this command option has been deprecated.

**username username**: Displays GTP information for a username specified as an alphanumeric string of 1 through 127 characters (including wildcards ‘$’ and ‘*’) that is case sensitive.

**Important**: In release 18.2 and later, this command option has been deprecated.

## Usage
This command displays statistics for every GTP message type based on the filter criteria. This information is useful for system monitoring or troubleshooting.

## Example
The following command displays GTPC counters for a GGSN service named *ggsn1*:

```
show gtpc counters ggsn-service ggsn1
```

The following command displays GTPC full information:

```
show gtpc full
```

The following command displays GTPC summary information for a specific call identification number of *05f62f34*:

```
show gtpc summary callid 05f62f34
```

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*.
show gtpc statistics

Displays GTPv0, GTPv1-C, GTPv1-U statistics with filtering options.

Product
GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show gtpc statistics [ [ custom1 | custom2 ] [ apn apn_name | ggsn-service ggsn_service_name | mseg-service mseg_service_name | sgsn-address ipv4_address ] [ [ verbose ] format1 | [ | [ grep grep_options | more ] ]
```

**custom1**
Displays statistics of GTP-C messages for preservation mode and free of charge service. This keyword is customer specific and license enabled. For more information, contact your Cisco sales representative.

**custom2**
Displays statistics for GTP-C messages related to overcharging protection on loss of radio coverage for a GGSN service. This keyword is feature specific and license enabled. For more information, contact your Cisco sales representative.

**apn apn_name**
Displays GTP-C statistics for an existing APN specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

**ggsn-service ggsn_service_name**
Displays GTP-C statistics for an existing GGSN service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

**mseg-service mseg_service_name**

**Important:** This keyword is not supported in this release.

**sgsn-address ipv4_address**
Displays GTP statistics for an SGSN specified by its IP address in IPv4 dotted-decimal notation.
show gtpc statistics

**verbose**
Displays detailed instead of concise statistics.

**format1**
Displays more detailed statistical breakouts.

```
| { grep grep_options | more }
```
Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**
The information displayed by this command consists of session statistics such as the number of currently active sessions categorized by PDP context type, and statistics for every GTP message type. The statistics are cumulative.
If the verbose keyword is used, additional information will be displayed such as statistics for every type of error code.

**Example**
The following command displays verbose GTP statistics:

```
show gtpc statistics verbose
```

**Important**: Output descriptions for commands are available in the Statistics and Counters Reference.
show gtpp

Displays information on the GPRS Tunneling Protocol Prime (GTPP) for the selected charging gateway function (CGF) or GCDR storage server.

**Product**
- GGSN
- P-GW
- SAEGW
- SGSN

**Privilege**
- Security Administrator, Administrator, Operator, Inspector

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show gtpp { accounting | counters { all | cgf-address | group } | group { all | name } | statistics { cgf-address | group } | storage server { counters | group | local | statistics | status | streaming } } [ | { grep grep_options | more } ]
```

**Usage**

This command displays the GTPP related information for the selected CGF or the G-CDRs storage server. If this command is issued from within the local context, information for all GTPP accounting servers configured on the system is displayed regardless of context.

**Example**

The following command displays the GTPP counters for all the servers:

```
show gtpp counters all
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show gtpp accounting

Displays information on the GPRS Tunneling Protocol Prime (GTPP) accounting server configuration.

**Product**
- GGSN
- P-GW
- SAEGW
- SGSN

**Privilege**
- Security Administrator, Administrator, Operator, Inspector

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name# 
```

**Syntax**

```
show gtpp accounting servers { group name group_name } [ | { grep grep_options | more } ]
```

**Usage**

This command is used to view the status of GTPP accounting servers configured within a context for monitoring or troubleshooting purposes.

If this command is issued from within the local context, information for all GTPP accounting servers configured on the system is displayed regardless of context.

**Example**

The following command displays the status of and information on configured GTPP accounting servers:

```
show gtpp accounting servers
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show gtppp counters

Displays GTPP counters for configured charging gateway functions (CGFs) within the given context.

**Product**

GGSN

P-GW

SAEGW

SGSN

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
show gtppp counters { all { gcdrs } | cgf-address cgf_address | group name group_name } [ | { grep grep_options | more } ]
```

- `all`
  
  Displays counters for all CGFs configured within the context.

- `cgf-address cgf_address`
  
  Displays counters for a CGF specified by its IP address in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**Usage**

Counters for a single CGF can be viewed using the `cgf-address` keyword. Counters for all CGFs in the context can be viewed by entering the command with the `all` keyword. If this command is issued from within the local context and no CGF-address is specified, the counters displayed will be cumulative for all CGFs configured on the system regardless of context.

**Example**

The following command displays counters for all CGF:

```
show gtppp counters all
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show gtpp group

Displays information pertaining to the configured GTTP storage server group.

**Product**
- GGSN
- P-GW
- SAEGW
- SGSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec
The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show gtpp group { name gtpp_group_name | all } [ | { grep grep_options | more } ]
```

- **name gtpp_group_name**
  Displays information and CDR statistics for an existing GTTP server group name specified as an alphanumeric string of 1 through 64 characters.

- **all**
  Displays statistics for all configured GTTP storage server groups, including default group.

  ```
  | { grep grep_options | more }
  ```

  Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.

  For more information on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to display the CDR statistics on the basis of GTTP server groups. It shows the information for all or specific GTTP server group configured in the context from which this command is issued.

**Example**

The following command displays the status of the GTTP server group backup server configured in a context called **GTTP_Group1**:

```
show gtpp group name GTTP_Group1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show gtpp statistics

Displays GTTP statistics for configured Charging Gateway Functions (CGFs) within the context.

Product
- ePDG
- GGSN
- P-GW
- SAEGW
- SGSN

Privilege
- Security Administrator
- Administrator
- Operator
- Inspector

Mode
- Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show gtpp statistics { cgf-address cgf_address | group name group_name } [ | { grep grep_options | more } ]

cgf-address cgf_address
Displays statistics for a CGF specified by its IP address expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

group name group_name
Displays server statistics information of an existing GTTP server group name specified as an alphanumeric string of 1 through 64 characters.

| { grep grep_options | more }

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For more information on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Statistics for a single CGF can be viewed by specifying its IP address. Statistics for all CGFs in the context can be viewed by not specifying an IP address.
If this command is issued from within the local context, the statistics displayed will be cumulative for all CGFs configured on the system regardless of context.

Example

The following command displays statistics for a CGF with an IP address of 192.168.1.14:

show gtpp statistics cgf-address 192.168.1.14
**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show gtpp storage-server

Displays information pertaining to the configured GTPP storage server (GSS).

**Product**
- GGSN
- P-GW
- SAEGW
- SGSN

**Privilege**
- Security Administrator, Administrator, Operator, Inspector

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#`

**Syntax**

```
show gtpp storage-server [ counters { all | group name group_name } | group name group_name ] local file { counters { all | group name group_name } | statistics [ group name group_name ] } status { group name group_name | verbose } | streaming file { counters { all | group name group_name } | statistics [ group name group_name ] } ] [ ] { grep grep_options | more } ]
```

### counters
Displays counters for the external GTPP storage server.

### group name group_name
Displays GTPP backup server information for the group name specified as an alphanumeric string of 1 through 64 characters.

### local file
Displays statistics and counters for the local storage-server. This is the hard disk if hard disk support has been enabled with the `gtpp storage-server mode` command in the GTPP Group Configuration Mode.

### statistics
Displays statistics for the GTPP storage server.

### status [ verbose ]
Displays status of the GTPP storage server. `verbose` enables the detailed view.

### streaming
Displays the status of Charging Data Record (CDR) backup on HDD while streaming mode is enabled.
show gtpp storage-server

| ( grep grep_options | more )

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage
Executing this command with no keywords displays status information for the GTTP backup server configured in the context from which this command is issued.

Example
The following command displays the GTTP CDR file statistics stored on the local SMC hard disk.

   show gtpp storage-server local file counters all

The following command displays the status of the GTTP backup server configured in a context called ggsn1:

   show gtpp storage-server

The following command displays statistics for the GTTP backup server configured in a context called ggsn1:

   show gtpp storage-server statistics

The following command displays GCDR storage server counters:

   show gtpp storage-server counters

The following command displays GCDR storage server status:

   show gtpp storage-server status

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show gtpu

Displays GPRS Tunneling Protocol user plane (GTP-U) statistics and counters on this system.

**Product**
ePDG
P-GW
SAEGW
SGSN
S-GW

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show gtpu { local-addresses | statistics [ [ gtpu-service gtpu_service_name ] [ gtpumgr-instance gtpumgr_instance | local-address ipv4/ipv6_address | mseg-service mseg_service_name | peer-address ipv4/ipv6_address ] ] [ | { grep grep_options | more } ] }
```

---

**local-addresses**
Displays the number of sessions on all GTPU local addresses in all GTPU services.

**statistics**
Displays all GTP-U statistics on all GTP-U services. Refine the display by including one of the filters listed below.

**gtpu-service gtpu_service_name**
Displays GTP-U statistics for an existing GTP-U service specified as an alphanumeric string of 1 through 63 characters.

**gtpumgr-instance instance_number**
Displays information for an existing GTP-U manager instance specified as an integer from 1 through 4294967295.

**local-address ipv4/ipv6_address**
Displays subscriber statistics and counters in the current active session per local GTPU IP address specified in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation in a GTPU service.
show gtpu

mseg-service mseg_service_name

| Important: This keyword is not supported in this release. |

peer-address ipv4/ipv6_address
Displays GTP-U statistics and counters for an existing peer IP address specified in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

| { grep grep_options | more } |
Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Reference Guide.

Usage
Use this command to view statistics and counters for GTP-U traffic on this system. Refine the statistics display by including a filter with the command.

| Important: The show gtpu statistics command should be given from the local context only; issuing the command from any other context will result in an error message. |

Example
The following command displays statistics for the GTP-U service named gtp1:

    show gtpu statistics gtpu-service gtp1

The following command displays active sessions on all local-addresses categorised by GTPU service:

    show gtpu local-addresses

The following command displays statistics for local GTPU address 168.123.123.1:

    show gtpu statistics local-address 168.123.123.1
show gtpu-service

Displays configuration information for GPRS Tunneling Protocol user plane (GTP-U) services on this system.

Product

- P-GW
- SAEGW
- S-GW

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show gtpu-service { all | name service_name } [ | { grep grep_options | more } ]

all
Displays configuration information for all GTP-U services configured on this system.

name service_name
Displays configuration information for an existing GTP-U service specified an alphanumeric string of 1 through 63 characters.

| { grep grep_options | more }

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Reference Guide.

Usage
Use this command to view configuration information for GTP-U services on this system.

Example
The following command displays service statistics for the GTP-U service named gtpu1:

show gtpu-service name gtpu1
Chapter 133
Exec Mode show Commands (H-L)

This section includes the commands `show ha-service` through `show lte-policy`.
The Exec Mode is the initial entry point into the command line interface system. Exec mode `show` commands are useful in troubleshooting and basic system monitoring.

Mode

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
show ha-service

Displays information on configured Home Agent (HA) services.

Product
HA

Privilege
Security Administrator Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show ha-service { all | name ha_name } [ | { grep grep_options | more } ]

- **all**: Displays information on all Home Agent services.
- **name ha_name**: Displays information for an existing HA service specified as an alphanumeric string of 1 through 63 characters.

| Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Display home agent service configuration information.

Example

The following commands displays information on the HA service *sampleService* and all services, respectively.

```
show ha-service name sampleService
show ha-service all
```
show ha-spi-list

Displays all or a specific Home Agent-Security Parameters Index (HA-SPI) remote address list(s).

Product
HA

Privilege
Security Administrator Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ha-spi-list { all | name ha_name } [ | { grep grep_options | more } ]

- **all** | **name ha_name**
  - **all**: Displays information on all HA-SPI lists.
  - **name ha_name**: Displays information for an existing HA-SPI list specified as an alphanumeric string of 1 through 63 characters.

| { grep grep_options | more } |

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the Command Line Interface Overview chapter.

Usage

Display a single or all HA-SPI lists.

Example

The following commands displays information on the HA-SPI list named **spi012** and all lists, respectively.

```
show ha-spi-list name spi012
show ha-spi-list all
```
show hardware

Displays information on the system hardware.

**Product**

All

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show hardware { card [ card_num ] | inventory | version [ board | diags | fans ] } [ | { grep grep_options | more } ]
```

*card [ card_num ]*

Provides the hardware information for all ASR 5x00 cards or the card specified by `card_num`. `card_num` must be a value in the range 1 through 48 for the ASR 5000 or 1 through 20 for the ASR 5500 and must refer to an installed card.

*inventory*

Displays the ASR 5x00 hardware information for all slots in tabular format.

*version [ board | diags | fans ]*

Displays the CPU information for all ASR 5x00 application cards and fan controller version for the upper and lower fan trays.

  *board*: Only include the CPLD and FPGA version information.
  *diags*: Only include the CFE diagnostics version information.
  *fans*: Show the fan controller versions for the upper and lower fan trays.

```
| { grep grep_options | more }
```

 Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Show the hardware information and hardware component versions.

**Example**

The following displays the hardware information for a card installed in slot 1.

```
show hardware card 1
```
The following command displays the hardware inventory for the entire chassis.

    show hardware inventory

The following command results in the display of the CPU version for all application cards displaying only the CPLD and FPGA information.

    show hardware version board

The following command displays VPC virtual card information:

    show hardware

---

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show hd raid

Shows the output of the Redundant Array of Independent Disks (RAID) established on the SMCs or FSCs.

**Product**

show hd raid [ verbose ]
```

**Example**

```
show hd raid verbose
```

---

*Important:* Output descriptions for commands are available in the *Statistics and Counters Reference.*
show hd-storage-policy

Displays Array Configuration Replicator (ACR) counter and statistic information.

Product
HSGW
P-GW
SAEGW
S-GW

Privilege
Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show hd-storage-policy { all | counters [ all ] [ name name ] [ verbose ] | name name | statistics [ all ] [ name name ] [ verbose ] }

all
Displays ACR information for all HD storage policies configured on the system.

counters [ all ] [ name name ] [ verbose ]
all: Displays ACR counter information for all HD storage policies configured on the system.
name name: Displays ACR counter information for an existing HD storage policy specified as an alphanumeric string of 0 through 63 characters.

statistics [ all ] [ name name ] [ verbose ]
all: Displays ACR statistical information for all HD storage policies configured on the system.
name name: Displays ACR statistical information for an existing HD storage policy specified as an alphanumeric string of 0 through 63 characters.

verbose
Displays HD storage statistics based on instance.

Usage
Use this command to display ACR counter and statistic information.

Example
The following command displays ACR statistic information for an HD storage policy named pgwsgw:

show hd-storage-policy statistics name pgwsgw
show henbgw

This command displays HENBGW service related information.

**Product**
HeNB-GW

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show henbgw { henb-association [ all | full | henbgw-access-service henbgw_acc_svc_name ]

| qci qci_value | sl-peer sl_peer_address | summary [ all | callid call_id | qci qci_value | sl-peer sl_peer_address ] } | ue [ all | summary ] [ | { grep grep_options | more } ]
```

- **henb-association** : Displays information about HENB associations.
  - *all* : Displays information for all HENB associations.
  - *full* : Displays all available information for associated display or filter keyword (previous keyword).
- **henbgw-access-service** : Displays information about HENB associations with the specified henbgw access service.
  - *henbgw_acc_svc_name* is a string of size 1 to 63.
- **peer-address** : Displays information about HENB associations with the specified peer.
  - *peer_ip_address* is an IPv4 address, using dotted-decimal notation or an IPv6 address, using xx:yy::zz format.
- **peer-id** : Displays information about HENB associations for the specified peer.
  - *peer_id_value* is an integer value ranging from 0 to 4294967295.
- **summary** : This is the summary of available information for associated display or filter keyword (previous keyword).

**session**

Displays HENBGW sessions.

- *all*
  - Displays information for all HENB sessions.
call-id \texttt{call\_id} \\
\texttt{call\_id}: This is specific Call Identification Number. This must be followed by \texttt{call\_id}, an eight digit HEX number.

\textbf{full} \\
This command displays information on session state for matching sessions

\textbf{qci} \texttt{qci\_value} \\
\texttt{call\_id}: This is specific qci value. Displays henbgw sessions for QCI value. This must be followed by \texttt{qci\_value}, an integer between 1 and 9.

\textbf{s1-peer} \texttt{s1\_peer\_address} \\
\texttt{s1-peer}: This is specific S1 peer. Must be followed by the IPv4 or IPv6 address of a peer eNodeB. \texttt{s1\_peer\_address} is an IPv4 address, using dotted-decimalnotation or an IPv6 address, using \texttt{xx:yy:zz} format.

\textbf{summary} \\
This command displays summary information covering matching sessions.

\textbf{ue} \\
Displays UE information.

\textbf{Usage} \\
Use this command to display HENBGW service related information.

\textbf{Example} \\
The following command displays information for all HENB associations:

\begin{verbatim}
    show henbgw henb-association all
\end{verbatim}
show henbgw-access-service

This command displays HENBGW ACCESS service related information.

Product
HeNB-GW

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show henbgw-access-service { all | henb-association { all | csg-id csg_id_value| full | henbgw-access-service henbgw_acc_svc_name | peer-address peer_ip_address | peer-id peer_id_value | summary | tai mcc mcc_val mnc mnc_val tac | name name | statistics [ henbgw-access-service henbgw_acc_svc_name | miscellaneous { verbose } | peer-id peer_id_value| slap [ cause | { verbose } ] | sctp [ buffer [ sessmgr sessmgr_value] ] [ verbose ] ] [ | { grep grep_options | more } ]}

henb-association : Displays information about HENB associations.
all : Displays all HENBGW ACCESS services.
csg-id : Displays information about HENB associations for the specified CSG ID.
csg_id_value is an integer value between 0 and 4294967295.
full : Displays all available information for associated display or filter keyword (previous keyword).
henbgw-access-service : Displays information about HENB associations with the specified henbgw access service.
henbgw_acc_svc_name is a string of size 1 to 63.
peer-address : Displays information about HENB associations with the specified peer.
peer_ip_address is an IPv4 address, using dotted-decimal notation or an IPv6 address, using xx:yy::zz format.
peer-id : Displays information about HENB associations for the specified peer.
peer_id_value is an integer value ranging from 0 to 4294967295.
summary : This is the summary of available information for associated display or filter keyword (previous keyword).
tai : Displays information about HENB associations for the specified TAI.
mcc : Specifies Mobile Country Code. MCC is a three digit number between 100 to 999.
mcc_val is MCC value. MCC values of 000-099 are Reserved codes.
mnc : Specifies Mobile National Code. MNC
mnc_val is MCC value. This is two/three digit number between 00 to 999.
tac : Displays information about HENB associations for the specified TAC.
miscellaneous : Displays all available information for associated display or filter keyword (previous keyword).
show henbgw-access-service

```
name name statistics [ henbgw-access-service henbgw_acc_svc_name | miscellaneous [ verbose ] | peer-id peer_id_value slap [ cause | [ verbose ] ] | sctp [ buffer [ sessmgr sessmgr_value
```

**name**: Displays information for specific HENBGW ACCESS service name.

**statistics**: Displays HENBGW ACCESS service statistics

**miscellaneous** : Displays Miscellaneous statistics.

**slap**: Displays S1AP statistics.

**cause**: Displays S1AP cause statistics.

**sctp**: Displays SCTP statistics.

**buffer**: Displays SCTP TX/RX buffer statistics.

**sessmgr**: Displays SCTP TX/RX buffer statistics on a specific sessmgr.

**verbose**: Specifies the verbosity.

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

---

**Usage**

Use this command to display HENBGW ACCESS service related information.

**Example**

The following command displays S1AP statistics:

```
show henbgw-access-service statistics slap
```
show henbgw-network-service

This command displays configuration for HENBGW NETWORK service.

**Product**
HeNB-GW

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```

henbgw_net_svc_name | peer-address peer_ip_address | peer-id peer_id_value | summary }
| name name | statistics { henbgw-network-service henbgw_net_svc_name | peer-id
peer_id_value | slap { cause | [ verbose ] } | sctp { buffer { henbgwmgr henbgwmgr_value}
} [ verbose ] ] [ | { grep grep_options | more } ]
}
```

- **henbgw-association**:
  - **[ all | csg-id csg_id_value | full | henbgw-access-service
  henbgw_acc_svc_name | peer-address peer_ip_address | peer-id peer_id_value | summary ] | name name**:
    - Displays information about MME associations.
    - **all**: Displays all HENBGW NETWORK services.
    - **full**: Displays all available information for associated display or filter keyword (previous keyword).
    - **henbgw-network-service**: Displays information about HENB associations with the specified henbgw access service.
    - **henbgw_net_svc_name** is a string of size 1 to 63.
  - **peer-address**: Displays information about HENB associations with the specified peer.
    - **peer_ip_address** is an IPv4 address, using dotted-decimal notation or an IPv6 address, using xx:yy:zz format.
  - **peer-id**: Displays information about HENB associations for the specified peer.
    - **peer_id_value** is an integer value ranging from 0 to 4294967295.
  - **summary**: This is the summary of available information for associated display or filter keyword (previous keyword).

- **name**: Displays information for specific HENBGW NETWORK service name.
  - **name**: is a string of size 1 to 63.
  - **statistics**: Displays statistics for specified object.
  - **slap**: Displays S1AP statistics.
  - **cause**: Displays S1AP cause statistics.
  - **sctp**: Displays SCTP statistics.
**buffer**  : Displays SCTP TX/RX buffer statistics.
**henbgwmgr**  : Displays SCTP TX/RX buffer statistics on a specific henbgwmgr.
**verbose**  : Specifies the verbosity.

|  \{ grep grep_options | more \}  

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

---

**Usage**

Use this command to display HENBGW NETWORK service related information.

**Example**

The following command displays SIAP Cause statistics:

```
show henbgw-network-service statistics s1ap Cause
```
show hnbgw access-control-db

Displays the white list of IMSI records in the Access Control database residing on Home-NodeB Gateway (HNB-GW) service instances that control HNB and UE access to HNB-GW sessions.

Product
HNB-GW

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:
[local] host_name#

Syntax

```
show hnbgw access-control-db { hnbgw-service hnbgw_svc_name | imsi imsi_value}
```

- **hnbgw-service hnbgw_svc_name**
  Displays Access Control database records for an existing HNB-GW service specified as an alphanumeric string of 1 through 63 characters.

- **imsi imsi_value**
  Specifies the International Mobile Subscriber Identification (IMSI) number which is found on the Access Control database for the HNB-GW service. 
  *imsi_value* is an integer consisting of the 3-digit MCC (Mobile Country Code), the 2- or 3-digit MNC (Mobile Network Code) followed by the MSIN (Mobile Subscriber Identification Number). The total IMSI value must not exceed 15 digits.

Usage

This command displays the white list IMSI records in an Access Control database residing on a system support all Home-NodeB Gateway (HNB-GW) service instances. The white list controls HNB and UE access to HNB-GW sessions. Access Control database records can be filtered by IMSI value.

Example

The following command displays the information for registered IMSIs and their status in the HNB-GW database:

```
show hnbgw access-control-db imsi
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show hnbgw counters

Displays the session counter information for Home-NodeB Gateway (HNB-GW) services connected on this system.

**Product**
HNB-GW

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show hnbgw counters [ hnbgw-service hnbgw_svc_name | hnbid hnb_identifier ] [ | { grep grep_options | more } ]
```

**hnbgw-service hnbgw_svc_name**
Filters the counter display based on an existing HNB-GW service name specified as an alphanumeric string of 1 through 63 characters.

**hnbid hnb_identifier**
Filters the counter display based on a Home-NodeB identifier specified as an alphanumeric string of 1 through 255 characters.

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section in Command Line Interface Overview chapter.

**Usage**

Use this command to view the session counter information for HNB-GW services configured and HNBs connected on this system.

**Example**

The following command displays the counters for the HNB-GW service named `hnbgw1`:

```
show hnbgw counter hnbgw-service hnbw1
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show hnb-gw-global

Displays the global configuration parameters for configured HNB-GW service(s) on this system.

**Product**
HNB-GW

**Privilege**

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
show hnb-gw-global
```

**Usage**

Use this command to view the global configuration parameters set for all HNB-GW service(s) on this system.

**Example**

The following command displays the global configuration parameters applicable for all HNB-GW services configured on this system:

```
show hnb-gw-global
```

---

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 

---

Command Line Interface Reference, StarOS Release 17

4598
show hnbgw sessions

Displays the active/dormant session information about registered HNB(s) on Home-NodeB Gateway (HNB-GW) service instances configured and running on this system based on different filter criteria.

Product
HNB-GW

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show hnbgw sessions [full | summary] [all] [address hnb_ip_address | cell-id cell_id | hnb-access-mode {closed | hybrid | open} | hnb-local-id hnb_id | hnbgw-service hnbgw_svc_name [ hnb-access-mode { closed | hybrid | open } | hnbid hnb_glbl_id | mcc mcc | mnc mnc [lac lac | rac rac | rnc rnc]] [ | {grep grep_options | more}]

full
Displays the full information for a specific registered HNB session(s) on an HNB-GW service instance running on the system. The display can be filtered based on given filtering criteria.

summary
Displays summarized information for a specific registered HNB session(s) on an HNB-GW service instance running on the system. The display can be filtered based on given filtering criteria.

all
Displays summarized information for all registered HNB sessions on an HNB-GW service instance running on the system. The display can be filtered based on given filtering criteria.

address hnb_ip_address
Filters the display of full or summarized session statistics to show only HNB session(s) based on the registered HNB IP address expressed in IPv4 dotted-decimal notation.

cell-id cell_id
Filters the display of full or summarized session statistics to show only HNB session(s) based on the registered Femto cell ID where the user/subscriber is geographically located. and must be an integer from 0 through 268435455. *cell_id* is an integer from 0 through 268435455.

hnb-access-mode {closed | open | hybrid}
Filters the display of full or summarized session statistics to show only HNB session(s) based on the HNB access mode in an HNB-GW service instance.
• **closed** filters the session statistics for closed HNBs connected with HNB-GW service instance in Closed Access mode.

• **hybrid** filters the session statistics for hybrid HNBs connected with HNB-GW service instance in Hybrid Access mode.

• **open** filters the session statistics for open HNBs connected with HNB-GW service instance in Open Access mode.

**hnb-local-id hnb_id**
Filters the display of full or summarized session statistics to show only HNB session(s) based on the registered local ID of HNB specified as an integer from 1 through 25.

**hnbgw-service hnbgw_svc_name**
Filters the display of session statistics to show only registered HNB session(s) based on an existing HNB-GW service name specified as an alphanumeric string of 1 through 63 characters. This can be further filtered by using access-mode criteria: Closed, Hybrid, or Open.

**hnbid hnb_glbl_id**
Displays summarized or full information of HNB session(s) based on the registered global ID of HNB specified as an integer between 1 through 255.

**mcc mcc**
Displays summary information of HNB session(s) based on the registered Mobile Country Code (MCC) identification number of the UE specified as an integer between 101 through 999.

**mnc mnc**
Displays summarized or full information of HNB session(s) based on the registered Mobile Network Code (MCC) identification number of the UE specified as a 2- or 3-digit integer between 00 through 999.

**lac lac**
Displays summarized or full information for HNB session(s) based on the registered Location Area Code (LAC) identification number of the UE specified as an integer between 1 through 65535.

**rac rac**
Displays summarized or full information for HNB session(s) based on the registered Radio Access Code (RAC) identification number of the UE specified as an integer between 1 through 255.

**rnc rnc**
Displays summarized or full information for HNB session(s) based on the registered Radio Network Code (RAC) identification number of the HNB specified as an integer between 1 through 65535.

| { grep grep_options | more } |

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command’s Output* section in *Command Line Interface Overview* chapter.
show hnbgw sessions

Usage

Use this command to view the session statistics of all or specific registered HNB session(s) or in selected part of user session for HNB-GW services configured and running on this system.

Example

The following command displays summarized session statistics for all registered HNBs on the HNB-GW service named hnbgw1:

```
show hnbgw sessions summary hnbgw-service hnbgw1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show hnbgw statistics hnbgw-service

Displays the session statistics for Home-NodeB Gateway (HNB-GW) services configured and running on this system.

Product
HNB-GW

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

```
show hnbgw statistics [ gtpu-only ] [ hnb-access-mode { closed | hybrid | open }] [ hnbgw-service hnbgw_svc_name [ gtpu-only | hnb-access-mode { closed | hybrid | open } | hnbap-only | ipne-only | paging-only | ranap-only | rtp-only | rua-only | sabp-only | sctp-only ] ] [ hnbid hnb_identifier ] [ hnbp-only | ipne-only | paging-only | ranap-only | rua-only | sccp-only | sctp-only ] ] [ verbose] [ | { grep grep_options | more } ]
```

gtpu-only
Displays Forwarded GTPU Pkt statistics for selected HNB/HNBGW Service.

hnb-access-mode { closed | hybrid | open }
Displays the session statistics of an existing HNB-GW service based on access mode filters. Other supported filters are:

- **closed**: shows the statistics of only those UEs which are connected through Closed HNBs to the HNB-GW services on a chassis. This command applies to all Closed HNB sessions on a chassis. If any other criteria specified it will filter the statistics based on given criteria.

- **hybrid**: shows the statistics of only those UEs which are connected through Hybrid HNBs to the HNB-GW services on a chassis. This command applies to all Closed HNB sessions on a chassis. If any other criteria specified it will filter the statistics based on given criteria.

- **open**: shows the statistics of only those UEs which are connected through Open HNBs to the HNB-GW services on a chassis. This command applies to all Closed HNB sessions on a chassis. If any other criteria specified it will filter the statistics based on given criteria.

hnbgw-service hnbgw_svc_name
Filters the display of session statistics for an existing HNB-GW service name specified as an alphanumeric string of 1 through 63 characters.

hnbp-only
Filters the display of session statistics to show only Home NodeB Application Part (HNBAP) traffic for the selected HNB-GW service which is configured and running on this system.
ipne-only
Filters the display of session statistics to show only IPNE for selected HNBGW Service which is configured and running on this system.

paging-only
Filters the display of Paging statistics for selected HNBGW Service.

ranap-only
Filters the display of session statistics to show only Radio Access Network Application Protocol (RANAP) traffic for the selected HNB-GW service which is configured and running on this system.

rua-only
Filters the display of session statistics to show only RANAP User Adaptation (RUA) traffic for the selected HNB-GW service which is configured and running on this system.

sccp-only
Filters the display of session statistics to show only Signaling Connection Control Part (SCCP) traffic for the selected HNB-GW service which is configured and running on this system.

sctp-only
Filters the display of session statistics to show only Stream Control Transmission Protocol (SCTP) traffic for the selected HNB-GW service which is configured and running on this system.

verbose
Displays detailed statistics for all sessions on HNB-GW services or for a selected filtered and named HNB-GW service which is configured and running on this system.

| { grep grep_options | more }
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section in Command Line Interface Overview chapter.

Usage
Use this command to view the session statistics for overall session or in selected part of user session for HNB-GW services configured and running on this system.

Example
The following command displays session statistics for the HNBAP part of session details for the HNB-GW service named hnbgw1:

```
show hnbgw statistics hnbgw-service hnbgw1 hnbap-only
```

The following command displays session statistics for the RANAP part of session with maximum details for the HNB-GW service named hnbgw1:

```
show hnbgw statistics hnbgw-service hnbgw1 ranap-only verbose
```
show hnbgw statistics hnbid

Displays the session statistics for Home-NodeB (HNB) connected to an HNB-GW service on this system.

**Product**
- HNB-GW

**Privilege**
- Inspector

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
show hnbgw statistics hnbid hnb_identifier [ hnbap-only | ranap-only | rua-only ] [ verbose ] [ | { grep grep_options | more } ]
```

- **hnbid hnb_identifier**
  Filters the display of session statistics based on an existing Home-NodeB identifier specified as an alphanumeric string of 1 through 255 characters.

- **hnbap-only**
  Filters the display of session statistics display to show only Home NodeB Application Part (HNBAP) traffic for the selected HNB which is connected to this system through HNB-GW service.

- **ranap-only**
  Filters the display of session statistics display to show only Radio Access Network Application Protocol (RANAP) traffic for the selected HNB which is connected to this system through HNB-GW service.

- **rua-only**
  Filters the display of session statistics display to show only RANAP User Adaptation (RUA) traffic for the selected HNB which is connected to this system through HNB-GW service.

- **verbose**
  Displays detailed statistics for all HNB sessions or for the selected filter and HNB which is connected to this system through HNB-GW service.

- `| { grep grep_options | more }`
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command’s Output* section in the *Command Line Interface Overview* chapter.
Usage

Use this command to view the session statistics for overall session or in selected part of user session for selected HNB which is connected to this system through HNB-GW service.

Example

The following command displays session statistics for the HNAP part of session details for the HNB identified as `hnb112234` on this system:

```
show hnbgw statistics hnbid hnb112234 hnbap-only
```

The following command displays detailed session statistics for the RANAP part of session details for the HNB identified as `hnb112234` on this system:

```
show hnbgw statistics hnbid hnb112234 ranap-only verbose
```
**show hnbgw-service**

Displays the configuration details for configured HNB-GW service(s) on this system.

**Product**

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show hnbgw-service { all | hnbgw-service hnbgw_svc_name }
```

- **all**
  
  Displays configuration and other default parameters for all HNB-GW service configured on this system.

- **hnbgw-service hnbgw_svc_name**
  
  Displays configuration and default parameters for an existing HNB-GW service name specified as an alphanumeric string of 1 through 63 characters.

**Usage**

Use this command to view the configuration and service parameters set for all or any specific HNB-GW service(s) on this system.

**Example**

The following command displays configuration parameters for all HNB-GW services configured on this system:

```
show hnbgw-service all
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show hsgw-service

Displays information for HRPD Serving Gateway (HSGW) services on this system.

Product
HSGW

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show hsgw-service { all | name service_name | statistics { all | name service_name } } [ dns-stats | pcf-status { address IPv4_address | filter { all | icmp-monitored | no-calls | summary | up } } | { grep grep_options | more } ]

all
Displays configuration information for all HSGW services configured on this system.

name service_name
Displays configuration information for an existing HSGW service specified as an alphanumeric string of 1 through 63 characters.

statistics
Displays node-level statistics for the HSGW.

dns-stats
Displays information related to DNS P-GW selection for load balancing using DNS SRV lookup.

pcf-status
Displays information about the status of Packet Control Functions (PCFs) being monitored.

address IPv4_address
Displays status information for the specified PCF. IPv4_address must be specified using IPv4 dotted-decimal notation.

filter { all | icmp-monitored | no-calls | summary | up }
Filters the PCF status information. Must be followed by the filter to be applied.
all: Shows all the PCFs.
icmp-monitored: Shows only PCFs which are ICMP monitored.
no-calls: Shows only PCFs which has no active sessions.
summary: Shows only a summary of the status of the PCFs.
**Usage**

Use this command to view configuration information for HSGW services on this system.

**Example**

The following command displays service statistics for the HSGW service named `hsgw1`:

```
show hsgw-service name hsgw1
```
show hss-peer-service

Displays service, session, and statistics information for Home Subscriber Server (HSS) peer services configured on this system.

Product
MME

Privilege
Inspector

Syntax

```
show hss-peer-service { service { all | name name } | session { all | callid id | full | mdn mdn | nai nai | summary } | statistics { all | service name | summary } } [ | { grep grep_options | more } ]
```

**service { all | name name }**
Displays HSS peer service statistics for HSS peer services configured on this system.
- all: Displays HSS peer service statistics for all configured HSS peer services on this system.
- name name: Displays HSS peer service statistics for an existing HSS peer service specified as an alphanumeric string of 1 through 63 characters.

**session { all | callid id | full | mdn mdn | nai nai | summary }**
Displays HSS peer service statistics for sessions on this system.
- all: Displays HSS peer service statistics for all sessions on this system.
- This keyword is also used to further filter the **full** and **summary** options.
- callid id: Displays summarized or detailed statistics of HSS peer service sessions running and filtered on the basis of the call identifier specified as an 8-digit hexadecimal number.
- This keyword is also used to further filter the **full** and **summary** options.
- mdn mdn: Displays summarized or detailed statistics of MME sessions running and filtered on the basis of an existing Mobile Directory Number (MDN) expressed as an alphanumeric string of 1 through 100 characters.
- This keyword is also used to further filter the **full** and **summary** options.
- nai nai: Displays summarized or detailed statistics of MME-HSS sessions running and filtered on the basis of an existing Network Access Identifier (NAI) expressed as an alphanumeric string of 1 through 128 characters.
- This keyword is also used to further filter the **full** and **summary** options.
- summary: Displays a summarized output of session information. This keyword can be further filtered by adding the following options:
  - full
  - callid id
  - mdn mdn
  - nai nai

**statistics { all | service name | summary }**
Displays statistics for HSS peer services configured on this system.
- all: Displays statistics for all HSS peer services configured on this system.
Show HSS Peer Service Information and Statistics

**service name**: Displays statistics for an existing HSS peer service expressed as an alphanumeric string of 1 through 63 characters.

**summary**: Displays summarized statistics for all HSS peer services configured on this system.

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of the `grep` and `more` commands, refer to the *Regulating a Command’s Output* section in **CLI Overview** chapter of the *Command Line Interface Reference*.

**Usage**

Use this command to display service, session, and statistics information for HSS peer services configured on this system.

**Example**

The following command displays HSS peer service information and statistics for a session with a call ID of 08f11fa4:

```
    show hss-peer-service sessions full callid 08f11fa4
```
show imei-profile

Displays information for configured International Mobile Equipment Identity (IMEI) profiles.

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show imei-profile { all | full { all | name imei_name } | name imei_name } [ | { grep grep_options | more } ]

| all
List all IMEI profiles configured on the system.

| full { all | name apn_name }
| full: Instructs the system to display all information in the IMEI profile(s).
| all: Displays a full set of information for all IMEI profiles configured on the system.
| name imei_name: Displays a full set of information for a specific IMEI profile.
| apn_name: Must be an existing IMEI profile expressed as an alphanumeric string of 1 through 64 characters.

| name imei_name
Displays information for a specific IMEI profile expressed as an alphanumeric string of 1 through 64 characters.

| { grep grep_options | more }
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display information for IMEI profiles configured on the system. APN profiles are configured through the global configuration mode and in the IMEI profile configuration mode. For more information regarding IMEI profile commands, refer to the IMEI Profile Configuration Mode Commands chapter.

Example

The following command displays all available information for an IMEI profile named imeiprof1:

    show imei-profile full name imeiprof1
show ims-authorization policy-control

Displays information and statistics specific to the policy control in IP Multimedia Subsystem (IMS) authorization service.

Product
SCM
GGSN
IMS
P-GW
SAEGW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ims-authorization policy-control statistics [ service ims_auth_svc_name | server { ip-address ip_address [ port port_value ] | name server_name } ] [ | { grep grep_options | more } ]

statistics
Displays the total collected statistics of all policy control parameters of IMS authorization service sessions since the last system restart or clear command.

service ims_auth_svc_name
Displays the total collected statistics of all IMS authorization sessions processed by a specific IMS authorization service since the last system restart or clear command. ims_auth_svc_name must be an existing IMS authorization service name, expressed as an alphanumeric string of 1 through 64 characters.

server { ip-address ip_address [ port port_value ] | name server_name }
Displays the server-level message statistics and the server IP address.
Specify the PCRF server name (1 through 64 alphanumeric characters), or server IP address in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

| { grep grep_options | more }
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.
Usage
Use this command to display information and statistics about policy control configuration in existing IMS authorization services.

Example
The following command displays the existing IMS authorization service name `ims_auth_gx1` on the system:

```
show ims-authorization policy-control statistics service ims_auth_gx1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show ims-authorization policy-control misc-info

Displays the maximum backpressure information.

Product
GGSN
P-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ims-authorization policy-control misc-info max-backpressure [ all | facility sessmgr instance instance_number ] [ | { grep grep_options | more } ]

- **all**
  Displays the max-backpressure count among all active session manager instances.

- **facility sessmgr instance instance_number**
  Displays logged events for specific facility. That is, it will display the maximum backpressure count on that specific session manager instance.
  *instance_number* must be an existing IMS authorization service name, expressed as an alphanumeric string of 0 to 10000000 characters.

  | { grep grep_options | more }

  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of *grep* and *more*, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display the maximum backpressure at a particular session manager instance or at all instances, and the time stamp at which maximum backpressure was seen.

Example

The following command displays the maximum backpressure information for session1 facility on the system:

```
show ims-authorization policy-control misc-info max-backpressure facility sessmgr instance session1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
**show ims-authorization policy-gate**

Displays information of installed Policy Gates for specific subscriber in an IP Multimedia Subsystem (IMS) authorization (IMSA) service.

**Product**
- SCM
- GGSN
- IMS
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show ims-authorization policy-gate { { status [ summary | full ] [ { imsi imsi_value [ nsapi nsapi_value ] } | callid call_id | { ims-auth-service ims_auth_svc } [ rulename rule_name ] ] | { counters [ all | { imsi imsi_value [ nsapi nsapi_value ] } | { rulename rule_name } | { callid call_id } ] ] [ | { grep grep_options | more } ] ]
```

- **status [ summary | full ]**
  Displays the status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based on the specified criteria.
  - **summary**: Limits the display to a summary on the status of the installed policy gates and their flow definitions along with their run-time status in an IMS authorization service based on the specified criteria.
  - **full**: Displays the full information on status of the installed policy gates and their flow definitions along with their run-time status in an IMS authorization service based on the specified criteria.

- **counters all**
  Displays the counters/statistics of the installed policy gates and their flow definitions along with their run-time status in an IMS authorization service based on the specified criteria.
  - **all** displays all counters of the installed gates and their flow definitions along with their run-time status in an IMS authorization service based on the specified criteria.

- **imsi imsi_value [ nsapi nsapi_value ]**
  Displays all of the counters/status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based on the International Mobile Subscriber Identity (IMSI).
  - **nsapi nsapi_value** specifies the Network Service Access Point Identifier (NSAPI) and limits the display to a single PDP context of the subscriber.
show ims-authorization policy-gate

callid call_id
Displays all of the counters/status of the installed policy gates and their flow definitions along with their run-time status in an IMS authorization service based on the call identifier.

ims-auth-service ims_auth_svc
Displays the status of the installed policy gates and their flow definitions along with their run-time status in the named IMS authorization service.

rule name rule_name
Displays all of the counters/status of the installed policy gates and their flow definitions along with their run-time status in an IMS authorization service based on the named dynamic charging rule.

| ( grep grep_options | more )
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
Please refer to the Regulating a Command’s Output section of the Command Line Interface Reference for details on the usage of grep and more.

Usage
Use this command to display information/statistics/counters about all of the installed policy gates and their flow definitions along with the run-time status with specified criteria and filters in existing IMS authorization services.

Example
The following command displays the full status of the installed policy gates in an existing IMS authorization service on the system:

    show ims-authorization policy-gate status full

The following command displays the all counters of the installed policy gates in an existing IMS authorization service on the system:

    show ims-authorization policy-gate counters all

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show ims-authorization servers

Displays information and statistics specific to the authorization servers used for IP Multimedia Subsystem (IMS) authorization (IMSA) service.

Product
SCM
GGSN
IMS
P-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ims-authorization servers [ ims-auth-service ims_auth_svc_name [ | { grep grep_options | more } ] ]

server [ ims-auth-service ims_auth_svc_name ]

Displays the information and statistics for all authorization servers configured within an IMS authorization service in a system.

ims-auth-service ims_auth_svc_name: Displays the configured authorization servers for IMS authorization within the named IMS authorization service.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

Please refer to the Regulating a Command’s Output section of the Command Line Interface Reference for details on the usage of grep and more.

Usage

Use this command to display information and statistics about IMS authorization servers configured on a system or IMS authorization service.

Example

The following command displays the information and statistics of the authorization servers in the IMS authorization service named in imsauth_gx1:

    show ims-authorization servers ims-auth-service ims_auth_gx1

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show ims-authorization service

Displays information, configuration, and statistics of all/specific IP Multimedia Subsystem (IMS) authorization (IMSA) service.

Product
GGSN
P-GW
SAEGW
SCM

Privilege
Security Administrator, Administrator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show ims-authorization service { { all [ verbose ] | name ims_auth_svc_name [ p-cscf { all | ip_address ipv4/ipv6_address | summary } } | { statistics [ all | name ims_auth_svc_name ] [ verbose ] } [ | { grep grep_options | more } ]

all [ verbose ]
Displays information and configuration for all configured IMS authorization services with a single line of information for each IMS authorization service.

verbose: Displays all information and configuration data for all IMS authorization services configured on system.

name ims_auth_svc_name [ p-cscf { all | ip_address ipv4/ipv6_address
Displays the information, statistics, and configuration data for the named IMS authorization service. If the optional keyword is configured, this command displays the statistics information of all P-CSCF servers or specific server.

summary
Displays summarized information and configuration data for all IMS authorization services configured in a system.

statistics [ all | name ims_auth_svc_name ] [ verbose ]
Displays the IMS Authorization service statistics including following information:
- Initial authorization procedures
- Re-authorization procedures initiated by us
- Re-authorization procedures initiated by servers
- Various failure statistics
```
If no criteria are specified, only summarized statistics for all IMS Authorization services are displayed
• **all**: displays individual statistics for every IMS authorization service configured on system.
• **name ims_auth_svc_name**: Displays the statistics for the IMS authorization service named in
  `ims_auth_svc_name`
• **verbose**: displays detailed statistics for a configured IMS authorization service.

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which
the output of this command will be sent.
Please refer to the *Regulating a Command’s Output* section of the *Command Line Interface Reference* for
details on the usage of `grep` and `more`.

Usage

Use this command to display the status, counters and configuration for an IMS Authorization service. The
status includes the state of a server table switchover. The Statistics option displays information about various
processes.

