1. Installation Overview

This document describes how to install the MURAL application. MURAL provides Web-based reporting and analytics abilities for deep packet inspection (DPI) data emerging from your network.

1.1 Before you begin

Before installing MURAL, you should possess a working knowledge of the following:

- Linux
- Cisco UCS

Prior to installing the application, we recommend that you:

- Review the MURAL 4.0 Release Notes.
- Complete a training course on MURAL.
- Ensure that installation package components are available. For more information see "Installation Package" on page 10.
- Have an understanding of Cisco UCS hardware administration.
- Ensure that MURAL system hardware installation has been completed successfully as specified in the bill of materials (BOM) and the setup is ready to install the system.
- The number of each type of node is customized for your deployment.
- Update the CIQ sheet completely, excluding 'storageInfo' section with MURAL setup details as required. For more information, see "Understanding the CIQ Sheet" on page 99.

1.2 System Components

The following figure illustrates the components of the MURAL platform, focusing on how the data flows through the system:
1.3 Standard Setup

The MURAL platform consists of the following nodes, each hosted on blades in the UCS Chassis:

1. **General Management System (GMS)**—Provides centralized management of the Reflex platform nodes, such as remote manufacturing of blades (installing the MURAL operating system), patch management, monitoring of all nodes and operations, and importing and running node configurations. The GMS node cluster supports high availability.

2. **Collector**—Collects data streams pushed to the Reflex platform, interprets the exported flows, enriches them with static data, and assembles data sets. The Collector stores the raw data in the Hadoop file system (HDFS) and sends it to the Compute node. The Collector node cluster can have any number of servers, in pairs for master and standby and uses 1+1 redundancy (transparent failover between pairs of active-active nodes).

3. **UI/Caching (Rubix)**—Hosts the Rubix engine and data cache. The Rubix engine queries the Insta nodes constantly and when new data is available, it fetches it to store in the data cache, so that it can respond more quickly.
to requests from the UI engine. The Caching node is sometimes called the Rubix node. The Caching node uses N+1 redundancy in active-active mode.

4. Compute node—Analyzes and aggregates the data, creating data cubes. The Compute node cluster can have any number of servers, depending on your deployment, and uses N+1 redundancy.

5. Insta node—Stores and manages the processed data in a columnar database. It also manages the Insta database, which stores processed data cubes. The Insta node cluster has two servers with 1+1 redundancy.

Apart from standard installations, MURAL system can be prepared with fewer blades by accommodating two or three application components into a single cluster, as described in the following sections.

1.3.1 Starter Pack Setup

In the Starter Pack setup, GMS, Collector (with Name-node) and UI components are hosted together on the same cluster.

1.3.2 Medium Pack Setup

In the Medium Pack setup, GMS and Collector (with Name node) components are hosted together on the same cluster.

1.3.3 Hardware

The MURAL application is hosted on the UCS Blade Server Chassis that comprises GMS, Collector, Rubix, Compute and Insta nodes. Data storage is hosted on the EMC storage devices.

The data flows that feed the MURAL system are pushed by an ASR.

1.4 Installation Package

The MURAL software installation package contains the following components:

- An ISO image: mfgcd-atlas<release version>.iso, where release version changes with each release, for example 4.0.rc2. mfgcd-atlas4.0.rc2.iso is
used as an example of ISO file.

**Note:** For the exact image name and the MD5 checksum for the software image, refer to the release notes for your release.

- The CIQ sheet file, which is used to create hardware and final configuration file (XML). This CIQ sheet is used to gather basic configuration information like IP addresses, cluster details, and storage details that will be used to create the configuration file (XML) for installation and configuration of MURAL system. For details, see "Customer Information Questionnaire (CIQ) Sheet" below

- Software patches that are available for the release. Refer to the release notes for your release for more information about patches.

- Management information bases (MIBs).

### 1.5 Customer Information Questionnaire (CIQ) Sheet

The Customer Information Questionnaire (CIQ) sheet is a spreadsheet containing hardware inventory information in a prescribed manner that needs to be collected before starting the installation process.

The CIQ sheet file contains the following worksheets:

- **MiscInfo** — Specifies configuration file name, site, hardware type, login message, and NTP settings.

- **NetworkInfo** — Specifies networks, default gateway, DNS, NTP, and SNMP servers. It also specifies UCS Manager access details, which is used to collect the MAC addresses from blades. MAC address can be left blank as the script that runs on CIQ can populate them automatically. If the script gives a warning that it is not able to get the MAC address, then you need to manually provide MAC addresses for all the nodes and run the script again.

- **ClusterInfo** — Specifies cluster names and type as well as interfaces and VIPs (if any).

- **NodeInfo** — Specifies chassis and slot IDs, hostnames, Mac IDs and IP addresses, KVM IPs of blades and Cluster Names for all the blades to group into specific roles.
• StorageInfo — Specifies node hostnames, WWIDs and MURAL components like Collectors, Datanodes, and so on to assign LUNs from SAN storage devices.

Apart from the CIQ sheet, following information is also required from site during the installation:

• Connectivity— Specifies the details for ports and connections

• Firewall— Identifies the firewall changes required for connectivity

• Static Configuration— Specifies locations for various information bases (IBs) that are required by the application

For detailed information about CIQ sheet, refer "Understanding the CIQ Sheet" on page 99
2. Installation Phases

This topic provides information about the various phases involved in setting up the system. It involves installing the software and all the configurations to make the system live.

Prerequisites:

- Obtain the CIQ sheet and verify that the UCS hardware is correctly configured for the MURAL system. For more information, see "Understanding the CIQ Sheet" on page 99
- Obtain the sizing sheet from the customer.

Warning: Skipping a phase or performing the tasks out of sequence may cause an incorrect configuration and result in installation failure.

2.1 Installing Operating System

This phase starts with uploading of the ISO file and manufacturing of all the nodes. Once the nodes are manufactured, the clusters are defined as per the CIQ sheet and the required software are installed. For details, see "Installing Operating System" on page 15

2.2 Configuring MURAL Nodes

Once the required software are installed on each node, the nodes are configured and roles are assigned for each node. The configuration are based on the site requirements. For details, see "Configuring Mural Nodes" on page 31

2.3 Configuring ASR and IBs

Once all the nodes are installed, the ASR feeds and IBs list must be configured to ensure that system receives the required data. Correct configuration also ensures that system is able to process the data as per the requirements. For more details, see "Configuring ASR and IBs" on page 43
2.4 Processing the Data

The successfully installed system is required to be configured with data processing parameters. These configurations are required to ensure that the system performs as per the requirements. For more details, see "Processing the Data" on page 52.
3. Installing Operating System

This topic describes the process of uploading of the ISO image file to be used for creating the master GMS node and configuring the CIQ sheet to create the hardware xml file. After the master GMS node is manufactured, all the related patches must be installed on the master GMS node.

3.1 Manufacturing the Initial Node

Set up a node that is used to create configuration files (XML). This node is manufactured by mapping the ISO image file of MURAL software as virtual media from UCS blade console. Manufacture all other nodes by installing OS through PXE boot. If PXE boot does not work, manufacture other nodes manually.

Prerequisite

Ensure that Serial over LAN (SOL) is configured on all the blades during UCS setup.

To manufacture the initial node, perform the following steps:

1. Download the ISO image to the machine from which you will access the Cisco UCS blades.

2. Verify the MD5 of the downloaded file. Execute the following command:

   ISO Image: mfgcd-atlas4.0.rc2.iso
   
   # md5sum mfgcd-atlas4.0.rc2.iso

   The output must resemble as follows:

   0e2ea0156132d0f1dd0c0a0b0ef0d78 mfgcd-atlas4.0.rc2.iso

   Verify the value of generated MD5 of ISO file with the actual MD5 of the ISO file.

   Note: For the exact name of the ISO file and the related MD5 value, refer to the Release Notes. The name of ISO image mfgcd-atlas4.0.rc2.iso is used as an example in the document.

3. Open the Cisco KVM Login page of the GMS node in a Web browser.
4. Click the **Launch KVM Manager** button to open the KVM login page.

5. Log in to the KVM Manager using your credentials. All the blades available on the chassis are displayed.

6. Click the **Launch** button for the first node. Click **OK** to download and open the `kvm.jnlp` file.

   The following image illustrates the opening of the `kvm.jnlp` file.

   ![Opening kvm.jnlp](image)

7. In the KVM Native Library warning box, click **OK**.

8. The console for the port is displayed. Click the **Virtual Media** tab.

9. Click **Activate Virtual Devices**.

10. Click **Map CD/DVD** and specify the path of the ISO image that you downloaded in Step 1.

    The following image illustrates the image that needs to be added.

    ![Map CD/DVD](image)
11. Check the check box in the **Mapped** column next to the ISO image to mount it.

The following image illustrates the selection of the check box.
12. Reboot the blade so that it can boot with the mounted image. Click the KVM tab and mouse over the Ctrl-Alt-Del from the Macros > Static Macros drop-down menu to select the option.

13. When the boot order screen appears, press F6 to select the boot order.

14. Execute the following command to start the manufacture process:

```
# manufacture.sh -v -t -f /mnt/cdrom/image.img -m 1D -L 1D --cc no --cs no --cl no -a
```

The following screens illustrate manufacturing of the node.
etht0: DEVC0000:71:0e:0
[ 55.613425] EDAC MCI: Giving out device to 'sbridge_edac.c' 'Sandy Bridge Soc
etht1: DEVC0000:71:0e:0
[ 55.740329] EDAC sbridge: Driver loaded.
Running startup scripts.
Running /etc/init.d/rcS.d/S10tmss_dhcpc
Starting DHCP client on interfaces: eth0 eth1

DHCP client started on eth0
DHCP client started on eth1
Sending discover...
Sending discover...
Sending discover...
Sending discover...
Sending discover...
Sending discover...
Dhcp eth0: failed to get lease
Dhcp eth1: failed to get lease
No lease, failing
No lease, failing
Running /etc/init.d/rcS.d/S30tmss_autostart
Automatically mounted cdrom /dev/scd to /mnt/cdrom
Running /etc/init.d/rcS.d/S34autofs
- Automatic manufacture is not enabled. Type 'autofs' to start it.

Processing /etc/profile... Done

 manufacture.sh -t -v -f /mnt/cdrom/image.img -m 1D -l 1D --cc no --cs no --cl no -a
The system displays the "Manufacture done" message and returns to the # prompt once the manufacturing of a blade is completed.

