Default: Amazon EC2 uses the default security group.

@returns

A reference to this object so that method calls can be chained together.

**Security Group IDs**

Amazon EC2 uses the default security group.

### getSecurityGroupIds()

- **Return Type**: java.util.List<String>
- **Documentation**: null

### getMember()

- **Return Type**: String
- **Documentation**: null

### createSecurityGroup()

- **Documentation**: Amazon EC2 uses the default security group. You can create a security group using `createSecurityGroup()`.

### withSecurityGroupIds...

- **Documentation**: Amazon EC2 uses the default security group. You can create a security group using `createSecurityGroup()`.

- **Getter Method**: `getSecurityGroupIds`
- **Getter Model**: java.util.List<String>
- **HTTP**: null
- **List**: true
- **Impl Type**: com.amazonaws.internal.SdkInternalList
- **Interface Type**: java.util.List
- **List Member Model**: String

### Helper Methods

- **Fluent Setter Method**: `withSecurityGroupIds`

**Additional Details**

- **Additional Marshalling Path**: null
- **Additional Unmarshalling Path**: null
- **Flattened**: false
- **Greedy**: false
- **Header**: false
- **Is Payload**: false
- **Is Streaming**: false

Constraint: Range is 100-20000 IOPS for <code>io1</code> volumes and 100-10000 IOPS for <code>gp2</code> volumes.
volumes, this represents the number of IOPS that are provisioned for the volume. For `<code>gp2</code>` volumes, this represents the baseline performance of the volume and the rate at which the volume accumulates I/O credits for bursting. For more information about `<code>gp2</code>` baseline performance, I/O credits, and bursting, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumeTypes.html">Amazon EBS Volume Types</a> in the `<i>Amazon Elastic Compute Cloud User Guide</i>`.

**Constraint:** Range is 100-20000 IOPS for `<code>io1</code>` volumes and 100-10000 IOPS for `<code>gp2</code>` volumes.

**Condition:** This parameter is required for requests to create `<code>io1</code>` volumes; it is not used in requests to create `<code>gp2</code>`, `<code>st1</code>`, `<code>sc1</code>`, or `<code>standard</code>` volumes.

**Parametr**

```java
public class EbsInstance
{
    private int iops;

    public EbsInstance(int iops)
    {
        this.iops = iops;
    }

    public int getIops()
    {
        return iops;
    }
}
```

**Documentation**

The number of I/O operations per second (IOPS) that the volume supports. For io1 volumes, this represents the number of IOPS that are provisioned for the volume. For `<code>gp2</code>` volumes, this represents the baseline performance of the volume and the rate at which the volume accumulates I/O credits for bursting. For more information about `<code>gp2</code>` baseline performance, I/O credits, and bursting, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumeTypes.html">Amazon EBS Volume Types</a> in the `<i>Amazon Elastic Compute Cloud User Guide</i>`.

**Constraint:** Range is 100-20000 IOPS for `<code>io1</code>` volumes and 100-10000 IOPS for `<code>gp2</code>` volumes.

**Condition:** This parameter is required for requests to create `<code>io1</code>` volumes; it is not used in requests to create `<code>gp2</code>`, `<code>st1</code>`, `<code>sc1</code>`, or `<code>standard</code>` volumes.

```java
public class EbsInstance
{
    private int iops;

    public EbsInstance(int iops)
    {
        this.iops = iops;
    }

    public int getIops()
    {
        return iops;
    }
}
```

**Return**

Returns a reference to this object so that method calls can be chained together.

```java
public class EbsInstance
{
    private int iops;

    public EbsInstance(int iops)
    {
        this.iops = iops;
    }

    public int getIops()
    {
        return iops;
    }
}
```
IOPS for `<code>io1</code>` volumes and 100-10000 IOPS for `<code>gp2</code>` volumes. </p>  

**Condition:**
This parameter is required for requests to create `<code>io1</code>` volumes; it is not used in requests to create `<code>gp2</code>`, `<code>st1</code>`, `<code>sc1</code>`, or `<code>standard</code>` volumes.

Encrypted Amazon EBS snapshots are copied asynchronously. If a snapshot copy operation fails (for example, if the proper AWS Key Management Service (AWS KMS) permissions are not obtained) this field displays error state details to help you diagnose why the error occurred. This parameter is only returned by the <a>DescribeSnapshots</a> API operation.

```java
public class DescribeSnapshotsResponse {
    // ...

    public String getStartTime() {
        return startTime;
    }

    public DescribeSnapshotsResponse withStartTime(DateTime startTime) {
        this.startTime = startTime;
        return this;
    }
}
```