Example

The following command displays the information and configuration data of the IMS authorization service
named in `ims_auth_gx1`:

```
show ims-authorization service name ims_auth_gx1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show ims-authorization sessions

Displays information, configuration, and statistics of sessions active in an IP Multimedia Subsystem (IMS) authorization (IMSA) service.

Product
SCM
GGSN
IMS
P-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ims-authorization sessions [ all | apn apn_name | callid call_id | facility sessmgr instance instance_no | full | ggsn-only | ims-auth-service ims_auth_svc_name | imsi imsi_value | nsapi nsapi_value | ip-address ip_address | local-sessions | remote-sessions | summary ] [ | { grep grep_options | more } ]

- **all**
  Displays information and configuration for all sessions running in IMS authorization services with a single line of information for each IMS authorization session.

- **apn apn_name**
  Displays all of the counters/status for the running services in an IMS authorization service based on the specified Access Point Name (APN).

- **callid call_id**
  Displays all of the counters/status for the running services in IMS authorization service based on the named call identifier.

- **facility sessmgr instance instance_no**
  Displays the IMS authorization sessions at the session manager instance level.

- **full**
  Displays complete information and configuration data for all sessions in IMS authorization services configured in a system.
show ims-authorization sessions

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ggsn-only</td>
<td>Displays GGSN-specific information in addition to detailed information about the session.</td>
</tr>
<tr>
<td>ims-auth-service ims_auth_svc_name</td>
<td>Displays the information, statistics, and configuration data for sessions in the named IMS authorization service.</td>
</tr>
<tr>
<td>imsi imsi_value [ nsapi nsapi_value ]</td>
<td>Displays all of the counters/status of the running services in an IMS authorization service based on the specified International Mobile Subscriber Identity (IMSI) and Network Service Access Point Identifier (NSAPI). The display is limited to a single PDP context of the subscriber.</td>
</tr>
<tr>
<td>ip-address ip_address</td>
<td>Displays all of the counters/status for the running services in IMS authorization service based on the specified host IP address.</td>
</tr>
<tr>

| | \{ grep grep_options | more \} |
| pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. |
| Please refer to the Regulating a Command's Output section of the Command Line Interface Reference for details on the usage of grep and more. |

**Usage**

Use this command to display the sessions running under IMS Authorization service on a system with different filter criteria.

**Example**

The following command displays the information and statistical data for a session in an IMS authorization service:

```
show ims-authorization sessions full
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show inventory

Displays Unique Device Identifier (UDI) information for all hardware in the system for which a UDI is available.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show inventory [ | { grep grep_options | more } ]
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of the `grep` and `more` commands, refer to the *Regulating a Command’s Output* section in the *Command Line Interface Overview* chapter.

**Usage**

Displays UDI information (card/item description, Cisco PID, serial number) for all hardware installed in this system.

**Example**

The following command displays UDI information for all cards in the system:

```
show inventory
```
show ip access-group statistics

Displays statistics for each rule in an access control group.

Product
HA

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ip access-group statistics [ | { grep grep_options | more } ]

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display the configured access control groups in the current context.

Example

The following command displays the contents of an access control group named ACG_4:

    show ip access-list ACG_4
show ip access-list

Displays the information for all Access Control Lists (ACLs) or the named ACL. With no keyword supplied, a list of all access lists and their entries is displayed.

**Product**

HA

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show ip access-list list_name [ | { grep grep_options | more } ]
```

- **list_name**
  
  Specifies the name of an existing ACL configured in the current context as an alphanumeric string of 1 through 47 characters.

- **| { grep grep_options | more }**
  
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**

Use this command to display the configured ACLs in the current context.

**Example**

The following command displays the contents of an ACL named `ACL_4`:

```
show ip access-list ACL_4
```
show ip arp

Displays the ARP table or the ARP information associated with the specified IP address.

- **Important:** When it restarts, the VPN Manager removes all interfaces from the kernel; the kernel then removes all ARP entries. When this happens, the NPU still holds all of the ARP entries so that there is no traffic disruption. From a user point of view, `show ip arp` is broken since this command gathers information from the kernel and not the NPU.

**Product**
HA

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show ip arp [ ip_address | vrf vrf_name ] [ | { grep grep_options | more } ]
```

- `ip_address`
  Specifies an IP address in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

- `vrf vrf_name`
  Displays information for an existing VPN Routing and Forwarding (VRF) name expressed as an alphanumeric string of 1 through 63 characters.

- `| { grep grep_options | more }`
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to display the configured ACLs in the current context.

**Example**

The following command displays the contents of an ACL named `ACL_4`:

```
show ip access-list ACL_4
```
show ip as-path-access-list

Displays the contents of a Border Gateway Protocol (BGP) router Autonomous System (AS) path access list in the current context.

Product
HA

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show ip as-path-access-list list_name [ | { grep grep_options | more } ]
```

- `list_name`
  Specifies the name of an existing AS path access list configured in the current context as an alphanumeric string of 1 through 79 characters.

- `| { grep grep_options | more }`
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display the configured entries for the specified BGP router AS path access list in the current context.

Example

The following command displays the contents of an AS path access list named `ASlist1`:

```
show ip as-path-access-list ASlist1
```
show ip bgp

Displays Border Gateway Protocol (BGP) information for the current context.

Product
HA

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ip bgp [ ip_address/mask | debugging | filter-list list_name | neighbors [ ip_address ] | route-map map_name | vpnv4 [ all [ ip_address/mask | neighbors | summary ] | route-distinguisher { ipv4_address | asn_value } rd_value | vrf vrf_name [ ip_address/mask | neighbors | summary ] | vpnv6 [ all [ ipv4_address | neighbors | summary ] | route-distinguisher { ipv4_address | asn_value } rd_value | vrf vrf-name [ ip_address/mask | neighbors | summary ] ] [ | { grep grep_options | more } ] ]

Specifies the IP address and netmask bits for the network for which information should be displayed. The IP address and mask is the number of subnet bits, representing a subnet mask in CIDR notation. These must be entered in the IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal CIDR notation.

debugging
Displays debug flags that are enabled.

filter-list list_name
Displays routes that match the specified filter list.

neighbors [ip_address]
Displays information for all neighbors or a neighbor specified as an IP address in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

route-map map_name
Displays routes that match the specified route-map.

summary
Displays summary BGP information.
Displays all VPNv4 routing data.

- **all**: Displays all VPNv4 routing information. If this is specified, the information displayed is gathered from all the VRF's known to BGP and displayed. It could contain the list of neighbors, the list of networks, or a particular network.

- **neighbors**: Displays neighbor information for the all the VRFs including the default VRF or for the VRF with a matching RD value.

- **summary**: Displays summary information of neighbors for all the VRFs including the default VRF or for the VRF with a matching RD value.

- **route-distinguisher { ipv4_address | asn_value } rd_value**: Displays information about the route distinguisher. Where
  - **ipv4_address**: Specifies an IP address in IPv4 dotted-decimal notation.
  - **asn_value**: Specifies an autonomous system number as an integer from 0 through 65535.
  - **rd_value**: Specifies a route distinguisher value as an integer from 0 through 4294967295.

- **vrf vrf_name [ ipv4_address/mask | neighbors | summary ]**: Displays information about the VRF. Where
  - **vrf_name**: Specifies the name of the VRF as an alphanumeric string of 1 through 63 characters.
  - **ipv4_address/mask**: Specifies an IP address in IPv4 dotted-decimal CIDR notation.
  - **neighbors**: Displays neighbor information for the all the VRFs including the default VRF or for the VRF with a matching RD value.
  - **summary**: Displays summary information of neighbors for all the VRFs including the default VRF or for the VRF with a matching RD value.

Displays all VPNv6 routing data.

- **all**: Displays all VPNv6 routing information. If this is specified, the information displayed is gathered from all the VRF's known to BGP and displayed. It could contain the list of neighbors, the list of networks, or a particular network.

- **neighbors**: Displays neighbor information for the all the VRFs including the default VRF or for the VRF with a matching RD value.

- **summary**: Displays summary information of neighbors for all the VRFs including the default VRF or for the VRF with a matching RD value.

- **route-distinguisher { ipv4_address | asn_value } rd_value**: Displays information about the route distinguisher. Where
  - **ipv4_address**: Specifies an IP address in IPv4 dotted-decimal notation.
  - **asn_value**: Specifies an autonomous system number as an integer from 0 through 65535.
  - **rd_value**: Specifies a route distinguisher value as an integer from 0 through 4294967295.
show ip bgp

- vrf vrf_name [ ipv4_address/mask | neighbors | summary ]: Displays information about the VRF. Where
  - vrf_name: Specifies the name of the VRF as an alphanumeric string of 1 through 63 characters.
  - ipv4_address/mask: Specifies an IP address in IPv4 dotted-decimal CIDR notation.
  - neighbors: Displays neighbor information for all the VRFs including the default VRF or for the VRF with a matching RD value.
  - summary: Displays summary information of neighbors for all the VRFs including the default VRF or for the VRF with a matching RD value.

| { grep grep_options | more } |

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command display to BGP information for the current context.

Example

The following command displays information for all BGP neighbors:

```
show ip bgp neighbors
```
**show ip igmp group**

Displays Internet Group Management Protocol (IGMP) information for all groups in a context or a specific IP address.

**Product**

All

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show ip igmp group [ ip_address | all ] [ | { grep grep_options | more } ]
```

- **ip_address**
  
  Displays IGMP information for the IP address specified in IPv4 dotted- decimal or IPv6 colon-separated- hexadecimal notation.

- **all**
  
  Displays information for all IGMP groups associated with this context.

| | { grep grep_options | more } |
|---|---|
| Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to display IGMP group information.

**Example**

To display general IGMP information for all groups in this context, enter the following command;

```
show ip igmp all
```
show ip interface

Displays statistical and configuration information for the IPv4-based interfaces, including a Virtual Routing and Forwarding (VRF) table for a specific context.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ip interface [ vrf vrf-name ] [ name intfc_name [ tunnel [ gre-keepalive ] ] [ summary ] [ vrf vrf-name ] ] | { grep grep_options | more }

| name intfc_name
| Displays information for an existing interface specified as an alphanumeric string of 1 through 79 characters. If no interface name is specified, the information for all IP interfaces is displayed.

| summary
| Displays summarized information about requested IP interfaces.

| tunnel [ gre-keepalive ]
| Filters the IP interface information for GRE/IP-in-IP tunnel type interfaces.
| gre-keepalive: Displays the keepalive information for a generic routing encapsulation (GRE) tunnel configured with this IP interface.

| vrf vrf_name
| Displays Virtual Routing and Forwarding (VRF) routing information for an existing VRF specified as an alphanumeric string of 1 through 63 characters.

| | { grep grep_options | more }
| Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
| For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display the summarized of detailed configuration and statistical information for a configured IP interface. This information can be used to verify and/or troubleshoot communication difficulties between to a remote host/node.
Example

The following command displays the interface information, including statistics, for the IP interface Interface_1.

```
show ip interface Interface_1 statistics
```

The following command displays the GRE keepalive information for an IP interface named in IP_grel.

```
show ip interface IP_grel tunnel gre-keepalive
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show ip ipsp

Displays the names of IP pools that are enabled for the IP pool sharing protocol (IPSP) and lists the disposition of addresses in the pools.

Product
PDSN
HA
ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ip ipsp [ summary ] [ | { grep grep_options | more } ]

summary
Displays only the disposition of the addresses in the participating IP pools. Does not show the names of the participating IP pools.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the `Regulating a Command’s Output` section of the `Command Line Interface Overview` chapter.

Usage

Use this command to list the names of IP pools that are participating in the IPSP and list the disposition of IP addresses in those pools.

Important: For information on configuring and using IPSP refer to the `System Administration Guide`.

Example

To list information on all IPSP participating pools and address disposition, enter the following command:

```
show ip ipsp
```

Important: Output descriptions for commands are available in the `Statistics and Counters Reference`.
show ip localhosts

Displays host name to IP address mapping for current context. Must be followed by a specific IP host name.

Product
- PDSN
- HA
- GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```bash
show ip localhosts hostname [ | { grep grep_options | more }]
```

**hostname**

Specifies a configured hostname as an alphanumeric string of 1 through 127 characters.

```bash
| { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display mappings of a host name to IP addresses.

Example

To display IP address mapping for host name *local_2345*, enter the following command:

```bash
show ip localhosts local_2345
```
show ip ospf

Displays Open Shortest Path First (OSPF) routing information.

Product
PDSN
HA
GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ip ospf [ border-routers | database [ verbose ] [ ls-id ip_addr ] [ adv-router ip_addr ] [ ls-type { router | network | summary | asbr-summary | external | nssa | integer } ] ] | debugging | interface | neighbor [ details ] | route | virtual-links ] | | { grep grep_options | more } ]

border-routers
Displays all known area border routers (ABRs) and autonomous system border routers (ASBRs) for OSPF.

database [ verbose ] [ ls-id ip_addr ] [ adv-router ip_addr ] [ ls-type { router | network | summary | asbr-summary | external | nssa | integer } ] ]

Displays a summary of the database information for OSPF.
verbose: Displays detailed OSPF database information.
ls-id ip_addr: Displays OSPF database information for the link state advertisements (LSAs) with the specified link state identifier (LSID). ip_addr is entered using IPv4 dotted-decimal notation.
adv-router ip_addr: Displays OSPF database information for the advertising router with the specified LSID. ip_addr is entered using IPv4 dotted-decimal notation.
ls-type { router | network | summary | asbr-summary | external | nssa | LSA_Numerical_Type } ]: Displays OSPF database information for the specified LSA type.

debugging
Lists which debugging parameters are enabled.

interface
Displays interface information for OSPF.

neighbor [ details ]
Displays summarized information about all known OSPF neighbors.
details: Displays detailed information about all known OSPF neighbors.
route [ summary ]
Displays the OSPF routing table.

summary: Displays the number of intra-area, inter-area, external-1 and external-2 routes.

virtual-links
Displays the OSPF virtual links.

| { grep grep_options | more }
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to display OSPF information.

Example
To display general OSPF information, enter the following command:

    show ip ospf
show ip policy-forward

Displays information for IP packet redirecting policy for Home Agent (HA).

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

The following prompt is displayed in the Exec mode:

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to see all the settings for IP packet redirection configuration from existing HA to new HA during upgrade.

Important: This is a customer specific command.

Example

The following command displays forward policy configuration for an HA:

    show ip policy-forward
show ip pool

Displays statistics specific to IP pools.

Product
PDSN
GGSN
HA
ASN-GW
A-BG

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ip pool [ address { pool-name pool_name | group-name group_name } { used | free | hold | release } [ limit limit ] | group-name group_name | groups | hold-timer { imsi imsi | msid msid | username username [ imsi imsi | msid msid ] } | many-to-one | nat-realm | one-to-one | overlap | pool-name pool_name | private | public | resource | static | summary | verbose | wide ] [ | { grep grep_options | more }]

address { pool-name pool_name | group-name group_name } { used | free | hold | release } [ limit limit ]

Displays IP pool addresses for the specified IP pool or pool group that are currently in the specified state.

pool-name pool_name: Displays IP addresses from an existing IP pool name specified as an alphanumeric string of 1 through 31 characters.

group-name group_name: Displays IP addresses from an existing IP pool group name specified as an alphanumeric string of 1 through 31 characters.

used: Displays the IP addresses that are in a used state.

free: Displays the IP addresses that are in a free state.

hold: Displays the IP addresses that are in a hold state.

release: Displays the IP addresses that are in a release state.

limit limit: Specifies the maximum number of address to display as an integer from 1 through 524287.

group-name group_name

Displays information about an existing IP pool group name specified as an alphanumeric string of 1 through 31 characters.

groups

Lists information about all IP pool groups.
**hold-timer** {imsi imsi | msid msid | username username [imsi imsi | msid msid]}

Displays hold timer address information for the specified IMSI, MSID, or username.

- **imsi imsi**: Displays hold-timer information for a valid IMSI (International Mobile Subscriber Identity), specified as a 15-character field that identifies the subscriber’s home country and carrier.
- **msid msid**: Displays hold-timer information for the MSID specified as a number from 7 through 16 digits.
- **username username**: Displays hold-timer information for an existing username specified as an alphanumeric string of 1 through 127 characters.

**Important**: Active users cannot be displayed. If an active ID or username is entered, the following error message appears: Failure: No address matching the specified information was found! Please confirm that the options used match the network architecture/deployment, i.e. IMSI/MSID only, Username only, or IMSI/MSID plus Username. Please note that this command does not apply for addresses in the used state.

- **many-to-one**
  Lists information on Many-to-One NAT Realm IP address pools.

- **nat-realm**
  Lists information on NAT Realm IP address pools.

- **one-to-one**
  Lists information One-to-One NAT Realm IP address pools.

- **overlap**
  Lists information on overlapping IP pools.

- **pool-name pool_name**
  Displays information about an existing IP pool.

- **private**
  Displays information about IP pools marked Private.

- **public**
  Displays information about IP pools marked Public.

- **resource**
  Displays information about resource IP pools.

- **static**
  Displays information about static IP pools.

- **summary**
  Displays a summary of all IP pool information.

- **verbose**
  Displays detailed information about all IP pools.
**show ip pool**

**wide**

Displays detailed information formatted to more than 80 columns.

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the Command Line Interface Overview chapter.

**Usage**

Use this command to display statistics pertaining to IP Pools in the current context.

**Example**

The following command displays IP address information for an IP Pool named *pool1*:

```
show ip pool address pool-name pool
```

To display a summary list for all IP pools in the current context, enter the following command:

```
show ip pool summary
```

The following command displays IP pool information for all IP pools configured in the current context:

```
show ip pool verbose
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show ip prefix-list

Displays IP prefix lists used to filter routes. With no keyword supplied, a list of all prefix lists and their entries is displayed.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ip prefix-list [ detail | name | summary ] list_name [ | { grep grep_options | more } ]

detail
Displays detailed information for the named prefix list.

name
Displays information for the named prefix list.

summary
Displays summary information for the named prefix list.

list_name
Specifies the name of an existing prefix list as an alphanumeric string of 1 through 79 characters.

| { grep grep_options | more } |
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to display information about IP prefix lists.

Example
To display detailed information about a prefix list named route_101, enter the following command:

    show ip prefix-list detail route_101
Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show ip route

Displays information related to currently configured static or VRF routes for the current context.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show ip route [ ip_address/mask | vrf vrf_name ] [ | { grep grep_options | more }]
```

- `ip_address/mask`
  Specifies an IP address/mask (CIDR) for a static route in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

- `vrf vrf_name`
  Displays information for an existing Virtual Routing and Forwarding (VRF) name expressed as an alphanumeric string of 1 through 63 characters.

- `{ grep grep_options | more }
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of `grep` and `more`, refer to the `Regulating a Command’s Output` section of the `Command Line Interface Overview` chapter.

Usage

Use this command to display information related to currently configured static or VRF routes for the current context.

Example

To display detailed information about a route for a static IP address, enter the following command:

```
show ip route 10.1.0.0/24
```

**Important:** Output descriptions for commands are available in the `Statistics and Counters Reference`.
show ip route-access-list

Displays information related to currently configured route-access-list used to filter routes.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
show ip route-access-list [ name ] [ | { grep grep_options | more }]
```

- `name`
  Specifies the name of an existing route access list as an alphanumeric string of 1 through 79 characters.

- `| { grep grep_options | more }`
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to display information about IP route access lists.

**Example**

To display detailed information about an access list named `access_route_3`, enter the following command:

```
show ip route-access-list access_route_3
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show ip static-route

Displays information related to currently configured static routes.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show ip static route [ ip_address/mask ] | { grep grep_options | more }
```

- **ip_address/mask**
  Specifies an IP address/mask (CIDR) for a static route in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

- | { grep grep_options | more }
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to display information about IP static routes.

**Example**

To display detailed information about route 192.155.33.2/24, enter the following command:

```
show ip static route 192.155.33.2/24
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show ip vrf

Displays configuration information for VPN Routing and Forwarding instances.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
show ip vrf [ vrf_name [mpls-map-dscp-exp] ] | { grep grep_options | more }
```

- **vrf_name**
  Specifies an existing VRF name as an alphanumeric string of 1 through 63 characters.

- **mpls-map-dscp-exp**
  Displays the MPLS mapping for the VRF.

**Usage**

Use this command to display information about VFR names.

**Example**

To display information for a VRF named `corporate_range2` with MPLS mapping:

```
show ip vfr corporate_range2 mpls-map-dscp-exp
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show ip vrf-list

Displays configuration information for VRF lists currently on the system.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
show ip vrf-list [ list_name ]
```

**list_name**
Specifies the name of an existing VRF list as an alphanumerical string of 1 through 63 characters.

**Usage**
Use this command to display information about all VRF lists or a specified VRF list.

**Example**
The following command displays information about all VRF lists in the system:

```
show ip vrf-list
```
show ipms status

Displays the status of Intelligent Packet Monitoring System (IPMS) client service with information related to system and call events. It also displays the status of configured IPMS servers.

**Product**
IPMS

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
show ipms status [ summary | all | server address ip_address ]
```

- **summary**
  Displays the summary of all configured IPMS client and IPMS servers.

- **all**
  Displays information for all configured IPMS client and IPMS servers.

- **server address ip_address**
  Displays status for the IPMS server specified as an IP address in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**Usage**

This command is used to show/verify the status or configuration of one or all IPMS server along with system and call event information.

**Example**

The following command displays status of an IPMS server with IP address 10.2.3.4:

```
show ipms status server address 10.2.3.4
```
show ipne peers

Generates a list of the IP Network Enabler (IPNE) peers.

**Product**
MME.

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show ipne peers { all | service ipne_service_name | summary } [ | { grep grep_options | more } ]
```

- **all**
  Generates a list of all peers bound to the IPNE services, including the local and peer addresses. Also displays the TCP connections for every Session Manager.

- **service ipne_service_name**
  Generates a list of the peers associated with the specified IPNE service.

- **Summary**
  Generates a summary of all available IPNE peer statistics.

- `| { grep grep_options | more }`
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to monitor and troubleshoot MME connections to the IPNE client and peer.

**Example**

List all IPNE peers with a command similar to the following:

```
show ipne peers all
```
show ipsg service

Displays IP Service Gateway (IPSG) service information.

Product

eWAG
IPSG

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ipsg service \{ all \[\[ verbose \] counters \] \| name ipsg_service_name \[ counters \] \} \[ \| \{ grep grep_options \| more \} \]

- **all \[\[ verbose \] counters \]**
  - Displays information for all IPSG service(s) configured on the system.
  - **verbose**: Specifies to display detailed information.
  - **counters**: Specifies to display counters associated with IPSG services.

- **name ipsg_service_name \[ counters \]**
  - Specifies name of the IPSG service. `<ipsg_service_name>` must be an alphanumeric string of 1 through 63 characters.
  - **counters**: Specifies to display counters associated with IPSG services.

- **\| \{ grep grep_options \| more \}**
  - Specifies to pipe (send) the output of this command to the specified command. You must specify a command to which the output of this command should be sent.
  - For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to view information for all or a specific IPSG service.

Example

The following command displays information for all IPSG services configured on the system:

```plaintext
show ipsg service all
```

**Important**: Output descriptions for commands are available in the Statistics and Counters Reference.
show ipsg sessions

Displays IP Service Gateway (IPSG) session information.

Product
- eWAG
- IPSG

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ipsg sessions [ counters | full | summary ] [ all | callid call_id | ip-address ipv4_address | msid msid_number | peer-address ipv4_address | username user_name ] [ | { grep grep_options | more } ]

---

counters
Displays session counters for matching sessions.

full
Displays all available information for matching sessions.

summary
Displays a summary of available information for matching sessions.

all
Displays session information including call ID, NAI, and home address for all current IPSG sessions. This is the default behavior for the show ipsg sessions command.

callid call_id
Displays session information for a current IPSG session based on the specified call ID. call_id must be an 8-digit hexadecimal number.

ip-address ipv4_address
Displays session information for a specific IPSG session based on the subscriber IP address. ipv4_address must be specified in IPv4 dotted-decimal notation.

msid msid_number
Displays session information for a current IPSG session based on the specified MSID. msid_number must be an 8-digit hexadecimal number.
show ipsg session

**peer-address ipv4_address**
Displays session information for a current IPSG session based on the IP address of the device sending the RADIUS accounting messages.  
`ipv4_address` must be specified in IPv4 dotted-decimal notation.

**username user_name**
Displays session information for an IPSG session based on subscriber’s user name.  
`user_name` must be an alphanumeric string of 1 through 127 characters.

| { grep grep_options | more } |

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.  
For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**
Use this command to view IPSG session information.

**Example**
The following command displays all the existing IPSG service sessions on the system:

```
show ipsg session all
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show ipsg statistics

Displays IP Services Gateway (IPSG) service statistics.

**Product**
- eWAG
- IPSG

**Privilege**
- Security Administrator, Administrator, Operator, Inspector

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show ipsg statistics [ name ipsg_service_name | peer-address ipv4_address ] [ | { grep grep_options | more }]
```

- **name ipsg_service_name**
  Displays cumulative statistics of all IPSG sessions processed by the specified service since the last system restart or clear command.
  - **ipsg_service_name** must be the name of an IPSG service, and must be an alphanumeric string of 1 through 63 characters.

- **peer-address ipv4_address**
  Displays cumulative statistics of all IPSG sessions associated with the specified IP address of the device sending the RADIUS accounting messages. The statistics displayed are from the last system restart or clear command.
  - **ipv4_address** must be specified in IPv4 dotted-decimal notation.

- **| { grep grep_options | more }**
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**

Use this command to view IPSG service statistics.

**Example**

The following command displays cumulative IPSG session statistics on the system:

```
show ipsg statistics
```

The following command displays the cumulative IPSG session statistics for an IPSG service named **ipsg1**:

```
show ipsg statistics name ipsg1
```
show ipsg statistics name ipsgl

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show ipv6 access-group statistics

Displays statistics for each rule in all IPv6 access groups or a specified IPv6 access control group.

Product
HA

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:
[local]host_name#

Syntax

show ipv6 access-group statistics [ | { grep grep_options | more } ]

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to display the configured IPv6 access control groups in the current context.

Example

The following command displays the contents of an IPv6 access control group named ACGv6_4:

    show ipv6 access-group ACGv6_4
show ipv6 access-list

Displays the information for all IPv6 Access Control Lists (ACLs) or the named ACL. With no keyword supplied, a list of all access lists and their entries is displayed.

**Product**

HA

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show ipv6 access-list list_name [ | { grep grep_options | more } ]
```

`list_name`

Specifies the name of an existing ACL configured in the current context as an alphanumeric string of 1 through 47 characters.

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to display the configured IPv6 ACLs in the current context.

**Example**

The following command displays the contents of an IPv6 ACL named `ACLv6_4`:

```
show ipv6 access-list ACLv6_4
```
show ipv6 interface

Displays statistical and configuration information for the IPv6-based interfaces, including a Virtual Routing and Forwarding (VRF) table for a specific context.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec
The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show ipv6 interface [ name intfc_name ] [ statistics ] [ summary ] [ vrf vrf-name ] [ | { grep grep_options | more } ]
```

- **name intfc_name**
  Displays information for an existing interface specified as an alphanumeric string of 1 through 79 characters. If no interface name is specified, the information for all IPv6 interfaces is displayed.

- **statistics**
  Displays the session statistics of all ingress and egress packets processed through this IPv6 interface.

- **summary**
  Displays summarized information about requested IPv6 interfaces.

- **vrf vrf_name**
  Displays Virtual Routing and Forwarding (VRF) routing information for an existing VRF specified as an alphanumeric string of 1 through 63 characters.

| { grep grep_options | more } |

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to display the summarized of detailed configuration and statistical information for a configured IPv6 interface. This information can be used to verify and/or troubleshoot communication difficulties between to a remote host/node.

**Example**
The following command displays the interface information, including statistics, for the IPv6 interface IPv6Interface_2.

```
show ipv6 interface IPv6Interface_2 statistics
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show ipv6 neighbors

Displays the neighbor table for all IPv6 addresses or a specified IPv6 address in the current context.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show ipv6 neighbors [ ipv6_address ] [ vrf vrf-name ] [ | { grep grep_options | more } ]
```

- `ipv6_address`
  Displays information for an existing IPv6 address specified in IPv6 colon-separated-hexadecimal notation. If no IPv6 address is specified, the information for all IPv6 addresses is displayed.

- `vrf vrf_name`
  Displays Virtual Routing and Forwarding (VRF) routing information for an existing VRF specified as an alphanumeric string of 1 through 63 characters.

  | { grep grep_options | more }

  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

  For details on the usage of `grep` and `more`, refer to the `Regulating a Command’s Output` section of the `Command Line Interface Overview` chapter.

Usage

Use this command to display neighbor information for IPv6 address(es) in the current context. This information can be used to verify and/or troubleshoot communication difficulties between to a remote host/node.

Example

The following command displays the neighbor information for the IPv6 address `ffe:ffff:101::230:6eff:fe04:d9aa`.

```
show ipv6 neighbor ffe:ffff:101::230:6eff:fe04:d9aa
```

**Important:** Output descriptions for commands are available in the `Statistics and Counters Reference`. 
show ipv6 ospf

Displays information regarding the configuration of the OSPFv3 Protocol on this system.

Product
- PDSN
- HA
- GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ipv6 ospf [ database | debugging | interface | neighbor | route | virtual-links ] [ verbose [ verbose ] [ | { grep grep_options | more } ]

show ipv6 ospf database [ adv-router ipv4-address ] [ ls-type { external | inter-prefix | inter-router | intra-prefix | link | network | router }]

show ipv6 ospf debugging

show ipv6 ospf interface

show ipv6 ospf neighbor [ details]

show ipv6 ospf route [ summary ]

show ipv6 ospf virtual-links

show ipv6 ospf database

Displays the OSPFv3 database including the following components.

- **adv-router ipv4-address**: Displays OSPF database information from the advertising router specified as an IP address in IPv4 dotted-decimal notation.

- **ls-type**: Displays the specified Link-State Advertisement (LSA) type, which can be one of the following:
  - **external**: Display External LSA information
  - **inter-prefix**: Displays Inter Area Prefix LSA information
  - **inter-router**: Displays Inter Area Router LSA information
  - **intra-prefix**: Displays Intra Area Prefix LSA information
  - **link**: Displays Link LSA information
  - **network**: Displays Network LSA information
**show ipv6 ospf**

Displays all OSPFV3 information.

<table>
<thead>
<tr>
<th>Usage</th>
</tr>
</thead>
</table>

Use this command to see all OSPFV3 information.

**Example**

The following command displays ipv6 ospf information:

```
show ipv6 ospf
```
show ipv6 pool

Displays information related IPv6 Pool configuration/state.

Product
PDSN
GGSN
ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ipv6 pool [ group-name group-name ] [ pool-name pool-name ] [ summary ] [ verbose ] [ |
                          { grep grep_options | more } ]

| group-name group-name
| Displays IP address pool information for an existing group-name specified as an alphanumeric string of 1 through 31 characters.

| pool-name pool-name
| Displays IPv6 address pool information for an existing pool name specified as an alphanumeric string of 1 through 31 characters.

| summary
| Displays summary information about all IP address pools; this is the default.

| verbose
| Displays detailed information about all IP address pools.

| { grep grep_options | more }
| Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

| For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to see all the ipv6 pool information.

Example
The following command displays ipv6 pool information:
show ipv6 pool
show ipv6 prefix-list

Displays information related to an IPv6 prefix list.

**Product**
PDSN
GGSN
ASN-GW

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show ipv6 prefix-list [ detail prefix-list-name ] [ name prefix-list-name [ ip-address/mask
[ longer ] [ match-first ] [ seq seq_value ] ] [ summary prefix-list-name ] [ | [ grep
grep_options | more ] ]
```

- **detail prefix-list-name**
  Displays detailed IP address information for an existing prefix-list specified as an alphanumeric string of 1 through 79 characters.

- **name prefix-list-name**
  Displays IP address information for an existing prefix-list specified as an alphanumeric string of 1 through 79 characters.

- **ip-address/mask**
  Specifies an IPv6 Network Address/Mask Bits combination in CIDR notation.

- **longer**
  Displays IP address prefix-list details in longer format.

- **match-first**
  Displays first matched IP address prefix-list details.

- **seq seq_value**
  Specifies the sequence number as an integer from 1 through 4294967295.
  seq_value is the integer value between 1 through 4294967295.

- **summary prefix-list-name**
  Displays prefix-list summary for an existing prefix-list specified as an alphanumeric string of 1 through 79 characters.
**Usage**

Use this command to see all the ipv6 prefix-list information.

**Example**

The following command displays ipv6 prefix-list information:

```
show ipv6 prefix-list
```
show ipv6 route

Displays information related to specific route for current context.

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ipv6 route [ ip-address/mask ] [ vrf vrf-name ] [ | { grep grep_options | more } ]

ip-address/mask

Specifies an IP address entered using IPv6 colon-separated-hexadecimal and CIDR notation.

vrf vrf-name

Displays Virtual Routing and Forwarding (VRF) routing information for an existing VRF specified as an alphanumeric string of 1 through 63 characters.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to see all the ipv6 route information.

Example

The following command displays ipv6 route information:

```
show ipv6 route 2001:0db8:85a3:0000:0000:8a2e:0370:7334/5
```
show ipv6 route-access-list

Displays the route access list.

Product

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show ipv6 route-access-list [ route-access-list ] [ | { grep grep_options | more } ]
```

route-access-list
route-access-list is an alphanumeric string of 1 through 79 characters.

| { grep grep_options | more } |
|-----------------------------|
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to see all the IPv6 route access list information.

Example
The following command displays ipv6 route access list information:

```
show ipv6 route-access-list
```
show iups-service

Displays information for Iu-PS services in the current context. The Iu-PS interface links the radio network controller (RNC) with the packet switched core network.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax
show iups-service { all | name srvc_name} [ gtpu-table | rnc { all | id rnc_id } ] [ | { grep grep_options | more } ]

- **all**
  Shows information for all configured IuPS services.

- **name srvc_name**
  Specifies an existing IuPS service as an alphanumeric string of 1 through 63 characters.

- **gtpu-table**
  Displays the configured GTPU database.

- **rnc all**
  Displays information for all configured RNCs.

- **rnc rnc_id**
  Specifies the identification number of an existing RNC configuration instance as an integer from 0 through 4095.

- | { grep grep_options | more }
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

Usage

Iu-PS services control the interface between the SGSN and the RNCs in the UMTS radio access network (UTRAN). Iu-PS services include the control plane and the data plane between these nodes.
Use this command to display information for a specific Iu-PS service or for all Iu-PS services configured within the context. A filtering keyword can limit the display to only information for a specific RNC or for a GTPU table in the Iu-PS service configuration.

**Example**

The next command displays information for all Iu-PS services configured in the current context:

```
show iups-service all
```

This command displays information for a specific RNC for a specific Iu-PS services:

```
show iups-service name iups-svc-1 rnc 123name
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 

---

**Exec Mode show Commands (H-L)**

**show iups-service**
show l2tp sessions

Displays information for Layer 2 Tunneling Protocol (L2TP) tunnels.

Product
LNS
PDSN
GGSN
HA

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show l2tp sessions [ full | summary | counters ] [ all | callid id | username name | msid ms_id |lac-service service_name | lns-service service_name peer-address [ operator ] peer_address ]

full
Displays all available information for the specified sessions.

summary
Displays a summary of available information for the specified sessions.

counters
Displays counters for the specified L2TP sessions.

all
Displays all current sessions.

callid id
Displays session information for the call ID. specified an 8-byte hexadecimal number. The output of the command show l2tp tunnels contains a field labeled Callid Hint which lists the call ID information to use with this command.

username name
Displays session information for an existing subscriber specified as an alphanumeric string of 1 through 127 characters. Wildcard characters $ and * are allowed.
msid ms_id
Displays session information for the MSID specified as 7 to 16 digits for an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed.

lac-service service_name
Displays all L2TP sessions in the specified LAC service.

lns-service service_name
Displays all L2TP sessions in the specified LNS service.

peer-address [ operator ] peer_address
Displays all L2TP sessions to the destination (peer LNS) specified as an IP address in IPv4 dotted-decimal notation.
In conjunction with sessions keyword, indicates a range of peers is to be displayed.
peer-address [ operator ] peer_address is specified using IPv4 dotted-decimal notation.
operator implies how to logically specify a range of peer-address and it must be one of the following:
• <: IP address less than the specified peer_address
• >: IP address less than the specified peer_address
• greater-than: IP address less than the specified peer_address
• less-than: IP address less than the specified peer_address

Usage
Use this command to show information for sessions in the current context.

Important: If this command is executed from within the local context, cumulative session information is displayed for all contexts.

Example
The following command displays cumulative statistics for all sessions processed within the current context:

    show l2tp sessions

The following command displays all information pertaining to the L2TP session of a subscriber named isp1vpnuser1:

    show l2tp session full username isp1vpnuser1

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show l2tp statistics

Displays statistics for all Layer 2 Tunneling Protocol (L2TP) tunnels and sessions.

**Product**
- LNS
- PDSN
- GGSN
- HA

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
show l2tp statistics [ lac-service service_name | ins-service service_name | peer-address peer_ip_address ]
```

- **lac-service service_name**
  Displays L2TP statistics for all tunnels and sessions in an existing L2TP Access Concentrator (LAC) service specified as an alphanumeric string of 1 through 63 characters.

- **ins-service service_name**
  Displays L2TP statistics for all tunnels and sessions in an existing L2TP Network Server (LNS) service specified as an alphanumeric string of 1 through 63 characters.

- **peer-address peer_address**
  Displays L2TP statistics for all tunnels and sessions to the destination (peer LNS) at the IP address specified in IPv4 dotted-decimal notation.

**Usage**

Use this command to display statistics for L2TP services.

**Example**

The following command displays statistics for a specific LAC service named **vpn1**:

```
show l2tp statistics lac-service vpn1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show l2tp tunnels

Displays information for Layer 2 Tunneling Protocol (L2TP) tunnels.

Product
- LNS
- PDSN
- GGSN
- HA

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show l2tp tunnels [ full | summary | counters ] [ all | callid id | username name | msid ms_id | lac-service service_name | lns-service service_name | peer-address [ operator ] peer_address ]
```

- **full**
  Displays all available information for the specified tunnels.

- **summary**
  Displays a summary of available information for the specified tunnels.

- **counters**
  Displays counters for the specified L2TP tunnels.

- **all**
  Displays all current tunnels.

- **callid id**
  Displays tunnel information for the call id specified as an 8-digit hexadecimal number. The output of the command `show l2tp tunnels` contains a field labeled Callid Hint which lists the call id information to use with this command.

- **username name**
  Displays tunnel information for an existing subscriber specified as an alphanumeric string of 1 through 127 characters. Wildcard characters $ and * are allowed.
**msid ms_id**
Displays tunnel information for the MSID specified as 7 to 16 digits for an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed.

**lac-service service_name**
Displays all L2TP tunnels in the specified LAC service.

**lns-service service_name**
Displays all L2TP tunnels in the specified LNS service.

**peer-address [ operator ] peer_address**
Displays all L2TP tunnels to the destination (peer LNS) at the IP address specified in IPv4 dotted-decimal notation.
In conjunction with tunnels keyword, indicates a range of peers is to be displayed.
**peer-address [ operator ]**: Specifies a peer address using IPv4 dotted-decimal notation.
operator implies how to logically specify a range of peer-address and it must be one of the following:
- •<: IP address less than the specified peer_address
- •>: IP address less than the specified peer_address
- •greater-than: IP address less than the specified peer_address
- •less-than: IP address less than the specified peer_address

**Usage**
Use this command to show information for tunnels in the current context.

**Example**
The following command displays all of the tunnels currently being facilitated by LAC services within the current context:

```
show l2tp tunnels all
```

The following command displays information pertaining to the L2TP tunnel(s) established for a LAC-service named vpn1:

```
show l2tp tunnels full lac-service vpn1
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show lac-service

Displays the information for all L2TP Access Concentrator (LAC) services or for a particular LAC service.

Product
- PDSN
- HA
- GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show lac-service { all | name service_name } [ | { grep grep_options | more } ]

- all
  Display information for all LAC services.

- name service_name
  Display information only for an existing LAC service specified as an alphanumeric string of 1 through 63 characters.

- | { grep grep_options | more }
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to list information for LAC services configured on this system.

Example
The following commands display information for all LAC services and the LAC service named lac1, respectively.

```
show lac-service all
show lac-service name lac1
```
show lawful-intercept

Refer to the *Lawful Intercept Configuration Guide* for a full description of this command.
show lawful-intercept ssdf statistics

Refer to the *Lawful Intercept Configuration Guide* for a description of these statistics.
show ldap connection all

Displays all details about the Lightweight Directory Access Protocol (LDAP) subsystem.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show ldap connection all [ | { grep grep_options | more } ]

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Display all details about the LDAP subsystem.

Example
The following command displays full information about the LDAP subsystem.

show ldap connection all
show leds

Displays the current status of the light emitting diodes (LEDs) for a specific card or all cards.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
show leds { all | card_num } [ | { grep grep_options | more } ]
```

- `all | card_num`
  - `all`: Displays the LED status for all cards.
  - `card_num`: Displays the LED status for the card specified by its slot number.

- `| { grep grep_options | more }`
  - Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  - For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**
Display the status of the LEDs as a part of an automated periodic script which checks the LEDs of the chassis.

**Important:** This command is not supported on all platforms.

**Example**

The following commands display the LED status for all cards and only card 8, respectively.

```
show leds all
show leds 8
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*.
show license information

Displays information about the licenses installed on this system, as well as the maximum number of sessions.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show license information { key_name | full } | { key } [ | { grep grep_options | more } ]

<table>
<thead>
<tr>
<th>key_name</th>
<th>full</th>
</tr>
</thead>
<tbody>
<tr>
<td>key_name: Displays the information for an existing license key specified as an alphanumeric string of 1 of 1 through 500 characters.</td>
<td></td>
</tr>
<tr>
<td>full: Displays the full features and quantities without any hardware limits in place.</td>
<td></td>
</tr>
</tbody>
</table>

| key: |
| Displays the installed keys in encrypted format. |

| | { grep grep_options | more } |
| Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. |
| For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter. |

Usage
Displays the license information to verify the proper keys have been installed. This command is also helpful in troubleshooting user system access due to the maximum number of sessions being reached.

Example
The following displays the encrypted installed key and the information for sampleKey respectively.

show license information sampleKey

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show linecard

Displays information on the interface cards installed in the rear of the system chassis.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show linecard { dlci-utilization card# | table } [ | { grep grep_options | more } ]
```

- **dlci-utilization card#**
  
  SGSN only
  
  In tabular format, displays current data link utilization (in 5 minute and 15 minute breakdowns) information for all Frame Relay ports on the specified CLC-type line card. Data links are referred to by data link connection identifiers (DLCI).
  
  `card#` - Identifies the chassis slot number where the line card resides. Enter an integer from 1 to 48.

- **table**
  
  Displays information on all line card slots in tabular format.

  ```
  | { grep grep_options | more }
  ```

  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

  For details on the usage of `grep` and `more`, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to show the line card information

- to verify hardware inventories and installed components.
- to review DLCI utilization for a specific Frame Relay channelized line card.

**Important:** This command is not supported on all platforms.

**Example**

Use the following command to display a table with information identifying all line cards installed in the chassis:

```
show linecard table
```
Use the following command to display DLCI utilization information for all ports on CLC card in slot 27:

```
show linecard dlc-i-utilization 27
```

**Important:** Output descriptions for `show` commands are available in the *Statistics and Counters Reference*. 
show link-aggregation

Displays information about any Link Aggregation Group (LAG) configured in this system. A LAG works by exchanging control packets via Link Aggregation Control Protocol (LACP) over configured physical ports with peers to reach agreement on an aggregation of links. The LAG sends and receives the control packets directly on physical ports.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show link-aggregation { info | lACP info | statistics } group group_number [ | { grep grep_options | more } ]

show link-aggregation table [all] [ | { grep grep_options | more } ]

show link-aggregation utilization table [ | { grep grep_options | more } ]

{ info | lACP info | statistics }
Displays the following categories of LAG information:

•info – LAG configuration and operating state
•lACP info – LACP Rx and Tx counters
•statistics – LAG Rx and Tx counters and data throughput statistics

group group_number
Specifies the LAG number as an integer from 1 through 1023.

table [all] group_number
Displays information about the current LAG port configuration in tabular form. The all option includes ATM PVCs for ATM ports (ASR 5000 only).

utilization table
Displays LAG utilization data in tabular form.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.
**Usage**

Use this command to display information about any Link Aggregation Group (LAG) configured in this system.

**Example**

The following command displays configuration information for LAG number 100:

```
show link-aggregation info group 100
```

**Important:** Output descriptions for `show` commands are available in the *Statistics and Counters Reference*.
show linkmgr

Displays statistics for the link manager (linkmgr).

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show linkmgr { all | instance instance } [ parser | | ]
```

- **all**
  Display statistics for all link managers.

- **instance instance**
  Display statistics for a single instance of a link manager specified as an integer from 1 to 4.

  | { grep grep_options | more } |

  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

Usage

This command displays statistical information for the SGSN’s link manager which handles the layer between the session manager and the SS7 functionality downwards from layer 3.

Example

Use the following command to display the statistics for link manager 4:

```
show linkmgr 4
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show llc statistics

Displays traffic statistics for the GPRS logical link-control (LLC) layer.

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show llc statistics [ gprs-service srvc_name ] [ verbose ] [ | { grep grep_options | more } ]

**gprs-service srvc_name**

Displays the statistics for an existing GPRS service specified as an alphanumeric string of 1 through 63 characters.

**verbose**

Displays all possible statistics for specified command or keyword.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. For more information on the usage of *grep* and *more*, refer to the *Regulating a Command’s Output* section of the Command Line Interface Reference.

Usage

This command can display either a summarized or full (verbose) view of statistics collected for the traffic that has gone through the LLC layer for either all GPRS services or for a specified GPRS service.

Example

The following command displays the frame Tx/Rx LLC statistics for GPRS service *gprs1*:

    show llc statistics gprs-service gprs1
show llc status

Displays status information for the GPRS logical link-control (LLC) layer.

**Product**
SGSN

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show llc status gprs-service srvc_name sessmgr instance instance { dlci ms-id ms_id sapi sapid | lsap sapid sapid | ms ms_id | usap sapid sapid [ | { grep grep_options | more } ] }
```

- `gprs-service srvc_name` Displays the LLC layer status for an existing GPRS service specified as an alphanumeric string of 1 through 63 characters.

- `sessmgr instance instance` Displays the LLC status for a session manager instance specified as an integer. The range varies depending upon the release:
  - for releases prior to 14.0, the range is from 1 to 4294967295.
  - for releases 14.0 and later, the range is from 1 to 384.

- `dlci ms-id ms_id [ sapi sapid ]` Displays the LLC status for a specific data link connection identifier (DLCI) between the LLC and the mobile station (MS). `ms_id` must be an integer from 0 to 65536 that identifies the DLCI interface connecting to a specific MS.
  - `sapi`: Filters the display of the LLC status information to focus on a specific service access point interface (SAPI) within the specified DLCI specified as an integer from 1 to 11

- `lsap sapid` Refines the display of the LLC status to focus on a specific lower service access point interface (LSAP) specified as an integer from 0 to 65536.

- `ms-id ms_id` Displays the LLC status for a connected MS specified as an integer from 0 to 65536.

- `usap sapid` Refines the display of the LLC statistics to focus on a specific upper service access point interface (USAP) specified as an integer from 0 to 65536.
show llc status

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which
the output of this command will be sent.
For more information on the usage of grep and more, refer to the Regulating a Command’s Output section
of the Command Line Interface Reference.

Usage
This command can display either a summarized or full (verbose) view of statistics collected for the traffic that
has gone through the LLC layer for either all GPRS services or for a specified GPRS service.

Example
The following command displays the frame Tx/Rx LLC statistics for GPRS service gprs1:

    show llc statistics gprs-service gprs1
show lma-service

Displays statistic and counter information for Local Mobility Anchor (LMA) services on this system.

**Product**
P-GW
SAEGW

**Privilege**
Inspector

**Mode**
Exec
The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
show lma-service all
show lma-service name service_name
show lma-service session [ all | callid id | counters | full | ipv6-address { < address | > address | address | greater-than address [ less-than address ] | less-than address [ greater-than address ] } | summary | username name ]
show lma-service statistics [ lma-service name ] ] [ | { grep grep_options | more } ]
```

---

**all**
Displays information about all configured LMA services on this system.

**name service_name**
Displays configuration information for an existing LMA service specified as an alphanumeric string of 1 through 63 characters.

