- `access-gw-address` (RADIUS client in the case of IPSG)
- `msisdn-range from msisdn_start_range to msisdn_to_range`
- `rat-type`

All these attributes are sent in access-request in Auth-Proxy mode or Acct-Start in other modes to trigger Virtual APN selection.

The functionality provided by this command can also be used to restrict access to particular APNs. To restrict access based on a particular criteria (domain name, mcc/mnc, etc.), the “virtual” APN reference should refer to an APN that is not configured on the system and contains the desired rule. All calls matching the configured rule would then be denied with a reason code of 219 (DBH), Missing or Unknown APN.

**P-GW/SAEGW**

The Virtual APN feature allows a carrier to use a single APN to configure differentiated services. The APN that is supplied by the MME is evaluated by the P-GW in conjunction with multiple configurable parameters. Then, the P-GW selects an APN configuration based on the supplied APN and those configurable parameters. APN configuration dictates all aspects of a session at the P-GW. Different policies imply different APNs. After basic APN selection, however, internal re-selection can occur based on the following parameters:

- S-GW address: `access-gw-address`
- Service name: `bearer-access-service`
- Call control profile index: `cc-profile`
- Domain name part of username (user@domain): `domain`
- MCC-MNC of IMSI: `mcc mcc_number mnc mnc_number`
- MSISDN range: `msisdn-range from msisdn_start_range to msisdn_to_range`
- Subscriber type: `rat-type`

In StarOS v12.x and earlier, the P-GW supports a maximum of 1024 Virtual APNs in a system. In StarOS v14.0 and later, the P-GW supports a maximum of 2048 Virtual APNs in a system.

The functionality provided by this command can also be used to restrict access to particular APNs. To restrict access based on a particular criteria (domain name, mcc/mnc, etc.), the “virtual” APN reference should refer to an APN that is not configured on the system and contains the desired rule. All PDN connections matching the configured rule would then be denied with a reason code of 219 (DBH), Missing or Unknown APN.

**Example**

The following commands configure two “virtual” APNs, priority 1 references the `bigco` APN with a domain rule of `bigco.com`, priority 2 references the `bigtown` APN with a mobile country code rule of 100 and a mobile network code rule of 50.

```plaintext
virtual-apn preference 1 apn bigco domain bigco.com
virtual-apn preference 2 apn bigtown mcc 100 mnc 50 msin-range from 4000000000 to 4999999999
```
virtual-apn preference 3 apn bigco.com access-gateway-address 192.168.62.2

virtual-apn preference 4 apn bigco.co.kr access-gateway-address 192.168.60.2/24
Chapter 24
APN Profile Configuration Mode

The APN Profile configuration mode defines a set of parameters controlling the SGSN or MME behavior when a specific APN is received or no APN is received in a Request. An APN profile is a key element in the Operator Policy feature and an APN profile is not used or valid unless it is associated with an APN and this association is specified in an operator policy (see the Operator Policy Configuration Mode Commands).

Essentially, an APN profile is a template that consists of a set of APN-specific commands that may be applicable to one or more APNs. When a subscriber requests an APN that has been identified in a selected operator policy, the set of commands in the associated APN profile will be applied. The same APN profile can be associated with multiple APNs and multiple operator policies.

The SGSN and the MME each support a total of 1,000 APN profile configurations per SGSN/MME; up to 50 APN profiles can be associated with a single operator policy. For additional SGSN limit information, refer to Engineering Rules in the SGSN Administration Guide.

Mode

Exec > Global Configuration > APN Profile Configuration

configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
accounting context

This command allows you to define the name of the accounting context and associate a GTPP group with this APN profile.

Product
SaMOG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > APN Profile Configuration

configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

accounting context context_name gtpp group group_name

remove accounting context

remove

Removes the accounting configuration from this profile’s configuration.

ccontext_name

Specifies the accounting context. context_name must be an alphanumeric string of 1 through 79 characters.

gtpp group group_name

Identifies the GTPP group, where the GTPP related parameters have been configured in the GTPP Group Configuration mode, to associate with this SaMOG APN profile. group_name must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to associate a predefined GTPP server group, including all its associated configuration, with a specific SaMOG APN profile. Even if an accounting context is also specified in a call control profile, the priority is given to the accounting context of the APN profile.

Example

The following command identifies an accounting context called account1 and associates a GTPP server group named roaming with defined charging gateway accounting functionality:

accounting context account1 gtpp group roaming
accounting mode

This command allows you to define the mode of accounting to be performed for this SaMOG APN profile.

Product
SaMOG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > APN Profile Configuration
configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

accounting mode { gtpp | none }
{ default | remove } accounting mode

---

default
Resets the accounting mode to GTPP.

---

remove
Removes the accounting mode from this profile’s configuration.

---

gtpp
Specifies that GTPP accounting is performed. This is the default method.

---

none
Specifies that no accounting will be performed for the APN profile.

---

Usage
Use this command to specify the accounting mode for an SaMOG APN profile to generate bearer-based SaMOG CDRs. Even if an accounting mode is also specified in a call control profile, the priority is given to the accounting mode of the APN profile.

Example
The following command specifies that no accounting will be used for the APN profile:

accounting mode none
address-resolution-mode

Identifies the address resolution mode for this APN profile.

Important: From release 16.2 onwards, the S4-SGSN also supports this command.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > APN Profile Configuration

configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

address-resolution-mode { fallback-for-dns | local }

default address-resolution-mode

default

Resets the configuration to the default value, that is, fallback-for-dns.

fallback-for-dns

Instructs the system to try DNS resolution. If the DNS query fails, the SGSN will use locally configured addresses, if they have been configured. The pgw-address configured under apn-profile will be treated as fallback for dns address and will used only after dns failure.

Default: enabled

local

Instructs the system to only use locally configured addresses and not to use DNS query.

Default: disabled

Usage

Use this command to specify the DNS query or local address resolution for this APN profile.

Example

The following command sets the address resolution mode to use local addresses only if the DNS query fails:

address-resolution-mode fallback-for-dns
apn-resolve-dns-query

Command enables the SGSN to send Straightforward Name Authority Pointer (SNAPTR) type DNS query for APN resolution on a per APN basis.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > APN Profile Configuration
configure > apn-profile *profile_name*

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```
apn-resolve-dns-query snaptr [ epc-ue | non-epc-ue ]
```

```
remove apn-resolve-dns-query snaptr
```

---

**remove**
Removes the DNS SNAPTR function from the configuration.

**epd-ue**
Configures the S-NAPTR queries to be applicable for EPC-capable UE.

**non-epc-ue**
Configures the S-NAPTR queries to be applicable for non-EPC-capable UE.

---

**Usage**
SNAPTR filters based on the EPC-capability of the user equipment (UE). Use this command to enable SNAPTR type DNS query for APN resolution for 3G subscribers with EPC subscription. Configuration in this mode promotes control of this feature per APN.
If neither of the keywords is included with the configuration, then S-NAPTR query is applicable to all UE, both EPC-capable UE and non-EPC capable UE.
By default, this functionality is not enabled.

**Example**
Enable the SGSN to select a PGW during APN resolution:

```
apn-resolve-dns-query snaptr
```
apn-restoration

Configures the APN restoration priority value.

Product

MME
SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > APN Profile Configuration

configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

apn-restoration priority priority_value

remove apn-restoration priority

---

remove

Removes the APN restoration priority value from the configuration.

---

priority priority_value

Configures the APN restoration priority value. The reactivation of PDNs after a P-GW restart notification is processed in the order of this priority.

priority_value

The priority value is an integer value from 1 through 16. Where “1” is the highest priority and “16” is the lowest priority. Default: 16 (lowest priority).

---

Usage

The PGW Restart Notification (PRN) message is sent by the S-GW when it detects a peer P-GW has restarted. After the affected subscribers have been deactivated, the MME/S4-SGSN will prioritize the reactivation of impacted PDN connections based on subscribed APN restoration priority, if received from the HSS. If an APN restoration priority is not received from the HSS, then this locally configured value is used. If there is no local configuration then by default such PDNs will be assigned the lowest restoration priority. The MME will only restore PDNs for which the APN restoration priority is configured and/or received from HSS. Otherwise PDNs will be released by regular deactivation.

For the MME, refer to the LTE Policy > LTE Emergency Profile > apn command to define a different APN restoration priority for emergency sessions for this APN profile.

---

Example

The following command is used to configure the APN restoration priority value of “10” for an APN profile:

```
apn-restoration priority 10
```
**apn-type**

Identifies the type of APN as an IMS APN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > APN Profile Configuration
**configure > apn-profile profile_name**

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```
apn-type { ims }
```

```
remove apn-type ims
```

```
remove

Erases this identification configuration from the APN profile and resets the APN profile to the default behavior which disables the APN type as IMS.
```

**Usage**

This command identifies the APN as an IMS APN. This enables the SGSN to delay sending Modify Bearer Request to the S-GW until after receiving the Forward Relocation Complete Ack from the peer during SRNS procedure.

Also, The following CLI identifies an APN as IMS APN and to configure to indicate whether the PGW supports optional extension or if the MME initiates PDN deactivation for HSS initiated P-CSCF restoration. To enable HSS-based P-CSCF Restoration, use the pcsf-restoration command under the Call Control Profile mode.

**Example**

Identify the APN for this profile as an IMS type APN:

```
apn-type ims
```

The following command selects pco-update as the P-CSCF Restoration method:

```
apn-type ims pcsf-restoration pco-update
```

The following command selects pdn-deactivate as the P-CSCF Restoration method:

```
apn-type ims pcsf-restoration pdn-deactivate
```
associate accounting-policy

Associates the APN with specific pre-configured policies configured in the same context for SaMOG charging.

**Product**
SaMOG

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > APN Profile Configuration
configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:
[local]host_name(apn-profile-profile_name)#

**Syntax**

```
associate accounting-policy policy_name
remove associate accounting-policy
```

**remove**

Removes the association of the policy from the APN profile.

**policy_name**

Specified the policy name to associate to the APN profile. `policy_name` must be an existing accounting policy, and must be an alphanumeric string of 1 through 63 characters.

**Usage**

Use this command to associate the SaMOG APN profile with an accounting policy configured in this context to provide triggers to generate CDRs. The accounting policy configured under the APN profile takes priority over the accounting policy configured under the call control profile.

**Example**

The following command associates this SaMOG APN with an accounting policy called `acct1`:

```
associate accounting-policy acct1
```
associate qci-qos-mapping

Provides operators with a configuration to associate a Qos Class Identifier (QCI) Quality of Service (QoS) mapping table with a specified APN profile configuration.

**Product**
SGW
SAE-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > APN Profile Configuration

configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

```[local]host_name(apn-profile-profile_name)#```

**Syntax**

```
[remove] associate qci-qos-mapping mapping_table_name
```

- **remove**
  Removes the specified QCI to QoS mapping table association.

- **associate qci-qos-mapping mapping_table_name**
  Instructs the application to associate the specified QCI QoS mapping to this APN profile.

**Usage**

Associates a QCI QoS mapping table with an APN profile.

**Example**

This example associates a QCI QoS mapping table with the APN Profile ‘QCIQOSMap’.

```
associate qci-qos-mapping QCIQOSMap
```
associate quality-of-service-profile

Associates the specified Quality of Service profile with the APN profile.

Product
SGSN

Privilege
Administrator

Mode
Exec > Global Configuration > APN Profile Configuration
configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

associate quality-of-service-profile qos_profile_name access-type [ gprs | umts ]

remove associate quality-of-service-profile access-type [ gprs | umts ]

remove
Removes the association of the specified Quality of Service profile with the APN profile.

access-type
Configures the access-types to be associated with the QoS profile for this APN profile.

  • gprs
  • umts

qos_profile_name
Identifies the name of the Quality of Service profile to be associated with the APN profile.

Usage
This command identifies a specific Quality of Service profile to be associated with the APN profile. The access-type must be configured as either gprs or umts.

Example

Use this command to associate a 3G (UMTS) QoS profile named test with the APN profile.

    associate quality-of-service-profile test access-type umts
associate sgw-paging-profile

This command allows the association of an SGW Paging Profile with an APN profile on the S-GW.

**Product**
S-GW

**Privilege**
Administrator, Security Administrator

**Mode**
Exec > Global Configuration > APN Profile Configuration

*configure > apn-profile profile_name*

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```
[ remove ] associate sgw-paging-profile three-tupple
```

- **remove**
  Removes the S-GW Paging Profile from the APN Profile.

- **associate sgw-paging-profile three-tupple**
  Associates an SGW Paging Profile with an APN profile on the S-GW. S-GW Paging Profiles are configured in Global Configuration Mode with the `sgw-paging-profile three-tupple` command.

**Usage**

Use this command to associate an S-GW paging profile with an APN profile on the S-GW.

**Example**

This example associates an S-GW paging profile with an APN profile on the S-GW.

```
associate sgw-paging-profile three-tupple
```
active-charging rulebase

Configure the name of the rulebase that contains the charging action for the HTTP redirection and the URL for the portal for SaMOG web authorization.

Product
SaMOG

Privilege
Administrator

Mode
Exec > Global Configuration > APN Profile Configuration

configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

active-charging rulebase rulebase_name

no active-charging rulebase

rulebase rulebase_name

Specifies the active charging rulebase to be used.

rulebase_name must be the name of an ACS rulebase, and must be an alphanumeric string of 1 through 63 characters, and can contain punctuation characters.

Usage

Use this command to configure the name of the rulebase that contains the charging action for the HTTP redirection and the URL for the authentication portal to facilitate HTTP redirection to the authorization portal during the pre-authentication phase. The ACS rulebase specified in this configuration will be used only if the AAA server does not specify the ACS rulebase during the pre-authentication phase.

Important: This command is license dependent. Contact your Cisco account representative for more information on SaMOG feature license requirements.

Example

The following command configures the rulebase webauthredir:

active-charging rulebase webauthredir
CC

Configures the charging characteristics (CC) for this APN profile.

Product
SGSN
S-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > APN Profile Configuration

Command Line Interface Reference, StarOS Release 17

configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

cc { local-value-for-scdrs behavior bit_value profile index_bit | prefer { hlr-value-for-scdrs | local-value-for-scdrs } }

remove cc { local-value-for-scdrs | prefer }

remove

Removes the charging characteristics configuration from this APN profile.

local-value-for-scdrs behavior bit_value profile index_bit

Sets the value of the behavior bits and profile index for the charging characteristics for S-CDRs locally, when the Home Location Register (HLR) does not provide these values.

If the HLR provides the charging characteristics with behavior bits and profile index, and the operator wants to ignore what the HLR provides, then specify the prefer local-value-for-scdrs keyword with this command.

bit_value: must be a hexadecimal value between 0x0 and 0xFFF.
index_bit: must be an integer from 1 through 15.

Some of the index values are predefined according to 3GPP standard:

- 1 for hot billing
- 2 for flat billing
- 4 for prepaid billing
- 8 for normal billing

Defaults: bit_value = 0x0; index_bit = 8

prefer { hlr-value-for-scdrs | local-value-for-scdrs }

Specify what charging characteristic settings the system will use for S-CDRs.
• **hlr-value-for-scdrs**: instructs the system to use charging characteristic settings received from the HLR for S-CDRs.

• **local-value-for-scdrs**: instructs the profile preference to only use locally configured/stored charging characteristic settings for S-CDRs.

Default: **hlr-value-for-scdrs**

### Usage

Use this command to specify the charging characteristic for S-CDRs -- either from the HLR or locally from the SGSN.

These charging characteristics parameters for S-CDRs and M-CDRs are also configurable in the Call-Control Profile configuration mode. When CC parameters are specified in both types of profiles, then:

- For generation of M-CDRs, the parameters configured in the Call-Control Profile configuration mode will take precedence.

- For generation of S-CDRs, the parameters configured in the APN Profile configuration mode will take precedence.

### Example

The following command configures the APN profile to instruct the SGSN not to use charging characteristic settings received from the HLR for S-CDR generation:

```
cc prefer hlr-value-for-scdrs
```
dedicated-bearers

Configures the MME to either accept or reject dedicated GBR and Non-GBR bearers.

Product
MME

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > APN Profile Configuration

configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

dedicated-bearers { gbr { accept | reject } | non-gbr { accept | reject } }

[ remove ] dedicated-bearers { gbr | non-gbr }

remove
Removes the configuration, returning the system to the default setting where the MME accepts GBR or Non-GBR dedicated bearers.

gbr { accept | reject }
Configures the MME to accept or reject dedicated GBR bearers.

non-gbr { accept | reject }
Configures the MME to accept or reject dedicated Non-GBR bearers.

Usage

The MME differentiates GBR and Non-GBR dedicated bearers as follows: GBR Bearers - QCI value ranges from 1 to 4; Non-GBR bearers - QCI value ranges from 5-9.
In the case of a UE-initiated Bearer Resource Allocation Reject, the ESM cause “EPS QOS not accepted” is used and the corresponding bearer allocation reject MME statistic is incremented.
In the case of a Create Bearer Request Reject, the EGTP cause “Service denied” is used and the corresponding EGTP statistic is incremented.
Note: Handling of multiple bearers in a Create Bearer request from S-GW for Partial accept/reject of GBR/Non-GBR dedicated bearers is a current limitation.

Example

The following commands configure the MME to reject both GBR and Non-GBR dedicated bearers:

dedicated-bearers gbr reject

dedicated-bearers non-gbr reject
**description**

Defines a descriptive string relevant to the specific APN profile.

**Product**

MME  
SGSN  
S-GW  
SAEGW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > APN Profile Configuration

`configure > apn-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```
description description
remove description
```

**remove**

Removes the configured description from this APN profile.

```
description
```

Specifies a description for this APN profile as an alphanumeric string of 1 through 100 characters. The string may include spaces, punctuation, and case-sensitive letters if the string is enclosed in double quotation marks (".

**Usage**

Define information that identifies this particular APN profile.

**Example**

Indicate that APN profile `apnprof1` is to be used for customers in Saudi Arabia and that the profile was created on April 10th of 2010:

```
description “apnprof1 defines APNs for customers in Saudi Arabia (4/10/10).”
```
direct-tunnel

Defines the permission for direct tunnel establishment by GGSNs. This command is specific to the SGSN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > APN Profile Configuration

`configure > apn-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```
direct-tunnel not-permitted-by-ggsn

remove direct-tunnel
```

- **remove**
  Removes the direct tunnel establishment configuration from this APN profile.

- **not-permitted-by-ggsn**
  Specifies that a direct tunnel is not permitted by the GGSN when resolved by this APN. Default: disabled.

**Usage**

Use this command to enable/disable the permission for establishment of direct tunnels between an RNC and a GGSN.

**Example**

The following command instructs the SGSN not to permit establishment of a direct tunnel with a GGSN:

```
direct-tunnel not-permitted-by-ggsn
```
dns

Configure the primary and secondary IP address of the DNS servers.

Product
SaMOG

Privilege
Administrator

Mode
Exec > Global Configuration > APN Profile Configuration
configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

dns { primary | secondary } ip_address

[ no ] dns { primary | secondary }

no
If previously configured, removes the DNS primary or secondary IP address to be used for web authorization.

primary | secondary ip_address

Specify the primary or secondary DNS server address using the primary | secondary keywords. ip_address must be expressed in IPv4 dotted-decimal or IPv6 colon-separated (when the ipv6 keyword is configured) notation format.

Usage
Use this command to configure the IP address of the primary and secondary DNS servers to be used during session setup. The primary and secondary DNS servers specified in this configuration will be used only if the AAA server does not specify the same.

Important: This command is license dependent. Contact your Cisco account representative for more information on SaMOG feature license requirements.

Example

The following command configures a primary DNS server with the IP address 162.123.23.1:

dns primary 162.123.23.1
**dns-extn**

Takes an offset group of digits from the MSISDN and appends the digits to the DNS query string to create a new APN intended to assist roaming subscribers to use the local GGSN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > APN Profile Configuration

```
configure > apn-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```
dns-extn { charg-id { binary | decimal | hexadecimal } | lac-rac | msisdn start-offset start_digits end-offset end-digits | rnc-id [ charg-id { binary | decimal | hexadecimal } ] }
```

```
remove dns-extn { charg-id | lac-rac | msisdn | rnc-id [ charg-id ] }
```

---

**charg-id { binary | decimal | hexadecimal }**

Instructs the SGSN to take the profile index value of the charging characteristics, from the PDP subscription record (selected during APN selection) and include the profile index value in the APN name prior to sending out DNS queries. The operator can also specify the format (binary, decimal or hexadecimal) for the CC information to be included.

---

**lac-rac**

Enables the SGSN to append geographical information to the APN string that is being sent in the DNS query. This information is used during the DNS query process to select the geographically closest GGSN.

---

**msisdn start-offset start_digits end-offset end-digits**

Defines an offset group of digits from the MSISDN and appends the digits to create a new APN DNS query string that is intended to assist roaming subscribers to use the local GGSN.

- **start_digits** is an integer from 1 through 14 that identifies the position of the first digit in the MSISDN to start the offset.
- **end-digits** is an integer from 2 through 15 that identifies the position of the last digit in the MSISDN to be part of the offset.

---

**rnc-id [ charg-id { binary | decimal | hexadecimal } ]**

Instructs the SGSN to include the ID of the calling RNC in the APN DNS query string. Optionally, the profile index value of the charging characteristics can be inserted into the APN name prior to sending out DNS queries. As well, the operator can specify the format (binary, decimal or hexadecimal) for the CC information to be included.
Usage

With this command, the APN in the DNS query string, used for querying the GGSN address, can be appended with additional information, such as:
- digits from the MSISDN
- LAC/RAC info
- RNC-ID
- profile index from the charging characteristics information (SCHAR)

This additional information allows some customization of the DNS query string to facilitate selecting a specific (usually local or nearest) GGSN. For example, roaming subscribers using a specific APN may want to be directed to a specific GGSN. This can be achieved by having an operator policy for roaming subscribers associated with an APN profile that includes a configuration specifying certain digits, from the MSISDN or geographical information from the LAC/RAC, be appended to the APN. This is then used as the DNS query string. In addition, the operator must configure appropriate DNS entries to enforce the selection of the required GGSN. After appending the MSISDN digits to the DNS query string, the string will have the form:

\[ \text{ni.<digits>.-mnc*.mcc*.gprs} \]

After appending the LAC/RAC information to the DNS query string, the string will have the form:

\[ <\text{apn_network_id}\.rac\text{AAAA}\.lac\text{BBBB}\.<\text{apn_operator_id}> \]

where the AAAA and BBBB are Hex-coded digits (less than 4 significant digits and one or more zeros (“0”) digits will be inserted to the left side of the Hex to fill the 4-digit coding). After appending the charging characteristic (SCHAR) information, the DNS string will take the following form:

\[ <\text{apn_network_id}\.<\text{profile_index}>\.<\text{apn_operator_id}> \]

The profile index in the following example has an integer value 10:

\[ \text{quicknet.com.uk.1010.mnc234.mcc027.gprs} \]

If the RNC-ID information is configured to be a part of the APN name, and if inclusion of the profile index of the charging characteristics information is also enabled before the DNS query is sent, the profile index is included after the included RNC-ID and the DNS APN name will appear in the following form:

\[ <\text{apn_network_id}\.<\text{rnc_id}>\.<\text{profile_index}>\.<\text{apn_operator_id}> \]

Once the DNS extension is defined, the selected extension is applicable when either the wildcard APN feature or the default APN feature are configured and used. The information is appended to the DNS query and the actual APN string sent to the GGSN will not be modified in any way.

Example

A sample MSISDN is ‘112233445566778’ and a sample APN NI (network identifier) is ‘wap98.testnetz.ca’. The following command instructs the SGSN to create a new APN with digits pulled from the MSISDN and appended to the APN:

\[ \text{msisdn start-offset 3 end-offset 9} \]

The resulting APN DNS query string would have appended 7 digits (2233445) to the APN NI so that it would appear something like \[ \text{wap98.testnetz.ca.2233445.MNC009.MCC262.GPRS} \]

Enable inclusion of geographical information in the APN string used for the DNS query to locate the closest GGSN:

\[ \text{lac-rac} \]

In the following example, the DNS query for a subscriber using RNC 0321 with the profile index of value 8 would appear as:

\[ \text{quicknet.com.uk.0321.1000.mnc234.mcc027.gprs} \]
end

Exits the current configuration mode and returns to the Exec mode.

**Product**

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Use this command to return to the parent configuration mode.
gn-gtp-version

This command enables the operator to prevent the SGSN from attempting GTPv0 Requests for GGSNs associated with specified APNs so that the SGSN tries activation with the next available GGSN if the current GGSN does not respond after the GTPv1 Request retries fail.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > APN Profile Configuration
configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

[ remove ] gn-gtp-version v1-only

remove
Used with the command, this filter erases the previous GTPv1 configuration and returns the SGSN configuration to the default value of both GTPv1 and GTPv0.

v1-only
This extension must be included to complete the command. This extension disables GTPv0 fallback.

Usage

During activation, the SGSN sends GTPv1 PDP Requests to a GGSN and if no response is available from the GGSN after the maximum number of retransmissions and timeout, then before trying an alternate GGSN, the SGSN attempts to create GTPv0 PDP Requests and retries are carried out. Only after GTPv0 retransmissions and timeout would the SGSN try activation with the next available GGSN.

The SGSN supported GTPv0 fallback. After exhausting all configured retry attempts for GTPv1, the SGSN would retry the GTP-C Request using GTPv0. This fallback is conditional and is done only when the GTP version of a GGSN is unknown during the first attempt at activating a PDP context with the GGSN.

This command allows the operator to disable the GTPv0 fallback for GTP-C Requests to GGSNs corresponding to a specific APN, thus reducing unnecessary signalling if all known GGSN support GTPv1 only. Hence, if more than one GGSN address is returned by the DNS server during activation, then the SGSN more immediately attempts activation with the next GGSN after exhausting all the GTPv1 retry attempts. If only one GGSN address is returned, then the SGSN rejects the activation after exhausting all the configured GTPv1 retries.

Example

The following command disables GTPv0 fallback:

gn-gtp-version v1-only
The following command deletes the previous configuration and re-enables the default so the SGSN will attempt activation via both GTPv1 and if needed GTPv0:

```
remove gn-gtp-version v1-only
```
**gateway-address**

Configures the IPv4 or IPv6 address of the GGSN supporting the APN associated with this APN profile. Also, use this command to create a secondary pool of GGSNs. This command is specific to the SGSN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**

Exec > Global Configuration > APN Profile Configuration

`configure > apn-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```
gateway-address ip_address { priority priority | weight weight [ secondary-pool ] }  

no gateway-address ip_address

no
```

Disables the GGSN address configured in this APN profile.

**ip_address**

Specifies the IP address for the GGSN in IPv4 dotted-decimal or IPv6 colon-separated notation.

**priority priority**

Specifies the priority, for the configured GGSN address, to be considered during address selection. If the highest priority GGSN fails to respond, the next priority level GGSN is selected. **priority** is an integer from 1 through 100. Note that the lower integer has the higher priority, so that 1 is the highest priority.

**weight weight [ secondary-pool ]**

Specifies the weight (preference) assigned to a GGSN to facilitate load balancing. **weight** is an integer from 1 to 100 where 1 is the least preferred and 100 is the most preferred.

If a weight is assigned to an address, then load balancing (of primary CPC requests) depends on the weight value. For example:

GGSN1 172.16.130.1 weight 30 and GGSN2 172.16.130.3 weight 70

With this configuration, 30% of the activation requests for this APN will go to GGSN1 and 70% of the requests will go to GGSN2. Also note that the sum of the weights does not need to be 100. The calculation of weight percentiles is carried out proportionately, so the following configuration will also yield the same 30% - 70% results:

GGSN1 172.16.130.1 weight 6 and GGSN2 172.16.130.3 weight 14
secondary-pool

This optional keyword allows the operator to enable multiple GGSN pools by assigning the GGSN to a secondary pool of GGSNs. The selection algorithm for GGSNs in a secondary pool is weight-based.

Usage

Use this command to define priority or load balancing to be applied during GGSN selection. A maximum of 16 GGSN address can be configured for this APN profile. Also use this command to setup GGSN pools - primary and secondary pools with up to 16 GGSNs in each pool. By default, GGSNs will always be selected from the primary pool. However, working in tandem with the `ggsn-fail-retry-timer` command configuration (SGTP service configuration mode) which enables the local DNS feature, some of the primary GGSNs can be temporarily blacklisted if they become unavailable or overburdened.

Example

Set a GGSN address with a secondary priority level:

```
gateway-address 123.123.123.2 priority 2
```

Add a GGSN to the secondary GGSN pool and define selection weighting of 7th:

```
gateway-address 198.168.138.8 weight 7 secondary-pool
```
gtp

Enables or disables the GTPC private extension for the Overcharging Protection feature. This command is specific to the SGSN.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > APN Profile Configuration configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

[ remove ] gtp private-extension loss-of-radio-coverage send-to-ggsn [ send-to-peer-sgsn ]

remove
Disables the inclusion of the GTPC private extension, thereby disabling the Overcharging Protection feature.

private-extension loss-of-radio-coverage send-to-ggsn
Instructs the SGSN to set a proprietary GTPC private extension (in the LORC Intimation IEs) in the event of loss of radio coverage (LORC). These private extensions are only understood by a GGSN with an Overcharging Protection license.
The mandatory loss-of-radio-coverage send-to-ggsn keyword set instructs the SGSN to forward the private extension flag to the GGSN in the event of a loss of radio coverage (LORC).

send-to-peer-sgsn
This optional keyword instructs the SGSN to also forward the LORC private extension to the peer SGSN.

Usage

gtp private-extension is one of the two commands required to enable the Overcharging Protection feature. The second command sets the RANAP cause code in the Iu Release to enable the SGSN to detect the LORC state of the MS/UE. This second command is configured in the IuPS service and is explained in the IuPS Service Configuration Mode chapter.

When there is a loss of coverage and the Overcharging Protection feature is enabled with the gtp private-extension command, the SGSN includes the proprietary private extension in the GTP LORC Intimation IE messages. This LORC IE is also included in UPCQ, DPCQ, and SGSN Context Response GTP messages. Refer to the SGSN Administration Guide for additional information regarding the Overcharging Protection feature.

Example

Use the following command to have the SGSN send the GGSN the GTPC private extension in the LORC Intimation IE:
gtp private-extension loss-of-radio-coverage send-to-ggsn
idle-mode-acl

Configures a group of access control lists (ACLs) that define rules to apply to downlink data destined for UEs in an idle mode.

Product
S-GW
SAEGW

Privilege
Administrator

Mode
Exec > Global Configuration > APN Profile Configuration
configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

[ remove ] idle-mode-acl { ipv4 | ipv6 } access-group acl_name

- remove
  Removes the specified ACL name from the access group.

- { ipv4 | ipv6 } access-group acl_name
  Specifies the ACL type to add to the access group.
  - ipv4: Specifies that an IPv4 ACL is being added to the access group.
  - ipv6: Specifies that an IPv6 ACL is being added to the access group.

access-group acl_name specifies the name of the ACL being added to the access group as an existing IPv4 or IPv6 ACL name expressed as an alphanumeric string of 1 through 47 characters.

Usage

Use this command to create a group of ACLs that contain rules to apply to data sent to UEs that are currently in idle mode.
IPv4 ACLs are configured through the Context Configuration Mode using the ip access-list command.
IPv6 ACLs are configured through the Context Configuration Mode using the ipv6 access-list command.

Example

The following command configures the APN profile to use an IPv4 ACL named acl-3-permit to apply rules to downlink data sent to UEs that are currently in idle mode:

idle-mode-acl ipv4 access-group acl-3-permit
ip

Defines the IP parameters for this APN profile.

SAEGW

Privilege

Administrator

Mode

Exec > Global Configuration > APN Profile Configuration

configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

ip { qos-dscp { { downlink | uplink } { background forwarding | conversational forwarding | interactive traffic-handling-priority priority forwarding | streaming forwarding } + } | source-violation { deactivate [ all-pdp | exclude-from accounting | linked-pdp | tolerance-limit ] | discard [ exclude-from-accounting ] | ignore } } default ip { qos-dscp [ downlink | uplink ] | source-violation }

no ip qos-dscp { downlink | uplink } { background | conversational | interactive | streaming } +

Important: All parameters not specifically configured will be included in the configuration with default values.

default

Resets the configuration to the default values.

no

Disables the specified IP QoS-DSCP mapping.

qos-dscp

Configures the Differentiated Services Code Point (DCSP) marking to be used for sending packets of a particular 3GPP QoS class.

downlink | uplink

Configures the packets for either downlink (network to subscriber) or uplink (subscriber to network) direction. downlink and uplink configuration must include one or more of the following:

• background - Configures the DSCP marking to be used for packets of sessions subscribed to 3GPP background class. Must be followed by a DSCP marking
• **conversational** - Configures the DSCP marking to be used for packets of sessions subscribed to 3GPP conversational class. Must be followed by a DSCP marking

• **interactive** - Configures the DSCP marking to be used for packets of sessions subscribed to different traffic priorities in the 3GPP interactive class. Must be followed by a traffic handling priority (THP): 1, 2, or 3.

• **streaming** - Configures the DSCP marking to be used for packets of sessions subscribed to 3GPP streaming class. Must be followed by a DSCP marking

---

**DSCP marking options**

Downlink and uplink must include a DSCP forwarding marking; supported options include:

• **af11** - Designates use of Assured Forwarding 11 PHB
• **af12** - Designates use of Assured Forwarding 12 PHB
• **af13** - Designates use of Assured Forwarding 13 PHB
• **af21** - Designates use of Assured Forwarding 21 PHB
• **af22** - Designates use of Assured Forwarding 22 PHB
• **af23** - Designates use of Assured Forwarding 23 PHB
• **af31** - Designates use of Assured Forwarding 31 PHB
• **af32** - Designates use of Assured Forwarding 32 PHB
• **af33** - Designates use of Assured Forwarding 33 PHB
• **af41** - Designates use of Assured Forwarding 41 PHB
• **af42** - Designates use of Assured Forwarding 42 PHB
• **af43** - Designates use of Assured Forwarding 43 PHB
• **be** - Designates use of Best Effort forwarding PHB
• **ef** - Designates use of Expedited Forwarding PHB

Forwarding defaults for both uplink and downlink are:

• **conversational** - ef;
• **streaming** - af11;
• **interactive 1** - ef;
• **interactive 2** - af21;
• **interactive 3** - af21;
• **background** - be

---

**source-violation**

Configures settings related to IP source-violation detection with one of the following criteria:

• **deactivate** - deactivate the PDP context with one of the following conditions:
  • **all-pdp** - deactivates all PDP context of the MS/UE. Default is to deactivate errant PDP contexts.
  • **exclude-from-accounting** - excludes packets having an invalid source IP address from the statistics used in the accounting records.
**linked-pdp** - deactivate all associated pdp contexts (primary and secondary). Default is to deactivate errant pdp context.

**tolerance-limit** - Configures maximum number of allowed IP source violations before the session is deactivated.

**discard** - discard errant packets, can include the following option:

- **exclude-from-accounting** - excludes packets having an invalid source IP address from the statistics used in the accounting records.

- **ignore** - ignore checking of packets for MS/UE IP source violation.

---

**Usage**

This command configures a range of IP functions to be associated with the APN profile; such as:

- SGSN/S-GW action in response to detected IP source violations,
- DSCP marking for downlink and uplink configuration per traffic class,
- QoS class diffserv code.

**Example**

The following command configures the APN profile to instruct the SGSN or S-GW not to check incoming packets for IP source violation information:

```
ip source-violation ignore
```
ip access-group

Configure the name of the access control list (ACL) for incoming and outgoing packets.

Product
SaMOG

Privilege
Administrator

Mode
Exec > Global Configuration > APN Profile Configuration

configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

[ no ] ip access-group group_name [ in | out ]

no
If previously configured, removes the IP access group.

group_name

group_name must be an alphanumeric string of 1 to 47 characters.

in | out
Specify the access group as inbound or outbound.

Usage

Use this command to configure the ACL name for incoming and outgoing packets to redirect HTTP packets, allow DNS packets and drop other packets. The IP access group specified in this configuration will be used only if the AAA server does not specify the same during authentication.

Important: This command is license dependent. Contact your Cisco account representative for more information on SaMOG feature license requirements.

Example

The following command configures an IP access group called webauthaccgroup and sets it as inbound:

ip access-group webauthaccgroup in
**ip address pool**

Configure the name of the IP address pool from which the IP address needs to be allocated to the user equipment (UE).

**Product**
SaMOG

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > APN Profile Configuration

```
configure > apn-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```
[ no ] ip address pool name pool_name
```

- **no**
  If previously configured, removes the IP address pool to be used for web authorization.

- **pool_name**
  *pool_name* must be an alphanumeric string of 1 to 31 characters.

**Usage**

Use this command to configure the name of the IP address pool from which the IP address is to be allocated to the UE during the pre-authentication phase. The IP address pool name specified in this configuration will be used only if the AAA server does not specify the same during the pre-authentication phase.

**Important:** This command is license dependent. Contact your Cisco account representative for more information on SaMOG feature license requirements.

**Example**

The following command configures an IP address pool name of *wapool*:

```
ip address pool name wapool
```
ip context-name

Configure the name of the context where the IP pool configuration needs to be obtained from.

Product
SaMOG

Privilege
Administrator

Mode
Exec > Global Configuration > APN Profile Configuration
configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

ip context-name context_name

no ip context-name

no
If previously configured, removes the IP context name to be used for web authorization.

context_name
context_name must be an alphanumeric string of 1 to 79 characters.

Usage
Use this command to configure the name of the context where the IP pool configuration needs to be obtained from and provide the VPN through which the URL to the portal can be reached during the SaMOG web authorization pre-authentication phase, or the data can be offloaded for Local Breakout. If the IP context name is not configured here, and the AAA server does not provide one, the VPN context of the SaMOG service will be used.

Important: This command is license dependent. Contact your Cisco account representative for more information on SaMOG feature license requirements.

Example
The following command configures the IP context name of wacxt

ip context-name wacxt
**isr-sequential-paging**

Enables or disables the Intelligent Paging for ISR feature.

**Product**
- S-GW
- SAEGW

**Privilege**
Administrator

**Mode**

```
Exec > Global Configuration > APN Profile Configuration
configure > apn-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```
[ remove ] isr-sequential-paging
```

```
remove
```

Disables Intelligent Paging for ISR.

**Usage**

This command initiates the Intelligent Paging for ISR feature for the specified APN Profile, where paging occurs first towards the last known RAT, then towards the other RAT. The Intelligent Paging for ISR feature is license dependant. Contact your Cisco account representative for more information.
local-offload

Enables or disables the SaMOG Local Breakout (LBO) Enhanced feature.

Product
SaMOG

Privilege
Administrator

Mode
Exec > Global Configuration > APN Profile Configuration

configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

local-offload

no local-offload

Disables Local Breakout for this APN profile.

Usage

Use this command to enable or disable the SaMOG LBO Enhanced feature. When enabled, LBO will be allowed for the UE connecting to the specified SSID, through which this APN profile is reached.
location-reporting

Configure location change reporting via ULI IE per APN for an S4-SGSN.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > APN Profile Configuration

configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

location-reporting access-type { gprs | umts }

remove location-reporting access-type { gprs | umts }

remove
Disables the location change reporting definition in the APN profile configuration.

access-type { gprs | umts }

Allows the operator to select location change reporting for the 2G and / or the 3G subscribers. Both access types can be identified in a single command or the command can be issued twice. Either way, two separate entries are created, one for each access type

Usage
As with all APN profiles, to enable location change reporting, this APN profile must be associated with a call control profile.

Location change reporting for a Gn-SGSN is enabled with the location reporting command in the Call Control Profile configuration mode. That command can be used to configure the location change reporting function for the S4-SGSN, however that configuration would be over-ridden by an APN profile configuration. As well, using this APN profile location reporting command gives the operator greater control to apply location change reporting per APN.

Example
Enable location change reporting for 2G subscribers:

    location-reporting access-type gprs
**mobility-protocol**

This command allows you to configure the default mobility protocol type to be used for setting up a call when the AAA server forwards an IP address directly.

**Product**
SaMOG

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > APN Profile Configuration

```
configure > apn-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```
mobility-protocol { gtpv1 | gtpv2 }
```

```
no mobility-protocol
```

Removes the mobility protocol configuration for this APN profile.

**Usage**

Use this command to configure the default mobility protocol type to be used for setting up a call when the AAA server forwards an IP address directly. If mobility protocol is also configured under the Call Control Profile Configuration Mode, the value configured here will override the configured value in the Call Control profile. By default, all APN profiles will use the mobility protocol configured under the Call Control Profile Configuration Mode. To configure different mobility protocol values for different APN profiles, use the `mobility-protocol` command in this configuration mode.

**Example**

The following command configures mobility protocol to GTPv2:

```
mobility-protocol GTPv2
```
ntsr

This command configures QCI and ARP in the apn-profile for Network Triggered Service Restoration (NTSR).

Product
S-GW

Privilege
Administrator, Security Administrator

Mode
Exec > Global Configuration > APN Profile Configuration
configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

```
ntsr { all | qci number arp-priority-watermark number }
no ntsr all
no ntsr qci number arp-priority-watermark number
```

- **no**
  - Removes the specified configuration parameters.
- **ntsr**
  - Enables the network triggered service restoration configuration.
- **all**
  - Specifies that the NTSR configuration is enabled for all bearers with any qci or arp for MME restoration.
- **qci**
  - Specifies the Quality of Class Identifier for this NTSR configuration. Must be an integer from 1 to 255.
- **arp-priority-watermark**
  - Specifies the ARP’s priority level watermark value. Must be an integer from 1 to 15.

Usage

This command configures qci and arp in the apn-profile for NTSR. The S-GW will decide to retain or release the bearer based on the configured qci/arp, after path failure is detected on ingress side of S-GW. The S-GW can configure a maximum of 2 qci and arp-priority-watermark per apn-profile. The apn-profile can also be configured to retain all bearers from that PDN.

Example

This example configures the apn-profile to retain all bearers from the PDN.
ntsr all
overcharge-protection

Enables overcharge protection for APNs controlled by this APN profile. Each overcharging protection option is a standalone configuration and it does not override the previous option set, if any.

Product
- S-GW
- P-GW

Privilege
- Security Administrator, Administrator

Mode
- Exec > Global Configuration > APN Profile Configuration
  ```
  configure > apn-profile profile_name
  ```

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

Syntax

```
overcharge-protection { abnormal-s1-release | ddn-failure | drop-limit drop_limit_value { packets | bytes } }

[ remove ] overcharge-protection { abnormal-s1-release | ddn-failure | drop-limit }

remove
Removes the specified configuration.

abnormal-s1-release
(for future use) If overcharging protection is enabled for abnormal-s1-release, S-GW would send MBR to pause charging at P-GW if Abnormal Release of Radio Link signal occurs from MME.

```

| Important: Though the command is available in this release, this scenario is not possible. |

```

| ddn-failure |
If overcharging protection is enabled for ddn-failure message, MBR would be sent to P-GW to pause charging upon receiving DDN failure from MME/S4-SGSN.

```

| drop-limit drop_limit_value { packets | bytes } |
Send MBR to pause charging at P-GW if specified number of packets/bytes is dropped for a PDN connection.

```

- **packets**: Configures drop-limit in packets.
- **bytes**: Configures drop-limit in bytes.
Usage

Use this command to specify P-GW to pause charging on abnormal-s1-release, DDN failure notification, or if the number of packets or bytes dropped exceeds the configured limit.

Example

Use the following command to signal P-GW to pause charging when the number of packets dropped exceeds 1000:

```
overcharge-protection drop-limit 1000 packets
```
**pdp-data-inactivity**

Configures the APN profile regarding PDP data inactivity. This command is specific to the SGSN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > APN Profile Configuration

```bash
configure > apn-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```bash
pdp-data-inactivity { action { deactivate [ all-pdp | linked-pdp ] | detach-when { all-pdp-inactive | any-pdp-inactive } } | timeout minutes minutes }

default pdp-data-inactivity { action | timeout }

no pdp-data-inactivity timeout
```

---

**default**

Resets the APN Profile configuration to the default values for PDP data-inactivity.

---

**no**

Disables the timeout feature of the PDP data-inactivity configuration for this APN profile.

---

**action**

Defines the action to be taken if PDP data-inactivity occurs:

- **deactivate** - defines which PDP context should be deactivated:
  - `all-pdp` - deactivates all PDP contexts.
  - `linked-pdp` - deactivates only linked PDP contexts.

- **detach-when** - defines the condition that warrants a detach:
  - `all-pdp-inactive` - detach when all PDP contexts are inactive.
  - `any-pdp-inactive` - detach when any PDP context is inactive.

---

**timeout minutes minutes**

Specifies the inactivity timeout in minutes. `minutes` is an integer from 1 through 1440. Note that even though the timeout is set for minutes, the configuration displays in seconds.
Usage

Use this command to define how the SGSN will handle a situation where the PDP is not fully active. Repeat the command, as needed, to configure more than one keyword-controlled function.

Example

Use the following command to have the SGSN deactivate all PDP contexts associated with the APN when it detects the PDP is inactive:

```
pdp-data-inactivity action deactivate all-pdp
```

Use the following command to have the SGSN wait 2 minutes after detecting PDP data inactivity:

```
pdp-data-inactivity timeout minutes 2
```
pdp-type-ipv4v6-override

Configure the PDP type to use, per APN, if dual PDP type addressing is not supported by the network and the MS/UE requests the IPv4v6 PDP type.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > APN Profile Configuration

```
configure > apn-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```
pdp-type-ipv4v6-override { ipv4 | ipv6 }
```

```
remove pdp-type-ipv4v6-override
```

**remove**
Deletes the override configuration and reverts to the default behavior so the SGSN ignores the IPv4v6 request and sends IPv4 to the GGSN.

```ipv4```

Configures IPv4 as the PDP type to send towards the GGSN when overriding the dual PDP type addressing requested by the MS/UE.

```ipv6```

Configures IPv6 as the PDP type to send towards the GGSN when overriding the dual PDP type addressing requested by the MS/UE.

**Usage**
This command configures the SGSN to send either IPv4 or IPv6 towards the GGSN when the MS/UE requests PDP type as IPv4v6 but either the SGSN or the RNC is not configured to support dual PDP type.

**Example**
Use this command to configure the SGSN to always send IPv6, for the PDP type, to the GGSN when overriding a dual PDP type address request from the MS/UE:

```
pdp-type-ipv4v6-override ipv6
```
pgw-address

Configures the IPv4 or IPv6 address of the P-GW supporting the APN associated with this APN profile.

Product
ePDG
MME
SGSN

Privilege
Administrator

Mode
Exec > Global Configuration > APN Profile Configuration
configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

pgw-address ip_address [s5-s8-protocol pmip] [primary | secondary]

no pgw-address ip_address

no

Disables the P-GW address configured in this APN profile.

ip_address

Specifies the IP address for the P-GW in IPv4 dotted-decimal or IPv6 colon-separated notation.

s5-s8-protocol pmip

MME only. Configures the S5-S8 protocol for the gateway.

weight weight

Specifies the weight (preference) assigned to the addressed P-GW for load balancing. weight is an integer from 1 through 100 where 1 is the least preferred and 100 is the most preferred. If no weight is specified, the P-GW address is assigned a default weight of 1. If a weight is assigned to an address, the weights of the P-GW(s) (that are operational) are totaled, and then a weighted round-robin selection is used to distribute new primary PDP contexts (for MME) or primary CPC requests (for SGSN) or new PDN connections (for ePDG) among the P-GW(s) according to their weights. As with all weighted round-robin algorithms, the distribution does not look at the current distribution, but simply uses the weights to distribute new requests. For example, two P-GWs assigned weights of 70 and 30 would distribute 70% of calls to one, and 30% to the other. The sum of all weights do not need to total 100.

Usage

Use this command to define load balancing to be applied during P-GW selection. A maximum of 16 P-GW addresses can be configured for this APN profile.
On the S4-SGSN, use this command to configure a local P-GW address for operators wishing to bypass DNS resolution of APN FQDN.

**Example**

The following command configures the P-GW IP address for this APN profile as `10.2.3.4`:

```
pgw-address 10.2.3.4
```
qos allow-upgrade

Configure this command to allow upgrade of QoS from GGSN. The “Upgrade QoS Supported” flag is now set in “Create PDP Context” and “Update PDP Context” messages sent by SGSN. The SGSN signals the availability of this functionality by use of the “Upgrade QoS Supported” bit within the Common Flags IE. The SGSN sets the “Upgrade QoS Supported” bit within the Common Flags IE to “1” within the “Create PDP Context” and “Update PDP Context” procedures.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > APN Profile Configuration
configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

qos allow-upgrade access-type { gprs | umts } [ prefer-as-cap-subscription ]
remove qos allow-upgrade access-type { gprs | umts }

remove
Removes the support for QoS upgrade from the configuration for this APN profile.

access-type { gprs | umts }
Allows the operator to choose the access type as either “gprs” or “umts” based on whether it is 2G or 3G network scenario.

prefer-as-cap-subscription
Enable this optional keyword to configure capping of QoS with Subscribed QoS (local/HLR). If this keyword is enabled, SGSN accepts a higher QoS in the Create/Update PDP Context Response than sent in Create/Update PDP Context Request, but negotiates and restricts the value within HLR/local subscribed QoS. If this keyword is disabled, the SGSN accepts the QoS in Create PDP Context Response and Update PDP Context Response as the Negotiated QoS (this QoS may be downgraded by the RNC in case of UMTS access).

Usage
This command enables the QoS upgrade support feature. On configuring this command, the SGSN sets the “Upgrade QoS Supported” flag within the common flags IE in Tunnel management messages, Create PDP Context Request and Update PDP Context Request messages. The SGSN accepts the QoS from GGSN in Create PDP Context Response, Update PDP Context Request/Response messages as the Negotiated QoS for the PDP session.

Example

Command Line Interface Reference, StarOS Release 17
Use the following command to configure QoS upgrade support in a UMTS scenario:

```bash
cmd allow-upgrade access-type umts prefer-as-cap-subscription
```
**qos apn-ambr**

Configures the APN-AMBR (aggregate maximum bit rate) that will be stored in the Home Subscriber Server (HSS).

**Product**
- MME
- SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > APN Profile Configuration
`configure > apn-profile profile_name`

Entering the above command sequence results in the following prompt:
```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```
qos apn-ambr max-ul mbr-up max-dl mbr-dwn
remove qos apn-ambr
```

**remove qos apn-ambr**

Removes the APN-AMBR changes from the configuration for this APN profile.

```
max-ul mbr-up max-dl mbr-dwn
```

Defines the maximum bit rates for uplink (subscriber to network) and downlink (network to subscriber) traffic.
- `mbr-up` is an integer from 0 through 1410065408.
- `mbr-dwn` is an integer from 0 through 1410065408.

**Usage**

Use this command to define the MBR that will be enforced by the GGSN or P-GW for both uplink and downlink traffic shaping.

**Example**
```
qos apn-ambr max-ul 24234222 max-dl 23423423
```
qos class

Configures local values for the traffic class (TC) parameters for the quality of service (QoS) configured for this APN profile.

**Important:** To enable any of the values/features configured with this command, the `qos prefer-as-cap` configuration (also in the APN profile configuration mode) must be set to either `local` or `both-hlr-and-local`.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > APN Profile Configuration

```
configure > apn-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```
qos class { background | conversational | interactive | streaming } [ qualif_option ]
```

```
remove qos class { background | conversational | interactive | streaming } [ qualif_option ]
```

- **remove**
  
  Removes previously defined values for the specified option or for an entire class if a qualifying option is not included in the command.

- **background**
  
  Selects the background traffic class. This ‘best-effort’ class manages traffic that is handled as a background function, like email, where time to delivery is not a key factor. The selection of background traffic class can be refined with the addition of one of the following qualifying options:

  - `all-values`
  - `arp`
  - `mbr-down`
  - `mbr-map-down`
  - `mbr-map-up`
  - `mbr-up`
  - `residual-bit-error-rate`
  - `sdu`
All qualifying options are explained below.

**conversational**

Selects the ‘real-time’ conversational traffic class of service, which has the most stringent time requirements of the four classes and is typically reserved for voice traffic. The section of the conversational traffic class can be refined with the addition of one of the following qualifying options:

- `all-values`
- `arp`
- `gbr-down`
- `gbr-up`
- `mbr-down`
- `mbr-map-down`
- `mbr-map-up`
- `mbr-up`
- `min-transfer-delay`
- `residual-bit-error-rate`
- `sdu`

All qualifying options are explained below.

**interactive**

Selects interactive traffic class of service. This class is characterized by a request/response pattern (someone sends data and then waits for a response) which requires the preservation of the data but delivers on a ‘best-effort’ model. The section of the interactive traffic class can be refined with the addition of one of the following qualifying options:

- `all-values`
- `arp`
- `mbr-down`
- `mbr-map-down`
- `mbr-map-up`
- `mbr-up`
- `residual-bit-error-rate`
- `sdu`
- `thp`

All qualifying options are explained below.
streaming

Selects the streaming traffic class of service, which handles one-way, real-time data transmission - such as streaming video or audio. The section of the interactive traffic class can be refined with the addition of one of the following qualifying options:

- all-values
- arp
- gbr-down
- gbr-up
- mbr-down
- mbr-map-down
- mbr-map-up
- mbr-up
- min-transfer-delay
- residual-bit-error-rate
- sdu

All qualifying options are explained below.

qualif_option

Qualifying options are the QoS parameters and they include:

- all-values - This option will change the configuration to predefined values for all the relevant QoS parameters for the class. This keyword is not used if other options are to be defined. The predefined values are:

1. Predefined QoS Parameters

**QoS Parameter** | **Predefined Value**
---|---
SDU Error Ratio | 7 \((1 \cdot 10^{-3})\)
Residual Bit Error Rate | 1 \((5 \cdot 10^{-2})\)

- **arp** - Sets the allocation/retention priority. Enter an integer from 1 to 3.
- **gbr-down** - Guaranteed Kbps rate for the downlink direction. Enter an integer from the range 1 to 256000.
- **gbr-up** - Guaranteed Kbps rate for the uplink direction. Enter an integer from 1 to 256000.
- **mbr-down** - Maximum Kbps rate for the downlink direction. Enter an integer from the range 1 to 256000.
- **mbr-map-down from from_kbps to to_kbps** - Map received HLR MBR (from value) to a locally configured downlink MBR value (to value):
  - **from_kbps** - Enter an integer from 1 to 25600.
  - **to_kbps** - Enter an integer from 1 to 25600.
- **mbr-map-up from from_kbps to to_kbps** - Map received HLR MBR (from value) to a locally configured uplink MBR value (to value):
  - **from_kbps** - Enter an integer from 1 to 25600.
  - **to_kbps** - Enter an integer from 1 to 25600.
- **mbr-up** - Maximum Kbps rate for the uplink direction. Enter an integer from 1 to 256000.
- **min-transfer-delay** - Minimum transfer delay in milliseconds. Enter an integer from 80 to 4000.
- **residual-bit-error-rate** -
  - Background TC residual-bit-error-rate range is from \(4 \cdot 10^{-4}\) to \(6 \cdot 10^{-8}\). Enter on of the following integers, where:
    - 4: represents \(4 \cdot 10^{-3}\)
    - 7: represents \(10^{-5}\)
    - 9: represents \(6 \cdot 10^{-8}\)
  - Conversational TC residual-bit-error-rate range is from \(5 \cdot 10^{-2}\) to \(10^{-6}\). Enter one of the following integers, where:
    - 1: represents \(5 \cdot 10^{-2}\)
    - 2: represents \(10^{-2}\)
    - 3: represents \(5 \cdot 10^{-3}\)
    - 5: represents \(10^{-3}\)
    - 6: represents \(10^{-4}\)
    - 7: represents \(10^{-5}\)
    - 8: represents \(10^{-6}\)
  - Interactive TC residual-bit-error-rate range is from \(4 \cdot 10^{-4}\) to \(6 \cdot 10^{-8}\). Enter one of the following integers, where:
• 4: represents $4 \times 10^{-3}$
• 7: represents $10^{-5}$
• 9: represents $6 \times 10^{-8}$

• Streaming TC residual-bit-error-rate range is from $5 \times 10^{-2}$ to $10^{-6}$. Enter one of the following integers, where:
  • 1: represents $5 \times 10^{-2}$
  • 2: represents $10^{-2}$
  • 3: represents $5 \times 10^{-3}$
  • 5: represents $10^{-3}$
  • 6: represents $10^{-4}$
  • 7: represents $10^{-5}$
  • 8: represents $10^{-6}$

• **sdu** - Signalling data unit keyword, must include one of the following options:
  • **delivery-order** - Enter one of the two following options:
    • **no** - Without delivery order
    • **yes** - With delivery order
  • **erroneous** - Enter one of the two following options:
    • **no** - Erroneous SDUs will not be delivered
    • **no-detect** - Erroneous SDUs are not detected ('-')
    • **yes** - Erroneous SDUs will be delivered
  • **error-ratio** - The SDU error-ratio range is from $10^{-3}$ to $10^{-6}$. Enter an integer from 1 to 6, where:
    • 3 - Represents $10^{-3}$
    • 4 - Represents $10^{-4}$
    • 6 - Represents $10^{-6}$

• **max-size** - Defines the maximum number of octets (size) of the SDU. Enter an integer from 10 to 1502.

• **thp** - Sets the traffic handling priority. Enter an integer from 1 to 3.

**Usage**

This command defines the qualifying options (parameters) for each QoS traffic class defined for this APN profile.

**Important:** Typically this command is only used to define QoS parameters when the APN record does not exist in the subscription record.
Repeat the command as often as needed with different options to define all required QoS criteria. For example, to configure the maximum bit rate (MBR) for the downlink and uplink directions for a traffic class, this command must be used twice, specifying `mbr-down` once and `mbr-up` once.

Advantage for local mapping of MBR: some HLRs cannot be configured with high MBR values. Using the `mbr-map-up` and the `mbr-map-down` parameters allows the SGSN to be configured to treat a specific HLR value as meaning the desired high MBR value. In a case where the HLR does not support HSPA+ bit rates, but the handsets and network do, this feature allows the operator to overcome limitations on the HLR and provide HSPA+ bit rates by overwriting the provisioned HLR-QoS MBR values with SGSN-configured values. When MBR mapping is configured, if QoS is preferred as the HLR value, then the subscription QoS MBR received from the HLR is compared with the "from" value in the table. If it matches, then it is converted to the value specified by the "to" value in the table. QoS negotiation happens based on the converted value.

Advantage for QoS capping with THP and ARP: Controlling THP and ARP via Operator Policy: This functionality can differentiate home vs. roaming subscribers, and prevent visiting subscribers from receiving a high-tiered service. For example, a service provider could offer service differentiation using Ultra/Super/Standard service levels based upon QoS; this could justify charging a corporate customer more to use the Internet APN than would be charged to a consumer. This could be accomplished by controlling the traffic handling priority (THP) over the air interface, i.e. THP 1 = Ultra, THP 2 = Super and THP 3 = Standard.

Example

Use the following command to configure the entire conversational traffic class with predefined QoS options:

```
qos class conversational all-values
```

Now change the background class ARP from 3 to 2:

```
qos class background arp 2
```

Invalidate the THP parameter, by removing all value from the parameter, for the interactive class:

```
remove qos class interactive thp
```
**qos dedicated-bearer**

Configures the quality of service maximum bit rate (MBR) parameters for the dedicated bearer. This command is specific to the MME.

**Product**

MME

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > APN Profile Configuration

```bash
configure > apn-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```bash
qos dedicated-bearer mbr max-ul mbr-up max-dl mbr-dl
```

**remove qos dedicated-bearer**

```bash
remove
```

Removes the dedicated bearer maximum bit rate (MBR) changes from the configuration for this APN profile.

```bash
max-ul mbr-up max-dl mbr-dl
```

Defines the maximum bit rates for uplink and downlink traffic.

- `mbr-up` is an integer from 0 through 1410065408.
- `mbr-dl` is an integer from 0 through 1410065408.

**Usage**

Use this command to define the MBRs that will be enforced by the P-GW for both uplink and downlink traffic shaping.

**Example**

```bash
qos dedicated-bearer mbr max-ul 24234222 max-dl 23423423
```
qos default-bearer

Configures the quality of service parameters for the default bearer. This command is specific to the MME.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > APN Profile Configuration

configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

**Syntax**

```
qos default-bearer { arp arp_value [ preemption-capability { may | shall-not } | vulnerability { not-preemptable | preemptable } ] | qci qci }
```

```
remove qos default-bearer { arp | qci }
```

**Usage**
Use this command to set the QoS APR and QCI parameters for the default bearer configuration.

**Example**

Remove the default bearer QoS configuration from this APN profile.

```
arp 15
```

Defines the address retention priority value. *arp_value* is an integer from 1 through 15.

```
preemption-capability { may | shall-not }
```

Specifies the preemption capability flag. Options are:
- **may**: Bearer may be preempted
- **shall-not**: Bearer shall not be preempted

```
vulnerability { not-preemptable | preemptable }
```

Specifies the vulnerability flag. Options are:
- **not-preemptable**: Bearer cannot be preempted.
- **preemptable**: Bearer can be preempted.

```
qci 1
```

Specifies the QoS Class Identifier for the default bearer profile. *qci* is an integer from 0 through 255.
qos default-bearer arp 2 preemption-capability may
qos pgw-upgrade

Configures the action to be taken when the MME receives a QoS upgrade from P-GW for default bearers/Non-Guaranteed Bit Rate (Non-GBR) bearers.

Product
MME

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > APN Profile Configuration

configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

qos pgw-upgrade non-gbr { accept | reject | locally-cap }

[ remove ] qos pgw-upgrade non-gbr

remove

Removes the configuration, returning the system to the default setting where the MME accepts the P-GW upgraded QoS values for Non-GBR (default) bearers.

non-gbr { accept | reject | locally-cap }

For Non-GBR (default) bearers, this keyword configures the action the MME takes when it receives a P-GW upgraded QoS value.

• accept: The MME will accept the P-GW upgraded QoS values.
• reject: The MME will reject the P-GW upgraded QoS values.
• locally-cap: The MME compares QCI, ARP and ARP-PVI provided by P-GW to the locally configured values of those parameters. If the values match, then accepts towards the P-GW and use locally configured values towards the UE/RAN for APN-AMBR and ARP-PCI. If the values do not match, the MME rejects the P-GW upgraded QoS values.

Usage

Use this command to provide configurability at the APN Profile level for the MME to accept, reject, or locally-cap P-GW upgraded QoS values for default (non-GBR) bearers. This S11 Control is applied whenever QoS parameters are received on S11 interface. The relevant procedures for default bearers are Create Session Response (sent by P-GW during Attach, UE requested PDN connectivity) and Update Bearer Procedures (initiated by P-GW resulting from trigger QoS change or other in PCEF/PCRF, or from Modify Bearer Command or Bearer Resource Command sent by MME). Note: This configuration is supported only for Default bearers (i.e Non-GBR bearers) in a roaming scenario.

The MME will set the sum of the APN-AMBR of all active APNs up to the value of the subscribed UE-AMBR, subject to the UE-AMBR restriction.
In the case of an Attach Reject or PDN Connectivity Reject, the ESM failure cause “Operator determined barring” is used and the corresponding MME schema bulk statistic is incremented.
In the case of Update Bearer Request Reject, the EGTP cause “Request rejected” is used and the corresponding EGTP bulk statistic is incremented.
A session disconnect reason mme-qos-pgw-upgrade-reject(589) is incremented when QoS upgrade by P-GW is rejected by the MME during initial attach. The corresponding session disconnect reason statistics are incremented.
Refer to the dedicated-bearers command to configure QoS controls for dedicated bearers (GBR and Non-GBR).

Example

The following command configures the MME to reject the QOS upgrade from P-GW for non-GBR bearers:

```
qos pgw-upgrade non-gbr reject
```
qos prefer-as-cap

Specifies operational preferences for QoS parameters, specifically QoS bit rates. This command is specific to the SGSN in releases prior to 14.0.

Product
MME
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > APN Profile Configuration

configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

qos prefer-as-cap { both-hlr-and-local | both-hss-and-local { local-when-subscription-not-available | minimum | subscription-exceed-reject } | hlr-subscription | local }

remove qos prefer-as-cap

Important: Command and keyword names have changed. prefer has become prefer-as-cap and hlr has become hlr-subscription. These changes will not impact configuration generated with earlier releases as the keywords are aliases for the previous names.

remove

Removes previous configuration changes and resets the default.

both-hlr-and-local

Instructs the SGSN to use, as the capping value during session establishment, the lower of either the locally configured QoS bit rate or the Home Location Register (HLR) subscription.

both-hss-and-local { local-when-subscription-not-available | minimum | subscription-exceed-reject }

For the MME only, specifies the QoS cap value to use.

• local-when-subscription-not-available: Use the locally configured values if the Home Subscriber Server (HSS) does not provide any values.

• minimum: Use the lower of either the locally configured QoS bit rate or the HSS-provided QoS bit rate.

• subscription-exceed-reject: If the requested QoS bit rate exceeds the locally configured value, reject the PDN connection.
**hlr-subscription**

Instructs the SGSN to take the QoS bit rates from the HLR configuration and use the HLR rate as the capping value for session establishment.

Default for SGSN.

**local**

Instructs the SGSN to take the QoS bit rate from the local configuration and use it for session establishment.

**Usage**

Use this command to instruct the SGSN or MME to take QoS configuration as the bit rate for session establishment.

The MME has no default setting for this command.

**Example**

The following command specifies use of the bit rate in subscription at the HLR:

```
qos prefer-as-cap hlr-subscription
```

The following command instructs the SGSN to cap the bit rate with the lower rate of the two configurations, HLR or local:

```
qos prefer-as-cap both-hlr-and-local
```
**qos rate-limit direction**

Configures the actions governing the subscriber traffic flow, if the flow violates or exceeds the configured or negotiated peak or committed data-rates.

This command can be entered multiple times to specify different combinations of traffic direction and class. The SGSN only performs traffic policing if **qos rate-limit direction** is configured.

Additional information on the QoS traffic policing functionality is located in the *System Administration Guide*.

**Product**

SGSN  
S-GW  
SAEGW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > APN Profile Configuration  
`configure > apn-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```
qos rate-limit direction { downlink | uplink } [ burst-size { auto-readjust [ duration seconds ] | bytes } ] [ class { background | conversational | interactive traffic_priority | streaming } ] [ exceed-action { drop | lower-ip-precedence | transmit } ] [ gbr-qci [ committed-auto-readjust duration seconds ] ] [ non-gbr-qci [ committed-auto-readjust duration seconds ] ] [ violate-action { drop | lower-ip-precedence | transmit } ] +
```

```
remove qos rate-limit direction { downlink | uplink } [ class { background | conversational | interactive traffic_priority | streaming } ]
```

**Syntax**

```
remove
```

Removes the qos rate-limit direction entries from the configuration.

```
downlink | uplink
```

Apply the limits and actions configured with the other keywords to the selected link:

**downlink** - This is the direction from the GGSN or P-GW to the MS.  
**uplink** - This is the direction from the MS to the GGSN or the P-GW.

```
burst-size { auto-readjust [ duration seconds ] | bytes }
```

Default: See the table of class default values in the *Usage* section below.  
This keyword specifies the peak burst size allowed. System measurements for this value exclude the GTP and outer packet headers. Supported options include:

**auto-readjust**: This keyword enables dynamic burst-size calculation using negotiated peak data-rate and negotiated committed data-rate.
• **duration seconds**: Must be an integer from 1 to 30; default is 1. This keyword sets the number of seconds that the dynamic burst-size calculation will last. This allows the traffic to be throttled at the negotiated rates.

• **bytes**: Must be an integer from 1 to 6000000. This value specifies the static burst size for traffic policing. This option is present for backward compatibility.

---

**Important**: Use of dynamic burst size (**auto-readjust**) for traffic policing is recommended, rather than the static burst size.

```
class { background | conversational | interactive traffic_priority | streaming }
```

The `class` keyword configures the specified traffic policing actions per traffic class, or per traffic priority in the case of interactive traffic class. The following classes are supported:

• **background**: Specifies the traffic action for traffic patterns in which the data transfer is not time-critical (for example, email exchanges).

• **conversational**: Specifies the traffic policing action for traffic patterns in which there is a constant flow of packets in each direction, upstream and downstream.

• **interactive traffic_priority**: Specifies the traffic policing action for traffic patterns in which there is an intermittent flow of packets in each direction, upstream and downstream.

  `traffic_priority` is the 3GPP traffic handling priority and can be an integer 1,2 or 3.

• **streaming**: Specifies the traffic policing action for traffic patterns in which there is a constant flow of data in one direction, either upstream or downstream.

---

**Important**: This is an SGSN-specific feature. If this keyword is omitted, the same values are used for all classes.

```
exceed-action { drop | lower-ip-precedence | transmit }
```

Default: See the table of class default values in the Usage section below.

The action to take on the packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:

• **drop**: Drop the packet

• **lower-ip-precedence**: Transmit the packet after lowering the ip-precedence

• **transmit**: Transmit the packet

```
gbr-qci [ committed-auto-readjust duration seconds ]
```

Applies the traffic policing policy to guaranteed bitrate bearers.

`committed-auto-readjust duration seconds`: Must be an integer from 1 to 30. This keyword sets the number of seconds that the committed burst-size calculation will last. This allows the traffic to be throttled to the negotiated rates.

---

**Important**: This is an S-GW-specific feature.

```
non-gbr-qci [ committed-auto-readjust duration seconds ]
```

Applies the traffic policing policy to non-guaranteed bitrate bearers.
committed-auto-readjust duration seconds: Must be an integer from 1 to 30. This keyword sets the number of seconds that the committed burst-size calculation will last. This allows the traffic to be throttled to the negotiated rates.

**Important:** This is an S-GW-specific feature.

violate-action { drop | lower-ip-precedence | transmit }

Default: See the table of class default values in the Usage section below. The action to take on the packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:

- *drop*: Drops the packet
- *lower-ip-precedence*: Transmits the packet after lowering the IP precedence
- *transmit*: Transmits the packet

+ This symbol indicates that the keywords can be entered multiple times within a single command.

**Usage**

This command configures the APN’s quality of service (QoS) traffic policing. Configured actions prevent subscriber flow exceeding or violating configured peak or negotiated peak or committed data rate limits.

**Important:** If either *exceed action* or *violate action* is set to *lower-ip-precedence*, this command may override the configuration of the ip qos-dscp command in the APN profile.

</table>

**Example**

The following command lowers the IP precedence when the committed-data-rate and the peak-data-rate are violated in uplink direction:

```
qos rate-limit direction uplink violate-action lower-ip-precedence
```

The following command drops the excess user packets when the subscriber traffic violates both the configured peak and the committed data-rate in the uplink direction. Once either the peak or the committed data-rate for that subscriber goes below the configured/negotiated limit, it transmits them.

```
qos rate-limit direction uplink exceed-action drop
```
**ranap allocation-retention-priority-ie**

Configures the allocation/retention priority (ARP) IE for this APN profile. This command is specific to the SGSN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > APN Profile Configuration

```
configure > apn-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```
ranap allocation-retention-priority-ie subscription-priority priority class { { background | conversational | interactive | streaming } { not-pre-emptable | priority | queuing-not-allowed | shall-not-trigger-pre-emptable } + }
```

**Important:** All parameters not specifically configured will be included in the configuration with default values.

```
[ default | remove | no ] ranap allocation-retention-priority-ie [ subscription-priority priority class { background | conversational | interactive | streaming } ]
```

- **default**
  
  Resets the configuration to the default values.

- **no**
  
  Disables the specified configuration

- **remove**
  
  Removes the specified configuration.

- **subscription-priority priority**
  
  This keyword sets the subscription priority. The lowest number has the highest priority.  
  `priority` must be an integer from 1 to 3.

- **class**
  
  Configure allocation/retention priority (ARP) for specific QoS traffic classes. Include one or more of the following class options:
  - **background**: background class of service
  - **conversational**: conversational class of service
  - **interactive**: interactive class of service
• **streaming**: streaming class of service

Default values will be included in the configuration for any class configuration not specified.

---

**qualifying options**

For each of the class options, the configuration must include one or more of the following qualifying options:

- **not-pre-emptable**
- **priority**: smallest number is the highest priority. Value must be an integer from 1 to 15
- **queuing-not-allowed**
- **shall-not-trigger-pre-emptable**

When entering more than one option, we recommend that you do it in the order in which they are listed.

---

**Usage**

Use this command to configure values for the allocation/retention priority (ARP) IE in the radio access bearer (RAB) assignment request message for RANAP that occurs during RAB setup.

This command can be used multiple times to define multiple priorities, with different combinations of `subscription-priority` and `class`.

If the HLR returns a matching value for the subscribed ARP for the desired traffic class, the SGSN includes the configured qualifying options for the ARP IE in the RANAP message.

If there is no matching configuration, the SGSN includes the following default values for the traffic class within the ARP IE:

---

**Table 18. Default ARP Values**

<table>
<thead>
<tr>
<th>Subscribed ARP</th>

<tr>
<td>2</td>
<td></td>
<td>5</td>
<td>0 (shall-not-trigger-pre-emption)</td>
<td>1 (pre-emptable)</td>
<td>queuing-not-allowed</td>
</tr>
<tr>
<td>3</td>
<td></td>
<td>6</td>
<td>0 (shall-not-trigger-pre-emption)</td>
<td>1 (pre-emptable)</td>
<td>queuing-not-allowed</td>
</tr>
<tr>
<td>1</td>
<td>Interactive THP2</td>
<td>7</td>
<td>0 (shall-not-trigger-pre-emption)</td>
<td>1 (pre-emptable)</td>
<td>queuing-not-allowed</td>
</tr>
</tbody>
</table>
### Example

The following series of commands define the highest priority for conversational traffic class with priority level 1-10 (Subscribed priority 0-3), PCI of shall-not-trigger-pre-emption, PVI of not-pre-emptable with queuing-not-allowed:

```
ranap allocation-retention-priority-ie subscription-priority 0 priority level 1 priority class conversational not-pre-emptable priority 1 shall-not-trigger-pre-emption
ranap allocation-retention-priority-ie subscription-priority 1 priority level 1 priority class conversational not-pre-emptable priority 4 shall-not-trigger-pre-emptable
ranap allocation-retention-priority-ie subscription-priority 2 priority level 1 priority class conversational not-pre-emptable priority 7 shall-not-trigger-pre-emptable
ranap allocation-retention-priority-ie subscription-priority 3 priority level 1 priority class conversational not-pre-emptable priority 10 shall-not-trigger-pre-emptable
```
restrict access-type

Configures the activation restrictions of PDP context on the basis of the access type and QoS class.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > APN Profile Configuration

```
configure > apn-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```
[ no ] restrict access-type { eps | { { gprs | umts } [ qos-class { background | conversational | interactive | streaming } ] } }
```

```
default restrict access-type {gprs | umts }
```

---

**no**
Remove the restriction rules for PDP context activation configured in this APN profile.

---

**default**
Resets the restriction rules for PDP context activation to the default values to allow all access types and with QoS class for GPRS and UMTS.

---

**gprs**
Configures the APN profile to restrict the PDP context activation from General Packet Radio Service (2.5G) network access.

---

**umts**
Configures the APN profile to restrict the PDP context activation from Universal Mobile Telecommunications Systems (3G) network access.

---

**qos-class**
Configures the APN profile to restrict the PDP context activation to a specific QoS traffic class. It is optional and can be configured after selecting the network access type. Possible traffic classes options are:

- **background**: Specifies the QoS class as background service session
- **conversational**: Specifies the QoS class as conversational service session
- **interactive**: Specifies the QoS class as interactive service session
- **streaming**: Specifies the QoS class as streaming service session
Usage

Use this command to configure the restriction rules in an APN profile for activation of PDP context on the basis of the access type. It also provides the facility to restrict type of traffic QoS class.

Example

The following command configures the APN profile to restrict all traffic from a GPRS network service having a QoS class of interactive:

```
restrict access-type grps qos-class interactive
```
sm t3396

The **sm** command includes a new keyword to set the SM T3396 back-off timer for an APN Profile.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > APN Profile Configuration

```
configure > apn-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```
sm t3396 min minimum_minutes max maximum_minutes cause code
```

```
remove sm t3396
```

---

**remove**

Including this filter with the command removes the SM back-off timer definition from the APN Profile configuration.

**min minimum**

Enter an integer from 1 to 15 to identify the minimum number of minutes the timer should run; default is 15 minutes.

**max maximum_minutes**

Enter an integer from 1 to 30 to identify the maximum number of minutes the timer should run; default is 30 minutes.

**cause code**

Enter an integer from 1 to 255 to identify the appropriate rejection cause code. The default is 26. During congestion, the configured value is ignored and 26 is sent.

**Usage**

- Under congestion, the SGSN can assign the T3396 back-off timers to the UEs and request the UEs not to access the network for a given (timer value) period of time.
- If a message is rejected due to congestion, then the T3396 value will be included in the reject message with cause code 26. The SM back-off timer value sent will be chosen randomly from within the configured T3396 timer value range.
- If T3396 timer value is configured in an APN Profile then it will override the back-off timer values defined for either the SGSN Service or GPRS Service configurations.
Example

Use a command similar to the following to define a T3396 with a timeout range of 2 to 15 minutes.

`sm t3396 min 2 max 15`
timeout bearer-inactivity

Supports a bearer inactivity timeout for GBR and non-GBR S-GW bearer type sessions.

**Product**
- S-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > APN Profile Configuration
`configure > apn-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```
[ remove ] timeout bearer-inactivity [ gbr | non-gbr ] dur_seconds volume-threshold
{ total bytes | uplink bytes | downlink bytes } | exclude-default-bearer
```

- **remove**
  Removes the timeout bearer-inactivity setting.

- **timeout**
  Specifies that a session time out value will be configured for this APN profile.

- **bearer-inactivity**
  Specifies that a session time out value will be configured for this APN profile.

- **gbr dur_seconds**
  Specifies that the system will check for low activity on a GBR bearer. `dur_seconds` specifies the bearer inactivity timer in seconds. Valid entries are from 900 to 2592000 seconds (15 minutes to 720 hours).

- **non-gbr dur_seconds**
  Specifies that the system will check for low activity on a non-GBR bearer. `dur_seconds` specifies the bearer inactivity timer in seconds. Valid entries are from 900 to 2592000 seconds (15 minutes to 720 hours).

- **volume-threshold**
  Specifies that a threshold value of the data traffic for a bearer will be used for the inactivity timeout value.

- **total bytes**
  Specifies that the total of both uplink and downlink data will be used as a volume threshold. `bytes` must be a value from 1 to 4294967295.
timeout bearer-inactivity

uplinkbytes
Specifies that an uplink data volume threshold will be used. bytes must be a value from 1 to 4294967295.

downlinkbytes
Specifies that a downlink data volume threshold will be used. bytes must be a value from 1 to 4294967295.

exclude-default-bearer
Specifies that inactivity handling for the default bearer will be excluded.

Usage
Use this command to support a bearer inactivity timeout for GBR and non-GBR S-GW bearer type sessions per Qos Class Identifier (QCI). This enables the deletion of bearers experiencing less data traffic than the configured threshold value. This allows for more efficient use of system resources. This feature is supported only for Pure S calls on the SAE-GW.

Example
The following example configures a 5 minute dedicated bearer timeout setting for GBR bearers on a downlink volume threshold of 100000 bytes.

    timeout bearer-inactivity gbr 300 downlink 100000
**twan**

Configures the APN profile with the default gateway address and mask to be sent in the DHCP offer and PBA messages. This command is specific to SaMOG.

**Product**
SaMOG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > APN Profile Configuration  
configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-profile-profile_name)#
```

**Syntax**

```
[ no ] twan default-gateway ipv4/ipv6_address/mask
```

**Usage**

Use this command to configure the APN profile with the default gateway address and mask to be sent in the DHCP offer and PBA messages. This configuration is required for GTPv1 support only. For 3G subscribers, if the configured default gateway is unavailable, or does not match with the subnet of the allocated IP from P-GW or GGSN, the call will be dropped.  
A maximum of 16 IP addresses and subnet masks can be configured (in separate lines) for each APN profile.

**Example**

The following command configures the APN profile with the default gateway address and mask of 194.122.12.20/12:

```
twan default-gateway 194.122.12.20/12
```
virtual-mac

Configures the virtual MAC address for this APN profile to use as the default gateway’s MAC address for the user equipment (UE). This command is specific to SaMOG.

Product
SaMOG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > APN Profile Configuration
configure > apn-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-profile-profile_name)#

Syntax

[ no ] virtual-mac mac_address

no

Removes the virtual MAC configuration from this APN profile.

mac_address

Specifies the media-specific access control layer address. mac_address must be specified as a 6-byte hexadecimal number with each byte separated by a colon or hyphen, for example, “AA:12:bb:34:f5:0E” or “AA-12-bb-34-f5-0E”.

Usage

Use this command to configure the virtual MAC address for this APN profile to use as the default gateway’s MAC address for the user equipment (UE).

By default, virtual MAC is not configured. In the event where no virtual MAC is configured, SaMOG creates a virtual MAC by adding fc:ff to the start of the IPv4 bind address of the CGW service.

Important: Dynamic change in the virtual MAC address will only affect new sessions. Older sessions will continue to use the old virtual MAC address until the session exists.

Example

The following command configures a virtual mac with the IP address of AB:12:22:34:f5:0E for this APN profile:

virtual-mac AB:12:22:34:f5:0E
Chapter 25
APN Remap Table Configuration Mode

APN Remap Table Configuration mode provides the commands to configure parameters for multiple features related to Access Point Name (APN) handling, such as: Default APN, APN Remap, and Wildcard APN. APN remap table is a key element of the Operator Policy feature and a table is not usable (valid) until it has been associated with an operator policy (see the Operator Policy Configuration Mode Commands) or an IMEI profile (see the IMEI Profile Configuration Mode Commands).

Important: Beginning with Release 16 for SGSN only, an APN Remap Table associated with an IMEI profile overrides a remap table associated with an operator policy. This means activation will be rejected if a local default APN configured, in an APN Remap Table associated with an IMEI profile, cannot be used. This will occur even if a valid local default APN is available in an APN Remap Table associated with an operator policy.

A maximum of 1,000 APN remap tables are supported, and each APN remap table supports a maximum of 100 APN remap entries. Multiple tables can be defined and stored but an operator policy and/or IMEI profile each only support association with a single (one) table per policy/profile configuration. The APN remap table associated with an IMEI profile will be used in IMEI override scenarios.

Mode

Exec > Global Configuration > APN Remap Table Configuration

configure > apn-remap-table table_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-remap-table_name)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
apn-remap

Creates an entry in the APN remap table and provides the ability to override the APN requested by the UE.

Product

MME
SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > APN Remap Table Configuration

configure > apn-remap-table table_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-remap-table_name)#

Syntax

apn-remap { network-identifier apn_net_id { new-ni new_apn_net_id | operator-identifier apn_op_id new-ni new_apn_net_id { new-oi new_apn_op_id | value-for-oi-mcc mcc | value-for-oi-mnc mnc } | value-for-ni-wc new_apn_net_id } | operator-identifier apn_op_id { new-oi new_apn_op_id | value-for-oi-mcc mcc | value-for-oi-mnc mnc } }

no apn-remap { network-identifier apn_net_id | operator-identifier apn_op_id }

no

Deletes the specified APN remap entry from the APN remap table.

network-identifier apn_net_id

Identifies the "old" APN network identifier that is being mapped for replacement.

apn_net_id is a string of 1 to 62 characters, including digits, letters, dots (.) and dashes (-). Additionally, one wildcard character (*) can be included anywhere within the string.

new-ni new_apn_net_id

Identifies the new (target) network identifier to use when no wildcard character is included in the “old” APN network identifier.

new_apn_net_id is a string of 1 to 62 characters, including digits, letters, dots (.) and dashes (-).

value-for-ni-wc new_apn_net_id

Identifies the information to replace the wildcard in the new APN network identifier when a wildcard character is included in the “old” APN network identifier.

new_apn_net_id is an alphanumeric string of characters, including dots (.) and dashes (-). This string replaces the wildcard (*) specified in the apn_net_id. The two strings together must not exceed 62 characters.

operator-identifier apn_op_id

Identifies the “old” APN operator identifier that is being mapped for replacement.
**Usage**

**Important:** Entries in the APN remap table are only valid if the table is associated with an operator policy. The same table can then be associated with an IMEI profile as IMEI-specific remap entries are not supported.

This command defines mapping entries in the APN remap table which supports a range of APN overrides. Mapping can be done one-to-one:

- a "new" APN network identifier (NI) can be mapped to override an “old” APN network identifier (NI) or an “old” APN operator identifier (OI)
- a "new" APN operator identifier (OI) can be mapped to override an “old” APN network identifier (NI) or an “old” APN operator identifier (OI)

Mapping can also be done with wildcards in the "old" APN entry mapped to wildcard replacements to dynamically create “new” APN network/operator identifiers.

**Related Commands:** APN override can also be based on charging characteristics. This type of override mapping is defined with the `cc` command, also part of this configuration mode.

**Example**

A one-to-one APN NI remap entry is illustrated by:

```
apn-remap network-identifier 123abc.com new-ni 333CBC.com
```

Create an entry with a wildcard so that part of an incoming APN NI will be replaced - for example, incoming `xyzabc$pqr.com` becomes `xyzinternet2$pqr.com`.

```
apn-remap network-identifier xyz$pqr.com value-for-ni-wc internet2
```

Replace any incoming APN NI with a new APN NI.
apn-remap network-identifier * value-for-ni-wc newnet.com

A one-to-one APN OI remap entry is illustrated by:

    apn-remap operator-identifier MNC423.MCC222.GPRS new-oi
    MNC123.MCC456.GPRS

Replace any incoming APN OI with a new APN OI MNC123.MCC456.GPRS:

    apn-remap operator-identifier MNC*.MCC*.GPRS value-for-oi-mnc 123 value-
    for-oi-mcc 456
apn-selection-default

Enables and configures or disables the Default APN feature for use when the normal APN selection process fails.

**Product**
MME
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > APN Remap Table Configuration

configure > apn-remap-table table_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-remap-table_name)#

**Syntax**

```

no apn-selection-default { first-in-subscription | lowest-context-id | network-identifier apn_net_id }
```

**no**
Delete the configuration statement and disable the default APN feature.

**first-in-subscription**

Specifies that the first APN in the subscription record matching the requested PDN type is used as the default APN. This applies when normal APN selection fails and if the UE APN is absent and the defined default APN is not a match.

For the SGSN, “first-in-subscription” means the first record from the list of records sent from the HLR (in the same order) with PDP type matching the requested PDP type. With this configuration, if the first record is a wildcard APN it is expected that the wildcard APN be configured. If not, the activation will be rejected.

For the MME, “first-in-subscription” means the first record from the list of records (apn-list) sent from the HSS with PDP type matching the UE-requested PDP type. The apn-list is sorted according to apn-name.

**lowest-context-id**

Specifies that the subscription APN with the lowest context-ID in the subscription record matching the PDN type is used as the default APN.

With this configuration, if the record with the lowest context-ID is a wildcard APN, then it is expected that the wildcard APN has already been configured. If not, the activation will be rejected.

If both apn-selection-default lowest-context-id and apn-selection-default first-in-subscription options are configured, whichever command was executed (configured) first will be the behavior used.

Starting with Release 14.0, MME also supports use of this keyword.
network-identifier apn_net_id

Specifies the network identifier will be used as the default APN name as a string of 1 to 62 characters, including digits, letters, dots (.) and dashes (-).
Any of the following optional keywords can be used with network-identifier as qualifications.

fallback-apn network-identifier apn_net_id

SGSN only.
Specifies a dummy APN to be used when the default APN is not present in the subscription so that the activation does not fail. With this keyword configured, the context is activated with a dummy APN and the GGSN displays a static page for this APN, instructing the subscriber to subscribe for appropriate services. apn_net_id is a string of 1 to 62 characters, including letters, digits, dots (.) and dashes (-).

fallback-to-first-in-subscription

Uses the APN from the first subscription record when the configured default APN is not available.

prefer-single-subscription

Uses the APN from the subscription record if it is the only record available and normal APN selection fails.

reject-blank-apn

Disables use of the default APN if a blank APN is received.

require-dns-fail-wildcard

Enables the default APN to be used if the DNS query fails with the requested APN.
Starting with Release 18.2, this keyword is also supported by the MME.

require-subscription-apn network-identifier apn_net_id

If defined, this APN name must also be included in the subscription data for the default APN feature to function.
apn_net_id is a string of 1 to 62 characters, including letters, digits, dots (.) and dashes (-).

Usage

The default APN feature will be used in error situations when the MME or the SGSN cannot select a valid APN via the normal APN selection process. Within an operator policy, an APN remap table with a default APN can be configured for the MME/SGSN to:

- override a requested APN when the HSS/HLR does not have the requested APN in the subscription profile.
- provide a viable APN if APN selection fails because there was no "requested APN" and wildcard subscription was not an option.

The default APN feature can also be used in the event of a DNS query failure with the selected APN, if:
- the wildcard-apn command is configured, (requirement only for SGSN)
- a wildcard subscription is present,
- the require-dns-fail-wildcard keyword is included with the apn-selection-default command then the configured default APN will be used when the DNS query is retried.

In all of the instances outlined above, the MME/SGSN can provide the default APN as an alternate behavior to ensure that PDP context activation is successful.
**Important:** For SGSN ONLY - Beginning with Release 16, customers already using an APN remap table that is associated with an IMEI profile will have to change the existing configuration to enable the default APN remapping associated with an operator policy rather than the one associated with an IMEI profile. For example, if an existing configuration forced all matching IMEI in a defined IMEI range to use xxx.net APN, the configuration needs to be changed to an APN remap table configuration similar to what is shown below:

Old APN remap table associated with an IMEI profile:

```
apn-selection-default network-identifier xxx.net
```

For a configuration to accomplish the same remapping function, change the APN remap table associated with an IMEI profile to the following:

```
apn-remap network-identifier * new-ni xxx.net
```

**Important:** For SGSN ONLY - With Release 16, an APN remap table associated with an IMEI profile overrides a remap table associated with an operator policy. This means activation will be rejected if a local default APN configured, in an APN remap table associated with an IMEI profile, cannot be used. This will occur even if a valid local default APN is available in an APN remap table associated with an operator policy.

For SGSN ONLY - Beginning with Release 16, the following sample configuration will enable the operator to bypass APN remapping for a specific IMEI range:

```
cfg
operator-policy name OpPol1
associate call-control-profile OpPol1CCprof1
associate apn-remap-table RemapOpPol1
imei-range first start_imei last ending_imei [ sv IMEI_sv ] imei-profile name IMEIprof1
exit
imei-profile name IMEIprof1
associate apn-remap-table remapIMEIprof1
exit
apn-remap-table remapIMEIprof1
exit
apn-remap-table RemapOpPol1
apn-selection-default network-identifier NewAPN.net
end
```
The following command enables the default APN feature for APN *HomeNet1* in an APN remap table associated with an operator policy:

```
apn-selection-default network-identifier HomeNet1
```

For SGSN only - Beginning with Release 16, if the APN remap table is associated with an IMEI profile, for a configuration to accomplish the same remapping function as noted in the sample above, then use syntax similar to the following:

```
apn-remap network-identifier * new-ni xxx.net
```

The following command, in an APN remap table associated with an operator policy, enables use of a default APN selected on the basis of lowest context-ID if the APN is not contained within the subscription:

```
apn-selection-default lowest-context-id
```

The following command enables use of a default APN if the DNS query fails:

```
apn-selection-default network-identifier HomeNet1 require-dns-fail wildcard
```
blank-apn

Enables the Blank APN feature and defines the APN that will be used when no APN is requested. This command is specific to SGSN.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > APN Remap Table Configuration
configure > apn-remap-table table_name

Entering the above command sequence results in the following prompt:

[local] host_name (apn-remap-table_name) #

Syntax

blank-apn network-identifier apn_net_id

no blank-apn

no

Removes the APN NI from the APN remap table configuration and disables the Default APN feature.

network-identifier apn_net_id

Identifies the APN network identifier (NI) that will be used when no APN is requested.
apn_net_id is a string of 1 to 62 characters, including letters, digits, dots (.) and dashes (-).

Usage
Use this command to enable the Blank APN feature.

Example

The following command creates an entry that supplies the starnet.com as the APN network identifier whenever a request does not include an APN:

blank-apn network-identifier starnet.com
This command maps an APN override based on charging characteristics.

**Product**
- MME
- SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > APN Remap Table Configuration
configure > apn-remap-table table_name

Entering the above command sequence results in the following prompt:

```
[local]host_name(apn-remap-table_name)#
```

**Syntax**

```
cache behavior bit_value profile index_bit apn-remap network-identifier apn_net_id new-ni new_apn_net_id
no cc behavior bit_value profile index_bit apn-remap network-identifier apn_net_id
```

**disables the configured cc-based remapping behavior.**

**behavior bit_value**
Specifies the value for the charging characteristic behavior bit.
`bit_value` is a hex value from 0x0 to 0xFFF.

**profile index_bit**
Specifies the index for the charging characteristic profile.
`index_bit` is an integer from 1 through 15.
Some of the index values are predefined according to 3GPP standards:
- 1 for hot billing
- 2 for flat billing
- 4 for prepaid billing
- 8 for normal billing

**apn-remap network-identifier apn_net_id**
Identifies the “old” APN network identifier that is being mapped for replacement.
`apn_net_id` is a string of 1 to 62 characters, including letters, digits, dots (.) and dashes (-).

**new-ni new_apn_net_id**
Identifies the “new” APN network identifier that is being mapped to.
`new_apn_net_id` is a string of 1 to 62 characters, including letters, digits, dots (.) and dashes (-).
Usage

Use this command to enable APN remapping only when the charging characteristic value in the subscription record associated with the requested APN matches the value configured for the new-ni.

The new APN NI must be part of the subscription data so that the charging characteristic associated with the new APN NI will be used for activating the context. If there is not one associated, then the general charging characteristic will be used.

Example

The following command associates a new APN NI `locals1` with a set of charging characteristics:

```
cc behavior 0xF profile 4 apn-remap network-identifier homer1 new-ni locals1
```
description

Defines a string that describes this APN remap table.

Product

MME
SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > APN Remap Table Configuration

configure > apn-remap-table table_name

No single command sequence results in the following prompt:

[local] host_name(apn-remap-table_name)#

Syntax

description description

no description

no

Removes the description configuration from this APN Remap Table configuration.

description

Specifies descriptive text to be associated with the APN remap table as an alphanumeric string of 1 through 100 characters. The string may include spaces, punctuation, and case-sensitive letters if the string is enclosed in double quotation marks (").

Usage

Define information that identifies this particularly APN remap table.

Example

description "APN_remap1 replaces all MNC1## Ids."
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Use this command to return to the parent configuration mode.
wildcard-apn

Enables or disables the Wildcard APN feature and define the default APN to be used whenever a wildcard APN is included in the subscriber record.

Product
MME
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > APN Remap Table Configuration
configure > apn-remap-table table_name

Entering the above command sequence results in the following prompt:

[local]host_name(apn-remap-table_name)#

Syntax

wildcard-apn pdp-type { dual-ipv4v6 | ipv4 | ipv6 | ppp } network-identifier apn_net_id

no wildcard-apn pdp-type { dual-ipv4v6 | ipv4 | ipv6 | ppp }

no

Disables the wildcard-apn definition from the configuration.

pdp-type { dual-ipv4v6 | ipv4 | ipv6 | ppp }

Specifies the PDP type.
- dual-ipv4v6 - for a dual PDP context association with one IPv4 address and one IPv6 address/prefix (SGSN only)
- ipv4 - for an IPv4 context
- ipv6 - for an IPv6 context
- ppp - for a PPP context

network-identifier apn_net_id

Identifies one of the APN network identifiers specified via the apn command in the Operator Policy configuration mode.
apn_net_id is a string of 1 to 62 characters, including letters, digits, dots (.) and dashes (-).

Usage
This command is used to define a wildcard APN with the type of PDP context and the APN’s network identifier (NI). This wildcard APN would be used when an APN is not identified.
The command should be repeated per PDP type, as needed, to enable wildcard APN for two or more of the PDP types.
The wildcard APN configured with the dual PDP IPv4v6 context will be used in the following scenarios:
• the UE requested a PDP type of IPv4v6
• the UE did not request any specific APN
• the subscription includes wildcard APN with PDP type as IPv4v6.

**Important:** Wildcard APN feature configuration is only valid if the APN remap table is associated with at least one operator policy. The same table can then be associated with an IMEI profile as IMEI-specific Wildcard APN is not supported.

**Example**

Use this command to enable an APN wildcard for PDP type IPv4 and NI homer1:

```shell
wildcard-apn pdp-type ipv4 network-identifier homer1
```
Chapter 26
ARP-RP Mapping Profile Configuration Mode

The commands in this mode configure the various parameters of the ARP-RP Mapping Profile.
The SGSN uses the ARP to RP mapping for a variety of reasons, such as choosing a preferred radio priority according to the ARP values sent by the GGSN and HLR. These mappings will be used by corresponding 2G and/or 3G services to choose the radio priority value sent in downlink messages towards the MS/UE:

- Activate PDP Accept.
- Modify PDP Request during network-initiated PDP modification procedure.
- Modify PDP Accept during MS-initiated PDP modification procedure provided the ARP has been changed by the network.

Mode

Exec > Global Configuration > SGSN Global Configuration > ARP-RP Mapping Profile Configuration

configure > sgsn-global > qos-arp-rp-map-profile arp-rp_prof_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-arp-rp-map-profile-arp-rp_prof_name)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
arp

This command modifies the ARP (allocation retention priority) to RP (radio priority) mapping in the ARP-RP Mapping Profile.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > SGSN Global Configuration > ARP-RP Mapping Profile Configuration

configure > sgsn-global > qos-arp-rp-map-profile arp-rp_prof_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-arp-rp-map-profile-arp-rp_prof_name)#

**Syntax**

```
arp arp_value  radio-priority rp_value
```

**arp**

Defines the allocation retention priority.

*arp_value*: Enter an integer from 1 to 3.

**radio-priority**

Defines the radio priority.

*rp_value*: Enter an integer from 1 to 4.

**Usage**

When the ARP-RP Mapping Profile is created it includes default ARP-RP mapping:

- ARP1 RP4
- ARP2 RP4
- ARP3 RP4

The commands in this mode can be issued as needed to modify the mapping.

Use the `show sgn-mode` command to display the ARP-RP profile and configuration.

Use the `radio-priority` keyword of the `sm` command in either the GPRS Service configuration mode or the SGSN Service configuration mode to associate the ARP-RP Mapping Profile with either of the service types.

**Example**

To change the radio priority from 4 to 2 for the allocation retention priority of 1, use the following command.

```
arp 1 rp 2
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Use this command to return to the parent configuration mode.
Chapter 27
ATM Port Configuration Mode Commands

The Asynchronous Transfer Mode (ATM) port configuration mode provides the commands to create, configure, bind, and manage the ATM ports on line cards that support ATM, such as the ATM/POS OC-3 single-mode and multi-mode optical line cards.

Important: Before using these commands, card framing should be configured for either SDH or SONET with the framing command described in the Card Configuration Mode chapter.

Mode

Exec > Global Configuration > ATM Port Configuration

configure > port atm slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
clock-source

This command sets the source of the port’s transmit clock.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > ATM Port Configuration

configure > port atm slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Syntax

clock-source { internal-timing | loop-timing }

default clock-source

default

Using this command combination sets the port clock source to internal timing.

internal-timing

Sets the port clock to derive timing from the recovered receive clock.

loop-timing

Sets the port clock to transmit in sync with the system timing.

Usage

Use this command for either SONETports on the SGSN.

Important: This command is only available for releases 8.1 or higher.

Example

The following command resets the transmit clock source to internal timing.

default clock-source

description

Defines descriptive text that provides useful information about the port.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > ATM Port Configuration
configure > port atm slot_number/port_number
Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Syntax

description text

no description

no
Erases the port’s defined description from the configuration file.

text

_text: must be a string of 1 to 79 alphanumeric characters with no spaces or a string within double quotes that includes printable characters. The description is case-sensitive.

Usage
Set the description to provide helpful information, for example the port’s primary function, services, end users. Define any information, the only limit is the number of characters.

Example
The following example sets a port description that will read in the configuration file:

description samplePortDescriptiveText

The following example sets a port description that will be easy to read because it retains the spaces between words:

description "This is a sample description"
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```exit```

**Usage**
Use this command to return to the parent configuration mode.
**line-timing**

This command enables the SPIO to recover transmit timing source via the line attached to the selected port. By default, line-timing is not enabled.

*Important:* To employ line-timing recovery, the SPIO card(s) must be equipped with the optional Stratum 3 clock module.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > ATM Port Configuration

configure > port atm slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

**Syntax**

```
[ no ] line-timing
```

*no*

Disables line-timing as the source for the transmit clock.

**Usage**

The port must be enabled (no shutdown) to enable recovery of timing source via the line. As well, the card’s slot number must be entered in the recover line# command in the BITS port configuration mode.

*Important:* If the SPIO is connected to an external Building Integrated Timing Supply (BITS) source, BITS timing always takes precedence over line-timing.

**Example**

Disable configured line-timing as the clock source for this port.

```
no line-timing
```
loopback

Enables/disables loopback and configures the type of loopback mode used for diagnostic testing.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > ATM Port Configuration
`configure > port atm slot_number/port_number`

Entering the above command sequence results in the following prompt:
```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**
```
loopback { ds1-e1-diag | ds1-e1-line | none | sonet-sdh-diag | sonet-sdh-line }
```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ds1-e1-diag</strong></td>
<td>Enables a system generated diagnostic lookback signal at the DS1/E1 layer.</td>
</tr>
<tr>
<td><strong>ds1-e1-line</strong></td>
<td>Loops back a network diagnostic signal at the DS1/E1 layer.</td>
</tr>
<tr>
<td><strong>none</strong></td>
<td>Stops diagnostic loopback signalling.</td>
</tr>
<tr>
<td><strong>sonet-sdh-diag</strong></td>
<td>Enables a system generated diagnostic lookback signal at the SONET/SDH layer.</td>
</tr>
<tr>
<td><strong>sonet-sdh-line</strong></td>
<td>Loops back a network diagnostic signal at the SONET/SDH layer.</td>
</tr>
</tbody>
</table>

**Usage**
Setup diagnostic loopback signals for troubleshooting purposes.

**Example**
Use the following command to setup loopback diagnosis:
```
loopback ds1-e1-diag
```
Use the following command to disable loopback:
```
loopback none
```
preferred slot

This command identifies which card in a chassis assumes revertive (redundancy auto-recovery) functionality when the slot/port being configured go down.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > ATM Port Configuration

configure > port atm slot_number/port_number

Entering the above command sequence results in the following prompt:

[local] host_name(config-port-slot_number/port_number)#

Syntax

preferred slot slot#

[ default | no ] preferred slot

default

Default: non-revertive operation.
Sets the port for non-revertive operation for port redundancy auto-recovery; requiring an administrative user to manually issue a port switch command to return service to the original port.

no

Disables revertive, or auto-recovery, operation for the port.

slot#

Identifies the physical slot in the chassis where the preferred line card is installed.

Usage

This command enables or disables revertive port redundancy. So after a port failover, when the original port is restored to service (i.e. link up) the system will return service to that port automatically.
This command must be issued on a per port basis, allowing you to configure specific ports to be used on individual LCs or SPIO cards. For example, ports 1 through 4 could be configured as "preferred" on the LC in slot 17 while ports 5 through 8 are "preferred" on the LC in slot 33. In this scenario, both LCs would be in an Active operational state while still providing LC and port redundancy for the other.
Enabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue a port switch command to return service to the original port.

Example

The following commands sets revertive port redundancy for ports on the card in slot 17:

preferred slot 17
**pvc**

This command creates a Permanent Virtual Connection (PVC), including the definition of the associated Virtual Path Identifiers (VPI) and Virtual Connection Identifiers (VCI) for the PVC. By defining a PVC, this command enters into PVC configuration mode. The ATM port supports a maximum of 256 PVC definitions.

**Product**
- HNB-GW
- SGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > ATM Port Configuration
- `configure > port atm slot_number/port_number`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**

```
[ no ] pvc vpi vpi# vci vci# [ type { aal2 [ -cps-payload-size cps_payload_value | aal5 ] } ] [ -noconfirm ]
```

- **no**
  - Deletes the PVC’s entry from the configuration.

- **vpi vpi#**
  - VPI identifies a unique path to a destination point in the ATM portion of the network. The VPI and the VCI combine to create the PVC between the MS and the destination point. **vpi#** must be an integer, 0 to 255.

- **vci vci#**
  - VCI identifies a unique virtual circuit within the associated VPI. **vci#** must be an integer, 0 to 65535.

- **type**
  - This keyword is used to define the type of PVC as AAL2 or AAL5 for HNB-GW service configuration within the associated VPI and VCI.

- **aal2**
  - This keyword is used to define the type of PVC as AAL2 for HNB-GW service configuration within the associated VPI and VCI.

- **aal5**
  - This keyword is used to define the type of PVC as AAL5 for HNB-GW service configuration within the associated VPI and VCI.
The command `pvc vpi 2 vci 353 type aal2 cps` configures the PVC as an ATM Adaptation Layer 2 (AAL2) PVC with VPI as 2 and VCI as 353. It also configures the CPS payload to 45 bytes over the ATM during the call.

```
pvc vpi 2 vci 353 type aal2 cps-payload-size 45
```
**shutdown**

Terminates all processes supporting the port or blocks the shutting down of the port. Conversely, this command with the `no` keyword enables the port.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > ATM Port Configuration

```
configure > port atm slot_number/port_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**

```
[ no ] shutdown
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no</code></td>
<td>Enables the port’s administrative state. When this command is omitted from the configuration, the card is shutdown (removed from service).</td>
</tr>
</tbody>
</table>

**Usage**
Shut down a port prior to re-cabling and/or other maintenance activities. This is the default state of each port upon installation and initial configuration. This command with the `no` keyword is *required* to bring a port into active service.

**Example**
The following command enables the port for service:

```
no shutdown
```

The following command disables the port and takes it out of service:

```
shutdown
```
**snmp trap link-status**

Enables/disables the generation and sending of an SNMP (notification) trap when the port experiences a change of state (up or down).

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > ATM Port Configuration

```
configure > port atm slot_number/port_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**
```
[ no ] snmp trap link-status
```

- **no**
  
  Disables the sending of traps for link-status changes.

**Usage**
Enable the sending of link-status change traps for this port if there is a monitoring facility that can use the information or if there are troubleshooting activities in progress.

**Example**
Use the following command to send SNMP link-status traps for this port:

```
snmp trap link-status
```

Use the following command to disable the sending SNMP link-status traps for this port:

```
no snmp trap link-status
```
threshold high-activity

Configures the port’s high and low activity thresholds.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > ATM Port Configuration
configure > port atm slot_number/port_number

Entering the above command sequence results in the following prompt:
[local]host_name(config-port-slot_number/port_number)#

Syntax

threshold high-activity high_thresh  [ clear low_thresh ]

default threshold high-activity

default
Restores both port high-activity thresholds to the system default of 50 percent.

high_thresh
Default: 50
Sets the threshold for the highest percentage of port activity that must be met or exceeded, within the polling interval, to generate an alert or alarm.
high_thresh_% can be configured to any integer value between 0 and 100.

clear low_thresh
Default: 50
Sets the threshold for the lowest percentage level of port activity that must be met to generate and send a clear alarm. If port activity does not drop to or below this threshold then the alarm is maintained.
low_thresh_% can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

High port activity thresholds generate alerts or alarms based on the utilization percentage of each configured port during the specified polling interval. This threshold is configured on a per-port basis. Alerts or alarms are triggered for high port activity based on the following rules:
- Enter condition: Actual percent utilization of a port > High Threshold
- Clear condition: Actual percent utilization of a port < Low Threshold
If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval. Refer to the `threshold poll` command in the *Global Configuration Mode Commands* chapter of this reference to configure the polling interval and the `threshold monitoring` command in this chapter to enable thresholding for this value.

**Example**

The following command configures a high port utilization threshold of 70 percent and a low threshold of 50 percent for a system using the Alarm thresholding model:

```plaintext
threshold high-activity 70 clear 50
```
threshold monitoring

Enables thresholding for port-level values.

Product

HNB-GW
SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > ATM Port Configuration
configure > port atm slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Syntax

[ default | no ] threshold monitoring

- default
  Restores the system default to disable threshold monitoring for port-level values.

- no
  Disables threshold monitoring for port-level values. This is the default setting.

Usage

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e high-activity) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps**: SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the starentMIB(8164).starentTraps(2) section of the SNMP MIB Reference.

  The generation of specific traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs**: The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of WARNING.

- **Alarm System**: High threshold alarms generated within the specified polling interval are considered “outstanding” until a the condition no longer exists and/or a condition clear alarm is generated. “Outstanding” alarms are reported to through the system’s alarm subsystem and are viewable through the system’s CLI.

The following table indicates the reporting mechanisms supported by each of the above models.
Table 19. Thresholding Reporting Mechanisms by Model

<table>
<thead>
<tr>
<th>Model</th>

<td>X</td>
</tr>
</tbody>
</table>

This command enables thresholding for port-level values. Refer to the sections covering `threshold high-activity`, `threshold rx-utilization`, and `threshold tx-utilization` commands in this chapter for information on configuring these values. In addition, refer to the `threshold poll` command in the `Global Configuration Mode Commands` chapter of this reference for information on configuring the polling interval over which these values are monitored.
threshold rx-utilization

Configures thresholds for receive-port utilization.

**Product**
- HNB-GW
- SGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
Exec > Global Configuration > ATM Port Configuration

`configure > port atm slot_number/port_number`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**

```
threshold rx-utilization high_thresh [ clear low_thresh ]

default threshold rx-utilization
```

---

**default**

Restores both rx-utilization thresholds to the system default of 80 percent.

---

**high_thresh**

Default: 80

The high threshold receive port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.

The percentage can be configured to any integer value between 0 and 100.

---

**clear low_thresh**

Allows the configuration of the low threshold.

Default: 80

The low threshold receive port utilization percentage that maintains a previously generated alarm condition.

If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.

The percentage can be configured to any integer value between 0 and 100.

---

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.
Usage

Receive port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data received during the specified polling interval. This threshold is configured on a per-port basis.

**Important:** Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive or transmit utilization threshold be configured.

Alerts or alarms are triggered for receive port utilization based on the following rules:

- **Enter condition:** Actual percent utilization of a port for received data > High Threshold
- **Clear condition:** Actual percent utilization of a port for received data < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the `threshold monitoring` command in this chapter to enable thresholding for this value.

Example

The following command configures a receive port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```plaintext
threshold rx-utilization 70 clear 50
```
threshold tx-utilization

Configures thresholds for transmit port utilization.

Product
HNB-GW
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > ATM Port Configuration
configure > port atm slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Syntax

threshold tx-utilization high_thresh [ clear low_thresh ]

default threshold tx-utilization

default
Restores the port tx-thresholds to their system defaults of 80 percent.

high_thresh
Default: 80
The high threshold transmit port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
The percentage can be configured to any integer value between 0 and 100.

clear low_thresh
Allows the configuration of the low threshold.
Default: 80
The low threshold transmit port utilization percentage that maintains a previously generated alarm condition.
If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
The percentage can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
Transmit port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data transmitted during the specified polling interval. This threshold is configured on a per-port basis.
**Important:** Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive or transmit utilization threshold be configured.

Alerts or alarms are triggered for transmit port utilization based on the following rules:
- **Enter condition:** Actual percent utilization of a port for transmit data > High Threshold
- **Clear condition:** Actual percent utilization of a port for transmit data < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the `threshold monitoring` command in this chapter to enable thresholding for this value.

**Example**

The following command configures a transmit port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold tx-utilization 70 clear 50
```
toh-sdsf

Enable/disable line SDSF BER thresholds and configure the line transport overhead (TOH) signal degrade and signal failure (SDSF) bit error rate (BER) threshold.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > ATM Port Configuration

configure > port atm slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Syntax

toh-sdsf toh_value

default toh-sdsf

default

Resets the default which disables this threshold.

toh_value

To facilitate configuration the SD and SF rates have been combined into a single setting.

- 0: Disabled
- 1 - 1.E-04
- 2 - 1.E-05
- 3 - 1.E-06
- 4 - 1.E-07
- 5 - 1.E-08
- 6 - 1.E-09
- 7 - 1.E-10
- 8 - 1.E-11

Usage

This command is typically configured in combination with configuring APS/MSP redundancy for the line card - see the aps and the redundancy commands documented in the Card Configuration Mode Commands chapter.

This command can be used to configure the line threshold whether the port is active or standby and sets a standard option for the paired values of the line’s signal degrade and signal failure (SDSF) BER.
The SD is kept at a value of 100 erroredBits/sec less than the corresponding value of the SF. So if the SD threshold is configured at 1 error in every 100000 bits/sec, then the SF threshold automatically becomes 1 error in every 1000 bits/sec.

The port will go operationally down as soon as the SD threshold is crossed.

Example

Set the SD and SF rates to 1.E-04:

```
toh-sdsf 1
```
Chapter 28
BFD Configuration Mode Commands

The BFD Configuration Mode manages the protocol settings for Bidirectional Forwarding Detection (BFD).

BFD provides a low-overhead, short duration method of detecting failures in the forwarding path between two BGP or OSPF adjacent routers, including the interfaces, data links, and forwarding plane. BFD must be enabled on both routers. The ASR 5000 and ASR 5500 supports BFD on Layer 3 clients only in asynchronous mode with optional Echo functionality.

Mode

Exec > Global Configuration > Context Configuration > BFD Configuration

configure > context context_name > bfd-protocol

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-bfd)#

![Important:](https://example.com/icon) The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

![Important:](https://example.com/icon) On the ASR 5000, one of the packet processing cards must be configured as a demux card for BFD to function.
**bfd multihop-peer**

Configures parameters for any multihop-BFD sessions with the same destination address. If these parameters are not configured via this command, MH-BFD sessions with the same destination address will be in the Admin-down state.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > BFD Configuration

```
configure > context context_name > bfd-protocol
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bfd)#
```

**Syntax**

```
bfd multihop-peer dst-ip-address { authentication { md5 | meticulous-md5 | meticulous-sha1 plain-text | sha1 } { encrypted password-string | password } encrypted-password-string | password } encrypted-password-string | password | interval tx_interval min_rx rx_interval multiplier value }
```

```
no bfd multihop-peer dst-ip-address authentication
```

**dst-ip-address**

Specifies the destination address of the BFD enabled peer in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation. This destination address must have been previously configured via the `ip route static bfd` or `ipv6 route static bfd` commands in the Context Configuration mode.

**authentication { md5 | meticulous-md5 | meticulous-sha1 plain-text | sha1**

Specifies the method for authenticating all multihop BFD sessions to the specified peer. By default, authentication for Multihop-BFD sessions to a destination address is disabled. The authentication type options include:

- **md5** – Message Digest 5
- **meticulous-md5** – MD5 using a secret key and sequence numbers updated for every packet
- **meticulous-sha1** – SHA1 with sequence numbers updated for every packet
- **plain-text** – plain text (unencrypted)
- **sha1** – Secured Hash Algorithm 1

**encrypted password-string | password**

Specifies the password for authentication of BFD sessions. The password must be the same between the peer neighbors for the BFD sessions to work. If the authentication password is configured incorrectly between
peers, the BFD sessions to the destination address will not come UP. If the password is configured for BFD sessions that are already UP, BFD neighbors will be reset.

- **encrypted password-string**: Specifies the use of an encrypted password for authentication of BFD sessions as an alphanumeric string of up to 523 characters.
- **password password-string**: Specifies the use of a plain text password for authentication of BFD sessions as an alphanumeric string of 1 through 19 characters.

**Important**: The destination address and its transmit/receive intervals must be configured before the password is applied to any MH-BFD sessions at a destination address.

```
interval tx_interval  min_rx rx_interval  multiplier value
interval tx_interval: Specifies the transmit interval (in milliseconds) between BFD packets as an integer from 50 through 999. Default: 50
min_rx rx_interval: Specifies the receive interval (in milliseconds) between BFD packets as an integer from 50 through 999. Default: 50
multiplier value: Specifies the multiplier value sued to compute holddown as an integer from 3 through 50. Default: 3
```

**Usage**

Use this command to configure basic operating parameters between BFD enabled peers.

**Example**

The following are example command strings for configuring BFD multihop sessions:

```bash
bfd multihop-peer 10.2.3.4 authentication md5 encrypted 5-klm7783bfd
multihop-peer 10.2.3.4 interval 100 min_rx 100 multiplier 5
```
**bfd nbr-group-name**

Configures BFD neighbor groups.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > BFD Configuration
configure > context context_name > bfd-protocol

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bfd)#
```

**Syntax**

```
[no] bfd nbr-group-name neighbor_group { active-if-name if_name | passive-if-name if_name }
  gw_ip_address
```

```
no bfd nbr-group-name neighbor_group
```

Removes all the parameters for the BFD neighbor group.

```
neighbor_group
```

Specifies an identifier for a BFD neighbor group as an alphanumeric string of 1 through 19 characters.

```
active-if-name if_name | passive-if-name if_name
```

Specifies the logical/physical interface associated with this BFD group.  
**active-if-name if_name**: Specifies an active interface that notifies all passive interfaces in this group.  
There should be only one active interface in a group.  
if_name is a logical or physical interface specified as an alphanumeric string of 1 through 79 characters.  
**passive-if-name if_name**: Specifies a passive interface that receives BFD notifications from the active interface in this group.  
if_name is a logical or physical interface specified as an alphanumeric string of 1 through 79 characters.

```
gw_ip_address
```

Specifies the gateway address of the BFD neighbor in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation (optional CIDR notation).

**Usage**

Allow scaling of BFD sessions when a large number of logical interfaces are configured on a physical interface.  
A failure on the physical interface or a logical interface can be propagated to all passive interfaces in this group.

**Example**

The following command configures BFD group bgpgroup132:
bfd nbr-group-name bgp-group132 active-if-name bgpif02
**echo**

Enables or disables BFD echo mode functionality. The Echo function tests the forwarding path on the remote system. Echo is only used for single hop BFD sessions.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > BFD Configuration

`configure > context context_name > bfd-protocol`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bfd)#
```

**Syntax**

```
[ no ] echo
```

- **no echo**
  
  Disables BFD echo functionality.

**Usage**

Use this function to send a stream of Echo packets that the other endpoint then sends back via its forwarding plane. Echo tests the forwarding path on the remote system.
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
**exit**

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
slow-timers

Specifies the asynchronous mode control packet interval when Echo mode is enabled. In BFD asynchronous mode, BFD-enabled peers periodically send BFD Control packets to one another. If a number of those packets in a row are not received within the specified interval by the other peer, the session is declared to be down.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > BFD Configuration

```
configure > context context_name > bfd-protocol
```

Entering the above command sequence results in the following prompt:
```
[context_name]host_name(config-bfd)#
```

**Syntax**

```
slow-timers timer_value
no slow-timers
```

**Usage**

Disables previously specified BFD slow timers.

```
timer_value
```

Specifies the BFD control packet interval (in milliseconds) for Echo mode as an integer from 1000 through 300000. Default: 2000

**Example**

Use this command to configure the interval between BFD control packets sent between peers in Echo mode.

The following example command configures an asynchronous mode control packet interval of 10000ms (10 seconds):

```
slow-timers 10000
```
Chapter 29
BGP Address-Family (IPv4/IPv6) Configuration Mode Commands

The Border Gateway Protocol (BGP) Address-Family (IPv4/IPv6) Configuration Mode is used to configure the IPv4 and IPv6 address family information.

Mode

Exec > Global Configuration > Context Configuration > BGP Configuration > BGP Address-Family Configuration

configure > context context_name > router bgp as_number > address-family address_family_type

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-bgp-af-v6)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

    end

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```text
exit
```

**Usage**

Use this command to return to the parent configuration mode.
maximum-paths

Controls the maximum number of parallel external BGP (eBGP) or internal BGP (iBGP) routes that can be installed in a routing table.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > BGP Configuration > BGP Address-Family Configuration

```
configure > context context_name > router bgp as_number > address-family address_family_type
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bgp-af-v6)#
```

Syntax

```
[ no ] maximum-paths { ebgp num_paths | ibgp num_paths }
no maximum-paths { ebgp | ibgp }
```

- **no**
  Disables maximum paths for the specified route type command.

- **maximum-paths ebgp num_paths**
  Specifies the maximum number of parallel External Border Gateway Protocol routes as an integer from 1 through 10.

- **maximum-paths ibgp num_paths**
  Specifies the maximum number of parallel Internal Border Gateway Protocol routes as an integer from 1 through 10.

**Important:** If configured under the router-bgp-mode, multipath is enabled only for the prefixes learnt in the default-vrf. There is no support for vpnv4 prefixes even though multipath is turned on for the default-vrf. If configured under the address-family-vrf-mode, multipath is enabled only for prefixes learnt in the vrf.

Usage

Use this command to forward packets over multiple paths. User can control the maximum number of parallel eBGP routes that can be installed in a routing table. Enabling multipath does not affect the best path selection in BGP. If multipath is enabled, all the paths with the same weight, local-preference, as-path length, origin, and multi-exit discriminator (MED) as the best path are added to the routing table.

Example

The following command disables forward of packets over multiple paths:

```
no maximum-paths { ebgp | ibgp }
```
no maximum-paths ebgp
neighbor

Configures the IPv4/IPv6 Address Family for BGP routers that interconnect to non-broadcast networks.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > BGP Configuration > BGP Address-Family Configuration

configure > context context_name > router bgp as_number > address-family address_family_type

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-bgp-af-v6)#

Syntax

[ no ] neighbor ip_address { activate | advertisement-interval adv_time | capability graceful-restart | default-originate [ route-map map_name ] | distribute-list dist_list { in | out } | ebgp-multihop [ max-hop number ] encrypted password encryp_password fallback bfd multihop | filter-list filt_list { in | out } | max-prefix max_num [ threshold thresh_percent ] [ warning-only ] next-hop-self | password password | remove-private-AS | restart-time rest_time | route-map map_name { in | out } | send-community { both | extended | standard } | shutdown | srp-activated-soft-clear | timers { connect-interval connect_interval [ keepalive-interval keepalive_interval holdtime-interval holdtime_interval [ min-peer-holdtime-interval min_peer_hold_interval ] ] | keepalive-interval keepalive_interval holdtime-interval holdtime_interval [ connect-interval connect_interval | min-peer-holdtime-interval min_peer_hold_interval ] | send-community { both | extended | standard } | shutdown | srp-activated-soft-clear | timers { connect-interval connect_interval | min-peer-holdtime-interval min_peer_hold_interval [ connect-interval connect_interval ] } } } | update-source ip_address | weight value }

no

Delete the specified parameter from the router configuration.

neighbor ip_address

Specifies the IP address of a BGP neighbor. ip_address must be in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

activate

Enables the exchange of routes with this neighbor.

advertisement-interval adv_time

Specifies the minimum interval (in seconds) between sending BGP routing updates. adv_time must be an integer from 0 through 600. Default: 30

capability graceful-restart

Configures graceful re-start attributes.
default-originate [ route-map map_name ]
Specifies the default originate routes to this neighbor
route-map map_name: Specifies the route-map that contains the criteria to originate default routes.
map_name must be the name of an existing route-map in the current context.

distribute-list dist_list { in | out }
Filters updates to and from this neighbor based on a route access list. Default: No filtering is performed.
dist_list is the name or number of an existing route-access-list.
in: Indicates that incoming advertised routes should be filtered.
out: Indicates that outgoing advertised routes should be filtered.

ebgp-multihop [ max-hop number ]
Allows eBGP neighbors that are not on directly connected networks.
max-hop number: Specifies the maximum number of hops allowed to reach a neighbor as an integer from 1 through 255. Default hop count: 255

encrypted password encryp_password
Specifies the encrypted password that is used only inside configuration files. This is an alphanumeric string of 1 through 24 characters.

fall-over bfd multihop
Supports Bidirectional Forwarding Detection (BFD) multihop for fallover.

filter-list filt_list { in | out }
Establishes BGP filters based on an autonomous system (AS) path access list. filt_list is name of an existing AS path access list.
in: Indicates that incoming advertised routes will be filtered.
out: Indicates that outgoing advertised routes will be filtered.

max-prefix max_num [ threshold thresh_percent ] [ warning-only ]
Specifies the maximum number of prefixes accepted from this peer. When the maximum is exceeded the neighbor connection is reset. max_num is an integer from 1 through 4294967295. Default: No maximum prefix limit.
threshold thresh_percent: Specifies a percentage value of when the BGP table is full. When this value is reached peer warnings are sent to the neighbor. thresh_percent must be an integer from 1 through 100.
warning-only: Specifies that only a warning message is sent when the limit is exceeded. The neighbor connection is not reset

next-hop-self ip_address
Disables the next hop calculation for this neighbor.

password password
Sets a password expressed as an alphanumeric string of 1 through 24 characters.

remote-as AS_num
Specify the AS number of the BGP neighbor as an integer from 1 through 4294967295.
remove-private-AS
Removes the private AS number from outbound updates. Default: Do not remove the private AS number.

restart-time rest_time
Specifies the maximum time (in seconds) required to for neighbor to restart as an integer from 1 through 3600.

route-map map_name { in | out }
Applies a route map to the neighbor. map_name must be the name of an existing route-map in the current context.
in: Indicates that the route map applies to incoming advertisements.
out: Indicates that the route map applies to outgoing advertisements.

send-community{ both | extended | standard }
Sends the community attributes to a peer router (neighbor).
both: Sends standard and extended community attributes
extended: Sends extended community attributes.
standard: Sends standard community attributes.

shutdown
Administratively shuts down this neighbor. This disables exchanging routes or configuring parameters for this neighbor.

srp-activated-soft-clear
Enables BGP updates when SRP-enabled resources are modified.

timers { [ connect-interval connect_interval ] | [ keepalive-interval keepalive_interval holdtime-interval holdtime_interval ] }
Sets BGP timers for the specified neighbor.
connect-interval connect_interval: Specifies the connect timer (in seconds) as an integer from 0 through 65535. The default is 60 seconds.
keepalive-interval keepalive_interval: Specifies the frequency (in seconds) at which the current BGP router sends keepalive messages to its neighbor. keep_time must be an integer from 0 through 65535. The default is 30 seconds.
holdtime-interval holdtime_interval: Specifies the interval (in seconds) the router waits for a keepalive message before declaring a neighbor dead. hold_time must be an integer from 0 through 65535. The default is 90 seconds.
min-peer-holdtime-interval min_peer_hold_interval: Specifies the minimum acceptable hold time (in seconds) from peer for a keepalive message before declaring a neighbor dead.
min_peer_hold_interval must be an integer from 0 through 65535. The default is 90 seconds.

update-source ip_address
Binds the specified IP address to the BGP socket that is used to communicate to the peer. ip_address is an IPv4 address in dotted-decimal notation.
In most cases you should set the update-source address to the address of the loopback interface in the current context. By doing this, the TCP connection does not go down until there is no route for the loopback address in the peering router.
weight value
Sets the default weight for routes from this neighbor as an integer from 0 through 65535. Default: 0

Usage
Use this command to set parameters for communication with a specified neighbor. The chassis supports a maximum of 64 peers per context.

**Important:** A remote AS number must be specified for a neighbor before other parameters can be configured.

Example
The following command specifies that the neighbor at the IP address 192.168.100.25 has an AS number of 2000:

```plaintext
neighbor 192.168.100.25 remote-as 2000
```

The following command allows BGP neighbors that are a maximum of 27 hops away:

```plaintext
neighbor 192.168.100.25 ebgp-multihop max-hop 27
```

The following command sets the minimum interval between sending routing updates to 3 minutes (180 seconds):

```plaintext
neighbor 192.168.100.25 advertisement-interval 180
```

The following command sets the default weight for all routes from the specified neighbor to 100:

```plaintext
neighbor 192.168.100.25 weight 100
```
**network**

Configures and specifies a network to announce via BGP.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > BGP Configuration > BGP Address-Family Configuration

```
configure > context context_name > router bgp as_number > address-family
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bgp-af-v6)#
```

**Syntax**

```
[ no ] network ip_address/mask [ route-map map_name ]
```

**no**
Delete the specified network from the configuration for the BGP router.

```
network ip_address/mask
```

Specifies the IP address and netmask bits for the network to announce via BGP. `ip_address` is a network IP address in IPV4 dotted-decimal notation and `mask` is the number of subnet bits, representing a subnet mask in CIDR. These must be entered in the IPv4 dotted-decimal notation/subnet bits format.

```
route-map map_name
```

Filter routes through the specified route map before announcing the network. `map_name` specifies the name of the route-map to use as an alphanumeric string of 1 through 79 characters.

**Usage**

Use this command to specify a network to announce via BGP.

**Example**

The following command announces the network 192.168.0.0 with a netmask of 16 via BGP:

```
network 192.168.0.0/16
```

The following command removes the network from the BGP router configuration:

```
no network 192.168.0.0/16
```
**redistribute**

Redistributes routes into BGP from another protocol as BGP neighbors.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > BGP Configuration > BGP Address-Family Configuration

```config
configure > context context_name > router bgp as_number > address-family address_family_type
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bgp-af-v6)#
```

**Syntax**

```
[ no ] redistribute { connected | ospf | rip | static } [ route-map map_name ]
```

- **no**
  
  Remove the specified redistribution parameters from the BGP router configuration.

- **redistribute connected**
  
  Specifies that connected routes will be redistributed.

- **redistribute ospf**
  
  Specifies that Open Shortest Path First (OSPF) routes will be redistributed.

- **redistribute rip**
  
  Specifies that Routing Information Protocol (RIP) routes will be redistributed. (RIP is not supported at this time.)

- **redistribute static**
  
  Specifies that static routes will be redistributed.

- **route-map map_name**
  
  Filters routes through the specified route map before redistribution. `map_name` specifies the name of the route-map to use as an alphanumeric string of 1 through 79 characters.

**Usage**

Use this command to specify what routes this BGP router should redistribute into BGP.

**Example**

The following command redistributes OSPF routes after filtering them through the route map named `Map1`:
The following command removes the redistribution of OSPF routes from the router’s configuration:

```bash
no redistribute ospf route-map Map1
```
**timers bgp**

Enables or disables an aggressive minimum BGP route advertisement interval (MinRtAdvInterval) for ICSR configurations.

**Product**
All products that support ICSR

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > BGP Configuration > BGP Address-Family Configuration

`configure > context context_name > router bgp as_number > address-family address_family_type`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bgp-af-v6)#
```

**Syntax**

```
[no] timers bgp icsr-aggr-advertisement-interval seconds
```

<table>
<thead>
<tr>
<th><strong>no</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Disables this aggressive ICSR BGP advertisement interval.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>seconds</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Sets the number of seconds as an integer from 0 to 30. Default: 0.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to configure an aggressive ICSR BGP advertisement interval (MinRtAdvInterval). The default value is 0. If set as 0, the aggressive advertisement interval is disabled.

The MinRtAdvInterval can be uniquely set for each address family.

After ICSR switchover, BGP will set the advertisement-interval for each AFI/SAFI (Address Family Identifier/Subsequent Address Family Identifier) supported by the peer to the configured value. BGP updates will be advertised to the peer based on this interval.

**Example**

The following command sets the MinRtAdvInterval for this address family to 1 second:

```
timers bgp icsr-aggr-advertisement-interval 1
```
Chapter 30
BGP Address-Family (VPNv4/VPNv6) Configuration Mode Commands

The Border Gateway Protocol (BGP) Address-Family (VPNv4/VPNv6) Configuration Mode is used to configure the VPNv4 or VPNv6 address family information.

Mode

Exec > Global Configuration > Context Configuration > BGP Configuration > BGP Address-Family Configuration

```
configure > context context_name > router bgp as_number > address-family address_family_type
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bgp-af-v4)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
- All

**Privilege**
- Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Use this command to return to the parent configuration mode.
neighbor

Configures the VPNv4 or VPNv6 address family on BGP routers that interconnects to non-broadcast networks and enables the exchange of routing information with a peer router (neighbor).

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > BGP Configuration > BGP Address-Family Configuration

```
configure > context context_name > router bgp as_number > address-family address_family_type
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bgp-af-v4)#
```

**Syntax**

```
[ no ] neighbor ip_address { activate | advertisement-interval interval_seconds | send-community { both | extended | standard } }
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>no</strong></td>
<td>Delete the specified parameter from the router configuration.</td>
</tr>
<tr>
<td><strong>neighbor ip_address</strong></td>
<td>Specifies the IP address of the peer router (neighbor) in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.</td>
</tr>
<tr>
<td><strong>activate</strong></td>
<td>Enables the exchange of routing information with this neighbor.</td>
</tr>
<tr>
<td><strong>advertisement-interval interval_seconds</strong></td>
<td>Specifies the minimum interval in seconds between sending BGP routing updates as an integer from 0 through 600.</td>
</tr>
</tbody>
</table>
| **send-community { both | extended | standard }** | Sends the community attributes to a peer router (neighbor).  
  *both*: Sends standard and extended community attributes.  
  *extended*: Sends extended community attributes.  
  *standard*: Sends standard community attributes. |

**Usage**

Use this command to enable the exchange of routing information with a peer router. The chassis supports a maximum of 64 peers per context.
Example

The following command enables the exchange of routing information with the neighbor at IP address 192.168.100.25:

```
neighbor 192.168.100.25 activate
```
timers bgp

Enables or disables an aggressive minimum BGP route advertisement interval (MinRtAdvInterval) for ICSR configurations.

Product
All products that support ICSR

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > BGP Configuration > BGP Address-Family Configuration

```
configure > context context_name > router bgp as_number > address-family address_family_type
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bgp-af-v6)#
```

Syntax

```
[no] timers bgp icsr-aggr-advertisement-interval seconds
```

- **no**
  - Disables this aggressive ICSR BGP advertisement interval.

- **seconds**
  - Sets the number of seconds as an integer from 0 to 30. Default: 0.

Usage

Use this command to configure an aggressive ICSR BGP advertisement interval (MinRtAdvInterval). The default value is 0. If set as 0, the aggressive advertisement interval is disabled. The MinRtAdvInterval can be uniquely set for each address family. After ICSR switchover, BGP will set the advertisement-interval for each AFI/Safi (Address Family Identifier/Subsequent Address Family Identifier) supported by the peer to the configured value. BGP updates will be advertised to the peer based on this interval.

Example

The following command sets the MinRtAdvInterval for this address family to 1 second:

```
timers bgp icsr-aggr-advertisement-interval 1
```
Chapter 31
BGP Address-Family (VRF) Configuration Mode Commands

The Border Gateway Protocol (BGP) Address-Family (VRF) Configuration Mode is used to configure the Virtual Routing and Forwarding address family information.

Mode

Exec > Global Configuration > Context Configuration > BGP Configuration > BGP Address-Family Configuration

configure > context context_name > router bgp as_number > address-family

address_family_type

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-bgp-af-vpnv4)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
neighbor

Configures the Virtual Routing and Forwarding (VRF) address family for BGP routers that interconnect to non-broadcast networks.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > BGP Configuration > BGP Address-Family Configuration

configure > context context_name > router bgp as_number > address-family address_family_type

Entering the above command sequence results in the following prompt:

[context_name] host_name(config-bgp-af-vpnv4)##

Syntax

[ no ] neighbor ip_address { activate | advertisement-interval adv_time | default-originate [ route-map map_name ] | distribute-list dist_list { in | out } | ebgp-multihop [ max-hop number ] | filter-list filt_list { in | out } | max-prefix max_num [ threshold thresh_percent ] [ warning-only ] | remote-as AS_num | remove-private-AS | route-map map_name { in | out } | shutdown | srp-activated-soft-clear | timers { [ connect-interval conn_time ] | [ keepalive-interval keep_time holdtime-interval hold_time ] } | update-source ip_address | weight value }

no
Delete the specified parameter from the router configuration.

neighbor ip_address

Specifies the IP address of the peer router (neighbor) in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

activate

Enables the exchange of routes with this neighbor.

advertisement-interval adv_time

The minimum interval (in seconds) between sending BGP routing updates.

adv_time must be an integer from 0 through 600.

Default: 30

default-originate [ route-map map_name ]

Originate default routes to this neighbor

route-map map_name: Specifies the route-map that contains the criteria to originate default routes.

map_name must be the name of an existing route-map in the current context.
**distribute-list** *dist_list* {in | out}
Filter updates to and from this neighbor based on a route access list.
Default: No filtering is performed.
*dist_list*: The name or number of an existing route-access-list.
*in*: Indicates that incoming advertised routes should be filtered.
*out*: Indicates that outgoing advertised routes should be filtered.

**ebgp-multihop** [max-hop *number*]
Allow external BGP (eBGP) neighbors not on directly connected networks.
*max-hop number*: The maximum number of hops allowed to reach a neighbor. *number* must be an integer from 1 through 255.
Default hop count: 255

**filter-list** *filt_list* { in | out }
Establish BGP filters based on an AS path access list.
*filt_list*: The name of an existing AS path access list.
*in*: Indicates that incoming advertised routes will be filtered.
*out*: Indicates that outgoing advertised routes will be filtered.

**max-prefix** *max_num* [ threshold *thresh_percent* ] [ warning-only ]
The maximum number of prefixes accepted from this peer. When the maximum is exceeded the neighbor connection is reset.
*max_num*: Specifies the maximum number of prefixes permitted. This must be an integer from 1 through 4294967295.
Default: No maximum prefix limit.
*threshold* *thresh_percent*: A percentage value which specifies that when the BGP table is the specified percentage full from this peer warnings are sent to the neighbor. *thresh_percent* must be an integer from 1 through 100.
*warning-only*: This keyword specifies that only a warning message is sent when the limit is exceeded. The neighbor connection is not reset.

**remote-as** *AS_num*
Specify the AS number of the BGP neighbor.
*AS_num*: The neighbor’s autonomous system number. must be an integer from 1 through 65535.

**remove-private-AS**
Remove the private AS number from outbound updates.
Default: Do not remove the private AS number.

**route-map** *map_name* { in | out }
Apply a route map to the neighbor.
*map_name*: Specifies the route-map apply. *map_name* must be the name of an existing route-map in the current context.
*in*: Indicates that the route map applies to incoming advertisements.
*out*: Indicates that the route map applies to outgoing advertisements.
shutdown

Administratively shut down this neighbor. This disables exchanging routes or configuring parameters for this neighbor.

srp-activated-soft-clear

Enables BGP updates when SRP-enabled resources are modified.

timers { [ connect-interval conn_time ] | [ keepalive-interval keep_time ] | [ holdtime-interval hold_time ] }

BGP timers for the specified neighbor.
connect-interval conn_time: Specifies the connect timer in seconds. conn_time must be an integer from 0 through 65535. The default is 60 seconds.
keepalive-interval keep_time: The frequency (in seconds) at which the current BGP router sends keepalive messages to its neighbor. keep_time must be an integer from 0 through 65535. The default is 30 seconds.
holdtime-interval hold_time: The interval (in seconds) the router waits for a keepalive message before declaring a neighbor dead. hold_time must be an integer from 0 through 65535. The default is 90 seconds.

update-source ip_address

use this keyword to bind the specified IP address to the BGP socket that is used to communicate to the peer. ip_address is an IPv4 address in dotted-decimal notation.
In most cases you should set the update-source address to the address of the loopback interface in the current context. By doing this, the TCP connection does not go down until there is no route for the loopback address in the peering router.

weight value

This command sets the default weight for routes from this neighbor.
value: This must be an integer from 0 through 65535.
Default: 0

Usage

Use this command to set parameters for communication with a specified neighbor. The chassis supports a maximum of 64 peers per context.

Important: A remote AS number must be specified for a neighbor before other parameters can be configured.

Example

The following command specifies that the neighbor at the IP address 192.168.100.25 has an AS number of 2000:

```
neighbor 192.168.100.25 remote-as 2000
```

The following command allows BGP neighbors that are a maximum of 27 hops away:

```
neighbor 192.168.100.25 ebgp-multihop max-hop 27
```

The following command sets the minimum interval between sending routing updates to 3 minutes (180 seconds):

```
neighbor 192.168.100.25 timers 3 30 90
```
neighbor 192.168.100.25 advertisement-interval 180

The following command sets the default weight for all routes from the specified neighbor to 100:

neighbor 192.168.100.25 weight 100
redistribute

Redistributes routes into BGP. This means that any routes from another protocol are redistributed to BGP neighbors using the BGP protocol.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > BGP Configuration > BGP Address-Family Configuration

```
configure > context context_name > router bgp as_number > address-family
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bgp-af-VPN4)#
```

**Syntax**

```
[no] redistribute {connected | ospf | rip | static} [route-map map_name]
```

- **no**
  Remove the specified redistribution parameters from the BGP router configuration.

- **connected**
  Specifies that connected routes will be redistributed.

- **ospf**
  Specifies that Open Shortest Path First (OSPF) routes will be redistributed

- **rip**
  Specifies that Routing Information Protocol (RIP) routes will be redistributed. (RIP is not supported at this time.)

- **static**
  Specifies that static routes will be redistributed.

- **route-map map_name**
  Filter routes through the specified route map before redistribution.
  `map_name` specifies the name of the route-map to use and must be specified as an alphanumeric string of 1 through 79 characters.

**Usage**
Use this command to specify what routes this BGP router should redistribute into BGP.

**Example**

Command Line Interface Reference, StarOS Release 17
The following command redistributes OSPF routes after filtering them through the route map named \textit{Map1}:

\texttt{redistribute ospf route-map Map1}

The following command removes the redistribution of OSPF routes from the router’s configuration:

\texttt{no redistribute ospf route-map Map1}
Chapter 32
BGP Configuration Mode Commands

The Border Gateway Protocol (BGP) Configuration Mode is used to configure properties for BGP-4 routing.

Mode

Exec > Global Configuration > Context Configuration > BGP Configuration

`configure > context context_name > router bgp as_number`

Entering the above command sequence results in the following prompt:

```
/context_name/host_name(config-bgp)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
accept-zero-as-rd

Configures to accept VPN prefixes with Router Distinguisher(RD) value having Administrator Subfield, which is an Autonomous System number 0.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > BGP Configuration

Syntax

```plaintext
[ no ] accept-zero-as-rd
```

no

Removes the configured VPN prefixes with RD value having AS number 0.

Usage

Use this command to configure VPN prefixes with RD value having Administrator Subfield, which is an Autonomous System number 0.

Example

Following command configures to accept VPN prefixes with RD value having AS number 0:

```plaintext
accept-zero-as-rd
```
address-family ipv4

Enters the IPv4 Address Family configuration mode. Optionally, it also enables the Virtual Routing and Forwarding (VRF) routing configuration, if specified.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > BGP Configuration

```text
configure > context context_name > router bgp as_number
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bgp)#
```

**Syntax**

```text
[ no ] address-family ipv4 [ vrf vrf_name ]
```

- **no**
  Removes the configured IPv4 address family VRF mode.

- **address-family ipv4**
  Enters the BGP Address-Family IPv4 mode to allow entry of IPv4 BGP parameters.

  **Important:** The route distinguisher ID must be configured for the VRF name via the `route-distinguisher` command in BGP VRF Configuration mode, before using this keyword.

  ```text
  vrf vrf_name
  ```

  Enables the exchange of VRF routing information. When this keyword is specified with this command, the address family mode changes to VRF address family mode. `vrf_name` is the name of an existing VFR expressed as an alphanumeric string of 1 through 63 characters.

**Usage**

Use this command to configure the IPv4 BGP address family configuration parameters and optionally enables the exchange of VRF routing information.

Use of the `address-family ipv4` command switches the command mode to BGP Address Family Configuration Mode; the CLI prompt changes to:

```
[context_name]>host_name(config-bgp-af-v4)#
```

Use of `address-family ipv4 vrf vrf_name` command switches the command mode to BGP Address Family Configuration Mode; the CLI prompt changes to:

```
[context_name]>host_name(config-bgp-af-vrf)#
```
Example

Use the following command to enter the IPv4 BGP Address-Family configuration mode:

```
address-family ipv4
```

Use the following command to enter the IPv4 VRF BGP Address-Family configuration mode for exchange of VRF routing information from VRF `route_vrf1`:

```
address-family ipv4 vrf route_vrf1
```
address-family ipv6

Enters the IPv6 Address Family configuration mode. Optionally, it also enables the Virtual Routing and Forwarding (VRF) routing configuration mode, if specified.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > BGP Configuration

configure > context context_name > router bgp as_number

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-bgp)#

Syntax

[ no ] address-family ipv6 [ vrf vrf_name ]

no

Removes the configured IPv6 address family VRF mode.

address-family ipv6

Enters the BGP Address-Family IPv6 mode to allow entry of IPv6 BGP parameters.

vrf vrf_name

Enables the exchange of VRF routing information. When this keyword is specified with this command, the address family mode changes to VRF address family mode. vrf_name is the name of an existing VFR expressed as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the IPv6 BGP address family configuration parameters for BGP router. Use of the address-family ipv6 command switches the command mode to BGP Address Family Configuration Mode and changes the CLI prompt to:

[context_name>]host_name(config-bgp-af-v6)#

Example

Use the following command to enter the IPv6 BGP Address-Family configuration mode:

address-family ipv6
address-family vpnv4

Enters the IPv4 VPN Address Family configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > BGP Configuration

configure > context context_name > router bgp as_number

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-bgp)#

Syntax

address-family vpnv4

Enters the BGP Address-Family IPv4 VPN mode to allow entry of VPN BGP parameters.

Usage
Use this command to configure the VPNv4 address family configuration parameters for BGP router. This command is also used to switch the command mode to enter the BGP Address Family Configuration Mode. Use of the address-family vpnv4 command switches the command mode to BGP Address Family Configuration Mode; the CLI prompt changes to:

[context_name>host_name(config-bgp-af vpnv4)#

Example
Use the following command to enter the BGP Address-Family configuration mode for IPv4 VPN address parameters:

address-family vpnv4
address-family vpnv6

Enters the IPv6 VPN Address Family configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > BGP Configuration
configure > context context_name > router bgp as_number

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-bgp)#

Syntax

address-family vpnv6

address-family vpnv6
Enters the BGP Address-Family IPv6 VPN mode to allow entry of VPN BGP parameters.

Usage
Use this command to configure the IPv6 VPN address family configuration parameters for BGP router. This command is also used to switch the command mode to enter the BGP Address Family Configuration Mode. Use of the address-family vpnv6 command switches the command mode to BGP Address Family Configuration Mode; the CLI prompt changes to:

[context_name>]host_name(config-bgp-af-vpnv6)#

Example
Use the following command to enter the BGP Address-Family configuration mode for IPv6 VPN address parameters:

address-family vpnv6
**bgp**

Defines the BGP-specific parameters regarding graceful restarts.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > BGP Configuration

`configure > context context_name > router bgp as_number`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-bgp)#`

**Syntax**

```
bgp graceful-restart { restart-time rest_time | stalepath-time stale_time | update-delay delay }
```

- **graceful-restart restart-time rest_time**
  Specifies the maximum time (in seconds) required for neighbor(s) to gracefully restart. *rest_time* must be an integer from 1 through 3600.

- **graceful-restart stalepath-time stale_time**
  Specifies the maximum time (in seconds) to retain stale paths from restarting neighbor(s). *stale_time* must be an integer from 1 through 3600.

- **graceful-restart update-delay delay**
  Specifies the maximum time (in seconds) to defer initial route-selection. *delay* must be an integer from 1 through 3600.

**Usage**

Use this command to set BGP-specific parameters regarding graceful restarts.

**Example**

Use the following command to retain stale paths from restarting neighbor(s) for 100 seconds:

```
bgp graceful-restart stalepath-time 100
```
description

Allows you to enter descriptive text for this configuration.

Product
All

Privilege
Security Administrator, Administrator

Syntax

description text

no
description
text

Clears the description for this configuration.

Enter descriptive text as an alphanumeric string of 1 to 63 characters. If you include spaces between words in the description, you must enclose the text within double quotation marks (" "), for example, “AAA BBBB”.

Usage

The description should provide useful information about this configuration.
distance

Defines the administrative distance for routes. The administrative distance is the default priority for a specific route or type route.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > BGP Configuration
configure > context context_name > router bgp as_number

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-bgp)>

Syntax

distance { admin distance prefix prefix_addr [ route-access-list list_name ] | bgp external ebgp_dist internal ibgp_dist local local_dist }

no distance { admin distance prefix prefix_addr [ route-access-list list_name ] | bgp [ external ebgp_dist internal ibgp_dist local local_dist ] }

no

Removes the specified administrative distance for the specific route.

distance admin distance prefix prefix_addr [ route-access-list list_name ]

Sets the administrative distance to a specified value for routes with a specific IP prefix. If you also specify a route access list, the IP prefix must match the rules of that access list.
admin distance: Specifies the administrative distance that you want to apply to the IP prefix. distance must be an integer from 1 through 254.
prefix prefix_addr: Specifies the IP prefix of routes that should have the admin distance applied. prefix_addr must be an IPv4 address in dotted-decimal notation and the number of subnet bits, representing the subnet mask in CIDR shorthand (for example, 10.1.1.1/24).
route-access-list list_name: Defines the name of a route access list that defines for which routes the administrative distance should be set.

distance bgp external ebgp_dist internal ibgp_dist local local_dist

Sets the administrative distance for external (eBGP), internal (iBGP) and local routes.
external ebgp_dist: Sets the administrative distance for eBGP routes. ebgp_dist must be an integer from 1 through 254.
internal ibgp_dist: Sets the administrative distance for iBGP routes. ibgp_dist must be an integer from 1 through 254.
local local_dist: Sets the administrative distance for local routes. local_dist must be an integer from 1 through 254.
Usage

Use this command to set the administrative distance for specific routes to values that you specify. These values are only applied to the current router.

Example

Use the following command to set the administrative distance to 100 for all routes that have an IP prefix of 192.168.0.0 with a netmask of 16 and are specified in a remote access list named rac11:

distance admin 100 prefix 192.168.0.0/16 route-access-list rac11
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```bash
dep
```

**Usage**
Use this command to return to the Exec mode.
enforce-first-as

Enforces the first Autonomous System (AS) for Exterior Border Gateway Protocol (eBGP) routes. An AS is a connected group of one or more Internet Protocol prefixes run by one or more network operators which has a single and clearly defined routing policy (RFC 1930).

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > BGP Configuration
configure > context context_name > router bgp as_number

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-bgp)#

Syntax

[ no ] enforce-first-as

---

no

Disables the enforcement of the first AS for Exterior Border Gateway Protocol (eBGP) routes.

---

enforce-first-as

Enables the enforcement of the first AS for Exterior Border Gateway Protocol (eBGP) routes.

---

Usage

Use this command to enforce the use of the first AS for EBGP routes.

Example

Use the following command to enable this functionality:

    enforce-first-as
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Use this command to return to the parent configuration mode.
ip vrf

Adds a preconfigured IP VRF context instance to the BGP ASN and configures the BGP attributes and related parameters to the VRF. This command also switches the command mode to BGP VRF Configuration mode.

**Product:** All

**Privilege:** Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > BGP Configuration

`configure > context context_name > router bgp as_number`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bgp)#
```

**Syntax**

```
[ no ] ip vrf vrf_name
```

- **no**
  
  Removes an associated IP VRF from specified BGP AS number and other configured parameters.

- **vrf_name**
  
  Specifies the IP VRF context configured in the Context configuration mode and to be associated with a BGP AS number. vrf_name must be an alphanumeric string of 1 through 79 characters identifying an existing instance.

**Usage**

Use this command to associate the specified IP VRF context instance to the BGP AS number and configures the BGP attributes and related parameters to the VRF. This command also switches the command mode to BGP VRF Configuration mode.

This command switches the command mode to BGP IP VRF Configuration Mode; the CLI prompt changes to:

```
[context_name>]host_name(config-bgp-vrf)#
```

**Example**

The following command associates the pre-defined VRF context instance `router_mpls` to this BGP AS number:

```
ip vrf router_mpls
```
maximum-paths

Enables forwarding packets over multiple paths and specifies the maximum number of external BGP (eBGP) or internal BGP (iBGP) paths between neighbors.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > BGP Configuration

```
configure > context context_name > router bgp as_number
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bgp)#
```

**Syntax**

```
maximum-paths { ebgp max_num | ibgp max_num }
[ no ] maximum-paths { ebgp | ibgp }
```

- **no**
  Disables forwarding packets over multiple eBGP or iBGP paths between neighbors.

- **ebgp max_num**
  Enables forwarding packets over multiple eBGP paths between neighbors and specifies the maximum number of eBGP paths. _max_num_ must be an integer from 1 through 10 or 1 through 32 (VPC-DI only).

- **ibgp max_num**
  Enables forwarding packets over multiple iBGP paths between neighbors and specifies the maximum number of iBGP paths. _max_num_ must be an integer from 1 through 10 or 1 through 32 (VPC-DI only).

**Usage**

Use this command to enable or disable forwarding packets over multiple paths between neighbors and specify the maximum number of EBGP or IBGP paths.

**Example**

To enable forwarding packets over multiple paths and set the maximum number of EBGP paths to 10, enter the following command:

```
maximum-paths ebgp 10
```

To disable forwarding packets over multiple EBGP paths, enter the following command:

```
no maximum-paths ebgp
```
**neighbor**

Configures BGP routers that interconnect to non-broadcast networks. Note that a remote AS number must be specified for a neighbor before other parameters can be configured.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > BGP Configuration

```
configure > context context_name > router bgp as_number
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bgp)#
```

**Syntax**

```
[ no ] neighbor ip_address { activate | advertisement-interval adv_time | capability graceful-restart | default-originate [ route-map map_name ] | distribute-list dist_list { in | out } | ebgp-multihop [ max-hop number ] | encrypted password encrypted_password | fall-over bfd [ multihop ] | filter-list filt_list { in | out } | max-prefix max_num [ threshold thresh_percent ] | [ warning-only ] | next-hop-self | password password | remote-as AS_num | remove-private-AS | restart-time rest_time | route-map map_name { in | out } | send-community { both | extended | standard } | shutdown | srp-activated-soft-clear | timers { [ connect-interval conn_time ] | [ keepalive-interval keep_time holdtime-interval hold_time ] } | update-source ip_address | weight value }
```

**no**
Delete the specified parameter from the router configuration.

**neighbor ip_address**
Specifies the IP address of a BGP neighbor. `ip_address` must be in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**activate**
Enable the exchange of routes with this neighbor.

**advertisement-interval adv_time**
The minimum interval (in seconds) between sending BGP routing updates. `adv_time` must be an integer from 0 through 600. Default: 30

**capability graceful-restart**
Configures BGP graceful restart attributes.

**default-originate [ route-map map_name ]**
Enables the origination of default routes to this neighbor.
route-map map_name: Specifies the route-map that contains the criteria to originate default routes. map_name must be the name of an existing route-map in the current context.

distribute-list dist_list { in | out }
Filters updates to and from this neighbor based on a route access list. dist_list: The name or number of an existing route-access-list. Default: No filtering is performed.
in: Indicates that incoming advertised routes should be filtered.
out: Indicates that outgoing advertised routes should be filtered.

ebgp-multihop [ max-hop number ]
Allows EBGP neighbors that are not on directly connected networks.
[ max-hop ] number: Specifies the maximum number of hops allowed to reach a neighbor. number must be an integer from 1 through 255. Default hop count: 255

encrypted password encrypted password
Specifies an encrypted password that is used only inside configuration files. This should be an alphanumeric string of 1 through 523 characters.

fall-over bfd [ multihop ]
Enables Bidirectional Fwarding Detection (BFD) multihop support for fallover.
This command adds or modifies a session in BFD for the BGP peer. If there is an existing session in BFD (same source-address/destination address), BGP or OSPF protocol will be added to the list of clients for the BFD session. BGP or OSPF will then be notified when there is a change in the BFD session state.
If there is no such BFD session, a new session is added in BFD. For MH-BFD, the session inherits the parameters including min-tx, min-rx, multiplier and authentication from the multihop-peer configuration in BFD by matching the destination address. If the parameters (interval) are not configured in BFD, then the BFD session will be in Admin-down state.
BGP adds a session in BFD only when the BGP peer is Established state. If there is a state transition in bgp where the peer is no longer in established state, then the bfd session is deleted. It will be added again, once the peer comes back to Established state.

filter-list filt_list { in | out }
Establishes BGP filters based on an AS path access list. filt_list is the name of an existing AS path access list.
in: Indicates that incoming advertised routes will be filtered.
out: Indicates that outgoing advertised routes will be filtered.

max-prefix max_num [ threshold thresh_percent ] [ warning-only ]
The maximum number of prefixes accepted from this peer. When the maximum is exceeded the neighbor connection is reset.
Default: No maximum prefix limit.
max_num: Specifies the maximum number of prefixes permitted. This must be an integer from 1 through 4294967295.
[ threshold thresh_percent ]: Specifies a percentage value of when the BGP table is full. When this value is reached, peer warnings are sent to the neighbor and the neighbor connection is reset.
thresh_percent must be an integer from 1 through 100.
[ warning-only ]: Specifies that only a warning message is sent when the limit is exceeded. The neighbor connection is not reset.
**BGP Configuration Mode Commands**

**next-hop-self**
Disables the next hop calculation for this neighbor.

**password password**
Specifies a password that is only used inside configuration files. This should be an alphanumeric string of 1 through 24 characters.

**remote-as AS_num**
Specify the AS number of the BGP neighbor.

*AS_num*: Specifies the neighbor’s AS number as an integer from 1 through 65535.

**remove-private-AS**
Removes the private AS number from outbound updates. Default: Do not remove the private AS number.

**restart-time rest_time**
Specifies the maximum time (in seconds) required for a neighbor to restart. *rest_time* must be an integer between 1 and 3600.

**route-map map_name { in | out }**
Applies a route map to the neighbor. *map_name* is the name of an existing route-map in the current context.

*in*: Indicates that the route map applies to incoming advertisements.

*out*: Indicates that the route map applies to outgoing advertisements.

**send-community { both | extended | standard }**
Sends the community attributes to a peer router (neighbor).

*both*: Sends extended and standard community attributes.

*extended*: Sends extended community attributes.

*standard*: Sends standard community attributes.

**shutdown**
Administratively shuts down this neighbor. This disables exchanging routes or configuring parameters for this neighbor.

**srp-activated-soft-clear**
Enables BGP updates when Service Redundancy Protocol SRP-enabled resources are modified.

**timers { [ connect-interval conn_time ] | [ keepalive-interval keep_time holdtime-interval hold_time ]]**
Specifies BGP timers for this neighbor.

*connect-interval conn_time*: Specifies the connect timer in seconds. *conn_time* must be an integer from 0 through 65535. The default is 60 seconds.

*keepalive-interval keep_time*: The frequency (in seconds) at which the current BGP router sends keepalive messages to its neighbor. *keep_time* must be an integer from 0 through 65535. The default is 30 seconds.

*Holdtime-interval hold_time*: The interval (in seconds) the router waits for a keepalive message before declaring a neighbor dead. *hold_time* must be an integer from 0 through 65535. The default is 90 seconds.
**update-source ip_address**

Binds the specified IP address to the BGP socket that is used to communicate to the peer. *ip_address* is an IPv4 address in dotted-decimal notation.

In most cases you should set the update-source address to the address of the loopback interface in the current context. By doing this, the TCP connection does not go down until there is no route for the loopback address in the peering router.

**weight value**

Sets the default weight for routes from this neighbor. *value* must be an integer from 0 through 65535. Default: 0

**Usage**

Use this command to set parameters for communication with a specified neighbor. The chassis supports a maximum of 64 peers per context.

**Example**

The following command specifies that the neighbor at the IP address 192.168.100.25 has an AS number of 2000:

```
neighbor 192.168.100.25 remote-as 2000
```

The following command allows BGP neighbors that are a maximum of 27 hops away:

```
neighbor 192.168.100.25 ebgp-multihop max-hop 27
```

The following command sets the minimum interval between sending routing updates to 3 minutes (180 seconds):

```
neighbor 192.168.100.25 advertisement-interval 180
```

The following command sets the default weight for all routes from the specified neighbor to 100:

```
neighbor 192.168.100.25 weight 100
```
**network**

Specifies a network to announce via BGP.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > BGP Configuration

`configure > context context_name > router bgp as_number`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bgp)#
```

**Syntax**

```
[ no ] network ip_address/mask [ route-map map_name ]
```

- **no**
  Delete the specified network from the configuration for the BGP router.

- **ip_address/mask**
  Specifies the IP address and netmask bits for the network to announce via BGP. *ip_address* is a network IPv4 address in dotted-decimal notation and *mask* is the number of subnet bits, representing a subnet mask in CIDR shorthand. These must be entered in the dotted-decimal notation/subnet bits format (for example, 10.1.1.1/24).

- **route-map map_name**
  Filter routes through the specified route map before announcing the network. *map_name* is the name of the route-map to use specified as an alphanumeric string of 1 through 79 characters.

**Usage**

Use this command to specify a network to announce via BGP.

**Example**

The following command announces the network 192.168.0.0 with a netmask of 16 via BGP:

```
network 192.168.0.0/16
```

The following command removes the network from the BGP router configuration:

```
no network 192.168.0.0/16
```
redistribute

Redistributes routes via BGP from another protocol to BGP neighbors.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > BGP Configuration

configure > context context_name > router bgp as_number

Entering the above command sequence results in the following prompt:

[context_name] host_name(config-bgp) #

Syntax

[ no ] redistribute { connected | ospf | rip | static } [ route-map map_name ]

no
Remove the specified redistribution parameters from the BGP router configuration.

redistribute connected
Specifies that connected routes will be redistributed.

redistribute ospf
Specifies that Open Shortest Path First (OSPF) routes will be redistributed.

redistribute rip
Specifies that Routing Information Protocol (RIP) routes will be redistributed. (RIP is not supported at this time.)

redistribute static
Specifies that static routes will be redistributed.

[ route-map map_name ]
Filter routes through the specified route map before redistribution. map_name specifies the name of the route-map to use and must be specified as an alphanumeric string of 1 through 79 characters.

Usage
Use this command to specify what routes this BGP router should redistribute into BGP.

Example
The following command redistributes OSPF routes after filtering them through the route map named Map1:

redistribute ospf route-map Map1
The following command removes the redistribution of OSPF routes from the router’s configuration:

```plaintext
no redistribute ospf route-map map1
```
**router-id**

Overides the configured router identifier and causes BGP peers to reset.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > BGP Configuration
```
configure > context context_name > router bgp as_number
```
Entering the above command sequence results in the following prompt:
```
[context_name]host_name(config-bgp)#
```

**Syntax**
```
router-id ip_address

no router-id [ ip_address ]
```

- **no**
  Remove the specified router ID from the router’s configuration and use the default router ID.

- **router-id ip_address**
  Specifies the IP address to use as the BGP router ID as an IPv4 address in dotted-decimal notation.

**Usage**
Use this command to configure a specific router ID that overrides the default.

**Example**
The following command sets the router ID to **192.168.100.25**:
```
router-id 192.168.100.25
```
scan-time

Configures the BGP background scanner interval. BGP monitors the next hop of the installed routes to verify next-hop reachability and to select, install, and validate the BGP best path. By default, the BGP scanner polls the Routing Information Base (RIB) for this information every 60 seconds. During the 60-second time period between scan cycles, Interior Gateway Protocol (IGP) instabilities or other network failures can cause temporarily black holes and routing loops.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > BGP Configuration

configure > context context_name > router bgp as_number

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-bgp)#

Syntax

[ no ] scan-time time

no

Remove the user specified scan time from the router’s configuration. The scan time is reset to the default value.

scan-time time

Specifies the amount of time (in seconds) to wait between background scans to determine next-hop validity. time must be an integer from 5 through 60. Default: 60

Usage

Use this command to set the background scanner interval for the BGP router.

Example

The following command sets the background scanner interval to 30 seconds:

scan-time 30
timers

Configures BGP routing timers.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > BGP Configuration

configure > context context_name > router bgp as_number

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-bgp)#

Syntax

```
timers bgp keepalive-interval interval holdtime-interval time [ min-peer-holdtime-interval time ]
```

no
Remove the user specified timer values from the router’s configuration. The timer values are reset to the default values.

```
timers bgp keepalive-interval interval holdtime-interval time
```

keepalive-interval interval: Specifies the interval (in seconds) to wait between sending keepalive packets as an integer from 0 through 65535. Default: 30

holdtime-interval time: Specifies the interval (in seconds) after which the neighbor is considered dead if keepalive messages are not received as an integer from 0 through 65535.

```
[ min-peer-holdtime-interval time ]
```

Specifies the interval (in seconds) that is the minimum acceptable hold time from a neighbor as an integer from 0 through 65535. The default is 0 so that there is no restriction on the hold time received in an OPEN message from the peer.

Usage

Use this command to configure the how long to wait between sending keepalive packets and how long to wait for a keepalive before considering a a neighbor dead.

Example

The following command sets the keepalive interval to 2 minutes (120 seconds) and the holdtime interval to 3 minutes (180 seconds):

```
timers bgp keepalive-interval 120 holdtime-interval 180 min-peer-holdtime-interval 0
```
Chapter 33
BGP IP VRF Configuration Mode Commands

The Border Gateway Protocol (BGP) IP VRF (Virtual Routing and Forwarding) Configuration Mode is used to configure properties for BGP-4 routing.

Important: The VRF must have been preconfigured using the `ip vrf` command in the Context Configuration mode before you can enter this configuration mode.

Mode

Exec > Global Configuration > Context Configuration > BGP Configuration > BGP-IP VRF Configuration

`configure > context context_name > router bgp as_number > ip vrf vrf_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bgp-vrf)#
```

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Use this command to return to the parent configuration mode.
**route-distinguisher**

Assigns a route distinguisher (RD) for the VRF that helps identify a virtual routing domain in a provider’s network and allows for overlapping IP space. The route distinguisher must be a unique value on the router for each VRF.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > BGP Configuration > BGP-IP VRF Configuration

```
configure > context context_name > router bgp as_number > ip vrf vrf_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bgp-vrf)#
```

**Syntax**

```
route-distinguisher { as_number | ip_address } rd_identifier
```

- **route-distinguisher as_number rd_value**
  
  Identifies the target VRF by an autonomous system (AS) number. **ASN value** is a 16-bit ASN expressed as an integer from 0 through 65535.

- **route-distinguisher ip_address rd_value**
  
  Identifies the target VRF by its IP address. **ip_address** is entered using IPv4 dotted-decimal notation.

  ```
  rd_identifier
  ```

  **rd_value** is a unique route distinguisher identifier and must be an integer from 0 through 4294967295.

**Usage**

Use this command to assign a router distinguisher (RD) for the IP VRF. The combination of AS number or IP address and RD value must be unique for every VRF configured. The RD is added to the beginning of the pool addresses to change them into globally unique VPN-IPv4 prefixes.

If the RD is not configured for a VRF, user cannot enter into the BGP Address-Family mode for that VRF to configure the neighbors or other related BGP commands.

An RD assigned to a VRF cannot be changed until the existing VRF is deleted or removed and reconfigured.

**Example**

The following command assigns a router distinguisher 12345 to VRF with AS number 300:

```
route-distinguisher 300 12345
```

The following command assigns a router distinguisher 12345 to VRF with IP address 10.5.3.4:

```
route-distinguisher 10.5.3.4 12345
```
route-target

Adds an export and/or import list of extended route target communities to the VRF. BGP uses an extended-community attribute, the route target, to filter appropriate VPN routes into the correct VRFs. You configure the export list on the VRF to specify export route targets. When BGP advertises a route from this VRF’s forwarding table, it associates the list of export route targets with the route and includes this attribute in the update message that advertises the route. You also configure a route-target import list on each VRF to specify import route targets.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > BGP Configuration > BGP-IP VRF Configuration

configure > context context_name > router bgp as_number > ip vrf vrf_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-bgp-vrf)#

Syntax

route-target { both | import | export } { as_value | ip_address } rt_value

route-target both

Creates a list of import and export route targets for the VRF with the same parameters. The list contains an AS number or IP address along with a route target (RT) value.

route-target import

Creates a list of import RTs for the VRF with the same parameters. The list contains an AS number or IP address along with an RT value.

route-target export

Creates a list of export RTs for the VRF with the same parameters. The list contains an AS number or IP address along with an RT value.

as_value

Specifies a 16-bit autonomous-system (AS) number expressed as an integer from 0 through 65535.

ip_address

Specifies an IP address in IPv4 dotted-decimal notation.

rt_value

Specifies a unique RT identifier as an integer from 0 through 4294967295.
### Usage

Use this command to create the list of export and/or import route target extended communities for VRF.
A maximum of 5 route targets can be defined with this command up to release 9.0.
A maximum of 10 route targets can be defined with this command from release 10.0 onward.

**Important:** This command must be executed for each route target extended community.

### Example

The following command creates an export list of route target extended community 12345 for VRF with AS number 300:

```bash
route-target export 300 12345
```

The following command creates an export list of route target extended community 12345 for VRF with IP address 192.168.1.2:

```bash
route-target export 192.168.1.2 12345
```
Chapter 34
BITS Port Configuration Mode Commands

The Building Integrated Timing Supply (BITS) port configuration mode allows you to configure an ASR 5000 SPIO equipped with an E1 or T1 BITS port. You can also configure line-timing whereby the SPIO recovers timing from a port on an optical (OLC/OLC2) or channelized (CLC/CLC2) card.

Mode

Exec > Global Configuration > BITS Port Configuration

configure > port bits slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**default**

Restores the BITS port’s default speed and communication mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > BITS Port Configuration

*configure > port bits slot_number/port_number*

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**

```
default { mode | preferred slot }
```

---

**mode**
Default: none
Sets the default for the ports framing mode.

---

**preferred slot**
Default: non-revertive
Sets the port for non-revertive operation for port redundancy auto-recovery; requiring an administrative user to manually issue a `port switch` command to return service to the original port.

---

**Usage**
Restores port-level parameters to their default values.

**Example**

Use the following command to remove any setting for this port’s framing mode:

```
default mode
```
description

Defines descriptive text that provides useful information about the BITS port.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > BITS Port Configuration

configure > port bits slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Syntax

description text

no description

no

Removes the port’s description from the configuration file.

text

text must be a string of 1 to 79 alphanumeric characters with no spaces or a string within double quotes that includes printable characters. The description is case-sensitive.

Usage

Enter a description that provides helpful information, for example the BITS port’s primary function, services, end users. Define any information, the only limit is the number of characters.

Example

Use the following command to set a sample port description in the configuration file:

description samplePortDescriptiveText

Use the following command to set a more readable description:

description "This is a sample description"
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
mode

Configures the framing mode for the port.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > BITS Port Configuration

```
configure > port bits slot_number/port_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

Syntax

```
mode { e1 | t1 } framing type
```

- **e1 | t1**
  - **e1** selects the SDH E1 framing mode.
  - **t1** selects the SONET T1 framing mode.

- **framing type**
  - Specifies the type of framing used by E1 or T1 modes from which to derive timing:
    - **basic**: Selects the Frame Alignment Signal (FAS) used with E1.
    - **crcmf**: Selects the Multiframe with CRC (FAS+CRC) used with E1.
    - **esf**: Selects the extended superframe format used with T1.
    - **sf**: Selects the superframe format (D4) used with T1.

Usage

Set the ports framing mode parameters.

Example

Configure the port to support E1 with crcmf framing.

```
mode e1 framing crcmf
```
**preferred slot**

Identifies which card in a chassis should assume revertive (redundancy auto-recovery) functionality should the slot/port being configured go down. There are only two SPIOs, one in slot 24 and the other in slot 25.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > BITS Port Configuration

`configure > port bits slot_number/port_number`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**

```
preferred slot  slot_number

[ default | no ] preferred slot  slot_number
```

- **default**
  
  Defaults to non-revertive operation.

- **no**
  
  Disables revertive (auto-recovery) operation for the port.

- **slot_number**
  
  Identifies the physical slot in the chassis where the card is installed.

**Usage**

This command enables or disables revertive port redundancy. So after a BITS port failover, when the original port is restored to service (i.e. link up) the system will return service to that port automatically. Disabled, which is the default setting, causes non-revertive operation which requires an administrative user to manually issue a `port switch` command to return service to the original port.

**Example**

Use this command to set the BITS port on the card in slot 25 as “preferred” for port redundancy:

```
preferred slot 25
```
recover

Configures line-timing so the SPIO recovers timing from a port on an optical (OLC/OLC2) or channelized (CLC/CLC2) card. The recovered clock is then distributed to synchronize timing on all line cards in the chassis.

**Important:** To employ line-timing recovery, the SPIO card(s) must be equipped with the optional Stratum 3 clock module.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > BITS Port Configuration

```bash
configure > port bits slot_number/port_number
```

Entering the above command sequence results in the following prompt:

```bash
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**

```bash
recover { line1 slot_number | line2 slot_number }
```

```bash
no recover { line1 | line2 }
```

- **no**
  - Deletes the identified line-timing source definition from the configuration.

- **line1 slot**
  - Sets first priority for line-timing clock recovered from the line card in the specified slot.
  - `slot_number` is an integer between 1 and 48.

- **line2 slot**
  - Sets second priority for line-timing clock recovered from the line card in the specified slot.
  - `slot_number` is an integer between 1 and 48. This cannot be the same slot number entered for line1.

**Usage**

Define which line-timing source has priority.

**Important:** If the SPIO is connected to an external Building Integrated Timing Supply (BITS) source, BITS timing always takes precedence over line-timing.

**Example**

Configure the line card in slot 19 as the preferred source for line-timing.
recover line1 19
shutdown

Terminates all processes supporting the BITS port or blocks the shutting down of the port. Conversely, this command with the no keyword enables the port and BITS timing as a transmit timing source.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > BITS Port Configuration
configure > port bits slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Syntax

[ no ] shutdown

no

Enables the port’s administrative state. When omitted the card is shutdown (removed from service).

Usage
Shut down a timing port prior to re-cabling and/or other maintenance activities. This command with the no keyword is required to bring a port into service.

Example
Use the following command to enable the port for service:

no shutdown
snmp trap link-status

Enables/disables the generation and sending of an SNMP (notification) trap when the port experiences a change of state (up or down).

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > BITS Port Configuration

configure > port bits slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Syntax

[ no ] snmp trap link-status

  no

  Disables the sending of traps for link-status changes.

Usage

Enable the sending of link-status change traps if there is a monitoring facility that can use the information or if there are troubleshooting activities in progress.

Example

Use this command to enable sending of link-status SNMP traps:

    snmp trap link-status

Use this command to disable sending of link-status SNMP traps:

    no snmp trap link-status
Chapter 35
BMSC Profile Configuration Mode Commands

The BMSC Profile Configuration Mode is used to configure Broadcast Multicast Service Center profiles for Multimedia Broadcast Multicast Service (MBMS) applications. The mode is accessed by entering the `bmsc-profile` command from the Context Configuration Mode.

**Mode**

Exec > Global Configuration > Context Configuration > BMSC Profile Configuration

```
configure > context context_name > bmsc-profile profile_name
```

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-bmsc-profile)#`

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

`end`

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
exit
```

**Usage**
Use this command to return to the parent configuration mode.
gmb diameter dictionary

This command specifies the Diameter dictionary for the Gmb interface in the BMSC profile of an MBMS user service.