15. Uncheck the ISO image selected in step 11. Type `reboot` to reboot the node with the new ISO image.

### 3.2 Configuring Node as Master GMS Node

To configure the initial node as the master GMS node, perform the following steps:

1. Log in to the initial node using the Console.

2. Execute the following commands to set the password:

```bash
> en
# conf t
(config) # username root password <rootpassword>
(config) # username admin password <adminpassword>
```
3. Assign the IP addresses for the management interface and default gateway:

   > en
   # conf t
   (config) # interface <mgmt_interface> ip address <mgmt_IP_of_GMS_server><subnetmask_of_mgmt_network>
   (config) # ip default-gateway <mgmt_network_default_gateway_IP>

For example:

   (config) # interface eth0 ip address 192.168.103.78 /24
   (config) # ip default-gateway 192.168.103.1
   (config) # write memory

4. Download the patches from the FTP server to the GMS server in the /data/tmp_patch directory and apply all patches applicable for GMS nodes. For more information, refer to the MURAL Release Notes for a complete list of 4.0 release patches and installation instructions.

5. Update the CIQ sheet with MAC IDs. For details, see "Fetching MAC ID from UCS Manager" on page 70.

6. Copy the CIQ sheet into GMS node under the /data folder and run the CIQ2XML script (without WWID mode) to generate the Hardware XML file.

   # mount -o remount,rw /
   # cd /opt/etc/scripts/mmi/CIQ2GMSXML/src/
   # python GMSXMLGenerator.py -f /data/Mural_CIQ_Template.xls -u true -s 0

   GMS HARDWARE XML saved as /data/configs/gms/Mural_Hardware.xml

---

Copyright © 2017, Guavus Systems, Inc.
Successful execution creates an XML file under /data/configs/gms/ folder. In case of error, details are available in the log file stored at /data/mmi/ciq2gmsxml.log.

**Note:**

- The command executed in this step collects MAC IDs from all the blades and interfaces specified in the CIQ sheet. If UCS Manager is not enabled to fetch MAC IDs, update the CIQ sheet for MAC IDs and run the command above without the ‘-u true’ option.
- If the command is unable to fetch the MAC IDs, automatically, refer to "Fetching MAC ID from UCS Manager" on page 70.

6. Ensure that the hardware XML file has been created and available under /data/configs/gms folder.

```bash
# ls -l /data/configs/gms/Mural_Hardware.xml
-rw-r--r-- 1 admin root 27352 Feb 23 11:16
/data/configs/gms/Mural_Hardware.xml
#
```

### 3.3 Manufacturing Other Nodes using the GMS Node

To manufacture all the other nodes for MURAL, perform the following steps:

1. Copy (by SCP or FTP) ISO image file into master GMS node under /data directory. This configures GMS node as the PXE boot server that is used to boot other nodes using the ISO image of MURAL.

2. Execute the prePxeGmsFlow.py script to mount the ISO image for all the nodes. Provide the information as mentioned in the following table.
<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hardware xml</td>
<td>Name and full path of the hardware XML file, name is same as the value of XML File Name from the MiscInfo tab in CIQ sheet.</td>
<td>Mural_Hardware.xml</td>
</tr>
<tr>
<td>Management Network</td>
<td>Name of the management network, same as value of Network Name in the NetworkInfo tab in CIQ sheet. hardware xml name.xml is a dynamic parameter that changes as per the hardware xml name provided, for example Mural_Hardware_StandardPack.xml</td>
<td>MgmtNW</td>
</tr>
<tr>
<td>ISO file name</td>
<td>Filename with full path of ISO image used to manufacture nodes.</td>
<td>/data/mfgcd-atlas4.0.rc2.iso</td>
</tr>
</tbody>
</table>

The following sample may resemble the output.

```
> en
# _shell
# cd /opt/etc/scripts/GMS_FlowAutomation
# python prePxeGmsFlow.py

#Logging started in log file : /data/mmi/install_gms_20161006.log
Available XML's:
/data/configs/gms/Mural_Hardware_StandardPack.xml
Enter the Hardware xml generated [default = Mural_Hardware_StandardPack.xml]:
Enter the Management Network name in Mural_Hardware_StandardPack.xml Hardware xml : MgmtNW
Enter the ISO path : /data/mfgcd-atlas4.0.rc2.iso

Initializing the GMS Node Class ...
```
Stopping PM Process: pgsql
Current state of pgsql : stopped
Stopping PM Process: gms_server
Current state of gms_server : stopped
GMS Version Mode set: lite-version
Starting gms_server process
Launched GMS in lite-version
Waiting web services to come up
Activating GMS HW XML: /data/configs/gms/Mural_Hardware_StandardPack.xml
Gms Hw Xml Activated : True
Fetching ISO: /data/mfgcd-atlas4.0.rc2.iso on GMS Node
ISO Fetch complete Done
Mounting ISO: mfgcd-atlas4.0.rc2.iso
Image mount successfully completed

Please manually execute the gms pxeBoot enable command(s) on gms master

Execution Complete !!!

Reboot all other blades to boot via PXE to initiate manufacturing
via cli on GMS node, execute below command till all blades are manufactured:
gms show manufacturing all

3. Launch PXE boot using the KVM console for all the MURAL nodes, one by one to manufacture the nodes with ISO image:

<table>
<thead>
<tr>
<th># cli -m config</th>
</tr>
</thead>
<tbody>
<tr>
<td>For all the nodes:</td>
</tr>
<tr>
<td>(config) # gms pxeBoot cluster all node all ucsManagerIP &lt;IP of UCS Manager&gt; loginName &lt;User Name&gt; loginPassword &lt;User Password&gt;</td>
</tr>
<tr>
<td>For example:</td>
</tr>
<tr>
<td>(config) # gms pxeBoot cluster all node all ucsManagerIP 192.168.125.4 loginName Gurgaon\uttam.meena loginPassword *</td>
</tr>
<tr>
<td>For a single node:</td>
</tr>
<tr>
<td>(config) # gms pxeBoot cluster &lt;cluster-name&gt; node &lt;node-name&gt; ucsManagerIP &lt;IP of UCS Manager&gt; loginName &lt;User Name&gt; loginPassword &lt;User Password&gt;</td>
</tr>
<tr>
<td>For example:</td>
</tr>
</tbody>
</table>
(config) # gms pxeBoot cluster DN-CLUS node UCS-DN-1
    ucsManagerIP 192.168.125.4 loginName Gurgaon\uttam.meena
    loginPassword *

**Note:** User ID used for loginName must have admin privilege on UCS Manager for all the MURAL nodes.

The following sample may resemble the output:

```
Total number of nodes to be processed : 1
Total number of nodes processed :1 . . . . . . . . . . . .  .
All nodes proccessed
Cluster : DN-CLUS       Node : UCS-DN-1 Sucessfully Pxebooted
```

This command triggers blade reboot from network. Once the blade starts booting from the network, GMS pushes the image on the blade using PXE boot. Manufacture process can be started on each blade in parallel.

A blade takes approximately 30 to 45 minutes to manufacture with the new image. Run the following command to check the blade manufacture status.

```
(config) # gms show manufacturing-status cluster <Cluster Name>
```

The following example illustrates the PXE boot status for nodes under specific cluster:

```
(config) # gms show manufacturing-status cluster DN-CLUS
UCS-DN-1: OK : Product release:  4.0.rc2
UCS-DN-2: OK : Product release:  4.0.rc2
```

The following example illustrates the PXE boot status for all the nodes:

```
(config) # gms show manufacturing-status all
```
Note: If the command based on PXE boot from GMS is not possible as mentioned in the procedure above, see "PXE Boot of Blades using the KVM console" on page 71 to launch blade PXE boot using KVM console.

3.4 Preparing the Final XML with WWIDs and Applications

Prerequisite

Once all blades are ready with MURAL image, ask hardware team to assign the required LUNs to respective nodes as specified in sizing sheet.

To collect storage information, perform the following:

1. Log into Master GMS node and run the following commands to reboot all the nodes after LUN allocation is done by hardware team. Provide the name of the Application XML and Management network name. If the name of the Application XML is same as the value displayed for default, press Enter.

```
> en
# _shell
# mount -o remount,rw /
# cd /opt/etc/scripts/GMS_FlowAutomation
# python reload_all_nodes.py
```

The output may resemble to the following sample.

```
Logging started in log file : /data/mmi/install_gms_20161006.log
Available XML's :
/data/configs/gms/Mural_Hardware.StandardPack.xml
Enter the Hardware xml generated [default = Mural_Hardware.StandardPack.xml]:
Enter the Management Network name in Mural_Hardware.StandardPack.xml : MgmtNW
GMS Version Mode set: lite-version
Cluster = rge-clu :
rge-1 => 192.168.188.53
rge-2 => 192.168.188.55 Cluster = ui-clu :
```
ui-1 => 192.168.188.57
ui-2 => 192.168.188.62
Cluster = col-clu :
col-1 => 192.168.188.58
col-2 => 192.168.188.59
Cluster = gms-clu :

Restarting Node: 192.168.188.62

-----------------------------
Reloading nodes of Cluster : col-clu
Restarting Node: 192.168.188.58
Restarting Node: 192.168.188.59

-----------------------------
Reloading nodes of Cluster : gms-clu
ALERT : This node [self] will also be restarted at the end:
192.168.188.66
Restarting Node: 192.168.188.56
-----------------------------
See "Getting the WWIDs of LUNs" on page 73 to collect WWIDs and update CIQ sheet.

2. Copy (SCP or FTP) the updated CIQ sheet into GMS node under /data directory.

3. Log into the GMS node using ssh and run the following commands to prepare the final XML:

```bash
> en
# _shell
# mount -o remount,rw /
# cd /opt/etc/scripts/mmi/CIQ2GMSXML/src/
# python GMSXMLGenerator.py -f /data/Mural_CIQ_Template.xls -s 1
File Exists!! Do you want to overwrite file at /data/configs/gms/Mural_Hardware.xml [Y/N]: Y
GMS HARDWARE XML saved as /data/configs/gms/Mural_Hardware.xml
**********************************************************************
SUCCESSFULLY COMPLETED GMS HARDWARE XML GENERATION
```
Successful execution creates an XML file under /data/configs/gms/ folder. In case of error, details are available in the log file stored at /data/mmi/ciq2gmsxml.log.

```bash
# ls -l /data/configs/gms/Mural_Hardware.xml
-rw-r--r-- 1 admin root 32349 Feb 23 11:26 /data/configs/gms/Mural_Hardware.xml
```

### 3.5 Applying Patches on MURAL Nodes

Apply all the patches applicable for the respective MURAL nodes.

**Note:** Refer to the MURAL Release Notes for a complete list of patches and installation instructions.
4. Configuring Mural Nodes

After you have installed the MURAL software on GMS, perform the following tasks to configure the software:

**Note:** It is recommended to create screen and use the created screen for installation to ensure that the connection is not lost between the terminal and servers during installation process.