**session [ all | callid id | counters | full | ipv6-address { < address | > address | address | greater-than address [ less-than address ] | less-than address [ greater-than address ] } | summary | username name ]**
Displays session information filtered by the following parameters:
all: Displays all active LMA sessions using LMA services on the system.
callid id: Displays available session information for the call identification number specified as an eight-byte hexadecimal number.
counters: Displays session counters for active LMA sessions using LMA services on the system. This keyword can also be filtered by the following:
* all
* callid
* ipv6-address
* username
Refer to the keyword descriptions in this command for information regarding these filters.

**full:** Displays additional session information for active LMA sessions using LMA services on the system. This keyword includes the information in the output of the **all** keyword plus additional information. This keyword can also be filtered by the following:

- **all**
- **callid**
- **ipv6-address**
- **username**

Refer to the keyword descriptions in this command for information regarding these filters.

**ipv6-address:**

- `<address and less-than address>`: Displays summarized information for a group of IPv6 addresses that are less than the specified IPv6 address using one of these keywords. A range can be specified by including an address with the **greater-than** option. *address* must be specified in IPv6 colon-separated-hexadecimal notation.

- `>> address and greater-than address`: Displays summarized information for a group of IPv6 addresses that are greater than the specified IPv6 address using one of these keywords. A range can be specified by including an address with the **less-than** option. *address* must be specified in IPv6 colon-separated-hexadecimal notation.

- `address`: Displays summarized information for a specific IPv6 address using an LMA service on this system. *address* must be specified in IPv6 colon-separated-hexadecimal notation.

**summary:** Displays the number of LMA sessions currently active for LMA services configured on the system.

**username name:** Displays available session information for an existing user specified as an alphanumeric string of 1 through 127 characters.

**statistics [ lma-service name ]**

**lma-service name:** Displays LMA service statistics for an existing LMA service specified as an alphanumeric string of 1 through 63 characters.

| { grep grep_options | more } |

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to view configuration information for LMA services on this system.

**Example**

The following command displays service statistics for the LMA service named **lmal:**

```
show lma-service name lmal
```
show lns-service

Displays the information for all L2TP Network Server (LNS) services or for a particular LNS service.

**Product**
- PDSN
- HA
- GGSN
- LNS

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show lns-service { all | name service_name } [ | { grep grep_options | more } ]
```

- `all`
  Display information for all LNS services.

- `name service_name`
  Displays information only for an existing LNS service specified as an alphanumeric string of 1 through 63 characters.

- `| { grep grep_options | more }`
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**

Use this command to list information for LNS services configured on this system.

**Example**

The following commands display information for all LNS services and the LNS service named `lns1`, respectively.

```
show lns-service all
show lns-service name lns1
```
show local-policy

Displays information pertaining to local QoS policy services.

Product
P-GW
SAEGW

Privilege
Security Administrator

Mode
Exec
The following prompt is displayed in the Exec mode:
[local] host_name#

Syntax

show local-policy statistics { all | service service_name | summary } | { grep grep_options | more }

Display statistics pertaining to local QoS services.
all: Displays information for all local QoS services.
service service_name: Displays statistics only for an existing local QoS service specified as an alphanumeric string of 1 through 64 characters.
summary: Displays summarized statistics all local QoS services.

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to display statistics for local QoS policies on this system.

Example
The following command displays statistics for the local QoS policy named sample1.
show local-policy statistics service sample1
show local-user

Displays information pertaining to local-user accounts.

Product
All

Privilege
Security Administrator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show local-user [ [ username name ] [ inactive filter ] [ verbose | wide ] | statistics [ verbose ] ]

username name

Displays information for an existing local-user administrative account specified as an alphanumeric string of 3 through 16 characters that is case sensitive. If a username is not specified, information is displayed for all local users.

inactive filter

Specifies a filter for displaying inactive local-user accounts:

*< days: Displays accounts that have been inactive less than the specified number of days.
*> days: Displays accounts that have been inactive more than the specified number of days.
*greater-than days: Displays accounts that have been inactive more than the specified number of days.
*less-than days: Displays accounts that have been inactive less than the specified number of days.

days can be configured to an integer from 1 through 365.

[ verbose | wide ]

Specifies how the information is to be displayed as one of the following options:

*verbose: The data is displayed in list format. Additional information is provided beyond what is displayed when the wide option is used.
*wide: The data is displayed in tabular format. This is the default setting.

statistics [ verbose ]

Displays local-user statistics.
Using the verbose keyword displays additional statistics.
Usage
Use this command to display information and statistics on local-user administrative accounts.

Example
The following command displays detailed information on local-user administrative accounts that have been inactive for more than 10 days:

```
show local-user inactive greater-than 10 verbose
```

The following command displays detailed information for a local-user account named Test:

```
show local-user username Test verbose
```

The following command displays detailed local-user account statistics:

```
show local-user statistics verbose
```

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show location-service

Displays information and statistics for all location services or for a specific location service.

Product
MME
SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show location-service { service { all | name service_name } | statistics { all | service service_name } [ | { grep grep_options | more } ]

| service { all | name service_name } |
|--------------------------------------|
| Display configuration information pertaining to location services. |
| all: Displays information for all location services. |
| name service_name: Displays information only for an existing location service specified as an alphanumeric string of 1 through 63 characters. |

| statistics { all | service service_name } |
|------------------------------------------|
| Display statistics pertaining to location services. |
| all: Displays statistics for all location services. |
| name service_name: Displays statistics only for an existing location service specified as an alphanumeric string of 1 through 64 characters. |

| | { grep grep_options | more } |
|--------------------------------|
| Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. |
| For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter. |

Usage
Use this command to list configuration information and statistics for location services configured on this system.

Example
The following commands display information for all location services and the location service named location_service1, respectively.

show location-service service all
show location-service service name location_service1

The following command displays statistics for the location service named `location_service1`.

`show location-service statistics service location_service1`
show logging

Displays the defined logging filters for the current context.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show logging [ active | verbose ] [ | { grep grep_options | more } ]

active | verbose

active: Displays only active CLI logging filter information in concise format.
verbose: Displays as much information as possible.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

View log filters to troubleshoot disk utilization issues.

Example

show logging

show logging active

show logging verbose

show logging active verbose
show logical-port utilization table

Displays logical port (VLAN and NPU) utilization for a specified interface port.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show logical port utilization table slot/port [vlan { 5-minute | hourly }] [ | { grep grep_options | more } ]
```

- **slot/port**
  Specifies the port for which logical-port statistics will be displayed. The slot and port must refer to an installed card and port.

- **vlan { 5-minute | hourly }**
  Displays only active VLAN information for the specified collection interval.
    - 5-minute: Displays 5-minute utilization intervals for the past 24 hours.
    - hourly: Displays hourly utilization intervals for the past 24 hours.

- **| { grep grep_options | more }**
  Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**

View logical port (VLAN) statistics for 5-minute intervals on port 17/1.

**Example**

```
show logical-port utilization table 17/1 vlan 5-minute
```
show logs

Displays active and inactive logs filtered by the options specified.

show logs [ active ] [ inactive ] [ callid call_id ] [ event-verbosity evt VERBOSENESS ] [ facility facility ] [ level severity level ] [ pdu-data pdu-format ] [ pdu-verbosity pdu VERBOSENESS ] [ proclet facility ] [ since from date_time [ until to date_time ] ] [ | { grep grep_options | more } ]

active
Displays data from active logs.

inactive
Displays data from inactive logs.

callid call_id
Displays log information only for a call ID specified as a 4-digit hexadecimal number.

event-verbosity evt VERBOSENESS
Specifies the level of verboseness to use in displaying of event data as one of:

• min - displays minimal information about the event. Information includes event name, facility, event ID, severity level, date, and time.
• concise - displays detailed information about the event, but does not provide the event source within the system.
• full - displays detailed information about event, including source information, identifying where within the system the event was generated.

facility facility
Specifies the facility to modify the filtering of logged information for as one of:

• a10: A10 interface facility
• a11: A11 interface facility
• a11mgr: A11 Manager facility
• aaa-client: Authentication, Authorization and Accounting (AAA) client facility
• aaamgr: AAA manager logging facility
• aaaproxy: AAA Proxy facility
• aal2: ATM Adaptation Layer 2 (AAL2) protocol logging facility
• acl-log: Access Control List (ACL) logging facility
• acsctrl: Active Charging Service (ACS) Controller facility
• acsmgr: ACS Manager facility
• afctrl: Fabric Controller facility [ASR 5500 only]
• afmgr: Fabric Manager logging facility [ASR 5500 only]
• alarmctrl: Alarm Controller facility
• alcap: Access Link Control Application Part (ALCAP) protocol logging facility
• alcapmgr: ALCAP manager logging facility
• all: All facilities
• asngwmgr: Access Service Network (ASN) Gateway Manager facility
• asnpcmgr: ASN Paging Controller Manager facility
• bfd: Bidirectional Forwarding Detection (BFD) protocol logging facility
• bgp: Border Gateway Protocol (BGP) facility
• bindmux: IPCF BindMux-Demux Manager logging facility
• bngmgr: Broadband Network Gateway (BNG) Demux Manager logging facility
• bssap+: Base Station Sub-system Application Part+ protocol facility for the login interface between the SGSN and the MSC/VLR (2.5G and 3G)
• bssgp: Base Station Sub-system GPRS Protocol logging facility handles exchange information between the SGSN and the BSS (2.5G only)
• callhome: Call Home application logging facility
• cap: CAMEL Application Part (CAP) logging facility for protocol used in prepaid applications (2.5G and 3G)
• chsmgr: Cell Broadcasting Service (CBS) logging facility [HNBGW]
• cdf: Charging Data Function (CDF) logging facility
• cgw: Converged Access Gateway (CGW) logging facility
• cli: Command Line Interface (CLI) logging facility
• cmp: Certificate Management Protocol (IPSec) logging facility
• connectedapps: SecGW ASR 9000 oneP communication protocol
• connproxy: Controller Proxy logging facility
• credit-control: Credit Control (CC) facility
• cscf: IMS/MMD Call Session Control Function (CSCF)
• cscfcpgmgr: CSCF CPMGR logging facility
• cscfmgr: SIP CSCF Manager facility
• cscfnpdb: CSCF Number Portability Database (NPDB) logging facility
• cscfrtcp: IMS/MMD CSCF RTCP log facility
**cscfrtp**: IMS/MMD CSCF RTP log facility
**cscfttmgmr**: SIP CSCF Tunnel and Transport Manager facility
**csp**: Card/Slot/Port controller facility
**css**: Content Service Selection (CSS) facility
**css-sig**: CSS RADIUS Signaling facility
**cx-diameter**: Cx Diameter Messages facility [CSCF <-> HSS]
**data-mgr**: Data Manager Framework logging facility
**dcardctrl**: IPSec Daughter Card Controller logging facility
**dcardmgr**: IPSec Daughter Card Manager logging facility
**demuxmgr**: Demux Manager API facility
**dgmbmgr**: Diameter Gmb Application Manager logging facility
**dhcp**: Dynamic Host Configuration Protocol (DHCP) logging facility
**dhcpv6**: DHCPv6
**dhost**: Distributed Host logging facility
**diabase**: Diabase messages facility
**diameter**: Diameter endpoint logging facility
**diameter-acct**: Diameter Accounting
**diameter-auth**: Diameter Authentication
**diameter-dns**: Diameter DNS subsystem
**diameter-ecs**: ACS Diameter signaling facility
**diameter-hdd**: Diameter Horizontal Directional Drilling (HDD) Interface facility
**diameter-svc**: Diameter Service
**diamproxy**: DiamProxy logging facility
**dpath**: IPSec Data Path facility
**drvctrl**: Driver Controller facility
**dpath**: IPSec Data Path logging facility
**drvctrl**: Driver Controller logging facility
**doulosuemgr**: Doulos (IMS-IPSec-Tool) user equipment manager
**eap-diameter**: Extensible Authentication Protocol (EAP) IP Security facility
**eap-ipsec**: Extensible Authentication Protocol (EAP) IPSec facility
**eap-sta-s6a-s13-s6b-diameter**: EAP/STA/S6A/S13/S6B Diameter messages facility
**ecs-css**: ACSMGR <-> Session Manager Signalling Interface facility
**egtpc**: eGTP-C logging facility
**egtpmgr**: enhanced GPRS Tunneling Protocol (eGTP) manager logging facility
**egtpu**: eGTP-U logging facility
**embms**: evolved Multimedia Broadcast Multicast Services Gateway facility
**embms**: eMBMS Gateway Demux facility
- **epdg**: evolved Packet Data (ePDG) gateway logging facility
- **event-notif**: Event Notification Interface logging facility
- **evlog**: Event log facility
- **famgr**: Foreign Agent manager logging facility
- **firewall**: Firewall logging facility
- **fng**: Femto Network Gateway (FNG) logging facility
- **gbmgr**: SGSN Gb Interface Manager facility
- **gmm**:
  - For 2.5G: Logs the GPRS Mobility Management (GMM) layer (above LLC layer)
  - For 3G: Logs the access application layer (above the RANAP layer)
- **gprs-app**: GPRS Application logging facility
- **gprs-ns**: GPRS Network Service Protocol (layer between SGSN and the BSS) logging facility
- **gq-rx-tx-diameter**: Gq/Rx/Tx Diameter messages facility
- **gss-gcdr**: GTPP Storage Server GCDR facility
- **gtpc**: GTP-C protocol logging facility
- **gtpcmgr**: GTP-C protocol manager logging facility
- **gtp**: GTP-prime protocol logging facility
- **gtpu**: GTP-U protocol logging facility
- **gtpumgr**: GTP-U Demux manager
- **gx-ty-diameter**: Gx/Ty Diameter messages facility
- **gy-diameter**: Gy Diameter messages facility
- **h248prt**: H.248 port manager facility
- **hamgr**: Home Agent manager logging facility
- **hat**: High Availability Task (HAT) process facility
- **hdctrl**: HD Controller logging facility
- **henbapp**: Home Evolved NodeB (HENB) App facility
- **henbgw**: HENB-GW facility
- **henbgw-pws**: HENB-GW Public Warning System logging facility
- **henbgw-sctp-acs**: HENB-GW access Stream Control Transmission Protocol (SCTP) facility
- **henbgw-sctp-nw**: HENBGW network SCTP facility
- **henbgwdemux**: HENB-GW Demux facility
- **henbgwmgr**: HENB-GW Manager facility
- **hnb-gw**: HNB-GW (3G Femto GW) logging facility
- **hnbmgr**: HNB-GW Demux Manager logging facility
- **hss-peer-service**: Home Subscriber Server (HSS) Peer Service facility
- **igmp**: Internet Group Management Protocol (IGMP)
- **ikev2**: Internet Key Exchange version 2 (IKEv2)
• **ims-authorizatn**: IP Multimedia Subsystem (IMS) Authorization Service facility
• **ims-sh**: HSS Diameter Sh Interface Service facility
• **imsimgr**: SGSN IMSI Manager facility
• **imsue**: IMS User Equipment (IMSUE) facility
• **ip-arp**: IP Address Resolution Protocol facility
• **ip-interface**: IP interface facility
• **ip-route**: IP route facility
• **ipms**: Intelligent Packet Monitoring System (IPMS) logging facility
• **ipne**: IP Network Enabler (IPNE) facility
• **ipsec**: IP Security logging facility
• **ipsecdemux**: IPSec demux logging facility
• **ips**: IP Service Gateway interface logging facility
• **ipsgmgr**: IP Services Gateway facility
• **ipsp**: IP Pool Sharing Protocol logging facility
• **kvstore**: Key/Value Store (KVSTORE) Store facility
• **l2tp-control**: Layer 2 Tunneling Precool (L2TP) control logging facility
• **l2tp-data**: L2TP data logging facility
• **l2tpdemux**: L2TP Demux Manager logging facility
• **l2tpmgr**: L2TP Manager logging facility
• **lagmgr**: Link Aggregation Group (LAG) manager logging facility
• **lcs**: Location Services (LCS) logging facility
• **ldap**: Lightweight Directory Access Protocol (LDAP) messages logging facility
• **li**: Refer to the *Lawful Intercept Interface Reference* for a description of this command.
• **linkmgr**: SGSN/BSS SS7 Link Manager logging facility (2.5G only)
• **llc**: Logical Link Control (LLC) Protocol logging facility; for SGSN: logs the LLC layer between the GMM and the BSSGP layers for logical links between the MS and the SGSN
• **local-policy**: Local Policy Service facility
• **location-service**: Location Services facility
• **m3ua**: M3UA Protocol logging facility
• **magmgr**: Mobile Access Gateway manager logging facility
• **map**: Mobile Application Part (MAP) protocol logging facility
• **megadiumgr**: MegaDiameter Manager (SLF Service) logging facility
• **mme-app**: Mobility Management Entity (MME) Application logging facility
• **mme-misc**: MME miscellaneous logging facility
• **mmedemux**: MME Demux Manager logging facility
• **mmemgr**: MME Manager facility
• **mmgr**: Master Manager logging facility

• **pdg**: Packet Data Gateway (PDG) logging facility
• **pdgdmg**: PDG Demux Manager logging facility
• **pdif**: Packet Data Interworking Function (PDIF) logging facility
• **pgw**: Packet Data Network Gateway (PGW) logging facility
• **pmm-app**: Packet Mobility Management (PMM) application logging facility
• **ppp**: Point-To-Point Protocol (PPP) link and packet facilities
• **ppoe**: PPP over Ethernet logging facility
• **push**: VPNMGR CDR push logging facility
• **radius-acct**: RADIUS accounting logging facility
• **radius-auth**: RADIUS authentication logging facility
• **radius-coa**: RADIUS change of authorization and radius disconnect
• **ranap**: Radio Access Network Application Part (RANAP) Protocol facility logging info flow between SGSN and RNS (3G)
• **rc**: Recovery Control Task logging facility
• **rdt**: Redirect Task logging facility
• **resmgr**: Resource Manager logging facility
• **rf-diameter**: Diameter Rf interface messages facility
• **rip**: Routing Information Protocol (RIP) logging facility [RIP is not supported at this time.]
• **rlf**: Rate Limiting Function (RLF) logging facility
• **rohc**: Robust Header Compression (RoHC) facility
• **rsvp**: Reservation Protocol logging facility
• **rua**: RANAP User Adaptation (RUA) [3G Femto GW - RUA messages] logging facility
• **s1ap**: S1 Application Protocol (S1AP) Protocol logging facility
• **sabp**: Service Area Broadcast Protocol (SABP) logging facility
• **saegw**: System Architecture Evolution (SAE) Gateway facility
• **sbc**: SBC protocol logging facility
• **sccp**: Signalling Connection Control Part (SCCP) Protocol logging (connection-oriented messages between RANAP and TCAP layers).
• **sct**: Shared Configuration Task logging facility
• **sctp**: Stream Control Transmission Protocol (SCTP) Protocol logging facility
• **sef-ec**: Severely Errored Frames (SEF) APIs printing facility
• **sess-gr**: SM GR facility
• **sessctrl**: Session Controller logging facility
• **sessmgr**: Session Manager logging facility
• **sesstrc**: session trace logging facility
• **sft**: Switch Fabric Task logging facility
show logs

- **sgs**: SGs interface protocol logging facility
- **sgsn-app**: SGSN-APP logging various SGSN “glue” interfaces (for example, between PMM, MAP, GPRS-FSM, SMS).
- **sgsn-failures**: SGSN call failures (attach/activate rejects) logging facility (2.5G)
- **sgsn-gtpc**: SGSN GTP-C Protocol logging control messages between the SGSN and the GGSN
- **sgsn-gtpu**: SGSN GTP-U Protocol logging user data messages between the SGSN and GGSN
- **sgsn-mbms-bearer**: SGSN Multimedia Broadcast/Multicast Service (MBMS) Bearer app (SMGR) logging facility
- **sgsn-misc**: Used by stack manager to log binding and removing between layers
- **sgsn-system**: SGSN System Components logging facility (used infrequently)
- **sgsn-test**: SGSN Tests logging facility; used infrequently
- **sgtpcmgr**: SGSN GTP-C Manager logging information exchange through SGTPC and the GGSN
- **sgw**: Serving Gateway facility
- **sh-diameter**: Sh Diameter messages facility
- **sitmain**: System Initialization Task main logging facility
- **sls**: Service Level Specification (SLS) protocol logging facility
- **sm-app**: SM Protocol logging facility
- **sms**: Short Message Service (SMS) logging messages between the MS and the SMSC
- ** sndcp**: Sub Network Dependent Convergence Protocol (SNDCP) logging facility
- **snmp**: SNMP logging facility
- **sprmgr**: IPCF Subscriber Policy Register (SPR) manager logging facility
- **srdb**: Static Rating Database
- **srp**: Service Redundancy Protocol (SRP) logging facility
- **sscfnni**: Service-Specific Coordination Function for Signaling at the Network Node Interface (SSCF-NNI) logging facility
- **sscop**: Service-Specific Connection-Oriented Protocol (SCCOP) logging facility
- **ssh-ipsec**: Secure Shell (SSH) IP Security logging facility
- **ssl**: Secure Socket Layer (SSL) message logging facility
- **stat**: Statistics logging facility
- **supserv**: Supplementary Services logging facility [H.323]
- **system**: System logging facility
- **tacacplus**: TACACS+ Protocol logging facility
- **tcap**: TCAP Protocol logging facility
- **testctrl**: Test Controller logging facility
- **testmgr**: Test Manager logging facility
- **threshold**: threshold logging facility
- **ttg**: Tunnel Termination Gateway (TTG) logging facility
- **tucl**: TCP/UDP Convergence Layer (TUCL) logging facility
Exec Mode show Commands (H-L)

show logs

- **udr**: User Data Record (UDR) facility (used with the Charging Service)
- **user-data**: User data logging facility
- **user-l3tunnel**: User Layer 3 tunnel logging facility
- **usertcp-stack**: User TCP Stack
- **vim**: Voice Instant Messaging (VIM) logging facility
- **vinfo**: VINFO logging facility
- **vmgctrl**: Virtual Media Gateway (VMG) controller facility
- **vmgctrl**: VMG Content Manager facility
- **vpn**: Virtual Private Network logging facility
- **wimax-data**: WiMAX DATA
- **wimax-r6**: WiMAX R6
- **wsg**: Wireless Security Gateway (ASR 9000 Security Gateway)

**level severity_level**

**level severity_level**: Specifies the level of information to be logged from the following list which is ordered from highest to lowest:

- **critical**: display critical events
- **error**: display error events and all events with a higher severity level
- **warning**: display warning events and all events with a higher severity level
- **unusual**: display unusual events and all events with a higher severity level
- **info**: display info events and all events with a higher severity level
- **trace**: display trace events and all events with a higher severity level
- **debug**: display all events

**pdu-data pdu_format**

Specifies output format for the display of packet data units as one of:

- **none**: output is in raw format (unformatted).
- **hex**: output being displayed in hexadecimal format.
- **hex-ascii**: output being displayed in hexadecimal and ASCII similar to a main-frame dump.

**pdu-verbosity pdu_verboseness**

Specifies the level of verboseness to use in displaying of packet data units as an integer from 1 through 5, where 5 is the most detailed.

**proclet facility**

Shows the logs from a specific proclet facility. The available facilities are the same as those listed earlier.

**since from_date_time [ until to_date_time ]**

Default: no limit.

**since from_date_time**: indicates only the log information which has been collected more recently than from_date_time is to be displayed.
**show logs**

**Until to_date_time:** indicates no log information more recent than to_date_time is to be displayed. **Until** defaults to current time when omitted.

**From_date_time** and **to_date_time** must be formatted as YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss. Where:

- **YYYY** = 4-digit year
- **MM** = 2-digit month in the range 01 through 12
- **DD** = 2-digit day in the range 01 through 31
- **HH** = 2-digit hour in the range 00 through 23
- **mm** = 2-digit minute in the range 00 through 59
- **ss** = 2-digit second in the range 00 through 59

**To_date_time** must be a time which is more recent than **from_date_time**.

The use of the **until** keyword allows for a time range of log information while only using the **since** keyword will display all information up to the current time.

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

View log files for general maintenance or troubleshooting system issues.

**Example**

The following command displays log information for the **allmgr** facility starting with July 1th, 2011 at midnight.

```
show logs facility allmgr since 2011:07:11:00:00
```

The following command displays the log information for call ID **FE881D32** only in active logs.

```
show logs active callid FE881D32
```
show lte-policy

Displays information for Long term Evolution (LTE) policy configurations on this system including congestion action profiles, handover restriction lists, paging maps, paging profiles, subscriber maps, and tracking area identifiers (TAIs).

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show lte-policy { cause-code-group { name group_name | summary } | congestion-action-profile { name congest_profile_name | summary } | foreign-plmn-guti-mgmt-db { name db_name | summary } | henbgw { mme-pool { name mme_pool_name | summary } | overload-control | sl-reset | session-recovery } | ho-restriction-list { name ho_list_name | summary } | lte-emergency-profile { name emer_profile_name | summary } | mme { henbgw mgmt-db { name henbgw_mgmtdb_name | summary } | paging cache parameters | paging-map { name page_map_name | summary } | paging-profile { name page_profile_name | summary } } | peer-map { name sub_map_name | summary } | subscriber-map { name sub_map_name | summary } | tai-list-db { name tai_list_name summary } | tai-mgmt-db { name tai_name [ tai-mgmt-obj name obj_name | tai-custom-list tac cstm_tac_value ] | summary } } [ | { grep grep_options | more } ]

cause-code-group { name group_name | summary }

This MME-specific keyword displays information about the Cause Code Groups configured on this system.

name group_name: Displays information about a specific cause code group configured on this system.
group_name must be an existing cause code group, expressed as an alphanumeric string of 1 to 16 characters.

summary: Displays summarized information about all cause code groups configured on this system.

congestion-action-profile { name congest_profile_name | summary }

Displays information about MME congesting action profiles configured on this system.

name profile_name: Displays information about a specific congestion action profile configured on this system. profile_name must be an existing HO restriction list, expressed as an alphanumeric string of 1 to 64 characters.

summary: Displays summarized information about all congestion action profiles configured on this system.
show lte-policy

```plaintext

foreign-plmn-guti-mgmt-db { name db_name | summary }

This MME-specific keyword displays information about LTE Foreign PLMN GUTI management databases configured on this system.

name db_name: Displays information about a specific management database configured on this system. 
db_name must be an existing management database, expressed as an alphanumeric string of 1 to 64 characters.

summary: Displays summarized information about all Foreign PLMN GUTI management databases configured on this system.

henbgw { mme-pool { name mme_pool_name | summary } | overload-control | session-recovery }

This HeNBGW keyword displays information about HeNBGW configured on this system.

mme-pool shows mme pool.

name mme_pool_name: Displays detailed information about specified MME Pool configured on this system. 
mme_pool_name must be an existing management database, expressed as an alphanumeric string of 1 to 63 characters.

summary: Displays summarized information about MME Pool configured on this system.

overload-control: Displays information about overload control.
s1-reset: Displays information about s1 reset.
session-recovery: Displays information about session recovery.

ho-restriction-list { name list_name | summary }

Displays information about handover restriction lists configured on this system.

name list_name: Displays detailed information about specified handover restriction list configured on this system. 
name must be an existing HO restriction list, expressed as an alphanumeric string of 1 to 64 characters.

summary: Displays summarized information about all handover restriction lists configured on this system.

lte-emergency-profile { name emer_profile_name | summary }

Displays information about LTE emergency profiles configured on this system.

name emer_profile_name: Displays information about a specific LTE emergency profile configured on this system. 
emer_profile_name must be an existing LTE emergency profile, expressed as an alphanumeric string of 1 to 64 characters.

summary: Displays summarized information about all LTE emergency profiles configured on this system.

mme paging cache parameters

Displays the configured MME paging cache timeout and MME paging cache size configured with the mme paging cache command in the LTE Policy configuration mode.

paging-map { name page_map_name | summary }

Displays information about LTE paging maps configured on this system.

name page_map_name: Displays information about an existing LTE paging map specified as an alphanumeric string of 1 through 64 characters.

summary: Displays summarized information about all LTE paging maps configured on this system.

paging-profile { name page_profile_name | summary }

Displays information about LTE paging profiles configured on this system.
```
**name page_profile_name**: Displays information about an existing LTE paging profile specified as an alphanumeric string of 1 through 64 characters.

**summary**: Displays summarized information about all LTE paging profiles configured on this system.

---

**peer-map** { **name** name | **summary** }

Displays information about peer maps configured on this system.

**name map_name**: Displays information about an existing peer map specified as an alphanumeric string of 1 through 64 characters.

**summary**: Displays summarized information about all peer maps configured on this system.

---

**subscriber-map** { **name** name | **summary** }

Displays information about subscriber maps configured on this system.

**name sub_map_name**: Displays information about an existing subscriber map specified as an alphanumeric string of 1 through 64 characters.

**summary**: Displays summarized information about all subscriber maps configured on this system.

---

**tai-list-db** { **name** tai_list_name | **summary** }

Displays information about TAI list databases configured on this system.

**name tai_list_name**: Displays information about specified TAI list database as an alphanumeric string of 1 through 64 characters.

**summary**: Displays summarized information about specified TAI list databases configured on this system.

---

**tai-mgmt-db** { **name** name [ **tai-mgmt-obj** obj_name obj_name | **tai-custom-list** tac cstm_tac_value ] | **summary** }

Displays information about TAI management databases configured on this system.

**name tai_name**: Displays information about an existing TAI management database specified as an alphanumeric string of 1 through 64 characters.

**tai-mgmt-obj obj_name**: Filters the information by the specified TAI Management Object name, where **obj_name** is a string from 1 through 64 characters.

**tai-custom-list tac cstm_tac_value**: Filters the information by the specified Custom TAI List TAC, where **cstm_tac_value** is an integer from 0 through 65535.

**summary**: Displays summarized information about all TAI management databases configured on this system.

---

| { **grep** grep_options | **more** }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command’s Output* section in *CLI Overview* chapter.

---

**Usage**

Use this command to display information for LTE policy configurations on this system including congestion action profiles, handover restriction lists, paging maps, paging profiles, subscriber maps, and tracking area identifiers (TAIs).

**Example**

The following command displays information about a subscriber map named **map3**:

```
show lte-policy subscriber-map name map3
```
show lte-policy

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
Chapter 134
Exec Mode show Commands (M-P)

This section includes the commands `show mag-service` through `show ps-network statistics`.

The Exec Mode is the initial entry point into the command line interface system. Exec mode `show` commands are useful in troubleshooting and basic system monitoring.

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
show mag-service

Displays statistic and counter information for Mobile Access Gateway (MAG) services on this system.

**Product**
- HSGW
- S-GW

**Privilege**
- Inspector

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show mag-service { all | name service_name | session { all | callid id | counters | full | ip-address home_ip_address | msid id | summary | username name } | statistics { name service_name } } [ | { grep grep_options | more } ]
```

**all**
Displays information for all configured MAG services on this system.

**name service_name**
Displays configuration information for a specific MAG service configured on this system. `service_name` must be an existing MAG service expressed as an alphanumeric string of 1 through 63 characters.

**session { all | callid id | counters | full | ip-address home_ip_address | msid id | summary | username name } | statistics { name service_name }**

- **all**: Displays all active MAG sessions using MAG services on the system.
- **callid id**: Displays available session information for the specific call identification number. `id` must be an 8-digit hexadecimal number.
- **counters**: Displays counters for all MAG services on the system. This keyword can also be filtered by the following:
  - **all**
  - **callid**
  - **ip-address**
  - **msid**
  - **summary**
  - **username**

Refer to the keyword descriptions in this command for information regarding these filters.

- **full**: Displays additional session information for all active MAG sessions using MAG services on the system. This keyword includes the information in the output of the `all` keyword plus additional information. This keyword can also be filtered by the following:
show mag-service

- `all`
- `callid`
- `ip-address`
- `msid`
- `summary`
- `username`

Refer to the keyword descriptions in this command for information regarding these filters.

**ip-address home_ip_address**: Displays available session information for a specific home IPv4 or IPv6 address of a subscriber in a service session.

**msid id**: Displays available information for a specific mobile station identification number or group of numbers based on wildcard entry.

`id` must be a valid MSID number and can be a sequence of characters and/or wildcard characters ('$' and/or '*'). The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as wildcard enclose them in single quotes ('). For example: ‘$’.

**summary**: Displays the number of MAG sessions currently active for MAG services configured on the system.

**username name**: Displays available session information for a specific user in a service session.

`name` must be followed by an existing user name expressed as an alphanumeric string of 1 through 127 characters.

```
statistics [ name service_name ]
```

`name service_name`: Displays MAG service statistics for an existing MAG service specified as an alphanumeric string of 1 through 63 characters.

| { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

### Usage

Use this command to view configuration information for MAG services on this system.

### Example

The following command displays service statistics for the MAG service named `mag1`:

```
show mag-service name mag1
```
**show map-service**

Displays information configured for the Mobile Application Part (MAP) services, including MAP service features and operational configuration. Also includes some related configuration information for the HLR and EIR configuration parameters.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
show map-service [ all | name srvc_name ] [ | { grep grep_options | more } ]
```

- `name srvc_name`
  Specifies an existing MAP service as an alphanumeric string of 1 through 63 characters.

- `| { grep grep_options | more }`
  Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**

Use this command to display all MAP service or the statistics for a particular MAP service.

**Example**

The following command displays configuration information for the MAP service named `map-svc-1`:

```
show map-service name map-srv-1
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show map statistics

Displays Mobile Application Part (MAP) statistics.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show map statistics [ name srvc_name ] [ recovered-values ] [ | { grep grep_options | more } ]

(name srvc_name)
Specifies an existing MAP service as an alphanumeric string of 1 through 63 characters.

(recovered-values)
Only displays recovered values for key KPI counters that were backed-up.

| { grep grep_options | more }
Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to display all MAP statistics or the statistics for a particular MAP service.

Example
The following command displays statistics for the MAP service named map-svc-1:

show map statistics name map-svc-1

The following command displays combined statistics for all MAP services in the current context:

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show maximum-temperatures

Shows the maximum temperature reached by each card since the last temperature timestamp reset.

**Product**

All

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name# 
```

**Syntax**

```
show maximum-temperatures [ verbose] [ | { grep grep_options | more } ]
```

- **verbose**
  
  Indicates that the output is to contain detailed information.

- | { grep grep_options | more }
  
  Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
  
  For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**

Verify the maximum temperature reached by components in the chassis since the indicated timestamp.

**Important:** This command is not supported on all platforms.

**Example**

```
show maximum-temperatures

show maximum-temperatures verbose
```
show mbms bearer-service

Displays configuration information for bearer services configured for the multimedia broadcast multicast service (MBMS) running on this system.

Product
GGSN
SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show mbms bearer-service [ all ] [ apn apn_name mcast-addr ip_address ] [ full ] [ instance instance_id ] [ service-type { broadcast | multicast } ] [ sgsn-sessions ] [ summary ] [ | { grep grep_options | more } ]

all
Displays information on all bearer services configured on the system.

apn apn_name mcast-addr ip_address
Displays bearer service information of the MBMS for a specific Access Point Name (APN). apn_name is bound to a given BM-SC (Broadcast Multicast - Service Center) server address ip_address.
apn_name is the name of the APN expressed as an alphanumeric string of 1 through 62 characters that is case sensitive.
ip_address is the IP address of the BM-SC server in IPv4 dotted-decimal notation bound to the APN.

full
Displays full information for specific or all instances of bearer service in MBMS feature on system.

instance instance_id
Displays session information filtered for an instance of a bearer service running as an MBMS session and specified an integer from 1 through 64.

service-type { broadcast | multicast }
Displays information for a specific type of service for MBMS.
broadcast: Specifies the MBMS service type as broadcast only.
multicast: Specifies the MBMS service type as multicast only.

sgsn-sessions
Displays summary information for all the SGSN multicast sessions.
ExeM Mode show Commands (M-P)

show mbms bearer-service

summary
Displays summary information for specific or all instances of a bearer service.

| { grep grep_options | more }
Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of grep and more options, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to verify the configuration of one or all bearer services and active instances of bearer services under MBMS. It is also useful for monitoring or troubleshooting purposes.
If this command is executed from within the local context with the all keyword, information for all bearer service instances running under MBMS will be displayed.

Example
The following command displays configuration information for all bearer service instances running on system:

    show mbms bearer-service full all

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
**show mipfa**

Displays information for specified Mobile IP Foreign Agent (MIP-FA) calls.

**Product**
- PDSN
- GGSN
- ASN-GW

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show mipfa { [ [ counters | full | summary ] { all | callid call_id | msid ms_id | peer-address [ operator ] peer_address | reverse-tunnel { on | off } | username user_name } | statistics { fa-service fa_name | peer-address [ peer_address | greater-than peer_address | less-than peer_address | > peer_address | < peer_address ] } | peers fa-service service_name [ current-sessions { { > | greater-than } sessions [ < sessions ] | { < | less-than } sessions [ > sessions ] | sessions ] } | peer-address address ] } | [ | { grep grep_options | more } ]
```

- **counters**: Displayed output includes the statistical counters.
- **full**: Displays detailed information.
- **summary**: Displays only summary information. This is the default setting.

These options are not available in conjunction with the **statistics** keyword.

```
all | callid call_id | msid ms_id | peer-address peer_ip_address | reverse-tunnel { on | off } | username user_name
```

- **all**: Displays all available information.
- **callid call_id**: Displays information only for calls with the call ID specified as a 4-byte hexadecimal number.
- **msid ms_id**: Displays information for a mobile subscriber ID expressed as a string from 7 to 16 digits for an IMSI, MIN, or RMI and/or characters $ and * for wildcard filter.

```
show mipfa msid 01234567$$
```

Shows any subscriber with an MSID that matches the upper 8 digits of the supplied MSID, such as 01234567, and any two digits at the remaining two places.

- **peer-address peer_ip_address**: Displays information for the MIP call for the peer IP address specified using IPv4 dotted-decimal notation.
- **reverse-tunnel { on | off }**: Enables the display of reverse IP tunnel information.
- **username user_name**: Displays MIP call user information for the username specified as an alphanumeric string of 1 through 127 characters that may include wildcard characters ($ and *).
statistics [ fa-service fa_name | peer-address [ peer_address | greater-than peer_address | less-than peer_address | > peer_address | < peer_address ] ]

Displays information for the foreign agent service specified by name or peer IP address.

- **fa-service fa_name** must be an alphanumeric string of 1 through 63 characters.
- **peer-address peer_address** must be specified using IPv4 dotted-decimal notation.
- **greater-than peer_address**: Specifies the range of IPv4 addresses greater than **peer_address**.
- **less-than peer_address**: Specifies the range of IPv4 addresses less than **peer_address**.
- **> peer_address**: Specifies the range of IPv4 addresses greater than **peer_address**.
- **< peer_address**: Specifies the range of IPv4 addresses less than **peer_address**.

**peer-address [ operator ] peer_address**

In conjunction with the **mipfa [ summary ] peer-address** keyword, indicates a range of peers is to be displayed.

- **peer-address [ operator ] peer_address** must be specified using IPv4 dotted-decimal notation.
- **operator** implies how to logically specify a range of peer-address and it must be one of the following:
  - **<**: IP address is less than the specified **peer_address**
  - **>**: IP address is greater than the specified **peer_address**
  - **greater-than**: IP address is greater than the specified **peer_address**
  - **less-than**: IP address is less than the specified **peer_address**

**peers fa-service service_name [ current-sessions { { > | greater-than } sessions [ < sessions ] } | { < | less-than } sessions [ > sessions ] | sessions ] ] [ peer-address address ]**

Displays peer servers for the specified FA service.

- **fa-service service_name**: Specifies the name of an existing FA service for which the associated peer servers are to be displayed as an alphanumeric string of 1 through 63 characters.
- **current-sessions**: Displays only peer servers with current sessions meeting the following criteria:
  - **> | greater-than sessions**: Displays only peer servers currently running sessions higher than the value entered in this parameter. **sessions** must be an integer from 1 to 3000000. **Note**: the keyword “greater-than” and the “>” symbol are interchangeable in this instance of the command.
  - **< sessions**: Displays only peer servers that are currently running sessions less than the **greater-than** parameter but less than the value entered in this parameter. **sessions** must be an integer from 1 to 3000000.
  - **< | less-than sessions**: Displays only peer servers currently running sessions lower than the value entered in this parameter. **sessions** must be an integer from 1 to 3000000. **Note**: the keyword “less-than” and the “<” symbol are interchangeable in this instance of the command.
  - **> sessions**: Displays only peer servers that are currently running sessions lower than the **less-than** parameter but more than the value entered in this parameter. **sessions** must be an integer from 1 to 3000000.
  - **sessions**: Displays only peer servers currently running sessions that are equal to the value entered in this parameter. **sessions** must be an integer from 1 to 3000000.

- **peer-address address**: Displays only peer servers matching the IP address entered in this parameter. **address** must be specified using IPv4 dotted-decimal notation and can be followed by the netmask of the address.
Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**

View MIP foreign agent information to support troubleshooting subscriber issues by viewing call information and filtering on the subscriber information using various methods.

**Example**

The following displays the call information for all mobile IP FA calls and statistics for `fa1`, respectively:

```
show mipfa all
```

The following command displays the statistics for the foreign agent service `fa1`:

```
show mipfa statistics fa-service fa1
```

The following commands displays call information for user `user6@aaa` in full detail and in summary:

```
show mipfa full username user6@aaa
show mipfa summary username user1
```

The following displays MIP FA call information for calls from mobile subscriber `4412345678` and peer address `10.2.3.4`, respectively:

```
show mipfa msid 4412345678 4412345678
show mipfa peer-address 10.2.3.4
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
**show mipha**

Displays information for specified Mobile IP Home Agent (MIP-HA) calls.

**Product**
HA

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
show mipha { [ [ counters | full | summary ] { all | callid call_id | imsi imsi_num | ip-address ip_addr | msid msid_num | peer-address [ operator ] peer_address | reverse-tunnel { on | off } | username user_name } | statistics [ ha-service ha_name | peer-address peer_address ] } ] | peers ha-service service_name [ current-sessions { { > | greater-than } sessions [ < sessions ] | { < | less-than } sessions [ > sessions ] | sessions ] } [ peer-address address ] ] [ [ [ grep grep_options | more ]
```

- **counters** | **full** | **summary**
  
  Default: concise output.
  
  - **counters**: Displayed output includes the statistical counters.
  
  - **full**: Displays detailed information.

  - **summary**: Displays only summary information.

  These options are not available in conjunction with the **statistics** keyword.

**msid msid_num**

Displays information for the subscriber with the supplied MSID on HA.

**msid msid_num** specifies a mobile subscriber ID for which information is to be displayed. **ms_id** must be from 7 to 16 digits for an IMSI, MIN, or RMI and/or characters $ and * for wildcard filtering.

If **enforce imsi-min equivalence** is enabled on the chassis and MIN or IMSI numbers are supplied, this keyword/filter will show subscribers with a corresponding MSID (MIN or IMSI) whose lower 10 digits matches the lower 10 digits of the supplied MSID.

```
show mipha msid ABCD0123456789 or
show mipha msid 0123456789
```

Shows any subscriber with a MSID that match the lower 10 digits of MSID supplied, such as 0123456789.

```
show mipha msid 01234567$$
```

Shows any subscriber with a MSID that match the upper 8 digits of the supplied MSID, such as 01234567 and any two digits at the remaining two places.

- **all | callid call_id | imsi imsi_num | ip-address ip_addr | msid msid_num | peer-address [ operator ] peer_address | reverse-tunnel { on | off } | username user_name
  
  - **all**: Displays all available information.
**callid call_id**: Displays information only for calls with the call ID specified as a 4-byte hexadecimal number.

**imsi imsi_num**: Specifies an IMSI (international mobile subscriber ID) for which information is to be displayed. The IMSI is a 15-character field which identifies the subscriber’s home country and carrier.

**ip-address ip_addr**: Displays statistics for a call with the IP address specified in IPv4 dotted-decimal notation.

**msid msid_num**: Specifies a mobile subscriber ID only for which information is to be displayed. The msid must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

**peer-address peer_address**: Displays statistical information for the peer IP address specified using IPv4 dotted-decimal notation.

**reverse-tunnel { on | off }**: Enables the display of reverse IP tunnel information.

**username user_name**: Displays user MIP call information for the username specified as an alphanumeric string of 1 through 127 characters including wildcard characters ($ and *).
• **sessions**: Displays only peer servers currently running sessions that are equal to the value entered in this parameter. `sessions` must be an integer from 1 to 3000000.

  **peer-address address**: Displays only peer servers matching the IP address entered in this parameter. `address` must be specified using IPv4 dotted-decimal notation and can be followed by the netmask of the address.

  ```bash
  | { grep grep_options | more }
  ```

  Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

  For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the Command Line Interface Overview chapter.

### Usage

View MIP home agent information to support troubleshooting subscriber issues by viewing call information and filtering on the subscriber information using various methods.

### Example

The following displays the call information for all mobile IP HA calls and statistics for `ha1`, respectively:

- `show mipha all`
- `show mipha statistics ha-service ha1`

The following commands displays call information for user `isp1user1` in full detail and in summary:

- `show mipha full username isp1user1`
- `show mipha summary username user1`

The following displays MIP-HA call information for calls from mobile subscribers with reverse tunneling off and peer address `10.2.3.4`, respectively:

- `show mipha reverse-tunnel off`
- `show mipha peer-address 10.2.3.4`

**Important**: Output descriptions for commands are available in the Statistics and Counters Reference.
show mipv6ha

Displays information for specified Mobile IPv6 Home Agent (MIPv6-HA) calls.

Product
PDSN
HA

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show mipv6ha [ all | callid call_id | counters filter | full filter | ipv6-address ip_addr | statistics mipv6ha-service mipv6ha-service_name | summary filter | username user_name ]

---

all
Displays all information for MIPv6-HA calls.

---

callid call_id
Specifies the Call Identification number as an 8-digit hexadecimal number.

---

counters [ all | callid | ipv6-address | username ]
Displays the counters associated with the MIPv6-HA service. The following filters are available:
  • all
  • callid:
  • ipv6-address
  • username

---

full [ all | callid | ipv6-address | username ]
Displays all available information for the associated display or filter keyword. The following filters are available:
  • all
  • callid:
  • ipv6-address
  • username

---

ipv6-address ip_addr
Displays information for subscribers connected via the packet control function for a specific or range of IPv6 addresses. The address must be specified using the IPv6 colon-separated-hexadecimal notation.
show mipv6ha

- `<`: Filters output so that only information less than the specified IPv6 address value is displayed.
- `>`: Filters output so that only information greater than the specified IPv6 address value is displayed.
- `less-than`: Filters output so that only information less than the specified IPv6 address value is displayed.
- `greater-than`: Filters output so that only information greater than the specified IPv6 address value is displayed.