Product
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > BMSC Profile Configuration

Syntax

```plaintext
configure > context context_name > bmsc-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bmsc-profile)#
```

**Syntax**

```
gmb diameter dictionary { custom1 | custom10 | custom2 | custom3 | custom4 | custom5 | custom6 | custom7 | custom8 | custom9 | standard }
gmb diameter dictionary
```

**default gmb diameter dictionary**

```
custom1 ... custom10
```
Custom-defined Diameter dictionary. Specific to customer requirement.

```
standard
```
Default: Enabled
Specifies the standard Gmb Diameter dictionary conforming to 3GPP TS 29.061 (Rel. 7).

```
default
```
Sets the Diameter dictionary to standard.

**Usage**
Use this command to select the Gmb Diameter dictionary in BM-SC profile of MBMS user service.

**Example**
The following command sets the Gmb Diameter dictionary to TS 29.061 (Rel. 7) specific:

```
gmb diameter dictionary standard
```
gmb diameter endpoint

This command specifies the Diameter endpoint name for the Gmb interface in the BMSC profile of an MBMS user service.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > BMSC Profile Configuration

```plaintext
configure > context context_name > bmsc-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bmsc-profile)#
```

**Syntax**

```
gmb diameter endpoint endpoint_name
```

```
o gmb diameter endpoint
```

---

**Usage**

Use this command to create a Gmb Diameter endpoint for a BMSC profile.

**Example**

The following command creates a Diameter endpoint named `test1` in the BMSC profile of an MBMS user service:

```
gmb diameter endpoint test1
```
**gmb diameter peer-select**

This command specifies the peer ids of BM-C Diameter primary and secondary host in the BMSC profile for an MBMS user service.

**Product**

GGSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > BMSC Profile Configuration

```
configure > context context_name > bmsc-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-bmsc-profile)#
```

**Syntax**

```
gmb diameter peer-select peer peer_name [ realm realm_name ] [ secondary-peer sec_peer_name [ realm sec_realm_name ] ]
gmb diameter peer-select
```

---

**no**

Removes the previously configured BM-C Diameter peer ids configured in the BMSC profile of an MBMS user service.

**peer peer_name**

Specifies the primary diameter host id for BMSC in this BMSC profile for MBMS user service. This is a unique name that is specified for the primary peer.  

peer_name must be an alphanumeric string of 1 through 127 characters including punctuation marks.

**realm realm_name**

Specifies the realm or domain for the Gmb Diameter peer. The realm may typically be a company or service name.

realm_name must be an alphanumeric string of 1 to 127 characters including punctuation marks.

**secondary-peer sec_peer_name**

Specifies a back-up host that is used for fail-over processing. When the route-table does not find an AVAILABLE route, the secondary host performs fail-over processing.

sec_peer_name must be an alphanumeric string of 1 through 127 characters including punctuation marks.

**realm sec_realm_name**

Specifies the realm or domain for the Gmb Diameter secondary host. The realm may typically be a company or service name.

sec_realm_name must be an alphanumeric string of 1 through 127 characters including punctuation marks.
gmb diameter peer-select

Usage
Use this command to select a BMSC Diameter peer and realm in this BMSC profile for MBMS user service.

Example
The following command selects a Gmb Diameter peer named test1 and a realm of companyx:

```
gmb diameter peer-select peer test1 realm companyx
```
gmb user-data

This command configures the parameters in this BMSC profile for user data for MBMS user service.

Product
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > BMSC Profile Configuration
configure > context context_name > bmsc-profile profile_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-bmsc-profile)#

Syntax

```
gmb user-data { mode-preference { multicast | unicast } | unicast-self-address self_ip_address }

default gmb user-data mode-preference

no gmb user-data unicast-self-address
```

**no**
Removes the configured self address of GGSN for unicast in the BMSC profile for user data of MBMS user service.

**default**
Sets the user data mode to unicast in the BMSC profile for user data of MBMS user service.

**mode-preference { multicast | unicast }**
Default: unicast
Specifies the preferred mode of GGSN for receiving MBMS user service data.
**multicast**: specifies the preferred mode as multicast for MBMS user service.

**Important**: Note that this **multicast** keyword is not supported in this release.

**unicast**: specifies the preferred mode as unicast for MBMS user service.

**unicast-self-address self_ip_address**
Specifies the GGSN’s IP address for BMSC to use as the outer destination address for the IP-in-IP tunnel to send multicast data, if the configured preferred data mode is unicast.
**self_ip_address** must be the IPv4 address in dotted-decimal notation.
This command must be configured if GGSN's user-data mode-preference is Unicast.
**Usage**

Use this command to configure user data mode and other parameters in the BMSC profile for user data of MBMS user service.

GGSN can receive multicast data from BMSC in one of two modes - Multicast or Unicast. In Unicast mode, BM-SC tunnels the multicast data to the GGSN in an IP-in-IP tunnel instead of direct multicast. This command with the `mode-preference` keyword configures the GGSN's preferred mode for receiving multicast data.

---

**Important:** Both GGSN and BMSC must support the Unicast mode of multicast data transfer. If any GGSN or BMSC does not support Multicast mode, BMSC will transfer multicast data using Unicast mode only.

---

Use the `unicast-self-address` keyword to configure the GGSN's IP address which the BMSC should use as the outer destination address for the IP-in-IP tunnel to send multicast data, if the selected user data mode to receive multicast data is Unicast.

**Example**

The following command sets the MBMS data transfer mode to unicast:

```
default gmb user-data mode-preference
```
Chapter 36
BSSGP Cause Code Group Configuration Mode

Commands in this mode enable the operator to define multiple cause codes for the 2G service.

Mode
Exec > Global Configuration > LTE Policy Configuration > BSSGP Cause Code Configuration
configure > lte-policy > cause-code-group group_name protocol bssgp

Entering the above command sequence results in the following prompt:

[local] host_name(bssgp-cause-code)

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
radio-cause

Enables the operator to specify one or more cause codes for the 2G service.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > LTE Policy Configuration > BSSGP Cause Code Configuration

configure > lte-policy > cause-code-group group_name protocol bssgp

Entering the above command sequence results in the following prompt:

[local] host_name(bssgp-cause-code)

Syntax

radio-cause cause_code

no radio-cause cause_code

no
When included with the command, the specified cause code is deleted from the group. If all cause codes are deleted from the group then the group is automatically deleted.

cause_code
Enter an integer from 0 to 255 to identify a BSSGP protocol radio cause code, as defined in the Radio Cause section of the 3GPP TS 48.028 specification.

Important: The SGSN does not support Enhanced Radio Status functionality; therefore, the SGSN treats cause code values 0x03 and 0x04 as “Radio contact lost with MS”. Therefore, the valid configurable cause codes values are 0, 1, and 2.

Usage
The command can be repeated to define up to 16 BSSGP cause codes. This means that that under each cause code group the maximum number of cause codes (ranap+bssgp+s1ap) that can be supported is 16.

Benefit of specifying the cause codes in a group:

•If the BSSGP radio cause code configured by the operator matches with the radio cause received in the Radio Status message, and

•If the Subscriber Overcharging Protection feature is enabled for 2G service in the GPRS-Service configuration,

•Then the S4-SGSN includes ARRL (Abnormal Release of Radio Link) bit in Release Access Bearer Request message Initiated on Ready-to-Standby state transition.
Example

Repeat the command with different cause values to create a group:

```
radio-cause 1
radio-cause 3
```
Chapter 37
Bulk Statistics Configuration Mode Commands

The Bulk Statistics Configuration Mode is used to manage the options for the collection, formatting and delivery of system statistics to remote nodes.

Refer to the Common Syntax Options section in this chapter for information about formatting the output of bulk statistics.

_Important:_ Unless otherwise indicated, all statistics are counters. For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295. For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.

**Mode**

Exec > Global Configuration > Bulk Statistics Configuration

`configure > bulkstats mode`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

_Important:_ The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
Overview

Schema Format String Syntax

The following defines common syntax block options. These options appear in similar commands and are detailed here for easy reference.

The schema format string is used to define the structure of generated bulk statistics data. The string may contain static text, dynamic content, and bulk statistic variables, or any combination.

Static text includes any ASCII characters that are of a fixed value. Static text may also include control characters by using Escape character sequences. Supported Escape character shortcuts are “\n” for new line and “\t” for tab.

Enclosing an alphanumeric string within double quotation marks (“”) allows you to include spaces in the string.

Variables within the format string must be enclosed within “% and %”, for example, “%var%”. The actual variables supported are command-dependent and are described in the Statistics and Counters Reference.

Schema Format String Length

The maximum length of schema formats specified via the CLI is restricted by a limit on the CLI command. The command, which has the following syntax, cannot be more than 1021 characters long.

```<schema> schema <schema_name> format <schema_format>```

Where:

- `<schema_name>` can be a maximum of 31 characters.
- `<schema_format>` can be a maximum of “1021 minus “number of characters in rest of the command, including spaces”” characters.

Common Statistics

For a list of the statistics that are common to all schema, refer to the Statistics and Counters Overview chapter of the Statistics and Counters Reference.
**aal2 schema**

Configures the ATM adaptation layer 2 (AAL2) bulk statistics schema within an ATM virtual connection by the HNB-GW.

**Product**
HNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

configure > bulkstats mode

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
aal2 schema schema_name format schema_format
```

```
no aal2 schema schema_name
```

**no**

Removes the specified schema.

```
schema_name
```

Specifies the schema’s name.

`schema_name` must be an alphanumeric string of 1 through 31 characters.

```
format schema_format
```

Specifies the schema’s format.

`schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of

the command, including spaces’” characters. For more information, see the Schema Format String Length

section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and

Counters Reference.

**Usage**

Use this command to define schemas for ATM adaptation layer 2 (AAL2) bulk statistics collection. Multiple

AAL2 schemas can be created to further categorize HNB-GW-level bulk statistics. All of the schemas are

processed at each collection interval. To create multiple AAL2 schemas, re-issue the `aal2 schema

schema_name` command using a different schema name.

**Example**
The following command creates a schema named `aal2stats1` that records the number of AAL2 uplink packets transmitted and AAL2 downlink packets received by Access Link Control Application Part (ALCAP) service on HNB-GW:

```
   aal2 schema aal2stats1 format "\%uplink-pkts-tx\%" "\%downlink-pkts-rx\%"
```
**alcap schema**

Configures the Access Link Control Application Part (ALCAP) bulk statistics schema for an ALCAP service on an HNB-GW node.

**Product**
HNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

`configure > bulkstats mode`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
ap schema schema_name format schema_format

no alcap schema schema_name
```

**no**
Removes the specified schema.

```
schema_name
```
Specifies the schema’s name.

*schema_name* must be an alphanumeric string of 1 through 31 characters.

```
format schema_format
```
Specifies the schema’s format.

*schema_format* must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the **Schema Format String Length** section.

For information on the schema format’s syntax, see the **Schema Format String Syntax** section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

**Usage**

Use this command to define schemas for Access Link Control Application Part (ALCAP) service bulk statistics collection on HNB-GW node. Multiple ALCAP schemas can be created to further categorize at AAL2 channel-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple ALCAP schemas, re-issue the `alcap schema schema_name` command using a different schema name.

**Example**
The following command creates a schema named `alcapstats1` that records the number of AAL2 channels in connecting and connected state on ALCAP service:

```
alcap schema alcapstats1 format "%num-aal2-channels-in-connecting%"
"%num-aal2-channels-in-connected-state%"
```
apn schema

Configures the Access Point Name (APN) bulk statistics schema.

Product
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

apn schema schema_name format schema_format

no apn schema schema_name

no
Removes the specified schema.

schema_name
Specifies the schema’s name. schema_name must be an alphanumeric string of 1 through 31 characters.

format schema_format
Specifies the schema’s format. schema_format must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
For information on the schema format’s syntax, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage
Use this command to define schemas for APN bulk statistics collection. Multiple APN schemas can be created to further categorize APN-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple APN schemas, re-issue the apn schema schema_name command using a different schema name.

Example
The following command creates a schema named apn1stats1 that records the number of sessions currently facilitated by the APN:
apn schema apnlstats1 format "%sess-curr%"
asngw schema

Configures Access Service Gateway (ASN-GW) bulk statistics schema.

Product
ASN-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

asngw schema schema_name format schema_format

no asngw schema schema_name

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removes the specified schema.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>schema_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the schema’s name.</td>
</tr>
<tr>
<td>schema_name must be an alphanumeric string of 1 through 31 characters.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>format schema_format</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the schema’s format.</td>
</tr>
<tr>
<td>schema_format must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.</td>
</tr>
<tr>
<td>For information on the schema format’s syntax, see the Schema Format String Syntax section.</td>
</tr>
</tbody>
</table>

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for ASN-GW bulk statistics collection. Multiple ASN-GW service schemas can be created to further categorize ASN-GW service bulk statistics. All of the schemas are processed at each collection interval. To create multiple ASN-GW service schemas, re-issue the asngw schema schema_name command using a different schema name.

Example

To create an ASN-GW schema named asngw_statistics that specifies a schema format of:

- VPN context name: vpnname
• VPN Context Identifier: vpnid
• ASN-GW Service name: servname
• ASN-GW Service identifier: servid
• Peer IP address: peeripaddr

Use the following command:

```
asngw schema asngw_statistics format "VPN name: %vpnname%
VPN ID: %vpnid%
ASN-GW Service Name: %servname%
ASN-GW Service Identifier: %servid%
Peer IP Address: %peeripaddr"
```
**bcmcs schema**

Configures Broadcast and Multicast Service (BCMCS) bulk statistics schema.

**Product**  
PDSN

**Privilege**  
Security Administrator, Administrator

**Mode**  
Exec > Global Configuration > Bulk Statistics Configuration  
`configure > bulkstats mode`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
bcmcs schema  schema_name format  schema_format

no bcmcs schema  schema_name
```

**Usage**

Use this command to define schemas for BCMCS bulk statistics collection. Multiple BCMCS schemas can be created to further categorize BCMCS-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple BCMCS schemas, re-issue the `bcmcs schema  schema_name` command using a different schema name.

**Example**

The following command creates a schema named `bcmcs1stats1` that records the number of sessions currently facilitated by BCMCS:
bcmcs schema bcmcs1stats1 format "%sess-curr%"
card schema

Configures card bulk statistics schema. These are statistics for circuit cards installed in the ASR 5x00 chassis.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration

configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

card schema schema_name format schema_format

no card schema schema_name

no
Removes the specified schema.

schema_name
Specifies the schema’s name.
schema_name must be an alphanumeric string of 1 through 31 characters.

format schema_format
Specifies the schema’s format.
schema_format must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
For information on the schema format’s syntax, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for card bulk statistics collection. Multiple card schemas can be created to categorize card-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple card schemas, re-issue the card schema schema_name command using a different schema name.

Important: Not supported on all platforms
Example

The following command creates a schema named `card1stats1` that records the number of processes for all installed cards:

```
card schema card1stats1 format "%slot%-%numproc%"
```

To create a card-level schema named `cardresourcestats` that specifies a schema format of:

- Chassis slot number: `slot`
- Available Memory: `memtotal` Memory Used (%): `memused`
- Available CPU (%): `cpuidle`

Use the following command:

```
card schema cardresourcestats format "Chassis slot number: %slot%
Available Memory: %memtotal%
Memory Used (%): %memused%
Available CPU (%): %cpuidle%"
```
context schema

Configures context bulk statistics schema.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration

configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

context schema schema_name format schema_format

no context schema schema_name

- **no**
  - Removes the specified schema.

- **schema_name**
  - Specifies the schema’s name.
  - `schema_name` must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  - Specifies the schema’s format.
  - `schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces” characters. For more information, see the Schema Format String Length section.
  - For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For the complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for Context bulk statistics collection. Multiple context schemas can be created to categorize context statistics. All of the schemas are processed at each collection interval. To create multiple context schemas, re-issue the `context schema schema_name` command using a different schema name.

Example

To create a Firewall context schema named `sfw_context_stats1` that specifies a schema format of:

- Total packets received by firewall: `sfw-total-rxpackets`
• Total packets sent by firewall: `sfw-total-tpackets`
• Total ICMP packets discarded by firewall: `fw-icmp-discardpackets`

Use the following command:

```bash
context schema sfw_context_stats1 format "Packets received Rx: %sfw-total-rxpackets\nPackets Sent Tx:: %sfw-total-txpackets\nICMP Packets discarded: %fw-icmp-discardpackets"
```
cscf schema

Configures Call Session Control Function (CSCF) bulk statistics schema.

Product
SCM

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

cscf schema schema_name format schema_format

no cscf schema schema_name

no

Removes the specified schema.

schema_name

Specifies the schema’s name.
schema_name must be an alphanumeric string of 1 through 31 characters.

format schema_format

Specifies the schema’s format.
schema_format must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
For information on the schema format’s syntax, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for CSCF bulk statistics collection. Multiple CSCF-service schemas can be created to categorize CSCF-service bulk statistics. All of the schemas are processed at each collection interval. To create multiple CSCF-service schemas, re-issue the cscf schema schema_name command using a different schema name.

Example

To create a CSCF schema named cscf_statistics that specifies a schema format of:

• Call attempts received: callattrx
• Call attempts transmitted: `callatttx`
• Call successes received: `callsuccrx`
• Call successes transmitted: `callsucctx`
• Call failures received: `callfailrx`
• Call failures transmitted: `callfailtx`

Use the following command:

```sh
    cscf schema cscf_schema_statistics format "Call Attempts Rx: %callattrx%
    Call Attempts Tx: %callatttx%
    Call Successes Rx: %callsuccrx%

    Call Failures Tx: %callfailtx%"
```
cs-network-ranap schema

Product
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration

configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

```
cs-network-ranap schema schema_name format schema_format
no cs-network-ranap schema schema_name
```

no

Removes the specified schema.

```
schema_name
```

Specifies the schema’s name.

*schema_name* must be an alphanumeric string of 1 through 31 characters.

```
format schema_format
```

Specifies the schema’s format.

*schema_format* must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for RANAP procedure related bulk statistics collection in a CS network associated with HNB-GW in a Femto UMTS network. Multiple CS Networks RANAP schemas can be created to further categorize at CS network or HNB-GW-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple CS Networks RANAP schemas, re-issue the `cs-network-ranap schema schema_name` command using a different schema name.

Example
The following command creates a schema named `cs_ranap1stats1` that records the total number of Iu Release Request messages transmitted and total number of Iu Release Command message received by the HNB-GW node:

```sh
cs-network-ranap schema cs_ranap1stats1 format "%iu-rel-req-tx%" "%iu-rel-cmd-rx%"
```
cs-network-rtp schema

Configures the Real-Time Transport Protocol (RTP) bulk statistics schema in a Circuit Switched (CS) network associated with an HNB-GW node.

**Product**
HNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
cs-network-rtp schema schema_name format schema_format

no cs-network-rtp schema schema_name
```

- **no**
  Removes the specified schema.

- **schema_name**
  Specifies the schema’s name.
  *schema_name* must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  Specifies the schema’s format.
  *schema_format* must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
  For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

Use this command to define schemas for RTP procedure related bulk statistics collection in a CS network associated with HNB-GW in a Femto UMTS network. Multiple CS Networks RTP schemas can be created to further categorize at CS network or HNB-GW-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple CS Networks RTP schemas, re-issue the `cs-network-rtp schema schema_name` command using a different schema name.

**Example**
The following command creates a schema named `cs_rtp1stats1` that records the total number of RTP Downlink Packets received and RTP Uplink Packets transmitted by HNB-GW node in an associated CS network:

```
cs-network-rtp schema cs_rtp1stats1 format "%rtp-uplink-pkts-tx%" "%rtp-downlink-pkts-rx%"
```
**cs-network-sccp schema**

Configures the Signalling Connection Control Part (SCCP) bulk statistics schema in a Circuit Switched (CS) network associated with an HNB-GW node.

**Product**
HNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

**configure > bulkstats mode**

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
cs-network-sccp schema schema_name format schema_format

no cs-network-sccp schema schema_name
```

- **no**
  
  Removes the specified schema.

- **schema_name**
  
  Specifies the schema’s name.
  
  `schema_name` must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  
  Specifies the schema’s format.
  
  `schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the [Schema Format String Length](#) section.
  
  For information on the schema format’s syntax, see the [Schema Format String Syntax](#) section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the [Statistics and Counters Reference](#).

**Usage**

Use this command to define schemas for SCCP connection related bulk statistics collection in a CS network associated with HNB-GW in a Femto UMTS network. Multiple CS Networks SCCP schemas can be created to further categorize at CS network or HNB-GW-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple CS Networks SCCP schemas, re-issue the `cs-network-sccp schema schema_name` command using a different schema name.

**Example**
The following command creates a schema named `cs_sccplstats1` that records the total number of SCCP connection requests received by HNB-GW and responses sent to CN node in an associated CS network:

```
cs-network-sccp schema cs_sccplstats1 format "%sccp-conn-req-rx%" "%sccp-conn-req-tx%"
```
**dcca schema**

Configures Diameter Credit Control Application (DCCA) bulk statistics schema. This command is available only in StarOS 9.0 and later releases.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Bulk Statistics Configuration

`configure > bulkstats mode`

[local]host_name(config-bulkstats)#
```

**Syntax**

```
dcca schema schema_name format schema_format

no dcca schema schema_name
```

- **no**
  - Removes the specified schema.

- **schema_name**
  - Specifies the schema’s name.
  - `schema_name` must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  - Specifies the schema’s format.
  - `schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the [Schema Format String Length section](#). For information on the schema format’s syntax, see the [Schema Format String Syntax section](#).

**Important:** For a complete list of the statistics that are supported for this schema, refer to the [Statistics and Counters Reference](#).

**Usage**

Use this command to define schemas for DCCA bulk statistics collection.
dcca-group schema

This command configures Diameter Credit Control Application (DCCA) group bulk statistics schema.

Please note that the DCCA-group related bulk statistics are copied from the "system" schema to this schema "dcca-group".

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

`configure > bulkstats mode`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
dcca-group schema schema_name format schema_format

no dcca-group schema schema_name
```

<table>

For information on the schema format’s syntax, see the **Schema Format String Syntax** section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the **Statistics and Counters Reference**.

**Usage**

Use this command to define schemas for DCCA group bulk statistics collection.
default

Restores the system default for the option specified.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

configure > bulkstats mode

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
default { limit | receiver mode | remotefile format | sample-interval | transfer-interval }
```

---

**limit**

Restores the memory utilization limit system default: 1000 kilobytes.

---

**receiver mode**

Restores the behavior for sending files to the receivers to the default value.

Default: secondary-on-failure

---

**remotefile format**

Restores the format of remote bulkstats file names to the default value.

Default: “%date%-%time%”

---

**sample-interval**

Restores the system default for the local polling interval for statistic sampling.

Default: 15 minutes

---

**transfer-interval**

Restores the system default for the time between transfer of data files to receivers.

Default: 480 minutes

---

**Usage**

Restore the default values when troubleshooting the system. Setting values to the system defaults places them in well known states as starting points for monitoring for problems.

**Example**

```
default limit
```
default transfer-interval
diameter-acct schema

Configures Diameter Accounting bulk statistics schema. This command is available only in StarOS 11.0 and later releases.

[local]host_name(config-bulkstats)#

Syntax

diameter-auth schema schema_name format schema_format

no diameter-auth schema schema_name

no

Removes the specified schema.

schema_name

Specifies the schema’s name.

schema_name must be an alphanumeric string of 1 through 31 characters.

format schema_format

Specifies the schema’s format.

schema_format must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for Diameter Authentication bulk statistics collection.
dlci-util schema

Configures the collection of statistics for the DLCI-Util (DLCI utilization) schema.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration
`configure > bulkstats mode`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**
```
dlci-util schema  schema_name  format  schema_format
no dlci-util schema  schema_name
```

- **no**
  Removes the specified schema.

- **schema_name**
  Specifies the schema’s name.
  `schema_name` must be an alphanumeric string of 1 through 31 characters.

- **format  schema_format**
  Specifies the format of the collected DLCI utilization statistics by identifying the statistics variables and ordering the variables for presentation within the bulk statistics messages.
  `schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces’” characters. For more information, see the Schema Format String Length section.
  For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for the DLCI-Util schema, refer to the Statistics and Counters Reference.

**Usage**

Use this command to define schemas for DLCI-Util bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.
Multiple schemas can be created to categorize DLCI-Util bulk statistics. All of the schemas are processed at each collection interval. To create multiple DLCI-Util schemas, re-issue the `dlci-util schema schema_name` command using a different schema name each time.

**Example**

Include the bulk statistic variable names to create a schema named `dlciutilstats_sgsn1` that specifies collection of statistics (a schema format) for:

- card
- port
- path
- DS1/E1
- DLCI
- DLCI utilization snapshot for received packets
- DLCI utilization for received packets in the last 5 minutes
- DLCI utilization for received packets in the last 15 minutes

Use the following command:

```
gprs schema gprsstats_sgsn1 format "Card: %card%
Port: %port%
DLCI in path: %dlci_util_path%
DS1/E1: %dlci_util_ds1e1%
DLCI ID: %dlci_util_dlci_no%
Current Rx: %dlci_util_dlci_curr_rx%
Rx in 5 minutes: %dlci_util_dlci_5min_rx%
Rx in 15 minutes: %dlci_util_dlci_15min_rx%"
```
dpca schema

Configures Diameter Policy Control Application (DPCA) bulk statistics schema. This command is available only in StarOS 9.0 and later releases.

Product

[local]host_name(config-bulkstats)#

Syntax

egtpc schema schema_name format schema_format

no egtpc schema schema_name

no

Removes the specified schema.

schema_name

Specifies the schema’s name.

schema_name must be an alphanumeric string of 1 through 31 characters.

format schema_format

Specifies the schema’s format.

schema_format must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.
Usage
Use this command to define schemas for enhanced GTP-C bulk statistics collection. Multiple eGTP-C service schemas can be created to categorize eGTP-C service bulk statistics. All of the schemas are processed at each collection interval. To create multiple eGTP-C service schemas, re-issue the `egtpc schema schema_name` command using a different schema name.

Example
For an eGTP-C-level schema named `egtpcservicestats` that specifies a schema format of:

- Tunnel - Create Session Request Sent: `tun-sent-cresess`
- Tunnel - Create Session Request Received: `tun-recv-cresess`

Use the following command:

```
egtpc schema egtpcservicestats format "Number of GTP Tunnel Requests Sent: %tun-sent-cresess\nNumber of GTP Tunnel Requests Received: %tun-recv-cresess\n"
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**

Security Administrator, Administrator

**Syntax**

`exit`

**Usage**

Use this command to return to the parent configuration mode.
fa schema

Configures Foreign Agent (FA) bulk statistics schema.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

fa schema schema_name format schema_format

no fa schema schema_name

no

Removes the specified schema.

schema_name

Specifies the schema’s name.

schema_name must be an alphanumeric string of 1 through 31 characters.

format schema_format

Specifies the schema’s format.

schema_format must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
For information on the schema format’s syntax, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for FA bulk statistics collection. Multiple FA service schemas can be created to categorize FA service bulk statistics. All of the schemas are processed at each collection interval. To create multiple FA service schemas, re-issue the fa schema schema_name command using a different schema name.

Example
To create a FA-level schema named faservicestats that separates the date, time, and vpnname by tabs, enter the following command:

```
fa schema faservicestats format %date%\t%time%\t%vpnname%
```

The schema format appears as follows:

```
date   time   vpnname
```
**file**

Enters the Bulk Statistics File Configuration Mode which supports the configuration of “files” used for grouping bulk statistic configuration information.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration
```
configure > bulkstats mode
```
Entering the above command sequence results in the following prompt:
```
[local]host_name(config-bulkstats)#
```

**Syntax**
```
[ no ] file number
```

- **no**
  Removes a previously configured bulk statistic file.

- **number**
  Specifies a number for the bulkstatistics file as an integer from 1 through 4. This number is how the file is recognized by the system.

**Usage**
Bulk statistics “files” are used to group bulk statistic schema, delivery options, and receiver configuration. Because multiple “files” can be configured, this functionality provides greater flexibility in that it allows you to configure different schemas to go to different receivers. A Maximum of four files can be assigned for bulk statistics collection.

Executing this command allows you to enter the Bulk Statistics File Configuration Mode. This mode supports all of the commands from the Bulk Statistics Configuration mode except limit, local-directory, sample-interval, and transfer-interval. (these commands are configured globally for all “files”.)

**Important:** Use of bulk statistics “files” is optional. If you do not wish to configure bulk statistic “files”, you can perform a standard configuration using the commands in the Bulk Statistic Configuration Mode. Note, however, that the system logically assigns “file 1” to the standard configuration. Therefore, if you wish to configure bulk statistics “files” at a later time, “file 1” will already be used.

**Caution:** If the Web Element Manager application is used to collect and process (XML parsing, graphing, etc.) bulk statistics data, “file 1” is used by the Web Element Manager’s default bulk statistics collection information and schemas. To avoid errors in processing by the Web Element Manager, do not configure ”file 1“ via the CLI. However, it is possible to configure files 1 through 4 using the system’s CLI, regardless of whether or not the Web Element
Manager is configured as a receiver. In this case, the bulk statistics data is written to the server but not processed by the Web Element Manager application.

Example

The following command creates a bulk statistics file numbered 2 and enters the Bulk Statistics File Configuration Mode:

```
file 2
```
fng schema

Configures Femto Network Gateway (FNG) bulk statistics schema.

Product
FNG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration

configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

fng schema schema_name format schema_format

no fng schema schema_name

no

Removes the specified schema.

schema_name

Specifies the schema’s name.
schema_name must be an alphanumeric string of 1 through 31 characters.

format schema_format

Specifies the schema’s format.
schema_format must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.
**footer**

Configures the footer string placed at the end of the generated bulk statistics data files.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Bulk Statistics Configuration

`configure > bulkstats mode`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
footer format schema_format
```

```
no footer format
```

---

Clears the footer format string which results in the default file footer being used in generated data files.

```
format schema_format
```

Specifies the footer format string for use in generated data files.

`schema_format` must be an alphanumeric string from 1 through 2047 characters. The format string syntax is described in the [Schema Format String Syntax](#) section. Default: “” (an empty footer)

The following variables are supported:

**Table 20. footer Command Format String Variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>The date that the collection file was created in YYYYMMDD format where YYYY represents the year, MM represents the month and DD represents the day.</td>
<td>String</td>
</tr>
<tr>
<td>host</td>
<td>The system hostname that created the file</td>
<td>String</td>
</tr>
<tr>
<td>ipaddr</td>
<td>The default management (local context) IP address in ###.###.###.### format. An empty string is inserted if no address is available.</td>
<td>String</td>
</tr>
<tr>
<td>sysuptime</td>
<td>The uptime (in seconds) of the system that created the file.</td>
<td>32-bit signed</td>
</tr>
<tr>
<td>time</td>
<td>The time that the collection file was created in HHMMSS format where HH represents the hours, MM represents the minutes, and SS represents the seconds.</td>
<td>String</td>
</tr>
</tbody>
</table>
Usage

Define a unique footer in data files which allows for easy identification of which system generated the data file or any other useful information. The use of the variables is suggested so as to allow for a uniform footer across all systems. The hostname variable should be used to identify the source of the data in the footer and all remaining items can be formatted consistently across all chassis.

Example

The following commands define different footer formats:

```plaintext
footer format northStreet
footer format "Created on: %date%-%time% by %host%"
no footer format
```
gather-on-standby

Controls whether or not statistics are gathered when a system is in the standby state.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration
  configure > bulkstats mode
Entering the above command sequence results in the following prompt:
  [local]host_name(config-bulkstats)#

Syntax

[ no | default ] gather-on-standby

no
Does not gather bulk statistics when the system is in the standby state.

default
Resets this command to its default action of gathering bulk statistics when the system is in the standby state.

Usage
Use this command to configure a system to either gather or not gather statistics when the system is in the standby state. This is useful for systems configured for Interchassis Session Recovery (ICSR). See the System Administration Guide for more details on this feature.
If a chassis transitions to standby state and it has accumulated but not yet transferred bulk statistics data, the previously accumulated data is transferred at the first opportunity. However, no additional statistics gathering takes place.

Example
The following command disables gathering statistics when the system is in the standby state:

  no gather-on-standby

The following command enables the gathering of statistics when the system is in the standby state:

  gather-on-standby
gprs schema

Configures the collection of statistics for the GPRS schema.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

```
gprs schema schema_name format schema_format
no gprs schema schema_name
```

no

Removes the specified schema.

```
schema_name
```

Specifies the schema’s name.

```
schema_name
```

must be an alphanumeric string of 1 to 31 characters.

```
format schema_format
```

Specifies the format of the collected GPRS statistics by identifying the statistics variables and ordering the variables for presentation within the bulk statistics messages.

```
schema_format
```

must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for the GPRS schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for GPRS bulk statistics collection in the generated stats report files.

Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.

Multiple GPRS schemas can be created to categorize GPRS bulk statistics. All of the schemas are processed at each collection interval. To create multiple GPRS schemas, re-issue the `gprs schema schema_name` command using a different schema name each time.
Example

Include the bulk statistic variable names to create a GPRS schema named `gprsstats_sgsn1` that specifies collection of statistics (a schema format) for:

- context name
- GPRS service name
- number of LLC packets dropped

Use the following command:

```
gprs schema gprsstats_sgsn1 format "Context Name: %vpnname%nGPRS Service Name: %servname%nTotal LLC Packets Dropped: %bssgp-total-usr-req-drop%n"
```
gtpc schema

Configures GPRS Tunneling Protocol-Control (GTPC) message statistics schema.

Usage

Use this command to define schemas for GTPC bulk statistics collection. Multiple GTPC schemas can be created to categorize GTPC bulk statistics. All of the schemas are processed at each collection interval. To
create multiple GTPC schemas, re-issue the `gtpc schema schema_name` command using a different schema name.

**Example**

To create a GTPC-level schema named `gtpc_stats` that specifies a schema format of:

- Context Name: `vpnname`
- GGSN Service Name: `servname`
- Total PDP Contexts Processed: `setup-total`

Use the following command:

```
gtpc schema gtpc_stats format "Context Name: %vpnname%nGGSN Service Name: %servname%nTotal PDP Contexts Processed: %setup-total%n"
```
gtpp schema

Configures GPRS Tunneling Protocol-Prime (GTPP) statistics schema.

**Product**
- GGSN
- SGSN
- P-GW
- S-GW
- SAEGW

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Bulk Statistics Configuration
- configure > bulkstats mode

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
 gtpp schema  schema_name  format  schema_format

no gtpp schema  schema_name
```

- **no**
  - Removes the specified schema.

- **schema_name**
  - Specifies the schema’s name.
  - `schema_name` must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  - Specifies the schema’s format.
  - `schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
  - For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.
**Usage**

Use this command to define schemas for GTPP bulk statistics collection. Multiple GTPP schemas can be created to categorize GTPP bulk statistics. All of the schemas are processed at each collection interval. To create multiple GTPP schemas, re-issue the `gtpp schema schema_name` command using a different schema name.

**Example**

To create a GTPP schema named `gtpp_statistics` that specifies a schema format of:

- Time: `time`
- Total Redirection Requests Received: `redir-rcvd`

Use the following command:

```
    gtpp schema gtpp_statistics format "Time: %time%
    Total Redirection Requests Received: %redir-rcvd%n"
```
gtpu schema

Configures GTP-U bulk statistics schema.

**Product**
- GGSN
- HNB-GW
- P-GW
- S-GW
- SAEGW

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Bulk Statistics Configuration
- configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

**Syntax**

```
gtpu schema schema_name format schema_format
no gtpu schema schema_name
```

- **no**
  - Removes the specified schema.

- **schema_name**
  - Specifies the schema’s name.
  - `schema_name` must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  - Specifies the format of the collected GTP-U statistics by identifying the statistics variables and ordering the variables for presentation within the bulk statistics messages.
  - `schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the [Schema Format String Length](#) section.
  - For information on the schema format’s syntax, see the [Schema Format String Syntax](#) section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*. 
**Usage**

Use this command to define schemas for GTP-U bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified. Multiple GTP-U schemas can be created to categorize GTP-U bulk statistics. All of the schemas are processed at each collection interval. To create multiple GTP-U schemas, re-issue the `gtpu schema` command using a different schema name each time.
ha schema

Configures Home Agent (HA) bulk statistics schema.

Product
HA

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

```
ha schema schema_name format schema_format

no ha schema schema_name
```

no
Removes the specified schema.

```
schema_name
```

Specifies the schema’s name.
schema_name must be an alphanumeric string of 1 through 31 characters.

```
format schema_format
```

Specifies the schema’s format.
schema_format must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for HA bulk statistics collection. Multiple HA service schemas can be created to categorize HA service bulk statistics. All of the schemas are processed at each collection interval. To create multiple HA service schemas, re-issue the ha schema schema_name command using a different schema name.

Example

For an HA schema named haservicestats that specifies a schema format of:
• Number of HA authentication failures: `reply-haauthfail`
• Number of Mobile Node authentication failures: `reply-mnauthfail`

Use the following command:

```plaintext
ha schema haservicestats format "Number of HA authentication failures: %reply-haauthfail\nNumber of Mobile Node authentication failures: %reply-mnauthfail\n"
```
header

Configures the header string placed at the beginning of the generated bulk statistics data files.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

```
configure > bulkstats mode
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
header format schema_format

no header format
```

no

Clears the header format string which results in the default file header being used in generated data files.

```
format schema_format
```

Specifies the header format string for use in generated data files.

*A schema_format must be an alphanumeric string of 1 through 2047 characters. The format string syntax is described in the Schema Format String Syntax section. Default: “” (an empty header)*

The following variables are supported:

**Table 21. header Command Format String Variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>The UTC date that the collection file was created in YYYYMDD format where YYY represents the year, MM represents the month and DD represents the day.</td>
<td>String</td>
</tr>
<tr>
<td>date3</td>
<td>The UTC date that the collection file was created in YYMMDD format where YY represents the year, MM represents the month and DD represents the day.</td>
<td>String</td>
</tr>
<tr>
<td>host</td>
<td>The system hostname that created the file</td>
<td>String</td>
</tr>
<tr>
<td>ipaddr</td>
<td>The default management (local context) IP address in ###.###.###.### format. An empty string is inserted if no address is available.</td>
<td>String</td>
</tr>
<tr>
<td>sysuptime</td>
<td>The uptime (in seconds) of the system that created the file.</td>
<td>32-bit signed</td>
</tr>
<tr>
<td>time</td>
<td>The time that the collection file was created in HHMMSS format where HH represents the hours, MM represents the minutes, and SS represents the seconds.</td>
<td>String</td>
</tr>
</tbody>
</table>
Usage

Define a unique header in data files which allows for easy identification as to which system generated the data file or any other useful information.

Using the variables described above allows for a uniform header across all systems. The hostname variable should be used to identify the source of the data in the header and all remaining items can be formatted consistently across all chassis.

Example

The following commands define different header formats:

```
header format northStreet

header format "Created on: %date%-%time% by %host%"

no header format
```
hnbgw-hnbap schema

Configures bulk statistics schema for HNB-Application Part (HNB-AP) message statistics collection in HNB-GW session instance.

**Product**
HNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

**Syntax**

```
hnbgw-hnbap schema schema_name schema_format
no hnbgw-hnbap schema schema_name
```

**no**

Removes the configured HNB-GW-HNB-AP schema.

**schema_name**

Specifies a name for the HNB-GW-HNB-AP schema.

`schema_name` must be an alphanumeric string of 1 through 31 characters.

**format schema_format**

Specifies the schema’s format.

`schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the [Schema Format String Length](#) section.

For information on the schema format’s syntax, see the [Schema Format String Syntax](#) section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

This command defines schemas used for HNB-AP statistics collection. Multiple HNB-AP schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the `hnbgw-hnbap schema schema_name` command using a different schema name.

**Example**
The following command creates a schema named `hnbap1stats1` that records the number of registered UEs and registered HNBs along with Context name, Context Id, and HNB-GW service name:

```
hnbgw-hnbap schema hnbap1stats1 format "%vpnname%-%vpnid%-%servname%-%registered-hnb%-%registered-ue%"
```

To create a schema named `hnbapuestats` that specifies a schema format of:

- Number of UEs with CS and PS Core Network Connections: `ue-with-ps-cs-conn`
- Number of UEs in Idle Condition: `idle-ue`

Use the following command:

```
hnbgw-hnbap schema hnbapuestats format "Number of UEs with CS and PS Core Network Connections: %ue-with-ps-cs-conn%\nNumber of UEs in Idle Condition: %idle-ue%"
```
**hnbgw-hnbap-access-closed schema**

Configures bulk statistics schema for HNB-Application Part (HNB-AP) message statistics collection in HNB-GW session instance for closed access mode.

**Product**
HNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

`configure > bulkstats mode`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
hnbgw-hnbap-access-closed schema schema_name schema_format

no hnbgw-hnbap-access-closed schema schema_name
```

**no**

Removes the configured HNB-GW-HNB-AP-ACCESS-CLOSED schema.

**schema_name**

Specifies a name for the HNB-GW-HNB-AP-ACCESS-CLOSED schema.

`schema_name` must be an alphanumeric string of 1 through 31 characters.

**format schema_format**

 Specifies the schema’s format.

`schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”“ characters. For more information, see the Schema Format String Length section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

This command defines schemas used for HNB-AP statistics collection in closed access mode. Multiple HNB-AP-ACCESS-CLOSED schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the `hnbgw-hnbap-access-closed schema schema_name` command using a different schema name.

**Example**

...
The following command creates a schema named `hnbapclosed1stats1` that records the number of registered UEs and registered HNBs along with Context name, Context Id, and HNB-GW service name:

```
hnbgw-hnbap-access-closed schema hnbapclosed1stats1 format "%vpnname%-%vpnid%-%servname%-%registered-hnb%-%registered-ue%"
```

To create a schema named `hnapaccesscloseduestats` that specifies a schema format of:

- Number of UEs with CS and PS Core Network Connections: `ue-with-ps-cs-conn`
- Number of UEs in Idle Condition: `idle-ue`

Use the following command:

```
hnbgw-hnbap-access-closed schema hnapaccesscloseduestats format "Number of UEs with CS and PS Core Network Connections: %ue-with-ps-cs-conn%
Number of UEs in Idle Condition: %idle-ue%"
```
**hnbgw-hnbap-access-hybrid schema**

Configures bulk statistics schema for HNB-Application Part (HNB-AP) message statistics collection in HNB-GW session instance for hybrid access mode.

**Product**
HNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

`configure > bulkstats mode`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
hnbgw-hnbap-access-hybrid schema schema_name schema_format

no hnbgw-hnbap-access-hybrid schema schema_name
```

- **no**
  - Removes the configured HNB-GW-HNB-AP-ACCESS-HYBRID schema.

- **schema_name**
  - Specifies a name for the HNB-GW-HNB-AP-ACCESS-HYBRID schema.
  - `schema_name` must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  - Specifies the schema’s format.
  - `schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
  - For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

This command defines schemas used for HNB-AP statistics collection in hybrid access mode. Multiple HNB-AP-ACCESS-HYBRID schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the `hnbgw-hnbap-access-hybrid schema schema_name` command using a different schema name.

**Example**
The following command creates a schema named `hnbabphyb1stats1` that records the number of registered UEs and registered HNBs along with Context name, Context Id, and HNB-GW service name:

```
hnbgw-hnbap-access-hybrid schema hnbaphyb1stats1 format "%vpnname%-%vpnid%-%servname%-%registered-hnb%-%registered-ue%"
```

To create a schema named `hnbabaccesshybuestats` that specifies a schema format of:

- Number of UEs with CS and PS Core Network Connections: `ue-with-ps-cs-conn`
- Number of UEs in Idle Condition: `idle-ue`

Use the following command:

```
hnbgw-hnbap-access-hybrid schema hnbapaccesshybuestats format "Number of UEs with CS and PS Core Network Connections: %ue-with-ps-cs-conn%nNumber of UEs in Idle Condition: %idle-ue%"
```
hnbgw-hnbap-access-open schema

Configures bulk statistics schema for HNB-Application Part (HNB-AP) message statistics collection in HNB-GW session instance for open access mode.

**Product**
HNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

**Syntax**

```
hnbgw-hnbap-access-open schema schema_name schema_format

no hnbgw-hnbap-access-open schema schema_name
```

*no*
Removes the configured HNB-AP-ACCESS-OPEN schema.

*schema_name*
Specifies a name for the HNB-AP-ACCESS-OPEN schema.
*schema_name* must be an alphanumeric string of 1 through 31 characters.

*format schema_format*
Specifies the schema’s format.
*schema_format* must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**
This command defines schemas used for HNB-AP statistics collection in open access mode. Multiple HNB-AP-ACCESS-OPEN schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the hnbgw-hnbap-access-open schema schema_name command using a different schema name.

**Example**
The following command creates a schema named `hnbapopenstats1` that records the number of registered UEs and registered HNBs along with Context name, Context Id, and HNB-GW service name:

```
hnbgw-hnbap-access-open schema hnbapopenstats1 format "\%vpnname\%-\%vpnid\%-\%servname\%-\%registered-hnb\%-\%registered-ue\%"
```

To create a schema named `hnbapaccessopenuestats` that specifies a schema format of:

- Number of UEs with CS and PS Core Network Connections: `ue-with-ps-cs-cnt`
- Number of UEs in Idle Condition: `idle-ue`

Use the following command:

```
hnbgw-hnbap-access-open schema hnbapaccessopenuestats format "Number of UEs with CS and PS Core Network Connections: \%ue-with-ps-cs-cnt\nNumber of UEs in Idle Condition: \%idle-ue\%"
```
**hnbgw-ranap schema**

**Product**
HNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

**Syntax**

```bash
hnbgw-ranap schema schema_name format schema_format

no hnbgw-ranap schema schema_name
```

**no**
Removes the configured HNB-GW-RANAP schema.

**schema_name**
Specifies a name for the HNB-GW-RANAP schema.
*schema_name* must be an alphanumeric string of 1 through 31 characters.

**format schema_format**
Specifies the schema’s format.
*schema_format* must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**
This command defines schemas used for RANAP messaging statistics collection. Multiple RANAP schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the *hnbgw-ranap schema schema_name* command using a different schema name.

**Example**
The following command creates a schema named `ranap1stats1` that records the number of CS-Direct-Transfer messages sent and received on RANAP along with Context name, Context Id, and HNB-GW service name:

```
hnbgw-ranap schema ranap1stats1 format "%vpnname%-%vpnid%-%servname%-%cs-dir-transfer-rx%-%cs-dir-transfer-tx%"
```

To create a schema named `ranappagingstats` that specifies a schema format of:

- Number of paging requests sent on RANAP from CS Core Network Connections: `cs-paging-req-tx`
- Number of paging requests sent on RANAP from PS Core Network Connections: `ps-paging-req-tx`

Use the following command:

```
hnbgw-ranap schema ranappagingstats format "Number of paging requests sent on RANAP from CS Core Network Connections: %cs-paging-req-tx%\nNumber of paging requests sent on RANAP from PS Core Network Connections: %ps-paging-req-tx%"

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

This command defines schemas used for RANAP messaging statistics collection in open access mode.
Multiple HNB-GW-RANAP-ACCESS-OPEN schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the hnbgw-ranap-access-open schema *schema_name* command using a different schema name.

Example
The following command creates a schema named `ranapopen1stats1` that records the number of CS-Direct-Transfer messages sent and received on RANAP along with Context name, Context Id, and HNB-GW service name:

```
hnbgw-ranap-access-open schema ranapopen1stats1 format "%vpnname%-%vpnid%-%servname%-%cs-dir-transfer-rx%-%cs-dir-transfer-tx%"
```

To create a schema named `ranapopenpagingstats` that specifies a schema format of:

- Number of paging requests sent on RANAP from CS Core Network Connections: `cs-paging-req-tx`
- Number of paging requests sent on RANAP from PS Core Network Connections: `ps-paging-req-tx`

Use the following command:

```
hnbgw-ranap-access-open schema ranapopenpagingstats format "Number of paging requests sent on RANAP from CS Core Network Connections: %cs-paging-req-tx\nNumber of paging requests sent on RANAP from PS Core Network Connections: %ps-paging-req-tx"
```
**hnbgw-rtp schema**

**Product**
HNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

```
configure > bulkstats mode
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
hnbgw-rtp schema schema_name format schema_format

no hnbgw-rtp schema schema_name
```

- **no**
  Removes the configured HNB-GW-RTP schema.

- **schema_name**
  Specifies a name for the HNB-GW-RTP schema.
  *schema_name* must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  Specifies the schema’s format.
  *schema_format* must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
  For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

This command defines schemas used for RTP messaging statistics collection. Multiple RTP schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the *hnbgw-rtp schema schema_name* command using a different schema name.

**Example**
The following command creates a schema named `rtp1stats1` that records the number of RTP uplink packets dropped and number of RTCP application report messages received on RTP link along with Context name, Context Id, and HNB-GW service name:

```
hnbgw-rtp schema rtp1stats1 format "%vpnname%-%vpnid%-%servname%-%rtp-uplink-pkts-dropped%-%rtcp-app-report-rx"
```
hnbgw-rtp-access-closed schema

Configures bulk statistics schema for Real-Time Protocol (RTP) message statistics collection in HNB-GW session instance for closed access mode.

Product
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

hnbgw-rtp-access-closed schema schema_name format schema_format

no hnbgw-rtp-access-closed schema schema_name

no
Removes the configured HNB-GW-RTP-ACCESS-CLOSED schema.

schema_name
Specifies a name for the HNB-GW-RTP-ACCESS-CLOSED schema.
schema_name must be an alphanumeric string of 1 through 31 characters.

format schema_format
Specifies the schema’s format.
schema_format must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage
This command defines schemas used for RTP messaging statistics collection in closed access mode. Multiple HNB-GW-RTP-ACCESS-CLOSED schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the hnbgw-rtp-access-closed schema schema_name command using a different schema name.

Example
The following command creates a schema named `rtpclosed1stats1` that records the number of RTP uplink packets dropped and number of RTCP application report messages received on RTP link along with Context name, Context Id, and HNB-GW service name:

```
hnbgw-rtp-access-closed schema rtpclosed1stats1 format "%vpname%-%vpnid%-%servname%-rtp-uplink-pkts-dropped%-rtcp-app-report-rx"
```
hnbgw-rtp-access-hybrid schema

Configures bulk statistics schema for Real-Time Protocol (RTP) message statistics collection in HNB-GW session instance for hybrid access mode.

Product
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

hnbgw-rtp-access-hybrid schema schema_name format schema_format

no hnbgw-rtp-access-hybrid schema schema_name

no
Removes the configured HNB-GW-RTP-ACCESS-HYBRID schema.

schema_name
Specifies a name for the HNB-GW-RTP-ACCESS-HYBRID schema.
schema_name must be an alphanumeric string of 1 through 31 characters.

format schema_format
Specifies the schema’s format.
schema_format must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces” characters. For more information, see the Schema Format String Length section.
For information on the schema format’s syntax, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage
This command defines schemas used for RTP messaging statistics collection in hybrid access mode. Multiple HNB-GW-RTP-ACCESS-HYBRID schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the hnbgw-rtp-access-hybrid schema schema_name command using a different schema name.

Example
The following command creates a schema named `rtphyb1stats1` that records the number of RTP uplink packets dropped and number of RTCP application report messages received on RTP link along with Context name, Context Id, and HNB-GW service name:

```
hnbwg-rtp-access-hybrid schema rtphyb1stats1 format "\%vpnname\%-%vpnid\%-\%servname\%-\%rtp-uplink-pkts-dropped\%-\%rtcp-app-report-rx\%"
```
**hnbgw-rtp-access-open schema**

Configures bulk statistics schema for Real-Time Protocol (RTP) message statistics collection in HNB-GW session instance for open access mode.

**Product**

HNB-GW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Bulk Statistics Configuration

configure > bulkstats mode

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
hnbgw-rtp-access-open schema schema_name format schema_format

no hnbgw-rtp-access-open schema schema_name
```

**no**

Removes the configured HNB-GW-RTP-ACCESS-OPEN schema.

**schema_name**

Specifies a name for the HNB-GW-RTP-ACCESS-OPEN schema.

*schema_name* must be an alphanumeric string of 1 through 31 characters.

**format schema_format**

Specifies the schema’s format.

*schema_format* must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

This command defines schemas used for RTP messaging statistics collection in open access mode. Multiple HNB-GW-RTP-ACCESS-OPEN schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the `hnbgw-rtp-access-open schema schema_name` command using a different schema name.

**Example**
The following command creates a schema named *rtpopen1stats1* that records the number of RTP uplink packets dropped and number of RTCP application report messages received on RTP link along with Context name, Context Id, and HNB-GW service name:

```
hnbgw-rtp-access-open schema rtpopen1stats1 format "%vpnname%-%vpnid%-%servname%-%rtp-uplink-pkts-dropped%-%rtcp-app-report-rx%"
```
**hnbgw-rua schema**

Configures bulk statistics schema for RANAP User Adaptation (RUA) protocol message statistics collection in HNB-GW session instance.

**Product**
HNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

`configure > bulkstats mode`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
hnbgw-rua schema schema_name format schema_format

no hnbgw-rua schema schema_name
```

**no**

Removes the configured HNB-GW-RUA schema.

**schema_name**

Specifies a name for the HNB-GW-RUA schema.

*schema_name* must be an alphanumeric string of 1 through 31 characters.

**format schema_format**

Specifies the schema’s format.

*schema_format* must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”“ characters. For more information, see the *Schema Format String Length* section.

For information on the schema format’s syntax, see the *Schema Format String Syntax* section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

**Usage**

This command defines schemas used for RUA protocol messaging statistics collection. Multiple RUA schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the `hnbgw-rua schema schema_name` command using a different schema name.

**Example**
The following command creates a schema named `rua1stats1` that records the number of CS-Connect messages received and sent on RUA link along with Context name, Context Id, and HNB-GW service name:

```
hnbgw-rua schema rua1stats1 format "%vpnname%-%vpnid%-%servname%-%cs-connect-rx%-%cs-connect-tx%"
```
hnbgw-rua-access-closed schema

Configures bulk statistics schema for RANAP User Adaptation (RUA) protocol message statistics collection in HNB-GW session instance in closed access mode.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Bulk Statistics Configuration

configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

hnbgw-rua-access-closed schema schema_name format schema_format

no hnbgw-rua-access-closed schema schema_name

- **no**
  
  Removes the configured HNB-GW-RUA-ACCESS-CLOSED schema.

- **schema_name**
  
  Specifies a name for the HNB-GW-RUA-ACCESS-CLOSED schema.
  `schema_name` must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  
  Specifies the schema’s format.
  `schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
  
  For information on the schema format’s syntax, see the Schema Format String Syntax section.

⚠️ **Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

This command defines schemas used for RUA protocol messaging statistics collection in closed access mode. Multiple HNB-GW-RUA-ACCESS-CLOSED schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the **hnbgw-rua-access-closed schema schema_name** command using a different schema name.

Example
The following command creates a schema named `ruaclosed1stats1` that records the number of CS-Connect messages received and sent on RUA link along with Context name, Context Id, and HNB-GW service name:

```
hnbgw-rua-access-closed schema ruaclosed1stats1 format "%vpnname%-%vpnid%-%servname%-cs-connect-rx%-cs-connect-tx"
```
**hnbgw-rua-access-hybrid schema**

Configures bulk statistics schema for RANAP User Adaptation (RUA) protocol message statistics collection in HNB-GW session instance in hybrid access mode.

**Product**
HNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

This command defines schemas used for RUA protocol messaging statistics collection in hybrid access mode. Multiple HNB-GW-RUA-ACCESS-HYBRID schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the `hnbgw-rua-access-hybrid schema schema_name` command using a different schema name.

**Example**
The following command creates a schema named `ruahybstats1` that records the number of CS-Connect messages received and sent on RUA link along with Context name, Context Id, and HNB-GW service name:

```bash
hnbgw-rua-access-hybrid schema ruahybstats1 format "%vpnname%-%vpnid-%servname%-cs-connect-rx%-cs-connect-tx"
```
hnbgw-rua-access-open schema

Configures bulk statistics schema for RANAP User Adaptation (RUA) protocol message statistics collection in HNB-GW session instance in open access mode.

Product
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

hnbgw-rua-access-open schema  schema_name  format  schema_format

no  hnbgw-rua-access-open schema  schema_name

no

Removes the configured HNB-GW-RUA-ACCESS-OPEN schema.

schema_name

Specifies a name for the HNB-GW-RUA-ACCESS-OPEN schema.

schema_name must be an alphanumeric string of 1 through 31 characters.

format  schema_format

Specifies the schema’s format.

schema_format must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

This command defines schemas used for RUA protocol messaging statistics collection in open access mode. Multiple HNB-GW-RUA-ACCESS-OPEN schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the hnbgw-rua-access-open schema  schema_name command using a different schema name.

Example
The following command creates a schema named *ruaopen1stats1* that records the number of CS-Connect messages received and sent on RUA link along with Context name, Context Id, and HNB-GW service name:

```
hnbgw-rua-access-open schema ruaopen1stats1 format "%vpnname%-\%vpnid%-\%servname%-\%cs-connect-rx%-\%cs-connect-tx%"
```
**hnbgw-sctp schema**

**Product**

HNB-GW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Bulk Statistics Configuration

```configure > bulkstats mode```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```  

**Syntax**

```
hnbgw-sctp schema schema_name format schema_format

no hnbgw-sctp schema schema_name
```

- **no**
  
  Removes the configured SCTP schema.

- **schema_name**
  
  Specifies a name for the SCTP schema.
  
  *schema_name* must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  
  Specifies the schema’s format.
  
  *schema_format* must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.

  For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

This command defines schemas used for SCTP protocol messaging statistics collection. Multiple SCTP schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the `hnbgw-sctp schema schema_name` command using a different schema name.

**Example**
The following command creates a schema named `sctp1stats1` that records the number of bytes received from lower layer and number of bytes sent to lower layer over SCTP connection along with Context name, Context Id, and HNB-GW service name:

```
hnbw-sctp schema sctp1stats1 format "%vpnname%-%vpnid%-%servname%-%total-bytes-sent-to-lower-layer%-%total-bytes-rcvd-from-lower-layer%"
```
hsgw schema

Configures HRPD Serving Gateway (HSGW) bulk statistics schema.

**Product**
HSGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode
Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
  hsgw schema  schema_name  format  schema_format

  no  hsgw schema  schema_name
  no
```

- **no**
  Removes the specified schema.

- **schema_name**
  Specifies the schema’s name.
  `schema_name` must be an alphanumeric string of 1 through 31 characters.

- **format  schema_format**
  Specifies the format of the collected HSGW statistics by identifying the statistics variables and ordering the variables for presentation within the bulk statistics messages.
  `schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the **Schema Format String Length** section.
  For information on the schema format’s syntax, see the **Schema Format String Syntax** section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the **Statistics and Counters Reference**.

**Usage**

Use this command to define schemas for HSGW bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified. Multiple HSGW schemas can be created to categorize HSGW bulk statistics. All of the schemas are processed at each collection interval. To create multiple HSGW schemas, re-issue the `hsgw schema  schema_name` command using a different schema name each time.
**hss schema**

Configures Home Subscriber Service (HSS) bulk statistics schema.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

```bash
configure > bulkstats mode
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```bash
hss schema schema_name format schema_format
```

```bash
no hss schema schema_name
```

<table>

</thead>
<tbody>
<tr>
<td>Specifies the schema’s format.</td>
</tr>
<tr>
<td><code>schema_format</code> must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.</td>
</tr>
<tr>
<td>For information on the schema format’s syntax, see the Schema Format String Syntax section.</td>
</tr>
</tbody>
</table>

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

Use this command to define schemas for HSS bulk statistics collection. Multiple HSS schemas can be created to further categorize HSS bulk statistics. All of the schemas are processed at each collection interval. To create multiple HSS schemas, re-issue the `hss schema schema_name` command using a different schema name.

**Example**

```bash
Command Line Interface Reference, StarOS Release 17
```
To create an hss schema named `hss_stats` that specifies a schema format of:

- Message Stats: Number of Cancel Location Request messages sent: `msg-cl-req`
- Message Stats: Number of Cancel Location Answer messages sent: `msg-cl-ans`

Use the following command:

```
hss schema hss_stats format "Message Stats: Number of Cancel Location Request messages sent: %msg-cl-req\nMessage Stats: Number of Cancel Location Answer messages sent: %msg-cl-ans\n"
```
imsa schema

**Product**
- GGSN
- HA
- HSGW
- IPSG

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-bulkstats)#
```

**Syntax**

```
imsa schema schema_name format schema_format

no imsa schema schema_name
```

- **no**
  
  Removes the specified schema.

- **schema_name**
  
  Specifies the schema’s name.
  
  **schema_name** must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  
  Specifies the schema’s format.
  
  **schema_format** must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
  
  For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.
Usage

Use this command to define schemas for IMSA bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified. Multiple IMSA schemas can be created to categorize IMSA bulk statistics. All of the schemas are processed at each collection interval. To create multiple IMSA schemas, re-issue the `imsa schema schema_name` command using a different schema name each time.
**ippool schema**

Configures IP pool bulk statistics schema.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
ippool schema schema_name format schema_format

no ippool schema schema_name
```

- **no**
  Removes the specified schema.

- **schema_name**
  Specifies the schema’s name.
  `schema_name` must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  Specifies the schema’s format.
  `schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of
  the command, including spaces”” characters. For more information, see the **Schema Format String Length**
  section.
  For information on the schema format’s syntax, see the **Schema Format String Syntax** section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the **Statistics and
Counters Reference**.

**Usage**

Use this command to define schemas for IP pool bulk statistics collection. Multiple IP pool schemas can be
created to further categorize IP pool bulk statistics. All of the schemas are processed at each collection
interval. To create multiple IP pool schemas, re-issue the **ippool schema schema_name** command using a
different schema name.

**Example**

To create an IP pool schema named `ippoolstats` that specifies a schema format of:
• Number of IP addresses on hold: hold
• Number of free IP addresses: free

Use the following command:

    ippool schema ippoolstats format "Number of IP addresses on hold: %hold%
    Number of free IP addresses: %free%"
**ipsg schema**

Configures IP Services Gateway (IPSG) bulk statistics schema.

**Product**

IPSG

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Bulk Statistics Configuration

`configure > bulkstats mode`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
ipsg schema  schema_name format  schema_format
no ipsg schema  schema_name
```

**Syntax Elements**

- **no**
  - Removes the specified schema.

- **schema_name**
  - Specifies the schema’s name.
  - `schema_name` must be an alphanumeric string of 1 through 31 characters.

- **format  schema_format**
  - Specifies the schema’s format.
  - `schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the **Schema Format String Length** section.
  - For information on the schema format’s syntax, see the **Schema Format String Syntax** section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the **Statistics and Counters Reference**.

**Usage**

Use this command to define the schemas used for IPSG bulk statistics collection. Multiple IPSG schemas can be created to categorize IPSG bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the `ipsg schema  schema_name` command using a different schema name.

**Example**

To create an IPSG schema named `ipsgstats` that specifies a schema format of:

- **Context name:** `vpnname`
• Service name: servname
• Total responses sent: total-rsp-sent

Use the following command:

```bash
ipsg schema ippoolstats format "Context name: %vpnname%
Service name: %servname%
Total responses sent: %total-rsp-sent"
```
**lac schema**

Configures LAC (L2TP Access Concentrator) bulk statistics schema.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

*configure > bulkstats mode*

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-bulkstats)#
```

**Syntax**

```
lac schema schema_name format schema_format

no lac schema schema_name
```

- **no**
  Removes the specified schema.

- **schema_name**
  Specifies the schema’s name.
  *schema_name* must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  Specifies the schema’s format.
  *schema_format* must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces””” characters. For more information, see the Schema Format String Length section.
  For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

Use this command to define schemas for LAC bulk statistics collection. Multiple LAC schemas can be created to categorize LAC bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the *lac schema schema_name* command using a different schema name.

**Example**

The following command creates a schema named *lac1stats1* that records the number of active subscriber sessions and the number of sessions that failed or were disconnected due to the maximum tunnel limit being reached:
lac schema lac1stats1 format “%sess-curactive%-%sess-maxtunnel%”

To create a schema named lacresourcestats that specifies a schema format of:
- Number of Successful Session Connections: sess-successful
- Number of Session Attempts That Failed: sess-failed
- Number of Sessions Currently Active: sess-curative

Use the following command:

lac schema lacresourcestats format “Number of Successful Session Connections: %sess-successful\nNumber of Session Attempts That Failed: %sess-failed\nNumber of Sessions Currently Active: %sess-curative%”
limit

Configures the maximum amount of system memory bulk statistics may utilize.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration

```configure > bulkstats mode```

Entering the above command sequence results in the following prompt:

```[local]host_name(config-bulkstats)#```

Syntax

```limit kilobytes```

**kilobytes**

Specifies the maximum amount of memory (in kilobytes) that may be used for bulk statistics as an integer from 1 through 32000. Default: 100

Usage

Adjust bulk statics memory usage when considering the sampling interval adjustments.

⚠️ **Caution:** Bulk statistics are stored in Random Access Memory (RAM) on the SPC/SMC/MIO. In the event of power loss or system failure, the statistics will be lost. If the maximum storage limit has been reached before the system's configured transfer-interval is reached, the oldest information stored in the collection will be overwritten.

Example

```limit 2048```
**lma schema**

Configures the Local Mobility Anchor (LMA) statistics schema for the naming conventions of data files.

**Product**
P-GW
SAEGW

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

```
configure > bulkstats mode
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```plaintext
lma schema  schema_name  format  schema_format

no lma schema  schema_name
```

**Removes the specified schema.**

```plaintext
no
```

**Specifies the schema’s name.**

```plaintext
schema_name
```

*schema_name* must be an alphanumeric string of 1 through 31 characters.

**Specifies the schema’s format.**

```plaintext
format  schema_format
```

*schema_format* must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces’”” characters. For more information, see the *Schema Format String Length* section.

For information on the schema format’s syntax, see the *Schema Format String Syntax* section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

**Usage**

Use this command to define schemas for LMA bulk statistics collection. Multiple LMA service schemas can be created to categorize LMA service bulk statistics. All of the schemas are processed at each collection interval. To create multiple LMA service schemas, re-issue the `lma schema schema_name` command using a different schema name.

**Example**

For an LMA-level schema named *lmaservicestats* that specifies a schema format of:
Bulk Statistics Configuration Mode Commands

lma schema

• Binding Update Received: bindupd
• Binding Update Received - Denied: bindupd-denied

Use the following command:

lma schema lmaservicestats format "Number of Binding Updates Received: %bindupd%nNumber of Binding Updates Received and Denied: %bindupd-denied%n"
Ins schema

Configures LNS (L2TP Network Server) bulk statistics schema.

**Product**
LNS

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

`configure > bulkstats mode`

Entering the above command sequence results in the following prompt:

`[local]host_name(config-bulkstats)#`

**Syntax**

```
lns schema  schema_name format  schema_format
```

```
no lns schema  schema_name
```

**no**

Removes the specified schema.

```
schema_name
```

Specifies the schema’s name.

`schema_name` must be an alphanumeric string of 1 through 31 characters.

```
format schema_format
```

Specifies the format of the collected LNS statistics by identifying the statistics variables and ordering the variables for presentation within the bulk statistics messages.

`schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

Use this command to define schemas for LNS bulk statistics collection in the generated stats report files.

Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.

Multiple LNS schemas can be created to categorize LNS bulk statistics. All of the schemas are processed at each collection interval. To create multiple LNS schemas, re-issue the `lns schema schema_name` command using a different schema name each time.
local-directory

Sets the local directory for storing bulkstats collection files.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

```plaintext
configure > bulkstats mode
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```plaintext
local-directory pathname
no local-directory
```

- **no**
  Delete the setting for local-directory.

- **pathname**
  Specifies the local path of the directory in which to store bulkstats collection files. `pathname` must be an alphanumeric string of 1 through 127 characters. Pathnames are case sensitive.

**Usage**

Use this command to designate a directory on a local file system in which collection files with bulkstats information are stored. The directory specified must already exist. Use the Exec Mode command `mkdir` to create a directory.

**Example**

To specify that bulkstats collection files are stored in the local directory `/flash/bulkstats`, enter the following command:

```plaintext
local-directory /flash/bulkstats
```
mag schema

Configures the Mobile Access Gateway (MAG) statistics schema for naming conventions of data files.

Product

HSGW
S-GW
SAEGW

Privilege

Administrator

Mode

Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

mag schema  **schema_name**  format  **schema_format**

no mag schema  **schema_name**

---

**no**

Removes the specified schema from MAG bulk statistics generation.

**schema_name**

Specifies the schema’s name.
**schema_name** must be an alphanumeric string of 1 through 31 characters.

**format  **schema_format****

Specifies the schema’s format.
**schema_format** must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for MAG bulk statistics collection. Multiple MAG service schemas can be created to categorize MAG service bulk statistics. All of the schemas are processed at each collection interval. To create multiple MAG service schemas, re-issue the **mag schema  **schema_name**  command using a different schema name.
Example

For a MAG-level schema named `magservicestats` that specifies a schema format of:

- Binding Update Sent: `bindupd`
- Binding Acknowledgement Received: `bindack`

Use the following command:

```bash
mag schema magservicestats format "Number of Binding Updates Sent: %bindupd%n
Number of Binding Acknowledgements Received: %bindack%n"
```
mipv6ha schema

Configures MIPv6 HA (home Agent) bulk statistics schema.

Product
HA

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

mipv6ha schema schema_name format schema_format

no mipv6ha schema schema_name

no
Removes the specified schema.

schema_name
Specifies the schema’s name.
schema_name must be an alphanumeric string of 1 through 31 characters.

format schema_format
Specifies the schema’s format.
schema_format must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
For information on the schema format’s syntax, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for MIPv6 HA bulk statistics collection. Multiple MIPv6 HA bulk statistics schemas can be created to categorize MIPv6 HA bulk statistics. All of the schemas are processed at each collection interval. To create multiple MIPv6 HA service schemas, re-issue the mipv6ha schema schema_name command using a different schema name.

Example

The following command creates a schema named mipv6haservicestats that records the number of authorization attempt failures due to access rejects from AAA:
mipv6ha schema mipv6haservicestats format "%aaa-actauthfail%"
mme schema

Configures MME (Mobility Management Entity) bulk statistics schema.

Product

**Syntax**

```
mvs schema schema_name format schema_format

no mvs schema schema_name
```

- **no**
  
  Removes the specified schema.

- **schema_name**
  
  Specifies the schema’s name.

- **format schema_format**
  
  Specifies the schema’s format.

  `schema_format` must be an alphanumeric string of 1 through 31 characters.

  For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference.*

**Important:** For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference.*
**nat-realm schema**

Creates and configures Network Address Translation (NAT) realm statistics schema.

**Product**
NAT

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

*configure > bulkstats mode*

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
nat-realm schema schema_name format schema_format

no nat-realm schema schema_name
```

- **schema_name**
  Specifies the schema’s name.
  `schema_name` must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  Specifies the schema’s format.
  `schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces””” characters. For more information, see the **Schema Format String Length** section.
  For information on the schema format’s syntax, see the **Schema Format String Syntax** section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the **Statistics and Counters Reference**.

**Usage**

Use this command to define schemas for NAT Realm bulk statistics collection. Multiple NAT realm schemas can be created to further categorize NAT realm level bulk statistics. All of the schemas are processed at each collection interval. To create multiple NAT Realm schemas, re-issue the `nat-realm schema schema_name` command using a different schema name.

**Example**

The following command creates a NAT realm schema with the VPN name, realm name, and flows information:

```
nat-realm schema realm1 format "%vpnname% %realmname% %nat-rlm-flows%"
```
**p2p schema**

Creates and configures P2P (Peer-to-Peer) statistics schema.

**Product**
ADC

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode
Entering the above command sequence results in the following prompt:

```
[local] host_name(config-bulkstats)#
```

**Syntax**

```
p2p schema schema_name format schema_format

no p2p schema schema_name
```

**Parameters**

- **schema_name**
  Specifies the schema’s name.
  *schema_name* must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  Specifies the schema’s format.
  *schema_format* must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the *Schema Format String Length* section.
  For information on the schema format’s syntax, see the *Schema Format String Syntax* section.

**Important**: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

**Usage**

Use this command to define schemas for P2P bulk statistics collection. Multiple P2P schemas can be created to further categorize P2P-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple P2P schemas, re-issue the *p2p schema schema_name* command using a different schema name.

**Example**

The following command creates a schema named *p2pstats* to record the total number of bytes detected in uplink and downlink direction:

```
p2p schema p2pstats format "%p2p-uplnk-bytes-name% %p2p-uplnk-bytes-value% %p2p-dwlnk-bytes-name% %p2p-dwlnk-bytes-value%"
```
pcc.af schema

Configures Policy and Charging Control-Application Function (PCC-AF) service bulk statistics schema.

Product
IPCF

Privilege
Security Administrator, Administrator

schema_name must be an alphanumeric string of 1 through 31 characters.

format schema_format

Specifies the schema’s format.

schema_format must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for PCC-Profile bulk statistics collection. Multiple PCC-Profile schemas can be created to categorize PCC-Profile bulk statistics. All of the schemas are processed at each collection interval. To create multiple PCC-Profile schemas, re-issue the pcc-profile schema schema_name command using a different schema name.

Example
The following command creates a schema named `pcc_profile1stats1` that records the total number of SGSN changes and QoS changes occurred for particular PCC profile along with Context name, Context Id, and PCC-Service name:

```
 pcc-profile schema pcc_profile1stats1 format "%vpname%-%vpnid%- %servname%-total-sgsn-change%-total-qos-change"
```
pcc-sp-endpt schema

Configures the bulkstats schema at the Sp interface endpoint for PCC procedures with Subscriber Service Controller/Subscriber Policy Register (SSC/SPR).

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode
Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

```
pcc-sp-endpt schema schema_name format schema_format

no pcc-sp-endpt schema schema_name
```

- **no**
  Removes the specified schema.

- **schema_name**
  Specifies the schema’s name.
  `schema_name` must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  Specifies the schema’s format.
  `schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
  For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for PCC-Sp-Endpoint bulk statistics collection. Multiple PCC-Sp-Endpoint schemas can be created to categorize PCC-Sp-Endpoint bulk statistics. All of the schemas are processed at each collection interval. To create multiple PCC-Sp-Endpoint schemas, re-issue the pcc-sp-endpt schema schema_name command using a different schema name.

Example
The following command creates a schema named `pcc_sp1stats1` that records the total number of SPRMgr Sh session close and open requests received from PCCMgr and processed by PCC-Sp-Endpoint along with Context name, Context Id, and PCC-Sp-Endpoint name:

```
pcc-sp-endpt schema pcc_svc1stats1 format "%vpnname%-%vpnid%-%endpt-name%-%req-open%-%req-close"%
```
**pcc-service schema**

Configures Policy and Charging Control-Service (PCC-Service) bulk statistics schema.

**Product**
IPCF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

```
configure > bulkstats mode
```

Entering the above command sequence results in the following prompt:

no pgw schema schema_name
```

---

**no**

Removes the specified schema.

---

**schema_name**

Specifies the schema’s name.  
`schema_name` must be an alphanumeric string of 1 through 31 characters.

---

**format schema_format**

Specifies the schema’s format.  
`scheme_format` must be an alphanumeric string of 1 through “1021 minus "number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.  
For information on the schema format’s syntax, see the Schema Format String Syntax section.

---

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

---

**Usage**

Use this command to define schemas for P-GW bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.  
Multiple P-GW schemas can be created to categorize P-GW bulk statistics. All of the schemas are processed at each collection interval. To create multiple P-GW schemas, re-issue the `pgw schema schema_name` command using a different schema name each time.
port schema

Configures port bulk statistics schema.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

`port schema  schema_name format  schema_format`

`no  port schema  schema_name`

no

Removes the specified schema.

`schema_name`

Specifies the schema’s name.
`schema_name` must be an alphanumeric string of 1 through 31 characters.

`format  schema_format`

Specifies the schema’s format.
`schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
For information on the schema format’s syntax, see the Schema Format String Syntax section.

⚠️ Important: For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for port bulk statistics collection. Multiple port schemas can be created to categorize port-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple port schemas, re-issue the `port schema  schema_name` command using a different schema name.

⚠️ Important: The `card` variable in the Port schema is not supported on all platforms
Example

To create a port-level schema named `portstats1` that separates the `card/port, bcast_inpackets, and bcast-outpackets` variables by hyphens ("-"), enter the following command:

```bash
port schema portstats1 format "%card%/%port%-%bcast_inpackets%- %bcast_outpackets%"
```
ppp schema

Configures Point-to-Point Protocol (PPP) bulk statistics schema.

format schema_format

Specifies the schema’s format.

schema_format must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for point-to-point protocol bulk statistics collection. Multiple PPP-service schemas can be created to categorize PPP-service bulk statistics. All of the schemas are processed at each collection interval. To create multiple PPP-service schemas, re-issue the ppp schema schema_name command using a different schema name.

Example

To create a ppp-level schema named pppstats that specifies a schema format of:
• CHAP: (Challenge Handshake Authentication Protocol)
- Auth. Attempts: auth-attempt-chap
- Successes: auth-success-chap

PAP: (Password Authentication Protocol)

- Auth. Attempts: auth-attempt-pap
- Successes: auth-success-pap

Use the following command:

```bash
cmd
ppp schema pppstats format "CHAP:
Auth. Attempts: %auth-attempt-chap
Successes: %auth-success-chap
PAP:
Auth. Attempts: %auth-attempt-pap
Successes: %auth-success-pap"
```
ps-network-gtpu schema

Configures the GTP-U bulk statistics schema in a Packet Switched (PS) network associated with an HNB-GW node.

Product
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode
Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

```plaintext
ps-network-gtpu schema schema_name format schema_format

no ps-network-gtpu schema schema_name
```

**no**
Removes the specified schema.

**schema_name**
Specifies the schema’s name.
*schema_name* must be an alphanumeric string of 1 through 31 characters.

**format schema_format**
Specifies the schema’s format.
*schema_format* must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage
Use this command to define schemas for GTP-U connection related bulk statistics collection in a PS network associated with HNB-GW in a Femto UMTS network. Multiple PS Networks GTP-U schemas can be created to further categorize at PS network or HNB-GW-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple PS Networks GTPU schemas, re-issue the *ps-network-gtpu schema schema_name* command using a different schema name.

Example
The following command creates a schema named `ps_gtpulstats1` that records the total number of GTP-U packets received by HNB-GW from CN and sent to CN node in an associated PS network:

```
ps-network-gtpu schema ps_gtpulstats1 format "gtpu-pkt-rx" "gtpu-pkt-tx"
```
ps-network-ranap schema

**Product**

HNB-GW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Bulk Statistics Configuration

configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

**Syntax**

```
ps-network-ranap schema schema_name format schema_format
```

```
nos-network-ranap schema schema_name
```

- **no**
  - Removes the specified schema.

- **schema_name**
  - Specifies the schema’s name.
  - `schema_name` must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  - Specifies the schema’s format.
  - `schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
  - For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

Use this command to define schemas for RANAP procedure related bulk statistics collection in a PS network associated with HNB-GW in a Femto UMTS network. Multiple PS Networks RANAP schemas can be created to further categorize at PS network or HNB-GW-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple PS Networks RANAP schemas, re-issue the `ps-network-ranap schema schema_name` command using a different schema name.

**Example**

The following command creates a schema named `ps_ranap1stats1` that records the total number of Iu Release Request messages transmitted and total number of Iu Release Command message received by HNB-GW node:

```
ps-network-ranap schema ps_ranap1stats1 format "%iu-rel-req-tx%" "%iu-rel-cmd-rx%"
```
### ps-network-sccp schema

Configures the Signalling Connection Control Part (SCCP) bulk statistics schema in a Packet Switched (PS) network associated with an HNB-GW node.

**Product**

HNB-GW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Bulk Statistics Configuration

    configure > bulkstats mode

Entering the above command sequence results in the following prompt:

    [local]host_name(config-bulkstats)#

**Syntax**

```
ps-network-sccp schema schema_name format schema_format
```  

```
no ps-network-sccp schema schema_name
```  

**no**

Removes the specified schema.

**schema_name**

Specifies the schema’s name.

*schema_name* must be an alphanumeric string of 1 through 31 characters.

**format schema_format**

Specifies the schema’s format.

*schema_format* must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.  

For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

Use this command to define schemas for SCCP connection related bulk statistics collection in a PS network associated with HNB-GW in a Femto UMTS network. Multiple PS Networks SCCP schemas can be created to further categorize at PS network or HNB-GW-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple PS Networks SCCP schemas, re-issue the *ps-network-sccp schema schema_name* command using a different schema name.

**Example**

Use this command to define schemas for SCCP connection related bulk statistics collection in a PS network associated with HNB-GW in a Femto UMTS network. Multiple PS Networks SCCP schemas can be created to further categorize at PS network or HNB-GW-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple PS Networks SCCP schemas, re-issue the *ps-network-sccp schema schema_name* command using a different schema name.
The following command creates a schema named `ps_sccplstats1` that records the total number of SCCP connection requests received by HNB-GW and responses sent to CN node in an associated PS network:

```
ps-network-sccp schema ps_sccplstats1 format "%sccp-conn-req-rx%" "%sccp-conn-req-tx%"
```
radius schema

Configures RADIUS bulk statistics schema.

Product
PDSN
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

radius schema schema_name format schema_format

no radius schema schema_name

no
Removes the specified schema.

schema_name
Specifies the schema’s name.
schema_name must be an alphanumeric string of 1 through 31 characters that is case sensitive.

format schema_format
Specifies the schema’s format.
schema_format must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
For information on the schema format’s syntax, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage
Use this command to define schemas for RADIUS bulk statistics collection. Multiple RADIUS schemas can be created to categorize RADIUS bulk statistics. All of the schemas are processed at each collection interval.
To create multiple RADIUS schemas, re-issue the radius schema schema_name command using a different schema name.

Example
To create a RADIUS schema named radius_statistics that specifies a schema format of:
- Server: `ipaddr`
- Authentication Requests Sent: `auth-req-sent`
- Accounting Requests Sent: `acc-req-sent`

Use the following command:

```sh
radius schema radius_statistics format "Server: %ipaddr%
Authentication Requests Sent: %auth-req-sent%
Accounting Requests Sent: %acc-req-sent%"
```
radius-group schema

Configures RADIUS group bulk statistics schema.

**Product**
PDSN
GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
radius-group schema schema_name format schema_format

no radius-group schema schema_name
```

**no**
Removes the specified schema.

```
schema_name
```
Specifies the schema’s name.
*schema_name* must be an alphanumeric string of 1 through 31 characters that is case sensitive.

```
format schema_format
```
Specifies the schema’s format.
*schema_format* must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**
Use this command to define schemas for RADIUS group bulk statistics collection. Multiple RADIUS group schemas can be created to categorize RADIUS group bulk statistics. All of the schemas are processed at each collection interval. To create multiple RADIUS group schemas, re-issue the *radius-group schema schema_name* command using a different schema name.

**Example**
To create a RADIUS group schema named *radius_statistics* that specifies a schema format of:
- Server: ipaddr
- Authentication Requests Sent: auth-req-sent
- Accounting Requests Sent: acc-req-sent

Use the following command:

```
radius-group schema radius_statistics format "Server:
%ipaddr%nAuthentication Requests Sent: %auth-req-sent%nAccounting Requests Sent: %acc-req-sent"
```
**receiver**

Configures a host system to receive bulkstats information through Trivial File Transfer Protocol (TFTP), File Transfer Protocol (FTP) or SSH File Transfer Protocol (SFTP).

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

```
configure > bulkstats mode
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)>
```

**Syntax**

```
receiver { mode { redundant | secondary-on-failure } | ip_address { primary | secondary } [ mechanism { { { ftp | sftp } login user_name [ encrypted ] password pwd } | tftp } ] }
```

```
no receiver ip_address
```

**no**

Removes the receiver specified from the list of receivers where data files are sent.

**mode { redundant | secondary-on-failure }**

Determines how bulkstats are delivered to the primary and secondary receivers. Default: **secondary-on-failure**

- **redundant**: Files are transferred to both the primary and secondary receivers. If either transfer is not currently possible, the file is transferred when possible. The system continues to hold in memory as much data as possible until the data has been successfully transferred to both receivers. Data is only discarded if the in-memory data reaches the configured limit. Refer to the limit command.
- **secondary-on-failure**: Files are transferred to the secondary receiver if the primary receiver fails. In-memory data is erased once the data is transferred to either the primary or secondary receiver. This is the default behavior.

**ip_address**

Specifies the IP address of the receiver of interest using IPv4 dotted-decimal notation.

**primary | secondary**

Primary and secondary are used to indicate the order in which receivers are connected. The secondary is used when the primary is unreachable.

- **primary**: indicates the receiver is the primary receiver of data.
- **secondary**: indicates the receiver is the secondary receiver of data.
mechanism { { { ftp | sftp } login user_name [ encrypted ] password pwd } | tftp } }

Specifies the method by which data is transferred to the receiver.

ftp login user_name [ encrypted ] password pwd: the FTP protocol shall be used for data file transfer. user_name specifies the user to provide for remote system secure logins and must be an alphanumeric string of 1 through 31 characters. The password to use for remote system authentication is specified as pwd and must be from 1 to 31 characters or 1 to 64 characters if the encrypted keyword is also specified.

sftp login user_name [ encrypted ] password pwd: the SFTP protocol shall be used for data file transfer. user_name specifies the user to provide for remote system secure logins and must be an alphanumeric string of 1 through 31 characters. The password to use for remote system authentication is specified as pwd and must be from 1 to 31 characters or 1 to 64 characters if the encrypted keyword is also specified.

tftp: the TFTP protocol is to be used to transfer files.

The encrypted keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the password keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

Usage

Use TFTP methods to reduce transfer times if excessive system resources are being used across the network for transfer of data.

FTP transfer method allows for login which then provides system logging within the enabled FTP logs. The initial connection is attempted to the primary receiver. If the primary receiver is unreachable for any reason, the secondary receiver is used. If the secondary receiver is also unreachable, the system retries after a delay period where it again attempts to connect to the primary receiver followed by the secondary receiver as necessary.

Important: For redundant receivers, configuration changes to the receivers are applied to all existing and all subsequent data sets pending transfer. If no receiver is configured, bulk statistics will be collected and stored on the system until the maximum amount of memory is used; they will not be transferred to the receiver(s). When the storage limit has been reached the oldest information is overwritten. When a receiver is configured for the primary and secondary target, this command will use both receivers as default if no receiver is specified.

Example

receiver 10.2.3.4 primary mechanism tftp
receiver 10.2.3.5 secondary
no receiver 10.2.3.4
**remotefile**

Configures the naming convention with support for multiple file format to multiple receivers when storing the data files on the remote receiver(s).

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Bulk Statistics Configuration

configure > bulkstats mode

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
remotefile format schema_format [ both-receivers | primary-receiver | secondary-receiver ]
```

```
no remotefile format
```

*no*

Resets the remote file naming convention to the system default.

```
format schema_format
```

Specifies the naming convention format to use.

*schema_format* must be an alphanumeric string of 1 through 127 characters. The format string syntax is described in the [Schema Format String Syntax](#) section. Default: “%date%-%time%”

---

**Important:** The remote file naming format should only use static text and bulk statistic variables to avoid any possible file creation issues on the receivers.

The following variables are supported:

**Table 22. remote file Command Naming Format Variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>date</strong></td>
<td>The UTC date that the collection file was created in YYYYMMDD format where YYYY represents the year, MM represents the month and DD represents the day.</td>
<td>String</td>
</tr>
<tr>
<td><strong>date3</strong></td>
<td>The UTC date that the collection file was created in YYMMDD format where YY represents the year, MM represents the month and DD represents the day.</td>
<td>String</td>
</tr>
<tr>
<td><strong>host</strong></td>
<td>The system hostname that created the file</td>
<td>String</td>
</tr>
</tbody>
</table>
Bulk Statistics Configuration Mode Commands

### remotefile

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysuptime</td>
<td>The uptime (in seconds) of the system that created the file.</td>
<td>32-bit signed</td>
</tr>
<tr>
<td>time</td>
<td>The time that the collection file was created in HHMMSS format where HH represents the hours, MM represents the minutes, and SS represents the seconds.</td>
<td>String</td>
</tr>
</tbody>
</table>

**both-receivers** | **primary-receiver** | **secondary-receiver**

Sets the remote file creation target to both receivers, primary receiver or secondary receiver. Default: Both receivers.

#### Usage
Set the remote file naming format to ensure consistent data file naming across a network or adjusting a single system’s format for easy identification.

This command specifies whether the format should be used in conjunction with both receivers, only the primary receiver, or only the secondary receiver.

#### Important:
For redundant receivers, the filenames for the output data files are applied when the information is first gathered. If the name format is modified, the change takes effect for the next data set. The current data set name remains unchanged, even if has not yet been transferred.

#### Example

```plaintext
remotefile format simpleFormat
remotefile format "%host%-%date%-%time%"
remotefile format "%host%-%date%-%time%" both-receivers
remotefile format "%host%-%date%" primary-receiver
no remotefile format
```
**rlf schema**

Configures the aggregated information for Rate Limiting Function (RLF) context statistics schema.

**Product**

GGSN
P-GW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Bulk Statistics Configuration

`configure > bulkstats mode`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
rlf schema schema_name format schema_format

no rlf schema schema_name
```

- **no**
  Removes the specified schema.

- **schema_name**
  Specifies the schema’s name.
  `schema_name` must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  Specifies the schema’s format.
  `schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces’”” characters. For more information, see the **Schema Format String Length** section.
  For information on the schema format’s syntax, see the **Schema Format String Syntax** section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

Use this command to define schemas for RLF bulk statistics collection. Multiple RLF schemas can be created to categorize RLF bulk statistics. All of the schemas are processed at each collection interval. To create multiple RLF schemas, re-issue the `rlf schema schema_name` command using a different schema name.

**Example**

To create an RLF-level schema named `rlfstats` that specifies a schema format of:

- Date: `date`
- Time: \texttt{time}
- Number of Authentication Denials: \texttt{deny-auth}

Use the following command:

\begin{verbatim}
rlf schema rlfstats format "Date: %date\%Time: %time\%Number of Authentication Denials: %deny-auth\n"
\end{verbatim}
**rlf-detailed schema**

Configures the detailed instance level information for RLF context statistics schema.

**Product**

GGSN

P-GW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Bulk Statistics Configuration

`configure > bulkstats mode`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
rlf-detailed schema schema_name format schema_format

no rlf-detailed schema schema_name
```

**no**

Removes the specified schema.

**schema_name**

Specifies the schema’s name.

`schema_name` must be an alphanumeric string of 1 through 31 characters.

**format schema_format**

Specifies the schema’s format.

`schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces’”” characters. For more information, see the `Schema Format String Length` section.

For information on the schema format’s syntax, see the `Schema Format String Syntax` section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the `Statistics and Counters Reference`.

**Usage**

Use this command to define schemas for detailed RLF bulk statistics collection. Multiple rlf-detailed schemas can be created to categorize RLF detailed bulk statistics. All of the schemas are processed at each collection interval. To create multiple rlf-detailed schemas, re-issue the `rlf-detailed schema schema_name` command using a different schema name.

**Example**

To create an rlf-detailed level schema named `rlfdetailedstats` that specifies a schema format of:
• Date: `date`
• Time: `time`
• Number of Authentication Denials: `deny-auth`

Use the following command:

```
rlf-detailed schema rlfstats format "Date: %date%
Time: %time%
Number of Authentication Denials: %deny-auth%"
```
**rp schema**

Configures R-P bulk statistics schema.

**Product**

PDSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Bulk Statistics Configuration

```
configure > bulkstats mode
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
rp schema schema_name format schema_format

no rp schema schema_name
```

- **no**
  - Removes the specified schema.

- **schema_name**
  - Specifies the schema’s name.
  - `schema_name` must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  - Specifies the schema’s format.
  - `schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
  - For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

Use this command to define schemas for R-P bulk statistics collection. Multiple PDSN service schemas can be created to categorize PDSN service bulk statistics. All of the schemas are processed at each collection interval. To create multiple PDSN service schemas, re-issue the `rp schema schema_name` command using a different schema name.

**Example**

To create an PDSN-level schema named `pdsnservicestats` that specifies a schema format of:

- **Date:** `date`
- **Time**: `time`
- **Number of Authentication Denials**: `deny-auth`

Use the following command:

```bash
rp schema rpservicestats format "Date: %date%
Time: %time%
Number of Authentication Denials: %deny-auth%"
```
saegw schema

Configures System Architecture Evolution Gateway (SAEGW) bulk statistics schema.

Product
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

```
saegw schema  schema_name  format  schema_format

no  saegw schema  schema_name
```

no

Removes the specified schema.

```
schema_name
```

Specifies the schema’s name.

```
schema_name  must be an alphanumeric string of 1 through 31 characters.
```

```
format  schema_format
```

Specifies the schema’s format.

```
schema_format  must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
For information on the schema format’s syntax, see the Schema Format String Syntax section.
```

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for SAEGW bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.

Multiple SAEGW schemas can be created to categorize SAEGW bulk statistics. All of the schemas are processed at each collection interval. To create multiple SAEGW schemas, re-issue the `saegw schema schema_name` command using a different schema name each time.
sample-interval

Configures the time interval between collecting local statistics.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

`configure > bulkstats mode`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```plaintext
sample-interval minutes
```

`minutes`

Specifies the frequency (in minutes) of polling for local statistics as an integer from 1 through 1440.

**Usage**
Adjust the sampling interval to tune the system response as shorter periods can cause undue system overhead whereas longer periods have less of a statistical importance when analyzing data. The system is shipped from the factory with the sampling interval set to 15 minutes.

**Example**

```
sample-interval 120
```
sbc schema

Configures the collection of statistics for the SBC schema.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-bulkstats) #
```

**Syntax**

```
sbc schema  schema_name  format  schema_format

no  sbc schema  schema_name
```

- **no**
  Removes the specified SBC schema from statistics collection.

- **schema_name**
  Specifies the schema’s name.
  *schema_name* must be an alphanumeric string of 1 through 31 characters.

- **format  schema_format**
  Specifies the schema’s format.
  *schema_format* must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the [Schema Format String Length](#) section.
  For information on the schema format’s syntax, see the [Schema Format String Syntax](#) section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the [Statistics and Counters Reference](#).

**Usage**

Use this command to define schemas for SBC bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.

Multiple SBC schemas can be created to categorize SBC bulk statistics. All of the schemas are processed at each collection interval. To create multiple SBC schemas, re-issue the *sbc schema schema_name* command using a different schema name each time.

**Example**

- Example text.
Include the bulk statistic variable names to create an SBC schema named \textit{stats\_SBC\_pkts\_tx\_rx} that specifies a collection of statistics (a schema format). The following command defines the collection of the total number of SCTP packets transmitted and received:

\begin{verbatim}
sbc schema stats\_SBC\_pkts\_tx\_rx format "Total SCTP Packets Sent: \%sctp\_totsent-pkts\nTotal SCTP Packets Received: \%sctp\_totrec-pkts\n"
\end{verbatim}
**scpp schema**

Configures the collection of statistics for the SCCP schema.

**Product**
- SGSN
- HNB-GW

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Bulk Statistics Configuration
- configure > bulkstats mode

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
scpp schema schema_name format schema_format
no scpp schema schema_name
```

**no**

Removes the specified schema.

```
schema_name
```

Specifies the schema’s name.

*schema_name* must be an alphanumeric string of 1 through 31 characters.

```
format schema_format
```

Specifies the schema’s format.

*schema_format* must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces’”’ characters. For more information, see the Schema Format String Length section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for the SCCP schema, refer to the Statistics and Counters Reference.

**Usage**

Use this command to define schemas for SCCP bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified. Multiple SCCP schemas can be created to categorize SCCP bulk statistics. All of the schemas are processed at each collection interval. To create multiple SCCP schemas, re-issue the `scpp schema schema_name` command using a different schema name each time.
Example

Include the bulk statistic variable names to create an SCCP schema named `sccpstats11` that specifies collection of statistics (a schema format) for:

- Subsystem available messages sent from the SCCP
- Subsystem available messages received by the SCCP

Use the following command:

```plaintext
sccp schema sccpstats11 format "Subsys avail SCCP Tx: %ssa-tx\nSubsys avail SCCP Rx: %ssa-rcvd\n"
```
schema

Configures the system-level bulk statistics schema.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

```
configure > bulkstats mode
```

Entering the above command sequence results in the following prompt:

```
[local]host_name (config-bulkstats) #
```

**Syntax**

```
schema schema_name format schema_format
no schema schema_name
```

- **schema**
  - **schema_name**
    - Specifies the schema’s name.
    - **schema_name** must be an alphanumeric string of 1 through 31 characters.

- **format**
  - **schema_format**
    - Specifies the schema’s format.
    - **schema_format** must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.
    - For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

Use this command to define schemas for system-level bulk statistics collection. Multiple schemas can be created to categorize system-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple system schemas, re-issue the `schema schema_name` command using a different schema name.

**Example**

The following command creates a schema named `systemstats1` that records the number of current Simple IP and the number of current Mobile IP sessions:
schema systemstats1 format "%sess-cursipconn% - %sess-curmipconn%"

To create a system-level schema named bulksysstats that specifies a schema format of:

- Number of currently active sessions: sess-curactcall
- Number of currently dormant sessions: sess-curdormcall

Use the following command:

```
schema bulksysstats format "Number of currently active sessions: %sess-curactcall\nNumber of currently dormant sessions: %sess-curdormcall\n"
```
**sgs schema**

Configures the collection of statistics for the SGs schema.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

```
configure > bulkstats mode
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
sgs schema schema_name format schema_format

no sgs schema schema_name
```

- `no`
  - Removes the specified SGs schema from statistics collection.

- `schema_name`
  - Specifies the schema’s name.
  - `schema_name` must be an alphanumeric string of 1 through 31 characters.

- `format schema_format`
  - Specifies the schema’s format.
  - `schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the [Schema Format String Length](#) section.
  - For information on the schema format’s syntax, see the [Schema Format String Syntax](#) section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the [Statistics and Counters Reference](#).

**Usage**

Use this command to define schemas for SGs bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.

Multiple SGs schemas can be created to categorize SGs bulk statistics. All of the schemas are processed at each collection interval. To create multiple SGs schemas, re-issue the `sgs schema schema_name` command using a different schema name each time.

**Example**
Include the bulk statistic variable names to create an SGs schema named `stats_SGs_release` that specifies a collection of statistics (a schema format) for the total number of release messages transmitted, retransmitted, and received:

Use the following command:

```
sgs schema stats_SGs_release format "Total transmitted: %rel-req-tx\nTotal retransmitted: %rel-req-retx\nTotal received: %rel-req-rx\n"
```
sgs-vlr schema

Configures the collection of statistics for the SGs-VLR schema.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

**Syntax**

```
sgs-vlr schema  schema_name  format  schema_format
no  sgs schema schema_name
```

**no**
Removes the specified SGs-VLR schema from statistics collection.

**schema_name**
Specifies the schema’s name. `schema_name` must be an alphanumeric string of 1 through 31 characters.

**format  schema_format**
Specifies the schema’s format. `schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

Use this command to define schemas for SGs-VLR bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.

Multiple SGs-VLR schemas can be created to categorize SGs-VLR bulk statistics. All of the schemas are processed at each collection interval. To create multiple SGs-VLR schemas, re-issue the `sgs-vlr schema schema_name` command using a different schema name each time.

**Example**

Include the bulk statistic variable names to create an SGs-VLR schema named `stats_SGsVLR_release` that specifies a collection of statistics (a schema format) for the total number of release messages transmitted, retransmitted, and received:

Use the following command:

```
sgs-vlr schema stats_SGsVLR_release format "Total Paging requests transmitted: %pag-req-tx\nTotal Paging requests retransmitted: %pag-req-retx\nTotal Paging requests received: %pag-req-rx\n"
```
sgsn schema

Configures the collection of statistics for the SGSN schema.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration

`configure > bulkstats mode`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

Syntax

```
sgsn schema schema_name format schema_format

no sgsn schema schema_name
```

<table>

</tr>
</tbody>
</table>

For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for SGSN bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified. Multiple SGSN schemas can be created to categorize SGSN bulk statistics. All of the schemas are processed at each collection interval. To create multiple SGSN schemas, re-issue the `sgsn schema schema_name` command using a different schema name each time.

Example
Include the bulk statistic variable names to create an SGSN schema named `stats_3Gsgsn1` that specifies collection of statistics (a schema format) for the total number of 3G Attaches per LAC/RAC per MCC&MNC:

Use the following command:

```plaintext
sgsn schema stats_3Gsgsn1 format "MCC: %mcc%\nMNC: %mnc%\nLAC: %lac%\nRAC: %rac%\nTotal 3G Subs Attached: %3G-attached%\n"
```
sgtp schema

Configures the collection of the SGSN’s GTP-C and GTP-U activity statistics.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration

configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

sgtp schema  schema_name  format  schema_format

no sgtp schema  schema_name

no

Removes the specified SGTP schema from statistics collection.

schema_name

Specifies the schema’s name.

schema_name must be an alphanumeric string of 1 through 31 characters.

format  schema_format

Specifies the schema’s format.

schema_format must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for SGTP bulk statistics collection in the generated stats report files.

Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.

Multiple SGTP schemas can be created to categorize SGTP bulk statistics. All of the schemas are processed at each collection interval. To create multiple SGTP schemas, re-issue the sgtp schema schema_name command using a different schema name each time.

Example
Include the bulk statistic variable names to create an SGTP schema named `sgtpstats_sgsn1` that specifies collection of statistics (a schema format) will be by IuPS service interface and by RNC for the total number of GTP-C Create PDP Context Request messages received.

Use the following command:

```
sgtp schema sgtpstats_sgsn1 format "IuPS Service ID: %iups-service\nRNC: %rnc-address\nTotal CPCR Rx: %sgtpc-total-cpc-req"
```

sgw schema

Configures the collection of the S-GW activity statistics.

Product
S-GW
SAEGW

Privilege
Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration
configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

sgw schema schema_name format schema_format

no sgw schema schema_name

no

Removes the specified S-GW schema from statistics collection.

schema_name

Specifies the schema’s name.

schema_name must be an alphanumeric string of 1 through 31 characters.

format schema_format

Specifies the schema’s format.

schema_format must be an alphanumeric string of 1 through 1021 characters minus the number of characters in rest of the command, including spaces and double quotes (" ") characters. For more information, see the Schema Format String Length section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for S-GW bulk statistics collection in the generated stats report files.

Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.

Multiple S-GW schemas can be created to categorize S-GW bulk statistics. All of the schemas are processed at each collection interval. To create multiple S-GW schemas, re-issue the sgw schema schema_name command using a different schema name each time.
Example

Include the bulk statistic variable names to create an S-GW schema named `sgwstats_sgw1` that specifies collection of statistics (a schema format) will be by S-GW service interface for the total number of currently idle and active UEs.

Use the following command:

```
sgw schema sgwstats_sgw1 format "SGW Service ID: %servname%
Total Current Idle UEs: %sessstat-totcur-ueidle%
Total Current Active UEs: %sessstat-totcur-ueactive%"
```
show variables

Displays the bulk statistics variable information based on schema names.

obsolete
Displays obsolete (but still available) schema variables. An asterisk (*) is displayed next to schema variables that have been obsoleted.

Usage
Use this command to list supported bulk statistic variables. Variables can be listed for a specified schema. If no schema is specified, all supported variables are listed on a per-schema basis.

Example
The following command displays the bulkstat variables only for the card schema:

    show variables card
sls schema

Configures the collection of statistics for the SLs schema.

Product
MME

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration

configure > bulkstats mode

Entering the above command sequence results in the following prompt:

[local]host_name(config-bulkstats)#

Syntax

sls schema schema_name format schema_format

no sls schema schema_name

no

Removes the specified SLs schema from statistics collection.

schema_name

Specifies the schema’s name.

schema_name must be an alphanumeric string of 1 through 31 characters.

format schema_format

Specifies the schema’s format.

schema_format must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for SLs bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified. Multiple SLs schemas can be created to categorize SLs bulk statistics. All of the schemas are processed at each collection interval. To create multiple SLs schemas, re-issue the sls schema schema_name command using a different schema name each time.

Example
Include the bulk statistic variable names to create an SLs schema named `stats_SLs_pkts_tx_rx` that specifies a collection of statistics (a schema format) for the total number of SCTP packets transmitted and received:

Use the following command:

```
sls schema stats_SLs_pkts_tx_rx format "Total SCTP Packets Sent: %sctp-totsent-pkts
Total SCTP Packets Received: %sctp-totrec-pkts"
```
ss7link schema

Configures the collection of the SS7 link activity statistics.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Bulk Statistics Configuration

`configure > bulkstats mode`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

Syntax

```
ss7link schema schema_name format schema_format

no ss7link schema schema_name
```

**no**

Removes the specified SS7 Link schema from statistics collection.

**schema_name**

Specifies the schema’s name.

*schema_name* must be an alphanumeric string of 1 through 31 characters.

**format schema_format**

Specifies the schema’s format.

*schema_format* must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the Schema Format String Length section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

Usage

Use this command to define schemas for SS7 link and linkset bulk statistics collection per SS7 routing domain in a generated stats report file. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.
Multiple collection schemas can be created to categorize SS7 link bulk statistics. All of the schemas are processed at each collection interval. To create multiple SS7 link schemas, re-issue the `ss7link schema schema_name` command using a different schema name each time.

**Example**

The following command creates a schema named `ss7lnk1stats1` that records the changeover orders sent and received per linkset and link and per SS7 routing domain:

```
ss7link schema ss7lnk1stats1 format "%ss7rd-number-%ss7-linkset-id-%ss7-link-id-%ss7-link-asn_instance-%ss7-link-mtp3-changeover-order-tx-%ss7-link-mtp3-changeover-order-rx%"
```
**ss7rd schema**

Configures the collection of bulk statistics for SS7 routing domain services, which include the activity statistics for SCTP, MTP, and M3UA data.

**Product**
SGSN
HNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

```bash
configure > bulkstats mode
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```bash
ss7rd schema schema_name format schema_format

no ss7rd schema schema_name
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no ss7rd schema schema_name</td>
<td>Removes the specified SS7 routing domain schema from statistics collection.</td>
</tr>
<tr>
<td>schema_name</td>
<td>Specifies the schema’s name. (\text{schema}_\text{name}) must be an alphanumeric string of 1 through 31 characters.</td>
</tr>
<tr>
<td>format (\text{schema}_\text{format})</td>
<td>Specifies the schema’s format. (\text{schema}_\text{format}) must be an alphanumeric string of 1 through (1021 - \text{number of characters in rest of the command, including spaces}) characters. For more information, see the Schema Format String Length section. For information on the schema format’s syntax, see the Schema Format String Syntax section.</td>
</tr>
</tbody>
</table>

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

Use this command to define schemas for collection of SS7 routing domain statistics to be included in the generated stats report file. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.
Multiple collection schemas can be created to categorize SS7 routing domain bulk statistics. All of the schemas are processed at each collection interval. To create multiple SS7 routing domain schemas, re-issue the `ss7rd schema schema_name` command using a different schema name each time.

**Example**

The following command creates a schema named `ss7rd1stats1` that identifies the SS7 routing domain and records the Application Server Process instance in the SS7 routing domain, along with the total number of sent and received SHUTDOWN messages per SS7 routing domain:

```
ss7rd schema ss7rd1stats1 format "%ss7rd-number%-%ss7rd-asp_instance%-%ss7rd-sctp-shutdown-tx%-%ss7rd-sctp-shutdown-rx%"
```
**tai schema**

Configures TAI (Tracking Area Identifier) bulk statistics schema.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

```
configure > bulkstats mode
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
tai schema schema_name format schema_format

no tai schema schema_name
```

- **no**
  Removes the specified schema.

- **schema_name**
  Specifies the schema’s name.
  `schema_name` must be an alphanumeric string of 1 through 31 characters.

- **format schema_format**
  Specifies the format of the collected TAI statistics by identifying the statistics variables and ordering the variables for presentation within the bulk statistics messages.
  `schema_format` must be an alphanumeric string of 1 through “1021 minus “number of characters in rest of the command, including spaces”” characters. For more information, see the **Schema Format String Length** section.
  For information on the schema format’s syntax, see the **Schema Format String Syntax** section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

Use this command to define schemas for TAI bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified. Multiple TAI schemas can be created to categorize TAI bulk statistics. All of the schemas are processed at each collection interval. To create multiple TAI schemas, re-issue the **tai schema schema_name** command using a different schema name each time.
Important: To enable collection of TAI schema bulk statistics, you must issue the MME Service Configuration Mode command: `statistics collection-mode tai`. Only those MME Services which are configured accordingly will provide TAI based statistics.

Example

The following command creates a TAI schema with the following information: MNC, MCC, TAC, and the total number of paging attempts.

```
tai schema paging_attempted format "%tai-mnc% %tai-mcc% %tai-tac% %tai-paging-attempted%"
```
transfer-interval

Configures the frequency of transfer of collected statistics to the receiver.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

```bash
configure > bulkstats mode
```

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-bulkstats) #
```

**Syntax**

```
transfer-interval minutes
```

*minutes*

Specifies the number of minutes between the transfer of collected statistics to the receivers as an integer from 1 through 999999.

**Usage**

Modify the transfer interval based upon the number of sessions per second. As the number of session requests a second increases it may become necessary to increase the transfer interval to reduce the processing overhead frequency for statistics delivery. This is tempered by the impact reduced resolution of statistical data has on usefulness of data when the interval gets larger than the least busy hours and most busy hours of the day.

The system is shipped from the factory with the transfer interval set to 480 minutes.

**Example**

```
transfer-interval 1440
```
vlan-npu schema

Configures the collection of VLAN-NPU activity statistics.

**Important:** The VLAN-NPU counters will only be displayed if the `logical-port-statistics` command has been enabled at the interface level under the Ethernet Interface Configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Bulk Statistics Configuration

`configure > bulkstats mode`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats)#
```

**Syntax**

```
vlan-npu schema `schema_name` format `schema_format`

no vlan-npu schema `schema_name`
```

**no**

Removes the specified VLAN-NPU schema from statistics collection.

`schema_name`

Specifies the schema’s name.

`schema_name` must be an alphanumeric string of 1 through 31 characters.

`format` `schema_format`

Specifies the schema’s format.

`schema_format` must be an alphanumeric string of 1 through 3599 characters minus the number of characters in rest of the command, including spaces and double quotation mark ("" ) characters. For more information, see the Schema Format String Length section.

For information on the schema format’s syntax, see the Schema Format String Syntax section.

**Important:** For a complete list of the statistics that are supported for this schema, refer to the Statistics and Counters Reference.

**Usage**

Use this command to define schemas for VLAN-NPU bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.
Multiple VLAN-NPU schemas can be created to categorize VLAN-NPU bulk statistics. All of the schemas are processed at each collection interval. To create multiple VLAN-NPU schemas, re-issue the `vlan-npu schema schema_name` command using a different schema name each time.

**Example**

Include the bulk statistic variable names to create a VLAN-NPU schema named `vlanstats_vlan12` that specifies collection of statistics (a schema format) will be by VLAN-NPU interface for the total number of frames and bytes received with no Access Control List (ACL) match.

```
vlan-npu schema vlanstats_vlan12 format "VLAN12: %interfacename%\nTotal Frames Recv’d with no ACL match: %no-acl-match-rx-frames%\nTotal Bytes Recv’d with no ACL match: %no-acl-match-rx-bytes%"
```
Chapter 38
Bulk Statistics File Configuration Mode Commands

This section describes a bulk statistic “file” under which to group the bulk statistic configuration. The Bulk Statistics File Configuration mode supports the configuration of “files” used for organizing bulk statistics schema, delivery options, and receiver information.

Because multiple “files” can be configured, this functionality provides greater flexibility in that it allows you to configure different schemas to go to different receivers.

**Important:** Use of bulk statistics “files” is optional. However system logically assigns “file 1” to the standard configuration. Therefore, if you wish to configure bulk statistics “files” at a later time, “file 1” can be used.

**Caution:** If the Web Element Manager application is used to collect and process (XML parsing, graphing, etc.) bulk statistics data, “file 1” is used by the Web Element Manager’s default bulk statistics collection information and schemas. To avoid errors in processing by the Web Element Manager, do not configure “file 1” via the CLI. However, it is possible to configure files 1 through 4 using the system’s CLI, regardless of whether or not the Web Element Manager is configured as a receiver. In this case, the bulk statistics data is written to the server but not processed by the Web Element Manager application.

**Mode**

**Exec > Global Configuration > Bulk Statistics Configuration > Bulk-File Configuration**

```bash
configure > bulkstats config_mode file file_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-bulkstats-file-number)#
```

**Important:** The schema related commands in this configuration mode are identical to the same commands in the “Bulk Statistics Configuration Mode Commands” chapter.

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
Chapter 39
Call Control Profile Configuration Mode

Call Control Profile configuration mode defines call-handling rules which can be combined with other profiles – such as an APN profile (see the APN Profile Configuration Mode Commands chapter) – when using the Operator Policy feature. The call control profile is a key element in the Operator Policy feature and the profile is not valid until it is associated with an operator policy (see the associate command in the Operator Policy Configuration Mode Commands chapter).

The MME and SGSN each support a maximum of 1,000 call control profiles; only one profile can be associated with an operator policy.

By configuring a call control profile, the operator fine tunes any desired restrictions or limitations needed to control call handling per subscriber or for a group of callers across IMSI (International Mobile Subscriber Identity) ranges.

Mode

Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
access-restriction-data

Enables the operator to assign a failure code to be included in reject messages if the attach rejection is due to access restriction data (ARD) checking in the incoming subscriber data (ISD) messages. The operator can also disable the ARD checking behavior.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name
Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

access-restriction-data { eutran-not-allowed | failure-code cause_code | no-check }
remove access-restriction-data { failure-code | eutran-not-allowed }

remove
Removes the failure code setting or eutran-not-allowed override setting.

eutran-not-allowed
Overrides the eutran-not-allowed flag received in ISD/ULA messages from the HLR/HSS received during the Attach process. The overridden value will be sent to the RNC during PDP context activation (in RAB Assignment Request messages) so that the RNC subsequently avoids performing a handover to E-UTRAN. Configuration of the eutran-not-allowed parameter is valid only if SRNS relocation first has been configured in Call Control Profile Configuration Mode via the srns-inter and/or srns-intra commands. The call-control-profile then must be associated with an operator policy in Operator Policy Configuration Mode using the associate command. Once the operator policy is associated with the call-control-profile, inclusion of the E-UTRAN Service Handover Information Element in RAB Assignment Request and Relocation Request RANAP messages must be enabled. This is done by executing the ranap eutran-service-handover-ie command in RNC Configuration Mode.

failure-code cause_code

cause_code: Enter an integer from 2 through 111; default code is 13 (roaming not allowed in this location area [LA]).
Refer to the GMM failure cause codes listed below (from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):
  • 2 - IMSI unknown in HLR
  • 3 - Illegal MS
  • 6 - Illegal ME
  • 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived by the network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 -MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable
- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented
- 100 - Conditional IE error
- 101 - Message not compatible with the protocol state
- 111 - Protocol error, unspecified

no-check
Including this keyword with the command disables the ARD checking behavior.

Usage
By default, the SGSN checks access restriction data (ARD) within incoming insert subscriber data (ISD) messages. This enables operator to selectively restrict subscribers in either 3G (UTRAN) or 2G (GERAN). The SGSN ARD checking behavior occurs during the attach procedure and if a reject occurs, the SGSN sends the subscriber an Attach Reject message with a configurable failure cause code.

Example
For this call control profile, the following command disables the ARD checking function:

```
access-restriction-data no-check
```
accounting context

Defines the name of the accounting context and optionally associates a GTPP group with this call control profile.

Product
- ePDG
- S-GW
- SAEGW
- SGSN
- SaMOG

Privilege
- Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

accounting context ctxt_name [ aaa-group grp_name ] [ gtpp group grp_name ]

remove accounting context [ aaa-group | gtpp ]

remove

Removes the accounting configuration from this profile’s configuration.

ctxt_name

Specifies the accounting context as an alphanumeric string of 1 through 79 characters.

aaa-group grp_name

Configures AAA Group for MRME.

grp_name is a string of 1 to 63 characters (any combination of letters and digits) to identify the aaa-group created with the aaa-group command in the Context configuration mode.

gtpp group grp_name

Identifies the GTPP group, where the GTPP related parameters have been configured in the GTPP Group Configuration mode, to associate with this call control profile.

grp_name is a string of 1 to 63 characters (any combination of letters and digits) to identify the GTPP group created with the gtpp group command in the Context configuration mode.
Usage

This command can be used to associate a predefined GTPP server group - including all its associated configuration - with a specific call control profile. The GTPP group would have been defined with the `gtpp group` command (see the Context Configuration Mode Commands chapter).

If the GTPP group is not specified, then a default GTPP group in the accounting context will be used.

If this command is not specified, use the name of the accounting context configured in the SGSN service configuration mode (for 3G) or the GPRS service configuration mode (for 2G), either will automatically use a “default” GTPP group generated in that accounting context.

If the accounting context is specified in the GPRS service or SGSN service and in a call control profile, the priority is given to the accounting context of the call control profile.

Example

For this call control profile, the following command identifies an accounting context called `acctng1` and associates a GTPP server group named `roamers` with defined charging gateway accounting functionality.

```
accounting context acctng1 gtpp group roamers
```
accounting mode

Configures the mode to be used for accounting – GTPP (default), RADIUS/Diameter or None.

Product
  S-GW
  SAEGW

Privilege
  Administrator

Mode
  Exec > Global Configuration > Call Control Profile Configuration
  configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

accounting mode { gtpp | none | radius-diameter }

remove accounting mode

remove
Remove the accounting mode.

gtpp
Specifies that GTPP accounting is performed. This is the default method.

none
Specifies that no accounting will be performed for the call control profile.

radius-diameter
Specifies that RADIUS/Diameter will be performed for the call control profile.

Usage

Use this command to specify the accounting mode for a call control profile. For additional information on accounting mode and its relationship to operator policy, refer to the System Administration Guide.

Example

The following command specifies that RADIUS/Diameter accounting will be used for the call control profile:

  accounting mode radius-diameter
accounting stop-trigger

Configures the trigger point for accounting stop CDR. Default is on session deletion request.

Product
S-GW
SAEGW

Privilege
Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

accounting stop-trigger custom

default accounting stop-trigger

default
Accounting stop CDR triggered once Delete Session/Delete Bearer Request is received at S-GW.

custom
Accounting stop CDR triggered once Delete Session/Delete Bearer Response is received at S-GW.

Usage

Use this command to specify the trigger point for accounting stop CDR for a call control profile.

Example

The following command specifies that accounting stop trigger would be at response of session deletion:

    accounting stop-trigger custom
**allocate-ptmsi-signature**

Enables or disables the allocation of a P-TMSI (Packet Temporary Mobile Subscriber Identity) signature.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

**Syntax**

```plaintext
[ no | default ] allocate-ptmsi-signature

no

Disables the allocation of the P-TMSI signature.

default

Resets the configuration value to the default, which is to allocate the P-TMSI signature.
```

**Usage**

Use this command to enable or disable the allocation of the P-TMSI signature.

**Example**

```plaintext
allocate-ptmsi-signature
```
apn-restriction

Enables the APN restriction feature and configures the instruction for the SGSN on the action to take when an APN restriction value is received from the GGSN during an Update PDP Context procedure.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
apn-restriction update-policy deactivate restriction

default apn-restriction
```

**default**

Creates a default APN restriction configuration.

```
update-policy deactivate restriction
```

Specifies one of the two restriction types to define the appropriate action if the APN restriction value received conflicts with the stored value:

- **least-restrictive** set the least restrictive value applicable when there are no already active PDP context(s).
- **most-restrictive** sets the most stringent restriction required by any already active PDP context(s).

**Usage**

When this feature is enabled, the SGSN will send the maximum APN restriction value in every CPC Request message sent to the GGSN. The SGSN expects to receive an APN restriction value in each PDP Context received from the GGSN. The SGSN stores and compares received APN restriction values to check for conflicts. In the case of a conflict, the SGSN rejects the PDP Context with appropriate messages and error codes to the MS.

If an APN restriction value is not assigned by the GGSN, the SGSN assumes the value of “1” (least restrictive) to allow APN restriction rules will be possible when valid values are assigned for new PDP Context(s) from the same MS.

The least or most restrictive values of the APN restriction are applicable only for the Gn SGSN, as the APN restriction can be present in UPCQ/UPCR for Gn SGSN and this configuration is required to determine the PDN to be de-activated when an APN restriction violation occurs during modification procedures in the Gn SGSN. In the case of S4-SGSN, the APN restriction arrives at the S4-SGSN only in Create Session Response during activation. During activation in S4-SGSN, a PDN connection that violates the current Maximum APN restriction...
restriction is always de-activated. Therefore in the case of S4-SGSN, this CLI is used only for enabling or disabling APN restriction.

**Example**

The following command applies the lowest level of APN restrictions:

```
apn-restriction update-policy deactivate least-restrictive
```
**associate**

Associates various MME-specific lists and databases with this call control profile. On an SGSN, this command can be used to associate some of these MME-related items to GPRS and/or SGSN services in support of S4 functionality. For SaMOG, this command can be used to associate various SGW and SGSN CDR triggers for the call control profile.

**Product**
ePDG
MME
SGSN
SaMOG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
associate { accounting-policy policy_name | ho-restrict-list list_name | hss-peer-service service_name | s13-interface | s6a-interface | s13-prime-interface | s6d-interface | tai-mgmt-db tai-db_name }
```

```
remove associate { accounting-policy | ho-restrict-list | hss-peer-service | s13-interface | s6a-interface | s13-prime-interface | s6d-interface | tai-mgmt-db }
```

**accounting-policy policy_name**

SaMOG only.

**Important:** With SaMOG mixed license, SaMOG supports both SGSN and SGW CDRs. With SaMOG 3G license, SaMOG supports only SGSN CDRs.

Associates the APN with specific pre-configured policies configured in the same context for SaMOG charging.

`policy_name` must be an alphanumber string of 1 through 63 characters.

**ho-restrict-list list_name**

MME only.

Identifies the handover restriction list that should be associated with this call control profile.

`list_name` is a string of 1 to 64 characters (any combination of letters and digits).
associate

**hss-peer-service service_name**

Associates a home subscriber server (HSS) peer service with this call control profile.

*service_name* is an existing HSS peer service expressed as a string of 1 to 63 characters (any combination of letters and digits).

[ s13-interface | s6a-interface | s13-prime-interface | s6d-interface ]

Optionally, identify the interface to be associated with the HSS service in this call control profile.

The *s13-interface* and the *s6a-interface* options apply to the MME only.

The *s13-prime-interface* and *s6d-interface* options apply to the SGSN only.

The *s6d-interface* is used by the SGSN to communicate with the HSS. It is a Diameter-based interface which supports location management, subscriber data handling, authentication, and fault recovery procedures.

The *s13-prime-interface* is used by the SGSN to communicate with the equipment identity register (EIR). It is a Diameter-based interface which performs the mobile equipment (ME) identity check procedure.

**Important:** The *s13-prime-interface* can only be used if an *s6d-interface* is configured.

**tai-mgmt-db tai-db_name**

Identifies the tracking area identifier (TAI) database that should be associated with this call control profile.

*tai-db_name* is a string of 1 to 64 characters (any combination of letters and digits).

This configuration overrides the S-GW selection and TAI list assignment functionality for a call that uses an operator policy associated with this call control profile. The TAI management object provides a TAI list for calls and provides S-GW selection functionality if a DNS is not configured for S-GW discovery for this operator policy or if a DNS discovery fails.

If a TAI management database is associated with a call-control-profile, and if DNS is used for S-GW lookups, then the DNS configuration for S-GW lookups must also be configured within the same call-control-profile using the *dns-sgw* command in the call-control-profile configuration mode.

On the S4-SGSN, use this option to associate a locally configured S-GW address for the RAI address for selection if operators wish to bypass DNS resolution of RAI FQDN. This option is valid only after the following commands have been executed on the S4-SGSN:

- The *tai-mgmt-db* command in *LTE Policy Configuration Mode*
- The *tai-mgmt-obj* command in *LTE TAI Management Database Configuration Mode*.
- The *tai* and *sgw-address* commands in *LTE TAI Management Object Configuration Mode*.

**Usage**

Use this command to associate handover restriction lists, HSS service (and interfaces), and a TAI database with the call control profile. This ensures that the information is available for application when a Request is received.

For SaMOG, use this command to associate the SaMOG call control profile with an accounting policy configured in this context to provide triggers to generate CDRs. If no policy is configured, triggers based on the call control profile will not be generated, and the accounting policy in the SaMOG service context will be used. Even if an accounting policy is also specified in a call control profile, the priority is given to the accounting policy of the APN profile.

Repeat the command as needed to associate each feature.

**Example**

Link HO restriction list named *HOrestrict1* with this call control profile:
associate ho-restrict-list HOrestrict1

The following command associates this SaMOG call control profile with an accounting policy called acct1:

associate accounting-policy acct1
attach access-type

Defines attach-related configuration parameters for this call control profile based on the access-type (GPRS, UMTS, or both) and location area list.

**Important**: SGSN only: Before using this command, ensure that the appropriate location area code (LAC) information has been defined via the `location-area-list` command.

**Product**
- MME
- SGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Call Control Profile Configuration
- `configure > call-control-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
attach access-type { gprs | umts } { all | location-area-list instance list_id } { failure-code code | user-device-release { before-r99 failure code code | r99-or-later failure code code } }

default attach access-type { eps | gprs | umts } { all | location-area-list instance list_id } { failure-code | user-device-release { before-r99 failure code | r99-or-later failure code } }

default

Restores the default values for the for the specified parameter.

**access-type type**

Defines the type of access to be allowed or restricted.
- *gprs
- *umts
- all

Instructs the SGSN or MME to apply the command action to all location area lists. Location area lists should already have been created with the `location-area-list` command. The location area list consists of one or more LACs, location area codes, where the MS is when placing the call.
location-area-list instance list_id

Instructs the SGSN to apply the command action to a specific location area list. Location area lists should already have been created with the location-area-list command. The location area list consists of one or more LACs, location area codes, where the MS is when placing the call. Using this keyword with either the allow or restrict keywords enables you to configure with more granularity.

list_id: Enter an integer between 1 and 5.

failure-code code

Specify a GMM failure cause code to identify the reason an attach did not occur. This GMM cause code will be sent in the reject message to the MS.

Default: 14.

fail-code: Enter an integer from 2 to 111. Refer to the GMM failure cause codes listed below (from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

- 2 - IMSI unknown in HLR
- 3 - Illegal MS
- 6 - Illegal ME
- 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived by the network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 - MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable
- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented
- 100 - Conditional IE error
Call Control Profile Configuration Mode

- 101 - Message not compatible with the protocol state
- 111 - Protocol error, unspecified

user-device-release { before-r99 | r99-or-later } failure-code code

Default: disabled

Enables the SGSN to reject an Attach procedure based on the detected 3GPP release version of the MS equipment and selectively send a failure cause code in the reject message. The SGSN uses the following procedure to implement this configuration:

1. When Attach Request is received, the SGSN checks the subscriber’s IMSI and current location information.
2. Based on the IMSI, an operator policy and call control profile are found that relate to this Attach Request.
3. Profile is checked for access limitations.
4. Attach Request is checked to see if the revision indicator bit is set
   - if not, then the configured common failure code for reject is sent;
   - if set, then the 3GPP release level is verified and action is taken based on the configuration of this parameter

One of the following options must be selected and completed:
- **before-r99**: Indicates the MS would be a 3GPP release prior to R99 and an appropriate failure code should be defined.
  - failure-code code: Enter an integer from 2 to 111.
- **r99-or-later**: Indicates the MS would be a 3GPP Release 99 or later and an appropriate failure code should be defined.
  - failure-code code: Enter an integer from 2 to 111.

**Usage**

Once the IMSI of an incoming call is known and matched with a specific operator policy, according to the filter definition of the mcc command, then the associated call control profile is selected to determine how the incoming call is handled.

By default, all attaches are allowed. If no access limitations are needed, do not use the attach command.

**Important:** Before using this command, ensure that the appropriate LAC information has been defined with the location-area-list command.

Use this command to define attach limitations for the call control profile.
Use this command to fine-tune the attach configuration specifying which calls/subscribers can attach and which calls are restricted from attaching and what failure code is included in the Reject message.
Attachment restrictions can be based on any one or combination of the options, such as location area code or access type. It is even possible to restrict all attaches.

The command can be repeated using different keyword values to further fine-tune the attachment configuration.

**Related Commands**

- Use the attach restrict command to restrict attaches.
• Use the `attach allow` command to re-enable restrictions after an `attach restrict` command has been used.

Example

The following example sets all restrictions for access-type gprs and specified release version to the default setting.

```
default attach access-type gprs all user-device-release before-r99 failure-code
```
attach allow

Configures the system to re-enable attaches that were previously restricted using the attach restrict command.

Important: SGSN only: Before using this command, ensure that the appropriate location area code (LAC) information has been defined via the location-area-list command.

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

[ no ] attach allow access-type { eps | gprs | umts } location-area-list instance list_id

no
Deletes the specified attach configuration.

allow
Enables attaches in the configuration after an attach restrict command has been used.

access-type type
 Defines the type of access to be allowed.
    •eps
    •gprs
    •umts

location-area-list instance list_id

Instructs the SGSN to apply the command action to a specific location area list. Location area lists should already have been created with the location-area-list command. The location area list consists of one or more LACs, location area codes, where the MS is when placing the call.
list_id: Enter an integer between 1 and 5.
Usage

Once the IMSI of an incoming call is known and matched with a specific operator policy, according to the filter definition of the \texttt{mcc} command, then the associated call control profile is selected to determine how the incoming call is handled.

By default, all attaches are allowed. If no access limitations are needed, then do not use the \texttt{attach} command.

\begin{itemize}
  \item \textbf{Important:} Before using this command, ensure that the appropriate LAC information has been defined with the \texttt{location-area-list} command.
\end{itemize}

Use this command to define attach limitations for the call control profile.

Use this command to fine-tune the attach configuration specifying which calls/subscribers can attach and which calls are restricted from attaching and what failure code is included in the Reject message.

Attachment restrictions can be based on any one or combination of the options, such as location area code or access type. It is even possible to restrict all attaches.

The command can be repeated using different keyword values to further fine-tune the attachment configuration.

\textbf{Related Commands}

\begin{itemize}
  \item Use the \texttt{attach access-type} command to define the type of access to restrict or allow.
  \item Use the \texttt{attach restrict} command to restrict attaches.
\end{itemize}

Example

For calls under the purview of this call control profile, the following command allows attaches of \texttt{all} subscribers using the GPRS access type.

\begin{verbatim}
attach allow access-type gprs all
\end{verbatim}
**attach imei-query-type**

Defines device Attach limitations for this call control profile if an IMEI is not already present in the Attach Request.

**Product**
MME
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
attach imei-query-type { imei | imei-sv | none } [ verify-equipment-identity [ allow-on-eca-timeout | deny-greylisted | deny-unknown | verify-emergency ] + ]
```

```
remove attach imei-query-type
```

Deletes the specified attach configuration.

**imei-query-type { imei | imei-sv | none }**

Configures system behavior during Attach procedures if an IMEI is not already present in the Attach Request.

- **imei**: Specifies that the system is required to query the UE for its International Mobile Equipment Identity (IMEI).
- **imei-sv**: Specifies that the system is required to query the UE for its International Mobile Equipment Identity - Software Version (IMEI-SV).
- **none**: Specifies that the system does not need to query for IMEI or IMEI-SV.

**verify-equipment-identity [ allow-on-eca-timeout | deny-greylisted | deny-unknown | verify-emergency ]**

Specifies that the identification (IMEI or IMEI-SV) of the UE is to be performed by the Equipment Identity Register (EIR) over the S13 interface.

- **allow-on-eca-timeout**: Configures the MME to allow equipment that has timed-out on ECA during the attach procedure.
- **deny-greylisted**: Configures the MME to deny grey-listed equipment during the attach procedure.
- **deny-unknown**: Configures the MME to deny unknown equipment during the attach procedure.
- **verify-emergency**: Configures the MME to ignore the IMEI validation of the equipment during the attach procedure in emergency cases. This keyword is only supported in release 12.2 and higher.
**Usage**

Configures system settings related to the UE Attach procedure for the specified call control profile. The command can be repeated using different keyword values to further fine-tune the attachment configuration.

**Example**

The following command configures the system to query the UE for its IMEI and to verify the UE equipment identity with an Equipment:

```
attach imei-query-type imei verify-equipment-identity
```
attach restrict

Configures the system to restrict attaches based on access type and location areas (either all or specified location area list) for this call control profile.

**Important:** SGSN only: Before using this command, ensure that the appropriate location area code (LAC) information has been defined via the `location-area-list` command.

Security Administrator, Administrator

### Mode
Exec > Global Configuration > Call Control Profile Configuration
`configure > call-control-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

### Syntax

```
```

- **no**
  - Deletes the specified attach configuration.

- **access-type type**
  - Defines the type of access to be allowed or restricted.
    - eps
    - gprs
    - umts

- **emm-cause-code code**
  - Specifies the EPS Mobility Management (EMM) cause code to return to the UE:
    - eps-service-disallowed
    - eps-service-not-allowed-in-this-plmn
    - no-suitable-cell-in-tracking-area
    - plmn-not-allowed
    - roaming-not-allowed-in-this-tracking-area
Call Control Profile Configuration Mode

**attach restrict**

*tracking-area-not-allowed*

The default cause code is **no-suitable-cell-in-tracking-area**.

**Important:** The **tracking-area-not-allowed** cause code is not supported for the MME.

**Important:** The **roaming-not-allowed-in-this-tracking-area** and **tracking-area-not-allowed** cause codes are not applicable for use with the **imsi-attach-fail** or **voice-unsupported** keywords.

**imsi-attach-fail**

Directs the MME to restrict EPS attach when IMSI attach fails. If the policy is configured, all IMSI failures will result in a EPS restriction.
The default cause code for calls rejected for imsi-attach-fail is **no-suitable-cell-in-tracking-area**.

**voice-unsupported**

Directs the MME to restrict EPS attach when voice is not supported, such as when Voice over IMS is not supported and the UE does not support Circuit Switched Fall Back (CSFB).
This setting is applicable when all of the following conditions apply:

- The UE is voice-centric as determined in the UE usage setting of the Voice Domain and UE Settings IE sent in the request.
- The UE does not support CSFB as determined in the EMM Combined procedures Capability bit of the MS Network Capability IE sent in the request, OR if CSFB is not supported on the MME as determined by the SGs service not being associated with the MME service.
- Voice over IMS is not supported in the network as defined by the **network-feature-support-ie ims-voice-over-ps** command.

The default cause code for calls rejected for voice-unsupported is **no-suitable-cell-in-tracking-area**.

**all**

Instructs the system to apply the command action to all location area lists. Location area lists should already have been created with the **location-area-list** command. The location area list consists of one or more LACs, location area codes, where the MS is when placing the call.

**location-area-list instance list_id**

Instructs the SGSN to apply the command action to a specific location area list. Location area lists should already have been created with the **location-area-list** command. The location area list consists of one or more LACs, location area codes, where the MS is when placing the call.
Using this keyword with either the **allow** or **restrict** keywords enables you to configure with more granularity.

`list_id`: Enter an integer between 1 and 5.

**Important:** This keyword only applies to the SGSN.
Call Control Profile Configuration Mode

Usage

Once the IMSI of an incoming call is known and matched with a specific operator policy, according to the filter definition of the mcc command, then the associated call control profile is selected to determine how the incoming call is handled.

By default, all attaches are allowed. If no access limitations are needed, then do not use the attach command.

Important: Before using this command, ensure that the appropriate LAC information has been defined with the location-area-list command.

Use this command to restrict attaches for the call control profile.

Use this command to fine-tune the attach configuration specifying which calls/subscribers can attach and which calls are restricted from attaching and what failure code is included in the Reject message.

Attachment restrictions can be based on any one or combination of the options, such as location area code or access type. It is even possible to restrict all attaches.

The command can be repeated using different keyword values to further fine-tune the attachment configuration.

Related Commands

- Use the attach access-type command to define the type of access to restrict or allow. The command attach restrict access-type gprs all has to be enabled, if the command attach access-type gprs all failure-code < code > is used to define a failure code. The failure code is saved after a re-boot only when the command attach restrict access-type gprs all is enabled.

- Use the attach allow command to re-enable restrictions after an attach restrict command has been used.

Example

For calls under the purview of this call control profile, the following command restricts the attaches of all subscribers using the GPRS access type.

```
attach restrict access-type gprs all
```

To change the attach restriction to only restrict attaches of GPRS subscribers from specified LACs included in location area list #2 and include failure-code 45 as the reject cause. This configuration requires two CLI commands:

```
attach restrict access-type gprs location-area-list instance 2
attach access-type gprs location-area-list instance 2 failure-code 45
```

In the case of a dual-access SGSN, it is possible to also add a second definition to restrict attaches of UMTS subscribers within the LACs included in location area list #3.

```
attach restrict access-type UMTS location-area-list instance 3
```

Change the configuration to allow attaches for GPRS access for all previously restricted LACs - note that GPRS attaches would still be limited:

```
no attach restrict access-type gprs all
```

Restrict (deny) all GPRS attach requests (coming from any location area) and assign a single failure code for the reject messages. This is a two command process:
attach restrict access-type gprs all
attach access-type grps all failure-code 22
authenticate all-events

Allows the operator to quickly define authentication procedures, based on limited parameters, for all types of events.

**Product**
MME
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration
`configure > call-control-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
authenticate all-events [ access-type { gprs | umts } | frequency frequency [ access-type { gprs | umts } ] ]
```

```
no authenticate all-events [ access-type { gprs | umts } ]
```

**no**
Disables the specified authentication configuration in the call control profile.

```
remove
```
Removes the specified authentication configuration from the call control profile configuration file.

```
access-type type
```
One of the following must be selected to identify the type of network access if the `access-type` keyword is included in the command:

* gprs
* umts

The `access-type` keyword can be included with any of the other three keywords available with the `authenticate all-events` command.

```
frequency frequency
```
This keyword defines 1-in-N selective authentication for all types of subscriber events. If the frequency is set for 12, then the service skips authentication for the first 11 events and authenticates on the 12th event.

`frequency` must be an integer from 1 to 16.
Call Control Profile Configuration Mode

authenticate all-events

Usage

By default, authentication is not performed for any subscriber events. Use this command to enable authentication for all types of events at one time, such as but not limited to: Activate Requests, Attach Requests, Detach Requests, Service-Requests.

Important: For the SGSN, in releases 15.0 and forward, the authentication on activation functionality has been removed so the SGSN will not authenticate on Activate Requests.

Example

The following command configures all authentication for all subscriber events to occur every tenth time a specific type of event occurs (for example every tenth time an Attach Request is received):

```
authenticate all-events frequency 10
```

The following command configures authentication for all Detach Requests and RAUs to occur if the UE access-type is UMTS:

```
authenticate all-events access-type umts
```
authenticate attach

Allows the operator to define authentication for Attach procedures.

Product
MME
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

authenticate attach access-type { gprs | umts }

authenticate attach attach-type { combined | gprs-only } [ access-type { gprs | umts } ] [ frequency frequency ]

authenticate attach frequency frequency [ access-type { gprs | umts } ]

authenticate attach inter-rat [ access-type { gprs | umts } ] | attach-type { combined | gprs-only } [ access-type { gprs | umts } ] | frequency frequency [ access-type { gprs | umts } ] | frequency frequency [ access-type { gprs | umts } ]

{ no | remove } authenticate attach [ access-type { gprs | umts } ] | attach-type { combined | gprs-only } | inter-rat | attach-type { combined | gprs-only } ] [ access-type { gprs | umts } ] ]

no

Disables the defined authentication procedures configured for Attach Requests from the call control profile.

remove

Deletes the defined authentication procedures for Attach Requests from the call control profile configuration file.

access-type type

One of the following must be selected to identify the type of network access if the access-type keyword is included in the command:

• gprs
• umts
**attach-type**

This keyword configures the Attach authentication based on the type of attach requested. The `attach-type` must be one of the following options:

- **combined**: Authenticates combined GPRS/IMSI Attaches.
- **gprs-only**: Authenticates GPRS Attaches only.

**frequency frequency**

This keyword defines 1-in-N selective authentication for this type of subscriber event - Attach Request. If the frequency is set for 12, then the service skips authentication for the first 11 events and authenticates on the twelfth event.  
`frequency` must be an integer from 1 to 16.

**inter-rat**

Enables/disables authentication for Inter-RAT Attaches.

**periodicity duration**

The periodicity configured specifies authentication periodicity. For example, if the configured periodicity is “20” minutes, the UE is authenticated at every “20” minutes.  
The `duration` is an integer with a range “1” up to “10800” minutes.

### Usage

Authentication for Attach is disabled by default. This command enables/disables authentication for an Attach with a local P-TMSI or Attaches with an IMSI, which will be authenticated to acquire the CK (cipher key) and the IK (integrity key).

### Example

The following command configures authentication to occur after every tenth attach event for GPRS access.

```
authenticate attach frequency 10 access-type gprs
```

The following command disables authentication for Inter-RAT Attaches, use:

```
no authenticate attach inter-rat
```
authenticate context

This command allows you to specify the authentication group, authentication method, context, and type of authentication for the AAA server.

**Product**
SaMOG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

\[local\]host_name(config-call-control-profile-profile_name)#

**Syntax**

```
authenticate context context_name [ aaa-group aaa_group_name ] [ auth-type { diameter | radius } ] [ auth-method { [ eap ] [non-eap] } ]
remove authenticate context [ aaa-group ]
```

**remove**

Sets the authentication type to its default value:
Default (SaMOG 3G license): radius
Default (SaMOG Mixed Mode license): diameter

**context_name**

Specified the name of the context for authentication.
**context_name** must be an alphanumeric string of 1 through 79 characters.

**aaa-group aaa_group_name**

Optionally, specifies the AAA group for MRME. **aaa_group_name** must be an alphanumeric string of 1 through 63 characters.

**auth-method { [ eap ] [non-eap] }**

Optionally, specifies the authentication method for the call control profile.
If this configuration is not used, the default value is EAP based authentication method.

**Important:** The SaMOG Web Authorization feature is license dependent. Contact your Cisco account representative for more information on license requirements.
Usage

Use this command to specify the authentication group, context, and type of authentication for the AAA server. Also specify an authentication method of EAP or non-EAP or both for the call control profile in the operator policy.

Example

The following command configures authentication of a context named cxtSaMOG, specifies AAA group named AAASaMOG, and sets the authentication to a DIAMETER-based authentication:

```
authenticate context cxtSaMOG aaa-group AAASaMOG auth-type diameter
```
authenticate detach

Allows the operator to enable and define authentication for Detach procedures.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax
authenticate detach [ access-type umts ]
[ no | remove ] authenticate detach [ access-type umts ]

no
Disables the defined authentication procedures configured for Detach Requests from the call control profile.

remove
Deletes the defined authentication procedures for Detach Requests from the call control profile configuration file.

access-type umts
Optionally, identifies the type of network access if the access-type umts keywords are included in the command. By default, access-type UMTS is assumed.

Usage
Authentication for Detach procedures is disabled by default. This command enables/disables authentication for a Detach Request and allows the operator to limit authentication based on the MS/UE access-type.

Example
The following command configures detach authentication to occur only for UMTS attached subscribers:

authenticate detach access-type umts

The following command disables authentication for all Detach Requests, use:

no authenticate detach
authenticate on-first-vector

Allows the operator to enable the SGSN to begin MS authentication immediately after receiving the first vector from the HLR.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

authenticate on-first-vector

remove authenticate on-first-vector

remove

Removes the authenticate on-first-vector definition from the configuration file and resets the default behavior so that the SGSN waits to receive all vectors before beginning authentication towards the MS.

Usage
After an initial attach request, some end devices restart themselves after waiting for the PDP to be established. In such cases, the SGSN restarts and a large number of end devices repeat their attempts to attach. The attach requests flood the radio network, and if the devices timeout before the PDP is established then they continue to retry, thus even more traffic is generated. To avoid the high traffic levels during PDP establishment, the SGSN has been modified to reduce the attach time, as much as possible, so that the devices can attach and discontinue sending requests. The current enhancement is intended to reduce the time needed to retrieve vectors over the GR interface by allowing the operator to configure the SGSN to start authentication towards the MS as soon as it receives the first vector from the AuC/HLR. With the new command included in the configuration, the SGSN begins the MS authentication process immediately after receiving the first vector from the HLR while the SAI continues in parallel.

Example
Use the following command to configure the SGSN to begin MS authentication immediately after receiving the first vector from the AuC/HLR:

authenticate on-first-vector

Use the following command to reset the default behavior, so that the SGSN waits to receive all vectors requested in the SAI from the AuC/HLR before beginning authentication towards the MS:

remove authenticate on-first-vector
authenticate rau

Enables or disables and fine tunes authentication procedures for routing area updates (RAUs)

Product

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)##

Syntax

authenticate rau [ access-type { gprs | umts } | frequency frequency ] [ access { gprs | umts } ] | periodicity duration ] [ access-type { combined-update | imsi-combined-update | periodic | ra-update } ] [ access-type { gprs | umts } | frequency frequency | periodicity duration ]

no authenticate rau [ access-type { gprs | umts } | update-type { combined-update | imsi-combined-update | periodic | ra-update } ] [ access-type { gprs | umts } ] [ access-type { gprs | umts } | frequency frequency | periodicity duration ]

remove authenticate rau [ access-type { gprs | umts } | periodicity [ access { gprs | umts } ] | update-type { combined-update | imsi-combined-update | periodic | ra-update } ] [ access-type { gprs | umts } | periodicity | with { foreign-ptmsi | inter-rat-local-ptmsi | local-ptmsi } ] [ access-type { gprs | umts } | periodicity ]

no

Disables authentication for the RAUs specified in the configuration for the call control profile.

remove

Deletes the authentication configuration for the RAUs from the call control profile in the configuration file.

access-type type

One of the following must be selected to identify the type of network access if the access-type keyword is included in the command:

* gprs
* umts

The access-type keyword can be included with any of the other keywords available with the authenticate rau command.
**authenticate rau**

---

**frequency**  
Defines 1-in-N selective authentication for RAU events. If the frequency is set for 12, then the SGSN skips authentication for the first 11 events and authenticates on the twelfth event.  
*frequency* must be an integer from 1 to 16.

---

**periodicity**  
Defines the length of time (number of minutes) that authentication can be skipped.  
*duration*: Must be an integer from 1 to 10800.

---

**update-type**  
Defines the type of RAU Request. Select one of the following:  

- `combined-update [ access-type | with inter-rat-local-ptmsi ]`
- `imsi-combined-update [ access-type | with inter-rat-local-ptmsi ]`
- `periodic [ access-type | frequency | periodicity ]`
- `ra-update [ access-type | with inter-rat-local-ptmsi ]`

---

**Usage**  
By default, authentication is not performed for routing area updates (RAUs). Use this command to enable/disable authentication and to fine tune the authentication procedure based on frequency, periods for skipping authentication and the various types of routing area updates.

---

**Example**  
The following command configures RAU authentication to occur after every tenth event for GPRS access.  

```
authenticate rau frequency 10 access-type gprs
```

The following command disables authentication for RAUs based on the combined IMSI with foreign P-TMSIs, use:  

```
no authenticate rau imsi-combined-update with foreign-ptmsi
```

The following command deletes all authentication configuration from the call control profile for all RAUs using GPRS access-type:  

```
remove authenticate rau access-type gprs
```
authenticate service-request

Enables or disables and fine-tunes authentication procedures for Service Requests.

Product
MME
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

authenticate service-request [ frequency frequency | periodicity duration | service-type { data | page-response | signaling } [ frequency frequency | periodicity duration ] ]

no authenticate service-request [ service-type { data | page-response | signaling } ]

remove authenticate service-request [ frequency | periodicity | service-type { data | page-response | signaling } [ frequency | periodicity ] ]

no
Disables authentication for the Service Requests specified in the configuration for the call control profile.

remove
Deletes the authentication configuration for Service Requests from the call control profile in the configuration file.

frequency frequency
Defines 1-in-N selective authentication for this type of subscriber event - Service Request. If the frequency is set for 12, then the service skips authentication for the first 11 events and authenticates on the twelfth event. frequency must be an integer from 1 to 16.

periodicity duration
Defines the length of time (number of minutes) that authentication can be skipped. duration: Must be an integer from 1 to 10800.

signaling-type
Defines the type of service being requested by the Service Request. Select one of the following:
  *data
  *page-response
Usage
By default, authentication is not performed for Service Requests. Use this command to enable/disable authentication and to fine-tune the authentication procedure based on frequency and periods for skipping authentication and the various types of service. Repeat the commands as needed to configure criteria for all service types.

Example
The following command configures authentication Service Requests for data service to only occur every 5 minutes:

```
authenticate service-request service-type data periodicity 5
```
authenticate sms

Enables or disables and fine tunes authentication procedures for Short Message Service (SMS).

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

**Syntax**

```
authenticate sms [ access-type { gprs | umts } ] | frequency frequency [ access-type { gprs | umts } ] | sms-type { mo-sms | mt-sms } [ access-type { gprs | umts } ] | frequency frequency

[ no | remove ] authenticate sms [ access-type { gprs | umts } ] | sms-type { mo-sms | mt-sms } [ access-type { gprs | umts } ]
```

**no**
Disables authentication for the SMS Requests specified in the configuration for the call control profile.

**remove**
Deletes the authentication configuration for SMS Requests from the call control profile in the configuration file.

**access-type type**
One of the following must be selected to identify the type of network access if the `access-type` keyword is included in the command:

- `gprs`
- `umts`

The `access-type` keyword can be included with any of the other keywords available with the `authenticate sms` command.

**frequency frequency**
Defines 1-in-N selective authentication for SMS Requests. If the frequency is set for 12, then the SGSN skips authentication for the first 11 events and authenticates on the twelfth event.

*frequency* must be an integer from 1 to 16.

**sms-type**
Enables authentication for the following SMS types:
Call Control Profile Configuration Mode

authenticate sms

• mo-sms: mobile-originated SMS
• mt-sms: mobile-terminated SMS

Usage
By default, authentication is not performed for short message service (SMS). Use this command to enable/disable authentication and to fine-tune the authentication procedure based on MS/UE access type and the frequency for the selected SMS type. Repeat the commands as needed to configure criteria for all service types.

Example
The following command configures MO-SMS authentication to occur every fifth request:

   authenticate sms sms-type mo-sms frequency 5
authenticate tau

Allows the operator to enable/disable and fine-tune authentication for the tracking area update (TAU) procedures.

Product
MME

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

authenticate tau [ frequency frequency | inter-rat | periodicity interval ]

no authenticate tau

no
Disables the TAU authentication procedures specified in the call control profile configuration.

remove
This keyword removes the configured TAU authentication procedures.

frequency frequency
Defines 1-in-N selective authentication for this type of subscriber event - a tracking area update for an inter-RAT Attach. If the frequency is set for 12, the MME skips authentication for the first 11 events and authenticates on the twelfth event.

frequency must be an integer from 1 to 16.

inter-rat
Enables authentication for TAU procedures for inter-RAT Attaches.

periodicity duration
Defines the length of time (number of minutes) that authentication can be skipped.

duration: Must be an integer from 1 to 10800.

Usage
Authentication for TAU procedures is disabled by default. This command enables/disables authentication for a inter-RAT TAU procedures and allows the operator to limit authentication based on the frequency of the events or elapsed intervals between the events.

Example

```plaintext
authenticate tau 12
```
The following command configures TAU authentication to occur when there is 15 minutes between inter-RAT Attaches:

```
authenticate tau periodicity 15
```

The following command disables authentication for all TAU Inter-RAT Attaches, use:

```
no authenticate tau
```
**CC**

Defines the charging characteristics to be applied for CDR generation when the handling rules are applied via the Operator Policy feature.

**Product**

MME  
SAEGW  
S-GW  
SGSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

**Syntax**

```plaintext
cc { behavior-bit no-records bit_value | local-value behavior bit_value profile index_bit |
prefer { hlr-hss-value | local-value } }

no cc behavior-bit no-records

remove cc { behavior-bit no-records | local-value | prefer }
```

---

**no**

Disables the no records generation behavior-bit configuration for this call control profile.

---

**remove**

Removes the specified charging characteristic configuration from this profile.

---

**behavior-bit no-records bit_value**

Default: disabled  
Specifies the charging characteristic behavior bit. **no-records** instructs the system not to generate any accounting records regardless of what may be configured elsewhere.  
*bit_value* is an integer from 1 through 12.

---

**local-value behavior bit_value profile index_bit**

Defaults: bit_value = 0x0, index_bit = 8  
Sets the local value of the behavior bits and profile index for the charging characteristics when the HLR/HSS does not provide values for these parameters.  
*bit_value* is a hexadecimal value between 0x0 and 0xFFF.  
*index_bit* is an integer value from 1 through 15.
Setting the profile index bis selects different charging trigger profiles to be used with the call control profile. Some of the index values are predefined according to 3GPP standard:

- 1 for hot billing
- 2 for flat billing
- 4 for prepaid billing
- 8 for normal billing

If the HLR/HSS provides the charging characteristics with behavior bits and profile index and the operator prefers to ignore the HLR/HSS values, then also configure the `prefer local-value` keyword.

```
prefer { hlr-hss-value | local-value }
```

Default: `hlr-hss-value`

Specifies a preference for using charging characteristics settings received from HLR or HSS, or those set by the SGSN or MME locally with the `local-value behavior` command.

- `hlr-hss-value` sets the call control profile to use charging characteristics settings received from HLR or HSS. This is the default preference.
- `local-value` sets the call control profile to use charging characteristics settings from the SGSN or MME only. If no charging characteristics are received from the HLR/HSS then local values will be applied.

**Usage**

Use this command to set the behavior for charging characteristic comings from either an HLR/HSS or locally from an MME/SGSN.

These charging characteristics parameters can also be set within an APN profile with the commands of the APN Profile configuration mode. For generation of M-CDRs, the parameters configured in this mode, Call Control Profile configuration mode, will prevail but for generation of S-CDRs the parameters configured in the APN Profile configuration mode will prevail.

The 12 behavior bits (of the `local-value behavior` keyword) can be used to enable or disable CDR generation.

**Example**

The following command specifies a rule not to generate charging records (CDRs) and sets the charging characteristics behavior bit to 2:

```
cc behavior-bit no-records 2
```
check-zone-code

Enables or disables the zone code checking mechanism.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```configure > call-control-profile profile_name```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
[ no | remove ] check-zone-code
```

- **no**
  - Included with the command, this keyword disables the mechanism.

- **remove**
  - Included with the command, this keyword causes the removal of the current `check-zone-code` configuration and returns to the SGSN to the default where zone-code checking is enabled.

**Usage**

Use this command to enable/disable the zone-code checking function.

**Example**

Disable checking of the zone code:

```
no check-zone-code
```
ciphering-algorithm-gprs

Defines the order of preference of the ciphering algorithms.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

ciphering-algorithm-gprs priority priority algorithm
remove ciphering-algorithm-gprs priority priority

remove
Delete the priority definition.

priority priority
Sets the order in which the algorithm will be selected for use.
"priority" is an integer from 1 to 4.

algorithm
Identifies the ciphering algorithm to be used.
"algorithm" is one of the following: gea0, gea1, gea2, gea3.

Usage
Define the order in which the ciphering algorithms are chosen for use. The command can be repeated to provide multiple definitions -- multiple priorities.

Example
Define gea1 as the third priority algorithm:

ciphering-algorithm-gprs priority 3 gea1
csfb

Configures circuit-switched fallback options. CSFB is the mechanism to move a subscriber from LTE to a legacy technology to obtain circuit switched voice or short message.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configuration > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local] host_name(config-call-control-profile-profile_name)#

Syntax

csfb { policy { not-allowed | not-preferred | sms-only | suppress-call-reject } | sms-only }

remove csfb { policy | sms-only }

---

sms-only: Removes the SMS-only restriction allowing the UE to request voice and short message service (SMS) support for circuit-switched fallback (CSFB).
policy: Removes the configured policy.

---

policy { not-allowed | not-preferred | sms-only | suppress-call-reject }

not-allowed: Specifies that the CSFB function is not allowed for both voice and SMS.

not-preferred: Specifies that the MME returns a “not-preferred” response for CSFB services. The MME does not enforce this and a voice centric is allowed to make CSFB calls on a not-preferred case if it chooses to do so.
sms-only: Specifies that the CSFB function only supports SMS.
suppress-call-reject: Configures the MME to ignore a paging request for an SMS-only CS call for an attached UE and suppress the paging reject. This allows the MME to process SGs CS call SMS-only paging requests for Ultra Card users where the same MSISDN is allocated to different IMSIs. By default the MME will reject the paging request with a cause:
SGSAP_SGS_CAUSE_MOBILE_TERMINATING_CSFB_REJECTED_BY_USER

sms-only

Specifies that the circuit-switched fallback function only supports SMS.

---

Important: This is a legacy keyword that remains to support earlier versions of the code. It operates identically to the policy sms-only keyword.
Usage

Use this command to restrict the circuit-switched fallback function to SMS only or no support for either voice or SMS.

Example

The following command enforces the SMS-only functionality for UEs requesting circuit-switched fallback:

```
csfb policy sms-only
```
**description**

Allows you to enter a relevant descriptive string.

Syntax

diameter-result-code-mapping s6a diameter_result_code mme-emm-cause mme_emm_error_code

remove diameter-result-code-mapping s6a diameter_result_code

Removes the mapping for the specified Diameter result code.

s6a diameter_result_code

Specifies the Diameter result code to which the EMM NAS cause code is mapped.

diameter_result_code: Specify one of the supported Diameter result codes:

- **diameter-authorization-rejected** - s6a result code 5003. Default mapped EMM code: “No suitable cells in tracking area.”
- **diameter-error-other** - miscellaneous s6a error result code. Default mapped EMM code: “Network failure.”
- **diameter-error-rat-not-allowed** - s6a result code 5421. Default mapped EMM code: “No suitable cells in tracking area.”
- **diameter-error-roaming-not-allowed** - s6a result code 5004. Default mapped EMM code: “PLMN not allowed.”
- **diameter-error-user-unknown** - s6a result code 5001/5030. Default mapped EMM code: “EPS Service and non-EPS services not allowed.”
- **diameter-invalid-avp-value** - s6a result code 5004. Default mapped EMM code: “Network failure.”
- **diameter-unable-to-comply** - s6a result code 5012. Default mapped EMM code: “Network failure.”
- **diameter-unknown-eps-subscription** - s6a result code 5420. Default mapped EMM code: “No suitable cells in tracking area.”
Call Control Profile Configuration Mode

---

**diameter-unsupported-feature** - s6a result code 5011. Default mapped EMM code: “Network failure.”

---

**mme-emm-cause mme_emm_error_code**

Specifies the EMM NAS cause code to be mapped to the Diameter result code.

*mme_emm_error_code*: Specify one of the supported EMM NAS error codes:

- **eps-non-eps-not-allowed**: Specifies that the EMM NAS cause code #8 “EPS services and non-EPS services not allowed” is to be mapped to the specified Diameter result code.
- **network-failure**: Specifies that the EMM NAS cause code #17 “Network failure” is to be mapped to the specified Diameter result code.
- **no-suitable-cell-in-tracking-area**: Specifies that the EMM NAS cause code #15 “No suitable cells in tracking area” is to be mapped to the specified Diameter result code.
- **plmn-not-allowed**: Specifies that the EMM NAS cause code #11 “PLMN not allowed” is to be mapped to the specified Diameter result code.
- **roaming-not-allowed-in-this-tracking-area**: Specifies that the EMM NAS cause code #13 “Roaming not allowed in this tracking area” is to be mapped to the specified Diameter result code.
- **severe-network-failure**: Specifies that the EMM NAS cause code #42 “Severe network failure” is to be mapped to the specified Diameter result code.
- **tracking-area-not-allowed**: Specifies that the EMM NAS cause code #12 “Tracking area not allowed” is to be mapped to the specified Diameter result code.

---

**Usage**

Use this command to map a selected EMM NAS cause code to a specific Diameter result code.

**Example**

The following command maps the EMM NAS cause code “Roaming not allowed in this tracking area” to the Diameter result code “S6a Diameter error RAT not allowed”:

```
diameter-result-code-mapping s6a diameter-error-rat-not-allowed mme-emm-cause roaming-not-allowed-in-this-tracking-area
```
**direct-tunnel**

Allows direct tunneling if direct tunneling is supported by the destination node.

**Product**  
SGSN

**Privilege**  
Security Administrator, Administrator

**Mode**  
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
direct-tunnel attempt-when-permitted
```

```
remove direct-tunnel
```

```
remove
```

Removes the configured setting from the call control profile.

```
attempt-when-permitted
```

Enables direct tunneling if the destination node allows it. Default: disabled.

**Usage**

Use this command to enable the Direct-Tunnel feature.
To ensure that direct tunnel is fully configured for support by the SGSN, check the settings for `direct-tunnel` in:
- the APN profile -- from the Exec mode, use command: `show apn-profile <profile_name> all`
- the RNC (radio network controller) configuration -- from the Exec mode, use command: `iups-service <service_name> all`

**Important:** Direct tunneling must be enabled at both of these two points to allow direct tunneling for the MS/UE.

**Example**

The following command sets the configuration to instruct the SGSN to attempt to setup a direct tunnel if permitted at the destination node:

```
direct-tunnel attempt-when-permitted
```
**dns-ggsn**

Defines the context to be used to do DNS lookup for GGSNs.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

*configure > call-control-profile profile_name*

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)##
```

**Syntax**

```
dns-ggsn context ctxt_name
no dns-ggsn context ctxt_name
```

- **no**
  
  Removes the dns-ggsn configuration from this call control profile.

- **context ctxt_name**
  
  Specifies the context to be used to do DNS lookup for GGSNs as an alphanumeric string of 1 through 64 characters.

**Usage**

Use this command to define the context to be used to do DNS lookup to find the GGSN address.

**Example**

```
dns-ggsn context sgsn1
```
**dns-mrme**

This command is used to configure the DNS client context and DNS query type used for the PGW/GGSN resolution for MRME.

**Product**
SaMOG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```
configure > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
dns-mrme { context context_name [ query-type { a-aaa | snaptr } ] | query-type { a-aaa | snaptr } }

no dns-mrme context

default dns-mrme query-type
```

---

**no**

Removes the dns-mrme configuration from this call control profile.

---

**default**

Sets the default value for the query-type and context will not be modified.

Default (SaMOG 3G license): a-aaa
Default (SaMOG Mixed Mode license): snaptr

---

**Important:** The **default dns-mrme query-type** command is available only when the SaMOG Mixed Mode license (supporting both 3G and 4G) is configured.

---

```
context_name
```

Specifies the DNS client context to be used for DNS lookup. `context_name` must be an alphanumeric string of 1 through 79 characters.

```
query-type { a-aaa | snaptr }
```

Specifies the the type of DNS query used for the PGW/GGSN resolution for MRME.

- **a-aaa**: Specifies to use A-AAA queries using pre-release 8 DNS procedures.
- **snaptr**: Specifies to use SNAPTR queries using post-release 7 DNS procedures. This is the default value when SaMOG Mixed Mode license is configured.
**Important:** This keyword is available only when the SaMOG Mixed Mode license (supporting both 3G and 4G) is configured. However, when an SaMOG 3G license is configured, the query type for the DNS query is set to use A-AAA queries using pre-release 8 DNS procedures.

**Usage**

Use this command to configure the DNS client context and DNS query type used for the PGW/GGSN resolution for MRME. The DNS context configuration is used to provide the context name where the DNS client for this AAA server is configured. The default dns-context is configured under the MRME Service Configuration Mode. If no DNS context is configured under the MRME Service Configuration Mode, the DNS context will be used as the context for the MRME service.

**Example**

```
dns-mrme context mrmel query-type snaptr
```

dns-msc

Defines the context to be used to do DNS lookup for Mobile Switching Centers (MSCs).

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

**Syntax**

dns-msc context ctxt_name

remove dns-msc

---

**Usage**

This feature requires that a valid SRVCC license key be installed.
Use this command to configure the context ID for the DNS lookup.
MSC selection using DNS takes precedence over locally configured MSCs. If DNS lookup fails, the MME will select the MSC from local configuration.
DNS based MSC selection can be defined for an MME service, or for a Call Control Profile. Both configuration options specify the context in which a DNS client configuration has been defined.
Configuration via Call Control Profile takes precedence in cases where DNS selection is also configured in the MME service.

**Example**
The following command associates a pre-configured context `dns_ctx1` where a DNS client service is configured for DNS query to MSC for this Call Control Profile.

dns-msc context dns_ctx1
**dns-sgsn**

Identifies the context to be used to do DNS to find an SGSN address.

**Product**  
SGSN

**Privilege**  
Security Administrator, Administrator

**Mode**  
Exec > Global Configuration > Call Control Profile Configuration  
`configure > call-control-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
[ no ] dns-sgsn context ctxt_name
```

- **no**  
  Removes the dns-sgsn configuration from this call control profile.

- **context ctxt_name**  
  Identify the context where the DNS client is configured to send the DNS query to get the peer SGSN address.  
  `context name`: Enter a string of 1 to 79 alphanumerical characters to identify the context.  
  This configuration would override any similar configuration for `dns-sgsn context` in the SGTP service configuration.

**Usage**

Use this command to configure the context ID for the SGSN address that will be used to do the DNS lookup.

**Example**

Configure context `sgsn1` for DNS lookup:

```
dns-sgsn context sgsn1
```
**dns-pgw**

Defines the context to be used to do DNS lookup for P-GWs.

**Product**
MME  
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration  
`configure > call-control-profile profile_name`

Entering the above command sequence results in the following prompt:

```plaintext
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```plaintext
[ remove ] dns-pgw context ctxt_name
```

- **remove**
  Deletes this definition from the call control profile.

```plaintext
context ctxt_name
```

Specifies the context to be used to do DNS lookup for P-GWs as an alphanumeric string of 1 through 64 characters.

On the S4-SGSN, if the interface selected for a UE is S4 and if there is no DNS-PGW context configured under a call control profile, then by default the system will look for the DNS client in the context where the eGTP service is defined. If the interface selected for a UE is Gn-Gp and if there is no `dns-pgw context` configured in a call control profile, then by default the S4-SGSN will look for the DNS client in the context where the SGTP service is configured for selecting a co-located PGW/GGSN if:

- the UE is EPC capable and,

  - `apn-resolve-dns-query snaptr` is configured in an APN profile using APN Profile Configuration Mode.

If the `dns-pgw context` is deleted with the `remove` option, the S4-SGSN chooses the DNS client from the context where the eGTP service is configured.

**Usage**

Use this command to configure the context ID for the DNS lookup.

**Example**

```plaintext
dns-pgw context pgw1
```
**dns-sgw**

 Defines the context to be used to do DNS lookup for S-GWs.

**Product**

 MME  
 SGSN

**Privilege**

 Security Administrator, Administrator

**Mode**

 Exec > Global Configuration > Call Control Profile Configuration  
 configure > call-control-profile profile_name

 Entering the above command sequence results in the following prompt:

 [local]host_name(config-call-control-profile-profile_name)#

**Syntax**

 [ remove ] dns-sgw context ctxt_name

---

**remove**

 Deletes this definition from the call control profile.

**context ctxt_name**

 Specifies the context to be used to do DNS lookup for S-GWs as an alphanumeric string of 1 through 64 characters.

 This command must be used to configure DNS client settings when using dynamic S-GW selection where the tai-mgmt-db has been associated with a call-control-profile.

 On the S4-SGSN, this specifies the name of the context where the DNS client is configured that will be used for DNS resolution of S-GWs. If **dns-sgw context** is not specified, the S4-SGSN uses the DNS client configured in the context where the eGTP service is configured to query the S-GW DNS address.

**Usage**

 Use this command to configure the context ID for the DNS lookup.

**Example**

 ```
 dns-sgw context sgw1
 ```
**egtp**

Configures the type of PLMN sent in either the user location information (ULI) IE or the Serving Network IE.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

Command Line Interface Reference, StarOS Release 17

**Syntax**

```bash
egtp network-sharing-plmn { serving-network { use-common-plmn | use-selected-plmn | use-ue-plmn } | uli { use-common-plmn | use-selected-plmn | use-ue-plmn } }

remove egtp network-sharing-plmn { serving-network | uli }
```

- **remove**
  Erases the IE choice from the call control profile configuration.

- **use-common-plmn**
  Instructs the SGSN to identify the Common PLMN for the shared network.

- **use-selected-plmn**
  Instructs the SGSN to identify the Selected PLMN for the shared network.

- **use-ue-plmn**
  Instructs the SGSN to identify the UE selected PLMN that is available in the shared network.

**Usage**
The SGSN supports location change reporting on the S4 interface, when requested by the P-GW, using a ULI IE in GTPv2 messages. When the network sharing feature is enabled the operator can determine which PLMN to send to the P-GW in the ULI IE and Serving Network IE. The command can be issued multiple times to configure the PLMN type for each IE.

The selections made for this configuration must match those configured for the call control profile’s GTP configuration.

This command can only be used if network sharing is enabled and the appropriate “Location-reporting in connected-mode” feature license is installed. For details, check with your Cisco Representative.

**Example**

Configure the ue-plmn type PLMN to be sent in the Serving Network IE:

```bash
egtp network-sharing-plmn serving-network ue-plmn
```
eir-profile

Identifies and associates an EIR profile to be used by the SGSN for EIR selection.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile *profile_name*

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
[ no ] eir-profile *profile_name*
```

  - **no**
  Disassociates the EIR profile with the call control profile.

**Usage**
The equipment identify register (EIR) profile contains all the parameters needed to identify and work with an EIR to perform check IMEI procedures and to address multiple EIR through a single EIR address. The configuration in the EIR profile associated with the call control profile take precedence over the EIR parameters configured in the MAP service.

**Example**
Associate the EIR profile called *LondonEIR1*:

```
eir-profile LondonEIR1
```
encryption-algorithm-lte

Defines the priorities for using the encryption algorithms.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

encryption-algorithm-lte priority1 128eea { 0 | 1 | 2 } priority2 128eea { 0 | 1 | 2 } priority3 128eea { 0 | 1 | 2 }

remove encryption-algorithm-lte

remove

Deletes the priorities definition from the call control profile configuration.

priority1 128eea { 0 | 1 | 2 }

Enter 0, 1, or 2 at the end of 128eea to define the algorithm being given first priority.

priority2 128eea { 0 | 1 | 2 }

Enter 0, 1, or 2 at the end of 128eea to define the algorithm being given second priority.

priority3 128eea { 0 | 1 | 2 }

Enter 0, 1, or 2 at the end of 128eea to define the algorithm being given third priority.

Usage

Set the order or priority in which the MME will select a 128-EEA algorithm for use. All three priorities must be set or the definition is invalid. The command can be re-entered to change the priorities without removing the configuration.

Example

Configure 128-EEA2 as first priority encryption algorithm:

encryption-algorithm-lte priority1 128-eea 2 priority2 128-eea 0 priority3 128-eea 1
**encryption-algorithm-umts**

Defines the priorities for using the encryption algorithms.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```plaintext
configure > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```plaintext
encryption-algorithm-umts { uea0 | uea1 | uea2 } [ then-uea# | then-uea# ]
```

**no encryption-algorithm-lte**

**Usage**
Set the order or priority in which the SGSN will select a UEA algorithm for use. It is not necessary to define priorities for all three priority levels. The command can be re-entered to change the priorities without removing the configuration.

**Example**
Configure algorithm UEA2 as the first priority encryption algorithm with no others to be considered:

```plaintext
encryption-algorithm-umts uea2
```
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

end

Usage
Use this command to return to the Exec mode.
**equivalent-plmn**

Configures the definition for an equivalent public land mobile network identifier (PLMN ID) and the preferred radio access technology (RAT). This is a list of PLMNs which should be considered by the mobile as equivalent to the visited PLMN for cell reselection and network selection. When configured, the equivalent PLMN list will be sent to the UE in NAS ATTACH ACCEPT / TAU ACCEPT messages (up to 15 PLMNs in each message).

