Small Businesses Ride the Cloud: 
SMB Cloud Watch—U.S. Survey Results

February 2010
Cloud services are currently one of the hottest topics in the IT world, and it's no wonder—Gartner projects this sector’s revenues will exceed $150 billion by 2013. In fact, Coda Research estimates that companies will shift up to 20 percent of their total IT spending to these hosted or subscription technology services by 2015. Cisco® Internet Business Solutions Group (IBSG) places cloud services into three broad categories: 1) Infrastructure as a Service (IaaS), e.g., storage and security; 2) Platform as a Service (PaaS), e.g., developer environments and compute on demand; and 3) Software as a Service (SaaS), e.g., collaboration, customer relationship management (CRM), and desktop productivity.

Small and medium-sized businesses (SMBs) have been the most aggressive segment to adopt cloud services. As they typically have less-complex IT needs, fewer legacy applications, and less IT support than larger enterprises, SMBs are often happy to hand over the delivery and operation of IT to third parties, freeing SMBs to focus on running their businesses. Research by McKinsey confirms this, finding that SMBs with fewer than 250 employees are more than twice as likely as larger companies to adopt subscription or on-demand technology services.

To date, much of the research and analysis on cloud services has focused on market sizing and the technology. Little emphasis has been placed on understanding customer needs and buying behavior. In particular, there is limited understanding of the needs and perspectives of SMBs, and how service providers (SPs) can be successful selling to this rapidly growing and attractive market.

Cisco IBSG undertook its SMB Cloud Watch survey to better understand customer needs and strategies for success in the SMB cloud services market. SMB Cloud Watch was an online survey of 510 IT buyers in the United States, representing SMB customers with 5 to 250 employees. The survey sought to understand which cloud services these customers use now, which they will employ in the future, and from whom they would buy these services. In addition, Cisco IBSG wanted to understand the specific role and opportunity for service providers, and how they might differentiate their cloud offers to SMBs.
SMBs Are Already Using Cloud Services

Although cloud services might be the talk of the IT world, the term doesn't mean much to typical SMBs. Only 20 percent claimed to know what the term means, and only an additional 35 percent confessed to having heard the term before. The level of awareness was directly related to company size. Sixty-five percent of Medium companies were aware of the term, in contrast to only 30 percent of Very Small companies having any understanding of the term. (For a definition of Very Small, Small, and Medium businesses, see Figure 1.)

Despite their claimed lack of knowledge of cloud services, SMBs are already wholeheartedly embracing these hosted or subscription technology services. Approximately three-quarters of the respondents were already using one of the services outlined in Figure 2. The top three, more traditional cloud services were used equally by all customer segments. More advanced services, such as hosted business and sales-and-marketing applications, were used more by the Small and Medium segments, while other advanced services, such as conferencing, collaboration, and on-demand computing, were used predominantly by Medium companies.

Figure 2. Future Use of Hosted/Subscription Services

Question: When, if ever, do you anticipate your company will use hosted or subscription technology services for the following?

<table>

SMBs are remarkably satisfied with the cloud services they are currently using. On average, they rated their level of satisfaction as 7.8 (out of 10), with less than 10 percent of respondents rating their satisfaction as 5 or less. The biggest sources of value from their current cloud services come from:

- Maximizing investment
- Access to innovation
- Ability to focus on the business and not the technology
- Ease of use and integration

Despite this high degree of satisfaction, SMBs did voice some concerns about their current cloud services. The chief concern by far was security, with close to 50 percent of respondents identifying this as a key issue. Following security, in order of concern, were cost, relevance to their business, and poor support.

Surprisingly, SPs (defined as SMBs’ providers of traditional telephony and Internet services) were the number-one provider of cloud services (see Figure 3). More than 50 percent of respondents identified SPs as their cloud provider, followed by software and hosting companies and technology providers. SMBs are reasonably satisfied with the levels of support they are receiving from their current cloud provider (average satisfaction of 7.1). There is room for improvement, however, as roughly 30 percent of respondents reported a satisfaction level of less than the mean.

Figure 3. Current and Future Providers of Hosted/Subscription Services

Question: From which of the following types of firms has your company bought hosted/subscription services? From which would your company most likely buy in the future? (Select all that apply.)

Source: Cisco IBSG, September 2009
More Clouds in the Forecast

The future for cloud services is definitely bright, with more than 80 percent of SMBs stating they intend to use at least one service within the next two years (see Figure 2). All service categories are projected to grow significantly in the future, but remarkably, advanced services such as conferencing and collaboration, SaaS, and on-demand computing appear to be the fastest relative growth areas over the next two years. Not only will the Medium companies continue to use these, but Small and even Very Small customers see a need for these services in the next two years. This shift toward cloud services is supported by anticipated shifts in IT spending. Figure 4 shows that at least 65 percent of the SMBs questioned anticipate they will spend up to 20 percent of their IT budget on cloud services in the next two years. And for an additional 25 percent of SMBs, cloud services could represent almost half of their entire IT budget.