```
statistics [ mipv6ha-service mipv6ha-service_name ]
```
Displays all information collected for specific protocol since last the `restart` or `clear` command. This can be filtered according to a specified `mipv6ha-service`.

```
summary [ all | callid | ipv6-address | username ]
```
Displays summary information for defined sessions, based on defined parameters. The following filters are available:
- `all`
- `callid`
- `ipv6-address`
- `username`

```
username user_name
```
Displays session information for a specific username.

**Usage**
View MIPv6 home agent information to support troubleshooting subscriber issues by viewing call information and filtering on the subscriber information using various methods.

**Example**
The following displays the call information for all mobile IPv6 HA calls:

```
show mipv6ha all
```

The following command displays call information for user `mipv6hauser1` in full detail and in summary:

```
show mipv6ha full username mipv6hauser1
```

**Important:** Output descriptions for commands are available in the `Statistics and Counters Reference`. 
show mme-service

Displays configuration information for Mobility Management Entity (MME) services on this system.

**Product**

MME

**Privilege**

Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
show mme-service { all | name svc_name [ offload statistics ] } [ | { grep grep_options | more } ]
```

- **all**
  
  Displays configuration information for all MME services configured on this system.

- **name service_name**
  
  Displays configuration information for an existing MME service specified as an alphanumeric string of 1 through 63 characters.

- **offload statistics**
  
  Displays configuration information for the MME load rebalancing feature (UE offload), as well as current statistics about any active offloading processes.
  
  This keyword option is only available in Release 14.0 and higher.

- **| { grep grep_options | more }**
  
  Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

  For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section in the Command Line Interface Overview chapter.

**Usage**

Use this command to view configuration information for MME services on this system.

**Example**

The following command displays service statistics for the MME service named `mme1`:

```
show mme-service name mme1
```

**Important:** Output descriptions for these commands are available in the Statistics and Counters Reference.
**show mme-service db record**

Displays the Mobile Management Entity (MME) database records for MME sessions grouped in session instances on this system and filtered with IMSI or GUTI as criteria.

**Product**
MME

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name# 
```

**Syntax**

```
show mme-service db record { all | call-id call_id | guti plmn plmn_id group-id mme_grp_id code mme_code m-tmsi mtmsi_value | imsi imsi_identifier }
```

- **all**
  Displays all database records of a session instance used for MME service.

- **call-id call_id**
  Displays database records filtered by the call ID specified as an 8-digit hexadecimal number

- **guti plmn plmn_id group-id mme_grp_id code mme_code m-tmsi mtmsi_value**
  Displays database records filtered by the Globally Unique Temporary Identifier (GUTI). The GUTI is constructed from the GUMMEI and the M-TMSI.
  The GUMMEI is constructed from the public land mobile network (PLMN) ID [MMC and MNC] and the MME Group ID (MMEGI). Within the MME, the mobile is identified by the M-TMSI.
  A GUTI has: 1) a unique identity for the MME which allocated the GUTI; and 2) the unique identity of the UE within the MME that allocated the GUTI.
  The MME Identifier (MMEI) is constructed from an MME Group ID (MMEGI) and an MME Code (MMEC).

- **imsi imsi_identifier**
  Displays database records filtered by International Mobile Subscriber Identity (IMSI).
  The **imsi_identifier** is a 15-character IMSI field which identifies the subscriber’s home country and carrier.
  Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘’). For example; ‘$’.

**Usage**

Use this command to view database records for all or a particular instance of session manager for MME services on this system with IMSI or GUTI as a filter criteria.

**Example**

```
```
The following command displays the summary database records of a session instance for a subscriber having IMSI as 123455432112345 in the MME service:

```
show mme-service db record imsi 123455432112345
```

**Important**: Output descriptions for these commands are available in the *Statistics and Counters Reference*. 
show mme-service db statistics

This command displays the Mobile Management Entity (MME) database statistics for all or specific MME sessions on this system.

Product
MME

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show mme-service db statistics [ instance smgr_instance ]

instance smgr_instance
Displays MME database statistics for a specific instance of a session manager running the MME service. smgr_instance is an instance ID specified as an integer from 0 through 4294967295. If an instance is not specified, summary statistics are displayed.

Usage
Use this command to view database statistics for all or a particular instance of session manager for MME services on this system.

Example
The following command displays summary database statistics for the MME service running on a system:

show mme-service db statistics

Important: Output descriptions for these commands are available in the Statistics and Counters Reference.
show mme-service enodeb-association

Displays configuration information for an eNodeB association within an MME service.

**Product**
MME

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show mme-service enodeb-association [ summary | full [ wfl ] | path-info [ wfl ] ] [ all |
tenodeb-name enodeb_name | henbgw | ipsec | mme-service-name mme_svc_name | peer-address
peer_ip_address | peer-id peer_identifier ] [ | { grep grep_options | more } ]
```

**summary**
Displays summarized output for this command.

**full**
Displays detailed output for this command.

**wf1**
Displays output in a tabular format.

**path-info**
Displays S1 path association information of eNodeBs associated with MME services on this system.

**all**
Displays information of all eNodeBs associated with MME services on this system.

**enodeb-name enodeb_name**
Displays information for the specified eNodeB associated with MME services on this system.

**henbgw**
Displays information for Home eNodeB Gateways (HeNB-GWs) associated with MME services on this system.

**ipsec**
Displays information of all IPSec enabled eNodeBs associated with MME services on this system.
**mme-service-name mme_svc_name**
Displays summarized or detailed configuration information for eNodeBs associated with an existing MME service specified as an alphanumeric string of 1 through 63 characters.

**peer-address peer_ip_address**
Displays summarized or detailed configuration information of eNodeBs associated with an existing MME peer IP address configured with an MME service and expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**peer-id peer_identifier**
Displays summarized or detailed configuration information for eNodeBs associated with a an existing MME peer ID configured with an MME service and specified as an integer from 1 through 4294967295.

```
| { grep grep_options | more }
```
Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section in the Command Line Interface Overview chapter.

**Usage**
Use this command to view configuration information of eNodeBs associated with an MME service on this system.

**Example**
The following command displays detailed service statistics for associated eNodeBs within the MME service named `ingress`:

```
show mme-service enodeb-association full mme-service-name ingress
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show mme-service id

This command displays the current number of MME-assigned and eNodeB-assigned S1AP session IDs.

Product
MME

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show mme-service id summary [ service-name name [ sessmgr instance ] ] | [ peer-id id [ sessmgr instance ] ] | | { grep grep_options | more }

id summary
Displays the current number of MME-assigned and eNodeB-assigned S1AP session IDs.

service-name name
Filters the output of the command by for an existing MME service name specified as an alphanumeric string of 1 through 63 characters.

peer-id id
Filters the output of the command by a MME peer identifier specified as an integer from 1 through 4294967295.

sessmgr instance
Filters the output of the command by the specified session manager instance as an integer from 1 through 4294967295.

| | { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section in the Command Line Interface Overview chapter.

Usage

Use this command to display the current number of MME-assigned and eNodeB-assigned S1AP session IDs.
**show mme-service session**

Displays session information for Mobile Management Entity (MME) service(s) running on a peer or local system.

**Product**
MME

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show mme-service session [ summary | full | counters ] [ all | callid call_identifier | imei imei_id | imsi imsi_id | ipsec | mme-service service_name | msisdn number | pdn-address pdn_ip_address | sl-peer sl_peer_ip_address | s1-peer s1_peer_ip_address | vlr-name vlr_name | ue-ecm-state { connected | idle } ] [ | { grep grep_options | more } ]
```

**summary**
Displays summarized output for this command.

**full**
Displays detailed output for this command.

**counters**
Displays all counters for related events and messages for an MME session running on a system.

**all**
Displays information for all MME sessions running on this system.

**callid call_identifier**
Displays summarized or detailed configuration information for an MME session filtered by a call identifier within an MME service configured on this system. `call_identifier` must be an existing call identity in 8-digit hexadecimal format running in an MME service on this system.

**imei imei_id**
Displays summarized or detailed configuration information about MME sessions running and filtered by an International Mobile Equipment Identification (IMEI) number within an MME service configured on this system. `imei_id` must be an existing IMEI in an existing MME service on the system. `imei_id` must contain an 8-digit TAC (Type Allocation Code) and a 6-digit SNR (Serial Number).
### Exec Mode show Commands (M-P)

#### show mme-service session

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>imsi</strong></td>
<td>Displays summarized or detailed configuration information about MME sessions running and filtered by an IMSI number within an MME service configured on the system.</td>
</tr>
<tr>
<td><strong>ipsec</strong></td>
<td>Displays information for all IPSec enabled sessions using MME services on the system.</td>
</tr>
<tr>
<td><strong>mme-service</strong></td>
<td>Displays summarized or detailed configuration information about MME sessions running and filtered by an MME service name configured on the system.</td>
</tr>
<tr>
<td><strong>msisdn</strong></td>
<td>Displays summarized or detailed configuration information about MME sessions running and filtered by a Mobile Station International ISDN Number.</td>
</tr>
<tr>
<td><strong>pdn-address</strong></td>
<td>Displays summarized or detailed configuration information about MME sessions running and filtered by the IP address of a connected PDN(s) within an MME service configured on this system.</td>
</tr>
<tr>
<td><strong>sl-peer</strong></td>
<td>Displays summarized or detailed configuration information of MME sessions running and filtered by the IP address of a peer connected through an S1 interface within an MME service configured on this system.</td>
</tr>
<tr>
<td><strong>s11-peer</strong></td>
<td>Displays summarized or detailed configuration information of MME sessions running and filtered by IP address of a peer connected through S11 interface with an MME service configured on this system.</td>
</tr>
<tr>
<td><strong>vlr-name</strong></td>
<td>Displays summarized or detailed configuration information of MME sessions running and filtered by Visitor Location Register (VLR) name.</td>
</tr>
</tbody>
</table>

* **imsi** `imsi_id`  
  Displays summarized or detailed configuration information about MME sessions running and filtered by an International Mobile Subscriber Identity (IMSI) number within an MME service configured on the system.  
  `imsi_id` must be an existing IMSI in an existing MME service on the system.  
  `imsi_id` is a 15-character IMSI field which identifies the subscriber’s home country and carrier.  
  Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘’). For example; ‘$’.

* **ipsec**  
  Displays information for all IPSec enabled sessions using MME services on the system.

* **mme-service** `service_name`  
  Displays summarized or detailed configuration information about MME sessions running and filtered by an MME service name configured on the system.  
  `service_name` must be a configured MME service on the system, expressed as an alphanumeric string of 1 through 63 characters.

* **msisdn** `number`  
  Displays summarized or detailed configuration information about MME sessions running and filtered by a Mobile Station International ISDN Number.  
  `number` must be a combination of the CC (Country Code) and National (significant) mobile number, not exceeding 15 digits.

* **pdn-address** `pdn_ip_address`  
  Displays summarized or detailed configuration information about MME sessions running and filtered by the IP address of a connected PDN(s) within an MME service configured on this system.  
  `pdn_ip_address` must be a configured IP address of a PDN expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation within an existing MME service on the system.

* **sl-peer** `sl_peer_ip_address`  
  Displays summarized or detailed configuration information of MME sessions running and filtered by the IP address of a peer connected through an S1 interface within an MME service configured on this system.  
  `sl_peer_ip_address` must be a configured IP address of a peer on S1 interface expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation within an existing MME service on this system.

* **s11-peer** `s11_peer_ip_address`  
  Displays summarized or detailed configuration information of MME sessions running and filtered by IP address of a peer connected through S11 interface with an MME service configured on this system.  
  `s11_peer_ip_address` must be a configured IP address of a peer on S11 interface expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation within an existing MME service on this system.

* **vlr-name** `vlr_name`  
  Displays summarized or detailed configuration information of MME sessions running and filtered by Visitor Location Register (VLR) name.  
  `vlr_name` must be an alphanumeric string of 1 through 63 characters.
show mme-service session

ue ECM state \{ connected | idle \}

Displays summarized or detailed configuration information about MME sessions running and filtered by the UE’s EPS Connected Management (ECM) state.

- **connected**: Specifies that summarized or detailed configuration information about MME sessions is to be displayed based on the UE ECM state of “connected”.
- **idle**: Specifies that summarized or detailed configuration information about MME sessions is to be displayed based on the UE ECM state of “idle”.

\| { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the *grep* and *more* commands, refer to the *Regulating a Command’s Output* section in the *Command Line Interface Overview* chapter.

**Usage**

Use this command to view information for MME sessions within MME services on this system.

**Example**

The following command displays detailed session statistics for an MME service running on this system:

```
show mme-service session full
```

**Important**: Output descriptions for these commands are available in the *Statistics and Counters Reference*.

The following command displays detailed session counters for an MME service running on this system:

```
show mme-service session counters
```
show mme-service statistics

This command displays MME service statistics specified by various criteria.

Product
MME

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show mme-service statistics [ emm-only | esm-only | handover | mme-service mme_svc_name [ emm-only | esm-only | handover | slap | sctp ] | peer-id peer_identifier [ emm-only | esm-only | handover | slap | sctp | tai taidb db_name mcc mcc mnc mnc tac tac ] [ verbose ] [ | { grep grep_options | more } ]

emm-only
Displays only EPS mobility management (EMM) related statistics, or filters EMM statistics for a specific MME service name or a specific eNodeB association peer identifier.

esm-only
Displays only EPS session management (ESM) related statistics, or filters ESM statistics for a specific MME service name or a specific eNodeB association peer identifier.

handover
Displays only handover related statistics (such as Intra-MME, EUTRAN<>EUTRAN via S10, EUTRAN<>UTRAN via GnGp, EUTRAN<>GERAN via GnGp, and EUTRAN<>UTRAN via S3), or filters handover statistics for a specific MME service name or a specific eNodeB association peer identifier.

mme-service mme_svc_name
Displays MME service statistics for only the specified MME service name.

peer-id peer_identifier
Displays MME service statistics for only the specified eNodeB association peer identifier.

recovered-values
Enables the display of recovered counter values if the backup and recovery of statistics has been enabled. This keyword can be combined with the emm-only, the esm-only, or the peer-id options. For details on this feature, refer to the Backup and Recovery of Key KPI Statistics feature chapter in the MME Administration Guide.
**show mme-service statistics**

---

**slap**
Displays only S1-AP related statistics, or filters S1-AP statistics for a specific MME service name or a specific eNodeB association peer identifier.

---

**sctp**
Displays only SCTP related statistics, or filters SCTP statistics for a specific MME service name or a specific eNodeB association peer identifier.

---

**tai tai db db_name mcc mcc mnc mnc tac tac**
Displays only TAI statistics stored for the specified TAI management database name and MCC/MNC/TAC.

- **db_name**: Specifies the name of the TAI management database as an alphanumeric string of 1 through 64 characters.
- **mcc**: Specifies the mobile country code (MCC) portion of a PLMN identifier as an integer from 100 through 999.
- **mnc**: Specifies the mobile network code (MNC) portion of a PLMN identifier as a 2- or 3-digit integer from 00 through 999.
- **tac**: Specifies the Tracking Area Code portion of the TAI as an integer from 1 through 65535.

---

**Important**: For the MME to report TAI level statistics, you must first issue the MME Service Configuration Mode command: statistics collection-mode tai. Only those MME Services which are configured accordingly will provide TAI based statistics. When the collection-mode is configured to tai, the peer-id keyword will no longer report valid statistics (All values will be shown as ZERO).

---

**Caution**: Changing this collection mode will restart the MME service and will clear all statistics at the MME service and eNodeB level.

---

**verbose**
Displays comprehensive information for a specific argument or set of arguments.

---

| { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section in the Command Line Interface Overview chapter.

---

**Usage**
This command is used to display the statistical information of MME services based on various filter criteria.

**Example**
The following command displays all service statistics for all MME services on a system:

```
show mme-service statistics
```

The following command displays the service statistics of all MME services on a system related to S1-AP:

```
show mme-service statistics slap
```

The following command displays only EMM related statistics for the only the MME service named ingress:
show mme-service statistics mme-service ingress emm-only
show module

Displays the current status of the Version Priority List (VPL) for one or all plugin modules installed on the system. This command is associated with the dynamic software upgrade process.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show module [ plugin_name ]

plugin_name
Filters the output of the VPL by an existing plugin name expressed as an alphanumeric string of 1 through 16 characters.

Usage
Display the priority, load status, location, installation timestamp and download status of one or all plugin modules. A plugin module is a shared object library that can be dynamically updated or rolled back. Refer to the System Administration Guide for additional information on dynamic software updates.

Example
The following command displays the VPL status of all plugin modules currently installed on the system:

    show module
show mpls cross-connect

Displays Multiprotocol Label Switching (MPLS) cross-connect information.

Product
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show mpls cross-connect [ | { grep grep_options | more } ]

| { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section in the Command Line Interface Overview chapter.

Usage

This command displays MPLS cross-connect information. MPLS tunnel cross-connects between interfaces and Label-Switched Paths (LSPs) connect two distant interface circuits of the same type by creating MPLS tunnels that use LSPs as the conduit.

Example

The following command displays MPLS cross-connect information:

    show mpls cross-connect

Important: Output descriptions for these commands are available in the Statistics and Counters Reference.
show mpls ftn

Displays MPLS FEC-to-NHLFE (FTN) table information.

Product
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show mpls ftn [ vrf vrf_name ] [ | { grep grep_options | more } ]

vrf vrf_name
Displays FTN information for the Virtual Routing and Forwarding (VRF) specified as an alphanumeric string of 1 through 63 characters.

| { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section in the Command Line Interface Overview chapter.

Usage

This command displays MPLS FEC (Forward Error Correction)-to-NHLFE (Next-Hop label Forwarding Entry) table information.

Example

The following command displays MPLS FTN information:

    show mpls ftn

Important: Output descriptions for these commands are available in the Statistics and Counters Reference.
show mpls ilm

Displays MPLS Incoming Label Map (ILM) table information.

Product
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show mpls ilm [ fec | label label_value | verbose ][ | { grep grep_options | more } ]

fec
Displays Forwarding Equivalency Class (FEC) information.

label label_value
Displays MPLS ILM information for the specified label. label_value is an integer from 16 through 1048575.

verbose
Displays detailed information for the MPLS ILM table.

Usage

This command displays MPLS Incoming Label Map (ILM) table information.

Example

The following command displays information for MPLS ILM information:

show mpls ilm

Important: Output descriptions for these commands are available in the Statistics and Counters Reference.
show mpls ldp

Displays MPLS Label Distribution Protocol (LDP) information.

Product
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show mpls ldp { bindings { ldp-id IPv4_add | local [ ldp-id | local | prefix | remote ] | prefix IPv4_addr | remote } | discovery | neighbor { detail | ldp-id } }

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bindings</td>
<td>Displays the MPLS LDP label bindings.</td>
</tr>
<tr>
<td>ldp-id</td>
<td>Displays label values for a specific peer LDP ID.</td>
</tr>
<tr>
<td>local</td>
<td>Displays locally assigned label values.</td>
</tr>
<tr>
<td>prefix</td>
<td>Displays label values for a specific prefix.</td>
</tr>
<tr>
<td>remote</td>
<td>Displays remotely assigned label values.</td>
</tr>
<tr>
<td>discovery</td>
<td>Displays the MPLS LDP discovery information.</td>
</tr>
<tr>
<td>neighbor</td>
<td>Displays the MPLS LDP peer information.</td>
</tr>
<tr>
<td>detail</td>
<td>Displays the MPLS LDP peer information in details. The displayed information includes, Local LDP ID, Peer LDP ID, Transport address, State (for example, Established), Role (for example, Active), Uptime, Keepalive negotiated hold time, Proposed Local/Peer, Remaining Keepalive hold time, and Address advertised.</td>
</tr>
</tbody>
</table>
Usage

This command displays statistical information for an MPLS Label Distribution Protocol configuration. The information includes Prefix, LDP ID, Label, Nexthop, and Egress if_index for all MPLS LDP Bindings configurations.

Example

The following command displays information about MPLS LDP protocol related configurations:

```
show mpls ldp discovery neighbor ldp-id 10.2.3.4 detail bindings ldp-id 31.32.33.34 prefix 192.168.102.232 local remote
```

The following command displays the MPLS LDP discovery information, including, LDP Peer IDs, Hold time (in seconds), Proposed Local/Peer, and Remaining (time in seconds):

```
show mpls ldp discovery
```

The following command displays the remotely assigned label values in the MPLS LDP binding configuration:

```
show mpls ldp bindings remote
```

**Important:** Output descriptions for these commands are available in the *Statistics and Counters Reference*. 
show mpls nexthop-label-forwarding-entry

Displays MPLS Next-Hop Label Forwarding Entry (NHLFE) table information.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
show mpls nexthop-label-forwarding-entry [ | { grep grep_options | more } ]

| { grep grep_options | more }
```

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent. For details on the usage of the `grep` and `more` commands, refer to the *Regulating a Command’s Output* section in the Command Line Interface Overview chapter.

**Usage**

This command displays MPLS Next-Hop Label Forwarding Entry (NHLFE) table information.

**Example**

The following command displays MPLS NHLFE information:

```
show mpls nexthop-label-forwarding-entry
```

**Important**: Output descriptions for these commands are available in the Statistics and Counters Reference.
show mrme-service

Displays configuration and/or statistical information for MRME services on this system.

Product
SaMOG

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax
```
show mrme-service { all | name name | statistics { all [ verbose ] | dns-stats | name name [ dns-stats ] } } [ | { grep grep_options | more } ]
```

- **all**
  Displays all MRME services.

- **name name**
  Displays information for specific MRME service name.
  *name* is a string of size 1 to 63.

- **statistics**
  Displays Node level Statistics for MRME.

- **verbose**
  Specifies Detailed statistics.

- **dns-stats**
  Specifies the information related to the DNS selection of P-GW.

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of *grep* and *more*, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

Usage
Use this command to displays configuration and/or statistical information for MRME services on this system.

Example
```
show mrme-service all
```
show mrme-service active-session

Displays configuration and statistical information of the data stored in the active session entry (if present) of the specified User Equipment’s (UE) MAC address.

Product
SaMOG

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show mrme-service active-session mac mac_address [ | { grep grep_options | more } ]
```

```
mac mac_address
```

Specifies the MAC address. `mac_address` must be an alpha-numeric string of 1 to 15 characters and should not be separated by a colon or hyphen.

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

Usage
Use this command to display the configuration and statistical information of the data stored in the active session entry (if present) of the specified User Equipment’s (UE) MAC address.

Example

```
show mrme-service active-session mac 001d33227310
```
show mrme-service imsi-sticky

Displays configuration and statistical information of the IMSI to session manager mapping (if available) in the mapping table of the IPSG manager.

Product
SaMOG

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax
show mrme-service imsi-sticky imsi imsi_value [ | { grep grep_options | more } ]

| imsi  imsi_value
| Specifies the International Mobile Subscriber Identity (IMSI) value. 
| imsi_value must be an integer from 1 to 15 digits.

| { grep grep_options | more }
| Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
| For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to display configuration and statistical information of the IMSI to session manager mapping (if available) in the mapping table of the IPSG manager.

Example

show mrme-service imsi-sticky imsi 123456789 all
show mrme-service mac-sticky

Displays configuration and statistical information of the User Equipment (UE) MAC address to IMSI mapping (if available) in the mapping table of the IPSG manager.

Product
SaMOG

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show mrme-service mac-sticky mac mac_address [ | { grep grep_options | more } ]
```

```
mac mac_address
```

Specifies the MAC address.

```
mac_address must be an alpha-numeric string of 1 to 15 characters and should not be separated by a colon or hyphen.
```

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to display the configuration and statistical information of the User Equipment (UE) MAC address to IMSI mapping (if available) in the mapping table of the IPSG manager.

Example

```
show mrme-service mac-sticky mac 001d33227310
```
show mseg-config

This command is not supported in this release.
show mseg-service

This command is not supported in this release.
**show multicast-sessions**

Displays information for multicast sessions defined by the specified keywords.

**Product**
- PDSN
- GGSN

**Privilege**
- Security Administrator, Administrator, Operator, Inspector

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show multicast-sessions [ command_keyword ] [ filter_keywords ] [ | { grep grep_options | more }
```

**command_keyword**

The following keywords are base commands that each have a distinct display output. Only one keyword can be entered on the command line.

```
debug-info { callid id | flowid id }
```

Displays internal call troubleshooting information for multicast sessions defined by the specified keywords.

- **callid id**: Displays subscriber information for the call specified as an 8-digit hexadecimal number.
- **flowid id**: Displays information for a specific BCMCS flow, defined by the flow ID as a hexadecimal number.

```
f
```

Displays all available multicast session information. The following filter keywords are valid for this command: active, all, callid, card-num, dormant, flowid, flowid-type, mcast-address, pcf, pdsn-service, grep, more

```
f
```

Only displays a summary of multicast session information. The following commands are valid for this command: active, all, callid, card-num, dormant, flowid, flowid-type, mcast-address, pcf, pdsn-service, grep, more

**filter_keywords**

The following keywords are filters that modify or filter the output of the Command Keywords. Not all filters are available for all Command Keywords. Multiple Filter Keywords can be entered on a command line. When multiple Filter Keywords are specified, the output conforms to all of the Filter Keywords specifications.
active

Only displays information for multicast sessions that are currently active.

all

If no keywords are specified before all, information for all multicast sessions is displayed. If keywords are specified before all, all information is displayed with no further options being allowed.

callid id

Displays multicast session information for the call specified by id. The call must be specified as an 8-digit hexadecimal number.

card-num card_num

The slot number of the processing card by which the subscriber session is processed. card_num is a slot number from 1 through 7 or 10 through 16 on the ASR 5000, or 1 through 4 or 7 through 10 on the ASR 5500.

dormant

Shows information for subscriber sessions that are dormant (not transmitting or receiving data).

flowid id

Displays information for a specific BCMCS flow, defined by id. The flow ID must be a hexadecimal number.

flowid-type [ flow | program ]

Displays information for multicast sessions according to the type of flow.
flow: Shows all multicast sessions for the flow ID type “flow”.
program: Shows all multicast sessions for the flow ID type “program”.

mcast-address ipv4_address

Show multicast sessions for a specific multicast address. Must be followed by the IP address of an interface, using IPv4 dotted-decimal notation.

pcf ipv4_address

Displays information for multicast sessions connected via the packet control function, defined by ipv4_address. The address must be specified using IPv4 dotted-decimal notation.

pdsn-service svc_name

Displays information for multicast session connected to the packet data service svc_name. The packet data service must have been previously configured and expressed as an alphanumeric string of 1 through 63 characters.

| { grep grep_options | more } |

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
Please refer to the Regulating a Command’s Output section in the Command Line Interface Overview chapter for details on the usage of grep and more.
**Usage**

Use this command to view information about multicast sessions. The output of this command may be considered for part of a periodic system auditing program by verifying active and dormant sessions.

**Example**

The following command displays the all broadcast-multicast sessions active in a context/system:

```
show multicast-sessions all
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*.
show network-requested-pdp-context

Displays information for the specified network-requested packet data protocol (PDP) context.

Product
GGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show network-requested-pdp-context imsi imsi_value

<table>
<thead>
<tr>
<th>imsi</th>
<th>imsi_value</th>
</tr>
</thead>
<tbody>
<tr>
<td>imsi</td>
<td>imsi_value</td>
</tr>
</tbody>
</table>

Specifies that information will be displayed for a particular International Mobile Subscriber Identity (IMSI).

Usage
USE this command to display information pertaining to network-requested PDP contexts.

Example
The following command displays network-requested PDP context information for a subscriber with an IMSI of 123456789:

    show network-requested-pdp-context imsi 123456789
show network-service-entity

Displays information regarding the network service entities (NSEs) in the network.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec
The following prompt is displayed in the Exec mode:

`[local]host_name#`

**Syntax**

```
show network-service-entity { consolidated-status | fr-config [ peer-nsei nsei ] | ip-config [ nsvl { all | instance value } ] }
```

- **consolidated-status**
  Displays Network Service Virtual Connection (NSVC) status information for all network service entities in the network. This keyword is particularly useful for troubleshooting.

- **fr-config [ peer-nsei nsei ]**
  Displays network service configurations for NSEs using Frame Relay configurations.
  `peer-nsei nsei` limits the display to a specific peer NSE identified as an integer from 0 through 65535.

- **ip-config [ nsvl { all | instance value } ]**
  Displays network service configurations for NSEs using IP configurations.
  Including the `nsvl` keyword limits the display to all or a single (instance 0 to 3) of a network service virtual link.

**Usage**
Use this command to display NSE information pertaining to the NSVCs of the NSEs in the networks or NSEs configured for Frame Relay or IP.

**Example**
The following command displays the status of all the NSVCs for all the NSEs in the network.

```
show network-service-entity consolidated-status
```
show npu arp

Displays an Address Resolution Protocol (ARP) for a specified VPN identifier.

**Product**
ASR 5000 only

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show npu arp lookup vpnid identifier nexthop ip_address slot slot_number
```

- **identifier**
  Specifies a valid VPN identifier as an integer from 0 through 2114.

- **nexthop ip_address**
  Specifies a valid nexthop IP address in IPv4 dotted decimal or IPv6 colon-separated-hexadecimal notation.

- **slot slot_number**
  Specifies the slot number of the card for which the lookup is being form. `slot` is one of the following integers: 1, 2, 8 or 9.

**Usage**

Use this command to perform an aRP lookup of a valid VPNid.

**Example**

The following command displays ARP lookup information for VPN 234:

```
show npu arp lookup vpnid 234 nexthop 10.1.1.1 slot 8
```
show npu error-counters

Displays packet error counters.

**Product**
ASR 5000 only

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec
The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show npu error-counters [ | { grep grep_options | more } ]
```

| { grep grep_options | more } | Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent. For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**
View network timing protocol information to troubleshooting system clock issues by displaying the associations and status of the local NTP client.

**Example**

The following displays the NPU information.

```
show npu error-counters
show npu error-counters | grep qwe
```
show npu utilization

Displays NPU information utilization.

Product
ASR 5000, ASR 5500

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show npu utilization table [ | { grep grep_options | more } ]

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

View network timing protocol information to troubleshooting system clock issues by displaying the associations and status of the local NTP client.

Example

The following displays the NPU information.

    show npu utilization table

    show npu utilization table | grep qwe
show ntp

Displays the network timing protocol (NTP) associations and status.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ntp { associations | status } [ address ip_address ] [ | { grep grep_options | more } ]

associations
Displays the current NTP server associations and related statistics.

status
Displays the client permeates configured and the synchronization status.

address ip_address
Specifies the IP address of an NTP server/client in the current context in IPv4 dotted-decimal notation.

| { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

View network timing protocol information to troubleshooting system clock issues by displaying the associations and status of the local NTP client.

Example

The following displays the NTP associations and status, respectively.

show ntp associations
show ntp status

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show nw-reachability server

Displays the configuration of network reachability servers for the current context.

Product
HA

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show nw-reachability server { all | ipv4-only | ipv6-only | name server_name }

- **all**
  Displays configuration information for all network reachability servers in the current context.

- **ipv4-only**
  Displays IPv4 Network Reachability Detection servers.

- **ipv6-only**
  Displays IPv6 Network Reachability Detection servers.

- **name server_name**
  Displays configuration information for an existing network reachability server specified as an alphanumeric string of 1 through 15 characters.

Usage

Use this command to display configuration information on network reachability servers configured in the current context.

Example

The following command displays information on all network reachability servers in the current context:

```
show nw-reachability server all
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show operator-policy

Displays the information configured for an operator policy.

Product
MME
SAEGW
S-GW
SGSN

Privilege
Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show operator-policy { all | full { all | name op_policy_name } | name op_policy_name } [ | { grep grep_options | more } ]

all
Displays a list of all operator policies configured on the system.

full { all | name op_policy_name }
full: Displays a full set of available information for the specified operator policy (policies).
all: Displays a full set of available information for all operator policies configured on the system.
name op_policy_name: Displays a full set of available information for an existing operator policy specified as an alphanumeric string of 1 through 64 characters.

name op_policy_name
Displays a full set of available information for an existing operator policy specified as an alphanumeric string of 1 through 64 characters.

| { grep grep_options | more }
Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section in the Command Line Interface Overview chapter.

Usage
Use this command to display information for operator policies configured on the system. Operator policies are configured through the Global Configuration Mode and in the Operator Policy Configuration Mode. For
more information regarding operator policy commands, refer to the *Operator Policy Configuration Mode Commands* chapter.

**Example**

The following command displays all available information for an operator policy named *policy-5*:

```
show operator-policy full name policy-5
```
show orbem

Displays information and statistics for the Object Request Broker Element Manager (ORBEM) interface in the current context.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show orbem { client { id client_name | table } | event-notif-service filters | session { id session_name | table } | status } [ | { grep grep_options | more }

| client { id client_name | table }
| Indicates the Common Object Request Broker Architecture (CORBA) client information is to be displayed. The keyword `table` is used to output to the display information on all configured clients. The keyword `id` is used to specify a specific client for which information is to be displayed specified as `client_name`. `client_name` must refer to an existing client which is found using the `table` keyword option.

| event-notif-service filters
| Displays information pertaining to filters configured for the ORB Notification Service.

**Important:** In 18.0 and later releases, this keyword is obsolete.

| session { id session_name | table }
| Indicates session information is to be displayed. The keyword `table` is used to output to the display information on all configured clients. The keyword `id` is used to specify a specific session for which information is to be displayed specified as `session_name`. `session_name` must refer to an existing session which is found using the `table` keyword option.

| status
| Indicates that the ORBEM server status information is to be displayed.

| | { grep grep_options | more }
| Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent. For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section in the *Command Line Interface Overview* chapter.
Usage
Display current sessions when ORBEM system response may appear sluggish. This command is also useful in periodic verification of the server status.

Example
The following commands will display the information for all clients.

```bash
show orbem client table
```

The following commands display the information for the `clientName` and `sessionID`, respectively:

```bash
show orbem client id clientName
show orbem session id sessionId
```

The following command displays the ORBEM server status:

```bash
show orbem status
```

The following command displays the information for all sessions:

```bash
show orbem session table
```

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show patch progress

Displays the status of the on-going software patch installation.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show patch progress

Usage

Use this command to show the status of an on-going software patch installation.

**Important:** Software Patch Upgrades are not supported in this release.
show pcc-af service

Displays the statistical and configuration information of configured Policy and Charging Control- Application Function (PCC-AF) services configured in a context.

Product
IPCF

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

    [local]host_name#

Syntax

show pcc-af service [ statistics ] { all | name pcc_af_svc_name | summary } [ | { grep grep_options | more } ]

- **all**: displays information for all configured PCC-AF services.

- **name pcc_af_svc_name**: Displays information only for an existing PCC-AF service specified as an alphanumeric string of 1 through 79 characters

- **statistics**: Displays the statistical information for a specific service or all PCC-AF services configured in a context.

- **summary**: Displays the summarized output of this command.

Usage

Use this command to display the statistical and configuration information of configured PCC-AF services configured in a context.

Display can further be filtered for specific PCC-AF service name or summarized output of the command.

Example

The following command displays the information for the PCC-AF service named `pccApp1` in summarized output:

```
show pcc-af service statistics pcc_app1
```
show pcc-af service name pccApp1 summary

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
**show pcc-af session**

Displays the active/dormant session information about Policy and Charging Control- Application Function (PCC-AF) service instances configured and running on this system based on different filter criteria.

**Product**

IPCF

**Privilege**

Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
show pcc-af sessions [ full | summary ] [ all ] [ apn | call-id call_id | ip-address pcc_af_ip_address | service pcc_af_svc_name | sipuri sip_uri ] [ | { grep grep_options | more } ]
```

### full

Displays the full information of specific registered IP Connectivity Access Network (IP-CAN) session(s) on a PCC-AF service instance running on system. Display can be filtered based on given filtering criteria.

### summary

Displays summarized information for specific registered IP-CAN session(s) on a PCC-AF service instance running on system. Display can be filtered based on given filtering criteria.

### all

Displays summarized or full information for all registered IP-CAN session(s) on a PCC-AF service instance running on system. Display can be filtered based on given filtering criteria.

### apn apn_name

Displays information for PCC-AF service sessions connected via an existing APN at the Policy and Charging Enforcement Function (PCEF).

### ip-address pcc_af_ip_address

Filters the display of full or summarized session statistics for IP-CAN session(s) based on the IP address of a registered PCC-AF server on a PCC-AF service instance.  

*pcc_af_ip_address* is an IP address expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

### call-id call_id

Filters the display of full or summarized session statistics for IP-CAN session(s) based on the registered call ID on a PCC-AF service instance for the IP-CAN session subscriber in 8-digit hexadecimal format.
**pcc-af-service pcc_af_svc_name**
Filters the display of session statistics for a registered IP-CAN session(s) based on an existing PCC-AF service name specified as an alphanumeric string of 1 through 63 characters.

**sipuri sip_uri**
Displays summarized or full information for IP-CAN session(s) based on the SIP-URI on a PCC-AF service instance.

*sip_uri* is the Session Initiation Protocol (SIP) addressing schema to call another person. It resembles an e-mail address and is written in the SIP URI format as `sip:x@y:Port` format, where `x` = username and `y` = host (domain or IP)

| | { grep grep_options | more } |

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the `grep` and `more` commands, refer to the *Regulating a Command’s Output* section in the *Command Line Interface Overview* chapter.

---

**Usage**

Use this command to view the session statistics of all or specific registered IP-CAN session(s) or in selected part of user session for PCC-AF services configured and running on this system.

**Example**

The following command displays the summarized session statistics for all registered IP-CAN sessions on the PCC-AF service named `pccAF1`:

```
show pcc-af sessions summary all service pccAF1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show pcc-policy service

Displays the statistical and configuration information of configured PCC-Policy services configured in a context.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name# 
```

**Syntax**

```
show pcc-policy service [ statistics] { all | name pcc_plcy_svc_name | summary } [ | { grep grep_options | more } ] 
```

- **all**
  - all: displays information for all configured PCC-Policy services.

- **name pcc_plcy_svc_name**
  - Displays information for an existing PCC-Policy service specified as an alphanumeric string of 1 through 79 characters.

- **statistics**
  - Displays statistical information for a specific or all PCC-Policy services configured in a context.

- **summary**
  - Displays summarized output for this command.

| Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent. For details on the usage of the **grep** and **more** commands, refer to the **Regulating a Command’s Output** section in the **Command Line Interface Overview** chapter. |

**Usage**

Use this command to display the statistical and configuration information of configured PCC-Policy services configured in a context.

Display can further be filtered for specific PCC-Policy service name or summarized output of the command.

**Example**

The following command displays the information for the PCC-Policy service named `pcc_policy1` in summarized output:
show pcc-policy service name pcc_policy1 summary

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show pcc-policy session

Displays active/dormant session information about PCC-Policy service instances configured and running on this system based on different filter criteria.

Product

IPCF

Privilege

Inspector

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show pcc-policy sessions [ full | summary ] [ all ] [ apn | call-id call_id | imsi imsi_id | ip-address pcc_pcef_ip_address | service pcc_plcy_svc_name ] [ | { grep grep_options | more } ]

- **full**
  Displays full information for a specific registered IP Connectivity Access Network (IP-CAN) session(s) on a PCC-Policy service instance running on system. Display can be filtered based on given filtering criteria.

- **summary**
  Displays summarized information for a specific registered IP-CAN session(s) on a PCC-Policy service instance running on system. Display can be filtered based on given filtering criteria.

- **all**
  Displays summarized or full information for all registered IP-CAN session(s) on a PCC-Policy service instance running on system. Display can be filtered based on given filtering criteria.

- **apn apn_name**
  Displays information for PCC-Policy service sessions connected via an existing APN on the PCEF.

- **imsi imsi_id**
  Displays summarized or full information for IP-CAN session(s) based on the International Mobile Subscriber Identity (IMSI) of a subscriber in a PCC-Policy service instance.
  
  *imsi_id* is the IMSI and must be a 15-character field which identifies the subscriber’s home country and carrier.

- **ip-address pcc_pcef_ip_address**
  Filters the display of full or summarized session statistics for IP-CAN session(s) based on the IP address of the registered PCEF node specified in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
**show pcc-policy session**

**call-id call_id**
Filters the display of full or summarized session statistics display for an IP-CAN session(s) based on the registered call ID in a PCC-Policy service instance.
*call_id* must be an existing call identifier in the IP-CAN session subscriber expressed in 8-digit hexadecimal format.

**pcc-policy-service pcc_plcy_svc_name**
Filters the display of session statistics for registered IP-CAN session(s) based on an existing PCC-Policy service name specified as an alphanumeric string of 1 through 63 characters.

```
| { grep grep_options | more }
```
Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the *grep* and *more* commands, refer to the *Regulating a Command’s Output* section in the *Command Line Interface Overview* chapter.

**Usage**
Use this command to view the session statistics for all or a specific registered IP-CAN session(s) for PCC-Policy services configured and running on this system.

**Example**
The following command displays summarized session statistics for all registered IP-CAN sessions on the PCC-Policy service named *pccPolicy1*:

```
show pcc-policy sessions summary all service pccPolicy1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show pcc-service

Displays the configuration information for Policy and Charging Control (PCC) services configured in a context.

Product
IPCF

Privilege
Security Administrator Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show pcc-service { summary | all | service-name pcc_svc_name } [ | { grep grep_options | more }]

| all
all: displays information for all configured PCC services.

| service-name pcc_svc_name
Displays information for an existing PCC service specified as an alphanumeric string of 1 through 79 characters.

| summary
Displays the summarized output of this command.

| { grep grep_options | more }
Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section in the Command Line Interface Overview chapter.

Usage
Use this command to display statistical and configuration information for configured PCC services in a context.
Display can further be filtered for a specific PCC service name.

Example

The following command displays the information for the PCC service named pcc_svc1:

show pcc-service service-name pcc_svc1 summary

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show pcc-service session

Displays active/dormant session information about Policy and Charging Control (PCC) service instances configured and running on this system based on different filter criteria.

Product
IPCF

Privilege
Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show pcc-service sessions [ full | summary ] [ all emergency-only ] [ call-id call_id | instance instance_id | service-name pcc_svc_name ] [ | { grep grep_options | more } ]

full
Displays full information for a specific registered IP Connectivity Access Network (IP-CAN) session(s) in a PCC service instance running on system. Display can be filtered based on given filtering criteria.

summary
Displays summarized information for a specific registered IP-CAN session(s) in a PCC service instance running on system. Display can be filtered based on given filtering criteria.

all
Displays summarized or full information for all registered IP-CAN session(s) in a PCC service instance running on system. Display can be filtered based on given filtering criteria.

emergency-only
Displays summarized or full information for all IP-CAN sessions on a PCC service instance running on system which are using emergency APN for emergency services. Display can be filtered based on given filtering criteria.

instance instance_id
Displays summarized or full information for an IP-CAN session(s) based on the PCC service instance identifier on an IPCF/PCRF node specified as an integer from 1 through 512.

service-name pcc_svc_name
Filters the display of session statistics display of registered IP-CAN session(s) based on an existing PCC service name specified as an alphanumeric string of 1 through 63 characters.
| { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section in the Command Line Interface Overview chapter.

Usage

Use this command to view session statistics for all or a specific registered IP-CAN session(s) in PCC services configured and running on this system.

Example

The following command displays summarized session statistics for all registered IP-CAN sessions in the PCC service named pccsvc1:

```
show pcc-service sessions summary service-name pccsvc1
```

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show pcc-service statistics

Displays the statistical information for Policy and Charging Control (PCC) services configured in a context.

Product
IPCF

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show pcc-service statistics { all | service-name pcc_svc_name [ profile-name pcc_profile_name ] } [ | { grep grep_options | more } ]
```

- **all**
  Displays statistical information for all configured PCC services on a system.

- **service-name pcc_svc_name**
  Displays information for an existing PCC service specified as an alphanumeric string of 1 to 79 characters. It can be further filtered by the PCC profile name used in an IP-CAN session.

- **profile-name pcc_profile_name**
  Displays information for an existing PCC profile in an IP-CAN session.

- `{ grep grep_options | more }`
  Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

Usage

Use this command to display the statistical information for PCC services configured in a context. Display can further be filtered for a specific Profile name used in a session.

Example

The following command displays the information for the PCC service named `pcc_svc1` using PCC profile named `pcc_profile_default`:

```
show pcc-service statistics service-name pcc_svc1 profile-name pcc_profile_default
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show pcc-sp-endpoint

Displays statistical and configuration information for a configured PCC Sp-Endpoint instance in a context.

**Product**

IPCF

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show pcc-sp-endpoint [statistics] [all | name sp_endpt_name] [ | [grep grep_options | more]] [connection [all | name sp_endpt_name]]
```

| all |
| Displays statistical information for all configured PCC Sp-Endpoint instances on a system. |

| name sp_endpt_name |
| Displays information for an existing PCC Sp-Endpoint instance specified as an alphanumeric string of 1 through 79 characters. |

| | {grep grep_options | more} |
| Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent. |
| For details on the usage of `grep` and `more` commands, refer to the *Regulating a Command’s Output* section in the *Command Line Interface Overview* chapter. |

| connection |
| Displays statistics for the configured connection values along with peer selection success and failures. |

**Usage**

Use this command to display statistical information and peer name for a configured PCC Sp-Endpoint instance in a context.

**Important:** If the secondary peer is not configured, then N/A is printed in the output.

**Example**

Display can further be filtered for a specific PCC Sp-Endpoint instance used in a session.

The following command displays statistical information for the PCC Sp-Endpoint instance named *Sp_Intfl*:

```
show pcc-sp-endpoint statistics name Sp_Intfl
```
**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show pcc-sp-endpoint connection

Displays statistical and configuration information for an Sp interface connection in a PCC Sp-Endpoint instance.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
show pcc-sp-endpoint connection [ all | name sp_endpt_name [ peer sp_peer_name ] ] [ | { grep grep_options | more } ]
```

- `all`
  Displays statistical information for all configured PCC Sp-Endpoint instances on a system.

- `name sp_endpt_name`
  Displays information for an existing PCC Sp-Endpoint instance specified as an alphanumeric string of 1 through 79 characters. It can further be filtered with an Sp Endpoint peer (SSC/SPR) name used for the IP Connectivity Access Network (IP-CAN) session.

- `peer ssc_name`
  Displays information only for the PCC Sp-Endpoint instance within an existing Subscriber Service Controller/Subscriber Profile Repository (SSC/SPR) as a peer for an IP-CAN session.
  - `ssc_name` is the name of the SSC/SPR node used by the Sp Endpoint interface.

- `| { grep grep_options | more }`
  Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

  For details on the usage of the `grep` and `more` commands, refer to the *Regulating a Command’s Output* section in the *Command Line Interface Overview* chapter.

**Usage**
Use this command to display statistical information for Sp interface connections in PCC Sp-Endpoint instances.
Display can further be filtered for a specific peer name (SSC/SPR).

