```

The full ARN of the AWS Key Management Service (AWS KMS) CMK to use when creating the snapshot copy. This parameter is only required if you want to use a non-default CMK; if this parameter is not specified, the default CMK for EBS is used. The ARN contains the <code>arn:aws:kms</code> namespace, followed by the region of the CMK, the AWS account ID of the CMK owner, the <code>key</code> namespace, and then the CMK ID. For example, arn:aws:kms:<i>us-east-1</i>:<i>012345678910</i>:key:<i>abcd1234-a123-456a-a12b-a123b4cd56ef</i>
```

```

The full ARN of the AWS Key Management Service (AWS KMS) CMK to use when creating the snapshot copy. An invalid or improperly signed &lt;code&gt;PresignedUrl&lt;/code&gt; will cause the copy operation to
fail asynchronously, and the snapshot will move to an `<code>error</code>` state.

```java
public void copySnapshots()
{
    // Method implementation...
}
```

The parameter `PresignedUrl` is a pre-signed URL that facilitates copying an encrypted snapshot. This parameter is only required when copying an encrypted snapshot with the Amazon EC2 Query API; it is available as an optional parameter in all other cases. The `<code>PresignedUrl</code>` should be signed using AWS Signature Version 4. Because EBS snapshots are stored in Amazon S3, the signing algorithm for this parameter uses the same logic as described in the [Authenticating Requests by Using Query Parameters (AWS Signature Version 4)](http://docs.aws.amazon.com/AmazonS3/latest/API/sigv4-query-string-auth.html). An invalid or improperly signed `<code>PresignedUrl</code>` will cause the copy operation to fail asynchronously, and the snapshot will move to an `<code>error</code>` state.

**Documentation**

The ARN for the IAM role that's used to post flow logs to a CloudWatch Logs log group.

```java
@Param deliverLogsPermissionArn
```

The ARN for the IAM role that's used to post flow logs to a CloudWatch Logs log group.

```java
@Return
```

Returns a reference to this object so that method calls can be chained together.

```java
public class DeliverLogsPermissionArn {
    private String deliverLogsPermissionArn;

    public DeliverLogsPermissionArn withDeliverLogsPermissionArn(String deliverLogsPermissionArn) {
        this.deliverLogsPermissionArn = deliverLogsPermissionArn;
        return this;
    }

    public String getDeliverLogsPermissionArn() {
        return deliverLogsPermissionArn;
    }
}
```

**FluentSetter Documentation**

The ARN for the IAM role that's used to post flow logs to a CloudWatch Logs log group.

```java
public class DeliverLogsPermissionArn {
    private String deliverLogsPermissionArn;

    public DeliverLogsPermissionArn withDeliverLogsPermissionArn(String deliverLogsPermissionArn) {
        this.deliverLogsPermissionArn = deliverLogsPermissionArn;
        return this;
    }

    public String getDeliverLogsPermissionArn() {
        return deliverLogsPermissionArn;
    }
}
```

**Getter Documentation**

The name of the CloudWatch log group.

```java
public class DeliverLogsPermissionArn {
    private String deliverLogsPermissionArn;

    public DeliverLogsPermissionArn withDeliverLogsPermissionArn(String deliverLogsPermissionArn) {
        this.deliverLogsPermissionArn = deliverLogsPermissionArn;
        return this;
    }

    public String getDeliverLogsPermissionArn() {
        return deliverLogsPermissionArn;
    }
}
```

**SecondaryPrivateIpAddressCount**

The number of secondary private IPv4 addresses to assign to a network interface. When you specify a number of secondary IPv4 addresses, Amazon EC2 selects these IP addresses within the subnet's IPv4 CIDR range. You can't specify this option and specify more than one private IP address using <code>privateIpAddresses</code>. The number of IP addresses you can assign to a network interface varies by instance type. For more information, see the Amazon Virtual Private Cloud User Guide.

In the following code snippet, the <code>setSecondaryPrivateIpAddressCount</code> method sets the number of secondary private IPv4 addresses:

```java
public void setSecondaryPrivateIpAddressCount(int secondaryPrivateIpAddressCount) {
    // Code to set the number of secondary private IPv4 addresses
}
```

The documentation for this method includes examples of how to use it in practice.
the subnet's IPv4 CIDR range. You can't specify this option and specify more than one private IP address using
<code>privateIpAddresses</code>.

The number of IP addresses you can assign to a network interface varies by instance type. For more information, see "The number of secondary private IPv4 addresses to assign to a network interface. When you specify a number of secondary IPv4 addresses, Amazon EC2 selects these IP addresses within the subnet's IPv4 CIDR range. You can't specify this option and specify more than one private IP address using
<code>privateIpAddresses</code>."

The number of IP addresses you can assign to a network interface varies by instance type. For more information, see "The number of secondary private IPv4 addresses to assign to a network interface. When you specify a number of secondary IPv4 addresses, Amazon EC2 selects these IP addresses within the subnet's IPv4 CIDR range. You can't specify this option and specify more than one private IP address using
<code>privateIpAddresses</code>."

The ID of an Internet gateway or virtual private gateway attached to your VPC.

```java
public GatewayId getGatewayId() {
    return gatewayId;
}
```

```java
public void setGatewayId(String gatewayId) {
    this.gatewayId = gatewayId;
}
```

```java
public GatewayId withGatewayId(String gatewayId) {
    return withInstanceId(gatewayId);
}
```

The ID of a NAT instance in your VPC. The operation fails if you specify an instance ID unless exactly one network interface is attached.

```java
public InstanceId getInstanceId() {
    return instanceId;
}
```

```java
public void setInstanceId(String instanceId) {
    this.instanceId = instanceId;
}
```

```java
public InstanceId withInstanceId(String instanceId) {
    return withInstanceId(instanceId);
}
```

If a <code>KmsKeyId</code> is specified, the <code>Encrypted</code> flag must also be set.

```java
public class EbsEncryptedInfo {
    private String KmsKeyId;
    ...
}
```

### KmsKeyId

- **Type:** String
- **Description:** The full ARN of the AWS Key Management Service (AWS KMS) customer master key (CMK) to use when creating the encrypted volume. This parameter is only required if you want to use a non-default CMK; if this parameter is not specified, the default CMK for EBS is used. The ARN contains the <code>arn:aws:kms</code> namespace, followed by the region of the CMK, the AWS account ID of the CMK owner, the <code>key</code> namespace, and then the CMK ID. For example, arn:aws:kms:<i>us-east-1</i>:<i>012345678910</i>:key:<i>abcd1234-a123-456a-a12b-a123b4cd56ef</i>. If a <code>KmsKeyId</code> is specified, the <code>Encrypted</code> flag must also be set.

### Getter Method

```java
public String getKmsKeyId() {
    return this.KmsKeyId;
}
```

### Setter Method

```java
public void setKmsKeyId(String kmsKeyId) {
    this.KmsKeyId = kmsKeyId;
}
```
ID. For example, arn:aws:kms:<i>us-east-1</i>:<i>012345678910</i>:key/<i>abcd1234-a123-456a-a12b-a123b4cd56ef</i>. If a <code>KmsKeyId</code> is specified, the <code>Encrypted</code> flag must also be set.*/

**PolicyDocument**

A policy to attach to the endpoint that controls access to the service. The policy must be in valid JSON format. If this parameter is not specified, we attach a default policy that allows full access to the service.

```

@<p>param policyDocument A policy to attach to the endpoint that controls access to the service.

@<p>param policyDocument A policy to attach to the endpoint that controls access to the service.

@return Returns a reference to this object so that method calls can be chained together.

The AWS service name, in the form `<code>com.amazonaws.<i>region</i>.<i>service</i>`.
To get a list of available services, use the `<a>DescribeVpcEndpointServices</a>` request.

```java
@Param
public void setServiceName(String serviceName)

public String getServiceName()
```

The ID of the VPC in which the endpoint will be used.
To get a list of available services, use the `<a>DescribeVpcEndpointServices</a>` request.

```java
@Param
public void setVpcId(String vpcId)

public String getVpcId()
```
The ID of the VPC in which the endpoint will be used.