4.1 Creating GMS XML using Deployment Wizard

The GMS XML is created by using the deployment wizard. The XML is further used for configuring the nodes by scripts.

To create the GMS XML, perform the following steps:

1. From the command terminal, execute the following commands to launch MURAL Deployment wizard to prepare the final hardware XML.

```bash
# sh /opt/etc/scripts/mmi/cisco_muralDeployment_wizard.sh
```

The MURAL Deployment wizard, as illustrated below, is launched on the terminal to accept various configuration inputs.

![MURAL Deployment wizard screenshot](image)

General instructions to use the MURAL Deployment wizard:
MURAL Software Installation Guide

- Use arrow keys to navigate in the Deployment wizard.
- Use Space-bar to choose the selected item(s).

- Press **Enter** after selecting **Next**, **Previous** or **Exit** to move into next screen, previous screen or exit from the Deployment wizard, respectively.

- Selected items appear with swapped colors for text and background.

By default, MURAL installs Content Analytics (CA) application and following additional application can be selected if purchased. These additional applications have impact on resources required for deployment and should be enabled only if the deployment was sized for them:

- Bulkstats and KPI
- Anomaly
- Tethering

MURAL nodes are further classified and installed together in a particular cluster to host specific application component. The following table lists cluster configurations for various installation types and applications to be selected for these clusters.

<table>
<thead>
<tr>
<th>Installation Type</th>
<th>GMS Cluster</th>
<th>Collector Cluster</th>
<th>UI Cluster (RGE)</th>
<th>iNSTA Cluster</th>
<th>DN Cluster</th>
</tr>
</thead>
<tbody>

</table>

2. Select **Generate & Exit**, and press the **Enter** key to create the final XML.

   After successful execution final XML (/config/gms/Mural_Application.xml) is generated.

### 4.2 Assigning Role to MURAL Nodes

After all the nodes are manufactured and GMS XML is manufactured, the nodes are assigned roles to be performed.

1. Log into the GMS server using the management IP address and start the configuration

2. Execute the `postPxeGmsFlow.py` script on the GMS server:

   ```
   > en
   # _shell
   # cd /opt/etc/scripts/GMS_FlowAutomation
   # python postPxeGmsFlow.py
   ```

3. The script installs appliance on all the nodes.
Provide the name of the Application XML and Management network name. If the name of the Application XML is same as the value displayed for default, press Enter.

The following sample may resemble the output:

```
Logging started in log file: install_gms_20160711.log

Enter the Application Installation xml generated [default = Mural_Application.xml]:

Enter the Management Network name in Mural_Application.xml:

Application xml : MgmtNW

From output messages of postPxeGmsFlow.py script, make sure that all the nodes have been successfully installed, before moving to next step.

4. Run the following command on pmx subshell of the master Name node:

```
# pmx_subshell hadoop_yarn repair hdfs
```

### 4.3 Configuring Site-Specific Applications

If anonymization feature is enabled, run the following commands on both the master and standby Name nodes:

```
# cli -m config
(config) # collector anonymization key <key> iv <iv_key> encode
(config) # write memory
(config) # pm process collector restart
(config) # quit
```

For example:

```
(config) # collector anonymization key
01234567890123456789012345678901 iv 0123456789012345 encode
```

`<key>` and `<iv_key>` string shall be provided by customer during installation.
4.4 Verifying the Setup

After making any performance related modifications, verify that the processes are running.

**Note:** After you make any modifications, wait for at least 15 minutes to ensure processes have had a chance to restart before running the following commands.

4.4.1 Verifying Processes

Perform the following steps to verify that the required processes are running:

1. Log in to the master Name node and execute the following commands to verify that all Compute nodes have joined the HDFS cluster. The output shown in the following sample command sequence indicates correct configuration.

```bash
> en
# _shell
# ps -ef | grep java | grep Dproc | grep -v Dproc_dfs | awk '{print $9}'
-Dproc_historyserver
-Dproc_journalnode
-Dproc_namenode
-Dproc_resourcemanager
-Dproc_namenode
-Dproc_datanode
-Dproc_secondarynamenode
#
# hdfs dfsadmin -report | egrep "available|Name|Status"
Datanodes available: 3 (3 total, 0 dead) Name:
10.10.2.13:50010
Decommission Status : Normal
Name: 10.10.2.14:50010
Decommission Status : Normal
Name: 10.10.2.17:50010
Decommission Status : Normal
```
Note: The IP addresses mentioned in the sample code above are internal IP addresses.

2. Run the following commands on the standby Name node:

```bash
> en
(config) # _shell
# ps -ef | grep java | grep Dproc | grep -v Dproc_dfs | awk '{print $9}'
-Dproc_namenode
-Dproc_namenode
-Dproc_datanode
-Dproc_secondarynamenode
-Dproc_journalnode
```

3. Log into the master Insta node, and execute the following commands:

```bash
> en
# conf t
(config) # show pm process insta
```

If the process is running, the command output is Current status: running.

Execute the following command to verify the status of the Insta node.

```bash
(config) # insta infinidb get-status-info
```

The output must show all modules in ACTIVE state. It must also list all the instances and Adaptor status as RUNNING.

4. Log into the standby Insta node and repeat the same commands shown in step 3.

5. Execute the following commands to check status of Postgres process on both the Master and Standby nodes.

For the Standard Pack setup, check the status of Postgres on GMS, Collector and iINSTA nodes.
For the Medium Pack setup, check the status of Postgress on GMS and iNSTA nodes.

```bash
> en
# _shell
# ps -ef | grep postmaster | grep -v grep
2278 1 0 Feb13 ? 00:22:34
/usr/pgsql-9.3/bin/postmaster -p 5432 -D /data/pgsql/9.3/data
```

### 4.4.2 Verifying Installation with Dummy Data

You can verify the installation and identify configuration issues by running the custom utility. For more information, see "Verifying Installation with Dummy Data" on page 75.
5. Configuring ASR and IBs

This topic provides information about creating and configuring the ASR and IBs. It also provides information about verification of the collector processes.

To configure your system for the data specific for your environment, you must update the information bases (IBs) and fetch them. In some cases, you might need to also manually modify the IBs to add or reclassify entries.

5.1 Updating IBs

The following table shows a sample data set for setting up the IBs.

![Sample Data Set](image)

**Note:** Refer to the preceding table as a sample. Use the data that matches your environment. For example, for GGSN, you may want to use GGSN, PGW, or HA. In this case, GGSNIP is the management IP address. For SGSN, you may want to use SGSN, SGW, HSGW, or PDSN. In this case, SSGNIP is the service IP address.

To configure the IBs:

1. Log into the master collector node and execute the following commands:

   ```
   [admin@collector-1 ~]# pmx
   Welcome to pmx configuration environment.
   pm extension> subshell aggregation_center
   pm extension (aggregation center)> update all ibs from image
   ```

2. Enter the GGSN IPs and GGSN names:

   ```
   pm extension (aggregation center)> edit ib ipGgsn.map add
   GGSN IP: 27.23.157.1
   GGSN: GGSN1
   pm extension (aggregation center)> show ib ipGgsn.map
   ```
1[27.23.157.1][GGSN1]

pm extension (aggregation center)>

3. Enter the SGSN IPs and SGSN name:

pm extension (aggregation center)> edit ib ipSgsn.map add
SGSN IP: 2.2.2.1
SGSN: SGSN1

pm extension (aggregation center)> show ib ipSgsn.map
1[2.2.2.1][SGSN1]

pm extension (aggregation center)>

4. Enter the APN name and corresponding APN group:

pm extension (aggregation center)> edit ib apnGroup.map add
APN: Sushfone-1APN Group: Sushfone-1

pm extension (aggregation center)> show ib apnGroup.map
1[Sushfone-1][Sushfone-1]
2[Sushfone-2][Sushfone-2]
3[Sushfone-3][Sushfone-3]pm extension (aggregation center)> quit

For performing the cell sector annotation see Modifying Behaviour for Cell Sector Annotation.

Execute the following commands to configure the IBs for BulkStats:

pm extension> subshell bulkstats
pm extension (bulk stats)> update all ibs from image
pm extension (bulk stats)> quit

5.2 Adding ASR Gateways

Add all new DC or gateways to the configuration for the system. DC, ASR, and Gateway are synonymous terms and can be used interchangeably. Gateway/DC name is a unique key for a gateway configuration. In the BulkStat hierarchy, the gateway name and DC name are the same.

The following section lists guidelines for adding new gateways:
- All input directories are created under the /data/collector path. Hence, in the example below, the ASR should send EDR files to data/collector/California/edr1 and send the Bulkstats file to /data/collector/California/bs1.

**Important:** Confirm the actual input directories with the Cisco Technical Support team for your ASR platform.

- Log into master Name-node and create a CSV file (under /data dir) for adding the gateways into system as per below prescribed format and example:

|---|---|---|---|---|---|---|---|---|---|---|---|

**Note:** This header must be the first line in the CSV file and the gateway details must be added after these.

Example of EDR with Bulkstat.

DC1,DC1,REGION1,AREA1,19,UTC,*_MURAL-edr- *
*_MM%DD%YYYY%hh%mm%ss*,*_YYYY%MM%DD%hh%mm%ss,*_*
*_MM%DD%YYYY%hh%mm%ss*.gz,*_YYYY%MM%DD%hh%mm%ss,192.168.192.130
192.168.192.131,/DC1/edr,/DC1/bs

Example of EDR with without Bulkstat.

DC1,DC1,REGION1,AREA1,,UTC,*_MURAL-edr- *
*_MM%DD%YYYY%hh%mm%ss*,*_ *
*_MM%DD%YYYY%hh%mm%ss*.gz,,192.168.192.130|192.168.192.131,/DC1/edr,

**Note:** Use internal physical IPs for collector IPs and separate them using vertical bar i.e. "|" for multiple entries.

For adding gateway without Bulkstat feed, keep the fields related to Bulkstat empty.

For EDR filename patterns, see "File Pattern Regular Expression" on page 89.
To configure gateways:

1. Add gateway information for each gateway based on the guidelines provided in the preceding table:

```plaintext
> en
# config
(config)# pmx subshell aggregation_center
pm extension (aggregation center)> Welcome to pmx configuration environment.
pm extension (aggregation center)> add bulk gateways
Please enter bulk file path: /data/gw.csv
```

2. Verify that the new gateway has been added successfully:

```
pm extension (aggregation center)> show gateways
```

3. Verify the IP addresses for all Collectors:

```
pm extension (aggregation center)> show collector IPs
192.168.103.110, 192.168.103.113
pm extension (aggregation center)>
```

4. Verify that the BulkStats timezone is UTC in gateway.conf for every gateway. The reason for this is that the ASR internally changes the time zone to GMT for the BulkStats file. Edit gateway.conf for every BulkStats source at the path:

```
/data/configs/gateway/gateway.conf "timezone": "UTC"
```

5. Push the gateway configuration to all the Collectors:

```
pm extension (aggregation center)> push gateway configuration
```

6. Generate and push all IBs:

```
pm extension (aggregation center)> generate urlcat ib from image
pm extension (aggregation center)> show urlcat version
pm extension (aggregation center)> generate all ibs
pm extension (aggregation center)> push all ibs
pm extension (aggregation center)> quit
```
For Bulkstats:

```
pm extension> subshell bulkstats
pm extension (bulk stats)> generate allibs
pm extension (bulk stats)> push allibs
```

Run the following commands if Anomaly Detection is enabled:

```
[admin@collector-1 ~]# pmx
Welcome to pmx configuration environment.
pm extension> subshell anomaly
pm extension (anomaly)> update allibs
pm extension (anomaly)> quit
```

### 5.3 Modifying Behaviour for Cell Sector Annotation

You can categorize the Cell Sectors, which are not present in the IB configuration into Other cells, and and GGSN and SGSN which are not present in the IB configuration into Miscellaneous.

The values of Cell Sectors, GGSN and SGSN to be retained in data are specified in the following IBs:

- `cellLocationInfo.list` for Cell Sectors
- `ipGGSN.map` for GGSN
- `ipSGSN.map` for SGSN

Perform the following steps for categorizing the Cell Sectors, GGSN and SGSN:

1. Execute the following command to create the backup of `Annotations.json`:

```
# mount -o remount,rw /
# cp -p /opt/etc/oozie/EDR/app/Annotations.json /opt/etc/oozie/EDR/app/Annotations.json.org
```

2. Execute the following command to check the current values assigned to `groupSGSNAsMisc`, `groupGGSNAsmisc` and `emitUsingMCCMNC`: 
3. Execute the following command to set the value of groupGGSNAsMisc as true:

```
# sed -i
's/"groupGGSNAsMisc":"false"/"groupGGSNAsMisc":"true"/
/opt/etc/oozie/EDR/app/Annotations.json
```

4. Execute the following command to set the value of groupSGSNAsMisc as true:

```
# sed -i
's/"groupSGSNAsMisc":"false"/"groupSGSNAsMisc":"true"/
/opt/etc/oozie/EDR/app/Annotations.json
```

5. Execute the following command to set the value of emitUsingMCCMNC as true:

```
# sed -i
's/"emitUsingMCCMNC":"false"/"emitUsingMCCMNC":"true"/
/opt/etc/oozie/EDR/app/Annotations.json
```

6. Execute the following command to validate the value of groupSGSNAsMisc, groupGGSNAsMisc and emitUsingMCCMNC:

```
# grep -e "groupSGSNAsMisc" -e "groupGGSNAsMisc" -e "emitUsingMCCMNC" /opt/etc/oozie/EDR/app/Annotations.json

"groupGGSNAsMisc":"true"
"groupSGSNAsMisc":"true"
"emitUsingMCCMNC":"true"
```

---

MURAL Software Installation Guide
5.3.1 Adding the Cell Sectors, GGSN and SGSN in IBs

If you want to retain the values of Cell Sectors, GGSN and SGSN, add their values in cellLocationInfo.list, ipGGSN.map and ipSGSN.map respectively.

To add the values, perform the following steps:

1. To add the values of Cell Sectors, GGSN and SGSN to be retained in cellLocationInfo.list, ipGGSN.map and ipSGSN.map respectively, execute the following commands:

```
> en
# conf t
(config)# pmx subshell aggregation_center
pm extension (aggregation center)> edit ib
cellLocationInfo.list add
MCC,MNC: 101,01
pm extension (aggregation center)> edit ib ipGgsn.map add
GGSN IP: 27.23.157.1
GGSN: GGSN1
pm extension (aggregation center)> edit ib ipSgsn.map add
SGSN IP: 2.2.2.1
SGSN: SGSN1
```

**NOTE:** If the IB is empty, all the cell sectors will be emitted as "Other Cells".

2. To update the IBs, execute the following commands:

```
> en
# conf t
(config)# pmx subshell aggregation_center
pm extension (aggregation center)> generate all ibs
pm extension (aggregation center)> push all ibs
```

5.4 Adding Home Network for Outbound Roaming Report

You can generate a report to understand the usage of the subscribers who are roaming (outbound roamers). MURAL provides device, content and Service
Provider usage reports per roaming partner based on the feature.

For the outbound roaming report feature, you must configure the mobile country code (MCC)/mobile network code (MNC) of the required outbound roamers.

Perform the following steps:

1. Verify if the outbound roaming report feature is enabled:

```
> en
# _shell
# grep -e "emitCubes" /opt/etc/oozie/EDR/app/Annotations.json
"emitCubes":"true",
```

**Note:** The value of "emitCubes" as "true" signifies that the feature is enabled.

2. Execute the following commands to add the MCC/MNC of the outbound roamers:

```
> en
# conf t
(config)# pmx subshell aggregation_center
pm extension (aggregation center)> edit ib homeNetwork.list
add
mcc: <mobile country code of roamer>
mnc: <mobile network code of roamer>
```

Add all the possible MCC/MNC combinations. To view all the added values:

```
pm extension (aggregation center)> show ib homeNetwork.list
1 [440][001]
```

3. Execute the following commands to add the IB to the system:

```
pm extension (aggregation center)> push ib homeNetwork.list
```

**Note:** Execute the code, opt/etc/scripts/validateHomeNwList.py before running the core job to check any overlapping MNC prefixes for a given MCC in the home network list.
For example,

```bash
# python /opt/etc/scripts/validateHomeNwList.py
```

The output may resemble to the following sample:

```
Fetching information from /data/ib/inbox/homeNetwork.list
Fetching information from /data/ib/inbox/globalNetwork.list
For 440:002 also exits 440:00
For 310:02 also exits 310:020
```

### 5.5 Verifying Collector Process

To verify the collector process, run the following command on both the master and standby Collector:

```bash
# cli -t "en" "conf t" "show pm process collector" | grep status
Current status: running
```
6. Processing the Data

This section includes information for setting up an ASR user in the Collector nodes and sending the EDR and BulkStats data feeds to the MURAL platform, setting the data start time, and running the data processing commands.

6.1 Verifying Incoming Data

This section includes information for setting up an ASR user in the Collector nodes and sending the EDR and BulkStats data feeds to the MURAL platform, setting the data start time, and running the data processing commands.

Use one of the ASR data feed methods to send data to the MURAL platform.

6.1.1 Creating a New User for the ASR in the Collectors

Perform the following step to set up a new user for the ASR in the Collectors.

1. Log into the master Collector node and execute the following commands create the user:

```bash
> en
# conf t
(config)# username <username> password <password>
(config)# write memory
(config)# _shell
```

**Note:** The username and password must be same as configured on the ASR for EDR and BulkStats file transfers.

6.1.2 Configuring the SSH Session Limit

Perform the following steps to configure the SSH session limits:

1. Execute the following commands to set the concurrent SSH limit to 50:

```bash
> en
# conf t
(config) # ssh server max-startups 50
```
2. Repeat steps 1 through 2 on the standby Collector node.

### 6.1.3 Verifying the Input Data Feed

Start sending the EDR and BulkStats data feeds to the MURAL platform. If the ASR is used as an input node, the start time from the filename is created in the incoming EDR flow directory.

The file name has the timestamp, which can be used for job scheduling in the following process.

**Notes:**

- MURAL processes data that is received after the deployment is completed. MURAL is not configured to process the historical data.
- MURAL recommends ASR files to be of 10MB compressed size for optimum performance.

**Validating Data on the Collector Nodes**

1. Log into the master Namenode and go to _shell_.

```
> en
# _shell
```

2. Run the indicated **hdfs** commands for the **mm** variable (minutes) in the timestamp), specify a multiple of 5 (**05, 10, 15**, and so on) up to **55**.

**Note:** Specify the year, month day, hour, and minute for which data is being sent to the MURAL system.

If the Collector node is receiving data in the expected format, it retains the data in HDFS. These directories and files are updated continuously as the data keeps coming in.
6.2 Configuring Oozie Jobs

This topic provides information about setting the start time of the oozie jobs and starting the oozie jobs after configuring the start time.

6.2.1 Setting the Start Time of Oozie jobs

To set the data start time in the configuration, perform the following steps:

1. Log into the master Name node and make the root "/" file system writable.

```bash
> en
# _shell
# mount -o remount,rw /
# cd /opt/deployment/Mural_setStartTime/
# ./setOozieTime --dataStartTime data-start-time --node --password admin-password
```

2. Execute the `setOozieTime` script to set the time at which EDR and BulkStats data starts coming into the Hadoop directories listed in "Configuring Oozie Jobs" above.

For example, if EDR and Bulkstats data starts coming into the Hadoop system from April 1, 2015, 06:00 onwards, run the following scripts with the `start_time` value as "2015-04-01T06:00Z":

```bash
# ./setOozieTime --dataStartTime 2015-04-01T06:00Z --node 192.168.147.11 --password admin@123
```

Note:

- Enter minutes as a multiple of 5. For example, "2013-04-01T06:00Z."
- If the start time is not provided in the command, system takes the current time of system as start time.
- If the start time of the setoozie script is set as the last day of the month, update the job timing of AnomalyHiveMonthly manually after executing the script. The new job start time to be updated should be last hour of the next month +/- offset of based on timezone. For example, if data start time for the system is 31st march 5:00 and
timezone is europe/budapest, then set the job AnomalyHiveMonthly starttime as 30 april 22:00.

Execute the following commands to update the start time:

```bash
> en
# _shell
# pmx subshell oozie
pm extension (oozie)> set job AnomalyHiveMonthly attribute jobStart 2016-04-30T22:00
```

3. Execute the Set Job Time Script for both the master and standby Namenodes.

   **Note:** This script may take upto 30 minutes to complete for one node. Therefore, wait until it completes and returns to the prompt.

### 6.2.2 Starting the Oozie Jobs

Log into the master Name node and run the data processing commands from the Oozie subshell:

```bash
> en
# conf
ten
(config)# pmx
Welcome to pmx configuration environment.
pm extension> subshell oozie
pm extension (oozie)> run job all
```

The command output shows all the jobs that were initiated and if the jobs started successfully or not.

**Note:** It may take approximately 20 minutes to start all the jobs, depending upon what all applications are enabled.

### 6.3 Validating Data on Nodes

This section includes instructions for validating data after completing the system installations.
6.3.1 Validating Data on the Compute Blades (Data Nodes)

This section includes the steps required to validate data on the Compute blades (Data nodes) following the installation process.

**Caution:** Wait for two hours after completing the steps in "Validating Data on Nodes" on the previous page. This allows sufficient time for the jobs that process the collector data to start, and the done.txt files to be updated. If you do not wait, the validation may fail.

6.3.2 Validating EDR Data

1. Log into the master node and go to the _shell.