**Example**
The following command displays the Sp interface connection related statistical information for the PCC Sp-Endpoint instance named `Sp_Intf1` using peer name `SSC1`:

```
show pcc-endpoint connection name Sp_Intf1 peer SSC1
```
Important: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show pdg-service

Displays configuration information about PDG services configured on the system.

Product
PDG/TTG

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show pdg-service { all | name service_name }  

| all  
| Displays information for all configured Packet Data Gateway/Tunnel Termination Gateway (PDG/TTG) services.  
| name service_name  
| Displays information only for an existing PDG service specified as an alphanumeric string of 1 through 63 characters.

| { grep grep_options | more }  
| Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of grep and more, refer to the Regulating a Command’s Output section in the Command Line Interface Overview chapter.

Usage
Use this command to display information for PDG services.

Example
The following command displays available information for all active PDG services:

    show pdg-service all
show pdg-service statistics

Displays statistics for the Packet Data Gateway/Tunnel Termination Gateway (PDG/TTG) since the last restart or clear command. The output includes the number of each type of Extensible Authentication Protocol (EAP) messages.

Product
PDG/TTG

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show pdg-service statistics [ name service_name | peer-address ipv4_address ]

name service_name
Displays statistics for an existing PDG service specified an alphanumeric string of 1 through 63 characters.

peer-address ipv4_address
Displays statistics for a specific subscriber with the WLAN IP address specified in IPv4 dotted-decimal notation.

| { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section in the Command Line Interface Overview chapter.

Usage
Use this command to display PDG service statistics.

Example
The following command displays statistics for all active PDG services:

   show pdg-service statistics
show pdif-service

Displays configuration information about Packet Data Interworking Function (PDIF) services configured on the system.

Product
PDIF

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show pdif service { all [ counters ] | name name [ counters ] | statistics [ name name | peer-address address ] } [ | { grep grep_options | more } ]

  all [ counters ]
  Displays configuration information and statistical counters for all PDIF services in the system.

  name name [ counters ]
  Displays configuration information and statistical counters for an existing PDIF service specified as an alphanumeric string of 1 through 63 characters.

  statistics [ name name | peer-address address ]
  name name: Displays service statistics for a an existing PDIF service specified as an alphanumeric string of 1 through 63 characters.
  peer-address address: Displays service statistics for a peer server IP address specified in IPv4 dotted-decimal notation.

  | { grep grep_options | more }
  Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
  For details on the usage of grep and more, refer to the Regulating a Command’s Output section in the Command Line Interface Overview chapter.

Usage

Use this command to display configuration information and statistics about PDIF services on the system.

Example

The following example displays configuration information about a PDIF service named pdif23:

  show pdif service name pdif23

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show pdn-connection-count

Displays the current number of PDN connections for each of the Restoration-Priority-Level values (1-8) received from AAA across S6b interface.

Product
P-GW
SAEGW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:
[local]host_name#

Syntax

show pdn-connection-count restoration-priority-level { priority_level | all }

restoration-priority-level { priority_level | all }

Restoration priority associated with PDN connection.
priority_level: Restoration priority level must be an integer from 1 through 8.
all: Displays the number of PDN connections associated with all restoration priorities.

Usage
To distinguish between VoLTE enabled IMS PDN connections and non-VoLTE enabled IMS PDN connections, the P-GW supports receiving AVP “Restoration-Priority-Indicator” from AAA server over the S6b interface. The P-GW also provides KPIs based on the AVP value.

Example
The following command displays the number of PDN connections associated with restoration priority level 2:

show pdn-connection-count restoration-priority-level 2
show pdsn-service

Displays information for configured packet data services in the current context.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show pdsn-service { all | name pdsn_name } [ pcf-status { address ip_address | filter [ all | icmp-monitored | no-calls | summary | up ] ] [ | { grep grep_options | more } ] ]
```

- **all**: Displays information for all configured packet data services.
- **name pdsn_name**: Displays information only for an existing PDSN service specified as an alphanumeric string of 1 through 79 characters.

```
pcf-status [ address ip_address | filter [ all | icmp-monitored | no-calls | summary | up ] ]
```

- **pcf-status**: Displays summary information for all Packet Control Functions (PCFs).
- **address ip_address**: Only lists information for the PCF with the IP address specified in IPv4 dotted-decimal notation.
- **filter**: Filters the output so only the specified information is displayed. If a filter is specified with no keywords, summary information for all PCFs is displayed.
  - **all**: Displays information for all the PCFs
  - **icmp-monitored**: Displays information only for PCFs which are ICMP monitored
  - **no-calls**: Displays information only for PCFs which have no active sessions
  - **summary**: Displays only a summary of the status of the PCFs
  - **up**: Displays information only for PCFs which are alive

```
| { grep grep_options | more }
```

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section in the *Command Line Interface Overview* chapter.

Usage
Show the PDSN service information for standard system monitoring or troubleshooting.
The following will display the information for all configured services and `sampleService`, respectively:

```
show pdsn-service all
show pdsn-service name sampleService
```
show peer-profile

Displays configuration of the specified peer profile.

Product

GGSN
P-GW
SAEGW
S-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show peer-profile { all | full { all | name profile_name } | name profile_name } [ | { grep grep_options | more } ]

all

Displays a list of all peer profiles configured on the system, arranged by service type.

full { all | name profile_name }

Displays detailed peer profile configuration information.
all: Displays detailed configuration information for all peer profiles configured on the system.
name profile_name: Displays detailed configuration information for the specified peer profile.
profile_name is an alphanumeric string of 1 through 64 characters.

name profile_name

Lists the specified peer profile, and the service type to which it belongs.
profile_name is an alphanumeric string of 1 through 64 characters.

| { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section in the Command Line Interface Overview chapter.

Usage

Use this command to display configuration information for the peer profiles created on the system.
Refer to the peer-profile command in the Global Configuration Mode Commands chapter and the Peer Profile Configuration Mode Commands chapter for more information.

Example

Command Line Interface Reference, StarOS Release 17
The following command displays detailed configuration information for the pp2 peer profile.

```bash
show peer-profile full name pp2
```
show pgw-service

Displays configuration information for PDN Gateway (P-GW) services on this system.

Product
P-GW
SAEGW

Privilege
Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show pgw-service { all | name service_name | statistics { all | name service_name } [ verbose ] } [ | { grep grep_options | more } ]

| |
| all
Displays configuration information for all P-GW services configured on this system.

| | name service_name
Displays configuration information for an existing P-GW service specified as an alphanumeric string of 1 through 63 characters.

| | statistics { all | name service_name } [ verbose ]
Displays P-GW service statistics.
| all: Displays statistics for all P-GW services on the system.
| name service_name: Displays statistics for an existing P-GW service specified as an alphanumeric string of 1 through 63 characters.
| If verbose is also specified, the information is displayed in more detail.

| | | grep grep_options | more }
Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of grep and more, refer to the Regulating a Command’s Output section in the Command Line Interface Overview chapter.

Usage
Use this command to view configuration information for P-GW services on this system.

Example
The following command displays service statistics for the P-GW service named pgw1:

show pgw-service name pgw1
show pilot-packet statistics

Display Pilot Packet statistics for all servers and all session manager instances, or for a specified server name.

Product
NAT

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show pilot-packet statistics { all | destination-context context_name } [ | { grep grep_options | more } ]
```

- **all**
  Displays statistics for all servers and session manager instances.

- **destination-context context_name**
  Displays statistics for a specified destination context. **context_name** is specified as an alphanumeric string of 1 through 79 characters.

  | | { grep grep_options | more }
  Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
  For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section in the Command Line Interface Overview chapter.

Usage

Use this command to display Pilot Packet statistics for all servers and all session manager instances, or for a specified server name.

Example

The following command displays Pilot Packet statistics for all servers and session manager instances:

```
show pilot-packet statistics all
```
**show plugin**

Displays the current configuration of one or all plugin modules installed on the system. This command is associated with the dynamic software upgrade process.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
show plugin [ plugin_name ]
```

`plugin_name`

Filters the output by an existing plugin name expressed as an alphanumeric string of 1 through 16 characters.

**Usage**

Displays the attribute settings, priority and version for one or all plugin modules. A plugin module is a shared object library that can be dynamically updated or rolled back. Refer to the *System Administration Guide* for additional information on dynamic software updates.

**Example**

The following command displays the configuration status of all plugin modules currently installed on the system:

```
show plugin
```
show port

Displays information on configured parameters and operational statistics for physical and logical ports in the system.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show port { datalink counters [ slot/port ] | info [ slot/port ] [ vlan vlan_id ] | npu counters [ slot/port [ tagged | untagged | vlan tag_id ] ] | table | transceiver slot/port | utilization table [ verbose ] } [ grep grep_options | more ]

show port info { slot/port } [ vlan vlan_id ] [ grep grep_options | more ]

datalink counters slot/port
Displays the physical layer information for all data links or only the one specified by the slot/port location of a previously configured port.

info [ slot/port ] [ vlan vlan_id ]
Displays detailed information for all ports within the chassis or only the one specified by slot/port location of a previously configured port.

vlan vlan_id: Displays detailed information about all Virtual Local Area Networks (VLANs) in the port/slot. If the optional vlan_id is not specified, this keyword displays port information for all VLANs in the slot/port location.

npu counters [ slot/port [ tagged | untagged | vlan tag_id ] ] [ bound | unbound ]
Displays the information for Network Processing Unit (NPU) ports. The information for all ports is output or only the one specified by the slot/port location of a previously configured port.

For ASR 5500 MIO ports, this command displays the combined statistics for the specified port and its paired port (virtual pair).

tagged: Display statistics for all tagged packets.
untagged: Display statistics for all untagged packets.

vlan tag_id: Display NPU counters for a previously configured VLAN ID.

bound: Displays individual and cumulative NPU port counters for the bound ports within the current context. If the command is invoked in the local context, all of the bound ports for all contexts and cumulative counter values for all contexts are displayed.

unbind: Displays individual and cumulative NPU port counters for all unbound ports within system.
**table**
Displays information for all physical ports on rear-installed cards with physical interfaces.

**transceiver slot/port**
Displays diagnostic information for all SFP+ transceivers connected to a specified subscriber traffic port on the MIO card.

**utilization table [ verbose ]**
Shows average port utilization in Mbps. The output is a table that lists the current utilization average, a 5-minute average, and a 15-minute average, for all enabled ports.
The *verbose* option displays port utilization with kilobyte accuracy using decimal points.

```
l | { grep grep_options | more }
```
Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of *grep* and *more*, refer to the *Regulating a Command’s Output* section in the *Command Line Interface Overview* chapter.

**Usage**
Display port information for troubleshooting of network communications by viewing statistics and configuration information for physical ports.

**Example**
The following displays detailed information for port 1 in slot 17:

```
show port info 17/1
show port table
```
The following displays information for the data link port 33/1:

```
show port datalink counters 33/1
show port npu counters 33/1
```
The following displays detailed information for port 11 in slot 5:

```
show port info 5/11
show port table
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show power

Displays information about the power on/off status of individual cards and the operating status of installed power filter units.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show power [ all | chassis | card_num ] [ | { grep grep_options | more } ]
```

- `all`: Displays power on/off state for all cards in the chassis.
- `chassis`: Displays the operating status of installed power filter units. This is the default setting.
- `card_num`: Displays the power on/off state for a single card specified an integer from 1 through 48 for the ASR 5000 or 1 through 20 for the ASR 5500.

| { grep grep_options | more } |
---|
Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section in the *Command Line Interface Overview* chapter.

**Usage**

View power source information to quickly check the power for all cards within a chassis.

**Important:** On some platforms, only `show power` is supported with no other keywords or variables.

**Example**

The following displays power supply status for the chassis:

```
show power
```

The following command displays the power status for all slots:

```
show power all
```
show ppp

Displays the point-to-point protocol (PPP) information, detailed or summarized, for one or all connections by the use of filtering options.

Product

PDSN
GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ppp { [ counters | full | summary ] { all | call id call_id | imsi id imsi_id | msid ms_id | username user_name } | statistics [ pcf-address [ pcf_ip_addr | all ] | pdsn-service pdsn_name ] } [ | { grep grep_options | more } ]

counters | full | summary

Filters the output for the level and type of information with the options described below.
counters: Displays PPP statistics.
full: Displays all available information.
summary: Displays only a summary of available information.

all | call id call_id | imsi id imsi_id | msid ms_id | username user_name } ]

all: Displays all available information.
call id call_id: Displays PPP information only for the call ID specified as a 4-digit hexadecimal number.
imsi id: Displays PPP information only for the subscriber with the specified IMSI (International Mobile Subscriber Identity). id is a 15-digit field which identifies the subscriber’s home country and carrier.
msid ms_id: Displays information for a mobile subscriber ID specified as 7 to 16 digits for an IMSI, MIN, or RMI.
username user_name: Displays user PPP information for the specified username.

statistics [ pcf-address [ pcf_ip_addr | all ] | pdsn-service pdsn_name ]

Displays statistics for all packet data services.
pcf-address [ pcf_ip_addr | all ]: Displays statistics only for the time the session is connected to the specified PCF (Packet Control Function) or for all PCFs. pcf_ip_addr must be specified using IPv4 dotted-decimal notation.
pdsn-service pdsn_name: Display statistics only for an existing PDSN service specified as an alphanumeric string of 1 through 63 characters.

| { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

### Usage
View Point-to-Point Protocol information to support troubleshooting subscriber connections by viewing information on PPP connections for a specific subscriber.

### Example
The following displays the PPP summary for all connections.

```
show ppp summary all
```

The following outputs the point-to-point detailed information for the user `user1`.

```
show ppp full username user1
```

The following command displays the standard information for the call with ID `FF0E11CD`.

```
show ppp callid ff0e11cd
```

The following command displays the PPP statistics for `pdsn1`.

```
show ppp statistics pdsn-service pdsn1
```

The following command provides summarized information for the PPP statistics.

```
show ppp
```

---

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show prepaid 3gpp2

Displays prepaid accounting information for all services or only the service specified.

Product
- PDSN
- GGSN

Privilege
- Security Administrator, Administrator, Operator, Inspector

Mode
- Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show prepaid 3gpp2 statistics all [ | { grep grep_options | more } ]
show prepaid 3gpp2 statistics { ggsn-service | ha-service | lns-service | pdsn-service { all | name service_name } [ | { grep grep_options | more } ]
show prepaid 3gpp2 statistics per-service-summary } [ | { grep grep_options | more } ]
```

all
Displays prepaid statistics for all services.

ggsn-service
Displays statistics for GGSN service(s).

ha-service
Displays statistics for HA service(s).

lns-service
Displays statistics for LNS service(s).

pdsn-service
Displays statistics for PDSN service(s).

{ all | name service_name }
all: Displays statistics for all services of the specified type.
name service_name: Displays statistics for an existing service specified an alphanumeric string of 1 through 63 characters.

per-service-summary
Displays prepaid statistics per service summary for all services.
Usage
Displays Pre-paid statistics for a particular named service or for all services.

Example
To display statistics for a PDSN service named PDSN1, enter the following command:

```
show prepaid 3gpp2 statistics pdsn-service name PDSN1
```

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show prepaid wimax

This command displays prepaid WiMAX accounting information for all services or only the service specified.

**Product**
ASN-GW

**Privelege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
show prepaid wimax statistics { all | asngw-service { all | name service_name } | ha-service { all | name service_name } | per-service-summary } [ | { s grep_options | more } ]
```

**all**
This keyword displays prepaid statistics for all services.

**asngw-service**
Displays prepaid statistics for Access Service Network-Gateway (ASN-GW) service(s).

**ha-service**
Displays prepaid accounting statistics for Home Agent (HA) service(s).

{ all | name service_name }
**all:** Displays statistics for all services of the specified type.
**name service_name:** Displays statistics for an existing service specified as an alphanumeric string of 1 through 63 characters.

**per-service-summary**
Displays prepaid statistics per service summary for all services.

| { grep grep_options | more } |
Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section in the *Command Line Interface Overview* chapter.

**Usage**
Use this command to display prepaid WiMAX accounting statistics for named service or for all services.

**Example**
The following command displays prepaid WiMAX accounting statistics for an ASN-GW service named \textit{asn1}:

\begin{verbatim}
show prepaid wimax statistics asngw-service name asn1
\end{verbatim}

\textbf{Important:} Output descriptions for commands are available in the \textit{Statistics and Counters Reference}.
show profile-id-qci-mapping

Displays QoS Class Identifier-Radio Access Network (QCI-RAN) mapping tables configured on this system.

**Product**

HSGW

**Privilege**

Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

```
show profile-id-qci-mapping table { all | name table_name } [ | { grep grep_options | more } ]
```

- **all**
  
  Displays information for all QCI-RAN mapping tables configured on this system.

- **name table_name**
  
  Displays information for an existing QCI-RAN table specified as an alphanumeric string of 1 through 63 characters.

- | { grep grep_options | more }

  Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

  For details on the usage of `grep` and `more`, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

**Usage**

Use this command to display the contents of a specific QCI-RAN mapping table or all mapping tables configured on this system.

**Example**

The following command displays the contents of a QCI-RAN mapping table named `table1`:

```
show profile-id-qci-mapping table name table1
```
show ps-network

Displays statistics for the Packet Switched (PS)-network(s) instance configured on a chassis for HNB-GW service sessions.

Product
HNB-GW

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ps-network { all | name ps_name } [ status ] [ | { grep grep_options | more }]

all
Displays status counters for all PS (packet switched) networks configured for HNB-GW service sessions on a chassis.

name ps_name
Displays status counters for a PS network configured for HNB-GW service specified as an alphanumeric string of 1 through 127 characters that is case sensitive

| { grep grep_options | more }
Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
Refer to Regulating a Command’s Output section of the Command Line Interface Overview chapter for details on the usage of grep and more.

Usage
Use this command to display the status of any or all PS-network(s) instance configured on a chassis for HNB-GW service sessions.

Example
The following command displays the output for PS network instance status named ps_1_hnb:

    show ps-network name ps_1_hnb status

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show ps-network counters

Displays the session counter information for a PS Network associated with Home-NodeB Gateway (HNB-GW) services configured and running on a system.

Product
HNB-GW

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

```
show ps-network counters [ name ps_svc_name [ sgsn sgsn_point_code ] ] [ | { grep grep_options | more } ]
```

```
name ps_svc_name
```

Filters the counter display based on an existing HNB-PS Network service name associated with an HNB-GW service running on system. `ps_svc_name` is an alphanumeric string of 1 through 63 characters.

```
sgsn sgsn_point_code
```

Filters the counter display filtered on the basis of SGSN address provided in the SS7 point code that is connected to a particular HNB-PS Network service. `sgsn_point_code` must be the address of an SGSN in SS7 point code notation.

```
| { grep grep_options | more }
```

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section in Command Line Interface Overview chapter.

Usage

Use this command to view the session counter information for HNB-PS Network services configured and SGSNs connected on a system.

Example

The following command displays the counters for the HNB-PS Network service named `hnb_ps_svc1`:

```
show ps-network counters name hnb_ps_svc1
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show ps-network statistics

Displays the Packet Switched session statistics for Home-NodeB Gateway (HNB-GW) services configured and running on this system.

Product
HNB-GW

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ps-network statistics [ name ps_svc_name [ sgsn sgsn_point_code]] [ gtpu-only | ranap-only | sccp-only ] [ | { grep grep_options | more } ]

name ps_svc_name
Filters the session statistics display based on an existing HNB-PS Network service name that is associated with an HNB-GW service running on this system. ps_svc_name is an alphanumeric string of 1 through 63 characters.

sgsn sgsn_point_code
Filters the counter display filtered on the basis of SGSN address provided in the SS7 point code that is connected to a particular HNB-PS Network service. sgsn_point_code must be the address of an SGSN in SS7 point code notation.

gtpu-only
Filters the session statistics to display only GTP-U traffic for the specified HNB-PS Network service which is configured and associated with an HNB-GW service running on this system.

ranap-only
Filters the session statistics to display only Radio Access Network Application Protocol (RANAP) traffic for an HNB-PS Network service which is configured and associated with an HNB-GW service running on this system.

scscp-only
Filters the session statistics to display only Signaling Connection Control Part (SCCP) traffic for the specified HNB-PS Network service which is configured and associated with an HNB-GW service running on this system.
show ps-network statistics

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of the `grep` and `more` commands, refer to the *Regulating a Command’s Output* section in *Command Line Interface Overview* chapter of the *Command Line Interface Reference*.

**Usage**

Use this command to view the session statistics for overall session or in selected part of user session for HNB-GW services configured and running on this system.

**Example**

The following command displays the session statistics for the HNB-PS Network service named `hnb_ps1`:

```
show ps-network statistics name hnb_ps1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
This chapter includes the commands `qci-qos-mapping` through `show system uptime`.

The Exec Mode is the initial entry point into the command line interface system. Exec mode `show` commands are useful in troubleshooting and basic system monitoring.

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
show qci-qos-mapping

Displays QoS Class Identifier-Quality of Service (QCI-QoS) mapping tables configured on this system.

Product

ePDG
HSGW
P-GW
SAEGW
S-GW

Privilege

Inspector

Mode

Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show qci-qos-mapping table { all | name table_name } [ | { grep_options | more } ]

| all |
| Displays information for all QCI-QoS mapping tables configured on this system. |

| name table_name |
| Displays information for an existing QCI-QoS mapping table specified as an alphanumeric string of 1 through 63 characters. |

| { grep grep_options | more } |
| Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent. For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter. |

Usage

Use this command to display the contents of a specific QCI-QoS mapping table or all mapping tables configured on this system.

Example

The following command displays the contents of a QCI-QoS mapping table named table1:

```
show qci-qos-mapping table name table1
```
show qos ip-dscp-iphb-mapping

Displays mapping QoS information in a packet to internal-qos marking.

**Product**
- ePDG
- HSGW
- P-GW
- SAEGW
- S-GW

**Privilege**
- Inspector

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show qos ip-dscp-iphb-mapping
```

**Usage**

Use this command to display mapping QoS information in a packet to internal-qos marking.
show qos l2-mapping-table

Displays named table for the internal to L2 mapping values, like 802.1p and MPLS.

Product

- ePDG
- HSGW
- P-GW
- SAEGW
- S-GW

Privilege

Inspector

Mode

Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

```
show qos l2-mapping-table { name table_name | system-default }
```

- **name table_name**
  Displays information for an existing QoS L2 mapping table.
  *table_name* is an existing table specified as an alphanumeric string of 1 through 80 characters.

- **system-default**
  Displays information for the default system internal mapping to L2 values.

Usage

Use this command to display named table for the internal to L2 mapping values, like 802.1p and MPLS.

Example

The following command displays the contents of a QOS L2 mapping table named *l2table*:

```
show qos l2-mapping-table name l2table
```
show qos npu inter-subscriber traffic

This command is only supported on PACs running on ST16 platforms. It has been deprecated for use on ASR 5x00 platforms.
show radius

Displays and statistic information for RADIUS accounting and/or authentication.

Product
PDSN
HA
GGSN
ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show radius { accounting servers | authentication servers } [ detail ] [ admin-status { enabled | disabled } ] [ | { grep grep_options | more } ] [ radius group group_name [ detail ] [ | { grep grep_options | more } ] ]

accounting servers
Lists information for configured accounting servers and their current state.

authentication servers
Lists information for configured authentication servers and their current state.

[ detail ]
Displays historical state information for configured servers of the specified type.

admin-status { enabled | disabled }
Displays information for accounting and/or authentication servers with an administrative status of “enabled” or “disabled”.

radius group group_name
Displays the authentication/authorization RADIUS server group information for an existing server group specified as an alphanumeric string of 1 through 63 characters.

| { grep grep_options | more }
Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.
Usage
Display the RADIUS server information as part of periodic monitoring of the health of the system.

Example
The following displays the information on configured accounting servers:

```
show radius accounting server
```

The following command displays detailed information for RADIUS accounting servers:

```
show radius accounting servers detail
```

The following command displays detailed information for RADIUS server group `star1` used for authentication:

```
show radius authentication servers radius group star1 detail
```

The following command displays detailed information for RADIUS server group `star1` used for accounting:

```
show radius accounting servers radius group star1 detail
```

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show radius charging servers

This command displays the RADIUS authentication and accounting servers or server group that are configured for use by charging services.

Product
PDSN
HA
GGSN
ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show radius charging servers [ radius group group_name ] [ | { grep grep_options | more }]

radius group group_name all

Displays all RADIUS counter information for an existing server group configured for use by charging services. group_name is specified as an alphanumeric string of 1 through 63 characters.

| { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to display information about RADIUS servers or server group configured for use by Charging Services.

Example
The following command displays RADIUS servers configured for Charging Services:

show radius charging servers

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show radius client

Displays information about the RADIUS client configured on the system.

- ASN-GW

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name>
```

**Syntax**

```
show radius client status [ | { grep grep_options | more } ]
```

- **status**
  
  Displays a status summary for the RADIUS client.

- **{ grep grep_options | more }**
  
  Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

  For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Configuring the RADIUS protocol on the system enables RADIUS client functionality. This command is displays information pertaining to the status of the client.

**Example**

The following command displays detailed information pertaining to the system’s RADIUS client:

```
show radius client status
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show radius counters

Displays RADIUS server and statistic information for accounting and/or authentication.

Product

- HA
- GGSN
- ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show radius counters { all | dynamic-auth | radius group group_name [ all | server ip_address [ port number ] | summary [ all-contexts [ verbose ] ] ] } [ | { grep grep_options | more } ]
```

counters { all | server ip_address [ port number ] }

- **all**: Displays statistics for all servers.
- **server ip_address**: Displays statistics for the server specified by its IPv4 address.
- **port number**: Displays statistics for a port on the server specified as an integer from 0 through 65535.

```
radius group group_name all
```

Displays all RADIUS counter information for an existing server group specified as an alphanumeric string of 1 through 63 characters.

- **all**: Displays statistics for all servers.

```
dynamic-auth
```

Displays Dynamic Authorization counters for configured RADIUS servers.

```
summary [ all-contexts [ verbose ] ]
```

Displays a summary of RADIUS statistics for all the RADIUS servers configured in a specific context.

- **all-contexts**: Displays a summary of RADIUS statistics for all RADIUS servers configured in all context. If **verbose** is also specified, the information is displayed in more detail.

```
| { grep grep_options | more }
```

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.
**Usage**

Display the RADIUS server information as part of periodic monitoring of the health of the system.

**Example**

The following command displays detailed information pertaining to the RADIUS server group `star1` with in current context:

```
show radius counters radius group star1 all
```

The following displays the statistics for the server with IP address `10.2.3.4`, then just port `7777`, followed by all services.

```
show radius counters server 10.2.3.4
show radius counters server 10.2.3.4 port 7777
show radius counters all
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show rct stats

Displays statistics associated with Recovery Control Task (RCT) events, including migrations, switchovers and shutdowns. RCT statistics are associated with card-to-card session recovery activities.

Product
All products supporting the Session Recovery feature

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show rct stats [verbose] [ | { grep grep_options | more } ]

[verbose]
Displays full details about RCT events, current status, time stamps and other associated information. This mode is only available if a session recovery event has occurred on the system. The default mode is to display a brief summary of RCT events.

| { grep grep_options | more }
Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to display RCT statistics in Summary or Detailed (verbose) mode. The Detailed output includes the following information:

• Recovery action taken – Migration, Shutdown, Switchover
• Type of event – Planned or Unplanned
• From card to card – slot numbers
• Start time – YYYY-MMM-DD+hh:mm:ss.sss
• Duration – seconds
• Card failure device (such as CPU\n)
• Card failure reason
• Card is in usable state or not failed
• Recovery action status – Success or failure reason
• If recovery action failed, failure time stamp
• If recovery action failed, failure task facility name
• If recovery action failed, failure instance number

Example
The following command displays detailed statistics for RCT events:

show rct stats verbose

Important: Output descriptions for show commands are available in the Statistics and Counters Reference. For additional information, see the System Administration Guide.
**show resources**

Displays the resource information by CPU or session.

**Product**
All

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name# 
```

**Syntax**

```
show resources { cpu | npu | session } [ | { grep grep_options | more } ]
```

- **cpu** | **npu** | **session**
  - **cpu**: Displays resource information by CPU.
  - **npu**: Displays resource information by network processing unit (NPU).
  - **session**: Displays resource information by session.

- **| { grep grep_options | more }**
  - Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
  - For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

View resource utilization as part of troubleshooting systems which appear sluggish or are having excessive connection timeouts or other connection issues.

**Example**

The following display the resource information by CPU and session, respectively.

```
show resources cpu

show resources session
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show rlf-context-statistics

Displays the statistics for all active RLF contexts.

Product
GGSN
P-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show rlf-context-statistics { diamproxy [ facility_num | [ endpoint endpoint_name [ peer-realm realm_name [ peer-host host_name ] ] ] | summary | verbose ] | { grep [ grep_options | more ] }
```

- `facility_num`
  Displays the context information for the specified facility. `num` must be an integer from 1 through 16.

- `endpoint endpoint_name`
  Displays the context information only for the endpoint specified as a string of size ranging from 1 through 63 characters.

- `realm realm_name`
  Displays the context information only for the realm specified as a string of size ranging from 1 through 127 characters.

- `peer-host host_name`
  Displays the context information only for the host specified as a string of size ranging from 1 through 63 characters.

- `instance facility_num`
  Displays the facility information for specific instance.

- `summary`
  Displays summary information.

- `verbose`
  Specifies to display detailed (all available) information. If not specified, concise information is displayed.
Displays the instance level stats. When multiple diamproxies are active, an RLF context's instance is created on each diamproxy or session manager for each peer.

 Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display RLF statistics for all active RLF contexts.

An RLF context is created only when –

• A peer is bound to a RLF template.

• The peer is in "OPEN" state.

Failure of any of these conditions will cause the RLF context to be deleted.

Example

The following command displays RLF statistics for all active RLF contexts:

```plaintext
show rlf-context-statistics diamproxy
```
show rlf-memcache-statistics

Displays the memory used by RLF for processing the messages.

Product
GGSN
P-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

```
show rlf-memcache-statistics { diamproxy facility_num [ | { grep grep_options | more } ]
```

- `facility_num`
  Displays the information for the specified facility. `num` must be an integer from 1 through 16.

- `| { grep grep_options | more }`
  Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
  For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to display the memory used by RLF for processing the messages. The output will be displayed only if the memcache is used.

Example
The following commands displays memory cache statistics for DIAMPROXY facility:

```
show rlf-memcache-statistics diamproxy
```
show rlf-template

Displays the statistics for all active RLF templates.

Product
GGSN
P-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show rlf-template { all | name template_name } [ | { grep grep_options | more } ]

- **all**
  Displays the statistics information for all the configured RLF templates.

- **name template_name**
  Displays the statistics information for the specified RLF template. `template_name` must be an integer from 1 through 127 characters.

- **| { grep grep_options | more }**
  Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent. For details on the usage of the `grep` and `more` commands, refer to the `Regulating a Command’s Output` section of the `Command Line Interface Overview` chapter.

Usage

Use this command to display statistics for all or specified RLF template(s).

Example

The following command displays statistics for all RLF templates:

```
show rlf-template all
```
show rohc counters

Displays ROBust Header Compression (ROHC) counters for all active calls.

Product
PDSN
HSGW
ASN-GW

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show rohc counters [ all | callid call_id | imsi imsi_num | ip-address ip_addr | msid msid_num | username user_name ] [ | { grep grep_options | more } ]

all
Displays all information.

callid call_id
Displays the information only for the call ID specified as a 4-byte hexadecimal number.

imsi imsi_num
Displays information for the specified IMSI (International Mobile Subscriber Identity). The IMSI is an up to 15-digit field which identifies the subscriber’s home country and carrier: 3 digits of Mobile Country Code (MCC), 2 or 3 digits of Mobile Network Code (MNC), followed by the Mobile Subscriber Identification Number MSIN. Example: 123-45-678910234. May also be entered as 12345678910234.

ip-address ip_addr
Displays information only for the mobile subscriber IP address specified in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

msid msid_num
Displays information only for a mobile subscriber ID from 7 to 16 digits for an IMSI, MIN, or RMI.

username user_name
Displays radio-packet (R-P) interface information only for a specified username.

| { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
Usage

Use this command to display ROHC counters for all active calls.

Example

The following command displays ROHC counters for all active calls:

```
show rohc counters all
```
show rohc statistics

Displays statistics and counters for RObust Header Compression (ROHC) IP header compression.

Product

PDSN
HSGW
ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show rohc statistics [ pdsn-service pdsnsvc_name ] [ asngw-service asngwsvc_name ] [ hsgw-service hsgwsvc_name ] [ | { grep grep_options | more } ]

Important: Keywords available for this command are license-driven. For example, if a PDSN license is loaded, the pdsn-service option is visible.

<table>
<thead>
<tr>
<th>pdsn-service pdsnsvc_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays ROHC statistics and counters for the an existing PDSN service specified as an alphanumeric string of 1 through 63 characters.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>asngw-service asngwsvc_name</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>hsgw-service hsgwsvc_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays ROHC statistics and counters for an existing HSGW service specified as an alphanumeric string of 1 through 63 characters.</td>
</tr>
</tbody>
</table>

| { grep grep_options | more } |
|-------------------------------|
| Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent. |
For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display ROHC statistics for all services or for a specific ASN-GW, PDSN, or HSGW.
The following command displays ROHC statistics for the PDSN service named pdsn1:

```
show rohc statistics pdsn-service pdsn1
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show route-map

Displays entries for all route maps or a specific route map.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show route-map [ name route-map name ] [ | { grep grep_options | more } ]

| name route-map name
| Displays information for a route-map specified as an alphanumeric string of 1 through 79 characters.

| | { grep grep_options | more }
Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to see the rules configured in all route-maps for the current context.

Example

The following command displays the route-map information for prefix list Prefix100:

    show route-map Prefix100

Refer to the match and set command descriptions in the Route-map Configuration Mode Commands chapter for descriptions of the various entries listed.
show rp

Displays radio-packet (R-P) interface statistics using the filtering options specified.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show rp [ counters | full | summary ] { all | callid call_id | msid ms_id | peer-address peer_ip_address | username user_name } [ | { grep grep_options | more } ]
```

counters | full | summary
Provides an optional modifier to the output for the desired level and type of information.
counters: Displays R-P protocol statistics.
full: Displays all available information.
summary: Displays only a summary of available information.
These options are not available in conjunction with the keywords statistics or service-option statistics.

all | callid call_id | msid ms_id | peer-address peer_ip_address | username user_name

all: Displays all R-P information.
callid call_id: Displays only the information for the call ID specified as a 4-digit hexadecimal number.
msid ms_id: Displays information only for a mobile subscriber ID specified by 7 to 16 digits for an IMSI, MIN, or RMI.
peer-address peer_ip_address: Displays R-P information for the peer IP address of the PCF specified in IPv4 dotted-decimal notation.
username user_name: Displays R-P information for the specified username.

| { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

View the R-P interface statistics for the current context.

Example
The following displays the summary for all connections.

```
show rp summary all
```

The following outputs the R-P interface detailed information for the user `ispuser1`.

```
show rp full username ispuser1
```

The following command displays the standard information for the call with ID `FF0E11CD`.

```
show rp callid ff0e11cd
```

The following displays the statistics summary for the R-P facility.

```
show rp
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
**show rp service-option**

Displays the radio-packet (R-P) service option statistics using the filtering options specified.

**Product**

PDSN

**Privilege**

Security Administrator, Administrator, Operator, Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show rp service-option statistics [ number svc_option_num | pdsn-service pdsn_name ] [ | { grep grep_options | more } ]
```

- **number svc_option_num | pdsn-service pdsn_name**
  
  Default: display statistics for all service option numbers and associated packet data services.
  
  number svc_option_num: Displays statistics for the specified service option number.
  
  pdsn-service pdsn_name: Displays statistics for the specified packet data service.

- **| { grep grep_options | more }**
  
  Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
  
  For details on the usage of the `grep` and `more` commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

View the R-P service option statistics for the current context.

**Example**

The following displays the statistics for all service options.

```
show rp service-option statistics
```

The following displays the statistics for service option 5.

```
show rp service-option statistics number 5
```

The following command displays the statistics for all service options in collected for the packet data service `sampleService`.

```
show rp service-option statistics pdsn-service sampleService
```
show rp statistics

Displays the radio-packet (R-P) protocol statistics using the filtering options specified.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show rp statistics [ hsgw-service hsgw-name | pcf-summary [ wfl ] | psdn-service psdn_name | peer-address { peer_address | all } ] [ include-bcmcs ] [ verbose ] [ | { grep grep_options | more } ]

hsgw-service hsgw-name
Specifies an eHRPD Serving Gate Way service followed by the name of an HSGW service specified as an alphanumeric string of 1 through 63 characters.

pcf-summary [ wfl ]
Displays a session summary of Packet Control Function (PCF) statistics. The wfl option displays PCF statistics in wide-format number 1.

psdn-service psdn_name
Displays the statistics information for the psdn-service specified as an alphanumeric string of 1 through 63 characters.

peer-address { peer_address | all }
- peer_address: Displays statistics only for the peer specified by its IP address in IPv4 dotted-decimal notation.
- all: Displays statistics for all peers.

verbose
Displays more detailed statistics.

| { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent. For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.
show rp statistics

Usage
View the R-P statistics for the current context.

Example
The following displays all collected R-P statistics.

    show rp statistics

The following displays the R-P statistics associated with the peer address 10.2.3.4.

    show rp statistics peer-address 10.2.3.4

The following command displays the R-P statistics for the packet data service PCFnet.

    show rp statistics pdsn-service PCFnet

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show rsvp counters

Displays Resource Reservation Protocol (RSVP) counters using the filtering options specified.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show rsvp counters [ all | callid call_id | msid ms_id | username user_name ]

- **all**: Displays all RSVP information.
- **callid call_id**: Displays information only for the call ID specified as a 4-digit hexadecimal number.
- **msid ms_id**: Displays information for a mobile subscriber ID specified a string of 7 to 16 digits for an IMSI, MIN, or RMI.
- **username user_name**: Displays RSVP information only for the specified username.

Usage

View the RSVP counters for the current context.

Example

The following displays all collected RSVP counters.

```
show rsvp counters all
```
show rsvp statistics

Displays Resource Reservation Protocol (RSVP) statistics using the filtering options specified.

Product
PDSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax
show rsvp counters [ pdsn-service service | sessmgr instance instance ]

- **pdsn-service service**: Displays statistics for the service specified as an alphanumeric string of 1 through 63 characters.
- **sessmgr instance instance**: Displays statistics for the specified session manager instance.

Usage
View the RSVP statistics for the current context.

Example
The following displays collected RSVP statistics for a sampleService.

```
show rsvp statistics pdsn-service sampleService
```
show s4-sgsn statistics

Displays statistics related to S4 functionality on the SGSN.

Product
SGSN

Privilege
Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show s4-sgsn statistics [ all | smgr-instance <instance_number> ]

- **all**
  Show all S4-SGSN statistics from all session managers.

- **smgr-instance**
  Show the statistics for a session manager instance of the SGSN service. `<instance_number>` must be specified as an integer between 1 and 65535.

**Important:** If no option is specified, then S4-SGSN statistics from all session managers will be added up and the cumulative totals will be shown.

Usage

Use this command to display information for S4-SGSN related services.

Example

The following commands displays and clear S4-SGSN-related statistics for all services on the system:

```
show s4-sgsn statistics all

clear s4-sgsn statistics all
```
**show saegw-service**

Displays configuration information and node-level statistics for System Architecture Evolution Gateway (SAEGW) services on this system.

**Product**
SAEGW

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name# 
```

**Syntax**

```
show saegw-service { all | name service_name | statistics { all | name service_name } [ function { pgw [ interface { GnGp | S2a | S5S8 } ] | sgw ] [ verbose ] } [ | { grep grep_options | more } ]
```

- **all**
  Displays configuration information for all SAEGW services configured on this system.

- **name service_name**
  Displays configuration information for an existing SAEGW service specified as an alphanumeric string of 1 through 63 characters.

- **statistics { all | name service_name } [ function { pgw [ interface { GnGp | S2a | S5S8 } ] | sgw ] [ verbose ] ] [ | { grep grep_options | more } ]**
  Displays node-level statistics for SAEGW.
  - **all**: Displays consolidated node-level statistics for all SAEGW services on the system.
  - **name service_name**: Displays node-level statistics for an existing SAEGW service specified as an alphanumeric string of 1 through 63 characters.
  - **function**: Displays node-level statistics of one of the following functions:
    - **pgw**: Displays node-level statistics of P-GW function within SAEGW.
    - **sgw**: Displays node-level statistics of S-GW function within SAEGW.
  - **interface**: Displays node-level statistics of P-GW function with respect to one of the following interfaces:
    - **GnGp**: Displays node-level statistics of P-GW function with respect to GnGp interface.
    - **S2a**: Displays node-level statistics of P-GW function with respect to S2a interface.
    - **S5S8**: Displays node-level statistics of P-GW function with respect to S5S8 interface.
  - If **verbose** is also specified, the information is displayed in more detail.

- **| { grep grep_options | more }**
  Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of `grep` and `more`, refer to the *Regulating a Command’s Output* section in the *Command Line Interface Overview* chapter.

**Usage**

Use this command to view configuration information and node-level statistics for SAEGW services on this system.

**Example**

The following command displays configuration information for the SAEGW service named `saegw1`:

```
show saegw-service name saegw1
```
show samog-service

Displays configuration and/or statistical information for SaMOG services on this system.

Product
SaMOG

Privilege
Security Administrator, Administrator, Operator, Inspector

Syntax

```
show samog-service { all | name name | statistics [ name name ] } [ | { grep grep_options | more } ]
```

| all |
| Displays all SaMOG services.

| name name |
| Displays information for specific SaMOG service name. |

| name is a string of size 1 to 63. |

| statistics |
| Displays Node level Statistics for SaMOG. |

| verbose |
| Specifies Detailed statistics. |

| | { grep grep_options | more } |
| Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent. |
| For details on the usage of grep and more, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter. |

Usage
Use this command to displays configuration and/or statistical information for SaMOG services on this system.

Example

```
show samog-service all
```
show sbc-service

Displays information about SBc interface services configured on this system.

<table>
<thead>
<tr>
<th>Product</th>
<th>MME</th>
</tr>
</thead>
<tbody>
<tr>
<td>Privilege</td>
<td>Inspector</td>
</tr>
<tr>
<td>Mode</td>
<td>Exec</td>
</tr>
</tbody>
</table>

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show sbc-service { all | cbc-associations { all | sbc-service-name sbc_svc_name [ path-info | summary ] } | sbc-service-name sbc_svc_name } [ | { grep grep_options | more } ]
```

**all**
Displays information about all SBc interface services configured on this system.

**cbc-associations { all | sbc-service-name sbc_svc_name**
Displays information about the SBc interface associations with the Cell Broadcast Centers (CBC).

**all** shows information about all CBC associations.

**sbc-service-name sbc_svc_name** shows information only for CBC associations for the SBc service name specified as an alphanumeric string of 1 through 63 characters.

**sbc-service-name sbc_svc_name**
Displays information only for the SBc service specified as an alphanumeric string of 1 through 63 characters.

| { grep grep_options | more } |

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the grep and more commands, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display information about SBc services configured on this system.

Refer to the show sbc statistics Exec Mode command to display statistics for SBc interface.

Example

The following command displays information about the CBC associations for the SBc service named sbc1

```
show sbc-service cbc-associations sbc-service-name sbc1
```
show sbc statistics

Displays statistics about SBc interface services configured on this system.

**Product**
MME

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show sbc statistics { all | peer-id peer_id | sbc-service-name sbc_svc_name } [ verbose | { | grep grep_options | more } ]
```

**all**
Displays statistics for all SBc services configured on this system.

**peer-id peer_id**
Displays statistics for a Cell Broadcast Center (CBC) peer association specified as an integer value from 0 through 4294967295.
Use the `show sbc-service cbc-associations all` command to display the available CBC association peer IDs.

**sbc-service-name sbc_svc_name**
Displays statistics for an SBc service specified as an alphanumeric string of 1 through 63 characters.

**verbose**
Displays expanded statistics.

```
| { | grep grep_options | more }
```

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the `grep` and `more` commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**
Use this command to display statistics about SBc services configured on this system.

**Example**
The following command displays verbose (expanded) statistics for an SBc service named *sbc1*

```
show sbc statistics sbc-service-name sbc1 verbose
```
**show sccp-network**

Displays SS7 Signaling Connection Control Part (SCCP) network configuration and status information.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show sccp-network { ntwk_index | all } [ status [ all | dpc ] ]
```

- `ntwk_index`
  Displays configuration and status information for the SCCP network configuration with the network index specified as an integer from 1 through 12.

- `all`
  Displays all available configuration and status information for all SCCP networks.

- `status all`
  Displays all status information for specified SCCP networks.

- `status dpc`
  Displays status information for the device in the SCCP network identified by the destination point-code (DPC).

**Usage**

Use this command to display global SCCP statistics or to display SCCP statistics for a specified service or network.

**Example**

The following command displays global SCCP statistics:

```
show sccp-network all
```

The following command displays information for an SCCP network configuration with the network index of 1:

```
show sccp-network 1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show sccp statistics

Displays SS7 Signaling Connection Control Part (SCCP) statistics for services that use the SCCP protocol.

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show sccp statistics [ iups-service iups_srvc_name | map-service map_srvc_name | sccp-network ntkw_index | dpc dpc | ssn ssn ] | global-title-translation { address-map instance add_map_inst | association instance assoc_inst } | sessmgr instance sessmgr_inst ] [ | { grep grep_options | more } ]

iups-service iups_srvc_name
Displays SCCP protocol statistics for an existing IuPS service in the current context specified as an alphanumeric string of 1 through 63 characters.

map-service map_srvc_name
Displays SCCP protocol statistics for the an existing Mobile Application Part (MAP) service in the current context specified as an alphanumeric string of 1 through 63 characters.

sccp-network ntkw_index
Displays SCCP protocol statistics for the SSCP network configuration with a network index specified as an integer from 1 through 12.

The following filters can be added to fine tune the display of SCCP network statistics:

- **dpc dpc**: Enter a standard pointcode address to limit the display of SCCP network statistics to those for the identified DPC.
- **ssn ssn**: Enter an integer from 1 to 255 to limit the display of SCCP network statistics to those for the identified subsystem number.
- **global-title-translation address-map instance add_map_inst**: Enter an integer from 1 to 4096 to limit the display of SCCP network statistics to those for the identified GTT address-map.
- **global-title-translation association instance assoc_inst**: Enter an integer from 1 to 16 to limit the display of SCCP network statistics to those for the identified GTT association.
- **sessmgr instance sessmgr_inst**: Enter an integer from 1 to 384 to limit the display of SCCP network statistics to those for the identified session manager.
Usage
Use this command to display global SCCP statistics or to display SCCP statistics for a specified service or SCCP network.