@vararg

The ID of the VPC in which the endpoint will be used.

@returns

Returns a reference to this object so that method calls can be chained together.

<code>host</code> into a dedicated tenancy VPC. The <code>host</code> value cannot be used with this parameter. Use the <code>default</code> or <code>dedicated</code> values only.

### PARAMETERS

**instanceTenancy**

- **Default**: <code>default</code>

**Description**

The tenancy options for instances launched into the VPC. For <code>default</code>, instances are launched with shared tenancy by default. You can launch instances with any tenancy into a shared tenancy VPC. For <code>dedicated</code>, instances are launched as dedicated tenancy instances by default. You can only launch instances with a tenancy of <code>dedicated</code> or <code>host</code> into a dedicated tenancy VPC. **Important**: The <code>host</code> value cannot be used with this parameter. Use the <code>default</code> or <code>dedicated</code> values only.

Default: <code>default</code>

```java
@see Tenancy*/
```

```java
public void setInstanceTenancy(String instanceTenancy) {
    this.instanceTenancy = instanceTenancy;
    this.withDefaultIfMissing(instanceTenancy);
}
```

```java
public String getInstanceTenancy() {
    return instanceTenancy;
}
```

```java
@see Tenancy*/
```

Any tags assigned to the customer gateway.

### Variable

- **Name**: `tags`
- **Type**: `java.util.List<Tag>`
- **Documentation**: Any tags assigned to the customer gateway.
- **Setter Method**: `withTags(java.util.Collection<Tag>)`
- **Getter Method**: `getTags()`

### Type

- **Type**: `String`
- **Documentation**: The type of VPN connection the customer gateway supports.

The code snippet illustrates the process of deleting an Egress Only Internet Gateway in a cloud service. It includes a description of the `DeleteEgressOnlyInternetGatewayRequest` and `DeleteEgressOnlyInternetGatewayResult` objects, with their respective attributes like `c2jName`, `c2jShape`, `documentation`, `enums`, and `getters`.

The key features of the `DeleteEgressOnlyInternetGatewayRequest` object include:
- It has a `ReturnCode` attribute that returns `true` if the request succeeds; otherwise, it returns an error.
- The `ReturnCode` is of type `Boolean`.

The `DeleteEgressOnlyInternetGatewayResult` object includes a `ReturnCode` attribute, which is also of type `Boolean`.

The `documentation` for the `ReturnCode` attribute is provided, stating that it returns `true` if the request succeeds; otherwise, it returns an error.

The `http` attributes are set to indicate that the request is not flattened, greedy, or streaming.

This code snippet is an example of how to handle requests and responses in a server-side application, particularly in environments where open-source software is utilized.

This method appends the values to the existing list (if any). Use \{@link 
isetInstanceIds(java.util.Collection)} or \{@link 
ewithInstanceIds(java.util.Collection)} if you want to override the
existing values.\n\p@param instanceIds One or more instance IDs. Must be instances linked to a VPC through ClassicLink.\n\return Returns a reference to this object so that method calls can be chained together.\n\}.

The ID of a VPC security group that's associated with the instance.\n\p\<li> <p>\<code>tag-key</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource.\n\</p>\</li>\<li> <p>\<code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "\tag-key=Purpose" and the filter "\tag-values=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag-key=Purpose</code> filter. If you want to list only resources where Purpose is X, see the <code>tag-key=Purpose</code> filter.\n\</p>\</li>\<li> <p>\<code>vpc-id</code> - The ID of the VPC that the instance is linked to.\n\</p>\</li>\</ul>
a tag assigned to the resource. 

This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter \\
"tag-key=Purpose\" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose \\
(regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list \\
only resources where Purpose is X, see the <code>tag</code>::<i>i</i>key<i>/i</i>=<i>i</i>value<i>/i</i> filter. 

### Filters:

- **tag-key** - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose\" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>::<i>i</i>key<i>/i</i>=<i>i</i>value<i>/i</i> filter.