Encrypted Amazon EBS snapshots are copied asynchronously. If a snapshot copy operation fails (for example, if the proper AWS Key Management Service (AWS KMS) permissions are not obtained) this field displays error state details to help you diagnose why the error occurred. This parameter is only returned by the <a>DescribeSnapshots</a> API operation.

```java
public class DescribeSnapshotsResponse {
    // ...

    public String getStateMessage() {
        return stateMessage;
    }

    public DescribeSnapshotsResponse withStateMessage(String stateMessage) {
        this.stateMessage = stateMessage;
        return this;
    }
}
```

  "variableSetterType": "java.util.Collection<Tag>"
Any tags assigned to the snapshot. This method appends the values to the existing list (if any). Use `setTags(java.util.Collection)` or `withTags(java.util.Collection)` if you want to override the existing values.

```java
public class Snapshot {
    private List<Tag> tags;

    // Getters and setters...
}
```

 Indicates whether the snapshot is encrypted.

```java
public class Snapshot {
    private boolean encrypted;

    // Getters and setters...
}
```

Marks the method as deprecated.

```java
@Deprecated
public void setTags(java.util.Collection<Tag> tags) {
    this.tags = tags;
}
```

The ID of the subnet in which to launch the instances. To specify multiple subnets, separate them using commas; for example, "subnet-a61dafcf, subnet-65ea5f08".

### documentation
The ID of the subnet in which to launch the instances. To specify multiple subnets, separate them using commas; for example, "subnet-a61dafcf, subnet-65ea5f08".

### fluentSetterDocumentation
The ID of the subnet in which to launch the instances. To specify multiple subnets, separate them using commas; for example, "subnet-a61dafcf, subnet-65ea5f08".

```java
public void withSubnetId(String subnetId) {
    // Implementation
}
```

### getterDocumentation
The ID of the subnet in which to launch the instances. To specify multiple subnets, separate them using commas; for example, "subnet-a61dafcf, subnet-65ea5f08".

```java
public String getSubnetId() {
    // Implementation
}
```

### setterDocumentation
The ID of the subnet in which to launch the instances. To specify multiple subnets, separate them using commas; for example, "subnet-a61dafcf, subnet-65ea5f08".

```java
public void setSubnetId(String subnetId) {
    // Implementation
}
```
The ID of the subnet in which to launch the instances. To specify multiple subnets, separate them using commas; for example, "subnet-a61dafcf, subnet-65ea5f08". To specify multiple subnets, separate them using commas; for example, "subnet-a61dafcf, subnet-65ea5f08".

```java
public void withUserData(String userData) {
    // Method implementation
}
```

The user data to make available to the instances. If you are using an AWS SDK or command line tool, Base64-encoding is performed for you, and you can load the text from a file. Otherwise, you must provide Base64-encoded text.

```java
public String getUserData() {
    // Method implementation
}
```

The user data to make available to the instances. If you are using an AWS SDK or command line tool, Base64-encoding is performed for you, and you can load the text from a file. Otherwise, you must provide Base64-encoded text.

```java
public void withUserData(String userData) {
    // Method implementation
}
```

The user data to make available to the instances. If you are using an AWS SDK or command line tool, Base64-encoding is performed for you, and you can load the text from a file. Otherwise, you must provide Base64-encoded text.

```java
public String getUserData() {
    // Method implementation
}

}
Grants the Spot fleet permission to terminate Spot instances on your behalf when you cancel its Spot fleet request using `<a>CancelSpotFleetRequests</a>` or when the Spot fleet request expires, if you set `<code>terminateInstancesWithExpiration</code>.

When you set `<code>terminateInstancesWithExpiration</code>` and the Spot fleet request expires, all Spot instances that are running in the Spot fleet will be terminated. If the Spot fleet request is pending or in the `pending` state, the Spot instances will continue to run.

### Notes

- **Grants the Spot fleet permission to terminate Spot instances on your behalf when you cancel its Spot fleet request using `<a>CancelSpotFleetRequests</a>` or when the Spot fleet request expires, if you set `<code>terminateInstancesWithExpiration</code>**.
- **Returns a reference to this object so that method calls can be chained together.**

```java
// Example code

```

request is persistent, it remains active until it is canceled or this date is reached.

@Retention(RETENTION.RUNTIME)
@Target(TARGET.METHOD)
The end date of the request, in UTC format (for example, yyyy-mm-ddThh:mm:ssZ). If this is a one-time request, it remains active until all instances launch, the request is canceled, or this date is reached. If the request is persistent, it remains active until it is canceled or this date is reached.

```java
public SpotInstanceRequest withValidUntil(Date validUntil) {
    // implementation
    return this;
}
```

The end date of the request, in UTC format (for example, yyyy-mm-ddThh:mm:ssZ). If this is a one-time request, it remains active until all instances launch, the request is canceled, or this date is reached. If the request is persistent, it remains active until it is canceled or this date is reached.