**Product**
- MME
- SGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Call Control Profile Configuration

```
classify > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-class-call-control-profile-profile_name) #
```

**Syntax**

```
 equivalent-plmn radio-access-technology { 2G | 3g | 4g | any } plmnid mcc mcc_number mnc mnc_number priority priority

no equivalent-plmn radio-access-technology { 2G | 3g | 4g | any } plmnid mcc mcc_number mnc mnc_number
```

- **no**
  - Removes the equivalent-PLMN configuration from this call control profile.

```
radio-access-technology { 2G | 3g | 4g | any }

Identify the RAT type of the equivalent PLMN:
- • 2G: 2nd generation
- • 3G: 3rd generation
- • 4G: 4th generation
- • any: Any RAT

plmnid mcc mcc_number mnc mnc_number

• mcc: Specifies the mobile country code (MCC) portion of the PLMN ID. The number can be any integer between 100 and 999.
• mnc: Specifies the mobile network code (MNC) portion of the PLMN ID. The number can be any 2- or 3-digit integer between 00 and 999.
priority priority
Enter an integer between 1 and 15 with the highest priority assigned to the integer of the lowest numeric value.

Usage
Use the command to identify an ‘equivalent PLMN’ and assign it a priority to define the preferred equivalent PLMN to be used. This command can be entered multiple times to set priorities of usage.

Example
The following command sets up a secondary equivalent PLMN definition that allows for any RAT with a PLMN ID of MCC121.MNC767:

```
equivalent-plmn radio_access_technology any plmnid mcc 121 mnc 767
priority 2
```
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
gmm Extended-T3312-timeout

This command enables the operator to determine how the SGSN handles Extended T3312 timer values at the Call-Control Profile level.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

gmm Extended-T3312-timeout { value ext3312_minutes | when-subscribed } [ low-priority-ind-ue ]

no gmm Extended-T3312-timeout

no

This command filter instructs the SGSN to remove the Extended T3312 configuration from the Call-Control Profile configuration.

value

This keyword instructs the SGSN to send the defined Extended T3312 timer value in Attach or RAU Accept messages to the MS if the subscriber has a subscription for the Extended T3312 timer (Subscribed Periodic RAU/TAU Timer in ISD) and indicates support for the extended periodic timer via the MS Network Feature Support.

ext3312_minutes : Enter an integer from 0 to 18600 to identify the number of minutes for the timeout; default is 186 minutes.

when-subscribed

This keyword instructs the SGSN to only send the Extended T3312 period RAU timer value in Attach or RAU Accept messages if the SGSN receives the timeout value in an ISD (insert subscriber data) when the MS has indicated support in “MS Network Feature Support”.

low-priority-ind-ue

This keyword instructs the SGSN to include the extended T3312 timer value only if the Attach/RAU Request messages include a LAPI (low access priority indicator) in the “MS Device Properties”.

Usage

An *Extended-T3312-timeout* configuration in the Call-Control Profile will override an *Extended-T3312-timeout* configuration done for either the GPRS or SGSN services. As well, a Call-Control Profile configuration enables the operator to finetune for Homers and Roamers.

Example

Use a command similar to the following to instruct the SGSN to only send the Extended T3312 value when the Attach/RAU Request includes a LAPI and when the received “MS Network Feature Support” information indicates the user is subscribed for this timer:

```plaintext
gmm Extended-T3312-timeout when-subscribed low-priority-ind-ue
```

Use the following command to remove the Extended T3312 timer configuration from the Call-Control Profile.

```plaintext
no gmm Extended-T3312-timeout
```
gmm information-in-messages

Provides the configuration to include the information in messages for the GPRS mobility management (GMM) parameters.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

```
gmm information-in-messages access-type { { gprs | umts } [ network-name { full-text name | short-text name } | [ send-after { attach | rau } ] } ]
```

[ default | no ] gmm { information-in-messages access-type { gprs | umts } }

**no**

Disables the GMM configuration from this call control profile.

**default**

Sets up a GMM configuration with system default values.

**access-type**

Must select one of the following options:

- **gprs** - General Packet Radio Service network
- **umts** - Universal Mobile Telecommunications System network

After selecting the access-type, an additional parameter can be configured:

- **network-name**: identifies the network name in either short text or full text.
- **send-after**: configures the information in message to send after attachment or Routing Area Update (RAU).

**network-name { full-text name | short-text name }**

This keyword provides the option to add the network name to the message. The network name will in full text or short text. Possible options are:

- **full-text name**: Indicate the network name in full text
- **short-text name**: Indicate the network name in short text
send-after{ attach | rau }

This keyword configures the information in message to send after attachment or RAU message. Possible options are:

- **attach**: Information sent after attachment
- **rau**: Information sent after routing area update

**Usage**

Use this command to configure identifying information about the network that will be included in GMM messages.

**Example**

Set default settings for calls coming from 2.5G networks:

```
default gmm information-in-messages access-type gprs
```
gmm rau-accept

Provides the configuration to set the Follow-On Proceed (FOP) bit in the Routing Area Update Accept (RAU) message.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
gmm rau-accept follow-on-proceed { on-following-nw-procedure | only-on-ue-request }

remove gmm rau-accept follow-on-proceed
```

**Usage**

Use this command to configure the setting of Follow On Proceed bit in Routing Area Accept Message. The FOP bit can be set only when the UE requests for it by configuring the command option `only-on-ue-request` or the FOP bit can be set when there is a following network procedure by configuring the CLI option `on-following-nw-procedure`. By default, the configuration is `gmm rau-accept follow-on-proceed only-on-ue-request`.

**Example**

Use this command to configure the SGSN to send the Follow On Proceed bit when there is a following Network Initiated Procedure.

```
gmm rau-accept follow-on-proceed on-following-nw-procedure
```
gmm retrieve-equipment-identity

Configures the International Mobile Equipment Identity (IMEI) or software version (SV) retrieval and validation procedure.

Product
SGSN
Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

gmm retrieve-equipment-identity { imei | imeisv [ unciphered ] [ then-imei ] } [ verify-equipment-identity [ deny-greylisted ] [ allow-unknown ] ]

[ no | default ] gmm retrieve-equipment-identity

no

Disables the equipment identity retrieval procedure configured for this call control profile.

default

Sets the default action for equipment identity retrieval (EIR) procedure:

• retrieve-equipment-identity: Default action is disabled - no retrieval of IMEI/IMEI-SV
• verify-equipment-identity: Default action is disabled - no verification with Equipment Identity Register (EIR)

equipment-identity-type

Default: disabled
Indicates the type of equipment identification, with the possible values:

• imei: International Mobile Equipment Identity
• imeisv: International Mobile Equipment Identity - Software Version

imei

Indicates the equipment identity retrieval type to International Mobile Equipment Identity (IMEI). IMEI is a unique 15-digit number consisting of a TAC (Technical Approval Code), a FAC (Final Assembly Code), an SNR (Serial Number), and a check digit.
Call Control Profile Configuration Mode

**gmm retrieve**

- **equipment**
- **identity**

Indicates the equipment identity retrieval type to IMEI with software version (SV). IMEI with SV is a unique 16-digit number consisting of a TAC (Technical Approval Code), a FAC (Final Assembly Code), an SNR (Serial Number), and a 2-digit software version number.

- **unciphered**: This optional keyword enables the unciphered retrieval of IMEI-SV. If this option is enabled the retrieval procedure will get IMEISV (if auth is still pending, get as part of Authentication and Ciphering Response otherwise, via explicit Identification Request after Security Mode Complete).

- **then-imei**: This optional keyword enables the retrieval of software version number before the IMEI. If this option is enabled the equipment identity retrieval procedure will get IMEISV on secured link (after Security mode procedure via explicit GMM Identification Request), and if MS is not having IMEISV (responded with NO Identity), SGSN will try to get IMEI.

If no other keyword is provided, imeisv will get IMEISV on a secured link (after a Security mode procedure via explicit GMM Identification Request).

**verify-equipment-identity**

- **deny-greylisted**
- **allow-unknown**

Default: disabled

This keyword enables the equipment identity validation and validates the equipment identity against the EIR.

- **deny-greylisted**: This keyword fine-tunes the configuration and enables the restriction to the user having mobile equipment with an IMEI in the EIR grey list.

- **allow-unknown**: If this keyword is configured and EIR sends equipment status as "UNKNOWN EQUIPMENT" then the call will be allowed to continue in SGSN.

**Usage**

Use this command to enable and configure the procedures for mobile equipment identity retrieval and validation from the EIR identified in the MAP Service Configuration mode.

**Example**

The following command enables the SGSN to send “check IMEI” messages to the EIR:

```
gmm retrieve-equipment-identity imei verify-equipment-identity
```
gmm t3346

The \texttt{gmm} command includes a new keyword to set the MM T3346 back-off timer for a Call-Control Profile.

Exec > Global Configuration > Call Control Profile Configuration

\texttt{configure > call-control-profile profile\_name}

Entering the above command sequence results in the following prompt:

[local]\texttt{host\_name(config-call-control-profile-profile\_name)#}

**Syntax**

\texttt{gmm t3346 min minimum\_minutes max maximum\_minutes}

\texttt{no gmm t3346}

- \texttt{no}
  - Including this filter with the command removes the MM back-off timer definition from the Call-Control Profile configuration.

- \texttt{min minimum}
  - Enter an integer from 1 to 15 to identify the minimum number of minutes the timer should run; default is 15 minutes.

- \texttt{max maximum\_minutes}
  - Enter an integer from 1 to 30 to identify the maximum number of minutes the timer should run; default is 30 minutes.

**Usage**

- Under congestion, the SGSN can assign the T3346 back-off timers to the UEs and request the UEs not to access the network for a given (timer value) period of time.

- If an Attach Request or RAU Request or Service Request is rejected due to congestion, then the T3346 value will be included in the reject message with GMM cause code 22 (congestion). The MM back-off timer value sent will be chosen randomly from within the configured T3346 timer value range.

- If T3346 timer value is configured in a Call-Control Profile then it will override the back-off timer values defined for either the SGSN Service or GPRS Service configurations.

- The timer will be ignored if an Attach Request or RAU Request is received after congestion has cleared.

**Example**

Use a command similar to the following to define a T3346 with a timeout range of 2 to 15 minutes.
gmm t3346 min 2 max 15
gs-service

Associates the context of a Gs service interface with this call control profile.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

```
gs-service gs_srvc_name context ctx_name

no gs-service svc_name
```

no

Removes/disassociates the named Gs service from the call control profile.

```
gs-service gs_srvc_name
```

Specifies the name of a specific Gs service for which to display information. `gs_srvc_name` is the name of a configured Gs service expressed as an alphanumeric string of 1 through 63 characters that is case sensitive.

```
context ctx_name
```

Specifies the specific context name where Gs service is configured. If this keyword is omitted, the named Gs service must exist in the same context as the GPRS/SGSN service.

`ctx_name` is name of the configured context of Gs service expressed as an alphanumeric string from 1 through 63 characters that is case sensitive.

Usage

Use this command to associate a specific Gs service interface with this GPRS service instance.

**Important:** A Gs service can be used with multiple SGSN and/or GPRS service.

Example

The following command associates a Gs service instance named `stargs1`, which is configured in context named `star_ctx`, with a call control profile:

```
gs-service stargs1 context star_ctx
```
gtp send

Configures which information elements (IE) the SGSN sends in GTP messages. These are required by the GGSN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```
configure > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
remove gtp send { imeisv | ms-timezone | rai | rat | uli }
no gtp send
```

**remove**
Removes the specified GTP send definition from the system configuration.

**no**
Disables the specified GTP send configuration.

**imeisv**
Instructs the SGSN to include the IMEISV (International Mobile Equipment Identity with Software Version) of the mobile when sending GTP messages of the type Create PDP Context Request.

By default, this function is disabled.

**derive-imeisv-from-imei**
This is a filter for the imeisv keyword. It allows the operator to configure the SGSN to send IMEI to the GGSN as IMEI-SV.

This filter instructs the SGSN to add four 1s (1111) to the final semi-octet of the CPCQ (Create PDP Context Request) message which enables the SGSN to deduce the IMEI-SV value from the IMEI. If this filter is used, then IMEI is also sent as IMEI-SV when the gmm retrieve-equipment-identity command is configured.
ms-timezone
Instructs the SGSN to include this IE in GTP messages of the type Create PDP Request and Update PDP Context Request. This IE specifies the offset between universal time and local time, where the MS currently resides, in 15-minute steps. This IE is sent by default.

rai
Configures the SGSN to include the Routing Area Identity (RAI) of the SGSN in the following situations:
- 2G new SGSN RAU
- 3G new SGSN SRNS
- 2G -> 3G HO (only if PLMN Id has changed)
- 3G -> 2G HO (only if PLMN Id has changed)
- multiple IUPS service RAU (only if PLMN Id has changed)
- multiple GPRS service RAU (only if PLMN Id has changed)
- 3G new SGSN RAU (change in behavior)
- 3G primary and secondary PDP activation (change in behavior)
- 2G primary and secondary PDP activation (change in behavior)
Optionally, this keyword can be followed with the keyword selection for the PLMN - use-local-plmn.

rat
Specifies which radio access technology (RAT) is being used by the MS (GERAN, UTRAN, or GAN). Including this keyword instructs the SGSN to include this IE when sending GTP messages of the type Create PDP Request and Update PDP Context Request. This IE is sent by default.

uli
Specifies the CGI (MCC, MNC, etc.) and SAI of the MS where it is registered. Including this keyword instructs the SGSN to include the IE when sending GTP messages of the type Create PDP Request and Update PDP Context Request. This IE is not sent by default. Optionally, this keyword can be followed with the keyword selection for the PLMN - use-local-plmn.

Important: Currently, the next 5 (five) keywords, are only used with parameters rai or uli.

use-local-plmn
This keyword selects the local PLMN when network is not shared.

network-sharing
This keyword is used to configure network-sharing.

use-selected-plmn
This keyword selects the Selected PLMN when network is shared.
Call Control Profile Configuration Mode

**gtp send**

---

**use-ue-plmn**

This keyword selects Selected PLMN for supporting UE and Common PLMN for non-supporting UE when network is shared.

---

**use-common-plmn**

This keyword selects the Common PLMN when network is shared.

---

**Usage**

Use this command to define a preferred set of information to include when GTP messages are sent. Repeat this command multiple times to enable or disable multiple options. This instruction will be implemented when the specific operator policy and call control profile are applied.

The PLMN value in RAI/ULI can be selected if 3G network-sharing is enabled.

---

**Example**

The following command series instructs the SGSN (1) not to send MS’ timezone IE, and (2) to identify the MS’ radio access technology info in the GTP messages:

```plaintext
no gtp send ms-timezone
gtp send rat
```

The next set of commands provides examples indicating the usage of keywords to select PLMN values in RAI/ULI.

On executing the following command, ULI is sent and PLMN will be “use-selected-plmn” if network-sharing is enabled. If network-sharing is not enabled, PLMN will be “use-local-plmn”.

```plaintext
gtp send uli
```

On executing the following command, ULI is sent and PLMN will be “use-selected-plmn” if network-sharing is enabled. If network-sharing is not enabled, PLMN will be “use-local-plmn”.

```plaintext
gtp send uli use-local-plmn
```

On executing the following command, ULI is sent and PLMN will be “use-selected-plmn” if network-sharing is enabled. If network-sharing is not enabled PLMN will be “use-local-plmn”.

```plaintext
gtp send uli use-local-plmn network-sharing use-selected-plmn
```

On executing the following command, ULI is sent and PLMN will be “use-common-plmn” if network-sharing is enabled. If network-sharing is not enabled PLMN will be “use-local-plmn”.

```plaintext
gtp send uli use-local-plmn network-sharing use-common-plmn
```
gtpp

Enables secondary GTPP accounting for an S-GW call control profile. By default, secondary GTPP accounting is disabled.

Product

S-GW
SAEGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

gtpp secondary-group group_name [ accounting context ctx_name ]

no gtpp secondary-group

no

Disables secondary GTPP accounting.

secondary-group group_name

Enables secondary GTPP accounting and specifies a GTPP group name.

group_name must be an alphanumeric string of 1 through 63 characters.

accounting context ctx_name

Specifies the specific accounting context to be used for secondary GTPP accounting. If this keyword is omitted, source context will be used for secondary GTPP accounting.

ctx_name must be an alphanumeric string of 1 through 79 characters.

Usage

Use this command to enable or disable secondary GTPP accounting for an S-GW call control profile.

Example

The following command enables secondary GTPP accounting for an S-GW call control profile and specifies a GTPP group named gtpp-grpl:

gtpp secondary-group gtpp-grpl
gtpu fast-path

Enables or disables the network processing unit (NPU) Fast Path support for NPU processing of GTP-U packets of user sessions at the NPU.

Product

Important: This command is deprecated from StarOS release 16.2 onwards as the NPU FastPath feature is not supported from the StarOS 16.2 release.

SAEGW
SGSN
S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

[ remove ] gtpu fast-path

remove

Removes the NPU fast path functionality configuration from the call control profile.

Usage

Use this command to enable/disable the NPU processed fast-path feature for processing of GTP-U data packets received from GGSN/RNC or P-GW/eNodeB. This feature enhances the GTP-U packet processing by adding the ability to fully process and forward the packets through the NPU itself.

Important: When enabled/disabled, fast-path processing will be applicable only to new subscriber who establishes a PDP context after issuing this command (enabling GTP-U fast path). No existing subscriber session will be affected by this command.

Example

The following command enables the NPU fast path processing for all new subscribers’ session established with this call control profile:

gtpu fast-path
**gw-selection**

Configures the parameters controlling the gateway selection process.

**Product**

MME  
SGSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Call Control Profile Configuration  
`configure > call-control-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
```

- **remove gw-selection**
  Deletes the gw-selection definition from the call control profile.

- **co-location [ weight [ prefer { sgw | pgw } ] ]**
  Selects “co-location” as the determining factor for gateway selection. Collocation should be configured for both P-GW and S-GW selection for collocation to function. If a collocated PGW/SGW node cannot be found, then topologically closest nodes are chosen next. Host names with both “topon” and “topoff” labels will be considered in collocation.  
  **weight**: Enables weighted selection if there are multiple co-located pairs.  
  **prefer { pgw | sgw}**: Configures which weight to be used for weighted selection.

- **pgw weight**
  Selects PDN-Gateway as the determining factor for gateway selection.

- **sgw weight**
  Selects Serving Gateway as the determining factor for gateway selection.

- **topology [ weight [ prefer { sgw | pgw } ] ]**
  Selects topology as the determining factor for gateway selection. Topological selection is done only during initial attach, and not used during S-GW relocation or additional-pdn-connection.  
  **weight**: Enables weighted selection if there are multiple pairs with the same degree of topological closeness.  
  **prefer { pgw | sgw}**: Configures which weight to be used for weighted selection.
Usage

Use this command to define the criteria for gateway selection. Selection of a co-located gateway (GW) node or a topologically closer GW node is based on string comparison of canonical node names included in two or more sets of records received in DNS S-NAPTR query result. For comparison, the canonical node names are derived from the hostnames received in the DNS records. The hostnames must adhere to the following format:

<topon|topoff>.<single-label-interface-name>.<canonical-node-name>;

Where “topon” or “topoff” is a prefix of the hostname and indicates whether or not the canonical node name can be used for topology matching.

The table below lists the behaviors with various CLI options:

Table 23. CLI Behavior Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Keyword Selected</th>
<th>Prefix in Hostname</th>
<th>Topological Match Nodes Selected</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>co-location</td>
<td>topon</td>
<td>Yes</td>
<td>Co-located nodes are selected if available as they are listed before topologically closer nodes in the DNS records.</td>
</tr>
<tr>
<td>2</td>
<td>co-location</td>
<td>topoff</td>
<td>Yes</td>
<td>Co-located nodes are selected if available as they are listed before topologically closer nodes in the DNS records.</td>
</tr>
<tr>
<td>3</td>
<td>topology</td>
<td>topon</td>
<td>Yes</td>
<td>Co-located nodes are selected if available as they are listed before topologically closer nodes in the DNS records.</td>
</tr>
<tr>
<td>4</td>
<td>topology</td>
<td>topoff</td>
<td>No</td>
<td>Nodes with prefix 'topoff' are ignored for topological matching purposes. If no nodes are present with 'topon' as prefix then nodes are selected independently based on Order/Priority mentioned in DNS Records.</td>
</tr>
<tr>
<td>5</td>
<td>co-location</td>
<td>neither</td>
<td>Yes</td>
<td>Will strip only the first label from hostname to fetch canonical node name for topology matching. Co-located nodes are selected if available as they are listed before topologically closer nodes in the DNS records.</td>
</tr>
<tr>
<td>6</td>
<td>topology</td>
<td>neither</td>
<td>No</td>
<td>No co-located node pair listing; topologically closer node listing used if available (Same behavior as defined for (4).)</td>
</tr>
</tbody>
</table>

Example

The following command instructs the MME or SGSN to determine gateway selection on the basis of topology:

```
gw-selection topology
```
ignore-ul-data-status

This command is used to enable or disable processing of Uplink Data Status IE in Service Request.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

[remove] ignore-ul-data-status

remove

Use this keyword to enable processing of Uplink Data Status IE in Service Request.

Usage

This feature is enabled by default, to disable the feature use the command ignore-ul-data-status. To enable this feature use the command remove ignore-ul-data-status. When this feature is enabled, RAB is established for NSAPIs present in the Uplink data status IE. RABs are not established if the NSAPI PDPs are not present in the SGSN. If the Uplink data Status IE contains NSAPI not known to the SGSN, the SGSN establishes all the RAB’s. RAB’s are not established if corresponding NSAPI is absent in the PDP-Context Status IE. When this feature is disabled, if Uplink data status IE is received in service request the SGSN ignores it and establishes RAB’s for all the PDP’s.

Example

Use the following command to disable processing of Uplink Data Status IE in Service Request:

ignore-ul-data-status
idle-mode-signaling-reduction

Enables or disables the Idle-Mode-Signaling-Reduction (ISR) feature on the S4-SGSN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

**Syntax**

[ remove ] idle-mode-signaling-reduction access-type [ gprs | umts ]

---

**remove**
Disables the ISR feature configuration from this call control profile.

---

**idle-mode-signaling-reduction**
Configures ISR for this call control profile.

---

**access-type**
Specifies the network access type for the ISR feature. Select one of the following options:

- **gprs** - General Packet Radio Service network. Specifies 2G network access support for the ISR feature. *This option is only supported for Release 15.0 and beyond.*

- **umts** - Universal Mobile Telecommunications System network. Specifies 3G network access support for the ISR feature.

**Usage**

Use this command to enable or disable the ISR feature on the S4-SGSN. Note that ISR is supported on the S4-SGSN only.

This command is available only if the Idle Mode Signaling Reduction license is enabled on the SGSN.

When 3G ISR is enabled, operators should set the ISR deactivation timer value sent by the S4-SGSN to the UE in Attach Accept and Routing Area Update Accept messages. Use the `gmm T3323-timeout` command in SGSN Service Configuration Mode to set the ISR deactivation timer value.

When 2G ISR is enabled, operators should set the implicit detach timeout value to use for 2G ISR. Use the `gmm implicit-detach-timeout` command in GPRS Service Configuration Mode.

**Example**

idle-mode-signaling-reduction access-type umts
integrity-algorithm-lte

Specifies the order of preference for using an Integrity Algorithm.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

```
integrity-algorithm-lte priority1 { 128-eia0 | 128-eia1 | 128-eia2 } priority2 128-eia { 0 | 1 | 2 } priority3 128-eia { 0 | 1 | 2 }

remove integrity-algorithm-lte
```

Usage
Set the order or priority in which the MME will select an integrity algorithm for use. All three priorities must be set or the definition is invalid. The command can be re-entered to change the priorities without removing the configuration.

Example
Configure 128-EIA0 as first priority integrity algorithm:

```
integrity-algorithm-lte priority1 128-eia 0 priority2 128-eia 2 priority3 128-eia 1
```
integrity-algorithm-umts

Configures the order of preference for the Integrity Algorithm used for 3G.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

`configure > call-control-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
integrity-algorithm-umts type then_type
default integrity-algorithm-umts
```

| default
| Specifies the default preference based on system defaults.

| type
| Creates a configuration defining an order of preference. Enter one or more of the following options in the order of preference:
| - `uia1` - uia1 Algorithm
| - `uia2` - uia2 Algorithm

**Usage**

Use this command to determine which integrity algorithm is preferred 3G. This command is configured in tandem with the algorithm type for `encryption-algorithm-umts` command.

**Example**

```
default integrity-algorithm-umts
```
lcs-mo

This command enables/disables mobile-originating Location Requests by access-type when Location Services functionality is enabled.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

lcs-mo { allow | restrict } access-type { gprs | umts }

allow
Enables mobile-originating Location Requests. This is the default state when Location Services are enabled.

Usage
This command ties Location Service functionality to a call-control profile by IMSI so that Location Services can optionally be determined by an operator policy for incoming calls.

Example
Use the following command to disable or disallow mobile-originating Location Requests within a GPRS network:

lcs-mo restrict access-type GPRS
**lcs-mt**

This command enables/disables mobile-terminating Location Requests by access-type when Location Services functionality is enabled.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

**Syntax**

```
lcs-mt { allow | restrict } access-type { gprs | umts }
```

**Usage**

Enables mobile-terminating Location Requests. This is the default state when Location Services are enabled.

This command ties Location Service functionality to a call-control profile by IMSI so that Location Services can optionally be determined by an operator policy for incoming calls.

**Example**

Use the following command to disable or disallow mobile-terminating Location Requests within a UMTS network:

```
lcs-mt restrict access-type umts
```
lcs-ni

This command enables/disables network-initiated Location Requests by access-type when Location Services functionality is enabled.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

lcs-ni { allow | restrict } access-type { gprs | umts }

allow
Enables network-initiated Location Requests. This is the default state when Location Services are enabled.

Usage
This command ties Location Service functionality to a call-control profile by IMSI so that Location Services can optionally be determined by an operator policy for incoming calls.

Example
Use the following command to enable or allow network-initiated Location Requests within a UMTS network if this function has been restricted previously:

   lcs-ni allow access-type umts
local-cause-code-mapping apn-mismatch

Configures the reject cause code to send to a UE when an APN mismatch occurs.

Product  
MME

Privilege  
Administrator

Mode  
Exec > Global Configuration > Call Control Profile Configuration
 configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

remove local-cause-code-mapping apn-mismatch

Removes the configured cause code mapping.

Specifies the EPS Mobility Management (EMM) cause code to return when an APN mismatch occurs.

• eps-service-not-allowed-in-this-plmn

• esm-failure esm-cause-code unknown-apn - Default.

For the esm-failure cause code only, the unknown-apn ESM code is also reported to the UE.

• no-suitable-cell-in-tracking-area

• plmn-not-allowed

• roaming-not-allowed-in-this-tracking-area

• tracking-area-not-allowed

Usage

Use this command to configure the cause code returned to a UE when an APN mismatch occurs, such as when an APN is present in the HSS subscription but the HSS subscription for this IMSI has other APNs present in the subscription.
Related Commands:

If a condition is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the `local-cause-code-mapping` command in the mme-service configuration mode. This command is described in the *MME Service Configuration Mode Commands* chapter.

Example

The following command maps the “PLMN not allowed” cause code to the APN mismatch condition:

```
local-cause-code-mapping apn-mismatch emm-cause-code plmn-not-allowed
```
**local-cause-code-mapping apn-not-subscribed**

Gives the operator the option to specify the local cause-code mapping when the UE-requested APN is not subscribed.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```bash
configure > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```bash
local-cause-code-mapping apn-not-subscribed esm-cause-code requested-service-option-not-subscribed

remove local-cause-code-mapping apn-not-subscribed
```

**Usage**

The operator can specify "Requested-Option-Not-Subscribed" cause code value #33 will be sent in the Reject message when the PDN Connectivity Request is rejected because no subscription is found. If the command option is not configured, then by default the MME uses the cause code value #27 (Unknown or Missing APN) in standalone PDN Connectivity Reject message when the UE-requested APN is not subscribed. The new keyword apn-not-subscribed is added to specify the local cause-code mapping when the UE-requested APN is not subscribed for that subscriber. If cause code mapping for apn-not-subscribed is explicitly configured with requested-service-option-not-subscribed in either the Call-Control-Profile or MME-Service configuration mode, then the new code "Requested-Option-Not-Subscribed" (cause-code #33) will be sent in the Reject message when the PDN Connectivity Request is rejected because no subscription is found.

**Example**

The following instructs the MME to use cause code #33 ("Requested-Option-Not-Subscribed") in place of the default #27 (Unknown or Missing APN):

```bash
local-cause-code-mapping apn-not-subscribed esm-cause-code requested-service-option-not-subscribed
```
local-cause-code-mapping auth-failure

Configures the reject cause code to send to a UE when an authentication failure occurs.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

remove local-cause-code-mapping auth-failure

Removes the configured cause code mapping.

Specifies the EPS Mobility Management (EMM) cause code to return when an authentication failure occurs.

• eps-service-not-allowed-in-this-plmn
• network-failure
• no-suitable-cell-in-tracking-area
• plmn-not-allowed
• roaming-not-allowed-in-this-tracking-area
• tracking-area-not-allowed

Usage
Use this command to configure the cause code returned to a UE when an authentication failure occurs. By default, the MME sends the UE the #3 - Illegal MS cause code when encountering an authentication failure. This condition occurs for TAU and ATTACH procedures in the following cases:

• The Authentication response from the UE does not match the expected value in the MME.
• Security Mode Reject is sent by the UE.
The UE responds to any identity request with a different type of identity (for example, the MME could query for IMSI and the UE responds with IMEI).

The following are not considered for the authentication failure condition:

- HSS returning a result code other than SUCCESS.
- HSS not available.
- EIR failures.
- UE not responding to requests.

Related Commands:
If a cause code mapping is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the `local-cause-code-mapping` command in the mme-service configuration mode. This command is described in the MME Service Configuration Mode Commands chapter.

Example
The following command maps the “network-failure” cause code to the authentication failure condition:

```
local-cause-code-mapping auth-failure emm-cause-code network-failure
```
**local-cause-code-mapping congestion**

Configures the reject cause code to send to a UE when a procedure fails due to a congestion condition.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```
configure > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```

remove local-cause-code-mapping congestion
```

Removes the configured cause code mapping.

```
```

Specifies the EPS Mobility Management (EMM) cause code to return when a UE requests access when the system is exceeding any of its congestion control thresholds.

- **congestion** - Default
- **eps-service-not-allowed-in-this-plmn**
- **network-failure**
- **no-suitable-cell-in-tracking-area**
- **plmn-not-allowed**
- **roaming-not-allowed-in-this-tracking-area**
- **tracking-area-not-allowed**
Call Control Profile Configuration Mode

esm-cause-code { congestion | insufficient-resources | service-option-temporarily-out-of-order }

Specifies the EPS Session Management (ESM) cause code to return when a UE requests access when the system is exceeding any of its congestion control thresholds.

- congestion - Default
- insufficient-resources
- service-option-temporarily-out-of-order

Usage
Use this command to configure the cause code returned to a UE when a UE procedure fails due to a congestion condition on the MME.

Related Commands:
To set the cause codes for situations where a call control profile cannot be attached to a call (for example new-call restrictions, congestion during new call attempt, etc.), use the local-cause-code-mapping command in the mme-service configuration mode. This command is described in the MME Service Configuration Mode Commands chapter.

Example
The following command maps the “network failure” cause code to the congestion event:

    local-cause-code-mapping congestion emm-cause-code network-failure
local-cause-code-mapping ctxt-TRANSFER-fail-mme

Configures the reject cause code to send to a UE when a UE context transfer failure from a peer MME occurs.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

**Syntax**

```plaintext
```

```plaintext
remove local-cause-code-mapping ctxt-TRANSFER-fail-mme
```

Removes the configured cause code mapping.

```plaintext
```

Specifies the EPS Mobility Management (EMM) cause code to return when a UE context transfer failure from a peer MME occurs.

*eps-service-not-allowed-in-this-plmn

*network-failure

*no-suitable-cell-in-tracking-area

*plmn-not-allowed

*roaming-not-allowed-in-this-tracking-area

*tracking-area-not-allowed

**Usage**

Use this command to configure the cause code returned to a UE when a UE context transfer failure from a peer MME occurs. By default, the MME sends the UE the #9 - MS identity cannot be derived by the network cause code for this condition.

After the peer node has been identified, the MME sends a Context Request to the peer node. If the peer node is an MME, and if the context transfer procedure fails, this condition is detected.
Related Commands:

If a cause code mapping is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the `local-cause-code-mapping` command in the mme-service configuration mode. This command is described in the MME Service Configuration Mode Commands chapter.

Example

The following command maps the “network-failure” cause code to the context transfer failure from MME condition:

```
local-cause-code-mapping ctxt-xfer-fail-mme emm-cause-code network-failure
```
local-cause-code-mapping ctxt-xfer-fail-sgsn

Configures the reject cause code to send to a UE when a UE context transfer failure from a peer SGSN occurs.

**Product**

MME

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

**Syntax**

remove local-cause-code-mapping ctxt-xfer-fail-sgsn

Removes the configured cause code mapping.

Specifies the EPS Mobility Management (EMM) cause code to return when a UE context transfer failure from a peer SGSN occurs.

- eps-service-not-allowed-in-this-plmn
- network-failure
- no-suitable-cell-in-tracking-area
- plmn-not-allowed
- roaming-not-allowed-in-this-tracking-area
- tracking-area-not-allowed

**Usage**

Use this command to configure the cause code returned to a UE when a UE context transfer failure from a peer SGSN occurs. By default, the MME sends the UE the #9 - MS identity cannot be derived by the network cause code when encountering this condition.

After the peer node has been identified, the MME sends a Context Request to the peer node. If the peer node is an SGSN, and if the context transfer procedure fails, this condition is detected.
Related Commands:

If a cause code mapping is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the `local-cause-code-mapping` command in the mme-service configuration mode. This command is described in the MME Service Configuration Mode Commands chapter.

Example

The following command maps the “network-failure” cause code to the context transfer failure from SGSN condition:

```
local-cause-code-mapping ctxt-xfer-fail-sgsn emm-cause-code network-failure
```
local-cause-code-mapping gw-unreachable

Configures the reject cause code to send to a UE when a gateway (S-GW or P-GW) does not respond during an EMM procedure.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

remove local-cause-code-mapping gw-unreachable [ attach | tau ]

Removes the configured cause code mapping.

Specifies the EPS Mobility Management (EMM) cause code to return when a gateway does not respond.

• eps-service-not-allowed-in-this-plmn
• network-failure
• no-bearers-active
• no-suitable-cell-in-tracking-area
• plmn-not-allowed
• roaming-not-allowed-in-this-tracking-area
• tracking-area-not-allowed

[ attach [ tau ] | tau [ attach ] ] | { no-bearers-active tau }

Optionally, the MME can return separate cause codes for Attach procedures and TAU procedures. This capability is available for any of the above EMM cause codes except no-bearers-active, which can only be defined for TAU procedures.
**Usage**

Use this command to configure the cause code returned to a UE when a gateway (S-GW or P-GW) does not respond during an EMM procedure.

**Defaults:**
Prior to StarOS 15.0 MR5, the MME sends the UE the **#19 - ESM Failure** cause code when encountering this condition.
In StarOS 15.0 MR5 and higher releases, the MME sends the UE the **#19 - ESM Failure** cause code for Attach procedures, and **#40 - NO-EPS-BEARER-CONTEXT-ACTIVATED** for TAU procedures.

**Related Commands:**

If a cause code mapping is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the `local-cause-code-mapping` command in the mme-service configuration mode. This command is described in the MME Service Configuration Mode Commands chapter.

**Example**

The following command maps the “network-failure” cause code to the gateway unreachable condition:

```
local-cause-code-mapping gw-unreachable emm-cause-code network-failure
```
local-cause-code-mapping hss-unavailable

Configures the reject cause code to send to a UE when the HSS does not respond.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

remove local-cause-code-mapping hss-unavailable

Removes the configured cause code mapping.

Specifies the EPS Mobility Management (EMM) cause code to return when the HSS does not respond.

*eps-service-not-allowed-in-this-plmn
*network-failure
*no-suitable-cell-in-tracking-area
*plmn-not-allowed
*roaming-not-allowed-in-this-tracking-area
*tracking-area-not-allowed

Usage

Use this command to configure the cause code returned to a UE when the HSS is unavailable. By default, the MME sends the UE the #17 - Network failure cause code when encountering this condition. This condition is detected in the following cases:

* HSS resolution fails in the MME.
* HSS does not respond in time.
The cause code configured for this condition will be signaled in TAU and ATTACH REJECT messages.

**Related Commands:**
If a cause code mapping is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the `local-cause-code-mapping` command in the mme-service configuration mode. This command is described in the *MME Service Configuration Mode Commands* chapter.

**Example**
The following command maps the “tracking-area-not-allowed” cause code to the HSS unavailable condition:

```
local-cause-code-mapping hss-unavailable emm-cause-code tracking-area-not-allowed
```
local-cause-code-mapping map-cause-code

Configures the operator-preferred GMM reject cause code to send to a UE in response to some failures, such as Inbound RAU Context Transfer failure.

**Product**
SGSN

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

**Syntax**

```
local-cause-code-mapping map-cause-code { roaming-not-allowed gmm-cause-code gmm-cause | unknown-subscriber { gmm-cause-code gmm-cause | map-diag-info { gprs-subscription-unknown gmm-cause-code gmm-cause | imsi-unknown gmm-cause-code gmm-cause } } }
```

```
remove local-cause-code-mapping map-cause-code { roaming-not-allowed | unknown-subscriber { gmm-cause-code | map-diag-info { gprs-subscription-unknown | imsi-unknown } } }
```

---

**roaming-not-allowed**

Instructs the SGSN to send a different GPRS mobility management (GMM) cause code to a UE when the UE’s access request is rejected due to map cause ‘roaming not allowed’. Specify one of the GMM cause codes listed below.

**unknown-subscriber**

Instructs the SGSN to send a different GPRS mobility management (GMM) cause code to a UE when the UE’s access request is rejected due to map cause ‘unknown-subscriber’. As well, the Operator is given the option to include MAP diagnostic information in the Reject message to provide additional details about the MAP failure.

- **gmm-cause-code** replaces the cause code. For options see below.
- **map-diag-info** instructs the SGSN to include one of two types of MAP diagnostic information in the Reject message AND specifies the replacement GMM cause code to use in the Reject message.
  - **gprs-subscription-unknown**
  - **imsi-unknown**
**Usage**

This command enables the operator to configure a preferred GMM cause code to return to the UE when a UE access request is rejected due to map-cause ‘roaming-not-allowed’ or ‘unknown-subscriber’. As well, the operator can send additional MAP failure details in the reject message when the map-cause being replaced is ‘unknown-subscriber’. It is possible to map replacement cause codes for both ‘roaming-not-allowed’ and ‘unknown-subscriber’, but additional configurations for either would overwrite.

**Example**

The following command maps `network-failure` as the GMM cause code to be included in an Access Reject sent to the UE when the UE is denied due to map-cause ‘roaming-not-allowed’:

```
local-cause-code-mapping map-cause-code roaming-not-allowed gmm-cause-code network-failure
```

Use the following to change a mapping configuration of ‘unknown-subscriber’ replaced by ‘roaming-not-allowed-in-this-la’ to ‘unknown-subscriber’ replaced by cause code ‘gprs-serv-not-in-this-plmn’ and include MAP diagnostic information in the Reject message:

```
local-cause-code-mapping map-cause-code unknown-subscriber map-diag-info gprs-subscription-unknown gmm-cause-code gprs-serv-not-in-this-plmn
```
local-cause-code-mapping no-active-bearers

Configures the reject cause code to send to a UE when the context received from a peer SGSN (during a TAU procedure) does not contain any active PDP contexts.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:
[local] host_name(config-call-control-profile-profile_name)#

Syntax

remove local-cause-code-mapping no-active-bearers

Removes the configured cause code mapping.

Specifies the EPS Mobility Management (EMM) cause code to return when no active PDP context exists.

• eps-service-not-allowed-in-this-plmn
• network-failure
• no-bearers-active
• no-suitable-cell-in-tracking-area
• plmn-not-allowed
• roaming-not-allowed-in-this-tracking-area
• tracking-area-not-allowed
Usage
Use this command to configure the cause code returned to a UE when the context received from a peer SGSN (during a TAU procedure) does not contain any active PDP contexts. By default, the MME sends the UE the 
\#40 - No PDP context activated cause code when encountering this condition.

Related Commands:
If a cause code mapping is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the local-cause-code-mapping command in the mme-service configuration mode. This command is described in the MME Service Configuration Mode Commands chapter.

Example
The following command maps the “plmn-not-allowed” cause code to the no active bearer condition:

```
local-cause-code-mapping no-active-bearers emm-cause-code plmn-not-allowed
```
local-cause-code-mapping path-failure

Configures SM cause codes for SGSN to send in Deactivate PDP Request.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

local-cause-code-mapping path-failure sm-cause-code { insufficient-resources | network-failure | reactivation-requested | regular-deactivation }

remove local-cause-code-mapping path-failure

remove

Erases defined cause code configuration.

sm-cause-code

Defines the SM cause code to replace the default cause code sent in a Deactivate PDP Request message when a GTP-C path failure occurs. Options include:

- insufficient-resources
- network-failure
- reactivation-requested
- regular-deactivation

Usage

This command is part of the Cause Code Mapping feature, documented in the SGSN Administration Guide, that provides the operator with the option to configure preferred cause codes to be sent in error or failure messages to the UE.

Example

Use the following command to replace the default cause code with SM cause network-failure:

local-cause-code-mapping path-failure sm-cause-code network-failure
local-cause-code-mapping peer-node-unknown

Configures the reject cause code to send to a UE when peer node resolution is not successful.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:
[local]host_name(config-call-control-profile-profile_name)#

Syntax

remove local-cause-code-mapping peer-node-unknown

Removes the configured cause code mapping.

Specifies the EPS Mobility Management (EMM) cause code to return when the peer node resolution is not successful.

• eps-service-not-allowed-in-this-plmn
• network-failure
• no-suitable-cell-in-tracking-area
• plmn-not-allowed
• roaming-not-allowed-in-this-tracking-area
• tracking-area-not-allowed

Usage

Use this command to configure the cause code returned to a UE when peer node resolution is not successful. By default, the MME sends the UE the #9 - MS identity cannot be derived by the network cause code when encountering this condition.

During processing of a TAU REQUEST, the resolution of a peer MME that had allocated the temporary identity that is signaled to the UE takes several steps in the MME. This resolution can be done based on DNS
or based on local configuration. This condition occurs when all mechanisms for peer node resolution are done with no success.

**Related Commands:**

If a cause code mapping is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the `local-cause-code-mapping` command in the mme-service configuration mode. This command is described in the *MME Service Configuration Mode Commands* chapter.

**Example**

The following command maps the “plmn-not-allowed” cause code to the peer node unknown condition:

```
local-cause-code-mapping peer-node-unknown emm-cause-code plmn-not-allowed
```
local-cause-code-mapping pgw-selection-failure

Configures the reject cause code to send to a UE when a failure occurs during P-GW selection.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

remove local-cause-code-mapping pgw-selection-failure

Removes the configured cause code mapping.

Specifies the EPS Mobility Management (EMM) cause code to return when a failure occurs during P-GW selection.

• eps-service-not-allowed-in-this-plmn
• network-failure
• no-suitable-cell-in-tracking-area
• plmn-not-allowed
• roaming-not-allowed-in-this-tracking-area
• tracking-area-not-allowed

Usage
Use this command to configure the cause code returned to a UE when a failure occurs during P-GW selection. By default, the MME sends the UE the #17 - Network failure cause code when encountering this condition.
Related Commands:

If a cause code mapping is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the local-cause-code-mapping command in the mme-service configuration mode. This command is described in the MME Service Configuration Mode Commands chapter.

Example

The following command maps the “plmn-not-allowed” cause code to the P-GW selection failure condition:

```
local-cause-code-mapping pgw-selection-failure emm-cause-code plmn-not-allowed
```
**local-cause-code-mapping restricted-zone-code**

Configures the reject cause code to send to a UE when a UE requests access to a restricted zone.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration
```
configure > call-control-profile profile_name
```
Entering the above command sequence results in the following prompt:
```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**
```
local-cause-code-mapping restricted-zone-code emm-cause-code { eps-service-not-allowed-in-this-plmn | no-suitable-cell-in-tracking-area | plmn-not-allowed | roaming-not-allowed-in-this-tracking-area | tracking-area-not-allowed }
```

```
remove local-cause-code-mapping restricted-zone-code
```

Removes the configured cause code mapping.

```
restricted-zone-code emm-cause-code  emm_cause_code
```

Specifies the EPS Mobility Management (EMM) cause code to return when a UE requests access to a restricted zone.

*emm_cause_code* must be one of the following options:

- eps-service-not-allowed-in-this-plmn
- no-suitable-cell-in-tracking-area - Default.
- plmn-not-allowed
- roaming-not-allowed-in-this-tracking-area
- tracking-area-not-allowed

**Usage**
Use this command to configure the cause code returned to a UE when a UE requests access to a restricted zone.

**Related Commands:**
To set the cause codes for situations where a call control profile cannot be attached to a call (for example new-call restrictions, congestion during new call attempt, etc.), use the `local-cause-code-mapping`
command in the mme-service configuration mode. This command is described in the *MME Service Configuration Mode Commands* chapter.

**Example**

The following command maps the “PLMN not allowed” cause code to the restricted zone code event:

```
local-cause-code-mapping restricted-zone-code emm-cause-code plmn-not-allowed
```
local-cause-code-mapping sgw-selection-failure

Configures the reject cause code to send to a UE when a failure occurs during S-GW selection.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

remove local-cause-code-mapping sgw-selection-failure

Removes the configured cause code mapping.

Specifies the EPS Mobility Management (EMM) cause code to return when a failure occurs during S-GW selection.

• eps-service-not-allowed-in-this-plmn
• network-failure
• no-suitable-cell-in-tracking-area
• plmn-not-allowed
• roaming-not-allowed-in-this-tracking-area
• tracking-area-not-allowed

Usage

Use this command to configure the cause code returned to a UE when a failure occurs during S-GW selection. By default, the MME sends the UE the #17 - Network failure cause code when encountering this condition.
Related Commands:

If a cause code mapping is specified in both the call-control-profile associated with a call, and also the mme-service, the cause configured for the call-control-profile will be signalled to the UE. See also the `local-cause-code-mapping` command in the mme-service configuration mode. This command is described in the *MME Service Configuration Mode Commands* chapter.

Example

The following command maps the “plmn-not-allowed” cause code to the S-GW selection failure condition:

```
local-cause-code-mapping sgw-selection-failure emm-cause-code plmn-not-allowed
```
local-cause-code-mapping vlr-down

Configures the cause code to send in a ATTACH ACCEPT or TAU ACCEPT to a UE that attachment to the VLR has failed because a VLR down condition is present.

Product
MME
Privilege
Administrator
Mode
Exec > Global Configuration > Call Control Profile Configuration    
    configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

local-cause-code-mapping vlr-down emm-cause-code { congestion | cs-domain-unavailable | imsi-unknown-in-hlr | msc-temp-unreachable | network-failure }

remove local-cause-code-mapping vlr-down

remove local-cause-code-mapping vlr-down
Removes the configured cause code mapping.

vlr-down emm-cause-code  emm_cause_code

Specifies the EPS Mobility Management (EMM) cause code to return when a VLR down condition is present.

emm_cause_code must be one of the following options:

•congestion
•cs-domain-unavailable
•imsi-unknown-in-hlr
•msc-temp-unreachable- Default.
•network-failure

Usage
Use this command to configure the cause code returned to a UE when a VLR down condition is present.

Related Commands:
To set the cause codes for situations where a call control profile cannot be attached to a call (for example new-call restrictions, congestion during new call attempt, etc.), use the local-cause-code-mapping
Example

The following command maps the “network failure” EMM cause code to the VLR down condition:

```
local-cause-code-mapping vlr-down emm-cause-code network-failure
```
**local-cause-code-mapping vlr-unreachable**

Configures the cause code to send in a ATTACH ACCEPT or TAU ACCEPT to a UE that attachment to the VLR has failed because a VLR unreachable condition is present.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

**Syntax**

local-cause-code-mapping vlr-unreachable emm-cause-code { congestion | cs-domain-unavailable | imsi-unknown-in-hlr | msc-temp-unreachable | network-failure }

remove local-cause-code-mapping vlr-unreachable

Removes the configured cause code mapping.

vlr-down emm-cause-code emm_cause_code

Specifies the EPS Mobility Management (EMM) cause code to return when a VLR unreachable condition is present.

*emm_cause_code* must be one of the following options:

• congestion
• cs-domain-unavailable
• imsi-unknown-in-hlr
• msc-temp-unreachable - Default.
• network-failure

**Usage**

Use this command to configure the cause code returned to a UE when a VLR unreachable condition is present.

**Related Commands:**

To set the cause codes for situations where a call control profile cannot be attached to a call (for example new-call restrictions, congestion during new call attempt, etc.), use the **local-cause-code-mapping**
command in the mme-service configuration mode. This command is described in the *MME Service Configuration Mode* Commands chapter.

**Example**

The following command maps the “network failure” EMM cause code to the VLR unreachable condition:

```
local-cause-code-mapping vlr-unreachable emm-cause-code network-failure
```
location-area-list

Defines the location area list to allow or restrict services in the specified location areas identified by location area code (LAC).

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

location-area-list instance instance area-code area_code [ area_code * ]

no location-area-list instance instance[ area-code area_code ]

no
If the area-code keyword is included in the command, then only the specified area code is removed from the identified list. If the area-code keyword is not included with the command, the entire list of LACs is removed from this call control profile.

instance instance
Specifies an identification for the specific location area list.
instance must be an integer between 1 and 5.

area-code area_code *
This keyword defines the location area codes (LACs) to be used by this call control profile as a determining factor in the handling of incoming calls. Multiple LACs can be defined in a single location-area-list.
area_code: Enter an integer between 1 and 65535.
* If desired, enter multiple LACs separated by a single blank space.

Usage
Use the command multiple times to configure multiple LAC lists or to modify the a list.

Example
The following command creates a location area list for a single area code:

    location-area-list instance 1 area-code 514

This command creates a second location area list for with multiple area codes - all separated by a single blank space:

    location-area-list instance 2 area-code 514 62552 32 1513
The next command corrects an area code mistake (327 not 32) made in the previous configuration:

```
location-area-list instance 1 area-code 514 62552 327 1513
```
location-reporting

Enable 3G/2G Location Change Reporting feature on the SGSN.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

[ remove ] location-reporting access-type { gprs | umts }

remove
If the remove keyword is included in the command, then the location change reporting feature is disabled.

access-type type
Defines the type of subscriber access which is to reported for location changes.

• gprs - 2G
• umts - 3G

Usage
Use the command multiple times to configure both types of access types.
This command enables the 3G/2G Location Change Reporting feature which notifies the GGSN whenever one of the following changes for a UE:
• the serving cell global identity (CGI), or
• the service area identity (SAI), or
• the routing area identity (RAI).

Example
The following command enables location change reporting to a GGSN for 3G subscribers:

location-reporting access-type umts

This command disables location change reporting that has been enabled for 2G subscribers:

remove location-reporting access-type gprs
lte-zone-code

Configures the enforcement of allowed or restricted zone code lists and associates an EPS Mobility Management (EMM) cause code to rejected attach attempts.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```plaintext
configure > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```plaintext

remove lte-zone-code zone-code-list
```  

- `remove`
  - Removes the zone code list from the call control profile.
  - `[ allow | restrict ]`
    - Specifies whether the zone code list is allowed or restricted.

**Important:** You can only create an allowed or restricted list, not both.

```plaintext
```

Optionally, specify one of the following EMM cause codes to apply when a UE request is rejected:

- `eps-service-not-allowed-in-this-plmn`
- `no-suitable-cell-in-tracking-area`
- `plmn-not-allowed`
- `roaming-not-allowed-in-this-tracking-area`
- `tracking-area-not-allowed`

```plaintext
zone-code-list zc_id +
```

- Specifies the zone code in the allowed or restricted list of zone codes. `zone_code` must be an integer value from 0 to 65535.

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

[ remove ] map message { mo-fwd-sm imsi | update-gprs-location { imeisv | private-extension access-type } } }

remove
IMEI-SV is not included in the GLU request -- this is the default behavior.

message mo-fwd-sm imsi
Configures the SGSN to include the IMSI of the originating subscriber in the mobile-originated SM transfer. This parameter shall be included when the sending entity (MSC or SGSN) supports mobile number portability (MNP). This IMSI IE is required in the in MAP-MO-FORWARD-SHORT-MESSAGE in countries where MNP is deployed. This keyword-set is required. The default is disabled.

update-gprs-location
Includes a GLU message.

imeisv
Specifies the International Mobile equipment Identity-Software Version (IMEI-SV) information to include in the GPRS Location Update (GLU) request message. SGSN will include IMEI-SV in the message, if available. Default: disabled

private-extension access-type
Includes a specific access-type private extension in the message.

Usage
This command configures optional extensions to MAP messages. The HLR should ignore these extensions if not supported by the HLR.

Example
Use the following command to have the SGSN add GLU extension information to the MAP messages sent to the HLR.
map message update-gprs-location private-extension access-type
map-service

Identifies a Mobile Application Part (MAP) service and the context which contains it and associates both with the call control profile.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

map-service context ctxt_name service map_srvc_name

no map-service context

no

Disables use of MAP service with this call control profile.

context ctxt_name

Specifies the name of the context for the MAP service as an alphanumeric string of 1 through 64 characters.

service map_srvc_name

Specifies the MAP service name as an alphanumeric string of 1 through 64 characters.

Usage

Use this command to enable or disable MAP service with this call control profile.

Example

no map-service context
max-bearers-per-subscriber

Defines the maximum number of bearers allowed per subscriber.

Product
MME

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

max-bearers-per-subscriber number

remove max-bearers-per-subscriber

remove

Deletes the definition from the call control profile.

number

Identifies the maximum number of bearers allowed per subscriber as an integer from 1 to 11.

Usage

Use this command to set the maximum number of bearers allowed per subscriber.

Example

Set the maximum to 3:

max-bearers-per-subscriber 3
max-pdns-per-subscriber

Defines the maximum number of PDNs allowed per subscriber.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```
configure > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
max-pdns-per-subscriber number
remove max-pdns-per-subscriber
```

**Usage**

Use this command to set the maximum number of PDNs allowed per subscriber.

**Example**

Set the maximum to 4:

```
max-pdns-per-subscriber 4
```
**min-unused-auth-vectors**

Configures a specific minimum number of unused vectors to be maintained by the SGSN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```bash
configure > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
min-unused-auth-vectors min#_vectors
remove min-unused-auth-vectors
```

---

**remove**

Removes the definition from the configuration file and restores the default behavior, which does not use the threshold.

---

**min#_vectors**

Enables and defines a threshold for the minimum number of unused vectors that the SGSN retains to trigger the initiation of a service area identity request (SAI).

*min#_vectors*: Enter a digit between 1 and 4.

---

**Usage**

Vectors are used by the SGSN for authentication. Use this command to enable a minimum threshold for unused vector for this call control profile. When the unused vector count falls below this configured threshold, then an SAI is initiated to fill the buffer back to 5 or to the most appropriate number based on the MAP service configuration.

**Example**

Enter a command similar to the following to set a threshold of 3:

```
min-unused-auth-vectors 3
```

Use the following command to disable this function and restore the default behavior, which does not use a threshold to trigger an SAI:

```
remove min-unused-auth-vectors
```
mobility-protocol

This command allows you to configure the default mobility protocol type to be used for setting up a call when the AAA server forwards an IP address directly.

**Product**
SaMOG

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```bash
configure > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
mobility-protocol { GTPv1 | GTPv2 }
```

**default mobility-protocol**

- **default**
  
  Sets the mobility-protocol configuration to its default values.

  **Default (SaMOG 3G license):** GTPv1  
  **Default (SaMOG Mixed Mode license):** GTPv2

**Usage**

Use this command to configure the default mobility protocol type to be used for setting up a call when the AAA server forwards an IP address directly. If the mobility protocol is also configured in the APN Profile Configuration Mode, the value configured here will be overridden with the configured value in the APN profile.

**Example**

The following command configures mobility protocol to GTPv2:

```
mobility-protocol GTPv2
```
network-feature-support-ie

Configures support for the IMS Voice over Packet-Switched indication and Homogenous Support of IMS Voice over PS indication.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

network-feature-support-ie ims-voice-over-ps { not-supported | supported }

remove network-feature-support-ie

remove

Disables support for Voice over PS.

ims-voice-over-ps { not-supported | supported }

Enables support for Voice over PS in all Tracking Areas.
not-supported: Configures the MME to add the "Homogenous Support of IMS Voice over PS Sessions" AVP to the S6a Update-Location-Request and Notify Request messages to the HSS, with the value set to “Not Supported”. This indicates that IMS Voice over PS is not supported in any Tracking Areas.
supported: Configures the MME to add the "Homogenous Support of IMS Voice over PS Sessions" AVP to the S6a Update-Location-Request and Notify Request messages to the HSS, with the value set to “Supported”. This indicates that IMS Voice over PS is supported in all Tracking Areas.
If the command is entered without either the supported or not-supported keywords, the AVP will not be sent.

Usage

Use this command to include the “IMS Voice over PS” indication, thereby indicating support for IMS Voice over PS sessions for all Tracking Areas.
This command also configures whether to include the “Homogenous Support of IMS Voice over PS Sessions” indication as well as the included in the indication, either supported or not supported.

Example

The following command enables support for IMS Voice over PS on the MME:

    network-feature-support-ie ims-voice-over-ps
network-initiated-pdp-activation

Configures the call control profile to perform two functions: (1) to enable or disable network-requested PDP context activation (NRPCA) for 3G attachments and (2) to define a failure cause code for inclusion in NRPCA-related reject messages.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

[ remove ] network-initiated-pdp-activation { allow primary | restrict primary | secondary } access type { gprs | umts } { all | location-area-list instance <instance> } failure-code code

network-initiated-pdp-activation primary access type { gprs | umts } { all | location-area-list instance <instance> } failure-code code

network-initiated-pdp-activation secondary access type { gprs | umts } { all | location-area-list instance <instance> } failure-code code

remove
Including this keyword with the command, removes all configured values for the specified configuration.

allow
Allows network-initiated PDP context activation. This keyword must be followed by other parameters to indicate the limitations for allowing the NRPCA.
Allow is the default for NRPCA.

restrict
Restricts network-initiated PDP context activation. This keyword must be followed by other command parameters to indicate the limitations for restricting the NRPCA.

primary
Specifies that only network-initiated primary PDP context activations are to be allowed.

secondary
Specifies that only network-initiated secondary PDP context activations (NRSPCAs) are to be allowed.
Important: The secondary keyword is visible and can be selected. However, NRSPCA functionality is only supported for Release 15.0 onwards.

`all`

Configures the SGSN to allow or to restrict NRPCA for calls within all location areas.

`location-area-list instance instance`

Selects a pre-defined list of location area codes (LACs) and allows/restricts the NRPCA procedure for calls within the listed area codes.

`instance`: Enter a list ID; an integer between 1 and 5.

Important: Before using this keyword, ensure that the appropriate LAC information has been defined with the `location-area-list` command, also in this configuration mode.

`failure-codes code`

Enter an integer from 192 to 226 to identify the GTPP failure cause code (from 3GPP TS29.060, list below) to be included in the reject messages when NRPCA is restricted. If a failure cause code is not defined, the default value is 200 (service not supported).

- 192 - Non-existent
- 193 - Invalid message format
- 194 - IMSI not known
- 195 - MS is GPRS Detached
- 196 - MS is not GPRS Responding
- 197 - MS Refuses
- 198 - Version not supported
- 199 - No resources available
- 200 - Service not supported
- 201 - Mandatory IE incorrect
- 202 - Mandatory IE missing
- 203 - Optional IE incorrect
- 204 - System failure
- 205 - Roaming restriction
- 206 - P-TMSI Signature mismatch
- 207 - GPRS connection suspended
- 208 - Authentication failure
- 209 - User authentication failed
- 210 - Context not found
- 211 - All dynamic PDP addresses are occupied
- 212 - No memory is available
Usage

Use this command to allow or restrict network-requested PDP context activation (NRPCA) based on access-type and location areas. NRPCA is used when there is downlink data at the GGSN for a subscriber, but there is no valid context for the already-established PDP address so the GGSN initiates an NRPCA procedure towards the SGSN.

This command can also be used to define the failure cause code that will be included in activation reject messages.

These commands can be repeated to define a unique set of NRPCA parameters for each access-type and each location area list.

The T3385-timeout and the max-actv-retransmission timers configure the retransmission timer and the number of retries for PDP context activation requests. Both of these timers are set in the SGSN service configuration mode.

The configuration for NRPCA can be viewed via the show call-control-profile full name profile_name. Statistics associated with NRPCA can be seen via the show gmm-sm statistics output and via the show sgtpc statistics verbose output.

Example

The following command changes the failure code for Reject messages from 200 (service not supported) to 205 (roaming restriction) for primary NRPCA for all GRPS access and all LACs:

```
network-initiated-pdp-activation primary access-type gprs all failure-code 205
```

The following command enables network-initiated primary PDP context activation for UMTS calls from the LACs in location-area-list 1:

```
network-initiated-pdp-activation allow primary access-type umts location-area-list instance 1
```

The following command restricts network-initiated primary PDP context activation for UMTS calls from the LACs in location-area-list 2:
network-initiated-pdp-activation restrict primary access-type umts
location-area-list instance 2
override-arp-with-ggsn-arp

Enables or disables the ability of the SGSN to override an Allocation/Retention Priority (ARP) value with one received from a GGSN. If there is no authorized Evolved ARP received from the GGSN, by default the SGSN continues to use the legacy ARP included in the Quality of Service (QoS) Profile IE.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration
`configure > call-control-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
[ remove ] override-arp-with-ggsn-arp
```

- **remove**
  
  Adding the `remove` keyword to the command disables the override feature.

**Usage**

Enabling this function on the SGSN will allow the ARP sent by the GGSN, in CPCR / UPCR / UPCQ, to be applicable as an overriding value.

**Example**

Use this command to configure the SGSN to negotiate the ARP to be used as an overriding value:

```
override-arp-with-ggsn-arp
```
pdp-activate access-type

Configures the PDP context activation option based the type of access technology.

Product
SGSN

Privilege
Security Administrator, Administrator

<thead>
<tr>
<th>failure-code code</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the failure code for PDP context activation as an integer from 8 through 112. Default: 8</td>
</tr>
</tbody>
</table>

Usage

Use this command to configure this call control profile to allow GPRS/UMTS access through PDP context activation request from MS.
Example

The following command configures the system to create the PDP context for requests from MS for GPRS access with location area list instance 2 and failure-code 5:

```
pdp-activate access-type gprs location-area-list 2 failure-code 5
```
pdp-activate allow

Configures the system to allow the PDP context activation based on the type of access technology.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```
configure > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
[ no ] pdp-activate allow access-type { gprs | umts } location-area-list instance instance
```

- **no**
  Removes the configured permission to create PDP context on request of PDP context activation from MS for an access type.

- **access-type { gprs | umts }**
  Specifies the access technology type for PDP context activation.
    - **gprs**: Enables access type as GPRS.
    - **umts**: Enables access type as UMTS.

- **location-area-list instance instance**
  Specifies the location area instance to create PDP context.
  *instance* must be an integer from 1 through 5. The value must be an already defined instance of a location area code (LAC) list created via the **location-area-list** command.

**Usage**

Use this command to configure this call control profile to allow GPRS/UMTS access through PDP context activation request from MS.

**Example**

The following command configures the system to allow the PDP context activation for GPRS access type with location area list instance 2:

```
pdp-activate allow access-type gprs location-area-list instance 2
```
**pdp-activate restrict**

Configures the system to restrict the PDP context activation based on the type of access technology.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```
configure > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
[ no | remove ] { { access-type { gprs | umts } { all | location-area-list instance
instance_id } } | { pdp-type { all | dual-ipv4v6 | ipv4 | ipv6 | ppp } { access-type { gprs
| umts } { all | location-area-list instance instance_id } } } | { secondary-activation
access-type { gprs | umts } { all | location-area-list instance instance_id } } }
```

- `no | remove`
  Either of these prefixes removes the previously configured restriction on PDP context activation and returns the 'allow' default.

- `access-type { gprs | umts }
  Specifies the access technology type for which to restrict PDP context activation.
  - `gprs`: Enables access type as GPRS.
  - `umts`: Enables access type as UMTS.
  - `all`: Configures the system to restrict all PDP context activation requests from the MS.
  - `location-area-list instance instance_id`: Specifies the location area instance to restrict PDP context activation, where `list_id` must be an integer from 1 through 5. The value must be an already defined instance of a location area code (LAC) list created with the `location-area-list` command.

- `pdp-type
  Sets the configuration to restrict PDP activation based on the requested PDP type.
  To restrict more than one type of PDP, the command must be reissued for each PDP type.
  - `all`: restricts activation of all types PDP.
  - `dual-ipv4v6`: restricts activation when dual-IPv4v6 PDP contexts are requested.
  - `ipv4`: restricts activation when IPv4 PDP contexts are requested.
  - `ipv6`: restricts activation when IPv6 PDP contexts are requested.
  - `ppp`: restricts activation when PPP PDP contexts are requested.
**secondary-activation**

Restricts the SGSN, based on the access-type, so that secondary PDP contexts are not created when receiving the PDP Context Activation Request from the MS.

**Usage**

Use this command to configure this call control profile to restrict PDP context activation requests from MS.

**Example**

The following command configures the system to restrict the PDP context activation for request from 2G MS with location area list instance 2:

```
pdp-activate restrict access-type gprs location-area-list instance 2
```

The following command configures the SGSN to restrict PDP context activation for requests from 3G MS if their PDP-type is IPv4. The second command restricts based on PDP-type IPv6.

```
pdp-activate restrict pdp-type ipv4 access-type umts all
pdp-activate restrict pdp-type ipv6 access-type umts location-area-list instance 1
```
pdn-type-override

Configures the MME or the SGSN to override the requested packet data network (PDN) type based on the inbound roamer PLMN, and re-assigns the UE to an IPv4-only or IPv6-only PDN. This override can be applied based on the type of access technology.

Product
MME
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

pbn-type-override ipv4v6 { ipv4 | ipv6 } [ access-type { eps | grps | umts } ]
remove pdn-type-override [ access-type { eps | grps | umts } ]

remove
Removes the configured PDN type override.

ipv4v6 { ipv4 | ipv6 }
Defines the PDN type (IPv4 or IPv6) to which UEs should be restricted.

access-type { eps | grps | umts }
Specifies the access technology type to which the override is applied.
  •eps- enables PDN override for EPS access type.
  •grps- enables PDN override for GPRS access type.
  •umts- enables PDN override for UMTS access type.
If this keyword is not included, then all three access types can have the PDN type overridden.

Usage
Use this command to configure the call control profile to override the requested packet data network (PDN) type and re-assign the UE to a different PDN type. Optionally, it is possible to filter the override based on access technology.

Important: This call control profile becomes valid only when it is associated with an operator policy using the associate command in the Operator Policy configuration mode.
Example

The following command configures the system to override the requested PDN type and assign a UE to an IPv4-only PDN if the UE’s access technology is GPRS:

```
pdn-type-override ipv4v6 ipv4 access-type gprs
```
peer-mme

Configures a peer MME address. S4-SGSN operators can use this command if they wish to bypass DNS resolution to obtain the MME address.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

```
peer-mme { mme-groupid <lac val> mme-code <rac value> | tac tac } prefer { fallback-for-dns | local } address { <ipv4_address> | <ipv6_address> } interface { gn | s3 | s3 [ gn ] }

remove peer-mme { mme-groupid <lac val> mme-code <rac value> | tac tac } address { <ipv4_address> | <ipv6_address> [ interface { gn | s3 | s3 [ gn ] } ]
```

**remove**
Removes a specified peer MME from the call control profile. The interface keyword is optional. If it is not used, the entire interface will be deleted.

**mme-groupid <lac val>**

Specifies the location area code value of the peer MME. The MME group ID of the peer MME maps to the LAC value when GUTI is converted to P-TMSI.

**<lac val>** must be an integer from 1 to 65535.

**mme-code <rac value>**

Specifies the routing area code value of the peer MME. The MME code of the peer MME maps to the RAC value when GUTI is converted to P-TMSI.

**<rac value>** must be an integer from 0 to 255.

**tac tac**

Optional. Specifies the Tracking Area Code (TAC) of the target eNodeB that is used for UTRAN to E-UTRAN (SGSN to MME) SRNS relocation across the S3 interface. Valid entries are 1 to 65535. This setting applies only if SRNS relocation first has been configured via the srns-inter and/or srns-intra commands in Call Control Profile Configuration Mode.
**prefer { fallback-for-dns | local }**

Indicates whether to use a DNS query to obtain the address or to use a locally configured peer MME address:

- **fallback-for-dns** - Instructs the SGSN to perform a DNS query to get the IP address of the peer MME. If the DNS query fails, then the IP address configured with this command is used.
- **local** - Use the locally configured address for the MME address.

**Important:** If the `prefer` command is used to change an existing peer-mme configuration (with the same LAC and RAC) from `fallback-for-dns` to `local` or from `local` to `fallback-for-dns`, the new setting overwrites the previously configured setting for all interfaces.

**address { ipv4_address | ipv6_address }**

Specifies the IP address of the peer MME. Currently, the IPv6 address option is not supported on the S4-SGSN. `ipv4` must be in standard dotted-decimal notation.

**interface { gn [ s3 ] | s3 [ gn ] }**

Specifies the interface to use for communication between the SGSN and the peer MME:

- **gn**: Use the Gn interface between the S4-SGSN and the MME in the LTE network.
- **s3**: Use the S3 interface between the S4-SGSN and the MME in the LTE network. This is the default setting.

**Usage**

Use this command to instruct the S4-SGSN how to determine a peer MME address, via DNS or local configuration. For a local address, use this command to configure the peer MME address. This command also sets the interface type to be used between the peer MME and the SGSN.

**Example**

The following command configures LAC/RAC 111/22 for the peer MME and instructs the SGSN to use the MME’s locally configured IPv4 address of 1.1.1.1 and an S3 interface between the MME and the SGSN.

```
peer-mme mme-groupid 111 mme-code 22 prefer local address 1.1.1.1
interface s3
```
peer-msc

Enables/disables weight-based selection of a peer MSC during MSC lookup. By default, this functionality is disabled.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```configure > call-control-profile profile_name```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
peer-msc interface-type sv weight

remove peer-msc interface-type sv weight
```

**Usage**

This command enables the operator to override the default behavior and define weight-based selection of a peer-MSC during MSC lookup to facilitate ‘weight’ based load balancing for the MME’s Sv interface.

**Example**

Disable weight-based MSC selection when it has been configured:

```
remove peer-msc interface-type sv weight
```
peer-nri-length

Enables the SGSN to use NRI-FQDN-based DNS resolution for non-local RAIs when selection of the call control profile is based on the old-RAI and the PLMN Id of the RNC (for 3G subscribers) or BSC (for 2G subscribers) where the subscriber originally attached. The SGSN also supports RAI-based query when NRI based query fails.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

peer-nri-length length [rai-fqdn-fallback]
remove peer-nri-length [rai-fqdn-fallback]

remove
Deletes the NRI length configuration for the non-local RAIs and the SGSN sends RAI-FQDN-based DNS resolution.

length
This defines the NRI length for the peer SGSN and enables use of NRI-FQDN-based DNS resolution for non-local RAIs. This variable allows for an integer from 1 to 10.

rai-fqdn-fallback
This keyword allows the operator to configure SGSN support for RAI-based query when NRI-based query fails. By default, this keyword is disabled.

Usage

Important:

- This feature is supported only for 3G subscribers until Release 15.0.
- This feature is also supported for 2G subscribers from Release 16.0 onwards.

The command enables the SGSN to perform DNS query with an NRI when RAU comes from an SGSN outside the pool. The SGSN uses NRI-FQDN-based DNS resolution for the non-local RAIs for 3G and 2G subscribers in place of RAI-FQDN-based DNS resolution.
This functionality is applicable in situations for either inter- or intra-PLMN when the SGSN has not chosen a local NRI value (configured with SGSN Service commands) other than \texttt{local-pool-rai} or \texttt{nb-rai}. This means the RAI (outside pool but intra-PLMN) NRI length configured here will be applicable even for intra-PLMN with differently configured NRI lengths (different from the local pool). This functionality is not applicable to call control profiles with an associated MSIN range as ccpProfile selection is not IMSI-based. When this feature is enabled, the selection of the ccpProfile is based on the old-RAI and the PLMN Id (if configured) of the RNC (for 3G subscribers) or BSC (for 2G subscribers) where the subscriber originally attached.

**Example**

The following command is used to configure a peer-nri-length of 3, with support for RAI based query when NRI based query fails:

```
peer-nri-length 3 rai-fqdn-fallback
```
plmn-protocol

Configures the protocol supported by the PLMN (Public Land Mobile Network).

Product
MME

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

plmn-protocol plmnid mcc mcc_num mnc mnc_num { s5-protocol | s8-protocol } { gtp | pmip }

remove plmn-protocol plmnid mcc mcc_num mnc mnc_num

remove
Deletes the definition from the call control profile configuration.

plmn-id mcc mcc_num mnc mnc_num
Identifies the PLMN by MCC (mobile country code) and MNC (mobile network code).
mcc_num: Enter a 3-digit integer from 100-999.
mnc_num: Enter a 2- or 3-digit integer from 00 to 999.

s5-protocol | s8-protocol
Select which protocol - S5 or S8 – that controls the identified PLMN.

gtp | pmip
Select the protocol variant - GTP or PMIP - that controls functionality for the identified PLMN.

Usage
Use this command to identify a particular PLMN and, at a higher level, its operational characteristics.

Example
The following command instructs the MME to use PLMN MCC423.MNC40.GPRS with PMIP under S8 Protocol:

plmn-protocol plmnid mcc 423 mnc 40 s8-protocol pmip
prefer subscription-interface

Selects the specified subscription interface (Gr or S6d) if both interface types are associated with a call-control-profile. Use of this command requires an S6d license. The SGSN also allows selection of S6d interface only if the UE is EPC capable. The keyword `epc-ue` supports the selection of HSS interface only for EPC capable subscribers.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
`configure > call-control-profile profile_name`

Entering the above command sequence results in the following prompt:

`[local] host_name(config-call-control-profile-profile_name)#`

Syntax

prefer subscription-interface { hlr | hss [ epc-ue ] }

remove prefer subscription-interface

remove

Removes the preferred subscription-interface for the call control profile.

hlr

Selects the HLR Gr interface.

hss

Selects the HSS S6d interface.

epc-ue

Configure this keyword to select the HSS interface for EPC capable subscribers. For other subscribers the MAP interface will be selected. This keyword will be applicable only when both MAP and HSS interfaces are configured in the Call-control profile. If this keyword is not configured then SGSN follows existing logic for interface selection. The interface selection based on UE capability is done only at the time of Attach / new SGSN RAU / SRNS. Once the interface is selected, the subscriber remains in same interface till the UE moves out of the SGSN.

Usage

Use of this command requires an S6d license.
The SGSN provides a mechanism to associate a MAP service with call control profile. It is possible that both MAP service and HSS peer service are associated with the call control profile. If the interface preference selected is “hlr”, the MAP protocol is used to exchange messages with the HLR. If the interface preference selected is “hss”, the Diameter-protocol is used to exchange messages with the HSS.

Example

The following command specifies that “hss” for S6d is selected as the subscription-interface:
prefer subscription-interface hss
ptmsi-reallocate

Defines P-TMSI reallocation for Attach Requests, RAU Request, and Service Requests.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:
[local]host_name(config-call-control-profile-profile_name)#

Syntax

ptmsi-reallocate { attach | frequency frequency | interval interval | routing-area-update [ update-type ] | service-request [ service-type ] } [ access-type { gprs | umts } ]

ptmsi-reallocate routing-area-update [ access-type { gprs | umts } | frequency frequency | update-type { combined-update | imsi-combined-update | periodic | ra-update } [ access-type { gprs | umts } ] | frequency frequency ]

ptmsi-reallocate service-request [ frequency frequency | service-type { data | page-response | signaling } [ frequency frequency ] ]

[ no | remove ] ptmsi-reallocate { attach | frequency | interval | routing-area-update [ update-type { combined-update | imsi-combined-update | periodic | ra-update } [ access-type { gprs | umts } ] ] | service-request [ service-type { data | page-response | signaling } ] } [ access-type { gprs | umts } ]

no
Disables the authentication procedures configured for the specified P-TMSI reallocation configuration in the call control profile.

remove
Deletes the defined authentication procedures for the specified P-TMSI reallocation configuration from the call control profile configuration file.

attach
Enables/disables P-TMSI reallocation for Attach with local P-TMSI.

Important: IMSI or inter-SGSN Attach is not configurable and will always be reallocated.
access-type type
One of the following must be selected to reallocate on the basis of the type of network access:

- gprs
- umts

This keyword can be used in combination with other keywords to refine the reallocation configuration.

frequency frequency
Defines frequency of the reallocation based on the number of messages skipped. If the frequency is set for 1, then the SGSN skips 1 message and then reallocates on receipt of the 2nd (alternate) request message, essentially reallocating the P-TMSI every time. If the frequency is set for 12, then the SGSN skips reallocation for 12 messages and reallocates on receipt of the 13th request message. This keyword can be used in combination with other keywords to refine the reallocation configuration.

frequency must be an integer from 1 to 50.

By default, frequency is not defined and, therefore, reallocation is done for every request message and none are skipped.

interval minutes
Enter an integer between 1 and 1440 to define the time interval (in minutes) for skipping the service/RAU/attach request message procedure.

routing-area-update [ update-type ]
Enables/disables P-TMSI reallocation for RAU (routing area update) with local P-TMSI. To refine the reallocation configuration, include one of the optional types of updates to limit reallocation:

- combined-update
- imsi-combined-update
- periodic
- ra-update

Important: Inter-SGSN RAU will always be reallocated.

service-request [ service-type ]
Enables/disables P-TMSI reallocation for Service Requests. To refine the Service-Request reallocation configuration, include one of the optional service-types to limit the reallocation:

- data
- page-response
- signaling

Usage
By default, reallocation is not enabled. Use this command to enable P-TMSI reallocation for Attach Requests, RAU Request, and Service Requests. Fine-tune the reallocation configuration according to frequency, interval, or access-type.

Example
The following command configures the SGSN to perform P-TMSI reallocation upon receiving 2G Attach Requests
**ptmsi-reallocate**

The following command configures the SGSN to disable all previously defined P-TMSI reallocations based on the combined criteria of interval and 3G requests:

```
no ptmsi-reallocate interval access-type umts
```
ptmsi-signature-reallocate

Enables P-TMSI signature reallocation during Attach/RAU procedures.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

**Syntax**

ptmsi-signature-reallocate { attach | frequency frequency | interval interval | ptmsi-reallocation-command | routing-area-update [ update-type ] } [ access-type { gprs | umts } | frequency frequency ]

ptmsi-signature-reallocate routing-area-update [ access-type { gprs | umts } | frequency frequency | update-type { combined-update | imsi-combined-update | periodic | ra-update } ] [ access-type { gprs | umts } | frequency frequency ]

[ no | remove ] ptmsi-signature-reallocate { attach | frequency | interval | routing-area-update [ update-type { combined-update | imsi-combined-update | periodic | ra-update } ] } [ access-type { gprs | umts } ]

---

**no**
Disables the authentication procedures configured for the specified P-TMSI signature reallocation configuration in the call control profile.

---

**remove**
Deletes the defined authentication procedures for the specified P-TMSI signature reallocation configuration from the call control profile configuration file.

---

**attach**
Enables/disables P-TMSI signature reallocation for Attach with local P-TMSI.

---

**access-type type**
One of the following must be selected to reallocate on the basis of the type of network access:

* gprs
* umts

This keyword can be used in combination with other keywords to refine the reallocation configuration.
**frequency**  
Defines 1-in-N selective reallocation. If the frequency is set for 12, then the SGSN skips reallocation for the first 11 messages and reallocates on receipt of the twelfth request message. 
*frequency* must be an integer from 1 to 50.  
This keyword can be used in combination with other keywords to refine the reallocation configuration.

**interval**  
Enter an integer between 1 and 1440 to define the time interval (in minutes) for skipping the service/RAU/attach request message procedure before performing a P-TMSI signature reallocation.

**ptmsi-reallocation-command**  
Includes P-TMSI signature reallocation as a part of the P-TMSI reallocation configuration.

**routing-area-update [ update-type ]**  
Enables/disables P-TMSI signature reallocation for RAU (routing area update) with local P-TMSI. To refine the reallocation configuration, include one of the optional types of updates to limit reallocation:
* combined-update  
* imsi-combined-update  
* periodic  
* ra-update

**Usage**  
By default, P-TMSI signature reallocation is disabled. This command allows the operator to configure when the P-TMSI signature is reallocated.

**Example**  
The following command configures the SGSN to reallocate the P-TMSI signature for every third UMTS attach procedure:

```
ptmsi-signature-reallocate attach frequency 3 access-type umts
```

The following command configures the SGSN to reallocate the P-TMSI signature for every seventh GPRS periodic RAU procedure:

```
ptmsi-signature-reallocate routing-area-update uupdate-type periodic frequency 7 access-type gprs
```

The following command removes all configuration instances for reallocating the P-TMSI signature based on intervals and UMTS access:

```
remove ptmsi-signature-reallocate interval access-type umts
```
qos

Configures the quality of service (QoS) parameters to be applied.

Product
MME
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

qos { gn-gp | ue-ambr }

qos gn-gp { arp high-priority priority medium-priority priority | pre-emption { capability { may-trigger-pre-emption | shall-not-trigger-pre-emption } | vulnerability { not-pre-emptable | pre-emptable } }

qos ue-ambr { max-ul mbr_up max-dl mbr_dl | prefer-as-cap { both-hss-and-local minimum | local } }

remove qos { gn-gp | ue-ambr }

remove

Deletes the configuration from the call control profile.

gn-gp

Configures Gn-Gp pre-release 8 ARP and pre-emption parameters.

arp

Maps usage of ARP (allocation/retention policy) high-priority (H) and medium-priority (M):

*high-priority priority: Enter an integer from 1 to 13.

*medium-priority priority: Enter an integer from 2 to 14.
pre-emption

Defines the pre-emption/vulnerability criteria for PDP Contexts imported from SGSN on Gn/Gp:

- **capability**
  - **may-trigger-pre-emption**: PDP Contexts imported from Gn/Gp SGSN may preempt existing bearers.
  - **shall-not-trigger-pre-emption**: PDP Contexts imported from Gn/Gp SGSN shall not preempt existing bearers.

- **vulnerability**
  - **not-pre-emptable**: PDP Contexts imported from Gn/Gp SGSN are not vulnerable to pre-emption.
  - **pre-emptable**: PDP Contexts imported from Gn/Gp SGSN are vulnerable to pre-emption.

ue-ambr

This keyword enables the operator to configure either the aggregate maximum bit rate stored on the UE (UE AMBR) or select the preferred uplink and downlink QoS cap values.

**Important:** The SGSN only supports the `ue-ambr` keyword beginning in Release 16.

Configures the aggregate maximum bit rate that will be stored on the UE (user equipment).

- **max-ul** `mbr-up`: Defines the maximum bit rate for uplink traffic.
  - `mbr-up`: Enter a value from 1 to 1410065408 (Release 16.1 and higher), or 0 to 1410065408.

- **max-dl** `mbr-down`: Defines the maximum bit rate for downlink traffic.
  - `mbr-down`: Enter a value from 1 to 1410065408 (Release 16.1 and higher), or 0 to 1410065408.

This set of options is only available on the MME.

Specifies the QoS cap value to use.

- **local-when-subscription-not-available**: Use the locally configured values if the Home Subscriber Server (HSS) does not provide QoS bit rate values.
- **minimum**: Use the lower of either the locally configured QoS bit rate or the HSS-provided QoS bit rate. This will override the HSS provided values if it is greater than the locally configured values, or if the HSS does not provide any values.
- **subscription-exceed-reject**: If the requested QoS bit rate exceeds the locally configured value, reject the PDN connection.
- **emm-cause-code**: Specifies the EPS Mobility Management (EMM) cause code to return when the PDN connection is rejected.
  - **eps-service-disallowed** - Default
  - **eps-service-not-allowed-in-this-plmn**
Call Control Profile Configuration Mode

**qos**

- no-suitable-cell-in-tracking-area
- plmn-not-allowed
- roaming-not-allowed-in-this-tracking-area
- tracking-area-not-allowed

prefer-as-cap { both-hss-and-local minimum | local }

This set of options is only available on the SGSN.

Specifies the QoS cap value to use:

- **both-hss-and-local minimum** Use the lower of either the locally configured QoS bit rate or the Home Subscriber Server (HSS)-provided QoS bit rate.
- **local** Use the locally configured QoS bit rate.

**Usage**

Use this command to configure the QoS parameters for the call control profile for either the MME or the SGSN.

On an S4-SGSN, this command ensures proper QoS parameter mapping between the S4-SGSN and EPC UEs, SGWs and PGWs:

- Map EPC ARP parameters to pre-release 8 ARP (Gn/Gp ARP) used during S4-SGSN-to-Gn SGSN call handovers.
- Map ARP parameters received in a GPRS subscription from the HLR to EPC ARP parameters if:
  - The S4 interface is selected for an EPC capable UE, and
  - The UE has only a GPRS subscription (but no EPS subscription) in the HLR / HSS.

**Example**

Configure the Gn/Gp interface ARP priority values:

```
qos gn-gp arp high-priority 2 medium-priority 3
```
rau-inter

Defines acceptable parameters for inter-SGSN routing area updates.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

rau-inter { accept use-auth-vector | access-type gprs { all | location-area-list instance instance } { failure-code fail_code | user-device-release { before-r99 | r99-or-later } failure-code fail_code } | allow accept access-type gprs location-area-list instance instance | avoid-s12-direct-tunnel | ctxt-xfer-failure | exclude-uteid-in-mbr | ignore-peer-context-id | peer-sgsn-addr-resolution-failure failure-code fail_code | restrict access-type { { gprs | umts } { all | location-area-list instance instance } }

default rau-inter { accept use-auth-vector | access-type { { gprs | umts } { all | location-area-list instance instance } failure-code fail_code | user-device-release { before-r99 | r99-or-later } failure-code fail_code } | avoid-s12-direct-tunnel | ctxt-xfer-failure | exclude-uteid-in-mbr | ignore-peer-context-id | peer-sgsn-addr-resolution-failure failure-code fail_code }

no rau-inter { accept use-auth-vector | allow access-type { gprs | umts } location-area-list instance instance | ignore-peer-context-id | peer-sgsn-addr-resolution-failure failure-code fail_code | restrict access-type { gprs | umts } { all | location-area-list instance instance } }

remove rau-inter { avoid-s12-direct-tunnel | exclude-uteid-in-mbr | ctxt-xfer-failure}

Including no as part of the command structure disables the values already configured for parameters specified in the command.

default

Resets the configuration of specified parameters to system default values.

remove

remove can only be used with the avoid-s12-direct-tunnel keyword to erase a configuration instructing the SGSN to avoid establishment of a direct tunnel for S12 interfaces.

accept use-auth-vector

Sets the SGSN to accept using the authorization vector.
allow access-type
Including this keyword with one of the following options, configures the SGSN to allow MS/UE with the identified access-type extension to be part of the intra-RAU procedure.
  *gprs - General Packet Radio Service
  *umts - Universal Mobile Telecommunications System

avoid-s12-direct-tunnel
Enables the operator to modify the Call-Control profile default configuration and instructs the SGSN to avoid establishment of a direct tunnel for S12 interfaces.
This keyword is only supported for configuration of S12 interfaces.

ctxt-xfer-failure fail_code
Configure or removes a GMM failure cause code to be sent in a RAU Reject to the UE due to context transfer failures.
  fail_code For acceptable options, refer to the failure-codes listed below.
  remove filter works with this keyword to erase the context transfer failure cause code definition.

exclude-uteid-in-mbr
By default, the SGSN sends user plane fully qualified tunnel end-point identifier (UTEID) in the Modify Bearer Request (MBR). If RABs are not yet established, this keyword disables or enables the sending of the UTEID in the MBR during a new SGSN RAU over S16/S3. This keyword is in compliance with 3GPP TS 23.401 v11.8.0.

ignore-peer-context-id
Sets the SGSN to ignore the peer's context-ID and replace with PDP context-ID information based on the HLR subscription.

peer-sgsn-addr-resolution-failure fail_code
Configure or remove a GMM failure cause code to be sent in a RAU Reject to the UE due to peer address resolution failures at the SGSN.
  fail_code Enter either 9 (MSID cannot be derived by the network) or 10 (Implicitly detached) to identify the GMM failure cause code.
  remove filter works with this keyword to erase the failure code definition.

restrict access-type
Including this keyword-set with one of the following options, configures the SGSN to restrict MS/UE with the identified access-type extension from the inter-RAU procedure.
  *gprs - General Packet Radio Service
  *umts - Universal Mobile Telecommunications System

all
  all - adding this option to the keyword determines that the failure cause code will be applicable to all location areas.
location-area-list instance instance

list_id must be an integer between 1 and 5. The value must be an already defined instance of a location area code (LAC) list created with the location-area-list command.

failure-code fail-code

Specify a GSM Mobility Management (GMM) failure cause code to identify the reason an inter SGSN RAU does not occur. This GMM cause code will be sent in the reject message to the MS. fail-code must be an integer from 2 to 111. Refer to the GMM failure cause codes listed below (from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

- 2 - IMSI unknown in HLR
- 3 - Illegal MS
- 6 - Illegal ME
- 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived by the network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 - MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable
- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented
- 100 - Conditional IE error
- 101 - Message not compatible with the protocol state
- 111 - Protocol error, unspecified
user-device-release { before-r99 | r99-or-later } failure-code code

Default: Disabled

Enables the SGSN to reject an Inter-RAU procedure based on the detected 3GPP release version of the MS equipment and selectively send a failure cause code in the reject message. The SGSN uses the following procedure to implement this configuration:

1. When Attach Request is received, the SGSN checks the subscriber’s IMSI and current location information.
2. Based on the IMSI, an operator policy and call control profile is found that relates to this Attach Request.
3. Call control profile is checked for access limitations.
4. Attach Request is checked to see if the revision indicator bit is set
   • if not, then the configured common failure code for reject is sent;
   • if set, then the 3GPP release level is verified and action is taken based on the configuration of this parameter

One of the following options must be selected and completed:

• before-r99: Indicates the MS would be a 3GPP release prior to R99 and an appropriate failure code should be defined.
  
  failure-code code: Enter an integer from 2 to 111.

• r99-or-later: Indicates the MS would be a 3GPP Release 99 or later and an appropriate failure code should be defined.
  
  failure-code code: Enter an integer from 2 to 111.

Usage

Use this command to configure the restrictions and function of the inter-RAU procedure.

Example

Configure default inter-RAU settings for Edge calls from subscribers on location-area-list no. 1:

    default rau-inter allow access-type gprs location-area-list instance 1
rau-inter-plmn

Enables or disables restriction of all Routing Area Updates (RAUs) occurring between different PLMNs.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:
[local]host_name(config-call-control-profile-profile_name)#

Syntax
rau-inter-plmn access-type { all | location-area-list instance instance } { failure-code fail_code | user-device-release { before-r99 | failure-code fail_code | r99-or-later } { failure-code fail_code } }

default rau-inter-plmn access-type { all | location-area-list instance instance } user-device-release { before-r99 failure-code | r99-or-later failure-code }

[ no ] rau-inter-plmn { restrict | allow } access-type { gprs | umts } { all | location-area-list instance instance }

[ no ] rau-inter-plmn { allow access-type | restrict access-type } { [ all ] failure-code fail_code | location-area-list instance instance }

default rau-inter { allow access-type | restrict access-type } { [ all ] failure-code fail_code | location-area-list instance instance }

no

Including “no” as part of the command structure disables the values already configured for parameters specified in the command.

default

Resets the configuration of specified parameters to system default values.

allow access-type

Including this keyword-set with one of the following options, configures the SGSN to allow MS/UE with the identified access-type extension to be part of the intra-RAU procedure.

• gprs - General Packet Radio Service
• umts - Universal Mobile Telecommunications System
restrict access-type

Including this keyword-set with one of the following options, configures the SGSN to restrict MS/UE with the identified access-type extension from the inter-RAU procedure.

- gprs - General Packet Radio Service
- umts - Universal Mobile Telecommunications System

all

all - adding this option to the keyword determines that the failure cause code will be applicable to all location areas.

location-area-list instance instance

list_id must be an integer between 1 and 5. The value must be an already defined instance of a LAC list created with the location-area-list command.

failure-code fail-code

Specify a GSM Mobility Management (GMM) failure cause code to identify the reason an inter SGSN RAU does not occur. This GMM cause code will be sent in the reject message to the MS.

fail-code must be an integer from 2 to 111. Refer to the GMM failure cause codes listed below (from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

- 2 - IMSI unknown in HLR
- 3 - Illegal MS
- 6 - Illegal ME
- 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived by the network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 -MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable
- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented
- 100 - Conditional IE error
- 101 - Message not compatible with the protocol state
- 111 - Protocol error, unspecified

user-device-release { before-r99 | r99-or-later } failure-code code

Default: Disabled
Enables the SGSN to reject an Inter-RAU procedure based on the detected 3GPP release version of the MS equipment and selectively send a failure cause code in the reject message. The SGSN uses the following procedure to implement this configuration:

1. When Attach Request is received, the SGSN checks the subscriber’s IMSI and current location information.
2. Based on the IMSI, an operator policy and call control profile are found that relate to this Attach Request.
3. The call control profile is checked for access limitations.
4. Attach Request is checked to see if the revision indicator bit is set
   - if not, then the configured common failure code for reject is sent;
   - if set, then the 3GPP release level is verified and action is taken based on the configuration of this parameter

One of the following options must be selected and completed:
- before-r99: Indicates the MS would be a 3GPP release prior to R99 and an appropriate failure code should be defined.
  failure-code code: Enter an integer from 2 to 111.
- r99-or-later: Indicates the MS would be a 3GPP Release 99 or later and an appropriate failure code should be defined.
  failure-code code: Enter an integer from 2 to 111.

Usage
Use this command to configure the restrictions and function of the inter-RAU procedure occurring across RNCs or BSSs where the PLMN changes. For example:
- inter-IuPS RAU, where the two IuPSs have different PLMNs
- inter-GPRS RAU, where the two GPRSs have different PLMNs
- inter-RAT RAU (2G > 3G), where the IuPS/GPRS services have different PLMNs
- inter-RAT-RAU (3G > 2G), where the IuPS/GPRS services have different PLMNs

Example

default rau-inter allow access-type gprs location-area-list instance 1
rau-intra

Defines an acceptable procedure for intra-SGSN Routing Area Updates (RAUs).

---

no

Including “no” as part of the command structure disables the values already configured for parameters specified in the command.

---

default

Resets the configuration of specified parameters to system default values.

---

allow access-type

Including this keyword-set with one of the following options, configures the SGSN to allow an MS/UE with the identified access-type extension to be part of the intra-RAU procedure.

- **gprs** - General Packet Radio Service
- **umts** - Universal Mobile Telecommunications System
restrict access-type

Including this keyword-set with one of the following options, configures the SGSN to restrict an MS/UE with the identified access-type extension from the intra-RAU procedure.

- **gprs** - General Packet Radio Service
- **umts** - Universal Mobile Telecommunications System

all

-all - adding this option to the keyword determines that the failure cause code will be applicable to all location areas.

location-area-list instance instance

*list_id* must be an integer between 1 and 5. The value must be an already defined instance of a location area code (LAC) list created via the *location-area-list* command.

failure-code fail-code

Specify a GSM Mobility Management (GMM) failure cause code to identify the reason an inter SGSN RAU does not occur. This GMM cause code will be sent in the reject message to the MS.

*fail-code* must be an integer from 2 to 111. Refer to the GMM failure cause codes listed below (from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

- 2 - IMSI unknown in HLR
- 3 - Illegal MS
- 6 - Illegal ME
- 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived by the network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 - MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable
- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
Call Control Profile Configuration Mode

user-device-release { before-r99 | r99-or-later } failure-code code

Default: Disabled

Enables the SGSN to reject an Intra-RAU procedure based on the detected 3GPP release version of the MS equipment and selectively send a failure cause code in the reject message. The SGSN uses the following procedure to implement this configuration:

1. When Attach Request is received, the SGSN checks the subscriber’s IMSI and current location information.
2. Based on the IMSI, an operator policy and call control profile are found that relate to this Attach Request.
3. Call control profile is checked for access limitations.
4. Attach Request is checked to see if the revision indicator bit is set
   - if not, then the configured common failure code for reject is sent;
   - if set, then the 3GPP release level is verified and action is taken based on the configuration of this parameter

One of the following options must be selected and completed:

**before-r99**: Indicates the MS would be a 3GPP release prior to R99 and an appropriate failure code should be defined.

failure-code code: Enter an integer from 2 to 111.

**r99-or-later**: Indicates the MS would be a 3GPP Release 99 or later and an appropriate failure code should be defined.

failure-code code: Enter an integer from 2 to 111.

Usage

Use this command to configure the restrictions and function of the intra-RAU procedure.

Example

default rau-intra allow access-type gprs location-area-list instance 1
re-authenticate

Enables or disables the re-authentication feature. This command is available in releases 8.1 and higher.

Product
 SGSN

Privilege
 Security Administrator, Administrator

Mode
 Exec > Global Configuration > Call Control Profile Configuration
 configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

re-authenticate [ access-type { gprs | umts } ]

remove re-authenticate

remove

Including this keyword with the command disables the feature. The feature is disabled by default.

access-type

Defines the type of access to be allowed or restricted.
  • gprs
  • umts

If this keyword is not included, then both access types are allowed by default.

Usage

Use this command to enable or disable the re-authentication feature, which instructs the SGSN to retry authentication with another RAND in situations where failure of the first authentication has occurred. To address the introduction of new SIM cards, for security reasons a systematic "last chance" authentication retry with a fresh Authentication Vector is needed, particularly in cases where there is an SRES mismatch at authentication.

Example

re-authenticate
regional-subscription-restriction

Allows the operator to define the cause code for subscriber rejection when it is due to regional subscription information failure.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

[ remove ] regional-subscription-restriction [ failure-code code | user-device-release { before-r99 failure-code code | r99-or-later failure-code code } ]

**remove**

This keyword causes the configuration to be deleted from the call control profile configuration.

**failure-code cause_code**

cause_code: Enter an integer from 2 to 111; default code is 13 (roaming not allowed in this location area [LA]).

Refer to the GMM failure cause codes listed below (from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

- 2 - IMSI unknown in HLR
- 3 - Illegal MS
- 6 - Illegal ME
- 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived by the network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 - MSC temporarily not reachable
- 17 - Network failure
• 20 - MAC failure
• 21 - Synch failure
• 22 - Congestion
• 23 - GSM authentication unacceptable
• 40 - No PDP context activated
• 48 to 63 - retry upon entry into a new cell
• 95 - Semantically incorrect message
• 96 - Invalid mandatory information
• 97 - Message type non-existent or not implemented
• 98 - Message type not compatible with state
• 99 - Information element non-existent or not implemented
• 100 - Conditional IE error
• 101 - Message not compatible with the protocol state
• 111 - Protocol error, unspecified

user-device-release { before-r99 | r99-or-later } failure-code code

Enables the SGSN to assign a reject cause code based on the detected 3GPP release version of the MS equipment.

One of the following options must be selected and completed:

• before-r99: Indicates the MS would be a 3GPP release prior to R99 and an appropriate failure code should be defined.

  failure-code code: Enter an integer from 2 to 111. Refer to the list above.

• r99-or-later: Indicates the MS would be a 3GPP Release 99 or later and an appropriate failure code should be defined.

  failure-code code: Enter an integer from 2 to 111. Refer to the list above.

Usage

Use this command to define GMM reject cause codes when rejection is due to regional subscription information failure.

Example

The following command sets a location area rejection message, code 12 for regional restriction rejections:

  regional-subscription-restriction failure-code 12
**release-access-bearer**

Enables sending of Release Access Bearer and configures the S4-SGSN to send Release Access Bearer Request on Iu-Release for non-DT and non-ISR subscribers in 3G and on Ready-to-Standby or Radio-Status-Bad for non-ISR subscribers in 2G.

**Important:** We recommend that Release Access Bearer be enabled (with this command) prior to enabling Subscriber Overcharging Protection for S4-SGSN. This will ensure that the S4-SGSN sends Release Access Bearer with the ARRL bit set if LORC (loss of radio coverage) is detected.

**Product**
SGSN.

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```
configure > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
release-access-bearer [ on-iu-release | on-ready-to-standby ]
remove release-access-bearer [ on-iu-release | on-ready-to-standby ]
```

**remove**
When included with the command, `remove` disables sending Release Access Bearer in either the selected (with optional keyword) 2G or 3G environment or both environments (with no keyword included).

**on-iu-release**
This optional keyword instructs the SGSN to send Release Access Bearer upon Iu-Release in a 3G network so that Release Access Bearer will be initiated for non-ISR and non-DT subscribers upon Iu-Release. For ISR and DT subscribers, Release Access Bearer will be initiated unconditionally.

**on-ready-to-standby**
This optional keyword instructs the SGSN to send Release Access Bearer on Ready-to-Standby transition in a 2G network so that Release Access Bearer will be initiated for non-ISR subscribers on Ready-to-Standby transition. For ISR subscribers, Release Access Bearer will be initiated unconditionally.

**Usage**
If no optional keywords are included with the `release-access-bearer` command, then the S4-SGSN applies Release Access Bearer for both 2G and 3G networks.

By default, Release Access Bearer initiation on Iu-Release or Ready-to-Standby transition is not enabled.

When disabled or prior to being enabled, either/both `remove release-access-bearer on-iu-release`
or/and remove release-access-bearer on-ready-to-standby will display in the output generated by the show configuration [ verbose ] command.

This command, in compliance with 3GPP TS 23.060 v11.7.0, provides the operator with the option to have the S4-SGSN send Release Access Bearer Request to the S-GW to remove the downlink user plane on the S4 interface for non-DT and non-ISR scenarios.

In accordance with 3GPP TS 23.401 v11.8.0, if the SGSN and the S-GW are configured to release S4 U-Plane when the EPS bearer contexts associated with the released RABs are to be preserved, then the SGSN should not send SGSN address and TEID for U-Plane in the Modify Bearer Request (MBR). The operator can now use the rau-inter exclude-uteid-in-mbr command (under Call-Control Profile configuration mode) to configure the SGSN not to send the UTEID in the MBR.

Example

To enable release access bearer in both 2G and 3G networks, use a command similar to the following:

    release-access-bearer

To disable release access bearer in 3G networks, use a command similar to the following:

    remove release-access-bearer on-iu-release
reuse-authentication-triplets

Creates a configuration entry to enable or disable the reuse of authentication triplets in the event of a failure.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

*configure > call-control-profile profile_name*

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
[ no | remove ] reuse-authentication-triplets no-limit
```

- **no**
  Disables this configuration entry and disables reuse of authentication triplets.

- **remove**
  This keyword causes the reuse configuration to be deleted from the call control profile configuration. This is the default behavior. Triplets are reused.

- **no-limit**
  This keyword enables reuse triplets as needed.

**Usage**
Use this command to enable reuse of authentication triplets.

**Example**

```
reuse-authentication-triplets no limit
```
rfsp-override

Configures RAT frequency selection priority override parameters for this call control profile.

Product
MME
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
  configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

rfsp-override { default value | eutran-ho-restricted value | ue-val value new-val value + }
remove rfsp-override { default | eutran-ho-restricted | ue-val value }

remove
Deletes the rfsp-override configuration from the call control profile.

default
Restores the default value assigned.

eutran-ho-restricted value
This keyword is used to configure the value for RAT frequency selection priority when Handover to EUTRAN is restricted. This value overrides the RFSP ID value sent by the HLR/HSS in an EPS subscription.

value: Enter an integer from 1 to 256.

ue-val value
Assign the UE value for the RAT frequency selection priority.

value: Enter an integer from 1 to 256.

new-val value
Assign a new RFSP Index value.

value: Enter an integer from 1 to 256.
Multiple UE value/new value combinations can be configured in a single command.

Usage
Use this command to configure the RAT frequency selection priority override parameter.
Multiple UE value/new value combinations can be configured.
Example

The following command resets the specified RFSP Index value (1) to its default value, thereby removing the RFSP Index override value previously configured:

```
rfsp-override default 1
```
rfsp-override ue-settings

Configures the override of the RAT Frequency Selection Priority (RFSP) of matching subscribers.

Product
MME

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

remove
Deletes the rfsp-override configuration from the call control profile.

ue-settings value
Assign the UE value for the RAT frequency selection priority.

data-centric ue-voice-domain-preference
Assign the UE value for the RAT frequency selection priority for data-centric calls.

• cs-voice-only: Circuit switched voice only.
• cs-voice-preferred-ims-ps-voice-secondary: Circuit switched voice preferred.
• ims-ps-voice-only: IMS Packet switched voice only.

voice-centric ue-voice-domain-preference
Assign the UE value for the RAT frequency selection priority for voice-centric calls.

• cs-voice-only: Circuit switched voice only.
• cs-voice-preferred-ims-ps-voice-secondary: Circuit switched voice preferred.
• ims-ps-voice-only: IMS Packet switched voice only.
new-val value

Assign a new RFSP Index value.
value: Enter an integer from 1 to 256.
Multiple UE value/new value combinations can be configured in a single command.

Usage

Use this command to assign an RFSP Index for a UE based on the following factors:

- Operator policy (where IMSI range or PLMN can influence the selected RFSP)
- UE usage setting (voice centric, data centric)
- Voice domain preference (CS voice only, CS voice preferred, IMS PS voice preferred, IMS PS voice only).

To support Radio Resource Management (RRM) in E-UTRAN, the MME provides the parameter RFSP Index to an eNodeB across S1. The RFSP Index is used by the eNodeB to apply specific RRM strategies. The MME receives the subscribed RFSP Index from the HSS, then overrides the RFSP Index for the UE based on the settings defined in this command.

Multiple UE value/new value combinations can be configured.

Example

The following command overrides the RFSP Index value for voice-centric circuit switched calls to an RFSP Index of 10:

   rfsp-override ue-setting voice-centric voice-domain-pref cs-voice_only
   new-val 10
**s1-reset**

Configures the behavior of user equipment (UE) on S1-reset.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

`configure > call-control-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
s1-reset { detach-ue | idle-mode-entry }

default s1-reset
```

- **default**
  
  Reset the profile configuration to the system default of `idle-mode-entry`.

- **detach-ue**
  
  Upon S1-reset the MME will detach the UE.

- **idle-mode-entry**
  
  Upon S1-reset the MME will move the UE to idle-mode. This is the default setting for this command.

**Usage**

Use this command to set the MME’s reactions to an S1-reset.

**Example**

Configure the MME to put the UE into idle-mode upon receipt of S1-reset:

```
s1-reset idle-mode-entry
```
sctp-down

Configures the behavior towards UE (user equipment) when Stream Control Transmission Protocol (SCTP) goes down.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
sctp-down { detach-ue | idle-mode-entry }
```

**default sctp-down**

```
default
Reset the profile configuration to the system default when SCTP layer goes down. The default for this command is idle-mode-entry.
```

```
detach-ue
When SCTP goes down, the MME will detach the UE.
```

```
idle-mode-entry
When the SCTP goes down, the MME will move the UE to idle-mode. This is the default for this command.
```

**Usage**

Use this command to set the MME’s reactions when the SCTP goes down.

**Example**

Configure the MME to put the UE into idle-mode when the SCTP layer goes down:

```
sctp-down idle-mode-entry
```
sgs-cause-code-mapping

Configures the EMM reject cause code to send to a UE when an SGs cause code is received.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

sgs-cause-code-mapping sgs-cause emm-cause-code emm_cause_code

remove sgs-cause-code-mapping sgs-cause

remove sgs-cause-code-mapping sgs-cause

Removes the configured cause code mapping and returns it to its default value.

sgs-cause-code

Specifies the SGs cause code received on the SGs interface to which the new cause code should be mapped.

• congestion - Default mapped EMM cause code: #22 Congestion.
• illegal-me - Default mapped EMM cause code: #16 MSC temporarily unreachable.
• illegal-ms - Default mapped EMM cause code: #16 MSC temporarily unreachable.
• imei-not-accepted - Default mapped EMM cause code: #16 MSC temporarily unreachable.
• imsi-unknown-in-hss - Default mapped EMM cause code: #2 IMSI unknown in HSS.
• imsi-unknown-in-vlr - Default mapped EMM cause code: #16 MSC temporarily unreachable.
• la-not-allowed - Default mapped EMM cause code: #16 MSC temporarily unreachable.
• network-failure - Default mapped EMM cause code: #17 Network failure.
• no-suitable-cells-in-la - Default mapped EMM cause code: #16 MSC temporarily unreachable.
• plmn-not-allowed - Default mapped EMM cause code: #16 MSC temporarily unreachable.
• protocol-error - Default mapped EMM cause code: #16 MSC temporarily unreachable.
• roaming-not-allowed-in-la - Default mapped EMM cause code: #16 MSC temporarily unreachable.
• service-not-subscribed - Default mapped EMM cause code: #16 MSC temporarily unreachable.
• service-not-supported - Default mapped EMM cause code: #16 MSC temporarily unreachable.

Call Control Profile Configuration Mode

sgs-cause-code-mapping

• service-out-of-order - Default mapped EMM cause code: #16 MSC temporarily unreachable.

esting

emmc-cause-code emm_cause_code

Specifies the EPS Mobility Management (EMM) cause code to return to the UE for the given SGs cause code.

• congestion
• cs-domain-unavailable
• imsi-unknown-in-hss
• msc-temp-unreachable
• network-failure

Usage

Use this command to configure the EMM cause code returned to a UE when an error is reported via the SGs interface when attachment to the VLR has failed. If a condition is specified in both the call control profile associated with a call and also the MME service, the cause configured on the call control profile is signalled to the UE.

Important: EMM cause code #18 “CS Domain not available” is not mapped to any SGs code but is returned when SGs service is disallowed by a policy or on unexpected behavior such as when the MME is unable to send an SGs message to a VLR.

Related Commands

To set the cause codes for situations where a call control profile cannot be attached to a call (for example new-call restrictions, congestion during new call attempt, etc.), use the local-cause-code-mapping command in the mme-service configuration mode. This command is described in the MME Service Configuration Mode Commands chapter.

Example

The following command maps the “congestion” EMM cause code to the “network-failure” SGs cause code:

    sgs-cause-code-mapping network-failure emm-cause-code congestion
sgsn-address

Defines the IP addresses for peer SGSNs in a static SGSN address table. These configured addresses can be used if operators wish to bypass DNS.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

sgsn-address { nri nri | rac rac-id lac lac_id | rnc_id rnc_id } [ nri nri ] prefer { fallback-for-dns | local } address { ipv4 ip_address | ipv6 ip_address } interface { gn | s16 }

no sgsn-address { ipv4 ip_address | ipv6 ip_address } { nri nri | rac rac_id lac lac_id [ nri nri | rnc_id rnc_id ] [ interface { gn | s16 } ]

---

no

Disables the specified peer-SGSN address configuration.

rac rac_id

Identifies the foreign routing area code (RAC) of the peer-SGSN address to be configured in the static peer-SGSN address table. rac_id must be an integer from 1 to 255.

lac lac_id

Identifies the foreign location area code (LAC) ID of the peer-SGSN address to be configured in the static peer-SGSN address table. lac_id must be an integer from 1 to 65535.

rnc_id rnc_id

Optional. Specifies the target RNC ID that maps to the address of the peer SGSN via the S16 interface. The RNC ID is used by the S4-SGSN for inter-SGSN SRNS relocations. Valid entries are 1 to 65535. This setting only applies if SRNS relocation has been configured via the srns-inter and/or srns-intra commands in Call Control Profile Configuration Mode.

nri nri

Identifies the network resource identifier stored in the P-TMSI (bit 17 to bit 23). nri must be an integer from 0 to 63.
**Important:** Typically, use of this keyword is optional. However, it must be included in the command when Flex (SGSN-Pooling) is implemented.

```
prefer { fallback-for-dns | local }
```

Indicates the preferred source of the address to be used.

- **fallback-for-dns** - Instructs the SGSN to perform a DNS query to get the IP address of the peer-SGSN. If the DNS query fails, then the IP address configured with this command is used.
- **local** - instructs the system to use the local IP address configured with this command.

**Important:** If the `prefer` command is used to change an existing sgsn-address configuration (with the same LAC and RAC) from `fallback-for-dns` to `local` or from `local` to `fallback-for-dns`, the new setting overwrites the previously configured setting for all interfaces.

```
address { ipv4 ip_address | ipv6 ip_address }
```

Specifies the IP address of the peer SGSN. Currently, the IPv6 address option is not supported on the S4-SGSN.

- **ipv4 ip_address** - specifies a valid address in IPv4 dotted-decimal notation.
- **ipv6 ip_address** -

**Important:** The `ipv6` option is under development for future use and is not supported in this release.

```
interface { gn | s16 }
```

`interface` - optional. Specifies the interface type used for communicating with the peer SGSN. Must be one of the following:

- **gn** specifies that communication will occur over the Gn interface with a peer SGSN configured for 2.5G, 3G, or dual access SGSN services.
- **s16** specifies that communication will occur over the S16 interface with a peer S4-SGSN.

**Usage**

Use this command to save time by avoiding DNS. This command enables a local mapping by setting the peer-SGSN IP address to be used for inter-SGSN Attach and inter-SGSN-RAU. When configured, if the SGSN receives a RAU or an Attach Request with a P-TMSI and an old-RAI that is not local, the SGSN consults this table and uses the configured IP address instead of resolving via DNS. If this table is not configured, then IP address resolution is done using DNS.

The MCC and MNC of the RAI are taken from the IMSI range configured in the operator policy and the LAC and RAC are configured here in the call control profile configuration mode.

The `sgsn-address` command differs from other Call Control Profile configuration mode commands in the following ways:

- Within the SGSN’s call logic, all other configuration elements defined with the other commands in this mode are used after the IMSI is learnt. The configuration defined with this command is part of the decision logic prior to the IMSI being known.
With the peer-SGSN address configured using this `sgsn-address` command, the peer-SGSN-RAI’s MCC/MNC is used as a 5 or 6-digit IMSI and the operator policy and call control profile selection are completed.

**Important:** Typically, use of this command is optional. However, it must be included in the configuration when Flex (SGSN-Pooling) is implemented if (1) the SGSN functions as a default SGSN, then configure the local-NRI of other SGSN with this command; or if (2) another SGSN is offloading, then configure the NB-RAI/null-NRI of the peer-SGSN with this command.

**Example**

Create a local peer-SGSN address mapping of an RAI with RAC of 123 and LAC of 4444 and an IPv4 address of 123.11.313.11 for the peer-SGSN:

```
sgsn-address rac 123 lac 4444 local address ipv4 123.11.313.11
```
sgsn-core-nw-interface

This command enables operators to select the Gn interface or the S4 interface for EPC capable UEs and Non-EPC capable UEs on the S4-SGSN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile *profile_name*

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

**Syntax**

```
sgsn-core-nw-interface { gn | s4 } [epc-ue {always | eps-subscribed} | non-epc-ue {never | always | eps-subscribed}] }
```

- **sgsn-core-nw-interface { gn | s4 }**
  Specifies the interface that EPC-capable UEs will use to communicate with the packet core gateways (GGSN/SGW). Selection must be one of:
  - **gn**: Forces the SGSN to forcefully select the Gn interface for EPC-capable UEs.
  - **s4**: Specifies that the SGSN will use the S4 interface between the S4-SGSN and packet core gateways (GGSN/SGW). This is the default setting for EPC-capable UEs.

- **epc-ue**
  Configures the S4 Interface Selection Option for EPC Capable UE.

- **non-epc-ue**
  Configures the S4 Interface Selection Option for Non-EPC Capable UE.

- **always**
  Instructs the SGSN to always choose a S4 Interface.

- **never**
  Instructs the SGSN to not choose a S4 Interface.

- **eps-subscribed**
  Instructs the SGSN to choose a S4 Interface if EPS Subscription is available.

**Usage**
Use this command to forcefully select the interface that the SGSN will use for EPC-capable UEs. This command is available only if the SGSN S4 Interface license is enabled on the SGSN.
Example

sgsn-core-nw-interface gn
sgsn-number

Defines the SGSN’s E.164 number to be used for interactions via the Mobile Application Part (MAP) protocol. E.164 is an ITU-T recommendation that defines the international public telecommunication numbering plan used in public switched telephone networks (PSTN) and some other data networks.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```bash
configure > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```bash
sgsn-number E164_number

no sgsn-number
```

---

**Syntax**

```
no
```

Disables the use of this configuration definition.

```
E164_number
```

Specifies a string of 1 to 16 digits that serve as the SGSN’s E.164 identification.

**Usage**

This command configures the current SGSN E164 contact number. The SGSN number configured for a call control profile is related to the SGSN number configured in the SGSN service configuration and/or in the GPRS service configuration. If the SGSN number is not configured as part of the call control profile configuration, then the SGSN number defined as part of the SGSN service or GPRS service configuration is used.

When the 3G SGSN supports multiple PLMNs configured through different IuPS services or when network sharing is implemented, then it may be required to use different SGSN numbers for each PLMN. In such cases, configure the per-PLMN SGSN number in a call control profile. SGSN number definition for a call control profile allows emulation of a different SGSN to each HLR per PLMN. SGSN number definitions in the call control profile also enable the SGSN to use a different SGSN number per operator when network sharing is implemented.

**Example**

Map the E.164 number 198765432123456 for the SGSN to this call control profile configuration:

```bash
sgsn-number 198765432123456
```
sgtp-service

Identifies the SGTP service configuration to be used according to this call control profile.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```bash
configure > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-call-control-profile-profile_name) #
```

**Syntax**

```bash
sgtp-service context ctxt_name service sgtp_service_name

no sgtp-service context
```

- **context ctxt_name**
  Specifies the SGTP context as an alphanumeric string of 1 through 64 characters.

- **service sgtp_service_name**
  Specifies the SGTP service name as an alphanumeric string of 1 through 64 characters.

- **no**
  Disables use of SGTP service.

**Usage**

Use this command to configure enabling or disabling of SGTP service for this call control profile.

**Example**

```bash
sgtp-service context sgtp1 service sgtp-srvc1
```
# sms-mo

Configures how mobile-originated (MO) short message service (SMS) messages are handled.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```
configure > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
[ remove ] sms-mo { access-type { gprs | umts } all-location-areas | location-area-list } allow access-type { gprs | umts } restrict access-type { gprs | umts } }
```

- **remove**
  Deletes the specified configuration.

- **access-type type**
  Access by SMS will be limited to SMS coming from this network type:
  - *gprs*
  - *umts*

- **allow**
  Allow either GPRS or UMTS type access for SMS.

- **restrict**
  Restrict either GPRS or UMTS type access for SMS.

- **location-area-list instance instance**
  *instance* must be an integer between 1 and 5. The value must identify an already defined location area code (LAC) list created with the `location-area-list` command.

- **failure-code code**
  *code*: Must be an integer from 2 to 111.

**Usage**
Configure filtering for SMS-MO messaging.

**Example**
sms-mo access-type gprs all-location-areas failure-code 100
sms-mt

This command configures how mobile-terminated (MT) short message service (SMS) messages are handled.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

[ remove ] sms-mt { { access-type { gprs | umts } | all-location-areas | location-area-list } | allow access-type { gprs | umts } | restrict access-type { gprs | umts } }

<table>

</tbody>
</table>

<table>
<thead>
<tr>
<th>failure-code code</th>
</tr>
</thead>
<tbody>
<tr>
<td>code: Must be an integer from 2 to 111.</td>
</tr>
</tbody>
</table>

Usage
Configure filtering for SMS-MT messaging.

Example
sms-mt access-type gprs all-location-areas failure-code 100
**srns-inter**

Defines handling parameters for Inter-SRNS (Serving Radio Network Subsystem) relocation.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration
`configure > call-control-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-call-control-profile-profile_name) #
```

**Syntax**

```
srns-inter { all failure-code | allow location-area-list instance instance | location-area-list instance instance failure-code code | restrict location-area-list instance instance }

no srns-inter { allow location-area-list instance instance | restrict location-area-list instance instance }

default srns-inter { all | location-area-list-instance instance }
```

---

**no**
Deletes the inter-SRNS relocation configuration.

**default**
Resets the configuration to default values.

**all failure-code code**
Define the failure code that will apply to all inter-SRNS relocations.
`code`: Must be an integer from 2 to 111.

**allow location-area-list instance instance**
Identify the location area list Id (LAC Id) that will allow services in the defined location area.

**location-area-list instance instance**
`instance`: Must be an integer between 1 and 5 that identifies the previously defined location area list created with the `location-area-list` command.

**restrict location-area-list instance instance**
Identify the location area list Id (LAC Id) that indicates the location areas where services will be restricted.
Usage
This command defines the operational parameters for inter-SRNS relocation.

Example
The following command allows services in areas listed in LAC list #3:

```
srns-inter allow location-area-list instance 3
```
**srns-intra**

Defines handling parameters for intra-SRNS (Serving Radio Network Subsystem) relocation.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```
configure > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
srns-intra { all failure-code | allow location-area-list instance instance failure-code code | restrict location-area-list instance instance }

no srns-intra { allow location-area-list instance instance | restrict location-area-list instance instance }

default srns-intra { all | location-area-list-instance instance }
```

---

**no**

Deletes the intra-SRNS relocation configuration.

---

**default**

Resets the configuration to default values.

---

**all failure-code code**

Define the failure code that will apply to all intra-SRNS relocations.

*code*: Must be an integer from 2 to 111.

---

**allow location-area-list instance instance**

Identify the location area list Id (LAC Id) that will allow services in the defined location area.

**location-area-list instance instance**

*instance*: Must be an integer between 1 and 5 that identifies the previously defined location area list created with the `location-area-list` command.

---

**restrict location-area-list instance instance**

Identify the location area list Id (LAC Id) of the target RNC to determine the location areas where services will be restricted.
Usage

This command defines the operational parameters for intra-SRNS relocation.

Example

The following command restricts service in areas listed in the LAC list 1:

srns-intra restrict location-area-list instance 1
**srvcc exclude-stnsr-nanpi**

Configures the MME to **not** include the Nature of Address and Numbering Plan Indicator (NANPI) in the Session Transfer Number for Single Radio Voice Call Continuity (STN-SR) IE on Sv interface in PS to CS requests to the MSC server and Forward Relocation requests to the peer-SGSN/peer-MME.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```bash
configure > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
[ remove ] srvcc exclude-stnsr-nanpi
```

- **remove**
  Deletes this configuration from the call control profile. This returns the MME to its default configuration where the NANPI is not included in the STN-SR IE.

**Usage**

This command applies to Release 15.0 MR3 and higher.

In Release 15.0 MR3 and later releases, the encoding of the STN-SR IE on Sv interface now includes the NANPI from the HSS in PS to CS requests to the MSC server and Forward Relocation requests to the peer-SGSN/peer-MME. The value of NANPI sent by the MME is 0x11. This change in behavior is provided in support of TS 29.280 V10.1.0.

This command provides an option to maintain backward compatibility. When this command is issued, the MME excludes the NANPI from these requests, as was the default in releases prior to 15.0 MR3.
**subscriber multi-device**

Enable or disable the operator policy from allowing multiple PDN connections. When enabled, a maximum of 11 PDN connections are allowed for a subscriber.

**Product**  
SaMOG

**Privilege**  
Security Administrator, Administrator

**Mode**  
Exec > Global Configuration > Call Control Profile Configuration  
`configure > call-control-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
[ no ] subscriber multi-device
```

- `no`  
  If previously enabled, disables multiple PDN device connections for a subscriber.

**Usage**

Use this command to enable or disable the operator policy from allowing multiple PDN connections for a subscriber. If this optional configuration is not enabled, only one PDN connection is allowed for a subscriber.

**Important:** The SaMOG Web Authorization feature is license dependent. Contact your Cisco account representative for more information on license requirements.

**Example**

The following command enables multiple device connections for a subscriber:

```
subscriber multi-device
```
subscriber-control-inactivity

Configures the subscriber-control inactivity timer. The system detects inactivity when no PDP context is activated and starts the timer.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

subscriber-control-inactivity timeout minutes time detach { immediate | next-connection | reattach-time-period }

{ no | default } subscriber-control-inactivity

---

no

Deletes the timer configuration.

---

default

Resets the timer configuration to the default value of 7 days (10080 minutes).

---

timeout minutes time [ detach ]

Sets the number of minutes the SGSN monitors the connection after inactivity has been detected. When the timer expires, the subscribe will be detached.

time: Enter an integer from 1 to 20160 (two weeks).

---

detach [ immediate | next-connection | reattach-time-period ]

Instructs the SGSN to detach and can be configured to specify when the detach will occur after inactivity is detected. To fine-tune the detach instruction, include one of the following with the command:

• **immediate** - Instructs the SGSN to detach immediately after inactivity is detected. May combine with reattach-time-period.

• **next-connection** - instructs the SGSN to detach after the next Iu connection after inactivity is detected.

---

**Important:** Supported for 3G SGSNs only.
• `reattach-time-period period [ action ]` - Specify the number of seconds the SGSN will monitor a new re-attach after the previous detach was due to inactivity. Also, you can define the action to be taken regarding new attaches.

  `period`: Enter an integer from 60 to 3600.

  `action` - Select an action:

  • `deny`
  • `permit-and-stop-monitoring`

Usage

Use this command to configure the timeout timer. After this timer times out the subscriber is detached from the SGSN.

Example

The following command instructs the SGSN to monitor the connection for up to 360 minutes after inactivity is detected, or detach immediately after inactivity is detected:

```
subscriber-control-inactivity timeout minutes 360 detach immediate
```
super-charger

Enables or disables the SGSN to work with a super-charged network.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration
configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

[ remove ] super-charger

<table>
<thead>
<tr>
<th>remove</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disables the super-charger functionality.</td>
</tr>
</tbody>
</table>

Usage

By enabling the super charger functionality for 2G or 3G connections controlled by an operator policy, the SGSN changes the hand-off and location update procedures to reduce signalling traffic management.

Example

The following command enables the super charger feature:

super-charger
tau

Configure parameters for the tracking area update (TAU) procedure.

Product
MME

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

Syntax

tau { imei-query-type { imei | imei-sv | none } [ verify-equipment-identity [ allow-on-eca-timeout | deny-greylisted | deny-unknown | verify-emergency ] ] | inter-rat security-ctxt { allow-mapped | native } }

remove tau { imei-query-type | inter-rat security-ctxt }

remove

Deletes this TAU configuration from the call control profile.

imei-query-type { imei | imei-sv | none }

This keyword set is specific to the MME. Sets the IMEI query-type if an IMEI (International Mobile Equipment Identity) is not already present.

• imei: Specifies that the MME is required to query the UE for its International Mobile Equipment Identity (IMEI).
• imei-sv: Specifies that the MME is required to query the UE for its International Mobile Equipment Identity - Software Version (IMEI-SV).
• none: Specifies that the MME does not need to query for IMEI or IMEI-SV.

verify-equipment-identity [ allow-on-eca-timeout | deny-greylisted | deny-unknown | verify-emergency ]

Specifies that the identification (IMEI or IMEI-SV) of the UE is to be performed by the Equipment Identity Register (EIR) over the S13 interface.

• allow-on-eca-timeout: Configures the MME to allow equipment that has timed-out on ECA during the attach procedure.
• deny-greylisted: Configures the MME to deny grey-listed equipment during the attach procedure.
• deny-unknown: Configures the MME to deny unknown equipment during the attach procedure.
• verify-emergency: Configures the MME to ignore the IMEI validation of the equipment during the attach procedure in emergency cases. This keyword is only supported in release 12.2 and higher.
inter-rat security-cxt { allow-mapped | native }

Configure inter-RAT parameters for TAU. This keyword provides the operator with the option of continuing with the mapped context or creating a new native context after an inter-RAT handover.

- **allow-mapped**: Configures inter-RAT security-context type as mapped. Mapped security context is allowed after inter-RAT handover. This is the default value.

- **native**: Configures inter-RAT security-context type as native only. Inter-RAT handover will always result in a native security context.

**Usage**

Use this command to define tracking area update procedures such as inter-RAT security context and IMEI query-type.

**Example**

The following command sets the IMEI query type to IMEI-SV:

```
tau imei-query-type imei-sv verify-equipment- identity
```
tcp-maximum-segment-size

This command enables the operator to define a maximum segment size (MSS), that will be used to overwrite received TCP MSS values in uplink/downlink packets between UE and the server.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

**Syntax**

```
tcp-maximum-segment-size size
remove tcp-maximum-segment-size
```

**Usage**
When configuring with this command, an additional Yes/No prompt is included due to the high impact of the MSS configuration.
Configure the MSS, helps the operator to avoid fragmentation. This command enables the operator to modify or overwrite the TCP MSS value exchanged between the UE and the server (for both 2G and 3G uplink/downlink traffic) if the requested value is more than the SGSN's locally configured value.

**Example**
Use a command similar to the following to define 1200 octets as the maximum segment size:

```
tcp-maximum-segment-size 1200
```
timeout

Configure the duration after which the cached MAC to IMSI mapping entry maintained by the IPSG manager during the SaMOG web authorization pre-authentication phase is removed.

**Product**

SaMOG

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Call Control Profile Configuration

configure > call-control-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-control-profile-profile_name)#

**Syntax**

```
timeout imsi cache timer_value
```

{ default | no } timeout imsi cache

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Sets the timeout duration to its default value. Default: 1440 minutes</td>
</tr>
<tr>
<td>no</td>
<td>If previously configured, removes the timeout duration.</td>
</tr>
<tr>
<td>timer_value</td>
<td>timer_value must be an integer between 1 to 20160 minutes</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to configure the duration after which the cached MAC to IMSI mapping entry of a subscriber device maintained by the IPSG manager during the SaMOG web authorization pre-authentication phase is removed.

**Important:** The SaMOG Web Authorization feature is license dependent. Contact your Cisco account representative for more information on license requirements.

**Example**

The following command sets a timeout value for clearing the MAC to IMSI mapping entry to 2000 minutes:

```
timeout imsi cache 2000
```
treat-as-hplmn

Enables or disables the SGSN to treat an IMSI series as coming from the home PLMN.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```
configure > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
[ remove ] treat-as-hplmn
```

- **remove**
  Deletes this configuration from the profile. This would disable this function and is the default.

**Usage**

Use this command to enable or disable the SGSN to treat an IMSI series as coming from the home PLMN.

**Example**

The following command disables previously configured feature:

```
remove treat-as-hplmn
```
vplmn-address

Enables/disables the SGSN to override the VPLMN address-allowed flag.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

```
configure > call-control-profile profile_name
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
vplmn-address { allowed | not-allowed }
remove vplmn-address
```

**remove**

Using remove disables the override behavior and the VPLMN-Address-Allowed flag is interpreted as it is in the subscription data.

**allowed**

Using allowed instructs the SGSN to set the VPLMN-Address-Allowed flag during GGSN selection - even if the flag was not received in the subscription data from the HLR.

**not-allowed**

Using not-allowed instructs the SGSN not to set the VPLMN-Address-Allowed flag during GGSN selection - even if the flag is received in the subscription data from the HLR.

**Usage**

Use this command to override the VPLMN-Address-Allowed flag received in subscription data from HLR during GGSN selection. This flag is used to decide whether to use the VPLMN-OI received from a roaming subscriber to form the full-APN. The full-APN is then used in a DNS query to select a GGSN. This override enables the operator to control selection of a different GGSN for a roaming subscriber by using/not-using VPLMN-OI in full-APN.

**Example**

The following command instructs the SGSN to set the VPLMN-Address-Allowed flag during GGSN selection, even if the flag was not received in subscription data from the HLR:

```
vplmn-address allowed
```

The following command instructs the SGSN not to set the VPLMN-Address-Allowed flag during GGSN selection, even if the flag was received in subscription data from the HLR:
vplmn-address not-allowed

The following command instructs the SGSN not to override standard behavior regarding the VPLMN-Address-Allowed flag:

remove vplmn-address
**zone-code**

Configures a zone code listing of one or more location area code (LACs) included in the zone.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call Control Profile Configuration

`configure > call-control-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-control-profile-profile_name)#
```

**Syntax**

```
zone-code zc_id location-area-code lac

no zone-code zc_id [ location-area-code lac ]
```

**no**

Removes either a specific LAC from the zone code list. If the `location-area-code` parameter is not included in the command, then the entire zone code list definition is removed from configuration.

**zc_id**

Identifies an instance of a zone code list as an integer from 1 to 65535. An unlimited number of zone code lists can be configured per call control profile as the zone code lists are allocated dynamically. A maximum of 10 zone code lists can be configured per Call Control Profile.

**location-area-code lac**

Prompts for the location area-code(s), where the subscribers can roam, that are part of the zone. `lac` is an integer from 1 to 65535.

Repeat the command with this parameter to include up to 100 LACs in the zone code list.

**Usage**

**Important:** While there is no limit to the number of zone codes that can be created, only 10 LACs per zone code can be defined.

Use this command to define zone code restrictions. Regional subscription data at the home location register (HLR) is used to determine the regional subscription area in which the subscriber is allowed to roam. The regional subscription data consists of a list of zone codes. A zone code is comprised of one or more location areas (identified by a LAC) into which the subscriber is allowed to roam. Regional subscription data, if present in the insert subscriber data (ISD) request from the HLR, defines the subscriber's subscription area for roaming.
the addressed SGSN. It contains the complete list (up to 10 zone codes) that apply to a subscriber in the currently visited PLMN.

During the GPRS Location Update procedure, the zone code list is received in the ISD request from the HLR. The zone code list from the HLR is validated against the configured values in the operator policy. If matched, then the ISD is allowed to proceed. If not matched, then the ISD response is that the Network Node Area is Restricted and the GPRS Location Update procedure fails. If no zone codes are included in the ISD (whether or not the zone codes are defined in the SGSN configuration), then checking is not done.

Example

The following command defines multiple LACs for zone code 1:

```
zone-code 1 lac 413 212 113
```
Chapter 40
Call-Home Configuration Mode

The Call-Home Configuration Mode sets parameters for the Smart Call Home feature. Smart Call Home is a contracted service that sends real-time alerts, remediation, and personalized web-based reports to the Cisco Technical Assistance Center (TAC) and other configured receivers.

Mode

Exec > Global Configuration > Call-Home Configuration

configure > call-home

Entering the above command sequence results in the following prompt:

[local] host_name(config-call-home) #

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
activate

Activates the Cisco Smart Call Home service.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call-Home Configuration

configure > call-home

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-home)#

Syntax

activate

default activate

no activate

default

Configures the call-home service back to default settings.

no

Disables the call-home services.

activate

Enables the call-home services.

Usage

Use this command to enable the call-home services.

Example

The following command disables the call-home service:

no activate
alert-group

Enables or disables the Smart Call Home alert-group.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call-Home Configuration

```
configure > call-home
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-home)#
```

**Syntax**

```
[ default | no ] alert-group { all | configuration | crashinfo | diagnostic | environment | inventory | syslog }
```

- **default**
  Configures the alert-group back to default settings. The default is enabled.

- **no**
  Disables the alert-groups.

- **alert-group all**
  Enables an alert group for all categories.

- **alert-group configuration**
  Enables an alert group related to configuration.

- **alert-group crashinfo**
  Enables an alert group related to crashes.

- **alert-group diagnostics**
  Enables an alert group related to diagnostics.

- **alert-group environment**
  Enables an alert group related to environment. These typically include events related to power, fan, and temperature alarms.

- **alert-group inventory**
  Enables an alert group related to inventory. This is a non-critical event that could include notifications when cards are inserted or removed, or when the system is cold-booted.
alert-group syslog

Enables an alert group related to syslog. This includes events generated by the syslog PORT facility.

Usage

An alert group is a predefined subset of Smart Call Home alerts that are supported on this device. Alert groups allow you to select the set of Smart Call Home alerts that you want to send to a predefined or custom destination profile.

Example

The following command enables alerts for all of the preconfigured Smart Call Home alerts:

    alert-group all
contact-email-addr

Sets the e-mail address of the person identified as the prime contact for this system.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call-Home Configuration
configure > call-home

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-home)#

**Syntax**

```
[ no ] contact-email-addr email_addr
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Removes the contact e-mail address.</td>
</tr>
<tr>
<td>contact-email-addr email_addr</td>
<td>Specifies the information for prime contact as an alphanumeric string in the format <code>local-part@domain</code>, where domain can be made up of a number of labels, each separated by a period and between 1 and 63 characters in length. The local-part can be 1-64 characters. The domain-label can be 1-63 characters. The domain can be 1 through 135 characters. The entire alphanumeric string can be a no larger than 200 characters.</td>
</tr>
</tbody>
</table>

**Usage**
Use this command to set up the e-mail address for the person identified as the contact person for this device.

**Important:** You can enter any valid e-mail address. You cannot use spaces.

**Example**
The following command specifies e-mail address for the entity `notity.TAC@NOCservices.net`:

```
contact-email-addr notity.TAC@NOCservices.net
```
**contract-id**

Configures the system’s contract-identifier for Cisco AutoNotify.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call-Home Configuration
`configure > call-home`

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-home)#
```

**Syntax**

```
[ default | no ] contract-id contractID
```

- **default**
  Configures the call-home contract-id back to default settings.

- **no**
  Removes the call-home contract-id.

- **contract-id contractID**
  Specifies the call-home contract-id as an alphanumeric string of 1 through 64 characters that is case sensitive. If you include spaces in this string, you must enclose it in double quotation marks.

**Usage**

Use this command to enter this system’s AutoNotify contract ID.

**Example**

The following command specifies the contract-id as `Contract1234_ID`:

```
contract-id Contract1234_ID
```
customer-id

Configures the system’s customer-identifier for Cisco AutoNotify.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call-Home Configuration
configure > call-home

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-home)#

Syntax

[ default | no ] customer-id customerID

default
Configures the call-home customer-id back to default settings.

no
Removes the call-home customer-id.

customer-id customerID
Specifies the call-home customer-id as an alphanumeric string of 1 through 64 characters that is case sensitive. If you include spaces in the string, you must enclose it in double quotation marks.

Usage

Use this command to set up the system’s customer ID for Cisco’s AutoNotify.

Example

The following command specifies the customer-id as CustID_1234:

    customer-id CustID_1234
end

Exits the current configuration mode and returns to the Exec mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

`end`

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product

Privilege
Security Administrator, Administrator

Syntax

```
exit
```

Usage
Use this command to return to the parent configuration mode.
mail-server

Configures the Smart Call Home mail-server.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call-Home Configuration

configure > call-home

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-home)#

Syntax

[ no ] mail-server server_name priority priority_num

no
Removes the call-home mail-server.

mail-server server_name
Identifies the mail server as an alphanumeric string of 1 through 64 characters. The server ID can take the form of a host name (DNS) or an IPv4 address in dotted-decimal notation.

priority
Sets the mail server priority order as an integer from 1 (highest) to 100 (lowest).

Usage
Use this command to set up the mail server for Smart Call Home. This configuration is mandatory when the user profile is configured to only send out e-mail messages.

Example
The following command specifies the mail-server as 10.2.3.4 with a priority of 1:

    mail-server 10.2.3.4 priority 1
phone-number

Enables or disables the phone-number for the Smart Call Home contact person.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call-Home Configuration

```plaintext
configure > call-home
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-home)#
```

**Syntax**

```
[ no | default ] phone-number phone-number-string
```

- **default**
  Configures the phone number back to default settings. The default is enabled.

- **no**
  Removes the call-home phone number.

```plaintext
phone-number phone-number-string
```

Specifies the phone number for the contact person for this system as an alphanumeric string that can only contain: + (plus sign), - (dash) and numbers. The total length of the string is 12 to 16 characters. If you include spaces, you must enclose the string in double quotation marks.

**Usage**

Use this command to set up the phone number for Smart Call Home contact.

**Example**

The following command specifies the phone number as +866-111-2234:

```
phone-number 866-111-2234
```
profile

Creates the Smart Call Home profile.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call-Home Configuration

configure > call-home
Entering the above command sequence results in the following prompt:

[local] host_name(config-call-home)#

Syntax

[ no ] profile profile_name

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removes the call-home profile.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>profile profile_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creates or modifies the profile name for this system as an alphanumeric string of 1 through 31 characters.</td>
</tr>
</tbody>
</table>

Usage
Use this command to create a new profile or modify an existing profile. This command moves you to the Call-Home Profile Configuration mode.

Example
The following command creates a profile named Profile_1:

profile Profile_1
rate-limit

Enables or disables the message rate-limit for Smart Call Home features.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call-Home Configuration

configure > call-home

Entering the above command sequence results in the following prompt:

[local] host_name(config-call-home)#

Syntax

[ no | default ] rate-limit message_count

default
Sets the rate limit back to the default of 20 messages per minute.

no
Removes the call-home rate-limit.

rate-limit message_count
Sets the rate limit in messages per minute. message_count is an integer from 1 to 60. Default: 20

Usage
Use this command to configure the call-home message rate limit per minute. The default is 20 messages per minute.

Example
The following command sets the call-home rate limit to 10:

rate-limit 10
**sender**

Specifies the Smart Call Home e-mail settings for the “from” address and “reply-to” address.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Call-Home Configuration

```
configure > call-home
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-call-home)#
```

**Syntax**

```
[ no | default ] sender { from email_address | to email_address }
```

- **default**
  
  Sets the sender back to the default.

- **from email_address**
  
  Sets the sender’s reply from address.

- **no**
  
  Removes the call-home sender.

- **to email_address**
  
  Sets the sender’s reply-to address.

- **email_address**
  
  This is an alphanumeric string in the format `local-part@domain`, where domain can be made up of a number of labels, each separated by a period and between 1 and 63 characters in length. The local-part can be 1-64 characters. The domain-label can be 1-63 characters. The domain can be 1 through 135 characters. The entire alphanumeric string can be a no larger than 200 characters.

**Usage**

Use this command to specify the e-mail settings for the sender. This command sets the “to” and “from” fields in the e-mail.

**Example**

The following command sets the from address to `notity.TAC@NOCservices.net` and the reply-to address to `support@cisco.com`:

```
sender from notity.TAC@NOCservices.net to support@cisco.com
```
site-id

Specifies the Smart Call Home site identifier for this system.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call-Home Configuration
configure > call-home

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-home)#

Syntax

[ default | no ] site-id siteID

default
Sets the site-id back to the default.

no
Removes the call-home site-id.

site-id siteID
Specifies the site ID as an alphanumeric string of 1 through 200 characters. If you include spaces, then you must enclose your entry in quotes.

Usage
Use this command to specify the Smart Call Home site identifier for this system.

Example
The following command sets the site-id to NOC_Services_site_1011:

site id NOC_Services_site_1011
street-address

Specifies the Smart Call Home street address for the system.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call-Home Configuration

configure > call-home

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-home)#

Syntax

[ default | no ] street-address streetADR

---

default
Sets the street-address back to the default.

---

no
Removes the call-home street-address.

---

street-address streetADR
Specifies the Smart Call Home street-address as an alphanumeric string of 1 through 200 characters. You can include the street address, City, State, and ZIP Code. If you include spaces, then you must enclose the string in double quotation marks.

Usage
Use this command to set up the street address for the system.

Example
The following command sets the street address to 123 Main St., Chicago, IL 60000:

street-address "123 Main St., Chicago, IL 60000"
Chapter 41
Call-Home Profile Configuration Mode

The Call-Home Profile Configuration Mode is used to create groups of users that will receive alerts when events occur. The Smart Call Home service sends real-time alerts, remediation, and personalized web-based reports to the Cisco Technical Assistance Center (TAC) and other configured receivers.

Mode

Exec > Global Configuration > Call-Home Configuration > Call-Home Profile Configuration

configure > call-home > profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-home-profile)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
active

Activates this Smart Call Home profile.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Call-Home Configuration > Call-Home Profile Configuration

configure > call-home > profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-home-profile)#

**Syntax**

active

default active

no active

---

default

Configures the call-home profile back to default settings. By default, the profile is enabled.

---

no

Deletes the call-home profile.

---

activate

Activates this Smart Call Home profile.

---

**Usage**

Use this command to activate or deactivate this call-home profile. By default, the profile is enabled.

**Example**

The following command disables the call-home profile:

    no active
destination

Configures the message destinations for this Smart Call Home profile.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call-Home Configuration > Call-Home Profile Configuration

configure > call-home > profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-home-profile)#

Syntax

default destination [ message-size-limit | preferred-msg-format | transport-method ]

address [ email email_address | http http_url ]

Configures an destination e-mail address or HTTP URL where short-text/long-text call-home message and XML-based call-home messages will be sent.

• email: Use this option to add an e-mail address to this profile. email_addr is an alphanumeric string of the form local-part@domain where domain can be made up of a number of labels, each separated by a period and between 1 and 63 characters in length. The local-part can be 1-64 characters. The domain-label can be 1-63 characters. The domain can be 1-135 characters. The entire alphanumeric string can be a no larger than 200 characters.

• http: Use this option to add an HTTP URL to this profile. http_url is an alphanumeric string of 1 through 200 characters.

default

Configures the call-home profile back to default settings. By default, the profile is enabled.

message-size-limit size

Specifies the message size (in bytes) for this profile as an integer from 50 to 3145728. The default is 3145728.

no

Deletes the call-home profile.
preferred-msg-format [ long-text | short-text | xml]

Specifies the message format for the profile. The default is xml.

• **long-text**: Use this option to set long-text messages as the preferred message format. The long message format has all the details related to the event, including information related to chassis, card, and outputs of show commands for the alert group.

• **short-text**: Use this option to set short-text messages as the preferred message format. The short message has information on the severity of event, a short description of the event, the event time, and the device ID.

• **xml**: Use this option to set XML as the preferred message format. (Default)

transport-method [ email email_address | http http_url ]

Specifies the transport-method for the messages. The default is e-mail. For the user profile, both e-mail and http can be enabled. If all are options are disabled, e-mail will be set for the profile.

For the Cisco TAC profile, only one transport method can be enabled. If the user enables a second transport method, the first one will be automatically disabled.

• **email**: Enables an e-mail address for this profile. This is the default.

• **http**: Enables an HTTP URL for this profile.

**Usage**

Use this command to activate the current call-home profile. By default, the profile is enabled.

**Example**

The following command disables the call-home profile:

```
no destination
```

The following command sets the preferred message format for the profile to the call-home profile to short text:

```
destination preferred-msg-format short-text
```
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

subscribe-to-alert-group

Subscribes this profile to the alert group for the call-home profile.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Call-Home Configuration > Call-Home Profile Configuration configure > call-home > profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(config-call-home-profile)#

Syntax

subscribe-to-alert-group [ all {severity [catastrophic | disaster | fatal | critical | major | minor | warning | notification | normal ]} | configuration { periodic [ daily | monthly | weekly ]} | crashinfo | diagnostic { severity [catastrophic | disaster | fatal | critical | major | minor | warning | notification | normal ]} | environment { severity [catastrophic | disaster | fatal | critical | major | minor | warning | notification | normal ]} | inventory { periodic [ daily | monthly | weekly ]} | syslog { severity [catastrophic | disaster | fatal | critical | major | minor | warning | notification | normal ]} ]

default subscribe-to-alert-group

no subscribe-to-alert-group [ all {severity [catastrophic | disaster | fatal | critical | major | minor | warning | notification | normal ]} | configuration { periodic [ daily | monthly | weekly ]} | crashinfo | diagnostic { severity [catastrophic | disaster | fatal | critical | major | minor | warning | notification | normal ]} | environment { severity [catastrophic | disaster | fatal | critical | major | minor | warning | notification | normal ]} | inventory { periodic [ daily | monthly | weekly ]} | syslog { severity [catastrophic | disaster | fatal | critical | major | minor | warning | notification | normal ]} [pattern pattern_to_match] ]

all {severity [catastrophic | disaster | fatal | critical | major | minor | warning | notification | normal ]}

Enables call-home messages based for all group-types and severity for the profile. The following severities are supported:

- **catastrophic** – Level 1: catastrophic event, matches platform logging level critical.
- **disaster** – Level 2: disaster event, matches platform logging level critical.
- **fatal** – Level 3: fatal event, matches platform logging level critical.
- **critical** – Level 4: critical event, matches platform logging level critical.
- **major** – Level 5: major event, matches platform logging level error.
- **minor** – Level 6: minor event, matches platform logging level warning.
Call-Home Profile Configuration Mode

**subscribe-to-alert-group**

- **warning** – Level 7: warning event, matches platform logging level warning.
- **notification** – Level 8: notification event, matches platform logging level unusual.
- **normal** – Level 9: normal event, matches platform logging level info.

**configuration { periodic [ daily | monthly | weekly] }**

Enables call-home messages based for configuration alert groups. The messages are sent at periodic intervals such as:

- **daily**: Sends a daily call-home message.
- **monthly**: Sends a monthly call-home message.
- **weekly**: Sends a weekly call-home message.

**crashinfo**

Configures the call-home profile back to default settings. By default, the profile is enabled.

**default**

Restores the parameter back to the default value.

**diagnostic { severity [ catastrophic | disaster | fatal | critical | major | minor | warning | notification | normal ] }**

Enables call-home messages based for diagnostic group-types and severity for the profile. The following severities are supported:

- **catastrophic** – Level 1: catastrophic event, matches platform logging level critical.
- **disaster** – Level 2: disaster event, matches platform logging level critical.
- **fatal** – Level 3: fatal event, matches platform logging level critical.
- **critical** – Level 4: critical event, matches platform logging level critical.
- **major** – Level 5: major event, matches platform logging level error.
- **minor** – Level 6: minor event, matches platform logging level warning.
- **warning** – Level 7: warning event, matches platform logging level warning.
- **notification** – Level 8: notification event, matches platform logging level unusual.
- **normal** – Level 9: normal event, matches platform logging level info.

**environment { severity [ catastrophic | disaster | fatal | critical | major | minor | warning | notification | normal ] }**

Enables call-home messages based for environment group-types and severity for the profile. The following severities are supported:

- **catastrophic** – Level 1: catastrophic event, matches platform logging level critical.
- **disaster** – Level 2: disaster event, matches platform logging level critical.
- **fatal** – Level 3: fatal event, matches platform logging level critical.
- **critical** – Level 4: critical event, matches platform logging level critical.
- **major** – Level 5: major event, matches platform logging level error.
- **minor** – Level 6: minor event, matches platform logging level warning.
- **warning** – Level 7: warning event, matches platform logging level warning.
**inventory** { periodic [ daily | monthly | weekly ] }

Enables call-home messages based for inventory alert groups. The messages are sent at periodic intervals such as:

- **daily**: Sends a daily call-home message.
- **monthly**: Sends a monthly call-home message.
- **weekly**: Sends a weekly call-home message.

---

**no**

Deletes the alert groups.

---

**syslog** { severity [catastrophic | disaster | fatal | critical | major | minor | warning | notification | normal ] [ pattern pattern_to_match ] }

Enables and disables call-home messages based on severity and syslog string pattern match for the profile. The following severities are supported:

- **catastrophic** – Level 1: catastrophic event, matches platform logging level critical.
- **disaster** – Level 2: disaster event, matches platform logging level critical.
- **fatal** – Level 3: fatal event, matches platform logging level critical.
- **critical** – Level 4: critical event, matches platform logging level critical.
- **major** – Level 5: major event, matches platform logging level error.
- **minor** – Level 6: minor event, matches platform logging level warning.
- **warning** – Level 7: warning event, matches platform logging level warning.
- **notification** – Level 8: notification event, matches platform logging level unusual.
- **normal** – Level 9: normal event, matches platform logging level info.

*pattern_to_match* is an alphanumeric string of 1 through 80 characters.

---

**Usage**

Use this command to enable or disable the call-home messages based on specified alert-groups and severities for the profile.

**Example**

The following command sets an alert group for the profile to send a daily inventory message:

```
subscribe-to-alert-group inventory periodic daily
```
Chapter 42
CAMEL Service Configuration Mode Commands

The CAMEL Service configuration mode provides a set of commands to define the parameters for the Customized Applications for Mobile networks Enhanced Logic (CAMEL) service functionality and the CAMEL interface - the Ge interface.

CAMEL service enables operators of 2.5G/3G networks to provide operator-specific services (such as prepaid GPRS service and prepaid SMS service) to subscribers, even when the subscribers are roaming outside their home public land mobile network (HPLMN).

Mode

Exec > Global Configuration > Context Configuration > CAMEL Service Configuration

configure > context context_name > camel-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-camel-service)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
associate-sccp-network

Configure an association between this CAMEL service and a specified SCCP network.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > CAMEL Service Configuration

configure > context context_name > camel-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-camel-service)#

Syntax

associate-sccp-network sccp_network_id

no associate-sccp-network

no

Removes the association with the CAMEL service configuration.

sccp_network_id

Identifies an already defined SCCP network.
sccp_network_id: Enter an integer from 1 to 12.

Usage

The SCCP network must be configured prior to use this command.
CAMEL service will not function unless an SCCP network is associated.

Example

Associate this CAMEL service with SCCP network configuration ID 2:

associate-sccp-network2
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
**tcap destination-address**

Configure the gsmSCF address to be used to open TC dialogues.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CAMEL Service Configuration

```plaintext
configure > context context_name > camel-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-camel-service)#
```

**Syntax**

```plaintext
tcap destination-address { configured-address | received-address }
```

**default tcap destination-address**

**configured-address**

Default.
Instructs the SGSN to use the SCF address from the GPRS-CSI.

**received-address**

Instructs the SGSN to overwrite the gsmSCF address with the memorised gsmSCF address that was in the first response message to the InitialDPGPRS and then to use that gsmSCF address.

**Usage**

This command enables the operator to determine which gsmSCF address is to be used to open new TC dialogues. In accordance with 3GPP 29.078, section 14.1.4.1.3, this command enables the SGSN to establish new TC dialogues within the context of a current GPRS dialogue, based on the operators choice:

- to use a ‘received-address’ where the gprsSSF learns the gsmSCF address used in the first response message to the InitialDPGPRS and uses it to open new TC dialogues, or

- to use a ‘configured-address’ where the gprsSSF uses the gsmSCF address from the GPRS-CSI to open new TC dialogues.

**Example**

Configure the SGSN to overwrite the SCF address and to use the gsmSCF address received in the response message:

```plaintext
tcap destination-address received-address
```
CAMEL Service Configuration Mode Commands

### timeout

Configure a range of timers needed to support CAMEL service.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CAMEL Service Configuration

```
configure > context context_name > camel-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-camel-service)#
```

**Syntax**

```
timeout { gprs-apply-charging-report-ack-timer seconds | gprs-entity-release-ack-timer seconds | gprs-event-report-ack-timer seconds | gprs-tssf-timer seconds | sms-event-report-ack-timer seconds | sms-tssf-timer seconds | tc-guard-timer seconds }

default
```

- **default**
  
  Resets the timers to default values.

- **gprs-apply-charging-report-ack-timer seconds**

  Configure the TCAP invoke timer to set the length of time the SGSN waits for an acknowledgement after sending an ApplyChargingReportGPRS to the SCF.

  **seconds**: Enter an integer from 1 to 20. Default: 4

  **Important**: This timer value should be less than the value configured for the `tc-guard-timer`.

- **gprs-entity-release-ack-timer seconds**

  Configure the TCAP invoke timer to set the length of time the SGSN waits for an acknowledgement from the SCF after sending Entity Release information.

  **seconds**: Enter an integer from 1 to 20. Default: 4

- **gprs-event-report-ack-timer seconds**

  Configure the TCAP invoke timer to set the length of time the SGSN waits for an acknowledgement from the SCF after the SGSN sends an event report.

  **seconds**: Enter an integer from 1 to 20. Default: 4
**gprs-tssf-timer seconds**

Configure the GPRS TSSF timer to set the length of time the SGSN waits for an instructions from the SCF. On expiry the SGSN handles the transaction through the default handling specified in the corresponding CSI.

*seconds*: Enter an integer from 1 to 10. Default: 5

**sms-event-report-ack-timer seconds**

Configure the TCAP invoke timer to set the length of time the SGSN waits for an acknowledgement from the SCF after the SGSN sends an event report for SMS.

*seconds*: Enter an integer from 1 to 20. Default: 4

**sms-tssf-timer seconds**

Configure the SMS TSSF timer to set the length of time the SGSN waits for an instructions from the SCF. On expiry the SGSN handles the transaction through the default handling specified in the corresponding CSI.

*seconds*: Enter an integer from 1 to 10. Default: 5

**tc-guard-timer seconds**

Configure the guard tier to start when the SGSN sends ApplyChargingReportGPRS to the SCF. On expiry the SGSN closes the TCAP dialogue if the GPRS Dialogue state is “monitoring”. Default handling complies with 3GPP 23.078.

*seconds*: Enter an integer from 1 to 10. Default: 5

---

**Important**: This timer value should be greater than the value configured for the gprs-apply-charging-report-ack-timer.

---

**Usage**

The SCCP network must be configured prior to use this command. CAMEL service will not function unless an SCCP network is associated.

Repeat the command to configure multiple timers.

**Example**

Set the tc-guard timer for 4:

```
tc-guard-timer 4
```
Chapter 43
Card Configuration Mode Commands

Use the Card configuration mode to create and manage the physical cards in the chassis.

Mode

Exec > Global Configuration > Card Configuration

configure > card card_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-card- slot_number)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
aps

Configures the parameters for the automatic protection switching (APS) feature for SONET CLC2 and OLC2 line cards or for multiplexed section (or switching) protection (MSP) type APS for SDH CLC2 and OLC2 line cards. (ASR 5000 only)

**Important:** This command should only be used after APS has been enabled with the `aps-mode` keyword of the `redundancy` command.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Card Configuration
`configure > card card_number`
Entering the above command sequence results in the following prompt:

```
[local] host_name(config-card- slot_number)#
```

**Syntax**

```
aps [ 1+1 ] [ uni-directional ] [ non-revertive ] [ -noconfirm ]
no aps
default aps
```

**1+1**
Selects 1+1 line (linear) protection. Traffic is carried simultaneously by the working line and the protection line. GR-253 and ITU-T G.783 require the bridging to be done at the electrical level; therefore, the same payloads are transmitted over the working and protection lines.

**no**
This keyword has been deprecated for releases 14.0 and higher To disable APS, enter `redundancy port-mode` in this command mode.
For releases prior to 14.0, this keyword disables APS.

**default**
This option is equivalent to: `aps 1+1 uni-directional non-revertive`. This option is only available in releases 14.0 and higher.

**uni-directional**
Enables protection on one end of the connection.
non-revertive
Prevents the network from automatically reverting to the original working line/port when the original working line/port is recovered/restore.

-noconfirm
Executes the command without additional prompting for command confirmation.

**Usage**

> **Important**: At this time, it is not necessary to use the `aps` command to configure parameters as all of these parameters are enabled by default when the APS feature is enabled with the `aps-mode` keyword of the `redundancy` command.

Use this command to configure feature parameters for the APS function for SONET CLC2 and OLC2 line cards or to configure MSP-type APS for SDH CLC2 and OLC2 line cards. Based on the card framing configuration (SONET or SDH), the system automatically knows whether the feature is APS or MSP.

**Example**

As all parameters are included by default it is only necessary to enter the command:

```
aps
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Use this command to return to the parent configuration mode.
framing

Configures the type of framing to be used for the signaling generated on a specific line card. (ASR 5000 only)

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Card Configuration

```
configure > card card_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-card- slot_number)#
```

**Syntax**

```
framing { ethernet | sdh [ ds1 | e1 ] [ ss-bits ] | sonet [ ds1 | e1 ] | unspecified } [ -noconfirm ]
```

```
default framing [ -noconfirm ]
```

**default framing**

Resets the framing generated by the card to the default for the particular card type.

**ethernet**

Configures the system to use Ethernet framing for this line card. This type of framing can only be used on an Ethernet card.

Default: Ethernet framing type is the default for an Ethernet line card.

**Important**: Using this keyword with an OLC/OLC2 or CLC/CLC2 takes the card offline.

```
sdh [ ds1 | e1 ] [ ss-bits ]
```

Configures the system to use SDH signal framing for either an OLC/OLC2 or CLC/CLC2 line card in an SGSN.

**Important**: Using this keyword with an Ethernet line card takes the line card offline.

In releases 8.1 and higher, you can also set the type of signaling path for a CLC2.

- ds1 - configures the card to support a DS1/T1.
- e1 - configures the card to support an E1. This is the default for SDH.
- ss-bits - enables/disables use of ss-bits (per ITU 1997 G.783 specification) for SDH configured line card.
sonet [ ds1 | el ]

Configures the system to use SONET signal framing for either an OLC/OLC2 or CLC/CLC2 line card in an SGSN.

Default: SONET is the default framing type for an OLC/OLC2 or CLC/CLC2 line card.

**Important:** Using this keyword with an Ethernet line card takes the line card offline.

In releases 8.1 and higher, you can also set the type of signaling path for a CLC2.

- **ds1** - configures the card to support a DS1/T. This is the default for SONET.
- **el** - configures the card to support an E1.

**unspecified**

Configures the system to use the default framing type for the particular line card resident in the identified slot.

**-noconfirm**

Instructs the system to execute the command without additional prompting for command confirmation.

**Usage**

Use the `framing` command to identify the type of signal framing to be used by the line card in the identified slot.

Note that each type of line card uses a different type of signal framing. If you configure the wrong framing type for a line card, the line card is taken offline.

**Important:** This command is not supported on all platforms.

**Example**

Use the following command to configure SDH signal framing on a CLC2. If you do not include the path-type, the default of `el` is automatically included in the card’s framing configuration:

```
framing sdh
```
header-type

Defines the size of the header frame for Frame Relay transmissions over a CLC or CLC2 channelized line card. (ASR 5000 only)

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Card Configuration

configure > card card_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-card- slot_number)#

Syntax

header-type header_size [ -noconfirm ]

default header-type [ -noconfirm ]

<table>
<thead>
<tr>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>header-type header_size [ -noconfirm ]</td>
</tr>
<tr>
<td>default header-type [ -noconfirm ]</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>header_size</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sets the size for the header frame. header_size must be either 2-bytes or 4-bytes.</td>
</tr>
</tbody>
</table>

- noconfirm  
Executes the command without additional prompting for command confirmation.

Usage
Use this command to set the size of the header frame for Frame Relay messages emanating from the line card. The size (2-bytes or 4-bytes) determines the amount of information that can be transmitted in that first information frame.

Important: Not supported on all platforms

Example

Set the header to the smallest size.

header-type 2-byte
**initial-e1-framing**

Configures the type of framing mode that will initially be available at the time the line card boots. (ASR 5000 only)

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Card Configuration

`configure > card card_number`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-card- slot_number)#
```

**Syntax**

```
initial-e1-framing [ crc4 | standard ]
```

**default initial-e1-framing**

```
default
Returns the configuration to CRC4 as the default type.
```

```
crc4
Accepts the default CRC4, in the configuration, as the initial at-boot framing mode.
```

```
standard
Accepts the standard mode as the initialization framing mode.
```

**Usage**

For a CLC-type line card, the default E1 framing mode is CRC4. When a card reboots, all E1s are initialized with CRC4 framing mode and then switch to the configured framing mode. With this keyword, you have the option to choose the initialization framing mode.

**Important:** Only supported on CLC/CLC2

**Example**

```
initial-e1-framing standard
```
link-aggregation

Configures system priority and toggle link settings for Link Aggregation. These parameters are usually changed to match the feature requirements of the remote Ethernet switch.

Product

- WiMAX
- PDSN
- HA
- FA
- GGSN
- SGSN

Privilege

- Security Administrator, Administrator

Mode

Exec > Global Configuration > Card Configuration
configure > card card_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-card- slot_number)#

Syntax

link-aggregation { system-priority priority | toggle-link } [-noconfirm ]

{ default | no } link-aggregation { system-priority | toggle-link } [-noconfirm ]

default

Resets the configuration to the default.

link-aggregation system-priority priority

This command sets the system priority used by Link Aggregation Control Protocol (LACP) to form the system ID.
priority is a hexadecimal value from 0x0000 through 0xFFFF. Default is 0x8000 (32768).

toggle-link

Sets the system to toggle link on port switch.

-noconfirm

Executes the command without additional prompting for command confirmation.
Usage

The system MAC address (6 bytes) and system priority (2 bytes) combine to form the system ID. A system consists of a packet processing card and its associated ASR 5000 QGLCs or XGLCs, or ASR 5500 MIO traffic ports. The highest system ID priority (the lowest number) handles dynamic changes.

For additional usage and configuration information for the link aggregation feature, refer to the System Administration Guide.

Important: Not supported on all platforms

Example

The following command configures the link aggregation system-priority to 10640 (0x2990):

```
link-aggregation system-priority 0x2990
```
mode

Sets the application processor card’s current administrative state to active or standby.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Card Configuration

configure > card card_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-card- slot_number)#

Syntax

mode { active | standby } [ -noconfirm ]
default mode [ -noconfirm ]

default

Returns the mode to the default value appropriate to the card type.
The default administrative mode for line cards affects a single card and its mated line card. The default state for line cards in the top shelf is active. The default for line cards in the bottom shelf is standby.
The default administrative state for the SPIO in slot 24 is active and the SPIO in slot 25 is standby.
The default administrative mode for packet processing cards is standby.

Important: This command results in a migration of processes if the default mode for a card is different than the current state of the card.

active

Defines which card type is to be switched from standby to active state. If a card is present in the slot, the packet processing card is automatically selected depending upon the type of card. If no card is present in the slot, a packet processing card is assumed.

standby

Sets the packet processing card in the slot to standby mode.

Caution: Switching an active packet processing card to standby deletes all port configurations, including bindings, for the attached line cards.

-noconfirm

Executes the command without additional prompting for command confirmation.
Usage
Set the desired mode of mated cards. The card targeted for maintenance is placed in the standby state first. The setting of the mode determines which packet processing cards are to be active and which are to be the standby cards for redundancy. Use this command to configure the set of active and standby packet processing cards. The application processor card’s standby priority is then used in conjunction with the set of standby packet processing cards to determine the order in which the standby cards are used for redundancy support.

Important: Not supported on all platforms

Important: This command results in a migration of processes if the mode specified for the card is different than the current state of the card.

Example
The following commands set the state of a card to active and standby, respectively.

```
mode active
mode standby
```
**redundancy**

Configures the type of redundancy for a line card or SPIO. (ASR 5000 only)

**Product**
- PDSN
- FA
- HA
- GGSN
- SSGN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Card Configuration

configure > card card_number

Entering the above command sequence results in the following prompt:

```plaintext
[local]host_name(config-card- slot_number)#
```

**Syntax**

```
redundancy { aps-mode | card-mode | port-mode } [ -noconfirm ]
```

```
default redundancy [ -noconfirm ]
```

```
default
Restores redundancy to port-mode type redundancy.
```

```
aps-mode
```

**Important:** This keyword works with SGSN only.

Enables automatic protection switching (APS), if the card is either a CLC2 or an OLC2 line card with card framing set to SONET. (Refer to the framing command.)

Enables multiplexed section (or switching) protection (MSP) type APS, if the card is a CLC2 line card with card framing set to SDH. (Refer to the framing command.)

**Important:** Using this keyword with any card type other than a CLC2 or an OLC2 will take the card offline.

**Related parameters:** You should consider setting appropriate SDSF BER (signal degrade/signal failure bit error rate) threshold settings. Access the hopath-sdsf, lopath-sdsf, and toh-sdsf commands via the port channelized configuration mode -- for a CLC2 line card refer to the Channelized Port Configuration Mode Commands chapter and for an OLC2 line card refer to the ATM Port Configuration Mode Commands chapter.
card-mode

Specifies no port redundancy is used. This is used mostly for legacy products.

**Important:** This keyword has been deprecated beginning with Release 14.0.

port-mode

Enables port redundancy on line cards or on SPIO cards. This is the default setting used by the system.

**Important:** Port-type redundancy does not affect line card failover/redundancy operations.

pseudo-aps-mode

**Important:** This keyword has been deprecated.

-noconfirm

Instructs the system to execute the command without additional prompting for command confirmation.

Usage

Use this command to configure redundancy on a line card (LC) or a SPIO card. With **port-mode** enabled, if an external network device or cable failure occurs that causes a link down failure on the port, the redundant port is used.

**Important:** Not supported on all platforms

**Important:** You do not need to enter this command for each line card or SPIO card, as the system intuitively understands that if the command is entered for an active line card or SPIO card, the standby line card or SPIO card switches to operate in the same mode. For example, if you enter the **port-mode** command for an LC in slot 17, you automatically enable a redundant line card in slot 33 for port redundant operation.

**Important:** **asp-mode** and **port-mode** are mutually exclusive.

Example

The following command sets the redundancy mode to port redundancy.

```
redundancy port-mode
```

The following sets APS/MSP 1+1 inter-card redundancy for the specified OLC2 or CLC2 line card:

```
redundancy aps-mode
```
redundant with

Enables side-by-side (SBS) redundancy for XGLCs. (ASR 5000 only)

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Card Configuration

configure > card card_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-card- slot_number)#

Syntax

redundant with card_number

<table>
<thead>
<tr>
<th>card_number</th>
</tr>
</thead>
</table>

Identifies the neighboring top slot number of the card to pair with the XGLC being configured.

card_number is an integer between 1 and 48.

Important: Attempting to use this command with any card other than an XGLC takes the card offline.

Usage

Use this command during configuration to identify the slot holding the XGLC card that will be used to provide redundancy to the XGLC you are configuring. Entering this command enables SBS redundancy when the two XGLCs occupy two upper (top) slots in a chassis.

Example

Pair the card in slot 30 with the card being configured:

redundant with 30
service-type

Configures the type of service that the CLC or CLC2 line card will support. (ASR 5000 only)

**Important**: Supported in software releases 8.1 and higher.

### Product
SGSN

### Privilege
Security Administrator, Administrator

### Mode
Exec > Global Configuration > Card Configuration

```bash
configure > card card_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-card- slot_number)#
```

### Syntax

```
service-type { frame-relay | mtp2 | multi-service | pwe3-cesopsn | unspecified } [-noconfirm ]
default service-type [ -noconfirm ]
```

- **default**
  
  Returns the card configuration to *unspecified*.

- **frame-relay**
  
  Configures the card to operate in Frame Relay service mode.

- **mtp2**
  
  **Important**: MTP2 functionality is not yet supported.

  Enables MTP2 type service to support narrowband transmissions.

- **multi-service**
  
  Enables path-level service for multiple simultaneous services (such as frame-relay and mtp2) to run over a single port. For additional information, see the Channelized Port Configuration Mode Commands chapter.

- **pwe3-cesopsn**
  
  **Important**: *pwe3-cesopsn* functionality has been replaced by *mtp2*.
service-type unspecified
This is the default mode for a CLC or CLC2.

Important: You must configure the line card to one of the available service types or the card will not function.

-noconfirm
Executes the command without additional prompting for user input.

Usage
Use this command to configure the operational service mode for the channelized line card (CLC or CLC2). Once you select the service-type, refer to the Channelized Port Configuration Mode Commands chapter to review the commands needed to configure the parameters for the port.

Example

```
    service-type frame-relay
```
**shutdown**

Configures a card for active service or terminates all processes on the card.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Card Configuration

```
configure > card card_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-card- slot_number)#
```

**Syntax**

```
[ no ] shutdown
```

- `no`
  - `no shutdown` enables the card.
  - Enter only the `shutdown` keyword to shut the card down.

**Usage**

Shut down a card to remove it from service or to enable a card to put it into service.

⚠️ **Important:** Do not use this command to remove a card from service for maintenance. Use the command `card halt` to remove a card for service to avoid changing or deleting the active-mode configuration. See the Exec Mode chapter.

⚠️ **Important:** Not supported on all platforms

**Example**

The following command shuts down the card:

```
shutdown
```

The following command switches the card to online:

```
no shutdown
```
Chapter 44
CBS Service Configuration Mode Commands

The Cell Broadcasting Service (CBS) Configuration Mode is used to create and manage CBS service instances for the current context.

Mode

Exec > Global Configuration > Context Configuration > Cell Broadcasting Service Configuration
configure > context context_name cbs-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cbs-service)#
bind

This command binds the CBS service to the IP address of a logical interface.

Product
HNB-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Cell Broadcasting Service Configuration

configure > context context_name cbs-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cbs-service)#

Syntax

bind address ip_address port port_number

no bind address

no
Removes a previously configured binding.

ip_address
Specifies the IPv4 type IP address of CBS service. ip_address must be expressed in IPv4 dotted-decimal notation.

port
Specifies the TCP port of the CBS service. port_number is an integer between 1 and 65535. Standard port used for service area broadcast protocol (SABP) is 3452 in case no other port is configured. It is an optional parameter.

Usage
Use this command to associate or tie a CBS service to a specific logical IP address previously configured in the current context and bound to a port.

Example
The following command binds the CBS service to the interface with an IP address of 192.168.1.111 having port number 8888:

bind address 192.168.1.111 port 8888
**cbc-address-validation**

This command is used for validation of Cell Broadcasting Centre IP address.

**Product**  
HNB-GW

**Privilege**  
Security Administrator, Administrator

**Syntax**

```
[ no ] cbc-address-validation
```

- **no**  
  Disables the validation of Cell Broadcasting Centre IP address.

**Usage**

Use this command to validate the Cell Broadcasting Centre IP address.

**Example**

The following command validates the Cell Broadcasting Centre IP address:

```
cbc-address-validation
```
**cbc-server**

This command configures the CBC server for cell broadcasting service.

**Product**
HNB-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Cell Broadcasting Service Configuration

```
configure > context context_name cbs-service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cbs-service)#
```

**Syntax**

```
cbc-server address ipv4_address [ port port_number ] [ secondary-address ipv4_address [ port port_number ] ]
```

no cbc-server address

- **no**
  Disables the previously configured CBC server.

- **ipv4_address**
  Specifies the IPv4 type IP address of CBC server. `ipv4_address` must be expressed in IPv4 dotted-decimal notation.

- **port**
  Specifies the TCP port of the CBS service. `port_number` is an integer between 1 and 65535. Standard port used for service area broadcast protocol (SABP) is 3452 in case no other port is configured. It is an optional parameter.

- **secondary-address**
  Specifies the address of other CBC server. `ipv4_address` is an IPv4 address, using dotted-decimal notation

**Usage**

Use this command to configure the CBC server.

**Example**

The following command configures a CBC server with an IP address of `92.168.1.112` having default port number 3452::

```
cbc-server 92.168.1.112
```
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

`exit`

**Usage**

Use this command to return to the parent configuration mode.
sabp timer

Configures the Service Area Broadcast Protocol (SABP) procedure timer value.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Cell Broadcasting Service Configuration
configure > context context_name cbs-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cbs-service)#

Syntax

[ default | no ] sabp timer timer_value

- **default**
  Restores the SABP timer value to the default: 10 seconds.

- **no**
  Disables the previously configured SABP timer value.

- **sabp timer**
  Configures the SABP timer which is the wait time for receiving the SABP response from a peer.
  **timer_value** is an integer value between 1 and 30.

Usage

This command is used to set/restore the SABP timer value.

Example

The following command configures the SABP timer value to 25:

```
  sabp timer 25
```
**sabp-class2-aggregation**

This command configures the SABP class-2 aggregation timeout.

**Product**
HNB-GW

**Privilege**
Security Administrator, Administrator

**Syntax**

```
sabp-class2-aggregation timeout timeout_value

[ default | no ] sabp-class2-aggregation timeout
```

- **default**
  Restores the SABP class-2 aggregation timeout value to the default: 2 seconds.

- **no**
  Disables the previously configured SABP class-2 aggregation timeout value.