- **tag-value** - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. For example, if you use both the filter "tag-key=Purpose\" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>::<i>i</i>key<i>/i</i>=<i>i</i>value<i>/i</i> filter.

- **group-id** - The ID of a VPC security group that's associated with the instance.

- **instance-id** - The ID of the instance.

- **tag-key** - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose\" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>::<i>i</i>key<i>/i</i>=<i>i</i>value<i>/i</i> filter.

- **tag-value** - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. For example, if you use both the filter "tag-key=Purpose\" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>::<i>i</i>key<i>/i</i>=<i>i</i>value<i>/i</i> filter.

- **vpc-id** - The ID of the VPC that the instance is linked to.

### Chained Calls:

If you use both the filter "tag-key=Purpose\" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>::<i>i</i>key<i>/i</i>=<i>i</i>value<i>/i</i> filter.

### Return Value:

The method returns a reference to this object so that method calls can be chained together.

```java
public FluentSettersMethod withFilters(List<Filter> filters)
```

### Parameters:

- **filters** - One or more filters.

One or more filters. • The ID of a set of DHCP options. • The key for one of the options (for example, <code>domain-name</code>). • The value for one of the options. • The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value. • The key/value combination of a tag assigned to the resource. This filter is independent of the filter value. For example, if you use both the filter <code>tag-key=Purpose</code> and the filter <code>tag-value=X</code>, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the filter value. • The value of a tag assigned to the resource. This filter is independent of the filter value. For example, if you use both the filter <code>tag-key=Purpose</code> and the filter <code>tag-value=X</code>, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the filter value.

### Examples

**Example 1:**

List all DHCP options.

```java
ListDhcpOptionsResult result = client.listDhcpOptions(
    new ListDhcpOptionsRequest()
);```

**Example 2:**

List DHCP options with the tag key Purpose and the tag value X.

```java
ListDhcpOptionsResult result = client.listDhcpOptions(
    new ListDhcpOptionsRequest()
        .withFilters(TagFilter.builder()
            .key("Purpose")
            .value("X")
            .build())
);```

**Example 3:**

List DHCP options with the tag key Purpose and the tag value X, and exclude resources where Purpose is Y.

```java
ListDhcpOptionsResult result = client.listDhcpOptions(
    new ListDhcpOptionsRequest()
        .withFilters(TagFilter.builder()
            .key("Purpose")
            .value("X")
            .build(),
        TagFilter.builder()
            .key("Purpose")
            .value("Y")
            .build())
);```

**Example 4:**

List all DHCP options.

```java
ListDhcpOptionsResult result = client.listDhcpOptions(
    new ListDhcpOptionsRequest()
);```

**Example 5:**

List DHCP options with the tag key Purpose and the tag value X, and return a reference to this object so that method calls can be chained together.

```java
ListDhcpOptionsResult result = client.listDhcpOptions(
    new ListDhcpOptionsRequest()
        .withFilters(TagFilter.builder()
            .key("Purpose")
            .value("X")
            .build())
);```

**Example 6:**

List all DHCP options with the tag key Purpose and tag value X, and return a reference to this object so that method calls can be chained together.

```java
ListDhcpOptionsResult result = client.listDhcpOptions(
    new ListDhcpOptionsRequest()
        .withFilters(TagFilter.builder()
            .key("Purpose")
            .value("X")
            .build())
);```

**Example 7:**

List all DHCP options with the tag key Purpose and tag value X, and return a reference to this object so that method calls can be chained together.

```java
ListDhcpOptionsResult result = client.listDhcpOptions(
    new ListDhcpOptionsRequest()
        .withFilters(TagFilter.builder()
            .key("Purpose")
            .value("X")
            .build())
);```

**Example 8:**

List all DHCP options with the tag key Purpose and tag value X, and return a reference to this object so that method calls can be chained together.

```java
ListDhcpOptionsResult result = client.listDhcpOptions(
    new ListDhcpOptionsRequest()
        .withFilters(TagFilter.builder()
            .key("Purpose")
            .value("X")
            .build())
);```

    "description" : "The DescribeEgressOnlyInternetGatewaysRequest structure is used for describing one or more EgressOnlyInternetGateways in an account in a Region.