Example
The following command displays global SCCP statistics:

```
show sccp statistics
```

The following command displays SCCP statistics for the IuPS service named `iups-serv1`:

```
show sccp statistics iups-service iups-serv1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show sctp-param-template

Displays configuration information for Stream Control Transmission Protocol (SCTP) parameter templates configured on this system.

Product
MME

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

Syntax

show sctp-param-template { all | name template_name } [ | { grep grep_options | more } ]

- **all**
  Displays configuration information for all SCTP parameter templates configured on this system.

- **name template_name**
  Displays configuration information for an existing SCTP parameter template specified as an alphanumeric string of 1 through 63 characters.

- **| { grep grep_options | more }**
  Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
  For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view configuration information for SCTP parameter templates on this system.

Example

The following command displays configured parameters for an SCTP parameter template named *sctp_pt3*:

```
show sctp-param-template name sctp_pt3
```
show service all

Displays configuration information for all services currently configured on this system.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show service all

Usage

Use this command to view configuration information for all services configured on this system.

Example

The following command displays information about all services configured on this system:

   show service all
show session counters historical

Displays historical information for session-related counters based on data collected in bulk statistics.

Product
All

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show session counters historical { all | arrived | callops | connected | disconnected | failed | handoff | rejected | renewal } [ all-intervals | recent-intervals ] [ cumulative | incremental ] [ graph | table ] [ | { grep grep_options | more } ]

- **all**
  Displays data for all counters either as a single, wide table or multiple graphs.

- **arrived**
  Displays only data for “total calls arrived” counters. This is based on the “sess-ttlarrived” statistic in the system schema.

- **callops**
  Displays data for all call operations. This is a calculated value based on the following formula: 
  \((\text{arrived} + \text{rejected} + \text{disconnected} + \text{failed} + \text{handoffs} + \text{renewals})\)

- **connected**
  Displays only data for “total calls connected” counters. This is based on the “sess-ttlconnected” statistic in the system schema.

- **disconnected**
  Displays only data for “total calls disconnected” counters. This is based on the “sess-ttldisconn” statistic in the system schema.

- **failed**
  Displays only data for “total calls failed” counters. This is based on the “sess-ttlfailed” statistic in the system schema.

- **handoff**
  Displays only data for “total handoffs” counters. This is based on the “sess-ttlhandoff” statistic in the system schema.
Exec Mode show Commands (Q-S)

show session counters historical

rejected
Displays only data for “total calls rejected” counters. This is based on the “sess-ttlrejected” statistic in the system schema.

renewal
Displays only data for “total renewal” counters. This is based on the “sess-ttlrenewal” statistic in the system schema.

| { grep grep_options | more }

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of `grep` and `more`, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Output Options
The following output options are available for this command:

- **all-intervals**: Displays all available historical information from all samples. This filter is used by default.
- **cumulative**: Displays total data for all samples up to and including the last one. In this view, values increase over time.
- **graph**: Displays data in graphical form.
- **incremental**: Displays data changes for each specific sample. The data for each sample is the amount of change since the previous sample. This filter is used by default.
- **recent-intervals**: Displays historical information for only recent samples.
- **table**: Displays data in tabular form. This is the default view.

Usage
This command provides the ability to track key session-related statistic information over time. This information can be used as part of system performance monitoring and capacity planning.

**Important**: The information provided in the output of this command requires that bulk statistics functionary be enabled on the system. Refer to the System Administration Guide for more information on configuring and enabling bulk statistics support.

The output of this command displays historical data collected at various sample intervals. The interval length is 15 minutes and is not user-configurable. Up to 192 samples (two days’ worth of data) are maintained.

**Important**: Data collection is “best-effort” over these intervals. Data is preserved on the SMC or MIO card switchovers. As with all counters, certain session failures can cause inaccuracies with counters, including counters which appear to go backwards.

Each sample is identified by a timestamp that displays the approximate time the data was gathered. The timestamp is in the format YYYY:MM:DD:hh:mm:ss.
Data acquired during the sample may be marked with an “S” appended to the end of the timestamp or to the counter value. The “S” indicates that the data is suspect (potentially bad). Occurrences of this result from events like changes to the real time clock, which can cause an interval to be an atypical length. Instances of suspect data should be rare. Additionally, there may be occasions in which a sample may be marked as “invalid”. “invalid” identifies bad data, a situation that could result when the polling has not run long enough, or because of an unexpected error retrieving data.

Since baseline values must be obtained prior to collecting interval samples, the first interval of data will not be available until up to twice the interval period.

Example

The following command displays cumulative total calls arrived information for the most recent intervals and displays the output in graphical format:

```
show session counters historical arrived recent-intervals cumulative graph
```

The following command displays historical data for all counters for all intervals and displays the output in tabular format:

```
show session counters historical all
```

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show session counters pcf-summary

Displays the Packet Control Function (PCF) summary which include the number of calls, call types, and Tx/Rx packets/octets statistics.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show session counters pcf-summary [ call-types | data | wfl [ pcf pcf_address | [ | { grep grep_options | more } ] ]]

---

call-types

Displays the number of calls and the types of calls.

---

data

Displays the number of successful calls and Tx/Rx packets/octets statistics.

---

pcf pcf_address

 Displays the given PCF summary for a particular address.

---

wfl

Displays the PCF summary in a single very wide line.

---

| { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display a summary of all PCFs.

Example

```bash
show session counters pcf-summary
```
show session disconnect-reasons

Displays a list of the reasons for call disconnects and the number of calls disconnected for each reason.

**Product**
All

**Privilege**
Security Administrator, Administrator, Inspector, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
show session disconnect-reasons [ gprs-only | sgsn-only | mme-only | verbose ] [ | { grep grep_options | more } ]
```

- **gprs-only**
  Only supported on the SGSN.
  This keyword limits the display to session disconnect reasons for the SGSN’s 2G MM and PDP context disconnects.

- **sgsn-only**
  Only supported on the SGSN.
  Displays session disconnect reasons for the SGSN’s 3G MM and PDP context disconnects.

- **mme-only**
  Displays session disconnect reasons for MME call disconnects.

- **verbose**
  List all disconnect reasons even if the values are zero (0).

**Important:** The **verbose** option is not supported for the **buckets** keyword.

```
| { grep grep_options | more }
```

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to display a list of the reasons why calls were disconnected.

**Example**

```
To view session disconnect statistics, enter the following command:

```
show session disconnect-reasons
```

To view a list of the disconnect reasons with verbose output, enter the following command:

```
show session disconnect-reasons verbose
```
**show session duration**

Displays session duration information for the current context filtered by the options specified.

**Product**
All

**Privilege**
Security Administrator, Administrator, Inspector, Operator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show session duration [ session_filter ] [ | { grep grep_options | more } ]
```

*session_filter*

Specifies the name of the entity whose session duration information is to be filtered and displayed. This options are:

- **apn apn_name**: Displays session information for an existing Access Point Name (APN) specified as an alphanumeric string of 1 through 62 characters that is case sensitive.

- **asn-peer-address ip_address**: Displays session information for the ASN GW peer whose IP address is specified in IPv4 dotted-decimal notation.

- **asngw-service service_name**: Displays session information for the specified ASN-GW service.

- **asnpc-peer-address ip_address**: Displays session information for the Access Service Network Paging Controller (ASN PC) peer whose IP address is specified in IPv4 dotted-decimal notation.

- **asnpc-service service_name**: Displays session information for the specified ASN PC service.

- **cscf-service service_name**: Displays session information for an existing Call Session Control Function (CSCF) service specified as an alphanumeric string of 1 through 63 characters.

---

**Important**: Displays information for in-progress CSCF SIP calls only. Registrations are not considered calls.

- **dhcp-server dhcp_address**: Displays session information for the Dynamic Host Configuration Protocol (DHCP) server specified by its IP address in IPv4 dotted-decimal notation.

- **epdg-service service_name**: Displays session information for ePDG service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

- **fa fa_address**: Displays session information for the foreign agent (FA) whose IP address is specified in IPv4 dotted-decimal notation.

- **fa-service fa_name**: Displays session information for the named foreign agent service.

- **fng-service fng_name**: Displays session information for the named Femto Network Gateway service.
show session duration

- **ggsn-service ggsn_name**: Displays session information for an existing GGSN service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.
- **gprs-only**: Limits the display to the session information for the SGSN’s 2G MM and PDP contexts.
- **ha ha_address**: Displays session information for the home agent specified by its IP address in IPv4 dotted-decimal notation.
- **ha-service ha_name**: Displays session information for the named home agent (HA) service.
- **hnbw-only**: Displays session information for the HNB-GW service related sessions instances (such as HNB, IuPS, IuCS).
- **hsgw-service service_name**: Displays session information for an existing HSGW service specified as an alphanumeric string of 1 through 63 characters.
- **lma-service service_name**: Displays session information for an existing Local Mobility Anchor (LMA) service specified as an alphanumeric string of 1 through 63 characters.
- **mag-service service_name**: Displays session information for an existing Mobile Access Gateway (MAG) service specified as an alphanumeric string of 1 through 63 characters.
- **mme-service service_name**: Displays session information for an existing Mobility Management Entity (MME) service specified as an alphanumeric string of 1 through 63 characters.
- **pcc-service service_name**: Displays session information for an existing Policy and Charging Control service specified as an alphanumeric string of 1 through 63 characters.
- **pcf pcf_address**: Displays session information for the packet control function specified by its IP address in IPv4 dotted-decimal notation.
- **pdif-service service_name**: Displays session information for the named Packet Data Interworking Function service.
- **pdsn-service pdsn_name**: Displays session information for the named packet data service.

**Important**: If no PCF address or PDSN service is specified, the session information for all sessions is displayed.

- **sgsn-address sgsn-address**: Displays session information for the SGSN specified by its IP address in IPv4 dotted-decimal notation.
- **sgsn-only**: Limits the display to the session information for the SGSN’s 3G MM and PDP contexts.
- **sgw-service service_name**: Displays session information for an existing S-GW service specified as an alphanumeric string of 1 through 63 characters.
- **wsg-service service_name**: Displays session information for an existing Security Gateway (wsg-service) service specified as an alphanumeric string of 1 through 63 characters.

| { grep grep_options | more } |

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the **grep** and **more** commands, refer to the **Regulating a Command’s Output** section of the **Command Line Interface Overview** chapter.

**Usage**

View the session information to troubleshoot subscriber problems and for general monitoring for orphaned sessions.
Example

The following commands display the duration for the session connected to the packet control function with address 10.2.3.4, packet data service `sampleService`, and for all sessions, respectively.

```bash
show session duration pcf 10.2.3.4
show session duration pdsn-service sampleService
show session duration
```
show session progress

Displays session progress information for the current context filtered by the options specified.

Product
All

Privilege
Security Administrator, Administrator, Inspector, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

`show session progress { apn apn_name | asn-peer-address ip_address | asngw-service service_name | asnpc-service service_name | asnpc-peer-address ip_address | csrf-service service_name | dhcp-server dhcp_address | epdg-service service_name | fa fa_address | fa-service fa_name | ggsn-service ggsn_name | ha ha_address | ha-service ha_name | hsgw-service service_name | lma-service service_name | mag-service service_name | mipv6-service service_name | mme-address mme_address | pcc-address service_name | pcf { pcf_address pdif-service service_name | pdsn-service pdsn_name | pgw-address ip_address | saegw-service service_name | samog-service service_name | sgn-address sgn_address | sgw-service service_name | wsg-service service_name } [ | { grep grep_options | more } ]`

---

`apn apn_name`
Displays session information for an existing Access Point Name (APN) specified as an alphanumeric string of 1 through 62 characters that is case sensitive.

---

`asn-peer-address ip_address`
Displays session information for the Access Service Network-Gateway (ASN-GW) peer specified by its IP address in IPv4 dotted-decimal notation.

---

`asngw-service service_name`
Displays session information for an existing ASN-GW service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

---

`asnpc-service service_name`
Displays session information for an existing Access Service Network Paging Controller (ASN PC) service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

---

`asnpc-peer-address ip_address`
Displays session information for the ASN PC peer specified by its IP address in IPv4 dotted-decimal notation.
cscf-service service_name
Displays session information for an existing Call Session Control Function (CSCF) service specified as an alphanumeric string of 1 through 63 characters.

Important: Displays information for in-progress CSCF SIP calls only. Registrations are not considered calls.

dhcp-server dhcp_address
Displays session information for a Dynamic Host Configuration Protocol (DHCP) server specified by its IP address in IPv4 dotted-decimal notation.

epdg-service service_name
Displays session information for an existing Evolved Packet Data Gateway (ePDG) service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

fa fa_address
Displays session information for the foreign agent (FA) whose IP address is specified in IPv4 dotted-decimal notation.

fa-service fa_name
Displays session information for an existing FA service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

ggsn-service ggsn_name
Displays session information for an existing Gateway GPRS Support Node (GGSN) service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

ha ha_address | ha-service
Displays session information for the home agent specified by its IP address in IPv4 dotted-decimal notation.

ha-service ha_name
Displays session information for an existing Home Agent (HA) service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

hsgw-service service_name
Displays session information for an existing HRPD Serving Gateway (HSGW) service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.

lma-service service_name
Displays session information for an existing Local Mobility Anchor (LMA) service specified as an alphanumeric string of 1 through 63 characters.

mag-service service_name
Displays session information for an existing Mobile Access Gateway (MAG) service specified as an alphanumeric string of 1 through 63 characters.

</table>
**wsgr-service service_name**

Displays session progress information for an existing Wireless Security Gateway (WSG) service specified as an alphanumeric string of 1 through 63 characters.

```
| { grep grep_options | more }
```

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the `grep` and `more` commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

View the session information to troubleshooting subscriber problems and for general monitoring for orphaned sessions.

**Example**

The following commands display the status information for the session connected to the packet control function with address **10.2.3.4**, packet data service **sampleService**, and for all sessions, respectively.

```
show session progress pcf 10.2.3.4
show session progress psdn-service sampleService
show session progress
```

**Important:** Output descriptions for this command are available in the *show session* chapter of the *Statistics and Counters Reference*. 
show session recovery status

Displays session recovery status information for the current context filtered by the options specified.

**Product**

All

**Privilege**

Security Administrator, Administrator, Inspector, Operator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

**Syntax**

`show session recovery status [ verbose ] [ | { grep grep_options | more } ]`

- `recovery status`
  
  Displays the current status of the system’s ability to recover from a hardware or software fault that requires the recovery of home agent-based Mobile IP session(s).

- `verbose`
  
  Includes per-CPU Session Recovery status.

- `| { grep grep_options | more }`
  
  Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
  
  For details on the usage of the `grep` and `more` commands, refer to the `Regulating a Command’s Output` section of the `Command Line Interface Overview` chapter.

**Usage**

View the session information for troubleshooting subscriber problems and for general monitoring for orphaned sessions.

**Example**

To display the session recovery status information, enter the following command:

```
show session recovery status
```

Adding the optional verbose keyword to this command provides more details.

```
show session recovery status verbose
```

**Important:** Output descriptions for commands are available in the `Statistics and Counters Reference`. 
show session setuptime

Displays session setup time information for all sessions or sessions associated with the specified Access Gateway (AGW).

Product
- ePDG
- PDSN
- HNB-GW
- SGSN

Privilege
Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show session setuptime [ epdg-only [ verbose ] | hnbgw-only | pcf pcf_address | gprs-only | gprs-address gsn_address | sgsn-only ] [ | { grep grep_options | more } ]
```

Displays the call setup times aggregated into basic ranges of time.

- `epdg-only`: Display ePDG Session Statistics.
- `verbose`: Displays session setup times in verbose mode.
- `hnbgw-only`: Filters and displays the call setup information for HNB-GW calls only.
- `pcf pcf_address`: displays call setup data for the packet control function whose IP address is specified as `pcf_address`. `pcf_address` must be specified using IPv4 dotted-decimal notation. The call setup times for all PCFs is displayed when no specified PCF is specified.
- `gprs-only`: Displays 2G call setup data for the for the SGSN for the MM and PDP contexts.
- `gprs-address sgsn_address`: Displays call setup times for the specified SGSN. `sgsn_address` is the IP address of the SGSN and must be expressed in IPv4 dotted-decimal notation. This keyword is used by the GGSN.
- `sgsn-only`: Displays 3G call setup data for the for the SGSN for the MM and PDP contexts.

| { grep grep_options | more } |

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.
Usage
View the session information to troubleshooting subscriber problems and for general monitoring for orphaned sessions.
When no keywords are specified, the information shown is cumulative for all sessions that have been facilitated by the system.

Example
The following command shows setup time statistics for all sessions from the PCF at IP address 192.168.10.3:

```
show session setuptime pcf 192.168.10.3
```
show session subsystem

Displays session information for system subsystems. If no keywords are specified, information for all subsystems is
displayed.

Product
All

Privilege
Security Administrator, Administrator, Inspector, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show session subsystem [ full | facility facility [ all | instance id ] ] [ verbose ] [ | { grep grep_options | more }]

- **full**: Indicates that a full statistics summary of all subsystems is to be displayed.
- **facility facility**: Specifies the facility for which subsystem statistics is to be displayed where
  facility is specified as one of:
  - **allmgr**: A11 Manager
  - **aaamgr**: Accounting and Authentication Manager
  - **aaaproxy**: AAA Proxy Manager
  - **alcapmgr**: ALCAP Manager
  - **asngwmgr**: ASN Gateway Manager
  - **asnpcmgr**: ASN Paging/Location-Registry Manager
  - **cscfmgdr**: SIP CSCF Manager
  - **cscfttmgdr**: SIP CSCFFT manager
  - **dgmbmgr**: Diameter Gmb Application Manager
  - **diamproxy**: Diameter Proxy Application Manager [Release 12.0 and earlier versions only]
  - **egtpegmgr**: EGTP Egress Demux Manager
  - **egtpinmgr**: EGTP Ingress Demux Manager
  - **famgr**: Foreign Agent Manager
  - **gtpcmgr**: GTP-C Manager
  - **gtpumgr**: GTP-U Demux Manager
  - **hamgr**: Home Agent Manager
  - **henbgwdemux**: Home eNodeB Gateway demux manager
  - **henbgwmgr**: Home eNodeB Gateway Manager
• **hnbmgr**: HNBGW HNB Manager  
• **imsimgr**: SGSN IMSI Manager  
• **ipsmgm**: IP Services Gateway Manager  
• **l2tpdemux**: L2TP Demux Manager  
• **l2tpmgr**: L2TP Manager  
• **linkmg**: SGSN/SS7 Master Manager  
• **magmgr**: Mobile Access Gateway Manager  
• **megadiammgr**: MegaDiameter Manager  
• **mmedemux**: MME Demux Manager  
• **mmemgr**: MME Manager  
• **mmgr**: SGSN/SS7 Master Manager  
• **pdgmgr**: PDG Manager  
• **phsgwmgr**: PHS Gateway Manager  
• **phspcmgr**: PHS Paging Controller Manager  
• **sessmgr**: Session Manager  
• **sgtpcmgr**: SGSN GTP-C Manager  

**all | instance id**: the keyword `all` indicates all instances of the specified facility are to be displayed whereas the keyword `instance` specifies a specific instance for which information is to be displayed where `id` must be specified as an integer from 0 through 4294967295. If all or instance is not specified summary statistics are displayed.

### verbose
Displays everything the `show session subsystem` command displays with the exception that the Setup Time statistics are reported in 100 millisecond increments from 100 ms up to 9600 ms.

| { grep grep_options | more } |

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

### Usage
View the session information to troubleshooting subscriber problems and for general monitoring for orphaned sessions.

If this command is entered with no keywords, the information displayed is cumulative for all sessions facilitated by the system.

### Example
The following commands display the statistics information summarized for all sessions, then for the `famgr` facility (all sessions), and finally only for the session ID 127589 for the `hamb` subsystem.

```bash
show session subsystem full

show session subsystem facility famgr all
```
show session subsystem facility hamgr instance 127589

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show session trace

Displays status and statistics for the session trace application.

Product
GGSN
MME
P-GW
SAEGW
S-GW

Privilege
Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show session trace { statistics | subscriber network-element { ggsn | mme | pgw | sgw } trace-ref value | tce-address ip_address tce-index num | tce-summary | trace-summary } [ | { grep grep_options | more }]

statistics
Displays summary statistics for the session trace subsystem.

subscriber network-element { ggsn | mme | pgw | sgw } trace-ref value
Displays status and statistics for a specified session trace using the network element type; GGSN, MME, P-GW, and S-GW, and a valid trace reference of 12 characters.

tce-address ip_address tce-index num
Displays status and statistics for an existing Trace Collection Entity (TCE) connection specified by its IP address in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

tce-index num: Specifies a TCE index of the trace collection entity as an integer from 0 through 7.

tce-summary
Displays a summary of all active TCE connections.

trace-summary
Displays a summary of all active session traces.

| { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
show session trace

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

### Usage

Use this command to display status and statistics for the session trace application.

### Example

The following command displays status and statistics for a subscriber session trace on a P-GW with a trace reference of **32223398765**:

```
show session trace subscriber network-element pgw trace-ref 32223398765
```

The following command displays status and statistics for a subscriber session trace on an MME with a trace reference of **32221234567**:

```
show session trace subscriber network-element mme trace-ref 32223398765
```

The following command displays status and statistics for a subscriber session trace on an GGSN with a trace reference of **1203398765**:

```
show session trace subscriber network-element ggsn trace-ref 1203398765
```

---

*Important:* Output descriptions for commands are available in the *Statistics and Counters Reference.*
show session-event-record

Displays session event module statistics and file space usage information.

Product
S-GW
SAEGW

Privilege
Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show session-event-record { file-space-usage | statistics }

file-space-usage
Displays session event module file storage limits and capacities.

statistics
Displays session event module statistics regarding the handling and transfer of event records to an external collection server.

Usage
View the session event information to troubleshoot handling and transfer problems and for general monitoring for file storage use.

Example
The following command displays the file storage limit and use for all event modules on the system:

show session-event-record file-space-usage
show sf

Displays switch fabric task (SFT) information associated with packet processing cards.

Product
All

Privilege
Inspector

Syntax
show sf stats sft [ historical ]

historical
Displays historical information regarding SFT performance.

Usage
Use this command to display information and statistics about the switch fabric task.

Example
The following command displays statistics for the SFT:

    show sf stats sft
show sgs-service

Displays information and statistics about Visitor Location Register (VLR) SGs interface services configured on this system.

Product
MME

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show sgs-service { all | name name | offload-status [ service-name sgs_svc_name ] | statistics { all | name name } | vlr-status [ service-name sgs_svc_name ] [ vlr-name name ] [ full [ wf1 ] ] [ | { grep grep_options | more } ]

all
Displays information about all SGs interface services configured on this system.

name name
Displays information about an existing SGs service specified as an alphanumeric string of 1 through 63 characters.

offload-status sgs_svc_name
Displays statistics for all VLRs flagged for offload for an existing SGs service specified as an alphanumeric string of 1 through 63 characters.

statistics { all | name name }
Displays statistics for SGs services configured on this system.
all: Displays statistics for all SGs services configured on this system.
name name: Displays statistics for an existing SGs service specified as an alphanumeric string of 1 through 63 characters.

vlr-status [ service-name sgs_svc_name ] [ vlr-name name ] [ full [ wf1 ] ]
Displays status information about VLRs configured in SGs services on this system.
service-name sgs_svc_name: Displays names and states of VLRs configured in an existing SGs service specified as an alphanumeric string of 1 through 63 characters.
vlr-name name: Displays the name and state of an existing VLR configured in SGs services on this system and specified as an alphanumeric string of 1 through 63 characters.
full: Displays additional information about VLRs configured in SGs services on this system. Additional information includes ports, addresses and peer IDs.
show sgs-service

wf1: Displays the output in a tabular format.

| { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**

Use this command to display information and statistics about SGs services configured on this system.

**Example**

The following command displays statistics for an SGs service named `sgs3`:

```
show sgs-service name sgs3
```

The following command displays VLR status information for a configured VLR named `vlr-main`:

```
show sgs-service vlr-status vlr-name vlr-main
```
show s4-sgsn statistics

Displays statistics related to S4 functionality on the SGSN.

**Product**
SGSN

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

[local] host_name#

**Syntax**

```
show s4-sgsn statistics [ all | smgr-instance <instance_number> ]
```

- **all**
  Show all S4-SGSN statistics from all session managers.

- **smgr-instance**
  Show the statistics for a session manager instance of the SGSN service. `<instance_number>` must be specified as an integer between 1 and 65535.

**Important:** If no option is specified, then S4-SGSN statistics from all session managers will be added up and the cumulative totals will be shown.

**Usage**
Use this command to display information for S4-SGSN related services.

**Example**

The following commands displays and clear S4-SGSN-related statistics for all services on the system:

```
show s4-sgsn statistics all

clear s4-sgsn statistics all
```
show sgsn fsm-statistics

The output of this command provides information on 3G SGSN (both Gn and S4) application FSM statistics.

**Product**
SGSN

**Privilege**
Inspector, Operator, Administrator, Security Administrator

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show sgsn fsm statistics { umts-sm | umts-pmm | all }
```

- **umts-sm**
  Displays 3G Session Management Access Side FSM statistics.

- **umts-pmm**
  Displays 3G Mobility Management PMM FSM statistics.

- **all**
  Displays all SGSN application FSM statistics.

**Usage**

Use this command to track 3G SGSN (both Gn and S4) application FSM statistics. The SGSN application FSM statistics will help collect the FSM usage information to quantify which events / state collisions happen most often in the field.

**Example**

Enter this command to display all SGSN FSM statistics:

```
show sgsn fsm statistics all
```
**show sgsn sessmgr**

Displays session manager (SessMGR) statistics specific to the SGSN service.

**Product**
SGSN

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
show sgsn sessmgr { all | instance smgr_inst }
```

- **all**
  - Displays all SessMGR statistics specific to the system’s SGSN services.

- **instance smgr_inst**
  - Displays the statistics for a session manager instance of the SGSN service specified as an integer between 1 and 10000000.

**Usage**

Use this command to display information for SGSN services.

**Example**

The following command displays SGSN SessMGR statistics for all SGSN services on the system:

```
show sgsn sessmgr all
```
show sgsn-fast-path

Displays information related to SGSN fast-path.

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show sgsn-fast-path statistics [ all | smgr-instance smgr_inst ] [ | { grep grep_options | more } ]

all
Displays fast-path statistics for all session managers.

smgr-instance smgr_inst
For releases prior to 14.0, this keyword displays the fast-path statistics for a session manager instance specified as an integer between 1 and 65535.
For releases 14.0 and higher, this keyword displays the fast-path statistics for a session manager instance specified as an integer between 1 and 384.

| { grep grep_options | more }
Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display statistics for SGSN fast-path configurations.

Example

The following command displays fast-path statistics for all SGSN session managers:

    show sgsn sessmgr all
show sgsn-map-app

Displays collected statistics for the SGSN Mobile Application Part (MAP).

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show sgsn-map-app statistics [ | { grep grep_options | more } ]

- **all**
  Displays collected statistics for the SGSN MAP application.

  | { grep grep_options | more } |
  Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

  For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display statistics for the SGSN MAP application.

Example

The following command displays SGSN MAP statistics:

```
show sgsn-map-app statistics
```
show sgsn-mode

Displays the SGSN global configuration.

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show sgsn-mode[ | { grep grep_options | more } ]

| { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display the configuration created with the commands in the SGSN Global Configuration mode.

Example

The following command displays the SGSN global configuration:

    show sgsn-mode
show sgsn-operator-policy

This command has been deprecated. Refer to the show operator-policy command.
show sgsn-pool

Displays collected pooling statistics for either GPRS services or SGSN services.

**Product**
SGSN

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show sgsn-pool statistics { gprs-service servc_name | sgsn-service servc_name} { nri-value
nri_value | peer-non-broadcast-lac lac rac rac | target-load-in-progress [ smgr-instance
smgr_instance | target-nri target_nri ] | target-offloaded-to-peer [ target-nri
target_nri ] [ | { grep grep_options | more } ]
```

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the `grep` and `more` commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**
Use this command to display the collected statistics for pooling in either GPRS or SGSN services. The outputs can be filtered to focus the statistics displayed.

**Example**

The following command displays the:

```
show sgsn-pool statistics sgsn-service sgsn1 nri-value 3
```
show sgsn-service

Displays information about the configured SGSN services in the current context.

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show sgsn-service { all | name srvc_name }

_all_
Displays information for all SGSN services in the current context.

_name srvc_name_
Displays information for an existing SGSN service specified as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to display information for SGSN services.

Example

The following command displays information for all SGSN services in the current context:

    show sgsn-service all

The following command displays information for an SGSN service in the current context that is named sgsn1:

    show sgsn-service name sgsn1

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
show sgtp-service

Displays information about the configured GPRS Tunnelling Protocol (SGTP) services in the current context, including GTP-C and GTP-U operational configuration.

**Product**
- SGSN
- PDG/TTG
- MME

**Privilege**
- Inspector

**Mode**
- Exec

The following prompt is displayed in the Exec mode:

```
[local] host_name#
```

**Syntax**

```
```

- `all [ gtpu-table ]`
  - Displays configuration information for all of the SGTP services defined for the current context.
  - `gtpu-table`: Limits the output to GTPU information for all SGTP services.

- `ggsn-table [ smgr-instance smgr_instance ]`
  - Displays GGSN information configured for the SGTP service(s) in the current context.
  - `smgr-instance smgr_instance`: Enter an integer from 1 through 384 to limit the GGSN output to information for a specific session manager.

- `mbms-bearers`
  - This keyword is specific to the SGSN and is not yet supported.

- `name srvc_name [ gtpu-table ]`
  - Displays information for the specified SGTP service in the current context. `srvc_name` must be an alphanumeric string of 1 through 63 characters that identifies a configured SGTP service.
  - `gtpu-table`: Limits the output to GTPU information for a specific SGTP service.

- `sgsn-table`
  - Displays SGSN information configured for the SGTP service(s) in the current context.

**Usage**

Use this command to control the display of SGTP services information.

**Example**

```
```

---

4886

Command Line Interface Reference, StarOS Release 17
The following command displays information for all SGTP services in the current context:

```
show sgtp-service all
```

The following command displays the GGSN information in SGTP services in the current context:

```
show sgtp-service ggsn-table
```

The following command displays the SGSN information in SGTP services in the current context:

```
show sgtp-service sgsn-table
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show sgtpc statistics

Displays all statistics, for SGSN GPRS Tunnelling Protocol (SGTP) interface parameters, collected since the last restart or last use of a clear command.

Product
SGSN
PDG/TTG
MME

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show sgtpc statistics [ all | gsn-address ipv4_address | sgtp-service sgtp_srvc_name ] [ verbose ]| { grep grep_options | more }
```

- **all**
  Displays configuration information for all of the SGTP services defined for the current context.

- **gsn-address ipv4_address**
  Displays statistics for an SGSN specified by its IP address in IPv4 dotted-decimal notation. This must be an existing and active interface.

- **sgtp-service sgtp_srvc_name**
  Displays statistics for an existing SGTP service specified as an alphanumeric string from 1 through 63 characters.

- **verbose**
  Causes the system to displays more detailed level of statistics.

  | { grep grep_options | more }
  Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
  For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display information for SGSN services.

Example
The following command displays statistics for the SGTP service named \textit{sgtp1}:

\begin{verbatim}
show sgtpc statistics sgtp-service sgtp1
\end{verbatim}

\textbf{Important:} Output descriptions for commands are available in the \textit{Statistics and Counters Reference}. 
**show sgtpu statistics**

Displays all transmission and reception statistics for pre-defined and active GTP-U interfaces collected since the last restart or last use of a `clear` command.

**Product**

SGSN
PDG/TTG

**Privilege**

Inspector

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show sgtpu statistics [ ggsn-address ipv4_address | gprs-service gprs_svc_name nsei nsei_id | iups-bind-address ipv4_address | iups-service iups_svc_name | recovered-values | rnc-address ipv4_address | sgtp-service sgtp_svc_name ] [ | { grep grep_options | more } ]
```

- **ggsn-address ipv4_address**
  Displays statistics for the GGSN specified by its IP address in IPv4 dotted-decimal notation.

- **gprs-service gprs_svc_name nsei nsei_id**
  Displays NSEI-based GTPU statistics associated with an existing GPRS service specified as an alphanumeric string of 1 through 63 characters.
  
  - **nsei nsei_id**: Specifies a GPRS NSEI as an integer from 0 through 65535.

- **iups-bind-address ipv4_address**
  Displays SGSN GPRS Tunneling Protocol (SGTP) statistics for an Iu GTPU interface specified by its IP address in IPv4 dotted-decimal notation.

- **iups-service iups_svc_name**
  Displays statistics for an existing IuPS service specified as an alphanumeric string of 1 through 63 characters.

- **recovered-values**
  Only displays recovered values for key KPI counters that were backed-up.

- **rnc-address ipv4_address**
  Displays statistics for a Radio Network Controller (RNC) identified by its IP address in IPv4 dotted-decimal notation.
show sgtpu statistics

**sgtp-service sgtp_svc_name**

Displays statistics for an existing SGTP service specified as an alphanumeric string of 1 through 63 characters.

| { grep grep_options | more } |

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the `grep` and `more` commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

**Usage**

Use this command to display statistics for the SGTPU interface.

**Example**

The following command displays GTP-U statistics for the traffic between an SGSN and a connected RNC:

```
show sgtpu statistics rnc-address 123.1.2.3
```
show sgw-service

Displays configuration settings and/or service statistics for Serving Gateway (S-GW) services on this system.

**Product**
S-GW
SAEGW

**Privilege**
Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Displays configuration information for all S-GW services configured on this system.</td>
</tr>
<tr>
<td>name service_name</td>
<td>Displays configuration information for an existing S-GW service specified as an alphanumeric string of 1 through 63 characters.</td>
</tr>
<tr>
<td>statistics { all</td>
<td>name service_name }</td>
</tr>
<tr>
<td></td>
<td>Indicates the output of the command is to be piped (sent) to the command specified.</td>
</tr>
</tbody>
</table>

A command to send output to must be specified.
For details on the usage of the `grep` and `more` commands, refer to the *Regulating a Command’s Output* section in the *Command Line Interface Overview* chapter.

**Usage**

Use this command to view configuration settings and/or service statistics for S-GW services on this system.

**Example**

The following command displays service statistics for the S-GW service named `sgw1`:

```
show sgw-service statistics name sgw1
```
show sls-service

Displays information and statistics about SLs interface services configured on this system.

Product
MME

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show sls-service { all | name svc_name | peers [ all | esmlc-id esmlc-id ] | statistics [ name svc_name [ sls | sctp ] ] [ sls | sctp ] [ esmlc-id esmlc-id ] } [ | { grep grep_options | more } ]

---

**all**
Displays information about all SLs interface services configured on this system.

**name svc_name**
Displays information about an existing SLs service specified as an alphanumeric string of 1 through 63 characters.

**peers [ all | esmlc-id esmlc-id ]**
Displays configuration information of the E-SMLC peers that are connected to the SLs service.
- **all**: Displays statistics for all E-SMLC peers.
- **esmlc-id esmlc-id**: Displays statistics for an existing E-SMLC peer specified as an integer value from 0 through 255.

**statistics [ name svc_name [ sls | sctp ] ] [ sls | sctp ] [ esmlc-id esmlc-id ]**
Displays all statistics for SLs services configured on this system.
- **name name**: Displays all statistics for an existing SLs service specified as an alphanumeric string of 1 through 63 characters.
- **sls**: Filters output to show only SLs interface related statistics.
- **sctp**: Filters output to show only SCTP related statistics.
- **esmlc-id esmlc-id**: Displays all statistics for an existing E-SMLC peer specified as an integer value from 0 through 255.

| { grep grep_options | more } |

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.
show sls-service

Usage
Use this command to display information and statistics about SLs services configured on this system.

Example
The following command displays all statistics for an SLs service named sls1

    show sls-service name sls1
show sms statistics

Displays traffic statistics for the Short Message Service (SMS).

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

```
show sms statistics [ gprs-only | name map_svc | recovered-values | sgsn-only ] [ verbose ] [ | { grep grep_options | more } ]
```

- **gprs-only**
  Displays only GPRS access type SMS statistics.

- **name map_svc**
  Displays statistics for an existing MAP service specified as an alphanumeric string of 1 through 63 characters.

- **recovered-values**
  Only displays recovered values for key KPI counters that were backed-up.

- **sgsn-only**
  Displays only UMTS access type SMS statistics.

- **verbose**
  Causes the system to displays more detailed level of statistics.

  `| { grep grep_options | more }`

  Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
  For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display traffic statistics for the SMS services.

Example

Use the following command to display SMS statistics for 3G traffic:
show sms statistics

```
show sms statistics sgsn-only
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference.*
show sndcp statistics

Displays statistics for the packet traffic going through the Subnetwork Dependent Convergence Protocol (SNDCP) layer.

Product
SGSN

Privilege
Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show sndcp statistics [ gprs-service srvc_name ] [ verbose ] [ | { grep grep_options | more } ]

- **gprs-service srvc_name**
  Displays statistics for an existing GPRS service specified as an alphanumeric string of 1 through 63 characters.

- **verbose**
  Displays a more detailed level of statistics.

| { grep grep_options | more } |

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent. For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display SNDCP traffic statistics. Include the gprs-service keyword to filter the output to statistics for only one GPRS service.

Example

Use the following command to display all SNDCP layer traffic statistics:

```
show sndcp statistics verbose
```

Use the following command to display SNDCP layer traffic statistics for the **test1** GPRS service:

```
show sndcp statistics gprs-service test1
```

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show snmp

Displays information on the Simple Network Management Protocol (SNMP) servers and interfaces.

Syntax

```python
show snmp { accesses | communities | notifies | server | transports | trap { history [ url | varbind | verbose ] | statistics [ verbose | wide ] } [ | { grep grep_options | more } ]
```

- **accesses**
  Displays SNMP server usage statistics.

- **communities**
  Displays SNMP community strings.

- **notifies**
  Displays SNMP event trap and notification statistics.

- **server**
  Displays SNMP server configuration information.

- **transports**
  Displays trap destination configuration information.

- **trap { history [ url | varbind | verbose ] | statistics [ verbose | wide ] }**
  - **history**: Displays SNMP event trap history. **trap history** Displays up to 5,000 time-stamped trap records stored in a buffer. The buffer may be cleared by entering the `clear snmp history` command.
  - **statistics**: Displays SNMP event trap and notification statistics.
  - **url pathname**: Redirects output to a file.
  - **varbind**: Displays varbind-based output which is easier to parse, but harder for an operator to read.
  - **verbose**: Displays rows for every defined trap, even if never generated.
  - **wide**: Displays trap statistical data in excess of 80 columns.
Usage

Display SNMP information as part of system verification and troubleshooting.

Example

The following commands display the usage statistics, community string information, event trap and notification data, server information, and trap destination configuration, respectively.

show snmp communities
show snmp transport
show snmp server
show snmp accesses
show snmp notifies
show snmp trap history

Important: Output descriptions for commands are available in the Statistics and Counters Reference.
**show srp**

Displays the Service Redundancy Protocol (SRP) information.

**Product**
All products that support Interchassis Session Recovery (ICSR)

**Privilege**
Security Administrator, Administrator, Operator, Inspector

**Mode**
Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show srp { audit-statistics [ all | instance number ] [ message-level | session-level ] | call-loss statistics | checkpoint statistics [ active | debug-info | standby ] [ verbose ] } | info | monitor [ all | authentication-probe | bfd | bgp | diameter ] | statistics } | [ grep grep_options | more ]
```

- **audit-statistics [ all | instance number ] [ message-level | session-level ]**
  Displays statistics of external audit.
  - **all**: Displays information for all Session Managers.
  - **instance number**: Displays information for an instance number of Session Manager specified as an integer from 1 through 4294967295.
  - **message-level**: Displays message-level statistics.
  - **session-level**: Displays session-level statistics.

- **call-loss statistics**
  Displays history of lost calls during switchover.

- **checkpoint statistics [ active | standby ] [ verbose ]**
  The **statistics** keyword displays check pointing statistics on session redundancy data (session managers, current call recovery records, etc.).
  - **active**: Displays information for the active chassis.
  - **standby**: Displays information for the standby chassis.
  - **verbose**: Displays cumulative information for all session managers in tabular output.

- **info**
  Displays Service Redundancy Protocol information (context, chassis state, peer, connection state, etc.).

- **monitor [ all | authentication-probe | bfd | bgp | diameter ]**
  Displays SRP monitor information.
  - **all**: Displays monitor information for all types (authentication-probe, bgp, and diameter).
  - **authentication-probe**: Displays authentication probe monitor information.
  - **bfd**: Displays BFD monitor information.
**show srp**

- `bgp`: Displays BGP monitor information.
- `diameter`: Displays Diameter monitor information.

---

### Statistics

Displays SRP statistics (hello messages sent, configuration validation, resource messages, switchovers, etc.).

```
| { grep grep_options | more }
```

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the `grep` and `more` commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

---

**Usage**

The output of this command may be considered as part of a periodic system auditing program by verifying the Service Redundancy Protocol performance. For more information, refer to the Interchassis Session Recovery appendix of the System Administration Guide and the Service Redundancy Protocol Configuration Mode chapter of this guide.

---

**Example**

The following commands display Service Redundancy Protocol information:

- `show srp audit-statistics`  
- `show srp call-loss statistics`  
- `show srp checkpoint statistics`  
- `show srp info`  
- `show srp monitor`  
- `show srp statistics`

---

**Important:** Output descriptions for commands are available in the Statistics and Counters Reference.
show ss7-routing-domain

This command displays the configuration information for the defined Signalling System #7 (SS7) routing domains. Since SS7 routing domains encompass a large number of operational parameters, this command enables you to narrow your displays to specific protocol parameters on a specific link.

Product
SGSN

Privilege
Security Administrator, Administrator, Inspector, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ss7-routing-domain { all | ss7rd_id { m3ua | mtp2 | mtp3 | qsaal | routes [ adjacent ] | sctp asp { all | instance asp_id } | sscf } }

show ss7-routing-domain ss7rd_id m3ua { statistics { gen | peer-server { all | id peer-server_id peer-server-process { all | instance psp_instance } } } | status { address-translation-table | destination-point-code { all | ss7_dpc } | gen | peer-server peer-server_id [ peer-server-process instance psp_id | verbose ] } }

show ss7-routing-domain 1 sscf { statistics linkset { all | id linkset_id link { all | id link_id } } | status linkset { all | id linkset_id link { all | id link_id [ verbose ] } } }

ss7-routing-domain { all | ss7rd_id }

all: Displays information for all SS7 routing domains.
ss7rd_id: Displays information for the SS7 routing domain ID specified as an integer from 1 through 12.

m3ua
Displays statistics and status information for the SS7 MTP3 User Adaptation Layer (M3UA) in the specified SS7 routing domain.

mtp2
Displays statistics and status information for the SS7 Message Transfer Part-2 (MTP2) in the specified SS7 routing domain.

mtp3
Displays statistics and status information for the SS7 Message Transfer Part-3 (MTP3) in the specified SS7 routing domain.
qsaal
Displays statistics and status information for the Service Specific Connection-Oriented Protocol (SSCOP) sub-layer of the Quasi Signaling Application Adaptation Layer (QSAAL) in the specified SS7 routing domain.

routes [ adjacent ]
Displays the destination point code (DPC) routing table.
adjacent: If this keyword is used with the routes keyword, access is provided to the statistics and status information for configured adjacent point codes.

sctp asp { all | instance asp_id }
Provides access to the status or statistics for the Stream Control Transmission Protocol (SCTP) application server processes (ASP) in the specified SS7 routing domain for all or a specified SCTP ASP instance.
  • all: Displays the information for all SCTP application server process instances for a specific SS7 routing domain.
  • instance asp_id: Displays the information for an SCTP application server process instance specified as an integer from 1 through 4.

sscf
Displays statistics and status information for the Service Specific Coordination Function (SSCF [q.2140]) in the specified SS7 routing domain.

peer-server [ all | id peer-server_id ]
Filters the information for the specific protocol in the SS7 routing domain for all or a specific peer server ID.
  • all: Displays the information for all peer servers for a specific protocol.
  • id peer-server_id: Indicates the specific linkset identifier as an integer from 1 through 49.

peer-server-process [ all | instance instance_id ]
Filters the information for the specific protocol in the SS7 routing domain for all or a specific instance of peer-server process.
  • all: Displays the information for all peer server process instances for a specific protocol.
  • instance instance_id: Specifies a peer server process instance as an integer from 1 through 4.

destination-point-code [ all | dest_point_code]
Filters the information for the specific protocol in the SS7 routing domain for all or a specific DPC.
  • all: Displays the information for all DPCs in the SS7 routing domain.
  • dest_point_code: Specifies a DPC in the SS7 routing domain.

gen
Displays general information for the specific protocol in the specified SS7 routing domain.

verbose
Enables the display of maximum information for a protocol.
**linkset [ all | id linkset_id ]**

Filters the information for the specific protocol in SS7 routing domain for all or a specific link set.
- **all**: Displays the information for all linkset for a specific protocol.
- **id linkset_id**: Specifies a linkset identifier as an integer from 1 through 49.

**link [ all | id link_id ]**

Filters the information for a specified protocol in the SS7 routing domain for all or a specific link set.
- **all**: Displays the information for all links for a specific protocol.
- **id link_id**: Specifies a linkset identifier as be an integer from 1 through 16.

**Usage**

Use this command to display the SS7 routing domain and different layer protocol information for SGSN service.

**Example**

Displays the information/statistics for all SCTP application server processes of peer server ID 17 and peer server process instance 1 in SS7 routing domain 12:

```plaintext
show ss7-routing-domain 12 sctp asp all status peer-server id 17 peer-server-process instance 1
```

**Important**: Output descriptions for commands are available in the *Statistics and Counters Reference*. 
show ssh key

Displays the secure shell (SSH) public key information.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ssh key [ type { v1-rsa | v2-rsa | v2-dsa } ] [ | { grep grep_options | more } ]

| type { v1-rsa | v2-rsa | v2-dsa } ]

Specifies the type of SSH key information to display. If type is not specified, information for all types is displayed.

v1-rsa: SSH v1 RSA host key only
v2-rsa: SSH v2 DSA host key only
v2-dsa: SSH v2 RSA host key only

| { grep grep_options | more }]

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Show the secure shell key information for all types to verify installed keys.

Example

The following command shows information for all SSH V1 and SSH V2 keys:

    show ssh key

The following command shows information for only SSH V2 RSA host keys:

    show ssh key type v2-rsa
show ssl cipher-suite

Displays information related to Secure Sockets Layer (SSL) cipher suites since the last restart or clear command. A cipher suite contains the cryptographic algorithms supported by the client.

Product
SCM (P-CSCF, A-BG)

Privilege
Security Administrator, Administrator, Inspector, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ssl cipher-suite [ name name ] [ | { grep grep_options | more } ]

name name
Displays information related to the SSL cipher suite specified as an alphanumeric string of 1 through 127 characters.

| { grep grep_options | more }
Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to display information related to SSL cipher suites.

Example
The following command displays information for the SSL cipher suite ssl_cipher_suite_1:

    show ssl cipher-suite name ssl_cipher_suite_1
show ssl connection

Displays information pertaining to Secure Sockets Layer (SSL) connections on the Proxy Call Session Control Function (P-CSCF).

Product
SCM (P-CSCF, A-BG)

Privilege
Security Administrator, Administrator, Inspector, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ssl connection [ list | summary [ service-name name ] ] [ name name ] [ | { grep grep_options | more } ]

list
Lists the SSL connections on the P-CSCF.

summary
Displays state and statistical information for the SSL connections on the P-CSCF.

service-name name
Lists the SSL connections on the P-CSCF for the specified P-CSCF service, or displays state and statistical information for the SSL connections on the P-CSCF for the specified P-CSCF service. name must be an alphanumeric string of 1 through 63 characters.

name name
Displays state and statistical information for the SSL connection specified as an alphanumeric string of 1 through 127 characters.

| { grep grep_options | more }
Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent. For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command in Exec Mode to display information and statistics pertaining to SSL connections. If the summary keyword is not used, detailed information is displayed.

Example
The following command displays SSL connection information for the P-CSCF service pcscf_tls_1:
show ssl connection list service-name pcscf_tls_1
show ssl map

Displays information related to configured Secure Sockets Layer (SSL) maps/templates since the last restart or clear command.

**Product**

SCM (P-CSCF, A-BG)

**Privilege**

Security Administrator, Administrator, Inspector, Operator

**Mode**

Exec

The following prompt is displayed in the Exec mode:

```
[local]host_name#
```

**Syntax**

```
show ssl map [ map-type ssl-subscriber-template ] [ name name ] [ | { grep grep_options | more } ]
```

**map-type ssl-subscriber-template**

Displays information related to configured SSL maps/templates for the SSL map/template type ssl-subscriber-template.

**name name**

Displays information related to configured SSL maps/templates for the map/template name specified as an alphanumeric string of 1 through 127 characters.