```
sabp-class2-aggregation timeout
```

Configures the SABP class-2 aggregation timeout value. *timeout_value* is an integer value between 1 and 10.

**Usage**
This command is used to configure the SABP class-2 aggregation timeout.

**Example**
The following command configures the SABP class-2 aggregation timeout value to 6:

```
sabp-class2-aggregation timeout 6
```
tcp-keepalive

This command is TCP Keepalive timer. It is used to check liveness of Cell Broadcasting Centre. The CBS service must be restarted after setting new values.

Product
HNB-GW

Privilege
Security Administrator, Administrator

Syntax

tcp-keepalive idle-timeout idle_timeout_value max-retransmission-count count interval value

[ default | no ] tcp-keepalive

default
Restores the TCP Keepalive timer related values to default: idle-timeout(600 seconds), max-retransmission-count (3) and interval (30 seconds).

no
Disables the TCP Keepalive timer.

tcp-keepalive idle-timeout
This is the time in seconds to wait before checking the liveness of Cell Broadcasting Centre. timeout_value is an integer value between 60 and 7200.

max-retransmission-count
This is the number of attempts to check liveness of Cell Broadcasting Centre after idle time. count is an integer value between 2 and 10.

interval
This is the time in seconds between attempts to check liveness of Cell Broadcasting Centre after idle time. value is an integer value between 10 and 100.

Usage
This command is used to check the liveness of Cell Broadcasting Centre.

Example
The following command checks the liveness of Cell Broadcasting Centre with tcp-keepalive idle-timeout as 66 seconds, max-retransmission-count as 5 and interval as 15:

tcp-keepalive idle-timeout 66 max-retransmission-count 5 interval 15
tcp-mode

This command configures the mode of TCP connection.

Product
HNB-GW

Privilege
Security Administrator, Administrator

Syntax

tcp-mode { client-server | server-only }

client-server
This specifies that the HNBGW can act either as client or server.

server-only
This specifies that the HNBGW can act only as server.

Usage
This command is used to configure the mode of TCP connection.

Example
The following command configures the HNBGW as Client and Server.

tcp-mode client-server
Chapter 45
Channelized Port Configuration Mode Commands

The channelized port configuration mode provides the commands to create, configure, bind, and manage the Frame Relay service ports on the channelized line card.

**Important:** The commands described in this chapter only run on the ASR 5000 platform. Before using these commands, card framing should be configured for either SDH or SONET with the framing command described in the Card Configuration Mode chapter.

**Mode**

Exec > Global Configuration > Channelized Port Configuration

```
configure > port channelized slot_number/port_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
alarm-disable

Entering this command disables the alarm detection for designated sets of alarms.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Channelized Port Configuration

configure > port channelized slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Syntax

alarm-disable { all | dsl-e1 | none | sonet-sdh }

[ no | default ] alarm-disable

no

Deletes the disable configuration.

default

Returns the settings for disabling alarms to the system default.

all

Disables detection of all SONET/SDH and DS1/E1 alarms.

dsl-e1

Disables detection of the DS1/E1 alarms.

none

None of the alarm detection is disabled so that all DS1/E1 and SONET/SDH alarms are detected.

sonet-sdh

Disables detection of SONE/SDH alarms.

Usage
Configure selected alarm detection for the port.

Example
Enter the following command to enable DS1/E1 and SONET/SDH alarm detection.

    alarm-disable none
alarm-soak-timer

This command sets the timer for the duration that a detected alarm will be soaked before the alarm is reported.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Channelized Port Configuration

`configure > port channelized slot_number/port_number`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**

```
alarm-soak-timer seconds

default alarm-soak-timer
```

**default alarm-soak-timer**

```
default

Returns the timer settings to the system default.
```

```
seconds

Defines the number of seconds the system waits (soaks the alarm) before reporting the alarm.
seconds: any integer from 0 to 32767.
```

**Usage**

Configures the delay before reporting detected alarms.

**Example**

Configure a 20 second alarm report delay.

```
alarm-soak-timer 20
```
clock-source

This command sets the source of the port’s transmit clock.

Important: This command is only available for releases 8.1 or higher.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Channelized Port Configuration

configure > port channelized slot_number/port_number

Entering the above command sequence results in the following prompt:

[local]host_name(config-port-slot_number/port_number)#

Syntax

clock-source { internal-timing | loop-timing }

default clock-source

default

Using this command combination sets the port clock source to internal timing.

internal-timing

Sets the port clock to derive timing from the recovered receive clock.

loop-timing

Sets the port clock to transmit in sync with the system timing.

Usage
Use this command for either SONET or SDH channelized (Frame Relay) ports on the SGSN.

Example
The following command resets the transmit clock source to internal timing.

default clock-source
description

Defines descriptive text that provides useful information about the port.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Channelized Port Configuration

configure > port channelized slot_number/port_number

Entering the above command sequence results in the following prompt:

[local] host_name(config-port-slot_number/port_number)#

Syntax

description text

no description

no

Erases the port’s description from the configuration file.

text

text must be a string of 1 to 79 alphanumeric characters with no spaces or a string within double quotes that includes printable characters. The description is case-sensitive.

Usage
Set the description to provide helpful information, for example the port’s primary function, services, end users. Define any information, the only limit is the number of characters.

Example

description samplePortDescriptiveText

description "This is a sample description"
dlci

Identifies a data link connection identifier (DLCI), a frame relay logical connection, and binds it with a specific channelized path configuration. Once the DLCI is bound to the path, the system enters DLCI configuration mode.

---

**Important:** The `path` command must be configured prior to attempting configuration with the `dlci` command.

---

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Channelized Port Configuration

```
configure > port channelized slot_number/port_number
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-port-slot_number/port_number)#
```

**Syntax**

```
dlci path path_id  { ds1 | e1 } connects { dlci dlci_id | timeslots slot# dlci dlci_id }
no dlci path path_id  { ds1 | e1 } connects
```

- `no` Disables the configured DLCI.

```
path path_id
```

Identifies a specific path configuration, set with the `path` command in this configuration mode, that will be associated with a DLCI.

- `path_id` must be an integer from 1 to 3.

```
ds1 connects | e1 connects
```

Selects the framing speed for the connection.

- **DS1:** Is associated with North American networks and would be the best choice to work with the SONET framing selected with the `card` configuration command.
- **connects:** Defines the number of logical connections supported via the DS1. The selection must be an integer from 1 to 28.

- **E1:** is associated with European networks and would be associated with the SDH framing selected with the `card` configuration command.
- **connects:** Defines the number of logical connections supported via the E1. The selection must be an integer from 1 to 21.

```
dlci dlci_id
```

Identifies a specific Frame Relay PVC DLCI to associate with the path.

- `dlci_id`: an integer from 16 to 991.
**timeslot slot#**

Identifies one of the timeslots within a timeslot group configured with the `path` command for the E1, DS1 or fractional E1 port. Identifying one slot in a group means that all the slots in that group will have the Frame Relay parameters configured in the same manner.

*slot#: Must be an integer from 1 to 31.*

---

**Usage**

Associating a routing path with a specific frame relay DLCI is a significant part of the process for defining the frame relay interface.

**Example**

Associate path 1 with DLCI 123.

```
dlci path 1 ds1 21 dlci 123
```
end

Exits the Channelized Port configuration mode and returns to the Exec mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
derm
```

**Usage**
Change the mode back to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Use this command to return to the parent configuration mode.
frame-relay

Configures the parameters for the Frame Relay connections for E1, DS1 and fractional E1 ports created with the path command. Frame

⚠️ **Important:** The path command must be configured prior to attempting configuration with the frame-relay command.

<table>
<thead>
<tr>
<th>Product</th>
<th>SGSN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Privilege</td>
<td>Security Administrator, Administrator</td>
</tr>
</tbody>
</table>

**Syntax**

```
frame-relay path path_id { ds1 connects | el connects } timeslot slot# [ intf-type intf_type ] [ lmi_type lmi_type ]
```

- **path path_id**
  Identifies a specific path configuration, set with the path command in this configuration model. path_id must be an integer from 1 to 3.

- **ds1 connects | el connects**
  Selects the pipe splitting for the connection.
  - **DS1:** Is associated with North American networks and would be the best choice to work with the SONET framing selected with the card configuration command. DS1 splits the path into 28 logical connections.
  - **connects:** Defines the number of logical connections supported via the DS1. The selection must be an integer from 1 to 28.
  - **E1:** is associated with European networks and would be associated with the SDH framing selected with the card configuration command. E1 splits the path into 21 logical connections.
  - **connects:** Defines the number of logical connections supported via the E1. The selection must be an integer from 1 to 21.

- **timeslot slot#**
  Identifies one of the timeslots within a timeslot group configured with the path command for the E1, DS1 or fractional E1 port. Identifying one slot in a group means that all the slots in that group will have the Frame Relay parameters configured in the same manner.
  - **slot#:** Must be an integer from 1 to 31.

- **intf-type intf_type**
  Selecting the interface type specifies signaling parameters for the DLCI, options include:
  - **dce:** Selects data circuit-terminating equipment -type signaling.
  - **dte:** Selects data terminal equipment -type signaling.
  - **nni:** Selects the network-to-network interface

Default: DTE for Release 8.0
Default: DCE for Release 8.1
**frame-relay lmi_type lmi_type**

Default: none.

Line management options include:

- **ansi** - ANSI ANNEXED LMI, may include option:
- **cisco** - Cisco/Gang Of Four LMI
- **none** - LMI Disabled
- **q933a** - Q.933A LMI

Any of the above LMI types can take one or more additional options:

- **n391 value** - Number of keep exchanges before requesting a full status message. Default is 6. value must be an integer from 1 to 255.
- **n392 value** - Error Threshold value. Default is 2. value must be an integer from 1 to 10.
- **n393 value** - Monitored events count value. Default is 2. value must be an integer from 1 to 10.
- **t391 value** - Timer to send messages. Default is 10. value must be an integer from 5 to 30.
- **t392 value** - Polling verification timer value. Default is 15. value must be an integer from 5 to 30.

**Usage**

Use this command to define LMI type and timers and to associate time group 2 with the Frame Relay connection.

**Example**

```
frame-relay path le1 3 timeslot 2
```
**hopath-sdsf**

Configures the high-order path for degrade/signal failure (SDSF) bit error rate (BER) thresholds.

**Product**

SGSN

**Privilege**

Security Administrator, Administrator

**Syntax**

```
hopath-sdsf hopath_value
```

<table>
<thead>
<tr>
<th>hopath_value</th>
</tr>
</thead>
<tbody>
<tr>
<td>• 0: Disabled</td>
</tr>
<tr>
<td>• 1 - 1.E-03</td>
</tr>
<tr>
<td>• 2 - 1.E-04</td>
</tr>
<tr>
<td>• 3 - 1.E-05</td>
</tr>
<tr>
<td>• 4 - 1.E-06</td>
</tr>
<tr>
<td>• 5 - 1.E-07</td>
</tr>
<tr>
<td>• 6 - 1.E-08</td>
</tr>
<tr>
<td>• 7 - 1.E-09</td>
</tr>
<tr>
<td>• 8 - 1.E-10</td>
</tr>
</tbody>
</table>

**Usage**

Sets a standard option for the high-order path for SDSF. The SD is kept at a value of 100 erroredBits/sec less than the corresponding value of the SF. So if the SD threshold is configured at 1 error in every 100000 bits/sec, then the SF threshold automatically becomes 1 error in every 1000 bits/sec.

**Example**

```
hopath-sdsf 1
```
line-timing

This command enables the SPIO to recover transmit timing source via the line attached to the selected port. By default, line-timing is not enabled.

Important: To employ line-timing recovery, the SPIO card(s) must be equipped with the optional Stratum 3 clock module.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

[ no ] line-timing

- no
  Disables line-timing as the source for the transmit clock.

Usage
The port must be enabled (with the no shutdown command) to enable recovery of timing source via the line. As well, the card's slot number must be entered in the recover line# command of the BITS port configuration mode.

Important: If the SPIO is connected to an external Building Integrated Timing Supply (BITS) source, BITS timing always takes precedence over line-timing.

Example
Disable timing clock recovery on this port.

no line-timing
loopback

Configures the type of loopback mode used for diagnostic testing.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
loopback { dsl-e1-diag | dsl-e1-line | none | sonet-sdh-diag | sonet-sdh-line }
```

- **dsl-e1-diag**
  Enables a system generated diagnostic lookback signal at the DS1/E1 layer.

- **dsl-e1-line**
  Loops back a network diagnostic signal at the DS1/E1 layer.

- **none**
  Stops diagnostic loopback signaling.

- **sonet-sdh-diag**
  Enables a system generated diagnostic lookback signal at the SONET/SDH layer.

- **sonet-sdh-line**
  Loops back a network diagnostic signal at the SONET/SDH layer.

Usage
Setup diagnostic loopback signals for troubleshooting purposes.

Example

```
loopback dsl-e1-diag
```
lopath-sdsf

Configures the low-order path for signal degrade/signal failure (SDSF) bit error rate (BER) thresholds.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
lopath-sdsf  lopath_value
```

*lopath_value*

- 0: Disabled
- 1 - 1.E-03
- 10 - 1.E-12
- 2 - 1.E-04
- 3 - 1.E-05
- 4 - 1.E-06
- 5 - 1.E-07
- 6 - 1.E-08
- 7 - 1.E-09
- 8 - 1.E-10
- 9 - 1.E-11

**Usage**
Sets a standard option for the low-order path for SDSF.
The SD is kept at a value of 100 erroredBits/sec less than the corresponding value of the SF. So if the SD threshold is configured at 1 error in every 100000 bits/sec, then the SF threshold automatically becomes 1 error in every 1000 bits/sec.

**Example**

```
lopath-sdsf 1
```
**path**

This command configures the parameters that define the routing path for a DLCI. It must match with the DLCI configuration parameters. The values entered with these commands should be noted as they will be needed to configure the `frame-relay` and `dlci` commands also in this configuration mode.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
path path_id { ds1 connects | e1 connects } service-type { frame-relay | mtp2 } frame-mapping multiplexing index# index# framing mode mapping-mode { bit-sync | byte-sync } [ timeslots slot# [ slot# ] | frame-relay [ intf-type intf_type [ lmi_type lmi_type ] ] ]
```

```
o path path_id { ds1 | e1 }connects
```

**no**

Deletes the routing path entry from the configuration.

```
path path_id
```

Identifies a specific path configuration that will be associated with a DLCI. The `path_id` must be an integer from 1 to 3.

```
ds1 connects | e1 connects
```

Selects the channelization for the connection.

**DS1** (AKA: T1) Is associated with North American networks and would be the best choice to work with the SONET (can also work with SDH) framing selected with the `card` configuration command. DS1 splits the path into 28 logical connections.

**connects**: Defines the number of logical connections supported via the DS1. The selection must be an integer from 1 to 28.

**E1**: is associated with European networks and would be associated with the SDH (can also work with SONET) framing selected with the `card` configuration command. E1 splits the path into 21 logical connections.

**connects**: Defines the number of logical connections supported via the E1. The selection must be an integer from 1 to 21.

```
service-type { frame-relay | mtp2 }
```

Specifies the service type to be used for this path. When `multi-service` is enabled at the card level, different services are supported at the path-level for this port. For additional information, refer to the description of the `service-type` command in the *Card Configuration Mode Commands* chapter.

- **frame-relay**: Specifies Frame Relay mode for this path.
- **mtp2**: Specifies MTP2 service for this path.
**frame-mapping**

Frame mapping sets the channelization according to the national standards that correlate with the framing/speed standards. This option selects the mapping of containers (C), virtual containers (VC), tributary units (TU), and tributary unit groups (TUG), that is appropriate for the channel characteristics:

- **tu11-au3**: Appropriate for DS1 in SDH. Maps as follows AU-3—VC-3—m#—TUG-2—m#—TU-12—VC-12—C-12
- **tu11-au4**: Appropriate for DS1 in SDH. Maps as follows AU-4—VC-4—TUG-3—m#—TUG-2—m#—TU-11—VC-11—C-11
- **tu12-au3**: Appropriate for E1 in SDH. Maps as follows AU-3—VC-3—m#—TUG-2—m#—TU-12—VC-12—C-12
- **tu12-au4**: Appropriate for E1 in SDH. Maps as follows AU-4—VC-4—TUG-3—m#—TUG-2—m#—TU-12—VC-12—C-12

Frame Mapping for E1 and DS1 to STM-n Interfaces

- **vt1.5**: Only appropriate for DS1 in SONET framing.
- **vt2**: Only appropriate for E1 in SONET framing.

**multiplexing index# index#**

**index#**: TUG-2 index - Must be an integer from 1 to 7 to identify a multiplex channel between TUG-2 and VC-3 (E1) or TUG-3 (DS1).

**index#**: TU index - Must be an integer from 1 to 4 (DS1) or 1 to 3 (E1) to identify a multiplex channel between TU-11 (DS1) and TUG-2 or between TU-12 (E1) and TUG-2.

**framing mode**

Defines the framing modes to be used for the channelization to E1 or T1 of the (optical) port.

- **options for E1:**
  - **cas**: standard mapping with CAS
  - **cas-crc4**: CRC4 mapping with CAS
  - **crc4**: CRC4 mapping
  - **standard**: mapping

- **options for DS1:**
  - **esf**: extended superframe mapping
  - **sf**: superframe mapping
• option for either E1 or DS1:
  • unframed

mapping-mode
  • bit-sync
  • byte-sync

timeslots
  Defines up to 8 timeslot groupings for multiple fractional DS1/E1 channels. Each slot is 2.048/32 Mbytes. Slots 0 and 16 are reserved for synchronization and alarms. Slots 1-15 and 17-31 are used for data. Timeslots must be unique — a timeslot can not be used in more than one grouping.

  timeslots: Must be an integer from 1 to 31. Timeslot groups are separated by spaces and can consist of a single slot and/or a range indicated with a hyphen. Example: 3,7-10 is a single fractional group. NOTE there is no space after the comma. Timeslots must be unique — a timeslot can not be used in more than one grouping.

frame-relay
  Enables definition of a Frame Relay connection with the frame-relay command.

  **Important:** For release 8.1 and higher, this feature has been moved to the frame-relay command.

intf-type
  Selecting the interface type specifies signaling parameters for the DLCI, options include:
  • **dce:** Selects data circuit-terminating equipment -type signaling.
  • **dte:** Selects data terminal equipment -type signaling.
  • **nni:** Selects the network-to-network interface

  Default: DTE for Release 8.0
  Default: DCE for Release 8.1

  **Important:** For release 8.1 and higher, this feature has been moved to the frame-relay command.

lmi_type
  Default: none.
  Line management type options include:
  • **ansi** - ANSI ANNEXED LMI, may include option:
  • **cisco** - Cisco/Gang Of Four LMI
  • **none** - LMI Disabled
  • **q933a** - Q.933A LMI

  Any of the above LMI types can take one or more additional options
  • **n391 value** - Number of keep exchanges before requesting a full status message. Default is 6. value must be an integer from 1 to 255.
  • **n392 value** - Error Threshold value. Default is 2. value must be an integer from 1 to 10.
• **n393** *value* - Monitored events count value. Default is 2. *value* must be an integer from 1 to 10.
• **t391** *value* - Timer to send messages. Default is 10. *value* must be an integer from 5 to 30.
• **t392** *value* - Polling verification timer value. Default is 15. *value* must be an integer from 5 to 30.

**Important:** For release 8.1 and higher, this feature has been moved to the `frame-relay` command.

**Usage**
Defines the signaling characteristics of a frame relay connection or timeslots for a fractional connection.
Use this command to create E1 ports or fractional E1 ports. Fractional E1 ports are created with the timeslot definitions. The fractional E1 port can consist of one or more or all of the timeslots.

**Example**
In the first example, define timers for the q933a LMI-type.

```bash
path 1 el 1 tu12-au4 1 1 framing crc4 mapping-mode bit-async frame-relay intf-type dce lmi_type q933a n391 6 n392 2 n393 2 t391 10 t392 15
```

The next example defines 3 groups of fractional timeslots with group 1 having slots 1-5 and 8, group 2 having slot 22-25, and group 3 having slots 31.

```bash
path 1 el 1 tu12-au3 1 1 framing cas mapping-mode bit-async timeslots 1-5,8 22-25 31
```
preferred slot

Identifies which card in a chassis should assume revertive (redundancy auto-recovery) functionality should the slot/port being configured go down. This command must be issued on a per port basis, allowing you to configure specific ports to be used on individual LCs or SPIO cards. For example, ports 1 through 4 could be configured as “preferred” on the LC in slot 17 while ports 5 through 8 are “preferred” on the LC in slot 33. In this scenario, both LCs would be in an Active operational state while still providing LC and port redundancy for the other.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

preferred slot slot#

no preferred slot

    slot#

    Identifies the physical slot in the chassis where the line card is installed.

    no

    Disables revertive, or auto-recovery, operation for the port.

Usage

This command enables or disables revertive port redundancy. So after a port failover, when the original port is restored to service (i.e. link up) the system will return service to that port automatically. Disabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue a port switch to command to return service to the original port.

Example

preferred slot 17
pwe3-cesopsn

This command has been deprecated and replaced by the `mtp2` command.
shutdown

Terminates all processes supporting the port or blocks the shutting down of the port. Conversely, this command with the no keyword enables the port.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

[ no ] shutdown

no

Enables the port’s administrative state. When omitted the card is shutdown (removed from service).

Usage
Shut down a port prior to re-cabling and/or other maintenance activities. This command with the no keyword is required to bring a port into service.

Example
Use the following command to disable a port:

    shutdown

Use the following command to enable a port for service:

    no shutdown
**snmp trap link-status**

Enables/disables the generation and sending of an SNMP (notification) trap when the port experiences a change of state (up or down).

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
[ no ] snmp trap link-status
```

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disables the sending of traps for link-status changes.</td>
</tr>
</tbody>
</table>

**Usage**

Enable the sending of link-status change traps if there is a monitoring facility that can use the information or if there are troubleshooting activities in progress.

**Example**

```plaintext
snmp trap link-status
```
threshold high-activity

Configures the port’s high and low activity thresholds.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```plaintext
threshold high-activity high_thresh [ clear low_thesh ]
```

**high_thresh**
Default: 50
Sets the threshold for the highest percentage of port activity that must be met or exceeded, within the polling interval, to generate an alert or alarm.

`high_thresh` can be configured to any integer value between 0 and 100.

**clear low_thesh**
Default: 50
Sets the threshold for the lowest percentage level of port activity that must be met to generate and send a clear alarm. If port activity does not drop to or below this threshold then the alarm is maintained.

`low_thesh` can be configured to any integer value between 0 and 100.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

High port activity thresholds generate alerts or alarms based on the utilization percentage of each configured port during the specified polling interval. This threshold is configured on a per-port basis.

Alerts or alarms are triggered for high port activity based on the following rules:

- **Enter condition:** Actual percent utilization of a port > High Threshold
- **Clear condition:** Actual percent utilization of a port < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the `threshold poll` command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the `threshold monitoring` command in this chapter to enable thresholding for this value.

**Example**

The following command configures a high port utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```plaintext
threshold high-activity 70 clear 50
```
threshold monitoring

Enables thresholding for port-level values.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
[ no ] threshold monitoring
```

**no**
Disables threshold monitoring for port-level values. This is the default setting.

**Usage**

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e. high-activity) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps:** SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the starentMIB(8164).starentTraps(2) section of the SNMP MIB Reference. The generation of specific traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs:** The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of WARNING.

- **Alarm System:** High threshold alarms generated within the specified polling interval are considered “outstanding” until a the condition no longer exists and/or a condition clear alarm is generated. “Outstanding” alarms are reported to through the system’s alarm subsystem and are viewable through the system’s CLI.

The following table indicates the reporting mechanisms supported by each of the above models.

<table>
<thead>
<tr>
<th>Model</th>
<th>SNMP Traps</th>
<th>Logs</th>
<th>Alarm System</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alert</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>Alarm</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

This command enables thresholding for port-level values. Refer to the `threshold high-activity`, `threshold rx-utilization`, and `threshold tx-utilization` commands in this chapter for information on configuring these values. In addition refer to the `threshold poll` command in the
Global Configuration Mode Commands chapter of this reference for information on configuring the polling interval over which these values are monitored.

**Example**

Use the following command to terminate thresholding:

```
no threshold monitoring
```
threshold rx-utilization

Configures thresholds for receive-port utilization.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
threshold rx-utilization high_thresh [ clear low_thresh ]
```

### high_thresh

Default: 80

The high threshold receive port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.

The percentage can be configured to any integer value between 0 and 100.

### clear low_thresh

Default: 80

Allows the configuration of the low threshold.

The low threshold receive port utilization percentage that maintains a previously generated alarm condition.

If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.

The percentage can be configured to any integer value between 0 and 100.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Receive port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data received during the specified polling interval. This threshold is configured on a per-port basis.

**Important:** Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive or transmit utilization threshold be configured.

Alerts or alarms are triggered for receive port utilization based on the following rules:

- **Enter condition:** Actual percent utilization of a port for received data \( \geq \) High Threshold
- **Clear condition:** Actual percent utilization of a port for received data \(<\) Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the `threshold monitoring` command in this chapter to enable thresholding for this value.

Example

The following command configures a receive port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold rx-utilization 70 clear 50
```
threshold tx-utilization

Configures thresholds for transmit port utilization.

Product
SGSN

Privilege
Security Administrator, Administrator

Syntax

```
threshold tx-utilization  high_thresh  [ clear  low_thresh ]
```

**high_thresh**

Default: 80
The high threshold transmit port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
The percentage can be configured to any integer value between 0 and 100.

**clear low_thresh**

Default: 80
Allows the configuration of the low threshold.
The low threshold transmit port utilization percentage that maintains a previously generated alarm condition.
If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
The percentage can be configured to any integer value between 0 and 100.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Transmit port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data transmitted during the specified polling interval. This threshold is configured on a per-port basis.

**Important:** Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive or transmit utilization threshold be configured.

Alerts or alarms are triggered for transmit port utilization based on the following rules:

- **Enter condition:** Actual percent utilization of a port for transmit data ≥ High Threshold
- **Clear condition:** Actual percent utilization of a port for transmit data < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the `threshold poll` command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the `threshold monitoring` command in this chapter to enable thresholding for this value.

**Example**

The following command configures a transmit port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold tx-utilization 70 clear 50
```
**toh-sdsf**

Enable/disable line SDSF BER thresholds and configure the line transport overhead (TOH) signal degrade and signal failure (SDSF) bit error rate (BER) threshold.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Syntax**

```
toh-sdsf toh_value
```

```
default toh-sdsf
```

**default**

Resets the default which disables this threshold.

**toh_value**

To facilitate configuration the SD and SF rates have been combined into a single setting.

- 0: Disabled
- 1 - 1.E-04
- 2 - 1.E-05
- 3 - 1.E-06
- 4 - 1.E-07
- 5 - 1.E-08
- 6 - 1.E-09
- 7 - 1.E-10
- 8 - 1.E-11

**Usage**

This command can be used to configure the line threshold whether the port is active or standby and sets a standard option for the paired values of the line’s signal degrade and signal failure (SDSF) BER. The SD is kept at a value of 100 erroredBits/sec less than the corresponding value of the SF. So if the SD threshold is configured at 1 error in every 100000 bits/sec, then the SF threshold automatically becomes 1 error in every 1000 bits/sec. The port will go operationally down as soon as the SD threshold is crossed.

**Example**

```
toh-sdsf 1
```
vc-mapping

This command has been deprecated. Go to the `frame-mapping` keyword in the `path` command to configure this functionality.
Chapter 46
Cipher Suite Configuration Mode Commands

The Cipher Suite Configuration Mode is used to configure the building blocks for SSL cipher suites, including the encryption algorithm, hash function, and key exchange.

Mode

Exec > Global Configuration > Context Configuration > Cipher Suite Configuration

configure > context context_name > cipher-suite cipher_suite_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(cfg-ctx-cipher-suite)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
encryption

Specifies the encryption algorithm for the SSL cipher suite.

**Product**

SCM (P-CSCF, A-BG)

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Cipher Suite Configuration

`configure > context context_name > cipher-suite cipher_suite_name`

Entering the above command sequence results in the following prompt:

`
[context_name]host_name(cfg-ctx-cipher-suite)#`

**Syntax**

```
encryption { 3des | aes-128 | null | rc4 }
```

```
default encryption:
```

```
default
```

Sets the encryption option to its default value of RC4.

```
encryption 3des | aes-128 | null | rc4
```

Specifies the encryption algorithm.

- **3des**: Encryption algorithm 3DES (Triple Encryption Algorithm). 3DES applies the Data Encryption Standard (DES) cipher algorithm three times to each data block.
- **aes-128**: Encryption algorithm AES-128 (Advanced Encryption Standard-128). AES-128 is a symmetric-key encryption standard which has a 128-bit block size, with key size of 128.
- **null**: Encryption algorithm Null.
- **rc4**: Encryption algorithm RC4 (Rivest Cipher 4). RC4 is a stream cipher used with SSL protocol.

**Usage**

Use this command to specify encryption for the SSL cipher suite.

**Example**

The following command sets the encryption option to its default value, which is RC4:

```
encryption rc4
```
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
**hmac**

Specifies the HMAC (keyed-Hash Message Authentication Code) for the SSL cipher suite.

**Product**

SCM (P-CSCF, A-BG)

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Cipher Suite Configuration

```plaintext
configure > context context_name > cipher-suite cipher_suite_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(cfg-ctx-cipher-suite)#
```

**Syntax**

```plaintext
hmac { sha1 }

default hmac
```

- **default**
  
  Sets the HMAC option to its default value of SHA-1.

- **hmac sha1**
  
  Specifies the SHA-1 (Secure Hash Algorithm-1) HMAC for the SSL cipher suite. SHA-1 uses a 160-bit secret key and produces a 160-bit digest.

**Usage**

Use this command to specify the SHA-1 HMAC for the SSL cipher suite. The default and only currently available option is SHA-1.

A keyed-Hash Message Authentication Code, or HMAC, is a type of message authentication code (MAC) calculated using a cryptographic hash function in combination with a secret key to verify both data integrity and message authenticity.

**Example**

The following command sets the HMAC option to its default value, which is SHA-1:

```plaintext
hmac sha1
```
key-exchange

Specifies the key exchange algorithm for the SSL cipher suite.

Product
SCM (P-CSCF, A-BG)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > Cipher Suite Configuration

configure > context context_name > cipher-suite cipher_suite_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(cfg-ctx-cipher-suite)#

Syntax

key-exchange { rsa }

default key-exchange

default

Sets the key exchange option to its default value of RSA.

key-exchange rsa

Specifies the RSA (Rivest, Shamir, and Adleman) key exchange algorithm for the SSL cipher suite. With RSA, the secret key is encrypted with the receiver’s public key, and a public-key certificate from the receiver’s key must be made available.

Usage

Use this command to specify the RSA key exchange for the SSL cipher suite. The default and only currently available option is RSA.

The key exchange algorithm provides the means by which the cryptographic keys for conventional encryption and MAC calculations are exchanged.

Example

The following command sets the key exchange option to its default value, which is RSA:

key-exchange rsa
Chapter 47
Class-Map Configuration Mode Commands

Class-Map is used to configure a packet classifier for the flow-based Traffic Policing feature within destination context. It filters egress and/or ingress packets of a subscriber session based on rules configured in a subscriber context.

**Mode**

Exec > Global Configuration > Context Configuration > Class-Map Configuration

```
configure > context context_name > class-map class_map_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-class-map)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
**exit**

Exits the current mode and returns to the parent configuration mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

`exit`

**Usage**

Use this command to return to the parent configuration mode.
match any

Allows all traffic types in this class map.

**Product**

PDSN
HA
ASN-GW
HSGW
P-GW
SAEGW
SCM

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Class-Map Configuration

`configure > context context_name > class-map class_map_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-class-map)#
```

**Syntax**

```text
match any
```

**Usage**

Sets the match rule to allow all traffic flow for specific class map.

**Example**

The following command allows all packets going to a system with this class map.

```text
match any
```
match dst-ip-address

Specifies a traffic classification rule based on the destination IP address of packets.

Product
- PDSN
- HA
- ASN-GW
- HSGW
- P-GW
- SAEGW
- SCM

Privilege
- Security Administrator, Administrator

Mode
- Exec > Global Configuration > Context Configuration > Class-Map Configuration
- configure > context context_name > class-map class_map_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-class-map)#

Syntax

match dst-ip-address dst_ip_address /subnet_mask

Specifies the destination IP address of the packets.
dst_ip_address must be entered in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
subnet_mask is an option that is entered in CIDR notation.

Usage

Sets the match rule based on the destination IP address of packets for specific Class Map.

Example

The following command specifies the rule for packets going to a system having an IP address 10.1.2.6.

match dst-ip-address 10.1.2.6
match dst-port-range

Specifies a traffic classification rule based on the range of destination ports for L4 packets.

**Product**
PDSN
HA
ASN-GW
HSGW
P-GW
SAEGW
SCM

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Class-Map Configuration

```
configure > context context_name > class-map class_map_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-class-map)#
```

**Syntax**

```
match dst-port-range initial_port_number [ to last_port_number ]
```

- `initial_port_number [ to last_port_number ]`

  Specifies the destination port or range of ports of L4 packets.
  
  - `initial_port_number` is the starting port number and must be an integer 1 to 65535 but less than `last_port_number`, if specified.
  - `last_port_number` is the end port number and must be an integer from 1 to 65535 but more than `initial_port_number`.

**Usage**

Sets the match rule based on the destination port number or range of ports of L4 packets for specific Class Map.

**Example**

The following command specifies the rule for packets having destination port number from 23 to 88.

```
match dst-port-range 23 to 88
```
match ip-tos

Specifies a traffic classification rule based on the IP Type of Service value in ToS field of packet.

Product
- PDSN
- HA
- ASN-GW
- HSGW
- P-GW
- SAEGW
- SCM

Privilege
- Administrator

Mode
- Exec > Global Configuration > Context Configuration > Class-Map Configuration
- configure > context context_name > class-map class_map_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-class-map)#
```

Syntax

```
match ip-tos { service_value [ ip-tos-mask mask_value ] | tos-range low_value to high_value }
```

- **service_value**
  - Specifies the IP Type-of-Service value to match inside the ToS field of packets as an integer from 0 to 255.

- **ip-tos-mask mask_value**
  - Specifies the IP Type-of-Service mask value to match inside the ToS field of packets as an integer from 1 to 255.

- **tos-range low_value to high_value**
  - Specifies a range that a ToS value in a received packet must fall within to be considered a match. **low_value** and **high_value** must be an integer from 0 to 255.

Usage
- Sets the match rule based on the IP ToS value in ToS field of packets for specific Class Map.

Example
- The following commands specifies the IP ToS value of 3 is the value to match in a ToS field in received packets.

```
mach ip-tos 3
```
**match ipsec-spi**

Specifies a traffic classification rule based on the IPSec Security Parameter Index (SPI) value in the SPI field of packet.

**Product**
- PDSN
- HA
- ASN-GW
- HSGW
- P-GW
- SAEGW
- SCM

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > Class-Map Configuration

```
configure > context context_name > class-map class_map_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-class-map)#
```

**Syntax**

```
match ipsec-spi index_value
```

*index_value*

Specifies the IPSec SPI value to match inside the SPI field of packets as an integer from 1 to 65535.

**Usage**
Sets the match rule based on the IPSec SPI value in SPI field of packets for specific Class Map.

**Example**

The following command specifies the IPSec SPI value as 1234 for the SPI field in packets.

```
match ipsec-spi 1234
```
**match packet-size**

Specifies a traffic classification rule based on the size of packet.

**Product**
- PDSN
- HA
- ASN-GW
- HSGW
- P-GW
- SAEGW
- SCM

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > Class-Map Configuration
  ```
  configure > context context_name > class-map class_map_name
  ```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-class-map)#
```

**Syntax**
```
match packet-size [ gt | lt ] size
```

[ gt | lt ] size

Specifies the packet length in bytes.
- **gt**: indicates a packet size greater than the specified size.
- **lt**: indicates a packet size less than the specified size.

*size* must be an integer from 1 to 65535.

**Usage**

Sets the match rule based on the size of packets for specific Class Map. This command is only applicable for static policies; it is not available for dynamic policies.

**Example**

The following command specifies the packet length to be 1024 bytes.

```
match packet-size 1024
```
match protocol

Specifies a traffic classification rule based on the protocol used for session flow.

Product

PDSN
HA
ASN-GW
HSGW
P-GW
SAEGW
SCM

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Class-Map Configuration

configure > context context_name > class-map class_map_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-class-map)#

Syntax

match protocol { gre | ip-in-ip | number | rtp | sip | tcp | udp }

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gre</td>
<td>Sets the match rule for session flow using Generic Routing Encapsulation (GRE) Protocol. It matches the protocol field to GRE inside the packet.</td>
</tr>
<tr>
<td>number</td>
<td>Sets the match rule for a session flow using Transmission Control Protocol (TCP). It matches the specified protocol field inside the packet.</td>
</tr>
<tr>
<td>rtp</td>
<td>Sets the match rule for a session flow using Real Time Protocol (RTP). It matches the specified protocol field inside the packet.</td>
</tr>
<tr>
<td>sip</td>
<td>Sets the match rule for a session flow using Session Initiation Protocol (SIP). It matches the specified protocol field inside the packet.</td>
</tr>
</tbody>
</table>
match protocol

---

**tcp**

Sets the match rule for a session flow using Transmission Control Protocol (TCP). It matches the protocol field to TCP inside the packet.

---

**udp**

Sets the match rule for a session flow having User Datagram Protocol (UDP). It matches the protocol field to UDP inside the packet.

---

**Usage**

Sets the match rule based on the protocol of packet flow for a specific Class Map.

**Example**

The following command specifies the rule for packet flow using IP-in-IP protocol.

```
match protocol ip-in-ip
```
match src-ip-address

Specifies a traffic classification rule based on the source IP address of packets.

Product
PDSN
HA
ASN-GW
HSGW
P-GW
SAEGW
SCM

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Class-Map Configuration
configure > context context_name > class-map class_map_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-class-map)#

Syntax

match src-ip-address src_ip_address /subnet_mask

src_ip_address/subnet_mask

Specifies the destination IP address of the packets.
src_ip_address must be entered in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
subnet_mask is an option that is entered in CIDR notation.

Usage
Sets the match rule based on the source IP address of packets for specific Class Map.

Example
The following command specifies the rule for packets coming from a system having an IP address 10.1.2.3.

match src-ip-address 10.1.2.3
**match src-port-range**

Specifies a traffic classification rule based on the range of source ports of L4 packets.

**Product**
- PDSN
- HA
- ASN-GW
- HSGW
- P-GW
- SAEGW
- SCM

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Class-Map Configuration

```
configure > context context_name > class-map class_map_name
```

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-class-map)#
```

**Syntax**

```
match src-port-range initial_port_number [ to last_port_number ]
```

Specifies the source port or range of ports of the L4 packets.

- `initial_port_number` is the starting port number and must be an integer from 1 to 65535 but less than `last_port_number`, if specified.
- `last_port_number` is the end port number and must be an integer from 1 to 65535 but more than `initial_port_number`.

**Usage**
Sets the match rule based on source port number or range of ports of L4 packets for specific Class Map.

**Example**

The following command specifies the rule for packets having source port number from 23 to 88.

```
match src-port-range 23 to 88
```
Chapter 48
CGW Service Configuration Mode Commands

Creates Convergence Gateway (CGW) service and enters CGW service configuration mode.

**Mode**

Exec > Global Configuration > Context Configuration > CGW Configuration

```
configure > context context_name > cgw-service cgw_service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cgw-service)#
```

**Important:** Available commands or keywords/variables vary based on platform type, product version, and installed license(s).
associate

This command associates another service to this CGW service.

Product
SaMOG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > CGW Configuration

configure > context context_name > cgw-service cgw_service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cgw-service)#

Syntax

associate { egress-egtp-service egress_egtp_service [ context context_name ] | ggsn-service ggsn_service | mrme-service mrme_service | pgw-service pgw_service | qci-qos-mapping qci_qos_mapping | sgtp-service sgtp_service [ context context_name ] | subscriber-map subscriber_map }

no associate { egress-egtp-service | ggsn-service | pgw-service | ingress-lma-service | qci-qos-mapping | sgtp-service| subscriber-map }

no

Disables association to CGW service.

egress-egtp-service egress_egtp_service [ context context_name ]

Configures the egtp-service which provides S2A functionality to the CGW service.
egress-egtp-service is a string and the value must be between 1 and 63.
Use the context keyword to associate the egress egtp service from a different context in the CGW service.
context_name must be an alphanumeric string of 1 through 79 characters.

ggsn-service ggsn_service

Configures the association of a GGSN service for this CGW service.
ggsn_service must be an alphanumeric string of 1 through 63 characters.

mrme-service mrme_service

Configures the association of egress MRME service for this CGW service.
mrme_service is a string and the value must be between 1 and 63.

pgw-service pgw_service

Configures the association of a PGW service for this CGW service.
pgw_service must be an alphanumeric string of 1 through 63 characters.
### qci-qos-mapping

Configuration related QCI to QoS mapping.  
`qci-qos-mapping` is a string and the value must be between 1 and 63.

### sgtp-service

Specifies the SGTP service instance to associate with this CGW service.  
`sgtp_service` must be an alphanumeric string of 1 through 63 characters.  
**context**: Defines the context in which the SGTP service was created. If no context is specified, the current context will be used.  
`context_name` must be an alphanumeric string of 1 through 79 characters.

### subscriber-map

Configures subscriber map association.  
`subscriber_map` is a string and the value must be between 1 and 64.

### ingress-lma-service

Configuration of the ingress LMA for this CGW service.

---

**Usage**

Use this command to associate another service to this CGW service.

**Example**

The following command is used to associate the configuration of egress EGTP service `egts` for this CGW service:

```bash
associate egress-egtp-service egts
```
bind

This command allows you to bind an IPv4 and/or IPv6 address for the LMA driver.

Product
SaMOG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > CGW Configuration

configure > context context_name > cgw-service cgw_service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cgw-service)#

Syntax

bind { ipv4-address ipv4_address [ ipv6-address ipv6_address ] | ipv6-address ipv6_address [ ipv4-address ipv4_address ] }

no bind { ipv4-address ipv4_address [ ipv6-address ipv6_address ] | ipv6-address ipv6_address [ ipv4-address ipv4_address ] }

no

Disables binding.

bind ipv6-address ipv6_address

Designates an IPv6 address. This must be followed by IPv6 address.
ipv6_address is IPv4 address, using dotted-decimal notation.

ipv4-address ipv4_address [ ipv6-address ipv6_address ] | ipv6-address ipv6_address [ ipv4-address ipv4_address ]

Specifies the IPv4 or IPv6 address to be used as the connection point between the WLC and the SaMOG gateway. You can optionally bind a secondary IPv4 address (if the primary bind address is an IPv6 address) or IPv6 address (if the primary bind address is an IPv4 address) to the MRME service.
The second bind address can be bond in the same command or separate commands. When the second bind address is provided, the CGW service restarts and existing sessions are lost for the other bind address.
ipv4_address must be an IPv4 address expressed in dotted-decimal notation.
ipv6_address must be an IPv6 address expressed in colon (or double-colon) notation.

Usage

Use this command to bind an IPv4 and/or IPv6 address for the LMA driver.

Example

The following command binds an IPv4 address for lma driver.

bind ipv4-address 192.130.30.14
enable-bra-failure-handling

This command enables the HAMGR to select the first session incase the Binding Revocation Ack (BRA) does not have required parameters and the session lookup fails.

Product
SaMOG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > CGW Configuration
cfgure > context context_name > cgw-service cgw_service_name

Entering the above command sequence results in the following prompt:
[context_name]host_name(config-cg-service)#

Syntax
[ no ] enable-bra-failure-handling

Syntax

no
Disables Binding Revocation Ack failure handling.

Usage
Use this command to enable Binding Revocation Ack failure handling.

Example
The following command enables Binding Revocation Ack failure handling.

enable-bra-failure-handling
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
**gre sequence-numbers**

This command allows you to enable or disable the inclusion of sequence number bit and sequence number value in the GRE encapsulation header.

**Product**
SaMOG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CGW Configuration

```bash
configure > context context_name > cgw-service cgw_service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cgw-service)#
```

**Syntax**

```bash
[ no ] gre sequence-numbers
```

- **no**
  - Disables the inclusion of sequence number bit and sequence number value in the GRE encapsulation header.
  - **Default:** Disabled

**Usage**

Use this command to enable or disable the inclusion of sequence number bit and sequence number value in the GRE encapsulation header for GRE tunneled packets.
reg-lifetime

Configures Mobile IPv6 session registration lifetime in seconds.

**Product**
SaMOG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CGW Configuration

```
configure > context context_name > cgw-service cgw_service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cgw-service)#
```

**Syntax**

```
reg-lifetime seconds
default reg-lifetime
```

**default reg-lifetime**

```
default
Configures Mobile IPv6 session registration lifetime, in seconds to its default value, 600.
```

```
reg-lifetime seconds
Configures Mobile IPv6 session registration lifetime.
seconds is the number of seconds, an integer value between 1 and 262140.
```

**Usage**

Use this command to configure Mobile IPv6 session registration lifetime, in seconds.

**Example**

The following command configures Mobile IPv6 session registration lifetime to 500 seconds.

```
reg-lifetime 500
```
revocation

Configures Binding Revocation support for specific CGW service.

**Product**
SaMOG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CGW Configuration

```
configure > context context_name > cgw-service cgw_service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cgw-service)#
```

**Syntax**

```
revocation { enable | max-retransmission max_retransmission | retransmission-timeout msecs }
```

```
default revocation { enable | max-retransmission | retransmission-timeout }
```

```
no revocation enable
```

<table>
<thead>
<tr>
<th><strong>default</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Resets the revocation to its default value.</td>
</tr>
</tbody>
</table>

| **no** |
| Disables revocation. |

| **enable** |
| Enables the Binding Revocation Support. Default is disabled. |

| **max-retransmission** max_retransmission |
| Configures the maximum number of retransmissions. |

*max_retransmission* must be an integer between 0 and 10.

| **retransmission-timeout** msecs |
| Configures the retransmission timeout in milli seconds. |

*msecs* must be an integer between 500 and 10000.

**Usage**

Use this command to configure Binding Revocation support for specific CGW service.

**Example**

The following command configures the retransmission timeout to 1000 milli seconds.
revocation retransmission-timeout 1000
**session-delete-delay**

Configures CGW to retain the session on receiving a termination request till configured delay time for session continuity in case of break-before-make scenario.

**Product**
SaMOG

**Privilege**
Security Administrator, Administrator

**Syntax**

```
session-delete-delay timeout delay_msecs
{ default | no } session-delete-delay timeout
```

- **default**
  Configures session delete delay to its default value, disabled. Default timeout when enabled is 10000 msecs.

- **no**
  Enables / disables session delete delay to its default value.

**timeout**: Configuration to retain session till configured time in msecs when enabled.

- **delay_msecs** is the number of milli seconds, an integer value between 1000 and 60000.

**Usage**

Use this command to configure CGW to retain the session on receiving a termination request till configured delay time for session continuity in case of break-before-make scenario.

**Example**

The following command configures CGW to retain the session timeout to 1500 milli seconds.

```
session-delete-delay timeout 1500
```
timestamp-option-validation

Configures validation of Timestamp Option in Binding Update messages. By default Timestamp option is mandatory.

**Product**
SaMOG

**Privilege**
Security Administrator, Administrator

**Syntax**

```
timestamp-option-validation
{ default | no } timestamp-option-validation
```

**Usage**

Use this command to configure validation of Timestamp Option in Binding Update messages.

**Example**

The following command configures validation of Timestamp Option in Binding Update messages.

```
timestamp-option-validation
```
timestamp-replay-protection

This command designates timestamp replay protection scheme as per RFC 4285.

Product
SaMOG

Privilege
Security Administrator, Administrator

Syntax

```
timestamp-replay-protection tolerance seconds
default timestamp-replay-protection tolerance
no timestamp-replay-protection
default
disables the timestamp replay protection scheme.
tolerance: Defines the acceptable difference in timing (between timestamps) before rejecting packet, in seconds. seconds is the seconds, an integer between 0 and 65535.
```

Usage
Use this command to designate timestamp replay protection scheme as per RFC 4285.

Example
The following command designates timestamp replay protection for 500 seconds.

```
timestamp-replay-protection tolerance 500
```
Chapter 49
Congestion Action Profile Configuration Mode Commands

The Congestion Policy Configuration Mode is used to create and manage the action profiles to be associated with congestion control policies supporting MME configurations on the system.

Mode

Exec > Global Configuration > LTE Policy Configuration > Congestion Action Profile Configuration

configure > lte-policy > congestion-action-profile profile_name

Entering the above command sequence results in the following prompt:

[local] host_name(congestion-action-profile)#

Important: Available commands or keywords/variables vary based on platform type, product version, and installed license(s).
**drop**

Specifies that incoming packets containing new session requests be dropped when a congestion control threshold has been reached.

**Product**

MME

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > LTE Policy Configuration > Congestion Action Profile Configuration

`configure > lte-policy > congestion-action-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local] host_name(congestion-action-profile) #
```

**Syntax**

```
drop { addn-brr-requests | addn-pdn-connects | brr-ctxt-mod-requests | combined-attaches | handovers | ps-attaches | sl-setups | service-request | tau-request } [ lapi ] [ apn-based ]
```

- **addn-brr-requests**
  Drops packets containing UE initiated bearer resource requests. This keyword option will be available only if a valid license is installed.

- **addn-pdn-connects**
  Drops packets containing additional PDN context connections. This keyword option will be available only if a valid license is installed.

- **brr-ctxt-mod-requests**
  Drops packets containing Bearer Context Modification requests. This keyword option will be available only if a valid license is installed.

- **combined-attaches**
  Drops packets containing combined Attach requests.

- **handovers**
  Drops packets containing handover attempts.

- **ps-attaches**
  Drops packets containing packet switched Attach requests.

- **sl-setups**
  Drops packets containing S1 setup attempts. This keyword option will be available only if a valid license is installed.
service-request

Drops packets containing all service requests. This keyword option will be available only if a valid license is installed.

tau-request

Drops packets containing all Tracking Area Update requests.

[ lapi ] [ apn-based ]

These keyword options are available only if a valid license is installed. When a congestion action profile is configured with the drop <call-event> lapi option, only requests with Low Access Priority Indication (LAPI) will be dropped for those call-events during congestion. However, if the call-event is configured without the lapi option, all LAPI and non-LAPI requests will be dropped.

If the congestion action profile is configured with the drop <call-event> apn-based option, only the requests for those APNs configured for congestion control in the Operator Policy will be dropped for those call-events during congestion. However, if the call-event is configured without the apn-based option, all requests will be dropped. Refer to the apn network-identifier command in the Operator Policy Configuration Mode chapter to enable congestion control for a specific APN.

If the congestion action profile is configured with both the lapi and apn-based options, the call-event will be dropped only if both conditions are matched.

Usage

Creates a congestion action profile that drops packets containing a specified request when a threshold is reached. Some keyword options are available only if a valid license is installed. For more information, contact your Cisco account representative.

Example

The following command drops packets containing Tracking Area Update (TAU) requests when a congestion threshold has been reached:

    drop tau-request

The following command drops Additional PDN Context connection requests when a congestion threshold has been reached. Only those APNs specified for APN-based congestion in the Operator Policy configuration mode will be dropped. Note that APN-based congestion control functionality supports APN remapping via the APN Remap Table Configuration Mode. The APN to which it is remapped will be checked for the congestion-control configuration.

    drop addn-pdn-connects apn-based
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Use this command to return to the Exec mode.
exclude-emergency-events

Excludes emergency events when a congestion control threshold is reached. Emergency events continue to be processed when the threshold has been exceeded.

Product
- ePDG
- MME

Privilege
- Administrator

Mode
- Exec > Global Configuration > LTE Policy Configuration > Congestion Action Profile Configuration
- configure > lte-policy > congestion-action-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(congestion-action-profile)#

Syntax

[no] exclude-emergency-events

no
Removes the specified option from the system.

Usage
Create a congestion action profile that allows emergency events to be processed when a congestion threshold has been reached.
When exclude-emergency is configured, congestion actions will not be applied for the following messages for emergency attached UEs:

- tau-request
- service-request
- handovers

When exclude-emergency is configured and addn-pdn-requests are configured for reject or drop actions, the reject or drop action on addn-pdn-requests for emergency PDN will not be applied.

Example
The following command allows emergency events to be processed:

exclude-emergency-events
exclude-voice-events

Excludes voice calls when a congestion control threshold is reached. Voice calls continue to be processed when the threshold has been exceeded.

Product

MME

Privilege

Administrator

Mode

Exec > Global Configuration > LTE Policy Configuration > Congestion Action Profile Configuration

configure > lte-policy > congestion-action-profile profile_name

Entering the above command sequence results in the following prompt:

[local]host_name(congestion-action-profile)#

Syntax

[no] exclude-voice-events

no

Removes the specified option from the system.

Usage

Create a congestion action profile that allows voice calls to be processed when a congestion threshold has been reached.

Example

The following command allows voice calls to be processed:

exclude-voice-events
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
none

Specifies that no congestion control action be taken on an incoming request when a congestion control threshold has been reached.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > LTE Policy Configuration > Congestion Action Profile Configuration

`configure > lte-policy > congestion-action-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(congestion-action-profile)#
```

Syntax

```
none \{ addn-brr-requests | addn-pdn-connects | combined-attaches | handovers | ps-attaches | sl-setups | service-request | tau-request \}
```

<table>

</tbody>
</table>
**service-request**

No congestion control action is taken for service requests when a congestion threshold is reached.

**tau-request**

No congestion control action is taken for Tracking Area Update requests when a congestion threshold is reached.

**Usage**

Specifies that no congestion control action be taken for the specified request when a threshold is reached. For all of the above requests, ‘none’ is the default action; requests are processed normally even when a congestion threshold has been reached.

**Example**

The following command configures the congestion action profile to take no Congestion Control action for Tracking Area Update (TAU) requests when a congestion threshold is reached, so TAU procedure proceeds normally:

```
none tau-request
```
reject

Processes a specified request when a congestion control threshold has been reached and responds with a reject message.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > LTE Policy Configuration > Congestion Action Profile Configuration

`configure > lte-policy > congestion-action-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(congestion-action-profile)#
```

**Syntax**

```
reject { addn-brr-requests | addn-pdn-connects | brr-ctxt-mod-requests | combined-attaches || handovers | ps-attaches | s1-setups time-to-wait { 1 | 10 | 2 | 20 | 50 | 60 } | service-request | tau-request }[ lapi ] [ apn-based ]
```

---

**addn-brr-requests**

Rejects UE initiated bearer resource requests.
This keyword option will be available only if a valid license is installed.

---

**addn-pdn-connects**

Rejects additional PDN context connections.
This keyword option will be available only if a valid license is installed.

---

**brr-ctxt-mod-requests**

Rejects packets containing Bearer Context Modification requests.
This keyword option will be available only if a valid license is installed.

---

**combined-attaches**

Rejects combined Attach requests.

---

**handovers**

Rejects handover attempts.

---

**ps-attaches**

Rejects packet switched Attach requests.

---

**s1-setups time-to-wait { 1 | 10 | 2 | 20 | 50 | 60 }**

Rejects S1 setup attempts with an eNodeB after 1, 2, 10, 20, 50 or 60 seconds.
This keyword option will be available only if a valid license is installed.
service-request
Rejects all service requests. This keyword option will be available only if a valid license is installed.

tau-request
Rejects all Tracking Area Update requests.

[ lapi ] [ apn-based ]
These keyword options are available only if a valid license is installed. When a congestion action profile is configured with the reject <call-event> lapi option, only requests with Low Access Priority Indication (LAPI) will be rejected for those call-events during congestion. However, if the call-event is configured without the lapi option, all LAPI and non-LAPI requests will be rejected.
If the congestion action profile is configured with the reject <call-event> apn-based option, only the requests for those APNs configured for congestion control in the Operator Policy will be rejected for those call-events during congestion. However, if the call-event is configured without the apn-based option, all requests will be rejected. Refer to the apn network-identifier command in the Operator Policy Configuration Mode chapter to enable congestion control for a specific APN.
If the congestion action profile is configured with both the lapi and apn-based options, the call-event will be rejected only if both conditions are matched.

Usage
Creates a congestion action profile that rejects a specified request when a congestion threshold is reached. Some keyword options are available only if a valid license is installed. For more information, contact your Cisco account representative.

Example
The following command rejects Tracking Area Update (TAU) requests when a congestion threshold has been reached:

    reject tau-request

The following command rejects Additional PDN Context connection requests when a congestion threshold has been reached. Only those APNs specified for APN-based congestion in the Operator Policy configuration mode will be rejected. Note that APN-based congestion control functionality supports APN remapping via the APN Remap Table Configuration Mode. The APN to which it is remapped will be checked for the congestion-control configuration.

    reject addn-pdn-connects apn-based
**report-overload**

Enables the MME to report overload conditions to eNodeBs to alleviate congestion scenarios.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > LTE Policy Configuration > Congestion Action Profile Configuration
`configure > lte-policy > congestion-action-profile profile_name`

Entering the above command sequence results in the following prompt:

```
[local]host_name(congestion-action-profile)#
```

Syntax

```
report-overload { permit-emergency-sessions-and-mobile-terminated-services | permit-high-priority-sessions-and-mobile-terminated-services | reject-delay-tolerant-access | reject-new-sessions | reject-non-emergency-sessions } enodeb-percentage percent

[no] report-overload
```

- **no**
  Removes the ‘report-overload’ action from this congestion action profile.

- **permit-emergency-sessions-and-mobile-terminated-services**
  Specifies in the overload message to the eNodeB that only emergency sessions are allowed to access the MME during the overload period.

- **permit-high-priority-sessions-and-mobile-terminated-services**
  Specifies in the overload message to the eNodeB that only high-priority sessions and mobile-terminated services are allowed to access the MME during the overload period.

- **reject-delay-tolerant-access**
  Specifies in the overload message to the eNodeB that delay-tolerant access destined for the MME will be rejected during the overload period.

- **reject-new-sessions**
  Specifies in the overload message to the eNodeB that all new connection requests destined for the MME will be rejected during the overload period.

- **reject-non-emergency-sessions**
  Specifies in the overload message to the eNodeB that all non-emergency sessions will be rejected during the overload period.
### `enobeb-percentage percentage`

Configures the percentage of known eNodeBs that will receive the overload report.  
**percentage** must be an integer from 1 through 100.

#### Usage

Configures the MME to invoke the S1 overload procedure (using the S1AP OVERLOAD START message) to report overload conditions to the specified proportion of eNodeBs to which this MME has an S1 interface connection. The MME selects the eNodeBs at random, such that two overloaded MMEs in the same pool do not send overload messages to the same eNodeBs. When the MME has recovered and can increase its load, the it sends an OVERLOAD STOP message to the eNodeBs.

**Important:** The ‘report-overload’ option must be configured before the threshold is exceeded in order for the action to take place.

#### Example

The following command configures the MME to report an overload condition to 50% of all known eNodeBs and to request the eNodeBs to reject all non-emergency sessions to this MME until the overload condition is cleared:

```
report-overload reject-non-emergency-sessions enodeb-percentage 50
```
Chapter 50
Connected Apps Configuration Mode Commands

The Connected Apps (CA) Configuration Mode is used to define CA client session parameters and High Availability (HA) settings for ASR 9000 VSMs supporting wsg-service virtual machines (VMs)

**Important:** The StarOS commands described in this chapter are only supported for VPC running within a VM on the ASR 9000 VSM.

Mode

Exec > Global Configuration > Connected Apps Configuration

`configure > connectedapps`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-connectedapps)#`
activate

Initiates a ConnectedApps (CA) client session with the IOS-XR server on the ASR 9000.

**Product**
SecGW (WSG)

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Connected Apps Configuration

```
configure > connectedapps
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-connectedapps)#
```

**Syntax**

```
activate

no activate
```

**Usage**

Use this command to establish or disconnect a ConnectedApps (CA) client session with the IOS-XR server on the ASR 9000. CA client session parameters must have been previously entered for this command to work.

**Example**

The following command establishes a CA client session:

```
activate
```
ca-certificate-name

Configures a ConnectedApps (CA) client session with the IOS-XR server using TLS (Transport Layer Security) and CA (Certification Authority) certificate. This is an IOS-XR 5.2.0 requirement.

Product
SecGW (WSG)

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Connected Apps Configuration

configure > connectedapps

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-connectedapps)#

Syntax

ca-certificate-name cert_name

cert_name

Specifies a CA certificate name as an alphanumeric string of 1 through 125 characters.

Usage

Use this command to configure a ConnectedApps client session with the IOS-XR server using TLS (Transport Layer Security) and a specified CA certificate.

Example

The following command configures a ConnectedApps session using a CA certificate named ux1345perm:

ca-certificate-name ux1345perm
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
ha-chassis-mode

Sets the High Availability (HA) mode for wsg-service virtual machines on VSMs in an ASR 9000.

Product
SecGW (WSG)

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Connected Apps Configuration

    configure > connectedapps

Entering the above command sequence results in the following prompt:

    [context_name]host_name(config-connectedapps)#

Syntax

ha-chassis-mode { inter | intra | standalone }

no ha-chassis-mode

no
Disables the current HA chassis mode

{ inter | intra | standalone }
Specifies the type of chassis mode as:

- **inter** – HA is established between VSMs in two ASR 9000 chassis.
- **intra** – HA is established between VSMs in a single ASR 9000 chassis.
- **standalone** – This is a standalone card; HA cannot be enabled.

Usage
Use this command to set or disable HA for VSMs within or across ASR 9000 chassis. To complete HA configuration you must also set its network mode.

Example
The following command sets HA mode between two ASR 9000 chassis:

    ha-chassis-mode inter
ha-network-mode

Sets the network mode for High Availability (HA) network configuration between VSMs in ASR 9000 chassis.

Product
SecGW (WSG)

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Connected Apps Configuration

configure > connectedapps

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-connectedapps)#

Syntax

ha-network-mode { L2 | L3 | NA }

no ha-network-mode

no

Deletes the current setting for HA network mode.

{ L2 | L3 | NA }

Specifies the desired HA network mode as:

• L2 – Layer 2
• L3 – Layer 3
• NA – Not Applicable (standalone VSM)

Usage
Use this command to set the network mode for the HA network configuration between VSMs in ASR 9000 chassis.

Example
The following command sets the HA network mode to Layer 2:

ha-network-mode L2
rri-mode

Configures Reverse Route Injection (RRI) mode. (VPC-VSM only)

**Product**
SecGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Connected Apps Configuration

configure > connectedapps

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-connectedapps)#
```

**Syntax**

```
rri-mode { both | none | ras | s2s }
```

```
no rri-mode
```

- **no**
  Disables the current RRI mode setting.

- **both**
  Support RAS and S2S modes.

- **none**
  Support neither RAS nor S2S mode.

- **ras**
  Support Remote Access Service mode only.

- **s2s**
  Support Site-to-Site mode only.

**Usage**
Use this command to set the RRI mode.

**Example**
The following command sets the RRI mode to RAS.

```
rri-mode ras
```
**sess-ip-address**

Sets the IP address for a Connected Apps (CA) session.

**Product**
SecGW (WSG)

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Connected Apps Configuration

```
configure > connectedapps
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-connectedapps)#
```

**Syntax**

```
sess-ip-address ip_address

no sess-ip-address
```

**Usage**

Use this command to set the IP address for a Connected Apps (CA) session.

**Example**

The following command sets an IPv4 address for a CA session.

```
sess-ip-address 10.10.1.1
```
**sess-name**

Sets the name for a CA session.

**Product**
SecGW (WSG)

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Connected Apps Configuration

```
configure > connectedapps
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-connectedapps)#
```

**Syntax**

```
sess-name session_name

no sess-name
```

**Usage**

Use this command to set the name for a CA client session.

**Example**

The following command sets the CA session name to `vsm0-1`:

```
sess-name vsm0-1
```
sess-passwd

Sets a password for a CA session.

Product
SecGW (WSG)

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Connected Apps Configuration
configure > connectedapps

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-connectedapps)#

Syntax

**sess-passwd { encrypted | password } password**

**no sess-passwd**

- **no**
  Deletes the current CA session password.

- **encrypted**
  This keyword is only used by StarOS when you save the configuration file. StarOS displays the encrypted keyword in the configuration file as a flag indicating that the variable following the keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

- **password**
  Specifies that the password will appear in plain text in the configuration file.

- **password**
  Specifies the password as an alphanumeric string of 1 through 63 characters that is case sensitive.

Usage

Use this password to set a password for a CA session.

Example

The following command sets a plain text password for a CA session:

```
  sess-passwd password admin012
```
**sess-userid**

Defines a user identifier (username) for the CA session.

**Product**  
SecGW (WSG)

**Privilege**  
Security Administrator, Administrator

**Mode**  
Exec > Global Configuration > Connected Apps Configuration

```
configure > connectedapps
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-connectedapps)#
```

**Syntax**

```
sess-userid  username

no  sess-userid
```

**Usage**

Use this command to define a user identifier (username) for the CA session.

**Example**

The following command sets the user identifier to *vsm-admin02*:

```
sess-userid  vsm-admin02
```
Chapter 51
Content Filtering Policy Configuration Mode Commands

The Content Filtering Policy Configuration Mode allows you to configure analysis and action when Content Filtering (CF) matches a Content Filtering Category Policy Identifier.

Mode
Exec > ACS Configuration > CFP Configuration

active-charging service service_name > content-filtering category policy-id cf_policy_id

Entering the above command sequence results in the following prompt:

[local]host_name(config-acs-content-filtering-policy)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
analyze

Specifies the action to take for the indicated result after content filtering analysis.

Product
CF

Privilege
Security Administrator, Administrator

Mode
Exec > ACS Configuration > CFP Configuration

Syntax

In 12.2 and later releases:

```
analyze priority priority { all | category category | x-category string } action { allow |
content-insert content_string | discard | redirect-url url | terminate-flow | www-
reply-code-and-terminate-flow reply_code } [ reporting-edr reporting_edr_format_name ]
```

```
no analyze priority priority
```

In 12.1 and earlier releases:

```
analyze priority priority { all | category category | x-category string } action { allow |
content-insert content_string | discard | redirect-url url | terminate-flow | www-
reply-code-and-terminate-flow reply_code } [ edr edr_format_name ]
```

```
no analyze priority priority
```

priority priority

Specifies the precedence of a category in the content filtering policy.

priority must be an integer from 1 to 65535 that is unique in the content filtering policy.

all

Specifies the default action to take if the category returned after rating is not configured in the subscriber’s content filtering policy. This has the lowest priority.

category category

Specifies the category.

category must be one of the following.

- ABOR
- ADULT
- ADVERT
- ANON
- ART
- AUTO
- BACKUP
- BLACK
- BLOG
- BUSI
- CAR
- CDN
- CHAT
- CMC
- CRIME

• REL
• SCI
• SEARCH
• SHOP
• SPORT
• STREAM
• SUIC
• SXED
• TECH
• TRAV
• VIOL
• VOIP
• WEAP
• WHITE
• UNKNOW

**Important:** Content can simultaneously match multiple categories, therefore specific **priority** must be used for required evaluation precedence.

`x-category string`

This keyword can be used to configure runtime categories not present in the CLI.  
`string` specifies the unclassified category to be rated, and must be an alphanumeric string of 1 through 6 characters.  
A maximum of 10 x-categories can be configured.

`action { allow | content-insert content_string | discard | redirect-url url | terminate-flow | www-reply-code-and-terminate-flow reply_code }`

Specifies the action to take for the indicated result of content filtering analysis.  
`allow`: With static content filtering, this option allows the request for content. In dynamic content filtering it allows the content itself.
content-insert content_string: Specifies the content string to be inserted in place of the message returned from prohibited/restricted site or content server.

For static content filtering, content_string is used to create a response to the subscriber’s attempt to get content. In dynamic content filtering, it is used to replace the content returned by a server.

content_string must be an alphanumeric string of 1 through 1023 characters.

discard: For static content filtering, this option discards the packet(s) that requested. In dynamic content filtering, it discards the packet(s) that contain(s) the content.

redirect-url url: Redirects the subscriber to the specified URL.

url must be an alphanumeric string of 1 through 1023 characters in the http://search.com/subtarg=#HTTP.URL# format.

terminate-flow: Terminates the TCP connection gracefully between the subscriber and server, and sends a TCP FIN to the subscriber and a TCP RST to the server.

www-reply-code-and-terminate-flow reply_code: Terminates the flow with the specified reply code. reply_code must be a reply code that is an integer from 100 through 599.

Important: Static-and-Dynamic Content Filtering is only supported in 9.0 and later releases.

edr edr_format_name

Important: This option is available only in 12.1 and earlier releases. In 12.2 and later releases, it is deprecated and replaced by the reporting-edr option.

Generates separate EDRs for content filtering based on action and content category using a specified EDR file format name.

edr_format_name is the name of a pre-defined EDR file format name in the EDR Format Configuration Mode, and must be an alphanumeric string of 1 through 63 characters.

Important: EDRs generated through this keyword are different from charging EDRs generated for subscriber accounting and billing. For more information on generation of charging EDRs, refer to the ACS Rulebase Configuration Mode Commands chapter.

reporting-edr reporting_edr_format_name

Important: This option is available only in 12.2 and later releases.

Generates separate reporting EDRs for Content Filtering based on the action and content category using the specified EDR file format name.

reporting_edr_format_name must be an alphanumeric string of 1 through 63 characters.

Usage

Example

The following command sets priority 10 for category ADULT with action as terminate-flow:

```
analyze priority 10 category ADULT action terminate-flow
```
**discarded-flow-content-id**

Accounts for packets discarded as a result of content filtering action.

**Product**
CF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > ACS Configuration > CFP Configuration

`active-charging service service_name > content-filtering category policy-id cf_policy_id`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-acs-content-filtering-policy)#
```

**Syntax**

```
discarded-flow-content-id content_id

no discarded-flow-content-id
```

`content_id`

Specifies the content ID for discarded flows as an integer from 1 through 65535.

**Usage**

Use this command in the configuration to account for packets discarded as a result of CF action. A flow end-condition EDR would be generated as a charging EDR for content-filtered packets. No billing EDRs (even with flow-end) would be generated for a discarded packet as the flow will not end. Dual EDRs would exist for customers who want to use “flow end” to get EDRs for charging, plus CF-specific EDRs. The second EDR for charging comes from the `flow end-condition content-filtering` configuration in the Rulebase Configuration Mode.

The `discarded-flow-content-id` configuration can be used for accumulating statistics for UDR generation in case CF discards the packets. These statistics for UDR generation (based on the CF content ID) would also be accumulated in case of ACS error scenarios where the packets are discarded but the flow does not end.

If, in the Rulebase Configuration Mode, the `content-filtering flow-any-error` configuration is set to `deny`, then all the denied packets will be accounted for by the `discarded-flow-content-id` config. That is, the `content_id` will be used to generate UDRs for the denied packets in case of content filtering.

**Example**

Use the following command to set the accumulation of statistics for UDR generation based on the CF content ID 1003:

```
discarded-flow-content-id 1003
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Use this command to return to the parent configuration mode.
failure-action

Specifies the failure action when the content filtering analysis results are not available to analyze.

Product
CF

Privilege
Security Administrator, Administrator

Mode
Exec > ACS Configuration > CFP Configuration

active-charging service service_name > content-filtering category policy-id cf_policy_id

Entering the above command sequence results in the following prompt:

[local]host_name(config-acs-content-filtering-policy)#

Syntax

failure-action { allow | content-insert content_string | discard | redirect-url url |
terminate-flow | www-reply-code-and-terminate-flow reply_code } [ edr edr_format_name ]

default failure-action [ edr edr_format_name ]

default

Configures the default setting of discard.

allow

In static content filtering, this option allows the request for content. In dynamic content filtering it allows the content itself.

Important: Static-and-Dynamic Content Filtering is only supported in 9.0 and later releases.

content-insertion content_string

Specifies the content string to be inserted in place of the message returned from the content server due to connection timeout or when no category policy ID is available for the content. For content filtering, the content_string is used to create a response to the subscriber’s attempt to get content. In dynamic content filtering it replaces the content returned by a server. content_string is an alphanumeric string of 1 through 1023 characters.

Important: Static-and-Dynamic Content Filtering is only supported in 9.0 and later releases.

discard

In static content filtering, specifies discarding the packet(s) that requested. In dynamic content filtering it discards the packet(s) that contain the content.
Important: Static-and-Dynamic Content Filtering is only supported in 9.0 and later releases.

**redirect-url**  
`url`  
Redirects the subscriber to the specified URL.  
`url` must be an alphanumeric string of 1 through 1023 characters, in the following format:  
http://search.com/subtarg=#HTTP.URL#

**terminate-flow**  
Terminates the TCP connection gracefully between the subscriber and external server and sends a TCP FIN to the subscriber and a TCP RST to the server.

**www-reply-code-and-terminate-flow**  
`reply_code`  
Sets action as terminate-flow with a reply code that is a 3-digit integer from 100 through 599.

**edr**  
`edr_format_name`  
Specifies the name of a pre-defined EDR format to be generated on the content filtering action as an alphanumeric string of 1 through 63 characters.

### Usage

Use this command to set the failure action to take when no content filtering analysis result is available to analyze for `analyze priority priority category category_string` command.

### Example

The following command sets the failure action as `discard`:

```
failure-action discard
```
timeout action

This command has been deprecated, and is replaced by the failure-action command.
Chapter 52
Content Filtering Server Group Configuration Mode Commands

Content Filtering Server Group Configuration Mode sets the parameters for interoperating with a group of external servers. It is accessed by entering the `content-filtering server-group` command in the Context Configuration Mode.

**Mode**

Exec > Global Configuration > Context Configuration > CFSG Configuration

configure > context context_name > content-filtering server-group server_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-content-filtering)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
connection retry-timeout

Configures the TCP connection retry timer for Internet Content Adaptation Protocol (ICAP) server and client.

Product
CF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > CFSG Configuration
configure > context context_name > content-filtering server-group server_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-content-filtering)#

Syntax

connection retry-timeout duration

{ default | no } connection retry-timeout

default

Configures the default setting of 30 seconds.

no

Removes the connection retry timeout configuration.

duration

Specifies the duration (in seconds) as an integer from 1 to 3600. Default: 30

Usage

Use this command to configure the connection retry timer between ICAP server and client TCP connection, i.e. how long to wait before re-attempting to establish a TCP connection.

Example

The following command sets the ICAP client and server connection retry timer to 120 seconds:

connection retry-timeout 120
deny-message

Configures the text message that is returned to the subscriber in a deny response.

Important: This command is obsolete in 10.0 and later releases.

Product
CF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > CFSG Configuration

```
configure > context context_name > content-filtering server-group server_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-content-filtering)#
```

Syntax

```
deny-message string
```

{ default | no } deny-message

- **default**
  
  Configures the default setting of Disabled.

- **no**
  
  Removes previously configured deny message setting.

- **string**
  
  Specifies a text message that is to be returned to the subscriber in a deny response as an alphanumeric string of 1 through 511 characters.

Usage

Use this command to define a text message that is returned to the subscriber in a deny response.

Example

The following command sets the text message to `no_Authorization` in a deny message:

```
deny-message no_Authorization
```
deny-response code

Configures the deny response message that is to be sent from the ICAP server to the subscribers.

Product
ICAP

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > CFSG Configuration

configure > context context_name > content-filtering server-group server_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-content-filtering)#

Syntax

deny-response code { 200 message string | 403 }

{ default | no } deny-response code

deny-response code 200 message string

Specifies a text message that is to be returned to the subscriber in a code 200 deny response. as an alphanumeric string of 1 through 511 characters. If deny-response code 200 is configured, the response sent to the subscriber will be of the form 200 OK with deny messages denied. If a message is configured for response code 200, that message will be used instead of "Access denied".

deny-response code 403

This keyword is used to set response code 403 for the deny response message. When this keyword is configured, the deny response from the ICAP server will be sent “as is” to the subscriber.

Usage
Use this command to define a text message that is returned to the subscriber in a deny response.

Example

The following command sets the text message to Not allowed in a deny response message:

deny-response code 200 message Not allowed
dictionary

Specifies the dictionary to use for requests to the server(s) in this Content Filtering Server Group (CFSG).

Product
CF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > CFSG Configuration

class > context context_name > content-filtering server-group server_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-content-filtering)#

Syntax

dictionary { custom1 | custom2 | standard }
{ default | no } dictionary

---

default
Sets the default dictionary.
Default: default

---

no
Removes the previously configured dictionary setting.

---

custom1
Specifies a custom-defined dictionary that conforms to TS 32.015 v 3.6.0 for R99. It provides proprietary header fields for MSISDN and APN/subscriber. Please contact your local Cisco representative for more information.

---

custom2
Custom-defined dictionary. Please contact your local Cisco representative for additional information.

---

custom3
Custom-defined dictionary. Please contact your local Cisco representative for additional information.

---

standard
Default: Enabled
This dictionary uses an HTTP Get Request to specify the URL. It conforms to TS 32.215 v 4.6.0 for R4 (and also R5 - extended QoS format).
**Usage**

Use this command to specify the standard and customized encoding mechanism used for elements included messages.

**Example**

The following command configures the system to use standard dictionary to encode messages:

```
default dictionary
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

`exit`

**Usage**

Use this command to return to the parent configuration mode.
failure-action

Specifies the actions to be taken when communication between ICAP endpoints within this Content Filtering Server Group (CFSG) fail.

Product
CF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > CFSG Configuration

configure > context context_name > content-filtering server-group server_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-content-filtering)#

Syntax

failure-action { allow | content-insertion content_string | discard | redirect-url url | terminate-flow }

{ default | no } failure-action

default
Configures the default setting of terminate-flow.

no
Removes previously configured failure action.

allow
For static content filtering, this option allows the request for content. In dynamic content filtering, it allows the content itself.

content-insertion content_string
Specifies the content string to be used for failure action.
For static content filtering, the specified text is used to create a response to the subscriber’s attempt to get content. In dynamic content filtering, the specified text replaces the content returned by a server.
content_string must be an alphanumeric string of 1 through 128 characters.

discard
For static content filtering, this option discards the packet(s) requested. In dynamic content filtering, it discards the packet(s) that contain(s) the content.

redirect-url url
Redirects the subscriber to the specified URL.
url must be an alphanumeric string of 1 through 128 characters in the following format:

http://search.com/subtarg=$HTTP.URL$

terminate-flow

For TCP, gracefully terminates the connection between the subscriber and external server, and sends a TCP FIN to the subscriber and a TCP RST to the server.
For WAP-Connection Oriented, the WSP session is gracefully terminated by sending WTP Aborts for each of the outstanding requests, and WSP Disconnect to the client and the server. For WSP-Connectionless, only the current WSP request is rejected.

Usage

Use this command to set the actions on failure for server connection.
ICAP rating is enabled for retransmitted packets when the default ICAP failure action was taken on an ICAP request for that flow. ICAP default failure action is taken on the pending ICAP request for a connection when the connection needs to be reset and there is no other redundant connection available. For example, in the ICAP request timeout and ICAP connection timeout scenarios, the retransmitted packet in the uplink direction is sent for ICAP rating again.
For WAP CO, uplink retransmitted packets for the WAP transactions for which ICAP failure action was taken will be sent for ICAP rating. The WSP header of the retransmitted packet is not parsed by the WSP analyzer. The URL received in the previous packet for that transaction is used for ICAP rating. If failure action was taken on multiple WTP transactions for the same flow (case: WTP concatenated GET request), the uplink retransmitted packet for each of the transactions is sent for rating again.
For HTTP, uplink retransmitted packets for the HTTP flow on which ICAP failure action is taken are sent for ICAP rating. The URL present in the current secondary session (last uplink request) is used for ICAP rating. However, if there were multiple outstanding ICAP requests for the same flow (pipelined request), the retransmitted packet for the URL sent for rating will be that of the last GET request.
Retransmission in various cases of failure-action taken on retransmitted packets when the ICAP response is not received for the original request and the retransmitted request comes in:

• WSP CO:
  • Permit: The uplink packet is sent for ICAP rating and depending on the ICAP response the WTP transaction is allowedblocked. It is possible that the WAP gateway sends the response for the permitted GET request. Hence, there is a race condition and the subscriber may be able to view the web page even thought the rating was redirect or content insert.
  • Content Insert: The retransmitted packet is not sent for ICAP rating.
  • Redirect: The retransmitted packet is not sent for ICAP rating.
  • Discard: The uplink packet is sent for ICAP rating and depending on the ICAP response the WTP transaction is allowedblocked.
  • Terminate flow: The uplink packet is sent for ICAP rating and depending on the ICAP response the WTP transaction is allowed or blocked. The WAP gateway may send an Abort transaction for this GET request if the WSP disconnect packet sent while terminating the flow is received by the WAP gateway.

• HTTP:
  • Permit: The uplink packet is sent for ICAP rating and depending on the ICAP response the last HTTP GET request. It is possible that the HTTP server sends the response for the permitted GET request. Hence there is a race condition and the subscriber may be able to view the web page even thought the rating was redirect or content insert.
  • Content Insert: Retransmitted packets are dropped and not charged.
- Redirect: Retransmitted packets are dropped and not charged.
- Discard: The uplink packet is sent for ICAP rating and depending on the ICAP response the WTP transaction allowed/blocked.
- Terminate flow: Retransmitted packets will be dropped and not charged.

**Example**

The following command sets the failure action to terminate:

```
failure-action terminate-flow
```
icap server

Adds an Internet Content Adaptation Protocol (ICAP) server configuration to the current Content Filtering Server Group (CFSG).

**Important:** In 8.1 and later releases, a maximum of five ICAP servers can be configured per Content Filtering Server Group. In 8.0 and earlier releases, only one ICAP Server can be configured per Content Filtering Server Group.

**Product**
CF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CFSG Configuration

```
configure > context context_name > content-filtering server-group server_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-content-filtering)#
```

**Syntax**

```
icap server ip_address [ port port_number ] [ max messages ] [ priority priority ] [ standby ]
```

```
no icap server ip_address [ port port_number ] [ priority priority ] [ standby ]
```

**no**

Removes the specified ICAP server configuration from the current Content Filtering Server Group.

**ip_address**

Specifies the ICAP server’s IP address in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**port port_number**

Specifies the ICAP server’s port number to use for communications as an integer from 1 to 65535. Default: 1344

**max_messages**

Specifies the maximum number of unanswered outstanding messages that may be allowed to the ICAP server as an integer from 1 to 4096. Default: 256

**Important:** The maximum outstanding requests per ICAP connection is limited to one. Therefore the value configured using the **max** keyword will be ignored.
priority priority

Specifies priority of the ICAP server in the current Content Filtering Server Group. The priority is used in server selection to determine which standby server becomes active. priority must be an integer from 1 (highest priority) to 65535 (lowest priority). Default: 1

Important: The priority keyword is only available in 8.1 and later releases.

standby

Configures the ICAP server as standby. A maximum of ten active and standby servers per group can be configured.

Usage

This command is used to add an ICAP server configuration to a Content Filtering Server Group with which the system is to communicate for content filtering communication. In 8.0, the ICAP solution supports only one connection between ACS Manager and ICAP server. In 8.1, multiple ICAP server connections are supported per manager. At any time only one connection is active with the other connections acting as standby. In case of a connection failure, based on its priority, a standby connection becomes active. Any pending ICAP requests are moved to the new active connection. If a standby connection is unavailable, failure action is taken on all pending ICAP requests. See the failure-action command. In 8.1 and later releases, a maximum of five ICAP servers can be configured per Content Filtering Server Group with a priority associated with each server. Once configured, an ICAP server’s priority cannot be changed. To change a server’s priority, the server configuration must be removed, and added with the new priority. In release 16.0, a maximum of ten active and standby servers per group can be configured.

Example

The following command sets the ICAP server IP address to 10.2.3.4 and port to 1024:

    icap server 10.2.3.4 port 1024

The following command specifies an ICAP server with IP address 10.6.7.8, port number 1024, and priority 3:

    icap server 10.6.7.8 port 1024 priority 3
origin address

Specifies a bind address for the Content Filtering Server Group (CFSG) endpoint.

Product
CF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > CFSG Configuration

configure > context context_name > content-filtering server-group server_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-content-filtering)#

Syntax

origin address ip_address

no origin address

- no
  Disables/releases the binding address for the CFSG endpoint.

  __ip_address__
  Specifies the IP address to bind the CFSG endpoint in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

Usage
Use this command to set the bind address for the CFSG endpoint.

Example
The following command sets the origin address of 10.1.1.1:

origin address 10.1.1.1
response-timeout

Sets the response timeout for the ICAP connection between the ICAP server and client.

Product
CF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > CFSG Configuration
configure > context context_name > content-filtering server-group server_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-content-filtering)#

Syntax

response-timeout duration

{ default | no } response-timeout

default
Configures the default setting of 30 seconds.

no
Removes the response timeout configuration.

duration
Specifies the timeout duration (in seconds) as an integer from 1 to 300. Default: 30

Usage
Use this command to set the ICAP connection response timeout, after which connection will be marked as unsuccessful between ICAP endpoint.

Example
The following command sets the ICAP connection response timeout to 100 seconds:

response-timeout 100
timeout action

This command has been deprecated, and is replaced by the failure-action command.
url-extraction

Enables configuration of ICAP URL extraction behavior.

Product
CF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > CFSG Configuration
configure > context context_name > content-filtering server-group server_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-content-filtering)#

Syntax

url-extraction { after-parsing | raw }
default url-extraction

---
default
default
Configures the default setting of after-parsing.

---

after-parsing

Specifies sending the parsed URI and host name. Percent-encoded hex characters in URLs sent from the ACF client to the ICAP server will be converted to corresponding ASCII characters before being sent. For example, the URL: http://www.google.co.uk/?this%20is%20a%20test will be sent to the ICAP server as:

http://www.google.co.uk/?this is a test

---

raw

Specifies sending raw URI and host name. The URLs will contain percent-encoded hex characters “as is”. For example, the URL http://www.google.co.uk/?this%20is%20a%20test will be sent to the ICAP server as:

http://www.google.co.uk/?this%20is%20a%20test

---

Usage

Use this command to configure the ICAP URL extraction behavior. Percent-encoded hex characters—for example, space (%20) and the percent character (%25)—in URLs sent from the ACF client to the ICAP server can be sent either as percent-encoded hex characters or as their corresponding ASCII characters.

---

Example

The following command configures URLs sent from the ACF client to the ICAP server to contain the escape encoding as is:

    url-extraction raw
Chapter 53
Context Configuration Mode Commands A-D

This section includes the commands `aaa accounting` through `domain` service.

Mode

Exec > Global Configuration > Context Configuration

`configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
aaa accounting

This command enables/disables accounting for subscribers and context-level administrative users for the current context.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

aaa accounting { administrator radius-diameter | subscriber [ radius-diameter ] }

default aaa accounting { administrator | subscriber }

no aaa accounting { administrator | subscriber } [ radius-diameter ]

default
Configures the default setting.
Default: RADIUS

no
Disables AAA accounting per the options specified.

radius-diameter
Enables AAA accounting for context-level administrative users.

subscriber
Enables AAA accounting for subscribers.

radius-diameter
Enables RADIUS or Diameter accounting for subscribers.

Usage
Use this command to enable/disable accounting for subscribers and context-level administrative users for the current context.
To enable or disable accounting for individual local subscriber configurations refer to the accounting-mode command in the Subscriber Configuration Mode Commands chapter.
**Important:** The accounting parameters in the APN Configuration Mode take precedence over this command for subscriber sessions. Therefore, if accounting is disabled using this command but enabled within the APN configuration, accounting is performed for subscriber sessions.

**Example**

The following command disables AAA accounting for context-level administrative users:

```plaintext
no aaa accounting administrator
```

The following command enables AAA accounting for context-level administrative users:

```plaintext
aaa accounting administrator radius-diameter
```
aaa authentication

This command enables/disables authentication for subscribers and context-level administrative users for the current context.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] aaa authentication { administrator | subscriber } { local | none | radius-diameter }

default aaa authentication { administrator | subscriber }

default

Configures the default setting for the specified parameter.

• administrator: local+RADIUS
• subscriber: RADIUS

no

Disables AAA authentication for administrator(s)/subscribers as specified.

• local: Disables local authentication for current context.
• none: Disables NULL authentication for current context, which enables both local and RADIUS-based authentication.
• radius-diameter: Disables RADIUS or Diameter-based authentication.

administrator | subscriber

• administrator: Enables authentication for administrative users.
• subscriber: Enables authentication for subscribers.

local | none | radius-diameter

Enables AAA authentication for administrator(s)/subscribers as specified.

• local: Enables local authentication for the current context.
• none: Disables authentication for the current context.
• radius-diameter: Enables RADIUS or Diameter-based authentication.
Usage

Use this command to enable/disable AAA authentication during specific maintenance activities or during test periods. The authentication can then be enabled again for the entire context as needed.

Example

The following command disables RADIUS or Diameter-based authentication for subscribers for the current context:

```plaintext
no aaa authentication subscriber radius-diameter
```

The following command enables RADIUS or Diameter-based authentication for subscribers for the current context:

```plaintext
aaa authentication subscriber radius-diameter
```
aaa constructed-nai

This command configures the password used during authentication for sessions using a Constructed Network Access Identifier (NAI) or an APN-specified user name.

Product
PDSN
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

aaa constructed-nai authentication [ [ encrypted ] password user_password | use-shared-secret-password ]

no aaa constructed-nai authentication

no

Disables authentication based upon the constructed NAI.

[ encrypted ] password user_password

encrypted: Specifies that the user password should be encrypted.
password user_password: Specifies an authentication password for the NAI-constructed user.
In 12.1 and earlier releases, the user_password must be an alphanumeric string of 0 through 63 characters with or without encryption.
In 12.2 and later releases, the user_password must be an alphanumeric string of 0 through 63 characters without encryption, or 1 through 132 characters with encryption.

use-shared-secret-password

Specifies using RADIUS shared secret as the password. Default: No password

Usage

This command configures passwords for user sessions that utilize a constructed NAI assigned via a PDSN service or a user name assigned via the APN configuration.
For simple IP sessions facilitated by PDSN services in which the authentication allow-noauth and aaa constructed-nai commands are configured, this command provides a password used for the duration of the session.
For PDP contexts using an APN in which the outbound user name is configured with no password, this command is used to provide the password. Additionally, this command is also used to provide a password for
situations in which an outbound username and password are configured and the authentication imsi-auth command has been specified. The encrypted keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the password keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

If a password is configured with this keyword, then the specified password is used. Otherwise, an empty user-password attribute is sent.

Note that this configuration works in a different way for GGSN services. If a password is configured with this keyword for GGSN service, the specified password is used. Otherwise, if an outbound password is configured, that password is used. If no outbound password is configured, the RADIUS server secret is used as the user-password string to compute the user-password RADIUS attribute.

The NAI-construction consists of the subscriber’s MSID, a separator character, and a domain. The domain that is used is either the domain name supplied as part of the subscriber’s user name or a domain alias.

### Important:
The domain alias can be set with the nai-construction domain command in the PDSN Service Configuration mode, or the aaa default-domain subscriber command in the Global Configuration mode for other core network services.

The domain alias is determined according to the following rules:

- If the domain alias is set by nai-construction domain, that value is always used and the aaa default-domain subscriber value is disregarded, if set. The NAI is of the form `<msid><symbol><nai-construction domain>`.  
- If the domain alias is not set by nai-construction domain, and the domain alias is set by aaa default-domain subscriber, the aaa default-domain subscriber value is used. The NAI is of the form `<msid><symbol><aaa default-domain subscriber>`.  
- If the domain alias is not set by nai-construction domain or aaa default-domain subscriber, the domain name alias is the name of the source context for the PDSN service. The NAI is of the form `<msid><symbol><source context of PDSN Service>`.  

The special separator character can be one of the following six: @, ~, %, \, /  
The subscriber’s MSID is constructed in one of the formats displayed in the following figure.
### Mobile Country Code
(3 digits)

### Mobile Network Code
(2 or 3 digits)

### Mobile Subscriber Identification Number
(10 digits max)

#### International Mobile Station Identity (IMSI)

<table>
<thead>
<tr>
<th>Area Code</th>
<th>Office Code</th>
<th>Subscriber Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>(3 digits)</td>
<td>(3 digits)</td>
<td>(4 digits)</td>
</tr>
</tbody>
</table>

#### Mobile Identification Number (MIN)

<table>
<thead>
<tr>
<th>Mobile Country Code</th>
<th>Mobile Network Code</th>
<th>Subscriber Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>(3 digits)</td>
<td>(1 digit)</td>
<td>(6 digits)</td>
</tr>
</tbody>
</table>

#### International Roaming MIN (IRM)

**Example**

The following command configures the authentication password for the NAI-constructed user.

```
aaa constructed-nai authentication
```
aaa filter-id rulebase mapping

This command configures the system to use the value of the Filter-Id AVP as the ACS rulebase name.

Product
ACS

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no | default ] aaa filter-id rulebase mapping

no
Disables the mapping of Filter-Id AVP and ACS rulebase name.

default
Configures the default setting. Default: Disabled

Usage
Use this command to enable the mapping of Filter-Id attribute’s value returned during RADIUS authentication as the ACS rulebase name.
This feature provides the flexibility for operator to transact between multi-charging-service support for postpaid and prepaid subscribers through Access Control Lists (ACLs) entered in AAA profiles in RADIUS server to single-charging-service system based on rulebase configuration for postpaid and prepaid subscribers.
This feature internally maps the received ACL in to rulebase name and configures subscriber for postpaid or prepaid services accordingly.
When this feature is enabled and ACS rulebase attribute is not received from RADIUS or not configured in local default subscriber template system copies the filter-id attribute value to ACS rulebase attribute.
This copying happens only if the filter-id is configured and received from RADIUS server and ACS rulebase is not configured in ACS or not received from RADIUS.

Example
The following command enables the mapping value of the Filter-Id attribute to ACS rulebase name:

aaa filter-id rulebase mapping
aaa group

This command enables/disables the creation, configuration or deletion of AAA server groups in the context.

**Product**

All

**Privilege**

aaa group group_name [ -noconfirm ]
no aaa group group_name
```

- `no`
  Deletes the specified AAA group.

- `group_name`
  Specifies name of the AAA group.
  If the specified AAA group does not exist, it is created, and the prompt changes to the AAA Server Group Configuration Mode, wherein the AAA group can be configured.
  If the specified AAA group already exists, the prompt changes to the AAA Server Group Configuration Mode, wherein the AAA group can be configured.
  `group_name` must be an alphanumeric string of 1 through 63 characters.

- `-noconfirm`
  Executes the command without any prompt and confirmation from the user.

**Usage**

Use this command to create/configure/delete AAA server groups within the context.

Entering this command results in the following prompt:

```
[context_name]host_name(config-aaa-group)#
```

AAA Server Group Configuration Mode commands are defined in the *AAA Server Group Configuration Mode Commands* chapter.

**Example**

The following command enters the AAA Server Group Configuration Mode for a AAA group named `test321`:

```
aaa group test321
```
aaa nai-policy

This command sets policies on how Network Access Identifiers (NAIs) are handled during the authentication process.

**Product**
- GGSN
- PDSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration
  - configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ default | no ] aaa nai-policy reformat-alg-hex-0-9
```

- **default**
  - Sets the NAI policy back to its default setting which is to remap hexadecimal digits in NAIs and accept calls with embedded 0x00 hexadecimal digits.

- **no**
  - Disable remapping of hexadecimal digits in the NAI and reject calls that have a 0x00 hexadecimal digit embedded in the NAI.

- **reformat-alg-hex-0-9**
  - Default: Enabled
  - Controls remapping of NAIs that consist only of hex digits 0x00 through 0x09 or if a 0x00 hexadecimal digit is embedded in the NAI.
  - By default, the system remaps NAIs that consist solely of characters 0x00 through 0x09 to their ASCII equivalent. For example; 0x00 0x01 0x02 0x03 will get remapped to 123.
  - Also by default the system accepts an NAI containing one or more 0x00 characters within the NAI ignoring all characters after the first 0x00.
  - When this keyword is disabled NAIs are processed as follows:
    - Remapping of hexadecimal digits 0x00 through 0x09 within the user-provided NAI is disabled.
    - When the NAI has an embedded 0x00 character anywhere within it (including if there is an extra 0x00 character at the end) the call is rejected.

**Usage**

Use this command to disable or re-enable remapping of hexadecimal digits in the NAI.

**Example**

The following command disables the remapping of hexadecimal digits in the NAI:
no aaa nai-policy reformat-alg-hex-0-9
access-list undefined

Configures the behavior of access control for the current context when an undefined access control list is specified.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
access-list undefined { deny-all | permit-all }
{ default | no } access-list undefined
```

- **default**
  Configures the default setting.

- **no**
  Disables handling undefined access lists.

- **deny-all**
  Specifies to drop all packets when an undefined ACL is specified.

- **permit-all**
  Specifies to forward all packets when an undefined ACL is specified.

**Usage**

Use this command to specify the default behavior when an ACL specified does not exist. When the security policies require strict access control the **deny-all** handling should be configured.

**Example**

The following command sets the packet handling to ignore (drop) all packets when an undefined ACL is specified.

```
access-list undefined deny-all
```
administrator

Configures a user with Security Administrator privileges in the current context.

Product
All

Privilege
Security Administrator

Mode
Exec > Global Configuration > Context Configuration

*configure > context context_name*

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

Syntax

```
administrator user_name [ encrypted ] [ nopassword ] password password | [ ecs ] [ expiry-date date_time ] [ ftp [ sftp-server sftp_name ] ] [ li-administration ] [ nocli ] [ noecs ] [ timeout-absolute timeout_absolute ] [ timeout-min-absolute timeout_min_absolute ] [ timeout-idle timeout_idle ] [ timeout-min-idle timeout_min_idle ]
```

no administrator user_name

Removes Security Administrator privileges for the specified user name.

```
user_name
```

Specifies the username for which Security Administrator privileges must be enabled in the current context.

`user_name` must be an alphanumeric string of 1 through 32 characters.

```
[ encrypted ] password password
```

Specifies password for the user name. Optionally, the *encrypted* keyword can be used to specify the password uses encryption.

*password* must be an alphanumeric string of 1 through 63 characters without encryption, and 1 through 132 characters with encryption.

The *encrypted* keyword is intended only for use by the system while saving configuration scripts. The system displays the *encrypted* keyword in the configuration file as a flag that the variable following the *password* keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

```
[ nopassword ]
```

This option allows you to create an administrator without an associated password. Enable this option when using ssh public keys (*authorized key* command in SSH Configuration mode) as a sole means of authentication. When enabled this option prevents someone from using an administrator password to gain access to the user account.
ecs
Permits the user to use ACS-specific configuration commands. Default: Permitted

expiry-date date_time
Specifies the date and time that this login account expires.
Enter the date and time in the YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss format. Where
YYYY is the year, MM is the month, DD is the day of the month, HH is the hour, mm is minutes, and ss is
seconds.

ftp
Permits the user to use FTP and SFTP. Default: Not permitted

[ sftp-server sftp_name ]
Assigns an optional root directory and access privilege to this user. sftp_name must have been previously
created via the SSH Server Configuration mode subsystem sftp command.

li-administration
Refer to the Lawful Intercept Configuration Guide for a description of this parameter.

nocli
Prevents the user from using the command line interface. Default: Permitted

noecs
Prevents the user from accessing ACS-specific commands.

timeout-absolute timeout_absolute

Important: This keyword is obsolete. It has been left in place for backward compatibility. If used, a warning is
issued and the value entered is rounded to the nearest whole minute.

Specifies the maximum time, in seconds, the Security Administrator may have a session active before the
session is forcibly terminated. timeout_absolute must be an integer from 0 through 30000000. The
value 0 disables this timeout configuration. Default: 0

timeout-min-absolute timeout_min_absolute
Specifies the maximum time (in minutes) the Security Administrator may have a session active before the
session is forcibly terminated. timeout_min_absolute must be an integer from 0 through 525600. The
value 0 disables this timeout configuration. Default: 0

timeout-idle timeout_idle

Important: This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is
issued and the value entered is rounded to the nearest whole minute.
Specifies the maximum time, in seconds, the Security Administrator may have a session active before the session is terminated. `timeout_idle` must be an integer from 0 through 30000000. The value 0 disables the idle timeout configuration. Default: 0

```
timeout-min-idle timeout_min_idle
```
Specifies the maximum time, in minutes, the Security Administrator may have a session active before the session is terminated. `timeout_min_idle` must be an integer from 0 through 525600. The value 0 disables the idle timeout configuration. Default: 0

**Usage**
Use this command to create new Security Administrators or modify existing user’s settings. Security Administrator users have read-write privileges and full access to all contexts and command modes. Refer to the *Command Line Interface Overview* chapter for more information.

**Important:** A maximum of 128 administrative users and/or subscribers may be locally configured per context.

**Example**
The following command creates a Security Administrator account named `user1` with access to ACS configuration commands:

```
administrator user1 password secretPassword
```

The following removes the Security Administrator account named `user1`:

```
no administrator user1
```
apn

Creates or deletes Access Point Name (APN) templates and enters the APN Configuration Mode within the current context.

Product
GGSN
P-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] apn apn_name [ -noconfirm ]

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Deletes a previously configured APN template.</td>
</tr>
<tr>
<td>apn_name</td>
<td>Specifies a name for the APN template as an alphanumeric string of 1 through 62 characters that is case insensitive. It may also contain dots (.) and/or dashes (-).</td>
</tr>
<tr>
<td>-noconfirm</td>
<td>Executes the command without any additional prompt and confirmation from the user.</td>
</tr>
</tbody>
</table>

Caution: If this keyword option is used with the no apn apn_name command, the APN named apn_name will be deleted with all active/inactive subscribers without prompting any warning or confirmation.

Usage
This command creates an APN within the system and causes the CLI to enter the APN Configuration Mode. The APN is a logical name for a packet data network and/or a service to which the system supports access. When a create PDP context request is received by the system, it examines the APN information element within the packet. The system determines if an APN with the identical name is configured. If so, the system uses the configuration parameters associated with that APN as a template for processing the request. If the names do not match, the request is rejected with a cause code of 219 (DBH, Missing or unknown APN).

- Up to 1000 APNs can be configured in the GGSN.
- In StarOS v12.x and earlier, up to 1024 APNs can be configured in the P-GW.
In StarOS v14.0 and later, up to 2048 APNs can be configured in the P-GW (SAEGW).

**Example**

The following command creates an APN template called `isp1`:

```bash
apn isp1
```
**asn-qos-descriptor**

Creates, deletes or manages the Quality of Service (QoS) descriptor table identifier for Access Service Node Gateway (ASN-GW) service and enters the ASN QoS Descriptor Table Identifier Configuration mode within the source context.

**Product**
ASN-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
 asn-qos-descriptor id qos_table_id [ default ] dscp [ be | af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af 43 | ef ] [ -noconfirm ]

no asn-qos-descriptor qos_table_id [ default ] dscp [ be | af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af 43 | ef ] [ -noconfirm ]
```

`no`

Deletes a previously configured ASN QoS descriptor table identifier.

```
id qos_table_id
```

Specifies a unique identifier for ASN QoS descriptor table to create/configure. `qos_table_id` must be an integer from 1 through 65535.

```
[ default ] dscp
```

Specifies DSCP marking for this QoS descriptor.

```
[ be | af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af 43 | ef ]
```

The DSCP marking for this QoS descriptor. Default value is be (best effort).

```
-noconfirm
```

Executes the command without any additional prompt and confirmation from the user.

⚠️ **Caution:** If this keyword option is used with `no asn-qos-descriptor id qos_table_id` command, the ASN QoS descriptor table with identifier `qos_table_id` will be deleted with all active/inactive configurations without prompting any warning or confirmation.
Usage

Use this command to configure a QoS description table to manage QoS functionality for an ASN-GW service subscriber. This command creates and allows the configuration of QoS tables within a context. This command can also be used to remove previously configured ASN-GW services QoS descriptor table. A maximum of 16 QoS Descriptor Tables can be configured per system. Refer to the ASN QoS Descriptor Configuration Mode Commands chapter of this reference for additional information.

Example

The following command creates a QoS descriptor table with identifier 1234 for the ASN-GW service subscribers:

```
asn-qos-descriptor id 1234
```
asn-service-profile

Creates, deletes or manages the Service Profiles Identifier for Access Service Node Gateway (ASN-GW) service subscribers and enters the ASN Service Profile Configuration mode within the current context.

**Product**
ASN-GW

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```plaintext
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```plaintext
asn-service-profile id asn_profile_id direction { bi-directional | downlink | uplink } [ activation-trigger { activate | admit | dynamic-reservation | provisioned } [ -noconfirm ]

no asn-service-profile id asn_profile_id [ -noconfirm ]
```

- **no**
  Deletes a previously configured ASN service profile identifier.

- **id asn-profile_id**
  Specifies a unique identifier for ASN profile to create/configure.

- **direction { bi-directional | downlink | uplink }**
  Specifies the direction of data traffic to apply this service profile.
  - **bi-directional**: Enables this service profile in both direction of uplink and downlink.
  - **downlink**: Enables this service profile in downlink direction, towards the subscriber.
  - **uplink**: Enables this service profile in uplink direction, towards the system.

- **activation-trigger { activate | admit | dynamic-reservation | provisioned }**
  Use this option to configure the activation-trigger for the asn-service-profile. Default: provisioned | admit | activate

- **-noconfirm**
  Executes the command without any additional prompt and confirmation from the user.

**Caution:** If this keyword option is used with `no asn-service-profile id asn_profile_id` command, the ASN service profile with identifier `asn_profile_id` will be deleted with all active/inactive configurations without prompting any warning or confirmation.
Usage
Use this command to configure a service profile to apply the ASN-GW service subscribers. This command creates and allows the configuration of service profiles with in a context. This command is also used to remove previously configured ASN-GW services profiles. A maximum of 32 ASN Service Profiles can be configured per context. Refer to the ASN Service Profile Configuration Mode Commands chapter of this reference for additional information.

Example
The following command creates an ASN Service Profile with identifier 1234 for the ASN-GW service subscribers:

    asn-service-profile id 1234 direction uplink
asngw-service

Creates, deletes or manages an Access Service Node Gateway (ASN-GW) service and enters the ASN Gateway Service Configuration Mode within the current context.

Product
ASN-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

asngw-service asngw_name [ -noconfirm ]

no asn-service asngw_name

no
Deletes a previously configured ASN-GW service.

asngw_name
Specifies the name of the ASN-GW service to create/configure as an alphanumeric string of 1 through 63 characters that is case sensitive.

Important: Service names must be unique across all contexts within a chassis.

-noconfirm
Executes the command without any additional prompt and confirmation from the user.

Caution: If this keyword option is used with no asn-service asngw_name command, the ASN-GW service named asngw_name will be deleted with all active/inactive subscribers without prompting any warning or confirmation.

Usage

Services are configured within a context and enable certain functionality. This command creates and allows the configuration of services enabling the system to function as an ASN Gateway in a WiMAX network. This command is also used to remove previously configured ASN-GW services. A maximum of 256 services (regardless of type) can be configured per system.
Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Refer to the ASN Gateway Service Configuration Mode Commands chapter of this reference for additional information.

Example

The following command creates an ASN-GW service name `asn-gw1`:

```
asngw-service asn-gw1
```
asnpc-service

Creates, deletes or manages an ASN Paging Controller service to manage the ASN paging controller service and enters the ASN Paging Controller Configuration mode within the current context.

Product
ASN-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] asnpc-service asn_pc_svc_name [ -noconfirm ]

no
Deletes a previously configured ASN paging controller service.

asnpc-service asn_pc_svc_name
Specifies the name of the ASN Paging Controller Service to create and enable as an alphanumeric string of 1 through 63 characters that is case sensitive.

Important: Service names must be unique across all contexts within a chassis.

-noconfirm
Executes the command without any additional prompt and confirmation from the user.

Caution: If this keyword option is used with no asnpc-service asn_pc_svc_name command, the ASN Paging Controller service named asn_pc_svc_name will be deleted and disabled with all active/inactive paging groups and paging agents configured in a context for ASN paging controller service without prompting any warning or confirmation.

Usage
Use this command to create and enable the ASN paging controller services in the system to provide functionality of an ASN Paging Controller service within a context. Additionally this command provides the access to the ASN Paging Controller Service Configuration mode and also used to remove previously configured ASN Paging Controller services. A maximum of 256 services (regardless of type) can be configured per system.
Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Example

The following command creates an ASN paging controller service name `asnpc_1`:

```
asnpc-service asnpc_1
```
associate

Associate a global QoS Level 2 mapping table to a VPN context.

Product
- ePDG
- HSGW
- P-GW
- SAEGW
- S-GW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name] host_name (config)#

Syntax

associate l2-mapping-table name map_table_name

default associate l2-mapping-table

default

Associates the system-default table with this context.

name map_table_name

Specifies the name of an existing internal table from which to map QoS to L2 values.

map_table_name is an alphanumeric string of 0 through 80 characters.

Usage

This command is used to associate an internal QoS L2 mapping table to a VPN context. If no explicit association is created/configured, the system-default mapping table is used.

Important: If an l2-mapping-table association is made at both the VRF and VPN level, the VRF level takes precedence.

Example

The mapping table is configured via the Global Configuration mode qos l2-mapping-table command.

The following command associates an internal QoS L2 mapping table to a VPN context:

associate l2-mapping-table qostable1
atcf

This command enables Access Transfer Control Function (ATCF) functionality for the context. Default is disabled.

Product

SCM: P-CSCF, A-BG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] atcf policy name atcf_policy_name [ -noconfirm ]

no

If previously configured, deletes the specified ATCF policy in the context.

atcf_policy_name

Specifies the name of the ATCF policy.
atcf_policy_name must be an alphanumeric string of 1 through 79 characters.

-noconfirm

Executes the command without any prompt and confirmation from the user.

Usage

Use this command to create/configure/delete an ATCF policy.
On entering this command, the CLI prompt changes to:
[context_name]host_name(config-atcf-atgw-policy)#

Refer to the CSCF ATCF-ATGW Policy Configuration Mode Commands chapter for additional information.

Example

The following command creates an ATCF Policy named access and enters the ATCF-ATGW Policy Configuration mode:

atcf policy name access
**bfd-protocol**

Enables or disables Bidirectional Forwarding Detection (BFD) protocol and enters the BFD Configuration mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
[ no ] bfd-protocol
```

**Usage**

Use this command to set configuration parameters for detecting faults in paths established with BFD-enabled routers.

Refer to the *BFD Configuration Mode Commands* chapter for additional information.

**Example**

The following command enables BFD Configuration mode:

```
bfd-protocol
```
**bgp extended-asn-cap**

Enables or disables the router to send 4-octet ASN capabilities.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```
[ no ] bgp extended-asn-cap
```

*no*

Disables the ability of the router to send 4-octet ASN capabilities.

**Example**

The following command enables the router to send 4-octet ASN Capabilities:

```
bgp extended-asn-cap
```
**bmsc-profile**

Creates or deletes Broadcast Multicast Service Center (BM-SC) profiles and enters the BMSC Profile Configuration Mode within the current context.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] bmsc-profile name bmsc_profile_name [ -noconfirm ]
```

- **no**
  Deletes a previously configured BM-SC profile.

- **name bmsc_profile_name**
  Specifies a name for the BM-SC profile as an alphanumeric string of 1 through 62 characters that is case insensitive. It may also contain dots (.) and/or dashes (-).

- **-noconfirm**
  Executes the command without any additional prompt and confirmation from the user.

**Caution:** If this keyword option is used with no bmsc-profile name bmsc_profile_name command, the BM-SC profile named bmsc_profile_name is deleted with all active/inactive subscribers without prompting any warning or confirmation.

**Usage**

Use this command to create a BM-SC profile within the context and take the user to enter the BMSC Profile Configuration Mode.

The BM-SC profile is a logical name for a Broadcast Multicast Service Center in Multimedia Broadcast and Multicast service.

BM-SC profile should be created/configured within contexts on the system. Up to four BM-SC profiles can be configured.

**Example**

The following command creates a BM-SC Profile called mbms_sc_1:

```
bmsc-profile name mbms_sc_1
```
busyout ip

Makes addresses from an IPv4 pool in the current context unavailable once they are free.

**Product**
- GGSN
- HA
- NAT
- PDSN
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration
- `configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-ctx)#
```

**Syntax**

```
[ no ] busyout ip pool { all | all-dynamic | all-static | name pool_name } [ address-range start_address end_address | lower-percentage percent | upper-percentage percent ]
```

- **no**
  Disables the busyout command specified.

- **ip**
  Configure IPv4 busyout information.

- **pool**
  Configure IPv4 pool busyout information.

- **all**
  Applies to all IPv4 pools in the current context.

- **all-dynamic**
  Applies to all dynamic IPv4 pools in the current context.

- **all-static**
  Applies to all static IPv4 pools in the current context.
name pool_name

Applies the named IP pool or IP pool group in the current context. pool_name must be the name of an existing IP pool or IP pool group in the current context.

address-range start_address end_address

Busyout all addresses from start_address through end_address. start_address: The beginning IP address of the range of addresses to busyout entered in IPv4 dotted-decimal notation. end_address: The ending IP address of the range of addresses to busyout. This IP address must exist in the pool specified and entered in IPv4 dotted-decimal notation.

lower-percentage percent

Busyout the percentage of IPv4 addresses specified, beginning at the lowest numbered IP address. This is a percentage of all of the IP addresses in the specified IP pool. percent must be an integer from 1 through 100.

upper-percentage percent

Busyout the percentage of IPv4 addresses specified, beginning at the highest numbered IP address. This is a percentage of all of the IPv4 addresses in the specified IP pool. percent must be an integer from 1 through 100.

Usage

Use this command to busyout IPv4 addresses when resizing an IPv4 pool. Up to 32 instances of this command can be executed per context. A single instance of this command can busy-out multiple IPv4 address pools in the context through the use of the all, all-static, or all-dynamic keywords.

Example

Assume an IPv4 pool named Pool10 with addresses from 192.168.100.1 through 192.168.100.254. To busy out the addresses from 192.168.100.50 through 192.169.100.100, enter the following command:

    busyout ip pool name Pool10 address-range 192.168.100.50 192.169.100.100

To restore the IPv4 addresses from the previous example and make them accessible again, enter the following command:

    no busyout ip pool name Pool10 address-range 192.168.100.50 192.169.100.100
busout ipv6

Makes addresses from an IPv6 pool in the current context unavailable once they are free.

Product
- GGSN
- HA
- NAT
- PDSN
- P-GW
- SAEGW

Privilege
- Security Administrator, Administrator

Mode
- Exec > Global Configuration > Context Configuration
  
  configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] busyout ipv6 pool { all | all-dynamic | all-static | name pool_name } [ address-range start_address end_address | lower-percentage percent | upper-percentage percent ]

no
Disables the busyout command specified.

ipv6
Configure IPv6 busyout information.

pool
Configure IPv6 pool busyout information.

all
Applies to all IPv6 pools in the current context.

all-dynamic
Applies to all dynamic IPv6 pools in the current context.

all-static
Applies to all static IPv6 pools in the current context.
name pool_name

Applies the named IPv6 pool or IPv6 pool group in the current context. pool_name must be the name of an existing IPv6 pool or IPv6 pool group in the current context.

address-range start_address end_address

Busyout all addresses from start_address through end_address. start_address: The beginning IP address of the range of addresses to busyout entered in IPv6 colon-separated-hexadecimal notation. end_address: The ending IP address of the range of addresses to busyout. This IP address must exist in the pool specified and entered in IPv6 colon-separated-hexadecimal notation.

lower-percentage percent

Busyout the percentage of IP addresses specified, beginning at the lowest numbered IPv6 address. This is a percentage of all of the IP addresses in the specified IP pool. percent must be an integer from 1 through 100.

upper-percentage percent

Busyout the percentage of IP addresses specified, beginning at the highest numbered IPv6 address. This is a percentage of all of the IP addresses in the specified IP pool. percent must be an integer from 1 through 100.

Usage

Use this command to busyout IPv6 addresses when resizing an IPv6 pool. Up to 32 instances of this command can be executed per context. A single instance of this command can busy-out multiple IP address pools in the context through the use of the all, all-static, or all-dynamic keywords.

Example

Assume an IP pool named Pool12. To busy out the addresses from 2700:2010:8003:: through 2700:2010:8003::, enter the following command:

```
busyout ipv6 pool name Pool12 address-range 2700:2010:8003::
2700:2010:8003::
```

To restore the IPv6 addresses from the previous example and make them accessible again, enter the following command:

```
no busyout ipv6 pool name Pool10 address-range 2700:2010:8003::
2700:2010:8003::
```
cae-group

Creates a CAE group, which is a CAE server cluster that services TCP video requests from the Mobile Video Gateway. The Mobile Video Gateway uses the configured CAE group for CAE load balancing. The CAE (Content Adaptation Engine) is an optional component of the Mobile Videoscape.

Product
MVG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] cae-group cae_group_name [ -noconfirm ]

no cae_group_name

Deletes the CAE group if previously configured.

da cae_group_name

Creates the specified CAE group and enters the Video Group Configuration Mode. cae_group_name is an alphanumeric string of 1 through 79 characters.

-noconfirm

Executes the command without any prompt and confirmation from the user.

Usage

Use this command to create a CAE group and enter the Video Group Configuration Mode. This command gets issued from the Context Configuration Mode.

Example

The following command creates a CAE group named group_1 and enters the Video Group Configuration Mode:

   cae-group group_1
camel-service

Creates an instance of the Customized Applications for Mobile Enhanced Logic (CAMEL) service and enters the CAMEL service configuration mode. This mode configures or edits the configuration for the parameters which control the CAMEL functionality on the SGSN.

**Important:** For details about the commands and parameters, check the CAMEL Service Configuration Mode chapter.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

`configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] camel-service srvc_name
```

no

Remove the configuration for the specified SGSN service from the configuration of the current context.

`srvc_name`

Creates a CAMEL service instance having a unique name expressed as an alphanumeric string of 1 through 63 characters.

**Important:** Service names must be unique across all contexts within a chassis.

**Usage**

Use this command to create, edit, or remove an CAMEL service

**Example**

The following command creates an CAMEL service named `camel1` in the current context:

```
camel-service camel1
```

The following command removes the CAMEL service named `camel2` from the configuration for the current context:

```
no camel-service camel2
```
cbs-service

Creates a new Cell Broadcasting Service (CBS) or specifies an existing CBS and enters the CBS Configuration Mode.

Product
HNB-GW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] cbs-service name

no

Removes the specified CBS service from the context.

name

Specifies the name of a new or existing CBS service as an alphanumeric string of 1 through 63 characters that must be unique within the same context and across all contexts.

Important: Service names must be unique across all contexts within a chassis.

Usage

Use this command to create a new CBS service or modify an existing one.

CBS Configuration Mode commands are defined in the CBS Configuration Mode Commands chapter of this guide.

Example

Following command creates a new CBS service names test-cbs in the context configuration mode:

cbs-service test-cbs
cipher-suite

Creates a new SSL cipher suite or specifies an existing cipher suite and enters the Cipher Suite Configuration Mode.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] cipher-suite name

no
Removes the specified SSL cipher suite from the context.

name
Specifies the name of a new or existing SSL cipher suite as an alphanumeric string of 1 through 127 characters that must be unique across all CSCF services within the same context and across all contexts.

Usage
Use this command to create a new SSL cipher suite or modify an existing one.

Important: One SSL cipher suite can be created per SSL template.

A cipher suite contains the cryptographic algorithms supported by the client, and defines a key exchange and a cipher spec, which specifies the encryption and hash algorithms used during authentication. SSL cipher suites allow operators to select levels of security and to enable communication between devices with different security requirements.

Entering this command results in the following prompt:

[context_name]host_name(cfg-ctx-cipher-suite)#

Cipher Suite Configuration Mode commands are defined in the Cipher Suite Configuration Mode Commands chapter.

Example

The following command specifies the SSL cipher suite cipher_suite_1 and enters the Cipher Suite Configuration Mode:

cipher-suite cipher_suite_1
class-map

Creates or deletes a class map. If the class-map is newly created, the system enters the Class-Map Configuration Mode within the current destination context to configure the match rules for packet classification to flow-based traffic policing for a subscriber session flow.

Product
ASN-GW
HA
HSGW
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] class-map name class_name [ match-all | match-any ]

no
Deletes configured Class-Map within the context.

class_name
Specifies the name of Class-Map rule as an alphanumeric string of 1 through 15 characters and is case sensitive.

match-all
Default: Enabled.
Enables AND logic for all matching parameters configured in specific Class-Map to classify traffic flow/packets. It indicates to match all classification rules in specific Class-Map to consider the specified Class-Map as a match.

match-any
Default: Disabled.
Enables OR logic for matching parameters configured in specific Class-Map to classify traffic flow/packets. It indicates to match any of the classification rule in specific Class-Map to consider the specified Class-Map as a match.
Usage
Use this command to enter in Class-Map Configuration Mode to set classification parameters or filters in traffic policy for a subscriber session flow.

Important: In this mode classification rules added sequentially with match command to form a Class-Map. To change and/or delete or re-add a particular rule entire Class-Map is required to delete.

Example
Following command configures classification map class_map1 with option to match any condition in match rule.

```
class-map name class_map1 match-any
```
closedrp-rp handoff

Enables or disables session handoff between Closed-RP and RP connections. Default: Disabled

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ default | no ] closedrp-rp handoff

default

Resets the command to its default setting of disabled.

no

Disables Closed-RP to RP session handoff.

Usage
Use this command to enable a PDSN service to handoff sessions between Closed-RP and RP connections.

Example
To enable Closed-RP to RP handoffs, use the following command:

closedrp-rp handoff

To disable Closed-RP to RP handoffs, use the following command:

no closedrp-rp handoff
**config-administrator**

Configures a context-level configuration administrator account within the current context.

**Product**
All

**Privilege**
Security Administrator

**Mode**
Exec > Global Configuration > Context Configuration
`configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
config-administrator user_name [ encrypted ] [ nopassword ] password [ password ] [ ecs ] [ expiry-date date_time ] [ ftp [ sftp-server sftp_name ] ] [ li-administration ] [ nocli ] [ noecs ] [ timeout-absolute abs_seconds ] [ timeout-min-absolute abs_minutes ] [ timeout-idle timeout_duration ] [ timeout-min-idle idle_minutes ]
```

**no config-administrator user_name**

**no**

Removes a previously configured context-level configuration administrator account.

**user_name**

Specifies the name for the account as an alphanumeric string of 1 through 32 characters.

```
[ encrypted ] password [ password ]
```

Specifies the password to use for the user which is being given context-level administrator privileges within the current context. The encrypted keyword indicates the password specified uses encryption.

`password` is an alphanumeric string of 1 through 63 characters without encryption, or 1 through 127 characters with encryption.

The encrypted keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the password keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

```
[ nopassword ]
```

This option allows you to create a configuration administrator without an associated password. Enable this option when using ssh public keys (authorized key command in SSH Configuration mode) as a sole means of authentication. When enabled this option prevents someone from using a configuration administrator password to gain access to the user account.
ecs
Permits the user access to ACS-specific configuration commands. Default: Enhanced Charging Service (ECS / ACS) specific configuration commands allowed.

expiry-date  date_time
Specifies the date and time that this account expires in the format YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss.
Where YYYY is the year, MM is the month, DD is the day of the month, HH is the hour, mm is minutes, and ss is seconds.

ftp
Indicates the user gains FTP and SFTP access with the administrator privileges. Default: FTP and SFTP are not allowed.

[ sftp-server  sftp_name ]
Assigns an optional root directory and access privilege to this user. sftp_name must have been previously created via the SSH Server Configuration mode subsystem sftp command.

li-administration
Refer to the Lawful Intercept Configuration Guide for a description of this parameter.

nocli
Indicates the user is not allowed to access the command line interface. Default: CLI access allowed.

noecs
Prevents the specific user from accessing ACS-specific configuration commands.

timeout-absolute  abs_seconds

**Important:** This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.

Specifies the maximum amount of time (in seconds) that the administrator may have a session active before the session is forcibly terminated. abs_seconds must be an integer from 0 through 300000000. The value 0 disables the absolute timeout. Default: 0

timeout-min-absolute  abs_minutes

Specifies the maximum amount of time (in minutes) the context-level administrator may have a session active before the session is forcibly terminated. abs_minutes must be an integer from 0 through 525600 (365 days). The value 0 disables the absolute timeout. Default: 0

timeout-idle  timeout_duration

**Important:** This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.
Specify the maximum amount of idle time, in seconds, the context-level administrator may have a session active before the session is terminated. `timeout_duration` must be a value in the range from 0 through 300000000. The value 0 disables the idle timeout. Default: 0

```shell
timeout-min-idle idle_minutes
```

Specifies the maximum amount of idle time, in minutes, the context-level administrator may have a session active before the session is terminated. `idle_minutes` must be a value in the range from 0 through 525600 (365 days). The value 0 disables the idle timeout. Default: 0

**Usage**

Create new context-level configuration administrators or modify existing administrator’s options, in particular, the timeout values.

Configuration administrator users have read-write privileges and full access to all contexts and command modes except for security functions. Refer to the *Command Line Interface Overview* chapter of this guide for more information.

**Important:** A maximum of 128 administrative users and/or subscribers may be locally configured per context.

**Example**

The following configures a context-level administration named `user1` with ACS parameter control:

```shell
cfg-administrator user1 password secretPassword ecs
```

The following command removes a context-level administrator named `user1`:

```shell
no cfg-administrator user1
```
### content-filtering

Enables or disables the creation, configuration or deletion of Content Filtering Server Groups (CFSG).

**Product**

CF

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
content-filtering server-group cf_server_group_name [ -noconfirm ]
```

* no content-filtering server-group cf_server_group_name

    * no
      
      Removes the specified CFSG previously configured in this context.

    * server-group cf_server_group_name
      
      Specifies the name of the CFSG as an alphanumeric string of 1 through 63 characters.

    * -noconfirm
      
      Executes the command without any prompt and confirmation from the user.

**Usage**

Use this command to create/configure/delete a CFSG.

**Example**

The following command creates a CFSG named CF_Server1:

```
content-filtering server-group CF_Server1
```
credit-control-service

Enables or disables the creation, configuration or deletion of credit-control services.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

credit-control-service service_name [ -noconfirm ]

no credit-control-service service_name

no
Deletes the specified credit-control service.

service_name

Specifies name of the credit-control service as an alphanumeric string of 1 through 63 characters.
If the named credit-control service does not exist, it is created, and the CLI mode changes to the Credit Control Service Configuration Mode wherein the service can be configured.
If the named credit-control service already exists, the CLI mode changes to the Credit Control Service Configuration Mode wherein the service can be configured.

Important: Service names must be unique across all contexts within a chassis.

-noconfirm
Executes the command without any additional prompt and confirmation from the user.

Usage

Use this command to create, configure or delete credit-control services.
Entering this command results in the following prompt:

[context_name]host_name(config-credit-control-service)

Credit control Service Configuration commands are described in the Credit Control Service Configuration Mode Commands chapter.

Example

The following command enters the Credit Control Service Configuration Mode for a credit-control service named test159:
credit-control-service test159
crypto dns-nameresolver

Enables or disables the reverse DNS query from a Security Gateway to DNS.

Product
All IPsec security gateway products

Important: This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

Privilege
Security Administrator

Mode
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

Syntax

```
[ no ] crypto dns-nameresolver
```

- **no**
  Disables the Reverse DNS query.

Usage

Use this command to enable or disable the reverse DNS query from a WSG to DNS.

Important: You must configure the DNS client prior to enabling the Reverse DNS query.

Example

The following command enables the reverse DNS query:

```
crypto dns-nameresolver
```
crypto group

Creates or deletes a crypto group and enters the Crypto Configuration Mode allowing the configuration of crypto group parameters.

Product

HA
GGSN
PDIF
PDSN

Privilege

Administrator, Config-Administrator

Mode

Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] crypto group group_name

- **no**
  - Deletes a previously configured crypto group.

- **group_name**
  - Specifies the name of the crypto group as an alphanumeric string of 1 through 127 characters that is case sensitive.

**Important:** A maximum of 32 crypto groups per context can be configured.

Usage

Use this command to enter the configuration mode allowing the configuration of crypto group parameters. Crypto (tunnel) groups are used to support the Redundant IPSec Tunnel Fail-over feature and consist of two configured ISAKMP crypto maps. Each crypto map defines the IPSec policy for a tunnel. In the crypto group, one tunnel serves as the primary, the other as the secondary (redundant).

Example

The following command configures a crypto group called *group1*:

```
crypto group group1
```
crypto ipsec transform-set

Configures transform-sets on the system and enters the Crypto IPSec Transform Set Configuration Mode.

**Product**
- PDSN
- PDIF
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration
- `configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
crypto ipsec transform-set transform_name [ ah { hmac { md5-96 | none | sha1-96 } } esp { hmac { { md5-96 | sha1-96 } } cipher { 3des-cbc | aes-cbc-128 | aes-cbc-256 | des-cbc } | none } ] ]

no crypto ipsec transform-set transform_name
```

**no**

Removes a previously configured transform set

**transform_name**

Specifies the name of the transform set as an alphanumeric string of 1 through 127 characters that is case sensitive.

**ah hmac**

Configures the Authentication Header (AH) hash message authentication codes (HMAC) parameter for the transform set to one of the following:
- **md5-96**: Message Digest 5 truncated to 96 bits
- **sha1-96**: Secure Hash Algorithm-1 truncated to 96 bits

**esp hmac**

Configures the Encapsulating Security Payload (ESP) hash message authentication codes (HMAC) parameter for the transform set to one of the following:
- **md5-96**: Message Digest 5 truncated to 96 bits
- **none**: Disables the use of the AH protocol for the transform set.
- **sha1-96**: Secure Hash Algorithm-1 truncated to 96 bits
crypto ipsec transform-set

cipher

If ESP is enabled, this option must be used to set the encapsulation cipher protocol to one of the following:

- 3des-cbc: Triple Data Encryption Standard (3DES) in chain block (CBC) mode.
- des-cbc: DES in CBC mode.

Usage

Use this command to create a transform set on the system. Transform Sets are used to define IPSec security associations (SAs). IPSec SAs specify the IPSec protocols to use to protect packets.

Transform sets are used during Phase 2 of IPSec establishment. In this phase, the system and a peer security gateway negotiate one or more transform sets (IPSec SAs) containing the rules for protecting packets. This negotiation ensures that both peers can properly protect and process the packets.

Example

Create a transform set that has the name tset1, no authentication header, an encapsulating security protocol header hash message authentication code of md5, and a bulk payload encryption algorithm of des-cbc with the following command:

    crypto ipsec transform-set tset1 ah hmac none esp hmac md5 cipher des-cbc
crypto map

Configures the name of the policy and enters the specified Crypto Map Configuration mode.

Product

- SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
 contextual_name host_name(config-ctx)#
```

Syntax

```
crypto map name [ ikev2-ipv6 | ipsec-dynamic | ipsec-ikev1 | ipsec-manual ]

no crypto map name
```

- **no**
  Removes a previously configured crypto map.

- **name**
  Specifies the name of the crypto map as an alphanumeric string of 1 through 127 characters that is case sensitive.

- **ikev2-ipv6**
  Refer to the *Lawful Intercept Configuration Guide* for a description of this parameter.

- **ipsec-dynamic**
  Creates a dynamic crypto map and/or enters the Crypto Map Dynamic Configuration Mode.

- **ipsec-ikev1**
  Creates an IKEv1 crypto map and/or enters the Crypto Map IKEv1 Configuration Mode.

- **ipsec-manual**
  Creates a manual crypto map and/or enters the Crypto Map Manual Configuration Mode.
Usage

Crypto Maps define the policies that determine how IPSec is implemented for subscriber data packets. There are several types of crypto maps supported by the system. They are:

- **Manual crypto maps**: These are static tunnels that use pre-configured information (including security keys) for establishment. Because they rely on statically configured information, once created, the tunnels never expire; they exist until their configuration is deleted.

**Important**: Because manual crypto map configurations require the use of static security keys (associations), they are not as secure as crypto maps that rely on dynamically configured keys. Therefore, it is recommended that they only be configured and used for testing purposes.

- **IKEv1 crypto maps**: These tunnels are similar to manual crypto maps in that they require some statically configured information such as the IP address of a peer security gateway and that they are applied to specific system interfaces. However, IKEv1 crypto maps offer greater security because they rely on dynamically generated security associations through the use of the Internet Key Exchange (IKE) protocol.

- **IKEv2-IPv6 cryptomaps**: Refer to the *Lawful Intercept Configuration Guide* for a description of this parameter.

- **Dynamic crypto maps**: These tunnels are used for protecting L2TP-encapsulated data between the system and an LNS/security gateway or Mobile IP data between an FA service configured on one system and an HA service configured on another.

**Important**: The crypto map type (dynamic, IKEv1, IKEv2-IPv6, or manual) is specified when the map is first created using this command.

Example

Create a dynamic crypto map named `map1` and enter the Crypto Map Dynamic Configuration Mode by entering the following command:

```
crypto map map1 ipsec-dynamic
```
crypto template

Creates a new or specifies an existing crypto template and enters the Crypto Template Configuration Mode.

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

crypto template name ikev2-dynamic

no crypto template name

no

Removes a previously configured crypto template.

name ikev2-pdif

Specifies the name of a new or existing crypto template as an alphanumeric string of 1 through 127 characters.

ikev2-dynamic

Configures the Crypto Template to be used for configuring IPSec functionality.

Usage

Use this command to create a new or enter an existing crypto template.

Entering this command results in the following prompt:

[context_name]host_name(config-crypto-tmpl-ikev2-tunnel)#

Crypto Template Configuration Mode commands are defined in the Crypto Template Configuration Mode Commands chapter.

Example

The following command configures an IKEv2 dynamic crypto template called crypto1 and enters the Crypto Template Configuration Mode:
crypto template crypto1 ikev2-dynamic
cscf access-profile

Creates a new or enters an existing access profile used to set signaling compression for various network access types.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration
cfg > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

cscf access-profile { default | name profile_name } [ -noconfirm ]

no cscf access-profile name profile_name

Usage
Use this command to create an access profile for the CSCF service and cause the system to enter the Access Profile Configuration Mode where parameters are configured for the profile.

Entering this command results in the following prompt:

[context_name]hostname(config-cscf-access-profile)#

Access Profile Configuration Mode commands are defined in the CSCF Access Profile Configuration Mode Commands chapter.

Example
The following command creates a CSCF Access Profile named profile2 and enters the Access Profile Configuration Mode:

```
cscf access-profile name profile2
```
cscf acl

Creates an Access Control List (ACL) and enters the ACL Configuration Mode.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cxt)#

Syntax

cscf acl { default | name list_name } [ -noconfirm ]

no cscf acl name list_name

no

Removes the CSCF ACL from the context.

default

Specifies that the system is to enter the ACL Configuration Mode for the default ACL.

name list_name

Specifies a name for the ACL as an alphanumeric string of 1 through 47 characters.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

Usage

Use this command to create an access control list for the CSCF service and cause the system to enter the ACL Configuration Mode where parameters are configured for the new list.

Entering this command results in the following prompt:

[context_name]host_name(config-cscf-acl)#

ACL Configuration Mode commands are defined in the CSCF ACL Configuration Mode Commands chapter.

Use this command when configuring the following SCM components: P-CSCF, S-CSCF, and SIP Proxy.

Example

The following command creates a CSCF access control list named acl1 and enters the ACL Configuration Mode:

cscf acl name acl1
cscf diameter-selection

Creates a CDF or HSS diameter selection table and enters the CSCF Diameter Selection Configuration Mode.

**Product**
SCM (S-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] cscf diameter-selection type { cdf | hss } [ -noconfirm ]
```

- **no**
  - Removes the specified CDF or HSS diameter selection table.

- **type { cdf | hss }**
  - Specifies the type of diameter selection table.
    - **cdf**: Diameter selection table for selecting CDF server
    - **hss**: Diameter selection table for selecting HSS server

- **-noconfirm**
  - Executes the command without any additional prompt and confirmation from the user.

**Usage**

Use this command to cause the system to enter the Diameter Selection Configuration Mode where parameters are configured for the diameter group.

**Important:** When HSS table has entries, this criteria is always applied for HSS server selection. CDF server selection, however, can be enabled or disabled for a given access type.

Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-diameter-selection)#
```

Diameter Selection Configuration Mode commands are defined in the **CSCF Diameter Selection Configuration Mode Commands** chapter.

Use this command when configuring the S-CSCF.

**Example**
The following command creates an HSS diameter selection table and enters the Diameter Selection Configuration Mode:

```
cscf diameter-selection type hss
```
cscf ifc-filter-criteria

Creates Initial Filter Criteria (iFC) filter criteria for shared iFC functionality.

**Product**

SCM (S-CSCF, SIP Proxy)

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
cscf ifc-filter-criteria id fc_id priority priority [ profile-part-indicator { registered | unregistered } ] app-server uri scheme { sip | sips } as as-default-handling { session-continue | session-terminate } [ -noconfirm ] [ include-reg-request ] [ include-reg-response ] [ service-info info ] [ trigger-point tp_id ]
```

```
no cscf ifc-filter-criteria id fc_id
```

- **id** *fc_id*
  Specifies an ID for the iFC filter criteria as an integer from 1 through 200.

- **priority** *priority*
  Specifies the priority of the filter criteria, which is used to select a particular filter criteria from multiple ones present under an ISC template. *priority* must be an integer from 0 through 1024.

- **profile-part-indicator** { registered | unregistered }
  Indicates whether the iFC is a part of the registered or unregistered user profile. If a value is not specified, then the configuration will be applied to both registered and unregistered subscribers.

- **app-server uri scheme** { sip | sips }
  Determines the associated application server’s URI scheme.
  - *sip*: SIP URI
  - *sips*: SIPS URI (TLS)

- **as**
  Specifies an address for the associated application server as an alphanumeric string of 1 through 127 characters.

- **no**
  Removes the specified CSCF iFC filter criteria from the context.
as-default-handling { session-continue | session-terminate }
Determines whether the dialog should be released (session-terminate) or not (session-continue) when the application server could not be reached or on application server error is returned.

-noconfirm
Executes command without any additional prompt and confirmation from the user.

include-reg-request
Specifies inclusion of UE's REGISTER to be included in 3rd party REGISTER request.

include-reg-response
Specifies inclusion of UE's 200OK to be included in 3rd party REGISTER response.

service-info info
Specifies optional service information to be sent to the application server. info is an alphanumeric string of 1 trough 63 characters.

trigger-point tp_id
Assigns an iFC trigger point to the filter criteria as an integer from 1 through 200.

Usage
Use this command to create a filter criteria ID and associate an application server address to it. You may also define a trigger point ID to be executed in order to select the application server. If no trigger point is specified, then the application server is selected unconditionally.

Important: Filter criteria is associated with an ISC template in the ISC Template Configuration Mode.

Important: Filter criteria can be assigned to more than one ISC template.

Example
The following command creates a iFC filter criteria 15, which has a priority of 2 and is part of the registered user profile. Filter criteria 15 is assigned to a sip application server named appserver. The dialog will not be released if the application server can not be reached. Filter criteria 15 is also assigned trigger point 12:

cscf ifc-filter-criteria id 15 priority 2 profile-part-indicator registered app-server uri scheme sip appserver as-default-handling session-continue trigger-point 12
**cscf ifc-spt-condition**

Creates an Initial Filter Criteria (iFC) Service Point Trigger (SPT) condition for shared iFC functionality.

**Product**

Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
cscf ifc-spt-condition id cond_id { request-uri content uri_content | session-case { originating-registered | originating-unregistered | terminating-registered | terminating-unregistered } | session-description sdp [ content sdp_data ] | sip-header hdr [ content hdr_data ] | sip-method method } [ -noconfirm ] [ condition-negated ]
```

```
no cscf ifc-spt-condition id cond_id
```

**no**
Removes the specified CSCF iFC SPT condition from the context.

```
id cond_id
```
Specifies an ID for the iFC SPT condition as an integer from 1 through 200.

```
request-uri content uri_content
```
Specifies request URI content as an alphanumeric string of 1 through 127 characters.

**Important**: Wildcard Extended Regular Expressions (ERE) are supported for this value. For example, "sip:user[0-9]@192\168\176\150"

```
session-case { originating-registered | originating-unregistered | terminating-registered | terminating-unregistered }
```
Determines the type of session:

- **originating-registered**: Session handling an originating end user.
- **originating-unregistered**: Session handling an unregistered originating end user.
- **terminating-registered**: Session handling a terminating registered end user.
- **terminating-unregistered**: Session handling a terminating unregistered end user.
session-description sdp [ content sdp_data ]

Specifies an SDP line type.  
*sdp* is an alphanumeric string of 1 through 15 characters.  
*content* specifies content on the SDP line.  
*sdp_data* is an alphanumeric string of 1 through 127 characters.

sip-header hdr [ content hdr_data ]

Specifies a header type.  
*hdr* is an alphanumeric string of 1 through 127 characters.  
*content* specifies content on the header.  
*hdr_data* is an alphanumeric string of 1 through 127 characters.

sip-method method

Specifies a sip method.  
*method* is an alphanumeric string of 1 through 127 characters.

--noconfirm

Executes the command without any additional prompt and confirmation from the user.

condition-negated

Negates the specified condition.

Usage

Use this command to create individual SPT conditions that are later associated with an SPT group in the iFC
SPT Group Configuration Mode.

**Important:** An iFC SPT group maybe associated with multiple SPT conditions.

Example

The following command creates iFC SPT condition 10 which handles an originating end user:

```
cscf ifc-spt-condition id 10 session-case originating-registered
```

The following command negates the condition created above:

```
cscf ifc-spt-condition id 10 session-case originating-registered condition-negated
```
cscf ifc-spt-group

Creates an Initial Filter Criteria (iFC) Service Point Trigger (SPT) group for shared iFC functionality.

**Product**
SCM (S-CSCF, SIP Proxy)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration

Available in context:

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
cscf ifc-spt-group id group_id [  [ -noconfirm ]  | reg-type { de-registration | initial-registration | re-registration } [ -noconfirm ] ]
```

```
no cscf ifc-spt-group id group_id
```

**Usage**
Use this command to create an iFC SPT group ID and bind different SPT conditions under it.

**Important:** An iFC SPT group may be associated with multiple SPT conditions.

The SPT group can also specify the registration type that defines whether the SPT condition matches to REGISTER messages that are related to:

- de-registration
- initial-registration
- re-registration

**Syntax**

```
cscf ifc-spt-group id group_id [  [ -noconfirm ]  | reg-type { de-registration | initial-registration | re-registration } [ -noconfirm ] ]
```

```
no cscf ifc-spt-group id group_id
```

**Usage**
Use this command to create an iFC SPT group ID and bind different SPT conditions under it.

**Important:** An iFC SPT group may be associated with multiple SPT conditions.
iFC SPT Group Configuration Mode commands are defined in the *CSCF IFC SPT Group Configuration Mode Commands* chapter.

**Example**

The following command creates iFC SPT group 21:

```
cscf ifc-spt-group id 21
```
cscf ifc-trigger-point

Creates an Initial Filter Criteria (iFC) trigger point for shared iFC functionality.

**Product**
SCM (S-CSCF, SIP Proxy)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
cscf ifc-trigger-point id tp_id condition-type { cnf | dnf } [ -noconfirm ]
```

```
no cscf ifc-trigger-point id tp_id
```

**no**
Removes the specified CSCF iFC trigger point from the context.

```
id tp_id
```
Specifies an ID for the iFC trigger point as an integer from 1 through 200.

```
condition-type { cnf | dnf }
```
Defines the condition type of the iFC trigger point:
- cnf: conjunctive normal form
- dnf: disjunctive normal form

```
-noconfirm
```
Executes the command without any additional prompt and confirmation from the user.

**Usage**

Use this command to create a trigger point ID and bind different SPT groups under it.

**Important:** An iFC SPT group can be assigned to more than one iFC trigger point.

Entering this command results in the following prompt:

```
[context_name]host_name(config-cscf-ifc-trigger-point)#
```

IFC Trigger Point Configuration Mode commands are defined in the *CSCF IFC Trigger Point Configuration Mode Commands* chapter.
Example

The following command creates iFC trigger point 11 with a cnf condition type:

```plaintext
cscf ifc-trigger-point id 11 condition-type cnf
```
cscf isc-template

Creates an IMS Service Control (ISC) template and enters the ISC Template Configuration Mode.

Product
SCM (S-CSCF)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] cscf isc-template id template_id

no

Removes the CSCF ISC template from the context.

cscf isc-template id template_id

Specifies an ID for the ISC template as an integer from 1 through 200.

Usage

Use this command to create an ISC template for the CSCF service and cause the system to enter the ISC Template Configuration Mode where parameters are configured for the new template.

Entering this command results in the following prompt:

[context_name]hostname(config-cscf-isc-tmpl)#

ISC Template Configuration Mode commands are defined in the CSCF ISC Template Configuration Mode Commands chapter.

Use this command when configuring the following SCM component: S-CSCF.

Example

The following command creates ISC template 10 and enters the ISC Template Configuration Mode:

   cscf isc-template id 10
cscf last-route-profile

Creates a last route profile, which will be specified on peer server configuration to select the Last Routing Option (LRO) number while forwarding an emergency call packet to a particular peering server, and enters the Last Route Profile Criteria Configuration Mode.

Product
SCM

Privilege
Administrator

Syntax

cscf last-route-profile name profile_name criteria { county-name | round-robin } [ -noconfirm ]

no cscf last-route-profile name profile_name

no
Removes the specified CSCF last route profile from the context.

name profile_name
Specifies the name of the last route profile as an alphanumeric string of 1 through 79 characters.

criteria { county-name | round-robin }

county-name: Profile specific to the county-name criteria. Entering this command results in the following prompt:

[context_name]hostname(config-county-name-lro-profile)#

Last Route Profile Criteria Configuration Mode commands are defined in the CSCF Last Route Profile Criteria Configuration Mode Commands chapter.

round-robin: Profile specific to the round-robin criteria. Entering this command results in the following prompt:

[context_name]hostname(config-round-robin-lro-profile)#

Last Route Profile Criteria Configuration Mode commands are defined in the CSCF Last Route Profile Criteria Configuration Mode Commands chapter.

-noconfirm
Executes the command without any additional prompt and confirmation from the user.

Usage

Use this command to create a last route profile and enter the Last Route Profile Criteria Configuration Mode.
**Important:** Last route profiles are associated with peer servers in the CSCF Peer Server Monitoring Configuration Mode.

Use this command when configuring the following SCM components: S-CSCF and SIP Proxy.

The following command creates a last route profile named *lro1* and enters the CSCF Last Route Profile Criteria Configuration Mode to specify county name criteria:

```
cscf last-route-profile name lro1 criteria county-name
```

The following command creates a last route profile named *lro2* and enters the CSCF Last Route Profile Criteria Configuration Mode to specify round robin criteria:

```
cscf last-route-profile name lro2 criteria round-robin
```
**cscf peer-servers**

Creates a peer server type for next-hop session routing and enters the Peer Servers Configuration Mode.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration
```
configure > context context_name
```
Entering the above command sequence results in the following prompt:
```
[context_name]host_name(config-ctx)#
```

**Syntax**
```
cscf peer-servers server_name type { type } [ -noconfirm ]
```
```
no cscf peer-servers server_name
```

---

**no**
Removes the specified CSCF peer server from the context.

**server_name**
Specifies the name of the peer server as an alphanumeric string of 1 through 79 characters.

**type { type }**
Specifies the type of peer server to configure:
- **bgcf**: Border Gateway Control Function
- **ecscf**: Emergency Call/Session Control Function
- **ibcf**: Interconnect Border Control Function
- **icscf**: Interrogating Call/Session Control Function
- **mgcf**: Media Gateway Control Function
- **mrfc**: Media Resource Function Controller
- **other**: Other Function
- **pcscf**: Proxy Call/Session Control Function
- **scscf**: Serving Call/Session Control Function
- **sip-as**: Session Initiation Protocol-Application Server

**-noconfirm**
Executes the command without any additional prompt and confirmation from the user.
Usage
Use this command to create a specific peer server and enter the Peer Servers Configuration Mode where connectivity parameters can be entered.
Entering this command results in the following prompt:

```
[context_name] hostname(config-cscf-peer-servers) #
```

Peer Servers Configuration Mode commands are defined in the CSCF Peer Servers Configuration Mode Commands chapter.
Use this command when configuring the following SCM components: E-CSCF, P-CSCF, S-CSCF, and SIP Proxy.

Example
The following command creates an I-CSCF server type called *icscf_peer1* and enters the Peer Servers Configuration Mode:

```
cscf peer-servers icscf_peer1 type icscf
```
cscf peer-servers-group

Creates a peer servers group and enters the Peer Servers Group Configuration Mode.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

cscf peer-servers-group group_name type { bgcf | ecscf | ibcf | icscf | mgcf | mrfc | other | pcscf | scscf | sip-as } [ -noconfirm ]

no cscf peer-servers-group group_name

removes the specified CSCF peer servers group from the context.

group_name

Specifies the name of the peer servers group as an alphanumeric string of 1 through 79 characters.

type { bgcf | ecscf | ibcf | icscf | mgcf | mrfc | other | pcscf | scscf | sip-as }

Specifies the type of peer servers group to configure.

bgcf: Border Gateway Control Function
ecscf: Emergency Call/Session Control Function
ibcf: Interconnect Border Control Function
icscf: Interrogating Call/Session Control Function
mgcf: Media Gateway Control Function
mrfc: Media Resource Function Controller
other: Other Function
pcscf: Proxy Call/Session Control Function
scscf: Serving Call/Session Control Function
sip-as: Session Initiation Protocol-Application Server

-noconfirm

Executes the command without any additional prompt and confirmation from the user.
Usage

Use this command to create a specific peer servers group and enter the Peer Servers Group Configuration Mode where peer servers lists can be managed.

Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-peer-servers-group)#
```

Peer Servers Group Configuration Mode commands are defined in the CSCF Peer Servers Group Configuration Mode Commands chapter.

Example

The following command creates a peer servers group called `group1` and enters the Peer Servers Group Configuration Mode:

```
cscf peer-servers-group group1 type sip-as
```
cscf policy

Creates a policy group for specific AoR profiles and enters the Policy Configuration Mode.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration
`configure > context context_name`
Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
cscf policy { default | name policy_name [ -noconfirm ] }  
nocscf policy name policy_name
```

-no

Removes the specified CSCF policy group from the context.

**default**
Specifies that the system is to enter the AoR Policy Rules Configuration Mode for the default policy. The default policy uses AoR policy rules. Entering this command results in the following prompt:

```
[context_name]host_name(config-aor-policy)#
```

Default (AoR) Policy Configuration Mode commands are defined in the **CSCF AoR Policy Rules Configuration Mode Commands** chapter.

**name policy_name**
Specifies the name of the policy group as an alphanumeric string of 1 through 79 characters. Entering this command results in the following prompt:

```
[context_name]host_name(config-cscf-policy)#
```

Policy Configuration Mode commands are defined in the **CSCF Policy Configuration Mode Commands** chapter.

- **-noconfirm**
Executes the command without any additional prompt and confirmation from the user.

**Usage**

Use this command to create a policy group and enter either the AoR Policy Rules Configuration Mode (**default**) or Policy Configuration Mode (**name policy_name**). Use this command when configuring the following SCM components: P-CSCF, S-CSCF, and SIP Proxy.

**Example**

Command Line Interface Reference, StarOS Release 17
The following command creates a policy group named `group2` and enters the CSCF Policy Configuration Mode:

```
cscf policy name group2
```
**cscf prefix-table**

Creates a CSCF prefix table and enters the CSCF Prefix Table Configuration Mode.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] cscf prefix-table
```

- **no**
  - Removes the prefix table.

**Usage**

Use this command to create a CSCF prefix table and cause the system to enter the Prefix Table Configuration Mode. The prefix table is used to configure for each number (or number prefix) whether it is ported and the SIP routing domain.

Entering this command results in the following prompt:

```
[context_name]host_name(config-cscf-prefix-table)#
```

Prefix Table Configuration Mode commands are defined in the *CSCF Prefix Table Configuration Mode Commands* chapter.

**Example**

The following command creates a CSCF prefix table and enters the Prefix Table Configuration Mode:

```
cscf prefix-table
```
**cscf routes**

Creates a route group for specifying routing information and enters the Routes Configuration Mode.

**Product**

SCM

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration

`configure > context context_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-ctx)#`

**Syntax**

```
cscf routes { default | name route_name [ -noconfirm ] }
no cscf routes name route_name
```

- **default**
  Specifies that the system is to enter the Routes Configuration Mode for the default route group.

- **name route_name**
  Specifies the name of the route group as an alphanumeric string of 1 through 79 characters.

- **-noconfirm**
  Executes the command without any additional prompt and confirmation from the user.

**Usage**

Use this command to create a route group and enter the Routes Configuration Mode.

Entering this command results in the following prompt:

`[context_name]host_name(config-cscf-route)#`

Routes Configuration Mode commands are defined in the *CSCF Routes Configuration Mode Commands* chapter.

Use this command when configuring the following SCM components: P-CSCF, S-CSCF, SIP Proxy.

**Example**

The following command creates a route group named `route_group5` and enters the Route Group Configuration Mode:

```
cscf routes name route_group5
```
cscf service

Creates a CSCF service or specifies an existing CSCF service and enters the CSCF Service Configuration Mode for the current context.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] cscf service service_name [ -noconfirm ]

no
Removes the specified CSCF service from the context.

service_name
Specifies the name of the CSCF service. If service_name does not refer to an existing service, the new service is created if resources allow.

service_name is an alphanumeric string of 1 through 63 characters.

Important: Service names must be unique across all contexts within a chassis.

-noconfirm
Executes the command without any additional prompt and confirmation from the user.

Usage
Enter the CSCF Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:
CSCF Service Configuration Mode commands are defined in the *CSCF Service Configuration Mode Commands* chapter.
Use this command when configuring the following SCM components: P-CSCF, S-CSCF, SIP Proxy.

**Example**

The following command enters the existing CSCF Service Configuration Mode (or creates it if it does not already exist) for the service named `cscf-service1`:

```
csf service cscf-service1
```

The following command will remove `cscf-service1` from the system:

```
no csf service cscf-service1
```
cscf session-template

Creates a session template and/or enters the Session Template Configuration Mode.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

```
cscf session-template { default | name template_name [ -noconfirm ] }

no cscf session-template name template_name
```

- **no**
  Removes the specified CSCF session template from the context.

- **default**
  Specifies that the system is to enter the Session Template Configuration Mode for the default session template.

- **name template_name**
  Specifies a name for the template as an alphanumeric string of 1 through 79 characters.

- **-noconfirm**
  Executes the command without any additional prompt and confirmation from the user.

Usage

Use this command to create a new session template and enter the Session Template Configuration Mode or enter the mode for an existing template.

Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-session-template)#
```

Session Template Configuration Mode commands are defined in the **CSCF Session Template Configuration Mode Commands** chapter.

Use this command when configuring the following SCM components: P-CSCF, S-CSCF, SIP Proxy.

Example

The following command enters the Session Template Configuration Mode for a template named `sess_temp4`:
cscf session-template name sess_temp4
cscf subdomain-routes

Creates subdomain-route list and enters the Subdomain-route List Configuration Mode.

**Product**
SCM (I-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

**Syntax**

[ no ] cscf subdomain-routes

no

Removes the CSCF subdomain-route list from the context.

**Usage**

Use this command to create a subdomain-route list and enter the Subdomain-route List Configuration Mode. I-CSCF, upon receiving the terminating request, checks the subdomain-route list for matches. If a match is found, the routing will happen based on it. Otherwise, I-CSCF performs a User Location Query (Location-Information-Request) before proceeding.

Entering this command results in the following prompt:

[context_name]host_name(config-cscf-subdomain-route)#

Subdomain-route List Configuration Mode commands are defined in the *CSCF Subdomain-route List Configuration Mode Commands* chapter.

**Example**

The following command enters the Subdomain-route List Configuration Mode:

```
cscf subdomain-routes
```
cscf translation

Creates a translation list and enters the Translation Configuration Mode.

**Product**  
SCM

**Privilege**  
Administrator

**Mode**  
Exec > Global Configuration > Context Configuration  
configure > context  
context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
cscf translation { default | name list_name [ -noconfirm ] }

no cscf translation name list_name
```

**no**  
Removes the specified CSCF translation list from the context.

**default**  
Specifies that the system is to enter the Translation Configuration Mode for the default translation list.

**name list_name**  
Specifies a name for the translation list as an alphanumeric string of 1 through 79 characters.

**-noconfirm**  
Executes the command without any additional prompt and confirmation from the user.

**Usage**

Use this command to create a new translation list and enter the Translation Configuration Mode or enter the mode for an existing list.  
Translation lists are used to modify or replace a request-URI such as an E.164 number. For example, a translation list can be configured to append digits to the end of a number or replace a domain name with another.  
Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-translation)#
```

Translation Configuration Mode commands are defined in the **CSCF Translation Configuration Mode Commands** chapter.

**Example**

Use this command when configuring the following SCM components: P-CSCF, S-CSCF, SIP Proxy.
The following command enters the Translation Configuration Mode for a translation list named `trans_list3`:

```
cscf translation name trans_list3
```
cscf urn-service-list

Creates a URN service list and enters the URN List Configuration Mode.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

cscf urn-service-list { default | name list_name [ -noconfirm ] }

no cscf urn-service-list name list_name

---

no

Removes the specified CSCF URN service list from the context.

default

Specifies that the system is to enter the URN List Configuration Mode for the default URN service list.

name list_name

Specifies a name for the URN service list as an alphanumeric string of 1 through 79 characters.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

Usage

Use this command to create a URN service list name and enter the URN List Configuration Mode. URN lists contain URN to URI mappings used for emergency and location-based services. A URN service list is selected by a CSCF session template. Entering this command results in the following prompt:

[context_name]host_name(config-cscf-service-urn)#

URN List Configuration Mode commands are defined in the CSCF URN List Configuration Mode Commands chapter.

Use this command when configuring the following SCM components: P-CSCF.

Example

The following command enters the URN List Configuration Mode for a URN list named urn_list:

```
cscf urn-service-list name urn_list1
css server

In StarOS 9.0 and later releases, this command is obsolete. And, in earlier releases, this command is restricted.
description

Allows you to enter descriptive text for this configuration.

Product
All

Privilege
Security Administrator, Administrator

Syntax

description text

no description

no
Cleans the description for this configuration.

text
Enter descriptive text as an alphanumeric string of 1 to 63 characters. If you include spaces between words in the description, you must enclose the text within double quotation marks (""), for example, “AAA BBBB”.

Usage

The description should provide useful information about this configuration.
dhcp-client-profile

Adds a specified Dynamic Host Control Protocol (DHCP) client profile name to allow configuration of DHCP client profile to the current context and enters the configuration mode for that profile.

Product
GGSN
P-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
  configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ]dhcp-client-profile clnt_profile_name [ -noconfirm ]

no

Removes a previously configured DHCP client profile from the current context.

clnt_profile_name

Specifies the name of the DHCP client profile as an alphanumeric string of 1 through 63 characters that is case sensitive.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

⚠️ Caution: If this keyword option is used with no dhcp-client-profile clnt_profile_name command the DHCP client profile named clnt_profile_name is deleted with all active/inactive subscribers without prompting any warning or confirmation.

Usage

Use this command to add a DHCP client profile to a context configured on the system and enter the DHCP Client Profile Configuration Mode.

Entering this command results in the following prompt:

[context_name]host_name(config-dhcp-client-profile)#

DHCP Client Profile Configuration Mode commands are defined in the DHCP Client Profile Configuration Mode Commands chapter.
Example

The following command creates a DHCP client profile called `test_profile`:

```
dhcp-client-profile test_profile
```
**dhcp-server-profile**

Adds a specified Dynamic Host Control Protocol (DHCP) server profile name to allow configuration of DHCP server profile to the current context and enters the configuration mode for that profile.

**Product**

GGSN  
P-GW  
SAEGW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration  
`configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ]dhcp-server-profile srvr_profile_name [ -noconfirm ]
```

---

**no**

Removes a previously configured DHCP server profile from the current context.

**srvr_profile_name**

Specifies the name of the DHCP server profile as an alphanumerical string of 1 through 63 characters that is case sensitive.

**-noconfirm**

Executes the command without any additional prompt and confirmation from the user.

⚠️ **Caution:** If this keyword option is used with `no dhcp-server-profile srvr_profile_name` command the DHCP server profile named `srvr_profile_name` is deleted with all active/inactive subscribers without prompting any warning or confirmation.

**Usage**

Use this command to add a DHCP server profile to a context configured on the system and enter the DHCP Server Profile Configuration Mode.  
Entering this command results in the following prompt:

```
[context_name]host_name(config-dhcp-server-profile)#
```

DHCP Server Profile Configuration Mode commands are defined in the *DHCP Server Profile Configuration Mode Commands* chapter.
The following command creates a DHCP server profile called \textit{test\_server\_profile}:

\begin{verbatim}
dhcp-server-profile test_server_profile
\end{verbatim}
**dhcp-service**

Adds a Dynamic Host Control Protocol (DHCP) service instance to the current context and enters the DHCP Service Configuration mode for that service.

**Product**
- ASN-GW
- eWAG
- GGSN
- HA
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration
  - configure > context context_name

  Entering the above command sequence results in the following prompt:

  
  `[context_name]host_name(config-ctx)#`

**Syntax**

```plaintext
dhcp-service service_name [ -noconfirm ]
```

```plaintext
no dhcp-service service_name
```

- **no**
  - Removes a previously configured DHCP service from the current context.

- **service_name**
  - Specifies the name of the DHCP service as an alphanumeric string of 1 through 63 characters that is case sensitive.

**Important:** Service names must be unique across all contexts within a chassis.

- **-noconfirm**
  - Executes the command without any additional prompt and confirmation from the user.

**Usage**

Use this command to add a DHCP service to a context configured on the system and enter the DHCP Service Configuration Mode. A DHCP service is a logical grouping of external DHCP servers. The DHCP Configuration Mode provides parameters that dictate the system’s communication with one or more of these DHCP servers.
A maximum of 256 services (regardless of type) can be configured per system.

⚠️ **Caution:** Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Refer to the *DHCP Service Configuration Mode* chapter of this reference for additional information.

**Example**

The following command creates a DHCP service called *dhcp1* and enters the DHCP Service Configuration Mode:

```
dhcp-service dhcp1
```
**dhcpv6-service**

Creates a specified DHCPv6 service name to allow configuration of DHCPv6 service to the current context and enters the configuration mode for that service.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] dhcpv6-service service_name [ -noconfirm ]
```

- **no**
  Removes a previously configured DHCPv6 service from the current context.

- **service_name**
  Specifies the name of the DHCPv6 service as an alphanumeric string of 1 through 63 characters that is case sensitive.

**Important:** Service names must be unique across all contexts within a chassis.

- **-noconfirm**
  Executes the command without any additional prompt and confirmation from the user.

**Caution:** If this keyword option is used with no dhcpv6-service service_name command the DHCPv6 service named service_name is deleted with all active/inactive subscribers without prompting any warning or confirmation.

**Usage**

Use this command to add a DHCPv6 service to a context configured on the system and enter the DHCPv6 Service Configuration Mode.

The DHCPv6 Service Configuration Mode provides parameters that dictate the system’s communication with one or more of these DHCPv6 servers.

Entering this command results in the following prompt:
DHCPv6 Service Configuration Mode commands are defined in the *DHCPv6 Service Configuration Mode Commands* chapter.

**Example**

The following command creates a DHCPv6 service called *dhcpv6* and enter the DHCPv6 Service Configuration Mode:

```
dhcpv6-service dhcpv6
```
diameter accounting

This command configures Diameter accounting related settings.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
diameter accounting { dictionary { aaa-custom1 | aaa-custom10 | aaa-custom2 | aaa-custom3 | aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | dynamic-load | nasreq | rf-plus } | endpoint endpoint_name | hd-mode fall-back-to-local | hd-storage-policy hd_policy | max-retries max_retries | max-transmissions transmissions | request-timeout duration | server host_name priority priority }

default diameter accounting { dictionary | hd-mode | max-retries | max-transmissions | request-timeout }

no diameter accounting { endpoint | hd-mode | hd-storage-policy | max-retries | max-transmissions | server host_name }
```

**no diameter accounting { endpoint | hd-mode | hd-storage-policy | max-retries | max-transmissions | server host_name }**

- **endpoint**: Removes the currently configured accounting endpoint. The default accounting server configured in the default AAA group will be used.
- **hd-mode**: Sends records to the Diameter server, if all Diameter servers are down or unreachable, then copies records to the local HDD and periodically retries the Diameter server.
- **hd-storage-policy**: Disables use of the specified HD storage policy.
- **max-retries**: Disables the retry attempts for Diameter accounting in this AAA group.
- **max-transmissions**: Disables the maximum number of transmission attempts for Diameter accounting in this AAA group.
- **server host_name**: Removes the Diameter host host_name from this AAA server group for Diameter accounting.

**default diameter accounting { dictionary | hd-mode | max-retries | max-transmissions | request-timeout }**

- **dictionary**: Sets the context’s dictionary to the default.
- **hd-mode**: Sends records to the Diameter server, if all Diameter servers are down or unreachable, then copies records to the local HDD and periodically retries the Diameter server.
- **max-retries**: 0 (disabled)
- **max-transmissions**: 0 (disabled)
diameter accounting

request-timeout: 20 seconds

dictionary { aaa-custom1 | aaa-custom10 | aaa-custom2 | aaa-custom3 | aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | dynamic-load | nasreq | rf-plus }

Specifies the Diameter accounting dictionary.

aaa-custom1 ... aaa-custom10: Configures the custom dictionaries. Even though the CLI syntax supports several custom dictionaries, not necessarily all of them have been defined. If a custom dictionary that has not been implemented is selected, the default dictionary will be used.

dynamic-load: Configures the dynamically loaded Diameter dictionary. The dictionary name must be an alphanumeric string of 1 through 15 characters. For more information on dynamic loading of Diameter dictionaries, see the diameter dynamic-dictionary in the Global Configuration Mode Commands chapter of this guide.

nasreq: nasreq dictionary—the dictionary defined by RFC 3588.

rf-plus: RF Plus dictionary.

endpoint endpoint_name

Enables Diameter to be used for accounting, and specifies which Diameter endpoint to use. endpoint_name is an alphanumeric string of 1 through 63 characters.

hd-mode fall-back-to-local

Specifies that records be copied to the local HDD if the Diameter server is down or unreachable. CDF/CGF will pull the records through SFTP.

hd-storage-policy hd_policy

Specifies the HD Storage policy name. hd_policy must be the name of a configured HD Storage policy, expressed as an alphanumeric string of 1 through 63 characters. HD storage policies are configured through the Global Configuration Mode. This and the hd-mode command are used to enable the storage of Rf Diameter Messages to HDD incase all Diameter Servers are down or unreachable.

max-retries max_retries

Specifies how many times a Diameter request should be retried with the same server, if the server fails to respond to a request. max_retries specifies the maximum number of retry attempts. The value must be an integer from 1 through 1000. Default: 0

max-transmissions transmissions

Specifies the maximum number of transmission attempts for a Diameter request. Use this in conjunction with the “max-retries max_retries” option to control how many servers will be attempted to communicate with. transmissions specifies the maximum number of transmission attempts for a Diameter request. The value must be an integer from 1 through 1000. Default: 0
**request-timeout duration**

Specifies how long the system will wait for a response from a Diameter server before re-transmitting the request.  
*duration* specifies the number of seconds the system will wait for a response from a Diameter server before re-transmitting the request. This value must be an integer from 1 through 3600. Default: 20

**server host_name priority priority**

Specifies the current context Diameter accounting server’s host name and priority.  
*host_name* specifies the Diameter host name, expressed as an alphanumeric string of 1 through 63 characters.  
*priority* specifies the relative priority of this Diameter host. The priority is used in server selection. The priority must be an integer from 1 through 1000.

**Usage**

Use this command to manage the Diameter accounting options according to the Diameter server used for the context.

**Example**

The following command configures the Diameter accounting dictionary as *aaa-custom4*:

```
diameter accounting dictionary aaa-custom4
```

The following command configures the Diameter endpoint named *aaaa_test*:

```
diameter accounting endpoint aaaa_test
```
**diameter authentication**

This command configures Diameter authentication related settings.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
diameter authentication { dictionary { aaa-custom1 | aaa-custom10 | aaa-custom11 | aaa-custom12 | aaa-custom13 | aaa-custom14 | aaa-custom15 | aaa-custom16 | aaa-custom17 | aaa-custom18 | aaa-custom19 | aaa-custom2 | aaa-custom20 | aaa-custom3 | aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | dynamic-load | nasreq } | endpoint endpoint_name | max-retries max_retries | max-transmissions transmissions | redirect-host-avp { just-primary | primary-then-secondary } | request-timeout duration | server host_name priority priority }

default diameter authentication { dictionary | max-retries | max-transmissions | redirect-host-avp | request-timeout }

no diameter authentication { endpoint | max-retries | max-transmissions | server host_name }
```

- **endpoint**: Removes the authentication endpoint. The default server configured in default AAA group will be used.
- **max-retries**: Disables the retry attempts for Diameter authentication in this AAA group.
- **max-transmissions**: Disables the maximum transmission attempts for Diameter authentication in this AAA group.
- **server host_name**: Removes the Diameter host host_name from this AAA server group for Diameter authentication.

**default diameter authentication**

```
default diameter authentication { dictionary | max-retries | max-transmissions | redirect-host-avp | request-timeout }
```

Configures default setting for specified parameter.

- **dictionary**: Sets the context’s dictionary to the default.
- **max-retries**: Sets the retry attempts for Diameter authentication requests in this AAA group to default 0 (disable).
**max-transmissions**: Sets the configured maximum transmission attempts for Diameter authentication in this AAA group to default 0 (disable).

**redirect-host-avp**: Sets the redirect choice to default (just-primary).

**request-timeout**: Sets the timeout duration, in seconds, for Diameter authentication requests in this AAA group to default (20).

dictionary { aaa-custom1 | aaa-custom10 | aaa-custom11 | aaa-custom12 | aaa-
custom13 | aaa-custom14 | aaa-custom15 | aaa-custom16 | aaa-
custom17 | aaa-custom18 | aaa-custom19 | aaa-custom20 | aaa-
custom21 | aaa-custom22 | aaa-custom23 | aaa-
custom24 | dynamic-
load | nasreq }

Specifies the Diameter authentication dictionary.

aaa-custom1 ... aaa-custom8,aaa-custom10 ... aaa-custom20: Configures the custom dictionaries. Even though the CLI syntax supports several custom dictionaries, not necessarily all of them have been defined. If a custom dictionary that has not been implemented is selected, the default dictionary will be used.

**Important**: aaa-custom11 dictionary is only available in Release 8.1 and later. aaa-custom12 to aaa-
custom20 dictionaries are only available in Release 9.0 and later releases.

aaa-custom9: Configures the STa standard dictionary.

dynamic-load: Configures the dynamically loaded Diameter dictionary. The dictionary name must be an alphanumeric string of 1 through 15 characters. For more information on dynamic loading of Diameter dictionaries, see the diameter dynamic-dictionary in the Global Configuration Mode Commands chapter of this guide.

**nasreq**: nasreq dictionary—the dictionary defined by RFC 3588.

**endpoint** endpoint_name

Enables Diameter to be used for authentication, and specifies which Diameter endpoint to use. endpoint_name is an alphanumeric string of 1 through 63 characters.

**max-retries** max_retries

Specifies how many times a Diameter authentication request should be retried with the same server, if the server fails to respond to a request. max_retries specifies the maximum number of retry attempts, and must be an integer from 1 through 1000. Default: 0

**max-transmissions** transmissions

Specifies the maximum number of transmission attempts for a Diameter authentication request. Use this in conjunction with the "max-retries max_retries" option to control how many servers will be attempted to communicate with. transmissions specifies the maximum number of transmission attempts, and must be an integer from 1 through 1000. Default: 0

diameter authentication redirect-host-avp { just-primary | primary-then-secondary }

Specifies whether to use just one returned AVP, or use the first returned AVP as selecting the primary host and the second returned AVP as selecting the secondary host.
**just-primary:** Redirect only to primary host.

**primary-then-secondary:** Redirect to primary host, if fails then redirect to the secondary host.

Default: **just-primary**

---

**request-timeout** `duration`

Specifies how long the system will wait for a response from a Diameter server before re-transmitting the request.

`duration` specifies the number of seconds the system will wait for a response from a Diameter server before re-transmitting the request, and must be an integer from 1 through 3600. Default: 20

---

**server** `host_name` `priority` `priority`

Specifies the current context Diameter authentication server’s host name and priority.

`host_name` specifies the Diameter host name, expressed as an alphanumeric string of 1 through 63 characters.

`priority` specifies the relative priority of this Diameter host, and must be an integer from 1 through 1000. The priority is used in server selection.

---

**Usage**

Use this command to manage the Diameter authentication configurations according to the Diameter server used for the context.