```bash
> en
# _shell
```

2. Check the last timestamp for the Core job.

```bash
# hdfs dfs -text /data/CoreJob/done.txt
```

3. Check the last timestamp for the EDR data cubes being generated by the job.

```bash
# hdfs dfs -text /data/EDR/done.txt
```

4. Check the last timestamp for CubeExporter data cubes.

```bash
# hdfs dfs -text /data/CubeExporter/done.txt
```

5. Check the last timestamp for generated and exported Bulkstats data cubes.

```bash
# hdfs dfs -text /data/BulkStat/done.txt
# hdfs dfs -text /data/BSAgg15min/done.txt
# hdfs dfs -text /data/BulkStatExporter_15min/done.txt
```

6.3.3 Validating Outbound Roamer Job

**Caution:** Before executing this procedure, wait for at least 30 minutes after verifying the successful running of CoreJob.
If the Outbound Roaming Report feature is enabled, execute the following command to verify the last timestamp of the OutboundRoamingReport job after the first instance of CoreJob completes:

```bash
> en
#_shell
# hdfs dfs -text /data/OutboundRoamingReport/done.txt
```

The output may resemble to the following sample:

```
2016-07-28T00:00Z
```

The following reports are generated:

- **OutboundRoamingReport_Content_09122016-1.csv** (from FLOW)
  
  "#DC, #RAT, #Country, #Network, #Device, #TT App, #TT App Category, #Down Bytes, #Up Bytes, #Flow Count, #Flow Duration, #Peak Flow Duration, #Subscriber Count"

- **OutboundRoamingReport_SP_09122016-1.csv** (from FLOW and HTTP)
  
  "#DC, #RAT, #Country, #Network, #SP, #Is HTTPS, #Down Bytes, #Up Bytes, #Hit Count, #Hit Duration, #Peak Hit Duration, #Subscriber Count"

### 6.3.4 Validating Insta Data

1. Log into the master Insta node and check the name of the database configured for DPI:

```bash
> en
#_shell
# cli -t "en" "conf t" "show runn full" |
grep "insta instance 0 cubes-database" | awk -F ' ' '{print $5}'
database_mural
```

2. Open the **idbmysql** user interface and specify **database_mural** as the database.

```bash
# idbmysql
Welcome to the MySQL monitor. Commands end with ; or \g.
...
mysql> use database_mural;
Database changed

3. Display the values in the **mints** and **maxts** columns for the 60-minute bin class and -1 aggregation level (shown in the first row of the following example).

```sql
mysql> select * from bin_metatable;
```

```
+-------------------+-------------------+-----------+-----------+-----------+-------------------+
| binclass | aggregationinterval | mints | maxts | binType | maxexportts |
+-------------------+-------------------+-----------+-----------+-----------+-------------------+
| 60min | | -1 | 1483228800 | 1483527600 | NULL |
| 1483527600 | |
| 60min | | 86400 | 0 | 0 | NULL |
| 0 | |
| 60min | | 604800 | 0 | 0 | NULL |
| 0 | |
| 60min | | 2419200 | 0 | 0 | NULL |
| 0 | |
+-------------------+-------------------+-----------+-----------+-----------+-------------------+
4 rows in set (0.02 sec)
```

4. Run the **date** command to convert the values from the **mints** and **maxts** columns to human-readable format.

The following example indicates that data was processed between 00:00 on January 1 and 11:00 on January 4.

```
date -d@1483228800
Sun Jan  1 00:00:00 UTC 2017
date -d@1483527600
Wed Jan  4 11:00:00 UTC 2017
```
6.3.5 Validating Bulk Stats Data on the Insta Blade

1. Use SSH to log into the master Insta node and check the name of the database configured for EDR:

```bash
> en
# _shell
# cli -t "en" "conf t" "show runn full" |
grep "insta instance 1 cubes-database" | awk -F ' ' '{print $5}'
bulkstats
```

2. Open the `idbmysql` user interface and select `bulkStats` as the database.

```bash
# idbmysql
Welcome to the MySQL monitor. Commands end with ; or \g.
...
mysql> use bulkStats;
Database changed
```

3. Display the values in the `mints` and `maxts` columns for the 900 aggregation interval (shown in the second row in the example).

```sql
mysql> select * from bin_metatable;
```

<table>
<thead>
<tr>
<th>binclass</th>
<th>aggregationinterval</th>
<th>mints</th>
<th>maxts</th>
<th>binType</th>
</tr>
</thead>
<tbody>
<tr>
<td>5min</td>
<td>-1</td>
<td>0</td>
<td>0</td>
<td>NULL</td>
</tr>
<tr>
<td>5min</td>
<td>900</td>
<td>1364713200</td>
<td>1367293500</td>
<td>NULL</td>
</tr>
<tr>
<td>5min</td>
<td>3600</td>
<td>1364713200</td>
<td>1365004800</td>
<td>NULL</td>
</tr>
<tr>
<td>5min</td>
<td>86400</td>
<td>1364688000</td>
<td>1364860800</td>
<td>NULL</td>
</tr>
<tr>
<td>5min</td>
<td>604800</td>
<td>0</td>
<td>0</td>
<td>NULL</td>
</tr>
<tr>
<td>5min</td>
<td>2419200</td>
<td>0</td>
<td>0</td>
<td>NULL</td>
</tr>
</tbody>
</table>

6 rows in set (12.18 sec)

mysql> quit
```

4. Convert the date format. Run the `date` command with the value of `maxts` (captured from the step above) for the row which shows `aggregationinterval` as 900.
The following example indicates that data was processed between 09:45 on July 30 and 08:45 on August 29.

<table>
<thead>
<tr>
<th>Command</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td># date -d @1406713500</td>
<td>Wed Jul 30 09:45:00 UTC 2014</td>
</tr>
<tr>
<td># date -d @1409301900</td>
<td>Fri Aug 29 08:45:00 UTC 2014</td>
</tr>
</tbody>
</table>

### 6.3.6 Configuring System Monitoring Interface

System Monitoring Interface (SMI) is a dashboard that can be used to display MURAL's system-related health information for the rolling 24-hours period.

Benefits of SMI:

- The system administrator can check the health of the MURAL system and contact Technical Support if a condition is not being met.
- The system administrator can use the dashboard to provide assurance to customer that MURAL services are working fine as per the benchmarking.

**Note:** You can install SMI only in a Standard pack or a Medium pack.

To configure SMI, perform the following steps:

1. Log into the RGE node master node.

2. Execute the following command to copy the active GMS file from the GMS node to the RGE master node:

   ```
   > en
   # _shell
   # cd /var/home/root
   # scp admin@<GMS Master IP/Hostname>:/config/gms/active-configuration/resolved_active.xml .
   ```

3. Execute the following commands to install SMI on the RGE master node:

   ```
   # cd /var/home/root
   # tar -xvzf pkg_dashboard.tgz
   # ./install_dashboard.sh
   ```
The output may resemble as follows:

```
------------------------------------------------------------------------
                install_dashboard.sh:msg: Usage.......                
------------------------------------------------------------------------

------------------------------------------------------------------------
                install_dashboard.sh:input: Enter TAR Filename(with full path): /var/home/root/dashboard.tgz
                install_dashboard.sh:input: Enter GMS XML Filename(with full path): /var/home/root/resolved_active.xml
                install_dashboard.sh:input: Enter Management Network Name used in above XML[MgmtNW]: MgmtNW
                install_dashboard.sh:msg: Network Name is : MgmtNW

------------------------------------------------------------------------

                install_dashboard.sh:msg: Extracting tar ball into node...
                .
                .
                .
                .
                .

                Stopping pm:
[ OK ]

                Starting pm:
[ OK ]

                install_dashboard.sh:msg: Dashboard configuration is done successfully!!!!
```

---

Copyright © 2017, Guavus Systems, Inc.
install_dashboard.sh:msg: Start Dashboard from UI by http://<This node IP>:15443

#

**Note:** Provide the value for "Management Network Name" attribute as specified in the resolved_active.xml file.

4. Execute the following commands to check if SMI processes have started successfully:

- To check if grafana is up:

```bash
# ps -ef|grep grafana
```

The output may resemble as follows:

```
admin 4300 2653 0 14:43 ?  00:00:00 /opt/grafana/bin/grafana-server -homepath=/opt/grafana
admin 6669 3148 4 14:44 pts/1  00:00:00 grep grafana
```

- To check if graphite and carbon-cache are up:

```bash
# ps -ef|grep graph
```

The output may resemble as follows:

```
admin 3313 2653 0 14:43 ?  00:00:00 /usr/local/bin/python /opt/graphite/bin/carbon-cache.py --nodaemon --logdir=/var/log --pidfile=/var/run/carbon-cache.pid start
```
MURAL Software Installation Guide

```
admin  5546  2653  1 14:43 ?  00:00:00
/usr/local/bin/python /usr/local/bin/gunicorn_django --
bind=127.0.0.1:12040 --log-file=/var/log/gunicorn-
graphite/gunicorn.log --preload --
pythonpath=/opt/graphite/webapp/graphite --
settings=settings --workers=3 --pid=/var/run/gunicorn-
graphite/gunicorn-graphite.pid

admin  5753  5546  0 14:43 ?  00:00:00
/usr/local/bin/python /usr/local/bin/gunicorn_django --
bind=127.0.0.1:12040 --log-file=/var/log/gunicorn-
graphite/gunicorn.log --preload --
pythonpath=/opt/graphite/webapp/graphite --
settings=settings --workers=3 --pid=/var/run/gunicorn-
graphite/gunicorn-graphite.pid

admin  5773  5546  0 14:43 ?  00:00:00
/usr/local/bin/python /usr/local/bin/gunicorn_django --
bind=127.0.0.1:12040 --log-file=/var/log/gunicorn-
graphite/gunicorn.log --preload --
pythonpath=/opt/graphite/webapp/graphite --
settings=settings --workers=3 --pid=/var/run/gunicorn-
graphite/gunicorn-graphite.pid

admin  5779  5546  0 14:43 ?  00:00:00
/usr/local/bin/python /usr/local/bin/gunicorn_django --
bind=127.0.0.1:12040 --log-file=/var/log/gunicorn-
graphite/gunicorn.log --preload --
pythonpath=/opt/graphite/webapp/graphite --
settings=settings --workers=3 --pid=/var/run/gunicorn-
graphite/gunicorn-graphite.pid

admin  6702  31484  0 14:44 pts/1  00:00:00 grep
```
Note the running statuses of the graphite and carbon-cache processes as highlighted in the preceding sample output.

5. Execute the following commands:

```bash
# cli -m config
(config)# cluster master self
(config)# quit
```

6.4 Starting UI Processes and Verifying Data

Start the UI processes and verify UI data. Ensure that the URL is set up in the DNS for the production system.

Starting the Rubix Tomcat Instance on Both Nodes

**Note:** You should only start UI Tomcat instances after at least two hours of data has been pushed into the Insta node.

1. Log into the master UI node.

   ```bash
   > en
   # conf t
   ```

   If RGE and DPI UI are running on same node, execute the following command:

   ```bash
   (config)# rubix modify-app rge set adv-attribute rubixReportQueueMax value 1
   (config)# write memory
   ```

2. Run the following commands to start the EDR process.

   ```bash
   (config)# pm process rubix restart
   (config)# rubix modify-app atlas enable
   (config)# rubix modify-app atlas modify-instance 1 enable
   (config)# write memory
   ```

   Check the tomcat process status using command:
3. Run the following commands to start the other processes:

```
> en
  # conf t
  (config)# pm process rubix restart
  (config)# rubix modify-app ApplicationName enable
  (config)# rubix modify-app ApplicationName modify-instance 1 enable
  (config)# write memory
```

Where `ApplicationName` is replaced by the following applications in the same order:

- bulkstats
- reportAtlas
- rge
- ruleEngine (if Anomaly or BulkStat is enabled)

Check the tomcat process status using command:

```
(config)# rubix status ApplicationName atlas
```

**Note:** Ensure the running status of above service as Current Status: running before starting the next process. Check the corresponding rubix.-log file to ensure that Atlas application is started properly without any exception.

4. Log into the standby node and repeat Steps 2 and 3.

5. Access the UIs by going to the URL `https://domain-name:6443/` through your browser.

The domain name to be used is the one which was provided at the time of initial configuration through GMS for the UI nodes configuration details. For example:
Note: Since the common certificate installation procedure is not finalized, you must click the same URL for the RGE ports once before opening the actual URL.

Visit the following ports once and accept the certificates:

https://domainName-report:20443/
https://domainName-report:30443/

For example:

https://demo-report.cisco.com:20443/
https://demo-report.cisco.com:30443/

6. If the Anomaly feature is enabled, also run the command on port 50443. For example,

https://demo-report.cisco.com:50443/

Note: Once the installation is completed, ensure to back up the configurations. Refer to the Operations and Troubleshooting Guide for more information.

6.5 Updating Whitelists

After running MURAL system for two-three hours, run the following command from master Namenode to generate updated whitelists:

```
# pmx subshell aggregation_center
pm extension (aggregation center)> generate whitelist
Triggered Whitelist Generation; Check status via 'show whitelist status' command
pm extension (aggregation center)> quit
pm extension> quit
#
```
Observe the categorization in UI after two hours to see the effects of whitelists update.

6.6 Setting Up Offline Reports

This topic provides information related to the configuration required for offline reports.

6.6.1 Uncategorized URL, UA, and TAC Reports

Create a file named serverFile_uncatReports on the master Namenode containing the destination information, to which the uncategorized URL, UA, and TAC reports would be copied.

1. The serverFile_uncatReports file contains the entries for the data transfer destination location. This file has the following format:

   `IP, username, password, location-to-copy-reports`

   For example,

   `192.168.156.96, admin, admin@123, /data/offline_uncat_reports`

   **Note:** The delimiter in this file must be ", " (comma followed by a space).

2. Log into the master Namenode and navigate to the /data/work sub-directory:

   ```
   $ en
   # _shell
   # cd /data
   # cd work
   ```

3. Create the serverFile_uncatReports file:

   ```
   # vi /data/work/serverFile_uncatReports
   192.168.156.96, admin, admin@123, /data/offline_uncat_reports
   ```

   **Note:** For the SCP protocol, the destination path should be the destination
server. The destination path is not required for SFTP.

4. Create the same file on the standby Namenode.

### 6.6.2 Tethering Reports

Create two files called `serverFile_tethering` and `serverFile_tethering_subscribers_report` with details of the ASR gateways, where the TAC, OS or UA databases, and subscriber reports created as a result of tethering processing, need to be pushed.

1. The `serverFile_tethering` file contains the entries for the data transfer destination location. This file has the following format:

<table>
<thead>
<tr>
<th>Gateway-IP, gateway-username, gateway-password, location-to-copy-reports</th>
</tr>
</thead>
</table>

Where:

- **Gateway-IP** is the ASR5K gateway IP address
- **gateway-username** is the username for logging into ASR5K Gateway
- **gateway-password** is the corresponding password to the username
- **location-to-copy-reports** is the location on the ASR5K Gateway machine where databases need to be copied

2. Log in to the master Namenode:

   ```
   > en
   # _shell
   ```

3. Go to the data directory and create a sub-directory named work:

   ```
   # cd /data
   # mkdir work
   ```

4. Go to the work subdirectory and create the files:

   ```
   # cd work
   # vi /data/work/serverFile_tethering
   192.168.156.96, admin, admin@123, /data/tethering_ibs
   ```
5. Create the same file on the standby Namenode as well.

For the SCP protocol, the destination path should be present at the destination server. This is not required for SFTP.

This file can have multiple rows of this kind.

### 6.6.3 Rule Base Reports

Create a file with details of ASR IP addresses, access the details and report the destination paths.

1. Log in to the master Name node and run the following commands:

```bash
> en
# _shell
# cd /data
# mkdir work
# cd work
# vi /data/work/serverfile_Rulebase
192.168.156.96, admin, admin@123, /data/ruleBase_reports
```

2. Create a similar file on the standby Name node as well.
A. Fetching MAC ID from UCS Manager

This topic provides information on getting the MAC ID from the UCS manager.

Before you execute the script, get UCS IP, and admin user password details.

1. Upload the `adaptors.sh` script available at `/opt/etc/scripts/GMS_FlowAutomation` on the master GMS node and execute the script from Master GMS Node.

```bash
# cd /opt/etc/scripts/GMS_FlowAutomation
# sh ./adaptors.sh <UCS IP> <adminPassword>
```

For example:

```bash
# cd /opt/etc/scripts/GMS_FlowAutomation
# sh ./adaptors.sh 172.30.4.9 *
1/1
eth0 00:A0:D7:42:08:7E
eth1 00:A0:D7:42:08:6E
1/2
eth0 00:A0:D7:42:08:9D
eth1 00:A0:D7:42:08:8D
1/3
eth0 00:A0:D7:42:08:5D
eth1 00:A0:D7:42:08:4D
```

**Note:** The script lists MAC IDs of all NICs for each blade that is installed into chassis/slot.

2. Update these MAC IDs into NodeInfo tab of the CIQ sheet for their respective blades, listed against chassis/slots.
B. PXE Boot of Blades using the KVM console

Before you begin, ensure to complete the following:

- Configure Serial over LAN (SOL) on all the blades during EMC setup.
- Locate your CIQ, and refer to it for details such as UCS access credentials.

To reboot the blades:

1. Open the Cisco UCS - KVM Launch Manager in a browser and enter your credentials.

   **Note:** Firefox with Java version 6, or later, is the most suitable browser to access the UCS.

   All the blades available on the chassis are displayed.

2. Click the **Launch** button for the first node.

3. Click **OK** to download and open the **kvm.jnlp** file.

4. Click **OK** in the keyboard access warning message that is displayed.

5. Perform the following steps in the KVM Console that is displayed:

   a. Open the KVM Console of the blade.

   b. Press **CTRL-ALT-DEL** to reboot the blade. Alternatively, click **Reset** at the top of the KVM console.

   c. After the prompt, press **F12** immediately to boot from the network.

   Once the blades start booting from the network, GMS pushes the image on all the blades using PXE boot for the manufacture process to start on each blade in parallel.

   A blade takes approximately 30 minutes to manufacture with the new image. Wait until the blade for which PXE boot was issued has been manufactured. A login prompt is displayed once the image has been manufactured on a blade.
Go back to "Installing Operating System" on page 15 to continue installing the MURAL system.
C. Getting the WWIDs of LUNs

This topic describes the process of getting the WWIDs of the LUNs assigned to various nodes.

Execute the `listWWIDs.py` script to fetch WWIDs from all the blades, using GMS hardware XML and Name of Management Network specified in the NetworkInfo tab of the CIQ sheet.

Execute the `listWWIDs.py` script on the master GMS Node to generate the list of WWIDs.

```
# cd /opt/etc/scripts/GMS_FlowAutomation
# python listWWIDs.py -f <GMS XML File> -n <Network Name of Management IPs>
```

For example:

```
# cd /opt/etc/scripts/GMS_FlowAutomation
# python listWWIDs.py -f /config/gms/active-configuration/active.xml -n MgmtNW
192.168.188.53, rge-1, [('36006016085003600f2264d58c633e611', '250G')]
192.168.188.55, rge-2, [('36006016085003600ce7bc22ac633e611', '250G')]
192.168.188.57, ui-1, [('36006016085003600e41beec8c833e611', '1.0T')]
192.168.188.62, ui-2, [('360060160850036002c59f07d94e2e311', '1.0T')]
192.168.188.58, gcn-1, [('360060160850036008680eec7c733e611', '250G'), ('36006016085003600a8f5513694e2e311', '1.0T')]
192.168.188.59, gcn-2, [('36006016085003600e408d47dc833e611', '250G'), ('360060160850036006e3e2b4494e2e311', '1.0T')]
192.168.188.66, reflex-42087e, [('36006016085003600ead331eb56f7e311', '250G')]
192.168.188.60, dn-1, [('3600601608500360036be5c5294e2e311', '1.0T')]
```
Update the WWIDs into **StorageInfo** tab of the CIQ Sheet against respective node. Refer sizing sheet for appropriate LUN allocation to each node.
D. Verifying Installation with Dummy Data

If real input feed is not available due to any reason, you can verify the installation and identify configuration issues by running the custom utility.

This custom utility performs the following functions:

- **Data Generator**
  - Generates EDR and Bulkstats feeds with the configurable parameters including input header and input file name.
  - Sets up configuration required for collector.
  - Sets up IB specific configuration including Bulkstats.
  - Creates new iNSTA database.

- **Job Configurations**
  - Stops all jobs and removes HDFS .done file.
  - Configures the job with parameters defined in the config.txt file.
  - Configures Rubix by enabling atlas application on Rubix servers.
  - Runs and monitors the jobs.
  - Checks disk cache size.

- **Cleanup**
  - Deletes the content from the /data/ib/ folder on all the servers.
  - Deletes the content from the /data/atlasData/ folder on Rubix servers.
  - Removes data from the /data/collector/edrflow_backup, /data/collector/edrhttp_backup, and /data/collector/bulkstats_files_backup/test/ folders on all the namenodes.
  - Removes the HDFS-related contents from the /IB/, /local/IB/, /data/ib/, and /data/output/ folders.
Removes the HDFS-related content from the /data/EDR_EDRSubcrBytesAgg_lastSuccess, /data/EDR_SubscriberDeviceMPH_lastSuccess, /data/EDR_EDRSubcrDev_lastSuccess, and /data/EDR_EDRTopN_lastSuccess folders.

Removes HDFS-related content from the /data/TEST/edrhttp/, and /data/TEST/edrflow/ folders.

Removes disk cache (/data/diskstore/UI-EDR) from all the Rubix servers.

Removes Bulkstats cache (/data/diskstore/bulkstats-<host-name>) from all the RGE nodes (applicable only if bulkstat is enabled).

Removes Bulkstats cache (/data/diskstore/bulkstats-<host-name>) from all the RGE nodes (applicable only if bulkstat is enabled).

Reverts the system to its original configurations (settings made before executing the utility).

**D.1 Prerequisite**

The following table lists the parameters and their default values that are required to be filled in the config.txt file available at /opt/etc/scripts/DummyData.
<table>
<thead>
<tr>
<th>Group</th>
<th>Parameter Name</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMON_CONF</td>
<td>jobName</td>
<td>CoreJob, EDR, and CubeExporter</td>
<td>Jobs that are configured, initiated, and monitored by the utility.</td>
</tr>
<tr>
<td></td>
<td>edrFlowPath</td>
<td>/data/TEST/edr-flow/%Y/%M/%D/%H/%mi</td>
<td>Path where collector puts the dummy data output for edrflow.</td>
</tr>
<tr>
<td></td>
<td>edrHttpPath</td>
<td>/data/TEST/edrhttp/%Y/%M/%D/%H/%mi</td>
<td>Path where collector puts the dummy data output for edrhttp.</td>
</tr>
<tr>

<td>Input edrhttp file header required for data generation.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Ensure to update it based on business requirement.</td>
</tr>
</tbody>
</table>
D.2 Assumptions

Refer to the following assumptions before using this utility:

- The Bulkstats generator version 19 is used.
- The anomaly jobs are not configured.
- The setup is freshly manufactured with no data in collector input/output paths and empty disk cache.
- After successful execution of the full pipe, separate script is run to clean the data from the system for all modules as follows:
  a. Collector— input local path and output hdfs path
  b. Jobs output and intermediate path (for example, last successful path for EDR actions)
  c. iNSTA— database used for dummy execution
  d. Rubix— diskcache and /data/atlasData ibs
  e. IBs that are updated or generated as part of the process
- The database used in iNSTA is hardcoded as TEST_MURAL and TEST_BULKSTATS. The default database is hardcoded as DATABASE_MURAL and BULKSTATS.
- The time range and data sizes are hardcoded.
- The cleanup IB procedure reverts any changes done in the IB manually.
- The setOozieTime script is executed after the cleanup action.
- The config.txt is correctly filled. Refer to the table in the "Prerequisite" on page 76.
- If the tool is stopped in between due to any reason, you must run the dummy script with option cleanup first before proceeding further.
- The whole pipeline is executed in the live mode.
D.3 Run the Complete Pipe

1. Log into the Master Namenode.

2. Update the config.txt file available at /opt/etc/scripts/DummyData as described in the "Prerequisite" on page 76.

3. Execute the script as follows:

   ```bash
   [admin@VM-MUR-GCN1 DummyData]# cd /opt/etc/scripts/DummyData
   [admin@VM-MUR-GCN1 DummyData]# python DummyData.py
   ************************************
   Welcome to the Dummy Data tool:
   This tool gives you the option of creating dummy data and run multiple jobs on it so that UI can be seen with dummy data.
   Once dummy data is populated, this tool also gives the option of cleaning up the dummy data and revert the system to its original state.
   Input required: /opt/etc/scripts/DummyData/config.txt
   Logs Path: /opt/etc/scripts/DummyData/log.txt
   ************************************
   Enter valid input from below options:
   1. Run complete pipe
   2. Cleanup the system
   3. Exit
   1
   Have you entered the proper values in config.txt file. Enter yes or no
   yes
   Please check /opt/etc/scripts/DummyData/log.txt for logs
   Welcome to Mural 4.0
   Execution finished. Now check UI for data
   ```

Refer to the following images that illustrate data in the MURAL UI after running the complete pipeline.
Note: Actual data in the UI may vary by two percent.

D.4 Clean up the Pipe

Execute the script as follows:

```
[admin@VM-MUR-GCN1 DummyData]# cd /opt/etc/scripts/DummyData
[admin@VM-MUR-GCN1 DummyData]# python DummyData.py

Welcome to the Dummy Data tool:
This tool gives you the option of creating dummy data and run multiple jobs on it so that UI can be seen with dummy data.
Once dummy data is populated, this tool also gives the option of cleaning up the dummy data and revert the system to its original state.

Input required : /opt/etc/scripts/DummyData/config.txt
Logs Path: /opt/etc/scripts/DummyData/log.txt

Enter valid input from below options:
1. Run complete pipe
2. Cleanup the system
3. Exit

2

Have you entered the proper values in config.txt file. Enter yes or no
yes
The Cleanup will do the following things:

1. It will delete all folder except /data/CoreJob/config from directory /data/CoreJob on local file system from all namenodes
2. It will delete the /data/ib/ contents on local file system from all servers
3. It will delete the contents of /data/atlasData/ on local file system from rubix servers
4. It will remove data from /data/collector1/bulkstats_files_backup/GMPLAB4/, /data/collector/bulkstats_files_backup/DC1/, /data/collector/bulkstats_files_backup/DC2/,
```
/data/collector/bulkstats_files_backup/DC1/,
/data/collector/bulkstats_files_backup/GMPLAB1/,
/data/collector/bulkstats_files_backup/delhi/,
/data/collector/bulkstats_files_backup/DC2/,
/data/collector/bulkstats_files_backup/DC1/,
/data/collector/bulkstats_files_backup/DC2/,
/data/collector/bulkstats_files_backup/DC1/,
/data/collector/bulkstats_files_backup/DC2/,
/data/collector1/edrflow_backup, /data/collector1/edrhttp_backup on local file system from all namenodes

5. It will remove the hdfs contents from the path: /IB/,
/local/IB/,/data/ib/, /data/output/

6. It will remove the hdfs content from the path:
/data/CoreJob,/data/EDR_EDRSubcrBytesAgg_lastSuccess,/data/EDR_SubscriberDeviceMPH_lastSuccess,/data/EDR_EDRSubcrDev_lastSuccess,/data/EDR_EDRTopN_lastSuccess

7. It will remove hdfs content from the path
/data/TEST/edrhttp/,/data/TEST/edrflow/ and /data/TEST/bulkStats/ (if bulkstat is enabled)

8. It will remove diskcache (/data/diskstore/UI-EDR) from all rubix servers

9. It will remove bulkstats cache (/data/diskstore/bulkstats-<hostname>) from all rge nodes (applicable only if bulkstat is enabled)

=======================================================================

Do you want to proceed: yes or no yes

Welcome to Mural 4.0
resolved_active.xml 100% 1618KB
1.6MB/s 1.6MB/s 00:00
Please check /opt/etc/scripts/DummyData/log.txt for logs
Cleanup finished Successfully
E. File Pattern Regular Expression

This topic provides information about the regular expression for the EDR and collector files.

The following list provides detailed description for the using the regular expression for EDR and Collector file names:

- Ensure to provide different input paths for each new gateway being added.
- The /edr-file-path and /bulkstat-file-path should always start with a forward slash (/).
- The ASR should send the gateway name in place of %DC, as specified in the file name pattern in the Collector configurations.
- If the filenames will have file extensions of .gz or .txt, then you must provide ".*" in the file name format configuration when adding the gateway.
- All incoming files should contain the string as per their type in the file name; that is, flow EDR files should contain the string "flow" delimited by an underscore (_) or hyphen (-) and similarly HTTP EDR files must contain string "http" delimited by an underscore (_) or hyphen (-) (so combinations would also work, like ".flow-" or "–http_").
- All collector (internal) IPs can be provided with comma (,) separated values like 10.10.10.133,10.10.10.134

Following are the guidelines and samples to help in configuring filename patterns and collector configurations:
<table>
<thead>
<tr>
<th>FileName pattern</th>
<th>Example</th>
<th>TimeStamp</th>
<th>Regex for EDR filename</th>
<th>Regex for collector Filename</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gateway-name_ (multiple strings separated by underscore or hyphen or both)_flow_timestamp_str4.gz</td>
<td>Gateway-name_hhmss</td>
<td>MMDDYYYY-hhmss</td>
<td><strong>.</strong>_.<strong>%MM%DD%YYYY%hh%mm%ss</strong>.*.gz</td>
<td>%DC__._<strong>%MM%DD%YYYY%hh%mm%ss</strong>.*.gz</td>
</tr>
<tr>
<td>Gateway-name_ (multiple strings separated by underscore or hyphen or both)_flow_timestamp_str4_str5.gz</td>
<td>Gateway-name_hhmss</td>
<td>MMDDYYYY-hhmss</td>
<td><strong>.</strong>_.<strong>%MM%DD%YYYY%hh%mm%ss</strong>.*.gz</td>
<td>%DC__._<strong>%MM%DD%YYYY%hh%mm%ss</strong>.*.gz</td>
</tr>
<tr>
<td>FileName pattern</td>
<td>Example</td>
<td>TimeStamp</td>
<td>Regex for EDR filename</td>
<td>Regex for collector Filename</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
<td>-----------</td>
<td>------------------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td>Gateway-name_ (multiple strings separated by underscore or hyphen or both)_ flow_string_timestamp string.gz</td>
<td>Gateway-name_str1_str2_str3_flow_str4_timestamp_str5.gz</td>
<td>MMDDYYYY-hhmms</td>
<td><strong>*</strong> __%MM%DD%YYYY%hh%mm%ss*.gz</td>
<td>%DC____ __%MM%DD%YYYY%hh%mm%ss*.gz</td>
</tr>
<tr>
<td>Filename pattern</td>
<td>Example</td>
<td>TimeStamp</td>
<td>Regex for EDR filename</td>
<td>Regex for collector Filename</td>
</tr>
<tr>
<td>---------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
<td>----------------</td>
<td>---------------------------------</td>
<td>----------------------------------------</td>
</tr>
<tr>
<td>Gateway-name__gate-way-name__ (multiple strings separated by underscore or hyphen or both) _flow_string__timestamp_string.gz</td>
<td>Gateway-name__gate-way-name__str1__str2__str3__flow__str4__timestamp_str5__str6.gz</td>
<td>MMDDYYYY-hhmmss</td>
<td>*<strong>*</strong>_<em>%MM%DD%YYYY%-hh%mm%ss</em>_*.gz</td>
<td>_<em>%MM%DD%YYYY%h-h%mm%ss</em>_*.gz</td>
</tr>
<tr>
<td>FileName pattern</td>
<td>Example</td>
<td>TimeStamp</td>
<td>Regex for EDR filename</td>
<td>Regex for collector Filename</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
<td>-----------</td>
<td>------------------------</td>
<td>-------------------------------</td>
</tr>
<tr>
<td>Gateway-name_ (multiple strings separated by underscore or hyphen or both)_ flow_string_ timestamp_string.gz</td>
<td>Gateway-name_str1_str2_str3_flow_str4_timestamp_str5_str6.gz</td>
<td>YYYYMMDD-hhmss</td>
<td><em>.*</em>.<em>.</em>%YYYY%MM%DD%hh%mm%ss_<em>.</em>.gz</td>
<td>%DC_<em>.</em>._%YYYY%MM%DD%hh%mm%ss*.gz</td>
</tr>
<tr>
<td>Filename pattern</td>
<td>Example</td>
<td>TimeStamp</td>
<td>Regex for EDR filename</td>
<td>Regex for collector Filename</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
<td>-----------</td>
<td>------------------------</td>
<td>-------------------------------</td>
</tr>
<tr>
<td>Gateway-name_ (multiple strings separated by underscore or hyphen or both)_ flow-string_ timestamp_string.gz</td>
<td>Gateway-name_ str1_ str2_ str3_ flow-str4_ timestamp_p_str5_ str6.gz</td>
<td>MMDDYYYY-hhmss</td>
<td><strong>*</strong><em>-<strong>%MM%DD%YYYY%-hh%mm%ss</strong></em>.gz</td>
<td>%DC__<em>_-%%MM%DD%YYYY%h-h%mm%ss</em>.gz</td>
</tr>
</tbody>
</table>

- It is mandatory to send gateway name as the first substring in EDR files, followed by an underscore (_) character.
- 'flow' can be replaced with 'http'.
- If timestamp is in MMDDYYYYhhmmss then set %MM%DD%YYYY%h-h%mm%ss in Regex pattern.
- If timestamp is in YYYYMMDDhhmmss then set %YYYY%MM%DD%h-h%mm%ss in Regex pattern.
F. Mandatory Parameters for Incoming ASR Files

The following is the list of mandatory headers that need to be present in files coming from the ASR so that the MURAL system can deduce meaningful information.

**Note:** MURAL recommends ASR files to be of 10MB compressed size for optimum performance.

### F.1 Mandatory Attributes for Flow EDRs for MURAL

Flow EDR data sent by the ASR platform to the MURAL system must contain the following attributes:

- flow-end-time
- flow-start-time
- radius-calling-station-id
- sn-app-protocol
- p2p-protocol
- sn-server-port
- sn-volume-amt-ip-bytes-downlink
- sn-volume-amt-ip-pkts-uplink
- sn-volume-amt-ip-pkts-downlink
- sn-volume-amt-ip-bytes-uplink
- tcp-os-signature
- bearere-3gpp imei

**Sample:**

