The status information or errors related to the disk image.

@returns

Returns a reference to this object so that method calls can be chained together.

### withStatusMessage

The status information or errors related to the disk image.

@returns

The status information or errors related to the disk image.

### setStatusMessage

The status information or errors related to the disk image.

@returns

A reference to this object so that method calls can be chained together.

### setStatusMessage

The status information or errors related to the disk image.

@returns

A reference to this object so that method calls can be chained together.

### withStatusMessage

The status information or errors related to the disk image.

@returns

The status information or errors related to the disk image.

### setStatusMessage

The status information or errors related to the disk image.

@returns

A reference to this object so that method calls can be chained together.

### withStatusMessage

The status information or errors related to the disk image.

@returns

The status information or errors related to the disk image.

### setStatusMessage

The status information or errors related to the disk image.

@returns

A reference to this object so that method calls can be chained together.

### withStatusMessage

The status information or errors related to the disk image.

@returns

The status information or errors related to the disk image.

### setStatusMessage

The status information or errors related to the disk image.

@returns

A reference to this object so that method calls can be chained together.

### withStatusMessage

The status information or errors related to the disk image.

@returns

The status information or errors related to the disk image.

### setStatusMessage

The status information or errors related to the disk image.

@returns

A reference to this object so that method calls can be chained together.

### withStatusMessage

The status information or errors related to the disk image.

@returns

The status information or errors related to the disk image.

### setStatusMessage

The status information or errors related to the disk image.

@returns

A reference to this object so that method calls can be chained together.

### `<param>` sourceDestCheck

Specifies whether to enable an instance launched in a VPC to perform NAT. This controls whether source/destination checking is enabled on the instance. A value of `<code>true</code>` means checking is enabled, and `<code>false</code>` means checking is disabled. The value must be `<code>false</code>` for the instance to perform NAT. For more information, see <a href="http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_NAT_Instance.html">NAT Instances</a> in the Amazon Virtual Private Cloud User Guide.

### `<returns>`

Returns a reference to this object so that method calls can be chained together.

### Fluent setter method name: `withSourceDestCheck`

### Getter documentation:

Specifies whether to enable an instance launched in a VPC to perform NAT. This controls whether source/destination checking is enabled on the instance. A value of `<code>true</code>` means checking is enabled, and `<code>false</code>` means checking is disabled. The value must be `<code>false</code>` for the instance to perform NAT. For more information, see <a href="http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_NAT_Instance.html">NAT Instances</a> in the Amazon Virtual Private Cloud User Guide.

### Getter method name: `getSourceDestCheck`

### Getter model:

- **returnType**: `Boolean`
- **documentation**: null

### HTTP:

## Get Methods

### Get DisableApiTermination

```
@GET
@Path("/disableApiTermination")
@Header("Authorization")
public DisableApiTermination getDisableApiTermination()
```

### With DisableApiTermination

```
@PUT
@Path("/disableApiTermination")
@Header("Authorization")
public DisableApiTermination withDisableApiTermination(Boolean disableApiTermination)
```

## Http Method

```
@GET
@Path("/disableApiTermination")
@Header("Authorization")
public DisableApiTermination getDisableApiTermination()
```

## Additional Marshalling/Unmarshalling

```
public @HttpMarshallingHandler
    @Path("/disableApiTermination")
    public void marshalDisableApiTermination(DisableApiTermination disableApiTermination)
```

## Additional Testing

```
public void testDisableApiTermination()
```

## Additional Classes

```
public class DisableApiTermination {
    private Boolean disableApiTermination;

    public DisableApiTermination(Boolean disableApiTermination) {
        this.disableApiTermination = disableApiTermination;
    }

    // Getters and Setters
```

## Additional Details

- **Description:**
  - The `DisableApiTermination` class is used to disable API termination for an instance.
  - It can be used to prevent users from terminating instances through the API.

- **Usage:**
  - This class is part of the Amazon EC2 API and can be used by developers to control instance termination.

- **Dependencies:**
  - Requires the Amazon EC2 library.

- **Example:**
  - To disable API termination for an instance, you can use the `withDisableApiTermination` method.

- **Further Reading:**
  - [Amazon EC2 API Documentation](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/)
  - [AWS SDK for Java](https://aws.amazon.com/sdk-for-java/)

You can't specify this option and specify more than one private IP address using the private IP addresses option. You cannot specify this option if you're launching more than one instance in a <a>RunInstances</a> request.\n\n### Examples

```java
// Example 1
instances.add(new InstanceSpecification()
  .withAssociatePublicIpAddress(true)
  .withSecondaryPrivateIpAddressCount(2));

// Example 2
instances.add(new InstanceSpecification()
  .withAssociatePublicIpAddress(false)
  .withSecondaryPrivateIpAddressCount(0));
```

\</p>\n\n### AssociatePublicIpAddress

- **Type**: Boolean
- **Default**: true
- **Description**: Indicates whether to assign a public IPv4 address to an instance you launch in a VPC. The public IP address can only be assigned to a network interface for eth0, and can only be assigned to a new network interface, not an existing one. You cannot specify more than one network interface in the request. If launching into a default subnet, the default value is true.

### FluentSetterDocumentation

- **Type**: null
- **Description**: Indicates whether to assign a public IPv4 address to an instance you launch in a VPC. The public IP address can only be assigned to a network interface for eth0, and can only be assigned to a new network interface, not an existing one. You cannot specify more than one network interface in the request. If launching into a default subnet, the default value is true.

### FluentSetterMethodName

- **Type**: "withAssociatePublicIpAddress"
- **Description**: Indicates whether to assign a public IPv4 address to an instance you launch in a VPC. The public IP address can only be assigned to a network interface for eth0, and can only be assigned to a new network interface, not an existing one. You cannot specify more than one network interface in the request. If launching into a default subnet, the default value is true.

### GetterDocumentation

- **Type**: null
- **Description**: Indicates whether to assign a public IPv4 address to an instance you launch in a VPC. The public IP address can only be assigned to a network interface for eth0, and can only be assigned to a new network interface, not an existing one. You cannot specify more than one network interface in the request. If launching into a default subnet, the default value is true.