**Example**

The following command configures the Diameter authentication dictionary `aaa-custom14`:

```
diameter authentication dictionary aaa-custom14
```

The following command configures the Diameter endpoint named `aaaul`:

```
diameter authentication endpoint aaaul
```
**diameter authentication failure-handling**

This command configures error handling for Diameter EAP requests.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
`configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
diameter authentication failure-handling { authorization-request | eap-request | eap-termination-request } { request-timeout action { continue | retry-and-terminate | terminate } | result-code result_code { [ to end_result_code ] action { continue | retry-and-terminate | terminate } } }

no diameter authentication failure-handling { authorization-request | eap-request | eap-termination-request } result-code result_code [ to end_result_code ]

default diameter authentication failure-handling { authorization-request | eap-request | eap-termination-request } request-timeout action
```

---

**no**
Disables Diameter authentication failure handling.

**default**
Configures the default Diameter authentication failure handling setting.

**authorization-request**
Specifies that failure handling is to be performed on Diameter authorization request messages (AAR/AAA).

**eap-request**
Specifies configuring failure handling for EAP requests.

**eap-termination-request**
Specifies configuring failure handling for EAP termination requests.

**request-timeout action { continue | retry-and-terminate | terminate }**
Specifies the action to be taken for failures:
- `continue`: Continues the session...
- **retry-and-terminate**: First retries, if it fails then terminates the session
- **terminate**: Terminates the session

```plaintext
result-code result_code { [ to end_result_code ] action { continue | retry-and-terminate | terminate } }
```

- **result_code**: Specifies the result code, must be an integer from 1 through 65535.
- **to end_result_code**: Specifies the upper limit of a range of result codes. `end_result_code` must be greater than `result_code`.
- **action { continue | retry-and-terminate | terminate }**: Specifies action to be taken for failures:
  - **continue**: Continues the session
  - **retry-and-terminate**: First retries, if it fails then terminates the session
  - **terminate**: Terminates the session

### Usage

Use this command to configure error handling for Diameter EAP, EAP-termination, and authorization requests. Specific actions (continue, retry-and-terminate, or terminate) can be associated with each possible result-code. Ranges of result codes can be defined with the same action, or actions can be specific on a per-result code basis.

### Example

The following commands configure result codes 5001, 5002, 5004, and 5005 to use action `continue` and result code 5003 to use action `terminate`:

```plaintext
diameter authentication failure-handling eap-request result-code 5002 to 5005 action continue
diameter authentication failure-handling eap-request result-code 5003 action terminate
```
diameter dictionary

This command is deprecated and is replaced by the `diameter accounting dictionary` and `diameter authentication dictionary` commands. See `diameter accounting` and `diameter authentication` commands respectively.
**diameter endpoint**

This command enables the creation, configuration or deletion of a Diameter endpoint.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration

`configure > context context_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-ctx)#`

**Syntax**

```
[ no ] diameter endpoint endpoint_name [ -noconfirm ]
```

`no`

Removes the specified Diameter endpoint.

`endpoint_name`

Specifies name of the Diameter endpoint as an alphanumeric string of 1 through 63 characters that should be unique within the system.

If the named endpoint does not exist, it is created, and the CLI mode changes to the Diameter Endpoint Configuration Mode wherein the endpoint can be configured.

If the named endpoint already exists, the CLI mode changes to the Diameter Endpoint Configuration Mode wherein the endpoint can be reconfigured.

`-noconfirm`

Executes the command without any additional prompt and confirmation from the user.

**Usage**

Use this command to create/configure/delete a Diameter origin endpoint.

Entering this command results in the following prompt:

`[context_name]host_name(config-ctx-diameter)`

Diameter origin endpoint configuration commands are described in the Diameter Endpoint Configuration Mode Commands chapter.

**Example**

The following command changes to the Diameter Endpoint Configuration CLI mode for Diameter origin endpoint named `test13`:

```
diameter endpoint test13
```
diameter sctp

This command configures Diameter SCTP parameters for all Diameter endpoints within the context. In 12.2 and later releases, this command is obsolete and replaced with `associate sctp-parameters-template` command in the Diameter Endpoint Configuration Mode.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
`configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

Syntax

```
diameter sctp { hearbeat-interval interval | path max-retransmissions retransmissions }

default diameter sctp { hearbeat-interval | path max-retransmissions }
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| default | Configures this command with the default settings.  
• `heartbeat-interval`: Sets the heartbeat interval to the default value.  
• `path max-retransmissions`: Sets the SCTP path maximum retransmissions to the default value. |
| `heartbeat-interval interval` | Specifies the time interval between heartbeat chunks sent to a destination transport address in seconds. `interval` must be an integer from 1 through 255. Default: 30 seconds |
| `path max-retransmissions retransmissions` | Specifies the maximum number of consecutive retransmissions over a destination transport address of a peer endpoint before it is marked as inactive. `retransmissions` must be an integer from 1 through 10. Default: 10 |

Usage
Use this command to configure Diameter SCTP parameters for all Diameter endpoints within the context.

Example
The following command configures the heartbeat interval to 60 seconds:

```
diameter sctp heartbeat-interval 60
```
The following command configures the maximum number of consecutive retransmissions to 6, after which the endpoint is marked as inactive:

```
diameter sctp path max-retransmissions 6
```
diameter origin

This command is deprecated and is replaced by the `diameter endpoint` command.
**dns-client**

Creates a DNS client and/or enters the DNS Client Configuration Mode.

**Product**
- ePDG
- MME
- P-GW
- SAEGW
- SCM
- SGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context  context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] dns-client  name  [ -noconfirm ]
```

- **no**
  Removes the specified DNS client from the context.

- **dns-client  name**
  Specifies a name for the DNS client as an alphanumeric string of 1 through 63 characters.

**Usage**

Use this command to create a new DNS client and enter the DNS Client Configuration Mode or enter the mode for an existing client.

Entering this command results in the following prompt:

```
[context_name]hostname(config-dns-client)#
```

DNS Client Configuration Mode commands are defined in the *DNS Client Configuration Mode Commands* chapter.

**Example**

The following command enters the DNS Client Configuration Mode for a DNS client named *dns1*:

```
dns-client  dns1
```
domain

Configures a domain alias for the current context.

Product
HA
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

domain [ * ]domain_name [ default subscriber subscriber_template_name ]

no domain [ * ]domain_name

no

Indicates the domain specified is to be removed as an alias to the current context.

[ * ]domain_name

domain_name specifies the domain alias to create/remove from the current context. If the domain portion of a subscribers user name matches this value, the current context is used for that subscriber.

domain_name must be an alphanumeric string of 1 through 79 characters. The domain name can contain all special characters, however note that the character * (wildcard character) is only allowed at the beginning of the domain name.

If the domain name is prefixed with * (wildcard character), and an exact match is not found for the domain portion of a subscriber’s username, subdomains of the domain name are matched. For example, if the domain portion of a subscriber’s user name is abc.xyz.com and you use the domain command domain *xyz.com it matches. But if you do not use the wildcard (domain xyz.com) it does not match.

Important: The domain alias specified must not conflict with the name of any existing context or domain names.

default subscriber subscriber_template_name

Specifies the name of the subscriber template to apply to subscribers using this domain alias.

subscriber_template_name must be an alphanumeric string of 1 through 127 characters. If this keyword is not specified the default subscriber configuration in the current context is used.
**Usage**

Use this command to configure a domain alias when a single context may be used to support multiple domains via aliasing.

**Example**

```
  domain sampleDomain.net
  no domain sampleDomain.net
```
Chapter 54
Context Configuration Mode Commands E-H

This section includes the commands `edr-module active-charging-service` through `hss-peer-service`.

**Mode**

Exec > Global Configuration > Context Configuration

`configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
eap-profile

Creates a new, or specifies an existing, Extensible Authentication Protocol (EAP) profile and enters the EAP Configuration Mode.

Product
ASN-GW
ePDG
PDIF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] eap-profile name

no
Removes the specified EAP profile.

name
Specifies the name of a new or existing EAP profile as an alphanumeric string of 1 through 256 characters.

Usage
Use this command to create a new or enter an existing EAP profile.
Entering this command results in the following prompt:

[context_name]host_name(config-ctx-eap-profile)#

EAP Configuration Mode commands are defined in the EAP Configuration Mode Commands chapter.

Example
The following command configures an EAP profile called eap1 and enters the EAP Configuration Mode:

eap-profile eap1
edr-module active-charging-service

Enables the creation, configuration, or deletion of the Event Data Record (EDR) module for this context. In releases prior to 15.0, the SGSN re-used the existing “EDR” module for generating event logs which is primarily used for charging records. But from release 15.0 onwards, the session-event module is used by SGSN for event logging. For more information see the session-event-module command.

Product
ACS
GGSN
HA

SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] edr-module active-charging-service [ charging | reporting ]

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removes the EDR module configuration for the current context.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>charging</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enables the EDR module for charging EDRs that are stored in the /records/edr directory.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>reporting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enables the EDR module for reporting EDRs that are stored in the /records/redr directory.</td>
</tr>
</tbody>
</table>

Usage

Use this command to create the EDR module for the context, and configure the EDR module for active charging service records. You must be in a non-local context when specifying this command, and you must use the same context when specifying the UDR module command.

If this CLI command is configured without the charging or reporting keywords, by default the EDR module is enabled for charging EDRs.

On entering the command with the charging keyword or without any keywords, the CLI prompt changes to:

[context_name]host_name(config-edr)#

On entering the command with the reporting keyword, the CLI prompt changes to:
Example

The following command creates the EDR module for the context for charging EDRs, and enters the EDR Module Configuration Mode:

```
edr-module active-charging-service
```

egtp-service

Creates an eGTP service or specifies an existing eGTP service and enters the eGTP Service Configuration Mode for the current context. On an S4-SGSN, creating and configuring the eGTP service is required for the S4-SGSN to communicate with the S-GW via the S4 interface.

Product

MME
P-GW
SAEGW
SGSN
S-GW

**Important:** Currently the SGSN is not supported on the ASR 5500 platform.

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

```
[ no ] egtp-service service_name [ -noconfirm ]
```

**egtp-service service_name**

Specifies the name of the eGTP service as an alphanumeric string of 1 through 63 characters. If `service_name` does not refer to an existing service, the new service is created if resources allow.

**Important:** Service names must be unique across all contexts within a chassis.

- `-noconfirm`
  
  Executes the command without any additional prompt and confirmation from the user.

- `no egtp-service service_name`
  
  Removes the specified eGTP service from the context.

**Usage**

Enter the eGTP Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service. A maximum of 256 services (regardless of type) can be configured per system.
Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-egtp-service)#
```

eGTP Service Configuration Mode commands are defined in the eGTP Service Configuration Mode Commands chapter.

Use this command when configuring the following GTP SAE components: MME, P-GW, and S-GW. Also use this command when configuring an S4-SGSN. Once the eGTP service has been created on the S4-SGSN, the eGTP service must be configured using the gtpc, validation-mode and interface-type commands in eGTP Service Configuration Mode. Once the service is created and configured, it then must be associated with the 2G and/or 3G services configured on the S4-SGSN using the associate command in Call Control Profile Configuration Mode.

Example

The following command enters the existing eGTP Service Configuration Mode (or creates it if it does not already exist) for the service named egtp-service1:

```
egtp-service egtp-service1
```

The following command will remove egtp-service1 from the system:

```
no egtp-service egtp-service1
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
epdg-service

Creates Evolved Packet Data GateWay service and enters EPDG service configuration mode.

Product
- ACS
- ePDG
- GGSN
- HA
- LNS
- PDSN
- SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] epdg-service name [ -noconfirm ]

no
Indicates the evolved packet data gateway service specified is to be removed.

name
Specifies the name of the ePDG service to configure as an alphanumeric string of 1 through 63 characters. If name does not refer to an existing service, the new service is created if resources allow.

**Important:** Service names must be unique across all contexts within a chassis.

-noconfirm
Executes the command without any additional prompt and confirmation from the user.

Usage
Enter the ePDG Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.

Example
The following command will enter the ePDG Service Configuration Mode creating the service `sampleService`, if necessary.

```
epdg-service sampleService
```

The following command will remove `sampleService` as being a defined ePDG service.

```
no epdg-service sampleService
```
event-notif-endpoint

Enables creation, configuration or deletion of an Event Notification collection server endpoint.

Product
IPCF

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] event-notif-endpoint en_node_name

no

Removes the specified Event Notification collection server endpoint.

en_node_name

Specifies name of the Event Notification collection server endpoint as an alphanumeric string of 1 through 31 characters.
If the named endpoint does not exist, it is created, and the CLI mode changes to the Event Notification Interface Endpoint Configuration Mode wherein the endpoint can be configured.
If the named endpoint already exists, the CLI mode changes to the Event Notification Interface Endpoint Configuration Mode wherein the endpoint can be reconfigured.

Usage

Use this command to create/configure/delete an Event Notification collection server endpoint.
Only 1 Event Notification interface across a chassis can be configured on a system.
Entering this command results in the following prompt:

[context_name]hostname(config-ntfyintf-endpoint)#

The commands configured in this mode are defined in the Event Notification Interface Endpoint Configuration Mode Commands chapter of Command Line Interface Reference.

Caution: This is a critical configuration. The PCC Event notification can not be collected on a server without this configuration. Any change to this configuration would lead to the loss of event notifications from PCC service on IPCF node.

Example

The following command creates an Event Notification Interface Endpoint named event_intfc_3:
event-notif-endpoint event_intfc_3
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Use this command to return to the parent configuration mode.
external-inline-server

This is a restricted command.
fa-service

Creates or deletes a foreign agent (FA) service or specifies an existing FA service for which to enter the FA Service Configuration Mode for the current context.

Product
ASN-GW
PDSN
FA

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] fa-service name [ -noconfirm ]

no
Indicates the foreign agent service specified is to be removed.

name
Specifies the name of the FA service to configure as an alphanumeric string of 1 through 63 characters. If name does not refer to an existing service, the new service is created if resources allow.

Important: Service names must be unique across all contexts within a chassis.

-noconfirm
Executes the command without any additional prompt and confirmation from the user.

Usage
Enter the FA Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service. A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.
Example

The following command will enter the FA Service Configuration Mode creating the service *sampleService*, if necessary.

```
fa-service sampleService
```

The following command will remove *sampleService* as being a defined FA service.

```
no fa-service sampleService
```
firewall max-associations

This command is obsolete.
**fng-service**

Creates a new, or specifies an existing FNG service and enters the FNG Service Configuration Mode. A maximum of 16 FNG services can be created. This limit applies per ASR 5000 chassis and per context.

**Product**
FNG

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
c

**Syntax**

```
fng-service name [ -noconfirm ]
```

```
no fng-service name
```

`fng-service name`
Specifies the name of a new or existing FNG service as an alphanumeric string of 1 through 63 characters that must be unique across all FNG services within the same context and across all contexts.

**Important:** Service names must be unique across all contexts within a chassis.

```
no fng-service name
```
Deletes the specified FNG service.

**Usage**
Use this command in Context Configuration Mode to create a new FNG service or modify an existing one. Executing this command enters the FNG Service Configuration Mode.

**Example**
The following command configures an FNG service named `fmg1` and enters the FNG Service Configuration Mode:

```
fng-service fmg1
```
ggsn-service

Creates or deletes a Gateway GPRS Support Node (GGSN) service and enters the GGSN Service Configuration Mode within the current context to configure it.

Product
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

ggsn-service svc_name [ -noconfirm ]

no ggsn-service svc_name

Important: Service names must be unique across all contexts within a chassis.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

Usage

Services are configured within a context and enable certain functionality. This command creates and allows the configuration of services enabling the system to function as a GGSN in a GPRS or UMTS network. This command is also used to remove previously configured GGSN services.

A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Example
The following command creates a GGSN service named *ggsn1*:

```
ggsn-service ggsn1
```
gprs-service

Creates a GPRS service instance and enters the GPRS Service Configuration Mode. This mode configures all of the parameters specific to the operation of an SGSN in a GPRS network.

**Important:** For details about the commands and parameters for this mode, check the *GPRS Service Configuration Mode* chapter.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

Syntax

```
gprs-service srvc_name [ -noconfirm ]

no gprs-service srvc_name
```

**no**
Removes the configuration for the specified IGPRS service from the configuration for the current context.

**srvc_name**
Specifies the name of the GPRS service as a unique alphanumeric string of 1 through 63 characters.

**Important:** Service names must be unique across all contexts within a chassis.

**-noconfirm**
Executes the command without any additional prompt and confirmation from the user.

Usage

Use this command to create or remove a GPRS service. Entering this command will move the system to the GPRS Service Configuration Mode and change the prompt to:

```
[context_name]host_name(config-gprs-service)#
```

Example

The following command creates an GPRS service named *gprs1*:

```
gprs-service gprs1
```
gprs-service gprsl

The following command removes the GPRS service named gprsl:

no gprs-service gprsl
gs-service

Creates a Gs service instance and enters the Gs Service Configuration Mode. This mode configures the parameters specific to the Gs interface between the SGSN and the MSC/VLR.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
gs-service svc_name [ -noconfirm ]

no gs-service svc_name
```

- **no**
  Remove the configured Gs service from the current context.

- **svc_name**
  Specifies the Gs service as a unique alphanumeric string of 1 through 63 characters.

**Important**: Service names must be unique across all contexts within a chassis.

- **-noconfirm**
  Executes the command without any additional prompt and confirmation from the user.

**Usage**

Use this command to create, edit, or remove a Gs service.
A maximum of 32 Gs service can be configured in one context/system. This limit is subject to maximum of 256 services (regardless of type) can be configured per system.

**Important**: For details about the commands and parameters for this mode, refer _Gs Service Configuration Mode_ chapter.

**Example**

The following command creates an Gs service named _gs1_:

```
gs-service gs1
```
The following command removes the Gs service named \textit{gs1}:

\begin{verbatim}
no gs-service gs1
\end{verbatim}
**gtpc overload-protection egress**

Configures the over-load protection of GGSN/PGW by throttling outgoing GTPv1 and GTPv2 control messages over Gn/Gp(GTPv1) or S5/S8 (GTPv2) interface using rate-limiting-function (RLF) template for services configured in a context.

**Product**
GGSN
P-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```bash
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cxt)#
```

**Syntax**

```
gtpc overload-protection egress [ rlf-template rlf_template_name | throttling-override-policy throttling_override_policy_name

[no] gtpc overload-protection egress
```

---

**no**

Disables the GTP Outgoing Control Message Throttling for GGSN/PGW services in this context.

**rlf-template rlf_template_name**

It associates the preconfigured Rate-Limiting-Function (RLF) template `rlf_template_name` in Global Configuration mode for throttling the GTP outgoing control messages for the GGSN/PGW services in this context. This is a mandatory parameter to enable throttling.

**throttling-override-policy throttling_override_policy_name**

INSERT TEXT HERE.

**Usage**

Use this command to enable the GTP Outgoing Control Message Throttling for GGSN/PGW services configured in the same context. The RLF template associated with this command controls the throttling parameters.

**Example**

The following command enables the outgoing GTP control messages in a context using rlf-template `gtpc_1`:

```
gtpc overload-protection egress rlf-template gtpc_1
```
**gtpc overload-protection ingress**

Configures the over-load protection of GGSN/PGW by throttling incoming GTPv1 and GTPv2 control messages over Gn/Gp(GTPv1) or S5/S8 (GTPv2) interface with other parameters for services configured in a context.

**Product**

GGSN
P-GW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
gtpc overload-protection ingress {msg-rate msg_rate} [delay-tolerance dur] [queue-size size]
```

[no] gtpc overload-protection ingress

- **no**
  
  Disables the GTP incoming control message throttling for GGSN/PGW services in this context.

- **msg-rate msg_rate**
  
  Defines the number of GTP incoming messages that can be processed per second.
  
  `msg_rate` is an integer between 100 through 12000.

- **delay-tolerance dur**
  
  Defines the maximum number of seconds a incoming GTP message can be queued before it is processed. After exceeding this, the message is dropped.
  
  `dur` is an integer between 1 through 10.

- **queue-size size**
  
  Defines the maximum size of the queue to be maintained for incoming GTPC messages. If the queue exceeds the defined `size`, any new incoming messages will be dropped.
  
  `size` is an integer between 100 through 10000.

**Usage**

Use this command to enable the GTP incoming control message throttling for GGSN/PGW services configured in the same context.

**Example**
The following command enables the incoming GTP control messages in a context using message rate 1000 per second with message queue size 10000 and delay of 1 second:

```
gtpc overload-protection ingress msg-rate 1000 delay-tolerance 1 queue-size 10000
```
**gtpp algorithm**

Configures GTPP routing algorithms for the current context. This command is deprecated but available for backward compatibility.

**Product**
GGSN
P-GW
SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
\[ configure > context context_name \]

Entering the above command sequence results in the following prompt:

\[ [context_name]host_name(config-ctx)# \]

**Syntax**

```
\[ gtp algorithm \{ first-server | round-robin | first-n count \} \]
```

**first-server**
Specifies that accounting data is sent to the first available charging gateway function (CGF) based upon the relative priority of each configured CGF. Default: Enabled

**round-robin**
Specifies that accounting data is transmitted in a circular queue fashion such that data is sent to the highest priority CGF first, then to the next available CGF of the highest priority, and so on. Ultimately, the queue returns to the CGF with the highest configured priority. Default: Disabled

**first-n count**
Specifies that the AGW must send accounting data to \[ count \] (more than one) CGFs based on their priority. Response from any one of the \[ count \] CGFs would suffice to proceed with the call. The full set of accounting data is sent to each of the \[ count \] CGFs.
\[ count \] is the number of CGFs to which accounting data will be sent, and must be an integer from 2 through 65535. Default: 1 (Disabled)

**Usage**
Use this command to control how G-CDR/P-CDR accounting data is routed among the configured CGFs.

**Example**
The following command configures the system to use the round-robin algorithm when transmitting G-CDR/P-CDR accounting data:

```
gtpp algorithm round-robin
```
gtpp attribute

Allows the specification of the optional attributes to be present in the Call Detail Records (CDRs) that the GPRS/PDN/UMTS access gateway generates. It also defines that how the information is presented in CDRs by encoding the attribute field values.

|-----------------|-------|-------------------------------|-------|-------------|---------|---------|-----------------|-------------|---------|---------------|--------------|--------|-----|-----|--------|-----------------------|-------------------|-----------|---------------|-----------|----|-------------------|

**default**

Sets the default GTPP attributes in the generated CDRs. It also sets the default presentation of attribute values in generated CDRs.

**no**

Removes the configured GTPP attributes from the CDRs.

**apn-ambr [ include-for-all-bearers | include-for-default-bearer | include-for-non-gbr-bearers ]**

Default: Disabled

This keyword controls the inclusion of the optional field “apn-ambr” in the PGW-CDRs in the custom24 GTPP dictionary.

### Important:

This keyword option will be available only if a valid license is installed. For more information, contact your Cisco account representative.

The APN Aggregate Maximum Bit Rate (AMBR) is a subscription parameter stored per APN. It limits the aggregate bit rate that can be expected to be provided across all non-GBR bearers and across all PDN connections of the same APN. Each of these non-GBR bearers potentially utilize the entire APN AMBR, e.g. when the other non-GBR bearers do not carry any traffic. The APN AMBR is present as part of QoS information.

In 15.0 and later releases, this CLI command should be configured along with the following additional options to support APN-AMBR reporting in SGW-CDRs in all GTPP dictionaries.

- **include-for-all-bearers**: Includes the APN-AMBR information in SGW-CDRs for all bearers (GBR and NON-GBR)
- **include-for-default-bearer**: Includes APN-AMBR information in SGW-CDRs only for default bearer.
- **include-for-non-gbr-bearers**: Includes APN-AMBR information for non-gbr-bearers.

This feature is required to enable post-processing of CDRs to verify MVNO subscribers actual QoS against invoicing systems.

### Important:

This CLI command and the associated options are not available for products other than S-GW and P-GW. The option “non-gbr-bearers-only” is available in S-GW and P-GW but the other options are available in S-GW only.

In the P-GW implementation, if the CLI command “gtpp attribute apn-ambr” is configured, it will be treated as “gtpp attribute apn-ambr non-gbr-bearers-only”. In case of S-GW/P-GW combo if any of the options is configured, it will be considered that the attribute is available.
### apn-ni
Default: Enabled
This keyword controls the inclusion of the optional field “APN” in the x-CDRs.

### apn-selection-mode
Default: Enabled
This keyword controls the inclusion of the optional field “APN Selection Mode” in the x-CDRs.

### camel-info
SGSN only
Enter this keyword to include CAMEL-specific fields in SGSN CDRs. Default: Disabled

### cell-plmn-id
SGSN only
Enter this keyword to enable the system to include the Cell PLMN ID field in the M-CDR. Default: Disabled

### charging-characteristic-selection-mode
Default: Enabled
This keyword controls the inclusion of the optional field “Charging Characteristic Selection Mode” in the x-CDRs.

### diagnostics
Default: Disabled
Enables the system to include the Diagnostic field in the CDR that is created when PDP contexts are released. The field will include one of the following values:

- **26** - For GGSN: if the GGSN sends “delete PDP context request” for any other reason (e.g., the operator types “clear subscribers” on the GGSN). For SGSN: The SGSN includes this cause code in the S-CDR to indicate that a secondary PDP context activation request or a PDP context modification request has been rejected due to insufficient resources.
- **36** - For GGSN: this cause code is sent in the G-CDR to indicate the PDP context has been deactivated in the GGSN due to the SGSN having sent a “delete PDP context request” to the GGSN. For SGSN, this cause code is used to indicate a regular MS or network-initiated PDP context deactivation.
- **37** - when the network initiates a QoS modification, the SGSN sends in the S-CDR to indicate that the MS initiation deactivate request message has been rejected with QoS not accepted as the cause.
- **38** - if the GGSN sends “delete PDP context request” due to GTP-C/GTP-U echo timeout with SGSN. If the SGSN sends this cause code, it indicates PDP context has been deactivated due to path failure, specifically GTP-C/GTP-U echo timeout.
- **39** - SGSN only - this code indicates the network (GGSN) has requested a PDP context reactivation after a GGSN restart.
- **40** - if the GGSN sends “delete PDP context request” due to receiving a RADIUS Disconnect-Request message.

### direct-tunnel
Default: Disabled
Includes the Direct Tunnel field in PGW-CDR/eG-CDRs.
This keyword is applicable for GGSN, P-GW and S-GW only.
### duration-ms

Specifies that the information contained in the mandatory Duration field be reported in milliseconds instead of seconds (as the standards require). Default: Disabled

### dynamic-flag

Default: Enabled
This keyword controls the inclusion of the optional field “Dynamic Flag” in the x-CDRs.

### dynamic-flag-extension

Default: Enabled
This keyword controls the inclusion of the optional field “Dynamic Address Flag Extension” in the x-CDRs. This field is seen in the CDR when the IPv4 address is dynamically assigned for a dual PDP context. This extension field is required in the 3GPP Release 10 compliant CDRs so that the Dual Stack Bearer support is available.

### furnish-charging-information

Default: Disabled
This keyword controls the inclusion of the optional field “pSFurnishChargingInformation” in the eG-CDRs and PGW-CDRs.

---

**Important:** The Furnish Charging Information (FCI) feature is applicable to all GTPP dictionaries compliant to 3GPP Rel.7 and 3GPP Rel.8 except custom43 dictionary. This keyword option will be available only if a valid license is installed. For more information, contact your Cisco account representative.

PGW-CDR and eG-CDR will contain FCI only if it is enabled at command level, i.e. using the `gtpp attribute furnish-charging-information` command in GTPP Server Group Configuration mode. Whenever FCI changes, a new Free-Format-Data (FFD) value is either appended to existing FDD or overwritten on the existing FDD depending on Append-Free-Format-Data (AFFD) flag. CDR is not generated upon FCI change.

FCI is supported in main CDR as well as in LOSDV. Whenever a trigger (volume, time, RAT, etc.) happens current available FFD at command level is added to the main body of the CDR. The same FFD at command level is added to the main body of the next CDRs until it is not appended or overwritten by next Credit-Control-Answer message at command level.

In the case of custom43 dictionary, the FCI implementation will be as follows:

- Whenever FCI changes PGW-CDR will generate CDR i.e close old bucket and will have old FCI details in the generated CDR.
- Translation for the PS-Free-Format-Data in CDR will be conversion of hexadecimal values in ASCII format (for numbers 0 to 9) to decimal values as integers.
- PS-Append-Free-Format-Data always OVERWRITE.

### imei

Default: Disabled
For SGSN: includes the IMEI value in the S-CDR.
For GGSN: includes the IMEISV value in the G-CDR.

### imsi-unauthenticated-flag

Default: Enabled
This keyword controls the inclusion of the optional field “IMSI Unauthenticated Flag” in the x-CDRs. When the served IMSI is not authenticated, this field “IMSI Unauthenticated Flag” if configured, will be present in the P-GW CDR record for custom35 dictionary. This field is added per 3GPP TS 32.298 v10.7.

_gtpp attribute

Default: Disabled
Includes the Low Access Priority Indicator (LAPI) field in the CDRs. This field is required to support MTC feature.
When UE indicates low priority connection, then the “lowPriorityIndicator” attribute will be included in the CDR.

local-record-sequence-number

Default: Disabled
This keyword provides both the local record sequence number and the Node ID. In the x-CDRs, this field indicates the number of CDRs generated by the node and is unique within the session manager.
The Node ID field is included in the x-CDR for any of several reasons, such as when PDP contexts are released or if partial-CDR is generated based on configuration. The field will consist of a AAA Manager identifier automatically appended to the name of the SGSN or GGSN service.
The name of the SGSN or GGSN service may be truncated, because the maximum length of the Node ID field is 20 bytes. Since each AAA Manager generates CDRs independently, this allows the Local Record Sequence Number and Node ID fields to uniquely identify a CDR.

**Important:** If this keyword is enabled and the _gtpp centralized-lrsn-creation_ option is enabled with the _gtpp single-source centralized-lrsn_ command, then the Node ID format changes as follows: <1-byte-AAAproxy-restart-counter> <3-byte AAAproxy instance number> <node-id-suffix>. If _gtpp centralized-lrsn-creation_ is not enabled, the node-id format for CDRs generated by Sessmgr is as follows: <1-byte Sessmgr restart-value> <3-byte Sessmgr instance number> <node-id-suffix>. If _gtpp centralized-lrsn-creation_ is not enabled, the node-id format for CDRs generated by ACSMG is as follows: <1-byte ACSmgr restart-value> <3-byte ACSmgr instance number> <Active charging service-name>.

losdv

Default: Enabled
This keyword controls the inclusion of the optional field “List of Service Data” in the x-CDRs.

ms-timezone

Default: Enabled
This keyword controls the inclusion of the optional field “MS-Timezone” in the x-CDRs.

msisdn

Default: Enabled
This keyword controls the inclusion of the optional field “MSISDN” in the x-CDRs.

defaults

Default: Enabled
This keyword controls the inclusion of the optional field “Node ID” in the x-CDRs.
node-id-suffix  STRING
Default: Disabled
Specifies the configured Node-ID-Suffix to use in the NodeID field of GTPP CDRs as an alphanumeric string of 1 through 16 characters. Each Session Manager task generates a unique NodeID string per GTPP context.

**Important:** The NodeID field is a printable string of the \textit{niddSTRING} format: \textit{n}: The first digit is the Sessmgr restart counter having a value between 0 and 7. \textit{ddd}: The number of sessmgr instances. Uses the specified NodeID-suffix in all CDRs. The “Node-ID” field consists of sessMgr Recovery counter (1 digit) \textit{n} + AAA Manager identifier (3 digits) \textit{ddd} + the configured Node-Id-suffix (1 to 16 characters) \textit{STRING}. If the centralized LRSN feature is enabled, the “Node-ID” field will consist of only the specified NodeID-suffix (NodeID-prefix is not included). If this option is not configured, then GTPP group name will be used instead (For default GTPP groups, context-name will be used).

**Important:** If this node-id-suffix is not configured, the GGSN uses the GTPP context name as the Node-id-suffix (truncated to 16 characters) and the SGSN uses the GTPP group named as the node-id-suffix.

pdn-connection-id
Default: Enabled
This keyword controls the inclusion of the optional field “PDN Connection ID” in the x-CDRs.

pdp-address
Default: Enabled
This keyword controls the inclusion of the optional field “PDP Address” in the x-CDRs.

pdp-type
Default: Enabled
This keyword controls the inclusion of the optional field “PDP Type” in the x-CDRs.

pgw-ipv6-addr
Default: Disabled
Specifying this option allows to configure the P-GW IPv6 address.

**Important:** This attribute can be controllably configured in custom24 and custom35 SGW-CDR dictionaries.

pgw-plmn-id
Default: Enabled
This keyword controls the inclusion of the optional field “PGW PLMN-ID” in the x-CDRs.

plmn-id  [ unknown-use ]
Default: Enabled
For SGSN, reports the SGSN PLMN Identifier value (the RAI) in the S-CDR provided if the dictionary supports it.
For GGSN, reports the SGSN PLMN Identifier value (the RAI) in the G-CDR if it was originally provided by the SGSN in the GTP create PDP context request. It is omitted if the SGSN does not supply one.
Normally when SGSN PLMN-id information is not available, the attribute sgsnPMLMIdentifier is not included in the CDR. This keyword enables the inclusion of the sgsnPMLMIdentifier with a specific value when the SGSN PLMN-id is not available.

`unknown-use hex_num` is an hexadecimal number from 0x0 through 0xFFFFFFFF that identifies a foreign SGSN that has not provided a PLMN-id. For GGSN only.

### `qos max-length`

Default: Disabled

Specifying this option will change the parameters related to QoS sent in S-CDR and SaMOG CDR. The `max-length` option is used to modify the length of QoS sent in CDR. The `qos_value` must be an integer from 4 through 24.

This feature is introduced to support Rel.7+ QoS formats.

### `rat`

Default: Enabled

For SGSN: includes the RAT (identifies the radio access technology type) value in the S-CDR.

For GGSN: includes the RAT (identifies the radio access technology type) value in the G-CDR.

### `recordextension`

Default: Disabled

This keyword controls the inclusion of the optional field “RecordExtension” in the x-CDRs.

### `record-extensions rat`

Default: Disabled

Enables network operators and/or manufacturers to add their own recommended extensions to the CDRs according to the standard record definitions from 3GPP TS 32.298 Release 7 or higher.

### `record-type { sgsnpdprecord | sgwrecord }`

**Important:** This keyword is available only when the SaMOG Mixed Mode license (supporting both 3G and 4G) is configured.

Default: sgwrecord

Specifies the SaMOG CDR type to use.

For an SaMOG 3G license, this keyword will not be available. However, sgsnpdprecord type will be used as the default record type.

### `served-mnai`

Default: Disabled

This keyword controls the inclusion of the optional field “Served MNAI” in the x-CDRs.

### `served-pdp-pdn-address-extension`

Default: Disabled

In support of IPv4v6 dual-stack PDP address types, this keyword causes the service to include IPv4v6 address information in the CDR. The IPv4 address goes in the Served PDP PDN Address Extension field and the IPv6 address goes in the Served PDP Address or Served PDP PDN Address field.
Important: This attribute will not be displayed if the GTPP dictionary is set to custom34.

**served-pdp-pdn-address-prefix-length**

Default: Enabled

In support of IPv6 prefix delegation, this keyword causes the service to include this field “Served PDP PDN Address” in the x-CDRs. If this field is configured, the servedPDPPDNAddress field will support reporting the IPv6 prefix length as outlined in 3GPP 32.298. The prefix length will only be reported if:

- it is configured
- it is not the default length of 64
- it is an IPv6 or IPv4v6 call

**sgsn-change**

Default: Enabled

This keyword is specific to SGSN and is license restricted. This keyword controls the inclusion of the S-CDR attribute “SGSN Change” in the S-CDRs. It is enabled by default and the attribute “SGSN Change” is included in the S-CDRs by default.

**sgw-ipv6-addr**

Default: Disabled

Specifying this option allows to configure the S-GW IPv6 address.

Important: This attribute can be controllably configured in custom24 and custom35 SGW-CDR dictionaries.

**sms { destination-number | recording-entity | service-centre }**

This keyword is specific to the SGSN. Entering this keyword causes the inclusion of an SMS-related field in the SMS-MO-CDR or SMS-MT-CDR. **destination-number**: Includes the “destinationNumber” field in the SMS-MO-CDR or SMS-MT-CDR. **recording-entity**: Includes the “recordingEntity” field in the SMS-MO-CDR or SMS-MT-CDR. **service-centre**: Includes the “serviceCentre” field in the SMS-MO-CDR or SMS-MT-CDR.

**sna-ipv6-addr**

Default: Disabled

Specifying this option allows to configure the Serving Node IPv6 Address (SNAv6).

Important: This attribute can be controllably configured in custom24 and custom35 SGW-CDR dictionaries.

**sponsor-id**

Default: Disabled

Includes the Sponsor ID and Application-Service-Provider-Identity fields in PGW-CDR. Note that the “Sponsor ID” and “Application-Service-Provider-Identity” attributes will be included in PGW-CDR if the PCEF supports Sponsored Data Connectivity feature or the required reporting level is sponsored connectivity level as described in 3GPP TS 29.212.
This feature is implemented to be in compliance with Release 11 3GPP specification for CDRs. So, this behavior is applicable to all GTPP dictionaries that are Release 11 compliant, i.e. custom35.

**start-time**
Default: Enabled
This keyword controls the inclusion of the optional field “Start-Time” in the x-CDRs.

**stop-time**
Default: Enabled
This keyword controls the inclusion of the optional field “Stop-Time” in the x-CDRs.

**uli**
Default: Enabled
This keyword controls the inclusion of the optional field “User Location Information” in the x-CDRs.

**user-csg-information**
Default: Disabled
This keyword controls the inclusion of the optional field “User CSG Information” in the x-CDRs.

**Important:** Currently, UCI values are only supported for SGW-CDRs. This attribute will not be displayed if the GTPP dictionary is set to custom11, custom34, or custom35.

**+**
Indicates that this command can be entered multiple times to configure multiple attributes.

**Usage**
Use this command to configure the type of optional information fields to include in generated CDRs (M-CDRs, S-CDRs, S-SMO-CDR, S-SMT-CDR from SGSN and G-CDRs, eG-CDRs from GGSN) by the AGW (SGSN/GGSN/P-GW/SAEGW). In addition, it controls how the information for some of the mandatory fields are reported. Fields described as optional by the standards but not listed above will always be present in the CDRs, except for Record Extensions (which will never be present).

**Important:** This command can be repeated multiple times with different keywords to configure multiple GTPP attributes.

**Example**
The following command configures the system to present the time provided in the Duration field of the CDR is reported in milliseconds:

```
gtp attribute duration-ms
```
gtpp charging-agent

Configures the IP address and port of the system interface within the current context used to communicate with the Charging Gateway Function (CGF).

Product
- GGSN
- SGSN
- P-GW
- SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

```
gtpp charging-agent address ip_address [ port port ]

no gtpp charging-agent
```

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removes a previously configured charging agent address.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>address ip_address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the IP address of the interface configured within the current context that is used to transmit CDR records (G-CDR/eG-CDR/M-CDR/S-CDR) to the CGF. <code>ip_address</code> must be entered using IPV4 dotted-decimal notation.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>port port</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the Charging Agent UDP port. as an integer from 1 through 65535. If <code>port</code> is not defined, IP will take the default port number 49999.</td>
</tr>
</tbody>
</table>

**Important:** Configuring `gtpp charging-agent` on port 3386 may interfere with a `ggsn-service` configured with the same `ip_address`.

Usage

This command establishes a Ga interface for the system. For GTPP accounting, one or more Ga interfaces must be specified for communication with the CGF. These interfaces must exist in the same context in which GTPP functionality is configured (refer to the `gtpp` commands in this chapter).
This command instructs the system as to what interface to use. The IP address supplied is also the address by which the GSN is known to the CGF. Therefore, the IP address used for the Ga interface could be identical to one bound to a GSN service (a Gn interface).
If no GSN service is configured in the same context as the Ga interface, the address configured by this command is used to receive unsolicited GTPP packets.

Example

The following command configures the system to use the interface with an IP address of 192.168.13.10 as the accounting interface with port 20000 to the CGF:

```
  gtpp charging-agent address 192.168.13.10 port 20000
```
gtpp data-record-format-version

Encodes the data record format version. The version indicates the 3GPP release version.

Important: This CLI command is applicable only to custom24 standard and custom35 GTPP dictionaries for S-GW.

Product
S-GW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] gtpp data-record-format-version string

no
Specifies that the default data record format will be encoded based on the GTPP dictionary being used.

gtpp data-record-format-version string
Specifies the 3GPP release version to be encoded. string must be in the format a.b (for example 10.10). This is applicable only for custom24 and custom35 GTPP dictionaries for S-GW. The entry can be from 1 to 1023 alphanumeric characters.

Usage

Use this command to support a configurable multiple data record format version only for Custom24 and Custom35 dictionaries. The entry can be from 1 to 1023 alphanumeric characters. This is useful when the value of the data record format version is taken according to the dictionary being used. If only the default configuration is used, a version mismatch causes the GTPP request to be discarded while using R10 attributes.

Example

This example configures the data record format version 10.10 to be encoded.

    gtpp data-record-format-version 10.10
gtpp data-request sequence-numbers

Configures the range of sequence numbers to be used in the GTPP data record transfer record (DRT). Use this command to set the start value for the sequence number.

**Product**
- GGSN
- SGSN
- P-GW
- SAEGW

**Privilege**
- Security Administrator
- Administrator

**Mode**
- Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
gtpp data-request sequence-numbers start { 0 | 1 }
gtpp data-request sequence-numbers start default
```

**default gtpp data-request sequence-numbers start**

- **default**
  - Default is 0 (zero).

- **{ 0 | 1 }**
  - Specifies the value of the start sequence number for the GTPP Data Record Transfer Request. Default: 0
    - 0: Designates the start sequence number as 0.
    - 1: Designates the start sequence number as 1.

**Usage**

When the GGSN/P-GW (SAEGW)/SGSN is configured to send GTPP echo request packets, the SGSN always uses 0 as the sequence number in those packets. Re-using 0 as a sequence number in the DRT packets is allowed by the 3GPP standards; however, this CLI command ensures the possibility of inter-operating with CGFs that can not properly handle the re-use of sequence number0 in the echo request packets.

**Example**

The following command sets the sequence to start at 1.

```
gtpp data-request sequence-numbers start 1
```
gtpp dead-server suppress-cdrs

Enables or disables CDR archiving when a dead server is detected.

Important: This command is customer specific. For more information please contact your local Cisco service representative.

Product
GGSN
P-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

Syntax

[ default | no ] gtpp dead-server suppress-cdrs

Usage
Use this command to enable/disable CDR archiving when a dead server is detected. With this CLI, once a server is detected as down, requests are purged. Also the requests generated for the period when the server is down are purged.
gtpp deadtime

Configures the amount of time to wait before attempting to communicate with a Charging Gateway Function (CGF) that was previously marked as unreachable.

Product
- GGSN
- P-GW
- SAEGW

Privilege
- Security Administrator, Administrator

Mode
- Exec > Global Configuration > Context Configuration
- `configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

Syntax

```
gtpp deadtime time
```

```
default gtpp deadtime
```

```
default
```

Configures this command with the default setting.
Default: 120 seconds

```
time
```

Specifies the amount of time (in seconds) that must elapse before the system attempts to communicate with a CGF that was previously unreachable. `time` is an integer from 1 through 65535.

Usage

If the system is unable to communicate with a configured CGF, after a pre-configured number of failures the system marks the CGF as being down.
This command specifies the amount of time that the system waits prior to attempting to communicate with the downed CGF.
Refer to the `gtpp detect-dead-server` and `gtpp max-retries` commands for additional information on the process the system uses to mark a CGF as down.

Example

The following command configures the system to wait 60 seconds before attempting to re-communicate with a CGF that was marked as down:

```
gtpp deadtime 60
```
**gtpp detect-dead-server**

Configures the number of consecutive communication failures that could occur before the system marks a Charging Gateway Function (CGF) as down.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
gtpp detect-dead-server consecutive-failures max_number
```

```
default gtpp detect-dead-server consecutive-failures
```

- **default**
  Configures this command with the default setting.
  Default: 0

- **consecutive-failures max_number**
  Specifies the number of failures that could occur before marking a CGF as down. `max_number` is an integer from 0 through 1000.

**Usage**

This command works in conjunction with the `gtpp max-retries` parameter to set a limit to the number of communication failures that can occur with a configured CGF.

The `gtpp max-retries` parameter limits the number of attempts to communicate with a CGF. Once that limit is reached, the system treats it as a single failure. The `gtpp detect-dead-server` parameter limits the number of consecutive failures that can occur before the system marks the CGF as down and communicate with the CGF of next highest priority.

If all of the configured CGFs are down, the system ignores the detect-dead-server configuration and attempt to communicate with highest priority CGF again.

**Important:** When the `gtpp detect-dead-server consecutive-failures` CLI command is used in the CDR streaming mode, the CDRs will not be written to the HDD even when all the CGF servers are inactive. The CDR records will be archived at AAA manager and then purged when the archival limit is reached.
If the system receives a GTPP Node Alive Request, Echo Request, or Echo Response message from a CGF that was previously marked as down, the system immediately treats it as being active. Refer to the `gtpp max-retries` command for additional information.

**Example**

The following command configures the system to allow 8 consecutive communication failures with a CGF before it marks it as down:

```
gtpp detect-dead-server consecutive-failures 8
```
**gtpp dictionary**

Designates a dictionary used by GTPP for a specific context.

**Mode**

Exec > Global Configuration > Context Configuration

```plaintext
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```plaintext
[context_name]host_name(config-ctx)#
```

**Syntax**

```plaintext
gtpp dictionary { custom1 | custom10 | custom11 | custom12 | custom13 | custom14 | custom15 | custom16 | custom17 | custom18 | custom19 | custom2 | custom20 | custom21 | custom22 | custom23 | custom24 | custom25 | custom26 | custom27 | custom28 | custom29 | custom3 | custom30 | custom31 | custom32 | custom33 | custom34 | custom35 | custom36 | custom37 | custom38 | custom39 | custom4 | custom40 | custom41 | custom42 | custom43 | custom44 | custom45 | custom46 | custom47 | custom48 | custom49 | custom5 | custom50 | custom51 | custom52 | custom53 | custom54 | custom55 | custom56 | custom57 | custom58 | custom59 | custom6 | custom60 | custom7 | custom8 | custom9 | standard }

default gtpp dictionary
```

---

**default**

Configures the default dictionary.

**custom1**

This is a custom-defined dictionary that conforms to TS 32.015 v 3.6.0 for R99. It supports the encoding of IP addresses in text format for G-CDRs.

**custom2**

Custom-defined dictionary.

**custom3**

This is a custom-defined dictionary that conforms to TS 32.015 v 3.6.0 for R99 except that it supports the encoding of IP addresses in binary format for G-CDRs.
**custom4**

This is a custom-defined dictionary that conforms to TS 32.015 v 3.6.0 for R99 except that:

- IP addresses are encoded in binary format.
- The Data Record Format Version information element contains 0x1307 instead of 0x1308.
- QoS Requested is not present in the LoTV containers.
- QoS negotiated is added only for the first container and the container after a QoS change.

---

**custom5**

Custom-defined dictionary.

---

**custom6**

This is a custom-defined dictionary for eG-CDR encoding.

---

**custom7 ... custom30**

These custom-defined dictionary have default behavior or “standard” dictionary.

---

**custom31**

This is a custom-defined dictionary for S-CDR encoding that is based on 3GPP TS 32.298 v6.4.1 with a special field appended for the PLMN-ID.

---

**custom33**

This is a custom-defined dictionary for S-CDR encoding that is based on the 3GPP TS 32.298v6.4.1 with the following exceptions:

- Proprietary PLMN-ID field is present.
- It is a SEQUENCE and not a SET.
- Diagnostics and SGSN-Change fields are not supported.
- Indefinite length encoding is used.
- Booleans are encoded as 0x01 (3GPP it is 0xff).
- IMEISV shall be sent if available else IMEI should be sent.
- Record Sequence Number is Mandatory.
- APN OI and NI part is length encoded.
- Cause for Record closure should be “RAT Change” instead of “intra-SGSNinter-system”.

---

**standard**

Default: Enabled

This dictionary conforms to TS 32.215 v 4.6.0 for R4 (and also R5 - extended QoS format).

---

**Usage**

Use this command to designate specific dictionary used by GTPP for specific context.
Important: Note that the following warning message will be displayed whenever an existing GTPP dictionary is being changed or a new GTPP dictionary is configured irrespective of whether or not the calls are active on the system.

Warning: It is not recommended to change the dictionary when the system has active calls. Are you sure? [Yes|No]: n

Important: This change will require user's input on the CLI console for GTPP dictionary configuration / change.

Example

The following command configures the system to use custom3 dictionary to encode IP address in Binary format in G-CDRs:

    gtp dictionary custom3
gtpp duplicate-hold-time

Configures the number of minutes to hold on to CDRs that are possibly duplicates while waiting for the primary Charging Gateway Function (CGF) to come back up.

Product
GGSN
SGSN
P-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

gtpp duplicate-hold-time minutes

default gtpp duplicate-hold-time

---
default
Configures this command with the default setting.
Default: 60 minutes

---

minutes
Specifies the number of minutes to hold on to CDRs that may be duplicates whenever the primary CGF is down, minutes must be an integer from 1 through 10080.

Usage
Use this command to configure how long to hold on to CDRs that are possibly duplicates while waiting for the primary CGF to come back up. If the GGSN/P-GW (SAEGW) determines that the primary CGF is down, CDRs that were sent to the primary CGF but not acknowledged are sent by the GSN to the secondary CGF as “possibly duplicates”. When the primary CGF comes back up, the GSN uses GTPP to determine whether the possibly duplicate CDRs were received by the primary CGF. Then the secondary CGF is told whether to release or cancel those CDRs. This command configures how long the system should wait for the primary CGF to come back up. As soon as the configured time expires, the secondary CGF is told to release all of the possibly duplicate CDRs.

Example
Use the following command to set the amount of time to hold on to CDRs to 2 hours (120 minutes);

gtpp duplicate-hold-time 120
**gtpp echo-interval**

Configures the frequency at which the system sends GTPP echo packets to configured CGFs.

**Product**
- GGSN
- SGSN
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```plaintext
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```plaintext
gtpp echo-interval time

{ default | no } gtpp echo-interval
```

- **default**
  Configures the default setting for this command,
  Default: 60 seconds

- **no**
  Disables the use of the echo protocol except for the scenarios described in the **Usage** section for this command.

- **time**
  Specifies the time interval (in seconds) for sending GTPP echo packets as an integer from 60 through 2147483647. Default: 60

**Usage**
The GTPP echo protocol is used by the system to ensure that it can communicate with configured CGFs. The system initiates this protocol for each of the following scenarios:

- Upon system boot
- Upon the configuration of a new CGF server on the system using the `gtpp server` command as described in this chapter
- Upon the execution of the `gtpp test accounting` command as described in the **Exec Mode Commands** chapter of this reference
Upon the execution of the `gtpp sequence-numbers private-extensions` command as described in this chapter,

the echo-interval command is used in conjunction with the `gtpp max-retries` and `gtpp timeout` commands as described in this chapter.

In addition to receiving an echo response for this echo protocol, if we receive a GTPP Node Alive Request message or a GTPP Echo Request message from a presumed dead CGF server, we will immediately assume the server is active again.

The alive/dead status of the CGFs is used by the AAA Managers to affect the sending of CDRs to the CGFs. If all CGFs are dead, the AAA Managers will still send CDRs, (refer to the `gtpp deadtime` command), albeit at a slower rate than if a CGF were alive. Also, AAA Managers independently determine if CGFs are alive/dead.

**Example**

The following command configures an echo interval of **120 seconds**:

```
gtpp echo-interval 120
```
**gtpp egcdr**

Configures the eG-CDR and P-CDR (P-GW CDR) parameters and triggers.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
gtpp egcdr { closure-reason admin-disconnect [ management-intervention | normal-release ] | final-record [ [ include-content-ids { all | only-with-traffic } ] ] [ closing-cause { same-in-all-partials | unique } ] ] | losdv-max-containers max losdv_containers | lotdv-max-containers max lotdv_containers | dynamic-path ddl-path | rulebase-max-length rulebase_name_max_length | service-data-flow threshold { interval interval | volume { downlink bytes [ uplink bytes ] | total bytes | uplink bytes [ downlink bytes ] } } | service-idle-timeout { 0 | service_idle_timeout } }
```

```
default gtpp egcdr { closure-reason admin-disconnect | dynamic-path | final-record include-content-ids only-with-traffic closing-cause same-in-all-partials | losdv-max-containers | lotdv-max-containers | service-idle-timeout 0 }
```

```
no gtpp egcdr { dynamic-path | rulebase-max-length | service-data-flow threshold { interval | volume { downlink [ uplink ] | total | uplink [ downlink ] } } }
```

---

**Important**: This behavioral change is limited to PGW-CDR Release 8 dictionaries only.

- **closing-reason**: Configures the record closing reason for PGW-CDR.
- **management-intervention**: Specifies to send Management-Intervention as causeForRecordClosing in PGW-CDRs. By default, Management-Intervention will be sent as the record closure reason for PGW-CDRs.
• **normal-release**: Specifies to send Normal Release as causeForRecordClosing in PGW-CDRs.

```
final-record [ [ include-content-ids { all | only-with-traffic } ] [ closing-cause { same-in-allpartials | unique } ] ]
```

Enables configuration of the final eG-CDR/P-CDR.
Default: Restores the GTTP eG-CDR/P-CDR final record to the default setting to include content IDs with some data to report are included. Also, sets the closing cause to the default of using the same closing cause for multiple final eG-CDR/P-CDRs.

• **include-content-ids**: Controls which content IDs are being included in the final eG-CDR/P-CDR.
  • **all**: Specifies that all content IDs be included in the final eG-CDR/P-CDR.
  • **only-with-traffic**: Specifies that only content-IDs with traffic be included in the final eG-CDR/P-CDRs.

• **closing-cause**: Configures closing cause for the final eG-CDR/P-CDR.
  • **same-in-allpartials**: Specifies that the same closing cause is to be included for multiple final eG-CDR/P-CDRs
  • **unique**: Specifies that the closing cause for final eG-CDR/P-CDRs is to be unique.

**losdv-max-containers max_losdv_containers**

The maximum number of List of Service Data Volume (LoSDV) containers in one eG-CDR/P-CDR.

*max_losdv_containers* must be an integer from 1 through 255.

Default: 10

**lotdv-max-containers max_lotdv_containers**

The maximum number of List of Traffic Data Volume (LoTDV) containers in one eG-CDR/P-CDR.

*max_lotdv_containers* must be an integer from 1 through 8.

Default: 8

**dynamic-path ddl-path**

This keyword activates a new and extensible framework to enable field defined (customer created) eGCDR/PGW-CDR generation. This option enables the user to load the customized or modified dictionary. The dictionary configured through this CLI command takes precedence over existing the **gtpp dictionary** CLI command.

This new framework is implemented to define a GTTP dictionary in a structured format using a “Dictionary Definition Language (DDL)”. Using this language, customers can clearly define fields, triggers and behaviors applicable for a particular GTTP dictionary.

DDL file will be parsed at compilation time and metadata will be populated to generate eGCDR and PGW-CDR. This metadata makes the new framework more modular and maintainable. This will help in faster turnaround time in supporting any new enhancements.

When customer wants to add/modify/remove a field, this information has to be updated in DDL. The DDL file is processed dynamically and the field reflects in CDR. This framework works only for eGCDR and PGW-CDR.

*ddl-path*: Specifies the path of dictionary DDL. The path must be a string of size 0 through 127. This is to support field-loadable dds. The DDL file will be parsed to populate metadata required to generate eGCDR/PGW-CDR.

**Important**: It is not recommended to enable **gtpp egcdr dynamic-path** when there are active calls.
In this release, both current and new framework are functional to enable field defined (customer created) eGCDR/PGW-CDR generation. By default, the new framework is disabled.

**rulebase-max-length** *rulebase_name_max_length*

Specifies the maximum character length of charging rulebase name in LOSDVs of eG-CDR/P-CDR.

*rulebase_name_max_length* must be an integer from 0 through 63. Zero (0) means the rulebase name is added as-is.

Default: None. That is, full (un-truncated) charging rulebase name will go in LOSDVs of eG-CDR/P-CDR.

**service-data-flow threshold** { *interval* *interval* | *volume* { *downlink* *bytes* [ *uplink* *bytes* ] | *total* *bytes* | *uplink* *bytes* [ *downlink* *bytes* ] } }

Configures the thresholds for closing a service data flow container within an eG-CDR/P-CDR.

- **interval** *interval*: Specifies the time interval, in seconds, to close the eG-CDR/P-CDR if the minimum time duration thresholds for service data flow containers satisfied in flow-based charging.

  *interval* must be an integer from 60 through 40000000.

Default: Disabled

- **volume** { *downlink* *bytes* [ *uplink* *bytes* ] | *total* *bytes* | *uplink* *bytes* [ *downlink* *bytes* ] }: Specifies the volume octet counts for the generation of the interim G-CDR/P-CDRs to service data flow container in FBC.

  - **downlink** *bytes*: specifies the limit for the number of downlink octets after which the eG-CDR/P-CDR is closed.
  
  - **total** *bytes*: Specifies the limit for the total number of octets (uplink+downlink) after which the eG-CDR/P-CDR is closed.
  
  - **uplink** *bytes*: specifies the limit for the number of uplink octets after which the eG-CDR/P-CDR is closed.

  *bytes* must be an integer from 10000 through 40000000.

A service data flow container has statistics for an individual content ID. When the threshold is reached, the service data flow container is closed.

**service-idle-timeout** { 0 | *service_idle_timeout* }

Specifies a time period where if no data is reported for a service flow, the service container is closed and added to eG-CDR/P-CDR (as part of LOSDV container list) with service condition change as ServiceIdleOut.

*service_idle_timeout* must be an integer from 10 through 86400.

0: Specifies no service-idle-timeout trigger.

Default: 0

**Usage**

Use this command to configure individual triggers for eG-CDR/P-CDR generation.

Use the **service-data-flow threshold** option to configure the thresholds for closing a service data flow container within an eG-CDR (eG-CDRs for GGSN and P-CDRs for PGW) during flow-based charging (FBC). A service data flow container has statistics regarding an individual content ID. Thresholds can be specified for time interval and for data volume, by entering the command twice (once with interval and once with volume). When either configured threshold is reached, the service data flow container will be closed. The volume trigger can be specified for uplink or downlink or the combined total (uplink + downlink) byte thresholds.
When the PDP context is terminated, all service data flow containers will be closed regardless of whether the thresholds have been reached. An eG-CDR/P-CDR will have at most ten service data flow containers. Multiple eG-CDR/P-CDRs will be created when there are more than ten.

**Example**

Use the following command to set the maximum number of LoSDV containers to 7:

```
gtpp egcdr losdv-max-containers 7
```

The following command sets an eG-CDR threshold interval of 6000 seconds:

```
gtpp egcdr service-data-flow threshold interval 6000
```
gtpp error-response

Configures the response when the system receives an error response after transmitting a DRT (data record transfer) request.

Product
- GGSN
- SGSN
- P-GW
- SAEGW

Privilege
- Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

gtpp error-response { discard-cdr | retry-request }

default gtpp error-response

```plaintext
default
default
Configures this command with the default setting.
Default: retry-request

discard-cdr
discard-cdr
Instructs the system to purge the request upon receipt of an error response and not to retry.

retry-request
retry-request
Instructs the system to retry sending a DRT after receiving an error response. This is the default behavior.
```

Usage

This command configures the system’s response to receiving an error message after sending a DRT request.

Example

```plaintext
gtpp error-response discard-cdr
```
gtpp group

Configures GTPP server group in a context for the Charging Gateway Function (CGF) accounting server(s) that the system is to communicate with.

Product

GGSN
SGSN
P-GW
SAEGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] gtpp group group_name [ -noconfirm ]

- group_name

Specifies the name of GTPP server group that is used for charging and/or accounting in a specific context. group_name must be an alphanumeric string of 1 through 63 character. A maximum of eight GTPP server groups (excluding system created default GTPP server group “default”) can be configured with this command in a context.

- no

Removes the previously configured GTPP group within a context. When a GTPP group is removed accounting information is not generated for all calls using that group and all calls associated with that group are dropped. A warning message displays indicating the number of calls that will be dropped.

- -noconfirm

Executes the command without any additional prompt and confirmation from the user.

Usage

This feature provides the charging gateway function (CGF) accounting server configurable for a group of servers. Instead of having a single list of CGF accounting servers per context, this feature configures multiple GTPP accounting server groups in a context and each server group is consist of list of CGF accounting servers.

In case no GTPP server group is configured in a context, a server group named “default” is available and all the CGF servers configured in a specific context for CGF accounting functionality will be part of this “default” server group.
Example

The following command configures a GTPP server group named star1 for CGF accounting functionality. This server group is available for all subscribers within that context.

  gtpg group star1
gtpp max-cdrs

Configures the maximum number of charging data records (CDRs) included per packet.

Product
GGSN
P-GW
SAEGW
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

gtpp max-cdrs max_cdrs [ wait-time wait_time ]

default gtpp max-cdrs

  default
  Configures this command with the default setting.
  Default: One CDR per packet; disables wait-time

  max_cdrs
  Specifies the maximum number of CDRs to be inserted in a single packet as an integer from 1 through 255.
  Default: 1

  wait-time wait_time
  Specifies the number of seconds the system waits for CDRs to be inserted into the packet before sending it.
  wait_time must be an integer from 1 through 300. Default: Disabled

  Important: If the wait-time expires, the packet is sent as this keyword over-rides max_cdrs.

Usage

CDRs are placed into a GTPP packet as the CDRs close. The system stops placing CDRs into a packet when either the maximum max_cdrs is met, or the wait-time expires, or the value for the gtpp max-pdu-size command is met.

Example

The following command configures the system to place a maximum of 10 CDRs in a single GTPP packet before transmitting the packet:
gtpp max-cdrs 10
**gtpp max-pdu-size**

Configures the maximum payload size of a single GTPP packet that could be sent by the system.

**Product**

- P-GW
- SAEGW
- SGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
```
  configure > context context_name
```

Entering the above command sequence results in the following prompt:
```
[context_name]host_name(config-ctx)#
```

**Syntax**
```
gtpp max-pdu-size pdu_size

default gtpp max-pdu-size
```

**default gtpp max-pdu-size**

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures this command with the default setting.</td>
</tr>
<tr>
<td>Default: 65400 bytes</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>pdu_size</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the maximum payload size (in octets) of the GTPP packet as an integer from 1024 to 65400. The payload includes the CDR and the GTPP header.</td>
</tr>
</tbody>
</table>

⚠️ **Caution:** This command is effective only when GTPP single-source is configured, otherwise this command has no effect.

**Usage**
The GTPP packet contains headers (layer 2, IP, UDP, and GTPP) followed by the CDR. Each CDR contains one or more volume containers. If a packet containing one CDR exceeds the configured maximum payload size, the system creates and send the packet containing the one CDR regardless.

The larger the packet data unit (PDU) size allowed, the more volume containers that can be fit into the CDR. The system performs standard IP fragmentation for packets that exceed the system’s maximum transmission unit (MTU).

⚠️ **Important:** The maximum size of an IPv4 PDU (including the IPv4 and subsequent headers) is 65,535. However, a slightly smaller limit is imposed by this command because the system’s max-pdu-size doesn't include the IPv4 and
UDP headers, and because the system may need to encapsulate GTPP packets in a different/larger IP packet (for sending to a backup device).

Example

The following command configures a maximum PDU size of 2048 octets:

```plaintext
gtp max-pdu-size 2048
```
gtpp max-retries

Configures the maximum number of times the system attempts to communicate with an unresponsive Charging Gateway Function (CGF).

Product
GGSN
P-GW
SAEGW
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

```
gtpp max-retries max_attempts

default gtpp max-retries
```

```
default

Configures this command with the default setting.
Default: 4

max_attempts

Specifies the number of times the system attempts to communicate with a CGF that is not responding.

max_attempts is an integer from 1 through 15.
```

Usage

This command works in conjunction with the `gtpp detect-dead-server` and `gtpp timeout` parameters to set a limit to the number of communication failures that can occur with a configured CGF.

When the value specified by this parameter is met, a failure is logged. The `gtpp detect-dead-server` parameter specifies the number of consecutive failures that could occur before the server is marked as down.

In addition, the `gtpp timeout` command controls the amount of time between re-tries.

If the value for the max-retries is met, the system begins storing CDRs in Random Access Memory (RAM). The system allocates memory as a buffer, enough to store one million CDRs for a fully loaded chassis (a maximum of one outstanding CDR per PDP context). Archived CDRs are re-transmitted to the CGF until they are acknowledged or the system’s memory buffer is exceeded.

Refer to the `gtpp detect-dead-server` and `gtpp timeout` commands for additional information.

Example

The following command configures the maximum number of re-tries to be 8:

```
gtpp max-retries 8
```
gtpp max-retries 8
**gtpp node-id**

Configures the GTPP Node ID for all CDRs.

**Product**
GGSN
P-GW
SAEGW
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```configure > context context_name```

Entering the above command sequence results in the following prompt:

```[context_name]host_name(config-ctx)#```

**Syntax**

```
gtpp node-id node_id
```

```
no gtpp node-id
```

```
no
```

Removes the previous gtpp node ID configuration.

```
node_id
```

Specifies the node ID for all CDRs as an alphanumeric string of 1 through 16 characters.

**Usage**

Use this command to configure the GTPP Node ID for all CDRs.

**Example**

The following command configures the GTPP Node ID as *test123*:

```
gtpp node-id test123
```
**gtpp redirection-allowed**

Configures the system to allow or disallow the redirection of CDRs when the primary Charging Gateway Function (CGF) is unavailable.

**Product**
- GGSN
- P-GW
- SAEGW
- SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
```
configure > context context_name
```
Entering the above command sequence results in the following prompt:
```
[context_name]host_name(config-ctx)#
```

**Syntax**
```
gtpp redirection-allowed
```

{ default | no } gtpp redirection-allowed

---

**Usage**
This command allows operators to better handle erratic network links, without having to remove the configuration of the backup server(s) via the `no gtpp server` command. This functionality is enabled by default.

If the `no gtpp redirection-allowed` command is executed, the system only sends CDRs to the primary CGF. If that CGF goes down, we will buffer the CDRs in memory until the CGF comes back or until the system runs out of buffer memory. In addition, if the primary CGF announces its intent to go down (with a GTPP Redirection Request message), the system responds to that request with an error response.
gtpp redirection-disallowed

This command has been obsoleted and is replaced by the \texttt{gtpp redirection-allowed} command.
gtpp server

Configures the Charging Gateway Function (CGF) accounting server(s) with which the system will communicate.

**Product**
- GGSN
- P-GW
- SAEGW
- SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
gtpp server ip_address [ max max_messages ] [ priority priority ] [ port port ] [ node-alive { enable | disable } ] [ -noconfirm ]
```  

```
no gtpp server ip_address
```

### no

Deletes a previously configured CGF.

- **ip_address**
  Specifies the IP address of the CGF in IPv4 dotted-decimal or IPV6 colon-separated-hexadecimal notation.

- **max max_messages**
  Default: 256
  Specifies the maximum number of outstanding or unacknowledged GTPP packets (from any one AAA Manager task) allowed for this CGF before the system begins buffering the packets.
  max_messages can be configured as an integer from 1 through 256.

#### Important: In release 16.0, a warning message is displayed if the user tries to configure a value greater than 100 and the max-outstanding is configured as 100. This is because there is an internal limit of up to 100 max outstanding requests that can be configured.

- **priority priority**
  Default: 1000
  Specifies the relative priority of this CGF. When multiple CGFs are configured, the priority is used to determine which CGF server to send accounting data to.
**Context Configuration Mode Commands**

**gtpp server**

**priority** can be configured as an integer from 1 through 1000. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this. If you use the **-noconfirm** option, you are not asked for confirmation and multiple servers could be assigned the same priority.

**port**

Default: 3386

Specifies the port the CGF is using. **port** can be configured as an integer from 1 through 65535. Default value for port is 3286.

**Important**: The **port** keyword option has been modified from **udp-port** to make it a generic command. The **udp-port** keyword can still be used, however, it will be in concealed mode and will not be shown in auto-complete or help for the command.

---

**node-alive**

Default: Disable.

This optional keyword allows operator to enable/disable GSN to send Node Alive Request to GTPP Server (i.e. CGF). This configuration can be done per GTPP Server basis.

**-noconfirm**

Executes the command without any additional prompt and confirmation from the user.

---

**Usage**

Use this command to configure the CGF(s) that the system sends CDR accounting data to. Multiple CGFs can be configured using multiple instances of this command. Up to 12 CGF scan be configured per system context. Each configured CGF can be assigned a priority. The priority is used to determine which server to use for any given subscriber based on the routing algorithm that has been implemented. A CGF with a priority of “1” has the highest priority.

**Important**: The configuration of multiple CGFs with the same IP address but different port numbers is not supported.

---

Each CGF can also be configured with the maximum allowable number of unacknowledged GTPP packets. Since multiple AAA Manager tasks could be communicating with the same CGF, the maximum is based on any one AAA Manager instance. If the maximum is reached, the system buffers the packets Random Access Memory (RAM). The system allocates memory as a buffer, enough to store one million CDRs for a fully loaded chassis (a maximum of one outstanding CDR per PDP context).

---

**Example**

The following command configures a CGF with an IP address of **192.168.2.2** and a priority of 5.

```
    gtpp server 192.168.2.2 priority 5
```

The following command deletes a previously configured CGF with an IP address of **100.10.35.7**:

```
    no gtpp server 100.10.35.7
```
gtpp source-port-validation

Toggles port checking for node alive/echo/redirection requests from the CGF.

**Product**

GGSN
P-GW
SAEGW

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ default | no ] gtpp source-port-validation
```

---

**default**

Configures this command with the default setting.
Default: Enabled

---

**no**

Disables CGF port checking. Only the IP address will be used to verify CGF requests.

**Usage**

This command is for enabling or disabling port checking on node alive/echo/redirection requests from the CGF. If the CGF sends messages on a non-standard port, it may be necessary to disable port checking in order to receive CGF requests. On the default setting, both IP and port are checked.

**Example**

The following command disables port checking for CGF requests:

```
no gtpp source-port-validation
```
**gtpp storage-server**

Configures information for the GTPP back-up storage server.

**Product**

GGSN  
P-GW  
SAEGW  
SGSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration  
```bash  
configure > context context_name  
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] gtpp storage-server ip-address port port-num
```

- **no**
  
  Removes a previously configured back-up storage server.

- **ip-address**
  
  Specifies the IP address of the back-up storage server expressed in IPv4 dotted-decimal notation.

- **port port-num**
  
  Specifies the UDP port number over which the GSN communicates with the back-up storage server. Default: 3386

**Usage**

This command configures the information for the server to which GTPP packets are to be backed up to if all the CGFs are unreachable.  
One backup storage server can be configured per system context.

**Important:** This command only takes affect if **gtpp single-source** in the Global Configuration Mode is also configured. Additionally, this command is customer specific. Please contact your local sales representative for additional information.

**Example**

The following command configures a back-up server with an IP address of 192.168.1.2:

```
gtpp storage-server 192.168.1.2
```
gtpp storage-server local file

Configures the parameters for GTPP files stored locally on the GTPP storage server. This command is available for the ASR 5000 platform only.

**Product**
- GGSN
- P-GW
- SAEGW
- SGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration

```bash
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
gtpp storage-server local file { compression | format | name { format | prefix } | purge-processed-files | rotation { cdr-count | time-interval | volume } | start-file-seq-num seq_num }

no gtpp storage-server local file { purge-processed-files | push | rotation { cdr-count | time-interval } }
```

---

**default**

Configures default setting for the specified parameter.

**no**

Removes a previously configured parameters for local storage of CDR files on HDD on SMC card.

**compression { gzip | none }**

Configures the type of compression to be used on the files stored locally.

- **gzip**: Enables Gzip file compression.
- **none**: Disables Gzip file compression - this is the default value.
Default: Disabled

format { custom-n }

Configures the file format to be used to format files to be stored locally.

- **custom1**: File format custom1—this is the default value.
- **custom2**: File format custom2.
- **custom3**: File format custom3.
- **custom4**: File format custom4.
- **custom5**: File format custom5.
- **custom6**: File format custom6 with a block size of 8K for CDR files.
- **custom7**: File format custom7 is a customer specific CDR file format.
- **custom8**: File format custom8 is a customer specific CDR file format. It uses node-id-suffix_date_time_fixed-length-seq-num format for file naming.

Default: custom1

name { format | prefix prefix }

Allows the format of the CDR filenames to be configured independently from the file format so that the name format contains the file name with conversion specifications.

- **prefix**—Enter an alphanumeric string of 1 through 127 characters. The string must begin with the % (percent sign).
  - %y: = year as a decimal number without century (range 00 to 99).
  - %Y: year as a decimal number with century.
  - %m: month as a decimal number (range 01 to 12).
  - %d: day of the month as a decimal number (range 01 to 31).
  - %H: hour as a decimal number 24-hour format (range 00 to 23).
  - %h: hour as a decimal number 12-hour format (range 01 to 12).
  - %M: minute as a decimal number (range 00 to 59).
  - %S: second as a decimal number (range 00 to 60). (The range is up to 60 to allow occasional leap seconds.)
  - %Q: File sequence number. Field width may be specified between the % and the Q. If the natural size of the field is smaller than this width, then the result string is padded (on the left) to the specified width with 0s
  - %N: No of CDRs in the file. Field width may be specified between the % and the N. If the natural size of the field is smaller than this width, then the result string is padded (on the left) to the specified width with 0s

- **max-file-seq-no**: This can be configured optionally. It indicates the maximum value of sequence number in file name (starts from 1). Once the configured max-file-seq-no limit is reached, the sequence number will restart from 1. If no max-file-seq-no is specified then file sequence number ranges from 1 - 4294967295.

By default the above keyword is not configured (default gtp storage-server local file name format). In which case the CDR filenames are generated based on the file format as before (maintains backward compatibility).

purge-processed-files [ file-name-pattern file_pattern | purge-interval purge_dur ]

Enables the GSN to periodically (every 4 minutes) delete locally processed (*.p) CDR files from the HDD on the SMC card. Default: Disabled
This keyword also deletes the processed push files (tx.*, under $CDR_PATH/TX/tx.*) a well when purging is enabled instead of "*.p:*.P".

**Important:** This option is available only when GTTP server storage mode is configured for local storage of CDRs with the `gtpp storage-server mode local` command.

Optional keyword `file-name-pattern file_pattern` provides an option for user to control the pattern of files. `file_pattern` must be mentioned in "".p:*:P:tx.*"" format in a string of size 1 through 127, which is also the default format. Wildcards * and: (synonymous to |) are allowed. Optional keyword `purge-interval purge_dur` provides an option for user to control the purge interval duration (in minutes). `purge_dur` must be an integer from 1 through 259200. Default value 60.

```
push { encrypted-url encrypted_url | url url } [ encrypted-secondary-url encrypted_url | secondary-url url ] [ via-local-context ]
```

Enables push method to transfer local CDR files to remote system.
- `encrypted-url`: Defines use of an encrypted url.
  - `encrypted_url` must be an alphanumeric string of 1 through 8192 characters in SFTP format.
- `url`: Location where the CDR files are to be transferred.
  - `url` must be an alphanumeric string of 1 through 1024 characters in the format: `scheme://user:password@host`
  - `encrypted_url` must be an alphanumeric string of 1 through 8192 characters in SFTP format.
- `secondary-url`: Secondary location where the CDR files are to be transferred, in case primary is unreachable.
  - `url` must be an alphanumeric string of 1 through 1024 characters in the format: `scheme://user:password@host`

**Important:** When a file transfer to primary fails four times, the transfer of files will automatically be failed over to the secondary server. The transfer will switch back to the original primary after 30 minutes, or if there are four transfer failures to the secondary server.

- `via-local-context`: Pushes the CDR files via SPIO in the local context.
  - Default: Pushes via the group's context.

**Important:** If the push is done through gtpp context, then the push rate is lesser compared to via local context as the HDD is attached to the local context.

```
rotation { cdr-count count | time-interval time | volume mb size }
```

Specifies rotation related configuration for GTTP files stored locally.
- `cdr-count count`: Configures the CDR count for the file rotation as an integer from 1000 through 65000. Default value 10000.
- `time-interval time`: Configures the time interval (in seconds) for file rotation as an integer from 30 through 86400. Default value 3600 (1 hour).
- `volume mb size`: Configure the file volume (in MB) for file rotation. Enter an integer from 2 to 40. This trigger cannot be disabled. Default value is 4MB.
`start-file-seq-num seq_num [ recover-file-seq-num ]`

Specifies the start sequence number. The sequence number goes on incrementing until ULONG_MAX (or max-seq-num configured in file name format) and then it would rollover. If `recover-file-seq-num` is configured, every time the system is rebooted (or aaaproxy recovery/ planned/ unplanned packet service card migration), the file sequence number continues from the last sequence number and during rollover it starts from first-sequence number.

`seq_num`: Configures the sequence number. Enter an integer from 1 through 4294967295.

`recover-file-seq-num`: Configures the recovery of file sequence number. This is an optional field and if configured, every time the machine rebooted, the file sequence number continues from the last sequence number.

**Usage**

This command configures the parameters for storage of GTPP packets as files on the local server—meaning the hard disk.

**Example**

The following command configures rotation for every 1.5 hours (5400 seconds) for locally stored files.

```
gtpp storage-server local file rotation time-interval 5400 start-file-seq-num 20 recover-file-seq-num
```
**gtpp storage-server max-retries**

Configures the maximum number of times the system attempts to communicate with an unresponsive GTPP back-up storage server.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration
  ```
  configure > context context_name
  ```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cxt)#
```

**Syntax**

```
gtpp storage-server max-retries max_attempts

default gtpp storage-server max-retries
```

**default gtpp storage-server max-retries**

- **default**
  - Configures this command with the default setting.
  - Default: 2

- **max_attempts**
  - Specifies the number of times the system attempts to communicate with a GTPP back-up storage server that is not responding. *max_attempts* enter an integer from 1 through 15.

**Usage**

This command works in conjunction with the **gtpp storage-server timeout** parameters to set a limit to the number of communication failures that can occur with a configured GTPP back-up storage server. The **gtpp storage-server timeout** command controls the amount of time between re-tries.

**Example**

The following command configures the maximum number of re-tries to be 8:

```
gtpp storage-server max-retries 8
```
gtpp storage-server mode

Configures storage mode, local or remote, for CDRs. Local storage mode is available with ASR 5000 platforms only.

Product

- GGSN
- P-GW
- SAEGW
- SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

```
gtpp storage-server mode { local | remote | streaming }
default gtpp storage-server mode
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Configures this command with the default setting. Default: remote</td>
</tr>
</tbody>
</table>
| local | Default: Disabled
Specifies the use of the hard disk on the SMC for storing CDRs |
| remote | Specifies the use of an external server for storing CDRs. This is the default value. |
| streaming | Default: Disabled
Allows the operator to configure “streaming” mode of operation for GTPP group. When this keyword is supplied the CDRs will be stored in following fashion:

- When GTPP link is active with CGF, CDRs are sent to a CGF via GTPP and local hard disk is NOT used as long as every record is acknowledged in time.
- If the GTPP connection is considered to be down, all streaming CDRs will be saved temporarily on the local hard disk and once the connection is restored, unacknowledged records will be retrieved from the hard disk and sent to the CGF. |
Usage

This command configures whether the CDRs should be stored on the hard disk of the SMC or remotely, on an external server.

Example

The following command configures use of a hard disk for storing CDRs:

```
gtpp storage-server mode local
```
gtpp storage-server timeout

Configures the amount of time that must pass with no response before the system re-attempts to communicate with the GTPP back-up storage server.

SAEGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

```
gtpp storage-server timeout duration
```

default gtpp storage-server timeout

default

Configures this command with the default setting.
Default: 30 seconds

duration

Specifies the maximum amount of time (in seconds) the system waits for a response from the GTPP back-up storage server before assuming the packet is lost. `duration` is an integer from 30 through 120.

Usage

This command works in conjunction with the `gtpp storage-server max-retries` command to establish a limit on the number of times that communication with a GTPP back-up storage server is attempted before a failure is logged. This parameter specifies the time between retries.

Example

The following command configures a retry timeout of 60 seconds:

```
gtpp storage-server timeout 60
```
gtpp suppress-cdrs zero-volume

This command suppresses the CDRs with zero byte data count. The CDRs can be classified as Final-cdrs, Internal-trigger-cdrs, and External-trigger-cdrs. This command allows the selection of CDRs to be suppressed and it is disabled by default.

Important: This command is license dependent. For more information, contact your Cisco account representative.

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

gtpp suppress-cdrs zero-volume { external-trigger-cdr | final-cdr | internal-trigger-cdr }

default gtpp suppress-cdrs zero-volume

no gtpp suppress-cdrs zero-volume

default

Configures this command with the default setting.

no

Disables suppression of the CDRs with zero byte data count.

Usage

This command suppresses the CDRs with zero byte data count. This command provides an option to select the CDRs to be suppressed.

Example

To suppress only final zero volume CDRs use:

      gtpp suppress-cdrs zero-volume final-cdr

To suppress final zero Volume CDRs and interim zero volume CDRs due to internal triggers use:

      gtpp suppress-cdrs zero-volume final-cdr internal-trigger-cdr
To suppress final zero volume CDRs and interim zero volume CDRs due to internal and external triggers use:

```
gtp suppress-cdrs zero-volume final-cdr internal-trigger-cdr external-trigger-cdr
```

To suppress interim zero volume CDRs due to internal and external triggers use:

```
gtp suppress-cdrs zero-volume internal-trigger-cdr external-trigger-cdr
```

To suppress interim zero volume CDRs due to external triggers use:

```
gtp suppress-cdrs zero-volume external-trigger-cdr
```
gtpp suppress-cdrs zero-volume-and-duration

Suppresses the CDRs created by sessions having zero duration and/or zero volume. By default this mode is disabled.

Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```bash
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
gtpp suppress-cdrs zero-volume-and-duration { gcdrs [ egcdrs ] | egcdrs [ gcdrs ] }
```

**Usage**
Use this command to suppress the CDRs (G-CDRs and eG-CDRs) which were created when zero-duration sessions and zero-volume sessions are encountered due to any reason. By default this command is disabled and system will not suppress any CDR.

**Example**
The following command configures the system to suppress the eG-CDRs created for a zero duration session or zero volume session:

```
gtpp suppress-cdrs zero-volume-and-duration egcdrs gcdrs
```
**gtpp timeout**

Configures the amount of time that must pass with no response before the system re-attempts to communicate with the Charging Gateway Function (CGF).

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:
```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
gtpp timeout time
```

**default gtpp timeout**

```
default
default
```

**Usage**

This command works in conjunction with the **gtpp max-retries** command to establish a limit on the number of times that communication with a CGF is attempted before a failure is logged. This parameter specifies the time between retries.

**Example**

The following command configures a retry timeout of 30 seconds:
```
gtpp timeout 30
```
**gtpp trigger**

This command is left in place for backward compatibility. To disable and enable GTPP triggers you should use the `gtpp trigger` command in GTPP Server Group Configuration Mode.
gtpp transport-layer

Selects the transport layer protocol for the Ga interface for communication between the access gateways (GSNs) and GTPP servers.

**Product**
- GGSN
- P-GW
- SAEGW
- SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-ctx)#
```

**Syntax**

```
gtpp transport-layer { tcp | udp }
default gtpp transport-layer
```

**Usage**
Use this command to select the TCP or UDP as the transport layer protocol for Ga interface communication between GTPP servers and AGWs (GSNs).

**Example**

The following command enables TCP as the transport layer protocol for the GSN’s Ga interface.

```
gtpp transport-layer tcp
```
**gtpu-service**

Creates a GTP-U service or specifies an existing GTP-U service and enters the GTP-U Service Configuration Mode for the current context.

**Product**

GGSN
P-GW
SAEGW
S-GW

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
gtpu-service service_name [ -noconfirm ]

no gtpu-service service_name
```

**gtpu-service service_name**

Specifies the name of the GTP-U service. If *service_name* does not refer to an existing service, a new service is created if resources allow. *service_name* is an alphanumeric string of 1 through 63 characters.

**Important:** Service names must be unique across all contexts within a chassis.

**-noconfirm**

Executes the command without any additional prompt and confirmation from the user.

**no gtpu-service service_name**

Removes the specified GTP-U service from the context.

**Usage**

Enter the GTP-U Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service. A maximum of 256 services (regardless of type) can be configured per system.

**Caution:** Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a
large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-gtpu-service)#
```

GTP-U Service Configuration Mode commands are defined in the GTP-U Service Configuration Mode Commands chapter.

**Example**

The following command enters the existing GTP-U Service Configuration Mode (or creates it if it does not already exist) for the service named `gtpu-service1`:

```
gtpu-service gtpu-service1
```

The following command will remove `gtpu-service1` from the system:

```
no gtpu-service gtpu-service1
```
ha-service

Creates/deletes a home agent service or specifies an existing HA service for which to enter the Home Agent Service Configuration Mode for the current context.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
ha-service name [ -noconfirm ]
no ha-service name
```

- **no**
  Indicates the home agent service specified is to be removed.

- **name**
  Specifies the name of the HA service to configure. If `name` does not refer to an existing service, the new service is created if resources allow. `name` is an alphanumeric string of 1 through 63 characters.

---

**Important:** Service names must be unique across all contexts within a chassis.

- **-noconfirm**
  Executes the command without any additional prompt and confirmation from the user.

**Usage**

Enter the HA Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.

A maximum of 256 services (regardless of type) can be configured per system.

---

**Caution:** Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

**Example**

The following command will enter, or create and enter, the HA service `sampleService`:
ha-service sampleService

The following command will remove sampleService as being a defined HA service:

no ha-service sampleService
**hnbgw-service**

Creates or removes an Home Node B Gateway (HNB-GW) service or configures an existing HNB-GW service and enters the HNB-GW Service Configuration Mode for Femto UMTS access networks configuration in the current context.

**Product**
HNB-GW

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
hnbgw-service hnbgw_svc_name [ -nocfirm ]

no hnbgw-service hnbgw_svc_name
```

- **no**
  Removes the specified HNB-GW service from the context.

- **hnbgw_svc_name**
  Specifies the name of the HNB-GW service. If service_name does not refer to an existing service, the new service is created if resources allow. hnbgw_svc_name is an alphanumeric string of 1 through 63 characters.

**Important**: Service names must be unique across all contexts within a chassis.

- **-noconfirm**
  Executes the command without any additional prompt and confirmation from the user.

**Usage**

Use this command to enter the HNB-GW Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.

A maximum of one HNB-GW service which is further limited to a maximum of 256 services (regardless of type) can be configured per system.

**Caution**: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.
Entering this command results in the following prompt:

```
[context_name]hostname(config-hnbgw-service)#
```

The commands available in this mode are defined in the *HNB-GW Service Configuration Mode Commands* chapter of *Command Line Interface Reference*.

**Caution:** This is a critical configuration. The HNB-GW service can not be configured without this configuration. Any change to this configuration would lead to restarting the HNB-GW service and removing or disabling this configuration will stop the HNB-GW service.

**Example**

The following command enters the existing HNB-GW Service Configuration Mode (or creates it if it does not already exist) for the service named *hnb-service1*:

```
hnbgw-service hnb-service1
```

The following command will remove *hnb-service1* from the system:

```
no hnbgw-service hnb-service1
```
hsgw-service

Creates an HSGW service or specifies an existing HSGW service and enters the HSGW Service Configuration Mode for the current context.

Product
HSGW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

hsgw-service service_name [ -noconfirm ]

no hsgw-service service_name

---

no

Removes the specified HSGW service from the context.

service_name

Specifies the name of the HSGW service. If service_name does not refer to an existing service, the new service is created if resources allow. service_name is an alphanumeric string of 1 through 63 characters.

---

Important: Service names must be unique across all contexts within a chassis.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

---

Usage

Enter the HSGW Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.

A maximum of 256 services (regardless of type) can be configured per system.

---

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:
hsgw-service

HSGW Service Configuration Mode commands are defined in the *HSGW Service Configuration Mode Commands* chapter.
Use this command when configuring the following eHRPD components: HSGW.

**Example**

The following command enters the existing HSGW Service Configuration Mode (or creates it if it does not already exist) for the service named *hsgw-service1*:

```
hsgw-service hsgw-service1
```

The following command will remove *hsgw-service1* from the system:

```
no hsgw-service hsgw-service1
```
hss-peer-service

Creates a Home Subscriber Service (HSS) peer service or configures an existing HSS peer service and enters the HSS Peer Service configuration mode.

**Product**
MME
SGSN

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
hss-peer-service service_name [ -noconfirm ]
no hss-peer-service service_name
```

- **no**
  Removes the specified HSS peer service from the context.

- **service_name**
  Specifies the name of the HSS peer service. If `service_name` does not refer to an existing service, a new service is created if resources allow. `service_name` is an alphanumeric string of 1 through 63 characters.

**Important:** Service names must be unique across all contexts within a chassis.

- **-noconfirm**
  Executes the command without any additional prompt and confirmation from the user.

**Usage**

Enter the HSS Peer Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.

The maximum number of HSS Peer Services that can be created and configured for the SGSN is 16.
The maximum number of HSS Peer Services that can be created and configured for the MME is 64.

**Important:** In some cases, two diameter endpoints (S6a and S13) can be configured for a single HSS Peer Service. To ensure peak system performance, we recommend that the total of all Diameter endpoints should be taken into consideration and limited to 64 endpoints.
**Caution:** A maximum of 256 services (regardless of type) can be configured per system. Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-hss-peer-service)#
```

HSS Peer Service Configuration Mode commands are defined in the *HSS Peer Service Configuration Mode Commands* chapter.

**Example**

The following command enters the existing HSS Peer Service Configuration Mode (or creates it if it does not already exist) for the service named `hss-peer1`:

```
hss-peer-service hss-peer1
```

The following command will remove `hss-peer1` from the system:

```
no hss-peer-service hss-peer1
```
Chapter 55
Context Configuration Mode Commands I-M

This section includes the commands `ikev1 disable-initial-contact` through `multicast-proxy` service.

Mode

Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
ikev1 disable-initial-contact

Disables the sending of the INITIAL-CONTACT message in the IKEv1 protocol after the node creates a new Phase1 SA, caused either by Dead Peer Detection or by a rekey.

Product
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

`configure > context context_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-ctx)#`

Syntax

```
[ no ] ikev1 disable-initial-contact
```

no

Disables this command, which re-enables the sending of the INITIAL-CONTACT message.

Usage

Use this command to disable the sending of the INITIAL-CONTACT message in the IKE v1 protocol.

Example

The following command disables the sending of the INITIAL-CONTACT message:

```
ikev1 disable-initial-contact
```
ikev1 disable-phase1-rekey

Configures the rekeying of Phase1 SA when the Internet Security Association and Key Management Protocol (ISAKMP) lifetime expires in Internet Key Exchange (IKE) v1 protocol.

Product
- PDSN
- HA
- GGSN

Privilege
- Security Administrator, Administrator

Mode
- Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cxt)#
```

Syntax

```
[ no ] ikev1 disable-phase1-rekey
```

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
</table>
| Re-enables Phase 1 SAs when the ISAKMP lifetime expires.

Usage

Use this command to disable the rekeying of Phase 1 SAs when the ISAKMP lifetime expires in IKE v1 protocol.

Example

The following command disables rekeying of Phase1 SAs when the lifetime expires:

```
ikev1 disable-phase1-rekey
```
ikev1 keepalive dpd

Configures the ISAKMP IPSec Dead Peer Detection (DPD) message parameters for IKE v1 protocol.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
Execute > Global Configuration > Context Configuration

```bash
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] ikev1 keepalive dpd interval interval timeout time num-retry retries
```

- **no**
  Deletes previously configured IPSec DPD Protocol settings.

- **dpd interval interval**
  Specifies the time interval (in seconds) at which IPSec DPD Protocol messages are sent. `interval` is an integer from 10 through 3600.

- **timeout time**
  Specifies the amount of time (in seconds) allowed for receiving a response from the peer security gateway prior to re-sending the message. `time` is an integer from 10 through 3600.

- **num-retry retries**
  Specifies the maximum number of times that the system should attempt to reach the peer security gateway prior to considering it unreachable. `retries` is an integer from 1 through 100.

**Usage**

Use this command to configure the ISAKMP dead peer detection parameters in IKE v1 protocol. Tunnels belonging to crypto groups are perpetually kept “up” through the use of the IPSec Dead Peer Detection (DPD) packets exchanged with the peer security gateway.

**Important:** The peer security gateway must support RFC 3706 in order for this functionality to function properly.
This functionality is for use with the Redundant IPSec Tunnel Fail-over feature and to prevent IPSec tunnel state mismatches between the FA and HA when used in conjunction with Mobile IP applications. Regardless of the application, DPD must be supported/configured on both security peers. If the system is configured with DPD but it is communicating with a peer that does not have DPD configured, IPSec tunnels still come up. However, the only indication that the remote peer does not support DPD exists in the output of the `show crypto isakmp security associations summary dpd` command.

**Important:** If DPD is enabled while IPSec tunnels are up, it will not take affect until all of the tunnels are cleared.

**Example**

The following command configures IPSec DPD Protocol parameters to have an interval of 15, a timeout of 10, to retry each attempt 5 times:

```
ikev1 keepalive dpd interval 15 timeout 10 num-retry 5
```
ikev1 policy

Configures or creates an ISAKMP policy with the specified priority and enters ISAKMP Configuration Mode for IKE v1 protocol.

Product
PDSN
HA
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name] host_name(config-ctx)#

Syntax

[ no ] ikev1 policy priority

- **no**
  Removes a previously configured ISAKMP policy for IKE v1 protocol.

- **priority**
  Specifies the priority of an ISAKMP policy as an integer from 0 through 100. ISAKMP policies for IKE v1 protocol with lower priority numbers take precedence over policies with higher priorities. “0” is the highest priority. Default: 0

Usage
Use this command to create ISAKMP policies to regulate how IPSec key negotiation is performed for IKE v1 protocol.
Internet Security Association Key Management Protocol (ISAKMP) policies are used to define Internet Key Exchange (IKE) SAs. The IKE SAs dictate the shared security parameters (i.e. which encryption parameters to use, how to authenticate the remote peer, etc.) between the system and a peer security gateway.
During Phase 1 of IPSec establishment, the system and a peer security gateway negotiate IKESAs. These SAs are used to protect subsequent communications between the peers including the IPSec SA negotiation process.
Multiple ISAKMP policies can be configured in the same context and are used in an order determined by their priority number.

Example
Use the following command to create an ISAKMP policy with the priority 1 and enter the ISAKMP Configuration Mode:

ikev1 policy 1
ikev2-ikesa

Creates a new, or specifies an existing, IKEv2 security association parameters and enters the IKEv2 Security Association Configuration Mode.

**Product**
ePDG
HeNBGW
PDIF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
*configure > context context_name*

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] ikev2-ikesa { auth-method-set auth_method_set_name | transform-set transform_set_name }
```

**no**
Removes the entered IKEv2 security association authentication method set or transform set from the system.

```
auth-method-set auth_method_set_name
```

Configure an IKEv2 IKE Security Association Auth-Method Set. Applicable for IKEv2 subscriber-mode based products. This object encapsulates various Authentication methods.

*auth_method_set_name* is the context level name to be used for the IKEv2 IKE Security Association Authentication methods Set, which is a string of size 1 to 127.

```
transform-set transform_set_name
```

Configure an IKEv2 IKE Security Association Transform Set. This object encapsulates various IKEv2 IKE algorithm configurations which are required for establishing and IKEv2 IKE Security Association with a remote peer.

*transform_set_name* is the context level name to be used for the IKEv2 IKE Security Association Transform Set, which is a string of size 1 to 127.

**Usage**

Use this command to create a new or enter an existing IKEv2 security association parameters set. A list of up to four separate transform-sets and three separate authentication method sets can be created.

Entering the command *transform-set transform_set_name* results in the following prompt:

```
[context_name]hostname(cfg-ctx-ikev2ikesa-tran-set)#
```
IKEv2 Security Association Configuration Mode commands are defined in the *IKEv2 Security Association Configuration Mode Commands* chapter.

**Example**

The following command configures an IKEv2 security association transform set called *ikesa3* and enters the IKEv2 Security Association Configuration Mode:

```
ikev2-ikesa transform-set ikesa3
```
ims-auth-service

This command enables the creation, configuration or deletion of an IMS authorization service in the current context.

Product
GGSN
HA
IPSG
PDSN
P-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

ims-auth-service auth_svc_name [ -noconfirm ]

{ no | default } ims-auth-service auth_svc_name

---

no
Deletes the specified IMS authorization service within the current context.

---

default
Restores default state of IMS authorization service, disabled for a specific context.

---

auth_svc_name
Specifies name of the IMS authorization service as a unique alphanumeric string of 1 through 63 characters. In releases prior to 18, a maximum of 16 authorization services can be configured globally in the system. There is also a system limit for the maximum number of total configured services. In 18 and later releases, up to a maximum of 30 IMS authorization service profiles can be configured within the system.

---

Important: Service names must be unique across all contexts within the system.

---

-noconfirm
Executes the command without any additional prompt and confirmation from the user.
Usage
Use this command to create/configure/delete an IMS authorization service for Gx interface support in the current context.
Entering this command results in the following prompt:

[context_name]hostname(config-imsa-service)

IMS authorization Service Configuration commands are described in the IMS Authorization Service Configuration Mode Commands chapter.

Important: Whenever a new ims-auth-serv is configured using an endpoint that is used by another ims-auth-serv, then the diabase callbacks are overwritten with values of the new IMSA service. This is a limitation on the system to register only one application per endpoint. So, multiple IMSA services registering with same endpoint may not work properly. If such scenario occurs, configure a different endpoint name for the IMSA service being used and then remove and re-configure the IMSA service used.

Example
The following command configures an IMS authorization service named ims_interface1 within the current context:

```bash
ims-auth-service ims_interface1
```
**ims-sh-service**

Creates the specified IP Multimedia Subsystem (IMS) Sh service name to allow configuration of an Sh service.

**Product**
- PDIF
- SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

\[context_name\]host_name(config-ctx)#

**Syntax**

`ims-sh-service name`

`no ims-sh-service name`

- **no**
  - Removes a previously configured IMS-Sh-service.

- **name**
  - Specifies the name of the IMS-Sh-service to be configured as an alphanumeric string of 1 through 63 characters.

**Important:** Service names must be unique across all contexts within a chassis.

**Usage**
The IMS-Sh-service is named in the pdif-service and/or cscf-service. Use this command to enter the IMS Sh Service Configuration Mode.

Entering this command results in the following prompt:

\[context_name\]host_name(config-ims-sh-service)#

IMS Sh Service Configuration Mode commands are defined in the *IMS Sh Service Configuration Mode Commands* chapter in this guide.

**Example**
The following example creates or enters an IMS Sh service named *ims-1*:

`ims-sh-service ims-1`
inspector

Configures a context-level inspector account within the current context.

Product
All

Privilege
Security Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

inspector user_name [ encrypted ] [ nopassword ] password password [ ecs | noecs ] [ expiry-date date_time ] [ li-administration ] [ nocns ] [ timeout-absolute abs_seconds ] [ timeout-min-absolute abs_minutes ] [ timeout-idle timeout_duration ] [ timeout-min-idle idle_minutes ]

no inspector user_name

no

Removes a previously configured inspector account.

user_name

Specifies a name for the context-level inspector account as an alphanumeric string of 1 through 32 characters.

[ encrypted ] password password

Specifies the password to use for the user which is being given context-level inspector privileges within the current context. The encrypted keyword indicates the password specified uses encryption.

password is an alphanumeric string of 1 through 63 characters without encryption, or 1 through 127 characters with encryption.

The encrypted keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the password keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

[ nopassword ]

This option allows you to create an inspector without an associated password. Enable this option when using ssh public keys (authorized key command in SSH Configuration mode) as a sole means of authentication. When enabled this option prevents someone from using an inspector password to gain access to the user account.

ecs | noecs

Default: noecs

ecs: Permits the specific user to access ACS-specific configuration commands.
noecs: Prevents the specific user to access ACS-specific configuration commands.

expiry-date  date_time
Specifies the date and time that this account expires. Enter the date and time in the format YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss.
Where YYYY is the year, MM is the month, DD is the day of the month, HH is the hour, mm is minutes, and ss is seconds.

li-administration
Refer to the Lawful Intercept Configuration Guide for a description of this parameter.

timeout-absolute  abs_seconds
This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.
Specifies the maximum amount of time (in seconds) the context-level inspector may have a session active before the session is forcibly terminated. abs_seconds must be an integer from 0 through 30000000. The value 0 disables the absolute timeout. Default: 0

timeout-min-absolute  abs_minutes
Specifies the maximum amount of time (in minutes) the context-level inspector may have a session active before the session is forcibly terminated. abs_minutes must be an integer from 0 through 525600 (365 days). The value 0 disables the absolute timeout. Default: 0

Usage
Create new context-level inspector or modify existing inspector’s options, in particular, the timeout values. Inspector users have minimal read-only privileges. Refer to the Command Line Interface Overview chapter for more information.

Important: A maximum of 128 administrative users and/or subscribers may be locally configured per context.

Example
The following command creates a context-level inspector account named user1:

    inspector user1 password secretPassword
The following command removes a context-level inspector account named *user1*:

```
no inspector user1
```
interface

Creates or deletes an interface or specifies an existing interface. By identifying an interface, the mode changes to configure this interface in the current context.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

interface name [ broadcast | loopback | point-to-point | tunnel ]

no interface name

---

no

Removes the specified interface.

name

Specifies the name of the interface to configure. If name does not refer to an existing interface, the new interface is created if resources allow. name is an alphanumeric string of 1 through 79 characters.

broadcast

Creates an Ethernet broadcast (IP) interface and enters the Ethernet Configuration Mode. Default: Enabled

Important: Refer to the Ethernet Interface Configuration Mode Command chapter for more information.

loopback

Creates an internal IP address that is always UP, is not bound to any physical card/port, and can be reached by any interface configured in the current context. As a loopback interface uses all available physical ports, this type of interface is particularly useful for load-balancing. The interface must be configured for loopback when configuring Interchassis Session Recovery (ICSR). A total of 256 loopback interfaces can be configured. Default: Disabled

This loopback option is not used to setup a diagnostic test port so it should not be confused with the loopback option used in the various card/port configuration modes.

Important: Refer to the Loopback Interface Configuration Mode Command chapter for more information.
point-to-point

Creates a permanent virtual connection (PVC) in the current context and enters the PVC Configuration Mode. Currently, this type of interface is only used with an optical (ATM) line card.

Important: Refer to the PVC Interface Configuration Mode Command chapter for more information.

tunnel

Creates a tunnel interface to support the various tunnel interfaces. Currently only IPv6-over-IPv4 and GRE tunnel interfaces are supported.

Important: Refer to the Tunnel Interface Configuration Mode Commands chapter for more information.

Usage

Use this command to enter or create the interface configuration mode for an existing interface or for a newly defined interface. This command is also used to remove an existing interface when it longer is needed.

Important: If no keyword is specified, broadcast is assumed and the interface is Ethernet by default.

Example

For IPv6-over-IPv4 or GRE tunneling, you need to specify the interface type as tunnel.

The following command enters the Ethernet Interface Configuration Mode creating the interface sampleService, if necessary:

```
interface sampleInterface
```

The following command removes sampleService as being a defined interface:

```
no interface sampleInterface
```

The following command enters the Tunnel Interface Configuration Mode creating the interface GRE_tunnel1, if necessary:

```
interface GRE_tunnel1 tunnel
```
**ip access-group**

Configures an access group with an Access Control List (ACL) for IP traffic for the current context. The Context-level ACL is applied only to outgoing packets.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
ip access-group name [ in | out ] [ priority_value ]
no ip access-group name [ in | out ]
```

- **no**
  Indicates the specified ACL rule is to be removed from the group.

- **name**
  Specifies the ACL rule to be added/removed from the group.
  In Release 8.1 and later, name is an alphanumeric string of 1 through 47 characters.
  In Release 8.0, name is an alphanumeric string of 1 through 79 characters.

**Important**: Up to eight ACLs can be applied to a group provided that the number of rules configured within the ACL(s) does not exceed the 256-rule limit for the context.

- **in | out**
  The in and out keywords are deprecated and are only present for backward compatibility. The Context-level ACL are applied only to outgoing packets.

- **priority_value**
  Specifies the priority of the access group. 0 is the highest priority. If priority_value is not specified, the priority is set to 0. priority_value must be an integer from 0 through 4294967295. Default: 0
  If access groups in the list have the same priority, the last one entered is used first.

**Usage**

Use this command to add IP access lists (refer to the ip access-list command) configured with in the same context to an ACL group.
Refer to the *Access Control Lists* appendix of the *System Administration Guide* for more information on ACLs.

**Example**

The following commands add `sampleGroup` to the context-level ACL with a priority of 0:

```
   ip access-group sampleGroup 0
```
**ip access-list**

Enables creation, configuration or deletion of an IP Access List in the current context.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
ip access-list name
{ default | no } ip access-list name
```

- **default**
  Sets the context’s default access control list to that specified by `name`.

- **no**
  Removes the specified access list.

- **name**
  Specifies the access list name.
  In Release 8.0, `name` is an alphanumeric string of 1 through 79 characters.
  In Release 8.1 and later, `name` is an alphanumeric string of 1 through 47 characters.
  If the named access list does not exist, it is created, and the CLI mode changes to the ACL Configuration Mode, wherein the access list can be configured.
  If the named access list already exists, the CLI mode changes to the ACL Configuration Mode, wherein the access list can be reconfigured.

**Usage**

Executing this command enters the ACL Configuration Mode in which rules and criteria are defined for the ACL.

**Important:** A maximum of 64 rules can be configured per ACL. The maximum number of ACLs that can be configured per context is limited by the amount of available memory in the VPN Manager software task; it is typically less than 200.

The no version of this command deletes the ACL.
Refer to the Access Control Lists appendix of the System Administration Guide for more information on ACLs.

Example

The following command creates an access list named `sampleList`, and enters the ACL Configuration Mode:

```
ip access-list sampleList
```
**ip arp**

Configures the allocation retention priority (ARP) options for the current context.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration  
*configure > context context_name*

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
ip arp ip_address mac_address [ vrf vrf_name ]

no ip arp ip_address mac_address
```

**ip_address**

Specifies the IP address for which to configure the ARP options where *ip_address* is an IP address expressed in IPv4 dotted-decimal notation.

**mac_address**

Specifies the media-specific access control layer address for the IP address. *mac_address* must be specified as a 6-byte hexadecimal number with each byte separated by a colon, for example, “AA:12:bb:34:f5:0E”.

**vrf vrf_name**

Associates a Virtual Routing and Forwarding (VRF) context with this static ARP entry. *vrf_name* is name of a preconfigured virtual routing and forwarding (VRF) context configured in *Context Configuration Mode* via the *ip vrf* command.

**Usage**

Manage the IP address mapping which is a logical/virtual identifier to the more lower layer addressing used for address resolution in ICMP messages.

For tunnel-based interface, network IP pool can have overlapping ip-addresses across Verve. To manage it adding a preconfigured VRF context is required to associate with an static ARP entry. By default, the ARP is added in the given context. If the VRF name is specified, then the ARP is added to the VRF ARP table.

**Example**

The following commands set the IP and MAC address for the current context then remove it from the configuration:
\texttt{ip arp 10.2.3.4 F1:E2:D4:C5:B6:A7}

\texttt{no ip arp 10.2.3.4}

The following commands set the IP and MAC address for a VRF context \textit{vrf1} in the configuration:

\texttt{ip arp 10.2.3.4 F1:E2:D4:C5:B6:A7 vrf vrf1}
# ip as-path access-list

**Product**

HA

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] ip as-path access-list list_name [ { deny | permit } reg_expr ]
```

- **no**
  
  Remove the specified regular expression from the AS path access list.

- **list_name**
  
  Specifies the name of an AS path list as an alphanumeric string of 1 through 79 characters.

- **{ deny | permit }**
  
  - **deny**: Denies access to AS paths that match the regular expression.
  - **permit**: Allows access to AS paths that match the regular expression.

- **reg_expr**
  
  A regular expression to define the AS paths to match. `reg_expr` is an alphanumeric string of 1 through 254 characters.

**Important:** The ? (question mark) character is not supported in regular expressions for this command.

**Usage**

Use this command to define AS path access lists for the BGP router in the current context. The chassis supports a maximum of 64 access lists per context.

**Example**

The following command creates an AS access list named `ASlist1` and permits access to AS paths:

```
ip as-path access-list ASlist1 permit
```
**ip community-list**

Configures filtering via a BGP community list. To filter by a BGP community, you must then match the community in a route-map.

**Product**
All products supporting BGP routing

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```bash
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```bash
[context_name]host_name(config-ctx)#
```

**Syntax**

```bash
ip community-list { named named_list | standard identifier } { deny | permit } { internet | local-AS | no-advertise | no-export | value AS-community_number AS-community_number AS-community_number ... }

{ internet | local-AS | no-advertise | no-export | value AS-community_number AS-community_number AS-community_number ... }

{ internet | local-AS | no-advertise | no-export | value AS-community_number AS-community_number AS-community_number ... }

no ip community-list { named named_list | standard identifier } { deny | permit } { internet | local-AS | no-advertise | no-export | value AS-community_number }
```

**no**
Entering `no ip community-list` with a permit/deny clause deletes the matching community-list entry. Entering `no ip community-list` without a permit/deny clause deletes all the entries belonging to a community-list.

**named named_list**
Specifies the name of a community list as an alphanumeric string of 1 through 79 characters.

**standard identifier**
Specifies the name of a community list as an integer from 1 through 99.

**{ deny | permit }**
Specifies whether this community will deny or permit access to a specified destination.

**{ internet | local-AS | no-advertise | no-export | value AS-community_number**

Specifies the destinations to deny or permit for the community.
- **internet** – Advertise this route to the internet community, and any router that belongs to it.
- **local-AS** – Use in confederation scenarios to prevent sending packets outside the local autonomous system (AS).
- **no-advertise** – Do not advertise this route to any BGP peer, internal or external.
- **no-export** – Do not advertise to external BGP (eBGP) peers. Keep this route within an AS.
- **value AS-community_number** – Specifies a community string in AS:NN format, where AS = 2-byte AS-community hexadecimal number and NN = 2-byte hexadecimal number (1 to 11 characters).

You can enter multiple destinations and AS community numbers separated by spaces.

---

**Usage**

Configures filtering via a BGP community list. To filter by a BGP community, you must then match the community in a route-map.

Multiple community-list entries can be attached to a community-list by adding multiple permit or deny clauses for various community strings. Up to 64 community-lists can be configured in a context.

The communities-list is a way to group destinations into communities and apply routing decisions based on the communities. This method simplifies the configuration of a BGP speaker that controls distribution of routing information.

A community is a group of destinations that share some common attribute. Each destination can belong to multiple communities. Autonomous system administrators define to which communities a destination belongs.

**Example**

The following command specifies that community list number 5 will permit access to AS destination 200:5.

```
ip community-list standard 5 permit value 200:5
```
ip dns-proxy source-address

Enables the proxy DNS functionality and identifies this context as the destination context for all redirected DNS requests.

⚠️ Important: This command must be entered in the destination context for the subscriber. If there are multiple destination contexts for different subscribers, the command must be entered in each context.

Product
HA

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] ip dns-proxy source-address ip_address

no

Removes the address in this context as a destination for redirected DNS packets.

ip_address

Specifies an interface in this context used for redirected DNS packets. ip_address must be entered using IPv4 dotted-decimal notation.

Usage

Use this command to identify the interface in this context where redirected DNS packets are sent to the home DNS. The system uses this address as the source address of the DNS packets when forwarding the intercepted DNS request to the home DNS server. For a more detailed explanation of the proxy DNS intercept feature, see the proxy-dns intercept-list command.

Example

The following command identifies an interface with an address of 10.23.255.255 in a destination context where the system forwards all intercepted DNS requests:

ip dns-proxy source-address 10.23.255.255
ip domain-lookup

Enables or disables domain name lookup via domain name servers for the current context.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context  context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

ip domain-lookup

no ip domain-lookup

Disables domain name lookup.

Usage

Domain name look up is necessary if the subscribers configured for the context are to be allowed to use logical host names for services which requires the host name resolution via DNS.

Example

ip domain-lookup

no ip domain-lookup
**ip domain-name**

Configures or removes a logical domain name for the current context.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] ip domain-name name
```

- **no**
  Indicates the logical domain name for the current context is to be removed.

- **name**
  Specifies the logical domain name to use for domain name server address resolution. `name` is an alphanumeric string of 1 through 1023 characters formatted to be a valid IP domain name.

**Usage**
Set a logical domain name if the context is to be accessed by logical domain name in addition to direct IP address.

**Example**

```
ip domain-name sampleName.org
```
**ip extcommunity-list**

Configures route target filtering via a BGP extended community list. To filter by a BGP extended community, you must then match the extended community in a route-map.

**Product**
All products supporting BGP routing

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
```
configure > context context_name
```

Entering the above command sequence results in the following prompt:
```
[context_name]host_name(config-ctx)#
```

**Syntax**
```
ip extcommunity-list { named named_list | standard identifier } { deny | permit } rt rt_number rt_number rt_number ...

no ip community-list { named named_list | standard identifier } { deny | permit } rt rt_number
```

**Usage**
Configures filtering via a BGP extended community list. To filter by a BGP extended community, you must then match the community in a route-map.
A BGP extended community defines a route target. MPLS VPNs use a 64-bit Extended Community attribute called a Route Target (RT). An RT enables distribution of reachability information to the correct information table.

Multiple extended community-list entries can be attached to an extended community-list by adding multiple permit or deny clauses for various extended community strings. Up to 64 extended community-lists can be configured in a context.

**Example**

The following command specifies that extended community list number 78 will deny access to route target 200:5:

```
ip extcommunity-list standard 78 deny rt 200:20```

ip forward

Configures an IP forwarding policy to forward outgoing pool packets whose flow lookup fails to the default-gateway.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] ip forward outbound unused-pool-dest-address default-gateway
```

- **no**
  Disables forwarding to the default gateway.

- **outbound unused-pool-dest-address default-gateway**
  Enables forwarding to the default gateway.

**Usage**

Use this command to set an IP forwarding policy that forwards outgoing pool packets whose flow lookup fails to the default gateway. By default, the behavior is to either send an ICMP Unreachable message or to discard the packet depending on the configuration of the IP pool.

Pool packets coming from the line card or MIO card whose flow lookup fails are discarded or ICMP unreachable is sent irrespective of whether this command is configured or not.

**Example**

To enable this functionality, enter the following command:

```
ip forward outbound unused-pool-dest-address default-gateway
```

To disable this functionality, enter the following command:

```
no ip forward outbound unused-pool-dest-address default-gateway
```
**ip guarantee**

Enables and disables local switching of framed route packets.

**Product**
- GGSN
- P-GW
- SAEGW

**Privilege**
- Administrator

**Mode**

Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

```plaintext
[context_name] host_name(config-ctx)#
```

**Syntax**

```plaintext
[no] ip guarantee framed-route local-switching
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>no</strong></td>
<td>Disables local switching of framed route packets.</td>
</tr>
<tr>
<td><strong>framed-route local-switching</strong></td>
<td>Enables local switching of framed route packets. By default, this functionality is disabled.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to enable and disable local switching of framed route packets. This functionality will be applicable only when there are some NEMO/framed route sessions in a context.

**Example**

The following command enables local switching of framed route packets:

```plaintext
ip guarantee framed-route local-switching
```
**ip identification packet-size-threshold**

Configures the packet size above which system will assign unique IP header identification.

**Product**

PDSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration

`configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cxt)#
```

**Syntax**

```
ip identification packet-size-threshold size

default ip identification packet-size-threshold
```

**Usage**

This configuration is used to set the upper limit of the IP packet size. All packets above that size limit will be considered “fragmentable”, and an unique non-zero identifier will be assigned.

**Example**

The following commands set the IP packet size to 1024 bytes as threshold. above this limit system will assign unique IP header identification for system generated IP encapsulation headers:

```
ip identification packet-size-threshold 1023
```
ip igmp profile

Configures an Internet Group Management Protocol (IGMP) profile and moves to the IGMP Profile Configuration mode.

### Product
- PDSN
- GGSN
- SGSN

### Privilege
- Security Administrator, Administrator

### Mode
- Exec > Global Configuration > Context Configuration
- `configure > context context_name`

Entering the above command sequence results in the following prompt:
```
[context_name] host_name(config-ctx)#
```

### Syntax
```
[ no ] ip igmp profile name
```

- **no**
  - Removes the specified IGMP profile.

- **name**
  - Specifies the name of an IGMP profile as an alphanumeric string of 1 through 63 characters. If this is not the name of an existing profile, you are prompted to create the new profile.

### Usage
Configure and existing IGMP profile or create a new one. When this command is executed you are moved to the IGMP Profile Configuration mode. For additional information, refer to the *IGMP Profile Configuration Mode Commands* chapter.

### Example
```
ip igmp profile default
```
**ip localhost**

Configures or removes the static local host logical name to IP address mapping for the current context.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
*configure > context context_name*

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-ctx)#
```

**Syntax**

```
[ no ] ip localhost name ip_address
```

- **no**
  Specifies that the static mapping must be removed.

- **name**
  Specifies the logical host name (DNS) for the local machine on which the current context resides. *name* is an alphanumeric string of 1 through 1023 characters formatted to be a valid IP host name.

- **ip_address**
  Specifies the IP address for the static mapping. *ip_address* must be expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**Usage**

Avoid excessive DNS lookups across the network by statically mapping the logical host name to the local host’s context.

**Example**

```
ip localhost localhostName 10.2.3.4
no ip localhost localhostName 10.2.3.4
```
ip name-servers

Modifies the list of domain name servers the current context may use for logical host name resolution.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

ip name-servers ip_address secondary_ip_address

no ip name-servers ip_address

no
Indicates the name server specified is to be removed from the list of name servers for the current context.

ip_address
Specifies the IP address of a domain name server using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

secondary_ip_address
Specifies the IP address of a secondary domain name server using either IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

Usage

Manage the list of name servers the current context may use in resolving logical host names. The DNS can be specified at the Context level in Context configuration as well as at the APN level in APN Configuration Mode with dns and ipv6 dns commands, or it can be received from AAA server. When DNS is requested in PCO configuration, the following preference will be followed for DNS value:

1. DNS Values received from LNS have the first preference.
2. DNS values received from RADIUS Server has the second preference.
3. DNS values locally configured with APN with dns and ipv6 dns commands has the third preference.
4. DNS values configured at context level has the last preference.

Important: The same preference would be applicable for the NBNS servers to be negotiated via ICPC with the LNS.
Example

    ip name-servers 10.2.3.4
**ip pool**

Enables creation, configuration or deletion of IP address pools in the current context.

**Product**

All

**Privilege**

Security Administrator, Administrator

no ip pool pool_name [ address-hold-timer ] [ address-quarantine-timer ] [ advertise-if-used ] [ alert-threshold [ group-available ] [ pool-free ] [ pool-hold ] [ pool-release ] [ pool-used ] + ] [ explicit-route-advertise ] [ group-name ] [ include-nw-bcast ] [ next-hop-forwarding-address respond-icmp-echo ] [ nw-reachability server ] [ policy allow-static-allocation ] [ framed-route-vrf-list ] [ send-icmp-dest-unreachable ] [ skip-nat-subscriber-ip-check ] [ srp-activate ] [ subscriber-gw-address ] [ suppress-switchover-arps ] [ tag none ] [ pdif-setup-addr ] [ unicast-gratuitous-arp-address ] + [ send-nat-binding-update ] [ framed-route-vrflist ]

---

**Command Line Interface Reference, StarOS Release 17**
### no

Removes the specified IP address pool from the current context’s configuration, or disables the specified option(s) for the specified IP pool.

### no alert-threshold

This command without any optional keywords disables all alert thresholds.

### name

Specifies the logical name of the IP address pool. *name* must be an alphanumeric string of 1 through 31 characters.

**Important:** An error message displays if the **ip pool name** and the **group name** in the configuration are the same. An error message displays if the **ip pool name** or **group name** are already used in the context.

### ip_address

Specifies the beginning IP address of the IP address pool using IPv4 dotted-decimal.

### subnet_mask

Specifies the IP address mask bits to determine the number of IP addresses in the pool. *ip_mask* must be specified using IPv4 dotted-decimal notation. 1 bits in the *ip_mask* indicate that bit position in the *ip_address* must also have a value of 1. 0 bits in the *ip_mask* indicate that bit position in the *ip_address* does not need to match – the bit can be either a 0 or a 1. For example, if the IP address and mask are specified as 172.168.10.0 and 255.255.255.224, respectively, the pool will contain IP addresses in the range 172.168.10.0 through 172.168.10.31 for a total of 32 addresses.

### ip_address_mask_combo

 Specifies a combined IP address subnet mask bits to indicate what IP addresses the route applies to.  
*ip_address_mask_combo* must be specified using CIDR notation where the IP address is specified using IPv4 dotted-decimal notation and the mask bits are a numeric value which is the number of bits in the subnet mask.

### range start_ip_address end_ip_address

Specifies the IP addresses for the IP pool as a range of addresses.  
*start_ip_address* specifies the beginning of the range of addresses for the IP pool.  
*end_ip_address* specifies the end of the range of addresses for the IP pool.  
The IP address range must be specified using IPv4 dotted-decimal notation.  
For example, if *start_ip_address* is specified as 172.168.10.0 and *end_ip_address* is specified as 172.168.10.31 the IP pool will contain addresses in the range 172.168.10.0 through 172.168.10.31 for a total of 32 addresses.

### private [ priority ]

Address pool may only be used by mobile stations which have requested an IP address from a specified pool. When private pools are part of an IP pool group, they are used in a priority order according to the precedence setting. *priority* must be an integer from 0 through 10 with 0 being the highest priority. The default value is 0.
### ip pool

**public [ priority ]**

Address pool is used in priority order for assigning IP addresses to mobile stations which have not requested a specific address pool. *priority* must be an integer from 0 through 10 with 0 being the highest priority. The default value is 0.

**static**

Designates local IP address pool to statically assign pooled addresses.

**Important:** The keyword `static` must be used for DHCP served IP addresses.

**tag { none | pdif-setup-addr }**

Default: `none`

- `none`: default tag for all IP address pools
- `pdif-setup-addr`: pool with this tag should only be used for PDIF calls.

**address-hold-timer seconds**

When this is enabled, and an active subscriber is disconnected, the IP address is held or considered still in use, and is not returned to the free state until the address-hold-timer expires. This enables subscribers who reconnect within the length of time specified (in seconds) to obtain the same IP address from the IP pool. *seconds* is the time in seconds and must be an integer from 0 through 31556926.

**Important:** Currently, the address-hold-timer only supports IPv4 addresses.

**address-quarantine-timer seconds**

Specifies the timer value in seconds for an address quarantine timer as an integer from 20 through 86400. This timer cannot be configured with an address-hold-timer in the same pool. The IP pool address-quarantine-timer is a mechanism to busy out a released IP address for a specified interval. This prevents an IP address from being reused until the quarantine timer expires. Each IP pool can be configured with a timer value that determines how long a recently released address will be held in quarantine before being freed. When the timer has expired, the address is returned to the list of free addresses, to be allocated again to a new subscriber. Any address that has been released, but for which the address-quarantine-timer has not expired, is still considered to be in use for the purposes of allocation. If a subscriber tries to reconnect while the address-quarantine timer is armed, even though it is the same subscriber ID, the subscriber does not get the same address.

**advertise-if-used**

Advertises to the peer routes only if addresses are being used in pool.

**alert-threshold { group-available | pool-free | pool-hold | pool-release | pool-used } low_thres [ clear high_thres ]**

Default: All thresholds are disabled.

Configures IP address pool-level utilization thresholds. These thresholds take precedence over context-level IP pool thresholds.

- `group-available`: Set an alert based on the available percentage of IP addresses for the entire IP pool group.
- `pool-free`: Set an alert based on the percentage of IP addresses that are unassigned in this IP pool.
pool-hold: Set an alert based on the percentage of IP addresses from this IP pool that are on hold.
pool-release: Set an alert based on the percentage of IP addresses from this IP pool that are in the release state.
pool-used: This command sets an alert based on the percentage of IP addresses that have been assigned from this IP pool.

**Important:** Refer to the `threshold available-ip-pool-group` and `threshold monitoring` commands in this chapter for additional information on IP pool utilization thresholding.

low_thresh: The IP pool utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured as an integer between 0 and 100.
clear high_thresh: The IP pool utilization percentage that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm is generated. It may be configured as an integer between 0 and 100.

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

group-name group_name
Assigns one or more preconfigured IP pools to the IP pool group. `group_name` is case sensitive and must be an alphanumeric string of 1 through 31 characters. One or more IP pool groups are assigned to a context and one IP pool group consists one or more IP pool(s).
IP pool group name is used in place of an IP pool name. When specifying a desired pool group in a configuration the IP pool with the highest precedence is used first. When that IP pool’s addresses are exhausted the pool with the next highest precedence is used.

include-nw-bcast
Includes the network and broadcast addresses for ordinary pools and NAT pools.
To remove the `include-nw-bcast` option from the ip pool, use the `no ip pool test include-nw-bcast` command.

napt-users-per-ip-address users_per_ip [ alert-threshold { { pool-free | pool-hold | pool-release | pool-used } low_thresh [ clear high_thresh ] } + ] [ max-chunks-per-user max_chunks_per_user [ nat-binding-timer nat_binding_timer ] [ nat-pkt-drop-threshold high_thresh [ clear low_thresh ] ] [ nexthop-forwarding-address ip_address ] [ on-demand ] [ port-chunk-size port_chunk_size ] [ port-chunk-threshold port_chunk_threshold ] [ send-nat-binding-update ] +

**Important:** In UMTS deployments this keyword is available in 9.0 and later releases. In CDMA deployments this keyword is available in 8.3 and later releases.

**Important:** In UMTS deployments, on upgrading from Release 8.1 to Release 9.0, and in CDMA deployments, on upgrading from Release 8.1 to 8.3, all NAT realms configured in Release 8.1 using the `nat-realm` keyword must be reconfigured using either the `nat-one-to-one` (for one-to-one NAT realms) or the `napt-users-per-ip-address` (for many-to-one NAT realms) keywords.

Configures many-to-one NAT realms.
**users_per_ip**: Specifies how many users can share a single NAT IP address.

*users_per_ip* must be an integer from 2 through 2016.

**alert-threshold**: Specifies the alert threshold for the pool:

- **pool-free**: Percentage free alert threshold for this pool
- **pool-hold**: Percentage hold alert threshold for this pool
- **pool-release**: Percentage released alert threshold for this pool
- **pool-used**: Percentage used alert threshold for this pool
- **low_thresh**: The IP pool utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm. *low_thresh* must be an integer from 0 through 100.
- **clear high_thresh**: The IP pool utilization percentage that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm is generated. *high_thresh* must be an integer from 0 through 100.

**Important**: The *high_thresh* value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

**max-chunks-per-user max_chunks_per_user**: Specifies the maximum number of port chunks to be allocated per subscriber in the many-to-one NAT pool.

*max_chunks_per_user* must be an integer from 1 through 2016.

Default: 1

**nat-binding-timer binding_timer**: Specifies NAT Binding Timer for the NAT pool. *timer* must be an integer from 0 through 31556926. If set to 0, is disabled. Default: 0

**nat-pkt-drop-threshold high_thresh [ clear low_thresh ]**: Specifies the NAT packet drop threshold in percentage (%).

*high_thresh* specifies the high NAT packet drop percentage threshold, and must be an integer from 0 through 100. Default: 0

*clear low_thresh* specifies the low NAT packet drop percentage threshold, and must be an integer from 0 through 100. Default: 0

**nexthop-forwarding-address address**: Specifies the nexthop forwarding address for this pool.

*address* must be an IPv4 or IPv6 address. If configured for a NAT pool, packets that are NATed using that NAT pool will be routed based on the configured nexthop address.

**Important**: The *nexthop-forwarding-address* support for NAT IP pools is functional only in later releases of Release 9.0 and in 10.0 and later releases.

- **on-demand**: Specifies allocating IP when matching data traffic begins.
- **port-chunk-size size**: Specifies NAT port chunk size (number of NAT ports per chunk) for many-to-one NAT pool.
size must be an integer from 32 through 32256 (in multiples of 32).

**Important:** The `port-chunk-size` configuration is only available for many-to-one NAT pools.

**Important:** The `port-chunk-size` must be a minimum of 64 with systems configured as an A-BG or P-CSCF.

**port-chunk-threshold** chunk_threshold: Specifies NAT port chunk threshold in percentage of number of chunks for many-to-one NAT pool. chunk_threshold must be an integer from 1 through 100. Default: 100%

**Important:** The `port-chunk-threshold` configuration is only available for many-to-one NAT pools.

**send-nat-binding-update**: Specifies sending NAT binding updates to AAA for this realm. Default: Disabled

**Important:** send-nat-binding-update is supported for both one-to-one and many-to-one realms.

The following IP pool configuration keywords can also be used in the many-to-one NAT pool configuration:

**group-name** group_name: Specifies the pool group name. The grouping enables to bind discontiguous IP address blocks in individual NAT IP pools to a single pool group.

This keyword is available for NAT pool configuration only in Release 10.0 and later.

NAT pool and NAT pool group names must be unique.

**srp-activate**

Activates the IP pool for Interchassis Session Recovery (ICSR).

```
nat priority
```

Designates the IP address pool as a Network Address Translation (NAT) address pool.

`priority` specifies the priority of the NAT pool. 0 is the highest priority. If `priority` is not specified, the priority is set to 0.

Must be a value from 0 (default) to 10.

**Important:** This functionality is currently supported for use with systems configured as an A-BG or P-CSCF.

```
nat-one-to-one [ alert-threshold { { pool-free | pool-hold | pool-release | pool-used } low_thres [ clear high_thres ] } + ] [ nat-binding-timer nat_binding_timer ] [ nat-pkt-drop-threshold high_thres [ clear low_thres ] ] [ nexthop-forwarding-address ip_address ] [ on-demand ] [ send-nat-binding-update ] +
```

**Important:** In UMTS deployments this keyword is available in Release 9.0 and later releases. In CDMA deployments this keyword is available in Release 8.3 and later releases.
**Important:** In UMTS deployments, on upgrading from Release 8.1 to Release 9.0, and in CDMA deployments, on upgrading from Release 8.1 to Release 8.3, all NAT realms configured in Release 8.1 using the `nat-realm` keyword must be reconfigured using either the `nat-one-to-one` (for one-to-one NAT realms) or the `napt-users-per-ip-address` (for many-to-one NAT realms) keywords.

Configures one-to-one NAT realm.

- **alert-threshold:** Specifies alert threshold for this pool:

**Important:** Thresholds configured using the `alert-threshold` keyword are specific to the pool in which they are configured. Thresholds configured using the `thresholdip-pool *` commands in the Context Configuration Mode apply to all IP pools in the context, and override the threshold configurations set within individual pools.

- **pool-free:** Percentage free alert threshold for this pool
- **pool-hold:** Percentage hold alert threshold for this pool
- **pool-release:** Percentage released alert threshold for this pool
- **pool-used:** Percentage used alert threshold for this pool
- **low_thresh:** The IP pool utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm. `low_thresh` must be an integer from 0 through 100.
- **clear high_thresh:** The IP pool utilization percentage that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm is generated. `high_thresh` must be an integer from 0 through 100.

**Important:** The `high_thresh` value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

- **nat-binding-timer nat_binding_timer:** Specifies NAT Binding Timer for the NAT pool. `binding_timer` must be an integer from 0 through 31556926. If set to 0, is disabled.

**Important:** For many-to-one NAT pools, the default NAT Binding Timer value is 60 seconds. For one-to-one NAT pools, it is 0. By default, the feature is disabled—the IP addresses/port-chunks once allocated will never be freed.

- **nat-pkt-drop-threshold high_thresh [ clear low_thresh ]** Specifies the NAT packet drop threshold in percentage (%).
  - `high_thresh` specifies the high NAT packet drop percentage threshold, and must be an integer from 0 through 100. Default: 0
  - `clear low_thresh` specifies the low NAT packet drop percentage threshold, and must be an integer from 0 through 100. Default: 0

- **nexthop-forwarding-address ip_address** Specifies the nexthop forwarding address for this pool. `address` must be an IPv4 or IPv6 address. If configured for a NAT pool, packets that are NATed using that NAT pool will be routed based on the configured nexthop address.

**Important:** The `nexthop-forwarding-address` support for NAT IP pools is functional only in later releases of Release 9.0 and in Release 10.0 and later releases.
**on-demand**: Specifies allocating IP address when matching data traffic begins.

**send-nat-binding-update**: Specifies sending NAT binding updates to AAA for this realm. Default: Disabled

---

**Important**: *send-nat-binding-update* is supported for both one-to-one and many-to-one realms.

---

The following IP pool configuration keywords can also be used in the one-to-one NAT pool configurations:

- **address-hold-timer address_hold_timer**
- **group-name group_name**: specifies the pool group name. The grouping enables to bind discontiguous IP address blocks in individual NAT IP pools to a single pool group. NAT pool and NAT pool group names must be unique. *group_name* is an alphanumeric string of 1 through 31 characters that is case sensitive. This keyword is available for NAT pool configuration only in StarOS 10.0 and later releases.
- **srp-activate**: Activates the IP pool for Interchassis Session Recovery (ICSR).

```plaintext
nat-realm users-per-nat-ip-address users [ on-demand [ address-hold-timer address_hold_timer ] ]
```

---

**Important**: In UMTS deployments, the *nat-realm* keyword is only available in Release 8.1.

---

**Important**: In Release 8.1, the NAT On-demand feature is not supported.

---

**Important**: This functionality is currently supported for use with systems configured as an A-BG or P-CSCF.

Designates the IP address pool as a Network Address Translation (NAT) realm pool.

- **users-per-nat-ip-address users**: specifies the number of users sharing a single NAT IP address as an integer from 1 through 5000.
- **on-demand**: Specifies to allocate IP when matching data traffic begins.
- **address-hold-timer address_hold_timer**: Specifies the address hold timer (in seconds) for this pool as an integer from 0 through 31556926. If set to 0, the address hold timer is disabled.

---

**Important**: Currently, the address-hold-timer only supports IPv4 addresses.

```plaintext
nexthop-forwarding-address ip_address
```

A subscriber that is assigned an IP address from this pool is forwarded to the next hop gateway with the specified IP address.

```plaintext
overlap vlan id vlan_id
```

When a nexthop forwarding address is configured, this keyword can be configured to enable over-lapping IP address pool support and associates the pool with the specified virtual LAN (VLAN). *vlan_id* is the identification number of a VLAN assigned to a physical port and can be configured to any integer from 1 through 4095.

For more information on configuring VLANs, refer to the *System Administration Guide*. **
**Important**: This functionality is currently supported for use with systems configured as an HA, or as a PDSN for Simple IP, or as a GGSN. This keyword can only be issued for pools of type private or static and must be associated with a different nexthop forwarding address and VLAN. A maximum of 256 over-lapping pools can be configured per context and a maximum of 256 over-lapping pools can be configured per HA or simple IPPDSN. For GGSNs, the total number of pools is limited by the number of VLANs defined but the maximum number per context is 256. Additional network considerations and configuration outside of the system maybe required.

```

**nw-reachability server server_name**
```

Binds the name of a configured network reachability server to the IP pool and enables network reachability detection for the IP pool. This takes precedence over any network reachability server settings in a subscriber configuration.

- **server_name**: Specifies the name of a network reachable server that has been defined in the current context, expressed as an alphanumeric string of 1 through 16 characters.

**Important**: Also see the following commands for more information: Refer to the **policy nw-reachability-fail** command in the HA Configuration Mode to configure the action that should be taken when network reachability fails. Refer to the **nw-reachability server** command in this chapter to configure network reachability servers. Refer to the **nw-reachability-server** command in the Subscriber Configuration Mode to bind a network reachability server to a specific subscriber.

```

**respond-icmp-echo ip_address**
```

Pings the first IP address from overlapping IP address pools.

**Important**: In order for this functionality to work, all of the pools should contain an initial IP address that can be pinged.

```

**resource**
```

Specifies this IP pool as a resource pool. The IP addresses in resource pools may have IP addresses that also exist in other resource pools. IP addresses from a resource pool should not be used for IP connectivity within the system where the pool is defined. These IP addresses should be allocated for sessions which are L3 tunneled through the system (IP-in-IP or GRE). It is possible for resource pools in the same context to have overlapping addresses when the terminating network elements for the L3 tunnels are in different VPNs.

- Default: Disabled

Also refer to the **Subscriber Configuration Mode Commands** chapter for a description of the **l3-to-12-tunnel address-policy** command.

```

**send-icmp-dest-unreachable**
```

When enabled, this generates an ICMP destination unreachable PDU when the system receives a PDU destined for an unused address within the pool.

- Default: Disabled

```

**skip-nat-subscriber-ip-check**
```

When enabled, this is configured to skip private IP address check for non-NAT pools. This can be configured only for non-NAT pools during call-setup if NAT is enabled for the subscriber. If NAT is disabled, this value is not considered.

- Default: Disabled (subscriber IP check is done).
**explicit-route-advertise**

When enabled, the output of `show ip pool verbose` includes the total number of explicit host routes.
Default: Enabled

**srp-activate**

Activates the IP pool for Interchassis Session Recovery (ICSR).

**subscriber-gw-address ip_address**

Configures the subscriber gateway address for this pool.

**suppress-switchover-arp**

Suppress corresponding gratuitous ARP generation when a line card or MIO card switchover occurs. Default: Disabled

**unicast-gratuitous-arp-address ip_address**

Perform a unicast gratuitous ARP to the specified IP address rather than broadcast gratuitous ARP when gratuitous ARP generation is required. Default: Perform broadcast gratuitous ARP.

**vrf vrf_name { [ mpls-label input in_label_value | output out_label_value1 [ out_label_value2 ] }**

Associates a preconfigured Virtual Routing and Forwarding (VRF) instance with this IP pool and configures MPLS label parameters.

**Important:** This command must be used with next-hop parameters.

- **vrf_name** is name of a preconfigured virtual routing and forwarding (VRF) context configured in Context Configuration Mode through `ip vrf` command.
- **in_label_value** is the MPLS label that identifies the inbound traffic destined for this pool.
- **out_label_value1 and out_label_value2** identify the MPLS labels to be added to the outgoing packets sent for subscribers from this pool. Where **out_label_value1** is the inner output label and **out_label_value2** is the outer output label.

MPLS label values must be an integer from 16 through 1048575.
By default, the pools configured are bound to the default VRF unless specified with a VRF name.

**Important:** You cannot have overlapping pool addresses using the same VRF. Also you cannot have two pools using different VRFs but the same in-label irrespective of whether or not the pools overlap. The pool must be private or static in-order to be associated with a certain VRF. If the VRF with such a name is not configured, you are prompted to add the VRF before configuring a pool.

**policy allow-static-allocation**

Configures static address allocation policy for dynamic IP pool. This keyword enables a dynamic IP pool to accept a static address for allocation.
**Important:** In static allocation scenario, the pool group name is returned by AAA in the attribute `SN1-IP-Pool-Name`, and the IP address to use will be returned in the `Framed-IP-Address` attribute.

**framed-route-vrf-list vrf_list_name**
Configures a vrf-list in order for NVSE VRF authorization.

**pool-route ip_address/ip_mask**
Configures the IP pool route instead of generating by-default. The address followed by the `pool-route` keyword can be an IPv4 or IPv6 address with the mask value.

**+**
Indicates that more than one of the previous keywords can be entered within a single command.

**Usage**
Define one or more pools of IP addresses for the context to use in assigning IPs to mobile stations. This command is also useful in resizing existing IP pools to expand or contract the number of addresses allocated. If you resize an IP pool, the change is effective immediately.
When using the `ip pool` command to resize an IP pool, the type must be specified since by default the command assumes the type as public. In other words, the CLI syntax to resize an IP pool is the same syntax used to create the pool. See examples below.

```
ip pool pool1 100.1.1.0/24 static
```

The syntax to resize that pool would be:

```
ip pool pool1 100.1.1.0/25 static
```

A pool which is deleted will be marked as such. No new IP addresses will be assigned from a deleted pool. Once all assigned IP addresses from a deleted pool have been released, the pool, and all associated resources, are freed.

**Important:** If an IP address pool is matched to a ISAKMP crypto map and is resized, removed, or added, the corresponding security association must be cleared in order for the change to take effect. Refer to the `clear crypto` command in the Exec mode for information on clearing security associations.

**Over-lapping IP Pools:** The system supports the configuration of over-lapping IP address pools within a particular context. Over-lapping pools are configured using either the resource or overlap keywords.

The `resource` keyword allows over-lapping addresses tunneled to different VPN end points.
The `overlap` keyword allows over-lapping addresses each associated with a specific virtual LAN (VLAN) configured for an egress port. It uses the VLAN ID and the nexthop address to determine how to forward subscriber traffic with addresses from the pool thus resolving any conflicts with over-lapping addresses.

Note that if an overlapping IP Pool is bound to an IPSec Tunnel (refer to the `match ip pool` command in the Crypto Group Configuration Mode chapter), that tunnel carries the traffic ignoring the nexthop configuration. Therefore, the IPSec Tunnel takes precedence over the nexthop configuration. (Thus, one can configure the overlapping IP Pool with fake VLAN ID and nexthop and still be able to bind it to an IPSec Tunnel for successful operation.

The `overlap` keyword allows over-lapping addresses each associated with a specific VLAN can only be issued for pools of type private or static and must be associated with a different nexthop forwarding address.
and VLAN. A maximum of 128 over-lapping pools can be configured per context and a maximum of 256 over-lapping pools can be configured per system.

**Important:** Overlapping IP address functionality is currently supported for use with systems configured as an HA for Mobile IP, or as a PDSN for Simple IP, or as a GGSN. For deployments in which subscriber traffic is tunneled from the FA to the HA using IP-in-IP, a separate HA service must be configured for each over-lapping pool.

**IP Pool Address Assignment Method:** IP addresses can be dynamically assigned from a single pool or from a group of pools. The addresses are placed into a queue in each pool. An address is assigned from the head of the queue and, when released, returned to the end. This method is known as least recently used (LRU). When a group of pools have the same priority, an algorithm is used to determine a probability for each pool based on the number of available addresses, then a pool is chosen based on the probability. This method, over time, allocates addresses evenly from the group of pools.

**Important:** Note that setting different priorities on each individual pool in a group can cause addresses in some pools to be used more frequently.

**Important:** In NAT IP pool configurations, the minimum number of public IP addresses that must be allocated to each NAT pool must be greater than or equal to the number of Session Managers (SessMgrs) available on the system. On the ASR 5000, it is >= 84 public IP addresses. This can be met by a range of 84 host addresses from a single Class C. The remaining space from the Class C can be used for other allocations.

**Example**

The following commands define a private IP address pool, a public IP address pool, and a static address pool, respectively.

```
ip pool samplePool1 1.2.3.0 255.255.255.0 private
nip pool samplePool2 1.3.0.0 255.255.0.0 public
nip pool samplePool3 1.4.5.0 255.255.255.0 static
```

The following command defines a private IP pool specified with a range of IP addresses. The pool has 101 addresses.

```
ip pool samplePool4 range 10.5.5.0 10.5.5.100 private
```

The following command sets the address hold timer on the pool to 60 minutes (3600 seconds):

```
ip pool samplePool4 address-hold-timer 3600
```

The following command removes the IP address pool from the configuration:

```
no ip pool samplePool1
```

The following command creates a static IP pool:

```
ip pool pool1 100.1.1.0/24 static
```

The following command resizes the static IP pool created in the previous example:

```
ip pool pool1 100.1.1.0/25 static
```
ip prefix-list

Creates an IP prefix list for filtering routes.

Product

PDSN
HA
GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

ip prefix-list name list_name [ seq seq_number ] ( deny | permit ) ( any | network_address/net_mask [ ge ge_value ] [ le le_value ]

no ip prefix-list list_name [ seq seq_number ] ( deny | permit ) ( any | network_address/net_mask [ ge ge_value ] [ le le_value ]

no
Delete the specified prefix-list entry.
	no
	name list_name

Specifies a name for the prefix list as an alphanumeric string of 1 through 79 characters.

seq seq_number

Assigns the specified sequence number to the prefix list entry as an integer from 1 through 4294967295.

deny

Specifies prefixes to deny.

permit

Specifies prefixes to permit.

any

Matches any prefix.

network_address/net_mask [ ge ge_value ] [ le le_value ]

Specifies the prefix to match.
network_address/net_mask: the IP address and the length, in bits, of the network mask that defines the prefix. The IP address and mask must be entered in IPv4 dotted-decimal notation. When neither ge (greater than or equal to) or le (less than or equal to) are specified an exact match is assumed.

ge \_ge\_value: Specifies the minimum prefix length to match as an integer from 0 through 32. If only the ge value is specified, the range is from the ge value to 32. The ge value must be greater than net_mask and less than the le value.

gle \_le\_value: Specifies the maximum prefix length to match as an integer from 0 through 32. If only the le value is specified, the range is from the net_mask to the le value. The le value must be less than or equal to 32.

The following equation describes the conditions that ge and le values must satisfy:

net_mask < ge_value < le_value <= 32

Usage

Use this command to filter routes by their IP prefix.

Example

    ip prefix-list name prelist10 seq 5 permit 192.168.100.0/8 ge 12 le 24
ip prefix-list sequence-number

Enables or disables the inclusion of IP prefix list sequence numbers in the configuration file. This option is enabled by default.

  ```

**Syntax**

```
[ no ] ip prefix-list sequence-number
```

- **no**
  
  Disables the listing of IP prefix list sequence numbers in the configuration file.

**Usage**

Use this command to enable and disable the inclusion of IP prefix list sequence numbers in the configuration file.

**Example**

To disable the inclusion of IP prefix list sequence numbers in the configuration file, enter the following command:

```
no ip prefix-list sequence-number
```
ip route

Adds or removes routing information from the current context’s configuration.

Product
All

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] ip route { ip_address/ip_mask | ip_address ip_mask } { gateway_ip_address | next-hop next_hop_ip_address | point-to-point | tunnel } egress_intrfc_name [ cost cost ] [ fall-over bfd multihop mhsess_name ] [ precedence precedence ] [ vrf vrf_name [ cost value ] [ fall-over bfd multihop mhsess_name ] [ precedence precedence ]

[ no ] ip route static bfd if_name remote-endpt_ipv4_address

[ no ] ip route static multihop bfd mhbfd_sess_name local_endpt_ipaddr
remote_endpt_ipaddr

no

Indicates the route specified by this options is to be removed from the configuration.

---

ip_address/ip_mask | ip_address/ip_mask

Specifies a destination IP address or group of addresses that will use this route.

ip_address/ip_mask: Specifies a combined IP address subnet mask bits to indicate what IP addresses to which the route applies. ip_address must be entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation. ip_address/ is entered using CIDR notation; the mask bits are a numeric value which is the number of bits in the subnet mask.
ip_address/ip_mask: Specifies an IP address and the networking (subnet) mask pair which is used to identify the set of IP addresses to which the route applies. ip_address must be specified using the standard IPv4 dotted decimal notation. ip_mask must be specified using the standard IPv4 dotted decimal notation as network mask for subnets.
The mask as specified by ip_mask or resulting from ip_address/ip_mask is used to determine the network for packet routing.
0’s in the resulting mask indicate the corresponding bit in the IP address is not significant in determining the network for packet routing.
1’s in the resulting mask indicate the corresponding bit in the IP address is significant in determining the network.
**gateway_ip_address** | **next-hop next_hop_ip_address** | **point-to-point** | **tunnel**

Specifies which device or network to use when forwarding packets.

- **gateway_ip_address**: Specifies the IP address of the network gateway to which to forward packets. The address must be entered in IPv4 dotted-decimal notation (###.###.###.###).
- **next-hop next_hop_ip_address**: Specifies the next-hop IP address to which packets are to be forwarded. The address must be entered in IPv4 dotted-decimal notation.
- **point-to-point**: Specifies that the egress port is an ATM point-to-point interface.
- **tunnel**: Sets the static route for this egress interface as tunnel type, such as IPv6-over-IPv4 or GRE.

**egress_intrfc_name**

Specifies the name of the egress (out-bound) interface name in the current context as an alphanumeric string of 1 through 79 characters.

**cost cost**

Specifies the relative cost of the route. **cost** must be an integer from 0 through 255 where 255 is the most expensive. Default: 0

**fall-over bfd multihop mhsess_name**

 Enables fall-over BFD functionality for the specified multihop session. The **fall-over bfd** option uses BFD to monitor neighbor reachability and liveliness. When enabled it will tear down the session if BFD signals a failure. Specify **mhsess_name** as an alphanumeric string of 1 through 19 characters.

**precedence precedence**

Specifies the selection order precedence for this routing information. **precedence** must be an integer from 1 through 254 where 1 is the highest precedence. Default: 1

**vrf vrf_name**

Associates a Virtual Routing and Forwarding (VRF) context with this static route configuration. **vrf_name** is the name of a preconfigured VRF context configured in **Context Configuration Mode** via the **ip vrf** command.

**static bfd if_name remote-endpt_ipv4_address**

Creates a static IP route that will be associated with Bidirectional Forwarding Detection (BFD). For additional information, see the **BFD Configuration Mode Commands** chapter.

- **if_name**: Specifies the name of the interface to which the static BFD neighbor is bound as an alphanumeric string of 1 through 79 characters.
- **remote_endpt_ipv4_address**: Specifies the gateway address of the BFD neighbor in IPv4 dotted-decimal notation.

**static multihop bfd mhbfd_sess_name local_endpt_ipaddr remote_endpt_ipaddr**

Creates a static multihop BFD route with local and remote endpoints.

- **mhbfd_sess_name**: Specifies the multihop BFD session name as an alphanumeric string of 1 through 79 characters.
- **local_endpt_ipaddr**: Specifies the local endpoint address in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
- **remote_endpt_ipaddr**: Specifies the remote endpoint address in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
Usage

Use this command to configure IP route parameters, precedence and cost options for the route selections such that routes of the same precedence are grouped together then lowest cost is selected first. This results in route’s being selected first by lower precedence then the cost is used if multiple route’s are defined with the same precedence.

This command also configures static IP routes when implementing Bidirectional Forwarding Detection (BFD).

Important: A maximum of 1,200 static routes may be configured per context.

Virtual Routing and Forwarding (VRF) context can be associated with static IP route for BGP/MPLS, GRE, or IPSec tunnel support.

Important: SNMP traps are generated when BFD sessions go up and down (BFDSessUp and BFDSessDown).

Example

The following command adds a route using the combined IP address and subnet mask form:

```
ip route 10.2.3.0/32 192.168.1.2 egressSample1 precedence 160
```

The following configures route options for a route specified using the distinct IP address and subnet mask form:

```
ip route 10.2.3.4 255.224.0.0 10.1.2.3 egressSample2 cost 43
```

The following deletes the two routes configured above:

```
no ip route 10.2.3.0/32 192.168.1.2 egressSample1 precedence 160
no ip route 10.2.3.4 255.224.0.0 10.1.2.3 egressSample2 cost 43
```

The following command adds a route using the combined IP address and subnet mask form and specifies the egress interface as tunnel type:

```
ip route 10.2.3.0/32 tunnel egressSample1 precedence 160 vrf vrf1
```
ip routing maximum-paths

Enables Equal Cost Multiple Path (ECMP) routing support and specifies the maximum number of ECMP paths that can be submitted by a routing protocol in the current context.

Product
All products that support Cost Multiple Path (CMP)

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

ip routing maximum-paths [ max_num ]

[ default | no ] ip routing maximum-paths

default
Resets the command to its default setting of 4.

no
Disables ECMP for the current context.

max_num

The maximum number of ECMP paths that can be submitted by a routing protocol. max_num must be an integer from 1 through 10 (releases prior to 18.2) or 1 through 32 (release 18.2+). Default: 4

Usage
Use this command to enable ECMP for routing and set the maximum number of ECMP paths that can be submitted by a routing protocol.

Example
To enable ECMP and set the maximum number of paths that may be submitted by a routing protocol in the current context to 10, enter the following command:

ip routing maximum-paths 10

To disable ECMP in the current context, enter the following command:

no ip routing maximum-paths
ip routing overlap-pool

Configures the routing behavior for overlap-pool addresses.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no | default ] ip routing overlap-pool

---

default

Resets the command to its default setting of disabled.

---

no

Disables the routing behavior for overlap-pool addresses for the current context.

Usage

Use this command configuration to advertise overlap-pool addresses in dynamic routing protocols when overlap pools are configured using vlan-ids. If the “iprouting overlap-pool” is configured, then the overlap-addresses are added as interface addresses and advertised.
ip rri

Configures Reverse Route Injection (RRI) egress clear port IPv4 parameters. (VPC-VSM only)

Product
SecGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

ip rri { ip_address | next-hop nexthop_address } interface interface_name [ vrf vrf_name ]

no ip rri { ip_address | next-hop nexthop_address } interface interface_name [ vrf vrf_name ]

no

Disables the specified RRI egress parameters.

ip_address
Specified in IPv4 dotted-decimal notation.

next-hop nexthop_address
Next hop address specified in IPv4 dotted-decimal notation. The next hop IP address is not required for point-to-point and tunnel interfaces.

interface interface_name
Specifies the name of an existing egress interface as an alphanumeric string of 1 through 79 characters.

vrf vrf_name
Specifies the name of an existing VRF as an alphanumerical string of 1 through 63 characters.

Usage
Use this command to configure RRI regress clear port IPv4 parameters.

Example

ip rri 10.1.1.1 interface rri02
ip rri-route

Configures High Availability (HA) IPv4 routing parameters for Reverse Route Injection (RRI). (VPC-VSM only)

Product
SecGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

ip rri-route network-mode { L2 | L3 } { clear_loopback_ip | rri-ip virtual_ip_address } { ip_address | next-hop nexthop_address } interface interface_name [ vrf vrf_name ]

no ip rri-route network-mode { L2 | L3 } { clear_loopback_ip | rri-ip virtual_ip_address } { ip_address | next-hop nexthop_address } interface interface_name [ vrf vrf_name ]

no

Disables the specified RRI route.

network-mode { L2 | L3 }

Specifies the RRI route network mode type as Layer 2 (L2) or Layer 3 (L3).

clear_loopback_ip

Specifies the loopback address for clear traffic in IPv4 dotted-decimal notation.

rri-ip virtual_ip_address

Specifies the use of a virtual IP address on both Primary and Secondary for RRI. virtual_ip_address is expressed in IPv4 dotted-decimal notation.

ip_address

Specified in IPv4 dotted-decimal notation.

next-hop nexthop_address

Next hop address specified in IPv4 dotted-decimal notation. The next hop IP address is not required for point-to-point and tunnel interfaces.

interface interface_name

Specifies the name of an existing egress interface as an alphanumeric string of 1 through 79 characters.
**vrf** vrf\_name

Specifies the name of an existing VRF as an alphanumerical string of 1 through 63 characters.

**Usage**

Use this command to configure HA IPv4 routing parameters for RRI.

**Example**

```
ip rri-route network-mode L3 rri-ip 10.1.1.23 next-hop 10.1.1.25 interface rriroute04
```
ip sri-route

Configures Layer 3 (L3) High Availability (HA) IPv4 routing parameters for Service Route Injection (SRI). (VPC-VSM only)

Product
SecGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

ip sri-route sri-ip network_address next hop nexthop_address interface interface_name [vrf vrf_name]

no ip sri-route sri-ip network_address next hop nexthop_address interface interface_name [vrf vrf_name]

Syntax

no
Disables the specified SRI route.

sri-ip network_address
Specifies the IPv4 address associated with the SRI route.

next hop nexthop_address
Next hop address specified in IPv4 dotted-decimal notation. The next hop IP address is not required for point-to-point and tunnel interfaces.

interface interface_name
Specifies the name of an existing egress interface as an alphanumeric string of 1 through 79 characters.

vrf vrf_name
Specifies the name of an existing VRF as an alphanumerical string of 1 through sixty-three characters.

Usage
Use this command to configure L3 HA routing parameters for SRI.

Example

ip sri-route sri-ip 10.1.1.21 next-hop 10.1.1.23 interface sri23
**ip vrf**

Creates a Virtual Routing and Forwarding (VRF) context instance, assigns a VRF identifier, and configures the VRF parameters for BGP/MPLS VPN, GRE tunnel, and IPSec interface configuration.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration

**Syntax**

```
ip vrf vrf_name
no ip vrf
```

- **no**
  
  Disables IP Virtual Routing and Forwarding (VRF) parameters.

- **vrf_name**
  
  Specifies the name of the virtual routing and forwarding interface as an alphanumeric string of 1 through 63 characters.

**Usage**

Use this command to create a VRF context and assign a VRF identifier for BGP/MPLS VPN, IPSec, GRE tunnel configuration in this context instance. This command is used when the system works as a BGP router with MPLS VPN and binds an MPLS VPN to the system or to facilitate GRE or IPSec tunnelling. The addresses assigned to this interface are visible in the VRF routing table. This command switches the command mode to IP VRF Context Configuration Mode:

```
[context_name>]host_name(config-context-vrf)#
```

If required, this command creates an IP VRF Context Configuration Mode instance. When using this command please note of the following:

- A VRF context instance must be created and configured before referring, associating, or binding the same with any command or mode.
- If the interface binding to a VRF context instance is changed or any IP address assigned to the interface is deleted, a warning is displayed.
- All interfaces bound with a VRF context instance will be deleted when that VRF is removed/deleted.
- An interface can be bound to only one VRF context instance.
A maximum of 100 VRF context instances can be configured on a system.

Refer to the *IP VRF Context Configuration Mode Commands* chapter for parameter configuration.

**Example**

The following command configures the virtual routing and forwarding context instance *vrf1* in a context:

```
ip vrf vrf1
```
ip vrf-list

Creates a VRF list and adds VRFs to the list. The VRFs must have been previously created via the `ip vrf` command.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
ip vrf-list list_name permit vrf_name
```

```
no ip vrf-list list_name [ permit vrf_name ]
```

**no**

Deletes a VRF list or delete VRFs from this list. If `permit` and `vrf_name` are not specified, the entire list of VRFs is deleted. Otherwise, the specified VRF(s) is deleted from the list.

```
list_name
```

Specifies the name of the VRF list as an alphanumerical string of 1 through 63 characters.

```
vrf_name
```

Specifies the name of the virtual routing and forwarding interface as an alphanumerical string of 1 through 63 characters.

**Usage**

Create a VRF list and add VRFs to the list. The VRFs must have been previously created via the `ip vrf` command. This command supports multiple VRFs over NEMO.

**Example**

The following command creates a VRF list named `corp103` and adds a VRF named `vrf3567`:

```
ip vrf-list corp103 permit vrf3567
```
ipms

Enables/disables/manages an intelligent packet monitoring system (IPMS) client service and enters the IPMS Client Configuration Mode within the current context.

Product
IPMS

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cxt)#

Syntax

[ no ] ipms [ -noconfirm ]

no
Deletes a previously configured IPMS client service.

-noconfirm
Executes the command without any additional prompt and confirmation from the user.

⚠️ Caution: If this keyword option is used with no ipms command, the IPMS client service will be deleted with all active/inactive IPMS sessions without prompting any warning or confirmation.

Usage

Use this command to enable/disable/manage the IPMS client service within a context and configure certain functionality. This command enables and allows the configuration of service enabling the system to function as an IPMS-enabled Access Gateway in a network. This command is also used to remove previously configured IPMS client service.
A maximum of 1 IPMS client can be configured per system.

Important: The IPMS is a license enabled external application support. Refer to the IPMS Installation and Administration Guide for more information on this product.

Example

The following command creates an IPMS client service name within the context:

ipms
**ipne-service**

Create and/or configure an IPNE service.

**Product**
MME

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

`configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name] host_name (config) #
```

**Syntax**

```
[ no ] ipne-service ipne_service
```

- **no**
  
  Included as a prefix of the command, no causes the system to disable IPNE service when it has been created with this command and removes the IPNE service definition from the MME’s configuration.

- **ipne_service**
  
  Enter 1 to 63 alphanumeric characters to create a unique name for an IPNE service instance.

**Usage**

This command creates an instance of an IPNE service in the context. It is recommended that the IPNE Service be configured in the same context in which the MME Service has been configured.

This command also accesses the commands in the IPNE service configuration mode to configure the IPNE service.

If an IPNE service is to be removed and the service has active handles, then the handles are deleted using a timer-based approach and then the IPNE service is removed.

**Example**

Create an IPNE service called **IPNEserv1**:

```
        ipne-service IPNEserv1
```

Use a command similar to the following to disable and remove the IPNE service configuration for the IPNE service called **ipneserv**.

```
        no ipne-service ipneserv
```
ipsec replay

Configures IKEv2 IPSec specific anti-replay.

**Product**
- ePDG
- PDIF
- SCM

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration
- `configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**
```
[ no ] ipsec replay [ window-size window_size ]
```

- `no`
  - Disables this option.

**replay**
Confirms IKEv2 IPSec anti-replay.

**window-size window_size**
Confirms anti-replay window size.

`window_size` is the window size 32, 64 (default), 128, 256, 384, 512, an integer value between 32..512

**Usage**
Use this command to configure IKEv2 IPSec specific anti-replay.

**Example**
The following command sets the window size to 256:

```
ipsec replay window-size 256
```
ipsec transform-set

Creates a new or specifies an existing IPSec transform set and enters the IPSec Transform Set Configuration Mode for the current context.

Product

ePDG
PDIF
SCM

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] ipsec transform-set transform_set_name

- no

Removes an existing transform set from the system.

- transform-set name

Specifies the name of a new or existing transform set as an alphanumeric string of 1 through 127 characters.

Usage

Use this command to Configure IKEv2 IPsec child security association transform set parameters. Up to four transform-sets can be created.

Entering this command results in the following prompt:

[context_name]host_name(config-ctx-ipsec-tran-set)#

This command applies to IKEv2. Please check crypto ipsec transform-set command for ipsec transform-set configuration for IKEv1.

Example

The following command configures an IPSec transform set called ipsec12 and enters the IPSec Transform Set Configuration Mode:

ipsec transform-set ipsec12
ipsg-service

This command allows you to create/modify/delete an IP Services Gateway (IPSG) service in the current context.

Product
eWAG
IPSG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

ipsg-service ipsg_service_name [ mode { radius-server [ ewag ] | radius-snoop } ] [ -noconfirm ]

no ipsg-service ipsg_service_name [ mode { radius-server [ ewag ] | radius-snoop } ]

---

no
If previously configured, deletes the specified IPSG service.

---

ipsg_service_name

Specifies the name of the IPSG service. 
ipsg_service_name must be an alphanumeric string of 1 through 63 characters.

---

Important: Service names must be unique across all contexts within a chassis.

---

mode { radius-server [ ewag ] | radius-snoop }

Configures the IPSG to perform as either a RADIUS server or as a device to extract user information from RADIUS accounting request messages (snoop). If the optional keyword mode is not entered, the system defaults to radius-server.

*radius-server* Creates the named IPSG RADIUS Server service in the current context and/or enters the IPSG RADIUS Server Configuration Mode.

*radius-server ewag* Enables the eWAG service (IPSG service in eWAG mode), and enters the IPSG RADIUS Server Configuration Mode, which is common for the eWAG and IPSG services.

*radius-snoop* Creates the named IPSG RADIUS Snoop service in the current context and/or enters the IPSG RADIUS Snoop Configuration Mode.

---

-noconfirm

Specifies to execute the command without additional prompt or confirmation.
Usage
Use this command to create/configure/delete an IPSG service. A maximum of one IPSG service can be configured per context. IPSG service commands are defined in the IPSG RADIUS Snoop Configuration Mode Commands chapter and the IPSG RADIUS Server Configuration Mode Commands chapters. A maximum of 256 services (regardless of type) can be configured per system.

⚠️ Caution: A large number of services greatly increases the complexity of system management and may impact overall system performance (i.e., resulting from system handoffs). Do not configure a large number of services unless your application requires it. Contact your Cisco account representative for more information.

🧐 Important: IP Services Gateway functionality is a license-controlled feature. A valid feature license must be installed prior to configuring an IPSG service. Contact your Cisco account representative for more information.

On entering the command with the radius-server mode or without any mode, the CLI prompt changes to:
[context_name]hostname(config-ipsg-service-radius-server)#
On entering the command with the radius-snoop mode, the CLI prompt changes to:
[context_name]hostname(config-ipsg-service-radius-snoop)#
For more information about the IP Services Gateway, refer to the IP Services Gateway Administration Guide.

Example
The following command configures an IPSG RADIUS Snoop service named ipsg1 and enters the IPSG RADIUS Snoop Configuration Mode:

`ipsg-service ipsg1 mode radius-snoop`

The following command enables the eWAG service (IPSG service in eWAG mode), and enters the IPSG RADIUS Server Configuration Mode, which is common for the eWAG and IPSG services:

`ipsg-service ipsg2 mode radius-server ewag`
**ipv6 access-group**

Configures the IPv6 Access group.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
ipv6 access-group group name { priority_value }
```

- **group_name**
  Specifies the name of the access group as an alphanumeric string of 1 through 79 characters.

- **priority_value**
  Specifies the priority of the access group. 0 is the highest priority. If priority_value is not specified the priority is set to 0. priority_value must be an integer from 0 through 4294967295. Default: 0
  If access groups in the list have the same priority, the last one entered is used first.

**Usage**

Use this command to specify IPv6 access group name and priority. Use a lower value to indicate a higher priority for the group.

**Example**

```
ipv6 access-group group_1
```
ipv6 access-list

Configures access list (or packet filter) name and enters the IPv6 ACL Configuration Mode.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] ipv6 access-list name

no
Indicates the access list specified is to be removed from the configuration.

name
Specifies the access list for which to enter the IPv6 ACL Configuration Mode or the list to remove. name is an alphanumeric string of 1 through 79 characters.

Usage
Executing this command enters the IPv6 ACL Configuration Mode in which rules and criteria are defined for the ACL.

Example

ipv6 access-list samplelist

no ipv6 access-list samplelist
ipv6 dns-proxy

Configures the domain name server proxy for the context.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] ipv6 dns-proxy source-ipv4-address ip_address

no
Removes the predefined IP address for local interface in the destination context.

ip_address
Specifies the IPv4 address of one of the local interface in the destination context to configure the IPv6 DNS proxy where ip_address must be specified using IPv4 dotted-decimal notation.

Usage
The IPv6 DNS proxy source IPv4 address is used as the source IP address for the DNS proxy transaction.

Example
The following command provides an example of configuring a IPv6 DNS proxy of 192.168.23.1:

ipv6 dns-proxy source-ipv4-address 192.168.23.1
ipv6 neighbor

Adds a static IPv6 neighbor entry into the neighbor discovery table.

Product
PDIF

Privilege
Administrator, Security Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] ipv6 neighbor ipv6_address hardware_address

no

Removes the specified address.

ipv6_address hardware_address

ipv6_address is the IP address of node to be added to the table.
hardware_address is the associated 48-bit MAC address.

Usage
Add a static IPv6 neighbor entry into the neighbor discovery table.

Important: On the ASR 5000, routes with IPv6 prefix lengths less than /12 and between the range of /64 and /128 are not supported.

Example

Add the ipv6 address fe80::210:83ff:fed7:7a9d::/24 and associated 48 bit MAC address 0:10:83:f7:7a:9d to the table.

ipv6 neighbor fe80::210:83ff:fed7:7a9d::/24 0:10:83:f7:7a:9d
**ipv6 pool**

Modifies the current context’s IP address pools by adding, updating or deleting a pool. This command also resizes an existing IP pool.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
ipv6 pool name { 6to4 local-endpoint ipv4_address [ default-relay-router router_address ] |
alert threshold | group-name name | policy { allow-static-allocation | dup-addr-
detection } | prefix ip_address/len [ 6to4-tunnel local-endpoint ip_address | default-relay-router router_address ] | range start_address end_address | suppress-switchover-arps |
| [ prefix-length prfx_length ] [ private priority ] [ public priority ] [ shared 
priority ] [ static priority ] [ group-name name ] [ vrf vrf-name ]
```

```
no ipv6 pool name
```

Deletes the previously configured IPv6 pool.

```
name
```

Specifies the logical name of the IP address pool as an alphanumeric string of 1 through 31 characters.

```
6to4-tunnel local-endpoint ip_address
```

Specifies the IPv4 address of the local interface to be used for IPv6-to-IPv4 compatible pool address construction.

```
alert threshold { 6to4 local-endpoint ipv4_address | alert threshold | group-available | group-name name | policy { allow-static-allocation | dup-addr-
detection } | pool-free | pool-used | prefix | range start_address end_address }
```

Default: All thresholds are disabled.

Configures IP address pool-level utilization thresholds. These thresholds take precedence over context-level IPv6 pool thresholds.

* **6to4**: Sets an alert based on the IPv6 Pool for an IPv6-to-IPv4 compatible address type.

  *alert-threshold*: Sets an alert based on the percentage free alert threshold for this group.

* **group-available**: Sets an alert based on the percentage free alert threshold for this group.

* **group-name**: Sets an alert based on the IPv6 Pool Group.
- **policy allow-static-allocation**: Sets an alert based on the address allocation policy.
- **pool-free**: Sets an alert based on the percentage free alert threshold for this pool.
- **pool-used**: Sets an alert based on the percentage used alert threshold for this pool.
- **prefix**: Sets an alert based on the IPv6 Pool address prefix.
- **range**: Sets an alert based on the IPv6 address pool range of addresses.
- **suppress-switchover-arps**: Sets an alert based on the Suppress Gratuitous ARPs when performing a line card or an MIO switchover.

```plaintext
group name name
```
IPv6 Pool Group.
The following options are available:
- **6to4**: IPv6 Pool for IPv6-to-IPv4 compatible address type
- **alert-threshold**: Percentage free alert threshold for this group
- **group-name**: IPv6 Pool Group
- **policy**: Configure an address allocation policy
- **prefix**: IPv6 Pool address prefix
- **range**: Configures IPv6 address pool to use a range of addresses
- **suppress-switchover-arps**: Suppress gratuitous ARPs when performing a line card or an MIO switchover.

```plaintext
ipv4_address
```
Specifies the beginning IPv4 address of the IPv4 address pool. `ipv4_address` must be specified using IPv4 dotted-decimal notation.

```plaintext
default-relay-router router address
```
Specifies the default relay router for the tunnel.

```plaintext
policy allow-static-allocation
```
Allows a dynamic pool to accept a static address allocation.
The following options are available:
- **6to4**: IPv6 Pool for IPv6-to-IPv4 compatible address type
- **alert-threshold**: Percentage free alert threshold for this group
- **group-name**: IPv6 Pool Group
- **policy**: Configure an address allocation policy
- **prefix**: IPv6 Pool address prefix
- **range**: Configures IPv6 address pool to use a range of addresses
- **suppress-switchover-arps**: Suppress gratuitous ARPs when performing a line card or an MIO switchover

```plaintext
policy dup-addr-detection
```
This command is valid for IPv6 shared pools only (Sample syntax: `ipv6 pool name prefix ip_address/len shared policy dup-addr-detection`). When this policy is enabled, the IPv6 shared
pool allows a prefix to be shared in different call sessions with different interface IDs for an IPv6 address. This allows the tracking of interface IDs per prefix and the detection of duplicate IDs. With this policy disabled, the IPv6 shared pool will allow a prefix to be shared across different call sessions. The interface ID is not considered for any duplicate address detection. Default: Disabled
The following options are available:

- **6to4**: IPv6 pool for IPv6-to-IPv4 compatible address type
- **alert-threshold**: Percentage free alert threshold for this group
- **group-name**: IPv6 pool group
- **policy**: Configure an address allocation policy
- **prefix**: IPv6 pool address prefix
- **range**: Configures IPv6 address pool to use a range of addresses
- **suppress-switchover-arps**: Suppress gratuitous ARPs when performing a line card or an MIO switchover

```
prefix ip_address/len
```
Specifies the beginning IPv6 address of the IPv6 address pool. `ip_address/len` must be specified using IPv6 colon-separated-hexadecimal. `len` is an integer that indicates the number bits of prefix length.

### Important:
On the ASR 5000, routes with IPv6 prefix lengths less than /12 and between the range of /64 and /128 are not supported.

```
range start_address end_address
```
Configures an IPv6 address pool to use a range of addresses.
`start_address` specifies the beginning of the range of addresses for the IPv6 pool. It must be specified using IPv6 colon-separated-hexadecimal notation.
`end_address` specifies the end of the range of addresses for the IPv6 pool. It must be specified using IPv6 colon-separated-hexadecimal notation.

```
suppress-switchover-arps
```
Suppresses gratuitous ARPs when performing a line card switchover.
The following options are available:

- **6to4**: IPv6 Pool for IPv6-to-IPv4 compatible address type
- **alert-threshold**: Percentage free alert threshold for this group
- **group-name**: IPv6 Pool Group
- **policy**: Configure an address allocation policy
- **prefix**: IPv6 Pool address prefix
- **range**: Configures IPv6 address pool to use a range of addresses
- **suppress-switchover-arps**: Suppress gratuitous ARPs when performing a line card or an MIO switchover

```
prefix-length prfx_length
```
Specifies a configured length of prefixes. `prfx_length` can be 48, 52, 56 or 64 bits of prefix (Default = 64). This option supports S-GW/P-GW validation of fixed-length addresses via DHCPv6 (TS 29.274 – 7.2.2 and 8.14).
**ipv6 pool**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Private priority</strong></td>
<td>Specifies that the address pool may only be used by mobile stations which have requested an IP address from a specified pool. When private pools are part of an IP pool group, they are used in a priority order according to the precedence setting. <strong>priority</strong> must be an integer from 0 through 10 with 0 being the highest. The default is 0.</td>
</tr>
<tr>
<td><strong>Public priority</strong></td>
<td>Specifies that the address pool is used in priority order for assigning IP addresses to mobile stations which have not requested a specific address pool. <strong>priority</strong> must be an integer from 0 through 10 with 0 being the highest and with a default of 0.</td>
</tr>
<tr>
<td><strong>Shared priority</strong></td>
<td>Specifies that the address pool that may be used by more than one session at any time. <strong>priority</strong> must be an integer from 0 through 10 with 0 being the highest and with a default of 0.</td>
</tr>
<tr>
<td><strong>Static priority</strong></td>
<td>Specifies that the address pool is used for statically assigned mobile stations. Statically assigned mobile stations are those with a fixed IP address at all times. <strong>priority</strong> must be an integer from 0 through 10 with 0 being the highest and with a default of 0.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to modify the current context’s IP address pools by adding, updating or deleting a pool. Also use this command to resize an existing IP pool.

**Example**

The following command adds an IPv6 pool named **ip6Star**:  
```
ipv6 pool ip6Star
```
**ipv6 prefix-list**

Creates an IPv6 prefix list for filtering routes.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration
- `configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
ipv6 prefix-list list_name [ seq seq_number ] { deny | permit } { any | network_address/net_mask [ ge ge_value ] [ le le_value ]
```

```
no ipv6 prefix-list list_name [ seq seq_number ] { deny | permit } { any | network_address/net_mask [ ge ge_value ] [ le le_value ]
```

**no**
Delete the specified prefix-list entry.

**name list_name**
Specifies a name for the prefix list as an alphanumeric string of 1 through 79 characters.

**seq seq_number**
Assigns the specified sequence number to the prefix list entry as an integer from 1 through 4294967295.