Figure 4. Proportion of IT Spending on Cloud Services

Question: What proportion of its total IT budget does/will your company spend on hosted or subscription technology services—now; in two years’ time?

Security is the most important factor that SMBs consider before purchasing cloud services (see Figure 5). The underlying technology seems to be of less importance in choosing a service, as security is closely followed by more business and ease-of-use considerations as important buyer values. Close to 40 percent of customers stated they were happy with their current services, or that they did not have any need. The majority of these customers tended to be Very Small businesses from less-technology-intensive industries, such as agriculture, hospitality, and manufacturing. For the remaining SMBs, security and perceived expense were the greatest reasons given for not buying cloud services.
Assurances and guarantees were the biggest considerations that increased SMBs' overall interest in cloud services (see Figure 6). SMBs are less concerned about the underlying technology and architectures; rather, they want guarantees on security, high reliability, and support levels. In addition, they want to see a clear business case that articulates how cloud services could save money over their current solutions.

Figure 6. Factors that Increase Interest in Buying Cloud Services

Question: What would increase your interest in buying and using hosted or subscription technology services (choose up to three)?
Vendor Trust Is Key to Successful Selling

Non-technology factors are the most important considerations for SMBs in choosing a provider of cloud services (see Figure 7). Small businesses look for providers that can offer guarantees, instill trust, are easy with whom to do business, have good reputations, and meet SMBs’ specific needs. Of course, they expect all this at a low price—or, at least, for a price that delivers reasonable value for their money.

Figure 7. Cloud Provider Selection Criteria

Question: Which of the following factors would be the most important criteria when selecting a hosted or subscription service provider (choose up to three)?

- Provides Guarantees
- Lowest Price
- Easy To Do Business With
- Reputation
- Service Tailored to Business Needs
- Best Online Tools
- “Best of Breed” Bundles
- Services Pre-Integrated with Existing Apps
- Other

Source: Cisco IBSG, September 2009

As we saw earlier, service providers are the preferred vendor for companies already using cloud services (see Figure 3). This situation may change in the future, as respondents identified not only SPs, but also software providers and technology equipment companies, as being important providers of cloud services. The rise of these providers appears to be related to the greater emphasis that SMBs are placing on advanced services in the future (see Figure 2). We hypothesize that SMBs view these advanced services more as the domain of these alternative providers than as core offerings of traditional SPs. For example, SaaS is more associated with software providers, infrastructure with technology companies, and platform services with online providers.

Service Providers Are Well Positioned with SMBs

Eighty percent of the small businesses surveyed purchase Internet access, and 65 percent of the respondents obtain local and long-distance telephone from cable and telephone network SPs. Overall, SMBs are very satisfied with this relationship (average satisfaction of 7.6), with less than 10 percent of respondents scoring a 5 or below.
Businesses are satisfied with the reliability of service (56 percent) and customer support (38 percent). They are also satisfied that the services meet their business needs (38 percent). Remarkably, 42 percent of the satisfied customers indicated that they were happy with the price. The small minority of dissatisfied customers identified the same areas as sources of dissatisfaction, including price (43 percent), customer support (42 percent), and reliability of service (36 percent).

Given this high degree of satisfaction, SMBs appear to be open to buying future cloud services from their existing service provider (see Figure 8). More than half of the respondents said they were likely to purchase future services from their SPs, and another 29 percent stated that they were “somewhat likely.” The small number of “not likely” respondents correlates with the customers who are “happy with their current solution,” rather than with those who are dissatisfied with their current SP.

![Figure 8. Likelihood of Buying Cloud Services from a Service Provider](source: Cisco IBSG, September 2009)

**Question:** How likely are you to purchase a hosted or subscription technology service from your current telephone or cable service provider specifically?

<table>
<thead>
<tr>
<th>Extremely Likely</th>
<th>Likely</th>
<th>Somewhat Likely</th>
<th>Not Likely</th>
</tr>
</thead>
<tbody>
<tr>

<td>0</td>
<td>10</td>
<td>20</td>
<td>30</td>
</tr>
<tr>
<td>Percentage of Respondents</td>
<td>N = 510</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**It’s All About the Network**

While SPs appear to be well positioned to deliver cloud services to small businesses, Cisco IBSG also wanted to test whether SPs could exploit network-based features to enhance their cloud offerings. And, most important, would SMBs see enough value in these enhanced services to actually pay a premium? To do this, we tested three offer concepts with the panel:

<table>
<thead>
<tr>
<th>Base Offer</th>
<th>Option 1</th>
<th>Option 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hosted or subscription technology service to access on-demand server</td>
<td>Base offer + Incremental bandwidth on as-required basis</td>
<td>Base offer + Incremental bandwidth on as-required basis + Security and uptime guarantees</td>
</tr>
<tr>
<td>processing and remote storage capabilities</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Customer pays the provider for server processing and storage IT actually</td>
<td></td>
<td></td>
</tr>
<tr>
<td>used</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
More than half of the respondents were interested (>6) in the base offer of on-demand computing and storage (see Figure 9). The preferred providers of such a service were almost equal in the minds of the SMBs: SPs (47 percent), technology equipment providers (46 percent), and application service providers (44 percent).