```plaintext
```
F.2 Mandatory HTTP EDR Attributes for MURAL

HTTP EDR data sent to the MURAL system must contain the following attributes:

- sn-start-time
- sn-end-time
- transaction-downlink-packets
- transaction-uplink-packets
- transaction-downlink-bytes
- transaction-uplink-bytes
- http-content type
- radius-calling-station-id
- http-User-Agent
- http-URL
- http-host
- http-reply code
- tcp-os-signature
- bearer-3gpp imei

Sample:
# F.3 ASR-Side Configuration

The corresponding configuration on the side of the ASR platform is as follows:

```plaintext
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Format</th>
<th>Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn-start-time</td>
<td>seconds</td>

G. Understanding the CIQ Sheet

Customer Information Questionnaire (CIQ) sheet provides key information related to configuration of the network and storage. CIQ sheet serves as a reference document for the various values related to network, clusters, nodes and storage. The CIQ sheet is has following tabs:

- "MiscInfo" below
- "NetworkInfo" on the next page
- "ClusterInfo" on page 101
- "NodeInfo" on page 101
- "StorageInfo" on page 102

G.1 MiscInfo

The MiscInfo tab provides miscellaneous information, for example site name. The information provided in this tab is used for providing the names of various XMLs generated during the installation process.

The following table describes fields in the MiscInfo tab.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>XML File Name</td>
<td>Name of the XML file to be created by system after uploading the CIQ sheet.</td>
<td>Mural_Hardware_StandardPack.xml</td>
</tr>
<tr>
<td>Site Name</td>
<td>Name of the site.</td>
<td>InterNap</td>
</tr>
<tr>
<td>HW Type</td>
<td>The type of hardware used at the site.</td>
<td>Cisco</td>
</tr>
<tr>
<td>Banner</td>
<td>The welcome text to be displayed on the console.</td>
<td>Welcome to Mural Standard Pack</td>
</tr>
<tr>
<td>Set GSM as NTP</td>
<td>Whether to use GSM server as NTP server.</td>
<td>FALSE</td>
</tr>
<tr>
<td>CIQ Template Version</td>
<td>The current version of the CIQ sheet.</td>
<td>1.0</td>
</tr>
</tbody>
</table>
### G.2 NetworkInfo

The NetworkInfo tab provides information related to various network parameters that are required to be configured. The network information is categorized into VLAN, UCS Management Interfaces and Misc Network.

The following table describes fields in the NetworkInfo tab.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VLAN</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Network Name</td>
<td>Name of network, whether public or management.</td>
<td>MgmtNW</td>
</tr>
<tr>
<td>Interface</td>
<td>The name of the interface.</td>
<td>eth0</td>
</tr>
<tr>
<td>Network Type</td>
<td>The type of network, whether normal or management.</td>
<td>Mgmt/Data</td>
</tr>
<tr>
<td>Network Prefix</td>
<td>The network prefix for the IP.</td>
<td>192.168.188.0</td>
</tr>
<tr>
<td>Subnet</td>
<td>The subnet or the value of subnet.</td>
<td>24</td>
</tr>
<tr>
<td>Vlan ID</td>
<td>The Vlan ID.</td>
<td>Not in use</td>
</tr>
<tr>
<td>No of Addresses</td>
<td>Number of IP addresses to be used.</td>
<td>Not in use</td>
</tr>
<tr>
<td>Remark</td>
<td>The cell is provided to be used for providing and additional information.</td>
<td>Not in use</td>
</tr>
<tr>
<td><strong>UCS Management Interfaces</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Fabric A IP</td>
<td>Fabric IP of interface A.</td>
<td>Not in use</td>
</tr>
<tr>
<td>Fabric B IP</td>
<td>Fabric IP of interface B.</td>
<td>Not in use</td>
</tr>
<tr>
<td>Cluster VIP</td>
<td>UCS manager IP.</td>
<td>17.10.10.9</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>Default Gateway</td>
<td>The default gateway IP.</td>
<td>172.30.0.1</td>
</tr>
<tr>
<td>DNS</td>
<td>The DNS IP.</td>
<td>103.14.2.35</td>
</tr>
<tr>
<td>NTP IP</td>
<td>NTP server IP.</td>
<td>103.14.2.37</td>
</tr>
<tr>
<td>NTP Version</td>
<td>The version of the NTP.</td>
<td>4</td>
</tr>
</tbody>
</table>
### G.3 ClusterInfo

The ClusterInfo tab provides information related to various clusters to be created on the hardware. It provides information such as Clustername, Cluster interface, cluster VIP and so on.

The following table describes fields in the ClusterInfo tab.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cluster Name</td>
<td>Name of the cluster.</td>
<td>cmp-clu</td>
</tr>
<tr>
<td>Cluster Type</td>
<td>Type of the cluster setup.</td>
<td>1+1 HA</td>
</tr>
<tr>
<td>Cluster Interface</td>
<td>Name of the interface connection for the cluster.</td>
<td>eth0</td>
</tr>
<tr>
<td>Eth0 VIP</td>
<td>VIP of eth0 interface.</td>
<td>192.168.188.75</td>
</tr>
<tr>
<td>Eth1 VIP</td>
<td>VIP of eth1 interface.</td>
<td>172.30.17.75</td>
</tr>
<tr>
<td>Eth2 VIP</td>
<td>VIP of the eth2 interface.</td>
<td>172.30.17.67</td>
</tr>
</tbody>
</table>

### G.4 NodeInfo

The NodeInfo provides detailed information related to each node in the system. It provides information like chassis number, slot number, hostname, cluster name etc. These information are required to uniquely identify each node present in the system.

The following table describes fields in the NodeInfo tab.
### Field Name | Description | Example
---|---|---
Chassis Number | The chassis number in which server is installed. | c1
Slot Number | The slot number where server is installed. | 1
Hostname | The host name of the server. | gms-1
Eth0 MAC | The MAC address of the eth0 interface. | 00:A0:D7:42:08:7E
Eth0 IP | The MAC IP of the eth0 interface. | 192.168.188.66
Eth1 MAC | The MAC address of the eth1 interface. | 00:A0:D7:42:08:6E
Eth1 IP | The MAC IP of the eth1 interface. | 172.30.17.66
Eth2 MAC | The MAC address of the eth2 interface. | 00:A0:D7:42:08:7E
Eth2 IP | The MAC IP of the eth2 interface. | 172.30.17.98
KVM IP | The IP of the KVM associated with the server. | 17.18.10.0
Cluster Name | The name of the cluster. | gms-clu

### G.5 StorageInfo

The StorageInfo provides information related to various parameters of the storage. The storage information provided are classified into two storage information, which provides general storage information and EMC interfaces, which provides information related to the EMC interfaces for the storage.

The following table describes fields in the StorgaeInfo tab.

### Field Name | Description | Example
---|---|---
**Storage Information**
Hostname | Host name of the server. | gms-1
WWID | The WWID of the storage associated with the server. | 36006016085003600ead331eb56f7e311
Component | The name of the components using the assigned storage. | PGSQL
<table>
<thead>
<tr>
<th><strong>Field Name</strong></th>
<th><strong>Description</strong></th>
<th><strong>Example</strong></th>