**deny**
Specifies prefixes to deny.

**permit**
Specifies prefixes to permit.

**any**
Matches any prefix.

**network_address/net_mask [ ge ge_value ] [ le le_value ]**
Specifies the prefix to match.
**network_address/net_mask**: The IPv6 address and the length, in bits, of the network mask that defines the prefix. The IP address and mask must be entered in IPv6 colon-separated-hexadecimal notation. When neither **ge** (greater than or equal to) or **le** (less than or equal to) are specified an exact match is assumed.

---

**Important**: On the ASR 5000, routes with IPv6 prefix lengths less than /12 and between the range of /64 and /128 are not supported.

- **ge ge_value**: Specifies the minimum prefix length to match as an integer from 0 through 128. If only the ge value is specified, the range is from the ge value to 128. The ge value must be greater than net_mask and less than the le value.
- **le le_value**: Specifies the maximum prefix length to match as an integer from 0 through 128. If only the le value is specified, the range is from the net_mask to the le value. The le value must be less than or equal to 128.

The following equation describes the conditions that ge and le values must satisfy:

```
net_mask < ge_value < le_value <= 128
```

---

**Usage**

Use this command to filter routes by their IPv6 prefix.

**Example**

```
ipv6 prefix-list name prelistv6-10 seq 5 permit 2002::123.45.67.89/32
```
**ipv6 prefix-list sequence-number**

Enables or disables the inclusion of IPv6 prefix list sequence numbers in the configuration file. This option is enabled by default.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```configure > context context_name```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] ipv6 prefix-list sequence-number
```

- **no**
  
  Disables the listing of IPv6 prefix list sequence numbers in the configuration file.

**Usage**

Use this command to enable and disable the inclusion of IPv6 prefix list sequence numbers in the configuration file.

**Example**

To disable the inclusion of IPv6 prefix list sequence numbers in the configuration file, enter the following command:

```
no ipv6 prefix-list sequence-number
```
ipv6 route

Configures a static IPv6 route to the next-hop router.

**Product**
All

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] ipv6 route ipv6_address/prefix_length { interface name | next-hop ipv6 address interface name } [ cost cost] [ fall-over bfd multihop mhsess_name ] [ precedence precedence ] [ vrf vrf_name [ cost value ] [ fall-over bfd multihop mhsess_name ] [ precedence precedence ]

[ no ] ipv6 route static bfd if_name remote-endpt_ipv6address

[ no ] ipv6 route static multihop bfd mhbfd_sess_name local_endpt_ipv6addr remote_endpt_ipv6addr
```

no

Removed the specified static route.

ipv6_address/prefix_length

Specifies a destination IPv6 address or group of addresses that will use this route.

*ipv6_address/prefix_length* must be specified using IPv6 colon-separated-hexadecimal with CIDR notation.

**Important:** On the ASR 5000, routes with IPv6 prefix lengths less than /12 and between the range of /64 and /128 are not supported.

interface name

Specifies the name of the interface on this system associated with the specified route or next-hop address.

*name* must be an existing interface name on the system expressed as an alphanumeric string of 1 through 79 characters.

next-hop ipv6_address

The IPv6 address of the directly connected next hop device in IPv6 colon-separated-hexadecimal notation.
**cost cost**

Defines the number of hops to the next gateway as an integer from 0 through 255. Default: 0

**fall-over bfd multihop mhsess_name**

Enables fall-over BFD functionality for the specified multihop session. The fall-over bfd option uses BFD to monitor neighbor reachability and liveness. When enabled it will tear down the session if BFD signals a failure. Specify mhsess_name as an alphanumeric string of 1 through 19 characters.

**precedence precedence**

Indicates the administrative preference of the route. A low precedence specifies that this route takes precedence over the route with a higher precedence. precedence must be an integer from 1 through 254. Default: 1

**vrf vrf_name**

Associates a Virtual Routing and Forwarding (VRF) context with this static route configuration. vrf_name is the name of a preconfigured VRF context configured in Context Configuration Mode via the ip vrf command.

**static bfd if_name remote-endpt_ipv6address**

Creates a static IP route that will be associated with Bidirectional Forwarding Detection (BFD). For additional information, see the BFD Configuration Mode Commands chapter.

- if_name: Specifies the name of the interface to which the static BFD neighbor is bound as an alphanumeric string of 1 through 79 characters.
- remote_endpt_ipv6address: Specifies the gateway address of the BFD neighbor in IPv6 colon-separated-hexadecimal notation.

**static multihop bfd mhbfd_sess_name local_endpt_ipv6addr remote_endpt_ipv6addr**

Creates a static multihop BFD route with local and remote endpoints.

- mhbfd_sess_name: Specifies the multihop BFD session name as an alphanumeric string of 1 through 79 characters.
- local_endpt_ipv6addr: Specifies the local endpoint address in IPv6 colon-separated-hexadecimal notation.
- remote_endpt_ipv6addr: Specifies the remote endpoint address in IPv6 colon-separated-hexadecimal notation.

**Usage**

Use this command to configure IPv6 route parameters, precedence and cost options for the route selections such that routes of the same precedence are grouped together then lowest cost is selected first. This results in route’s being selected first by lower precedence then the cost is used if multiple route’s are defined with the same precedence.

This command also configures static IP routes when implementing Bidirectional Forwarding Detection (BFD).

**Important:** A maximum of 1,200 static routes may be configured per context.

Virtual Routing and Forwarding (VRF) context can be associated with static IP route for BGP/MPLS, GRE, or IPSec tunnel support.
**Important:** SNMP traps are generated when BFD sessions go up and down (BFDSessionUp and BFDSessionDown).

Example

The following example configures a static route with IPv6 prefix/length

```
ipv6 route 2001:0db8:3c4d:0015:0000:0000:abcd:ef12/24 interface egress1
```
ipv6 route-access-list

Configures an IPv6 route access list for filtering routes.

**Product**
- GGSN
- HA
- PDSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration
  ```
  configure > context context_name
  ```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```sql
ipv6 route-access-list named list_name ] { deny | permit } network_address/net_mask [ exact-match ]

no ipv6 prefix-list list_name ] { deny | permit } { any | network_address/net_mask [ exact-match ]
```

- **no**
  Delete the specified prefix-list entry.

- **name **list_name
  Specifies a name for the prefix list as an alphanumeric string of 1 through 79 characters.

- **deny**
  Specifies prefixes to deny.

- **permit**
  Specifies prefixes to permit.

- **network_address/net_mask [ exact-match ]**
  Specifies the prefix to match.

  *network_address/net_mask*: the IPv6 address and the length, in bits, of the network mask that defines the prefix. The IP address and mask must be entered in IPv6 colon-separated-hexadecimal notation.

- **Important:** On the ASR 5000, routes with IPv6 prefix lengths less than /12 and between the range of /64 and /128 are not supported.

  **exact-match le_value**: Specifies that only an exact match will initiate access list deny/permit function.
**Usage**

Use this command to filter routes by their IPv6 prefix.

**Example**

```
ipv6 route-access-list name routelistv6 seq 5 permit
2002::123.45.67.89/24
```
ipv6 rri

Configures Reverse Route Injection (RRI) egress clear port IPv6 parameters. (VPC-VSM only)

Product
SecGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

ipv6 rri { ipv6_address | next-hop nexthop_address } interface interface_name [ vrf vrf_name ]

no ipv6 rri { ipv6_address | next-hop nexthop_address } interface interface_name [ vrf vrf_name ]

no

Disables the specified RRI egress route.

ipv6_address
Specified in IPv6 colon-separated-hexadecimal notation.

next-hop nexthop_address
Next hop address specified in IPv6 colon-separated-hexadecimal notation. The next hop IP address is not required for point-to-point and tunnel interfaces.

interface interface_name
Specifies the name of an existing egress interface as an alphanumeric string of 1 through 79 characters.

vrf vrf_name
Specifies the name of an existing VRF as an alphanumerical string of 1 through 63 characters.

Usage
Use this command to configure IPv6 RRI egress clear port IPv6 parameters.

Example

ipv6 rri 2001:4A2B::1f3F interface rri03
ipv6 rri-route

Configures High Availability (HA) IPv6 routing parameters for Reverse Route Injection (RRI). (VPC-VSM only)

**Product**
SecGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

```
/context_name>host_name(config-ctx)#
```

**Syntax**

```
ipv6 rri-route network-mode { L2 | L3 } { clear_loopback_ip | rri-ip virtual_ipv6_address }
{ ipv6_address | next-hop nexthop_address } interface interface_name [ vrf vrf_name ]
```

```
no ipv6 rri-route network-mode { L2 | L3 } { clear_loopback_ip | rri-ip virtual_ipv6_address }
{ ipv6_address | next-hop nexthop_address } interface interface_name [ vrf vrf_name ]
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>no</strong></td>
<td>Disables the specified RRI route.</td>
</tr>
</tbody>
</table>

**network-mode { L2 | L3 }**

Specifies the RRI route network mode type as Layer 2 (L2) or Layer 3 (L3).

**clear_loopback_ip**

Specifies the loopback address for clear traffic in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**rri-ip virtual_ipv6_address**

Specifies the use of a virtual IP address on both Primary and Secondary for RRI. `virtual_ipv6_address` is expressed in IPv6 colon-separated-hexadecimal notation.

**ipv6_address**

Specified in IPv6 colon-separated-hexadecimal notation.

**next-hop nexthop_address**

Next hop address specified in IPv6 colon-separated-hexadecimal notation. The next hop IP address is not required for point-to-point and tunnel interfaces.
interface interface_name
Specifies the name of an existing egress interface as an alphanumeric string of 1 through 79 characters.

vrf vrf_name
Specifies the name of an existing VRF as an alphanumerical string of 1 through 63 characters.

Usage
Use this command to configure HA IPv6 routing parameters for RRI.

Example
ipv6 rri-route network-mode L3 rri-ip 2001:4A2B::1f3F
ipv6 sri-route

Configures Layer 3 (L3) High Availability (HA) IPv6 routing parameters for Service Route Injection (SRI). (QvPC-VSM only)

**Product**
SecGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
ipv6 sri-route sri-ip network_address next hop nexthop_address interface interface_name
  [ vrf vrf_name ]

no ipv6 sri-route sri-ip network_address next hop nexthop_address interface
  interface_name  [ vrf vrf_name ]

no
```

- **Disables the specified SRI route.**

```
sri-ip network_address
```

- Specifies the IPv6 address associated with the SRI route.

```
next hop nexthop_address
```

- Next hop address specified in IPv6 colon-separated-hexadecimal notation. The next hop IP address is not required for point-to-point and tunnel interfaces.

```
interface interface_name
```

- Specifies the name of an existing egress interface as an alphanumeric string of 1 through 79 characters.

```
vrf vrf_name
```

- Specifies the name of an existing VRF as an alphanumeric string of 1 through 63 characters.

**Usage**

Use this command to configure L3 HA IPv6 routing parameters for SRI.

**Example**

```
ipv6 sri-route sri-ip 2001:4A2B::1f3F interface sri23
```
isakmp disable-phase1-rekey

This command is deprecated. Use `ikev1 disable-phase1-rekey` command to configure the parameters for Phase1 SA rekeying when ISAKMP lifetime expires for IKE v1 protocol.
isakmp keepalive

This command is deprecated. Use `ikev1 keepalive dpd` command to configure ISAKMP IPSec Dead Peer Detection (DPD) message parameters for IKE v1 protocol.
isakmp policy

This command is deprecated. Use `ikev1 policy` command to create/configure an ISAKMP policy with the specified priority for IKE v1 protocol.
iups-service

Creates an Iu-PS service instance and enters the Iu-PS Service Configuration Mode. This mode defines the configuration and usage of Iu-PS interfaces between the SGSN and the RNCs in the UMTS radio access network (UTRAN). It defines both the control plane (GTP-C) and the data plane (GTP-U) between these nodes.

**Important:** For details about the commands and parameters for this mode, check the *IuPS Service Configuration Mode Commands* chapter.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] iups-service srvc_name
```

- **no**
  Remove the configuration for the specified Iu-PS service from the configuration for the current context.

- **srvc_name**
  Specifies the IuPS service name as a unique alphanumeric string of 1 through 63 characters.

**Important:** Service names must be unique across all contexts within a chassis.

**Usage**

Use this command to create, edit, or remove an Iu-PS service. Add up to eight definitions to be used with a single SGSN service so the SGSN can support multiple PLMNs.

**Example**

The following command creates an Iu-PS service named `iu-ps1`:

```
iups-service iu-ps1
```

The following command removes the Iu-PS service named `iu-ps1`:

```
no iups-service iu-ps1
```
**I2tp peer-dead-time**

Configures a delay when attempting to tunnel to a specific peer which is initially unreachable due to reasons such as a network issue or temporarily having reached its capacity.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
l2tp peer-dead-time seconds
```

```
default l2tp peer-dead-time
```

---

**default**

Rests the command to its default setting of 60.

---

**seconds**

Specifies the interval (in seconds) to wait before attempting to tunnel to a specific peer which is initially unreachable as an integer from 5 through 64,000. Default: 60

**Usage**

The time to wait before trying to establish a tunnel to a known peer after the initial attempt was unsuccessful.

**Example**

The following example configures the delay in attempting to tunnel to a temporarily unreachable peer. The delay is set to 120 seconds in this example.

```
l2tp peer-dead-time 120
```
lac-service

Enters the LAC Service Configuration Mode, or is used to add or remove a specified L2TP Access Concentrator (LAC) service.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] lac-service name
```

- **no**
  
  Removes the specified lac-service from the current context.

- **name**
  
  Specifies the name of a LAC service to configure, add, or remove as an alphanumeric string of 1 through 63 characters that is case-sensitive.

**Important:** Service names must be unique across all contexts within a chassis.

**Usage**

Enter the LAC Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.

A maximum of 256 services (regardless of type) can be configured per system.

**Caution:** Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

**Example**

To add a new LAC service named *LAC1* and enter the LAC Service Configuration Mode, enter the following command:

```
lac-service LAC1
```

To configure an existing LAC service named *LAC2*, enter the following command:
lac-service LAC2

To delete an existing LAC service named LAC3, enter the following command:

   no lac-service LAC3
lawful-intercept

Refer to the Lawful Intercept Configuration Guide for a description of this command.
lawful-intercept dictionary

Refer to the *Lawful Intercept Configuration Guide* for a description of this command.
**Ima-service**

Creates an Local Mobility Anchor (LMA) service or specifies an existing LMA service and enters the LMA Service Configuration Mode for the current context.

**Product**

P-GW

SAEGW

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
lma-service service_name [ -noconfirm ]
```

```
no lma-service service_name
```

no

Removes the specified LMA service from the context.

```
service_name
```

Specifies the name of the LMA service. If `service_name` does not refer to an existing service, the new service is created if resources allow.

`service_name` is an alphanumeric string of 1 through 63 characters.

**Important:** Service names must be unique across all contexts within a chassis.

```
-service_name
```

Executes the command without any additional prompt and confirmation from the user.

**Usage**

Enter the LMA Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.

A maximum of 256 services (regardless of type) can be configured per system.

**Caution:** Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a
large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-lma-service)#
```

LMA Service Configuration Mode commands are defined in the *LMA Service Configuration Mode Commands* chapter.

Use this command when configuring the following eHRPD and PMIP SAE components: P-GW (SAEGW).

**Example**

The following command enters the existing LMA Service Configuration Mode (or creates it if it does not already exist) for the service named `lma-service1`:

```
lma-service lma-service1
```

The following command will remove `lma-service1` from the system:

```
no lma-service lma-service1
```
**Ins-service**

Enters the LNS Service Configuration Mode, or is used to add or remove a specified L2TP Network Server (LNS) service.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration

`configure > context context_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-ctx)#`

**Syntax**

```
[ no ] lns-service name
```

- **no**
  
  Removes the specified lac-service from the current context.

- **name**

  Specifies the name of a LNS service to configure, add or remove as an alphanumeric string of 1 through 63 characters that is case-sensitive.

**Important:** Service names must be unique across all contexts within a chassis.

**Usage**

Enter the LNS Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.

A maximum of 256 services (regardless of type) can be configured per system.

**Caution:** Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

**Example**

To add a new LNS service named LNS1 and enter the LNS Service Configuration Mode, enter the following commands:

```
lns-service LNS1
```

To configure an existing LNS service named LNS2, enter the following command:
lns-service LNS2

To delete an existing LNS service named LNS3, enter the following command:

no lns-service LNS3
location-service

Creates a location service configuration instance or configures an existing location service configuration and enters the Location Service Configuration Mode. LoCation Services (LCS) are used to determine the geographic location of a UE.

Product
- MME
- SGSN

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

location-service service_name [ -noconfirm ]

no location-service service_name

no
Removes the specified location service configuration instance from the context.

service_name
Specifies the name of the location service configuration instance. If service_name does not refer to an existing service, the new service is created if resources allow.

service_name is an alphanumeric string of 1 through 63 characters.

Important: Service names must be unique across all contexts within a chassis.

-noconfirm
Executes the command without any additional prompt and confirmation from the user.

Usage

Enter the Location Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing Service Configuration instance.

Location Service Configuration Mode commands are defined in the Location Service Configuration Mode Commands chapter.

A maximum of 16 location service instances can be configured per system.

Entering this command results in the following prompt:

[context_name]host_name(config-location-service)#
Example

The following command enters the existing Location Service Configuration Mode (or creates it if it does not already exist) for the service named `location-service1`:

```
location-service location-service1
```

The following command will remove `location-service1` from the system:

```
no location-service location-service1
```
logging

Modifies the logging options for a specified system log server for the current context.

**Product**
All

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] logging syslog ip_address [ event-verbosity { min | concise | full } ] [ facility facilities ] [ pdu-data { none | hex | hex-ascii } ] [ pdu-verbosity pdu_level ] [ rate value ]
```

- **no**
  Indicates that internal logging is to be disabled for the options specified.

- **syslog ip_address**
  Specifies the IP address of a system log server on the network in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

- **event-verbosity { min | concise | full }**
  Specifies the level of detail to use in logging of events. Detail level must be one of the following:
  - **min**: Displays minimal detail.
  - **concise**: Displays summary detail.
  - **full**: Displays full detail.

- **facility facilities**
  Default: **local7**
  Specifies the local facility for which the system logging server’s logging options shall be applied. Local facility must be one of the following:
  - **local0**
  - **local1**
  - **local2**
  - **local3**
  - **local4**
  - **local5**
• **local6**
• **local7**

Multiple system log servers can share the logging options of a given local facility. This allows for the logical grouping of system log servers and the options which affect all of those associated with the same local facility.

---

**pdu-data { none | hex | hex-ascii }**

Specifies output format for packet data units when logged. Format must be one of the following:

- **none**: Displays data in raw format.
- **hex**: Displays data in hexadecimal format.
- **hex-ascii**: Displays data in hexadecimal and ASCII format (similar to a main-frame dump).

---

**pdu-verbosity pdu_level**

Specifies the level of verboseness to use in logging of packet data units as a value from 1 through 5, where 5 is the most detailed.

---

**rate value**

Specifies the rate at which log entries are allowed to be sent to the system log server. No more than the number specified by value will be sent to a system log server within any given one-second interval. value must be an integer from 0 through 100000. Default: 1000

---

**Usage**

Set the log servers to enable remote review of log data.

Example

The following sets the logging for events to the maximum for the local7 facility:

```
logging syslog 10.2.3.4 event-verbosity full
```

The following command sets the logging for packet data units to level 3 and sets the output format to the main-frame style hex-ascii for the local3 facility:

```
logging syslog 10.2.3.4 facility local3 pdu-data hex-ascii pdu-verbosity 3
```

The following sets the rate of information for the local1 facility:

```
logging syslog 10.2.3.4 facility local1 rate 100
```

The following disables internal logging to the system log server specified:

```
no logging syslog 10.2.3.4
```
mag-service

Creates a Mobile Access Gateway (MAG) service or specifies an existing MAG service and enters the MAG Service Configuration Mode for the current context.

Product
HSGW
S-GW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

mag-service service_name [ -noconfirm ]

no mag-service service_name

no
Removes the specified MAG service from the context.

service_name
Specifies the name of the MAG service. If service_name does not refer to an existing service, the new service is created if resources allow.

service_name is an alphanumeric string of 1 through 63 characters.

Important: Service names must be unique across all contexts within a chassis.

-noconfirm
Executes the command without any additional prompt and confirmation from the user.

Usage
Enter the MAG Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your Cisco service representative for more information.

Command Line Interface Reference, StarOS Release 17
Entering this command results in the following prompt:

```
[context_name]hostname(config-mag-service)#
```

MAG Service Configuration Mode commands are defined in the *MAG Service Configuration Mode Commands* chapter.

Use this command when configuring the following eHRPD and PMIP SAE components: HSGW and S-GW.

**Example**

The following command enters the existing MAG Service Configuration Mode (or creates it if it does not already exist) for the service named `mag-service1`:

```
mag-service mag-service1
```

The following command will remove `mag-service1` from the system:

```
no mag-service mag-service1
```
map-service

Creates a Mobile Application Part (MAP) Service instance and enters the MAP Service Configuration mode to define or edit the MAP service parameters.

MAP is the SS7 protocol that provides the application layer required by some of the nodes in GPRS/UMTS networks to communicate with each other in order to provide services to mobile phone users. MAP is used by the serving GPRS support node (SGSN) to access SS7 network nodes such as a home location register (HLR) or a radio access network (RAN).

Product
SGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
  configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

map-service srvc_name

no map-service srvc_name

no
Remove the specified MAP service from the configuration for the current context.

srvc_name
Specifies the name of the MAP service as a unique alphanumeric string of 1 through 63 characters.

**Important:** Service names must be unique across all contexts within a chassis.

Usage
Use this command to create, edit, or remove a MAP service configuration.

**Important:** For details about the commands and parameters, check the MAP Service Configuration Mode Commands chapter.

Example
The following command creates a MAP service named map_1:

map-service map_1
The following command removes the configuration for a MAP service named `map_1` from the configuration for the current context:

```
no map-service map_1
```
mipv6ha-service

Creates a Mobile IPv6 Home Agent (MIPv6-HA) service instance and enters the MIPv6 HA Service Configuration mode to define or edit the MIPv6-HA service parameters.

Product

PDSN

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

mipv6ha-service srvc_name

no mipv6ha-service srvc_name

no

Remove the specified MIPv6-HA service from the configuration for the current context.

srvc_name

Specifies the name of the MIPv6-HA service as a unique alphanumeric string of 1 through 63 characters.

Important: Service names must be unique across all contexts within a chassis.

Usage

Use this command to create, edit, or remove a MIPv6-HA service configuration.

Important: For details about the commands and parameters, check the MIPv6 HA Service Configuration Mode Commands chapter.

Example

The following command creates a MIPv6-HA service named mipv6ha_1:

mipv6ha-service mipv6ha_1

The following command removes the configuration for a MIPv6-HA service named mipv6ha_1 from the configuration for the current context:

no mipv6ha-service mipv6ha_1
mme-service

Creates an Mobility Management Entity (MME) service or configures an existing MME service and enters the MME Service Configuration Mode for Evolved Packet Core (EPC) networks in the current context.

**Product**
MME

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
mme-service service_name [ -noconfirm ]

no mme-service service_name
```

- **no**
  Removes the specified MME service from the context.

- **service_name**
  Specifies the name of the MME service. If *service_name* does not refer to an existing service, the new service is created if resources allow. *service_name* is an alphanumeric string of 1 through 63 characters.

---

**Important:** Service names must be unique across all contexts within a chassis.

- **-noconfirm**
  Executes the command without any additional prompt and confirmation from the user.

---

**Usage**
Enter the MME Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.

A maximum of 8 MME service can be configured on a system which is further limited to a maximum of 256 services (regardless of type) can be configured per system.

---

**Caution:** Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.
Entering this command results in the following prompt:

```
[context_name]hostname(config-mme-service) #
```

MME Service Configuration Mode commands are defined in the *MME Service Configuration Mode Commands* chapter.

---

**Caution:** This is a critical configuration. The MME service cannot be configured without this configuration. Any change to this configuration would lead to restarting the MME service and removing or disabling this configuration will stop the MME service.

---

**Example**

The following command enters the existing MME Service Configuration Mode (or creates it if it does not already exist) for the service named *mme-service1*:

```
mme-service mme-service1
```

The following command will remove *mme-service1* from the system:

```
no mme-service mme-service1
```
mobile-access-gateway

Controls whether duplicate MAG sessions are allowed in HSGW. By default, duplicate sessions are rejected.

**Product**
HSGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
mobile-access-gateway newcall duplicate-session { purge | reject }
```

**Usage**

**Example**

The following command allows duplicate MAG sessions in HSGW on this context:

```
mobile-access-gateway newcall duplicate-session purge
```
**mobile-ip fa**

Configures settings that effect all FA services in the current context.

**Product**
FA

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-ctx)#
```

**Syntax**

```
mobile-ip fa { multiple-dynamic-reg-per-nai | newcall duplicate-home-address { accept | reject } } { default | no } mobile-ip fa { multiple-dynamic-reg-per-nai | newcall duplicate-home-address }
```

---

**default**

Configures the default setting for the specified parameter.

- `multiple-dynamic-reg-per-nai`:
  All FA services in the current context can not simultaneously setup multiple dynamic home address registrations that have the same NAI.

- `newcall duplicate-home-address`: reject

---

**no**

- `multiple-dynamic-reg-per-nai`:
  Disables all FA services in the current context from simultaneously setting up multiple dynamic home address registrations that have the same NAI.

- `newcall duplicate-home-address`:
  Resets this option to its default of reject.

---

**multiple-dynamic-reg-per-nai**

This keyword allows all FA services in the current context to simultaneously setup multiple dynamic home address registrations that have the same NAI.

```
newcall duplicate-home-address { accept | reject }
```

- `accept`:
  The new call is accepted and the existing call is dropped.

- `reject`:
  The new call is rejected with an Admin Prohibited code.

---

**Usage**

Use this command to set the behavior of all FA services in the current context.
Example

To configure all FA services to accept new calls and drop the existing call when the new call requests an IP address that is already in use by an existing call, enter the following command:

```
mobile-ip fa newcall duplicate-home-address accept
```

To enable all FA services in the current context to allow all FA services in the current context to simultaneously setup multiple dynamic home address registrations that have the same NAI, enter the following command:

```
mobile-ip fa multiple-dynamic-reg-per-nai
```
mobile-ip ha assignment-table

Creates a Mobile IP HA assignment table and enters Mobile IP HA Assignment Table Configuration Mode.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
mobile-ip ha assignment-table atable_name [ -noconfirm ]
no mobile-ip ha assignment-table atable_name
```

- **no**
  This keyword deletes the specified assignment table

- **atable_name**
  Specifies the name of the MIP HA assignment table to create or edit as an alphanumeric string of 1 through 63 characters.

- **-noconfirm**
  Executes the command without any additional prompt and confirmation from the user.

**Usage**

Use this command to create a new MIP HA assignment table or edit an existing MIP HA assignment table.

**Important:** A maximum of eight MIPHA assignment tables can be configured per context with a maximum of 8 MIP HA assignment tables across all contexts.

**Important:** A maximum of 256 non-overlapping hoa-ranges can be configured per MIP HA Assignment table with a maximum of 256 non-overlapping hoa-ranges across all MIP HA Assignment tables.

**Example**

The following command creates a new MIP HA assignment table name `MIPHAtable1` and enters MIP HA Assignment Table Configuration Mode without asking for confirmation from the user:

```
mobile-ip ha assignment-table MIPHAtable1
```
mobile-ip ha newcall

Configures the behavior of all HA services when duplicate home addresses and duplicate IMSI sessions occur for new calls.

Product
HA

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

mobile-ip ha newcall { duplicate-home-address { accept | reject } | duplicate-imsi-session { allow | disallow | global-disallow } | wimax-session-overwrite { allow | disallow }

{ default | no } mobile-ip ha newcall { duplicate-home-address | duplicate-imsi-session | wimax-session-overwrite }

---

default

Configures the default setting for the specified parameter.

- **duplicate-home-address: reject**—sets HA services to reject a new call that requests an IP address that is already assigned.

- **duplicate-imsi-session: allow**—sets HA services to accept new calls that have the same IMSI as a call that is already active.

- **wimax-session-overwrite: disallow**—disable session overwrite feature for WiMax mobile-ip calls on the HA.

---

no

Configures the default setting for the specified parameter.

duplicate-home-address { accept | reject }

Configures the HA to either accept or reject new calls if the new call requests a static IP home address that is already assigned to an existing call from an IP address pool in the same destination context.

- **accept**: The new call is accepted and the existing call is dropped.

- **reject**: The new call is rejected with an Admin Prohibited code.

duplicate-imsi-session { allow | disallow | global-disallow }

Configures the HA to either permit or not permit multiple sessions for the same IMSI.

- **allow**: Allows multiple sessions for the same IMSI.
**disallow**: If a mobile node already has an active session and a new session is requested using the same IMSI, the currently active session is dropped and the new session is accepted.

**global-disallow**: Enables HA services in this context to accept a new session and disconnect any other session(s) having the same IMSI being processed in this context. In addition, a request is sent to all other contexts containing HA services to do the same.

---

**Important**: In order to ensure a single session per IMSI across all contexts containing HA services, the global-disallow option must be configured in every context.

```
import mobile-ip ha newcall
```

**Usage**: Use this command to enable or disable the overwrite feature for WiMAX mobile ip (MIPv4) calls on the HA.

**Example**

To configure all HA services to accept new calls when the new call requests a static IP that is already assigned from an IP pool in the same destination context, enter the following command:

```
mobile-ip ha newcall duplicate-home-address accept
```

To configure all HA services to drop an active call and accept a new one that uses the same IMSI, enter the following command:

```
mobile-ip ha newcall duplicate-imsi-session disallow
```
**mobile-ip ha reconnect**

Sets the behavior of all HA services to reconnect dropped calls.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
```

- **static-homeaddr**
  Specifies that the home address as a static IP address.

- **dynamic-pool-allocation**
  Allows a dynamic pool to accept a static address allocation.

**Usage**
Use this command to reset the HA behavior for new calls.

**Example**

```
mobile-ip ha reconnect
mobile-ip ha reconnect static-homeaddr
mobile-ip ha reconnect static-homeaddr dynamic-pool-allocation
no mobile-ip ha reconnect
no mobile-ip ha reconnect static-homeaddr
```
mpls bgp forwarding

Globally enables Multi protocol Label Switching (MPLS) Border Gateway Protocol (BGP) forwarding.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] mpls bgp forwarding

no

Disables MPLS BGP forwarding.

Usage

Use this command to globally enable the MPLS BGP forwarding. By enabling this command, the BGP VPNv4 routes need not have an underlying LSP to forward the IP packets. If this command is not enabled, then the nexthop for the BGP routes must be reachable via LDP.

⚠️ Caution: This command should always be enabled when nexthop is not reachable thorough LSP.

Example

The following command enables the MPLS BGP forwarding on the system:

mpls bgp forwarding
**mpls exp**

Sets the default behavior as Best Effort using a zero value in the 3-bit MPLS EXP (Experimental) header. This setting overrides the value sent by the mobile subscriber.

**Product**
- eHRPD
- GGSN
- PDSN (HA)

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration

```bash
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] mpls exp <value>
```

- **no**
  
  Reverts back to the default behavior, which is to copy the DSCP from the mobile subscriber packet to the EXP header of the packet, if there is no explicit configuration for DSCP to EXP.

- **<value>**

  Specifies the MPLS EXP header value as an integer from 0 through 7. Higher value indicates higher priority.

**Usage**

Set the default behavior as Best Effort using a zero value in the 3-bit MPLS EXP header. This value applies to all the VRFs in the context. The default behavior is to copy the DSCP value of mobile subscriber traffic to the EXP header, if there is no explicit configuration for DSCP to EXP (via the `mpls map-dscp-to-exp dscp <n> exp <m>` command).

This command disables the default behavior and sets the EXP value to the configured `<value>`.

**Example**

The following command sets the MPLS EXP header value to 2:

```bash
mpls exp 2
```
**mpls ip**

Globally enables the Multiprotocol Label Switching (MPLS) forwarding of IPv4 packets along normally routed paths.

**Product**
- GGSN
- HA
- P-GW
- SAEGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```bash
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] mpls ip
```

- **no**
  Disables MPLS forwarding of IPv4 packets configured on the system. `no mpls ip` stops dynamic label distribution on all the interfaces regardless of interface configuration.

**Usage**

Globally enables the MPLS forwarding of IPv4 packets along normally routed paths for the entire context. It does not start label distribution over an interface until MPLS has been enabled for the interface as well. Refer to the *Ethernet Interface Configuration Mode Commands* chapter for additional information.

⚠️ **Caution:** This feature is not enabled by default.

**Example**

Following command enables (but does not start) MPLS forwarding of IPv4 packets along normally routed paths:

```bash
mpls ip
```
mseg-service

This command is not supported in this release.
multicast-proxy

Creates, configures or deletes a multicast proxy host configuration.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[no] multicast-proxy { igmp interface ip_address range-start start_ip_address range-end end_ip_address | listen address listen_ip_address port port_number protocol protocol_number sessmgr instance }
```

*no*

If previously configured, deletes the specified multicast proxy parameter from the current context.

**igmp interface ip_address range-start start_ip_address range-end end_ip_address**

Specifies the IP address and range of associated addresses for this Internet Group Management Protocol (IGMP) interface.

- **ip_address** is the IP address of this interface expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
- **range-start start_ip_address** is the start point for the multicast address range expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
- **range-end end_ip_address** is the end point for the multicast address range expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**listen address listen_ip_address port port_number protocol protocol_number sessmgr instance**

Configures this context as a multicast proxy listener.

- **listen_ip_address** is the IP address that will be listened to, expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
- **port port_number** is the port number which will be listened to. If this is not provided, the listener will receive all packets from the listen_ip_address.
- **port_number** is an integer from 1 through 65535.
- **protocol protocol_number** is the IANA protocol number associated with the port number. If this is not provided, the listener will receive all packets from the listen_ip_address and port_number.
- **protocol_number** is an integer from 1 through 255.
- **sessmgr instance** session manager instance that will do the listening. **instance** is an integer from 1 through 270.
Usage
Use this command to create/configure/delete a multicast proxy host configuration.

Example
The following command creates an IGMP multicast host configuration:

```
multicast proxy igmp interface 192.155.1.34 range-start 255.0.0.0 range-end 255.0.0.1
```
Chapter 56
Context Configuration Mode Commands N-R

This section includes the commands `nw-reachability server` through `router` service.

Mode

Exec > Global Configuration > Context Configuration

`configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
nw-reachability server

Adds or deletes a reachability-detect server and configures parameters for retrying the failure-detection process. When network reachability is enabled, an ICMP ping request is sent to this device. If there is no response after a specified number of retries, the network is deemed failed. Execute this command multiple times to configure multiple network reachability servers.

Product
P-GW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

nw-reachability server server_name [ interval seconds ] [ local-addr ip_addr ] [ num-retry num ] [ remote-addr ip_addr ] [ timeout seconds ] [ vfr name ]

no nw-reachability server server_name

no
Delete the reference to the specified network reachability server.

server_name
Specifies the name for the network device that is sent ping packets to test for network reachability.

interval seconds
Specifies the frequency in seconds for sending ping requests as an integer from 1 through 3600. Default: 60

local-addr ip_addr
Specifies the IP address to be used as the source address of the ping packets; If this is unspecified, an arbitrary IP address that is configured in the context is used. ip_addr must be entered using IPv4 dotted-decimal notation.

num-retry num
Specifies the number of retries before deciding that there is a network-failure as an integer from 0 through 100. Default: 5

remote-addr ip_addr
Specifies the IP address of a network element to use as the destination to send the ping packets for detecting network failure or reachability. ip_addr must be entered using IPv4 dotted-decimal notation.
timeout seconds
Specifies how long to wait (in seconds) before retransmitting a ping request to the remote address as an integer from 1 through 1. Default: 3

vrf name
Specifies an existing VRF name as an alphanumeric string of 1 through 63 characters.

Usage
Use this command to set up a network device on a destination network that is used ensure that Mobile IP sessions can reach the required network from the P-GW.

Important: Refer to the P-GW Configuration Mode command policy nw-reachability-fail to configure the action that should be taken when network reachability fails.

Important: Refer to the Subscriber Config Mode command nw-reachability-server to bind the network reachability to a specific subscriber.

Important: Refer to the nw-reachability-server server_name keyword of the ip pool command in this chapter to bind the network reachability server to an IP pool.

Example
To set a network device called Internet Device with the IP address of 192.168.100.10 as the remote address that is pinged to determine network reachability and use the address 192.168.200.10 as the origination address of the ping packets sent, enter the following command:

```
nw-reachability server InternetDevice local-addr 192.168.200.10 remote-addr 192.168.100.10
```
network-requested-pdp-context activate

Configures the mobile station(s) (MSs) for which network initiated PDP contexts are supported.

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

\[context_name]host_name(config-ctx)#

Syntax

network-requested-pdp-context activate address ip_address dst-context context_name imsi

no network-requested-pdp-context activate address ip_address dst-context context_name

Usage

Use this command to specify the MS(s) for which network initiated PDP contexts are supported. When a packet is received for an MS that does not currently have a PDP context established, the system checks the configuration of this parameter to determine if the destination IP address specified in the packet is specified by this parameter. If the address is not specified, then the system discards the packet. If the address is specified, then the system attempts to establish a PDP context for the MS with the specified destination IP address. The system checks the configuration of the PDP context for the MS to determine if the destination IP address is specified by this parameter. If the destination IP address is specified by this parameter, then the system establishes a PDP context for the MS with the specified destination IP address. If the destination IP address is not specified by this parameter, then the system discards the packet.

no

Disables the system’s ability to accept network-requested PDP contexts on the specified interface.

ip_address

Specifies the static IP address of the MS n IPv4 dotted-decimal notation.

dst-context context_name

Specifies the name of the destination context configured on the system containing the static IP address pool in which the MS’s IP address is configured. context_name is an alphanumeric string of 1 through 79 characters that is case sensitive.

imsi imsi

Specifies the International Mobile Subscriber Identity (IMSI) of the MS as a string of 1 through 15 numeric characters.

apn apn_name

Specifies the Access Point Name (APN) that is passed to the SGSN by the system. apn_name is an alphanumeric string of 1 through 63 characters that is case sensitive.
is specified, the system uses the configured IMSI and APN to determine the appropriate SGSN from the Home Location Register (HLR). The system communicates with the HLR through the interworking node configured using the network-requested-pdp-context gsn-map command.

Once the session is established, the destination context specified by this command is used in place of the one either configured within the specified APN template or returned by a RADIUS server during authentication. This command can be issued multiple times supporting network initiated PDP contexts for up to 1,000 configured addresses per system context.

**Example**

The following command enables support for network initiated PDP contexts for an MS with a static IP address of 20.13.5.40 from a pool configured in the destination context pdn1 with an IMSI of 3319784450 that uses an APN template called isp1:

```
network-requested-pdp-context activate address 20.13.5.40 dst-context pdn1 imsi 3319784450 apn isp1
```
network-requested-pdp-context gsn-map

Configures the IP address of the interworking node that is used by the system to communicate with the Home Location Register (HLR), and optionally sets the GTP version to use.

Product
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

network-requested-pdp-context gsn-map ip_address [ gtp-version { 0 | 1 } ]

no network-requested-pdp-context gsn-map

no

Deletes a previously configured gsn-map node.

ip_address

Specifies the IP address of the gsn-map node in Pv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

gtp-version { 0 | 1 }

Specifies the gtp version used. Default: 1

Usage

Communications from the system to the HLR must go through a GSN-map interworking node that performs the protocol conversion from GTPC to SS7. The UDP port for this communication is 2123.
Support for network requested PDP contexts must be configured within source contexts on the system. Only one gsn-map node can be configured per source context.
The source context also contains the GGSN service configuration that specifies the IP address of the Gn interface. If multiple GGSN services are configured in the source context, one is selected at random for initiating the Network Requested PDP Context Activation procedure.
Communication with the gsn-map node is done over the Gn interface configured for the GGSN service. The IP address of that interface is used as the system’s source address.

Example

The following command configures the system to communicate with a gsn-map node having an IP address of 192.168.2.5:
network-requested-pdp-context gsn-map 192.168.2.5
network-requested-pdp-context hold-down-time

Configures the time duration to that the system will wait after the SGSN rejects an attempt for a network-requested PDP context creation for the subscriber.

**Product**

GGSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
network-requested-pdp-context hold-down-time time

default network-requested-pdp-context hold-down-time
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Configures the default setting. Default: 60 seconds</td>
</tr>
<tr>
<td>time</td>
<td>Specifies the time interval (in seconds) as an integer from 0 through 86400.</td>
</tr>
</tbody>
</table>

**Usage**

Packets received during this time period would be discarded, rather than being used to cause another network-requested PDP context creation attempt for the same subscriber. After the time period has expired, any subsequent packets received would cause another network-requested PDP context creation procedure to begin.

**Example**

The following command configures a hold-down-time of 120 seconds:

```
network-requested-pdp-context hold-down-time 120
```
network-requested-pdp-context interval

Configures the minimum amount of time that must elapse between the deletion of a network initiated PDP context and the creation of a new one for the same MS.

Product
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

network-requested-pdp-context interval time

default network-requested-pdp-context interval

default
Returns the command to its default setting of 60.

time
Specifies the minimum amount of time (in seconds) that must pass before the system allows another network-requested PDP context for a specific MS after the previous context was deleted. time is an integer from 0 through 86400. Default: 60

Usage

Once an MS deletes a PDP context that initiated from the network, the system automatically waits the amount of time configured by this parameter before allowing another network initiated PDP context for the same MS.

Example

The following command specifies that the system waits 120 seconds before allowing another network requested PDP context for an MS:

network-requested-pdp-context interval 120
network-requested-pdp-context sgsn-cache-time

Configures the time duration that the GGSN keeps the SGSN/subscriber pair cached in its local memory.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

- `network-requested-pdp-context sgsn-cache-time time`
- `default network-requested-pdp-context sgsn-cache-time`

**Usage**
For an initial network-requested PDP context creation, the system contacts the HLR (via the GSN-MAP interworking node) to learn which SGSN is currently servicing the subscriber. The system keeps that information in cache memory for the configured time, so that future network-requested PDP context creations for that subscriber can be initiated without having to contact the HLR again.

**Example**

The following command configures an sgsn-cache-time of 500 seconds:

```
network-requested-pdp-context sgsn-cache-time 500
```
**operator**

Configures a context-level operator account within the current context.

**Product**
All

**Privilege**
Security Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
command > context command
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
operator user_name [ encrypted ] [ nopassword ] password password [ ecs ] [ expiry-date date_time ] [ li-administration ] [ noecs ] [ timeout-absolute abs_seconds ] [ timeout-min-absolute abs_minutes ] [ timeout-idle timeout_duration ] [ timeout-min-idle idle_minutes ]
```

```
no operator user_name
```

Removes a previously configured context-level operator account.

```
user_name
```

Specifies a name for the account as an alphanumeric string of 1 through 32 characters.

```
[ encrypted ] password password
```

Specifies the password to use for the user which is being given context-level operator privileges within the current context. The `encrypted` keyword indicates the password specified uses encryption. `password` is an alphanumeric string of 1 through 63 characters without encryption, or 1 through 127 with encryption.

The `encrypted` keyword is intended only for use by the system while saving configuration scripts. The system displays the `encrypted` keyword in the configuration file as a flag that the variable following the `password` keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

```
[ nopassword ]
```

This option allows you to create an operator without an associated password. Enable this option when using ssh public keys (`authorized key` command in SSH Configuration mode) as a sole means of authentication. When enabled this option prevents someone from using an operator password to gain access to the user account.

```
ecs
```

Permits the specific user to access ACS-specific configuration commands from Exec Mode only. Default: ACS-specific configuration commands are not allowed.
**expiry-date** date_time

Specifies the date and time that this account expires. Enter the date and time in the format YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss.
Where YYYY is the year, MM is the month, DD is the day of the month, HH is the hour, mm is minutes, and ss is seconds.

**li-administration**

Refer to the *Lawful Intercept Configuration Guide* for a description of this parameter.

**noecs**

Prevents the user from accessing ACS-specific configuration commands. Default: Enabled

**timeout-absolute** abs_seconds

This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.
Specifies the maximum amount of time (in seconds) the context-level operator may have a session active before the session is forcibly terminated. *abs_seconds* must be a value in the range from 0 through 300000000. The value 0 disables the absolute timeout. Default: 0

**timeout-min-absolute** abs_minutes

Specifies the maximum amount of time (in minutes) the context-level operator may have a session active before the session is forcibly terminated. *abs_minutes* must be an integer from 0 through 300000000. The value 0 disables the absolute timeout. Default: 0

**timeout-idle** timeout_duration

This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.
Specifies the maximum amount of idle time (in seconds) the context-level operator may have a session active before the session is terminated. *timeout_duration* must be an integer from 0 through 300000000. The value 0 disables the idle timeout. Default: 0

**timeout-min-idle** idle_minutes

Specifies the maximum amount of idle time (in minutes) the context-level operator may have a session active before the session is terminated. *idle_minutes* must be an integer from 0 through 300000000. The value 0 disables the idle timeout. Default: 0

---

**Usage**

Use this command to create new context-level operator or modify existing operator’s options, in particular, the timeout values.
Operators have read-only privileges. They can maneuver across multiple contexts, but cannot perform configuration operations. Refer to the *Command Line Interface Overview* chapter for more information.

**Important:** A maximum of 128 administrative users and/or subscribers may be locally configured per context.

---

**Example**
The following command creates a context-level operator account named `user1` with ACS control:

```
operator user1 password secretPassword ecs
```

The following command removes a previously configured context-level operator account named `user1`:

```
no operator user1
```
optimize pdsn inter-service-handoff

Controls the optimization of the system’s handling of inter-PDSN handoffs.

Product

PDSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ default | no ] optimize pdsn inter-service-handoff

default

Resets the command to its default setting of enabled.

no

Disables the feature.

Usage

When more than one PDSN service is defined in a context, each PDSN-Service acts as an independent PDSN. When a Mobile Node (MN) moves from one PDSN service to another PDSN service, by rule, it is an inter-PDSN handoff. This command optimizes PDSN handoffs between PDSN Services that are defined in the same context in the system.

The default for this parameter is enabled. The no keyword disables this functionality.

When enabled, the system treats handoffs happening between two PDSN services in the same context as an inter-PDSN handoff. Existing PPP session states and connection information is reused. If the inter-PDSN handoff requires a PPP restart, then PPP is restarted. The optimized inter-service-handoff may not restart the PPP during handoffs allowing the MN to keep the same IP address for the Simple IP session.

Example

optimize pdsn inter-service-handoff
pcc-af-service

Creates or removes an IPCF Policy and Charging Control (PCC) Application Function (AF) service or configures an existing PCC-AF service. It enters the PCC-AF Service Configuration Mode to link, configure, and manage the Application Function endpoints and associated PCC services over the Rx interface for the IPCF services.

Product
IPCF

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

pcc-af-service service_name [ -noconfirm ]

no pcc-af-service service_name

no
Removes the specified PCC-AF service from the context.

service_name
Specifies the name of the PCC-AF service. If service_name does not refer to an existing service, the new service is created if resources allow. service_name is an alphanumeric string of 1 through 63 characters.

Important: Service names must be unique across all contexts within a chassis.

-noconfirm
Executes the command without any additional prompt and confirmation from the user.

Usage
Use this command to enter the PCC-AF Service Configuration Mode for an existing service or for a newly defined PCC-AF service. This command is also used to remove an existing service. The PCC-AF-Service consolidates the provisioning and management required for the PCC-AF services being supported by the network that fall under the PCC regime. The application service handles the Rx interface over which the IPCF may receive media information for the application usage from AF.

Important: In the absence of an Rx interface, the media information is available in the PCC-AF Service statically.
A maximum of 256 services (regardless of type) can be configured per system.

⚠️ **Caution:** Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-imsapp-service)#
```

The commands available in this mode are defined in the *PCC-AF Service Configuration Mode Commands* chapter.

⚠️ **Caution:** This is a critical configuration. The PCC-AF service cannot be configured without this configuration. Any change to this configuration would lead to restarting the PCC-AF service and removing or disabling this configuration will stop the PCC-AF service.

**Example**

The following command enters the existing PCC-AF Service Configuration Mode (or creates it if it does not already exist) for the service named `af-service1`:

```
pcc-af-service af-service1
```

The following command will remove `af-service1` from the system:

```
no pcc-af-service af-service1
```
**pcc-policy-service**

Creates or removes an IPCF PCC-Policy service or configures an existing PCC-Policy service. It enters the PCC-Policy Service Configuration Mode to link, configure, and manage the Gx interface endpoints for policy authorization where IPCF acts as a policy server.

**Product**

IPCF

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
pcc-policy-service service_name [ -noconfirm ]
```

```
no pcc-policy-service service_name
```

- **no**
  - Removes the specified PCC-Policy service from the context.

- **service_name**
  - Specifies the name of the PCC-Policy service. If `service_name` does not refer to an existing service, the new service is created if resources allow. `service_name` is an alphanumeric string of 1 through 63 characters.

**Important:** Service names must be unique across all contexts within a chassis.

- **-noconfirm**
  - Executes the command without any additional prompt and confirmation from the user.

**Usage**

Use this command to enter the PCC-Policy Service Configuration Mode for an existing service or for a newly defined PCC-Policy service. This command is also used to remove an existing service. The PCC-Policy-Service is mainly used to provide a mechanism to manage the external Gx or similar interfaces required for policy authorization purpose. It manages Gx and Gx-like interfaces such as Gxc/Gxa between IPCF/PCRF and PCEF or BBERF, which is based on the dictionary used for PCC. Multiple instances of PCC-Policy-Service may exist in a system which could link with the same PCC-Service that controls the business logic. This service allows for management of configuration for peers as well self related to Gx like functions.

A maximum of 256 services (regardless of type) can be configured per system.
**Caution:** Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-pccpolicy-service)#
```

The commands available in this mode are defined in the *PCC-Policy Service Configuration Mode Commands* chapter.

**Caution:** This is a critical configuration. The PCC-Policy service cannot be configured without this configuration. Any change to this configuration would lead to restarting the PCC-Policy service and removing or disabling this configuration will stop the PCC-Policy service.

**Example**

The following command enters the existing PCC-Policy Service Configuration Mode (or creates it if it does not already exist) for the service named `gx-service1`:

```
pcc-policy-service gx-service1
```

The following command will remove `gx-service1` from the system:

```
no pcc-policy-service gx-service1
```
pcc-service

Creates or removes an IPCF Policy and Charging Control (PCC) service or configures an existing PCC service. It enters the PCC Service Configuration Mode for IPCF related configurations in the current context.

Product
IPCF

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

pcc-service service_name [ -noconfirm ]

no pcc-service service_name

---

no

Removes the specified PCC service from the context.

service_name

Specifies the name of the PCC service. If service_name does not refer to an existing service, the new service is created if resources allow. service_name is an alphanumeric string of 1 through 63 characters.

---

Important: Service names must be unique across all contexts within a chassis.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

Usage

Use this command to enter the PCC Service Configuration Mode for an existing service or for a newly defined PCC service. This command is also used to remove an existing service.
The IPCF PCC Service Configuration Mode is used to link, consolidate and manage the policy logic for the networks. The authorization of resources for a subscriber’s data usage under various conditions and policies are defined in the IPCF PCC service.
Only one PCC service can be configured on a system which is further limited to a maximum of 256 services (regardless of type) configured per system.

---

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a
large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-pcc-service)#
```

The commands available in this mode are defined in the *PCC Service Configuration Mode Commands* chapter.

⚠️ **Caution:** This is a critical configuration. The PCC service cannot be configured without this configuration. Any change to this configuration would lead to restarting the Policy and Charging Control service and removing or disabling this configuration will stop the PCC service.

**Example**

The following command enters the existing PCC Service Configuration Mode (or creates it if it does not already exist) for the service named `ipcf-service1`:

```
pcc-service ipcf-service1
```

The following command will remove `ipcf-service1` from the system:

```
no pcc-service ipcf-service1
```
**pcc-sp-endpoint**

Creates or removes a PCC Sp interface endpoint or configures an existing PCC Sp interface client endpoint. It enters the PCC Sp Endpoint Configuration Mode to link, configure, and manage the operational parameters related to its peer.

**Product**
IPCF

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
pcc-sp-endpoint sp_intfcl [ -noconfirm ]

no pcc-sp-endpoint name sp_intfcl
```

**Usage**

Use this command to enter the PCC-Sp-Endpoint Configuration Mode for an existing interface or for a newly defined PCC Sp interface endpoint. This command is also used to remove an existing endpoint. An instance of PCC Sp endpoint represents a client end for SSC/SPR interactions. It is possible to support multiple Sp endpoints each supporting the same or different protocol(s). The PCC Sp endpoint facilitates the configuration of the treatment required of the Sp interface as well as manages the connection and operational parameters related to its peer. Only one PCC Sp endpoint across a chassis can be configured on a system. Entering this command results in the following prompt:

```
[context_name]host_name(config-spendpoint)#
```

The commands available in this mode are defined in the *PCC-Sp-Endpoint Configuration Mode Commands* chapter.
**Caution:** This is a critical configuration. The PCC Sp endpoint cannot be configured without this configuration. Any change to this configuration would lead to reset the PCC Sp interface and removing or disabling this configuration also disables the PCC Sp interface.

**Example**

The following command enters the existing PCC Sp Endpoint Configuration Mode (or creates it if it does not already exist) for the endpoint named `sp_intfcl`:

```bash
pcc-sp-endpoint sp_intfcl
```

The following command will remove `sp_intfcl` from the system:

```bash
pcc-sp-endpoint name sp_intfcl
```
pdg-service

Creates a new PDG service or specifies an existing PDG service and enters the PDG Service Configuration Mode. A maximum of 16 PDG services can be created. This limit applies per ASR 5000 chassis and per context.

Product
PDG/TTG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] pdg-service name

no name

Deletes the specified PDG service.

name

Specifies the name of a new or existing PDG service as an alphanumeric string 1 through 63 characters that must be unique across all FNG services within the same context and across all contexts.

Important: Service names must be unique across all contexts within a chassis.

Usage

Use this command in Context Configuration Mode to create a new PDG service or modify an existing one. Executing this command enters the PDG Service Configuration Mode.

Example

The following command configures an PDG service named pdg_service_1 and enters the PDG Service Configuration Mode:

    pdg-service pdg_service_1
pdif-service

Creates a new, or specifies an existing, Packet Data Interworking Function (PDIF) service and enters the PDIF Service Configuration Mode.

**Product**
PDIF

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] pdif-service name [ -noconfirm ]
```

- **name**
  Specifies the name of a new or existing PDIF service as an alphanumeric string of 1 through 63 characters.

**Important:** Service names must be unique across all contexts within a chassis.

**Usage**

Use this command to create a new or enter an existing PDIF service.

Entering this command results in the following prompt:

```
[context_name]host_name(config-pdif-service)#
```

PDIF Service Configuration Mode commands are defined in the *PDIF Service Configuration Mode Commands* chapter.

**Example**

The following command configures a PDIF service called `pdif2` and enters the PDIF Service Configuration Mode:

```
pdif-service pdif2
```
pdsn-service

Creates or deletes a packet data service or specifies an existing PDSN service for which to enter the Packet Data Service Configuration Mode for the current context.

Product
PDSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] pdsn-service name

- **no**
  Indicates the packet data service specified is to be removed.

- **name**
  Specifies the name of the PDSN service to configure. If *name* does not refer to an existing service, the new service is created if resources allow. *name* is an alphanumeric string of 1 through 63 characters.

**Important:** Service names must be unique across all contexts within a chassis.

Usage

Enter the PDSN Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

**Caution:** Large numbers of services greatly increase the complexity of management and may impact overall system performance (resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your Cisco service representative for more information.

Example

The following command will enter the PDSN Service Configuration Mode creating the service *sampleService*, if necessary.

```
pdsn-service sampleService
```

The following command will remove *sampleService* as being a defined PDSN service.
no pdsn-service sampleService
pgw-service

Creates a PDN-Gateway (P-GW) service or specifies an existing P-GW service and enters the P-GW Service Configuration Mode for the current context.

Product

P-GW
SAEGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

/context_name]host_name(config-ctx)#

Syntax

pgw-service service_name [ -noconfirm ]

no pgw-service service_name

  service_name

  Specifies the name of the P-GW service. If service_name does not refer to an existing service, the new service is created if resources allow. service_name is an alphanumeric string of 1 through 63 characters.

Important: Service names must be unique across all contexts within a chassis.

  -noconfirm

  Executes the command without any additional prompt and confirmation from the user.

  no pgw-service service_name

  Removes the specified P-GW service from the context.

Usage

Enter the P-GW Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.
Entering this command results in the following prompt:

```
[context_name] hostname(config-pgw-service)#
```

P-GW Service Configuration Mode commands are defined in the *P-GW Service Configuration Mode Commands* chapter.

Use this command when configuring the following eHRPD and SAE components: P-GW.

**Example**

The following command enters the existing P-GW Service Configuration Mode (or creates it if it does not already exist) for the service named `pgw-service1`:

```
pgw-service pgw-service1
```

The following command will remove `pgw-service1` from the system:

```
no pgw-service pgw-service1
```
pilot-packet

Configures Pilot Packets containing key pieces of information about a subscriber session to third party network elements.

Product
HA
NAT
PDSN
P-GW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

```
pilot-packet { attribute { foreign-agent-ip-address | nai | rat-type | serving-nw-id } | name server_name source-ip-address source_ip_address destination-ip-address destination_ip_address destination-udp-port udp_port_value [ dscp-marking dscp_value ]

no pilot-packet name server_name
```

**no**
Disables the Pilot packet option.

**name server_name**
Specifies Pilot packet server name.

**source-ip-address source_ip_address**
Specifies the IP addresses for the sourcing and terminating Pilot Packets. The IP address must be entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

- **source_ip_address**: Specifies the IP address of the source for sending Pilot Packets.
- **destination_ip_address**: Specifies the IP address of the destination for the Pilot Packets.

**destination-udp-port udp_port_value**
Specifies the UDP port value as an integer from 1 through 65535.

**dscp-marking dscp_value**
Enables DSCP marking. DSCP is used for control plane packets. 
*dscp_value* must be a hexadecimal number between 0x0 and 0x3F.
Important: For Pilot Packet, the generated UDP packet is currently expected to use DSCP 0x20 (32).

Usage
Use this command to configure Pilot Packet parameters.
Repeat this command to send Pilot Packets to up to four destinations.

Example
The following command configures pilot packets with source and destination IPv4/IPv6 addresses along with the destination port:

```
pilot-packet source-ip-address 10.2.3.4 destination-ip-address 10.3.4.5
destination-udp-port 221
```
policy

Enters an existing accounting policy or creates a new one where accounting parameters are configured.

**Product**
HSGW
P-GW
S-GW
SAEGW

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] policy accounting name
```

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Removes the specified accounting policy from the context.</td>
</tr>
<tr>
<td>name</td>
<td>Specifies the name of the existing or new accounting policy as an alphanumeric string of 1 through 63 characters.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to enter the Accounting Policy Configuration mode to edit an existing accounting policy or configure a new policy. Entering this command results in the following prompt:

```
[context_name]hostename(config-accounting-policy)#
```

Accounting Policy Configuration Mode commands are defined in the *Accounting Policy Configuration Mode Commands* chapter.

**Example**

The following command enters the Accounting Policy Configuration Mode for a policy named `acct5`:

```
policy accounting acct5
```
policy-group

Creates or deletes a policy group. It enters the Policy-Group Configuration Mode within the current destination context for flow-based traffic policing to a subscriber session flow.

**Product**
- PDSN
- HA
- ASN-GW
- HSGW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] policy-group name policy_group
```

- **no**
  Deletes configured policy group within the context.

- **name policy_group**
  Specifies the name of Policy-Group as an alphanumeric string of 1 through 15 characters that is case sensitive.

**Usage**

Use this command to form a policy group from a set of configured Policy-Maps. A policy group supports up to 16 policies for a subscriber session flow.

**Example**

The following command configures a policy group `policy_group1` for a subscriber session flow:

```
policy-group name policy_group1
```
policy-map

Creates or deletes a policy map. It enters the Traffic Policy-Map Configuration Mode within the current destination context to configure the flow-based traffic policing for a subscriber session flow.

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] policy-map name policy_name

no
Deletes configured Policy-Map within the context.

name policy_name
Specifies the name of Policy-Map as an alphanumeric string of 1 through 15 characters that is case sensitive.

Usage
Use this command to enter Traffic Policy-Map Configuration Mode and to set the Class-Map and corresponding traffic flow treatment to traffic policy for a subscriber session flow.

Example
Following command configures a policy map policy1 where other flow treatments is configured.

    policy-map name policy1
Context Configuration Mode Commands

**ppp**

Configures point-to-point protocol parameters for the current context.

**Product**
- PDSN
- GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-ctx) #
```

**Syntax**

```
ppp { acfc { receive { allow | deny } | transmit { apply | ignore | reject } } | auth-retry suppress-aaa-auth | chap fixed-challenge-length length | dormant send-lcp-terminate | echo-max-retransmissions num_retries | echo-retransmit-timeout msec | first-lcp-retransmit-timeout milliseconds | lcp-authentication-discard retry-alternate num_discard | lcp-authentication-reject retry-alternate | lcp-start-delay delay | lcp-terminate connect-state | lcp-terminate mip-lifetime-expiry | lcp-terminate mip-revocation | max-authentication-attempts num | max-configuration-nak num | max-retransmissions number | max-terminate number | mru packet_size | negotiate default-value-options | peer-authentication user_name [ encrypted ] password password | pfc { receive { allow | deny } | transmit { apply | ignore | reject } } | reject-peer-authentication | renegotiation retain-ip-address | retransmit-timeout milliseconds }
```

```
no ppp { auth-retry suppress-aaa-auth | chap fixed-challenge-length | dormant send-lcp-terminate | lcp-authentication-discard retry-alternate num_discard | lcp-authentication-reject retry-alternate | lcp-start-delay | lcp-terminate connect-state | reject-peer-authentication | renegotiation retain-ip-address }
```

```
default lcp-authentication-discard retry-alternate num_discard
```

```
default
```

Restores the system defaults for the specific command/keyword.

```
no
```

Disables, deletes, or resets the specified option.

For **no ppp renegotiation retain-ip-address** the initially allocated IP address will be released and a new IP address will be allocated during PPP renegotiation.

```
acfc { receive { allow | deny } | transmit { apply | ignore | reject } }
```

Configures PPP Address and Control Field Compression (ACFC) parameters.

```
receive { allow | deny }
```

---

Command Line Interface Reference, StarOS Release 17
This keyword specifies whether to allow Address and Control Field Compressed PPP packets received from the Peer. During LCP negotiation, the local PPP side indicates whether it can handle ACFC compressed PPP packets. Default: allow
When allow is specified, the local PPP side indicates that it can process ACFC compressed PPP packets and compressed packets are allowed. When deny is specified, the local PPP side indicates that it cannot handle ACFC compressed packets and compressed packets are not allowed.

**transmit { apply | ignore | reject }**
Specifies how Address and Control Field Compression should be applied for PPP packets transmitted to the Peer. During LCP negotiation, the Peer indicates whether it can handle ACFC compressed PPP packets. Default: ignore
When apply is specified, if the peer requests ACFC, the request is accepted and ACFC is applied for transmitted PPP packets. When ignore is specified, if the peer requests ACFC, the request is accepted, but ACFC is not applied for transmitted PPP packets. When reject is specified, if the peer requests ACFC, the request is rejected and ACFC is not applied to transmitted packets.

```
auth-retry suppress-aaa-auth
```
This option does not allow PPP authentication retries to the AAA server after the AAA server has already authenticated a session. PPP locally stores the username and password, or challenge response, after a successful PPP authentication. If the Mobile Node retries the PAP request or CHAP-Response packet to the PDSN, PPP locally compares the incoming username, password or Challenge Response with the information stored from the previous successful authentication. If it matches, PAP ACK or CHAP Success is sent back to the Mobile Node, without performing AAA authentication. If the incoming information does not match with what is stored locally, then AAA authentication is attempted. The locally stored PPP authentication information is cleared once the session reaches a connected state. Default: no auth-retry suppress-aaa-auth

```
chap fixed-challenge-length length
```
Normally PPP CHAP use sa random challenge length from 17 to 32 bytes. This command allows you to configure a specific fixed challenge length of from 4 through 32 bytes. length must be an integer from 4 through 32. Default: Disabled. PAPCHAP uses a random challenge length.

```
dormant send-lcp-terminate
```
Indicates a link control protocol (LCP) terminate message is enabled for dormant sessions.

```
echo-max-retransmissions num_retries
```
Configures the maximum number of retransmissions of LCP ECHO_REQ before a session is terminated in an always-on session. num_retries must be an integer from 1 through 16. Default: 3

```
echo-retransmit-timeout msec
```
Configures the timeout (in milliseconds) before trying LCP ECHO_REQ for an always-on session. msec must be an integer from 100 through 5000. Default: 3000
**first-lcp-retransmit-timeout milliseconds**

Specifies the number of milliseconds to wait before attempting to retransmit control packets. This value configures the first retry. All subsequent retries are controlled by the value configured for the `ppp retransmit-timeout` keyword. 

`milliseconds` must be an integer from 100 through 5000. Default: 3000

**lcp-authentication-discard retry-alternate num_discard**

Sets the number of discards up to which authentication option is discarded during LCP negotiation and retries starts to allow alternate authentication option. `num_discard` must be an integer from 0 through 5. Recommended value is 2. Default: Disabled.

**lcp-authentication-reject retry-alternate**

Specifies the action to be taken if the authentication option is rejected during LCP negotiation and retries the allowed alternate authentication option. 

Default: Disabled. No alternate authentication option will be retried.

**lcp-start-delay delay**

Specifies the delay (in milliseconds) before link control protocol (LCP) is started. `delay` must be an integer from 0 through 5000. Default: 0

**lcp-terminate connect-state**

Enables sending an LCP terminate message to the Mobile Node when a PPP session is disconnected if the PPP session was already in a connected state. 

Note that if the no keyword is used with this option, the PDSN must still send LCP Terminate in the event of an LCP/PCP negotiation failure or PPP authentication failure, which happens during connecting state. 

**Important**: This option is not supported in conjunction with the GGSN product.

**lcp-terminate mip-lifetime-expiry**

Configures the PDSN to send an LCP Terminate Request when a MIP Session is terminated due to MIP Lifetime expiry (default). 

Note that if the no keyword is used with this option, the PDSN does not send a LCP Terminate Request when a MIP session is terminated due to MIP Lifetime expiry.

**lcp-terminate mip-revocation**

Configures the PDSN to send a LCP Terminate Request when a MIP Session is terminated due to a Revocation being received from the HA (default). 

Note that if the no keyword is used with this option, the PDSN does not send a LCP Terminate Request when a MIP session is terminated due to a Revocation being received from the HA.

**max-authentication-attempts num**

Configures the maximum number of time the PPP authentication attempt is allowed. `num` must be an integer from 1 through 10. Default: 1
max-configuration-nak num
This command configures the maximum number of consecutive configuration REJ/NAKs that can be sent during CP negotiations, before the CP is terminated. num must be an integer from 1 through 20. Default: 10

max-retransmission number
Specifies the maximum number of times control packets will be retransmitted. number must be an integer from 1 through 16. Default: 5

max-terminate number
Sets the maximum number of PPP LCP Terminate Requests transmitted to the Mobile Node. number must be an integer from 0 through 16. Default: 2

Important: This option is not supported in conjunction with the GGSN product.

mru packet_size
Specifies the maximum packet size that can be received in bytes. packet_size must be an integer from 128 through 1500. Default: 1500

negotiate default-value-options
Enables the inclusion of configuration options with default values in PPP configuration requests. Default: Disabled
The PPP standard states that configuration options with default values should not be included in Configuration Request (LCP, IPCP, etc.) packets. If the option is missing in the Configuration Request, the peer PPP assumes the default value for that configuration option.
When negotiate default-value-options is enabled, configuration options with default values are included in the PPP configuration Requests.

peer-authenticate user_name [ [ encrypted ] password password ]
Specifies the username and an optional password required for point-to-point protocol peer connection authentications. user_name is an alphanumeric string of 1 through 63 characters. The keyword password is optional and if specified password is an alphanumeric string of 1 through 63 characters. The password specified must be in an encrypted format if the optional keyword encrypted was specified.
The encrypted keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the password keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

pfc { receive { allow | deny } | transmit { apply | ignore | reject} }
Configures Protocol Field Compression (PFC) parameters.
receive { allow | deny } Default: allow
This keyword specifies whether to allow Protocol Field Compression (PFC) for PPP packets received from the peer. During LCP negotiation, the local PPP side indicates whether it can handle Protocol Field Compressed PPP packets.
When allow is specified, the peer is allowed to request PFC during LCP negotiation. When deny is specified, the Peer is not allowed to request PFC during LCP negotiation.
transmit { apply | ignore | reject } Default: ignore
This keyword specifies how Protocol field Compression should be applied for PPP packets transmitted to the Peer. During LCP negotiation, the Peer indicates whether it can handle PFC compressed PPP packets. When `apply` is specified, if the peer requests PFC, it is accepted and PFC is applied for transmitted PPP packets. When `ignore` is specified, if the peer requests PFC, it is accepted but PFC is not applied for transmitted packets. When `reject` is specified, all requests for PCF from the peer are rejected.

**reject-peer-authentication**

If disabled, re-enables the system to reject peer requests for authentication. Default: Enabled

**renegotiation retain-ip-address**

If enabled, retain the currently allocated IP address for the session during PPP renegotiation (SimpleIP) between FA and Mobile node. Default: Enabled

If disabled, the initially allocated IP address will be released and a new IP address will be allocated during PPP renegotiation.

**retransmit-timeout milliseconds**

Specifies the number of milliseconds to wait before attempting to retransmit control packets. `milliseconds` must be an integer from 100 through 5000. Default: 3000

**Usage**

Modify the context PPP options to ensure authentication and communication for PPP sessions have fewer dropped sessions.

**Example**

The following commands set various PPP options:

```plaintext
ppp dormant send-lcp-terminate
ppp max-retransmission 3
ppp peer-authenticate user1 password secretPwd
ppp peer-authenticate user1
ppp retransmit-timeout 1000
```

The following command disables the sending of LCP terminate messages for dormant sessions.

```plaintext
no ppp dormant send-lcp-terminate
```
**ppp magic-number**

Manages magic number checking during LCP Echo message handling. The magic number is a random number chosen to distinguish a peer and detect looped back lines.

**Product**

PDSN  
GGSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration  
`configure > context` context_name

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-ctx)#`

**Syntax**

```
[ no | default ] ppp magic-number receive ignore
```

- **no**  
  Disables the specified behavior.

- **default**  
  Restores the system defaults for the specific command/keyword.

- **receive ignore**  
  Ignores the checking of magic number at the PDSN during LCP Echo message handling. Default: Disabled. If a valid magic numbers were negotiated for the PPP endpoints during LCP negotiation and LCP Echo Request/Response have invalid magic numbers, enabling this command will cause the system to ignore the checking of magic number during LCP Echo message handling.

**Usage**

Use this command to allow the system to ignore invalid magic number during LCP Echo Request/Response handling.

**Example**

The following command allows the invalid magic number during LCP Echo Request/Response negotiation:

```
ppp magic-number receive ignore
```
ppp statistics

Changes the manner in which some PPP statistics are calculated.

Product
PDSN
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] ppp statistics success-sessions { lcp-max-retry | misc-reasons | remote-terminated }

no
Disable the specified behavior.

ppp statistics success-sessions lcp-max-retry
Alters statistical calculations so that: ppp successful session = successful sessions + lcp-max-retry.

success-sessions misc-reasons
Alters statistical calculations so that: ppp successful session = successful sessions + misc-reasons.

success-sessions remote-terminated
Alters statistical calculations so that: ppp successful session = successful sessions + remote-terminated.

Usage
Use this command to alter how certain PPP statistics are calculated.

⚠️ Caution: This command alters the way that some PPP statistics are calculated. Please consult your designated service representative before using this command.

Example
The following command alters the statistic “ppp successful session” so that it displays the sum of successful sessions and lcp-max-retry:

ppp statistics success-sessions lcp-max-retry

The following command disables the alteration of the statistic ppp successful session:
no ppp statistics success-sessions lcp-max-retry
proxy-dns intercept-list

Enters the HA Proxy DNS Configuration Mode and defines a name of a redirect rules list for the domain name servers associated with a particular FA (Foreign Agent) or group of FAs.

**Important:** HA Proxy DNS Intercept is a license-enabled feature.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
_configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] proxy-dns intercept-list name
```

- **no**
  
  Removes the intercept list from the system.

- **name**
  
  Defines the rules list and enters the Proxy DNS Configuration Mode. *name* must be an alphanumeric string of 1 through 63 characters.

**Usage**

Use this command to define a name for a list of rules pertaining to the IP addresses associated with the foreign network’s DNS. Up to 128 rules of any type can be configured per rules list.

Upon entering the command, the system switches to the HA Proxy DNS Configuration Mode where the lists can be defines. Up to 64 separate rules lists can be configured in a single AAA context.

This command and the commands in the HA Proxy DNS Configuration Mode provide a solution to the Mobile IP problem that occurs when a MIP subscriber, with a legacy MN or MN that does not support IS-835D, receives a DNS server address from a foreign network that is unreachable from the home network. The following flow shows the steps that occur when this feature is enabled:
By configuring the Proxy DNS feature on the Home Agent, the foreign DNS address is intercepted and replaced with a home DNS address while the call is being handled by the home network.

**Example**

The following command creates a proxy DNS rules list named *list1* and places the CLI in the HA Proxy DNS Configuration Mode:

```
proxy-dns intercept-list list1
```
radius accounting

This command configures RADIUS accounting parameters for the current context.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

radius accounting { archive [ stop-only ] | deadtime dead_minutes | detect-dead-server { consecutive-failures consecutive_failures | keepalive | response-timeout timeout_duration } | interim interval seconds | max-outstanding max_messages | max-pdu-size octets | max-retries max_retries | max-transmissions max_transmissions | timeout timeout_duration | unestablished-sessions }

default radius accounting { deadtime | detect-dead-server | interim interval seconds | max-outstanding | max-pdu-size | max-retries | max-transmissions | timeout }

no radius accounting { archive | detect-dead-server | interim interval | max-transmissions | unestablished-sessions }

default

Configures the default settings.

no

Removes earlier configuration for the specified keyword.

archive [ stop-only ]

Enables archiving of RADIUS Accounting messages in the system after the accounting message has exhausted retries to all available RADIUS Accounting servers. All RADIUS Accounting messages generated by a session are delivered to the RADIUS Accounting server in serial. That is, previous RADIUS Accounting messages from the same call must be delivered and acknowledged by the RADIUS Accounting server before the next RADIUS Accounting message is sent to the RADIUS Accounting server.

stop-only specifies archiving of STOP accounting messages only.

Default: Enabled

deadtime dead_minutes

Specifies the number of minutes to wait before attempting to communicate with a server which has been marked as unreachable.

dead_minutes must be an integer from 0 through 65535.
Command Line Interface Reference, StarOS Release 17

Default: 10

detect-dead-server { consecutive-failures consecutive_failures | keepalive | response-timeout timeout_duration }

• **consecutive-failures** consecutive_failures: Specifies the number of consecutive failures, for each AAA manager, before a server is marked as unreachable. default: 4
• **keepalive**: Enables the AAA server alive-dead detect mechanism based on sending keep alive authentication messages to all authentication servers. Default: Disabled
• **response-timeout** timeout_duration: Specifies the number of seconds for each AAA manager to wait for a response to any message before a server is detected as failed, or in a down state. timeout_duration must be an integer from 1 through 65535.

**Important**: If both consecutive-failures and response-timeout are configured, then both parameters have to be met before a server is considered unreachable, or dead.

interim interval seconds

Specifies the time interval (in seconds) for sending accounting INTERIM-UPDATE records. seconds must be an integer from 50 through 4000000.

**Important**: If RADIUS is used as the accounting protocol for the GGSN product, other commands are used to trigger periodic accounting updates. However, these commands would cause RADIUS STOP/START packets to be sent as opposed to INTERIM-UPDATE packets. Also note that accounting interim interval settings received from a RADIUS server take precedence over those configured on the system.

Default: Disabled

max-outstanding max_messages

Specifies the maximum number of outstanding messages a single AAA manager instance will queue. max_messages must be an integer from 1 through 4000. Default: 256

max-pdu-size octets

Specifies the maximum sized packet data unit which can be accepted/generated in bytes (octets), octets must be an integer from 512 through 4096. Default: 4096

max-retries max_retries

Specifies the maximum number of times communication with a AAA server will be attempted before it is marked as unreachable and the detect dead servers consecutive failures count is incremented. max_retries must be an integer from 0 through 65535. Default: 5

Once the maximum number of retries is reached this is considered a single failure for the consecutive failures count for detecting dead servers.
max-transmissions max_transmissions
Sets the maximum number of transmissions for a RADIUS accounting message before the message is declared as failed. max_transmissions must be an integer from 1 through 65535. Default: Disabled

timeout seconds
Specifies the amount of time to wait for a response from a RADIUS server before retransmitting a request. seconds must be an integer from 1 through 65535. Default: 3

unestablished-sessions
Indicates RADIUS STOP events are to be generated for sessions that were initiated but never fully established.

Usage
Manage the RADIUS accounting options according to the RADIUS server used for the context.

Example
The following commands configure accounting options.

    radius accounting detect-dead-server consecutive-failures 5
    radius accounting max-pdu-size 1024
    radius accounting timeout 16
radius accounting algorithm

This command specifies the fail-over/load-balancing algorithm to select the RADIUS accounting server(s) to which accounting data must be sent.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

radius accounting algorithm { first-n n | first-server | round-robin }

default radius accounting algorithm

default

Configures the default setting.
Default: first-server

first-n n

Specifies that the AGW must send accounting data to n (more than one) AAA accounting servers based on their priority. The full set of accounting data is sent to each of the n AAA servers. Response from any one of the servers would suffice to proceed with the call. On receiving an ACK from any one of the accounting servers, all retries are stopped.

n is the number of AAA accounting servers to which accounting data will be sent, and must be an integer from 2 through 128. Default: 1 (Disabled)

first-server

Specifies that the context must send accounting data to the RADIUS accounting server with the highest configured priority. In the event that this server becomes unreachable, accounting data is sent to the accounting server with the next-highest configured priority. This is the default algorithm.

round-robin

Specifies that the context must load balance sending accounting data among all of the defined RADIUS accounting servers. Accounting data is sent in a circular queue fashion on a per Session Manager task basis, where data is sent to the next available accounting server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.
**Usage**

Use this command to specify the algorithm to select the RADIUS accounting server(s) to which accounting data must be sent.

**Example**

The following command specifies to use the round-robin algorithm to select the RADIUS accounting server:

```
radius accounting algorithm round-robin
```
radius accounting apn-to-be-included

This command configures the Access Point Name (APN) to be included for RADIUS accounting.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
radius accounting apn-to-be-included { gi | gn }

default radius accounting apn-to-be-included
```

---

**default**

Configures the default setting.

---

**gi**

Specifies the usage of the Gi APN name in the RADIUS accounting request. The Gi APN represents the APN received in the Create PDP context request message from the SGSN.

---

**gn**

Specifies the usage of the Gn APN name in the RADIUS accounting request. The Gn APN represents the APN selected by the GGSN.

---

**Usage**

Use this command to configure the APN name for RADIUS Accounting. This can be set to either gi or gn.

**Example**

The following command specifies the usage of Gn APN name in the RADIUS accounting request:

```
radius accounting apn-to-be-included gn
```
radius accounting billing-version

This command configures the billing-system version of RADIUS accounting servers.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name] host_name(config-ctx)#

Syntax

radius accounting billing-version version

default radius accounting billing-version

default

Configures the default setting. Default: 0

version

Specifies the billing-system version of RADIUS accounting servers as an integer from 0 through 4294967295. Default: 0

Usage

Use this command to configure the billing-system version of RADIUS accounting servers.

Example

The following command configures the billing-system version of RADIUS accounting servers as 10:

radius accounting billing-version 10
radius accounting gtp trigger-policy

This command configures the RADIUS accounting trigger policy for GTP messages.

Product
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

\[\text{[context_name]}\text{host_name(config-ctx)}\#\]

Syntax

radius accounting gtp trigger-policy [ standard | ggsn-preservation-mode ]

default radius accounting gtp trigger-policy

default

Resets the RADIUS accounting trigger policy to standard behavior for GTP session.

standard

Sets the RADIUS accounting trigger policy to standard behavior which is configured for GTP session for GGSN service.

ggsn-preservation-mode

Sends RADIUS Accounting Start when the GTP message with private extension of preservation mode is received from SGSN.

\[\textbf{Important}:\] This is a customer-specific keyword and needs customer-specific license to use this feature. For more information on GGSN preservation mode, refer to \textit{GGSN Service Configuration Mode Commands} chapter.

Usage

Use this command to set the trigger policy for the AAA accounting for a GTP session.

Example

The following command sets the RADIUS accounting trigger policy for GTP session to standard:

default radius accounting gtp trigger-policy
radius accounting ha policy

This command configures the RADIUS accounting policy for HA sessions.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
radius accounting ha policy { session-start-stop | custom1-aaa-res-mgmt }
```

```
default radius accounting ha policy
```

---

**session-start-stop**

Specifies to send Accounting Start when the session is connected, and send Accounting Stop when the session is disconnected. This is the default behavior.

---

**custom1-aaa-res-mgmt**

Accounting Start/Stop messages are generated to assist special resource management done by AAA servers. It is similar to the session-start-stop accounting policy, except for the following differences:

- Accounting Start is generated when a new call overwrites an existing session. Accounting Start is also generated during MIP session handoffs.
- No Accounting stop is generated when an existing session is overwritten and the new session continues to use the IP address assigned for the old session.

---

**Usage**

Use this command to set the behavior of the AAA accounting for an HA session.

**Example**

The following command sets the HA accounting policy to `custom1-aaa-res-mgmt`:

```
radius accounting ha policy custom1-aaa-res-mgmt
```
radius accounting interim volume

This command configures the volume of uplink and downlink volume octet counts that triggers RADIUS interim accounting.

[context_name]host_name(config-ctx)#

Syntax

radius accounting interim volume { downlink bytes uplink bytes | total bytes | uplink bytes downlink bytes }

no radius accounting interim volume

no
Disables volume based RADIUS accounting.

downlink bytes uplink bytes
Specifies the downlink to uplink volume limit for RADIUS Interim accounting, in bytes. bytes must be an integer to 100000 through 4000000000.

total bytes
Specifies the total volume limit for RADIUS interim accounting in bytes. bytes must be an integer from 100000 through 4000000000.

uplink bytes
Specifies the uplink volume limit for RADIUS interim accounting in bytes. bytes must be an integer from 100000 through 4000000000.

downlink bytes
Specifies the downlink volume limit for RADIUS interim accounting in bytes. bytes must be an integer from 100000 through 4000000000.
Usage

Use this command to trigger RADIUS interim accounting based on the volume of uplink and downlink bytes.

Example

The following command triggers RADIUS interim accounting when the total volume of uplink and downlink bytes reaches 110000:

```
radius accounting interim volume total 110000
```
radius accounting ip remote-address

This command configures IP remote address-based RADIUS accounting parameters.

Product
PDSN
HA

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

\[context_name]host_name(config-ctx)#

Syntax

[ no ] radius accounting ip remote-address \{ collection | list list_id \}

no
Removes earlier configuration for the specified keyword.

collection
Enables collecting and reporting Remote-Address-Based accounting in RADIUS Accounting. This should be enabled in the AAA Context. It is disabled by default.

list list_id
Enters the Remote Address List Configuration Mode. This mode configures a list of remote addresses that can be referenced by the subscriber's profile. list_id must be an integer from 1 through 65535.

Usage

This command is used as part of the Remote Address-based Accounting feature to both configure remote IP address lists and enable the collection of accounting data for the addresses in those lists on a per-subscriber basis.

Individual subscriber can be associated to remote IP address lists through the configuration/specification of an attribute in their local or RADIUS profile. (Refer to the radius accounting command in the Subscriber Configuration mode.) When configured/specified, accounting data is collected pertaining to the subscriber’s communication with any of the remote addresses specified in the list.

Once this functionality is configured on the system and in the subscriber profiles, it must be enabled by executing this command with the collection keyword.

Example

The following command enables collecting and reporting Remote-Address-Based accounting in RADIUS Accounting:

radius accounting ip remote-address collection
radius accounting keepalive

This command configures the keepalive authentication parameters for the RADIUS accounting server.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
radius accounting keepalive { calling-station-id id | consecutive-response responses_no_of | framed-ip-address ip_address | interval interval_duration | retries retries_no_of | timeout timeout_duration | username user_name }
```

```
no radius accounting keepalive framed-ip-address

default radius accounting keepalive { calling-station-id | consecutive-response | interval | retries | timeout | username }
```

**no**
Removes configuration for the specified keyword.

**default**
Configures the default settings.

**calling-station-id id**
Configures the Calling-Station ID to be used for the keepalive authentication as an alphanumeric string of size 1 to 15 characters. Default: 000000000000000

**consecutive-response responses_no_of**
Configures the number of consecutive authentication response after which the server is marked as reachable. responses_no_of must be an integer from 1 through 5. Default: 1

**framed-ip-address ip_address**
Specifies the framed ip-address to be used for the keepalive accounting in IPv4 dotted-decimal notation.

**interval interval_duration**
Configures the time interval (in seconds) between the two keepalive access requests. Default:30
retries retries_no_of

Configures the number of times the keepalive access request to be sent before marking the server as unreachable. retries_no_of must be an integer from 3 through 10. Default: 3

timeout timeout_duration

Configures the time interval between each keepalive access request retries. timeout_duration must be an integer from 1 through 30. Default: 3

username user_name

Configures the username to be used for the authentication as an alphanumeric string of 1 through 127 characters. Default: Test-Username

Usage

Configures the keepalive authentication parameters for the RADIUS accounting server.

Example

The following command sets the user name for the RADIUS keepalive access requests to Test-Username2:

    radius accounting keepalive username Test-Username2

The following command sets the number of retries to 4:

    radius accounting keepalive retries 4
radius accounting rp

This command configures the current context’s RADIUS accounting R-P originated call options.

Mode
Exec > Global Configuration > Context Configuration
    configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

radius accounting rp { handoff-stop { immediate | wait-active-stop } | tod minute hour | trigger-event { active-handoff | active-start-param-change | active-stop } | trigger-policy { airlink-usage [ counter-rollover ] | custom [ active-handoff | active-start-param-change | active-stop ] | standard } | trigger-stop-start }

no radius accounting rp { tod minute hour | trigger-event { active-handoff | active-start-param-change | active-stop } | trigger-stop-start }

default radius accounting rp { handoff-stop | trigger-policy }

no

Removes earlier configuration for the specified keyword.

default

Configures this command with the default settings.

handoff-stop { immediate | wait-active-stop }

Specifies the behavior of generating accounting STOP when handoff occurs.

• immediate: Indicates that accounting STOP should be generated immediately on handoff, i.e. not to wait active-stop from the old PCF.

• wait-active-stop: Indicates that accounting STOP is generated only when active-stop received from the old PCF when handoff occurs.

Default: wait-active-stop

tod minute hour

Specifies the time of day a RADIUS event is to be generated for accounting. Up to four different times of the day may be specified through separate commands.

minute must be an integer from 0 through 59.

hour must be an integer from 0 through 23.
trigger-event \{ active-handoff | active-start-param-change | active-stop \}

Configures the events for which a RADIUS event is generated for accounting as one of the following:

- **active-handoff**: Disables a single R-P event (and therefore a RADIUS accounting event) when an Active PCF-to-PFC Handoff occurs. Instead, two R-P events occur (one for the Connection Setup, and the second for the Active-Start). Default: Disabled

- **active-start-param-change**: Disables an R-P event (and therefore a RADIUS accounting event) when an Active-Start is received from the PCF and there has been a parameter change. Default: Enabled

- **active-stop**: Disables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF. Default: Disabled

**Important**: This keyword has been obsoleted by the `trigger-policy` keyword. Note that if this command is used, if the context configuration is displayed, RADIUS accounting RP configuration is represented in terms of the `trigger-policy`.

Default: airlink-usage: Disabled

**Custom**

- **active-handoff**: Disabled
- **active-start-param-change**: Disabled
- **active-stop**: Disabled
- **standard**: Enabled

Configures the overall accounting policy for R-P sessions as one of the following:

- **airlink-usage [ counter-rollover ]**: Designates the use of Airlink-Usage RADIUS accounting policy for R-P, which generates a start on Active-Starts, and a stop on Active-Stops.

  If the `counter-rollover` option is enabled, the system generates a STOP/START pair before input/output data octet counts (or input/output data packet counts) become larger than \(2^{32} - 1\) in value. This setting is used to guarantee that a 32-bit octet count in any STOP message has not wrapped to larger than \(2^{32}\) thus ensuring the accuracy of the count. The system may send the STOP/START pair at any time, so long as it does so before the 32-bit counter has wrapped. Note that a STOP/START pair is never generated unless the subscriber RP session is in the Active state, since octet/packet counts are not accumulated in the Dormant state.

- **custom**: specifies the use of custom RADIUS accounting policy for R-P. The custom policy can consist of the following:

  - **active-handoff**: Enables a single R-P event (and therefore a RADIUS accounting event) when an Active PCF-to-PFC Handoff occurs. Normally two R-P events will occur (one for the Connection Setup, and the second for the Active-Start).

  - **active-start-param-change**: Enables an R-P event (and therefore a RADIUS accounting event) when an Active-Start is received from the PCF and there has been a parameter change.

**Important**: Note that a custom trigger policy with only `active-start-param-change` enabled is identical to the `standard` trigger-policy.
• **active-stop**: Enables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF.

---

**Important**: If the `radius accounting rp trigger-policy custom` command is executed without any of the optional keywords, all custom options are disabled.

• **standard**: Specifies the use of Standard RADIUS accounting policy for R-P in accordance with IS-835B.

---

**trigger-stop-start**

Specifies that a stop/start RADIUS accounting pair should be sent to the RADIUS server when an applicable R-P event occurs.

---

**Usage**

Use this command to configure the events for which a RADIUS event is sent to the server when the accounting procedures vary between servers.

**Example**

The following command enables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF:

```
radius accounting rp trigger-event active-stop
```

The following command generates the STOP only when active-stop received from the old PCF when handoff occurs:

```
default radius accounting rp handoff-stop
```
radius accounting server

This command configures RADIUS accounting server(s) in the current context.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

Syntax

```plaintext
radius [ mediation-device ] accounting server ip_address [ encrypted ] key value [ acct-on { enable | disable } ] [ acct-off { enable | disable } ] [ max max_messages ] [ oldports ] [ port port_number ] [ priority priority ] [ type { mediation-device | standard } ] [ admin-status { enable | disable } ] [ -noconfirm ]

no radius [ mediation-device ] accounting server ip_address [ oldports | port port_number ]
```

no

Removes the server or server port(s) specified from the list of configured servers.

**mediation-device**

Enables mediation-device specific AAA transactions used to communicate with this RADIUS server.

> **Important:** If this option is not used, the system by default enables standard AAA transactions.

**ip_address**

Specifies the IP address of the accounting server.  
*ip_address* must be specified in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

**[ encrypted ] key value**

Specifies the shared secret key used to authenticate the client to the servers. The *encrypted* keyword indicates the key specified is encrypted.
In 12.1 and earlier releases, the *key value* must be an alphanumeric string of 1 through 127 characters without encryption, and 1 through 256 characters with encryption.
In 12.2 and later releases, the *key value* must be an alphanumeric string of 1 through 127 characters without encryption, and 1 through 236 characters with encryption enabled.
The `encrypted` keyword is intended only for use by the system while saving configuration scripts. The system displays the `encrypted` keyword in the configuration file as a flag that the variable following the `key` keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

```
acct-on { enable | disable }
```

This keyword enables/disables sending of the Accounting-On message when a new RADIUS server is added to the configuration. By default, this keyword will be disabled. When enabled, the Accounting-On message is sent when a new RADIUS server is added in the configuration. However, if for some reason the Accounting-On message cannot be sent at the time of server configuration (for example, if the interface is down), then the message is sent as soon as possible. Once the Accounting-On message is sent, if it is not responded to after the configured RADIUS accounting timeout, the message is retried the configured number of RADIUS accounting retries. Once all retries have been exhausted, the system no longer attempts to send the Accounting-On message for this server.

```
acct-off { enable | disable }
```

Default: `enable`
Disables and enables the sending of the Accounting-Off message when a RADIUS server is removed from the configuration. The Accounting-Off message is sent when a RADIUS server is removed from the configuration, or when there is an orderly shutdown. However, if for some reason the Accounting-On message cannot be sent at this time, it is never sent. The Accounting-Off message is sent only once, regardless of how many accounting retries are enabled.

```
max max_messages
```

Specifies the maximum number of outstanding messages that may be allowed to the server. `max_messages` must be an integer from 0 through 4000. Default: 0

```
oldports
```

Sets the UDP communication port to the out of date standardized default for RADIUS communications to 1646.

```
port port_number
```

Specifies the port number to use for communications as an integer from 1 through 65535. Default: 1813

```
priority priority
```

Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to. `priority` must be an integer from 1 through 1000, where 1 is the highest priority. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this. If you use the `-noconfirm` option, you are not asked for confirmation and multiple servers could be assigned the same priority.

Default: 1000

```
type { mediation-device | standard }
```

Specifies the type of AAA transactions to use to communicate with this RADIUS server.

- `standard`: Use standard AAA transactions.
- `mediation-device`: This keyword is obsolete.
Default: `standard`

```plaintext
type standard
```
Specifies the use of standard AAA transactions to use to communicate with this RADIUS server. Default: `standard`

```plaintext
admin-status { enable | disable }
```
Enables or disables the RADIUS authentication/accounting/charging server functionality, and saves the status setting in the configuration file to re-establish the set status at reboot.

```plaintext
-noconfirm
```
Executes the command without any additional prompt and confirmation from the user.

---

**Usage**

This command is used to configure the RADIUS accounting servers with which the system is to communicate for accounting.

Up to 128 RADIUS servers can be configured per context. The servers can be configured as Accounting, Authentication, charging servers, or any combination thereof.

**Example**

The following commands configure the RADIUS accounting server with the IP address set to 10.2.3.4, port to 1024, and priority to 10:

```plaintext
radius accounting server 10.2.3.4 key sharedKey port 1024 max 127
radius accounting server 10.2.3.4 encrypted key scrambledKey oldports priority 10
no radius accounting server 10.2.5.6
```

The following command sets the accounting server with mediation device transaction for AAA server 10.2.3.4:

```plaintext
radius mediation-device accounting server 10.2.3.4 key sharedKey port 1024 max 127
```
**radius algorithm**

This command configures the RADIUS authentication server selection algorithm for the current context.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
`configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
radius algorithm { first-server | round-robin }
default radius algorithm
```

**default radius algorithm**

```
default
Configures this command with the default setting. Default: first-server
```

**first-server**

Sends authentication data to the first available RADIUS authentication server based upon the relative priority of each configured server.

**round-robin**

Sends authentication data in a circular queue fashion on a per Session Manager task basis where data is sent to the next available RADIUS authentication server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

**Usage**

Use this command to configure the context’s RADIUS server selection algorithm to ensure proper load distribution through the available RADIUS authentication servers.

**Example**

The following command configures to use the round-robin algorithm for RADIUS authentication server selection:

```
radius algorithm round-robin
```
radius allow

This command configures the system behavior to allow subscriber sessions when RADIUS accounting and/or authentication is unavailable.

Product

FA

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] radius allow { accounting-down | authentication-down }

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removes earlier configuration for the specified keyword.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>accounting-down</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allows sessions while accounting is unavailable (down). Default: Enabled</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>authentication-down</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allows sessions while authentication is not available (down). Default: Disabled</td>
</tr>
</tbody>
</table>

Usage

Allow sessions during system troubles when the risk of IP address and/or subscriber spoofing is minimal. The denial of sessions may cause dissatisfaction with subscribers at the cost/expense of verification and/or accounting data.

Important: Please note that this command is applicable ONLY to CDMA products. To configure this functionality in UMTS/LTE products (GGSN/P-GW/SAEGW), use the command mediation-device delay-GTP-response in APN Configuration mode.

Example

The following command configures the RADIUS server to allow the sessions while accounting is unavailable:

radius allow accounting-down
radius attribute

This command configures the system’s RADIUS identification parameters.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:
```
[context_name]host_name(config-ctx)#
```

Syntax

```
radius attribute { nas-identifier id | nas-ip-address address primary_address [ backup secondary_address ] [ nexthop-forwarding-address nexthop_ip_address ] [ vlan vlan_id ] [ mpls-label input in_label_value output out_label_value1 out_label_value1 ] }

no radius attribute { nas-identifier | nas-ip-address }

default radius attribute nas-identifier
```

no

Removes earlier configuration for the specified keyword.

default

Configures the default setting.

```
nas-identifier id
```

Specifies the attribute name by which the system will be identified in Access-Request messages. *id* must be an alphanumeric string of 1 through 32 characters that is case sensitive.

```
nas-ip-address address primary_address
```

Specifies the AAA interface IP address(es) used to identify the system. Up to two addresses can be configured. *primary_address* is the IP address of the primary interface to use in the current context in IPV4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

```
backup secondary_address
```

Specifies the IP address of the secondary interface to use in the current context in IPV4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

```
mpls-label input in_label_value | output out_label_value1 [ out_label_value2 ]
```

This command configures the traffic from the specified AAA client NAS IP address to use the specified MPLS labels.
in_label_value is the MPLS label that identifies inbound traffic destined for the configured NAS IP address.

cut_label_value1 and cut_label_value2 identify the MPLS labels to be added to the packets sent from the specified NAS IP address.

- cut_label_value1 is the inner output label.
- cut_label_value2 is the outer output label.

MPLS label values must be an integer from 16 through 1048575.

**Important:** This option is available only when nexthop-forwarding gateway is also configured with the `nexthop-forwarding-address` keyword.

```plaintext
nexthop-forwarding-address nexthop_ip_address
```

Configures the next hop IP address for this NAS IP address in IPV4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

```plaintext
vlan vlan_id
```

Specifies the VLANID to be associated with the next-hop IP address as an integer from 1 through 4094.

**Usage**

This is necessary for NetWare Access Server usage such as the system must be identified to the NAS. The system supports the concept of the active nas-ip-address. The active nas-ip-address is defined as the current source ip address for RADIUS messages being used by the system. This is the content of the nas-ip-address attribute in each RADIUS message.

The system will always have exactly one active nas-ip-address. The active nas-ip-address will start as the primary nas-ip-address. However, the active nas-ip-address may switch from the primary to the backup, or the backup to the primary. The following events will occur when the active nas-ip-address is switched:

- All current in-process RADIUS accounting messages from the entire system are cancelled. The accounting message is re-sent, with retries preserved, using the new active nas-ip-address. Acct-Delay-Time, however, is updated to reflect the time that has occurred since the accounting event. The value of Event-Timestamp is preserved.
- All current in-process RADIUS authentication messages from the entire system are cancelled. The authentication message is re-sent, with retries preserved, using the new active nas-ip-address. The value of Event-Timestamp is preserved.
- All subsequent in-process RADIUS requests uses the new active nas-ip-address.

The system uses a revertive algorithm when transitioning active NAS IP addresses as described below:

- If the configured primary nas-ip-address transitions from UP to DOWN, and the backup nas-ip-address is UP, then the active nas-ip-address switches from the primary to the backup nas-ip-address
- If the backup nas-ip-address is active, and the primary nas-ip-address transitions from DOWN to UP, then the active nas-ip-address switches from the backup to the primary nas-ip-address

**Example**

The following command configures the RADIUS attribute nas-ip-address as 10.2.3.4:

```plaintext
radius attribute nas-ip-address 10.2.3.4
```
radius authenticate null-username

This command enables (allows) or disables (prevents) the authentication of user names that are blank or empty. This is enabled by default.

**Product**

PDSN

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration

`configure > context context_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-ctx)#`

**Syntax**

```
[ no | default ] radius authenticate null-username
```

- **default**
  Configures the default setting.
  Default: Authenticate, send Access-Request messages to the AAA server, all user names, including NULL user names.

- **no**
  Disables sending an Access-Request message to the AAA server for user names (NAI) that are blank.

- **null-username**
  Enables sending an Access-Request message to the AAA server for user names (NAI) that are blank.

**Usage**

Use this command to disable, or re-enable, sending Access-Request messages to the AAA server for user names (NAI) that are blank (NULL).

**Example**

The following command disables sending of Access-Request messages for user names (NAI) that are blank:

```
no radius authenticate null-username
```

The following command re-enables sending of Access-Request messages for user names (NAI) that are blank:

```
radius authenticate null-username
```
radius authenticate apn-to-be-included

This command configures the Access Point Name (APN) to be included for RADIUS authentication.

```

**Syntax**

```
[ default ] radius authenticate apn-to-be-included { gi | gn }
```

- **default**
  - Configures the default setting.

- **gi**
  - Specifies the use of the Gi APN name in the RADIUS authentication request. The Gi APN represents the APN received in the Create PDP Context Request message from the SGSN.

- **gn**
  - Specifies the use of the Gn APN name in the RADIUS authentication request. The Gn APN represents the APN selected by the GGSN.

**Usage**

Use this command to configure the APN name for RADIUS authentication. This can be set to either gi or gn.

**Example**

The following command specifies the usage of Gn APN name in the RADIUS authentication request.

```
radius authenticate apn-to-be-included gn
```
radius authenticator-validation

This command enables (allows) or disables (prevents) the MD5 authentication of RADIUS users. By default this feature is enabled.

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax
[ default | no ] radius authenticator-validation

default
Enables MD5 authentication validation for an Access-Request message to the AAA server.

no
Disables MD5 authentication validation for an Access-Request message to the AAA server.

Usage
Use this command to disable, or re-enable, sending Access-Request messages to the AAA server for MD5 validation.

Example
The following command disables MD5 authentication validation for Access-Request messages for user names (NAI):

    no radius authenticator-validation

The following command enables MD5 authentication validation for Access-Request messages for user names (NAI):

    radius radius authenticator-validation
radius change-authorize-nas-ip

This command configures the NAS IP address and UDP port on which the current context will listen for Change of Authorization (COA) messages and Disconnect Messages (DM). If the NAS IP address is not defined with this command, any COA or DM messages from the RADIUS server are returned with a Destination Unreachable error.

Privilege
- Security Administrator, Administrator

Mode
- Exec > Global Configuration > Context Configuration
  
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

radius change-authorize-nas-ip ip_address [ encrypted ] key value [ port port ] [ event-timestamp-window window ] [ no-nas-identification-check ] [ no-reverse-path-forward-check ] [ mpls-label input in_label_value | output out_label_value1 [ out_label_value2 ]

no radius change-authorize-nas-ip

Delete the NAS IP address information which disables the system from receiving and responding to COA and DM messages from the RADIUS server.

ip_address

Specifies the NAS IP address of the current context’s AAA interface that was defined with the radius attribute command.

ip_address can be expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

[ encrypted ] key value

Specifies the shared secret key used to authenticate the client to the servers. The encrypted keyword indicates the key specified is encrypted.

In 12.1 and earlier releases, the key value must be an alphanumeric string of 1 through 127 characters without encryption, and 1 through 256 characters with encryption.

In 12.2 and later releases, the key value must be an alphanumeric string of 1 through 127 characters without encryption, and 1 through 236 characters with encryption enabled.

The encrypted keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the
key keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

```
key
```

```
port port
```

The UDP port on which to listen for CoA and DM messages. Default: 3799

```
event-timestamp-window window
```

When a COA or DM request is received with an event-time-stamp, if the current-time is greater than the received-pkt-event-time-stamp plus the event-time-stamp-window, the packet is silently discarded. When a COA or DM request is received without the event-time stamp attribute, the packet is silently discarded.

```
window must be an integer from 0 through 4294967295. If window is specified as 0 (zero), this feature is disabled; the event-time-stamp attribute in COA or DM messages is ignored and the event-time-stamp attribute is not included in NAK or ACK messages. Default: 300
```

```
no-nas-identification-check
```

Disables the context from checking the NAS Identifier/NAS IP Address while receiving the CoA/DM requests. By default this check is enabled.

```
no-reverse-path-forward-check
```

Disables the context from checking whether received CoA or DM packets are from one of the AAA servers configured under the default AAA group in the current context. Only the src-ip address in the received CoA or DM request is validated and the port and key are ignored. The reverse-path-forward-check is enabled by default.

```
If reverse-path-forward-check is disabled, the CoA and DM messages will be accepted from AAA servers from any groups. If the check is enabled, then the CoA and DM messages will be accepted only from servers under default AAA group.
```

```
mpls-label input in_label_value | output out_label_value1 [ out_label_value2 ]
```

This command configures COA traffic to use the specified MPLS labels.

- `in_label_value` is the MPLS label that identifies inbound COA traffic.
- `out_label_value1` and `out_label_value2` identify the MPLS labels to be added to COA response.
  - `out_label_value1` is the inner output label.
  - `out_label_value2` is the outer output label.

MPLS label values must be an integer from 16 through 1048575.

Usage

Use this command to enable the current context to listen for COA and DM messages. Any one of the following RADIUS attributes may be used to identify the subscriber:

- **3GPP-IMSI**: The subscriber’s IMSI. It may include the 3GPP-NSAPI attribute to delete a single PDP context rather than all of the PDP contexts of the subscriber when used with the GGSN product.
- **Framed-IP-address**: The subscriber’s IP address.
- **Acct-Session-Id**: Identifies a subscriber session or PDP context.
**Important:** For the GGSN product, the value for Acct-Session-Id that is mandated by 3GPP is used instead of the special value for Acct-Session-Id that we use in the RADIUS messages we exchange with a RADIUS accounting server.

**Important:** When this command is used in conjunction with the GGSN, CoA functionality is not supported.

**Example**

The following command specifies the IP address `192.168.100.10` as the NAS IP address, a key value of `123456` and uses the default port of `3799`:

```
radius change-authorize-nas-ip 192.168.100.10 key 123456
```

The following command disables the `nas-identification-check` for the above parameters:

```
radius change-authorize-nas-ip 192.168.100.10 key 123456 no-nas-identification-check
```
**radius charging**

This command configures basic RADIUS options for Active Charging Services.

**Product**  
All

**Privilege**  
Security Administrator, Administrator

**Mode**  
Exec > Global Configuration > Context Configuration

```bash
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
radius charging { deadtime dead_minutes | detect-dead-server { consecutive-failures consecutive_failures | response-timeout timeout_duration } | max-outstanding max_messages | max-retries max_retries | max-transmissions transmissions | timeout timeout_duration }

default radius charging { deadtime | detect-dead-server | max-outstanding | max-retries | max-transmissions | timeout }

no radius charging { detect-dead-server | max-transmissions | timeout }
```

---

**no**  
Removes configuration for the specified keyword.

**default**  
Configures the default settings.

**deadtime dead_minutes**  
Specifies the number of minutes to wait before attempting to communicate with a server which has been marked as unreachable.  
`dead_minutes` must be an integer from 0 through 65535.  
Default: 10

**detect-dead-server { consecutive-failures consecutive_failures | response-timeout timeout_duration }**  
`consecutive-failures consecutive_failures`: Default: 4. Specifies the number of consecutive failures, for each AAA manager, before a server is marked as unreachable. `consecutive_failures` must be an integer from 0 through 1000.  
`response-timeout timeout_duration`: Specifies the number of seconds for each AAA manager to wait for a response to any message before a server is detected as failed, or in a down state. `timeout_duration` must be an integer from 1 through 65535.
max-outstanding max_messages

Specifies the maximum number of outstanding messages a single AAA manager instance will queue. max_messages must be an integer from 1 through 4000. Default: 256

max-retries max_retries

Specifies the maximum number of times communication with a AAA server will be attempted before it is marked as unreachable and the detect dead servers consecutive failures count is incremented. max_retries must be an integer from 0 through 65535. Default: 5

max-transmissions transmissions

Sets the maximum number of re-transmissions for RADIUS authentication requests. This limit is used in conjunction with the max-retries for each server. transmissions must be an integer from 1 through 65535. Default: Disabled

When failing to communicate with a RADIUS sever, the subscriber is failed once all of the configured RADIUS servers have been exhausted or once the configured number of maximum transmissions is reached. For example, if 3 servers are configured and if the configured max_retries is 3 and max-transmissions is 12, then the primary server is tried 4 times (once plus 3 retries), the secondary server is tried 4 times, and then a third server is tried 4 times. If there is a fourth server, it is not tried because the maximum number of transmissions (12) has been reached.

timeout timeout_duration

Specifies the number of seconds to wait for a response from the RADIUS server before re-sending the messages. timeout_duration must be an integer from 1 through 65535. Default: 3

Usage

Manage the basic Charging Service RADIUS options according to the RADIUS server used for the context.

Example

The following command configures the AAA server to be marked as unreachable when the consecutive failure count exceeds 6:

radius charging detect-dead-server consecutive-failures 6

The following command sets the timeout value to 300 seconds to wait for a response from RADIUS server before resending the messages:

radius charging timeout 300
radius charging accounting algorithm

This command specifies the fail-over/load-balancing algorithm to be used for selecting RADIUS servers for charging services.

PDSN
GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax
radius charging accounting algorithm { first-n n | first-server | round-robin }

first-n n
Specifies that the AGW must send accounting data to n (more than one) AAA servers based on their priority. Response from any one of the n AAA servers would suffice to proceed with the call. The full set of accounting data is sent to each of the n AAA servers.

n is the number of AAA servers to which accounting data will be sent, and must be an integer from 2 through 128. Default: 1 (Disabled)

first-server
Specifies that the context must send accounting data to the RADIUS server with the highest configured priority. In the event that this server becomes unreachable, accounting data is sent to the server with the next-highest configured priority. This is the default algorithm.

round-robin
Specifies that the context must load balance sending accounting data among all of the defined RADIUS servers. Accounting data is sent in a circular queue fashion on a per Session Manager task basis, where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

Usage
Use this command to specify the accounting algorithm to use to select RADIUS servers for charging services configured in the current context.

Example
The following command specifies to use the round-robin algorithm to select the RADIUS server:

radius charging accounting algorithm round-robin
radius charging accounting server

This command configures RADIUS charging accounting servers in the current context for Active Charging Services prepaid accounting.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

radius charging accounting server ip_address [ encrypted ] key key [ max max_messages ] [ max-rate max_rate ] [ oldports ] [ port port_number ] [ priority priority ] [ admin-status { enable | disable } ] [ -noconfirm ]

no radius charging accounting server ip_address [ oldports | port port_number ]

no

Removes the server or server port(s) specified from the list of configured servers.

ip_address
Specifies IP address of the accounting server in IPv4 dotted-decimal notation. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[ encrypted ] key key
Specifies the shared secret key used to authenticate the client to the servers. The encrypted keyword indicates the key specified is encrypted.
In 12.1 and earlier releases, the key value must be an alphanumeric string of 1 through 127 characters without encryption, and 1 through 256 characters with encryption.
In 12.2 and later releases, the key value must be an alphanumeric string of 1 through 127 characters without encryption, and 1 through 236 characters with encryption enabled.
The encrypted keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the key keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

max max_messages
Specifies the maximum number of outstanding messages that may be allowed to the server. max_messages must be integer from 0 through 4000. Default: 0
max-rate max_rate
Specifies the rate (number of messages per second) at which the authentication messages should be sent to the RADIUS server. max_rate must be an integer from 0 through 1000. Default: 0 (Disabled)

oldports
Sets the UDP communication port to the out of date standardized default for RADIUS communications to 1646.

port port_number
Specifies the port number to use for communications as an integer from 1 through 65535. Default: 1813

priority priority
Specifies the relative priority of this accounting server. The priority is used in server selection for determining to which server to send accounting data. priority must be an integer 1 through 1000 where 1 is the highest priority. Default:1000

admin-status { enable | disable }
Enables or disables the RADIUS authentication/ accounting/charging server functionality, and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm
Executes the command without any additional prompt and confirmation from the user.

Usage
This command is used to configure the RADIUS charging accounting server(s) with which the system is to communicate for Active Charging Services prepaid accounting requests. Up to 128 AAA servers can be configured per context when the system is functioning as a PDSN and/or HA. Up to 16 servers are supported per context when the system is functioning as a GGSN.

Example
The following commands configure RADIUS charging accounting server with the IP address set to 10.2.3.4, port to 1024, and priority to 10:

```
radius charging accounting server 10.2.3.4 key sharedKey port 1024 max 127
radius charging accounting server 10.2.3.4 encrypted key scrambledKey oldports priority 10
```
radius charging algorithm

This command configures the RADIUS authentication server selection algorithm for Active Charging Services for the current context.

[context_name]host_name(config-ctx)#

Syntax

radius charging server ip_address [ encrypted ] key key [ max max_messages ] [ max-rate max_rate ] [ oldports ] [ port port_number ] [ priority priority ] [ admin-status { enable | disable } ] [ -noconfirm ]

no radius charging server ip_address [ oldports | port port_number ]

no

Removes the server or server port(s) specified from the list of configured servers.

ip_address

Specifies the IP address of the server in IPv4 dotted-decimal notation. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[ encrypted ] key key

Specifies the shared secret key used to authenticate the client to the servers. The encrypted keyword indicates the key specified is encrypted.

In 12.1 and earlier releases, the key value must be an alphanumeric string of 1 through 127 characters without encryption, and 1 through 256 characters with encryption.

In 12.2 and later releases, the key value must be an alphanumeric string of 1 through 127 characters without encryption, and 1 through 236 characters with encryption enabled.

The encrypted keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the key keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

max max_messages

Specifies the maximum number of outstanding messages that may be allowed to the server. max_messages must be an integer from 0 through 4000. Default: 256
**max-rate max_rate**

Specifies the rate (number of messages per second), at which the authentication messages should be sent to the RADIUS server. *max_rate* must be an integer from 0 through 1000. Default: 0 (Disabled)

**oldports**

Sets the UDP communication port to the old default for RADIUS communications to 1645.

**port port_number**

Specifies the port number to use for communications as an integer from 1 through 65535. Default: 1812

**priority priority**

Specifies the relative priority of this accounting server. The priority is used in server selection for determining to which server to send accounting data. *priority* must be an integer from 1 through 1000 where 1 is the highest priority. Default: 1000

**admin-status { enable | disable }**

Enables or disables the RADIUS authentication/accounting/charging server functionality and saves the status setting in the configuration file to re-establish the set status at reboot.

**-noconfirm**

Executes the command without any additional prompt and confirmation from the user.

**Usage**

This command is used to configure the RADIUS charging server(s) with which the system is to communicate for Active Charging Services prepaid authentication requests.

Up to 128 AAA servers can be configured per context when the system is functioning as a PDSN and/or HA.

Up to 16 servers are supported per context when the system is functioning as a GGSN.

**Example**

The following commands configure RADIUS charging server with the IP address set to 10.2.3.4, port to 1024, and priority to 10:

```bash
radius charging server 10.2.3.4 key sharedKey port 1024 max 127
radius charging server 10.2.3.4 encrypted key scrambledKey oldports priority 10
```
### radius deadtime

This command configures the maximum period of time (in minutes) that must elapse between when a context marks a RADIUS server as unreachable and when it can re-attempt to communicate with the server.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
radius deadtime minutes
```

default radius deadtime

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Configures the default setting. Default: 10 minutes</td>
</tr>
<tr>
<td>minutes</td>
<td>Specifies the number of minutes to wait before changing the state of a RADIUS server from “Down” to “Active”. minutes must be an integer from 0 through 65535.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to configure the basic RADIUS parameters according to the RADIUS server used for the context.

**Important:** This parameter should be set to allow enough time to remedy the issue that originally caused the server’s state to be changed to “Down”. After the dead time timer expires, the system returns the server’s state to “Active” regardless of whether or not the issue has been fixed.

**Important:** For a complete explanation of RADIUS server states, if you are using StarOS 12.3 or an earlier release, refer to the RADIUS Server State Behavior appendix in the AAA and GTPP Interface Administration and Reference. If you are using StarOS14.0 or a later release, refer to the AAA Interface Administration and Reference.

**Example**

The following command configures the RADIUS deadtime to 100 minutes:

```
radius deadtime 100
```
radius detect-dead-server

This command configures how the system detects a dead RADIUS server.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
radius detect-dead-server { consecutive-failures consecutive_failures_count | keepalive | response-timeout timeout_duration }

{ default | no } radius detect-dead-server
```

- **no**
  Removes the configuration.

- **default**
  Configures the default setting.
  - **consecutive-failures**: Enabled; 4 consecutive failures
  - **keepalive**: Disabled
  - **response-timeout**: Disabled

- **consecutive-failures consecutive_failures_count**
  Specifies the consecutive number of times that the system must find the AAA server unreachable for the server to be marked unreachable, that is the server’s state is changed from “Active” to “Down”.
  `consecutive_failures_count` must be an integer from 1 through 1000. Default: Enabled; 4 consecutive failures

- **keepalive**
  Enables the AAA server alive-dead detect mechanism based on sending keepalive authentication messages to all authentication servers. Default: Disabled

- **response-timeout timeout_duration**
  Specifies the time duration, in seconds, that the system must wait for a response from the AAA server to any message before the server is marked unreachable, that is the server’s state is changed from “Active” to “Down”.
  `timeout_duration` must be an integer from 1 through 65535. Default: Disabled
Usage

Use this command to configure how the system detects a dead RADIUS server.

**Important:** If both `consecutive-fails` and `response-timeout` are configured, then both parameters must be met before a server’s state is changed to “Down”.

**Important:** The “Active” or “Down” state of a RADIUS server as defined by the system, is based on accessibility and connectivity. For example, if the server is functional but the system has placed it into a “Down” state, it could be the result of a connectivity problem. When a RADIUS server’s state is changed to “Down”, a trap is sent to the management station and the `deadtime` timer is started.

Example

The following command enables the detect-dead-server consecutive-fails mechanism and configures the consecutive number of failures to 10:

```
radius detect-dead-server consecutive-fails 10
```
radius dictionary

Configures the RADIUS dictionary.

[context_name]host_name(config-ctx)#

Syntax

radius dictionary dictionary

default radius dictionary

default

Configures the default setting.

dictionary

Specifies which dictionary to use.

dictionary must be one of the following values:

Table 25. RADIUS Dictionary Types

<table>
<thead>
<tr>
<th>Dictionary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3gpp</td>
<td>This dictionary consists of all the attributes in the standard dictionary, and all of the attributes specified in 3GPP 32.015.</td>
</tr>
<tr>
<td>3gpp2</td>
<td>This dictionary consists of all the attributes in the standard dictionary, and all of the attributes specified in IS-835-A.</td>
</tr>
<tr>
<td>3gpp2-835</td>
<td>This dictionary consists of all the attributes in the standard dictionary, and all of the attributes specified in IS-835.</td>
</tr>
</tbody>
</table>
| customXX   | These are customized dictionaries. For information on custom dictionaries, contact your local service representative. 

XX is the integer of the custom dictionary. 

NOTE: RADIUS dictionary custom23 should be used in conjunction with Active Charging Service (ACS). |
| standard   | This dictionary consists only of the attributes specified in RFC 2865, RFC 2866, and RFC2869. |
| starent    | This dictionary consists of all the attributes in the starent-vsai dictionary and incorporates additional VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the dictionaries supported by the system. |
### Dictionary Description

<table>
<thead>
<tr>
<th>Dictionary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>starent-835</td>
<td>This dictionary consists of all of the attributes in the starent-vsa1-835 dictionary and incorporates additional VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the -835 dictionaries supported by the system.</td>
</tr>
<tr>
<td>starent-vsal</td>
<td>This dictionary consists not only of the 3gpp2 dictionary, but also includes vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0–255). This is the default dictionary.</td>
</tr>
<tr>
<td>starent-vsal-835</td>
<td>This dictionary consists not only of the 3gpp2-835 dictionary, but also includes vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0–255). This is the default dictionary.</td>
</tr>
</tbody>
</table>

### Usage

Use this command to configure the RADIUS dictionary.

### Example

The following command configures the RADIUS dictionary standard.

```
radius dictionary standard
```
radius group

This command has been deprecated and is replaced by AAA Server Group configurations. See the *AAA Server Group Configuration Mode Commands* chapter.
radius ip vrf

This command associates the specific AAA group (NAS-IP) with a Virtual Routing and Forwarding (VRF) Context instance for BGP/MPLS, GRE, and IPSec tunnel functionality which needs VRF support for RADIUS communication. By default the VRF is NULL, which means that AAA group is associated with global routing table.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

radius ip vrf vrf_name

no radius ip vrf

no

Disables the configured IP Virtual Routing and Forwarding (VRF) context instance and removes the association between the VRF context instance and the AAA group instance (NAS-IP). By default this command is disabled, which means the NAS-IP being used is assumed a non-VRF IP and specific AAA group does not have any VRF association.

vrf_name

Specifies the name of a pre-configured VRF context instance. vrf_name is the alphanumeric string of a pre-configured VRF context configured in Context Configuration Mode via the ip vrf command.

⚠️ Caution: Any incorrect configuration, such as associating AAA group with wrong VRF instance or removing a VRF instance, will fail the RADIUS communication.

Usage

Use this command to associate/disassociate a pre-configured VRF context for a feature such as BGP/MPLS VPN or GRE, and IPSec tunneling which needs VRF support for RADIUS communication. By default the VRF is NULL, which means that AAA group (NAS-IP) is associated with global routing table and NAS-IP being used is assumed a non-VRF IP. This IP VRF feature can be applied to RADIUS communication, which associates the VRF with the AAA group. This command must be configured whenever a VRF IP is used as a NAS-IP in the AAA group or at the Context level for 'default' AAA group. This is a required configuration as VRF IPs may be overlapping hence AAA needs to know which VRF the configured NAS-IP belongs to. By this support different VRF-based subscribers can communicate with...
different RADIUS servers using the same, overlapping NAS-IP address, if required across different AAA groups.

**Example**

The following command associates VRF context instance `ip_vrf1` with specific AAA group (NAS-IP):

```
radius ip vrf ip_vrf1
```
radius keepalive

This command configures the keepalive authentication parameters for the RADIUS server.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name] host_name (config-ctx) #

Syntax

radius keepalive [ calling-station-id id | consecutive-response responses_no_of | encrypted | interval interval_duration | password | retries retries_no_of | timeout timeout_duration | username user_name | valid-response access-accept [ access-reject ] ]

default radius keepalive { calling-station-id | consecutive-response | interval | password | retries | timeout | username | valid-response }

default

Configures the default setting for the specified parameter.

calling-station-id id

Configures the Calling-Station ID to be used for the keepalive authentication. id must be an alphanumeric string of size 1 to 15 characters. Default: 000000000000000

consecutive-response responses_no_of

Configures the number of consecutive authentication responses after which the server is marked as reachable. responses_no_of must be an integer from 1 through 10. Default: 1

encrypted password

Designates use of encryption for the password.

In 12.1 and earlier releases, password must be an alphanumeric string of 1 through 63 characters.

In 12.2 and later releases, password must be an alphanumeric string of 1 through 132 characters.

Default: Test-Password

interval interval_duration

Configures the time interval (in seconds) between two keepalive access requests. interval_duration must be an integer from 30 through 65535. Default: 30
password
Configures the password to be used for the authentication as an alphanumeric string of 1 through 63 characters. Default: Test-Password

retries retries_no_of
Configures the number of times the keepalive access request are sent before marking the server as unreachable. retries_no_of must be an integer from 3 through 10. Default: 3

timeout timeout_duration
Configures the time interval (in seconds) between keepalive access request retries. timeout_duration must be an integer from 1 through 30. Default: 3

username user_name
Configures the username to be used for authentication as an alphanumeric string of 1 through 127 characters. Default: Test-Username

valid-response access-accept [ access-reject ]
Configures the valid response for the authentication request. If access-reject is configured, then both access-accept and access-reject are considered as success for the keepalive authentication request. If access-reject is not configured, then only access-accept is considered as success for the keepalive access request. Default: keepalive valid-response access-accept

Usage
Use this command to configure the Keepalive Authentication parameters for the RADIUS server.

Example
The following command sets the user name for the RADIUS keepalive access requests to Test-Username2:

```
radius keepalive username Test-Username2
```

The following command sets the number of retries to 4:

```
radius keepalive retries 4
```
radius max-outstanding

This command configures the maximum number of outstanding messages a single AAA Manager instance will queue.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
radius max-outstanding max_messages
```

```
default radius max-outstanding
```

```
default
```

Configures the default setting.
Default: 256

```
max_messages
```

Specifies the maximum number of outstanding messages a single AAA Manager instance will queue. `max_messages` must be an integer from 1 through 4000. Default: 256

**Usage**

Use this command to configure the maximum number of outstanding messages a single AAA Manager instance will queue.

**Example**

The following command configures the maximum number of outstanding messages a single AAA Manager instance will queue to 100:

```
radius max-outstanding 100
```
**radius max-retries**

This command configures the maximum number of times communication with a AAA server will be attempted before it is marked as “Not Responding”.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```bash
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```bash
radius max-retries max_retries
```

**default radius max-retries**

```bash
default
```

Configures the default setting.

```bash
max_retries
```

Specifies the maximum number of times communication with a AAA server will be attempted before it is marked as “Not Responding”, and the detect dead server’s consecutive failures count is incremented. `max_retries` must be an integer from 0 through 65535. Default: 5

**Usage**
Use this command to configure the maximum number of times communication with a AAA server will be attempted before it is marked as “Not Responding”.

**Example**
The following command configures the maximum number of times communication with a AAA server will be attempted before it is marked as “Not Responding” to 10:

```bash
radius max-retries 10
```
radius max-transmissions

This command configures the maximum number of re-transmissions for RADIUS authentication requests.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

radius max-transmissions max_transmissions

{ default | no } radius max-transmissions

no

Deletes the RADIUS max-transmissions configuration.

default

Configures the default setting.
Default: Disabled

max_transmissions

Specifies the maximum number of re-transmissions for RADIUS authentication requests. This limit is used in conjunction with radius max-retries configuration for each server. max_transmissions must be an integer from 1 through 65535. Default: Disabled

When failing to communicate with a RADIUS sever, the subscriber is failed once all of the configured RADIUS servers have been exhausted, or once the configured number of maximum transmissions is reached. For example, if three servers are configured and if the configured max-retries is 3 and max-transmissions is 12, then the primary server is tried four times (once plus three retries), the secondary server is tried four times, and then a third server is tried four times. If there is a fourth server, it is not tried because the maximum number of transmissions (12) has been reached.

Usage

Use this command to configure the maximum number of re-transmissions for RADIUS authentication requests.

Example

The following command configures the maximum number of re-transmissions for RADIUS authentication requests to 10:

radius max-transmissions 10
radius mediation-device

See the radius accounting server command.
radius probe-interval

This command configures the interval between two RADIUS authentication probes.

Product
All products supporting Interchassis Session Recovery (ICSR)

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

radius probe-interval seconds

default radius probe-interval

default

Configures the default setting of 3.

seconds

Specifies the time duration (in seconds) to wait before sending another probe authentication request to a RADIUS server. The value must be an integer from 1 through 65535. Default: 3

Usage

Use this command for ICSR support to set the duration between two authentication probes to the RADIUS server.

Example

The following command sets the authentication probe interval to 30 seconds.

radius probe-interval 30
radius probe-max-retries

This command configures the number of retries for RADIUS authentication probe response.

Product
All products supporting Inter chassis Session Recovery (ICSR)

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

radius probe-max-retries retries

default radius probe-max-retries

default

Configures the default setting.
Default: 5

retries

Specifies the number of retries for RADIUS authentication probe response before the authentication is declared as failed. retries must be an integer from 1 through 65535. Default: 5

Usage

Use this command for ICSR support to set the number of attempts to send RADIUS authentication probe without a response before the authentication is declared as failed.

Example

The following command sets the maximum number of retries to 6:

radius probe-max-retries 6
**radius probe-message**

This command configures the service ip-address to be sent as an AVP in RADIUS authentication probe messages.

**Product**
All products supporting Inter chassis Session Recovery (ICSR)

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
radius probe-message local-service-address ipv4/ipv6_address

no radius probe-message local-service-address
```

- **no**
  Disables sending of AVPs configured under probe-message cli in RADIUS authentication probe messages.

```
radius probe-message local-service-address
radius probe-message
```

Configures AVPs to be sent in RADIUS authentication probe messages.

```
local-service-address
```

Configures the service ip-address to be sent as an AVP in RADIUS authentication probe messages.

```
ipv4/ipv6_address
```

Specifies the IPv4/IPv6 address of the server in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

**Example**

The following command configures the service ip-address 21.32.36.25 to be sent as an AVP in RADIUS authentication probe messages:

```
radius probe-message local-service-address 21.32.36.25
```
**radius probe-timeout**

This command configures the timeout duration to wait for a response for RADIUS authentication probes.

**Product**
All products supporting Interchassis Session Recovery (ICSR)

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

`configure > context context_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-ctx)#`

**Syntax**

```
radius probe-timeout timeout_duration

default radius probe-timeout
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>default radius probe-timeout</code></td>
<td>Configures the default setting. Default: 3</td>
</tr>
<tr>
<td><code>timeout_duration</code></td>
<td>Specifies the time duration (in seconds) to wait for a response from the RADIUS server before resending the authentication probe. <code>timeout_duration</code> must be an integer from 1 through 65535. Default: 3</td>
</tr>
</tbody>
</table>

**Usage**

Use this command for ICSR support to set the duration to wait for a response before re-sending the RADIUS authentication probe to the RADIUS server.

**Example**

The following command sets the authentication probe timeout to 120 seconds:

```
radius probe-timeout 120
```
radius server

This command configures RADIUS authentication server(s) in the current context.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
radius server ip_addr_address [ encrypted ] key value [ max max_messages ] [ max-rate max_rate ] [ oldports ] [ port port_number ] [ priority priority ] [ probe | no-probe ] [ probe-username user_name ] [ probe-password [ encrypted ] password password ] [ type { mediation-device | standard } ] [ admin-status { enable | disable } ] [ -noconfirm ]
```

```
no radius server ip_address [ oldports | port port_number ]
```

**no**

Removes the server or server port(s) specified from the list of configured servers.

**ip_address**

Specifies the IP address of the server in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

**[ encrypted ] key value**

Specifies the shared secret key used to authenticate the client to the servers. The `encrypted` keyword indicates the key specified is encrypted.

In 12.1 and earlier releases, the key value must be an alphanumeric string of 1 through 127 characters without encryption, and 1 through 256 characters with encryption.

In 12.2 and later releases, the key value must be an alphanumeric string of 1 through 127 characters without encryption, and 1 through 236 characters with encryption enabled.

The `encrypted` keyword is intended only for use by the system while saving configuration scripts. The system displays the `encrypted` keyword in the configuration file as a flag that the variable following the `key` keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

**max max_messages**

Specifies the maximum number of outstanding messages that may be allowed to the server. `max_messages` must be an integer from 0 through 4000. Default: 256
max-rate \texttt{max\_rate}

Specifies the rate (number of messages per second), at which the authentication messages should be sent to the RADIUS server. \texttt{max\_rate} must be an integer from 0 through 1000. Default: 0 (Disabled)

\texttt{oldports}

Sets the UDP communication port to the old default for RADIUS communications to 1645.

\texttt{port \texttt{port\_number}}

Specifies the port number to use for communications as an integer from 1 through 65535. Default: 1812

\texttt{priority \texttt{priority}}

Specifies the relative priority of this accounting server. The priority is used in server selection for determining to which server is to send accounting data. \texttt{priority} must be an integer from 1 through 1000 where 1 is the highest priority. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this. If you use the \texttt{-noconfirm} option, you are not asked for confirmation and multiple servers could be assigned the same priority. Default: 1000

\texttt{probe}

Enables probe messages to be sent to the specified RADIUS server.

\texttt{no-probe}

Disables probe messages from being sent to the specified RADIUS server. This is the default behavior.

\texttt{probe-username \texttt{username}}

Specifies the username sent to the RADIUS server to authenticate probe messages. \texttt{username} must be an alphanumeric string of 1 through 127 characters.

\texttt{probe-password [ encrypted ] password \texttt{password}}

The password sent to the RADIUS server to authenticate probe messages. \texttt{encrypted}: This keyword is intended only for use by the system while saving configuration scripts. The system displays the \texttt{encrypted} keyword in the configuration file as a flag that the variable following the \texttt{password} keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file. \texttt{password \texttt{password}}: Specifies the probe-user password for authentication. \texttt{password} must be an alphanumeric string of 1 through 63 characters.

\texttt{type \{ mediation-device | standard \}}

Specifies the type of transactions the RADIUS server accepts. \texttt{mediation-device}: Specifies mediation-device specific AAA transactions. This device is available if you purchased a transaction control services license. Contact your local sales representative for licensing information. \texttt{standard}: Specifies standard AAA transactions. (Default)
admin-status { enable | disable }

Enables or disables the RADIUS authentication/accounting/charging server functionality, and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

Usage

This command is used to configure the RADIUS authentication server(s) with which the system is to communicate for authentication. Up to 128 RADIUS servers can be configured per context. The servers can be configured as Accounting, Authentication, charging servers, or any combination thereof.

Example

The following commands configure RADIUS server with the IP address set to 10.2.3.4, port to 1024, and priority to 10:

radius server 10.2.3.4 key sharedKey port 1024 max 127

radius server 10.2.3.4 encrypted key scrambledKey oldports priority 10
radius strip-domain

This command configures the stripping of the domain from the user name prior to authentication or accounting.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
radius strip-domain { authentication-only | accounting-only }
```

```
no radius strip-domain
```

- **no**
  Removes the RADIUS strip-domain configuration.

- **authentication-only**
  Specifies that the domain must be stripped from the user name prior to authentication.

- **accounting-only**
  Specifies that the domain must be stripped from the user name prior to accounting.

**Usage**

Use this command to configure the stripping of domain from the user name prior to authentication or accounting.

By default, strip-domain configuration will be applied to both authentication and accounting messages, if configured. When the argument `authentication-only` or `accounting-only` is present, `strip-domain` is applied only to the specified RADIUS message types.

**Example**

The following command configures the stripping of domain from the user name prior to authentication:

```
radius strip-domain authentication-only
```
radius timeout

This command configures the time duration to wait for a response from the RADIUS server before resending the messages.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
`configure > context context_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-ctx)#`

**Syntax**

```
radius timeout timeout_duration

default radius timeout
```

**default radius timeout**

```
default

Configures the default setting.
```

```
timeout_duration

Specifies the time duration (in seconds) to wait for a response from the RADIUS server before resending the messages. `timeout_duration` must be an integer from 1 through 65535. Default: 3
```

**Usage**
Use this command to configure the time duration to wait for a response from the RADIUS server before resending the messages.

**Example**
The following command configures the RADIUS timeout parameter to 300 seconds:

```
radius timeout 300
```
radius trigger

This command enables specific RADIUS triggers. The RADIUS Trigger configuration in the Context Configuration Mode is to enable backward compatibility. To configure RADIUS triggers for the default AAA group, you must configure them in the Context Configuration Mode.

Product
GGSN
P-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Syntax
[ no ] radius trigger { ms-timezone-change | qos-change | rai-change | rat-change | serving-node-change | uli-change }

default radius trigger

no
Disables the specified RADIUS trigger.

default
Configures the default setting.
Default: All RADIUS triggers are enabled.

ms-timezone-change
Specifies to enable RADIUS trigger for MS time zone change.

qos-change
Specifies to enable RADIUS trigger for Quality of Service change.

rai-change
Specifies to enable RADIUS trigger for Routing Area Information change.

rat-change
Specifies to enable RADIUS trigger for Radio Access Technology change.
radius trigger

---

**serving-node-change**

Specifies to enable RADIUS trigger for Serving Node change.

**uli-change**

Specifies to enable RADIUS trigger for User Location Information change.

---

**Usage**

Use this command to enable RADIUS triggers.

**Example**

The following command enables RADIUS trigger for RAT change:

```
radius trigger rat-change
```
remote-server-list

Creates or specifies the name of an existing remote server list for this context and enters the Remote Access List Configuration Mode.

Product
All

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

remote-server-list name list_name

no remote-server-list name list_name

no

Removes the specified remote server list from the context.

list_name

Specifies the name of the remote server list. If list_name does not refer to an existing list, the new list is created if resources allow. list_name is an alphanumeric string of 1 through 31 characters.

Usage

Enter the Remote Server List Configuration Mode for an existing list or for a newly defined list. This command is also used to remove an existing remote access list. A maximum of 256 services (regardless of type) can be configured per system. Entering this command results in the following prompt:

[context_name]host_name(config-remote-server-list)#

Remote Server List Configuration Mode commands are defined in the remote Server List Configuration Mode Commands chapter.

Example

The following command enters the Remote Server List Configuration Mode for the list named remote_list_1:

remote-server-list remote_list_1

The following command will remove remote_list_1 from the system:

no remote-server-list remote_list_1
route-access-list extended

Configures an access list for filtering routes based on a specified range of IP addresses.

Product
- PDSN
- HA
- GGSN

Privilege
- Security Administrator, Administrator

Mode
- Exec > Global Configuration > Context Configuration
- configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] route-access-list extended identifier { deny | permit } ip { network_parameter } { mask_parameter }

no
Deletes the specified route access list.

identifier
Specifies a value to identify the route access list as an integer from 100 through 999.

deny
Deny routes that match the specified criteria.

permit
Permit routes that match the specified criteria.

ip network_parameter ip_address wildcard_mask

Specifies the network portion of the route to match. The network portion of the route is mandatory and must be expressed in one of the following ways:

- ip_address wildcard_mask: Matches a network address and wildcard mask expressed in IPv4 dotted-decimal notation.
- any: Matches any network address.
- host network_address: Match the specified network address exactly. network_address must be an IPv4 address specified in dotted-decimal notation.
**mask_parameter**

This specifies the mask portion of the route to match. The mask portion of the route is mandatory and must be expressed in one of the following ways:

- `mask_address wildcard_mask`: A mask address and wildcard mask expressed in IPv4 dotted-decimal notation.
- `any`: Match any network mask.
- `host mask_address`: Match the specified mask address exactly. `mask_address` must be an IPv4 address specified in dotted-decimal notation.

**Usage**

Use this command to create an extended route-access-list that matches routes based on network addresses and masks.

**Example**

Use the following command to create an extended route-access-list:

```plaintext
route-access-list extended 100 permit ip 192.168.100.0 0.0.0.255
```
route-access-list named

Configures an access list for filtering routes based on a network address and net mask.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] route-access-list named list_name { deny | permit } { ip_address/mask | any } [ exact-match ]
```

- **no**
  Deletes the specified route access list.

- **list_name**
  Specifies name that identifies the route access list as an alphanumeric string of 1 through 79 characters.

- **deny**
  Denies routes that match the specified criteria.

- **permit**
  Permits routes that match the specified criteria.

- **ip_address/mask**
  Specifies the IP address (in IPv4 dotted-decimal notation) and the number of subnet bits, representing the subnet mask in CIDR notation (for example 10.1.1.1/24).

- **any**
  Matches any route.

- **exact-match**
  Matches the IP address prefix exactly.
**Usage**

Use this command to create route-access lists that specify routes that are accepted. Up to 16 routes can be added to each route-access-list.

**Example**

Use the following command to create a route access list named `list27` that permits routes that match `192.168.1.0/24` exactly:

```
route-access-list named list 27 permit 192.168.1.0/24 exact-match
```

To delete the list, use the following command:

```
no route-access-list named list 27 permit 192.168.1.0/24 exact-match
```
route-access-list standard

Configures an access-list for filtering routes based on network addresses.

**Product**
- PDSN
- HA
- GGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration
  - `configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] route-access-list standard identifier { permit | deny } { ip_address wildcard_mask | any | host network_address }
```

- **no**
  - Deletes the specified route access list.

- **identifier**
  - Specifies a value that identifies the route-access-list as an integer from 1 through 99.

- **deny**
  - Denies routes that match the specified criteria.

- **permit**
  - Permits routes that match the specified criteria.

- **ip_address wildcard_mask**
  - Specifies the IP address and subnet mask to match for routes. Both `ip_address` and `wildcard_mask` must be entered in IPv4 dotted-decimal notation. (For example, 192.168.100.0 255.255.255.0)

- **any**
  - Matches any route.

- **host network_address**
  - Matches only route having the specified network address as if it had a 32-bit network mask. `network_address` must be an IPv4 address specified in dotted-decimal notation.
Usage

Use this command to create route-access-lists that specify routes that are accepted.

Example

Use the following command to create a route access list with an identifier of 10 that permits routes:

```
route-access-list standard 10 permit 192.168.1.0 255.255.255.0
```

To delete the list, use the following command:

```
no route-access-list standard 10 permit 192.168.1.0 255.255.255.0
```
route-map

Creates a route-map that is used by the routing features and enters Route-map Configuration mode. A route-map allows redistribution of routes and includes a list of match and set commands associated with it. The match commands specify the conditions under which redistribution is allowed; the set commands specify the particular redistribution actions to be performed if the criteria specified by match commands are met. Route-maps are used for detailed control over route distribution between routing processes. Up to eight route-maps can be created in each context. Refer to the Route-map Configuration Mode Commands chapter for more information.

Product
PDSN

GGSN

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

route-map map_name { deny | permit } seq_number

no route-map map_name

---

no

Deletes the specified route map.

---

map_name

Specifies the name of the route map to create or edit as an alphanumeric string of 1 through 69 characters.

---

deny

If the deny parameter is specified and the match command criteria are met, the route is not redistributed and any other route maps with the same map name are not examined. Set commands have no affect on deny route-maps.

---

permit

If the permit parameter is specified, and the match criteria are met, the route is redistributed as specified by set actions. If the match criteria are not met, the next route map with the same name is tested.
seq_number

Specifies the sequence number that indicates the position a new route map is to have in the list of route maps already configured with the same name. Route maps with the same name are tested in ascending order of their sequence numbers. This must be an integer from 1 through 65535.

Usage

Use this command to create route maps that allow redistribution of routes based on specified criteria and set parameters for the routes that get redistributed. The chassis supports a maximum of 64 route maps per context.

Example

To create a route map named map1 that permits routes that match the specified criteria, use the following command:

```
route-map map1 permit 10
```

To delete the route-map, enter the following command:

```
no route-map map1 permit 10
```
router

Enables BGP, Open Shortest Path First (OSPF) or OSPF version 3 (OSPFv3) routing functionality and enters the corresponding Configuration Mode. Refer to the BGP Configuration Mode Commands, OSPF Configuration Mode Commands or OSPFv3 Configuration Mode Commands chapter for details on associated Configuration mode commands.

Product

SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] router { bgp as_number | ospf | ospfv3 | rip }

no

Disables the specified routing support in the current context.

bgp as_number

Enables a BGP routing service for this context and assigns it the specified Autonomous System (AS) number before entering the BGP Configuration mode. as_number must be an integer from 1 through 4294967295.

Important: BGP routing is supported only for use with the HA.

ospf

Enables OSPF routing in this context and enters OSPF Configuration mode.

ospfv3

Enables OSPFv3 routing in this context and enter OSPFv3 Configuration mode.

Usage
Use this command to enable and configure OSPF and BGP routing in the current context.
**Important:** You must obtain and install a valid license key to use these features. Refer to the *System Administration Guide* for details on obtaining and installing feature use license keys.

### Example

The following command enables the OSPF routing functionality and enters the OSPF Configuration Mode:

```bash
router ospf
```

The following command enables the OSPFv3 routing functionality and enters the OSPFv3 Configuration Mode:

```bash
router ospfv3
```

The following command enables a BGP routing service with an AS number of 100, and enters the BGP Configuration Mode:

```bash
router bgp 100
```
Chapter 57
Context Configuration Mode Commands S-Z

This section includes the commands `s102-service` through `wsg-service` service.

Mode

Exec > Global Configuration > Context Configuration

`configure > context context_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-ctx)#`

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
saegw-service

Creates a System Architecture Evolution Gateway (SAEGW) service or specifies an existing SAEGW service and enters the SAEGW Service Configuration Mode for the current context.

Product
SAEGW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

saegw-service service_name [ -noconfirm ]

no saegw-service service_name

no

Removes the specified SAEGW service from the context.

service_name

Specifies the name of the SAEGW service. If service_name does not refer to an existing service, the new service is created if resources allow. service_name is an alphanumeric string of 1 through 63 characters.

Important: Service names must be unique across all contexts within a chassis.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

Usage

Enter the SAEGW Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.

Important: An S-GW and/or P-GW created in the same context must be associated with this SAEGW service.

A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a
large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-saegw-service)#
```

SAEGW Service Configuration Mode commands are defined in the *SAEGW Service Configuration Mode Commands* chapter.

Use this command when configuring the following SAE components: SAEGW.

**Example**

The following command enters the existing SAEGW Service Configuration Mode (or creates it if it does not already exist) for the service named `saegw-service1`:

```
saegw-service saegw-service1
```

The following command will remove `pgw-service1` from the system:

```
no saegw-service saegw-service1
```
sbc-service

Creates or removes an SBc service and enters the SBc Service Configuration mode. This mode configures or edits the configuration for an SBc service which controls the interface between the MME and E-SMLC.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] sbc-service sbc_svc_name

- no
  Remove the configuration for the specified SBc service from the configuration of the current context.

- sbc_svc_name
  Specifies the name of the SBc service as a unique alphanumeric string from 1 to 63 characters.
  The SBc service name must be unique across all contexts.

**Important:** Service names must be unique across all contexts within a chassis.

Usage

Use this command to create, edit, or remove an SBc service.
Up to 8 SGs + MME + SBc + SLs Services can be configured on the system.

Example

The following command creates an SBc service named sbc1 in the current context:

```bash
sbc-service sbc1
```
server

Configures remote server access protocols for the current context. This command is used to enter the specified protocols configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

`configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
server { ftpd | named | sshd | telnetd | tftpd }
no server { ftpd | named | sshd | telnetd | tftpd } [ kill ]
```

- **no**
  Disables the specified service.

- **ftpd**
  Enters the FTP Server Configuration Mode.

**Important:** The FTPD server can only be configured in the local context.

- **named**
  Starts the named server.

- **sshd**
  Enters the SSH Server Configuration Mode.

**Important:** The SSHD server allows only three unsuccessful login attempts before closing a login session attempt.

- **telnetd**
  Enters the Telnet Server Configuration Mode.

**Important:** The TELNET server allows only three unsuccessful login attempts before closing a login session attempt.
**tftp**

Enters the TFTP Server Configuration Mode.

---

**Important:** The TFTP server can only be configured in the local context.

**kill**

Indicates all instances of the server are to be stopped.

This option only works with the `ftpd`, `sshd`, `telnetd`, and `tftp` commands.

---

**Usage**

Enter the Context Configuration Mode for the appropriate, previously defined context, to set the server option(s). Repeat the command as needed to enable/disable more than one option server daemon.

**Example**

```
server ftpd
server named
no server tftp
server sshd
server telnetd
no server telnetd kill
```
service-redundancy-protocol

Configures Interchassis Session Recovery (ICSR) services for the current context. This command is used to enter the Service Redundancy Protocol Configuration Mode.

**Product**
All products supporting ICSR

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
service-redundancy-protocol
```

**Usage**
Enter the Configuration Mode to set the service redundancy protocol options.

**Example**
The following command enters Service Redundancy Protocol Configuration Mode.

```
service-redundancy-protocol
```
session-event-module

Enables the event module, enters the Session Event Module Configuration Mode where the sending of S-GW subscriber-specific event files to an external server can be configured. From release 15.0 onwards, the session-event module is used by SGSN for event logging. By default, EDR files are generated at the location: /hd-raid/records/edr. After upgrading to release R15.0, if this CLI is configured, the path for EDR files changes to: /hd-raid/records/event.

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] session-event-module

no

Disables the event module configuration.

Usage
Enter the Session Event Module Configuration Mode where the sending of S-GW subscriber-specific event files to an external server can be configured.

Entering this command results in the following prompt:

[context_name]host_name(config-event)#

Session Event Module Configuration Mode commands are defined in the Session Event Module Configuration Mode Commands chapter.
sgsn-service

Creates an SGSN service instance and enters the SGSN Service Configuration mode. This mode configures or edits the configuration for an SGSN service which controls the SGSN functionality.

An SGSN mediates access to GPRS/UMTS network resources on behalf of user equipment (UE) and implements the packet scheduling policy between different QoS classes. It is responsible for establishing the packet data protocol (PDP) context with the GGSN.

**Important:** For details about the commands and parameters, check the *SGSN Service Configuration Mode* chapter.

**Product**
SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```
configure > context context_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] sgsn-service srvc_name
```

- **no**
  Remove the configuration for the specified SGSN service from the configuration of the current context.

- **srvc_name**
  Specifies the name of the SGSN service as a unique alphanumeric string of 1 through 63 characters.

**Important:** Service names must be unique across all contexts within a chassis.

**Usage**

Use this command to create, edit, or remove an SGSN service.

**Example**

The following command creates an SGSN service named *sgsn1* in the current context:

```
sgn-service sgsn1
```

The following command removes the sgsn service named *sgsn1* from the configuration for the current context:
no sgsn-service sgsn1
sgs-service

Creates an SGs service instance and enters the SGS Service Configuration mode.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] sgs-service name

| no
Remove the configuration for the specified SGs service from the configuration of the current context.

name
Specifies a name for an SGs service as a unique alphanumeric string of 1 through 63 characters.

Important: Service names must be unique across all contexts within a chassis.

-noconfirm
Executes the command without any additional prompt and confirmation from the user.

Usage

Enter the SGS Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following CLI prompt:

[context_name]host_name(config-sgs-service)#

SGS Service Configuration Mode commands are defined in the MME SGS Service Configuration Mode Commands chapter.
Example

The following command creates an SGS service named *sgs1* in the current context:

```
sgs-service sgs1
```

The following command removes the SGS service named *sgs1* from the configuration for the current context:

```
no sgs-service sgs1
```
sgtp-service

Creates an SGTP service instance and enters the SGTP Service Configuration mode. This mode configures the GPRS Tunneling Protocol (GTP) related settings required by the SGSN and eWAG to support GTP-C (control plane) messaging and GTP-U (user data plane) messaging.

Product
- eWAG
- SGSN

Privilege
- Security Administrator, Administrator

Mode
- Exec > Global Configuration > Context Configuration
  - `configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

Syntax

```
[ no ] sgtp-service sgtp_service_name
```

- `no`
  - If previously configured, removes the specified SGTP service configuration in the current context.

- `sgtp_service_name`
  - Specifies name of the SGTP service.
  - `sgtp_service_name` must be an alphanumeric string of 1 through 63 characters.

**Important:** Service names must be unique across all contexts within a chassis.

Usage

Use this command to create, edit, or remove an SGTP service.

On entering this command, the CLI prompt changes to:

```
[context_name]host_name(config-sgtp-service)#
```

Example

The following command creates an SGTP service named `sgtp1` in the current context:

```
sgtp-service sgtp1
```

The following command removes, if previously configured, the SGTP service named `sgtp1` from the current context:

```
no sgtp-service sgtp1
```
sgw-service

Creates an S-GW service or specifies an existing S-GW service and enters the S-GW Service Configuration Mode for the current context.

Product
S-GW
SAEGW

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration
`configure > context context_name`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

Syntax

```
sgw-service service_name [ -noconfirm ]

no sgw-service service_name
```

Specifies the name of the S-GW service. If `service_name` does not refer to an existing service, the new service is created if resources allow. `service_name` is an alphanumeric string of 1 through 63 characters.

**Important:** Service names must be unique across all contexts within a chassis.

```
-noconfirm
```

Executes the command without any additional prompt and confirmation from the user.

```
no sgw-service service_name
```

Removes the specified S-GW service from the context.

Usage

Enter the S-GW Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.

A maximum of 256 services (regardless of type) can be configured per system.

**Caution:** Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.
Entering this command results in the following prompt:

```
[context_name]hostname(config-sgw-service)#
```

S-GW Service Configuration Mode commands are defined in the *S-GW Service Configuration Mode Commands* chapter.

Use this command when configuring the following SAE components: S-GW.

**Example**

The following command enters the existing S-GW Service Configuration Mode (or creates it if it does not already exist) for the service named `sgw-service1`:

```
sgw-service sgw-service1
```

The following command will remove `spgw-service1` from the system:

```
no sgw-service sgw-service1
```
sls-service

Creates an SLs service or configures an existing SLs service and enters the SLs Service Configuration Mode in the current context.

Product
MME

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > SLs Service Configuration

configure > context context_name > sls-service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-slsl-service)#

Syntax

sls-service service_name [ -noconfirm ]
[ no ] sls-service service_name

no
Removes the specified SLs service from the context.

service_name
Specifies the name of the SLs service. If service_name does not refer to an existing service, the new service is created if resources allow.

service_name is an alphanumeric string of 1 through 64 characters.

Important: Service names must be unique across all contexts within a chassis.

Usage
Enter the SLs Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.

Up to 4 SLs services can be configured on the system.
The SLs service name must be unique across all contexts.

Entering this command results in the following prompt:

[context_name]host_name(config-slsl-service)#

SLs Service Configuration Mode commands are defined in the SLs Service Configuration Mode Commands chapter.

Example
The following command enters the existing SLs Service Configuration Mode (or creates it if it does not already exist) for the service named sls1.
sls-service slsl
**ssh**

Generates public and private keys for use with the configured Secure Shell (SSH) server for the current context and sets the public/private key pair to specified values.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration
```
class > context context_name
```
Entering the above command sequence results in the following prompt:
```
[context_name]host_name(config-ctx)#
```

**Syntax**
```
ssh { generate key | key data length octets } [ type { v1-rsa | v2-rsa | v2-dsa } ]
```
```
no ssh key [ type { v1-rsa | v2-rsa | v2-dsa } ]
```

This command clears configured SSH keys. If type is not specified, all SSH keys are cleared.

- **generate key**
  Generates a public/private key pair which is to be used by the SSH server. The generated key pair is in use until the command is issued again.

- **key data length octets**
  Sets the public/private key pair to be used by the system where *data* is the encrypted key and *length* is the length of the encrypted key in octets. *data* must be an alphanumeric string of 1 through 1023 characters and *octets* must be a value in the range of 0 through 65535.

  ```
  [ type { v1-rsa | v2-rsa | v2-dsa } ]
  ```

  Specifies the type of SSH key to generate. If type is not specified, all three key types are generated.
  - **v1-rsa**: SSHv1 RSA host key only
  - **v2-rsa**: SSHv2 DSA host key only
  - **v2-dsa**: SSHv2 RSA host key only

**Important:** For maximum security, it is recommended that only SSH v2 be used. **v2-rsa** is the recommended key type.

**Usage**
Generate secure shell keys for use in public key authentication.
Example

```bash
ssh generate key
ssh key g6j93fw59cx length 128
```
ssl

Creates a new Secure Sockets Layer (SSL) template or specifies an existing one and enters the SSL Template Configuration Mode.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
[ no ] ssl template name { ssl-subscriber }
```

- **no**
  Removes the specified SSL template from the context.

- **template name**
  Specifies the name of a new or existing SSL template as an alphanumeric string of 1 through 127 alphanumeric characters.

- **ssl-subscriber**
  Specifies that the SSL template is an SSL subscriber template.

**Usage**

Use this command to create a new SSL template or modify an existing one.

Entering this command results in the following prompt:

```
[context_name]host_name(config-ctx-ssl-subscriber-template)#
```

SSL Template Configuration Mode commands are defined in the *SSL Template Configuration Mode Commands* chapter.

**Example**

The following command specifies the SSL template `ssl_template_1` and enters the SSL Template Configuration Mode:

```
ssl template ssl_template_1 ssl-subscriber
```
subscriber

Configures the specified subscriber for the current context.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

`configure > context context_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-ctx)#`

Syntax

```
subscriber { default | name user_name } asn-service-info mobility [ ipv4 | ipv6 | ipv6-ipv4 ]
```

```
o subscriber { default | name user_name }
```

no

Indicates the subscriber specified is to be removed from the list of allowed users for the current context.

```
default | name user_name
```

**default**: Enters the Subscriber Configuration Mode for the context’s default subscriber settings.

**name user_name**: Specifies the user which is to be allowed to use the services of the current context.

**user_name** must be an alphanumeric string of 1 through 127 characters.

**asn-service-info mobility**: Indicates the type of mobility supported and enabled in the Autonomous System Number (ASN).

Usage

Enter the Subscriber Configuration Mode for actual users as well as for a default subscriber for the current context.

Entering this command results in the following prompt:

`[context_name]host_name(config-subscriber)#`

Subscriber Configuration Mode commands are defined in the *Subscriber Configuration Mode Commands* chapter.

NAS uses the specified parameter for `asn-service-info mobility` to indicate and pack the mobility support field for IPv4, IPv6, or both, in the Service-Info attribute in the Access-request. RADIUS sends back this attribute in the Access-accept message by indicating respective bits to authorize the service indicated by NAS.

**Important**: A maximum of 128 subscribers and/or administrative users may be locally configured per context.
Example

Following command configures the default subscriber in a context:

```
subscriber default
```

Following command removes the default subscriber from a context:

```
no subscriber default
```

Following command configures a subscriber named `user1` in a context:

```
subscriber name user1
```

Following command removes a subscriber named `user1` from a context:

```
no subscriber name user1
```
threshold available-ip-pool-group

Configures context-level thresholds for IP pool utilization for the system.

Product

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

 contextual_host_name(config-ctx)#

Syntax

threshold available-ip-pool-group low_thresh [ clear high_thresh ]

default threshold available-ip-pool-group

<table>
<thead>
<tr>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures the default setting.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>low_thresh</th>
</tr>
</thead>
<tbody>
<tr>
<td>The low threshold IP pool utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm. low_thresh can be configured as an integer from 0 through 100. Default: 10</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>clear high_thresh</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the high threshold IP pool utilization percentage that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm will be generated. high_thresh can be configured as an integer from 0 through 100. Default: 10</td>
</tr>
</tbody>
</table>

ℹ️ Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

When IP address pools are configured on the system, they can be assigned to a group. IP address pool utilization thresholds generate alerts or alarms based on the utilization percentage of all IP address contained in the pool group during the specified polling interval.

All configured public IP address pools that were not assigned to a group are treated as belonging to the same group. Individual configured static or private pools are each treated as their own group.

Alerts or alarms are triggered for IP address pool utilization based on the following rules:

- **Enter Condition**: Actual IP address utilization percentage per pool group ≤ Low Threshold
- **Clear Condition**: Actual IP address utilization percentage per pool group > High Threshold
If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

The following table describes the possible methods for configuring IP pool utilization thresholds:

### Table 26. IP Pool Utilization Thresholds - Configuration Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Context-level</td>
<td>A single IP pool utilization threshold can be configured for all IP pool groups within a given system context. If a single threshold is configured for all pool groups, separate alerts or alarms can be generated for each group. This command configures that threshold.</td>
</tr>
<tr>
<td>IP address pool-level</td>
<td>Each individual IP address pool can be configured with its own threshold. Thresholds configured for individual pools take precedence over the context-level threshold that would otherwise be applied (if configured). In the event that two IP address pools belonging to the same pool group are configured with different thresholds, the system uses the pool configuration that has the greatest low threshold for that group.</td>
</tr>
</tbody>
</table>

### Example

The following command configures a context-level IP pool utilization low threshold percentage of 10 and a high threshold of 35 for a system using the Alarm thresholding model:

```
threshold available-ip-pool-group 10 clear 35
```
**threshold ha-service init-rrq-rcvd-rate**

Sets an alarm or alert based on the average number of calls setup per second for an HA service.

**Product**
HA

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

```config > context context_name```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-ctx)#
```

**Syntax**

```
threshold ha-service init-rrq-rcvd-rate high_thresh [ clear low_thresh ]
```

```
no threshold ha-service init-rrq-rcvd-rate
```

- **no**
  Deletes the alert or alarm.

- **high_thresh**
  Sets the high threshold average number of calls setup per second that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured as an integer from 0 through 1000000. Default: 0

- **clear low_thresh**
  Sets the low threshold average number of calls setup per second that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured as an integer from 0 through 1000000. Default: 0

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Use this command to set an alert or an alarm when the average number of calls setup per second is equal to or less than a specified number of calls per second.

Alerts or alarms are triggered for the number of calls setup per second based on the following rules:

- **Enter Condition:** Actual number of calls setup per second > High Threshold
- **Clear Condition:** Actual number of calls setup per second ≤ Low Threshold

**Example**
The following command configures a number of calls setup per second threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:

```
threshold ha-service init-rrq-rcvd-rate 1000 clear 500
```
threshold ip-pool-free

Sets an alarm or alert based on the percentage of IP addresses that are unassigned in an IP pool. This command affects all IP pools in the current context.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

threshold ip-pool-free low_thresh [ clear high_thresh ]

default threshold ip-pool-free

default
Configures the default setting.

low_thresh
Sets the low threshold percentage of addresses available in an IP pool that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured as an integer between 0 and 100. Default: 0

clear high_thresh
Sets the high threshold percentage of addresses available in an IP pool that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm will be generated. It may be configured as an integer between 0 and 100. Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

Use this command to set an alert or an alarm when the number of unassigned IP addresses in any pool is equal to or less than a specified percentage of the total number of addresses in the pool.
Alerts or alarms are triggered for percentage of IP address pool free based on the following rules:
• Enter Condition: Actual percentage of IP addresses free per pool \( \leq \) Low Threshold
• Clear Condition: Actual percentage of IP addresses free per pool \( > \) High Threshold
threshold ip-pool-free

**Important:** This command is overridden by the settings of the `alert-threshold` keyword of the `ip pool` command.

**Example**

The following command configures a context-level IP pool percentage of IP addresses that are unused low threshold percentage of 10 and a high threshold of 35 for a system using the Alarm thresholding model:

```
threshold ip-pool-free 10 clear 35
```
threshold ip-pool-hold

Sets an alert based on the percentage of IP addresses from an IP pool that are on hold. This command affects all IP pools in the current context.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

Syntax

threshold ip-pool-hold high_thresh [ clear low_thresh ]

default threshold ip-pool-hold

default
Configures the default setting.

high_thresh
Sets the high threshold percentage of addresses on hold in an IP pool that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured as an integer from 0 through 100. Default: 0

clear low_thresh
Sets the low threshold percentage of addresses on hold in an IP pool that maintains a previously generated alarm condition. If the utilization percentage rises below the low threshold within the polling interval, a clear alarm will be generated. It may be configured as an integer from 0 through 100. Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage
Use this command to set an alert or an alarm when the percentage of IP addresses on hold in any pool is equal to or greater than a specified percentage of the total number of addresses in the pool.
Alerts or alarms are triggered for percentage of IP address pool addresses on hold based on the following rules:

- **Enter Condition**: Actual percentage of IP addresses on hold per pool > High Threshold
- **Clear Condition**: Actual percentage of IP addresses on hold per pool ≤ Low Threshold
**Important:** This command is overridden by the settings of the `alert-threshold` keyword of the `ip pool` command.

**Example**

The following command configures a context-level IP pool percentage of IP addresses that are on high threshold percentage of 35 and a low threshold of 10 for an system using the Alarm thresholding model:

```
threshold ip-pool-hold 35 clear 10
```
threshold ip-pool-release

Sets an alert based on the percentage of IP addresses from an IP pool that are in the release state. This command affects all IP pools in the current context.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

threshold ip-pool-release high_thresh [ clear low_thresh ]

default threshold ip-pool-release

default

Configures the default setting.

high_thresh

Sets the high threshold percentage of addresses in the release state in an IP pool that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured as an integer from 0 through 100. Default: 0

clear low_thresh

Sets the low threshold percentage of addresses in the release state in an IP pool that maintains a previously generated alarm condition. If the utilization percentage rises below the low threshold within the polling interval, a clear alarm will be generated. It may be configured as an integer from 0 through 100. Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

Use this command to set an alert or an alarm when the number of IP addresses the release state in any pool is equal to or greater than a specified percentage of the total number of addresses in the pool. Alerts or alarms are triggered for percentage of IP address pool addresses in the release state based on the following rules:

- **Enter Condition**: Actual percentage of IP addresses in the release state per pool > High Threshold
- **Clear Condition**: Actual percentage of IP addresses in the release state per pool ≤ Low Threshold
threshold ip-pool-release

Important: This command is overridden by the settings of the alert-threshold keyword of the ip pool command.

Example

The following command configures a context-level IP pool percentage of IP addresses that are in the release state high threshold percentage of 35 and a low threshold of 10 for an system using the Alarm thresholding model:

```
threshold ip-pool-release 35 clear 10
```
**threshold ip-pool-used**

Sets an alert based on the percentage of IP addresses that have been assigned from an IP pool. This command affects all IP pools in the current context.

</tr>
</tbody>
</table>

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

**Usage**

Use this command to set an alert or an alarm when the number of IP addresses assigned from any pool is equal to or greater than a specified percentage of the total number of addresses in the pool. Alerts or alarms are triggered for percentage of IP address pool addresses used based on the following rules:

- **Enter Condition:** Actual percentage of IP addresses used per pool > High Threshold
- **Clear Condition:** Actual percentage of IP addresses used per pool ≤ Low Threshold
**Important:** This command is overridden by the settings of the `alert-threshold` keyword of the `ip pool` command.

**Example**

The following command configures a context-level IP pool percentage of IP addresses that are used high threshold percentage of 35 and a low threshold of 10 for an system using the Alarm thresholding model:

```
threshold ip-pool-used 35 clear 10
```
threshold monitoring

Enables or disables thresholds alerting for a group of thresholds.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ default | no ] threshold monitoring available-ip-pool-group

default

Configures the default setting.

no

Disables threshold monitoring for the specified value.

available-ip-pool-group

Enables threshold monitoring for IP pool thresholds at the context level and the IP address pool-level. Refer to the threshold available-ip-pool-group command, the threshold ip-pool-x commands and the alert-threshold keyword of the ip pool command for additional information on these values.

Usage

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e. high CPU utilization, or packet collisions on a network) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps**: SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the starentMIB(8164).starentTraps(2)section of the SNMPMIB Reference.

The generation of specific traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs**: The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of WARNING.
• **Alarm System:** High threshold alarms generated within the specified polling interval are considered “outstanding” until a the condition no longer exists and/or a condition clear alarm is generated. “Outstanding” alarms are reported to through the system’s alarm subsystem and are viewable through the CLI. The following table indicates the reporting mechanisms supported by each of the above models.

<table>
<thead>
<tr>
<th>Model</th>
<th>SNMP Traps</th>
<th>Logs</th>
<th>Alarm System</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alert</td>

<td>Alarm</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Refer to the `threshold poll` command in Global Configuration Mode Commands for information on configuring the polling interval over which IP address pool utilization is monitored.

**Example**

the following command enables threshold monitoring for IP pool thresholds at the context level and the IP address pool-level:

```
threshold monitoring available-ip-pool-group
```
threshold pdsn-service init-rrq-rcvd-rate

Sets an alarm or alert based on the average number of calls setup per second for a PDSN service.

**Product**
PDSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

`configure > context context_name`

Entering the above command sequence results in the following prompt:

```
<context_name>host_name(config-ctx)#
```

**Syntax**

```
threshold pdsn-service init-rrq-rcvd-rate high_thresh [ clear low_thresh ]
```

```
no threshold pdsn-service init-rrq-rcvd-rate
```

`no`

Deletes the alert or alarm.

`high_thresh`

Sets the high threshold average number of calls setup per second that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured as an integer between 0 and 1000000. Default: 0

`clear low_thresh`

Sets the low threshold average number of calls setup per second that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured as an integer between 0 and 1000000. Default: 0

**Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

**Usage**

Use this command to set an alert or an alarm when the average number of calls setup per second is equal to or less than a specified number of calls per second.

Alerts or alarms are triggered for the number of calls setup per second based on the following rules:

- **Enter Condition:** Actual number of calls setup per second > High Threshold
- **Clear Condition:** Actual number of calls setup per second ≤ Low Threshold

**Example**
The following command configures a number of calls setup per second threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:

```
threshold pdsn-service init-rrq-rcvd-rate 1000 clear 500
```
twan-profile

Creates a Trusted Wireless Access Network (TWAN) profile and enters the TWAN Profile Configuration Mode for the current context. The TWAN profile contains information on the RADIUS client addresses (WLC) and access-type corresponding to the RADIUS clients.

Product
SaMOG

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

[ no ] twan-profile twan_profile_name

no

Deletes the TWAN profile configuration for the current context.

twan_profile_name

Specifies the name of the TWAN profile. If a twan_profile_name does not already exist, a new profile is created.
In Release 17 and earlier, twan_profile_name must be an alphanumeric string of 1 through 64 characters.

Usage

Use this command to create a Trusted Wireless Access Network (TWAN) profile and enter the TWAN Profile Configuration Mode for the current context.
On entering this command, the CLI prompt changes to:
[context_name]host_name(config-twans-profile)#

TWAN Profile Configuration Mode commands are defined in the TWAN Profile Configuration Mode Commands chapter.
**udr-module active-charging-service**

Enables creation, configuration and deletion of the User Data Record (UDR) module for the context.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration

configure > context context_name

Entering the above command sequence results in the following prompt:

```
[context_name]hostname(config-ctx)#
```

**Syntax**

```
[ no ] udr-module active-charging-service
```

- **no**
  
  Deletes the UDR module configuration for the current context.

**Usage**

Use this command to create the UDR module for the context, and configure the UDR module for active charging service records. You must be in a non-local context when specifying this command, and you must use the same context when specifying the EDR module command.

On entering this command, the CLI prompt changes to:

```
[context_name]hostname(config-udr)#
```

**Example**

The following command creates the UDR module for the context, and enters the UDR Module Configuration Mode:

```
udr-module active-charging-service
```
wsg-service

Enables or disables Wireless Security Gateway (WSG) service. When enabled you are in WSG Service Configuration mode. (VPC only)

Product
SecGW (WSG)

Privilege
Security Administrator

Mode
Exec > Global Configuration > Context Configuration
configure > context context_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-ctx)#

Syntax

wsg-service service_name

no wsg-service service_name

no

Disables the specified WSG service.

service_name

Specifies the name of the WSG service as an alphanumeric string of 1 through 63 characters.

Important: Service names must be unique across all contexts within a chassis.

Usage

Use this command to enter the WSG Service Configuration Mode. For additional information, see the WSG Service Configuration Mode Commands chapter.

Example

The following command enters the WSG Service Configuration Mode:

wsg-service wsg01
Chapter 58
Credit Control Configuration Mode Commands

The Credit Control configuration Mode is used to configure prepaid services for Diameter/RADIUS applications.

Mode

Exec > ACS Configuration > Credit Control Configuration

```
active-charging service service_name > credit-control
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dcca)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**apn-name-to-be-included**

This command configures whether the virtual or real Access Point Name (APN) is sent in Credit Control Application (CCA) messaging.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > ACS Configuration > Credit Control Configuration

`active-charging service service_name > credit-control`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dcca)#
```

**Syntax**

```
apn-name-to-be-included { gn | virtual }
```

**default apn-name-to-be-included**

```
default

Configures this command with the default setting.
Default: gn
```

```
gn

Sends the Gn APN name in the CCA messages.
```

```
virtual

Sends the virtual APN name, if configured in the APN Configuration Mode, in the CCA messages.
```

**Usage**

Use this command to configure the APN information in CCA messages. Virtual APN name can be set to be sent in CCA messages if it is configured in the APN Configuration Mode.

**Example**

The following command sets the virtual APN name to be sent in CCA message:

```
apn-name-to-be-included virtual
```
app-level-retransmission

This command enables/disables application-level retransmissions with the “T” bit set.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > ACS Configuration > Credit Control Configuration

active-charging service service_name > credit-control

Entering the above command sequence results in the following prompt:

[local]host_name(config-dcca)#

Syntax

app-level-retransmission { set-retransmission-bit | unset-retransmission-bit }

default app-level-retransmission

default
Configures this command with the default setting.
Default: unset-retransmission-bit

set-retransmission-bit
Sets the retransmission bit.

unset-retransmission-bit
Unsets the retransmission bit.

Usage
Use this command to enable application-level transmission with “T” bit set.
'T' bit setting is done only for DIABASE protocol-based rerouting and not for application-based retransmissions. In order to identify such retransmissions, the server expects the T bit to be set at all levels (both DIABASE and application) of retransmission, which can be achieved with this CLI command.

Example
The following command specifies to set retransmission bit:

    app-level-retransmission set-retransmission-bit
associate

This command associates/disassociates a failure handling template with the Diameter Credit Control Application (DCCA) service.

Product
GGSN
HA
HSGW
IPSG
PDSN
P-GW
S-GW
SAEGW

Privilege
Security Administrator, Administrator

Mode
Exec > ACS Configuration > Credit Control Configuration

Syntax

associate failure-handling-template template_name

no associate failure-handling-template

no
Disassociates a failure handling template with the DCCA service.

failure-handling-template template_name

Associates a previously created failure handling template with the DCCA service. template_name specifies the name for a pre-configured failure handling template. template_name must be an alphanumeric string of 1 through 63 characters.

For more information on failure handling templates, refer to the failure-handling-template command in the Global Configuration Mode Commands chapter.

Usage
Use this command to associate a configured failure handling template with the DCCA service. The failure handling template defines the action to be taken when the Diameter application encounters a failure supposing a result-code failure, Tx-expiry or response-timeout. The application will take the action given by the template. For more information on failure handling template configurations, refer to the Diameter Failure Handling Template Configuration Mode Commands chapter.
**Important:** Only one failure handling template can be associated with the DCCA service. The failure handling template should be configured prior to issuing this command.

If the association is not made to the template then failure handling behavior configured in the application with the `failure-handling` command will take its effect.

**Example**

The following command associates a pre-configured failure handling template called `fht1` to the DCCA service:

```
associate failure-handling-template fht1
```
diameter dictionary

This command configures the Diameter Credit Control dictionary for the Active Charging Service (ACS).

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
`Exec > ACS Configuration > Credit Control Configuration`

**Syntax**
```
diameter dictionary { dcca-custom1 | dcca-custom10 | dcca-custom11 | dcca-custom12 | dcca-custom13 | dcca-custom14 | dcca-custom15 | dcca-custom16 | dcca-custom17 | dcca-

  custom97 | dcca-
  custom98 | dcca-
  custom99 | dynamic-load | standard }
```

**Usage**
Use this command to select the Diameter dictionary for ACS.

**Example**
The following command selects the standard Diameter dictionary:
diameter dictionary standard
diameter disable-final-reporting-in-ccru

This command controls sending of CCR-U with reporting reason as FINAL immediately on receiving a 4012 or 4010 result-code at MSCC level.

⚠ Important: In StarOS release 16.0 and later, this command is obsolete and is only supported for backward compatibility reasons. Release 16.0 and beyond, use the diameter msg-type { ccru| ccrt } suppress-final-reporting command for this functionality.

Product
- GGSN
- HA
- IPSG
- PDSN
- P-GW

Privilege
- Security Administrator, Administrator

Mode
Exec > ACS Configuration > Credit Control Configuration
active-charging service service_name > credit-control

Entering the above command sequence results in the following prompt:

[local]host_name(config-dcca)#

Syntax

diameter disable-final-reporting-in-ccru

{ default | no } diameter disable-final-reporting-in-ccru

default | no

Configures this command with the default setting. Default behavior is to send CCR-U with reporting reason as FINAL immediately on receiving 4010/4012 result-code.

Usage
As per the current implementation, CCR-U is sent immediately on receiving 4010 or 4012 Result-Code at MSCC level. This new CLI command controls sending of immediate CCR-U with FINAL as Reporting-Reason. All other behaviors remain almost same like a Rating-group being blacklisted.

If this CLI command is configured, on receiving the result-code 4010/4012 at MSCC-level, immediate CCR-U with FINAL as Reporting-Reason will not be sent. All USU corresponding to that rating group is reported in CCR-T message.

Example
The following command specifies not to send immediate CCR-U with FINAL as Reporting-Reason:

diameter disable-final-reporting-in-ccru
diameter dynamic-rules request-quota

This command specifies to request quota immediately in the CCR sent to the Gx interface when the traffic matches the dynamic rules with Online AVP enabled and received over Gx interface.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > ACS Configuration > Credit Control Configuration

Syntax

diameter dynamic-rules request-quota { on-traffic-match | on-receiving-rule }

default diameter dynamic-rules request-quota

default
Configures this command with the default setting.
Default: on-receiving-rule

on-traffic-match
Requests quota only when there is traffic matching the dynamic rules with Online AVP enabled.

on-receiving-rule
Requests quota on receiving a dynamic rule with Online AVP enabled.

Usage
Use this command to request quota when the traffic matches the dynamic rules with Online AVP enabled.

Example
The following command specifies to request quota on receiving a dynamic rule with Online AVP enabled:

diameter dynamic-rules request-quota on-receiving-rule
**diameter enable-quota-retry**

This command enables/disables Quota Retry Timer for blacklisted content.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > ACS Configuration > Credit Control Configuration

`active-charging service service_name > credit-control`

Entering the above command sequence results in the following prompt:

```plaintext
[local]host_name(config-dcca)#
```

**Syntax**

```
[ no ] diameter enable-quota-retry end-user-service-denied
```

- **no**

  Configures this command with the default setting.

**Usage**

Quota-Retry-Time is currently not applicable to a Rating-Group which is blacklisted with 4010 (END_USER_SERVICE_DENIED).

If this CLI command is configured, after the quota-retry timeout, CCR-U including the RSU is sent for blacklisted content also. That is, quota will be requested for 4010 blacklisted content also.

Without the configuration of this CLI command, the old behavior persists that is, after quota retry-timer expiry, CCR-U is not sent for 4010 blacklisted category.

**Example**

The following command allows sending CCR-U requesting quota for blacklisted content:

```
diameter enable-quota-retry end-user-service-denied
```
**diameter exclude-mscc-in-ccr-terminate**

This command enables to exclude Multiple-Services-Credit-Control (MSCC) AVP in CCR-T message.

**Product**
- GGSN
- IPSG

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > ACS Configuration > Credit Control Configuration
  
  ```
  active-charging service service_name > credit-control
  ```

  Entering the above command sequence results in the following prompt:

  ```
  [local]host_name(config-dcca)#
  ```

**Syntax**

```
[ default | no ] diameter exclude-mscc-in-ccr-terminate
```

- **default**
  - Includes MSCC AVP in CCR-T.

- **no**
  - Includes MSCC AVP in CCR-T.

**Usage**

Use this command to exclude MSCC AVP in CCR-T, which is included by default. Also, see the `diameter mscc-per-ccr-update` command.

**Example**

The following command specifies to exclude MSCC AVP in CCR-T:

```
diameter exclude-mscc-in-ccr-terminate
```
diameter fui-redirected-flow

This command enables to control the behavior of marking redirected HTTP flow as free-of-charge.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > ACS Configuration > Credit Control Configuration

active-charging service service_name > credit-control

Entering the above command sequence results in the following prompt:

[local]host_name(config-dcca)#

Syntax

[ no ] diameter fui-redirected-flow allow

  no

Disables the behavior of marking redirected HTTP flow as free-of-charge.
Default: diameter fui-redirected-flow allow

Usage

Use this command to control the behavior of marking redirected HTTP flow as free-of-charge when the Final-Unit-Indication (FUI) Diameter AVP comes without Filter IDs.

Important: Note that the default value, when configured, does not appear in the output of the show configuration command output; instead appear only in the output of the show configuration verbose command. When the HTTP redirection feature is disabled using the no diameter fui-redirected-flow allow command, it will be appear in the output of the show configuration command.

Example

The following command specifies to allow the packets free of charge, when matching the redirected-flow:

diameter fui-redirected-flow allow
diameter gsu-with-only-infinite-quota

This command configures whether to accept/reject CCA messages that contain Granted-Service-Unit AVP with only infinite quota grants from the server.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > ACS Configuration > Credit Control Configuration

active-charging service service_name > credit-control

Entering the above command sequence results in the following prompt:

[local]host_name(config-dcca)#

Syntax

diameter gsu-with-only-infinite-quota { accept-credit-control-answer | reject-credit-control-answer }

default diameter gsu-with-only-infinite-quota

default
Configures this command with the default setting.
Default: reject-credit-control-answer

accept-credit-control-answer
Accepts the Credit-Control-Answer message.

reject-credit-control-answer
Rejects the Credit-Control-Answer message.

Usage
Use this command to accept/reject CCA messages that contain the Granted-Service-Unit AVP with only infinite quota grants from the server.

Example
The following command specifies to accept CCA with the Granted-Service-Unit AVP containing only Infinite quota:

diameter gsu-with-only-infinite-quota accept-credit-control-answer
diameter ignore-returned-rulebase-id

This command configures to accept/ignore the rulebase ID in the Rulebase-Id AVP returned by the Diameter server in CCA messages.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > ACS Configuration > Credit Control Configuration

```
active-charging service service_name > credit-control
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dcca)#
```

**Syntax**

```
[ default | no ] diameter ignore-returned-rulebase-id
```

- **default**
  Configures this command with the default setting.
  Default: Accept

- **no**
  Accepts the rulebase ID received from Diameter server in CCA.

**Usage**

Use this command to ignore/accept rulebase ID returned from the Diameter server in CCA.

**Example**

The following command ignores the rulebase ID returned from the Diameter server in CCA:

```
diameter ignore-returned-rulebase-id
```
diameter ignore-service-id

This command enables to accept/ignore service ID in the Service-Identifier AVP defined in the Diameter dictionaries. This command is applicable to all products that use the Gy interface.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > ACS Configuration > Credit Control Configuration

```plaintext
active-charging service service_name > credit-control
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dcca)#
```

**Syntax**

```
[ default | no ] diameter ignore-service-id
```

- **default**
  
  Configures this command with the default setting.
  
  Default: Accept

- **no**
  
  Specifies to accepts the service ID.

**Usage**

Use this command to ignore/accept service ID value in the Service-Identifier AVP in the Diameter dictionaries for Gy interface implementations.

This command can be used to disable the usage of the Service-Identifier AVP for Gy interface implementations even if any of the Diameter dictionaries support the Service-Identifier AVP, and if this AVP should not be used for Gy interactions but must be present in GCDRs/eGCDRs.

**Example**

The following command specifies to ignore service ID in the Diameter dictionaries:

```
diameter ignore-service-id
```
diameter mscc-final-unit-action terminate

This command enables either to terminate a PDP session immediately when the Final-Unit-Action (FUA) in a particular Multiple Service Credit Control (MSCC) is set as TERMINATE and the quota is exhausted for that service, or to terminate the session after all other MSCCs (categories) have used up their available quota.

**Important:** This command is available only in StarOS 10.2 and later releases.

**Product**
GGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > ACS Configuration > Credit Control Configuration

**Syntax**
```
diameter mscc-final-unit-action terminate { category | session { on-per-mscc-exhaustion | on-all-mscc-exhaustion } } 
```

```
default diameter mscc-final-unit-action terminate 
```

- **default**
  Configures this command with the default setting.
  Default: Same as `diameter mscc-final-unit-action terminate category`

- **category**
  This is the standard behavior wherein the category is terminated if the Final-Unit-Indication AVP comes with TERMINATE for a given MSCC.

- **session { on-per-mscc-exhaustion | on-all-mscc-exhaustion }**
  Terminates the session depending on the quota usage of one MSCC or all the MSCCs.
  - **on-per-mscc-exhaustion:** When the FUA in a particular MSCC is set as TERMINATE and the quota is exhausted for that service, the session will be terminated immediately regardless of the state of the other MSCCs.
  - **on-all-mscc-exhaustion:** When the FUA in a particular MSCC is set as TERMINATE and the quota is exhausted for that service, the session termination will be initiated after all the other MSCCs (categories) have used up their available quota. There will no more CCR(U) messages sent requesting quota after receiving the FUA as TERMINATE in the MSCC level.
Usage

Use this command to terminate a PDP session immediately when the FUA in a particular MSCC is set as TERMINATE and the quota is exhausted for that service, or to terminate the session after all other MSCCs (categories) have used up their available quota.

Example

The following command terminates the PDP session after quota exhausts for all MSCCs when MSCC FUA is set to TERMINATE:

```
diameter mscc-final-unit-action terminate session on-all-mscc-exhaustion
```
diameter mscc-per-ccr-update

This command configures sending single/multiple Multiple-Services-Credit-Control (MSCC) AVP in CCR-U messages.

**Important:** This command is available only in StarOS 8.3 and later releases.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > ACS Configuration > Credit Control Configuration

```text
active-charging service service_name > credit-control
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dcca)#
```

**Syntax**

```
diameter mscc-per-ccr-update { multiple | single }
```

**default diameter mscc-per-ccr-update**

```
default

Configures this command with the default setting.
Default: **multiple**
```

```
multiple

Sends multiple Multiple-Services-Credit-Control AVP in a single CCR-U message.
```

```
single

Sends only one Multiple-Services-Credit-Control AVP in a CCR-U message.
```

**Usage**

Use this command to configure sending single/multiple Multiple-Services-Credit-Control AVP in CCR-U messages.

**Example**

The following command configures sending a single Multiple-Services-Credit-Control AVP in CCR-U messages:

```
diameter mscc-per-ccr-update single
```
**diameter msg-type**

This command controls sending of CCR-U/CCR-T with reporting reason as FINAL immediately on receiving a 4012 or 4010 result-code at MSCC level or when the MSCC is in FUI Redirect/Restrict-access state.

**Product**
GGSN
HA
IPSG
PDSN
P-GW

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > ACS Configuration > Credit Control Configuration

```
active-charging service service_name > credit-control
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dcca)#
```

**Syntax**

```
diameter msg-type { ccru | ccrt } suppress-final-reporting

[ no ] diameter msg-type ccru suppress-final-reporting
```

**Important:** This default behavior is applicable to all dictionaries except for dcca-custom12 and dcca-custom13 dictionaries. In the case of dcca-custom12 and dcaaa-custom13, the FINAL reporting will always be sent in CCR-T even if MSCC is in FUI Redirect/Restrict-access state and USU is zero.

**no**

Depending on the configuration, this keyword will selectively send FINAL either in CCR-U or CCR-T even if MSCC is in FUI Redirect/Restrict-access state and USU is zero. The default behavior is to not send CCR-T with reporting reason as FINAL even when MSCC is in FUI Redirect/Restrict-access state and USU is zero.

**ccru**

This keyword disables Immediate FINAL reporting for result code 4010/4012 in CCR-U message.

**ccrt**

This keyword disables FINAL reporting for MSCC which are in no-quota and FUI Redirect/Restrict-access state.
Usage

With this CLI command “diameter msg-type ccrt suppress-final-reporting” configured:
Before MSCC enters into FUI Redirect or Restrict-Access state, all the used quota is reported using the Reporting-Reason as “OTHER_QUOTA_TYPE”. Since all the quota is reported, there is no need to send any other FINAL reporting to OCS.

Releases prior to 16.0, even if there is no quota utilization, the gateway sends FINAL with USU as ‘0’ octets in CCR-T. In this release, the FINAL reporting in CCR message is controlled when there is no quota usage to report to the OCS server during the FUI Redirect/Restrict-access scenario.

With this CLI command “diameter msg-type ccru suppress-final-reporting” configured:
In releases prior to 15.0, CCR-U is sent immediately on receiving 4010 or 4012 Result-Code at MSCC level. This new CLI command controls sending of immediate CCR-U with FINAL as Reporting-Reason. All other behaviors remain almost same like a Rating-group being blacklisted.
If this CLI command is configured, on receiving the result-code 4010/4012 at MSCC-level, immediate CCR-U with FINAL as Reporting-Reason will not be sent. All USU corresponding to that rating group is reported in CCR-T message.

Example

The following command specifies not to send FINAL reporting for FUA Redirect/Restrict-access:

    diameter msg-type ccrt suppress-final-reporting
diameter origin host

This command is obsolete. See the diameter origin endpoint command.
**diameter origin endpoint**

This command configures the Diameter Credit Control Origin Endpoint.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > ACS Configuration > Credit Control Configuration

**active-charging service service_name > credit-control**

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-dcca) #
```

**Syntax**

```
diameter origin endpoint endpoint_name [ realm realm_name ]
```

**no diameter origin endpoint**

```
no
```

Removes the Diameter Credit Control Origin Endpoint configuration.

```
endpoint endpoint_name
```

Specifies the Diameter Credit Control Origin Endpoint name as an alphanumeric string of 1 through 63 characters.

```
realm realm_name
```

Specifies the Diameter Credit Control Realm ID as an alphanumeric string of 1 through 127 characters.