Figure 9. Interest in Base Cloud Offer

Question: What is your level of interest in such a service?
(1 = None; 10 = Extreme)

The results became more interesting when we added the network-based options to the base offer (see Figure 10). Adding only bandwidth on demand, however, had little effect on the attractiveness of the base offer. When the base offer included bandwidth on demand, along with security and uptime guarantees, more SMBs became interested in the offer (average of 7.1 interest level). This offer testing confirms our findings that security and guarantees are the most important SMB buyer values for cloud services. Not only were SMBs more interested in the enhanced offer (Option 2)—they were willing to pay more for it. Of those respondents expressing interest in Option 2 (>6), 75 percent were willing to pay a premium of 3 percent or more over the non-enhanced base offer. And almost one-quarter were willing to pay at least a 10 percent premium for the network enhancements.
While SMBs showed no provider preference regarding the base offer, service providers were by far the preferred provider for the test offer that included value-added features, such as bandwidth on demand, security, and service and uptime guarantees. Almost 60 percent identified SPs as their vendor of choice for this network-enhanced cloud service, as opposed to 40 percent for technology companies, and 30 percent for application service providers. In fact, for this test offer, application service providers dropped down to the same level as online and hosting companies as preferred providers of this potential service.

**Implications for Service Providers**

*SMB Cloud Watch* research is encouraging for the future of cloud services within the small business segment. SMBs are already using many of these cloud services and like them. Plus, SMBs intend to purchase more, and continue to expand their use of more advanced cloud services. The good news for service providers is that SMBs are generally satisfied with their current relationship and are likely to buy more cloud services from them. In addition, SMBs see real value in augmenting cloud offerings with network-enhanced valued-added features.

While the news is encouraging for service providers, there are several important implications and potential strategies that need to be considered for SPs to be successful in the SMB cloud services space:

1. **Build on Your Base.** Build on the high level of customer satisfaction that you have with your installed base to lock them in, increase usage of existing services, and
upsell them to new services. Special emphasis should be given to larger SMBs (Medium companies), as they are currently the predominant users of higher-margin, advanced cloud services.

2. **Expand into Advanced Services.** While Medium companies are currently the main users of advanced cloud services, Cisco IBSG’s research shows that all segments of SMBs are considering using these services. SPs need to increase their emphasis on these new services to capture new market share and mindshare, and to lock out perceived better-placed competitors. To expand this portfolio of services, SPs must partner and collaborate with VARs and software and technology companies to become bigger players in SaaS and IaaS.

3. **Sell Business Benefits, not Technology.** Selling messages need to be clearly aligned with SMBs’ core buying values. SPs need to emphasize security, performance, and reliability guarantees and business impact. The sales toolkit needs to include a solid business case and clear articulation of the benefits to convince small businesses that cloud services are better and less costly than their current solutions.

4. **Differentiate with Network Features.** Service providers alone have the ability to integrate the network with IT to deliver enhanced cloud services. SPs need to develop differentiated cloud services that exploit this natural advantage to deliver services that include enhanced network features such as bandwidth on demand and guarantees of security and reliability.

Adoption by SMBs will be a major contributor to the growth of the cloud services market. SMBs have a good idea of what they want and from whom they want to buy cloud services. Successful providers of cloud services will be not only those vendors who focus on the technology, but those who clearly understand their customers and develop offerings, features, and sales tactics that successfully meet the needs that we have uncovered in this survey.
About the Survey
Cisco IBSG, with the support of Cisco Marketing and the CTO organization, launched SMB Cloud Watch, an online survey of 510 U.S.-based companies, in September 2009. The survey base was distributed across companies with 5 to 250 employees:

- 5–19 employees (25 percent)
- 20–49 employees (18 percent)
- 50–99 employees (20 percent)
- 100–250 employees (37 percent)

Respondents were IT decision makers, buyers, or key influencers:

- CXOs, senior executives, or CIO/IT VPs (41 percent)
- Department managers (29 percent)
- Technical staff (14 percent)
- Professional staff (12 percent)

In addition to cloud-specific questions, numerous business demographic questions (such as industry, number of locations, employee mobility) and technology use and spending questions (e.g., installed technologies, importance of IT, IT spending) were also asked.