```
| { grep grep_options | more }
```

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

**Usage**

Use this command to display information related to configured SSL maps/templates.

**Example**

The following command displays information related to configured SSL maps/templates for the SSL map/template **ssl_template_1**:

```
show ssl map name ssl_template_1
```
show ssl statistics

Displays statistics for Secure Sockets Layer (SSL) since the last restart or clear command.

Product
SCM (P-CSCF, A-BG)

Privilege
Security Administrator, Administrator, Inspector, Operator

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show ssl statistics [ service-name name ] [ | { grep grep_options | more } ]

service-name name
Displays SSL statistics for the Proxy Call Session Control Function (P-CSCF) service. specified as an alphanumeric string of 1 through 127 characters.

| { grep grep_options | more }
Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage
Use this command to display SSL statistics.

Example
The following command displays SSL statistics for all P-CSCF services:

show ssl statistics
show subscribers

Displays information for subscriber sessions that are defined by specified keywords. Command keywords are base commands that display distinctive types of data. Filter keywords are a superset of command keywords that modify or filter the output of the base commands.

Important: Not all filter keywords are available for all command keywords. CLI Help displays available filter keywords based on: the platform type (ASR 5000 or ASR 5500), the products that are licensed to run on the platform, and the preceding command keyword and subsequent filter keywords.

Product
All

Privilege
Security Administrator, Administrator, Inspector, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show subscribers [ command_keyword ] [ filter_keywords ] [ | { grep grep_options | more } ]

command_keyword

The following keywords are base commands that each have a distinct display output. Only one command keyword can be entered on the command line.

aaa-configuration

Displays Authentication Authorization and Accounting (AAA) configuration information for subscriber sessions defined by the specified filter keywords. The following filter keywords are valid with this command:

active, active-charging -service, all, apn, asn-peer-address, asngw-service, asnpce-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, dormant, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-only, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-address, l3-tunnel-remote-address, lac, lac-service, lma-service, lna, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, nemo-only network-requested, network-type, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto,
show subscribers

session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, tx-data, username, verbose, grep, more

access-flows { accounting | dynamic | pre-provisioned | static }

Shows the ip-flows for the subscribers defined by the specified filter keywords.

- **accounting**: displays the accounting type of access flows for a subscriber.
- **dynamic**: displays the dynamic type of access flows for a subscriber.
- **pre-provisioned**: displays the pre-provisioned type of access flows for a WiMAX subscriber.
- **static**: displays the static type of access flows for a subscriber.

The following filter keywords are valid with this command:

- active, active-charging-service, all, apn, asn-peer-address, asngw-service, asngw-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, dormant, epdg-address, epdg-service, fa, fa-service, flow-type, ggsn-service, gprs-service, gsm-traffic-class, ha, ha-ipsec-only, ha-service, hnbgw-only, hsgw-service, idle-time, imsi, ip-address, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-address, 13-tunnel-remote-address, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mme-address, mme-service, msid, msisdn, network-requested, network-type, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, plmn-type, rulebase, rx-data, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, tx-data, username, verbose, grep, more

access-type { lxcdma | ehrpd | lte | undetermined | wcdma | wifi | wired }

Displays active subscribers using a specific type of UE.

- **lxcdma**: 1XCDMA – Wireless CDMA 1x high speed internet service
- **ehrpdp**: eHRPD – Enhanced High Rate Packet Data
- **evdo**: EvDO – EVolution-Data Optimized
- **lte**: LTE – Long Term Evolution
- **undetermined**
- **wcdma**: WCDMA – Wideband Code Division Multiple Access
- **wifi**: WiFi – Wireless local area network
- **wired**

The following filter keywords are valid with this command:

- active, active-charging-service, all, apn, asn-peer-address, asngw-service, asngw-service, callid, card-num, configured-idle-timeout, csacf-service, domain, ebi, enodeb-address, fa, firewall, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, hnbgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, nat, network-type, profile-id, profile-name, qci, rx-data, slu-state,
show subscribers

security-type, session-time-left, sgw-address, smgr-instance, tx-data, ue-type, username, grep, more

**active**

Displays active subscribers. When no Filter Keywords are specified, the output is a summary of all active subscribers. When Filter Keywords are specified, the percentage is displayed as graphs in which one is displayed using a high sampling rate, a 10-second interval between samples, and a low sampling rate, a 15-minute interval between samples.

The following filter keywords are valid with this command:

apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mme-address, mme-service, mauid, msa, mnsdn, nat, nemo-only, network-requested, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, session-time-left, sgsn-address, sgsn-service, smgr-instance, sgw-address, sgw-service, tx-data, username, grep, more

**active-charging-service** **acs_service**

Displays information for subscribers being processed by the active charging service specified as an alphanumeric string of 1 through 15 characters.

The following filter keywords are valid with this command:

active-charging-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, configured-idle-timeout, connected-time, ebi, encoded-address, epdg-address, epdg-service, fa, firewall, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, ims-auth-service, imsi, ip-address, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mag-service, mipv6ha-service, msid, nat, network-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, session-time-left, sgw-address, smgr-instance, tx-data, username, grep, more

**activity**

Displays subscriber link activity percentage. When no Filter Keywords are specified, the output is a summary of all subscriber activity. When Filter Keywords are specified, the link activity percentage is displayed as graphs in which one is displayed using a high sampling rate, a 10-second interval between samples, and a low sampling rate, a 15-minute interval between samples.

The following filter keywords are valid with this command:

active, all, apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid,.card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, dormant, ebi,
show subscribers

enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hsgw-service, idle-time, imei, imsi-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tx-data, username, grep, more

all ip_address

Displays all current subscribers who have either active or dormant sessions.

apn apn_string

Displays subscribers currently facilitated by the Access Point name (APN) configured on the SGSN or GGSN.
The following filter keywords are valid with this command:

active-charging-service, apn, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, ccb-policy, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, dormant, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, imsi-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-address, 13-tunnel-remote-address, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, nat, nemo-only network-requested, network-type, pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tx-data, username, verbose, grep, more

asn-peer-address ip_address

Displays information for subscribers on an ASN-GW trusted peer.

ip_address is the IP address of the ASN-GW peer server expressed in IPv4 dotted-decimal notation.
The following filter keywords are valid with this command:

asn-peer-address, asngw-service, bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, connected-time, ebi, enodeb-address, fa, fa-service, firewall, full, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, imsi-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-address, 13-tunnel-remote-address, long-duration-time-left, mipv6ha-service, msid, nat, network-type, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgsn-address, smgr-instance, tx-data, username, grep, more
**asngw-only service_name**

Displays ASN-GW specific context information for the session. The following filter keywords are valid with this command:

```plaintext
aaa-configuration, access-flows, active, activity, all, asn-peer-address, asngw-service, bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, connected-time, counters, data-rate, dormant, ebi, enodeb-address, fa, fa-service, firewall, full, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-address, 13-tunnel-remote-address, long-duration-time-left, mipv6ha-service, msid, nat, network-type, policy, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgw-address, smgr-instance, subscription, summary, tft, tx-data, username, wfi, grep, more
```

**asngw-service service_name**

Displays counters for subscribers accessing the ASN-GW service. `service_name` must be an existing service and be from 1 to 63 alphanumeric characters. The following filter keywords are valid with this command:

```plaintext
asn-peer-address, asngw-service, bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, connected-time, ebi, enodeb-address, fa, fa-service, firewall, full, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-address, 13-tunnel-remote-address, long-duration-time-left, mipv6ha-service, msid, nat, network-type, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgw-address, smgr-instance, tx-data, username, grep, more
```

**bandwidth-policy policy_name**

Show information for subscribers associated with the specified Active Charging bandwidth policy. Must be followed by the name of an existing bandwidth policy specified as an alphanumeric string of 1 trough 63 characters. The following filter keywords are valid with this command:

```plaintext
access-type, active-charging-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, configured-idle-timeout, connected-time, csccf-service, domain, ebi, enodeb-address, epdg-address, epdg-service, fa, firewall, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, hnbgw-service, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lma-service, long-duration-time-left, mag-service, mipv6ha-service, msid, nat, network-type, profile-id, profile-name, qci, rulebase, rx-data, slu-state, security-type, session-time-left, sgw-address, smgr-instance, tx-data, ue-type, username, grep, more
```
**bearer-establishment** { **direct-tunnel** | **normal** | **pending** }

Selects Bearer Establishment type defined by the specified filter keywords.
- **direct-tunnel**: Select subscribers having direct tunnel established with the Radio Network Controller (RNC).
- **normal**: Select subscribers having bearer established with SGSN.
- **pending**: Select subscribers for whom bearer is not fully established.

The following filter keywords are valid with this command:

**bng-service** **srvc_name**

Displays current configuration the specified Broadband Network Gateway (BNG) service. The following filter keywords are valid with this command:

**callid** **id**

Displays subscriber information for the call ID specified as an 8-byte hexadecimal number.
The following filter keywords are valid with this command:

timeout, connected-time, css-delivery-sequence, css-service, dhcp-server, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, mlsdn, nat, nemo-only, network-requested, network-type, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, pimm-type, rx-data, slu-state, s5-proto, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tx-data, username, grep, more

card-num  card_num

The slot number of the processing card by which the subscriber session is processed. The slot number is an integer from 1 through 7 and 10 through 16 on the ASR 5000, or 1 through 4 and 7 through 10 on the ASR 5500.

The following filter keywords are valid with this command:

apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, cpu-num, css-delivery-sequence, css-service, dhcp-server, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, mlsdn, nat, nemo-only, network-requested, network-type, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, pimm-type, rx-data, slu-state, s5-proto, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tx-data, username, grep, more

cbb-policy  policy_name

Show information for subscribers associated with the specified Active Charging Content Based Billing (CBB) policy. Must be followed by the name of an existing Active Charging CBB policy specified as an alphanumeric string of 1 through 63 characters.

The following filter keywords are valid with this command:

active, active-charging -service, all, apn, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, dormant, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-only, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-address, l3-tunnel-remote-address, lac, lac-service, lma-service, lns, lns-service, long-
duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, msid, nemo-only network-requested, network-type, pcf, psdn-service, plmn-type, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgsn-address, sgsn-service, tx-data, username, verbose, grep, more

ccoa-only
Displays current configuration for all MIP-HA subscribers that registered with a collocated COA only. The following filter keywords are valid with this command:

access-type, active-charging-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, configured-idle-timeout, connected-time, domain, ebi, enodeb-address, epdg-address, epdg-service, fa, firewall, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, hnbgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, nat, network-type, pcc-service, profile-id, profile-name, qci, rulebase, rx-data, slu-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, smgr-instance, tx-data, username, grep, more

configuration { all | username name }
Displays current configuration for all subscribers or a specified subscriber.

configured-idle-timeout [ < | > | greater-than | less-than ] value
Shows the idle timeout that is configured for the specified subscriber. A value of 0 (zero) indicates that the subscribers idle timeout is disabled.

• <: Filters output so that only information less than the specified value is displayed.
• >: Filters output so that only information greater than the specified value is displayed.
• greater-than: Filters output so that only information greater than the specified value is displayed.
• less-than: Filters output so that only information less than the specified value is displayed.
• value: Used in conjunction with <, >, greater-than, less-than. If no other filtering options are specified only output matching value is displayed. If value is not specified all data is displayed. value must be an integer from 0 through 4294967295.

congestion_mgmt { not-required | required }
Shows the current subscribers for which congestion management is not-required or required. The following filter keywords are valid with this command:

active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, configured-idle-timeout, congestion_mgmt, connected-time, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, ims-auth-service, imsi, interface-type, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mipv6ha-service, mme-address, mme-service, msid, nat, network-type, pcp, pgw-address, plmn-type, profile-
Exec Mode show Commands (Q-S)

id, profile-name, qci, rulebase, rx-data, slu-state, s5-proto, saegw-service, session-time-left, sgw-address, SGW-Service, smgr-instance, tx-data, username, wsg-service

connected-time [ < | > | greater-than | less-than ] value

Shows how long the subscriber has been connected.
- `<`: Filters output so that only information less than the specified value is displayed.
- `<=`: Filters output so that only information less than or equal to the specified value is displayed.
- `>`: Filters output so that only information greater than the specified value is displayed.
- `>=`: Filters output so that only information greater than or equal to the specified value is displayed.
- `>:` Filters output so that only information greater than the specified value is displayed.
- `*less-than*: Filters output so that only information less than the specified value is displayed.
- `*value*: Used in conjunction with `<`, `>`, greater-than, less-than, If no other filtering options are specified only output matching value is displayed. If value is not specified all data is displayed. value must be an integer from 0 through 4294967295.

counters

Shows the counters associated with the subscriber. The following filter keywords are valid with this command:

access-type, active, active-charging-service, all, apn, asn-peer-address, asngw-service, asnp-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, dns-proxy, domain, dormant, ebi, enodeb-address, epdg-address, epdp-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, imei, ime-command-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mipv6a-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcc-service, pcf, pdg-service, pdif-service, pgw-service, pdn-service, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, slu-state, s5-proto, security-type, session-time-left, sgsgw-address, sgsm-service, sgw-address, sgw-service, smgr-instance, tx-data, ue-type, username, grep, more

cscf-only

Displays information for Call Session Control Function (CSCF) subscribers only. The following filter keywords are valid with this command:

aaa-configuration, access-flows, active, activity, all, bearer-establishment, callid, card-num, configured-idle-timeout, connected-time, counters, cscf-service, data-rate, dormant, fa, full, gtp-version, ha, idle-time, lms-auth-service, imsi, ip-address, ip-alloc-method, ip-pool ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, long-duration-time-left, mipv6a-service, msid, network-type, policy, rx-data, session-
show subscribers

time-left, smgr-instance, subscription, summary, tft, tx-data, username, wfl

cscf-service service_name

Displays information for subscribers accessing the specified CSCF service. 

service_name must be an existing service expressed as an alphanumeric string of 1 through 63 characters. 

The following filter keywords are valid with this command:

  bearer-establishment, callid, card-num, configured-idle-timeout, 
  connected-time, cscf-service, fa, gtp-version, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, 
  long-duration-time-left, mipv6ha-service, msid, network-type, rx-data, session-time-left, smgr-instance, subscription, tx-data, username

css-delivery-sequence

Important: This is a restricted keyword. In StarOS 9.0 and later, this keyword is obsoleted.

css-service csssvc_name

Important: This is a restricted keyword. In StarOS 9.0 and later releases, this keyword is obsolete. 

data-rate

Displays subscriber throughput data. This keyword is best used for individual subscriber output. 

The following filter keywords are valid with this command:

  access-type, active, active-charging-service, all, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbp-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, dormant, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, graph, gsm-traffic-class, htb-address, ha-address, ha-ipv6-address, ha-service, high, hnbgw-service, hsgw-only, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ip6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, low, mag-service, mipv6ha-service, mme-address, mme-service, msid, msisdn, network-requested, network-type, pcc-service, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, slu-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, summary, tx-data, ue-type, username, verbose, grep, more
### Exec Mode show Commands (Q-S)

#### show subscribers

```plaintext
displayers { callid id | msid id | username name }
```

Displays internal call troubleshooting information for subscriber sessions defined by the specified keywords.

- **callid id**: Displays subscriber information for the call specified by `id`. The call ID must be specified as an 8-digit hexadecimal number.
- **msid id**: Displays information for the mobile user identified by `id`. `id` must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters `$` and `*` are allowed. The `*` wildcard matches multiple characters and the `$` wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘`’). For example; ‘$’.
- **username name**: Displays information for connections for the subscriber identified by `name`. The user name must have been previously configured. `name` must be a sequence of characters and/or wildcard characters (‘$’ and ‘*’) from 1 to 127 characters. The `*` wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as wildcard enclose them in single quotes (‘`’). For example; ‘$’.

```plaintext
dhcp-server ipv4_address
```

Displays subscribers based on a specific DHCP server where their IP address was allocated. Must be followed by IP address of the server, using IPv4 dotted-decimal notation.

The following filter keywords are valid with this command:

- apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, msid, msisdn, nat, nemo-only, network-requested, pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rx-data, slu-state, session-time-left, sgsn-address, sgsn-service, smgr-instance, tx-data, username, grep, more

```plaintext
domain name
```

Displays all subscribers with an Address-of-Record (AoR) from the specified domain. `name` is an alphanumeric string of 1 through 79 characters.

The following filter keywords are valid with this command:

- access-type, active-charging-service, all, apn, asn-peer-address, asngw-service, asnp-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, fa, firewall, fw-and-nat, ggsn-service, graph, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, hnbgw-service, hsgw-only, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, long-duration-time-left, mip6ha-service, msid, network-type, pcc-service, profile-id, profile-name, qci, rulebase, rx-data, slu-state, s5 proto, security-type, session-time-left, sgw-address, smgr-instance, summary, tx-data, ue-type, username, grep, more
**dormant number**

Displays all dormant subscribers, those registered but not transmitting/receiving data.

The following filter keywords are valid with this command:

- access-type
- active-charging-service
- apn
- asn-peer-address
- asngw-service
- asnp-c-service
- bandwidth-policy
- bearer-establishment
- bng-service
- callid
- card-num
- ccb-policy
- ccoa-only
- configured-idle-timeout
- connected-time
- dhcp-server
- domain
- ebi
- enodeb-address
- epdg-address

- sgsn-service
- sgw-address
- sgw-service
- smgr-instance
- tx-data
- ue-type
- username
- grep
- more

**ebi number**

Displays subscribers based on an EPS bearer identity. `number` specifies the EBI number and must be an integer value from 5 to 15.

The following filter keywords are valid with this command:

- access-type
- active-charging-service
- apn
- asn-peer-address
- asngw-service
- asnp-c-service
- bandwidth-policy
- bearer-establishment
- bng-service
- callid
- card-num

- tx-data
- ue-type
- username
- grep
- more

**enodeb-address ip_address**

Displays subscribers based on the eNodeB to which they are attached. `ip_address` must be a valid IP address of an existing eNodeB specified in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

The following filter keywords are valid with this command:
access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, ccb-policy, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, domain, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcc-service, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, security-type, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, tx-data, ue-type, username, grep, more

**epdg-address ipv4_ipv6_address**

Displays subscribers connected to the specified ePDG peer specified in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

The following filter keywords are valid with this command:

apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, interface-type, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgsn-address, sgw-service, sgw-address, sgw-service, smgr-instance, tx-data, username, wsg-service, grep, more

**fa ipv4_address**

Displays subscribers for a specified Peer Foreign Agent. Must be followed by the IP address of a Remote FA, in IPv4 dotted-decimal notation.

The following filter keywords are valid with this command:

access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, ccb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lma-service, lns,
show subscribers

lns-service, long-duration-time-left, mag-service, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcc-service, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, slu-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tx-data, ue-type, username, grep, more

epdg-only
Displays epdg-specific context information for the session.
The following filter keywords are valid with this command:

all, callid, card-num, configured-idle-timeout, connected-time, counters, data-rate, full, gtp-version, gtpu-bind-address, gtpu-service, idle-time, ip-address, ipv6-prefix, long-duration-time-left, network-type, qci, rx-data, session-time-left, smgr-instance, summary, tft, tx-data, username, grep, more

epdg-service srvc_name
Displays subscribers for a specified Evolved Packet Data Gateway service. Must be followed by ePDG service name expressed as an alphanumerical string of 1 through 63 characters.
The following filter keywords are valid with this command:

all, callid, card-num, configured-idle-timeout, connected-time, counters, data-rate, epdg-address, epdg-service, full, gtp-version, gtpu-bind-address, gtpu-service, idle-time, ip-address, ipv6-prefix, long-duration-time-left, network-type, qci, rx-data, session-time-left, smgr-instance, summary, tft, tx-data, username, grep, more

fa-only
Displays FA-specific context information for the session.
The following filter keywords are valid with this command:

aaa-configuration, access-flows, active, activity, all, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, callid, card-num, configured-idle-timeout, connected-time, counters, csrf-service, data-rate, dhcp-server, dormant, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, full, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipseonly, ha-service, idle-time, imel, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdif-service, pdsn-service, pgw-address, plmn-type, policy, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgw-address, sgw-service, smgr-instance, subscription, summary, tft, tx-data, username, wfl, grep, more
fa-service svc_name

Displays subscribers for a specified Foreign Agent service. Must be followed by FA service name expressed as an alphanumerical string of 1 through 63 characters.
The following filter keywords are valid with this command:

aaa-configuration, access-flows, active, activity, all, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configuration, configured-idle-timeout, connected-time, counters, csccf-service, data-rate, debug-info, dhcp-server, dormant, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-only, fa-service, firewall, full, fw-and-nat, ggsn-only, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-only, lac-service, lns, lns-only, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdif-service, pdns-service, pgw-address, plmn-type, policy, profile-id, profile-name, qci, rx-data, slu-state, s5- proto, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, subscription, summary, tft, tx-data, username, wfl, grep, more

firewall { not-required | required }

Displays information for subscribers based on whether or not firewall processing is required.
The following filter keywords are valid with this command:

apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv4, ipv6, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdg-service, pdif-service, pdns-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, slu-state, s5- proto, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, subscription, summary, tft, tx-data, username, wfl, grep, more

fng-only

Displays Femto Network Gateway (FNG) context information for the session.
The following filter keywords are valid with this command:

aaa-configuration, access-flows, active, activity, all, bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, connected-time, counters, data-rate, dormant, ebi, enodeb-address, epdg-address, firewall { not-required | required }
show subscribers

address, epdg-service, fa, fa-service, firewall, fng-service, full, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, long-duration-time-left, mipv6a-service, msid, nat, network-type, pdif-service, policy, profile-id, profile-name, qci, rx-data, slu-state, s5-state, session-time-left, sgw-address, smgr-instance, subscription, summary, tft, tx-data, username, wfi, grep, more

fng-service src_name

Displays information for subscribers accessing the specified FNG service.

**service_name** must be an existing service expressed as an alphanumeric string of 1 through 63 characters.

The following filter keywords are valid with this command:

- bearer-establishment
- bng-service
- callid
- card-num
- configured-idle-timeout
- connected-time
- ebi
- enodeb-address
- epdg-address
- epdg-service

fw-and-nat policy fw_\_nat_policy

**Important:** This option is customer-specific and is only available in StarOS 8.1.
Exec Mode show Commands (Q-S)

show subscribers

Displays information for subscribers using an existing Firewall-and-NAT policy specified as an alphanumeric string of 1 through 15 characters.

**ggsn-only**

Displays only GGSN-specific subscriber context information. The following filter keywords are valid with this command:

- aaa-configuration
- access-flows
- active
- activity
- all
- apn
- bearer-establishment
- bng-service
- callid
- card-num
- ccoa-only
- configured-idle-timeout

- more

**ggsn-service srvc_name**

Displays only subscribers for a specified GGSN service. Must be followed by the GGSN service name expressed as an alphanumeric string of 1 through 63 characters. The following filter keywords are valid with this command:

- apn
- bearer-establishment
- bng-service
- callid
- card-num
- ccoa-only
- configured-idle-timeout
- connected-time
- dhcp-server
- dormant
- ebi

- tx-data
- username
- wfl
- grep
- more

**gsm-traffic-class { background | conversational | interactive }**

Displays subscribers associate with the specified 3GPP QoS traffic class. The following filter keywords are valid with this keyword:

- apn
- bearer-establishment
- bng-service
- callid
- card-num
- ccoa-only
- configured-idle-timeout
- connected-time
- dhcp-server
- ebi
- enodeb-address
- epdg-address

Command Line Interface Reference, StarOS Release 17
show subscribers

service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdns-service, plmn-type, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgsn-address, sgw-address, smgr-instance, tx-data, username, grep, more

gprs-only

This keyword is specific to the SGSN and only displays 2G SGSN subscriber information.
The following filter keywords are valid with this keyword:

aaa-configuration, active, active-charging-service, activity, all, apn, callid, card-num, configured-idle-timeout, connected-time, counters, data-rate, full, ggsn-address, gprs-service, gsm-traffic-class, idle-time, imsi, msid, msisdn, partial, plmn-type, profile-name, rx-data, session-time-left, summary, tx-data, wide-format, grep, more

gprs-service srvc_name

Enter the name of the configured 2G GPRS service to display subscriber information specific to the named GPRS service for the SGSN.
srvc_name must be an alphanumeric string of 1 through 63 characters that identifies a configured GPRS service.
The following filter keywords are valid with this command:

apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, dormant, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-address, gsm-service, gsm-traffic-class, gtp-connection, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdns-service, plmn-type, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgsn-address, sgw-address, smgr-instance, tx-data, username, grep

gsm-traffic-class { background | conversational | interactive | streaming }

Displays information for subscriber traffic that matches the specified 3GPP traffic class.

•background: 3GPP QoS background class.

•conversational: 3GPP QoS conversational class.

•interactive: 3GPP QoS interactive class. Must be followed by a traffic priority.

•streaming: 3GPP QoS streaming class.
The following filter keywords are valid with this command:

apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-
GTP Version { 0 | 1 }
Displays the specific GTP version number. Must be followed by one of the supported GTP versions (0 or 1).
The following filter keywords are valid with this command:

- apn, bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, connected-time, ebi, enodeb-address, epdg-address, epdg-service, fa, firewall, fw-and-nat, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdns-service, plmn-type, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgsn-address, sgsn-service, sgw-address, smgr-instance, tx-data, username, grep, more

GTPu Bind Address ipv4_address
Displays the subscribers associated with the specified GTPU service bind address. Must be followed by an IPv4 address in dotted decimal notation.
The following filter keywords are valid with this command:

- access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcc-service, pcf, pdg-service, pdif-service, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, slu-state, s5-proto, security-type, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, tx-data, ue-type, username, grep, more
show subscribers

**gtpu-service svc-name**
Displays the subscribers associated with an existing GTPU service specified as an alphanumeric string of 1 through 63 characters.
The following filter keywords are valid with this command:

- access-type
- active-charging-service
- apn
- asn-peer-address
- asngw-service
- asnpc-service
- bandwidth-policy
- bearer-establishment
- bng-service

**ha ipv4_address**
Displays the subscribers associated with the specified Peer Home Agent. Must be followed by the IP address of a Remote HA in IPv4 dotted-decimal notation.
The following filter keywords are valid with this command:

- access-type
- active-charging-service
- apn
- asn-peer-address
- asngw-service
- asnpc-service
- bandwidth-policy
- bearer-establishment
- bng-service
- callid

**ha-ipsec-only**
Displays MIPHA subscribers with subscriber IPSec tunnel only.
The following filter keywords are valid with this command:
Exec Mode show Commands (Q-S)

**show subscribers**

Displays subscriber information based on the HNB-GW

The following filters/keywords are valid with this command:

**ha-service svc_name**

Displays the subscribers associated with an existing Home Agent service specified as an alphanumeric string of 1 through 63 characters.

The following filter keywords are valid with this command:

**hnbgw-only**

Displays HNB-GW subscriber session information.

The following filters/keywords are valid with this command:

**hnbgw-service svc_name**

Displays subscriber information based on the HNB-GW service name.
**svc_name** must be an existing HNB-GW service expressed as an alphanumeric string of 1 through 63 characters.

The following filters/keywords are valid with this command:

- access-type, active-charging-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, configured-idle-timeout, connected-time, csclf-service, domain, ebi, enodeb-address, epdg-address, epdg-service, fa, firewall, full, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, hnbgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, nat, network-type, pcc-service, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, smgr-instance, tx-data, ue-type, username, grep, more

**hsgw-only**

Displays HSGW subscriber session information.

The following filters/keywords are valid with this command:

- aaa-configuration, access-flows, active, active-charging-only, all, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, configured-idle-timeout, connected-time, counters, data-rate, dormant, ebi, enodeb-address, epdg-address, epdg-service, fa, firewall, full, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mag-service, mipv6ha-service, msid, nat, network-type, pgw-address, policy, profile-id, profile-name, qci, rulebase, rx-data, slu-state, s5proto, session-time-left, sgw-address, smgr-instance, subscription, summary, tft, tx-data, username, wfl, grep, more

**hsgw-service svc_name**

Displays subscriber information based on the HSGW service name. **svc_name** must be an existing HSGW service expressed as an alphanumeric string of 1 through 63 characters.

**hsgw-service svc_name**

Displays subscriber information based on the HSGW service name. **svc_name** must be an existing HSGW service expressed as an alphanumeric string of 1 through 63 characters.

The following filters/keywords are valid with this command:

- active-charging-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, configured-idle-timeout, connected-time, ebi, enodeb-address, epdg-address, epdg-service, fa, firewall, full, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mag-service, mipv6ha-service, msid, nat, network-type, profile-id, profile-name, qci, rulebase, rx-data, slu-state, s5proto, session-time-left, sgw-address, smgr-instance, tx-data, username, grep, more
**idle-time**

Displays current configuration for all subscribers within the specified idle-time interval.

- `<`: Filters output so that only information less than the specified value is displayed.
- `<`: Filters output so that only information less than the specified value is displayed.
- `>`: Filters output so that only information greater than the specified value is displayed.
- **greater-than**: Filters output so that only information greater than the specified value is displayed.
- **less-than**: Filters output so that only information less than the specified value is displayed.
- **value**: Used in conjunction with `<`, `>`, greater-than, less-than, If no other filtering options are specified 
  only output matching **value** is displayed. If **value** is not specified all data is displayed. **value** 
  must be an integer from 0 through 4294967295.

The following filter keywords are valid with this command:

```
epdg-address, epdg-service
```
mip-up-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcc-service, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, slu-state, s5-proto, security-type, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, tx-data, ue-type, username, grep, more

**imsi**

Displays information specific to one subscriber or group of subscribers. Enter 1 to 15 digits to identify a specific subscriber’s IMSI (International Mobile Subscriber Identity).

The following filters/keywords are valid with this command:

access-type, active-charging-service, apn, asn-peer-address, asngw-service, asn-pc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, ccb-policy, ccoa-only, configured-idle-timeout, connected-time, csmon-service, dhcp-server, domain, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-services, mip-up-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, nsapi, pcc-service, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, slu-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-service, smgr-instance, tx-data, ue-type, username, grep, more

**interface-type** { S2aGTP | S2bGTP | S5/S8GTP }

Specifies subscriber type as either **S2a** (eHRPD), **S2b** (ePDG) or **S5/S8** (PMIPv6/GTP).

The following filter keywords are valid with this command:

apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, congestion_mgmt, connected-time, dhcp-server, ebi, enodeb-address, epdg-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imsi, ims-auth-service, imsi, interface-type, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-up-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pcp, pdsn-service, plmn-type, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgsn-address, sgw-address, smgr-instance, tx-data, username, wsg-service, grep, more
**ip-address ipv4_address**

Displays the subscribers associated with the specified IPv4 address. Must be followed by the IP address in IPv4 dotted-decimal notation.

The following filter keywords are valid with this command:

- access-type
- active-charging-service
- apn
- asn-peer-address
- asngw-service
- asnpc-service
- bandwidth-policy
- bearer-establishment
- bng-service
- callid
- card-num
- cbb-policy
- ccoa-only
- configured-idle-timeout
- connected-time
- csccf-service
- dhcp-server
- domain
- ebi
- enodeb-address
- epdg-address
- epdg-service
- fa
- fa-service
- firewall
- fw-and
- nat
- ggsn-service
- gprs-service
- gsm-traffic-class
- gtp-version
- gtpu-bind-address
- gtpu-service
- ha
- ha-ipsec-only
- ha-service
- hnbgw-service
- hsgw-service
- idle-time
- ims-auth-service
- imsi
- ip-address
- ip-alloc-method
- ip-pool
- ipv6-address
- ipv6-prefix
- l3-tunnel-local-addr
- l3-tunnel-remote-addr
- lac
- lac-service
- lma-service
- lns
- lns-service
- long-duration-time-left
- mag-service
- mip-up_tunnel-only
- mipv6a-service
- mme-address
- mme-service
- msid
- msisdn
- nat
- nemo-only
- network-requested
- network-type

- username

**ip-alloc-method {aaa-assigned | dhcp [ relay-agent | proxy-client ] | dynamic-pool | l2tp- lns-assigned | mip-ha-assigned | ms-provided-static | not-ms-provided-static | static pool }**

Displays the specific IP Allocation Method. Must be followed by one of the IP Allocation Methods:

- **aaa-assigned**: Selects subscribers whose IP addresses were assigned by AAA.
- **dhcp**: Selects subscribers whose IP addresses were assigned by DHCP.
  - **relay-agent**: Selects subscribers whose IP addresses were assigned by the DHCP Relay Agent
  - **proxy-client**: Selects subscribers whose IP addresses were assigned by the DHCP Proxy Client
- **dynamic-pool**: Selects subscribers whose IP addresses were assigned from a dynamic IP address pool.
- **l2tp-lns-assigned**: Selects subscribers whose IP addresses were assigned by the Layer 2 Tunneling Protocol (LT2P) Network Server.
- **mip-ha-assigned**: Selects subscribers whose IP addresses were assigned by the Mobile IP Home Agent.
- **ms-provided-static**: Selects subscribers whose IP addresses were provided by the Mobile Station.
- **not-ms-provided-static**: Selects subscribers whose IP addresses were not provided by the Mobile Station.
- **static-pool**: Selects subscribers whose IP addresses were assigned from a static IP address pool.

The following filter keywords are valid with this command:

- access-type
- active-charging-service
- apn
- asn-peer-address
- asngw-service
- asnpc-service
- bandwidth-policy
- bearer-establishment
- bng-service
- callid
- card-num
- cbb-policy
- ccoa-only
- configured-idle-timeout
timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, ins, lns-service, long-duration-time-left, mag-service, mip-up-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, nsapi, pcc-service, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, relay-agent, rulebase, rx-data, slu-state, s5proto, security-type, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, tx-data, ue-type, username, grep, more

**ip-pool ip_pool_name**

Displays subscriber information based on the IP pool name. *ip_pool_name* must be an existing IP pool name expressed as an alphanumeric string of 1 through 31 characters.

The following filter keywords are valid with this command:

access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, ins, lns-service, long-duration-time-left, mag-service, mip-up-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, nsapi, pcc-service, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, relay-agent, rulebase, rx-data, slu-state, s5proto, security-type, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, tx-data, ue-type, username, grep, more

**ipcf-only**

Displays Intelligent Policy Control Function (IPCF) subscriber session information.

**ipsg-only**

Displays IP Services Gateway (IPSG) subscriber session information.

The following filter keywords are valid with this command:

epdg-address, epdg-service
**ipv6-address ipv6_address**

Displays the subscribers associated with the specified IPv6 address. Must be followed by the IP address in IPv6 colon-separated-hexadecimal notation.

The following filter keywords are valid with this command:

- apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsecc-only, ha-service, hsgw-service, idle-time, imei, imsi-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, sla-state, s5proto, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, tx-data, username, grep, more

**ipv6-prefix ipv6_prefix**

Displays the subscribers associated with the specified IPv6 address prefix. Must be followed by an IPv6 address prefix in the format xx:xx:xx::/len

The following filter keywords are valid with this command:

- access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, ccb-policy, ccoa-only, configured-idle-timeout, connected-time, csf-service, dhcp-server, domain, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsecc-only, ha-service, hnbgw-service, hsgw-service, idle-time, imsi-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-up-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, nsapi, pcc-service, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, sla-state, s5proto, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tx-data, ue-type, username, grep, more

**l3-tunnel-local-addr ipv4_address**

Displays subscriber information based on the layer 3 tunneling interface. Must be followed by an IP address of the local interface, using IPv4 dotted-decimal notation.

The following filter keywords are valid with this command:

- access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-
The following filter keywords are valid with this command:

- service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, csccf-service, dhcp-server, domain, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpv6a-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, nsapi, pcc-service, pcf, pdg-service, pdif-service, psdn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, sla-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tx-data, ue-type, username, grep, more

**13-tunnel-remote-addr ipv4_address**

Displays subscriber information based on the layer 3 tunneling interface. Must be followed by an IP address of the remote interface, using IPv4 dotted-decimal notation.

The following filter keywords are valid with this command:

- access-type, active-charging-service, apn, asnp-service, asngw-service, bng-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, csccf-service, dhcp-server, domain, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpv6a-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, nsapi, pcc-service, pcf, pdg-service, pdif-service, psdn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, sla-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tx-data, ue-type, username, grep, more

**lac ipv4_address**

Displays subscriber information based on the Peer L2TP Access Concentrator (LAC). Must be followed by the IP address of a Remote LAC in IPv4 dotted-decimal notation.

The following filter keywords are valid with this command:

- apn, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, domain, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpv6a-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, nsapi, pcc-service, pcf, pdg-service, pdif-service, psdn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, sla-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tx-data, ue-type, username, grep, more
The following filter keywords are valid with this command:

- addres
- Displays subscriber information based on the L2TP Network Server (LNS)). Must be followed by the IP
  address, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, psdn-service, plmn-type, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, ggsn-address, sgw-address, smgr-instance, tx-data, username, grep, more

**lac-only**
Displays subscriber information based on the L2TP Access Concentrator (LAC) context information for the session.

**lac-service svc_name**
Displays subscriber information based on an existing LAC service name expressed as an alphanumeric string of 1 through 63 characters.
The following filter keywords are valid with this command:

- apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipseonly, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lns, lns-service, local-tunnel-id, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, psdn-service, plmn-type, profile-id, profile-name, qci, remote-tunnel-id, rx-data, slu-state, s5-proto, session-time-left, ggsn-address, sgw-address, smgr-instance, tx-data, username, grep, more

**lma-only**
Displays Local Mobility Anchor (LMA) specific context information for the session.

**lma-service svc_name**
Displays subscriber information based on the LMA service name. **svc_name** must be an existing LMA service expressed as an alphanumeric string of 1 through 63 characters.

**lns ipv4_address**
Displays subscriber information based on the L2TP Network Server (LNS)). Must be followed by the IP address of an LNS in IPv4 dotted-decimal notation.
The following filter keywords are valid with this command:

- apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipseonly, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type,
Exec Mode show Commands (Q-S)

show subscribers

lns-only
Displays LNS specific information only.

lns-service svc_name
Displays subscriber information based on an existing L2TP Network Server (LNS) service name expressed as an alphanumeric string of 1 through 63 characters.
The following filter keywords are valid with this command:

long-duration-time-left [ < | > | greater-than | less-than ] value
Shows how much time is left for the maximum duration of a specified subscriber session.
• <: Filters output so that only information less than the specified value is displayed.
• >: Filters output so that only information greater than the specified value is displayed.
• greater-than: Filters output so that only information greater than the specified value is displayed.
• less-than: Filters output so that only information less than the specified value is displayed.
• value: Used in conjunction with <, >, greater-than, less-than. If no other filtering options are specified only output matching value is displayed. If value is not specified all data is displayed. value must be an integer from 0 through 4294967295.

mag-only
Displays Mobile Access Gateway (MAG) subscriber session information.

mag-service svc_name: Displays subscriber information based on the Mobile Access Gateway (MAG) service name. svc_name must be an existing MAG service expressed as an alphanumeric string of 1 through 63 characters.

mip-udp-tunnel-only
Displays Mobile IP Home Agent (MIP-HA) subscriber information for subscribers that negotiated MIP-UDP tunnels.
The following filter keywords are valid with this command:

pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgsn-address, sgw-address, smgr-instance, tx-data, username, grep, more

lns-only
Displays LNS specific information only.

lns-service svc_name
Displays subscriber information based on an existing L2TP Network Server (LNS) service name expressed as an alphanumeric string of 1 through 63 characters.
The following filter keywords are valid with this command:

long-duration-time-left [ < | > | greater-than | less-than ] value
Shows how much time is left for the maximum duration of a specified subscriber session.
• <: Filters output so that only information less than the specified value is displayed.
• >: Filters output so that only information greater than the specified value is displayed.
• greater-than: Filters output so that only information greater than the specified value is displayed.
• less-than: Filters output so that only information less than the specified value is displayed.
• value: Used in conjunction with <, >, greater-than, less-than. If no other filtering options are specified only output matching value is displayed. If value is not specified all data is displayed. value must be an integer from 0 through 4294967295.

mag-only
Displays Mobile Access Gateway (MAG) subscriber session information.

mag-service svc_name: Displays subscriber information based on the Mobile Access Gateway (MAG) service name. svc_name must be an existing MAG service expressed as an alphanumeric string of 1 through 63 characters.

mip-udp-tunnel-only
Displays Mobile IP Home Agent (MIP-HA) subscriber information for subscribers that negotiated MIP-UDP tunnels.
The following filter keywords are valid with this command:
Exec Mode show Commands (Q-S)

show subscribers

apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipseck-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgsn-address, sgw-address, smgr-instance, tx-data, username, grep, more

mipv6ha-only
Displays MIP-HA-IPv6 context information for the session.
The following filters/keywords are valid with this command:

aaa-configuration, access-flows, access-type, active, active-charging-service, activity, all, apn, aspn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, counters, csf-service, data-rate, dhcp-server, domain, dormant, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, full, fw-and-nat, ggsn-address, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipseck-only, ha-service, hnbgw-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mipv6ha-service, mmme-address, mme-service, msid, nat, network-requested, network-type, pcc-service, pcf, pdng-service, pdnf-service, pgw-address, policy, profile-id, profile-name, qci, rulebase, rx-data, slu-state, s5-proto, security-type, session-time-left, sgsn-address, sgw-address, smgr-instance, subscription, summary, tft, tx-data, ue-type, username, wfi, grep, more

mipv6ha-service svc_name
Displays subscriber information based on an existing MIP Home Agent IPv6 service name expressed as an alphanumeric string of 1 through 63 characters.
The following filter keywords are valid with this command:

access-type, active-charging-service, apn, aspn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, csf-service, dhcp-server, domain, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipseck-only, ha-service, hnbgw-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service,
long-duration-time-left, mag-service, mip-up-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcc-service, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, slu-state, s5 proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tx-data, ue-type, username, grep, more

**mme-address**

Displays subscriber information based on the Mobility Management Entity (MME) IP address. ip_address must be an existing MME IP address and be entered in IPv4 dotted-decimal notation or IPv6 colon-separated-hexadecimal notation.

The following filter keywords are valid with this command:

- bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, connected-time, ebi, enodeb-address, epdg-address, epdg-service, fa, firewall, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, network-type, profile-id, profile-name, qci, rx-data, slu-state, s5 proto, session-time-left, sgw-address, smgr-instance, tx-data, username, grep, more

**mme-only**

Displays MME subscriber session information.

**mme-service svc_name**: Displays subscriber information based on the MME service name. svc_name must be an existing MME service expressed as an alphanumeric string of 1 through 63 characters.

**mme-address ip_address**: Displays subscriber information based on the MMM IP address. ip_address must be an existing MME IP address entered in IPv4 dotted-decimal notation or IPv6 colon-separated-hexadecimal notation.

The following filter keywords are valid with this command:

- bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, connected-time, ebi, enodeb-address, epdg-address, epdg-service, fa, firewall, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, network-type, profile-id, profile-name, qci, rx-data, slu-state, s5 proto, session-time-left, sgw-address, smgr-instance, tx-data, username, grep, more

**mseg-only**

> Important: This keyword is not supported in this release.
**show subscribers**

**mseg-service mseg_service_name**

**Important:** This keyword is not supported in this release.

**msid msid**

For this SGSN-specific keyword, enter the MSID (Mobile Station IDentifier) to display information specific to one subscriber’s equipment by entering the MSID. The following filter keywords are valid with this command:

apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdg-service, pdif-service, pdns-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, sla-state, s5-proto, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, tx-data, username, grep, more

**msisdn msisdn**

For this SGSN-specific keyword, enter the MSISDN (Mobile Station ISDN number - unique SIM phone number) to display information specific to one subscriber’s equipment by entering the MSISDN. The following filter keywords are valid with this command:

apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdns-service, plmn-type, profile-id, profile-name, qci, rx-data, sla-state, s5-proto, session-time-left, sgsn-address, sgw-address, smgr-instance, tx-data, username, grep, more

**nat { not-required | required }**

Displays information for subscribers based on whether or not Network Address Translation (NAT) processing is required. The following filter keywords are valid with this command:
access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, csacf-service, dhcp-server, domain, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipseonly, ha-service, hnbgw-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-up-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nat-ip, nat-real, nemo-only, network-requested, network-type, pcf, pdsn-service, pdiff-service, pdif-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, slu-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-service, smgr-instance, tx-data, ue-type, usage-time, username, grep, more

nemo-only

Displays information on MIP-HA subscribers that are mobile routers (Network Mobility).

The following filter keywords are valid with this command:

apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipseonly, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-up-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nat-ip, nat-real, nemo-only, network-requested, network-type, pcf, pdsn-service, pdiff-service, pdif-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, slu-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-service, smgr-instance, tx-data, ue-type, usage-time, username, grep, more

network-requested

Selects the currently active subscribers whose sessions were initiated by a GGSN network requested to create a PDP context.

The following filter keywords are valid with this command:

access-type, active-charging-service, apn, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, csacf-service, dhcp-server, domain, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipseonly, ha-service, hnbgw-service, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mip-up-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-
**show subscribers**

only, network-requested, network-type, nsapi, pcc-service, pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, slu-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, smgr-instance, tx-data, ue-type, username, grep, more

**network-type** { gre | ipip | ipsec | ipv4 | ipv4-pmipv6 | ipv4v6 | ipv4v6-pmipv6 | ipv6 | ipv6-pmipv6 | l2tp | mobile-ip | proxy-mobile-ip }

Selects the currently active subscribers based on network service access type.

- **gre**: Generic Routing Encapsulation
- **ipip**: IP-in-IP
- **ipsec**: IPSec
- **ipv4**: IPv4 only
- **ipv4-pmipv6**: IPv4 and/or Proxy Mobile IPv6 (PMIP)
- **ipv4v6**: IPv4 and/or IPv6
- **ipv4v6-pmipv6**: IPv4, IPv6 and/or Proxy Mobile IPv6
- **ipv6**: IPv6 only
- **ipv6-pmipv6**: IPv6 and/or Proxy Mobile IPv6 (PMIP)
- **l2tp**: Layer 2 Tunneling Protocol
- **mobile-ip**: Mobile IP (MIP)
- **proxy-mobile-ip**: Proxy Mobile IPv6 (PMIP)

The following filter keywords are valid with this command:

- apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-also-multipath, gtpu-service, ha, ha-ipseck-only, ha-service, hsgw-service, idle-time, imei, ims-auth-service, insi, ip-address, ip-alloca-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, mmsdn, nat, nemo-only, network-requested, network-type, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgsn-address, sgw-address, smgr-instance, tx-data, username, grep, more

**pcc-service name**

Displays statistics for users associated with an existing Policy and Charging Control (PCC) service name expressed as an alphanumeric string of 1 through 63 characters.
pcf [ < | > | less-than | greater-than] ipv4_address [ < | > | less-than | greater-than] ipv4_address

Displays information for subscribers connected via the packet control function (PCF) with a specific or range of IP addresses. The address must be specified using IPv4 dotted-decimal notation.

- `<`: Filters output so that only information less than the specified IPv4 address value is displayed.
- `>:` Filters output so that only information greater than the specified IPv4 address value is displayed.
- `less-than`: Filters output so that only information less than the specified IPv4 address value is displayed.
- `greater-than`: Filters output so that only information greater than the specified IPv4 address value is displayed.

Note: It is possible to define a limited range of IP addresses by using the less-than and greater-than options to define minimum and maximum values.

The following filter keywords are valid with this command:

<, apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, less-than, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgsn-address, sgw-address, smgr-instance, tx-data, username, grep, more

pdg-only

Displays a summary of PDG subscriber statistics.

The following filters/keywords are valid with this command:

aaa-configuration, access-flows, active, activity, all, apn, bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, connected-time, counters, data-rate, dormant, ebi, enodeb-address, epdg-address, epdg-service, fa, firewall, full, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, nat, network-type, pdg-service, policy, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgw-address, smgr-instance, subscription, summary, tft, tx-data, username, wfi, grep, more

pdg-service name

Displays statistics for users associated with an existing Packet Data Gateway (PDG) service name expressed as an alphanumeric string of 1 through 63 characters.

The following filters/keywords are valid with this command:

bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, connected-time, ebi, enodeb-address, epdg-address, epdg-
service, fa, firewall, fng-service, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, nat, network-type, pdg-service, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgw-address, smgr-instance, tx-data, username, grep, more

**pdif-only**

Displays a summary of Packet Data Interworking Function (PDIF) subscriber statistics.
The following filters/keywords are valid with this command:

aaa-configuration, access-flows, active, activity, all, apn, bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, connected-time, counters, data-rate, dormant, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fng-service, full, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, nat, network-type, pdif-service, policy, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgw-address, smgr-instance, subscription, summary, tft, tx-data, username, wfl, grep, more

**pdif-service name**

Displays connection statistics for users associated with a specific PDIF service name.
The following filters/keywords are valid with this command:

bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, connected-time, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fng-service, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, nat, network-type, pdif-service, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgw-address, smgr-instance, tx-data, username, grep, more

**pdsn-only**

Displays a summary of Packet Data Serving Node (PDSN) subscriber statistics.
The following filters/keywords are valid with this command:

aaa-configuration, access-flows, active, activity, all, apn, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, counters, data-rate, dhcp-server, dormant, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, full, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipssec-only, haservice, idle-time, imsi, imsi, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-
The following filters/keywords are valid with this command:

```
time-left, mip-udp-tunnel-only, mipv6ha-service, msid, nat, nemo-only, network-requested, network-type, pcf, pdsn-service, plmn-type, policy, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgns-address, sgns-service, sgw-address, smgr-instance, subscription, summary, tft, tx-data, username, wfl, grep, more
```

### `pdsn-service name`

Displays statistics for users associated with an existing PDSN service name expressed as an alphanumeric string of 1 through 63 characters.

The following filter keywords are valid with this command:

```
apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, ipv6local-addr, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mag-address, mip-udp-tunnel-only, mipv6ha-service, msid, mmsdn, nat, nemo-only, network-requested, network-type, pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgns-address, sgw-address, smgr-instance, tx-data, username, grep, more
```

### `pgw-address ip_address`

Displays information about the subscribers connected to the specified P-GW.

`ip_address` must be specified by its IP address using dotted-decimal notation for IPv4 or colon separated notation for IPv6.

The following filters/keywords are valid with this command:

```
active-charging-service, apn, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, ccb-policy, configured-idle-timeout, connected-time, ebi, enodeb-address, epdg-address, epdg-service, fa, firewall fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, ipv6-local-addr, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac-service, lma-service, lns, long-duration-time-left, mag-service, mipv6ha-service, msid, nat, network-type, pgw-address, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, slu-state, s5-proto, saegw-service, session-time-left, sgw-address, sgw-address, smgr-instance, tx-data, username
```

### `pgw-only`

Displays PDN-Gateway (P-GW) subscriber session information.

The following filters/keywords are valid with this command:

```
all, apn, callid, card-num, ebi, epdg-address , full, imsi, interface-type, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, network-type, pgw-service, plmn-type, profile-name, qci, sgw-address, smgr-instance, summary
```
**epdg-address ip_address**: Displays subscriber information based on the ePDG IP address.  
*ip_address* must be an existing ePDG IP address.

**interface-type**: Interface type of subscriber.  
- **S2bGTP**: Interface type S2b GTP.  
- **S5S8GTP**: Interface type S5/S8 GTP.

**pgw-service svc_name**: Displays subscriber information based on the P-GW service name.  
*svc_name* must be an existing P-GW service expressed as an alphanumeric string of 1 through 63 characters.

**qci number**: Displays subscriber session information based on the QoS Class Identifier (QCI) value assigned to the subscriber.  
*number* must be an integer value from 0 to 9.

**sgw-address ip_address**: Displays subscriber information based on the S-GW IP address.  
*ip_address* must be an existing S-GW IP address.

---

**plmn-type [ home | roaming | visiting ]**  
Displays subscriber information based on the type of Public Land Mobile Network (PLMN).

- **home**: For GGSN/PGW, shows all the subscribers of charging type HOME.
- **roaming**: For GGSN/PGW, shows all the subscribers of charging type ROAMING.
- **visiting**: For GGSN/PGW, shows all the subscribers of charging type VISITING.

The following filter keywords are valid with this command:

apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mip-upd-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdsm-service, plmn-type, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgsn-address, sgw-address, smgr-instance, tx-data, username, grep, more

---

**policy**  
Displays the current policies associated with the subscriber session.

The following filter keywords are valid with this command:

access-type, active-charging-service, all, apn, asn-peer-address, asngw-service, asnp-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, ccb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, dormant, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, 13-tunnel-local-addr, 13-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-up-tunnel-only,
show subscribers

mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, nsapi, pcc-service, pcf, pdg-service, pdif-service, psdn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, slu-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tx-data, ue-type, username, grep, more

profile-id id_number
Displays subscriber session information based on the profile-id granted for the flow. *id_number* must be an integer from 0 to 4294967295.

profile-name name
Displays subscriber session information based on an existing policy profile name expressed as an alphanumeric string of 1 through 63 characters.

qci number
Displays subscriber session information based on the QoS Class Identifier (QCI) value assigned to the subscriber. *number* must be an integer value from 0 to 9.

rulebase name
Displays subscriber session information based on the named Active Charging System rulebase. *name* must be an alphanumeric string of 1 through 63 characters.

rx-data [ < | > | greater-than | less-than ] value
The number of bytes received by the specified subscriber.

- *<*: Filters output so that only information less than the specified value is displayed.
- *>: Filters output so that only information greater than the specified value is displayed.
- *greater-than*: Filters output so that only information greater than the specified value is displayed.
- *less-than*: Filters output so that only information less than the specified value is displayed.
- *value*: Used in conjunction with <, >, greater-than, less-than. If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 18446744073709551615.

slu-state { active | idle | idle-active }
Displays session information based on the subscriber’s S1-U state. The S1-U interface is the interface from the eNodeB to the S-GW.

- *active*: Displays session information for subscribers with an S1-U state set to active.
- *idle*: Displays session information for subscribers with an S1-U state set to idle.
- *idle-active*: Displays session information for subscribers with an S1-U state set to idle-active.

s5-proto { gtp | pmip }
Displays subscriber session information based on the S5 interface protocol used. This interface provides user plane tunneling and tunnel management between S-GW and P-GW. Choose either GPRS Tunneling Protocol (GTP) or Proxy Mobile IPv6 (PMIP).
**saegw-only**

Displays System Architecture Evolution Gateway (SAEGW) subscriber session information. The following filters/keywords are valid with this command:

- `aaa-configuration`, `access-flows`, `active`, `active-charging-service`, `activity`, `all`, `apn`, `bandwidth-policy`, `bearer-establishment`, `bng-service`, `callid`, `card-num`, `cbb-policy`, `co-located`, `configured-idle-timeout`, `connected-time`, `counters`, `data-rate`, `dormant`, `ebi`, `enodeb-address`, `epdg-address`, `epdg-service`, `fa`, `firewall`, `full`, `fw-and-nat`, `gtp-version`, `gtpu-bind-address`, `gtpu-service`, `ha`, `idle-time`, `ims-auth-service`, `imsi`, `ip-address`, `ip-alloc-method`, `ip-pool`, `ipv6-address`, `ipv6-prefix`, `13-tunnel-local-addr`, `13-tunnel-remote-addr`, `lac-service`, `lma-service`, `lns`, `long-duration-time-left`, `mipv6ha-service`, `msid`, `nat`, `network-type`, `pgw-address`, `pgw-anchored`, `plmn-type`, `policy`, `profile-id`, `profile-name`, `qci`, `rulebase`, `rx-data`, `slu-state`, `s5-proto`, `saegw-service`, `session-time-left`, `sgw-address`, `sgw-anchored`, `smgr-instance`, `subscription`, `summary`, `tft`, `tx-data`, `username`, `wfl`

- **co-located**: Shows only co-located subscribers which have both S-GW and P-GW functions.
- **pgw-anchored**: Shows only PGW-anchored subscribers.
- **saegw-service <svc_name>**: Displays subscriber information based on the SAEGW service name. `<svc_name>` must be an existing SAEGW service expressed as an alphanumeric string of 1 through 63 characters.
- **sgw-anchored**: Shows only SGW-anchored subscribers.

**saegw-service <svc_name>**

Displays subscriber information based on the SAEGW service name. `<svc_name>` must be an existing SAEGW service expressed as an alphanumeric string of 1 through 63 characters.

The following filters/keywords are valid with this command:

- `active-charging-service`, `apn`, `bandwidth-policy`, `bearer-establishment`, `bng-service`, `callid`, `card-num`, `cbb-policy`, `configured-idle-timeout`, `connected-time`, `ebi`, `enodeb-address`, `epdg-address`, `epdg-service`, `fa`, `firewall`, `fw-and-nat`, `gtp-version`, `gtpu-bind-address`, `gtpu-service`, `ha`, `idle-time`, `ims-auth-service`, `imsi`, `ip-address`, `ip-alloc-method`, `ip-pool`, `ipv6-address`, `ipv6-prefix`, `13-tunnel-local-addr`, `13-tunnel-remote-addr`, `lac-service`, `lma-service`, `lns`, `long-duration-time-left`, `mipv6ha-service`, `msid`, `nat`, `network-type`, `pgw-address`, `pgw-anchored`, `plmn-type`, `policy`, `profile-id`, `profile-name`, `qci`, `rulebase`, `rx-data`, `slu-state`, `s5-proto`, `saegw-service`, `session-time-left`, `sgw-address`, `sgw-anchored`, `smgr-instance`, `subscription`, `summary`, `tft`, `tx-data`, `username`

**security-type { ipsec | tls }**

Displays subscriber information based on the specified type of security.

- **ipsec**: IPSec
- **tls**: Transport Layer Security
**session-time-left [ < | > | greater-than | less ] value**

How much session time is left for the specified subscriber.

- `<`: Filters output so that only information less than the specified value is displayed.
- `>`: Filters output so that only information greater than the specified value is displayed.
- `greater-than`: Filters output so that only information greater than the specified value is displayed.
- `less-than`: Filters output so that only information less than the specified value is displayed.

- `value`: Used in conjunction with `<`, `>`, `greater-than`, `less-than`. If no other filtering options are specified, only output matching `value` is displayed. If `value` is not specified, all data is displayed. `value` must be an integer from 0 through 4294967295.

**sgsn-address ipv4_address**

This SGSN-only keyword displays only subscriber context information for the specified interface. Must be followed by the IP address of the interface, using IPv4 dotted-decimal notation.

The following filter keywords are valid with this command:

- `apn`, `callid`, `card-num`, `connected-time`, `idle-time`, `gprs-service`, `gsm-traffic-class`, `gtp-version`, `imsi`, `msid`, `msisdn`, `nri`, `nsei`, `sgsn-service`, `smgr-instance`

**sgsn-only**

This SGSN-only keyword displays only 3G SGSN-specific subscriber context information.

The following filter keywords are valid with this command:

- `aaa-configuration`, `active`, `active-charging-service`, `activity`, `all`, `apn`, `callid`, `card-num`, `configured-idle-timeout`, `connected-time`, `counters`, `data-rate`, `fa`, `full`, `ggsn-address`, `gsm-traffic-class`, `idle-time`, `imei`, `imsi`, `msid`, `partial`, `plmn-type`, `profile-name`, `rnc`, `rx-data`, `session-time-left`, `sgsn-service`, `summary`, `tx-data`, `wide-format`, `grep`, `more`

**sgsn-service service_name**

For this SGSN-only keyword, enter the name of the configured 3G SGSN service to display subscriber information specific to the named SGSN service.

The following filter keywords are valid with this command:

- `apn`, `bearer-establishment`, `bng-service`, `callid`, `card-num`, `configured-idle-timeout`, `connected-time`, `ebi`, `enodeb-address`, `epdg-address`, `epdg-service`, `fa`, `firewall`, `fw-and-nat`, `gprs-service`, `gsm-traffic-class`, `gtp-version`, `gtpu-address`, `gtpu-service`, `ha`, `idle-time`, `imei`, `imsi`, `ip-address`, `ip-alloc-method`, `ip-pool`, `ipv6-address`, `ipv6-prefix`, `13-tunnel-local-addr`, `13-tunnel-remote-addr`, `long-duration-time-left`, `mipv6ha-service`, `msid`, `msisdn`, `nat`, `network-type`, `nri`, `plmn-type`, `profile-id`, `profile-name`, `qci`, `rx-data`, `s1u-state`, `s5-proto`, `session-time-left`, `sgsn-service`, `sgw-address`, `smgr-instance`, `tx-data`, `username`, `grep`, `more`

**sgw-address ip_address**

For this MME-only keyword, enter the IP address of the peer S-GW to display information about the subscribers connected to the specified S-GW. `ip_address` must be specified by its IP address using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
**sgw-only**
Displays S-GW subscriber session information.
The following filters/keywords are valid with this command:

```
all, full, summary
```

• **sgw-service svc_name**: Displays subscriber information based on an existing S-GW service specified as an alphanumeric string of 1 through 63 characters.

• **pgw-address ip_address**: Displays subscriber information based on an existing P-GW specified by its IP address in IPv4 dotted-decimal notation.

**sgw-service svc_name**
Displays subscriber information based on an existing S-GW service specified as an alphanumeric string of 1 through 63 characters.
The following filter keywords are valid with this command:

```
epdg-address, epdg-service,
```

**smgr-instance instance_id**
Displays subscription information associated with the Session Manager identifier express as an integer from 1 through 4294967295.
The following filter keywords are valid with this command:

```
epdg-address, epdg-service,
```

**subscription { aor address | callid id | full }**
Displays subscription information for defined subscribers, based on defined parameters.

• **aor address**: Clears session(s) by Address of Record.

• **callid id**: Specifies a Call Identification Number as an 8-digit hexadecimal number.

• **full**: Displays all available information.

**summary**
Displays only a summary of the subscriber information. The following filter keywords are valid with this command:

```
access-type, active, active-charging-service, activity, all, asn-peer-address, asngw-service, asnpc-service, apn, bandwidth-policy, bearer-establishment, callid, card-num, ccb-policy, configured-idle-timeout, connected-time, dhcp-server, domain, dormant, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-service, hnbgw-service, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-services, mme-address, mmething-service, mseg-service, msid, mlsdn, nat, network-requested, network-type, pcc-service, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, plmn-type, profile-id, qci, rulebase, rx-data, slu-state, s5-
show subscribers

proto, security-type, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, tx-data, ue-type, username, grep, more

tft
Displays the current Traffic Flow Template (TFT) associated with the subscriber session. The following filter keywords are valid with this command:

active, all, apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, dormant, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdg-service, pdif-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, slu-state, s5-proto, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, tx-data, username, grep, more

tax-data [ < | > | greater-than | less-than ] value
The number of bytes transmitted by the specified subscriber.

- `<`: Filters output so that only information less than the specified value is displayed.
- `>`: Filters output so that only information greater than the specified value is displayed.
- `greater-than`: Filters output so that only information greater than the specified value is displayed.
- `less-than`: Filters output so that only information less than the specified value is displayed.
- `value`: Used in conjunction with `<, >`, greater-than, less-than. If no other filtering options are specified only output matching value is displayed. If value is not specified all data is displayed. value must be an integer from 0 through 18446744073709551615.

The following filter keywords are valid with this command:

epdg-address, epdg-service,

ue-type { ims | non-ims }
Displays information for the subscribers based on User Equipment type.

- `ims`: IP Multimedia Subsystem
- `non-ims`: UE other than IMS

The following filter keywords are valid with this command:

access-type, active-charging-service, bandwidth-policy, bearer-establishment, callid, card-num, cbb-policy, configured-idle-timeout, connected-time, csf-service, domain, ebi, enodeb-address, epdg-address, epdg-service, fa, fa-service, firewall, fw-and-nat, gprs-service, gtp-version, gtpu-bind-address, gtpu-service, ha, hnbgw-service, idle-time,
Exec Mode show Commands (Q-S)

show subscribers

Displays information for connections for the subscriber identified by `name`. The user must have been previously configured. `name` must be a sequence of characters and/or wildcard characters ('$' and '*') from 1 to 127 characters. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes ('). For example; `$`.

The following filter keywords are valid with this command:

```plaintext
username
```

displays information for connections for the subscriber identified by `name`. The user must have been previously configured. `name` must be a sequence of characters and/or wildcard characters ('$' and '*') from 1 to 127 characters. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes ('). For example; `$`.

The following filter keywords are valid with this command:

```plaintext
epdg-address, epdg-service,
```

**wf1**

Displays subscriber information in wide format number 1. Wide format number 1 includes the following information for each listed subscriber session:

- Access Type
- Access Technology
- Call State
- Link Status
- Network Type
- Call ID
- MSID
- Username
- IP Address
- Time-Idle
- Access Peer Address
- Service Address
- Network Peer Address
- Connect Time

The following filter keywords are valid with this command:

```plaintext
epdg-address, epdg-service,
```

**filter_keywords**

The following keywords are filters that modify or filter the output of the Command Keywords. Not all filters are available for all Command Keywords. Multiple Filter Keywords can be entered on a command line. When multiple Filter Keywords are specified, the output conforms to all of the Filter Keywords specifications.

For example; if you enter the following command:

```plaintext
show subscribers counters ip-pool pool1 card-num 1
```
show subscribers

Counters for all subscriber sessions that were assigned an IP address from the IP pool named pool1 and also are being processed by the processing card in slot 1 is displayed. Information for all other subscribers is not displayed.

**active**
Only display information for those subscribers who currently have active sessions.

**active-charging-service acs_service**
Displays information for subscribers being processed by the active charging service specified as an alphanumeric string of 1 through 15 characters.

**activity**
Displays subscriber link activity percentage.

**all**
If no keywords are specified before all, information for all subscribers is displayed. If keywords are specified before all, all information is displayed with no further options being allowed.

**apn name**
Displays subscribers currently facilitated by the access point name (APN) configured on the SGSN or GGSN.

**asngw-only**
Displays counters for subscribers accessing the ASN-GW service only.

**asnpc-only**
Displays counters for subscribers accessing the ASN Paging Controller and Location Registry service only.

**bandwidth-policy policy_name**
Displays information for subscribers associated with the specified Active Charging bandwidth policy.

**bearer-establishment { direct-tunnel | normal | pending } id**
Displays subscriber information for selected bearer establishment type.

**bng-service srvc_name**
Displays the current configuration for the specified Broadband Network Gateway (BNG) service.

**callid id**
Displays subscriber information for the call ID specified as an 8-byte hexadecimal number.

**card-num card_num**
The slot number of the processing card by which the subscriber session is processed. The slot number is an integer from 1 through 7 and 10 through 16 on the ASR 5000, or 1 through 4 and 7 through 10 on the ASR 5500.
**cbb-policy policy_name**
Displays information for subscribers associated with the specified Active Charging Content Based Billing (CBB) policy.

**ccoa-only**
Displays the subscribers that registered a MIP with CoA directly with the HA. This option is only valid when a MIPHA session license is enabled.

**configuration { all | username name }**
Displays current configuration for all subscribers or a specified subscriber.

**configured-idle-timeout [ < | > | greater-than | less-than ] value**
Shows the idle timeout that is configured for the specified subscriber. A value of 0 (zero) indicates that the subscribers idle timeout is disabled.
- <: Filters output so that only information less than the specified value is displayed.
- >: Filters output so that only information greater than the specified value is displayed.
- greater-than: Filters output so that only information greater than the specified value is displayed.
- less-than: Filters output so that only information less than the specified value is displayed.
- value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching value is displayed. If value is not specified all data is displayed. value must be an integer from 0 through 4294967295.

**connected-time [ < | > | greater-than | less-than ] value**
Shows how long the subscriber has been connected.
- <: Filters output so that only information less than the specified value is displayed.
- >: Filters output so that only information greater than the specified value is displayed.
- greater-than: Filters output so that only information greater than the specified value is displayed.
- less-than: Filters output so that only information less than the specified value is displayed.
- value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching value is displayed. If value is not specified all data is displayed. value must be an integer from 0 through 4294967295.

**counters keyword**
Displays the specified counter for the subscribers.

**cpu-num number**
Displays information for calls processed through the specified CPU number.

**cscf-only**
Displays information for Call Session Control Function (CSCF) subscribers only.

**cscf-service service_name**
Displays information for subscribers accessing an existing CSCF service specified as an alphanumeric string of 1 through 63 characters.
### dhcp-server address
Displays subscribers currently accessing the system that have been provided an IP address by the DHCP server specified by its address. GGSN only.

### dns-proxy
Displays all subscribers associated with a DNS proxy.

### domain name
Displays all subscribers with an Address-of-Record (AoR) from the specified domain. name is an alphanumeric string of 1 through 79 characters.

### dormant
Shows information for subscriber sessions that are dormant (not transmitting or receiving data).

### ebi number
Displays subscribers based on an EPS bearer identity number.

### enodeb-address ip_address
Displays subscribers based on the eNodeB to which they are attached.

### epdg-address ip_address
Displays information of subscribers connected to the specified ePDG address in IPv4 dotted-decimal notation or IPv6 (::) notation.

### epdg-service service_name
Displays information of subscribers of ePDG service specified as an alphanumeric string of 1 through 63 characters.

### fa address
Displays information for subscribers connected to the foreign agent specified by its IP address in IPv4 dotted-decimal notation.

### fa-only
Only display FA-specific context information.

### fa-service name
Displays information for subscribers connected to the named foreign agent (FA) service.

### firewall { not-required | required }
Displays information for the specified subscribers:
- **not-required**: Subscribers for whom firewall processing is not required.
- **required**: Subscribers for whom firewall processing is required.
show subscribers

**firewall-policy fw_policy_name**
This keyword is obsolete.

**full**
Displays all available information for subscribers.

**fw-and-nat policy fw_nat_policy**

**Important:** This option is customer-specific and is only available in StarOS 8.1.

Displays information for subscribers using an existing Firewall-and-NAT policy specified as an alphanumeric string of 1 through 15 characters.

**ggsn-address ip_address**
Displays information for subscribers connected to an existing GGSN specified by its IP address in IPv4 dotted-decimal notation. SGSN only.

**ggsn-preservation-mode**
Displays information for subscribers connected to the GGSN service with preservation mode enabled. GGSN only.

**ggsn-service name**
Displays information for subscribers connected to the named GGSN service. This keyword is for GGSN only.

**gprs-only**
Displays only 2G SGSN subscribers content. SGSN only.

**gprs-service srvc_name**
Displays subscriber information for the named 2G GPRS service. SGSN only.

**gsm-traffic-class { background | conversational | interactive | streaming }**
Displays information for subscriber traffic that matches the specified 3GPP traffic class.
  - **background**: 3GPP QoS background class.
  - **conversational**: 3GPP QoS conversational class.
  - **interactive**: 3GPP QoS interactive class. Must be followed by a traffic priority.
  - **streaming**: 3GPP QoS streaming class.

**ha address**
Displays information for subscribers connected to the home agent specified by its IP address in IPv4 dotted-decimal notation.

**ha-ipsec-only**
Only displays information for subscriber sessions that are using IP-Security (IPSec).
**ha-only**
Only displays HA-specific context information.

**ha-service name**
Displays information for subscribers connected to the named home agent service.

**hnbgw-only**
Displays counters for subscribers accessing the Home evolved NodeB Gateway (HNB-GW) service only.

**idle-time [ < | > | greater-than | less-than ] value**
Displays how long the subscriber session has been idle or display subscriber sessions that meet the idle time criteria specified.
- •<: Filters output so that only information less than the specified value is displayed.
- •>: Filters output so that only information greater than the specified value is displayed.
- •greater-than: Filters output so that only information greater than the specified value is displayed.
- •less-than: Filters output so that only information less than the specified value is displayed.
- •value: Used in conjunction with <, >, greater-than, less-than. If no other filtering options are specified only output matching value is displayed. If value is not specified all data is displayed. value must be an integer from 0 through 4294967295.

**imei imei_number**
Displays information for subscribers having the specified International Mobile Equipment Identity (IMEI/IMEISV) number.

**ims-auth-service service_name**
Displays information for subscribers for an existing IMS Authorization Service name.

**imsi id**
Displays the subscriber with the specified ID. The IMSI (International Mobile Subscriber Identity) ID is a 15-character string which identifies the subscriber’s home country and carrier. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (’). For example; ‘$’.

**ip-address [ < | > | greater-than | less-than ] address**
Displays information for subscribers connected to the specified address.
- •<: Filters output so that only information for subscribers with an IP address lower than the specified address is displayed.
- •>: Filters output so that only information for subscribers with an IP address higher than the specified address is displayed.
- •greater-than: Filters output so that only information for subscribers with an IP address higher than the specified address is displayed.
- •less-than: Filters output so that only information for subscribers with an IP address lower than the specified address is displayed.
**address:** The address must be specified using IPv4 dotted-decimal notation. Used in conjunction with <,>, greater-than, less-than. If the IP address is specified without a qualifier, only subscribers with the specified IP address have their information displayed.

```plaintext
ip-alloc-method {aaa-assigned | dhcp [ relay-agent | proxy-client ] | dynamic-pool | l2tp-lns-assigned | mip-ha-assigned | ms-provided-static | not-ms-provided-static | static pool }
```

Displays the specific IP Allocation Method. Must be followed by one of the IP Allocation Methods:
- **aaa-assigned:** Selects subscribers whose IP addresses were assigned by AAA.
- **dhcp:** Selects subscribers whose IP addresses were assigned by DHCP.
  - **relay-agent:** Selects subscribers whose IP addresses were assigned by the DHCP Relay Agent
  - **proxy-client:** Selects subscribers whose IP addresses were assigned by the DHCP Proxy Client
- **dynamic-pool:** Selects subscribers whose IP addresses were assigned from a dynamic IP address pool.
- **l2tp-lns-assigned:** Selects subscribers whose IP addresses were assigned by the Layer 2 Tunneling Protocol (LT2P) Network Server.
- **mip-ha-assigned:** Selects subscribers whose IP addresses were assigned by the Mobile IP Home Agent.
- **ms-provided-static:** Selects subscribers whose IP addresses were provided by the Mobile Station.
- **not-ms-provided-static:** Selects subscribers whose IP addresses were not provided by the Mobile Station.
- **static-pool:** Selects subscribers whose IP addresses were assigned from a static IP address pool.

```plaintext
ip-pool name
```

Displays information for subscribers assigned addresses from an existing IP address pool or IP pool group. *name* will be an IP address in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation based on the call line setup for the specified pool.

```plaintext
ipv4
```

Displays information for subscribers with an IPv4 Firewall enabled/disabled.

```plaintext
ipv6
```

Displays information for subscribers with an IPv6 Firewall enabled/disabled.

```plaintext
ipv6-address address
```

Displays information for subscribers connected to the specified IPv6 address.

```plaintext
ipv6-prefix prefix
```

Displays information for subscribers connected to the specified IPv6 address prefix.

```plaintext
l3-tunnel-local-addr ip_address
```

A layer 3 tunneling interface specified by its IP address in IPv4 dotted-decimal notation.
**l3-tunnel-remote-addr ip_address**
A layer 3 tunneling peer specified by its IP address in IPv4 dotted-decimal notation.

**lac address**
Displays information for calls to the peer L2TP Access Concentrator (LAC) specified by its IP address.

**lac-only**
Displays LAC specific information only.

**lac-service name [ local-tunnel-id id | remote-tunnel-id id ]**
Displays information for calls associated with the LAC service specified as an alphanumeric string of 1 through 63 characters.
- **local-tunnel-id id**: Specifies a local tunnel from which to clear calls as an integer from 1 through 65535.
- **remote-tunnel-id id**: Specifies a remote tunnel from which to clear calls as an integer from 1 through 65535.

**lns address**
Displays information for calls to the peer L2TP Network Server (LNS) specified by its IP address.

**lns-only**
Displays LNS specific information only.

**lns-service name [ local-tunnel-id id | remote-tunnel-id id ]**
Displays information for calls associated with the LNS service specified as an alphanumeric string of 1 through 63 characters.
- **local-tunnel-id id**: Indicates a specific local tunnel from which to clear calls. *id* must be an integer from 1 through 65535.
- **remote-tunnel-id id**: Indicates a specific remote tunnel from which to clear calls. *id* must be an integer from 1 through 65535.

**local-tunnel-id identifier**
Displays information for a local tunnel identifier specified as an integer from 1 to 65535.

**long-duration-time-left [ < | > | greater-than | less-than ] value**
Shows how much time is left for the maximum duration of a specified subscriber session.
- **<**: Filters output so that only information less than the specified value is displayed.
- **>**: Filters output so that only information greater than the specified value is displayed.
- **greater-than**: Filters output so that only information greater than the specified value is displayed.
- **less-than**: Filters output so that only information less than the specified value is displayed.
- **value**: Used in conjunction with <, >, greater-than, less-than. If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.
mag-only
Displays Mobile Access Gateway (MAG) subscriber session information.

mag-service svc_name
Displays subscriber information based on the Mobile Access Gateway (MAG) service name. svc_name must be an existing MAG service expressed as an alphanumeric string of 1 through 63 characters.

mip-udp-tunnel-only
Displays the subscribers that negotiated MIP-UDP tunneling with the HA. This option is only valid when MIP NAT Traversal license is enabled.

mipv6ha-only
Displays MIPV6HA-specific context information for the session.

mipv6ha-service service_name
Displays specific configured MIPV6 Home Agent service. service_name must have been previously defined.

msid id
Displays information for the mobile user identified by id. id must be from 7 to 16 hexadecimal digits specified as an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (’). For example: ‘$’. In case of enforce imsi-min equivalence is enabled on the chassis and MIN or IMSI numbers supplied, this filter will show subscribers with a corresponding MSID (MIN or IMSI) whose lower 10 digits matches to lower 10 digits of the supplied MSID.

show subscribers msid ABCD0123456789 or
show subscribers msid 0123456789
will show any subscriber with a MSID that match the lower 10 digits of MSID supplied, for example, 0123456789.

msisdn msisdn
Displays information for the mobile user identified by the Mobile Subscriber ISDN Number (MSISDN). msisdn must be 7 to 16 digits; specified as an IMSI, MIN, or RMI.

nat { not-required | required }
Displays information for the specified subscribers.
  • not-required: Subscribers for whom Network Address Translation (NAT) processing is not required.
  • required: Subscribers for whom NAT processing is required.

nat-ip nat_ip_address ] }
Displays information for the subscribers for whom NAT processing is enabled and are using the specified NAT IP address. nat_ip_address specifies the NAT IP address and must be in IPv4 dotted-decimal notation. The nat-ip keyword is only available in StarOS 8.3 and later releases.
**show subscribers**

---

**nat-realm nat_realm**

Displays information for the subscribers for whom NAT processing is enabled and are using the specified NAT realm. *nat_realm* specifies the NAT realm name and must be a string from 1 through 63 characters.

---

**network-requested**

Display information for currently active subscribers whose sessions were initiated by the GGSN network requested create PDP context procedure.

---

**network-type { gre | ipip | ipsec | ipv4 | ipv4-pmipv6 | ipv4v6 | ipv4v6-pmipv6 | ipv6 | ipv6-pmipv6 | l2tp | mobile-ip | proxy-mobile-ip }**

Selects the currently active subscribers based on network service access type.

- **gre**: Generic Routing Encapsulation
- **ipip**: IP-in-IP
- **ipsec**: IPSec
- **ipv4**: IPv4 only
- **ipv4-pmipv6**: IPv4 and/or Proxy Mobile IPv6 (PMIP)
- **ipv4v6**: IPv4 and/or IPv6
- **ipv4v6-pmipv6**: IPv4, IPv6 and/or Proxy Mobile IPv6
- **ipv6**: IPv6 only
- **ipv6-pmipv6**: IPv6 and/or Proxy Mobile IPv6 (PMIP)
- **l2tp**: Layer 2 Tunneling Protocol
- **mobile-ip**: Mobile IP (MIP)
- **proxy-mobile-ip**: Proxy Mobile IPv6 (PMIP)

---

**nri nri_value**

This SGSN-specific filter uses the configured network resource identifier (NRI) to identify a specific SGSN in a pool to fine-tuned the subscriber information to be displayed.

- **nri_value**: enter an integer from 0 through 63

This filter can be used in combination with further refining filters.

---

**nsapi nsap_id**

Displays session information for the mobile user identified by Network Service Access Point Identifier (NSAPI) between MS and SGSN. NSAPI is also used as part of the tunnel identifier between GPRS Support Nodes (GSNs). The user identity IMSI and the application identifier (NSAPI) are integrated into the Tunnel IDentifier (GTPv0) (TID) or Tunnel Endpoint Identifier (GTPv1) (TEID) that uniquely identifies the subscriber’s sublink between the GSNs (SGSN and GGSN). The NSAPI is an integer value within the PDP context header.

- **nsap_id** must be an integer from 5 through 15.

---

**partial qos { negotiated | requested }**

This filter is specific to the SGSN.

- **negotiated**: Displays the display of information to requested or negotiated QoS information for the subscriber.
- **requested**: Displays the display of information to requested or negotiated QoS information for the subscriber.
This filter can be used in combination with further defining filters: active, active-charging-service, all, apn, callid, card-num, configured-idle-timeout, connected-time, ggsn-address, gprs-service, gsm-traffic-class, idle-time, imsi, msid, msisdn, negotiated, plmn-type, requested, rx-data, session-time-left, tx-data

**pcc-service name**
Displays statistics for users associated with an existing Policy and Charging Control (PCC) service name expressed as an alphanumeric string of 1 through 63 characters.

**pcf [ < | > | less-than | greater-than] ipv4_address [ < | > | less-than | greater-than ] ipv4_address ]**
Displays information for subscribers connected via the packet control function with a specific or range of IP addresses. The address must be specified using IPv4 dotted-decimal notation.
- •<: Filters output so that only information less than the specified IPv4 address value is displayed.
- •>: Filters output so that only information greater than the specified IPv4 address value is displayed.
- •less-than: Filters output so that only information less than the specified IPv4 address value is displayed.
- •greater-than: Filters output so that only information greater than the specified IPv4 address value is displayed.

Note: It is possible to define a limited range of IP addresses by using the less-than and greater-than options to define minimum and maximum values.

**pdsn-only**
Show PDSN specific information only.

**pdsn-service name**
Displays information for subscribers connected to the packet data service name. The packet data service must have been previously configured.

**plmn-type**
Displays subscriber type (HOME, VISITING, or ROAMING). This keyword is for the GGSN or the SGSN only.

**policy**
Displays the current policies associated with the subscriber session.

**profile-id id_number**
Displays subscriber session information based on the profile-id granted for the flow. id_number must be an integer from 0 to 4294967295.

**profile-name profile_name**
Displays the subscribers filtered with PCC profile named profile_name in particular IP-CAN session.

**qci number**
Displays subscriber session information based on the QoS Class Identifier (QCI) value assigned to the subscriber. number must be an integer value from 0 to 9.
**show subscribers**

**relay-agent**
Selects subscribers whose IP Addresses were assigned by the DHCP Relay Agent.

**remote-tunnel-id** `identifier`
Displays information for a remote tunnel identifier specified as an integer from 1 to 65535.

**rnc id** `rnc_id` `mcc` `mcc_num` `mnc` `mnc_num`
Displays information for subscribers connected to the SGSN via a specific RNC (radio network controller) identified by the RNC ID, the MCC (mobile country code), and the MNC (mobile network code). SGSN only.

**rulebase** `name`
Selects subscribers associated with the specified Active Charging rulebase.

**rx-data** `[ < | > | greater-than | less-than ]` `value`
The number of bytes received by the specified subscriber.
- `<`: Filters output so that only information less than the specified value is displayed.
- `>`: Filters output so that only information greater than the specified value is displayed.
- `greater-than`: Filters output so that only information greater than the specified value is displayed.
- `less-than`: Filters output so that only information less than the specified value is displayed.
- `value`: Used in conjunction with `<`, `>`, greater-than, less-than. If no other filtering options are specified only output matching `value` is displayed. If `value` is not specified all data is displayed. `value` must be an integer from 0 through 18446744073709551615.

**saegw-only**
Displays System Architecture Evolution Gateway (SAEGW) subscriber session information only.

**saegw-service** `svc_name`
Displays subscriber information based on the SAEGW service name.
`svc_name` must be an existing SAEGW service expressed as an alphanumeric string of 1 through 63 characters.

**security-type** `{ ipsec | tls }
Displays subscriber information based on the specified type of security.
- `ipsec`: IPSec
- `tls`: Transport Layer Security

**session-time-left** `[ < | > | greater-than | less ]` `value`
How much session time is left for the specified subscriber.
- `<`: Filters output so that only information less than the specified value is displayed.
- `>`: Filters output so that only information greater than the specified value is displayed.
- `greater-than`: Filters output so that only information greater than the specified value is displayed.
- `less-than`: Filters output so that only information less than the specified value is displayed.
show subscribers

- `value`: Used in conjunction with `<`, `>`, greater-than, less-than. If no other filtering options are specified only output matching `value` is displayed. If `value` is not specified all data is displayed. `value` must be an integer from 0 through 4294967295.

**smgr-instance number**
Specific sessmgr instance. `number` must be in the range of 1 to 4294967295.

**sgsn-address address**
Shows information for subscribers whose PDP contexts are currently being facilitated by the SGSN specified by address. This command is for GGSN only.

**sgsn-service srcv_name**
Shows subscriber information for a specified 3G SGSN service. `srcv_name` must be an alphanumeric string of 1 through 63 characters that identifies a configured SGSN service. This command is for SGSN only.

**subscription { aor address | callid id | full }**
Displays subscription information for defined subscribers, based on defined parameters.
- `aor address`: Clears session(s) by Address of Record.
- `callid id`: Specifies a Call Identification Number as an 8-digit hexadecimal number.
- `full`: Displays all available information.

**tft**
Displays the current Traffic Flow Template (TFT) associated with the subscriber session.

**tx-data [ < | > | greater-than | less-than ] value**
The number of bytes transmitted by the specified subscriber.
- `<`: Filters output so that only information less than the specified value is displayed.
- `>`: Filters output so that only information greater than the specified value is displayed.
- `greater-than`: Filters output so that only information greater than the specified value is displayed.
- `less-than`: Filters output so that only information less than the specified value is displayed.
- `value`: Used in conjunction with `<`, `>`, greater-than, less-than. If no other filtering options are specified only output matching `value` is displayed. If `value` is not specified all data is displayed. `value` must be an integer from 0 through 18446744073709551615.

**ue-type { ims | non-ims }**
Displays information for the subscribers based on User Equipment type.
- `ims`: IP Multimedia Subsystem
- `non-ims`: UE other than IMS

**username name**
Displays information for connections for the subscriber identified by `name`. The user must have been previously configured. `name` must be a sequence of characters and/or wildcard characters (`'$' and '*'`) from 1 to 127 characters. The `*` wildcard matches multiple characters and the `$` wildcard matches a single character.
If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

**verbose**
Display detailed information.

**wide-format**
Display detailed information in a wider screen format.

| { grep grep_options | more }

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command’s Output* section of the Command Line Interface Overview chapter.

---

**Usage**

Use this command to view information about subscriber sessions. The output of this command may be considered for part of a periodic system auditing program by verifying active and dormant subscribers.

The Command Keywords may be used standalone to display detailed information or you may use one or more of the various Filter Keywords to reduce the amount of information displayed.

⚠️ **Caution:** Executing this command may negatively impact performance if multiple instances are executed while the system is under heavy load and simultaneously facilitating multiple CLI sessions.

---

**Example**

The following command displays information for all subscriber sessions:

```
show subscribers all
```

The following command displays information for all ggsn-only subscriber sessions:

```
show subscribers ggsn-only all
```

The following command displays information for all subscriber sessions in wide format 1:

```
show subscribers wfl all
```

```
show subscribers aaa-configuration
```

```
show subscribers counters username ispluser1
```

The following command displays information for subscriber in GGSN service:

```
show subscribers ggsn-only all
```

```
show subscribers ggsn-only full
```

The following command displays information for all subscriber with SGSN session having partial QoS requests:

```
show subscribers sgsn-only partial qos requested
```
The following command displays information for all subscriber with MME session connected to MME service having IP address as 10.1.1.1:

```
show subscribers mme-only mme-address 10.1.1.1
```

**Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*. 

---

Command Line Interface Reference, StarOS Release 17

4969
show subscribers samog-only

Displays SaMOG specific context information for the session.

Product
SaMOG

Privilege
Inspector

Syntax

show subscribers samog-only [ [ all ] [ callid call_id ] [ card-num card_num ] [ connected-time [ < | > | greater-than | less-than ] connected_time ] [ full ] [ idle-time [ < | > | greater-than | less-than ] idle_time ] [ ip-address [ < | > | greater-than | less-than ] ipv4_addr ] [ ipv6-prefix ipv6_prefix ] [ network-type [ gre | ipip | ipsec | ipv4 | ipv4-pmipv6 | ipv4v6 | ipv4v6-pmipv6 | ipv6 | ipv6-pmipv6 | l2tp | mobile-ip | proxy-mobile-ip ] ] [ session-time-left [ < | > | greater-than | less-than ] session_time_left ] [ smgr-instance smgr_instance ] [ summary ] [ username user_name ] [ | { grep grep_options | more } ]

idle-time [ < | > | greater-than | less-than ] idle_time
Displays how long the subscriber has been idle.

> and greater-than Specifies greater than. This must be followed by idle_time, an integer ranging from 0 and 4294967295.

< and less-than Specifies less than. This must be followed by idle_time, an integer ranging from 0 and 4294967295.

ipv6-prefix ipv6_prefix
Displays the subscribers associated with the specified IPv6 address prefix. Must be followed by an IPv6 address prefix in the format xx:xx:xx::/len

| { grep grep_options | more }

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For details on using the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.
show subscribers wsg-service

Displays information for specific configured WSG service. This command must be followed by the WSG service name.

Product
SecGW (WSG)

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec
The following prompt is displayed in the Exec mode:
[local]host_name#

Syntax

```
show subscribers wsg-service service_name [ | { grep grep_options | more } ]
```

```
service_name
```

Specifies the name of the WSG service as an alphanumeric string of 1 through 63 characters.

Usage
Use this command to displays information about selected WSG calls and services.

Example
The following command displays counter information for wsg-service wsg01:
```
show subscribers wsg-service wsg01 arg1
```
show super-charger

Lists subscribers with valid super-charger configuration. When super-charger is enabled for a subscriber, the SGSN handles 2G or 3G connections controlled by an operator policy and changes hand-off and location update procedures to reduce signaling traffic management (3GPP, TS.23.116).

Product
SGSN

Privilege
Security Administrator, Administrator, Operator, Inspector

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show super-charger { imsi imsi | all }

**imsi**
Defines a specific subscriber’s international mobile subscriber identity (IMSI) number.

**imsi** is a string of up to 15 digits that includes the MCC (mobile country code), the MNC (mobile network code) and the MSIN (mobile station identification number),

**all**
Instructs the SGSN to display super charger subscription information for all subscribers.

Usage
Use this command to determine if a single subscriber, identified by the IMSI, has a super charger configuration. Also, this command can display the list of all subscribers with a super charger configuration. If a subscriber has super charger as part of the configuration, subscriber data is backed up (using the IMSI Manager) after the subscriber detaches and the purge timer expires.

Example
The following command displays the super charger configuration information for the subscriber identified by the IMSI 90121882144672.

```
show super-charger imsi 90121882144672
```
show supplementary-service statistics

Displays the statistics for Supplementary Service Information.

Product
SGSN

Privilege
Security Administrator, Administrator, Operator

Mode
Exec
The following prompt is displayed in the Exec mode:
[local]host_name#

Syntax

show supplementary-service statistics

Usage
Use this command to display the Supplementary Service Information.

Example
The following command displays the Supplementary Service Information:

show supplementary-service statistics
show support collection

Displays information about when and where the Support Data Collector (SDC) stores its Support Data Record (SDR) files.

Product
All

Privilege
All

Mode
Exec

The following prompt is displayed in the Exec mode:

[local]host_name#

Syntax

show support collection [ definitions ] [ | { grep grep_options | more } ]

definitions
Displays the list of default support record section definitions. This is the list of all valid record section definitions. The display also indicates whether the record section is enabled or disabled by default.

| { grep grep_options | more }
Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For details on using the grep and more commands, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter.

Usage

Use this command to display the status of SDR collection, collection times, SDR file names and sizes, as well as the date/time the files were written. If SDR collection has occurred this command displays the pathname where the files have been stored.