**Usage**

Use this command to configure the Diameter Credit Control Origin Endpoint. The endpoint to configure should be pre-configured. For information on creating and configuring a Diameter endpoint, see the `diameter endpoint` command in the Context Configuration mode.

**Example**

The following command configures a Diameter Credit Control Origin Endpoint named `test`:

```
diameter origin endpoint test
```
diameter peer-select

This command configures the Diameter credit control primary and secondary hosts for DCCA.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > ACS Configuration > Credit Control Configuration

active-charging service service_name > credit-control

Entering the above command sequence results in the following prompt:

[local]host_name(config-dcca)#

Syntax

In 8.x and earlier releases:

diameter peer-select peer peer_name [ realm realm_name ] [ secondary-peer secondary_peer_name [ realm realm_name ] ] [ imsi-based start-value imsi_start_value end-value imsi_end_value ]

no diameter peer-select [ imsi-based start-value imsi_start_value end-value imsi_end_value ]

In 9.0 and later releases, for UMTS deployments:

diameter peer-select peer peer_name [ realm realm_name ] [ secondary-peer secondary_peer_name [ realm realm_name ] ] [ imsi-based { { prefix | suffix } imsi/prefix/suffix_start_value } [ to imsi/prefix/suffix_end_value ] ] [ msisdn-based { { prefix | suffix } msisdn-based/prefix/suffix_start_value } [ to msisdn-based/prefix/suffix_end_value ] ]

no diameter peer-select [ imsi-based { { prefix | suffix } imsi/prefix/suffix_start_value } [ to imsi/prefix/suffix_end_value ] ] | [ msisdn-based { { prefix | suffix } msisdn-based/prefix/suffix_start_value } [ to msisdn-based/prefix/suffix_end_value ] ]

no

Removes previously configured Diameter credit control peer selection setting.

peer peer_name

Specifies the primary host name. as an alphanumeric string of 1 through 63 characters that can contain punctuation characters.

imi-based start-value imsi_start_value end-value imsi_end_value

**Important:** This section applies only to 8.3 and earlier releases.
Credit Control Configuration Mode Commands

Specifies peer selection based on International Mobile Subscriber Identification (IMSI) range.

\texttt{start-value imsi\_start\_value} specifies the start of range in integer value of IMSI, and \texttt{end-value imsi\_end\_value} specifies the end of range in integer value of IMSI.

\texttt{imsi-based \{ \{ prefix | suffix \} imsi/prefix/suffix\_start\_value \} [ to imsi/prefix/suffix\_end\_value ]}

\textbf{Important:} This section applies only to 9.0 and later releases for UMTS deployments.

Selects peer based on IMSI prefix or suffix or IMSI range.

\texttt{prefix}: Specifies the prefix range
\texttt{suffix}: Specifies the suffix range
\texttt{imsi/prefix/suffix\_start\_value}: Specifies the IMSI/prefix/suffix start value. prefix/suffix must be an IMSI prefix/suffix, and must be an integer from 1 through 15 characters.
\texttt{imsi/prefix/suffix\_end\_value}: Specifies the IMSI/prefix/suffix end value. prefix/suffix must be an IMSI prefix/suffix, and must be an integer from 1 through 15 characters that must be greater than the start value.

\textbf{Important:} If prefix/suffix is used, the lengths of both start and end prefix/suffix must be equal. If the \texttt{prefix} or \texttt{suffix} keyword is not specified, it will be considered as suffix.

\texttt{msisdn-based \{ \{ prefix | suffix \} msisdn/prefix/suffix\_start\_value \} [ to msisdn/prefix/suffix\_end\_value ]}

Specifies peer selection based on MSISDN prefix or suffix or MSISDN range.

\texttt{prefix}: Specifies the prefix range
\texttt{suffix}: Specifies the suffix range
\texttt{msisdn/prefix/suffix\_start\_value}: Specifies the MSISDN/prefix/suffix start value.
\texttt{prefix/suffix} must be an MSISDN prefix/suffix, and must be an integer from 1 through 15 characters.
\texttt{msisdn/prefix/suffix\_end\_value}: Specifies the MSISDN/prefix/suffix end value. prefix/suffix must be an MSISDN prefix/suffix, and must be an integer from 1 through 15 characters that must be greater than the start value.

\texttt{realm \ realm\_name}

The \texttt{realm\_name} must be an alphanumeric string of 1 through 127 characters, and can contain punctuation characters. The realm may typically be a company or service name.

\texttt{secondary-peer \ secondary\_peer\_name}

Specifies a name for the secondary host to be used for failover processing. When the route-table does not find an AVAILABLE route, the secondary host performs a failover processing if the \texttt{diameter session failover} command is set.

\texttt{secondary\_peer\_name} must be an alphanumeric string of 1 through 63 characters, and can contain punctuation characters.

\textbf{Usage}

Use this command to configure Diameter credit control host selection.
If the `diameter peer-select` command is not configured, and if multiple peers are configured in the endpoint, the available peers configured in the endpoint are automatically chosen in a load-balanced round-robin manner.

9.0 and later releases support peer selection using prefix or suffix of IMSI or IMSI range. Subscribers are now assigned to a primary OCS instance based on the value of the IMSI prefix or suffix of a length of 1 to 15 digits. If the prefix or suffix keyword is not specified, it will be considered as suffix. Up to 64 peer selects can be configured. At a time either prefix or suffix mode can be used in one DCCA config. If prefix or suffix mode is used, the lengths of all prefix/suffix must be equal.

In 12.2 and later releases, Diameter peer selection can also be performed based on the configurable prefix or suffix of MSISDN or MSISDN range.

Each primary OCS may have a designated secondary OCS in case of failure of the primary. It will be the responsibility of the GGSN to use the appropriate secondary OCS in case of primary failure. The secondary OCS for each primary OCS will be one of the existing set of OCSs.

### Example

The following command configures a Diameter credit control peer named `test` and the realm `companyx`:

```
diameter peer-select peer test realm companyx
```

The following command configures IMSI-based Diameter credit control peer selection in the IMSI range of 1234567890 to 1234567899:

```
diameter peer-select peer star imsi-based start-value 1234567890 end-value 1234567899
```

The following command configures IMSI-based DCCA peer selection with IMSI suffix of 100 through 200:

```
diameter peer-select peer test_peer realm test_realm secondary-peer test_sec_realm realm test_realm2 imsi-based suffix 100 to 200
```
**diameter pending-timeout**

This command configures the maximum time period to wait for response from a Diameter peer.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > ACS Configuration > Credit Control Configuration

```
active-charging service service_name > credit-control
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dcca)#
```

**Syntax**

```
diameter pending-timeout duration deciseconds msg-type { any | ccr-event | ccr-initial | ccr-terminate | ccr-update }
```

```
default diameter pending-timeout
```

**Usage**

Use this command to set the maximum time for Diameter credit control to receive a response from its peer.
DCCA refers to this as the Tx Timer. Typically, this should be configured to a value smaller than the response-timeout value of Diameter Endpoint Configuration Mode. That value is typically too large for DCCA's purposes.

If DCCA gets a “no available routes” error before pending-timeout expires, then DCCA tries to send to the secondary host (if one has been configured). If DCCA gets no response and pending-timeout expires, then DCCA either tries the secondary host or gives up. This can now be managed using the failure-handling command.

If routing has failed, i.e., the attempt to the primary host, as well as, the attempt to the secondary host (if that has been configured), then the processing configured by the failure-handling command is performed. The routing (i.e., returning a good response, no response or an error response such as "no available routes") is controlled by Diameter Endpoint Configuration Mode. That uses a watchdog timer (called Tw Timer) to attempt a different route to a host. Multiple routes could be attempted. If there's no response before the endpoint's configured response-timeout expires, then "no available routes" is the routing result. The routing logic remembers the status of routes, so it can return "no available routes" immediately, without using any timers.

The default case will disable DCCA resending message at Tx (pending-timeout). So messages are retried only at Tw (device watchdog timeout) by diabase or at response-timeout by DCCA.

Example

The following command configures a Diameter Credit Control Pending Timeout setting of 20 seconds:

```
diameter pending-timeout 20
```
**diameter reauth-blacklisted-content**

This command allows reauthorization of blacklisted content (blacklisted with Result-Code like 4012, 4010, etc) when a Rating Group (RG) based Re-Authorization Request (RAR) or generic RAR is received.

**Product**
- GGSN
- HA
- IPSG
- PDSN
- P-GW
- SAEGW

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > ACS Configuration > Credit Control Configuration

```
active-charging service service_name > credit-control
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dcc)#
```

**Syntax**

```
diameter reauth-blacklisted-content [ content-based-rar ]
```

```
no diameter reauth-blacklisted-content
```

- **no**
  - Configures this command with the default setting. That means, the reauthorization of blacklisted RG will not happen.

- **content-based-rar**
  - Reauthorizes blacklisted RG only when RG specific RAR is received.

**Usage**

The current Gy implementation does not allow reauthorization of Blacklisted content (blacklisted with Result-Code like 4012, 4010, etc) when Gy receives an RAR (either a RG based RAR or generic RAR). With this CLI based enhancement, it is possible to perform one of the following actions:

- to reauthorize blacklisted RG only when RG specific RAR is received.
- to reauthorize blacklisted RG on any kind of RAR (both RG specific or generic)
- do not reauthorize blacklisted RG (default implementation).

This feature determines if the RAR received from OCS is generic or to any specific rating-group.
If it is a generic RAR:

- If this CLI command “diameter reauth-blacklisted-content” is configured, then reauthorize all the Rating-Groups (RGs) which are blacklisted. CCR-U forced-reauthorization will be triggered all the RGs.

- If this CLI command “diameter reauth-blacklisted-content content-based-rar” is configured, then RG which are blacklisted will not be reauthorized. CCR-U forced-reauthorization will be triggered only for active RGs alone.

If Rating-Group information is received in RAR:

- If either “diameter reauth-blacklisted-content” or “diameter reauth-blacklisted-content content-based-rar” is configured, then RG gets re-authorized even it is blacklisted. CCR-U forced-reauthorization will be triggered for the received RG.

If this CLI command is not configured, then the default behavior which is not to reauthorize blacklisted RG persists.

**Example**

The following command enables reauthorization of blacklisted content on receiving RG specific RAR:

```
diameter reauth-blacklisted-content [ content-based-rar ]
```
diameter redirect-url-token

This command allows configuring a token to be used for appending original URL to the redirect address.

Important: This command is customer specific. For more information contact your Cisco account representative.

Product
- GGSN
- HA
- IPSG
- PDSN
- P-GW
- SAEGW

Privilege
- Security Administrator, Administrator

Mode
- Exec > ACS Configuration > Credit Control Configuration
- active-charging service service_name > credit-control

Entering the above command sequence results in the following prompt:

[local]host_name(config-dcca)#

Syntax

diameter redirect-url-token string

default diameter redirect-url-token

default
- Configures this command with the default setting.

string
- The redirect url token name must be an alphanumeric string of size 1 through 63 characters.

Usage

The chassis should perform dynamic Advice of Charge (AoC) redirections (URL provided by Online Charging System (OCS)) for a particular Service ID/Rating Group combination without affecting the flows mapped to other Service ID/Rating Group combinations. Redirections can be removed by OCS for a particular MSCC (Service ID/Rating Group combination) using a RAR message containing a specific Service ID/Rating Group combination.

As part of redirection to an AoC or Top-UP server (302 Moved HTTP message) the PCEF should be able to append the original HTTP URL to the redirected session. This way, once the subscriber has successfully been redirected (and potentially topped up their prepaid account) they can be presented with an option to be redirected back to their original URL. The OCS can indicate to the PCEF if the original URL is to be
appended to the redirection by specifying a special character to the end of the AoC redirection — for example, a "?" character.

Upon final unit indication a redirect server address will be returned together with the FUI.

On redirection, the redirect URL will be appended with the original URL information using the token name configured with the **diameter redirect-url-token** command so that on completion of AoC, the AoC server may redirect the client back to the original location.

The rules for appending the original URL before redirection are as follows:

1. The “?” character at the end of the AoC page provided by the OCS in the redirect URL will be replaced with the “&” character.
2. A configurable parameter will be appended after the “&” character. The parameter whose name will be defined in a command line in the chassis configuration. The parameter name is case sensitive.
3. An “=” will be appended to the parameter.
4. The subscriber's original URL will be appended to the “=” character.

For example:

When the original URL was **http://homepage/**

OCS provided URL:

```
```

The text in bold in the following sample indicates the current configuration for implementing the dynamic AoC redirection.

```
```

**Example**

The following command configures the redirect-url-token as **returnUrl**:

```
diameter redirect-url-token returnUrl
```
diameter redirect-validity-timer

This command allows you to control the starting of validity timer for the FUI-redirect scenario.

Product
- GGSN
- HA
- IPSG
- PDSN
- P-GW

Privilege
- Security Administrator, Administrator

Mode
- Exec > ACS Configuration > Credit Control Configuration
- active-charging service service_name > credit-control

Entering the above command sequence results in the following prompt:

[local]host_name(config-dcca)#

Syntax

```
diameter redirect-validity-timer { immediate | traffic-start }
```

```
default diameter redirect-validity-timer
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Configures this command with the default setting. By default, the validity timer is started on receiving the first matching packet.</td>
</tr>
<tr>
<td>immediate</td>
<td>This keyword will make the redirect-validity-timer to get started immediately.</td>
</tr>
<tr>
<td>traffic-start</td>
<td>This keyword will make the redirect-validity-timer to get started only on receiving matching traffic. This is the default configuration.</td>
</tr>
</tbody>
</table>

Usage

Use this CLI command to control the starting of validity timer on receipt of CCA in all cases. Based on the configuration value, DCCA decides when to start the redirect-validity-timer. By default, it is started on receiving the first matching packet.

Example

The following command configures the redirect-validity-timer to get started immediately on receiving CCA:

```
diameter redirect-validity-timer immediate
```
**diameter result-code**

This command enables sending a GTP Create-PDP-Context-Rsp message with cause code based on the DCCA result code.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > ACS Configuration > Credit Control Configuration

```
active-charging service service_name > credit-control
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dcca)#
```

**Syntax**

```
diameter result-code { authorization-rejected | credit-limit-reached | end-user-service-denied | user-unknown } use-gtp-cause-code { apn-access-denied-no-subscription | authentication-failure | no-resource-available | system-failure }
```

```
default diameter result-code { authorization-rejected | credit-limit-reached | end-user-service-denied | user-unknown } use-gtp-cause-code
```

**default**
Configures this command with the default setting.

In 12.1 and earlier releases: no-resource-available
In 12.2 and later releases: system-failure

**authorization-rejected**
Result code received as DIAMETER_AUTHORIZATION_REJECTED(5003).

**credit-limit-reached**
Result code received as DIAMETER_CREDIT_LIMIT_REACHED(4012).

**end-user-service-denied**
Result code received as DIAMETER_END_USER_DENIED(4010).

**user-unknown**
Result code received as DIAMETER_USER_UNKNOWN(5030).

**use-gtp-cause-code**
Cause code to be sent in GTP response.
apn-access-denied-no-subscription
Sends the GTP cause code GTP_APN_ACCESS_DENIED_NO_SUBSCRIPTION in GTP response. If this keyword is configured and if the CCR-U is received with auth-rejected(5003) or credit-limit-reached(4012) or user-unknown(5030) or end-user-service-denied(4010), then the GTP result-code is sent as “apn-access-denied-no-subscription”.

authentication-failure
Sends the GTP cause code GTP_USER_AUTHENTICATION_FAILED in GTP response.

no-resource-available
Sends the GTP cause code GTP_NO_RESOURCES_AVAILABLE in GTP response.

system-failure
Sends the GTP cause code GTP_SYSTEM_FAILURE in GTP response.

Usage
On receiving result-code as AUTHORIZATION-REJECTED, CREDIT_LIMIT_REACHED, END_USER_DENIED or USER_UNKNOWN from DCCA server, based on this CLI configuration, in GTP Create-PDP-Context Response message the cause code can either be sent as GTP_NO_RESOURCE_AVAILABLE or GTP_AUTHENTICATION_FAILED or GTP_SYSTEM_FAILURE or GTP_APN_ACCESS_DENIED_NO_SUBSCRIPTION.

Example
The following command sets the deny cause as user authentication failure when the CCA-Initial has the result code DIAMETER_AUTHORIZATION_REJECTED(5003):

diameter result-code authorization-rejected use-gtp-cause-code authentication-failure
diameter send-ccri

This command configures when to send an initial Credit Control Request (CCR-I) for the subscriber session.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > ACS Configuration > Credit Control Configuration
active-charging service service_name > credit-control

Entering the above command sequence results in the following prompt:

[local]host_name(config-dcca)#

Syntax

diameter send-ccri { session-start | traffic-start }

default diameter send-ccri

default

Configures this command with the default setting.
Default: session-start

session-start

Sends CCR-I when the PDP context is being established (on receiving Create-PDP-Context-Request).

traffic-start

Delays sending CCR-I until the first data packet is received from the subscriber.

Important: Please note that the CCR-I will be sent only with the default rulebase and not with Rulebase list even if the rulebase-list configuration is enabled. When the rulebase-list command is used in conjunction with diameter send-ccri traffic-start command, the former one's function is invalidated. The rulebase-list is used to allow the OCS to select one of the rulebases from the list configured during the session setup. But in case of send-ccri traffic-start the CLI causes the session setup to complete without OCS interaction. For more information on rulebase-list command, please see the ACS Configuration Mode Commands chapter of the Command Line Interface Reference.

Usage
Use this command to configure when to send CCR-Initial for the subscriber session.

Example
The following command configures to send CCR-I on traffic detection and not on context creation:

diameter send-ccri traffic-start
diameter service-context-id

This command configures the value to be sent in the Service-Context-Id AVP, which identifies the context in which DCCA is used.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > ACS Configuration > Credit Control Configuration

.active-charging service service_name > credit-control

Entering the above command sequence results in the following prompt:

[local]host_name(config-dcca)#

Syntax

diameter service-context-id service_context_id

default diameter service-context-id

default

Configures this command with the default setting. Currently, the default value is encoded based on the dictionary wherever applicable; when not applicable, it is not encoded.

service_context_id

Specifies the service context as an alphanumeric string of 1 through 63 characters that can contain punctuation characters.

Usage

If Service-Context-Id is applicable and configured using this command, it will be sent in the AVP Service-Context-Id in the Diameter CCR message.

Example

The following command specifies the value version@customer.com to be sent in the Service-Context-Id AVP in the Diameter CCR message:

    diameter service-context-id version@customer.com
**diameter session failover**

This command enables/disables Diameter Credit Control Session Failover. When enabled, the secondary peer is used in the event the main peer is unreachable.

**Product**
- GGSN
- HA
- IPSG
- PDSN
- P-GW

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > ACS Configuration > Credit Control Configuration
- `active-charging service service_name > credit-control`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dcca)#
```

**Syntax**

```
[ default | no ] diameter session failover
```

- **default**
  - Configures this command with the default setting.
  - Default: Depends on the `failure-handling` configuration

- **no**
  - If the primary server is not reachable, failover is not triggered and the session is torn down. No failover action is taken.

**Usage**

Use this command to enable/disable Diameter Credit Control Session Failover. The `failure-handling` configuration comes into effect only if `diameter session failover` is present in the configuration. The failover can be overridden by the server in the response message, and it takes precedence.

**Example**

The following command enables Diameter Credit Control Session Failover:

```
diameter session failover
```
**diameter update-dictionary-avps**

This command enables dictionary control of the AVPs that need to be added based on the version of the specification with which the Online Charging System (OCS) is compliant. This command is applicable to all products that use the dcca-custom8 dictionary for Gy interface implementation.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > ACS Configuration > Credit Control Configuration

```
active-charging service service_name > credit-control
```

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-dcca)#
```

**Syntax**

```
diameter update-dictionary-avps { 3gpp-rel8 | 3gpp-rel9 | 3gpp-rel10 }

[ default | no ] diameter update-dictionary-avps
```

- **default | no**
  Configures this command with the default setting.
  Default: Compliant with the oldest release (Rel. 7) and send only Rel. 7 AVPs
  
- **3gpp-rel8**
  Select the 3GPP Rel. 8 AVPs for encoding.
  
- **3gpp-rel9**
  Selects the 3GPP Rel. 9 AVPs for encoding.
  
- **3gpp-rel10**
  Select the 3GPP Rel. 10 AVPs for encoding.

**Usage**

**Important:** This command is applicable ONLY to the dcca-custom8 dictionary. If, for any dictionary other than dcca-custom8, this command is configured with a value other than the default, configuration errors will be indicated in the output of the `show configuration errors` section of the `active-charging` command.

- Use this command to encode the AVPs in the dictionary based on the release version of the specification to which the OCS is compliant with.

**Example**

The following command enables encoding of AVPs in the dictionary based on 3GPP Rel. 9:
diameter update-dictionary-avps 3gpp-rel9
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
**event-based-session**

This command configures the parameters for event-based Gy session.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > ACS Configuration > Credit Control Configuration

```
active-charging service service_name > credit-control
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dcca) #
```

**Syntax**

```
[ no ] event-based-session trigger type { location-any | mcc | mnc | timezone } +
```

**default event-based-session trigger type**

```
default
```

Configures this command with the default setting.
Default: No triggers.

```
no
```

Removes the previously configured trigger type.

```
location-any
```

Sets the trigger based on change in user location.

```
mcc
```

Sets the trigger based on change in Mobile Country Code (MCC) of the serving node (for e.g. SGSN, S-GW).

```
mnc
```

Sets the trigger based on change in Mobile Network Code (MNC) of the serving node (for e.g. SGSN, S-GW).

```
timezone
```

Sets the trigger based on change in the timezone of UE.

```
+
```

Indicates that more than one of the previous keywords can be entered within a single command.
Usage
Use this command to enable the credit control reauthorization triggers for event-based-session in the credit-control group.

Example
The following command selects a credit control trigger as mcc:

```
event-based-session trigger type mcc
```
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
failure-handling

This command configures Diameter Credit Control Failure Handling (CCFH) behavior in the event of communication failure with the prepaid server or on reception of specific error codes from prepaid server.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > ACS Configuration > Credit Control Configuration

`active-charging service service_name > credit-control`

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-dcca) #
```

**Syntax**

```

default failure-handling [ initial-request | terminate-request | update-request ]
```

- **default failure-handling**
  - Configures the default CCFH setting.
  - `initial-request`: The default setting is `terminate`.
  - `update-request`: The default setting is `retry-and-terminate`.
  - `terminate-request`: The default setting is `retry-and-terminate`.

- **initial-request**
  - Specifies the message type as CCR-Initial.

- **terminate-request**
  - Specifies the message type as CCR-Terminate.

- **update-request**
  - Specifies the message type as CCR-Update.

- **continue**
  - Specifies the CCFH setting as continue. The online session is converted into an offline session. The associated PDP Context is established (new sessions) or not released (ongoing sessions).
retry-and-terminate

Specifies the CCFH setting as retry-and-terminate. The user session will continue for the duration of one retry attempt with the prepaid server. If there is no response from both primary and secondary servers, the session is torn down.

terminate

Specifies the CCFH setting as terminate. All type of sessions (initial or update) are terminated in case of failure.

go-offline-after-tx-expiry

Starts offline charging after Tx expiry.

retry-after-tx-expiry

Retries after Tx expiry. Enables secondary-host, if up, to take over after Tx expiry.

Usage

Use this command to select the CCFH behavior. The specified behavior is used for sessions when no behavior is specified by the prepaid server. By default, the CCFH is taken care at response-timeout except for terminate setting.

If the Credit-Control-Failure-Handling AVP is received from the server, the received setting will be applied to all the message types.

The following table indicates the CCFH behavior for the combination of different CCFH settings, and the corresponding CLI commands.

**Example**
The following command sets the Credit Control Failure Handling behavior for initial request message type to retry-and-terminate:

```plaintext
failure-handling initial-request retry-and-terminate
```
gy-rf-trigger-type

This command enables the Gy event triggers for configuration of matching Rf ACR containers.

**Product**
- GGSN
- HA
- IPSG
- PDSN
- P-GW

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > ACS Configuration > Credit Control Configuration

```
active-charging service service_name > credit-control
```

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-dca)#
```

**Syntax**

```
gy-rf-trigger-type { final | forced-reauthorization | holding-time | quota-exhausted | rating-condition-change | threshold | validity-time }

{ default | no } gy-rf-trigger-type
```

- **default | no**
  
  The “default/no” variant of this command will not enable any of the Gy event-triggers which means the containers would not be closed for any of the event-triggers.

- **final**
  
  Enables Gy trigger “final” for Rf

- **forced-reauthorization**
  
  Enables Gy trigger “forced-reauthorization” for Rf.

- **holding-time**
  
  Enables Gy trigger “qht” for Rf. The trigger “qht” indicates Quota Holding Time.

- **quota-exhausted**
  
  Enables Gy trigger “quota-exhausted” for Rf.

- **rating-condition-change**
  
  Enables Gy trigger “rating-condition-change” for Rf.
threshold
Enables Gy trigger “threshold” for Rf.

validity-time
Enables Gy trigger “validity-time” for Rf.

Usage
Use this command to enable the Gy reporting reasons/event triggers.
For all the Gy event triggers a container will be cached at Rf and will be sent based on other events at Rf (for example, max-charging-change-condition, RAT-Change, etc).

Important: The CLI command “gy-rf-trigger-type” is currently applicable only for CCR-U and not CCR-T.

For example, when the CLI for QUOTA_EXHAUSTED event trigger is configured under credit-control group configuration, if there is quota_exhausted event then the container should be cached with appropriate change-condition value and ACR-I would be sent out based on other Rf event triggers. Similar behavior is applicable to other event triggers when configured.

Example
The following command specifies the validity-time event trigger to be enabled.

    gy-rf-trigger-type validity-time
**imsi-imeisv-encoded-format**

This command configures the encoding format of IMSI/IMEISV in the User-Equipment-Info, 3GPP-IMSI and 3GPP-IMEISV AVPs.

**Product**
- GGSN
- HA
- IPSG
- PDSN
- P-GW

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > ACS Configuration > Credit Control Configuration

```
active-charging service service_name > credit-control
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dcca)#
```

**Syntax**

```
[ default | no ] imsi-imeisv-encoded-format { ascii | tbcd }
```

- **ascii**
  - Sends IMSI/IMEISV as an octet string in ASCII encoded format. By default, the IMSI/IMEISV will be encoded in ASCII format.

- **tbcd**
  - Sends IMSI/IMEISV as an octet string in Telephony Binary Coded Decimal (TBCD) format, i.e. the nibbles in an octet are inter-changed.

**Usage**

Use this command to configure the encoding format of IMSI/IMEISV in User-Equipment-Info, 3GPP-IMSI and 3GPP-IMEISV AVPs.

**Example**

The following command specifies the encoding format of IMSI/IMEISV as ASCII:

```
imsi-imeisv-encoded-format ascii
```
mode

This command configures the Prepaid Credit Control mode to RADIUS or Diameter.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > ACS Configuration > Credit Control Configuration

active-charging service service_name > credit-control

Entering the above command sequence results in the following prompt:

[local]host_name(config-dcca)#

Syntax

mode { diameter | radius }

default mode

default

Configures the default prepaid credit control mode.
Default: diameter

diameter

Enables Diameter Credit Control Application (DCCA) for prepaid charging.

radius

Enables RADIUS Credit Control for prepaid charging.

Usage

Use this command to configure the prepaid charging application mode to Diameter or RADIUS credit control.

Example

The following command specifies to use RADIUS prepaid credit control application:

mode radius
pending-traffic-treatment

This command controls the pass/drop treatment of traffic while waiting for definitive credit information from the server.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > ACS Configuration > Credit Control Configuration

```
active-charging service service_name > credit-control
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dcca)#
```

**Syntax**

```
pending-traffic-treatment { { { forced-reauth | trigger | validity-expired } drop | pass } } | { noquota { buffer | drop | limited-pass volume | pass } } | { quota-exhausted { buffer | drop | pass } } }

default pending-traffic-treatment { forced-reauth | noquota | quota-exhausted | trigger | validity-expired }
```

---

**default**

Configures this command with the default setting.
Default: drop

---

**forced-reauth**

Sets the Diameter credit control pending traffic treatment to forced reauthorization.

---

**trigger**

Sets the Diameter credit control pending traffic treatment to trigger.

---

**validity-expired**

Sets the Diameter credit control pending traffic treatment to validity expired.

---

**noquota**

Sets the Diameter credit control pending traffic treatment to no quota.

---

**quota-exhausted**

Sets the Diameter credit control pending traffic treatment to quota exhausted.
buffer
Specifies to tentatively count/time traffic, and then buffer traffic pending arrival of quota. Buffered traffic will be forwarded and fully charged against the quota when the quota is eventually obtained and the traffic is passed.

drop
Drops any traffic when there is no quota present.

limited-pass volume
Enables limited access for subscribers when the OCS is unreachable.
volume specifies the Default Quota size (in bytes) and must be an integer from 1 through 4294967295. This feature allows the subscriber to use the network when the OCS response is slow. This configuration enables to set a Default Quota size from which the subscriber can consume quota until response from the OCS arrives. The traffic consumed by the subscriber from the Default Quota at the beginning of the session is reported and counted against the quota assigned from the OCS.

Important: Default Quota is used only for noquota case (Rating Group (RG) seeking quota for the first time) and not for quota-exhausted. Default Quota is not used for subsequent credit requests.

If the Default Quota is NOT exhausted before the OCS responds with quota, traffic is allowed to pass. Initial Default Quota usage is counted against initial quota allocated. If quota allocated is less than the actual usage, the actual usage and request additional quota are reported. If no additional quota is available, the traffic is denied.
If the Default Quota is NOT exhausted before the OCS responds with denial of quota, traffic is blocked after the OCS response. The gateway will report usage on Default Quota even in for CCR-U (FINAL) or CCR-T until the OCS responds.
If the Default Quota is exhausted before the OCS responds, the session is dropped.
The default pending-traffic-treatment for noquota is drop. The default pending-traffic-treatment noquota command removes any Default Quota limit configured.

pass
Passes all traffic more or less regardless of quota state.

Usage
Use this command to set the Diameter credit control pending traffic treatment while waiting for definitive credit information from the server.
This CLI command is different than the failure-handling command, which specifies behavior in the case of an actual timeout or error, as opposed to the behavior while waiting. See also the buffering-limit command in the Active Charging Service Configuration Mode.

Example
The following command sets the Diameter credit control pending traffic treatment to drop any traffic when there is no quota present:

    pending-traffic-treatment noquota drop
**quota**

This command sets various time-based quotas in the prepaid credit control service.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > ACS Configuration > Credit Control Configuration

`active-charging service service_name > credit-control`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dcca)#
```

### Syntax

```
quota holding_time | validity-time validity_time }
{ default | no } quota { holding-time | validity-time }

holding-time holding_time

Specifies the Quota Holding Time (QHT) in seconds. The value must be an integer from 1 through 4000000000.

validity-time validity_time

Specifies the validity lifetime of the quota, in seconds. The value must be an integer from 1 through 400000.
```

### Usage

Use this command to set the prepaid credit control quotas.

### Example

The following command sets the prepaid credit control request holding time to 30000 seconds:

```
quota holding-time 30000
```
**quota request-trigger**

This command configures the action on the packet that triggers the credit control application to request quota.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > ACS Configuration > Credit Control Configuration

**Syntax**

```
quota request-trigger { exclude-packet-causing-trigger | include-packet-causing-trigger }
{ default | no } quota request-trigger

default quota request-trigger
```

**Usage**
Use this command to configure action on the packet that triggers the credit control application to request quota, whether the packet should be excluded/included in the utilization information within the quota request.

**Example**
The following command sets the system to exclude the packets causing threshold limit triggers from accounting of prepaid credit of a subscriber:

```
quota request-trigger exclude-packet-causing-trigger
```

---

**Important:** In 10.0 and later releases, this keyword is deprecated.
quota time-threshold

This command configures the time threshold limit for subscriber quota in the prepaid credit control service.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > ACS Configuration > Credit Control Configuration

```
active-charging service service_name > credit-control
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dcca)#
```

**Syntax**

```
quota time-threshold { abs_time_value | percent percent_value }
```

```
{ default | no } quota time-threshold
```

**default**

Configures this command with the default setting.
Default: Disabled

**no**

Disables time threshold for prepaid credit control quota.

**abs_time_value**

Specifies the absolute threshold time (in seconds) for configured time quota in prepaid credit control charging. `abs_time_value` must be an integer from 1 through 86400. To disable this assign 0. Default: 0 (Disabled)

**percent_value**

Specifies the time threshold value as a percentage of the configured time quota in DCCA. `percent_value` must be an integer from 1 through 100.

**Usage**

Use this command to set the time threshold for prepaid credit control quotas.

**Example**

The following command sets the prepaid credit control time threshold to 400 seconds:

```
quota time-threshold 400
```
**quota units-threshold**

This command sets the unit threshold limit for subscriber quota in the prepaid credit control service.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > ACS Configuration > Credit Control Configuration

`active-charging service service_name > credit-control`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dcca)#
```

**Syntax**

```
quota unit-threshold { abs_unit_value | percent percent_value }
{ default | no } quota units-threshold
```

**Usage**

Use this command to set the units threshold for prepaid credit control quotas.

**Example**

The following command sets the prepaid credit control time threshold to 160400 units:

```
quota units-threshold 160400
```
**quota volume-threshold**

This command sets the volume threshold limit for subscriber quota in the prepaid credit control service.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > ACS Configuration > Credit Control Configuration

```
active-charging service service_name > credit-control
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dca)#
```

**Syntax**

```
quota volume-threshold { abs_vol_value | percent percent_value }
{ default | no } quota volume-threshold
```

- **default**
  
  Configures this command with the default setting.
  
  Default: Disabled

- **no**
  
  Disables volume threshold for prepaid credit control quota.

- **abs_vol_value**
  
  Specifies the absolute threshold volume (in bytes) to the configured volume quota in prepaid credit control. 
  
  `abs_vol_value` must be an integer from 1 through 400000000. To disable this assign 0. Default: 0 (Disabled)
  
  If configured, the Credit Control client will seek re-authorization from the server for the quota when the quota contents fall below the specified threshold.

- **percent percent_value**
  
  Specifies the volume threshold value as a percentage of the configured volume quota in prepaid credit control. 
  
  `percent_value` must be an integer from 1 through 100.

**Usage**

Use this command to set the volume threshold for prepaid credit control quotas.

**Example**

The following command sets the prepaid credit control volume threshold to 160400 bytes:

```
quota volume-threshold 160400
```
radius usage-reporting-algorithm

This command configures the usage reporting algorithm for RADIUS prepaid using the Diameter Credit-Control Application (DCCA).

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > ACS Configuration > Credit Control Configuration

active-charging service service_name > credit-control

Entering the above command sequence results in the following prompt:

[local]host_name(config-dcca)#

Syntax

radius usage-reporting-algorithm { cumulative | relative }

default radius usage-reporting-algorithm

default
Configures this command with the default setting.
Default: cumulative

cumulative
Reports the total accumulated usage of quota in every accounting interim.

relative
Reports the quota usage per accounting interim (since the previous usage report).

Usage
Use this command to configure the usage reporting algorithm for RADIUS prepaid using DCCA.

Example

The following command configures the usage reporting algorithm for RADIUS prepaid using DCCA to relative:

radius usage-reporting-algorithm relative
redirect-indicator-received

This command configures the action on buffered packets when a redirect-indicator is received from the RADIUS server.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > ACS Configuration > Credit Control Configuration

```
active-charging service service_name > credit-control
```

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-dcca) #
```

**Syntax**

```
redirect-indicator-received { discard-buffered-packet | reprocess-buffered-packet }
{ default | no } redirect-indicator-received
```

- **default**
  Configures this command with the default setting. Default: `discard-buffered-packet`

- **no**
  Disables the redirect-indicator-received configuration.

- **discard-buffered-packet**
  Discards the buffered packet.

- **reprocess-buffered-packet**
  Redirects the buffered packet on receiving a redirect-indicator from the RADIUS server.

**Usage**

Use this command to configure the action taken on buffered packet when redirect-indicator is received. Diameter can return a redirect URL but not a redirect indicator, however RADIUS can return a redirect indicator. In this situation, any subsequent subscriber traffic would match ruledefs configured with cca redirect-indicator, and charging actions that have flow action redirect-url should be configured. However, some handsets do not retransmit, so there will be no subsequent packets. On configuring reprocess-buffered-packet, the ruledefs are reexamined to find a new charging action, which may have flow action redirect-url configured.

**Example**

The following command configures the action taken on buffered packet when redirect-indicator is received to reprocess-buffered-packet:

```
redirect-indicator-received reprocess-buffered-packet
```
redirect-require-user-agent

This command conditionally verifies the presence of user-agents in the HTTP header, based on which HTTP URL redirection will be applied.

Product
- GGSN
- HA
- IPSG
- PDSN
- P-GW
- SAEGW

Privilege
- Security Administrator, Administrator

Mode
- Exec > ACS Configuration > Credit Control Configuration

active-charging service service_name > credit-control

Entering the above command sequence results in the following prompt:

[local]host_name(config-dcca)#

Syntax

[ no ] redirect-require-user-agent

no

Disables the “user-agent” check in the HTTP header.

Usage

Use this command to conditionally verify the presence of configured user-agents in the HTTP header. The user agent is configured using the redirect user-agent command in the ACS Configuration Mode. The user agent could be, for example, Mozilla, Opera, Google Chrome, etc.

The default configuration is to enable the "user-agent" check, and compare it with the configured list of supported user-agents. The packet will be redirected only when the user-agent is matched with one of the configured user-agents.

If no redirect-require-user-agent is configured, the user-agent check is disabled. The packets will be redirected even if it does not contain a "user-agent" information in the HTTP header.
servers-unreachable

This command configures whether to continue or terminate calls when Diameter server or the OCS becomes unreachable.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > ACS Configuration > Credit Control Configuration

```
active-charging service service_name > credit-control
```

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-dcca) #
```

**Syntax**

In 12.1 and earlier releases:

```
servers-unreachable { initial-request { continue | terminate [ after-timer-expiry timeout_period ] } | update-request { continue | terminate [ after-quota-expiry | after-timer-expiry timeout_period ] } }
```

```
no servers-unreachable { initial-request | update-request }
```

In 12.2 and later releases:

```
```

```
no servers-unreachable { initial-request | update-request }
```

```
default servers-unreachable behavior-triggers { initial-request | update-request }
```

```
no
```

Deletes the current servers-unreachable configuration.

In 15.0 and later releases, to remove the error result code configuration, the `no` command syntax is:

```
no servers-unreachable behavior-triggers { initial-request | update-request } result-code { any-error | result-code [ to end-result-code ] }.
```
behavior-triggers { initial-request | update-request } { result-code { any-error | result-code [ to end-result-code ] } | transport-failure [ response-timeout | tx-expiry ] }

This keyword is used to determine when to apply server-unreachable action. This supports three configurable options to apply server-unreachable action either at transport failure, Tx expiry or at response timeout. Out of these three options, the transport failure is the default option.

- **initial-request**: Specifies the behavior when Diameter server(s)/OCS become unreachable during initial session establishment.
- **update-request**: Specifies the behavior when Diameter server(s)/OCS become unreachable during mid-session.
- **result-code { any-error | result-code [ to end-result-code ] }**: Specifies to configure any Diameter error result code or a range of result codes to trigger entering server unreachable mode.
  
  `result-code` must be an integer ranging from 3000 to 5999.

- **transport-failure [ response-timeout | tx-expiry ]**: This keyword specifies to trigger the behavior either at transport failure or response timeout OR at Transport failure or Tx expiry.

```plaintext
initial-request { continue | terminate [ after-timeout-expiry timeout_period ] }
```

### Important:
This section applies only to 12.1 and earlier releases.

Specifies behavior when Diameter server(s)/OCS become unreachable during initial session establishment.

- **continue**: Specifies to continue call if Diameter server(s) becomes unreachable.
- **terminate**: Specifies to terminate call if Diameter server(s) becomes unreachable.

`after-timeout-expiry timeout_period`: On detecting transport failure, this keyword variable specifies the time limit for which the subscriber session will remain in offline state before the call is terminated.

`timeout_period` specifies the timeout period, in seconds, and must be an integer from 1 through 4294967295.

```plaintext
initial-request { continue [ { [ after-interim-time timeout_period ] [ after-interim-volume quota_value ] } server-retries retry_count ] | terminate [ { [ after-interim-time timeout_period ] [ after-interim-volume quota_value ] } server-retries retry_count ] | after-timeout-expiry timeout_period }
```

### Important:
This section applies only to 12.2 and later releases.

Specifies behavior when Diameter server(s)/OCS become unreachable during initial session establishment.

- **continue**: Specifies to continue call if Diameter server(s) becomes unreachable.
- **terminate**: Specifies to terminate call if Diameter server(s) becomes unreachable.

- **after-interim-time timeout_period**: Specifies to continue or terminate call after the interim timeout period expires.

`timeout_period` specifies the timeout period, in seconds, and must be an integer from 1 through 4294967295.
**after-interim-volume** *quota_value*: Specifies to continue or terminate call on exhaustion of the assigned quota.

*quota_value* specifies the volume-based quota value, in bytes, and must be an integer from 1 through 4294967295.

The **after-interim-volume** and **after-interim-time** can be configured in one of the following ways:

- **after-interim-volume** *quota_value* server-retries *retry_count*
- **after-interim-time** *timeout_period* server-retries *retry_count*
- **after-interim-volume** *quota_value* **after-interim-time** *timeout_period* server-retries *retry_count*

**after-timer-expiry** *timeout_period*: On detecting transport failure, this keyword variable specifies the time limit for which the subscriber session will remain in offline state before the call is terminated.

*timeout_period* specifies the timeout period, in seconds, and must be an integer from 1 through 4294967295.

**server-retries** *retry_count*: Specifies the number of retries that should happen to OCS before allowing the session to terminate/offline.

*retry_count* specifies the retries to OCS, and must be an integer from 0 through 65535. If the value 0 is defined for this keyword, the retry to OCS will not happen instead the configured action will be immediately applied.

```
update-request { continue | terminate [ after-quota-expiry | after-timer-expiry timeout_period ] }
```

**Important**: This section applies only to 12.1 and earlier releases.

Specifies behavior when Diameter server(s)/OCS become unreachable during mid session.

- **continue**: Specifies to continue call if Diameter server(s) becomes unreachable.
- **terminate**: Specifies to terminate call if Diameter server(s) becomes unreachable.
- **after-quota-expiry**: Specifies to terminate call on exhaustion of all available quota.
- **after-timer-expiry** *timeout_period*: On detecting transport failure, this keyword variable specifies the time limit for which the subscriber session will remain in offline state before the call is terminated.

*timeout_period* specifies the timeout period, in seconds, and must be an integer from 1 through 4294967295.

```
update-request { continue [ { [ after-interim-time timeout_period ] [ after-interim-volume quota_value ] } server-retries *retry_count | terminate [ { [ after-interim-time timeout_period ] [ after-interim-volume quota_value ] } server-retries *retry_count | after-quota-expiry | after-timer-expiry timeout_period ] ] }
```

**Important**: This section applies only to 12.2 and later releases.
Specifies behavior when Diameter server(s)/OCS become unreachable during mid session.

- **continue**: Specifies to continue call if Diameter server(s) becomes unreachable.
- **terminate**: Specifies to terminate call if Diameter server(s) becomes unreachable.

- **after-interim-time** `timeout_period`: Specifies to continue or terminate call after the interim timeout period expires.
  
  `timeout_period` specifies the timeout period, in seconds, and must be an integer from 1 through 4294967295.

- **after-interim-volume** `quota_value`: Specifies to continue or terminate call on exhaustion of the assigned quota.
  
  `quota_value` specifies the volume-based quota value, in bytes, and must be an integer from 1 through 4294967295.

The **after-interim-volume** and **after-interim-time** can be configured in one of the following ways:

- **after-interim-volume** `quota_value` server-retries `retry_count`
- **after-interim-time** `timeout_period` server-retries `retry_count`
- **after-interim-volume** `quota_value` **after-interim-time**
  
  `timeout_period` server-retries `retry_count`

- **after-quota-expiry**: Specifies to terminate call on exhaustion of all available quota.

- **after-timer-expiry** `timeout_period`: On detecting transport failure, this keyword variable specifies the time limit for which the subscriber session will remain in offline state before the call is terminated.
  
  `timeout_period` specifies the timeout period, in seconds, and must be an integer from 1 through 4294967295.

- **server-retries** `retry_count`: Specifies the number of retries that should happen to OCS before allowing the session to terminate/offline.
  
  `retry_count` specifies the retries to OCS, and must be an integer from 0 through 65535. If the value 0 is defined for this keyword, the retry to OCS will not happen instead the configured action will be immediately applied.

**Usage**

Use this command to configure whether to continue/terminate calls when Diameter server(s)/OCS are unreachable. This command can be used to verify the functionality of the configurable action if the OCS becomes unreachable.

In 12.1 and earlier releases, the OCS is considered down/unreachable when all transport/TCP connections are down for that OCS.

In 12.2 and later releases, the OCS is declared unreachable when all transport connections are down OR message timeouts happen (for example, a Tx expiry or response timeout, for all available OCS servers) owing to slow response from the OCS (may be due to network congestion or other network related issues).

The following set of actions are performed if the servers become unreachable:

- During initial session establishment:
  - Block traffic: Terminate the session.
  - Continue call: Continue by making the session offline.
  - Pass traffic until timer expiration post which terminates the call: Session would be offline while the timer is running.
• Pass traffic until interim time expiration post which continues or terminates the call.
• Pass traffic until interim volume expiration post which continues or terminates the call.
• During mid session:
  • Block traffic: Terminate the session.
  • Continue call: Continue by making the session offline.
  • Run out of session quota post which terminates the call.
  • Pass traffic until timer expiration post which terminates the call: Session would be offline while the timer is running.
• Pass traffic until interim time expiration post which continues or terminates the call.
• Pass traffic until interim volume expiration post which continues or terminates the call.

This command works on the same lines as the `failure-handling` command, which is very generic for each of the xxx-requests.
The `servers-unreachable` CLI command is specifically for TCP connection error. In the event of TCP connection failure, the `failure-handling` and/or `servers-unreachable` commands can be used. This way, the operator has the flexibility to configure CCFH independent of OCS-unreachable feature, that is having two different failure handlings for same request types.

**Important:** Please note that the flexibility to configure CCFH independent of OCS-unreachable feature is applicable only to 12.1 and earlier releases. In 12.2 and later releases, if configured, the `servers-unreachable` takes precedence over the `failure-handling` command.

This command can also be used to control the triggering of behavior based on transport failure, response message timeouts or Tx expiry when OCS becomes unreachable. The OCS could be unreachable due to no TCP connection and the message timeout could be due to network congestion or any other network related issues.
The following are the possible and permissible configurations with respect to behavior triggering:

- `servers-unreachable behavior-triggers { initial-request | update-request } transport-failure`
- `servers-unreachable behavior-triggers { initial-request | update-request } transport-failure response-timeout`
- `servers-unreachable behavior-triggers { initial-request | update-request } transport-failure tx-expiry`

Of these configurations, the first one is considered to be the default configuration and it will take care of backward compatibility with 12.0 implementation.
If the server returns the CC-Failure-Handling AVP, it would apply for transport-failure/response-timeout/tx-expiry when the CLI command `servers-unreachable` is not configured. If the `servers-unreachable` is configured for a set of behavior-triggers, then servers-unreachable configuration will be applied for them.
For those behavior-triggers for which servers-unreachable is not configured, the CC-Failure-Handling value provided by the server will be applied.
By default, Result-Code such as 3002 (Unable-To-Deliver), 3004 (Too-Busy) and 3005 (Loop-Detected) falls under delivery failure category and will be treated similar to response-timeout configuration.

**Example**

The following command configures the duration of 1111 seconds, for the subscriber session to be in offline state, after which the initial request calls will be terminated.

```
servers-unreachable initial-request terminate after-timer-expiry 1111
```
subscription-id service-type

This command enables required Subscription-Ids for various service types.

Product
- GGSN
- HA
- IPSG
- PDSN
- P-GW

Privilege
Security Administrator, Administrator

Mode
Exec > ACS Configuration > Credit Control Configuration

active-charging service service_name > credit-control

Entering the above command sequence results in the following prompt:

[local]host_name(config-dcca)#

Syntax

subscription-id service-type { closedrp | ggsn | ha | ipsg | l2tplns | mipv6ha | pdsn | pgw } { e164 | imsi | nai }

[ no ] subscription-id service-type { closedrp | ggsn | ha | ipsg | l2tplns | mipv6ha | pdsn | pgw }

default

Configures the default timestamp-rounding setting.
Default: floor

closedrp | ggsn | ha | ipsg | l2tplns | mipv6ha | pdsn | pgw { e164 | imsi | nai }

Includes the Subscription-Id for the chosen service type. For example, if ipsg is configured as the keyword option, then the subscription-id is included for the IPSG service.
The following subscription-Id types are available:
- e164 - Include E164 information in the Subscription-Id AVP
- imsi - Include IMSI information in the Subscription-Id AVP
- nai - Include NAI information in the Subscription-Id AVP

Usage
Currently, Subscription-Id AVP is encoded in the Gy CCRs based on dictionary and service-type checks.
With the new CLI command, customers will have the provision of enabling required Subscription-Id types for various services.
Each service can have a maximum of three Subscription-Id types (e164, imsi & nai) that can be configured through this CLI command. The DCCA specific changes are made in such a way that, if the CLI command is configured for any particular service, then the CLI takes precedence. Else, it falls back to default (hard-coded) values configured for that service.

The advantage of this CLI command is that any further dictionary additions in DCCA can be minimized.

**Important:** The CLI configured for any of the service will contain the most recent Subscription-Id-types configured for that service (i.e. overrides the previous values).

For an instance, if a customer wants IMSI value to be encoded in Gy CCRs (along with E164) for MIPv6HA service, then this CLI command `subscription-id service-type mipv6ha e164 imsi` should be configured in the Credit Control Configuration mode.

If only imsi is configured through the CLI, then Gy CCRs will only have imsi value.

**Example**

The following command configures imsi type for ggsn service:

```
subscription-id service-type ggsn imsi
```
timestamp-rounding

This command configures how to convert exact time into the units that are used in quotas.

Product
ACS

Privilege
Security Administrator, Administrator

Mode
Exec > ACS Configuration > Credit Control Configuration

active-charging service service_name > credit-control

Entering the above command sequence results in the following prompt:

[local]host_name(config-dcca)#

Syntax

```
timestamp-rounding { ceiling | floor | roundoff }
```

default timestamp-rounding

default

Configures the default timestamp-rounding setting.
Default: floor

timestamp-rounding ceiling

Round off to the smallest integer greater than the fraction. If the fractional part of the seconds is greater than 0, add 1 to the number of seconds and discard the fraction.

timestamp-rounding floor

Discard the fractional part of the second.

timestamp-rounding roundoff

Set the fractional part of the seconds to the nearest integer value. If the fractional value is greater than or equal to 0.5, add 1 to the number of seconds and discard the fractional part of second.

Usage

Use this command to configure how to convert exact time into the units that are used in quotas for CCA charging. The specified rounding will be performed before system attempts any calculation. For example using roundoff, if the start time is 1.4, and the end time is 1.6, then the calculated duration will be 1 (i.e., 2 – 1 = 1).

Example

The following command sets the CCA timestamp to nearest integer value second (for example, 34:12.23 to 34:12.00):

```
timestamp-rounding roundoff
```
trigger type

This command enables/disables triggering a credit reauthorization when the named values in the subscriber session changes.

Product
All

Privilege
Security Administrator, Administrator

Mode
Exec > ACS Configuration > Credit Control Configuration

active-charging service service_name > credit-control

Entering the above command sequence results in the following prompt:

[local]host_name(config-dcca)#

Syntax

[ no ] trigger type { cellid | lac | mcc | mnc | qos | rat | serving-node | sgsn | timezone } +

default trigger type

default

Configures this command with the default setting.
Default: No triggers.

no

Removes the previously configured trigger type.

cellid

Sets the trigger based on change in cell identity or Service Area Code (SAC).

lac

Sets the trigger based on change in Location Area Code.

mcc

Sets the trigger based on change in Mobile Country Code (MCC).

mnc

Sets the trigger based on change in Mobile Network Code (MNC).

qos

Sets the trigger based on change in the Quality of Service (QoS).
**rat**
Sets the trigger based on change in the Radio Access Technology (RAT).

**serving-node**
Sets the trigger based on change in serving node. The serving node change causes the credit control client to ask for a re-authorization of the associated quota. Typically used as an extension to sgsn trigger in P-GW (SAEGW), however, may also be used alone.

**sgsn**
Sets the trigger based on change in the IP address of SGSN.

**timezone**
Sets the trigger based on change in the timezone of UE.

**+**
Indicates that more than one of the previous keywords can be entered within a single command.

**Usage**
Use this command to set the credit control reauthorization trigger.

**Example**
The following command selects a credit control trigger as **lac**:

```
trigger type lac
```
usage-reporting

This command configures the ACS Credit Control usage reporting type.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Mode**

Exec > ACS Configuration > Credit Control Configuration

`active-charging service service_name > credit-control`

Entering the above command sequence results in the following prompt:

```
[local]host_name(config-dcca)#
```

**Syntax**

```
usage-reporting quotas-to-report based-on-grant { report-only-granted-volume }
```

**default usage-reporting quotas-to-report**

```
default

Configures this command with the default setting.
Default: Disabled
```

```
report-only-granted-volume

Suppresses the input and output octets. If the Granted-Service-Unit (GSU) AVP comes with CC-Total-Octets, then the device will send total, input and output octets in Used-Service-Unit (USU) AVP. If it comes with Total-Octets, the device will send only Total-Octets in USU.
```

**Usage**

Use this command to configure reporting usage only for granted quota. On issuing this command, the Used-Service-Unit AVP will report quotas based on grant i.e, only the quotas present in the Granted-Service-Unit AVP.

With this command only the units for which the quota was granted by the DCCA server will be reported irrespective of the reporting reason.

**Example**

The following command configures to report usage based only on granted quota:

```
usage-reporting quotas-to-report based-on-grant
```
Chapter 59
Crypto Group Configuration Mode Commands

The Crypto Group Configuration Mode is used to configure crypto (tunnel) groups that provide fail-over redundancy for IPSec tunnels to packet data networks (PDNs).

Mode
Exec > Global Configuration > Context Configuration > Crypto Group Configuration

configure > context context_name > crypto group group_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-crypto-grp)#

⚠️ **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```plaintext
type
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Use this command to return to the parent configuration mode.
**match address**

Associates an access control list (ACL) with the crypto group.

**Product**
- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW
- HSGW
- MME
- P-GW
- PDSN
- S-GW
- SAEGW
- SCM
- SecGW
- SGSN

**Privilege**
- Security Administrator, Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Crypto Group Configuration

`configure > context context_name > crypto group group_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-crypto-grp)#`

**Syntax**

```plaintext
[ no ] match address acl_name [ preference ]
```

- **no**
  - Deletes a previously configured ACL association.

- **match address acl_name**
  - Specifies the name of the ACL being matched to the crypto group entered as an alphanumeric string of 1 through 47 characters.
**Preference**

The priority of the ACL.
The ACL preference is factored when a single packet matches the criteria of more than one ACL. *preference* is an integer from 0 through 4294967295; 0 is the highest priority.

If multiple ACLs are assigned the same priority, the last one entered will be used first.

**Important:** The priorities are only compared for ACLs matched to other groups or to policy ACLs (those applied to the entire context).

### Usage

IP ACLs are associated with crypto groups using this command. Both the crypto group and the ACLs must be configured in the same context.

ISAKMP crypto maps can then be associated with the crypto group. This allows user traffic matching the rules of the ACL to be handled according to the policies configured as part of the crypto map.

### Example

The following command associates an ACL called *corporate_acl* to the crypto group:

```
match address corporate_acl
```
**match ip pool**

Matches the specified IP pool to the current crypto group. This command can be used multiple times to match more than one IP pool.

> **Important:** The **match ip pool** command is not supported within a crypto group on the ASR 5500 platform.

**Syntax**

```bash
[ no ] match ip pool pool-name pool_name
```

**no**

Deletes the matching statement for the specified IP pool from the crypto group.
**match ip pool pool-name pool_name**

Specifies the name of an existing IP pool that should be matched entered as an alphanumeric string of 1 through 31 characters.

**Usage**

Use this command to set the names of IP pools that should be matched in the current crypto group.

**Example**

The following command sets a rule for the current crypto group that will match an IP pool named ippool1:

```
    match ip pool pool-name ippool1
```
**switchover**

Configures the fail-over properties for the crypto group as part of the Redundant IPSec Fail-Over feature.

**Product**
- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW
- HSGW
- MME
- P-GW
- PDSN
- S-GW
- SAEGW
- SCM
- SecGW
- SGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > Crypto Group Configuration

```bash
configure > context context_name > crypto group group_name
```

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-crypto-grp) #
```

**Syntax**

```
[ no ] switchover auto [ do-not-revert ]
```

- **no**
  
  Disables the automatic switchover of tunnels. This applies to switching primary-to-secondary and secondary-to-primary.

- **switchover auto**
  
  Allows the automatic switchover of tunnels. Default: Enabled

- **do-not-revert**
  
  Disables the automatic switchover of secondary tunnels to primary tunnels. Default: Disabled
**Usage**

This command configures the fail-over options for the Redundant IPSec Fail-over feature. If the automatic fail-over options are disabled, tunneled traffic must be manually switched to the alternate tunnel (or manually activated if no alternate tunnel is configured and available) using the following command in the Exec Mode:

```
crypto-group group_name activate { primary | secondary }
```

For a definition of this command, see the `crypto-group` section of the Exec Mode Commands chapter of this guide.

**Example**

The following command disables the automatic secondary-to-primary switchover:

```
switchover auto do-not-revert
```
Chapter 60
Crypto IPSec Transform Set Configuration Mode

The Crypto IPSec Transform Set Configuration Mode is used to configure properties for system transform sets.
Transform Sets are used to define IPSec security associations (SAs). IPSec SAs specify the IPSec protocols to use to protect packets.

Mode

Exec > Global Configuration > Context Configuration > Crypto IPSec Transform Set Configuration

configure > context context_name > crypto ipsec transform-set transform_set_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-crypto-trans)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
**exit**

Exits the current mode and returns to the parent configuration mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

```plaintext
exit
```

**Usage**

Use this command to return to the parent configuration mode.
mode

Configures the IPSec encapsulation mode for an existing or new transform set. For a new transform set, you must specify transform set parameters as described for the `crypto ipsec transform-set` command in the *Context Configuration Mode Commands* chapter.

**Product**
- PDSN
- HA
- GGSN
- PDIF

**Privilege**
Security Administrator

**Syntax**
```
mode { transport | tunnel }
```

- `transport`
  Specifies that the transform set only protects the upper layer protocol data portions of an IP datagram, leaving the IP header information unprotected. Default: Disabled

> **Important:** This mode should only be used if the communications end-point is also the cryptographic end-point.

- `tunnel`
  Specifies that the transform set protects the entire IP datagram. This mode should be used if the communications end-point is different from the cryptographic end-point as in a VPN. Default: Enabled

**Usage**
This command specifies the encapsulation mode for the transform set.

**Example**
The following command configures the transform set’s encapsulation mode to transport:
```
mode transport
```
Chapter 61
Crypto Map IKEv2-IPv4 Configuration Mode Commands

The Crypto Map IKEv2-IPv4 Configuration Mode is used to configure an IKEv2 IPsec policy for secure X3 interface tunneling between a P-GW and a lawful intercept server.

Mode

Exec > Global Configuration > Context Configuration > Crypto Map IKEv2-IPv4 Configuration

configure > context context_name > crypto map template_name ikev2-ipv4

Entering the above command sequence results in the following prompt:

[context_name]host_name(cfg-crypto-ikev2-ipv4-map)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
allow-cert-enc cert-hash-url

Enables support for a certificate encoding type other than the default. When enabled hash and URL encoding type are supported in CERT and CERTREQ payloads.

**Product**
Security gateway products

**Privilege**
Security Administrator

**Syntax**

```
[ no ] allow-cert-enc cert-hash-url
```

- **no**
  Disables support for hash and URL encoding type in CERT and CERTREQ payloads.

**Usage**
Enable support for a certificate encoding type other than the default. When enabled hash and URL encoding type are supported in CERT and CERTREQ payloads.

**Example**
The following command enables hash and URL encoding type in CERT and CERTREQ payloads:

```
allow-cert-enc cert-hash-url
```
**authentication**

Configures the subscriber authentication method used for this crypto map.

**Product**
- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW
- HSGW
- MME
- P-GW
- PDSN
- S-GW
- SAEGW
- SCM
- SecGW
- SGSN

**Privilege**
Security Administrator

**Syntax**

```
authentication { local | remote } ( certificate | pre-shared-key { encrypted key value | key value } )
```

**local | remote**
Specifies which authentication method will be used by the crypto map – local or remote.

**certificate**
Specifies that a certificate will be used by this crypto map for authentication.

**pre-shared-key { encrypted key value | key value }**
Specifies that a pre-shared key will be used by this crypto map for authentication.

*encrypted key value:* Specifies that the pre-shared key used for authentication is encrypted and expressed as an alphanumeric string of 1 through 255 characters for releases prior to 15.0, or 16 to 496 characters for release 15.0 and higher.

*key value:* Specifies that the pre-shared key used for authentication is clear text and expressed as an alphanumeric string of 1 through 32 characters for releases prior to 14.0 or 1 through 255 characters for release 14.0 and higher.
Usage

Use this command to specify the type of authentication performed for IPSEC peers attempting to access the system via this crypto map.

Example

The following command sets the authentication method to an open key value of 6d79706173737764:

```
    authentication pre-shared-key key 6d79706173776f7264
```
blacklist

Enables or disables a blacklist (access denied) for this map.

Product
All products supporting IPSec blacklisting

Important: This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

Privilege
Security Administrator

Syntax

[ no ] blacklist

no

Disables blacklisting for this crypto map. By default blacklisting is disabled.

Usage
Use this command to enable blacklisting for this crypto map. A blacklist is a list or register of entities that are denied a particular privilege, service, mobility, access or recognition. With blacklisting, any peer is allowed to connect as long as it does not appear in the list. For additional information on blacklisting, refer to the System Administration Guide.

Example
The following command enables blacklisting:

blacklist
ca-certificate list

Used to bind an X.509 Certificate Authority (CA) certificate to a crypto map.

Product
- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW
- HSGW
- MME
- P-GW
- PDSN
- S-GW

- SCM
- SecGW
- SGSN

Privilege
- Security Administrator

Syntax

```plaintext
ca-certificate list ca-cert-name name [ ca-cert-name name ]
```

```plaintext
no ca-certificate
```

```plaintext
no
```

Unbinds the ca-certificate(s) bound to the crypto map.

```plaintext
ca-cert-name name
```

Binds the named X.509 Certificate Authority (CA) certificate to a crypto map. `name` is an alphanumeric string of 1 through 129 characters.

You can chain multiple (max 4) certificates in a single command instance.

Usage

Used to bind an X.509 CA certificate to a map.

Example

Use the following example to add a CA certificate to a list:

```plaintext
ca-certificate list ca-cert-name CA_list1
```
ca-crl list

Binds one or more Certificate Authority-Certificate Revocation Lists (CA-CRLs) to this crypto map.

Product
- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW
- HSGW
- MME
- P-GW
- PDSN
- S-GW
- SAEGW
- SCM

Syntax

ca-crl list ca-crl-name name [ ca-crl-name name ] +

no ca-crl

<table>
<thead>
<tr>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>no ca-crl</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

Removes the CA-CRL configuration from this map.

<table>
<thead>
<tr>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>ca-crl-name</td>
</tr>
<tr>
<td>name</td>
</tr>
</tbody>
</table>

Specifies the CA-CRL to associate with this crypto map. name must be the name of an existing CA-CRL expressed as an alphanumeric string of 1 through 129 characters.
+ indicates that a list of multiple CA-CRLs can be configured for a crypto map. You can chain multiple (max four) CA-CRLs in a single command instance.

Usage

Use this command to associate a CA-CRL name with this crypto map.
CA-CRLs are configured in the Global Configuration Mode. For more information about configuring CA-CRLs, refer to the ca-crl name command in the Global Configuration Mode Commands chapter.

Example
The following example binds CA-CRLs named CRL-5 and CRL-7 to this crypto map:

```
ca-crl list ca-crl-name CRL-5 ca-crl-name CRL-7
```
**certificate**

Used to bind a single X.509 trusted certificate to a crypto map.

**Product**
- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW
- HSGW
- MME
- P-GW
- PDSN
- S-GW
- SAEGW
- SCM
- SecGW
- SGSN

**Privilege**
Security Administrator

**Syntax**

```
[ no ] certificate name
```

- **no**
  Unbinds a certificate from crypto map.

- **name**
  Specifies the name of a X.509 trusted certificate to bind to a crypto map. `name` is an alphanumeric string of 1 through 129 characters.

**Usage**
Use this command to bind an X.509 certificate to a map.

**Example**
Use the following example to prevent a certificate from being included in the Auth Exchange payload:

```
no certificate
```
control-dont-fragment

Controls the Don’t Fragment (DF) bit in the outer IP header of the IPSec tunnel data packet.

Product
- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW
- HSGW
- MME
- P-GW
- PDSN
- S-GW
- SAEGW
- SCM
- SecGW
- SGSN

Privilege
Security Administrator

Syntax
```
control-dont-fragment \{ clear-bit | copy-bit | set-bit \}
```

<table>
<thead>
<tr>
<th>clear-bit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clears the DF bit from the outer IP header (sets it to 0).</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>copy-bit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copies the DF bit from the inner IP header to the outer IP header. This is the default action.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>set-bit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sets the DF bit in the outer IP header (sets it to 1).</td>
</tr>
</tbody>
</table>

Usage
A packet is encapsulated in IPsec headers at both ends. The new packet can copy the DF bit from the original unencapsulated packet into the outer IP header, or it can set the DF bit if there is not one in the original packet. It can also clear a DF bit that it does not need.

Example
The following command sets the DF bit in the outer IP header:
control-dont-fragment set-bit
end

Exits the current configuration mode and returns to the Exec mode.

Syntax

```
exit
```

Usage
Use this command to return to the parent configuration mode.
ikev2-ikesa

Configures parameters for the IKEv2 IKE Security Associations within this crypto template.

Product
- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW
- HSGW
- MME
- P-GW
- PDSN
- S-GW
- SAEGW
- SCM
- SecGW
- SGSN

Privilege
- Security Administrator

Syntax

```

default ikev2-ikesa { allow-empty-ikesa | max-retransmissions | policy error-notification | rekey [ disallow-param-change ] | setup-timer }

no ikev2-ikesa { allow-empty-ikesa name | policy { error-notification | use-rfc5996-notification } | rekey sec | transform-set list }
```

```
no ikev2-ikesa

Disables a previously enabled parameter.

allow-empty-ikesa

Default is not to allow-empty-ikesa. Activate to have the IKEv2 stack keep the IKE SA when all the Child SAs have been deleted.
```
max-retransmissions number

Specifies the maximum number of retransmissions of an IKEv2 IKE Exchange Request if a response has not been received. number must be an integer from 1 through 8. Default: 5

Specifies the default policy for generating an IKEv2 Invalid Message ID error when PDIF receives an out-of-sequence packet.

- error-notification: Sends an Error Notify Message to the MS for Invalid IKEv2 Exchange Message ID and Invalid IKEv2 Exchange Syntax for the IKE_SA_INIT Exchange.
- [invalid-major-version]: Sends an Error Notify Message for Invalid Major Version
- [invalid-message-id]: Sends an Error Notify Message for Invalid IKEv2 Exchange Message ID.
- [invalid-syntax]: Sends an Error Notify Message for Invalid IKEv2 Exchange Syntax.
- use-rfc5996-notification: Enables support for TEMPORARY_FAILURE and CHILDSA_NOT_FOUND notify payloads.

rekey [ disallow-param-change ]

Specifies if IKESA rekeying should occur before the configured lifetime expires (at approximately 90% of the lifetime interval). Default is not to re-key.

The disallow-param-change option does not allow changes in negotiation parameters during rekey.

retransmission-timeout msec

Specifies the timeout period (in milliseconds) before a retransmission of an IKEv2 IKE exchange request is sent (if the corresponding response has not been received). msec must be an integer from 300 to 15000. Default: 500

exponential

Specifies that the subsequent retransmission delays are exponentially increased with a maximum limit of 15000ms.

setup-timer sec

Specifies the number of seconds before a IKEv2 IKE Security Association that is not fully established is terminated. sec must be an integer from 1 through 3600. Default: 16

transform-set list name1 ...

Specifies the name of a context-level configured IKEv2 IKE Security Association transform set. name1 ...

name6 must be an existing IKEv2 IKESA Transform Set expressed as an alphanumeric string of 1 through 127 characters.

The transform set is a space-separated list of IKEv2-IKESA SA transform sets to be used for deriving IKEv2 IKE Security Associations from this crypto template. A minimum of one transform-set is required; maximum configurable is six.

Usage

Use this command to configure parameters for the IKEv2 IKE Security Associations within this crypto template.

Example
The following command configures the maximum number of IKEv2 IKESA request retransmissions to 7:

```
ikev2-ikesa max-retransmissions 7
```

The following command configures the IKEv2 IKESA request retransmission timeout to 400 milliseconds:

```
ikev2-ikesa retransmission-timeout 400
```

The following command configures the IKEv2 IKESA transform set `ikesa43`:

```
ikev2-ikesa transform-set list ikesa43
```
keepalive

Configures keepalive or dead peer detection for security associations used within this crypto template.

Product

Privilege

Security Administrator

Syntax

```plaintext
keepalive [ interval sec ] [ timeout sec [ num-retry num ]
no keepalive
```

**no**

Disables keepalive messaging.

**interval sec**

Specifies the amount of time (in seconds) that must elapse before the next keepalive request is sent. `sec` must be an integer from 10 through 3600. Default: 10

**timeout sec**

Specifies the amount of time (in seconds) which must elapse during which no traffic is received from the IKE_SA peer or any CHILD_SAs derived from the IKE_SA for Dead Peer Detection to be initiated. `sec` must be an integer from 10 through 3600. Default: 10
**keepalive**

```plaintext
num-retry num
```

Specifies the number of times the system will retry a non-responsive peer before defining the peer as off-line or out-of-service. `num` must be an integer from 1 through 100. Default: 2

**Usage**

Use this command to set parameters associated with determining the availability of peer servers.

**Example**

The following command sets a keepalive interval to three minutes (180 seconds):

```
keepalive interval 180
```
**match**

Matches or associates the crypto map to an access control list (ACL) configured in the same context.

**Product**
- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW
- HSGW
- MME
- P-GW
- PDSN
- S-GW
- SAEGW
- SCM
- SecGW
- SGSN

**Privilege**
Security Administrator

**Syntax**

```
match address acl_name [ priority ]
no match address acl_name
```

**no**
Removes a previously matched ACL.

```
match address acl_name
```
Specifies The name of the ACL with which the crypto map is to be matched. `acl_name` is an alphanumeric string of 1 through 79 characters that is case sensitive.

```
priority
```
Specifies the preference of the ACL as integer from 0 through 4294967295. 0 is the highest priority. Default: 0
The ACL preference is factored when a single packet matches the criteria of more than one ACL.

**Important:** The priorities are only compared for ACLs matched to other crypto maps or to policy ACLs (those applied to the entire context).
Usage
ACLs matched to crypto maps are referred to as crypto ACLs. Crypto ACLs define the criteria that must be met in order for a subscriber data packet to routed over an IPSec tunnel. Prior to routing, the system examines the properties of each subscriber data packet. If the packet properties match the criteria specified in the crypto ACL, the system will initiate the IPSec policy dictated by the crypto map.

Example
The following command sets the crypto map ACL to the ACL named `acl-list1` and sets the crypto maps priority to the highest level.

```
match address acl-list1 0
```
natt

Configures Network Address Translation - Traversal (NAT-T) for all security associations associated with this crypto template. This feature is disabled by default.

Product
All Security Gateway products

Privilege
Security Administrator

Syntax

[ default | no ] natt [ include-header ] [ send-keepalive [ idle-interval idle_secs ] [ interval interval_secs ] ]

__default__
Disables NAT-T for all security associations associated with this crypto template.

__no__
Disables NAT-T for all security associations associated with this crypto template.

__include-header__
Includes the NAT-T header in IPSec packets.

__send-keepalive [ idle-interval idle_secs ] [ interval interval_secs ]__
Sends NAT-Traversal keepalive messages.

idle-interval idle_secs: Specifies the number of seconds that can elapse without sending NAT keepalive packets before sending NAT keepalive packets is started. idle_secs is an integer from 20 to 86400. Default: 60.

interval interval_secs: Specifies the number of seconds between the sending of NAT keepalive packets. interval_secs is an integer from 20 to 86400. Default: 60.

Usage
Use this command to configure NAT-T for security associations within this crypto template.

Example
The following command disables NAT-T for this crypto template:

```
no natt
```
ocsp

Enables use of Online Certificate Status Protocol (OCSP) from a crypto template. OCSP provides a facility to obtain timely information on the status of a certificate.

**Product**
All products supporting IPSec

**Important:** This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

**Privilege**
Security Administrator

**Syntax**

```
ocsp [ nonce | responder-address ipv4_address [ port port_value ] ]
oeocsp [ nonce | responder-address [ port ] ]
default ocsp [ nonce ]
```

- **no**
  Disables the use of OCSP.

- **default**
  Restores the default value assigned for ocsp nonce.

- **nonce**
  Enables sending nonce (unique identifier) in OCSP requests.

- **responder-address ipv4_address**
  Configures the OCSP responder address that is used when absent in the peer (device) certificate. `ipv4_address` is an IPv4 address specified in dotted decimal format.

- **port port_value**
  Configures the port for OCSP responder. `port_value` is an integer value between 1 and 65535. The default port is 8889.

**Usage**

This command enables the use of Online Certificate Protocol (OCSP) from a crypto map/template. OCSP provides a facility to obtain timely information on the status of a certificate. OCSP messages are exchanged between a gateway and an OCSP responder during a certificate transaction. The responder immediately provides the status of the presented certificate. The status can be good, revoked or unknown. The gateway can then proceed based on the response.

**Example**

The following command enables OCSP:
ocsp
payload

Creates a new, or specifies an existing, crypto map payload and enters the Crypto Map Payload Configuration Mode.

Privilege

Security Administrator

Syntax

payload name match ipv4

no payload name

payload name

Specifies the name of a new or existing crypto template payload as an alphanumeric string of 1 through 127 characters.

match ipv4

Filters IPSec IPv4 Child Security Association creation requests for subscriber calls using this payload. Further filtering can be performed by applying the following:

Usage

Use this command to create a new or enter an existing crypto template payload. The payload mechanism is a means of associating parameters for the Security Association (SA) being negotiated.
Two payloads are required: one each for MIP and IKEv2. The first payload is used for establishing the initial Child SA Tunnel Inner Address (TIA) which will be torn down. The second payload is used for establishing
the remaining Child SAs. Note that if there is no second payload defined with home-address as the ip-address-allocation then no MIP call can be established, just a Simple IP call.
Currently, the only available match is for ChildSA, although other matches are planned for future releases. Entering this command results in the following prompt:

```
[ctxt_name]hostname(cfg-crypto-<name>-ikev2-tunnel-payload)#
```

Crypto Template IKEv2-IPv4 Payload Configuration Mode commands are defined in the Crypto Template IKEv2-IPv4 Payload Configuration Mode Commands chapter.

**Example**

The following command configures a crypto template payload called `payload5` and enters the Crypto Template IKEv2-IPv6 Payload Configuration Mode:

```
payload payload5 match ipv4
```
**peer**

Configures the IP address of a peer IPSec.

**Product**
- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW
- HSGW
- MME
- P-GW
- PDSN
- S-GW
- SAEGW
- SCM
- SecGW
- SGSN

**Privilege**
- Security Administrator

**Syntax**

```
peer ip_address
no peer
```

- **no**
  - Removes the configured peer IP address.

  ```
  peer ip_address
  ```

  - Specifies the IP address of a peer IPSec server in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

  **Usage**
  Use this command to specify a peer IPsec peer server. The IPsec peer server can also be the Lawful Intercept server.

  **Example**
  The following command configures the system to recognize an IPsec peer server with an IPv6 address of `fe80::200:ff:fe21:67cf`. 
peer fe80::200:ff:fe21:67cf
remote-secret-list

Enables the use of a Remote Secret List containing up to 1000 pre-shared keys.

**Product**
All Security Gateway products

**Important:** This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

**Privilege**
Security Administrator

**Syntax**

```
remote-secret-list list_name
no remote-secret-list
```

do
Disables use of a Remote Secret List.

```
list_name
```
Specifies the name of an existing Remote Secret List as an alphanumeric string of 1 through 127 characters.

**Usage**
Enable the use of a Remote Secret List containing up to 1000 pre-shared keys.
Only one active remote-secret-list is supported per system.
For additional information, refer to the Remote Secret List Configuration Commands chapter of the Command Line Interface Reference and the System Administration Guide.

**Example**
The following command enables a remote-secret-list named rs-list:

```
remote-secret-list rs-list
```
whitelist

Enables or disables a whitelist (access granted) for this crypto map.

**Product**

All products supporting IPSec whitelisting

**Important:** This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

**Privilege**

Security Administrator

**Syntax**

```
[ no ] whitelist
```

<table>
<thead>
<tr>
<th>no</th>
</tr>
</thead>
</table>
| Disables whitelisting for this crypto map. By default whitelisting is disabled.

**Usage**

Use this command to enable whitelisting for this crypto map. A whitelist is a list or register of entities that are being provided a particular privilege, service, mobility, access or recognition. With whitelisting, no peer is allowed to connect unless it appears in the list. For additional information on whitelisting, refer to the *System Administration Guide*.

**Example**

The following command enables whitelisting:

```
whitelist
```
Chapter 62
Crypto Map IKEv2-IPv4 Payload Configuration Mode Commands

The Crypto Map IKEv2-IPv4 Payload Configuration Mode is used to assign the correct IPSec transform-set from a list of up to four different transform-sets, and to assign Mobile IP addresses.

Mode

Exec > Global Configuration > Context Configuration > Crypto Map IKEv2-IPv4 > Crypto Map IKEv2-IPv4 Payload Configuration

```
configure > context context_name > crypto map map_name ikev2-ipv4 > payload payload_name
match ipv4
```

Entering the above command sequence results in the following prompt:

```
[context_name] host_name (cfg-crypto-ikev2-ipv4-payload) #
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.

Privilege

Security Administrator

Syntax

ipsec transform-set list transform_set_name transform_set_name transform_set_name transform_set_name

no ipsec transform-set list

ipsec transform-set list transform_set_name

Specifies the context-level IKEv2 IPSec Child Security Association (SA) transform sets to be used in the crypto template payload. This is a space-separated list. Up to four transform sets can be entered.

transform_set_name is an alphanumeric string of 1 through 127 characters.

Usage

Use this command to list the IPSec transform set(s) to use in this crypto template payload.

Example

The following command configures IPSec transform sets named ipset1 and ipset2 for use in this crypto template payload:

ipsec transform-set list ipset1 ipset2
lifetime

Configures the number of seconds and/or kilobytes for IPSec Child SAs derived from this crypto template payload to exist.

Product

- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW
- HSGW

- SCM
- SecGW
- SGSN

Privilege

Security Administrator

Syntax

```
lifetime { sec [ kilo-bytes kbytes ] | kilobytes kbytes }
```

```
default lifetime
```

- default

Returns the lifetime value to the default setting of 86400 seconds.

- sec

Specifies the number of seconds for IPSec Child Security Associations derived from this crypto template payload to exist. `sec` must be an integer from 60 through 604800. Default: 86400

- kilo-bytes kbytes

Specifies lifetime in kilobytes for IPSec Child Security Associations derived from this Crypto Map. `kbytes` must be an integer from 1 through 2147483648.
Usage

Use this command to configure the number of seconds and/or kilobytes for IPSec Child Security Associations derived from this crypto template payload to exist.

Example

The following command configures the IPSec child SA lifetime to be 120 seconds:

```
lifetime 120
```
rekey

Configures child security association rekeying.

Product
- ePDG
- FA
- FNG
- GGSN
- HA
- HNBGW
- P-GW
- PDSN
- SAEGW
- SCM
- SGSN

Privilege
Security Administrator

Syntax

rekey [ keepalive ]
[ default | no ] rekey

-------------
default
Returns the feature to the default setting of disabled.

-------------
no
Disables this feature.

-------------
keepalive
If specified, a session will be rekeyed even if there has been no data exchanged since the last rekeying operation. By default rekeying is only performed if there has been data exchanged since the previous rekey.

Usage
Use this command to enable or disable the ability to rekey IPSec Child SAs after approximately 90% of the Child SA lifetime has expired. The default, and recommended setting, is not to perform rekeying. No rekeying means the P-GW will not originate rekeying operations and will not process CHILD SA rekeying requests from the MS.

Example
The following command disables rekeying:

no rekey
Chapter 63
Crypto Map IKEv2-IPv6 Configuration Mode Commands

The Crypto Map IKEv2-IPv6 Configuration Mode is used to configure an IKEv2 IPsec policy for secure X3 interface tunneling between a P-GW and a lawful intercept server.

Mode

Exec > Global Configuration > Context Configuration > Crypto Map IKEv2-IPv6 Configuration

configure > context context_name > crypto map map_name ikev2-ipv6

Entering the above command sequence results in the following prompt:

[context_name]host_name(cfg-crypto-ikev2-ipv6-map)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
allow-cert-enc cert-hash-url

Enables support for a certificate encoding type other than the default. When enabled hash and URL encoding type are supported in CERT and CERTREQ payloads.

**Product**
Security gateway products

**Privilege**
Security Administrator

**Syntax**

```
[ no ] allow-cert-enc cert-hash-url
```

- `no`
  Disables support for hash and URL encoding type in CERT and CERTREQ payloads.

**Usage**
Enable support for a certificate encoding type other than the default. When enabled hash and URL encoding type are supported in CERT and CERTREQ payloads.

**Example**
The following command enables hash and URL encoding type in CERT and CERTREQ payloads:

```
allow-cert-enc cert-hash-url
```
authentication

Configures the subscriber authentication method used for this crypto map.

Product

- ePDG
- FA
- GGSN

- SCM
- SecGW
- SGSN

Privilege

Security Administrator

Syntax

```
authentication { local | remote } ( certificate | pre-shared-key { encrypted key value | key value })
```

- **local | remote**
  Specifies which authentication method will be used by the crypto map – local or remote.

- **certificate**
  Specifies that a certificate will be used by this crypto map for authentication.

- **pre-shared-key { encrypted key value | key value }**
  Specifies that a pre-shared key will be used by this crypto map for authentication.
  - `encrypted key value`: Specifies that the pre-shared key used for authentication is encrypted and expressed as an alphanumeric string of 1 through 255 characters for releases prior to 15.0, or 16 to 444 characters for release 15.0 and higher.
  - `key value`: Specifies that the pre-shared key used for authentication is clear text and expressed as an alphanumeric string of 1 through 32 characters for releases prior to 14.0 or 1 through 255 characters for release 14.0 and higher.
Usage

Use this command to specify the type of authentication performed for subscribers attempting to access the system via this crypto map.

Example

The following command sets the authentication method to an open key value of 6d7970617373776f7264:

```
authentication pre-shared-key key 6d79706173776f7264
```
blacklist

Enables or disables a blacklist (access denied) for this map.

**Product**
All products supporting IPSec blacklisting

**Important:** This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

**Privilege**
Security Administrator

**Syntax**

```
[ no ] blacklist

no
```

Disables blacklisting for this crypto map. By default blacklisting is disabled.

**Usage**

Use this command to enable blacklisting for this crypto map. A blacklist is a list or register of entities that are denied a particular privilege, service, mobility, access or recognition. With blacklisting, any peer is allowed to connect as long as it does not appear in the list. For additional information on blacklisting, refer to the System Administration Guide.

**Example**

The following command enables blacklisting:

```
blacklist
```
**ca-certificate list**

Used to bind an X.509 Certificate Authority (CA) certificate list to a crypto template.

**Product**
- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW
- HSGW

**Syntax**
```
ca-certificate list ca-cert-name cert_name [ ca-cert-name cert_name ] [ ca-cert-name cert_name ] ... [ ca-cert-name cert_name ]
```

```
no ca-certificate
```

**Usage**
Used to bind an X.509 CA certificate list to a crypto map.

**Example**
Use the following example to add a CA root certificate named **CAS_list1** to a list:

```
```
ca-certificate list ca-cert-name CA_list1
ca-crl list

Binds one or more Certificate Authority-Certificate Revocation Lists (CA-CRLs) to this crypto template.

Privilege

Security Administrator

Syntax

ca-crl list ca-crl-name name [ ca-crl-name name ] [ ca-crl-name cacrl_name ]... [ ca-crl-name cacrl_name ]

no ca-crl

no

Removes the CA-CRL configuration from this template.

ca-crl-name cacrl_name

Specifies the CA-CRL to associate with this crypto template. cacrl_name must be the name of an existing CA-CRL expressed as an alphanumeric string of 1 through 129 characters. Multiple lists can be configured for a crypto template.
You can chain multiple CA-CRLs in a single command instance.

Usage

Use this command to associate a CA-CRL name with this crypto template.
CA-CRLs are configured in the Global Configuration Mode. For more information about configuring CA-CRLs, refer to the ca-crl name command in the Global Configuration Mode Commands chapter.
Example

The following example binds CA-CRLs named \textit{CRL-5} and \textit{CRL-7} to this crypto template:

\begin{verbatim}
ca-crl list ca-crl-name CRL-5 ca-crl-name CRL-7
\end{verbatim}
**certificate**

Used to bind a single X.509 trusted certificate to a crypto map.

**Product**
- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW
- HSGW
- MME
- P-GW
- PDSN
- S-GW
- SAEGW
- SCM
- SecGW
- SGSN

**Privilege**
- Security Administrator

**Syntax**

```
certificate cert_name [ validate ]
```

```
no certificate [ validate ]
```

**no**

Removes any applied certificate or prevents the certificate from being included in the Auth Exchange response payload.

**cert_name**

Specifies the name of a X.509 trusted certificate to bind to a crypto map. *name* is an alphanumeric string of 1 through 127 characters.

**validate**

Enables validation for the self-certificate.

**Usage**

Can be used to bind an X.509 certificate to a template, or include or exclude it from the Auth Exchange response payload.
Example

Use the following example to prevent a certificate from being included in the Auth Exchange payload:

    no certificate validate
control-dont-fragment

Controls the Don’t Fragment (DF) bit in the outer IP header of the IPSec tunnel data packet.

Product
- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW
- HSGW
- MME
- P-GW
- PDSN
- S-GW
- SAEGW
- SCM
- SecGW
- SGSN

Privilege
Security Administrator

Syntax

```
control-dont-fragment { clear-bit | copy-bit | set-bit }
```

- **clear-bit**
  
  Clears the DF bit from the outer IP header (sets it to 0).

- **copy-bit**
  
  Copies the DF bit from the inner IP header to the outer IP header. This is the default action.

- **set-bit**
  
  Sets the DF bit in the outer IP header (sets it to 1).

Usage

A packet is encapsulated in IPsec headers at both ends. The new packet can copy the DF bit from the original unencapsulated packet into the outer IP header, or it can set the DF bit if there is not one in the original packet. It can also clear a DF bit that it does not need.

Example

The following command sets the DF bit in the outer IP header:
control-dont-fragment set-bit
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
ikev2-ikesa

Configures parameters for the IKEv2 IKE Security Associations within this crypto map.

**Product**
- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW
- HSGW
- MME
- P-GW
- PDSN
- S-GW
- SAEGW
- SCM
- SecGW
- SGSN

**Privilege**
- Security Administrator

**Syntax**

```
ikev2-ikesa { allow-empty-ikesa | max-retransmissions number | policy { error-notification | use-rfc5996-notification } | rekey [ disallow-param-change ] | retransmission-timeout msec | setup-timer sec | transform-set list name }

default ikev2-ikesa { allow-empty-ikesa | max-retransmissions | policy error-notification | rekey | setup-timer }

no ikev2-ikesa { allow-empty-ikesa | policy { error-notification | use-rfc5996-notification } | rekey | transform-set list }
```

**Default**
Restores the selected keyword to its default value.

**No**
Disables a previously enabled parameter.
allow-empty-ikesa
Default is not to allow-empty-ikesa. Activate to have the IKEv2 stack keep the IKE SA when all the Child SAs have been deleted.

max-retransmissions number
Specifies the maximum number of retransmissions of an IKEv2 IKE exchange request if a response has not been received.
number must be an integer from 1 to 8.
Default: 5

policy { error-notification | use-rfc5996-notification }
Notifies error policy.
error-notification: Error Notify Messages will be sent to MS for Invalid IKEv2 Exchange Message ID and Invalid IKEv2 Exchange Syntax for the IKE_SA_INIT Exchange.
use-rfc5996-notification: Enables sending and receive processing for RFC 5996 notifications - TEMPORARY_FAILURE and CHILD_SA_NOT_FOUND.

rekey [ disallow=param-change ]
Specifies if IKESA rekeying should occur before the configured lifetime expires (at approximately 90% of the lifetime interval).
Default is not to re-key.
The disallow-param-change option prevents changes in negotiation parameters during rekey.

retransmission-timeout msec
Specifies the timeout period in milliseconds before a retransmission of an IKEv2 IKE exchange request is sent (if the corresponding response has not been received).
msec must be an integer from 300 to 15000.
Default: 500

setup-timer sec
Specifies the number of seconds before an IKEv2 IKE Security Association that is not fully established is terminated.
sec must be an integer from 16 to 3600.
Default: 60

transform-set list name
A space-separated list of context-level configured IKEv2 IKE Security Association transform sets to be used for deriving IKEv2 IKE Security Associations from this crypto map.
name must be an existing IKEv2 IKESA Transform Set expressed as an alphanumeric string of 1 through 127 characters. A minimum of one transform set is required; maximum configurable is six.

Usage
Use this command to configure parameters for the IKEv2 IKE Security Associations within this crypto map.

Example
The following command configures the maximum number of IKEv2 IKESA request retransmissions to 7:

ikev2-ikesa max-retransmissions 7
keepalive

Configures keepalive or dead peer detection for security associations used within this crypto template.

**Product**
- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW
- HSGW
- MME
- P-GW
- PDSN
- S-GW
- SAEGW

- SecGW
- SGSN

**Privilege**
- Security Administrator, Administrator

**Syntax**

```
keepalive [ interval sec ] [ timeout ] [ num-retry num ]
default keepalive [ interval ] [ timeout ] [ num-retry ]
no keepalive
```

**no**

Disables keepalive messaging.

**interval sec**

Specifies the amount of time (in seconds) that must elapse before the next keepalive request is sent. sec must be an integer from 10 through 3600. Default: 10

**timeout sec**

Specifies the amount of time (in seconds) which must elapse during which no traffic is received from the IKE_SA peer or any CHILD_SAs derived from the IKE_SA for Dead Peer Detection to be initiated. sec must be an integer from 10 through 3600. Default: 10
**num-retry num**

Specifies the number of times the system will retry a non-responsive peer before defining the peer as off-line or out-of-service. `num` must be an integer from 1 through 100. Default: 2

**Usage**

Use this command to set parameters associated with determining the availability of peer servers.

**Example**

The following command sets a keepalive interval to three minutes (180 seconds):

```
keepalive interval 180
```
match

Matches or associates the crypto map to an access control list (ACL) configured in the same context.

Syntax

match address acl_name [ priority ]

no match address

no
Removes a previously matched ACL.

match address acl_name

Specifies The name of the ACL with which the crypto map is to be matched. acl_name is an alphanumeric string of 1 through 79 characters that is case sensitive.

priority

Specifies the preference of the ACL as integer from 0 through 4294967295. 0 is the highest priority. Default: 0
The ACL preference is factored when a single packet matches the criteria of more than one ACL.

Important: The priorities are only compared for ACLs matched to other crypto maps or to policy ACLs (those applied to the entire context).
Usage

ACLs matched to crypto maps are referred to as crypto ACLs. Crypto ACLs define the criteria that must be met in order for a subscriber data packet to routed over an IPSec tunnel. Prior to routing, the system examines the properties of each subscriber data packet. If the packet properties match the criteria specified in the crypto ACL, the system will initiate the IPSec policy dictated by the crypto map.

Example

The following command sets the crypto map ACL to the ACL named acl-list1 and sets the crypto maps priority to the highest level.

```
match address acl-list1 0
```
ocsp

Enables use of Online Certificate Status Protocol (OCSP) from a crypto template. OCSP provides a facility to obtain timely information on the status of a certificate.

**Product**
All products supporting IPSec

**Important:** This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

**Privilege**
Security Administrator

**Syntax**

```
ocsp [ nonce | responder-address ipv4_address [ port port_value ] ]
no ocsp [ nonce | responder-address [ port ] ]
default ocsp [ nonce ]
```

- **no**
  Disables the use of OCSP.

- **default**
  Restores the default value assigned for ocsp nonce.

- **nonce**
  Enables sending nonce (unique identifier) in OCSP requests.

- **responder-address ipv4_address**
  Configures the OCSP responder address that is used when absent in the peer (device) certificate. `ipv4_address` is an IPv4 address specified in dotted decimal format.

- **port port_value**
  Configures the port for OCSP responder. `port_value` is an integer value between 1 and 65535. The default port is 8889.

**Usage**

This command enables the use of Online Certificate Protocol (OCSP) from a crypto map/template. OCSP provides a facility to obtain timely information on the status of a certificate. OCSP messages are exchanged between a gateway and an OCSP responder during a certificate transaction. The responder immediately provides the status of the presented certificate. The status can be good, revoked or unknown. The gateway can then proceed based on the response.

**Example**

The following command enables OCSP:
ocsp
payload

Creates a new, or specifies an existing, crypto template payload and enters the Crypto Template Payload Configuration Mode.

Product

ePDG
FA

Privilege

Security Administrator

Syntax

payload name match ipv6

no payload name

payload name

Specifies the name of a new or existing crypto template payload as an alphanumeric string of 1 through 127 characters.

match ipv6

Filters IPSec IPv6 Child Security Association creation requests for subscriber calls using this payload. Further filtering can be performed by applying the following:

Usage

Use this command to create a new or enter an existing crypto template payload. The payload mechanism is a means of associating parameters for the Security Association (SA) being negotiated. Two payloads are required: one each for MIP and IKEv2. The first payload is used for establishing the initial Child SA Tunnel Inner Address (TIA) which will be torn down. The second payload is used for establishing
the remaining Child SAs. Note that if there is no second payload defined with home-address as the *ip-address-allocation* then no MIP call can be established, just a Simple IP call. Currently, the only available match is for ChildSA, although other matches are planned for future releases. Entering this command results in the following prompt:

```
[ctxt_name]hostname(cfg-crypto-<name>-ikev2-tunnel-payload)#
```

Example

The following command configures a crypto template payload called `payload5` and enters the Crypto Template IKEv2-IPv6 Payload Configuration Mode:

```
payload payload5 match ipv6
```
peer

Configures the IP address of a peer IPSec server.

Privilege

Security Administrator

Syntax

peer ip_address

no peer

no

Removes the configured peer server IP address.

peer ip_address

 Specifies the IP address of a peer IPSec server in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

Usage

Use this command to specify a peer IPsec peer server. The IPsec peer server can also be the Lawful Intercept server.

Example

The following command configures the system to recognize an IPsec peer server with an IPv6 address of fe80::200:f8ff:fe21:67cf.
peer fe80::200:ff:fe21:67cf
remote-secret-list

Enables the use of a Remote Secret List containing up to 1000 pre-shared keys.

**Product**
All Security Gateway products

**Important:** This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

**Privilege**
Security Administrator

**Syntax**

```
remote-secret-list list_name
no remote-secret-list
```

**Usage**
Enable the use of a Remote Secret List containing up to 1000 pre-shared keys.
Only one active remote-secret-list is supported per system.
For additional information, refer to the Remote Secret List Configuration Commands chapter of the Command Line Interface Reference and the System Administration Guide.

**Example**
The following command enables a remote-secret-list named `rs-list`:

```
remote-secret-list rs-list
```
whitelist

Enables or disables a whitelist (access granted) for this crypto map.

**Product**
All products supporting IPSec whitelisting

**Important:** This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

**Privilege**
Security Administrator

**Syntax**

```
[ no ] whitelist
```

- `no`
  
  Disables whitelisting for this crypto map. By default whitelisting is disabled.

**Usage**
Use this command to enable whitelisting for this crypto map. A whitelist is a list or register of entities that are being provided a particular privilege, service, mobility, access or recognition. With whitelisting, no peer is allowed to connect unless it appears in the list. For additional information on whitelisting, refer to the *System Administration Guide*.

**Example**
The following command enables whitelisting:

```
whitelist
```
Chapter 64
Crypto Map IKEv2-IPv6 Payload Configuration Mode Commands

The Crypto Map IKEv2-IPv6 Payload Configuration Mode is used to assign the correct IPSec transform-set from a list of up to four different transform-sets, and to assign Mobile IP addresses.

Mode
Exec > Global Configuration > Context Configuration > Crypto Map IKEv2-IPv6 Configuration > Crypto Map IKEv2-IPv6 Payload Configuration

configure > context context_name > crypto map map_name ikev2-ipv6 > payload payload_name
match ipv6

Entering the above command sequence results in the following prompt:

[context_name]host_name(cfg-crypto-ikev2-ipv6-payload)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege

Mode

Exec > Global Configuration > Context Configuration > Crypto Map IKEv2-IPv6 Configuration > Crypto Map IKEv2-IPv6 Payload Configuration

configure > context context_name > crypto map map_name ikev2-ipv6 > payload payload_name
match ipv6

Entering the above command sequence results in the following prompt:

[context_name]host_name(cfg-crypto-ikev2-ipv6-payload)#

Syntax

ipsec transform-set list transform_set_name [ transform_set_name ] [ transform_set_name ] [ transform_set_name ]

no ipsec transform-set list

no

Disables the transform set list.
ipsec transform-set list transform_set_name

Specifies the context-level name of the IKEv2 IPsec Child Security Association (SA) transform set to be used in the crypto map payload. This is a space-separated list. From 1 to 4 transform sets can be entered. 

`transform_set_name` is an alphanumeric string of 1 through 127 characters.

Usage

Use this command to list the IPSec transform set(s) to use in this crypto map payload.

Example

The following command configures IPsec transform sets named `ipset1` and `ipset2` to be used in this crypto template payload:

```
ipsec transform-set list ipset1 ipset2
```
**lifetime**

Configures the number of seconds and/or kilobytes for IPSec Child SAs derived from this crypto template payload to exist.

**Product**
- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW

**Mode**

Exec > Global Configuration > Context Configuration > Crypto Map IKEv2-IPv6 Configuration > Crypto Map IKEv2-IPv6 Payload Configuration

```
configure > context context_name > crypto map map_name ikev2-ipv6 > payload payload_name
match ipv6
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(cfg-crypto-ikev2-ipv6-payload)#
```

**Syntax**

```
lifetime { sec [ kilo-bytes kbytes ] | kilobytes kbytes }

default lifetime
```

`default`

Returns the lifetime value to the default setting of 86400 seconds.
Lifetime

Specifies the number of seconds for IPSec Child Security Associations derived from this crypto template payload to exist. \texttt{sec} must be an integer from 60 through 604800. Default: 86400

\texttt{kilo-bytes \texttt{kbytes}}

Specifies lifetime in kilobytes for IPSec Child Security Associations derived from this Crypto Map. \texttt{kbytes} must be an integer from 1 through 2147483648.

Usage

Use this command to configure the number of seconds and/or kilobytes for IPSec Child Security Associations derived from this crypto template payload to exist.

Example

The following command configures the IPSec child SA lifetime to be 120 seconds:

\texttt{lifetime 120}
**rekey**

Configures child security association rekeying.

**Product**
- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW
- HSGW
- MME
- P-GW
- PDSN
- S-GW

- SecGW
- SGSN

**Privilege**
- Security Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > Crypto Map IKEv2-IPv6 Configuration > Crypto Map IKEv2-IPv6 Payload Configuration

`configure > context context_name > crypto map map_name ikev2-ipv6 > payload payload_name match ipv6`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(cfg-cryptoikev2-ipv6-payload)#
```

**Syntax**

```
rekey [ keepalive ]
[ default | no ] rekey
```

---

**Default**

- Returns the feature to the default setting of disabled.

**No**

- Disables this feature.
keepalive

If specified, a session will be rekeyed even if there has been no data exchanged since the last rekeying operation. By default rekeying is only performed if there has been data exchanged since the previous rekey.

Usage

Use this command to enable or disable the ability to rekey IPSec Child SAs after approximately 90% of the Child SA lifetime has expired. The default, and recommended setting, is not to perform rekeying. No rekeying means the P-GW will not originate rekeying operations and will not process CHILD SA rekeying requests from the MS.

Example

The following command disables rekeying:

   no rekey
Chapter 65
Crypto Map IPSec Dynamic Configuration Mode Commands

The Crypto Map IPSec Dynamic Configuration Mode is used to configure IPSec tunnels that are created as needed to facilitate subscriber sessions using Mobile IP or L2TP.

Modification(s) to an existing dynamic crypto map configuration will not take effect until the related security association has been cleared. Refer to the description of the `clear crypto security-association` command in the `Exec Mode Commands` chapter for more information.

Mode

Exec > Global Configuration > Context Configuration > Crypto Map Dynamic Configuration

`configure > context context_name > crypto map policy_name ipsec-dynamic`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-crypto-dynamic-map)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

Mode
- Exec > Global Configuration > Context Configuration > Crypto Map Dynamic Configuration

configure > context context_name > crypto map policy_name ipsec-dynamic

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-crypto-dynamic-map)#

Syntax

```
set { control-dont-fragment { clear-bit | copy-bit | set-bit } | ikev1 natt [ keepalive sec ] | ip mtu bytes | pfs { group1 | group2 | group5 } | phase1-idtype { id-key-id | ipv4-address } [ mode { aggressive | main } ] | phase2-idtype { ipv4-address | ipv4-address-subnet } | security-association lifetime { keepalive | kilo-bytes kilo-bytes | seconds secs } | transform-set transform_name [ transform-set transform-name2... transform-set transform-name6 ] }
no set { ikev1 natt | pfs | security-association lifetime { keepalive | kilo-bytes | seconds } | phase1-idtype | phase2-idtype | transform-set transform_name [ transform-set transform-name2... transform-set transform-name6 ] }
```

no

Deletes the specified parameter or resets the specified parameter to the default value.
control-dont-fragment \{ clear-bit | copy-bit | set-bit \}
Controls the don’t fragment (DF) bit in the outer IP header of the IPSec tunnel data packet. Options are:

- clear-bit: Clears the DF bit from the outer IP header (sets it to 0).
- copy-bit: Copies the DF bit from the inner IP header to the outer IP header. This is the default action.
- set-bit: Sets the DF bit in the outer IP header (sets it to 1).

ikev1 natt \[ keepalive sec \]
Enables IPSec NAT Traversal.

keepalive sec: The time to keep the NAT connection alive in seconds. sec must be an integer from 1 through 3600.

ip mtu bytes
Specifies the IP Maximum Transmission Unit (MTU) in bytes as an integer from 576 to 2048.

mode \{ aggressive | main \}
Configures the IKE negotiation mode as AGGRESSIVE or MAIN.

pfs \{ group1 | group2 | group5 \}
Specifies the modp Oakley group (also known as the Diffie-Hellman [D-H] group) that is used to determine the length of the base prime numbers that are used for Perfect Forward Secrecy (PFS).

- group1: Diffie-Hellman Group1 (768-bit modp)
- group2: Diffie-Hellman Group2 (1024-bit modp)
- group5: Diffie-Hellman Group5 (1536-bit modp)

phase1-idtype \{ id-key-id | ipv4-address \} \[ mode \{ aggressive | main \} \]
Sets the IKE negotiations Phase 1 payload identifier.
Default: ipv4-address

id-key-id: Use ID_KEY_ID as the Phase 1 payload identifier.
ipv4-address: Use IPV4_ADDR as the Phase 1 payload identifier.
mode \{ aggressive | main \}: Specify the IKE mode.

phase2-idtype \{ ipv4-address | ipv4-address-subnet \}
Sets the IKE negotiations Phase 2 payload identifier.
Default: ipv4-address-subnet

ipv4-address: Use IPV4_ADDR as the Phase 2 payload identifier.
ipv4-address-subnet: Use IPV4_ADDR_SUBNET as the Phase 2 payload identifier.

security-association lifetime \{ keepalive | kilo-bytes kbytes | seconds secs \}
Defaults:

- keepalive: Disabled
- kilo-bytes: 4608000 kbytes
- seconds: 28800 seconds
This keyword specifies the parameters that determine the length of time an IKE Security Association (SA) is active when no data is passing through a tunnel. When the lifetime expires, the tunnel is torn down. Whichever parameter is reached first expires the SA lifetime.

- **keepalive**: The SA lifetime expires only when a keepalive message is not responded to by the far end.
- **kilo-bytes**: This specifies the amount of data in kilobytes to allow through the tunnel before the SA lifetime expires; entered as an integer from 2560 through 4294967294.
- **seconds**: The number of seconds to wait before the SA lifetime expires; entered as an integer from 1200 through 86400.

**Important**: If the dynamic crypto map is being used in conjunction with Mobile IP and the Mobile IP renewal timer is less than the crypto map’s SA lifetime (either in terms of kilobytes or seconds), then the `keepalive` parameter must be configured.

```
transform-set transform_name [ transform-set transform_name2 ... transform-set transform_name6 ]
```

Specifies the name of a transform set configured in the same context that will be associated with the crypto map. Refer to the command `crypto ipsec transform-set` for information on creating transform sets. You can repeat this keyword up to 6 times on the command line to specify multiple transform sets. `transform_name` is the name of the transform set entered as an alphanumeric string from 1 through 127 characters that is case sensitive.

**Usage**

Use this command to set parameters for a dynamic crypto map.

**Example**

The following command sets the PFS group to Group1:

```
set pfs group1
```

The following command sets the SA lifetime to 50000 KB:

```
set security-association lifetime kilo-bytes 50000
```

The following command sets the SA lifetime to 10000 seconds:

```
set security-association lifetime seconds 10000
```

The following command enables the SA to re-key when the tunnel lifetime expires:

```
set security-association lifetime keepalive
```

The following command defines transform sets `tset1` and `tset2`:

```
set transform-set tset1 transform-set tset2
```
Chapter 66
Crypto Map IPSec IKEv1 Configuration Mode Commands

The Crypto Map IPSec IKEv1 Configuration Mode is used to configure properties for IPSec tunnels that will be created using the Internet Key Exchange (IKE) that operates within the framework of the Internet Key Exchange version 1 (IKEv1).

Modification(s) to an existing IKEv1 crypto map configuration will not take effect until the related security association has been cleared. Refer to the description of the clear crypto security-association command in the Exec Mode Commands chapter for more information.

Mode

Exec > Global Configuration > Context Configuration > Crypto Map IPSec IKEv1 Configuration

configure > context context_name > crypto map policy_name ipsec-ikev1

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-crypto-map)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Use this command to return to the Exec mode.
**exit**

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

---

**Usage**

Use this command to return to the parent configuration mode.
**match address**

Matches or associates the crypto map to an access control list (ACL) configured in the same context.

**Product**

**Mode**
**Exec > Global Configuration > Context Configuration > Crypto Map IPSec IKEv1 Configuration**

```bash
configure > context context_name > crypto map policy_name ipsec-ikev1
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-crypto-map)#
```

**Syntax**

```
[ no ] match address acl_name priority
```

- **no**
  - Removes a previously matched ACL.

- **match address acl_name**
  - Specifies the name of the ACL with which the crypto map is to be matched as an alphanumeric string of 1 through 79 characters that is case sensitive.
priority

Specifies the preference of the ACL. The ACL preference is factored when a single packet matches the criteria of more than one ACL.
The preference is an integer value from 0 to 4294967295; 0 is the highest priority. Default: 0

**Important:** The priorities are only compared for ACLs matched to other crypto maps or to policy ACLs (those applied to the entire context).

**Usage**

ACLs matched to crypto maps are referred to as crypto ACLs. Crypto ACLs define the criteria that must be met in order for a subscriber data packet to routed over an IPSec tunnel.
Prior to routing, the system examines the properties of each subscriber data packet. If the packet properties match the criteria specified in the crypto ACL, the system will initiate the IPSec policy dictated by the crypto map.

**Example**

The following command sets the crypto map ACL to the ACL named `ACLlist1` and sets the crypto maps priority to the highest level.

```plaintext
match address ACLlist1 0
```
match crypto group

Matches or associates the crypto map a crypto group configured in the same context.

configure > context context_name > crypto map policy_name ipsec-ikev1

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-crypto-map)#

Syntax

[ no ] match crypto group group_name { primary | secondary }

no

Deletes a previously configured crypto group association.

match crypto group group_name

Specifies the name of the crypto group entered as an alphanumeric string of 1 through 127 characters that is case sensitive.
primary
Specifies that the policies configured as part of this crypto map will be used for the primary tunnel in the Redundant IPSec Tunnel Failover feature.

secondary
Specifies that the policies configured as part of this crypto map will be used for the secondary tunnel in the Redundant IPSec Tunnel Failover feature.

Usage
Use this command to dictate the primary and secondary tunnel policies used for the Redundant IPSec Tunnel Failover feature.
At least two policies must be configured to use this feature. One policy must be configured as the primary, the other as the secondary.

Example
The following command associates the crypto map to a crypto group called group1 and dictates that it will serve as the primary tunnel policy:

match crypto group group1 primary
match ip pool

Matches the specified IP pool to the current IKEv1 crypto map. This command can be used multiple times to change more than one IP pool.

Important: The match ip pool command is not supported on the ASR 5500 platform.

Security Administrator

Mode
Exec > Global Configuration > Context Configuration > Crypto Map IPSec IKEv1 Configuration

configure > context context_name > crypto map policy_name ipsec-ikev1

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-crypto-map)#

Syntax

[ no ] match ip pool pool-name pool_name [ destination-network ip_address [ /mask ]

no

Delete the matching statement for the specified IP pool from the crypto map.
match ip pool pool-name pool_name

Specifies the name of an existing IP pool that should be matched as an alphanumeric string of 1 through 31 characters.

destination-network ip_address [ /mask ]

Specifies the IP address of the destination network in IPv4 dotted-decimal or IPV6 colon-separated-hexadecimal notation.

/mask specifies the subnet mask bits (representing the subnet mask). This variable must be entered in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal CIDR notation.

An IP pool attached to the crypto map can have multiple IPSec tunnels according to the destination of the packet being forwarded to internet.

**Important:** Each invocation of this command will add another destination network to the IP pool, with a maximum of eight destination networks per crypto map.

**Usage**

Use this command to set the names of IP pools that should be matched in the current crypto map.

**Important:** If an IP address pool that is matched to an IKEv1 crypto map is resized, removed, or added, the corresponding security association must be cleared in order for the change to take effect. Refer to the `clear crypto` command in the Exec mode for information on clearing security associations.

**Example**

The following command sets a rule for the current crypto map that will match an IP pool named ippool1:

```
match ip pool pool-name ippool1
```
**set**

Configures parameters for the dynamic crypto map.

no set { ikev1 natt | pfs | phase1-idtype | phase2-idtype | security-association lifetime { disable-phase2-rekey | keepalive | kilo-bytes | seconds } | transform-set transform_name [ transform-set transform_name2 ... transform-set transform_name6 ]
```

---

**Command Line Interface Reference, StarOS Release 17**

2964
**bgp peer_address**

Specifies the IP address of the BGP peer in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**control-dont-fragment { clear-bit | copy-bit | set-bit }**

Controls the don’t fragment (DF) bit in the outer IP header of the IPSec tunnel data packet. Options are:
- **clear-bit**: Clears the DF bit from the outer IP header (sets it to 0).
- **copy-bit**: Copies the DF bit from the inner IP header to the outer IP header. This is the default action.
- **set-bit**: Sets the DF bit in the outer IP header (sets it to 1).

**ikev1 natt [ keepalive time ]**

Specifies IKE parameters.
- **natt**: Enables IPSec NAT Traversal.
- **keepalive time**: The time to keep the NAT connection alive in seconds. `time` must be an integer of from 1 through 3600.

**ip mtu bytes**

Specifies the IPv4 Maximum Transmission Unit (MTU) in bytes as an integer from 576 to 2048.

**ipv6 mtu bytes**

Specifies the IPv6 Maximum Transmission Unit (MTU) in bytes as an integer from 576 to 2048.

**mode { aggressive | main }**

Configures the IKE negotiation mode as AGRESSIVE or MAIN.

**peer peer_address**

Specifies the peer IP address of a remote gateway in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

**pfs { group1 | group2 | group5 }**

Specifies the modp Oakley group (also known as the Diffie-Hellman [D-H] group) that is used to determine the length of the base prime numbers that are used for Perfect Forward Secrecy (PFS).
- **group1**: Diffie-Hellman Group1 (768-bit modp)
- **group2**: Diffie-Hellman Group2 (1024-bit modp)
- **group5**: Diffie-Hellman Group5 (1536-bit modp)

**phasel-idtype { id-key-id | ipv4-address [ mode { aggressive | main } ] }**

Sets the IKE negotiations Phase 1 payload identifier. Default: id-key-id
- **id-key-id**: ID KEY ID
- **ipv4-address**: ID IPV4 Address
  - **mode**: Configures IKE mode
    - **aggressive**: IKE negotiation mode: AGRESSIVE
    - **main**: IKE negotiation mode: MAIN
Crypto Map IPSec IKEv1 Configuration Mode Commands

**phase2-idtype { ipv4-address | ipv4-address-subnet }**

Sets the IKE negotiations Phase 2 payload identifier.
Default: ipv4-address-subnet
- `ipv4-address`: Use IPV4_ADDR as the Phase 2 payload identifier.
- `ipv4-address-subnet`: Use IPV4_ADDR_SUBNET as the Phase 2 payload identifier.

**security-association lifetime { disable-phase2-rekey | keepalive | kilo-bytes kbytes | seconds secs }**

Defaults:
- `disable-phase2-rekey`: Rekeying is enabled by default
- `keepalive`: Disabled
- `kilo-bytes`: 4608000 kbytes
- `seconds`: 28800 seconds

Specifies the parameters that determine the length of time an IKE Security Association (SA) is active when no data is passing through a tunnel. When the lifetime expires, the tunnel is torn down. Whichever parameter is reached first expires the SA lifetime.
- `disable-phase2-rekey`: If this keyword is specified, the Phase2 SA is not rekeyed when the lifetime expires.
- `keepalive`: The SA lifetime expires only when a keepalive message is not responded to by the far end.
- `kilo-bytes`: This specifies the amount of data (n kilobytes) to allow through the tunnel before the SA lifetime expires. `kbytes` must be an integer from 2560 through 4294967294.
- `seconds`: The number of seconds to wait before the SA lifetime expires. `secs` must be an integer from 1200 through 86400.

**Important**: If the dynamic crypto map is being used in conjunction with Mobile IP and the Mobile IP renewal timer is less than the crypto map’s SA lifetime (either in terms of kilobytes or seconds), then the keepalive parameter must be configured.

**transform-set transform_name [ transform-set transform_name2 ... transform-set transform_name6 ]**

Specifies the name of a transform set configured in the same context that will be associated with the crypto map. Refer to the command `crypto ipsec transform-set` for information on creating transform sets. You can repeat this keyword up to 6 times on the command line to specify multiple transform sets.
`transform name` is the name of the transform set entered as an alphanumeric string of 1 through 127 characters that is case sensitive.

**no**

Deletes the specified parameter or resets the specified parameter to the default value.

**Usage**

Use this command to set parameters for a dynamic crypto map.

**Example**

The following command sets the PFS group to Group1:
set pfs group1

The following command sets the SA lifetime to 50000 KB:

    set security-association lifetime kilo-bytes 50000

The following command sets the SA lifetime to 10000 seconds:

    set security-association lifetime seconds 10000

The following command enables the SA to re-key when the tunnel lifetime expires:

    set security-association lifetime keepalive

The following command defines transform sets tset1 and tset2.

    set transform-set tset1 transform-set tset2
Chapter 67
Crypto Map IPSec Manual Configuration Mode Commands

The Crypto IPSec Map Manual Configuration Mode is used to configure static IPSec tunnel properties. Modification(s) to an existing crypto map manual configuration will not take effect until the related security association has been cleared. Refer to the description of the `clear crypto security-association` command in the *Exec Mode Commands* chapter for more information.

**Important:** Because manual crypto map configurations require the use of static security keys (associations), they are not as secure as crypto maps that rely on dynamically configured keys. Therefore, they only be used for testing purposes.

Mode

Exec > Global Configuration > Context Configuration > Crypto Map Manual Configuration

`configure > context context_name > crypto map map_name ipsec-manual`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-crypto-manual-map)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**end**

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

**Syntax**

`exit`

**Usage**

Use this command to return to the parent configuration mode.
match address

Matches or associates the crypto map to an access control list (ACL) configured in the same context.

Mode
- Exec > Global Configuration > Context Configuration > Crypto Map Manual Configuration
- configure > context context_name > crypto map map_name ipsec-manual

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-crypto-manual-map)#

Syntax

[ no ] match address acl_name [ priority ]

no

Removes a previously matched ACL.

match address acl_name

Specifies the name of the ACL with which the crypto map is to be matched. acl_name is an alphanumeric string of 1 through 47 characters that is case sensitive.
priority

Specifies the preference of the ACL. The ACL preference is factored when a single packet matches the criteria of more than one ACL. priority is an integer from 0 through 4294967295. 0 is the highest priority. Default: 0

Important: The priorities are only compared for ACLs matched to other crypto maps or to policy ACLs (those applied to the entire context).

Usage

ACLs matched to crypto maps are referred to as crypto ACLs. Crypto ACLs define the criteria that must be met in order for a subscriber data packet to routed over an IPSec tunnel. Prior to routing, the system examines the properties of each subscriber data packet. If the packet properties match the criteria specified in the crypto ACL, the system will initiate the IPSec policy dictated by the crypto map.

Example

The following command sets the crypto map ACL to the ACL named ACLlist1 and sets the crypto maps priority to the highest level.

```
match address ACLlist1 0
```
**set control-dont-fragment**

Controls the Don’t Fragment (DF) bit in the outer IP header of the IPSec tunnel data packet.

**Product**

- Exec > Global Configuration > Context Configuration > Crypto Map Manual Configuration

```
configure > context context_name > crypto map map_name ipsec-manual
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-crypto-manual-map)#
```

**Syntax**

```
[ default ] set control-dont-fragment { clear-bit | copy-bit | set-bit }
```

- **default**
  Sets or restores default value assigned to a specified parameter.

- **clear-bit**
  Clears the DF bit from the outer IP header (sets it to 0).

- **copy-bit**
  Copies the DF bit from the inner IP header to the outer IP header. This is the default action.
set-bit

Sets the DF bit in the outer IP header (sets it to 1).

Usage

Use this command to clear, copy, or set the don’t fragment (DF) bit in the outer IP header of the IPSec tunnel data packet.

Example

The following command sets the DF bit in the outer IP header.

```
set control-dont-fragment set-bit
```
set ip mtu

Configures the IPv4 Maximum Transmission Unit (MTU) in bytes.

configure > context context_name > crypto map map_name ipsec-manual

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-crypto-manual-map)#
```

**Syntax**

```
ip mtu bytes
```

```
ip mtu bytes
```

Specifies the IPv4 MTU in bytes as an integer from 576 to 2048. Default is 1438.

**Usage**

Use this command to set the IPv4 MTU in bytes

**Example**

The following command configures an IPv4 MTU of 1024 bytes.

```
set ip mtu 1024
```
**set ipv6 mtu**

Configures the IPv6 Maximum Transmission Unit (MTU) in bytes.

**Product**
- ePDG
- FA
- GGSN
- HA

Exec > Global Configuration > Context Configuration > Crypto Map Manual Configuration
```
configure > context context_name > crypto map map_name ipsec-manual
```
Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-crypto-manual-map)#
```

**Syntax**

```
ipv6 mtu bytes
```

```
ip mtu bytes
```

Specifies the IPv6 MTU in bytes as an integer from 576 to 2048. Default is 1438.

**Usage**
Use this command to set the IPv6 MTU in bytes

**Example**
The following command configures an IPv6 MTU of 1024 bytes.
```
set ip mtu 1024
```
set peer

Configures the IP address of the peer security gateway that the system will establish the IPSec tunnel with.

**Product**
- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW
- HSGW
- MME
- P-GW
- PDSN
- S-GW

- SGSN

**Privilege**
- Security Administrator, Administrator

**Mode**
- Exec > Global Configuration > Context Configuration > Crypto Map Manual Configuration

```bash
configure > context context_name > crypto map map_name ipsec-manual
```

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(config-crypto-manual-map)#
```

**Syntax**

```
[ no ] set peer gw_address
```

- **no**
  
  Removes a previously configured peer address.

```
set peer gw_address
```

Specifies the IP address of the peer security gateway with which the IPSec tunnel will be established. The IP address can be in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
**Usage**

Once the manual crypto map is fully configured and applied to an interface, the system will establish an IPSec tunnel with the security gateway specified by this command. Because the tunnel relies on statically configured parameters, once created, it never expires; it exists until its configuration is deleted.

**Example**

The following command configures a security gateway address of 192.168.1.100 for the crypto map with which to establish a tunnel.

```
set peer 192.168.1.100
```
**set session-key**

Configures session key parameters for the manual crypto map.

**Product**
- ePDG
- FA
- GGSN
- HA
- HeNBGW
- HNBGW
- HSGW
- MME
- P-GW
- PDSN
- S-GW
- SAEGW
- SCM
- SecGW
- SGSN

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Crypto Map Manual Configuration
configure > context context_name > crypto map map_name ipsec-manual

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-crypto-manual-map)#
```

**Syntax**

```
set session-key { inbound | outbound } { ah ah_spi [ encrypted ] key ah_key | esp esp_spi [ encrypted ] cipher encryption_key [ encrypted ] authenticator auth_key }
no set session-key { inbound | outbound }
```

**no**
Removes previously configured session key information.

**inbound**
Specifies that the key(s) will be used for tunnels carrying data sent by the security gateway.

**outbound**
Specifies that the key(s) will be used for tunnels carrying data sent by the system.
ah  ah_spi
Configures the Security Parameter Index (SPI) for the Authentication Header (AH) protocol. The SPI is used to identify the AH security association (SA) between the system and the security gateway. ah_spi is an integer from 256 through 4294967295.

encrypted
Indicates the key provided is encrypted.
The encrypted keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the key, cipher, and/or authenticator keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

key  ah_key
Configures the key used by the system to de/encapsulate IP packets using Authentication Header (AH) protocol. ah_key must be entered as either an alphanumeric string or a hexadecimal number beginning with “0x”.
The length of the configured key must match the configured algorithm.

esp  esp_spi
Configures SPI for the Encapsulating Security Payload (ESP) protocol. The SPI is used to identify the ESP security association (SA) between the system and the security gateway. esp_spi is an integer from 256 through 4294967295.
The length of the configured key must match the configured algorithm.

cipher  encryption_key
Specifies the key used by the system to de/encrypt the payloads of IP packets using the ESP protocol. encryption_key must be entered as either an alphanumeric string or a hexadecimal number beginning with “0x”.
The length of the configured key must match the configured algorithm.

authenticator  auth_key
Specifies the key used by the system to authenticate the IP packets once encryption has been performed. auth_key must be entered as either an alphanumeric string or a hexadecimal number beginning with “0x”.
The length of the configured key must match the configured algorithm.

Usage
Manual crypto maps rely on the use of statically configured keys to establish IPSec tunnels. This command allows the configuration of the static keys.
Identical keys must be configured on both the system and the security gateway in order for the tunnel to be established.
The length of the configured key must match the configured algorithm.
This command can be entered up to two time for the same crypto map: once to configure inbound key properties, and once to configure outbound key properties.

Example
The following command configures a manual crypto map with the following session key properties:
- Keys are for tunnels initiated by the system to the security gateway.
- ESP will be used with an SPI of 310.
• Encryption key is \textit{sd23r9skd0fi3as}.
• Authentication key is \textit{sfd23408imi9yn}.

\texttt{set session-key outbound esp 310 cipher sd23r9skd0fi3as authenticator sfd23408imi9yn}
set transform-set

Configures the name of a transform set that the crypto map is associated with.

Product

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > Crypto Map Manual Configuration

configure > context context_name > crypto map map_name ipsec-manual

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-crypto-manual-map)#

Syntax

[ no ] set transform-set transform_name

no

Removes a previously configured transform set association.

set transform-set transform_name

Specifies the name of the transform set expressed as an alphanumeric string of 1 through 127 characters that is case sensitive.
**Usage**

System transform sets contain the IPSec policy definitions for crypto maps. Refer to the `crypto ipsec transform-set` command for information on creating transform sets.

**Important:** Transform sets must be configured prior to configuring session key information for the crypto map.

**Example**

The following command associates a transform set named `esp_tset` with the crypto map:

```
set transform-set esp_tset
```
Chapter 68
Crypto Template Configuration Mode Commands

The Crypto Template Configuration Mode is used to configure an IKEv2 IPsec policy. It includes most of the IPsec parameters and IKEv2 dynamic parameters for cryptographic and authentication algorithms. A security gateway service will not function without a configured crypto template. Only one crypto template can be configured per service.

Mode

Exec > Global Configuration > Context Configuration > Crypto Template Configuration

configure > context context_name > crypto template template_name ikev2-dynamic

Entering the above command sequence results in the following prompt:

[context_name]host_name(crf-crypto-tmpl-ikey2-tunnel)#

Important: Available commands or keywords/variables vary based on platform type, product version, and installed license(s).
allow-cert-enc cert-hash-url

Enables support for a certificate encoding type other than the default. When enabled hash and URL encoding type are supported in CERT and CERTREQ payloads.

Product
Security gateway products

Privilege
Security Administrator

Syntax

[ no ] allow-cert-enc cert-hash-url

no
Disables support for hash and URL encoding type in CERT and CERTREQ payloads.

Usage
Enable support for a certificate encoding type other than the default. When enabled hash and URL encoding type are supported in CERT and CERTREQ payloads.

Example
The following command enables hash and URL encoding type in CERT and CERTREQ payloads:

    allow-cert-enc cert-hash-url
allow-custom-fqdn-idr

Allows non-standard FQDN (Fully Qualified Domain Name) strings in the IDr (Identification - Responder) payload of IKE_AUTH messages received from the UE with the payload type as FQDN.

Product
All services using IKEv2 IPSec

Privilege
Security Administrator

Syntax

[ default | no ] allow-custom-fqdn-idr

no

Does not allow non-standard FQDN strings in the IDr payload of IKE_AUTH messages received from the UE with the payload type as FQDN.

default

Restores the default setting, which does not allow non-standard FQDN strings in the IDr payload of IKE_AUTH messages received from the UE with the payload type as FQDN. You can chain multiple CA-CRLs in a single command instance.

Usage

Use this command to configure the system to skip the syntax check for the IDr payload in IKE_AUTH messages received from the UE with the payload type as FQDN. This allows non-standard FQDN strings such as APN names in the IDr payload.

Example

The following command configures the system to allow non-standard FQDN strings in the IDr payload of IKE_AUTH messages received from the UE with the payload type as FQDN:

allow-custom-fqdn-idr
**authentication**

Configures the gateway and subscriber authentication methods to be used by this crypto template.

**Product**

All IPSec-related services

**Privilege**

Security Administrator

**Syntax**

```
authentication { eap-profile name [ second-phase eap-profile name ] | local { certificate | pre-shared-key { encrypted key value | key clear_text } } | pre-shared-key { encrypted key value | key clear_text [ second-phase eap-profile name ] } | remote { certificate | eap-profile name [ second-phase eap-profile name ] | pre-shared-key { encrypted key value | key clear_text [ second-phase eap-profile name ] } } }
```

```
nno authentication local { certificate | pre-shared-key }
```

```
default authentication
```

```
default
```

Returns the command to its default setting.

```
no
```

Removes the authentication parameters from the configuration.

```
eap-profile name [ second-phase eap-profile name ]
```

Specifies that authentication is to be performed using a named Extensible Authentication Protocol (EAP) profile. `name` is an alphanumeric string of 1 through 127 characters. Entering this keyword places the CLI in the EAP Authentication Configuration Mode.

The `second-phase eap-profile name` is only required for installations using multiple authentications. `name` must be an alphanumeric string of 1 through 127 characters.

```
local { certificate | pre-shared-key { encrypted key value | key clear_text } }
```

Specifies the local authentication method required for services using the crypto template.

- `certificate`: Specifies that the certificate method of authentication must be used for services using the crypto template.
- `pre-shared-key { encrypted key value | key clear_text }`: Specifies that a pre-shared key is to be used for services using the crypto template. `encrypted key value` configures an encrypted pre-shared key used for authentication. `value` must be an alphanumeric string of 16 through 255 characters for releases prior to 15.0, or 15 through 444 characters for release 15.0 and higher. `key clear_text` configures a clear text pre-shared key used for authentication. `clear_text` must be an alphanumeric string of 1 through 255 characters.

```
pre-shared-key { encrypted key value | key clear_text }
```

Specifies that a pre-shared key is to be used for services using the crypto template.
**encrypted key** value: Specifies that the pre-shared key used for authentication is encrypted. value must be an alphanumeric string of 1 through 255 characters for releases prior to 15.0, or 15 through 444 characters for release 15.0 and higher.

**key clear_text**: Specifies that the pre-shared key used for authentication is clear text. clear_text must be an alphanumeric string of 1 through 255 characters.

```
remote { certificate | eap-profile name [ second-phase eap-profile name ] | pre-
shared-key { encrypted key value | key clear_text } }
```

Specifies the remote authentication method required for services using the crypto template.

certificate: Specifies that the certificate method of remote authentication must be used for services using the crypto template.

eap-profile name [ second-phase eap-profile name ]: Specifies that remote authentication is to be performed using a named EAP profile. name must be an alphanumeric string of 1 through 127 characters. Entering this keyword places the CLI in the EAP Authentication Configuration Mode. The second-phase eap-profile name is only required for installations using multiple authentications. name must be an alphanumeric string of 1 through 127 characters.

pre-shared-key { encrypted key value | key clear_text }: Specifies that a pre-shared key is to be used for services using the crypto template. encrypted key value configures an encrypted pre-shared key used for authentication. value must be an alphanumeric string of 1 through 255 characters for releases prior to 15.0, or 15 through 444 characters for release 15.0 and higher. key value configures a clear text pre-shared key used for authentication. clear_text must be an alphanumeric string of 1 through 255 characters.

---

**Usage**

Use this command to specify the type of authentication performed for subscribers or gateways attempting to access the service using this crypto template.

Entering the `authentication eap-profile` command results in the following prompt:

```
[context_name]hostname(cfg-crypto-tmpl-eap-key)#
```

EAP Authentication Configuration Mode commands are defined in the *EAP Authentication Configuration Mode Commands* chapter.

**Example**

The following command enables authentication via an EAP profile named `eap23` for subscribers using the service with this crypto template:

```
authentication eap-profile eap23
```
blacklist

Enables the use of a blacklist (access denied) file to be used by a security gateway.

Product

All products supporting IPSec blacklisting

Important: This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

Privilege

Security Administrator

Syntax

[ no ] blacklist

no

Disables the use of a blacklist.

Usage

Enable the use of a previously created blacklist to deny access to prohibited peers via a security gateway. A blacklist is a list or register of entities that are being denied a particular privilege, service, mobility, access or recognition. With blacklisting, any peer is allowed to connect as long as it does not appear in the list. Each entry in the blacklist file should contain the ID type so that the validation is performed for that ID type. In every entry, the ID type and ID value should be separated by a space. Only DOS and UNIX file formatting are supported. For additional information, refer to the System Administration Guide.

Example

The following command enables use of a blacklist:

blacklist
ca-certificate list

Used to bind an X.509 Certificate Authority (CA) certificate to a crypto template.

**Product**
All IPSec-related services

**Privilege**
Security Administrator, Administrator

**Syntax**

```
ca-certificate list ca-cert-name name [ ca-cert-name name ] [ ca-cert-name name ] [ ca-cert-name name ] [ ca-cert-name name ]
```

no ca-certificate

---

**Usage**

Used to bind an X.509 CA certificate to a template.

**Example**

Use the following example to add a CA certificate named CA_list1 to a list:

```
ca-certificate list CA_list1
```
ca-crl list

Binds one or more Certificate Authority-Certificate Revocation Lists (CA-CRLs) to this crypto template.

Product
All IPSec-related services

Privilege
Security Administrator

Syntax
ca-crl list ca-crl-name name [ ca-crl-name name ] [ ca-crl-name name ] [ ca-crl-name name ]

no ca-crl

no
Removes the CA-CRL configuration from this template.

ca-crl-name name
Specifies the CA-CRL to associate with this crypto template. name must be the name of an existing CA-CRL expressed as an alphanumeric string of 1 through 129 characters. Multiple lists (maximum 4) can be configured for a crypto template. You can chain multiple CA-CRLs in a single command instance.

Usage
Use this command to associate a CA-CRL name with this crypto template. CA-CRLs are configured in the Global Configuration Mode. For more information about configuring CA-CRLs, refer to the ca-crl name command in the Global Configuration Mode Commands chapter.

Example
The following example binds CA-CRLs named CRL-5 and CRL-7 to this crypto template:

ca-crl list ca-crl-name CRL-5 ca-crl-name CRL-7
**certificate**

Used to bind a single X.509 trusted certificate to a crypto template.

**Product**
All IPSec-related services

**Privilege**
Security Administrator

**Syntax**

```
certificate name [ validate ]
no certificate [ validate ]
```

- **no**
  
  Removes any applied certificate or prevents the certificate from being included in the Auth Exchange response payload.

- **name**
  
  Specifies the name of a X.509 trusted certificate to bind to a crypto template. *name* is an alphanumeric string of 1 through 129 characters.

- **validate**
  
  Enable validations for the self-certificate.

**Usage**
Can be used to bind an X.509 certificate to a template, or include or exclude it from the Auth Exchange response payload.

**Example**
Use the following example to prevent a certificate from being included in the Auth Exchange payload:

```
no certificate
```
configuration-payload

This command is used to configure mapping of the configuration payload attributes.

Product
All IPSec-related services

Privilege
Security Administrator

Syntax
configuration-payload private-attribute-type { imei integer | p-cscf-v4 v4_value | p-cscf-v6 v6_value }

[ no | default ] configuration-payload private-attribute-type { imei | p-cscf-v4 | p-cscf-v6 }

no
Removes mapping of the configuration payload attributes.

default
Restores the default value for mapping of the configuration payload attributes.

private-attribute-type
Defines the private payload attribute.

imei integer
Defines an International Mobile Equipment Identity number as an integer from 16384 to 32767.

p-cscf-v4 v4_value
Defines the IPv4 pcscf payload attribute value. Default value is 16384.

v4_value is an integer from 16384 to 32767.

p-cscf-v6 v6_value
Defines IPv6 pcscf payload attribute value. Default value is 16390.

v6_value is an integer from 16384 to 32767.

Usage
Use this command to configure mapping of the configuration payload attributes.

Example
The following command configures the mapping of the configuration payload attributes p-cscf-v6 to 17001.

configuration-payload private-attribute-type p-cscf-v6 17001
control-dont-fragment

Controls the Don’t Fragment (DF) bit in the outer IP header of the IPSec tunnel data packet.

**Product**
All IPSec-related services

**Privilege**
Security Administrator

**Syntax**

```plaintext
control-dont-fragment { clear-bit | copy-bit | set-bit }
```

- **clear-bit**
  Clear the DF bit from the outer IP header (sets it to 0).

- **copy-bit**
  Copies the DF bit from the inner IP header to the outer IP header. This is the default action.

- **set-bit**
  Sets the DF bit in the outer IP header (sets it to 1).

**Usage**
A packet is encapsulated in IPSec headers at both ends. The new packet can copy the DF bit from the original unencapsulated packet into the outer IP header, or it can set the DF bit if there is not one in the original packet. It can also clear a DF bit that it does not need.

**Example**
The following command sets the DF bit in the outer IP header:

```
control-dont-fragment set-bit
```
dns-handling

Adds a custom option to define the ways a DNS address is returned based on prescribed circumstances described below.

**Product**
PDIF

**Privilege**
Security Administrator

**Syntax**

```
[ default ] dns-handling { custom | normal }
```

- **default**
  Configures the default condition as *normal*. By default, PDIF always returns the DNS address in the config payload in the second authentication phase if one is received from either the configuration or the HA.

- **dns-handling custom**
  Configures the PDIF to behave as described in the Usage section below.

- **dns-handling normal**
  This is the default action. The service always returns the DNS address in the config payload in the second authentication phase if one is received from either the configuration or the HA.

**Usage**

During IKEv2 session setup, MS may or may not include INTERNAL_IP4_DNS in the Config Payload (CP). PDIF may obtain one or more DNS addresses for the subscriber in DNS NVSE from a proxy-MIP Registration Reply message. If Multiple Authentication is used, these DNS addresses may be also received in Diameter AVPs during the first authentication phase, or in RADIUS attributes in the Access Accept messages during the second authentication phase.

In *normal* mode, by default PDIF always returns the DNS address in the config payload in the second authentication phase if one is received from either the configuration or the HA.

In *custom* mode, depending on the number of INTERNAL_IP4_DNS, PDIF supports the following behaviors:

- If MS includes no INTERNAL_IP4_DNS in Config Payload: PDIF does not return any INTERNAL_IP4_DNS option to MS, whether or not PDIF has received one in DNS NVSE from HA or from local configurations.

- If MS requests one or more INTERNAL_IP4_DNS(s) in Config Payload, and if P-MIP NVSE doesn't contain any DNS address or DNS address not present in any config, PDIF omits INTERNAL_IP4_DNS option to MS in the Config Payload.

- And if P-MIP NVSE includes one DNS address (a.a.a.a / 0.0.0.0), then PDIF sends one INTERNAL_IP4_DNS option in Config Payload back to the MS.

- If the Primary DNS is a.a.a.a and the Secondary DNS is 0.0.0.0, then a.a.a.a is returned (only one instance of DNS attribute present in the config payload).

- If the Primary DNS is 0.0.0.0 and the Secondary DNS is a.a.a.a, then a.a.a.a is returned (only one instance of DNS attribute present in the config payload). PDIF does not take 0.0.0.0 as a valid DNS address that can be assigned to the MS.
- And if P-MIP NVSE includes two DNS addresses (a.a.a.a and b.b.b.b) or configurations exist for these two addresses, then PDIF sends two INTERNAL_IP4_DNSs in the CP for the MS (typically known as primary and secondary DNS addresses).

**Example**

The following configuration applies the `custom` dns-handling mode:

```
dns-handling custom
```
**dos cookie-challenge notify-payload**

Configure the cookie challenge parameters for IKEv2 INFO Exchange notify payloads for the given crypto template.

**Product**
All IPSec-related services

**Privilege**
Security Administrator

**Syntax**

```
dos cookie-challenge notify-payload [ half-open-sess-count start integer stop integer ]
```

[ default | no ] cookie-challenge detect-dos-attack

```
default
Default is to disabled condition.
```

```
no
Prevents Denial of Service cookie transmission. This is the default condition.
```

```
half-open-sess-count start integer stop integer
```

The `half-open-sess-count` is the number of half-open sessions per IPSec manager. A session is considered half-open if a PDIF has responded to an IKEv2 INIT Request with an IKEv2 INIT Response, but no further message was received on that particular IKE SA.

* `start integer`: Starts when the current half-open-sess-count exceeds the start count. The start count is an integer from 0 to 100000.

* `stop integer`: Stops when the current half-open-sess-count drops below the stop count. The stop count number is an integer from 0 to 100000. It is always less than or equal to the start count number.

**Important:** The start count value 0 is a special case whereby this feature is always enabled. In this event, both `start` and `stop` must be 0.

**Usage**

This feature (which is disabled by default) helps prevent malicious Denial of Service attacks against the server by sending a challenge cookie. If the response from the sender does not incorporate the expected cookie data, the packets are dropped.

**Example**

The following example configures the cookie challenge to begin when the half-open-sess-count reaches 50000 and stops when it drops below 20000:

```
dos cookie-challenge notify-payload half-open-sess-count start 50000 stop 20000
```
end

Exits the current configuration mode and returns to the Exec mode.

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
identity local

Configures the identity of the local IPSec Client (IKE ID).

**Product**
All Security Gateway products

**Important:** This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

**Privilege**
Security Administrator

**Syntax**

```
identity local id-type type id name
```

```
no identity local
```

**no**
Resets the ID to the IP address of the interface to which the crypto template is associated (type = IPv4 or IPv6).

**id-type type**
Configures the IKE identity that the local client uses when authenticating to the gateway. Valid values are:

- **der-ans1-dn**: configures NAI Type DER ASN1 DN (Distinguished Encoding Rules, ASN.1 encoding, Distinguished Name)
- **fqdn**: configures NAI Type ID_FQDN (Internet Fully Qualified Domain Name).
- **ip-addr**: configures NAI Type ID_IP_ADDR (IP Address).
- **key-id**: configures NAI Type ID_KEY_ID (opaque octet string).
- **rfc822-addr**: configures NAI Type ID_RFC822_ADDR (RFC 822 email address).

**id name**
Specifies the identifier for the local IKE client as an alphanumeric string of 1 through 127 characters.

**Usage**
Use this command to configure the identity of the local IPSec Client.

**Example**
The following command configures the local IPSec Client.

```
identity local id-type der-ans1-dn id system14
```
ikev2-ikesa

Configures parameters for the IKEv2 IKE Security Associations within this crypto template.

**Product**
All IPSec-related services

**Privilege**
Security Administrator

**Syntax**

```plaintext
ikev2-ikesa { allow-empty-ikesa | cert-sign { pkcs1.5 | pkcs2.0 } | ignore-notify-protocol-id | ignore-rekeying-requests | keepalive-user-activity | max-retransmissions number | policy { congestion-rejection [ notify-status-value value ] | error-notification [ invalid-major-version ] [ invalid-message-id [ invalid-major-version | invalid-syntax ] ] | invalid-syntax [ invalid-major-version ] | use-rfc5996-notification } | rekey [ disallow-param-change ] | retransmission-timeout msec | setup-timer sec | transform-set list name1 name2 name3 name4 name5 name6 }

default ikev2-ikesa { allow-empty-ikesa | cert-sign | ignore-notify-protocol-id | ignore-rekeying-requests | keepalive-user-activity | max-retransmissions | mobike | policy error-notification | rekey [ disallow-param-change ] | retransmission-timeout | setup-timer }

no ikev2-ikesa { allow-empty-ikesa | ignore-notify-protocol-id | ignore-rekeying-requests | | keepalive-user-activity | list name | mobike | policy error-notification | rekey }

no ikev2-ikesa

Disables a previously enabled parameter.

**allow-empty-ikesa**
Default is not to allow-empty-ikesa. Activate to have the IKEv2 stack keep the IKE SA when all the Child SAs have been deleted.

**cert-sign { pkcs1.5 | pkcs2.0 }**
Specifies the certificate sign to be used. Default: pkcs1.5

**pkcs1.5:** Use the Public-Key Cryptography Standards (PKCS) version 1.5, RSA Encryption Standard.

**pkcs2.0:** Use the PKCS version 2.0, RSA Encryption Standard.

**ignore-notify-protocol-id**
Ignores IKEv2 Informational Exchange Notify Payload Protocol-ID values for strict RFC 4306 compliance.

**ignore-rekeying-requests**
Ignores received IKE_SA Rekeying Requests.

**keepalive-user-activity**
Default is no keepalive-user-activity. Activate to reset the user inactivity timer when keepalive messages are received from peer.
**max-retransmissions number**

Specifies the maximum number of retransmissions of an IKEv2 IKE Exchange Request if a response has not been received. number must be an integer from 1 through 8. Default: 5

**mobike**

IKEv2 Mobility and Multihoming Protocol: MOBIKE allows the IP addresses associated with IKEv2 and tunnel mode IPSec Security Associations to change. A mobile Virtual Private Network (VPN) client could use MOBIKE to keep the connection with the VPN gateway active while moving from one address to another. Similarly, a multihomed host could use MOBIKE to move the traffic to a different interface if, for instance, the one currently being used stops working. Default: disable

**policy { congestion-rejection { notify-status-value value } | error-notification { invalid-major-version } | invalid-message-id }**

Specifies the default policy for generating an IKEv2 Invalid Message ID error when PDIF receives an out-of-sequence packet.

- **congestion-rejection**: Sends an Error Notify Message to the MS as a reply to an IKE_SA_INIT Exchange when no more IKE_SA sessions can be established.
- **notify-status-value value**: Notify Message will be sent to MS as a reply to an IKE_SA_INIT Exchange when no more IKE_SA sessions can be established. value is RFC 4306 IKEv2 Private Use Status Range - integer 40960..65535.
- **error-notification**: Sends an Error Notify Message to the MS for Invalid IKEv2 Exchange Message ID and Invalid IKEv2 Exchange Syntax for the IKE_SA_INIT Exchange.

**rekey [ disallow-param-change ]**

Specifies if IKEv2 rekeying should occur before the configured lifetime expires (at approximately 90% of the lifetime interval). Default is not to re-key.

The **disallow-param-change** option prevents changes in negotiation parameters during rekey.

**retransmission-timeout msec**

Specifies the timeout period (in milliseconds) before a retransmission of an IKEv2 IKE exchange request is sent (if the corresponding response has not been received). msec must be an integer from 300 to 15000. Default: 500

**setup-timer sec**

Specifies the number of seconds before a IKEv2 IKE Security Association that is not fully established is terminated. sec must be an integer from 1 through 3600. Default: 16

**transform-set list name1 ...name6**

Specifies the name of a context-level configured IKEv2 IKE Security Association transform set. name1 ...name6 must be an existing IKEv2 IKESA Transform Set expressed as an alphanumeric string of 1 through 127 characters.
The transform set is a space-separated list of IKEv2-IKESA SA transform sets to be used for deriving IKEv2 IKE Security Associations from this crypto template. A minimum of one transform-set is required; maximum configurable is six.

**Usage**

Use this command to configure parameters for the IKEv2 IKE Security Associations within this crypto template.

**Example**

The following command configures the maximum number of IKEv2 IKESA request retransmissions to 7:

```
ikev2-ikesa max-retransmissions 7
```

The following command configures the IKEv2 IKESA request retransmission timeout to 400 milli seconds:

```
ikev2-ikesa retransmission-timeout 400
```

The following command configures the IKEv2 IKESA list, consisting of a transform set named as `ikesa43`:

```
ikev2-ikesa transform-set list ikesa43
```
keepalive

Configures keepalive or dead peer detection for security associations used within this crypto template.

Product
All products supporting IPSec

Privilege
Security Administrator

Syntax

keepalive [ interval sec ]
default keepalive [ interval ]
no keepalive

no
Disables keepalive messaging.

interval sec
Specifies the amount of time (in seconds) that must elapse before the next keepalive request is sent. sec must be an integer from 10 through 3600. Default: 10

Usage
Use this command to set parameters associated with determining the availability of peer servers.

Example
The following command sets a keepalive interval to three minutes (180 seconds):

keepalive interval 180
max-childsa

Defines a soft limit for the number of child Security Associations (SAs) per IKEv2 policy.

Product
All products supporting IPSEcv2

Privilege
Security Administrator

Syntax

max-childsa integer [ overload-action { ignore | terminate } ]

max-childsa integer
Specifies a soft limit for the maximum number of Child SAs per IKEv2 policy as an integer from 1 to 4 for releases prior to 15.0, or 1 to 5 for 15.0 and higher. Default = 2.

overload-action { ignore | terminate }
Specifies the action to be taken when the specified soft limit for the maximum number of Child SAs is reached. The options are:

• ignore: The IKEv2 stack ignores the specified soft limit for Child SAs.
• terminate: The IKEv2 stack rejects any new Child SAs if the specified soft limit is reached.

Usage
Two maximum Child SA values are maintained per IKEv2 policy. The first is a system-enforced maximum value, which is four Child SAs per IKEv2 policy. The second is a configurable soft maximum value, which can be a value between one and four. This command defines the soft limit for the maximum number of Child SAs per IKEv2 policy.

Example
The following command specifies a soft limit of four Child SAs with the overload action of terminate.

   max-childsa 4 overload-action terminate
nai

Configures the Network Access Identifier (NAI) parameters to be used for the crypto template IDr (recipient’s identity).

**Important:** This command is deprecated from 15.0 and later releases.

**Product**
All Security Gateway products

**Privilege**
Security Administrator

**Syntax**

```
nai { idr name [ id-type { der-asn1-dn | der-asn1-gn | fqdn | ip-addr | key-id | rfc822-addr } ] | use-received-idr }

default nai idr

no nai { idr | use-received-idr }
```

**default**

Configures the default command `no nai idr`. As a result, the default behavior is for the PDIF-service IP address to be sent as the IDr value of type ID_IP_ADDR.

**no**

`no nai idr` configures the value whereby the service IP address is sent as the IDr value with the type ID_IP_ADDR. This is the default condition.

**idr name**

Specifies the name of the IDr crypto template as an alphanumeric string of 1 through 79 characters.

**id-type { der-asn1-dn | der-asn1-gn | fqdn | ip-addr | key-id | rfc822-addr }**

Configures the NAI IDr type parameter. If no id-type is specified, then `rfc822-addr` is assumed.

- `der-asn1-dn`: configures NAI Type DER ASN1_DN (Distinguished Encoding Rules, ASN.1 encoding, Distinguished Name)
- `der-asn1-gn`: configures NAI Type DER ASN1_GN (Distinguished Encoding Rules, ASN.1 encoding, General Name)
- `fqdn`: configures NAI Type ID_FQDN (Internet Fully Qualified Domain Name).
- `ip-addr`: configures NAI Type ID_IP_ADDR (IP Address).
- `key-id`: configures NAI Type ID_KEY_ID (opaque octet string).
- `rfc822-addr`: configures NAI Type ID_RFC822_ADDR (RFC 822 email address).

**use-received-idr**

Specifies that the received IDr be used in the crypto template.
Usage
The configured IDr is sent to the MS in the first IKEv2 AUTH response.

Example
The following command configures the NAI IDr to the default condition.

```
default naiidr idr
```
natt

Configures Network Address Translation - Traversal (NAT-T) for all security associations associated with this crypto template. This feature is disabled by default.

Product
All Security Gateway products

Privilege
Security Administrator

Syntax

```
[ default | no ] natt [ include-header ] [ send-keepalive [ idle-interval idle_secs ] [ interval interval_secs ] ]
```

- **default**
  Disables NAT-T for all security associations associated with this crypto template.

- **no**
  Disables NAT-T for all security associations associated with this crypto template.

- **include-header**
  Includes the NAT-T header in IPSec packets.

- **send-keepalive [ idle-interval idle_secs ] [ interval interval_secs ]**
  Sends NAT-Traversal keepalive messages.
  - **idle-interval idle_secs**: Specifies the number of seconds that can elapse without sending NAT keepalive packets before sending NAT keepalive packets is started. `idle_secs` is an integer from 20 to 86400. Default: 60.
  - **interval interval_secs**: Specifies the number of seconds between the sending of NAT keepalive packets. `interval_secs` is an integer from 20 to 86400. Default: 60.

Usage
Use this command to configure NAT-T for security associations within this crypto template.

Example

The following command disables NAT-T for this crypto template:

```
no natt
```
ocsp

Enables use of Online Certificate Status Protocol (OCSP) from a crypto template. OCSP provides a facility to obtain timely information on the status of a certificate.

Product

All products supporting IPSec

**Important:** This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

Privilege

Security Administrator

Syntax

```
ocsp [ nonce | responder-address ipv4_address [ port port_value ] ]
no ocsp [ nonce | responder-address [ port ] ]
default ocsp [ nonce ]
```

- **no**
  - Disables the use of OCSP.

- **default**
  - Restores the default value assigned for ocsp nonce.

- **nonce**
  - Enables sending nonce (unique identifier) in OCSP requests.

- **responder-address ipv4_address**
  - Configures the OCSP responder address that is used when absent in the peer (device) certificate.
    - `ipv4_address` is an IPv4 address specified in dotted decimal format.

- **port port_value**
  - Configures the port for OCSP responder.
    - `port_value` is an integer value between 1 and 65535. The default port is 8889.

Usage

This command enables the use of Online Certificate Protocol (OCSP) from a crypto map/template. OCSP provides a facility to obtain timely information on the status of a certificate. OCSP messages are exchanged between a gateway and an OCSP responder during a certificate transaction. The responder immediately provides the status of the presented certificate. The status can be good, revoked or unknown. The gateway can then proceed based on the response.

Example

The following command enables OCSP:
ocsp
payload

Creates a new, or specifies an existing, crypto template payload and enters the Crypto Template Payload Configuration Mode.

Product
All Security Gateway products

Privilege
Security Administrator

Syntax

[ no ] payload name match childsa [ match { any | ipv4 | ipv6 } ]

no
Removes a currently configured crypto template payload.

payload name
Specifies the name of a new or existing crypto template payload as an alphanumeric string of 1 through 127 characters.

match { any | ipv4 | ipv6 }
Filters IPSec Child Security Association creation requests for subscriber calls by applying the following options:

*any*: Configures this payload to be applicable to IPSec Child Security Association requests for IPv4 and/or IPv6.

*ipv4*: Configures this payload to be applicable to IPSec Child Security Association requests for IPv4 only.

*ipv6*: Configures this payload to be applicable to IPSec Child Security Association requests for IPv6 only.

Usage
Use this command to create a new or enter an existing crypto template payload. The payload mechanism is a means of associating parameters for the Security Association (SA) being negotiated. Two payloads are required: one each for MIP and IKEv2. The first payload is used for establishing the initial Child SA Tunnel Inner Address (TIA) which will be torn down. The second payload is used for establishing the remaining Child SAs. Note that if there is no second payload defined with home-address as the ip-address-allocation then no MIP call can be established, just a Simple IP call. Currently, the only available match is for ChildSA, although other matches are planned for future releases. Omitting the second match parameter for either IPv4 or IPv6 will make the payload applicable to all IP address pools.

Crypto Template Payload Configuration Mode commands are defined in the Crypto Template IKEv2-Dynamic Payload Configuration Mode Commands chapter.

Example
The following command configures a crypto template payload called payload5 and enters the Crypto Template Payload Configuration Mode:
payload payload5 match childsa
**peer network**

Configures a list of allowed peer addresses on this crypto template.

**Product**

All IPSec-related services

**Privilege**

Security Administrator

**Syntax**

```
peer network ip_address /mask [ encrypted pre-shared-key encrypt_key | pre-shared-key key ]
```

```
o peer network ip_address/ mask
```

```
no
```

Removes the specified peer network IP address from this crypto template.

```
peer network ip_address [ /mask ]
```

Specifies the IP address of the peer network in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation. 

`/mask` specifies the subnet mask bits. 

`mask` is an integer value from 1 to 32 for IPv4 addresses and 1 to 128 for IPv6 addresses (CIDR notation).

```
encrypted pre-shared-key encrypt_key
```

Specifies that an encrypted pre-shared key is to be used for IPSec authentication for the address range.

`encrypt_key` must be an alphanumeric string or hexadecimal sequence from 16 to 212.

```
pre-shared-key key
```

Specifies that a clear text pre-shared key is to be used for IPSec authentication for the address range. 

`key` must be an alphanumeric string or hexadecimal sequence from 1 to 32.

**Usage**

Use this command to configure a list or range of allowed peer network IP addresses for this template.

**Example**

The following command configures a set of IP addresses with starting address of 10.2.3.4 and a bit mask of 8:

```
peer network 10.2.3.4/8
```
remote-secret-list

Enables the use of a Remote Secret List containing up to 1000 pre-shared keys.

**Product**
All Security Gateway products

**Important:** This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

**Privilege**
Security Administrator

**Syntax**

```
remote-secret-list list_name

no remote-secret-list
```

- **no**
  Disables use of a Remote Secret List.

- **list_name**
  Specifies the name of an existing Remote Secret List as an alphanumeric string of 1 through 127 characters.

**Usage**
Enable the use of a Remote Secret List containing up to 1000 pre-shared keys.
Only one active remote-secret-list is supported per system.
For additional information, refer to the Remote Secret List Configuration Commands chapter of the Command Line Interface Reference and the System Administration Guide.

**Example**
The following command enables a remote-secret-list named `rs-list`:

```
remote-secret-list rs-list
```
timeout

Sets the OCSP Certificate Server timeout interval in seconds. This is the interval within which the response from an external OCSP or HASH-url server should be received.

Product Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > Crypto Template Configuration

configure > context context_name > crypto template template_name ikev2-dynamic

Entering the above command sequence results in the following prompt:

[context_name]host_name(crf-crypto-tmpl-ikev2-tunnel)#

Syntax

timeout cert-server timeout_value

default timeout cert-server

default

Sets/Restores default value assigned for Certificate Server timeout in seconds. Default is 20 seconds.

timeout_value

Specifies the timeout value in seconds which is an integer between 1 through 60.

Usage

Use this command to configure Certificate Server timeout in seconds.

Example

The following command configures Certificate Server timeout as 50 seconds:

    timeout cert-server 50
**whitelist**

Enables the use of an existing whitelist (access permitted) file by a security gateway.

**Product**

All products supporting IPSec whitelisting

---

**Important:** This command appears in the CLI for this release. However, it has not been qualified for use with any current Cisco StarOS gateway products.

**Privilege**

Security Administrator

**Syntax**

```
[ no ] whitelist
```

- **no**
  - Disables the use of a whitelist.

**Usage**

Enable the use of a previously created whitelist to allow privileged peers access via a security gateway. A whitelist is a list or register of entities that are being provided a particular privilege, service, mobility, access or recognition. With whitelisting, no peer is allowed to connect unless it appears in the list. Each entry in the whitelist file should contain the ID type so that the validation is performed for that ID type. In every entry, the ID type and ID value should be separated by a space. Only DOS and UNIX file formatting are supported. For additional information, refer to the *System Administration Guide*.

**Example**

The following command enables the use of a whitelist:

```
whitelist
```
Chapter 69
Crypto Template IKEv2-Dynamic Payload Configuration Mode Commands

The Crypto Template IKEv2-Dynamic Payload Configuration Mode is used to assign the correct IPSec transform-set from a list of up to four different transform-sets, and to assign Mobile IP addresses. There should be two payloads configured. The first must have a dynamic addressing scheme from which the ChildSA gets a TIA address. The second payload supplies the ChildSA with a HoA, which is the default setting for `ip-address-allocation`.