```java
public SpotInstanceState withValidUntil(Date validUntil) {
    // implementation
    return this;
}
```

The end date of the request, in UTC format (for example, yyyy-mm-ddThh:mm:ssZ). If this is a one-time request, it remains active until all instances launch, the request is canceled, or this date is reached. If the request is persistent, it remains active until it is canceled or this date is reached.

```java
public SpotInstanceState withValidUntil(Date validUntil) {
    // implementation
    return this;
}
```

The status code. For a list of status codes, see [Spot Bid Status Codes](http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/spot-bid-status.html#spot-instance-bid-status-understand) in the *Amazon Elastic Compute Cloud User Guide*. Returns a reference to this object so that method calls can be chained together.

```java
public String getCode()
{
    return code;
}
```

```java
public void setCode(String code)
{
    this.code = code;
}
```

The description for the status code. Returns a reference to this object so that method calls can be chained together.

```java
public String getMessage()
{
    return message;
}
```

```java
public void setMessage(String message)
{
    this.message = message;
}
```

```java
public String getStatus()
{
    return status;
}
```

```java
public void setStatus(String status)
{
    this.status = status;
}
```

The description for the status code.

```java
public String getMessage()
{
    return message;
}
```

```java
public void setMessage(String message)
{
    this.message = message;
}
```

The tenancy of the instance (if the instance is running in a VPC). An instance with a tenancy of `dedicated` runs on single-tenant hardware. The `host` tenancy is not supported for Spot instances.

```java
@ GPI spec: class Tenancy {

  public String getTenancy();

  public void setTenancy(String tenancy);

  // Other methods...
}
```

The `getTenancy` method returns the tenancy of the instance (if the instance is running in a VPC). An instance with a tenancy of `dedicated` runs on single-tenant hardware. The `host` tenancy is not supported for Spot instances.

```java
     @return The tenancy of the instance (if the instance is running in a VPC). An instance with a tenancy of `dedicated` runs on single-tenant hardware. The `host` tenancy is not supported for Spot instances.
```

The `setTenancy` method sets the tenancy of the instance (if the instance is running in a VPC). An instance with a tenancy of `dedicated` runs on single-tenant hardware. The `host` tenancy is not supported for Spot instances.

```java
     @param tenancy the tenancy of the instance (if the instance is running in a VPC). An instance with a tenancy of `dedicated` runs on single-tenant hardware. The `host` tenancy is not supported for Spot instances.
```

**Setter Documentation**:

The maximum price (bid) that you are willing to pay for a Spot instance.

```java
public void setSpotPrice(String spotPrice) {
    this.spotPrice = spotPrice;
}
```

**Vararg Setter Documentation**:

The maximum price (bid) that you are willing to pay for a Spot instance.

```java
public void setSpotPrice(String... spotPrices) {
    this.spotPrice = Arrays.asList(spotPrices);
}
```

**Simple**

```java
public String getSpotPrice() {
    return spotPrice;
}
```

**Xml Namespace Uri**

```java
public String getSpotPrice() {
    return spotPrice;
}
```

**Example**

```java
SpotPrice spotPrice = new SpotPrice();
spotPrice.setSpotPrice("1.23");
```

**Additional Information**

- **documentation**: The maximum price (bid) that you are willing to pay for a Spot instance.
- **simpleType**: String
- **variableSetterType**: String
- **variableDeclarationType**: String
- **variableName**: spotPrice
- **variableType**: String

---

**Timestamp**

**c2j Name**: Timestamp

**c2j Shape**: DateTime

**deprecated**

```java
public Timestamp getTimestamp() {
    return timestamp;
}
```

**Fluent Setter Documentation**:

The date and time the request was created, in UTC format (for example, YYYY-MM-DD HH:mm:ss).

```java
public void setTimestamp(java.util.Date timestamp) {
    this.timestamp = timestamp;
}
```

**documentation**: The date and time the request was created, in UTC format (for example, YYYY-MM-DD HH:mm:ss).

```java
public java.util.Date getTimestamp() {
    return timestamp;
}
```

**Example**

```java
Timestamp timestamp = new Timestamp();
timestamp.setTimestamp(new java.util.Date());
```
@Param timestamp

The date and time the request was created, in UTC format (for example, YYYY-MM-DD HH:MM:SS).

@return The date and time the request was created, in UTC format (for example, YYYY-MM-DD HH:MM:SS).

@ReturnType java.util.Date

The IPv4 CIDR block assigned to the subnet.

```
@return
```

Returns a reference to this object so that method calls can be chained together.

```
@param
```

The IPv4 CIDR block assigned to the subnet.

```
@method
```

Returns a reference to this object so that method calls can be chained together.

```
@method
```

Returns a reference to this object so that method calls can be chained together.

```
@method
```

Returns a reference to this object so that method calls can be chained together.

```
@method
```

Returns a reference to this object so that method calls can be chained together.

```
@method
```

Returns a reference to this object so that method calls can be chained together.