Mode

Exec > Global Configuration > Context Configuration > Crypto Template Configuration > Crypto Template IKEv2-Dynamic Payload Configuration

```
configure > context context_name > crypto template template_name ikev2-dynamic > payload
payload_name match childsa match { any | ipv4 | ipv6 }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(cfg-crypto-tmpl-ikev2-tunnel-payload)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
**ignore-rekeying-requests**

Ignores CHILD SA rekey requests from the Packet Data Interworking Function (PDIF).

**Product**
All Security Gateway products

**Privilege**
Security Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Crypto Template Configuration > Crypto Template IKEv2-Dynamic Payload Configuration

```
configure > context context_name > crypto template template_name ikev2-dynamic > payload payload_name match childsa match { any | ipv4 | ipv6 }
```

Entering the above command sequence results in the following prompt:

```
[context_name] host_name{cfg-crypto-tmpl-ikev2-tunnel.payload)#
```

**Syntax**

```
ignore-rekeying-requests
```

**Usage**

Prevents creation of a CHILD SA based on this crypto template.

**Example**

The following command prevents creation of a CHILD SA based on this crypto template:

```
ignore-rekeying-requests
```
ip-address-allocation

Configures IP address allocation for subscribers using this crypto template payload. Configure two payloads per crypto template. The first must have a dynamic address to assign a tunnel inner address (TIA) to the ChildSA. The second payload is configured after a successful MANaged IP (MIP) initiation and can use the default Home Address (HoA) option.

Product
All Security Gateway products

Privilege
Security Administrator

Mode
Exec > Global Configuration > Context Configuration > Crypto Template Configuration > Crypto Template IKEv2-Dynamic Payload Configuration

configure > context context_name > crypto template template_name ikev2-dynamic > payload payload_name match childsa match { any | ipv4 | ipv6 }

Entering the above command sequence results in the following prompt:

[context_name]host_name(cfg-crypto-tmpl-ikev2-tunnel-payload)#

Syntax

ip-address-allocation { dynamic | home-address }

default ip-address-allocation

- default
  Sets IP address allocation to the home-address.

- ip-address-allocation dynamic
  Specifies that the IP address for the subscriber is allocated from a dynamic IP pool.

- ip-address-allocation home-address
  The IP address for the subscriber is allocated by the Home Agent. This is the default setting for this command.

Usage
Use this command to configure how ChildSA payloads are allocated IP addresses for this crypto template.

Example

The following command is for the first ChildSA and will ensure that it gets a TIA address from an IP address pool:

ip-address-allocation dynamic

The following command is for the second ChildSA and will ensure that it gets a HoA address from the HA:

default ip-address-allocation
ipsec transform set?

Configures the IPSec transform set to be used for this crypto template payload.

**Product**
All Security Gateway products

**Privilege**
Security Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Crypto Template Configuration > Crypto Template IKEv2-Dynamic Payload Configuration

```
configure > context context_name > crypto template template_name ikev2-dynamic > payload payload_name match childsa match { any | ipv4 | ipv6 }
```

Entering the above command sequence results in the following prompt:

```
[context_name] host_name(cfg-crypto-tmpl-ikev2-tunnel-payload)#
```

**Syntax**

```
[ no ] ipsec transform-set list name [name2 ] [name3 ] [name4 ]
```

- **no**
  Specifies the IPSec transform set to be deleted. This is a space-separated list. From 1 to 4 transform sets can be entered. *name* must be an alphanumeric string of 1 through 127 characters.

- **name**
  Specifies the context configured IPSec transform set name to be used in the crypto template payload. This is a space-separated list. From 1 to 4 transform sets can be entered. *name* must be an alphanumeric string of 1 through 127 characters.

**Usage**

Use this command to list the IPSec transform set(s) to use in this crypto template payload.

**Example**

The following command configures IPSec transform sets named *ipset1* and *ipset2* to be used in this crypto template payload:

```
ipsec transform-set list ipset1 ipset2
```
lifetime

Configures the number of seconds for IPSec Child SAs derived from this crypto template payload to exist.

**Product**
All Security Gateway products

**Privilege**
Security Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Crypto Template Configuration > Crypto Template IKEv2-Dynamic Payload Configuration

```
configure > context context_name > crypto template template_name ikev2-dynamic > payload
payload_name match childsa match { any | ipv4 | ipv6 }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(cfg-crypto-tmpl-ikev2-tunnel-payload)#
```

**Syntax**

```
lifetime { sec [ kilo-bytes kbytes ] | kilo-bytes kbytes }
```

**default lifetime**

```sec
sec
```

Specifies the number of seconds for IPSec Child Security Associations derived from this crypto template payload to exist. `sec` must be an integer from 60 through 604800. Default: 86400

```kilo-bytes kbytes
```

Specifies lifetime in kilobytes for IPSec Child Security Associations derived from this crypto template payload. `kbytes` must be an integer from 1 through 2147483647.

**default lifetime**

Sets the lifetime to its default value of 86400 seconds.

**Usage**

Use this command to configure the number of seconds and/or kilobytes for IPSec Child Security Associations derived from this crypto template payload to exist.

**Example**

The following command configures the IPSec child SA lifetime to be 120 seconds:

```
lifetime 120
```
**maximum-child-sa**

Configures the maximum number of IPSec child security associations that can be derived from a single IKEv2 IKE security association.

**Product**
All Security Gateway products

**Privilege**
Security Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Crypto Template Configuration > Crypto Template IKEv2-Dynamic Payload Configuration

```plaintext
configure > context context_name > crypto template template_name ikev2-dynamic > payload payload_name match childsa match { any | ipv4 | ipv6 }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(cfg-crypto-tmpl-ikev2-tunnel-payload)#
```

**Syntax**

```
maximum-child-sa num

default maximum-child-sa
```

**Usage**

Specifies the maximum number of IPSec child security associations that can be derived from a single IKEv2 IKE security association. `num` must be 1. Default: 1

```
default maximum-child-sa
```

Sets the maximum number of Child SAs to its default value of 1.

**Example**

Use this command to configure the maximum number of IPSec child security associations that can be derived from a single IKEv2 IKE security association.

The following command configures the maximum number of child SAs to 1:

```
maximum-child-sa 1
```
rekey

Configures IPSec Child Security Association rekeying.

Product
All Security Gateway products

Privilege
Security Administrator

Mode
Exec > Global Configuration > Context Configuration > Crypto Template Configuration > Crypto Template IKEv2-Dynamic Payload Configuration

configure > context context_name > crypto template template_name ikev2-dynamic > payload payload_name match childsa match { any | ipv4 | ipv6 }

Entering the above command sequence results in the following prompt:

[context_name]host_name(cfg-crypto-tmpl-ikev2-tunnel-payload)#

Syntax

[ no ] rekey [ keepalive ]

---

  no

  Disables this feature.

---

  keepalive

  If specified, a session will be rekeyed even if there has been no data exchanged since the last rekeying operation. By default, rekeying is only performed if there has been data exchanged since the previous rekey.

Usage

Use this command to enable or disable the ability to rekey IPSec Child SAs after approximately 90% of the Child SA lifetime has expired. The default, and recommended setting, is not to perform rekeying. No rekeying means the PDIF will not originate rekeying operations and will not process CHILD SA rekeying requests from the UE.

Example

The following command disables rekeying:

    no rekey
tsi

Configures the IKEv2 Traffic Selector-Initiator (TSi) payload address options.

**Product**
All Security Gateway products

**Privilege**
Security Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Crypto Template Configuration > Crypto Template IKEv2-Dynamic Payload Configuration

```
configure > context context_name > crypto template template_name ikev2-dynamic > payload payload_name match childsa match { any | ipv4 | ipv6 }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(cfg-crypto-tmpl-ikev2-tunnel-payload)#
```

**Syntax**

```
tsi start-address { any end-address any | endpoint end-address endpoint }
```

<table>
<thead>
<tr>
<th>any end-address any</th>
</tr>
</thead>
</table>
| Configures the TSi payload to allow all IP addresses.

<table>
<thead>
<tr>
<th>endpoint end-address endpoint</th>
</tr>
</thead>
</table>
| Configures the TSi payload to allow only the Mobile endpoint address. (Default)

**Usage**

On receiving a successful IKE_SA_INIT Response from PDIF, the MS sends an IKE_AUTH Request for the first EAP-AKA authentication. If the MS is capable of doing multiple-authentication, it includes the MULTI_AUTH_SUPPORTED Notify payload in the IKE_AUTH Request. MS also includes an IDi payload containing the NAI, SA, TSi, TSr, and CP (requesting IP address and DNS address) payloads.

**Example**

Use the following example to configure a TSi payload that allows all addresses:

```
tsi start-address any end-address any
```
tsr

Configures the IKEv2 Traffic Selector-Responder (TSr) payload address options.

Product

All Security Gateway products

Privilege

Security Administrator

Mode

Exec > Global Configuration > Context Configuration > Crypto Template Configuration > Crypto Template IKEv2-Dynamic Payload Configuration

```
configure > context context_name > crypto template template_name ikev2-dynamic > payload payload_name match childsa match { any | ipv4 | ipv6 }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(cfg-crypto-tmpl-ikev2-tunnel-payload)>
```

Syntax

```
[ no ] tsr start-address ip address end-address ip address
```

- **no**
  
  Disables the specified tsr address range.

- **start-address ip address**
  
  Specifies the starting IP address of the TSr payload in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
  
  See the limitations listed in the *Usage* section.

- **end-address ipv4 address**
  
  Specifies the ending IP address of the TSr payload in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
  
  See the limitations listed in the *Usage* section.

Usage

This command is used to specify an IP address range in the single TSr payload that the PDG/TTG returns in the last IKE_AUTH message. This TSr is Child SA-specific.

This command is subject to the following limitations:

- The configuration is restricted to a maximum of four TSrs per payload and per childsa.
- Overlapping TSrs are not allowed either inside the same payload or across different payloads.
- When a TSr is configured via this command, only the configured TSr will be considered for narrowing-down. For example, if one IPv4 TSr is configured, and the gateway receives an IPv6 TSr, the gateway will reject the call with a TS_UNACCEPTABLE notification.
- The UE/PEER must send both INTERNAL_IP4_ADDRESS and INTERNAL_IP6_ADDRESS in the Configuration Payload, whenever it needs both IPv4 and IPv6 addresses in TSrs. Otherwise, the

---

3029
Command Line Interface Reference, StarOS Release 17
gateway will respond back with only one type depending upon the type of address received in the Configuration Payload. For example, if the gateway receives only INTERNAL_IP4_ADDRESS in the Configuration Payload but both IPv4 and IPv6 addresses are in the TSrs, the GW will narrow down only the IPv4 address, and ignore the IPv6 TSrs.

- IPv4 TSrs are not allowed inside IPv6 payloads.
- IPv6 TSrs are not allowed inside IPv4 payloads.

Example

Use the following example to configure a TSr payload that specifies an IPv4 address range for the payload:

```
tsr start-address 10.2.3.4 end-address 10.2.3.155
```
Chapter 70
CSCF Access Profile Configuration Mode Commands

The Access Profile Configuration Mode is used to set commands supporting the use of signaling compression, authentication, and SIP timers for subscribers accessing the system from varying network types.

Mode
Exec > Global Configuration > Context Configuration > CSCF Access Profile Configuration
configure > context context_name > cscf access-profile { default | name profile_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-access-profile)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
access-security-type

Sets the type of access security for a P-CSCF/A-BG.

**Product**
SCM (P-CSCF, A-BG)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Access Profile Configuration
configure > context context_name > cscf access-profile { default | name profile_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-access-profile)#

**Syntax**

```
[ no ] access-security-type ipsec-3gpp-cscf
```

- **no**
  Disables the selected access security type.

- **ipsec-3gpp-cscf**
  Security mechanism 3GPP/3GPP2 IPSec.

**Usage**
Use this command to enable or disable an access security type for a P-CSCF or A-BG.

**Example**
Enables 3GPP/3GPP2 IPSec access security on P-CSCF or A-BG:

```
access-security-type ipsec-3gpp-cscf
```

Disables 3GPP/3GPP2 IPSec access security on P-CSCF or A-BG:

```
no access-security-type ipsec-3gpp-cscf
```
**authentication**

Sets the authentication method to use for subscribers using this access profile.

**Product**

SCM (P-CSCF, A-BG)

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Access Profile Configuration  
`configure > context context_name > cscf access-profile { default | name profile_name }`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-access-profile)#
```

**Syntax**

```
[ no ] authentication { aka-v1 | custom-md5 | md5 }
```

- **no**
  
  Disables the selected authentication type.

- **aka-v1 | custom-md5 | md5**
  
  - **aka-v1**: Specifies that the AKA-v1 algorithm will be used for subscribers using this access profile.
  - **custom-md5**: Specifies that custom algorithm HTTP-Digest-MD5 will be used for subscribers using this access profile.
  - **md5**: Specifies that the MD5 algorithm will be used for subscribers using this access profile. This is the default setting for this command.

**Usage**

Use this command to set the authentication method used for subscribers using this access profile.

**Example**

The following command sets the authentication type for subscribers using this access profile to **md5**:

```
authentication md5
```
diameter-selection

Enables or disables prefix and capability-based CDF server selection for this access profile. By default, this command is disabled.

Product
SCM (S-CSCF)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Access Profile Configuration

configure > context context_name > cscf access-profile { default | name profile_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-access-profile)#

Syntax

[ no ] diameter-selection cdf

no

Disables prefix and capability-based CDF server selection.

Usage

Use this command to enable or disable prefix and capability-based CDF server selection per access-type.
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
pcrf-policy-control

Enables PCRF policy control for this access profile. By default, this command is disabled.

**Product**
SCM (P-CSCF, A-BG)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Access Profile Configuration

```
configure > context context_name > cscf access-profile { default | name profile_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-access-profile)#
```

**Syntax**

```
[ default | no ] pcrf-policy-control
```

- **default** | **no**
  
  PCRF policy control is disabled.

**Usage**

Use this command to enable or disable PCRF policy control for this access profile.

When a subscriber sends a REGISTER message, P-CSCF extracts the access-type mentioned in the P-Access-Network-Info and stores it. When P-CSCF needs to trigger an AAR for a subscriber, either for signaling-loss-detection or media-authorization, it will check if pcrf-policy-control is enabled for that subscriber's stored access-type. If pcrf-policy-control is enabled, AAR will be sent to PCRF for that subscriber.
**sigcomp**

Enables signalling compression for the Access Profile.

**Product**

SCM (P-CSCF, A-BG)

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Access Profile Configuration

```
configure > context context_name > cscf access-profile { default | name profile_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-access-profile)#
```

**Syntax**

```
[ no ] sigcomp [ force ]
```

- **no**
  
  Disables signalling compression for the Access Profile.

- **force**
  
  Specifies that signaling compression is to be forced for the access type. When this feature is enabled, messages received by the P-CSCF/A-BG that are not compressed are rejected.

**Usage**

Use this command to enable signalling compression for the specific Access Profile.
timeout

Sets timeout values for CSCF and SIP transactions for subscribers using this Access Profile.

Product
SCM (P-CSCF, A-BG)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Access Profile Configuration

configure > context context_name > cscf access-profile { default | name profile_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-access-profile)#

Syntax

```
timeout sip { 3gpp-d sec | 3gpp-t1 msec | 3gpp-t2 sec | 3gpp-t4 sec | c sec | d sec | invite-expiry sec | t1 msec | t2 sec | t4 sec }

default timeout sip { 3gpp-d | 3gpp-t1 | 3gpp-t2 | 3gpp-t4 | c | d | invite-expiry | t1 | t2 | t4 }
```

Sets transaction and expiry timers for SIP.

3gpp-d sec: This time is used to control the retransmission of 200OK messages to INVITEs after an ACK is sent. The ACK transaction is cleared after this period. This timer is applicable only for unreliable transport. sec must be an integer from 0 to 2147483646.

Default: 64*1T1 (128 seconds, recommended minimum)

3gpp-t1 msec: This timer is used to control the time interval between each retransmission. The interval doubles after each retransmission. This is used by P-CSCF/A-BG only when it sending message toward the UE. Example: T1, 2T1, 4T2, etc. This timer is applicable only for unreliable transport. msec must be an integer from 0 to 2147483646.

Default: 2000 ms (2 secs, recommended minimum).

3gpp-t2 sec: This timer is used to control the period for which the request continues to get retransmitted. This is used by P-CSCF/A-BG only when it sending message toward the UE. This timer is applicable both for reliable and unreliable transport. sec must be an integer from 0 to 2147483646.

Default: 16 seconds (recommended minimum).

3gpp-t4 sec: This timer is used to control the period for which the final response to non-invite transaction should be buffered. The buffered response for the retransmitted non-invite request should be sent within that interval. This timer is applicable only for unreliable transport. sec must be an integer from 0 to 2147483646.

Default: 17 seconds (recommended minimum).

c sec: This timer is used for an INVITE transaction; if the response is a provisional response with status codes 101 to 199 inclusive (anything but 100), the proxy must reset timer C for that client transaction. The timer may be reset to a different value, but this value must be greater than 3 minutes (180 seconds). When
timer C in S-CSCF fires first, S-CSCF will send CANCEL request to Terminating P-CSCF and Terminating P-CSCF will send CANCEL request to UAS.

- **d sec:** This time is used to control the retransmission of 200 OK to INVITE after ACK is sent. The ACK transaction will be cleared after this interval. This timer is applicable only for unreliable transport.
  - **sec** must be an integer from 0 to 2147483646.
  - Default: 180 seconds

- **invite-expiry sec:** This timer is used by SIP while acting as UA Role and no final response is received for the INVITE request sent. This timer is applicable for both reliable and unreliable transport.
  - **sec** must be an integer from 0 to 2147483646.
  - Default: 64*T1 (32 seconds, recommended minimum)

- **t1 msec:** Specifies the time interval (in milliseconds) between each retransmission. The interval doubles after each retransmission, for example: T1, 2T1, 4T2, etc. This timer is applicable only for unreliable transport.
  - **msec** must be an integer from 0 to 2147483646.
  - Default: 500 milliseconds (recommended minimum).

- **t2 sec:** This timer is used to control the period for which the request keeps getting retransmitted. This timer is applicable both for reliable and unreliable transport.
  - **sec** must be an integer from 0 to 2147483646. The recommended minimum value for this parameter is 4 seconds.
  - Default: 64*T1 (32 seconds)

- **t4 sec:** This timer is used to control the period for which the final response to non-invite transaction should be buffered so as to send the buffered response for the retransmitted non-invite request within that interval. This timer is applicable only for unreliable transport.
  - **sec** must be an integer from 0 to 2147483646.
  - Default: 5 seconds (recommended minimum).

- **default**
  - Sets/restores default value assigned for specified parameter.

### Usage

Use this command to configure SIP Stack timers and CSCF service specific timers for subscriber traffic using this Access Profile.

### Example

The following command sets the SIP d timer to 64 seconds:

```
timeout sip d 64
```
Chapter 71
CSCF ACL Configuration Mode Commands

The CSCF ACL (Access Control List) Configuration Mode is used to configure session permissions (permit/deny access) within the system.

**Mode**

Exec > Global Configuration > Context Configuration > CSCF ACL Configuration

```plaintext
configure > context context_name > cscf acl { default | name list_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-acl)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
after

Places the CSCF ACL entry at the bottom or end of the ACL. Use this command in conjunction with the *permit* and/or *deny* commands.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF ACL Configuration

```
configure > context context_name > cscf acl { default | name list_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-acl)#
```

**Syntax**

```
after
```

**Usage**

Add this command before the *permit* and/or *deny* commands to place the entry at the end of the ACL.
before

Places the CSCF ACL entry at the beginning or top of the ACL. Use this command in conjunction with the `permit` and/or `deny` commands.

**Product**

SCM

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > CSCF ACL Configuration

```
configure > context context_name > cscf acl { default | name list_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-acl)#
```

**Syntax**

```
before
```

**Usage**

Add this command before the `permit` and/or `deny` commands to place the entry at the beginning of the ACL.
deny

Configures the system to deny subscriber sessions based on criteria matching the received packet.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF ACL Configuration

```bash
configure > context context_name > cscf acl { default | name list_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-acl)#
```

**Syntax**

```bash
deny { any | destination aor aor | log { any | destination aor aor | source { address ip_address | aor aor } | subscriber-capability capability_type | user-agent device-type device_type } | source { address ip_address | aor aor } | subscriber-capability capability_type } +
```

```bash
no deny { any | destination aor aor | source { address ip_address | aor aor } | subscriber-capability capability_type }
```

- **any**
  Filters all CSCF sessions.

- **destination aor aor**
  Filters sessions based on the destination AoR. `aor` must be an existing AoR from 1 to 79 characters in length.

---

**Important:** AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

```bash
log { any | destination aor aor | source { address ip_address | aor aor } | subscriber-capability { capability_type } | user-agent device-type device_type }
```

Enables logging for CSCF sessions meeting the criteria specified in the ACL. The logs can be viewed by executing the `logging filter active facility acl-log` command in the Exec mode.

Specifies the criteria that packets will be compared against. The following criteria are supported:

- **any**
- **destination aor aor**
- **source address ip_address**
- **source aor aor**
- **subscriber-capability capability_type**
**user-agent device-type device_type**

source { address ip_address | aor aor }

Filters session based on the source IP address or AoR.
- *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- *aor* must be an existing AoR from 1 to 79 characters in length.

**Important:** AoR regular expressions are supported. Refer to the *SCM Engineering Rules* Appendix in the *Cisco ASR 5000 Series Session Control Manager Administration Guide* for more information about regular expressions.

**subscriber-capability { capability_type }**

Filters session based on one of the following subscriber capability types:
- *at* - Custom AT Type
- *audio* - Audio Capability Type
- *chat* - Custom CHAT Type
- *cs* - Custom CS Type
- *ft* - Custom FT Type
- *im* - Custom IM Type
- *lte-voip* - Custom LTE-VOIP Type
- *lte-vt* - Custom LTE-VT Type
- *mms* - Custom MMS Type
- *msg* - Custom MSG Type
- *oma-sip-im* - Custom OMA SIP-IM Type
- *rcs-dp* - Custom RCS-DP Type
- *rcs-e* - Custom RCS-E Type
- *rcs-ft* - Custom RCS-FT Type
- *rcs-im* - Custom RCS-IM Type
- *rcs-is* - Custom RCS-IS Type
- *rcs-sp* - Custom RCS-SP Type
- *rcs-vs* - Custom RCS-VS Type
- *smart-edu* - Custom SMART-EDU Type
- *text* - Text Capability Type
- *video* - Video Capability Type
- *vt* - Custom VT Type
- *vt-ft* - Custom VT-FT Type
- *vt-is* - Custom VT-IS Type
- *vt-loc* - Custom VT-LOC Type
- *vt-memo* - Custom VT-MEMO Type
user-agent device-type device_type

Filters session based on device-type in user-agent header.

device_type must be from 1 to 15 characters in length. The following user agent device types are supported.

- feature_phone
- smart_phone
- pad
- tablet_pc
- pc
- soft_phone
- modem

+ This symbol indicates that the keywords can be entered multiple times within a single command.

no deny { any | destination aor | source { address ip_address | aor | subscriber-capability { capability_type } } }

Removes specified filter criteria.

Usage

Specifies the subscriber sessions to deny based on the criteria specified.

Example

The following command denies access to subscribers with a source address of 1.2.3.4:

   deny source address 1.2.3.4
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
permit

Configures the system to allow subscriber sessions based on criteria matching the received packet.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF ACL Configuration

configure > context context_name > cscf acl { default | name list_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-acl)#

Syntax

permit { any | destination aor aor | log { any | destination aor aor | source { address ip_address | aor aor } | subscriber-capability capability_type | user-agent device-type device_type } | source { address ip_address | aor aor } | subscriber-capability capability_type | user-agent device-type device_type } +

no permit { any | destination aor aor | source { address ip_address | aor aor } | subscriber-capability capability_type }

any
Filters all CSCF sessions.

destination aor aor
Filters sessions based on the destination AoR.
aor must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Cisco ASR 5000 Series Session Control Manager Administration Guide for more information about regular expressions.

log { any | destination aor aor | source { address ip_address | aor aor } | subscriber-capability { capability_type } | user-agent device-type device_type }

Enables logging for CSCF sessions meeting the criteria specified in the ACL. The logs can be viewed by executing the logging filter active facility acl-log command in the Exec mode.

Specifies the criteria that packets will be compared against. The following criteria are supported:

• any
• destination aor aor
• source address ip_address
• source aor aor
• subscriber-capability capability_type
• user-agent device-type device_type

source { address ip_address | aor aor }

Filters session based on the source IP address or AoR.
  • ip_address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
  • aor must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

subscriber-capability { capability_type }

Filters session based on one of the following subscriber capability types:
  • at - Custom AT Type
  • audio - Audio Capability Type
  • chat - Custom CHAT Type
  • cs - Custom CS Type
  • ft - Custom FT Type
  • im - Custom IM Type
  • lte-voip - Custom LTE-VOIP Type
  • lte-vt - Custom LTE-VT Type
  • mms - Custom MMS Type
  • msg - Custom MSG Type
  • oma-sip-im - Custom OMA SIP-IM Type
  • rcs-dp - Custom RCS-DP Type
  • rcs-e - Custom RCS-E Type
  • rcs-ft - Custom RCS-FT Type
  • rcs-im - Custom RCS-IM Type
  • rcs-is - Custom RCS-IS Type
  • rcs-sp - Custom RCS-SP Type
  • rcs-vs - Custom RCS-VS Type
  • smart-edu - Custom SMART-EDU Type
  • text - Text Capability Type
  • video - Video Capability Type
  • vt - Custom VT Type
  • vt-ft - Custom VT-FT Type
  • vt-is - Custom VT-IS Type
  • vt-loc - Custom VT-LOC Type
  • vt-memo - Custom VT-MEMO Type
user-agent device-type  device_type

Filters session based on device-type in user-agent header.  
*device_type* must be from 1 to 15 characters in length. The following user agent device types are supported:

- feature_phone
- smart_phone
- pad
- tablet_pc
- pc
- soft_phone
- modem

This symbol indicates that the keywords can be entered multiple times within a single command.

no permit { any | destination aor aor | source { address ip_address | aor aor } | subscriber-capability { capability_type } }

Removes specified filter criteria.

Usage

Specifies the subscriber sessions to permit based on the criteria specified.

Example

The following command permits access to subscribers with a destination AoR of $.@abc123.com:

```
permit destination aor $.@abc123.com
```
CSCF ACL Configuration Mode Commands

Redirect

Configures the system to redirect subscriber sessions to another CSCF based on criteria matching the received packet.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF ACL Configuration

cmd > context context_name > cscf acl { default | name list_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-acl)#

Syntax

redirect { address ip_address | host host_name } [ port port_number ] { any | destination aor aor | log { any | destination aor aor | source { address ip_address | aor aor } | subscriber-capability capability_type | user-agent device-type device_type } | source { address ip_address | aor aor } | subscriber-capability capability_type | user-agent device-type device_type } +

no redirect { address ip_address | host host_name } [ port port_number ] { any | destination aor aor | source { address ip_address | aor aor } | subscriber-capability capability_type }

address ip_address

The address to which UE should be redirected.

ip_address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

host host_name

The host to which UE should be redirected.

host_name must be an existing name from 1 to 79 characters in length.

port port_number

The port at which request should be redirected.

port_number must be an integer from 1 to 65535.

any

Redirect UE to address/host.

destination aor aor

Redirect UE to address/host if destination AoR matches.

aor must be an existing AoR from 1 to 79 characters in length.
**Important:** AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

```bash
log { any | destination aor aor | source { address ip_address | aor aor } | subscriber-capability { capability_type } | user-agent device-type device_type }
```

Enables logging for redirect ed UE meeting the criteria specified in the ACL. The logs can be viewed by executing the `logging filter active facility acl-log` command in the Exec mode. Specifies the criteria that packets will be compared against. The following criteria are supported:

- `any`
- `destination aor aor`
- `source address ip_address`
- `source aor aor`
- `subscriber-capability capability_type`
- `user-agent device-type device_type`

```bash
source { address ip_address | aor aor }
```

Redirect UE to address/host if source IP address or AoR matches.

- `ip_address` must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- `aor` must be an existing AoR from 1 to 79 characters in length.

**Important:** AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

```bash
subscriber-capability { capability_type }
```

Redirect UE to address/host if contact has one of the following subscriber capability types:

- `at` - custom AT type
- `audio` - audio capability type
- `chat` - custom CHAT type
- `cs` - custom CS type
- `ft` - custom FT type
- `im` - custom IM type
- `lte-voip` - Custom LTE-VOIP Type
- `lte-vt` - Custom LTE-VT Type
- `mms` - custom MMS type
- `msg` - Custom MSG Type
- `oma-sip-im` - Custom OMA SIP-IM Type
- `rcs-dp` - Custom RCS-DP Type
- `rcs-e` - Custom RCS-E Type
- `rcs-ft` - Custom RCS-FT Type
- `rcs-im` - Custom RCS-IM Type
**redirect**

- rcs-is - Custom RCS-IS Type
- rcs-sp - Custom RCS-SP Type
- rcs-vs - Custom RCS-VS Type
- smart-edu - Custom SMART-EDU Type
- text - Text Capability Type
- video - Video Capability Type
- vt - Custom VT Type
- vt-ft - Custom VT-FT Type
- vt-is - Custom VT-IS Type
- vt-loc - Custom VT-LOC Type
- vt-memo - Custom VT-MEMO Type

**user-agent device-type device_type**

Redirect UE to address/host according to device-type in user-agent header.  
*device_type* must be from 1 to 15 characters in length. The following user agent device types are supported.

- feature_phone
- smart_phone
- pad
- tablet_pc
- pc
- soft_phone
- modem

+  
This symbol indicates that the keywords can be entered multiple times within a single command.

**no redirect { address ip_address | host host_name } [ port port_number ] { any | destination aor aor | source { address ip_address | aor aor } | subscriber-capability { capability_type } }**

Removes specified redirect location and filter criteria.

**Usage**

Specifies the subscriber sessions to redirect based on the criteria specified.

**Example**

The following command redirects subscribers with a destination AoR of $.@abc123.com to host scscf.com:

```
redirect host scscf.com destination aor $.@abc123.com
```
Chapter 72
CSCF AoR Policy Rules Configuration Mode Commands

The CSCF AoR Policy Rules Configuration Mode is used to manage AoR policy profiles within the system. Both default and user-defined profiles can be managed in this mode.

Mode

Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > AoR Policy Rules Configuration

configure > context context_name > cscf policy { default | name policy_name } > aor-policy-rules

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-policy_name-aor)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
after

Places the CSCF policy entry at the bottom or end of the policy list. Use this command in conjunction with the aor command.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > AoR Policy Rules Configuration

configure > context context_name > cscf policy { default | name policy_name } > aor-policy-rules

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-policy_name-aor)#

Syntax

after

Usage

Add this command before the aor command to place the entry at the end of the policy list.
**aor**

Configures an AoR profile and enters the CSCF Policy Rules Configuration Mode.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > AoR Policy Rules Configuration

```
configure > context context_name > cscf policy { default | name policy_name } > aor-policy-rules
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-policy_name-aor)#
```

**Syntax**

```
[ no ] aor aor_name
```

- **no**
  Removes the AoR profile from the system.

- **aor_name**
  Specifies a name for the AoR profile.
  aor_name must be from 1 to 79 alpha and/or numeric characters in length.

**Usage**

Use this command to create or modify an AoR profile and enter the CSCF Policy Rules Configuration Mode.

Entering this command results in the following prompt:

```
[context_name]host_name(config-aor_name-aor)#
```

CSCF Policy Rules Configuration Mode commands are defined in the *CSCF Policy Rules Configuration Mode Commands* chapter of this guide.

**Example**

The following command creates an AoR profile named *aor5* and enters the CSCF Policy Rules Configuration Mode:

```
aor aor5
```
before

Places the CSCF policy entry at the top or beginning of the policy list. Use this command in conjunction with the `aor` command.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > AoR Policy Rules Configuration

configure > context context_name > cscf policy { default | name policy_name } > aor-policy-rules

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-policy_name-aor)#
```

**Syntax**

```
before
```

**Usage**

Add this command before the `aor` command to place the entry at the beginning of the policy list.
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Use this command to return to the parent configuration mode.
Chapter 73
CSCF ATCF-ATGW Configuration Mode Commands

The CSCF ATCF (Access Transfer Control Function)/ATGW (Access Transfer Gateway) Configuration Mode is used to configure the ATCF-ATGW functionality in the Proxy-CSCF service.

Mode

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > CSCF ATCF-ATGW Configuration

configure > context context_name > cscf service service_name > proxy-cscf > atcf-atgw

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-atcf-atgw)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**call-linger-timer**

This command configures the timeout value after call termination request for ATCF service.

**Product**

SCM: P-CSCF, A-BG

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > CSCF ATCF-ATGW Configuration

configure > context context_name > cscf service service_name > proxy-cscf > atcf-atgw

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-atcf-atgw)#
```

**Syntax**

```
call-linger-timer timer_seconds
[ default | no ] call-linger-timer
```

- **default**
  
  Configures this command with the default setting.

- **no**
  
  Disables the timeout configuration.

- **timer_seconds**
  
  Specifies the call linger timer value in seconds.

  *timer_seconds* must be an integer from 1 to 32.

**Usage**

Use this command to enable or disable call linger timer after call termination request. This determines the timeout value of session for abnormal procedure parameters in ATCF service.

**Example**

The following command sets the call linger timer value to 20 seconds:

```
call-linger-timer 20
```
end

Ends the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
mgmt-uri

This command supports PSI-based routing mode in I-CSCF.

Product
SCM: P-CSCF, A-BG, I-CSCF

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > CSCF ATCF-ATGW Configuration

```bash
configure > context context_name > cscf service service_name > proxy-cscf > atcf-atgw
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-atcf-atgw)#
```

Syntax

```bash
mgmt-uri mgmt_uri
```

**default mgmt-uri**

```bash
  default
```

Configures this command with its default setting.

```bash
  mgmt_uri
```

Specifies the ATCF management URI, and indicates SIP URI or hostname with domain. `mgmt_uri` must be an alphanumeric string of 1 to 127 characters.

Example format of management URI:

- `sip:xyz@abc.com` for SIP URI
- `sip:atcf.xyz.net` for hostname with domain

**Usage**

Use this command to configure ATCF management URI for PSI based routing in I-CSCF.

**Example**

The following command configures the ATCF management URI for hostname with domain `sip:atcf.xyz.net`

```bash
mgmt-uri sip:atcf.xyz.net
```
policy name

This command assigns or removes an existing ATCF policy.

**Product**

SCM: P-CSCF, A-BG

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > CSCF ATCF-ATGW Configuration

`configure > context context_name > cscf service service_name > proxy-cscf > atcf-atgw`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-cscf-atcf-atgw)#`

**Syntax**

```
[ no ] policy name policy_name
```

- no
  - If previously configured, disables the configuration.

- `policy_name`
  - Specifies the name of the ATCF policy list.
  - `policy_name` must be an alphanumeric string of 1 to 127 characters.

**Usage**

Use this command to assign or remove an existing ATCF policy.

**Example**

The following command sets the ATCF policy named `access`:

`policy name access`
**stn-sr**

This command specifies a Session Transfer Number for Single Radio (STN-SR) for the ATCF service.

**Product**
SCM: P-CSCF, A-BG

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > CSCF ATCF-ATGW Configuration

```
configure > context context_name > cscf service service_name > proxy-cscf > atcf-atgw
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-atcf-atgw)#
```

**Syntax**

```
stn-sr stnsr_num

no stn-sr
```

**Usage**

If previously configured, disables the configuration.

```
no
```

```
stnsr_num
```

Specifies the STN-SR.

```

stnsr_num must be a string of up to 15 digits.
```

**Example**

The following command sets STN-SR number to 1005002115000:

```
stn-sr 1005002115000
```
trusted scc-as

This command allows you to configure trusted Service Centralization and Continuity - Application Server (SCC-AS) addresses in ATCF service.

Product
SCM: P-CSCF, A-BG

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > CSCF ATCF-ATGW Configuration

configure > context context_name > cscf service service_name > proxy-cscf > atcf-atgw

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-atcf-atgw)#

Syntax

[ no ] trusted scc-as scc_as

- no
  If previously configured, disables the configuration.

- scc_as
  Specifies the list of trusted SCC-AS.
  scc_as must be an alphanumeric string of 1 to 79 characters.

Usage

Use this command to add or delete an SCC-AS address in ATCF service.

Example

The following command adds SCC-AS address cscfscc

trusted scc-as sccl
Chapter 74
CSCF ATCF-ATGW Policy Configuration Mode Commands

The CSCF ATCF-ATGW Policy Configuration Mode is used to configure ATCF (Access Transfer Control Function) policy in the context.

Mode

Exec > Global Configuration > Context Configuration > ATCF Configuration

configure > context context_name > atcf policy name policy_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-atcf-atgw-policy)#
criteria

This command enables criteria to invoke ATCF functionality.

Product
SCM: P-CSCF, A-BG

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > ATCF Configuration

configure > context context_name > atcf policy name policy_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-atcf-atgw-policy)#

Syntax

criteria { access-type { 3gpp-e-utran-fdd | 3gpp-e-utran-tdd | 3gpp-geran | 3gpp-utran-fdd | 3gpp-utran-tdd | any | cellular | docsis | dsl | ethernet | wlan } | all | any | ics-capability | roaming }

default criteria access-type

no criteria { access-type { 3gpp-e-utran-fdd | 3gpp-e-utran-tdd | 3gpp-geran | 3gpp-utran-fdd | 3gpp-utran-tdd | cellular | docsis | dsl | ethernet | wlan } | ics-capability | roaming }

default

Configures this command with its default setting.

no

If previously configured, disables the configuration.

criteria { access-type { 3gpp-e-utran-fdd | 3gpp-e-utran-tdd | 3gpp-geran | 3gpp-utran-fdd | 3gpp-utran-tdd | any | cellular | docsis | dsl | ethernet | wlan } | all | any | ics-capability | roaming }

Specifies the access type of UE to invoke ATCF.
The supported access types are:

- **3gpp-e-utran-fdd**: Access type of UE is E-UTRAN-FDD
- **3gpp-e-utran-tdd**: Access type of UE is E-UTRAN-TDD
- **3gpp-geran**: Access type of UE is GERAN
- **3gpp-utran-fdd**: Access type of UE is UTRAN_FDD
- **3gpp-utran-tdd**: Access type of UE is UTRAN_TDD
- **any**: Access type of UE is any of the following: UTRAN, E-UTRAN, GERAN, DSL, ETHERNET, CELLULAR, WLAN or DOCSIS
- **cellular**: Access type of UE is CELLULAR
• **docsis**: Access type of UE is DOCSIS
• **dsl**: Access type of UE is DSL
• **ethernet**: Access type of UE is ETHERNET
• **wlan**: Access type of UE is WLAN

---

**all**
Specifies that all criteria must be met.

---

**any**
Specifies that any criteria must be met.

---

**ics-capability**
Specifies that UE is ICS capable.

---

**roaming**
Specifies that UE is in visited network.

---

**Usage**

Use this command to enable criteria based on UE’s access type to invoke ATCF functionality.

---

**Example**

The following command enables ATCF to be invoked based on UE’s access type of E-UTRAN-TDD:

```
criteria access-type 3gpp-utran-tdd
```
end

Exits the current configuration mode and returns to the Exec mode.

Product

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
ps-cs-alerting

This command configures access transfer during alerting support in ATCF service.

Product
SCM: P-CSCF, A-BG

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > ATCF Configuration
configure > context context_name > atcf policy name policy_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-atcf-atgw-policy)#

Syntax

[ no ] ps-cs-alerting

no
If previously configured, disables the configuration.

Usage
Use this command to configure access transfer during alerting support in ATCF service.
Chapter 75
CSCF Charging Configuration Mode Commands

The CSCF Charging Configuration Mode is used to manage CSCF service policy profiles within the system.

Mode

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > CSCF Charging Configuration
configure > context context_name > csf service service_name > charging

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-charging)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
exclude

Configures the service to exclude SIP requests from the Rf charging configuration.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > CSCF Charging Configuration

configure > context context_name > cscf service service_name > charging

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-charging)#

Syntax

[ no ] exclude { custom sip_method | invite | message | notify | register | subscribe | update }

no
Removes the exclusion of the specified SIP request message type.

custom sip_method
Specifies CUSTOM SIP requests that are to be excluded from Rf charging.

sip_method can be a name of any SIP method and be from 1 to 31 alpha and/or numeric characters.

invite
Specifies that INVITE SIP requests are to be excluded from Rf charging.

message
Specifies that MESSAGE SIP requests are to be excluded from Rf charging.

notify
Specifies that NOTIFY SIP requests are to be excluded from Rf charging.

register
Specifies that REGISTER SIP requests are to be excluded from Rf charging.

subscribe
Specifies that SUBSCRIBE SIP requests are to be excluded from Rf charging.

update
Specifies that UPDATE SIP requests are to be excluded from Rf charging.
Usage

Use this command to exclude specific SIP requests from Rf charging.

Example

The following command configures the service to exclude SIP REGISTER requests from Rf charging:

```
exclude register
```
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
exit

Usage
Use this command to return to the parent configuration mode.
Chapter 76
CSCF Crypto Template Configuration Mode Commands

The CSCF Crypto Template Configuration Mode is used to configure a P-CSCF IPsec policy. It includes most of the IPsec parameters and Internet Key Exchange version 1 (IKEv1) parameters for cryptographic and authentication algorithms etc. A P-CSCF service will not support IPsec without a configured crypto template. Only one crypto template can be configured per P-CSCF service.

Mode

Exec > Global Configuration > Context Configuration > CSCF Crypto Template Configuration

configure > context context_name > crypto template template_name ipsec-3gpp-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(cfg-crypto-tmpl-ims-cscf-tunnel)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
**exit**

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**
Use this command to return to the parent configuration mode.
ipsec

Configures parameters for the 3GPP/3GPP2 P-CSCF security associations within this crypto template.

Product
SCM

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Crypto Template Configuration

configure > context context_name > crypto template template_name ipsec-3gpp-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(cfg-crypto-tmpl-ims-cscf-tunnel)#

Syntax

ipsec transform-set list list_name

transform-set list name

transform-set: Specifies a context-level IPSec security association transform set to be used for deriving 3GPP/3GPP2 P-CSCF security associations from this crypto template.

list list_name: A space separated list of 3GPP/3GPP2 P-CSCF security association transform sets. list_name must be an existing 3GPP/3GPP2 P-CSCF transform set and be from 1 to 127 alpha and/or numeric characters.

Important: A minimum of one transform set is required. A maximum of four transform sets may be specified.

Usage

Use this command to configure parameters for the 3GPP/3GPP2 P-CSCF security associations within this crypto template.

Example

The following command configures the 3GPP/3GPP2 P-CSCF transform set list name to ikev1list1:

ipsec transform-set list ikev1list1
Chapter 77
CSCF Diameter Selection Configuration Mode Commands

The Diameter Selection Configuration Mode is used to configure AAA group selection criteria that will be used for all CDF (enabled for a given access type) or HSS interactions for a subscriber.

Mode

Exec > Global Configuration > Context Configuration > CSCF Diameter Selection Configuration

configure > context context_name > cscf diameter-selection type { cdf | hss }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-diameter-selection)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
### aaa-group

Configures diameter selection entries.

**Product**

SCM

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Diameter Selection Configuration

`configure > context context_name > cscf diameter-selection type { cdf | hss }`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-diameter-selection)#
```

**Syntax**

```
aaa-group name { [ preference value ] [ skiplir ] [ criteria { aor aor_prefix | subscriber-capability capability_type | subscriber-ip-type { v4 | v6 } | user-agent value } ] } +

no aaa-group name preference value
```

- **name**
  
  Specifies a name for the diameter selection entry.
  
  *name* must be from 1 to 63 alpha and/or numeric characters.

- **preference value**
  
  Configures preference that will be associated with each diameter selection entry. If preference is specified, the entry matching the preference is updated and a new entry is created in the prefix table. If preference is not specified, it is assigned a preference one greater than the last entry's preference in the diameter selection table.
  
  *value* must be an integer from 1 to 65535.

- **skiplir**
  
  Configures selected AAA group to skip LIR-LIA (Location-Info-Request — Location-Info-Answer). This is applicable only for HSS.

- **criteria**
  
  Specifies AAA group selection criteria.

- **aor aor_prefix**
  
  Filters based on the source or destination AoR.
  
  *aor_prefix* must be an existing AoR from 1 to 79 characters in length.
**Important:** AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Cisco ASR 5000 Series Session Control Manager Administration Guide for more information about regular expressions.

```
subscriber-capability capability_type
```

Filters based on the capability of the subscriber.

- `at` - Custom AT Type
- `audio` - Audio Capability Type
- `chat` - Custom CHAT Type
- `cs` - Custom CS Type
- `ft` - Custom FT Type
- `im` - Custom IM Type
- `lte-voip` - Custom LTE-VOIP Type
- `lte-vt` - Custom LTE-VT Type
- `mms` - Custom MMS Type
- `msg` - Custom MSG Type
- `oma-sip-im` - Custom OMA SIP-IM Type
- `rcs-dp` - Custom RCS-DP Type
- `rcs-e` - Custom RCS-E Type
- `rcs-ft` - Custom RCS-FT Type
- `rcs-im` - Custom RCS-IM Type
- `rcs-is` - Custom RCS-IS Type
- `rcs-sp` - Custom RCS-SP Type
- `rcs-vs` - Custom RCS-VS Type
- `smart-edu` - Custom SMART-EDU Type
- `text` - Text Capability Type
- `video` - Video Capability Type
- `vt` - Custom VT Type
- `vt-ft` - Custom VT-FT Type
- `vt-is` - Custom VT-IS Type
- `vt-loc` - Custom VT-LOC Type
- `vt-memo` - Custom VT-MEMO Type

```
subscriber-ip-type { v4 | v6 }
```

Filters based on the IP type of the subscriber.

- `v4` - IPv4 type
- `v6` - IPv6 type

```
user-agent value
```

Filters based on the User-Agent Header value.
aaa-group

value must be from 1 to 127 alpha and/or numeric characters.

+
This symbol indicates that the keywords can be entered multiple times within a single command.

no
Removes configured diameter selection entry.

Usage
This command configures matching criteria for selecting a AAA group name. When a subscriber registers, the selection criteria are compared and the AAA group name from the matching entry will be picked up. The selected aaa-group will be used for all CDF (enabled for a given access type) or HSS interactions for that subscriber.

Example
The following command creates a diameter selection entry named aaa1, with a destination AoR criteria of $.@abc123.com and preference 125 associated with it:

aaa-group aaa1 preference 125 criteria aor $.@abc123.com

The following command (immediately following in the configuration file) creates a diameter selection entry named aaa2, with a destination AoR criteria of user@cisco.com and preference 126 automatically associated with it:

aaa-group aaa2 criteria aor user@cisco.com
end

Exits the current configuration mode and returns to the Exec mode.

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
The CSCF EATF Configuration Mode is used to set commands for enabling service continuity of IMS emergency sessions.

Mode

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Emergency-CSCF Configuration > CSCF EATF Configuration

configure > context context_name > cscf service service_name > emergency-cscf > eatf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-eatf)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**e-stn-sr**

This command adds the Emergency Session Transfer Number for Single Radio (E-STN-SR) to the EATF.

**Product**
SCM: E-CSCF

**Privilege**
Administrator

**Syntax**
```
e-stn-sr estnsr_num
no e-stn-sr
```

- **no**
  Removes E-STN-SR number from the E-CSCF.

- **estnsr_num**
  Specifies the E-STN-SR.
  `estnsr_num` must be a string of up to 15 digits (+ prefix may be added).

**Usage**
Use this command to configure E-STN-SR number for EATF service. EATF performs session continuity when the Access Transfer request indicated by the E-STN-SR is received.

**Example**
The following command sets the E-STN-SR number to 5656565:
```
e-stn-sr 5656565
```
end

Exits the current configuration mode and returns to the Exec mode.

Use this command to return to the parent configuration mode.
Chapter 79
CSCF Emergency-CSCF Configuration Mode Commands

The Emergency-CSCF Configuration Mode is used to set commands supporting the role of the CSCF service as an Emergency CSCF.

Mode

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Emergency-CSCF Configuration

configure > context context_name > cscf service service_name > emergency-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-emergency-cscf)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**eatf**

This command enables Emergency Call Access Transfers (EATF) functionality for the service. Default is disabled.

**Product**

SCM: E-CSCF

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Emergency-CSCF

configure > context context_name > cscf service service_name > emergency-cscf

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-emergency-cscf)#
```

**Syntax**

```
[ no ] eatf
```

```
no
```

Removes EATF support from the E-CSCF.

**Usage**

Use this command to enable or disable EATF functionality in emergency-CSCF service.

On entering this command, the CLI prompt changes to:

```
[context_name]host_name(config-cscf-eatf)#
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Use this command to return to the parent configuration mode.
plani

Sets parameters associated with P-LANI (P-Last-Access-Network-Info) header.

**Product**
SCM: E-CSCF

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Emergency-CSCF Configuration

```
configure > context context_name > csf service service_name > emergency-cscf
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-emergency-cscf)#
```

**Syntax**

```
plani age seconds
[ default | no ] plani age
```

---

**default**

Sets the acceptable P-LANI age to 7200 seconds.

---

**no**

Removes the acceptable P-LANI age configured for the E-CSCF.

---

**age seconds**

Specifies the acceptable P-LANI age from registration time.

- `seconds` must be an integer from 1 to 65535.
- Default: 7200

**Usage**

This command is used to identify location aging of subscriber is within acceptable limits. Two timestamps are included in Emergency SIP INVITES P-LANI header to determine the “location age” of the last known cellular information at registration. The first timestamp shall be the date/time the P-LANI was captured. The second timestamp shall be the data and time of the Initial registration for voice services. The E-CSCF shall calculate the delta between the two timestamps to determine the P-LANI location age at registration. E-CSCF will compare the P-LANI location age to the “p-lani-acceptable-age” specified in this command. E-CSCF will omit/disregard the LDAP query for CGI location when “p-lani-acceptable-age” is exceeded.

**Example**

The following command sets the acceptable P-LANI age for the E-CSCF to 5000 seconds:
plani age 5000

The following command sets the acceptable P-LANI age for the E-CSCF to 7200 seconds:

    default plani age

The following command removes the acceptable P-LANI age configured for the E-CSCF:

    no plani age
privacy

Enables privacy support on the E-CSCF.

Syntax

[ no | default ] privacy

no | default

Removes privacy support from the E-CSCF.

Usage

Use this command to enable privacy support for Emergency CSCF service.
psap-file

Sets the location of the PSAP-Database file to maintain and access the ESRK-Ranges provided by the operator for the E-CSCF.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Emergency-CSCF Configuration

```
configure > context context_name > cscf service service_name > emergency-cscf
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-emergency-cscf)#
```

**Syntax**

```
psap-file file_name

no psap-file
```

**no**

Removes the PSAP-Database file from the E-CSCF.

```
file_name
```

Specifies the PSAP-Database file in one of the following formats:

- `ftp://[username]:[password]@host[/directory]/<filename>` - URL
- `file:/flash[/directory]/<filename>` - URL
- `sftp://[username]:[password]@host[/directory]/<filename>` - URL

**Usage**

This command is used by the SRDB proclet for ESRK-PSAP database management for the E-CSCF.

**Example**

The following command specifies a PSAP-Database file for the E-CSCF:

```
psap-file
ftp://[username]:[password]@10.6.2.246/home/nthattil/psap_profile_CSV_new1.csv
```
Chapter 80
CSCF Enforce Codec Policy Configuration Mode Commands

The CSCF Enforce Codec Policy Configuration Mode is used to manage audio and video codec policies within the system. The parameters defined in this chapter are derived from IETF RFC 3551: “RTP Profile for Audio and Video Conferences with Minimal Control”.

Mode

Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > CSCF Policy Rules Configuration > Enforce Codec Policy Configuration

```
configure > context context_name > cscf policy { default | name policy_name } > service-policy-rules > enforce-codec-policy
```

-or-

```
configure > context context_name > cscf policy { default | name policy_name } > aor-policy-rules > aor aor_name > enforce-codec-policy
```

Entering the above command sequences results in the following prompt:

```
[context_name]host_name(config-policy-enforce-code)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
dynamic-codec

Creates a list of dynamic codecs supported by the system.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > CSCF Policy Rules Configuration > Enforce Codec Policy Configuration

configure > context context_name > cscf policy { default | name policy_name } > service-policy-rules > enforce-codec-policy

-or-

configure > context context_name > cscf policy { default | name policy_name } > aor-policy-rules > aor aor_name > enforce-codec-policy

Entering the above command sequences results in the following prompt:

[context_name]host_name(config-policy-enforce-code)#

Syntax

dynamic-codec { audio encoding_name | video encoding_name } [ clock_rate ] [ channels ]

default dynamic-codec

no dynamic-codec [ encoding_name ] [ clock_rate ] [ channels ]

default

Specifies that the default list of dynamic codecs is added to the allowed codecs list. Default dynamic codecs: H263 and AMR.

no

Specifies that all dynamic codecs are removed from the allowed codecs list. If an encoding_name is specified, then only the codec specified by the encoding_name is removed. Furthermore, if a supporting clock_rate and/or channels are specified, then only the encoding_name with the specified clock_rate and/or channels is removed.

audio encoding_name | video encoding_name

audio encoding_name: Specifies the encoding name of the dynamic audio codec added to the allowed codec list. encoding_name must be from 1 to 49 alpha and/or numeric characters.

video encoding_name: Specifies the encoding name of the dynamic video or audio-video codec added to the allowed codec list. encoding_name must be from 1 to 49 alpha and/or numeric characters.
[clock_rate] [channels]

clock_rate: Specifies the sampling rate of the codec. clock_rate must be an integer from 0 to 1000000.
channels: Specifies the number of channels required by the codec. channels must be an integer from 1 to 1000000.

Valid dynamic audio codecs:

<table>
<thead>
<tr>
<th>Encoding Name</th>
<th>Clock Rate (Hz)</th>
<th>Channels</th>
</tr>
</thead>
<tbody>
<tr>
<td>G726-40</td>
<td>8,000</td>
<td>1</td>
</tr>
<tr>
<td>G726-32</td>
<td>8,000</td>
<td>1</td>
</tr>
<tr>
<td>G726-24</td>
<td>8,000</td>
<td>1</td>
</tr>
<tr>
<td>G726-16</td>
<td>8,000</td>
<td>1</td>
</tr>
<tr>
<td>G729D</td>
<td>8,000</td>
<td>1</td>
</tr>
<tr>
<td>G729E</td>
<td>8,000</td>
<td>1</td>
</tr>
<tr>
<td>GSM-EFR</td>
<td>8,000</td>
<td>1</td>
</tr>
<tr>
<td>L8</td>
<td>Variable</td>
<td>Variable</td>
</tr>
<tr>
<td>RED</td>
<td>See RFC3551</td>
<td></td>
</tr>
<tr>
<td>VDVI</td>
<td>Variable</td>
<td>1</td>
</tr>
</tbody>
</table>

Valid dynamic video codecs:

<table>
<thead>
<tr>
<th>Encoding Name</th>
<th>Clock Rate (Hz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>H263-1998</td>
<td>90,000</td>
</tr>
</tbody>
</table>

Usage

Use this command to create a list of supported dynamic audio and video codecs in the system. When a request is received by the CSCF, the SDP fields in the message are checked to determine the codec being used. The codec in the SDP fields must match a codec in the allowed codec list or the CSCF rejects the request.

Example

The following command adds the GSM-EFR codec to the allowed dynamic codec list:

```
dynamic-codec GSM-EFR
```
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**

All

**Privilege**

**Syntax**

`exit`

**Usage**

Use this command to return to the parent configuration mode.
**static-codec**

Creates a list of static codecs supported by the system.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > CSCF Policy Rules Configuration > Enforce Codec Policy Configuration

```
configure > context context_name > cscf policy { default | name policy_name } > service-policy-rules > enforce-codec-policy
```

---

```
configure > context context_name > cscf policy { default | name policy_name } > aor-policy-rules > aor aor_name > enforce-codec-policy
```

Entering the above command sequences results in the following prompt:

```
[context_name]host_name(config-policy-enforce-code)#
```

**Syntax**

```
static-codec { audio payload_type | video payload_type }

default static-codec

no static-codec [ payload_type ]
```

---

**default**

Specifies that the default list of static codecs is added to the allowed codecs list. The default static codec is 5: DVI4.

---

**no**

Specifies that all static codecs are removed from the allowed codecs list. If a `payload_type` is specified, then only the codec specified by the `payload_type` is removed.

---

**audio payload_type | video payload_type**

**audio payload_type:** Specifies the audio codec added to the allowed codecs list. `payload_type` must be an integer from 0 to 95. Default value is 5.

**Valid static audio codecs:**

<table>
<thead>
<tr>
<th>Audio Codec</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>0: PCMU</td>
<td>7: LPC</td>
</tr>
<tr>
<td>1: reserved</td>
<td>8: PCMA</td>
</tr>
<tr>
<td>2: reserved</td>
<td>9: G722</td>
</tr>
<tr>
<td>14: MPA</td>
<td>15: G728</td>
</tr>
<tr>
<td>21: unassigned</td>
<td>16: DVI4</td>
</tr>
<tr>
<td>22: unassigned</td>
<td>23: unassigned</td>
</tr>
</tbody>
</table>
**CSCF Enforce Codec Policy Configuration Mode Commands**

<table>
<thead>
<tr>
<th>video payload_type:</th>
<th>Specifies the video or audio-video codec added to the allowed codecs list. payload_type must be an integer from 0 to 95. Default value is 5.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Valid static video codecs:</th>
</tr>
</thead>
<tbody>
<tr>
<td>24: unassigned</td>
</tr>
<tr>
<td>25: CelB</td>
</tr>
<tr>
<td>26: JPEG</td>
</tr>
<tr>
<td>27: unassigned</td>
</tr>
</tbody>
</table>

**Usage**

Use this commands to create a list of supported static audio and video codecs in the system. When a request is received by the CSCF, the SDP fields in the message are checked to determine the codec being used. The codec in the SDP fields must match a codec in the allowed codec list or the CSCF rejects the request.

**Example**

The following command adds the G729 audio codec to the allowed codecs list:

```
static-codec 18
```
Chapter 81
CSCF IFC SPT Group Mode Commands

The CSCF iFC SPT Group Configuration Mode is used to associate individual SPT conditions with an Initial Filter Criteria (iFC) Service Point Trigger (SPT) group.

Mode

Exec > Global Configuration > Context Configuration > CSCF IFC SPT Group Configuration

configure > context context_name > cscf ifc-spt-group id group_id

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-ifc-spt-group)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**

```
[context_name]host_name(config-cscf-ifc-spt-group)#
```

Syntax

```
[ no ] spt-condition id cond_id
```

- **no**
  
  Removes the specified CSCF iFC SPT condition from the iFC SPT group.

- **spt-condition id cond_id**
  
  Specifies the name of an existing iFC SPT condition.
  `cond_name` must be an integer from 1 to 200.

Usage

Use this command to associate individual SPT conditions with an iFC SPT group.

**Important:** An iFC SPT group may be associated with multiple SPT conditions.

Example

The following command assigns 2 to an iFC SPT group:

```
spt-condition id 2
```
Chapter 82
CSCF IFC Trigger Point Mode Commands

The CSCF iFC Trigger Point Configuration Mode is used to associate an Initial Filter Criteria (iFC) Service Point Trigger (SPT) group with an iFC trigger point.

Mode

Exec > Global Configuration > Context Configuration > CSCF IFC Trigger Point Configuration

configure > context context_name > cscf ifc-trigger-point id trigger_point_id condition-
type { cnf | dnf }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-ifc-trigger-point)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

**Syntax**
exit

**Usage**
Use this command to return to the parent configuration mode.
spt-group

Assigns an existing iFC SPT group to an iFC trigger point.

Product
SCM (S-CSCF, SIP Proxy)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF IFC Trigger Point Configuration

configure > context context_name > cscf ifc-trigger-point id trigger_point_id condition-type { cnf | dnf }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-ifc-trigger-point)#

Syntax

[ no ] spt-group id group_id

---

no

Removes the specified CSCF iFC SPT group from the iFC trigger point.

---

spt-group id group_id

Specifies the ID of an existing iFC SPT group.

group_id must be an integer from 1 to 200.

Important: An iFC SPT group can be assigned to more than one iFC trigger point.

Usage

Use this command to associate an iFC SPT group with an iFC trigger point.

Example

The following command assigns iFC SPT group 2 to an iFC trigger point:

spt-group id 2
Chapter 83
CSCF ISC Template Configuration Mode Commands

The CSCF ISC Template Configuration Mode is used to configure the IMS Service Control (ISC) interface within the system.

**Mode**

Exec > Global Configuration > Context Configuration > CSCF ISC Template Configuration

`configure > context context_name > cscf isc-template id template_id`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-isc-tmpl)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
CSCF ISC Template Configuration Mode Commands

CNSA

Core Network Service Authorization (CNSA) related commands used to create media profile and service ids.

Product

SCM (S-CSCF)

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > CSCF ISC Template Configuration

configure > context context_name > cscf isc-template id template_id

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-isc-tmpl)#

Syntax

cnsa { media-profile-id profile_id | service-id service_id [ service_id ]...[ service_id ] }

no cnsa { media-profile-id | service-id [ service_id ] [ service_id ]...[ service_id ] }

media-profile profile_id

Specifies the cnsa media profile id.

profile_id must be an integer from 0 to 10.

The media profile id is assigned to a service policy using the cnsa-media-profile command under CSCF Service configuration.

Important: You can only create one media profile id per ISC template.

service-id service_id

Specifies the cnsa service id(s). These ids represent URN parameters which are ICSI (IMS Communication Service Identifier) values that are mapped to a service profile through a media profile id.

service_id must be from 1 to 79 alpha and/or numeric characters.

no cnsa { media-profile-id | service-id [ service_id ] [ service_id ]... [ service_id ] }

Removes a media profile or service id(s).

Usage

Use this command to configure cnsa media profile ids and service ids. Information for core network authorization is received from HSS. It contains a list of service ids and a media profile id. Since the media profile id is an integer value, the S-CSCF needs to have a static database that contains the mapping between the integer value and the subscribed media profile. The media profile id is assigned to this service policy using the cnsa-media-profile command under CSCF Service configuration.
The S-CSCF selects the service profile based on the media profile id set and the policies, such as enforce-codec-policy and video-sessions, will be matched with the incoming request. Other policies, if configured, will be ignored in this scenario.

**Example**

The following command defines the media profile id as 2:

```
cnsa media-profile-id 2
```

The following command defines several service ids:

```
cnsa service-id xxx:exampletelephony.version1 xxx:abc.com
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**

All

**Privilege**

Security Administrator, Administrator

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Use this command to return to the parent configuration mode.
filter-criteria

Configure the filter criteria to be used by this template.

Product
SCM (S-CSCF)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF ISC Template Configuration

configure > context context_name > cscf isc-template id template_id

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-isc-tmpl)#

Syntax

[ no ] filter-criteria id criteria_id

no
Removes the specified filter criteria.

id criteria_id
Specifies the ID of existing filter criteria to be used by this template. The particular criteria applied to a subscriber will be based on the priority parameter.
criteria_id must be an integer from 1 to 200.

Important: Filter criteria can be assigned to more than one ISC template.

Usage

Use this command to configure the filter criteria to be used by this template.

Example

The following command identifies the filter criteria 1:

filter-criteria id 1
Chapter 84
CSCF Last Route Profile Criteria Configuration Mode Commands

The CSCF Last Route Profile Criteria Configuration Mode is used to configure county names and assign them Last Routing Option (LRO) numbers to be used by the CSCF last route profile. The S-CSCF forwards emergency call packets to the correct Public Safety Answering Point (PSAP) based on this criteria, which it receives from a peer server.

Mode

Exec > Global Configuration > Context Configuration > CSCF Last Route Profile Criteria Configuration

configure > context context_name > cscf last-route-profile name profile_name criteria { county-name | round-robin }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-criteria_type-lro-profile)#

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**county-name**

Configure county names and assign them Last Routing Option (LRO) numbers to be used by the CSCF last route profile.

**Product**
SCM (S-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Last Route Profile Criteria Configuration

```
configure > context context_name > cscf last-route-profile name profile_name criteria {
    county-name | round-robin }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-criteria_type-lro-profile)#
```

**Syntax**

```plaintext
county-name county_name lro-number value

[ no ] county-name county_name

county_name

Specifies the county name.

*county_name* must be from 1 to 79 alpha and/or numeric characters in length.

lro-number value

Specifies an existing LRO number.

*value* can be a maximum of ten digits in length.

no county-name county_name

Removes the specified county name.
```

**Usage**

Use this command to configure county names and assign them LRO numbers.

**Important:** You may configure up to 100 county names.

**Example**

The following command creates a county name called *norfolk* and assigns it an LRO number of 8884384357:

```
county-name norfolk lro-number 8884384357
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
exit

**Usage**
Use this command to return to the parent configuration mode.
Chapter 85
CSCF NPDB Client Configuration Mode Commands

The NPDB Client Configuration Mode is used to set various commands supporting the role of the NPDB (Number Portability Data Base) client. The NPDB client in a CSCF service performs query for called subscriber number on NPDB server, which returns the Routing Number for the query.

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration > NPDB Client Configuration

```
configure > context context_name > cscf service service_name > serving-cscf > npdb-client client_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-npdb-client)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
bind

Binds the NPDB client to an IP address.

Product
SCM (S-CSCF)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration > NPDB Client Configuration

configure > context context_name > cscf service service_name > serving-cscf > npdb-client

context_name

client_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-npdb-client)#

Syntax

bind address IPv4_address system-id system_id id client_id [ encrypted ] password

password

no bind

address IPv4_address

Specifies the NPDB client IP address to establish the TCP connection with NPDB server.

IPv4_address must be expressed in dotted decimal notation for IPv4.

system-id system_id

Specifies the identifier of the system performing query to NPDB server.

system_id must be an unsigned integer from 0 to 4294962295.

id client_id

Specifies the ID of the NPDB client.

client_id must be from 1 to 15 alpha and/or numeric characters.

[ encrypted ] password password

Specifies the password of the NPDB client and whether it is encrypted.

password password must be from 1 to 15 alpha and/or numeric characters.

encrypted password password must be from 1 to 132 alpha and/or numeric characters.

Important: Normally, encrypted passwords are only used inside configuration files.

no bind

Removes the binding of the NPDB client.
Usage

Use this command to establish the NPDB client parameters for TCP connection with NPDB server.

Important: This command can be entered multiple times to identify multiple IP addresses.

In connected state, only NPDB client will able to send query messages to get routing number from NPDB server. When query message is received in non-connected state from core, the NPDB client sends an error message to CSCF core.

Example

The following command binds the NPDB client to an IP address of 1.2.3.4, system ID of 4294, client ID of asdds, and encrypted password A01h4b5t5rojj205dhrete:

```
bind address 1.2.3.4 system-id 4294 id asdds encrypted password A01h4b5t5rojj205dhrete
```
end

Exits the current configuration mode and returns to the Exec mode.

npdb-primary-server

Configure the NPDB primary server.

Product
SCM (S-CSCF)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration > NPDB Client Configuration

configure > context context_name > scsf service service_name > serving-cscf > npdb-client client_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-npdb-client)#

Syntax

npdb-primary-server { address IPv4_address | domain domain } port port_number

no npdb-primary-server

address IPv4_address | domain domain
Specifies the NPDB primary server.
address IPv4_address: IP addresses must be expressed in dotted decimal notation for IPv4.
domain domain: Domain name must be entered using from 1 to 255 alpha and/or numeric characters.

port port_number
Specifies the port at which NPDB primary server listens.
port_number may be an integer from 1024 to 65534.

no
Removes the NPDB primary server.

Usage

Use this command to configure the NPDB primary server.

Example

The following command adds an NPDB primary server with an IP address of 1.2.3.4 and a port number of 3878:

npdb-primary-server address 1.2.3.4 port 3878
npdb-secondary-server

Configure the NPDB secondary server.

**Product**
SCM (S-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration > NPDB Client Configuration

```
configure > context context_name > cscf service service_name > serving-cscf > npdb-client
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-npdb-client)#
```

**Syntax**

```
npdb-secondary-server { address IPv4_address | domain domain } port port_number
```

**no npdb-secondary-server**

- **address IPv4_address | domain domain**
  Specifies the NPDB secondary server.
  - **address IPv4_address**: IP addresses must be expressed in dotted decimal notation for IPv4.
  - **domain domain**: Domain name must be entered using from 1 to 255 alpha and/or numeric characters.

- **port port_number**
  Specifies the port at which NPDB secondary server listens.
  - **port_number** may be an integer from 1024 to 65534.

- **no**
  Removes the NPDB secondary server.

**Usage**
Use this command to configure the NPDB secondary server.

**Example**
The following command adds an NPDB secondary server with an IP address of 1.2.3.5 and a port number of 3878:

```
npdb-secondary-server address 1.2.3.5 port 3878
```
timeout

Sets timeout values for NPDB client.

**Product**
SCM (S-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Serving-CSCF Configuration > NPDB Client Configuration

```
configure > context context_name > cscf service service_name > serving-csfc > npdb-client client_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-npdb-client)#
```

**Syntax**

```
timeout { bind-response sec | error-response sec | idle sec | ping sec | ping-response sec | query-response sec | release-response sec | tcp-retry sec }

[ default | no ] timeout { bind-response | error-response | idle | ping | ping-response | query-response | release-response | tcp-retry }
```

---

**bind-response sec**
Default: 30
This timer is used to specify the timeout for connection path creation in seconds.
*sec* must be an integer from 1 to 5000.

**error-response sec**
Default: 30
This timer is used to specify the timeout for error response in seconds.
*sec* must be an integer from 1 to 5000.

**idle sec**
Default: 30
This timer is used to specify the timeout interval for retrying failed NPDB BIND in seconds.
*sec* must be an integer from 1 to 5000.

**ping sec**
Default: 20
This timer is used to specify the timeout to send ping message to make the connection alive in seconds.
*sec* must be an integer from 1 to 5000.

**ping-response sec**
Default: 30
This timer is used to specify the timeout for ping response in seconds. 
\(sec\) must be an integer from 1 to 5000.

```
query-response \(sec\)
```
Default: 6
This timer is used to specify the timeout for query response in seconds. 
\(sec\) must be an integer from 1 to 5000.

```
release-response \(sec\)
```
Default: 30
This timer is used to specify the timeout for release response in seconds. 
\(sec\) must be an integer from 1 to 5000.

```
tcp-retry \(sec\)
```
Default: 15
This timer is used to specify the timeout interval for retrying failed TCP connection in seconds. 
\(sec\) must be an integer from 1 to 5000.

```
default
```
Returns the command to the default settings. See keywords above for specific defaults.

```
no
```
Deletes the value configured for the specified timer.

**Usage**

Use this command to configure timeout values for NPDB client. 
When CSCF service is started, NPDB client establishes TCP connections with NPDB primary and secondary 
servers (if configured) and sets the connection path by sending Bind message to server. If NPDB client fails 
to establish TCP connection to either of the servers, it will retry the connection every TCPRetryTimer 
interval until it is successful. When the connection is successful, NPDB client will go to the connected state 
and will start PingTimer. Whenever NPDB client receives service request from CSCF core, it sends the 
request based on the connected state of the server(s); it should always give higher preference to the primary 
server. When it fails to send a query message to server, NPDB client returns failure message to the core. If both 
servers are not in connected state, NPDB client will send failure message to CSCF core.

**Example**

The following command sets the release response timeout to 64 seconds:

```
timeout release-response 64
```
Chapter 86
CSCF PCRF-Policy-Control Configuration Mode
Commands

The PCRF-Policy-Control Configuration Mode is used to enable PCRF policy control within the service.

Mode

Exec > Global Configuration > Context Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > CSCF PCRF-Policy-Control Configuration

configure > context context_name > cscf service service_name > proxy-cscf > pcrf-policy-control

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcrf-policy-control)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
authorization inactive-media

Enables policy authorization for calls with inactive media.

Product
SCM (P-CSCF, A-BG)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > CSCF PCRF-Policy-Control Configuration

configure > context context_name > cscf service service_name > proxy-cscf > pcrf-policy-control

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcrf-policy-control)#

Syntax

[ default | no ] authorization inactive-media

default
Calls with all media lines in the inactive state are authorized via Rx.

no
Calls with all media lines in the inactive state will not be authorized via Rx.

Usage
Use this command to enable or disable policy authorization for calls with inactive media. The media will be considered inactive when all m lines in SDP are in inactive state.

Example

The following command enables policy authorization for calls with inactive media:

authorization inactive-media
authorization mediatype

Enables media authorization, using external PCRF via Rx, of specific media types (present in the SDP of a SIP message) only.

Product
SCM (P-CSCF, A-BG)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > CSCF PCRF-Policy-Control Configuration

configure > context context_name > csf service service_name > proxy-cscf > pcrf-policy-control

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcrf-policy-control)#

Syntax

[ no ] authorization mediatype { application | audio | control | data | message | others | text | video }

mediatype { application | audio | control | data | message | others | text | video }

Enables the external authorization of calls for the following SDP media types:

* application
* audio
* control
* data
* message
* others
* text
* video

Usage

As Per 3GPP 29.214V8.5, P-CSCF/A-BG will authorize VOIP calls only for the media types enabled via this command. The P-CSCF/A-BG sends all media information for all supported media types present in SDP in AAR message to PCRF via Rx. For the other (unsupported) media types, P-CSCF will not send media information in AAR.

Be default, media authorization for all the media types is enabled.

Example
Enables the P-CSCF to authorize calls for audio media types:

authorization mediatype audio

Disables the authorization of calls for audio media types:

no authorization mediatype audio
authorization policy-interworking-failure

Allows/rejects a session based on configuration in case of failure from PCRF.

Product
SCM (P-CSCF, A-BG)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > CSCF PCRF-Policy-Control Configuration

configure > context context_name > csf service service_name > proxy-cscf > pcrf-policy-control

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcrf-policy-control)#

Syntax

authorization policy-interworking-failure { session-continue | session-reject [ response-code code ] }

default authorization policy-interworking-failure

session-continue
P-CSCF continues session in case of failure from PCRF.

session-reject
P-CSCF rejects session in case of failure from PCRF.

response-code code
Specifies SIP response code for rejected session. number must be an integer from 400 to 699. Default is 500.

default
By default, session-reject is activated to reject session with default response code 500.

Usage

Use this command to configure for policy interworking failure. Allow or reject a session based on configuration in case of failure from PCRF.

Example

The following command rejects session in case of failure from PCRF with SIP response code 450:

    authorization policy-interworking-failure session-reject response-code 450
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege

exit

Usage
Use this command to return to the parent configuration mode.
signaling-bearer-loss

Enables subscription to Notification of Signaling Transmission Path Status, as well as IPCAN Change type notification. This command is enabled by default.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > CSCF PCRF-Policy-Control Configuration

configure > context context_name > csf service service_name > proxy-csfc > pcrf-policy-control

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-pcrf-policy-control)#

Syntax

[ no ] signaling-bearer-loss subscription

__no__

Disables subscription to Notification of Signaling Transmission Path Status, as well as IPCAN Change type notification.

__subscription__

Enables subscription to Notification of Signaling Transmission Path Status, as well as IPCAN Change type notification.

Usage

Use this command to enable or disable subscription to Notification of Signaling Transmission Path Status, as well as IPCAN Change type notification.

When enabled, the P-CSCF/A-BG sends AAR to the external PCRF via the Rx interface after UE registration. When disabled, the P-CSCF/A-BG will not subscribe to any event during Registration with PCRF and no diameter session will be established.

Example

Enables subscription to Notification of Signaling Transmission Path Status, as well as IPCAN Change type notification:

    signaling-bearer-loss subscription

Disables subscription to Notification of Signaling Transmission Path Status, as well as IPCAN Change type notification:

    no signaling-bearer-loss subscription
Chapter 87
CSCF Peer Servers Configuration Mode Commands

The CSCF Peer Servers Configuration Mode is used to configure peer servers (for next-hop session routes) within the system.

Mode

Exec > Global Configuration > Context Configuration > CSCF Peer Servers Configuration

`configure > context context_name > cscf peer-servers server_name type { bgcf | ibcf | icscf | mgcf | mrcf | pcscf | scscf | sip-as }

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-cscf-peer-servers-group)#`

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**
end

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

### Product

### Syntax
```
exit
```

### Usage
Use this command to return to the parent configuration mode.
**hunting-method**

Configures the method by which server is contacted.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Peer Servers Configuration

```
configure > context context_name > cscf peer-servers server_name type { bgcf | ibcf | icscf | mgcf | mrcf | pcscf | scscf | sip-as }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-peer-servers-group)#
```

**Syntax**

```
hunting-method { round-robin | sequence-on-failure | weighed }
```

```
default hunting-method
```

**Usage**

Use this command to configure the method that is used by the system to connect to the peer server.

**Example**

The following command sets the hunting method for a server to contact sequentially only when a server fails:

```
hunting-method sequence-on-failure
```
server

Configures the name, IP address, and port of servers belonging to this peer server and enters the Server Configuration Mode.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Peer Servers Configuration

```bash
configure > context context_name > cscf peer-servers server_name type { bgcf | ibcf | icscf | mgcf | mrcf | pcscf | scscf | sip-as }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-peer-servers-group)#
```

**Syntax**

```bash
server name { address ip_address | domain domain_name } [ port number ] [ transport { tcp | udp } ] [ weight number ]

no server name
```

no

Removes the specified server from the group.

name

Specifies a name for the server. `name` must be from 1 to 79 alpha and/or numeric characters in length.

address `ip_address`

Specifies the IP address of the server. `ip_address` is expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

domain `domain_name`

Specifies the domain name of the peer server. `domain_name` must be from 1 to 255 alpha and/or numeric characters in length.

port `number`

Specifies the port number of the server. `number` must be an integer value from 1 to 65535.

transport `{ tcp | udp }`

Specifies the transport type (TCP or UDP).
**Usage**

Use this command to configure servers and enter the Server Configuration Mode.
Entering this command results in the following prompt:

```
[context_name]hostname(config-server_name-peer-server)#
```

Server Configuration Mode commands are defined in the [CSCF Peer Server Monitoring Configuration Mode Commands](#) chapter.

**Example**

The following command configures a server named `scscf5` with an IP address of `1.2.3.4` and a port number of `5060`:

```
server scscf5 address 1.2.3.4 port 5060
```
Chapter 88
CSCF Peer Servers Group Configuration Mode Commands

The CSCF Peer Servers Group Configuration Mode is used to configure peer servers lists within a peer servers group.

Mode

Exec > Global Configuration > Context Configuration > CSCF Peer Servers Group Configuration
`configure > context context_name > cscf peer-servers-group group_name type sip-as`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-peer-servers-group)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
**peer-servers**

Configures peer servers lists in the peer servers group.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Peer Servers Group Configuration

```
configure > context context_name > csf peer-servers-group group_name type sip-as
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-csf-peer-servers-group)#
```

**Syntax**

```
peer-servers list_name { default | mode { active | standby } }
no peer-servers list_name
```

- `list_name`
  Specifies a name for the peer servers list. `list_name` must be from 1 to 79 alpha and/or numeric characters in length.

- `default`
  Specifies that the peer servers list is default.

- `mode { active | standby }`
  Specifies whether the peer servers list is active or standby.

```
no peer-servers list_name
```

Removes the specified peer servers list from the group.

**Usage**

Use this command to manage peer servers lists in a peer servers group.

**Important:** There can be one active, one standby, and one default peer servers list in a peer servers group.

**Example**

The following command configures an active peer servers list named `active_as_list`:

```
peer-servers active_as_list mode active
```
Chapter 89
CSCF Peer Server Monitoring Configuration Mode

Commands

The CSCF Peer Server Monitoring Configuration Mode is used to configure an individual peer server’s monitoring parameters and operational mode. It also associates a network session template with the server.

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Peer Servers Configuration > Server Configuration

```
configure > context context_name > cscf peer-servers server_name type { bgcf | ibcf | icscf | mgcf | mrcf | pcscf | scscf | sip-as } > server server_name { address ip_address | domain domain_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-server_name-peer-server)#
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
**dummy-as**

Sets a response code for Dummy-AS peer server.

**Product**
SCM (S-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Peer Servers Configuration > Server Configuration

```
configure > context context_name > cscf peer-servers server_name type { bgcf | ibcf | icscf | mgcf | mrcf | pcscf | scscf | sip-as } > server server_name { address ip_address | domain domain_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-server_name-peer-server)#
```

**Syntax**

```
dummy-as custom-response-code SIP_response_code

default dummy-as custom-response-code
```

<table>
<thead>
<tr>
<th>custom-response-code</th>
<th>SIP_response_code</th>
</tr>
</thead>
<tbody>
<tr>
<td>If the peer server is configured as dummy-as and it is chosen as per routing table configured, a UMM response message will be formed with the response code configured and sent as reply to incoming MESSAGE/PUBLISH requests.</td>
<td></td>
</tr>
<tr>
<td>SIP_response_code must be an integer from 200 to 699.</td>
<td></td>
</tr>
</tbody>
</table>

**Important:** The response code can be 2xx/4xx/5xx/6xx; 3xx, 401, and 407 are not allowed.

```
default dummy-as custom-response-code
```

Sets the response code to 200.

**Usage**

Use this command to configure a response code for Dummy-AS. If this mode is selected, then MESSAGE/PUBLISH requests will be responded to by S-CSCF with configured response code.

**Example**

The following command configures AS as Dummy-AS with a corresponding response code of 425:

```
dummy-as custom-response-code 425
```
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Use this command to return to the parent configuration mode.
**ims-capable**

Indicates whether the peer server belongs to a 3GPP/IMS network or a non-IMS network such as the Internet. This command is used to determine at the S-CSCF whether SIP signaling inter-working is needed when the calls are forwarded to external networks.

**Product**
SCM (S-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Peer Servers Configuration > Server Configuration

```
configure > context context_name > cscf peer-servers server_name type { bgcf | ibcf | icscf | mgcf | mrcf | pcscf | scscf | sip-as } > server server_name { address ip_address | domain domain_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-server_name-peer-server)#
```

**Syntax**

```
[ no ] ims-capable
```

- **no**

  Removes the identification of “IMS capable” from the selected peer server.

**Usage**

Use this command to identify a peer server as IMS capable allowing the S-CSCF to use SIP signalling inter-working when forwarding calls to non-IMS capable networks.
Iro-selection-profile

Binds a CSCF last route profile with the peer server.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Peer Servers Configuration > Server Configuration

```bash
configure > context context_name > cscf peer-servers server_name type { bgcf | ibcf | icscf | mgcf | mrcf | pcscf | scscf | sip-as } > server server_name { address ip_address | domain domain_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-server_name-peer-server)#
```

**Syntax**

```bash
lro-selection-profile name profile_name

no lro-selection-profile
```

**profile_name** must be an existing CSCF last route profile and be from 1 to 79 alpha and/or numeric characters.

**Usage**
Use this command to identify a CSCF last route profile to use for finding the correct Public Safety Answering Point (PSAP) during emergency calls.

**Example**
The following command assigns a CSCF last route profile named lro1 to the peer server group:

```bash
lro-selection-profile name lro1
```

The following command removes a CSCF last route profile from the peer server group:

```bash
no lro-selection-profile
```
mode

Sets the peer server mode to either active or standby. By default, peer servers are in active mode.

**Product:** SCM

**Privilege:** Administrator

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Peer Servers Configuration > Server Configuration

```plaintext
configure > context context_name > cscf peer-servers server_name type { bgcf | ibcf | icsf | mgcf | mrcf | pcscf | scscf | sip-as } > server server_name { address ip_address | domain domain_name }
```

Entering the above command sequence results in the following prompt:

```plaintext
[context_name]host_name(config-server_name-peer-server)#
```

**Syntax**

```plaintext
mode { active | standby }
```

- **active**
  
  Defines the mode of the CSCF peer server as active.

- **standby**
  
  Defines the mode of the CSCF peer server as standby.

**Usage**

Use this command to set the peer server mode to either active or standby.

**Example**

The following command sets the peer server’s mode to standby:

```plaintext
mode standby
```
monitor-status

Sets parameters for monitoring the status of peer servers.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Peer Servers Configuration > Server Configuration

```
configure > context context_name > cscf peer-servers server_name type { bgcf | ibcf | icscf | mgcf | mrcf | pcscf | scscf | sip-as } > server server_name { address ip_address | domain domain_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-server_name-peer-server)#
```

**Syntax**

```
```

```
no monitor-status { monitor | response-code { negative | positive } | [ SIP_response_code ] }
```

---

**max-response-codes negative max**

Default: 1
Specifies the maximum number of negative response codes to receive to mark server unavailable.

*max* must be an integer from 1 to 10.

**monitor-interval seconds**

Default: 30
Specifies the interval that peer server monitoring will occur.

*seconds* must be an integer from 1 to 65535.

**monitor-message options [ max-forwards max | response-timer seconds ]**

Specifies that SIP message (OPTIONS) are to be sent periodically after each monitoring interval.

*max-forwards max*: Max-forwards in number of hops. *max* must be an integer from 0 to 70.

*response-timer seconds*: Response wait timer in seconds. *seconds* must be an integer from 1 to 65535.

**monitor-response-timer seconds**

Default: 180
Specifies the interval that the CSCF will wait for responses from the peer server.

*seconds* must be an integer from 1 to 65535.
response-code { positive SIP_response_code | negative SIP_response_code }

Specifies the Options Message response codes.

- **negative**: Negative response codes. `SIP_response_code` must be an integer from 300 to 699.
- **positive**: Positive response codes. `SIP_response_code` must be an integer from 200 to 299.

**timer mark-out-of-service seconds**

Default: 864000

Timer to mark server out-of-service from unavailable state.

- `seconds` must be an integer from 0 to 2147483646.

**timer unavailable-monitor-interval seconds**

Periodic monitor interval to be used when server is marked as unavailable.

- `seconds` must be an integer from 0 to 2147483646.

**timer unavailable-notification seconds**

Default: 180

Time after which to send notification to operations administrator.

- `seconds` must be an integer from 0 to 2147483646.

**no monitor-status { monitor | response-code [ negative | positive ] [ SIP_response_code ] }**

Disables peering server status monitoring.

### Usage

Use this command to set parameters for monitoring the status of a peer server.

### Example

The following command sets the monitoring interval to three minutes (180 seconds) and the response timer to six minutes (360 seconds):

```
monitor-status monitor-interval 180 monitor-response-timer 360
```
nw-session-template

Specifies a session template for sessions terminating from the peer server group.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Peer Servers Configuration > Server Configuration

```
configure > context context_name > cscf peer-servers server_name type { bgcf | ibcf | icscf | mgcf | mrcf | pcscf | scscf | sip-as } > server server_name { address ip_address | domain domain_name }
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-server_name-peer-server)#
```

Syntax

```
nw-session-template name template_name
no nw-session-template
```

**name template_name**

*template_name* must be an existing session template created in the Session Template Configuration Mode.

**no**

Removes session template from the peer server group.

Usage

Use this command to identify a session template to use for sessions terminating from the peer server group.

Example

The following command identifies a session template named *template-25* to use for sessions terminating from the peer server group:

```
nw-session-template template-25
```
registration

This command specifies whether the S-CSCF skips third party registration to the Application Server (AS) by a configured time after initial registration.

Product
SCM (S-CSCF)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Peer Servers Configuration > Server Configuration

configure > context context_name > cscf peer-servers server_name type { bgcf | ibcf | icscf | mgcf | mrcf | pcscf | scscf | sip-as } > server server_name { address ip_address | domain domain_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-server_name-peer-server)#

Syntax

registration skip-count count

no registration skip-count

skip-count count

Number of times to skip third party registration.

count must be an integer from 0 (default) to 60.

no registration skip-count

The S-CSCF does not skip third party registration to the AS by a configured time after initial registration.

Usage

Use this command to specify whether the S-CSCF skips third party registration to the Application Server (AS) by a configured time after initial registration. After skipping the configured number of times, the third party register should be sent again to AS to reduce overload on AS.

Example

The following command sets the number of times to skip third party registration to 25:

registration skip-count 25
tps-rate

Controls the rate of messages based on Transactions Per Second (TPS) from S-CSCF towards the peer server application server (AS).

Product
SCM (S-CSCF)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Peer Servers Configuration > Server Configuration

configure > context context_name > cscf peer-servers server_name type { bgcf | ibcf | icscf | mgcf | mrpf | pcsf | scsrf | sip-as } > server server_name { address ip_address | domain domain_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-server_name-peer-server)#

Syntax

tps-rate rate [ exclude Register ]

no tps-rate

rate

TPS from S-CSCF towards the peer server AS.

r
rate must be an integer from 1 to 1000.

exclude Register

Specifies that for Register method, TPS rate need not be applied.

no

TPS rate not applied from S-CSCF towards the peer server AS.

Usage

Use this command to control the TPS towards the peer server AS. If TPS rate is exceeded, the incoming requests will be rejected with 500 error response; Retry-After Header specifies the number of seconds before UE should retry.

Example

The following command sets the TPS rate towards the AS to 25:

tps-rate 25
Chapter 90  
CSCF Policy Configuration Mode Commands

The CSCF Policy Configuration Mode is used to manage AoR policy profiles within the system. User-defined profiles can be managed in this mode.

Mode

Exec > Global Configuration > Context Configuration > CSCF Policy Configuration

configure > context context_name > cscf policy name policy_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-aor-policy)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
aor-policy-rules

Specifies that the newly created policy is an AoR policy and enters the AoR Policy Rules Configuration Mode.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Policy Configuration

configure > context context_name > cscf policy name policy_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-aor-policy)#

Syntax

aor-policy-rules

Usage

Use this command to create an AoR policy group and enter the AoR Policy Rules Configuration Mode. Entering this command results in the following prompt:

[context_name]host_name(config-aor-policy)#

AoR Policy Configuration Mode commands are defined in the *CSCF AoR Policy Rules Configuration Mode Commands* chapter.
end

Exits the current configuration mode and returns to the Exec mode.

**Product**

service-policy-rules

Usage
Use this command to create a service policy group and enter the CSCF Policy Rules Configuration Mode. Entering this command results in the following prompt:

[context_name]host_name(config-service-policy)#

Service Policy Rule Configuration Mode commands are defined in the CSCF Policy Rules Configuration Mode Commands chapter.
Chapter 91
CSCF Policy Rules Configuration Mode Commands

The CSCF Policy Rules Configuration Mode is used to manage CSCF AoR and service policy profiles within the system.

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > CSCF Policy Rules Configuration

```
configure > context context_name > cscf policy { default | name policy_name } > service-policy-rules
```

—or—

Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > AoR Policy Configuration > CSCF Policy Rules Configuration

```
configure > context context_name > cscf policy { default | name policy_name } > aor-policy-rules > aor aor_name
```

Entering the above command sequences results in the following prompt:

```
[context_name]host_name(config-policy_name-aor)>
```

**Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
allow-noauth

Configures the policy to allow unauthenticated access. Default is disabled.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > CSCF Policy Rules Configuration

```bash
configure > context context_name > cscf policy { default | name policy_name } > service-policy-rules
```

--or--

Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > AoR Policy Configuration > CSCF Policy Rules Configuration

```bash
configure > context context_name > cscf policy { default | name policy_name } > aor-policy-rules > aor aor_name
```

Entering the above command sequences results in the following prompt:

```
[context_name]host_name(config-policy_name-aor)#
```

**Syntax**

```
[ default | no ] allow-noauth
```

---

**Usage**

Use this command to allow access to subscribers without authenticating them.
allow-unsecure

Configures the policy to allow access to the system without a security association. Default is disabled.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > CSCF Policy Rules Configuration

configure > context context_name > cscf policy { default | name policy_name } > service-policy-rules

```text
configure > context context_name > csf policy { default | name policy_name } > aor-policy-rules > aor aor_name
```

Entering the above command sequences results in the following prompt:

```
[context_name]host_name(config-policy_name-aor)#
```

**Syntax**

```
[ default | no ] enforce-codec-policy
```

**Usage**

Use this command to enter the Enforce Codec Policy Configuration Mode. Entering this command results in the following prompt:

```
[context_name]hostname(config-policy-enforce-codec)#
```

CSCF Enforce Codec Policy Mode commands are defined in the *Enforce Codec Policy Configuration Mode Commands* chapter in this guide.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
**max-cscf-concurrent-sessions**

Configures the maximum number of concurrent sessions allowed per subscriber.

**Product**

SCM

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > CSCF Policy Rules Configuration

configure > context context_name > cscf policy { default | name policy_name } > service-policy/rules

-or-

Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > AoR Policy Configuration > CSCF Policy Rules Configuration

configure > context context_name > cscf policy { default | name policy_name } > aor-policy/rules > aor aor_name

Entering the above command sequences results in the following prompt:

[context_name]host_name(config-policy_name-aor)#

**Syntax**

```
max-cscf-concurrent-sessions number

default max-cscf-concurrent-sessions
```

**number**

Default: 5
Specifies the number of concurrent sessions allowed per subscriber for this policy. `number` must be an integer from 1 to 100.

**default**

Resets defaults for this command.

**Usage**

Use this command to set the maximum number of allowed sessions per subscriber for this policy. If enabled, the `subscriber-policy-override` command in the CSCF Service Configuration Mode overrides the service-level policy.

**Example**

The following command sets the maximum number of concurrent sessions for a subscriber using this policy to 7:

```
max-cscf-concurrent-sessions 7
```
**policy**

Configures the overload response for this policy. When the P-CSCF/A-BG becomes congested, this overload policy is used to reject subsequent sessions or redirect them to another server.

**Product**

SCM (P-CSCF, A-BG)

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > CSCF Policy Rules Configuration

```
configure > context context_name > cscf policy { default | name policy_name } > service-policy-rules
```

-or-

Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > AoR Policy Configuration > CSCF Policy Rules Configuration

```
configure > context context_name > cscf policy { default | name policy_name } > aor-policy-rules > aor aor_name
```

Entering the above command sequences results in the following prompt:

```
[context_name]host_name(config-policy_name-aor)#
```

**Syntax**

```plaintext
policy overload { redirect address1 [ weight weight1 ] [ address2 [ weight weight2 ] ] ...
 ... | reject [ use-reject-code { admin-prohibited | insufficient-resources } ] }

default policy overload

no policy overload redirect address1[address2] ...
```

- **redirect address1 [ weight weight1 ] [ address2 [ weight weight2 ] ] ...**
  
  Specifies that upon policy overload, the system will redirect the session to another CSCF.
  
  address1 must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
  
  weight weight1: Defines the priority of the redirect address.
  
  weight1 must be an integer from 1 to 10. Default is 1.

- **reject [ use-reject-code { admin-prohibited | insufficient-resources } ]**
  
  Specifies that upon policy overload, the system will reject the session. This is the default setting.

  use-reject-code: Specifies that a reject code will be returned upon policy overload.
  
  • **admin-prohibited**: Specifies that the “admin-prohibited” reject code will be returned upon policy overload.
  
  • **insufficient-resources**: Specifies that the “insufficient resources” reject code will be returned upon policy overload. This is the default reject code.
**default policy overload**

Resets defaults for this command.

**no policy overload redirect address1 [ address2 ] ...**

Removes configured policy overload redirect address(es).

---

**Usage**

Use this command to define the response to an overload condition on the P-CSCF/A-BG using this AoR policy.

**Example**

The following command configures the policy overload response to redirect to a series of CSCFs with IP address of 1.2.3.4, 1.2.3.5, and 1.2.3.6 with respective priorities (weights) of 1, 3, and 2:

```
policy overload redirect 1.2.3.4 weight 1 1.2.3.5 weight 3 1.2.3.6 weight 2
```
qos

Configures QoS bandwidth settings for uplink and downlink specific to media types.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > CSCF Policy Rules Configuration
configure > context context_name > csf policy { default | name policy_name } > service-policy-rules

Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > AoR Policy Configuration > CSCF Rules Configuration
configure > context context_name > csf policy { default | name policy_name } > aor-policy-rules > aor aor_name

Entering the above command sequences results in the following prompt:

[context_name] host_name(config-policy_name-aor)#

Syntax

```
qos bandwidth { media-type { audio | other | video } | { downlink | uplink } } [ peak value ]
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bandwidth { downlink</td>
<td>uplink }</td>
</tr>
<tr>
<td>downlink: Configures the downlink bandwidth.</td>
<td>uplink: Configures the uplink bandwidth.</td>
</tr>
<tr>
<td>peak value</td>
<td>Peak value of bandwidth in kilobits per second (kbit/s).  value must be an integer from 1 to 99999999.</td>
</tr>
</tbody>
</table>

| media-type { audio | other | video } |
|-------------------------------------------------|
| Configures QoS bandwidth for media types.       |
| • audio: QoS bandwidth for audio media-type.     |
| • other: QoS bandwidth for media-types other than audio and video. |
| • video: QoS bandwidth for video media-type.     |

Usage

The P-CSCF/A-BG fills the required bandwidth for downlink and uplink from the Session Description Protocol (SDP) in the message when communicating with an external policy server via Rx/Tx/Gq. Use this
command to configure the peak uplink and downlink bandwidth to be used when the SDP does not contain bandwidth. Bandwidth configuration can now be specified per media type.

**Example**

Set the media type to **audio** and peak uplink bandwidth to **256 kbit/s**:

```
qos bandwidth media-type audio uplink peak 256
```
signalling-bearer-loss

This command enables or disables signalling bearer loss.

Product

SCM

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > CSCF Policy Rules Configuration

```bash
configure > context context_name > cscf policy { default | name policy_name } > service-policy-rules
```

--or--

Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > AoR Policy Configuration > CSCF Policy Rules Configuration

```bash
configure > context context_name > cscf policy { default | name policy_name } > aor-policy-rules > aor aor_name
```

Entering the above command sequences results in the following prompt:

```
[context_name]host_name(config-policy_name-aor)#
```

Syntax

```bash
[ no ] signalling-bearer-loss de-register
```

**no**

Disables signalling bearer loss for this policy.

Usage

Use this command to trigger De-register request from P-CSCF to S-CSCF, and clear the entry of subscriber. When P-CSCF gets ASR for Signalling Bearer, it sends ASA response and triggers STR for same session ID.
**video-sessions**

Configures the policy to allow video bearers. Default is disabled.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > CSCF Policy Rules Configuration

```bash
configure > context context_name > cscf policy { default | name policy_name } > service-policy-rules

Exec > Global Configuration > Context Configuration > CSCF Policy Configuration > AoR Policy Configuration > CSCF Policy Rules Configuration

```bash
configure > context context_name > cscf policy { default | name policy_name } > aor-policy-rules > aor aor_name
```

Entering the above command sequences results in the following prompt:

```bash
[context_name]host_name(config-policy_name-aor)#
```

**Syntax**

```
[ default | no ] video-sessions
```

- **default | no**
  - Disables the “allow video sessions” feature.

**Usage**

Use this command to allow video session via this policy.
Chapter 92
CSCF Prefix Table Configuration Mode Commands

The CSCF prefix table is used to configure for each number (or number prefix) whether it is ported and the SIP routing domain. Only one CSCF prefix table can be configured per context.

Mode

Exec > Global Configuration > Context Configuration > CSCF Prefix Table Configuration

configure > context context_name > cscf prefix-table

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-prefix-table)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
end

Exits the current configuration mode and returns to the Exec mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax
end

Usage
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

Product
All

Privilege
Security Administrator, Administrator

Syntax

exit

Usage
Use this command to return to the parent configuration mode.
**number**

Determines for each number (or number prefix) in a prefix table whether it is ported and the SIP routing domain.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Prefix Table Configuration

```
configure > context context_name > cscf prefix-table
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-prefix-table)#
```

**Syntax**

```
number number [ ported ] [ routing-domain domain_name ]

no number number
```

Specifies number or number prefix. `number` must be a string of digits from 1 to 31 and/or special character “$.”

**Important:** If the number is a prefix, it should end with “$.”

- **ported**
  The number (or number prefix) is in ported range and NPDB (Number Portability Data Base) has to be contacted.

- **routing-domain domain**
  Specifies the SIP routing domain for this number (or number prefix). `domain_name` must be from 1 to 79 alpha and/or numeric characters in length.

```
no number number
```

Removes the specified number or number prefix from the prefix table.

**Usage**

Use this command to determine whether each number (or number prefix) in a prefix table is ported and the SIP routing domain. The S-CSCF service will use the prefix table configured in its source context for the lookup.

**Example**

The following command specifies a ported number prefix named `821057$` with SIP routing domain `cisco.com`:
number 821057$ ported routing-domain cisco.com
Chapter 93
CSCF Proxy-CSCF Configuration Mode Commands

The Proxy-CSCF Configuration Mode is used to enable Diameter policy control within the service.

Mode

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration

configure > context context_name > csf service service_name > proxy-csf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-proxy-cscf)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
allow rfc3261-ua-interworking

Enables the function to allow IMS interworking with RFC3261 SIP User Agents.

**Product**
SCM (P-CSCF, A-BG)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration

```bash
configure > context context_name > cscf service service_name > proxy-cscf
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-proxy-cscf)#
```

**Syntax**

```
[ no ] allow rfc3261-ua-interworking
```

- `no`
  Disables the interworking capability.

**Usage**

Use this command to enable the P-CSCF/A-BG to allow IMS interworking with RFC3261 SIP User Agents.
atcf-atgw

This command enables ATCF functionality for the P-CSCF.

**Product**
SCM (P-CSCF, A-BG)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration

```
configure > context context_name > cscf service service_name > proxy-cscf
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-proxy-cscf)#
```

**Syntax**

```
[ no ] atcf-atgw
```

- **no**
  Disables ATCF support for P-CSCF.

**Usage**

Use this command to enable or disable ATCF functionality for the P-CSCF. This command is disabled by default.

On entering this command, the CLI prompt changes to:

```
[context_name]hostname(config-cscf-atcf-atgw)#
```

Refer to the *CSCF ATCF-ATGW Configuration Mode Commands* chapter for additional information.
core-reg-expiry-time

Configures Registration Expiry Timer Handling in P-CSCF/A-BG to keep pin holes open in B2BUA mode.

**Product**
SCM (P-CSCF, A-BG)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration

`configure > context context_name > cscf service service_name > proxy-cscf`

Entering the above command sequence results in the following prompt:

```
[context_name]# host_name(config-cscf-service-proxy-cscf)#
```

**Syntax**

```
core-reg-expiry-time sec
```

[ default | no ] core-reg-expiry-time

- **default**
  Sets the core-reg-expiry-time to 3600 seconds.

- **no**
  Disables the timer.

- **sec**
  Expiry age should be less than or equal to the maximum in seconds. Must be an integer from 300 to 86400.

**Usage**

Use this command to configure Registration Expiry Timer Handling in P-CSCF/A-BG to keep pin holes open in B2BUA mode.

**Example**

The following sets the core-reg-expiry-time to \(4000\) seconds:

```
core-reg-expiry-time 4000
```
diameter

This command:
- configures the Diameter dictionary used in this function.
- enables the selection of a Diameter host-select-template for PCRF server selection.
- configures the policy control origin endpoint used in this function.
- enables the selection of a Diameter policy control peer server providing Rx/Tx/Gq applications for this service.
- configures the Diameter requested timeout value used in this function.

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration

configure > context context_name > cscf service service_name > proxy-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-proxy-cscf)#

Syntax

diameter location-info { dictionary { e2custom01 | e2custom02 | e2custom03 | e2custom04 | e2custom05 | e2custom06 | e2custom07 | e2custom08 | e2custom09 | e2standard } | origin endpoint endpoint_name | peer-select peer peer_name [ peer-realm realm_name ] [ secondary-peer peer_name [ sec-peer-realm realm_name ] ] | request-timeout sec }

In StarOS v12.0 and earlier:

diameter policy-control { dictionary { Gq-custom | Gq-standard | Rq-custom | Rx-rel8 | Rx-standard | Tx-standard | custom01 | custom02 | custom03 | custom04 | custom05 | custom06 | custom07 | custom08 | custom09 } | origin endpoint endpoint_name | peer-select peer peer_name [ peer-realm realm_name ] [ secondary-peer peer_name [ sec-peer-realm realm_name ] ] | request-timeout sec }

In StarOS v12.2 and later:

diameter policy-control { dictionary { dynamic-load | gq-custom | gq-standard | rq-custom | rx-custom01 | rx-custom02 | rx-custom03 | rx-custom04 | rx-custom05 | rx-rel8 | rx-standard | tx-standard } | host-select-template name template_name | origin endpoint endpoint_name | peer-select peer peer_name [ peer-realm realm_name ] [ secondary-peer peer_name [ sec-peer-realm realm_name ] ] | request-timeout sec }

default diameter { location-info | policy-control } { dictionary | request-timeout }

no diameter { location-info | policy-control } { host-select-template | origin endpoint | peer-select ]
diameter

CSCF Proxy-CSCF Configuration Mode Commands

default
Sets the Diameter’s location-info or policy control dictionary or requested timeout value as the default.

no
Removes the Diameter location-info or policy control origin endpoint or Diameter peer from the service.

location-info
Defines the E2 interface for location information.

dictionary { e2custom01...e2custom09 | e2standard }
custom01...custom09: Specifies that a customer-specific (custom) dictionary is to be used for expansion and behaviors.
e2standard: Specifies that the E2-Standard-Dictionary is to be used.

Important: If this keyword is not configured, the system defaults to the default dictionary (e2standard). In the Proxy-CSCF configuration, at any time, the location-info dictionary can either be an explicitly configured dictionary or the default dictionary. Hence, there is no corresponding “no” CLI to disable the location-info dictionary setting.

policy-control
Defines external policy control.

dictionary { Gq-custom | Gq-standard | Rq-custom | Rx-rel8 | Rx-standard | Tx-standard | custom01...custom09 }
Gq-custom: Specifies that the Gq Operax dictionary is to be used for Operax-specific behavior.
Gq-standard: Specifies that the Gq standard dictionary is to be used.
Rq-custom: Specifies that the Rq custom dictionary is to be used.
Rx-rel8: Specifies that the Rx Release 8 dictionary is to be used.
Rx-standard: Specifies that the Rx standard dictionary is to be used.
Tx-standard: Specifies that the Tx standard dictionary is to be used.
custom01...custom09: Specifies that a customer-specific (custom) dictionary, for customer-specific expansion and behaviors, is to be used.

dictionary { dynamic-load | gq-custom | gq-standard | rq-custom | rx-custom01 | rx-custom02 | rx-custom03 | rx-custom04 | rx-custom05 | rx-rel8 | rx-standard | tx-standard }
dynamic-load: Configures the dynamically loaded Diameter dictionary. The dictionary name must be an alphanumerical string of 1 through 15 characters. For more information on dynamic loading of Diameter dictionaries, see the diameter dynamic-dictionary in the Global Configuration Mode Commands chapter of this guide.
gq-custom: Specifies that the Gq Operax dictionary is to be used for Operax-specific behavior.
gq-standard: Specifies that the Gq standard dictionary is to be used.
rq-custom: Specifies that the Rq custom dictionary is to be used.
rx-custom01...rx-custom05: Specifies that a customer-specific (custom) dictionary, for customer-specific expansion and behaviors, is to be used.
rx-rel8: Specifies that the Rx Release 8 dictionary is to be used.
rx-standard: Specifies that the Rx standard dictionary is to be used.
rx-standard: Specifies that the Tx standard dictionary is to be used.
**host-select-template name** template_name

Specifies the Diameter host-select-template. The host-select-template has a table of prefix and PCRF peers. When configured, PCRF server is selected using a lookup based on subscriber IMSI prefix from this table. **template_name** must be the template’s name and an alpha and/or numeric string of 1 through 63 characters in length.

**origin endpoint** endpoint_name

Specifies the Diameter location-info or policy control endpoint name. **endpoint_name** must be the endpoint’s name and an alpha and/or numeric string of 1 through 63 characters in length.

**peer-select peer** peer_name

Specifies the name of the Diameter location-info or policy control peer server. **peer_name** must be from 1 to 63 alpha and/or numeric characters in length. Diameter peer servers are configured through the **diameter endpoint** command in the Context Configuration Mode. The **diameter endpoint** command is a generic command and can be found in the Cisco ASR 5000 Series Command Line Interface Reference.

**peer-realm** realm_name

Specifies the realm name for which the Diameter location-info or policy control peer server has responsibility. **realm_name** must be from 1 to 63 alpha and/or numeric characters in length.

**secondary-peer** peer_name

Specifies the name of the secondary Diameter location-info or policy control peer server. **peer_name** must be from 1 to 63 alpha and/or numeric characters in length.

**sec-peer-realm** realm_name

Specifies the realm name for which the secondary Diameter location-info or policy control peer server has responsibility. **realm_name** must be from 1 to 63 alpha and/or numeric characters in length.

**Important:** If this keyword is not configured, the system defaults to the realm name configured for the selected peer server.

**Important:** The **diameter location-info peer-select peer <primary_peer> peer-realm <primary_peer_realm> secondary-peer <secondary_peer> sec-peer-realm <secondary_peer_realm>** CLI configures Peer Switching—selecting which peers the Diameter messages are routed to. When the secondary peer is configured, in case the primary fails, request messages are rerouted to the secondary. Note that the **no diameter location-info peer-select** CLI command will remove the entire Peer Switching CLI from the configuration.
**request-timeout** *sec*

Specifies the Diameter location-info or policy control requested timeout value in seconds.

*sec* must be an integer from 1 to 300.

Default: 10

**Important:** If this keyword is not configured, the system defaults to the default setting (10 seconds). In the Proxy-CSCF configuration, at any time, the request-timeout setting can either be an explicitly configured value or the default value. Hence, there is no corresponding “no” CLI to disable the request-timeout setting.

**Usage**

Use this command to:

- define the Diameter dictionary to use for the service.
- specify the Diameter origin endpoint.
- specify a Diameter location-info or policy control peer server to support Rx/Tx/Gq applications.
- specify the Diameter requested timeout value for this service.

**Example**

The following command configures the system to use the Tx standard Diameter dictionary for this service:

```
diameter policy-control dictionary Tx-standard
```

The following command sets the Diameter location-info origin endpoint to *test*:

```
diameter location-info origin endpoint test
```

The following command selects a Diameter policy control peer server with a name of *diam-2* and a realm name of *realm-6*:

```
diameter policy-control peer-select peer diam-2 peer-realm realm-6
```
emergency

Configures the function to allow or disallow the emergency-session or emergency-registration of a particular type.

Product
SCM (P-CSCF, A-BG, SIP Proxy)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration

configure > context context_name > cscf service service_name > proxy-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-proxy-cscf)#

Syntax

[ default | no ] emergency { registration [ visited-ue ] | session [ 3gpp-ims-xml-body | anonymous | non-emergency-registered | sdp-CS-media | visited-ue ] }

default
Specifies that the emergency-session or emergency-registration of a particular type can be allowed.

no
Disallows the emergency-session or emergency-registration of a particular type.

registration [ visited-ue ]
Allow emergency-registration. By default, it's allowed.

visited-ue: Allow emergency-registration from a visited UE. By default, it's allowed.

session [ 3gpp-ims-xml-body | anonymous | non-emergency-registered | sdp-CS-media | visited-ue ]
Specifies the type of emergency-session to be allowed or disallowed. By default, all are allowed.

3gpp-ims-xml-body: Allow 3GPP IM CN XML body to be added in 380 response messages.
anonymous: Allow anonymous subscribers (unregistered UEs) to initiate emergency sessions.
non-emergency-registered: Allow non-emergency registered subscribers to initiate emergency sessions.
sdp-CS-media: Allow emergency calls with SDP CS Media.
visited-ue: Allow emergency calls from visited UE.

Usage
Use this command to configure the function to allow or disallow the emergency-session or emergency-registration of a particular type.

Example
The following command configures the function to allow non-emergency registered subscribers to initiate emergency sessions:

emergency session non-emergency-registered
emergency-call-mode

Enables the P-CSCF/A-BG service to add “P-Emergency-Call-Mode-Preference” header in 200OK to REGISTER message. By default, this command is disabled.

Product
SCM (P-CSCF, A-BG)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration
configure > context context_name > cscf service service_name > proxy-cscf

Entering the above command sequence results in the following prompt:
[context_name]host_name(config-cscf-service-proxy-cscf)#

Syntax

emergency-call-mode { 3gpp-cs | 3gpp-ims }

[ default | no ] emergency-call-mode

default
Specifies 3GPP IMS access preference in header.

no
Disables “P-Emergency-Call-Mode-Preference” header insertion for the P-CSCF/A-BG service.

3gpp-cs | 3gpp-ims
3gpp-cs: Specifies 3GPP CS access preference in header.
3gpp-ims (default): Specifies 3GPP IMS access preference in header.

Usage
Enabling this command allows the P-CSCF or A-BG to add a “P-Emergency-Call-Mode-Preference” header in 200OK to REGISTER message.

Example
The following command enables “P-Emergency-Call-Mode-Preference” header insertion with a 3GPP CS access preference defined:

emergency-call-mode 3gpp-cs
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**
Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
exit
```

**Usage**

Use this command to return to the parent configuration mode.
interrogating-cscf-role

Enables the function to also perform as an Interrogating-CSCF.

**Product**
SCM (P-CSCF, A-BG)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration

```bash
configure > context context_name > cscf service service_name > proxy-cscf
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-proxy-cscf)#
```

**Syntax**

```
[ no ] interrogating-cscf-role
```

- **no**
  Disables the Interrogating-CSCF role in this function.

**Usage**

Use this command to enable the P-CSCF/A-BG to also perform as an Interrogating-CSCF.

**Important:** All Interrogating-CSCF functions have been moved to the Serving-CSCF exclusively in v10.0 and beyond.
message-max-size

Configures the maximum message body size in MESSAGE method.

Product
SCM (P-CSCF, A-BG)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration

```
configure > context  context_name > cscf service  service_name > proxy-cscf
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-proxy-cscf)#
```

Syntax

```
message-max-size  limit

[  default | no ] message-max-size
```

<table>
<thead>
<tr>
<th>default</th>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns/sets the maximum SIP message size to 1024 bytes.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 1024</td>
</tr>
<tr>
<td>Configures the maximum SIP message size limit in bytes for any SIP message buffer.</td>
</tr>
<tr>
<td>limit must be an integer from 512 to 65535.</td>
</tr>
</tbody>
</table>

**Important:** Message body size should be less than the max-sipmsg-size set in the CSCF Service Configuration Mode.

Usage

Use this command to configure the maximum SIP message size for any SIP message buffer.

Example

The following command limits the SIP message size to **4000** bytes:

```
message-max-size  4000
```
network-id

Configures the Network Identifier.

Product
SCM (P-CSCF, A-BG)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration

configure > context context_name > csf service service_name > proxy-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-proxy-cscf)#

Syntax

[ no ] network-id id

no

Removes the configured Network Identifier of the entity.

id

The Network Identifier of the entity.

id must be from 1 to 79 alpha and/or numeric characters in length.

Usage

The Network Identifier is used by the P-CSCF or A-BG to fill the P-Visited-Network-ID header.

Example

Sets the Network Identifier to pcscf01.company.com:

    network-id pcscf01.company.com
pcrf-policy-control

Enables enables external policy control via PCRF through the Rx Diameter interface and enters the PCRF-Policy-Control Configuration Mode. Default is disabled.

**Product**

SCM (P-CSCF, A-BG)

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration

```
configure > context context_name > cscf service service_name > proxy-cscf
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-proxy-cscf)#
```

**Syntax**

```
[ no ] pcrf-policy-control
```

```
no
```

Disables external policy control via PCRF for this service. P-CSCF/A-BG will not establish any Diameter session with PCRF, even though the PCRF is configured. This option disables both authorization and subscription to PCRF during Registration and VOIP call.

**Usage**

Use this command to enable PCRF policy control and enter the PCRF-Policy-Control Configuration Mode. It enables authorization and subscription to PCRF during Registration and VOIP calls. If the P-CSCF cannot connect to the PCRF server (due to wrong configuration in CSCF or PCRF unavailability), then P-CSCF/A-BG does not authorize media and VOIP calls will be rejected due to auth failure. Registrations will be handled normally.

Entering this command results in the following prompt:

```
[context_name]host_name(config-pcrf-policy-control)#
```

PCRF-Policy-Control Configuration Mode commands are defined in the *CSCF PCRF-Policy-Control Configuration Mode Commands* chapter in this guide.
peer-sbc

Configures peer Session Border Controller (SBC) addresses from where the P-CSCF/A-BG service can receive requests.

Product
SCM (P-CSCF, A-BG)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration
configure > context context_name > cscf service service_name > proxy-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-proxy-cscf)#

Syntax

[ no ] peer-sbc ip_address

no
Removes the IP address of a peer SBC from this P-CSCF/A-BG service.

ip_address
Specifies the IP address of a peer SBC for this P-CSCF/A-BG service.
ip_address is expressed in standard dotted decimal notation for IPv4 or colon notation for IPv6.

Usage

Use this command to specify peer Session Border Controller (SBC) addresses from where the P-CSCF/A-BG service can receive requests.

Important: This command must be entered multiple times if more than one SBC is present.

Example

The following commands identify three peer SBCs for a single P-CSCF/A-BG service:

    peer-sbc 200.6.2.3
    peer-sbc 200.6.2.10
    peer-sbc 200.6.2.11

The following command removes the peer SBC with IP address 200.6.2.10 from the P-CSCF/A-BG service:

    no peer-sbc 200.6.2.10
plmn-id

Configures location specific mobile network identifiers used to help translate local emergency and service-related numbers. Default is disabled.

Product
SCM (P-CSCF, A-BG)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration
configure > context context_name > cscf service service_name > proxy-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-proxy-cscf)#

Syntax

plmn-id mcc code mnc code

no plmn-id

   no
   Removes the access network configuration for this P-CSCF/A-BG service.

     mcc code
     Specifies the Mobile Country Code for the mobile access network. code must be a three-digit integer from 200 to 999.

     mnc code
     Specifies the Mobile Network Code for the mobile access network. code must be a two or three-digit integer from 00 to 999.

Usage
Use this command to help match location specific emergency/service numbers when configuring translations. The mcc and mnc values are compared against those received in p-access-network-info headers as per 3GPP TS 24.229. If mnc is not provided in the criteria only mcc is compared.

Example
The following command identifies the mobile network with a MCC of 123 and a MNC of 12:

    plmn-id mcc 123 mnc 12
**reg-preloaded-route**

Enables the function to use the preloaded-route-headers received in REGISTER for routing at P-CSCF.

**Product**
SCM (P-CSCF, A-BG)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration

`configure > context context_name > cscf service service_name > proxy-cscf`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-cscf-service-proxy-cscf)#`

**Syntax**

```
[ default | no ] reg-preloaded-route
```

<table>
<thead>
<tr>
<th>default</th>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disables the ability to use preloaded-route-headers for routing REGISTER.</td>
<td></td>
</tr>
</tbody>
</table>

**Usage**

Use this command to enable or disable usage of preloaded-route-headers for routing REGISTER.
**reg-service-route**

Enables the function to use service routes when routing re-registrations.

**Product**

SCM (P-CSCF, A-BG)

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration

```bash
configure > context context_name > cscf service service_name > proxy-cscf
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-proxy-cscf)#
```

**Syntax**

```
[ no ] reg-service-route
```

- **no**
  
  Disables the ability to use service routes for re-registration.

**Usage**

Use this command to enable the P-CSCF/A-BG service to use service routes when routing re-registrations.
reliable-prov-resp

Enables/disables the reliability of provisional responses feature.

Product
SCM (P-CSCF, A-BG)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration
configure > context context_name > cscf service service_name > proxy-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-proxy-cscf)#

Syntax
reliable-prov-resp { mandatory | optional }

[ no ] reliable-prov-resp

- no
   Disables the reliability of provisional responses feature.

  mandatory | optional

  mandatory: Both inbound and outbound will request reliability.
  optional(default): Reliability is imposed by inbound side. Only if inbound call requests reliability will outbound also request reliability.

Usage
Use this command to enable/disable the reliability of provisional responses feature.

Example
The following command sets the reliability of provisional responses feature to mandatory:

   reliable-prov-resp mandatory

The following command disables the reliability of provisional responses feature:

   no reliable-prov-resp
restoration-procedure

Enables the P-CSCF/A-BG service to reject with a 504 response when it receives 3xx, 480, or “no response” to service request. This feature is disabled by default.

Product
SCM (P-CSCF, A-BG)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration

configure > context context_name > cscf service service_name > proxy-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-proxy-cscf)#

Syntax

[ no ] restoration-procedure

no

Disables restoration procedure on the P-CSCF/A-BG service.

Usage

Restoration procedure is intended to handle unreachability of service-route header content. Enabling this command allows the P-CSCF/A-BG service to reject with a 504 response when it receives 3xx, 480, or “no response” to service request.

Example

Enables restoration procedure on the P-CSCF/A-BG service:

restoration-procedure

Disables restoration procedure on the P-CSCF/A-BG service:

no restoration-procedure
security-parameters

Enters the Security Configuration Mode in which Denial of Service (DOS) prevention commands can be configured.

**Product**
SCM (P-CSCF, A-BG)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration

```
configure > context context_name > cscf service service_name > proxy-cscf
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-proxy-cscf)#
```

**Syntax**

```
security-parameters
```

**Usage**
Use this command to enter the Security Configuration Mode.

Entering this command results in the following prompt:

```
[context_name]hostname(config-security-parameters)#
```

Security Configuration Mode commands are defined in the *CSCF Security Configuration Mode Commands* chapter in this guide.
sigcomp

Enables signaling compression for the P-CSCF/A-BG service and enters the Signaling Compression Configuration Mode.

Product
SCM (P-CSCF, A-BG)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration

configure > context context_name > csf service service_name > proxy-cscf

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service-proxy-cscf)#

Syntax
[ no ] sigcomp

no

Disables signaling compression for the P-CSCF/A-BG service.

Usage
Use this command to enable signaling compression for the P-CSCF/A-BG service and enter the CSCF Signaling Compression Configuration Mode.

Entering this command results in the following prompt:

[context_name]host_name(config-sigcomp)#

Signaling Compression Configuration Mode commands are defined in the CSCF Signaling Compression Configuration Mode Commands chapter in this guide.
**sip-header**

Enable SIP header insertion for the P-CSCF/A-BG service. SIP header insertion is disabled by default.

**Product**  
SCM (P-CSCF, A-BG)

**Privilege**  
Administrator

**Mode**  
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration

```bash
configure > context context_name > cscf service service_name > proxy-cscf
```

Entering the above command sequence results in the following prompt:

```bash
[context_name]host_name(config-cscf-service-proxy-cscf)#
```

**Syntax**

```bash
[ no ] sip-header insert { p-access-network-info | p-cust1-prid-info | p-user-database }
```

*no*

Disables SIP header insertion for the P-CSCF/A-BG service.

```bash
insert { p-access-network-info | p-cust1-prid-info | p-user-database }
```

- **p-access-network-info**: Inserts P-Access-Network-Info (PANI) header in received request/response.
- **p-cust1-prid-info**: Inserts a custom header, P-LGUPplus-PRID-Info, which contains the private user id of the user sending any dialogue creating request or any standalone requests, to be added in the message toward nexthop. Addition of the header will be done when P-CSCF forwards this message.
- **p-user-database**: Inserts P-User-Database (PUD) header in SIP (REGISTER) message and Invite from I-CSCF to S-CSCF.

**Usage**

Enabling this command allows SIP header insertion on the P-CSCF or A-BG.

**Important:** Use the `access-type` command to configure a ue-ip-address-range per access type. CSCF Service Configuration Mode commands are defined in the *CSCF Service Configuration Mode Commands* chapter in this guide.

**Example**

Enables SIP PANI header insertion for the P-CSCF/A-BG service:

```bash
sip-header insert p-access-network-info
```
sip-param

Enable the addition of “integrity-protected” parameter in the authorization header of a SIP (REGISTER) message for the P-CSCF/A-BG service.

**Product**
SCM (P-CSCF, A-BG)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration

`configure > context context_name > cscf service service_name > proxy-cscf`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-cscf-service-proxy-cscf)#`

**Syntax**

```
[ no ] sip-param insert integrity-protected [ custom-logic | transparent ]
```

- **no**
  Disables the addition of “integrity-protected” parameter in the authorization header of a SIP (REGISTER) message for the P-CSCF/A-BG service.

- **insert integrity-protected**
  Inserts “integrity-protected” parameter in the authorization header of a SIP (REGISTER) message for the P-CSCF/A-BG service.

- **custom-logic**
  Insert “integrity-protected” parameter for custom-logic in Authorization header.

- **transparent**
  Pass the “integrity-protected” parameter received from the previous node unmodified.

**Usage**

Enabling this command allows the P-CSCF or A-BG to add the “integrity-protected” parameter in the authorization header of a SIP (REGISTER) message. The parameter will be used by the S-CSCF to decide which authentication mode to use to authenticate the user.

**Example**

Enables the addition of `integrity-protected` parameter:

```
sip-param insert integrity-protected
```

Disables the addition of `integrity-protected` parameter:

```
no sip-param insert integrity-protected
```
store-session-path

Enables the P-CSCF or A-BG to store and process the session path information, which includes the Route list, Record-Route list, Service-Route list, and ViaList.

**Product**
SCM (P-CSCF, A-BG)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration

```
configure > context context_name > csf service service_name > proxy-cscf
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service-proxy-cscf)#
```

**Syntax**

```
[ no ] store-session-path
```

- **no**
  
  Disables the storing of session path information by the P-CSCF or A-BG. In addition, the P-CSCF/A-BG will not overwrite the Route list, Record-Route list, Service-Route list, or ViaList in the in-dialog request and responses.

**Usage**

Enabling this command allows the P-CSCF or A-BG to store and process the session path information.

**Example**

Enables the storage and processing of session path information:

```
store-session-path
```

Disables the storage and processing of session path information:

```
no store-session-path
```
Chapter 94
CSCF Routes Configuration Mode Commands

The CSCF Routes Configuration Mode is used to configure session forwarding within the system.

Mode

Exec > Global Configuration > Context Configuration > Routes Configuration

configure > context context_name > cscf routes { default | name list_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-route)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
after

Places the CSCF route entry at the bottom or end of the route list. Use this command in conjunction with the `route` command.

**Product**
SCM (P-CSCF, S-CSCF, SIP Proxy)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > Routes Configuration

c**onfigure > context context_name > cscf routes { default | name list_name }

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-route)#
```

**Syntax**

```
after
```

**Usage**

Add this command before the `route` command to place the entry at the end of the route list.
before

Places the CSCF route entry at the top or beginning of the route list. Use this command in conjunction with the `route` command.

**Product**
SCM (P-CSCF, S-CSCF, SIP Proxy)

**Privilege**
Administrator

**Mode**

Exec > Global Configuration > Context Configuration > Routes Configuration

```

Mode
Exec > Global Configuration > Context Configuration > Routes Configuration

configure > context context_name > cscf routes { default | name list_name }

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-route)#

Syntax

route { domain name | local { icscf | pcscf | scscf } | nexthop-address address | peer-servers server_name | peer-servers-group group_name | route-list group_name | vpn name } { [ [ mod-req-uri ] base-criteria criteria [ filter-criteria1 criteria ] [ filter-criteria2 criteria ] ] | [ log ]

no route { domain name | local { icscf | pcscf | scscf } | nexthop-address address | peer-servers server_name | peer-servers-group group_name | route-list group_name | vpn name } base-criteria criteria [ filter-criteria1 criteria ] [ filter-criteria2 criteria ]

no

Removes the specified routing parameters for the CSCF service.

domain name

Specifies a valid next-hop domain name. name must be from 1 to 79 alpha and/or numeric characters in length.

local { icscf | pcscf | scscf }

Specifies a local interrogating, serving, or proxy call/session control function to which all calls processed by the context will be routed.

nexthop-address ip_address

Specifies a next-hop address.

ip_address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

peer-servers server_name

Specifies a configured peer server.

server_name must be the name of a configured peer server on this system.
peer-servers-group group_name
Specifies a configured peer servers group.
group_name must be the name of a configured peer servers group on this system.

route-list group_name
Specifies a configured route list group.
group_name must be the name of a configured route list group on this system.

vpn name
Specifies a configured VPN context on the system.
name must be a configured context name.

mod-req-uri
Specifies that a route lookup should be performed and the request URI modified.

base-criteria criteria
Specifies the base criteria that packets will be compared against. The following criteria is supported:

- **access-type type**: Filters sessions based on a specific access-type used by the subscriber. Possible access types are:
  - 3gpp-geran: 3GPP Access Type
  - 3gpp-utran-fdd: 3GPP Access Type
  - 3gpp-utran-tdd: 3GPP Access type
  - 3gpp2-1x: 3GPP2 Access Type
  - 3gpp2-1x-hrp: 3GPP2 Access Type
  - 3gpp2-cdma-cs: 3GPP2-CDMA-CS
  - 3gpp2-umb: 3GPP2-UMB
  - adsl: FixedLine Access Type
  - adsl2: FixedLine Access Type
  - adsl2p: FixedLine Access Type ADSL2+
  - docsis: DOCSIS
  - gshdsl: Fixed Line Access Type G.SHDSL
  - hds1: Fixed Line Access Type
  - hds12: Fixed Line Access Type
  - ids1: Fixed Line Access Type
  - ieee-80211: WLAN Access Type
  - ieee-80211a: WLAN Access Type
  - ieee-80211b: WLAN Access Type
  - ieee-80211g: WLAN Access Type
  - ieee-80216e: Wireless MAN Access Type
  - rads1: Fixed Line Access Type
**route**

- **sdsl**: Fixed Line Access Type
- **vdsl**: Fixed Line Access Type
- **any**: Filters all CSCF sessions.
- **carrier-id** *name*: Filters sessions based on the carrier’s ID. *name* must be from 1 to 79 alpha and/or numeric characters in length.
- **destination aor** *aor*: Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

**Important**: The destination aor and carried-id criteria cannot occur in the same route rule.

- **nexthop-uri** *name*: Filters sessions based on Address of Record. *name* must be from 1 to 79 alpha and/or numeric characters in length.
- **plmn-id** *mcc* *mnc* *mnc_code*: Filters sessions based on the mobile country and network codes. *mcc* *mnc* *mnc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be a two or three-digit integer from 00 to 999.
- **source address** *ip_address*: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- **source aor** *aor*: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.
- **subscriber-capability** *capability_type*: Filters sessions based on capability of the subscriber. Possible capability types are:
  - **at**: Custom AT Type
  - **audio**: Audio Capability Type
  - **chat**: Custom CHAT Type
  - **cs**: Custom CS Type
  - **ft**: Custom FT Type
  - **im**: Custom IM Type
  - **lte-voip**: Custom LTE-VOIP Type
  - **lte-vt**: Custom LTE-VT Type
  - **mms**: Custom MMS Type
  - **msg**: Custom MSG Type
  - **oma-sip-im**: Custom OMA SIP-IM Type
  - **rcs-dp**: Custom RCS-DP Type
  - **rcs-e**: Custom RCS-E Type
  - **rcs-ft**: Custom RCS-FT Type
  - **rcs-im**: Custom RCS-IM Type
  - **rcs-is**: Custom RCS-IS Type
  - **rcs-sp**: Custom RCS-SP Type
  - **rcs-vs**: Custom RCS-VS Type
• **smart-edu** - Custom SMART-EDU Type
• **text** - Text Capability Type
• **video** - Video Capability Type
• **vt** - Custom VT Type
• **vt-ft** - Custom VT-FT Type
• **vt-is** - Custom VT-IS Type
• **vt-loc** - Custom VT-LOC Type
• **vt-memo** - Custom VT-MEMO Type

• **subscriber-ip-type { v4 | v6 }**: Filters sessions based on IP type of the subscriber. Possible IP types are:
  • **v4** - IPV4 Type
  • **v6** - IPV6 Type

• **time-of-day**: Filters sessions based on the time of the day. Additional filter criteria for **time-of-day** is as follows:
  • **day-of-month** *day*: Filters session based on the day of the month. *day* must be an integer from 1 to 31.
  • **day-of-week** *day*: Filters session based on the day of the week. *day* must be an integer from 1 to 7 with 1 signifying Sunday and 7 signifying Saturday.
  • **start date/time [ end date/time ]**: Filters sessions based on a start time to, optionally, an end time during the day. *date/time* must be integers in either of the following formats: YYYY:MM:DD:HH:mm or YYYY:MM:DD:mm:ss. YYYY: year range 2005 to 2099 MM: months (integer range 1 to 12) DD: days (integer range 1 to 31) HH: hours (integer range 0 to 23) mm: minutes (integer range 0 to 59) ss: seconds (integer range 0 to 59)
  • **week-of-month** *week*: Filters sessions based on the week of the month. *week* must be an integer from 1 to 5.

---

**Important**: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

---

**filter-criteria criteria**

Specifies the filter criteria that packets that have passed the base criteria will be compared against. The following criteria is supported:

• **access-type** *type*: Filters sessions based on a specific access-type used by the subscriber. Possible access types are:
  • **3gpp-geran**: 3GPP Access Type
  • **3gpp-utran-fdd**: 3GPP Access Type
  • **3gpp-utran-tdd**: 3GPP Access type
  • **3gpp2-1x**: 3GPP2 Access Type
  • **3gpp2-1x-hrp**: 3GPP2 Access Type
  • **3gpp2-cdma-cs**: 3GPP2-CDMA-CS
  • **3gpp2-umb**: 3GPP2-UMB
• **ads1**: Fixed Line Access Type
• **ads12**: Fixed Line Access Type
• **ads12p**: Fixed Line Access Type ADSL2+
• **docsis**: DOCSIS
• **gshdsl**: Fixed Line Access Type G.SHDSL
• **hdsl**: Fixed Line Access Type
• **hdsl2**: Fixed Line Access Type
• **idsl**: Fixed Line Access Type
• **ieee-80211**: WLAN Access Type
• **ieee-80211a**: WLAN Access Type
• **ieee-80211b**: WLAN Access Type
• **ieee-80211g**: WLAN Access Type
• **ieee-80216e**: Wireless MAN Access Type
• **rads1**: Fixed Line Access Type
• **sdsl**: Fixed Line Access Type
• **vdsl**: Fixed Line Access Type
• **any**: Filters all CSCF sessions.
• **carrier-id name**: Filters sessions based on the carrier's ID. name must be from 1 to 79 alpha and/or numeric characters in length.
• **destination aor aor**: Filters sessions based on the destination AoR. aor must be an existing AoR from 1 to 79 characters in length.

**Important**: The destination aor and carrier-id criteria cannot occur in the same route rule.

• **nexthop-uri name**: Filters sessions based on Address of Record. name must be from 1 to 79 alpha and/or numeric characters in length.
• **plmn-id mcc mcc_code mnc mnc_code**: Filters sessions based on the mobile country and network codes. mcc_code must be a three-digit integer from 200 to 999. mnc_code must be a two or three-digit integer from 00 to 999.
• **source address ip_address**: Filters sessions based on source IP address. ip_address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
• **source aor aor**: Filters sessions based on the source AoR. aor must be an existing AoR from 1 to 79 characters in length.

• **subscriber-capability capability_type**: Filters sessions based on capability of the subscriber. Possible capability types are:
  • **at** - Custom AT Type
  • **audio** - Audio Capability Type
  • **chat** - Custom CHAT Type
  • **cs** - Custom CS Type
• **ft** - Custom FT Type
• **im** - Custom IM Type
• **lte-voip** - Custom LTE-VOIP Type
• **lte-vt** - Custom LTE-VT Type
• **mms** - Custom MMS Type
• **msg** - Custom MSG Type
• **oma-sip-im** - Custom OMA SIP-IM Type
• **rcs-dp** - Custom RCS-DP Type
• **rcs-e** - Custom RCS-E Type
• **rcs-ft** - Custom RCS-FT Type
• **rcs-im** - Custom RCS-IM Type
• **rcs-is** - Custom RCS-IS Type
• **rcs-sp** - Custom RCS-SP Type
• **rcs-vs** - Custom RCS-VS Type
• **smart-edu** - Custom SMART-EDU Type
• **text** - Text Capability Type
• **video** - Video Capability Type
• **vt** - Custom VT Type
• **vt-ft** - Custom VT-FT Type
• **vt-is** - Custom VT-IS Type
• **vt-loc** - Custom VT-LOC Type
• **vt-memo** - Custom VT-MEMO Type

• **subscriber-ip-type** { v4 | v6 }: Filters sessions based on IP type of the subscriber. Possible IP types are:
  • **v4** - IPV4 Type
  • **v6** - IPV6 Type

• **time-of-day**: Filters sessions based on the time of the day. Additional filter criteria for **time-of-day** is as follows:
  • **day-of-month** day: Filters session based on the day of the month. day must be an integer from 1 to 31.
  • **day-of-week** day: Filters session based on the day of the week. day must be an integer from 1 to 7 with 1 signifying Sunday and 7 signifying Saturday.
  • **start date/time** [ end date/time ]: Filters sessions based on a start time to, optionally, an end time during the day. date/time must be integers in either of the following formats: YYYY:MM:DD:HH:mm or YYYY:MM:DD:mm:ss. YYYY: year range 2005 to 2099 MM: months (integer range 1 to 12) DD: days (integer range 1 to 31) HH: hours (integer range 0 to 23) mm: minutes (integer range 0 to 59) ss: seconds (integer range 0 to 59)
  • **week-of-month** week: Filters sessions based on the week of the month. week must be an integer from 1 to 5.
**Important:** AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

```
filter-criteria2 criteria
```

Specifies the filter criteria that packets that have passed the base criteria and filter-criteria will be compared against. The following criteria is supported:

- **access-type type:** Filters sessions based on a specific access-type used by the subscriber. Possible access types are:
  - `3gpp-geran`: 3GPP Access Type
  - `3gpp-utran-fdd`: 3GPP Access Type
  - `3gpp-utran-tdd`: 3GPP Access Type
  - `3gpp2-1x`: 3GPP2 Access Type
  - `3gpp2-1x-hrp`: 3GPP2 Access Type
  - `3gpp2-cdma-cs`: 3GPP2-CDMA-CS
  - `3gpp2-umb`: 3GPP2-UMB
  - `ads1`: FixedLine Access Type
  - `ads12`: FixedLine Access Type
  - `ads12p`: FixedLine Access Type ADSL2+
  - `docsis`: DOCSIS
  - `gshdsl`: Fixed Line Access Type G.SHDSL
  - `hds1`: Fixed Line Access Type
  - `hds12`: Fixed Line Access Type
  - `ids1`: Fixed Line Access Type
  - `ieee-80211`: WLAN Access Type
  - `ieee-80211a`: WLAN Access Type
  - `ieee-80211b`: WLAN Access Type
  - `ieee-80211g`: WLAN Access Type
  - `ieee-80216e`: Wireless MAN Access Type
  - `rads1`: Fixed Line Access Type
  - `sds1`: Fixed Line Access Type
  - `vds1`: Fixed Line Access Type
  - `any`: Filters all CSCF sessions.
  - `carrier-id name`: Filters sessions based on the carrier’s ID. `name` must be from 1 to 79 alpha and/or numeric characters in length.
  - `destination aor aor`: Filters sessions based on the destination AoR. `aor` must be an existing AoR from 1 to 79 characters in length.
**Important:** The destination aor and carried-id criteria cannot occur in the same route rule.

- **nexthop-uri** *name*: Filters sessions based on Address of Record. *name* must be from 1 to 79 alpha and/or numeric characters in length.

- **plmn-id mcc mnc mcc_code mnc_code**: Filters sessions based on the mobile country and network codes. *mcc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be a two or three-digit integer from 00 to 999.

- **source address ip_address**: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

- **source aor aor**: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

- **subscriber-capability capability_type**: Filters sessions based on capability of the subscriber. Possible capability types are:
  - **at** - Custom AT Type
  - **audio** - Audio Capability Type
  - **chat** - Custom CHAT Type
  - **cs** - Custom CS Type
  - **ft** - Custom FT Type
  - **im** - Custom IM Type
  - **lte-voip** - Custom LTE-VOIP Type
  - **lte-vt** - Custom LTE-VT Type
  - **mms** - Custom MMS Type
  - **msg** - Custom MSG Type
  - **oma-sip-im** - Custom OMA SIP-IM Type
  - **rcs-dp** - Custom RCS-DP Type
  - **rcs-e** - Custom RCS-E Type
  - **rcs-ft** - Custom RCS-FT Type
  - **rcs-im** - Custom RCS-IM Type
  - **rcs-is** - Custom RCS-IS Type
  - **rcs-sp** - Custom RCS-SP Type
  - **smart-edu** - Custom SMART-EDU Type
  - **rcs-vs** - Custom RCS-VS Type
  - **text** - Text Capability Type
  - **video** - Video Capability Type
  - **vt** - Custom VT Type
  - **vt-ft** - Custom VT-FT Type
  - **vt-is** - Custom VT-IS Type
  - **vt-loc** - Custom VT-LOC Type
**vt-memo** - Custom VT-MEMO Type

**subscriber-ip-type** { v4 | v6 }: Filters sessions based on IP type of the subscriber. Possible IP types are:

- **v4** - IPV4 Type
- **v6** - IPV6 Type

**time-of-day**: Filters sessions based on the time of the day. Additional filter criteria for **time-of-day** is as follows:

- **day-of-month** *day*: Filters session based on the day of the month. *day* must be an integer from 1 to 31.
- **day-of-week** *day*: Filters session based on the day of the week. *day* must be an integer from 1 to 7 with 1 signifying Sunday and 7 signifying Saturday.
- **start** *date/time* [ **end** *date/time* ]: Filters sessions based on a start time to, optionally, an end time during the day. *date/time* must be integers in either of the following formats: YYYY:MM:DD:HH:mm or YYYY:MM:DD:mm:ss. YYYY: year range 2005 to 2099 MM: months (integer range 1 to 12) DD: days (integer range 1 to 31) HH: hours (integer range 0 to 23) mm: minutes (integer range 0 to 59) ss: seconds (integer range 0 to 59)
- **week-of-month** *week*: Filters sessions based on the week of the month. *week* must be an integer from 1 to 5.

---

**log**

Enables logging for CSCF sessions meeting the criteria specified in the ACL. The logs can be viewed by executing the `logging filter active facility cscf-acl-log` command in the Exec mode.

---

**Important**: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

---

**Usage**

Use this command to configure routing parameters for the service.

---

**Important**: Use the **before** or **after** command to place the route entry in the route list.

---

**Example**

The following command is placed at the end of the route list and routes sessions to a peer server group named `icscf_peer5`, filters sessions with a base criteria of the source address (1.2.3.4) and a filter criteria of the destination AoR ($.@test.com):

```
after route peer-servers icscf_peer5 base-criteria source address 1.2.3.4 filter-critical destination aor $.@test.com
```
Chapter 95
CSCF Security Configuration Mode Commands

The CSCF Security Configuration Mode is used to configure Denial of Service (DOS) prevention commands.

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > CSCF Security Configuration

configure > context context_name > csdf service service_name > proxy-csdf > security-parameters

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-security-parameters)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
auth-failure-weight

Sets a severity number for authorization failures used in calculating a value for determining when to suspend registration attempts.

**Important:** The system will ignore the configuration of this command unless the `dos-prevention` command has been enabled.

**Product**
SCM (P-CSCF, A-BG)

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > CSCF Security Configuration

```
configure > context context_name > cscf service service_name > proxy-cscf > security-parameters
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-security-parameters)##
```

**Syntax**

```
auth-failure-weight weight
```

```
default auth-failure-weight
```

```
default
```

Sets/restores the default value assigned to the specified command.

```
weight
```

Default: 1
Assigns a weight to an authorization failure. Defines the severity of a single authorization failure.

`weight` must be an integer from 1 to 5.

**Usage**
Use this command to define the severity of an authorization failure. This parameter is used in calculating the current number of authorization failures to compare to the `per-aor-failure-limit` and the `per-ip-failure-limit`. Configuring this command with a lower number causes the system to suspend registration attempts with repeated authorization failures much sooner than when configured with a higher number.

**Example**
The following command assigns a weight of 3 to an authorization failure:

```
auth-failure-weight 3
```
bad-request-weight

Sets a severity number for bad registration requests used in calculating a value for determining when to suspend registration attempts.

**Important:** The system will ignore the configuration of this command unless the `dos-prevention` command has been enabled.

<table>

<td>Exec &gt; Global Configuration &gt; Context Configuration &gt; CSCF Service Configuration &gt; Proxy-CSCF Configuration &gt; CSCF Security Configuration</td>
</tr>
</tbody>
</table>

`configure > context context_name > csf service service_name > proxy-cscf > security-parameters`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-security-parameters)#
```

**Syntax**

```
bad-request-weight weight

default bad-request-weight
```

**default**

Sets/restores the default value assigned to the specified command.

**weight**

Default: 2
Assigns a weight to a bad registration request. Defines the severity of a single bad request.

`weight` must be an integer from 1 to 5.

**Usage**

Use this command to define the severity of bad registration request. This parameter is used in calculating the current number of request failures to compare to the `per-aor-failure-limit` and the `per-ip-failure-limit`. Configuring this command with a lower number causes the system to suspend registration attempts with repeated request failures much sooner than when configured with a higher number.

**Example**

The following command assigns a weight of 3 to a bad registration request:

```
bad-request-weight 3
```
dos-prevention

Enables the denial of service (DoS) attack prevention feature.

Product
SCM (P-CSCF, A-BG)

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > CSCF Security Configuration

configure > context context_name > cscf service service_name > proxy-cscf > security-parameters

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-security-parameters)#

Syntax

[ default | no ] dos-prevention

[ default | no ]
Disables the DoS attack prevention feature.

Usage

Use this command to enable the DoS attack prevention feature. The default value for this command is disabled. When this command is enabled, the commands in this mode are enabled with default values configured.

Important: This command must be enabled before configuring other commands in this mode.
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```
end
```

**Usage**

Use this command to return to the Exec mode.
exit

Exits the current mode and returns to the parent configuration mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

```exit```

**Usage**

Use this command to return to the parent configuration mode.
forking-contact-limit

Sets a limit on the number of contacts a user ID can register with the system.

**Important:** The system will ignore the configuration of this command unless the `dos-prevention` command has been enabled.

**Product**
SCM (P-CSCF, A-BG)

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > CSCF Security Configuration

`configure > context context_name > cscf service service_name > proxy-cscf > security-parameters`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-security-parameters)#
```

**Syntax**

```
forking-contact-limit limit

default forking-contact-limit
```

**Usage**

Sets/restores the default value assigned to the specified command.

**Example**

The following command limits all users to 2 registered contacts on the system:

```
forking-contact-limit 2
```
greylist-duration

Configures the amount of time an AoR or IP address remains on a “grey list” after having crossed the registration authorization limit or the bad registration request limit.

**Important:** The system will ignore the configuration of this command unless the `dos-prevention` command has been enabled.

**Product**
SCM (P-CSCF, A-BG)

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > CSCF Security Configuration

```
configure > context context_name > cscf service service_name > proxy-cscf > security-parameters
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-security-parameters)#
```

**Syntax**

```
greylist-duration time

default greylist-duration
```

**Default greylist-duration**

```
default
```

Sets/restores the default value assigned to the specified command.

```
time
```

Default: 10

Defines the time, in minutes, that an AoR or IP address remains on a “grey list”.

**Example**

The following command sets the duration AoRs or IP addresses remain on a “grey list” to 30 minutes:

```
greylist-duration 30
```
per-aor-failure-limit

Sets a failure limit that, when exceeded, causes the suspension of registration attempts for the offending AoR.

**Important:** The system will ignore the configuration of this command unless the `dos-prevention` command has been enabled.

**Product**
SCM (P-CSCF, A-BG)

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > CSCF Security Configuration

`configure > context context_name > cscf service service_name > proxy-cscf > security-parameters`

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-security-parameters)#
```

**Syntax**

```plaintext
per-aor-failure-limit limit

default per-aor-failure-limit
```

**Syntax**

`default`
Sets/restores the default value assigned to the specified command.

`limit`
Default: 200
Defines the threshold for registration failures based on a calculation using weighted multipliers defined in `auth-failure-weight` and `bad-request-weight`. `limit` must be an integer from 5 to 10,000.

**Usage**

Use this command to set a failure limit for registration attempts from an identified AoR. The following calculation determines when this threshold is reached for a specific AoR:

Current authorization failures ÷ `auth-failure-weight` = current failures per AoR

or

Total bad registration requests ÷ `bad-request-weight` = current failures per AoR

If `auth-failure-weight = 2` and `bad-request-weight = 1`, and the `per-aor-failure-limit = 100`, then the tolerance for registration authentication failures = 50 per AoR and the tolerance for bad registration requests = 100 per AoR.

When an AoR reaches the failure limit, it is added to a “grey list” for a period of time as defined by the `greylist-duration` command.
Example

The following command sets the AoR failure limit to 300:

```
per-aor-failure-limit 300
```
per-ip-failure-limit

Sets a failure limit that, when exceeded, causes the suspension of registration attempts for the offending IP address.

**Important:** The system will ignore the configuration of this command unless the `dos-prevention` command has been enabled.

Product
SCM (P-CSCF, A-BG)

Privilege
Security Administrator, Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > CSCF Security Configuration

`configure > context context_name > cscf service service_name > proxy-cscf > security-parameters`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-security-parameters)#`

Syntax

```
per-ip-failure-limit limit
```

```
default per-ip-failure-limit
```

**default**
Sets/restores the default value assigned to the specified command.

```
limit
```

Default: 100
Defines the threshold for registration failures based on a calculation using weighted multipliers defined in `auth-failure-weight` and `bad-request-weight`. `limit` must be an integer from 5 to 10,000.

Usage
Use this command to set a failure limit for registration attempts from an identified IP address. The following calculation determines when this threshold is reached for any IP address:

Current authorization failures \( \div \) `auth-failure-weight` = current failures per AoR or

Total bad registration requests \( \div \) `bad-request-weight` = current failures per AoR

If `auth-failure-weight = 2` and `bad-request-weight = 1`, and the `per-ip-failure-limit = 200`, then the tolerance for registration authentication failures = 100 per each IP address and the tolerance for bad registration requests = 200 per each IP address.

When an IP address reaches the failure limit, it is added to a “grey list” for a period of time as defined by the `greylist-duration` command.
Example

The following command sets the IP address registration failure limit to 200:

```
per-ip-failure-limit 200
```
### threshold-rate

Configures the rate per second at which the system must receive authorization failures or bad registration requests before it considers the failures/requests a DoS attack.

**Important:** The system will ignore the configuration of this command unless the `dos-prevention` command has been enabled.

**Product**
SCM (P-CSCF, A-BG)

**Privilege**
Security Administrator, Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration > Proxy-CSCF Configuration > CSCF Security Configuration

```
configure > context context_name > cs cf service service_name > proxy-cscf > security-parameters
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-security-parameters)#
```

**Syntax**

```
threshold-rate rate

default threshold-rate
```

**default**
Sets/restores the default value assigned to the specified command.

**rate**
Default: 1
Specifies the rate per second that the system must receive authorization failures or bad registration requests to determine that it is under a DoS attack.

*rate* must be an integer from 1 to 1,000.

**Usage**
Use this command to specify the threshold rate for authorization failures or bad registration requests. For example, if a malicious user sends bad registration requests at a rate of 5 per second and this parameter is set to 10, the system will not consider itself under a DoS attack.

**Example**
The following command sets the threshold rate to 5 authorization failures or bad registration requests per second:

```
threshold-rate 5
```
Chapter 96
CSCF Service Configuration Mode Commands

The CSCF Service Configuration Mode is used to create and manage CSCF services within the current context.

Mode

Exec > Global Configuration > Context Configuration > CSCF Service Configuration
configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
RetryAfter-header-value

Sets the minimum and maximum value in seconds for Retry-After Header.

**Product**
SCM (S-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

```bash
configure > context context_name > cscf service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
RetryAfter-header-value min-value sec max-value sec
```

default RetryAfter-header-value

- **default**
  Returns the command to the default settings.

- **min-value sec max-value sec**
  - **min-value sec**: Specifies the minimum amount of time for Retry-After Header. **sec** must be an integer from 2 to 3600. Default is 2 seconds.
  - **max-value sec**: Specifies the maximum amount of time for Retry-After Header. **sec** must be an integer from 3 to 3601. Default is 10 seconds.

**Important**: Maximum value should be greater than minimum value.

**Usage**

Use this command to set the minimum and maximum value in seconds for Retry-After Header. If Transactions Per Second (TPS) rate towards the peer-server application server (AS) is exceeded, the incoming requests will be rejected with 500 error response; Retry-After Header specifies the number of seconds before UE should retry.

**Example**

The following command configures the minimum value to 3 and maximum value to 12 for Retry-After Header:

```
RetryAfter-header-value min-value 3 max-value 12
```
access-service

Configures the name of the P-CSCF/A-BG access service from which the system receives requests and sends responses. The access service lets the core service know where a packet needs to be routed.

**Product**
SCM (P-CSCF, A-BG)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

```
configure > context context_name > cscf service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
access-service name name

no access-service [ name name ]
```

- **no**
  Removes the access service.

- **name name**
  Specifies the name of the P-CSCF/A-BG access service from which the system receives requests and sends responses.
  *name* must be from 1 to 63 alpha and/or numeric characters.

**Important:** This command should only be issued in the core service configuration, however, multiple access services may be configured per core service.

**Usage**

Use this command to identify the name of the P-CSCF/A-BG access service from which the system receives requests and sends responses from/to the UEs. This command is used in systems that deploy two P-CSCF/A-BG services in bridging (Back-to-Back User Agent) mode configurations where an access service P-CSCF/A-BG faces the UE network and a core P-CSCF/A-BG faces the public network.

**Example**

The following command identifies the P-CSCF/A-BG access service named to the CSCF/A-BG core service:

```
access-service name HA3
```
access-type

Specifies the access types for IMS core.

Product
SCM (P-CSCF, A-BG)

**ieee-8023y**: Ethernet Access Type
**ieee-8023z**: Ethernet Access Type
**radsl**: FixedLine Access Type
**sdsl**: FixedLine Access Type
**vdsl**: FixedLine Access Type

**access-profile** { default | name access_profile_name }

Associates an access type with a CSCF access profile. Different access types can refer to the same access profile.

**ue-ip-address-range** name ue_ip_name { address ip_address_mask | range start_ip_address end_ip_address }

Configures UE IP address/range for a specific access type.
**ue_ip_name** must be from 1 to 79 alpha and/or numeric characters.
**address ip_address_mask**: Specifies a combined IP address subnet mask bits to indicate what IP addresses the specific access-type applies to. **ip_address_mask** must be specified using the form “IP Address/Mask Bits” where the IP address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6, and the mask bits are a numeric value, which is the number of bits in the subnet mask.
**range start_ip_address end_ip_address**: Configure UE IP range for specific access-type.
  * **start_ip_address** specifies the beginning of the range of addresses.
  * **end_ip_address** specifies the end of the range of addresses.
  * **ip_address** must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

**Usage**

Use this command to associated the access types for a specified CSCF access profile or UE IP address/range name.

**Important**: Use the `sip-header` command to enable SIP P-Access-Network-Info (PANI) header insertion. CSCF Proxy-CSCF Configuration Mode commands are defined in the *CSCF Proxy-CSCF Configuration Mode Commands* chapter in this guide.

**Example**

The following command identifies the access type adsl and assigns it to access profile `ap1`:

```
access-type adsl access-profile name ap1
```
**allow-dereg**

Allows the CSCF to send de-registration requests. Feature is disabled by default.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

```
configure > context context_name > cscf service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
[ no ] allow-dereg
```

```
no
```

Disables the feature.

**Usage**

Use this command to allow the CSCF service to send de-registration requests.
If the UE stops sending keepalive packets, which ends the connection between the UE and the proxy, UE information is cleared from the Proxy-CSCF (P-CSCF) or Access Border Gateway (A-BG). If de-registration requests are enabled, any UE-related information that is shared with the Serving-CSCF (S-CSCF) will also be cleared.
bind

Binds the CSCF service to a logical IP interface and specifies the maximum number of sessions that can access this service over the specified interface.

Product
SCM (P-CSCF, A-BG)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration
configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Syntax

bind address ip_address [ cscf-hostname host_name ] [ ipsec-crypto-template template ] [ max-sessions max# ] [ port number ] [ reserved-call-capacity percentage ] [ tls-crypto-template template [ tls-port number ] ] [ transport tcp ] [ use-serviceport-towards-network ]

no bind address

no
Removes the binding of the service to a specified interface.

address ip_address

Specifies the IP address of the interface to which the service is being bound.
ip_address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

CSCF Host Name host_name

Specifies the local host name of the CSCF service.
host_name must be an existing CSCF service name and be from 1 to 127 alpha and/or numeric characters. Configuring this keyword associates the CSCF service with the AOR domain configured in the default-aor-domain command and uses the domain name in SIP headers.

Important: If this keyword is not configured, SIP headers will contain the IP address of the CSCF service instead of the domain name.

ipsec-crypto-template template

Specifies the name of an existing IPSec CSCF crypto template to be used for accessing CSCF service by user equipment. Valid only for P-CSCF or A-BG.
template must be an existing IPSec CSCF crypto template and be from 1 to 127 alpha and/or numeric characters.
**Important:** The IPSec CSCF crypto template should be configured in the same context in which the P-CSCF is configured.

```
max-sessions max#
Default: 500,000
Specifies the maximum number of sessions managed by this service on this interface.
max# must be configured to any integer value from 0 to 500,000.
```

**Important:** The total session capacity of the system is 500,000. `max-sessions` is also limited by the capacity in the license generated for the service. If licenses for PDSN/GGSN/HA are generated for x number of sessions, then the license for the CSCF service will be generated at 500,000-x. Hardware configuration and installed features can also affect the maximum number of sessions that can be supported.

```
port number
Default: 5060
Specifies the UDP port number.
number must be an integer value from 1 to 65534.
```

```
reserved-call-capacity percentage
Default: 10
Specifies the call capacity percentage per session manager (sessmgr).
percentage must be an integer value from 1 to 50.
```

```
tls-crypto-template template [ tls-port number ]
Specifies the name of an existing Transport Layer Security (TLS) crypto template to enable TLS functionality. Valid only for P-CSCF or A-BG.
template must be an existing TLS crypto template and be from 1 to 127 alpha and/or numeric characters.
Default: 5061
Specifies the TLS port number.
number must be an integer value from 1 to 65534.
```

**Important:** When the `tls-crypto-template` is configured, TCP transport must be enabled, otherwise this command will throw an error. The configured `tls-crypto-template` should be configured in the same context in which the P-CSCF service is configured and must be complete with all certificate and cipher suite configuration. If the `tls-crypto-template` is not present or not completely configured, the P-CSCF service will not be started.

```
transport tcp
Enables TCP transport for the address.
```

```
use-serviceport-towards-network
Enables use of service port for sending and receiving UDP messages from network elements.
```
Usage

Use this command to associate the service with a specific logical IP address. This command also configures the identity of the CSCF in SIP headers as either the domain name of the CSCF service or the IP address.

**Important**: Multiple keywords can be used per bind command.

Example

The following command binds the CSCF service to a logical interface with an IP address of 1.2.3.4 and sets the maximum number of supported sessions for this interface at 250000:

```
bind address 1.2.3.4 max-sessions 250000
```
caller-preference

Enables custom SIP caller preferences; standards-based caller preference will not be applied.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Syntax

caller-preference custom

[ default | no ] caller-preference

default

Enables standards-based caller preference.

no

Disables custom caller preference processing; contact will be selected without considering caller preference.

Usage

Use this command to enable or disable custom SIP caller preferences.
charging

Enables RF charging in this CSCF service for SIP messages.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

```
configure > context context_name > cscf service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
[ default | no ] charging
```

- **default | no**
  Disables RF charging in this CSCF service for SIP messages.

**Usage**

Use this command to enable the RF charging feature in this service and enter the CSCF Charging Configuration Mode.

Entering this command results in the following prompt:

```
[context_name]host_name(config-cscf-charging)#
```

CSCF Charging Configuration Mode commands are defined in the *CSCF Charging Configuration Mode Commands* chapter in this guide.
cnsa-media-profile

Configures the media profile id to be set for a previously created service policy.

Product
SCM (S-CSCF)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Syntax

[ no ] cnsa-media-profile profile_id cscf-service-policy policy_name content-type { application-3gpp-ims-xml | application-pidf-diff-xml | application-pidf-partial-xml | application-pidf-xml | application-reginfo-xml | application-sdp | application-xml | message-sipfrag | multipart-mixed | multipart-related | text-plain }

no

Removes the media profile from the service policy.

cnsa-media-profile profile_id

Specifies the media profile id.
profile_id must be an integer from 0 to 10 and be an existing media profile id in the system. CNSA media profile ids are created and maintained in the CSCF ISC Template Configuration Mode.

cscf-service-policy policy_name

Assigns the media profile id to a service policy.
policy_name must be from 1 to 63 alpha and/or numeric characters and be an existing policy name in the system. Service policies are created and maintained in the CSCF Policy Configuration Mode.

content-type { application-3gpp-ims-xml | application-pidf-diff-xml | application-pidf-partial-xml | application-pidf-xml | application-reginfo-xml | application-sdp | application-xml | message-sipfrag | multipart-mixed | multipart-related | text-plain }

Specifies the content type(s).
application-3gpp-ims-xml - format for exchanging information in SIP Requests and Responses as used within the 3GPP IM CN Subsystem
application-pidf-diff-xml - contains changed presence elements. Contains full presence document when there are many changes
application-pidf-partial-xml - contains only changed parts of PIDF-based presence information
application-pidf-xml - XML MIME entity that contains presence information
application-reginfo-xml - used in Notifications to SIP user agents about registration expiry
application-sdp - SDP session description
application-xml - content type for generic xml documents
message-sipfrag - contains subsets of well formed SIP messages
multipart-mixed - intended for use when the body parts are independent and need to be bundled in a particular order
multipart-related - intended for compound objects consisting of several inter-related body parts
text-plain - plain text

**Important:** You may specify multiple types of content.

**Usage**
Use this command to assign a media profile id to a service policy. The policies defined in the service policy apply to all subscribers using this service.
CNSA media profile ids are created and maintained in the CSCF ISC Template Configuration Mode. Service policies are created and maintained in the CSCF Policy Configuration Mode.

**Example**
The following command defines the media profile id as 2 and assigns it to `serv_policy3` with plain text content type.

```
cnsa-media-profile 2 cscf-service-policy serv_policy3 content-type text-plain
```
core-service

Configures a core service if:

- CSCF services are run in bridging (Back-to-Back User Agent) mode
- A-BG is an Application-level Gateway (ALG) for Network Address Translation (NAT)

By default, no core-service name will be present.

Product
SCM (CSCF, A-BG)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Syntax

[ no ] core-service name service_name

- no
  Removes the core service.

- name service_name
  Specifies the name of the core service.
  service_name must be from 1 to 80 alpha and/or numeric characters.

Usage
Use this command to assign a core service to the CSCF/A-BG service.

Example
The following command identifies the core service:

core-service name servicel
custom cdf-selection

Enables using the CDF selected during registration for “VT” calls. For other calls, the CDF in default AAA-Group is used. Default is disabled.

Product
SCM (S-CSCF)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Syntax

[ no ] custom cdf-selection

no
When disabled, the CDF selected during registration shall be used for all calls.

Usage

Use this command to apply prefix-based CDF selection logic for VT calls only. For non-VT calls, CDF in default AAA Group is used.
When disabled, prefix-based CDF selection logic is applied for all calls.
custom reason-header-cause

This command configures SIP Reason header cause value.

Product
SCM (S-CSCF)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Syntax

custom reason-header-cause node-type node_type node-number node_num base-cause-code cause_code

no custom reason-header-cause node-type

no
Disables SIP reason header cause configuration.

node-type node_type

Specifies the node type and indicates P-CSCF or S-CSCF.
node_type must be an integer from 1 to 9.

node-number node_num

Specifies the node number assigned to the node.
node_num must be an integer from 1 to 99.

base-cause-code cause_code

Specifies the base number to be added to internal cause code.
cause_code must be an integer from 1 to 65536.
Default: 999

Usage
Use this command to configure parameters which will be used for building the SIP Reason header's cause value.

Example
The following command sets the node type to 1, node number to 5 and base cause code value to 7000:

custom reason-header-cause node-type 1 node-number 5 base-cause-code 7000
custom reg-binding

Enables the S-CSCF to return only one binding (latest contact) for each registration without including other bindings, if any. Default is disabled.

Product
SCM (S-CSCF)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

\texttt{configure > context context\_name > cscf service service\_name}

Entering the above command sequence results in the following prompt:

\texttt{[context\_name]host\_name(config-cscf-service)#}

Syntax

\begin{verbatim}
[ no ] custom reg-binding
\end{verbatim}

\noindent \texttt{no}

S-CSCF returns all the bindings for AOR in 200 OK REGISTER response.

Usage

Use this command to control whether the S-CSCF returns only one or all bindings for AOR in 200 OK REGISTER response.
**custom response**

Configures reject with specific response code for UE capability failure or UE status. Feature is disabled by default.

**Product**

SCM (S-CSCF)

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Service Configuration

```
configure > context context_name > cscf service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
custom response { ue-capability-failure capability_type | ue-status status } reject response-code response_code

no custom response { ue-capability-failure capability_type | ue-status status }
```

**no**

Removing customer-specific UE capability failure or UE status configuration, if present, and uses default RFC/3GPP specification behavior.

```
ue-capability-failure capability_type
```

Specifies UE capability failure type:

- **all** - UE capability all
- **at** - UE capability AT
- **audio** - UE capability audio
- **chat** - UE capability CHAT
- **cs** - UE capability CS
- **ft** - UE capability FT
- **im** - UE capability IM
- **lte-voip** - UE capability LTE-VOIP
- **lte-vt** - UE capability LTE-VT
- **mms** - UE capability MMS
- **msg** - UE capability MSG
- **oma-sip-im** - UE capability OMA SIP-IM
- **rcs-dp** - UE capability RCS-e DP
- **rcs-e** - UE capability RCS-E
custom response

CSCF Service Configuration Mode Commands

- rcs-ft - UE capability RCS-e FT
- rcs-im - UE capability RCS-e IM
- rcs-is - UE capability RCS-e IS
- rcs-sp - UE capability RCS-e SP
- rcs-vs - UE capability RCS-e VS
- smart-edu - UE capability SMART-EDU
- text - UE capability text
- video - UE capability video
- vt - UE capability VT
- vt-ft - UE capability VT-FT
- vt-is - UE capability VT-IS
- vt-loc - UE capability VT-LOC
- vt-memo - UE capability VT-MEMO

ue-status status
Specifies UE status:
- 1x-busy - UE status 1x-busy
- all - UE status all
- idle - UE status idle
- power-off - UE status power-off
- unreg - UE status unreg
- vt-busy - UE status vt-busy

reject response-code response_code
Specifies reject for UE capability failure with specific response code.
response_code must be an integer from 400 to 699.

Usage
As per RFC/3GPP specifications, S-CSCF rejects with 480 response code for UE capability failure (caller preference) or UE status. Use this command to configure the S-CSCF to reject with specific response code based on UE capability failure or UE status.

Example
The following command configures S-CSCF reject with response code 455 for a UE capability audio failure.

custom-response ue-capability-failure audio reject response-code 455
**custom volte**

Enables custom Voice over LTE (VoLTE) features.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

```
configure > context context_name > cscf service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
[ default | no ] custom volte
```

- **default**
  - Enables custom VoLTE features.
- **no**
  - Disables custom features.

**Usage**

Use this command to enable or disable custom VoLTE features.
default-aor-domain

Configures the domain name of the service.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

```
configure > context context_name > cscf service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
[ no ] default-aor-domain alias
```

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Removes the domain name from the service.</td>
</tr>
<tr>
<td>alias</td>
<td>Specifies the domain name for the service.</td>
</tr>
</tbody>
</table>

**Usage**

Use this command to define the domain name of the service.

**Example**

The following command defines the domain name of the CSCF service as `business.com`:

```
default-aor-domain business.com
```
**emergency-cscf**

Enables the Emergency-CSCF for the service and enters the Emergency-CSCF Configuration Mode. Default is disabled.

**Product**

SCM

**Privilege**

Administrator

**Mode**

Exec > Global Configuration > Context Configuration > CSCF Service Configuration

configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
[ no ] emergency-cscf
```

- **no**

  Disables the E-CSCF for the service.

**Usage**

Use this command to enable the Emergency-CSCF feature and enter the Emergency-CSCF Configuration Mode.

Entering this command results in the following prompt:

```
[context_name]host_name(config-cscf-service-emergency-cscf)#
```

Emergency-CSCF Configuration Mode commands are defined in the *CSCF Emergency-CSCF Configuration Mode Commands* chapter in this guide.

**Important:** Only one function (P-CSCF, S-CSCF, E-CSCF, SIP Proxy, or A-BG) can be enabled per service.
end

Exits the current configuration mode and returns to the Exec mode.

**Product**
All

**Privilege**
Security Administrator, Administrator

**Syntax**

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Syntax

[ default | no ] history-info

<table>
<thead>
<tr>
<th>default</th>
<th>no</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Disables the inclusion of the history-info header.</td>
<td></td>
</tr>
</tbody>
</table>

Usage

Use this command to include the history-info header in SIP requests to capture the request URI information for routing or translation.
interface statistics sip

Enables interface SIP statistic collection in this CSCF service.

Product

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Syntax

[ default | no ] interface statistics sip

default | no
Disables interface SIP statistic collection for this service.

Usage
Use this command to enable or disable the collection of interface SIP statistics in this service.
interrogating-cscf

This command is not supported in this release.
ipv4-ipv6-interworking

Allows the P-CSCF to provide IPv4-IPv6 interworking when UEs are IPv6-only and the IMS core network is IPv4-only. Feature is disabled by default.

**Product**
SCM (P-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

```bash
configure > context context_name > cscf service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]-host_name(config-cscf-service)#
```

**Syntax**

```
[ no ] ipv4-ipv6-interworking
```

- **no**
  
  Disables the feature.

**Usage**

Use this command to allow IPv4-IPv6 interworking functionality.
keepalive

Configures the CSCF to receive and respond to different types of keep-alive requests.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

```
configure > context context_name > cscf service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
```

```
```

```
no keepalive [ method { crlf | stun } ]
```

---

**default**

Returns the command to the default settings. All methods are enabled by default. See keywords above for specific defaults.

---

**no**

Disables the specified method of keepalive messages.

---

**expire-timer sec**

Default: 29

This value is used according to timed-keepalives parameter present in Path header. UEs are expected to send keepalive messages according to this time interval.

*sec* must be an integer from 24 to 150.

---

**max-retry num**

Default: 3

Specifies the maximum number of times the CSCF waits for the UE to send a keepalive request before it deletes the user information.

*num* must be an integer from 1 to 10.

---

**method { crlf | stun }**

Default: both methods enabled.
Specifies the method of keepalive messages supported by the CSCF.

**crlf:** "\r\n" string (CRLF packets) sent by UE

**stun:** STUN protocol messages (rfc3489-bis)

---

**Usage**

Use this command to configure how the CSCF manages keepalive requests.

**Example**

The following example sets the expire timer to 40 and the maximum retry parameter to 5:

```
keepalive expire-timer 40 max-retry 5
```
lawful-intercept

Enables Lawful Intercept (LI) in this CSCF service. Feature is disabled by default.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

```
configure > context context_name > cscf service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
[ no ] lawful-intercept
```

```
no
```

Disables the feature.

**Usage**

Refer to the *Lawful Intercept Configuration Guide* for more information on LI.
li-packet-cable

Refer to the Lawful Intercept Configuration Guide for a description of this command.
max-reqmsg-size

Configures the maximum SIP Request processing size.

Product
SCM

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Syntax

[ no ] max-reqmsg-size sipreq_size

no
Disables the SIP processing configuration.
If disabled, then P-CSCF will not reject the message with 513 and the old functionality of message drop
based on max-sipmsg-size will only apply.

sipreq_size
Configures the SIP request processing size limit in bytes.
sipreq_size must be an integer from 1024 to 65535.

Usage
Use this command to configure the maximum SIP Request processing size.
The configured value for max-reqmsg-size must always be lesser than the configured value for max-
sipmsg-size in the same CSCF service for the new implementation to take effect.

Example
The following command limits the SIP request processing size to 1024 bytes:

max-reqmsg-size 1024
max-sipmsg-size

Configures the maximum SIP message size.

**Product**
SCM

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

`configure > context context_name > cscf service service_name`

Entering the above command sequence results in the following prompt:

`[context_name]host_name(config-cscf-service)#`

**Syntax**

```
max-sipmsg-size limit

[ default | no ] max-sipmsg-size
```

- **default | no**
  
  Returns/sets the maximum SIP message size to 4096 bytes.

- **limit**
  
  Default: 4096
  
  Configures the SIP message size limit in bytes.
  
  *limit* must be an integer from 1024 to 65535.

**Important:** Maximum SIP message size should be more than the message-max-size set in the CSCF Proxy-CSCF Configuration Mode.

**Usage**

Use this command to configure the maximum SIP message size.

**Example**

The following command limits the SIP message size to 4500 bytes:

```
max-sipmsg-size 4500
```
media-bridging

Enables SDP modification that terminate media on CSCF. Feature is disabled by default.

Product
SCM (P-CSCF)

Privilege
Administrator

Mode
Exec > Global Configuration > Context Configuration > CSCF Service Configuration
configure > context context_name > cscf service service_name

Entering the above command sequence results in the following prompt:

[context_name]host_name(config-cscf-service)#

Syntax

media-bridging [ v6port-range start_port end_port ]

no media-bridging

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no</td>
<td>Disables the feature.</td>
</tr>
<tr>
<td>v6port-range start_port end_port</td>
<td>Specifies port ranges to be used with IPv6 addresses. Only selected ports from the range specified should be used for media bridging. start_port: Start of port range; must be an integer from 1024 to 65535. end_port: End of port range; must be an integer from 1025 to 65535.</td>
</tr>
</tbody>
</table>

Usage
Use this command to allow termination of media on CSCF.

Example
The following command allows media bridging on ports 2000 to 4000 for IPv6 addresses:

```
media-bridging v6port-range 2000 4000
```
monitoring

Enables thresholds alerting for this CSCF service.

Syntax

monitoring

Usage

Use this command to enable thresholds alerting for this CSCF service.
multiple-reg same-private-id

This command allows multiple registrations for the same private user-id from different devices.

**Product**
SCM (P-CSCF, A-BG, S-CSCF)

**Privilege**
Administrator

**Mode**
Exec > Global Configuration > Context Configuration > CSCF Service Configuration

```
configure > context context_name > cscf service service_name
```

Entering the above command sequence results in the following prompt:

```
[context_name]host_name(config-cscf-service)#
```

**Syntax**

```
[ default | no ] multiple-reg same-private-id
```

* default | no
  Multiple registrations are not allowed for the same private user-id.

**Usage**
Use this command to allow or disallow multiple registrations for the same private user-id from different devices.

**Example**
The following command allows multiple registrations for the same private user-id from different devices:

```
multiple-reg same-private-id
```
nat-policy

Configures a NAT (Network Address Translation) policy for the service if the CSCF service is performing one of the following functions:

- CSCF services are run in bridging (Back-to-Back User Agent) mode
- A-BG is an Application-level Gateway (ALG) for NAT