    This operation returns a list of EgressOnlyInternetGateways in an account in a Region.

    The DescribeEgressOnlyInternetGatewaysRequest takes no parameters.

    The response to DescribeEgressOnlyInternetGateways contains a collection of EgressOnlyInternetGateways.

    **Example Request**

    The following example describes one or more EgressOnlyInternetGateways in an account in a Region.

    **XML Request**

    ```xml
    <DescribeEgressOnlyInternetGatewaysRequest/>
    ```

    **Example Response**

    The following example provides an XML response to the DescribeEgressOnlyInternetGateways request.

    ```xml
    <DescribeEgressOnlyInternetGatewaysResponse>
      <EgressOnlyInternetGateways>
        <EgressOnlyInternetGateway>
          <groupId>[groupId]
          <vpcId>[vpcId]
        </EgressOnlyInternetGateway>
      </EgressOnlyInternetGateways>
    </DescribeEgressOnlyInternetGatewaysResponse>
    ```
  }

### Fluent Setter Method Name

The fluent setter method name for the `NextToken` field is `withNextToken`.

### Getter Documentation

The token to use to retrieve the next page of results. This value is <code>null</code> when there are no more results to return.

```java
/**
 * The token to use to retrieve the next page of results. This value is null when there are no more results to return.
 *
 * @param nextToken The token to use to retrieve the next page of results. This value is null when there are no more results to return.
 * @return Returns a reference to this object so that method calls can be chained together.
 */
```

### Getter Method Name

The getter method name for the `nextToken` field is `getNextToken`.

### Getter Model

- **Type**: String
- **Documentation**: null

### HTTP

- **Additional Marshalling Path**: null
- **Additional Unmarshalling Path**: null
- **Flattened**: false
- **Greedy**: false
- **Header**: false
- **Is Payload**: false
- **Is Streaming**: false
- **Location**: null
- **Marshalling Location Name**: `nextToken`
- **Query String**: false
- **StatusCode**: false
- **Unmarshalling Location Name**: `nextToken`
- **URI**: false

### Idempotency Token

False

### List

False

### List Model

null

### Map

False

### Map Model

null

### Name

`NextToken`

### Setter Documentation

The token to use to retrieve the next page of results. This value is <code>null</code> when there are no more results to return.

```java
/**
 * The token to use to retrieve the next page of results. This value is null when there are no more results to return.
 *
 * @param nextToken The token to use to retrieve the next page of results. This value is null when there are no more results to return.
 * @return Returns a reference to this object so that method calls can be chained together.
 */
```

### Setter Method Name

The setter method name for the `nextToken` field is `setNextToken`.

### Setter Model

- **Variable Declaration Type**: String
- **Variable Name**: `nextToken`
- **Variable Type**: String
- **Documentation**: 
- **Simple Type**: String
- **Variable Setter Type**: String

### Simple

True

### Vararg Setter Documentation

The token to use to retrieve the next page of results. This value is <code>null</code> when there are no more results to return.

```java
/**
 * The token to use to retrieve the next page of results. This value is null when there are no more results to return.
 * @param nextToken The token to use to retrieve the next page of results. This value is null when there are no more results to return.
 * @return Returns a reference to this object so that method calls can be chained together.
 */
```
the next page of results. This value is `<code>null</code>` when there are no more results to return.

`@return` Returns a reference to this object so that method calls can be chained together.

```java
private int maxDuration = 94608000;
```

### maxDuration documentation

This is the maximum duration of the reservation you’d like to purchase, specified in seconds. Reservations are available in one-year and three-year terms. The number of seconds specified must be the number of seconds in a year (365x24x60x60) times one of the supported durations (1 or 3). For example, specify 94608000 for three years.

```java
public FilterList getFilter()
```

### FilterList documentation

One or more filters. The instance family of the offering (e.g., m4). The payment option (NoUpfront | PartialUpfront | AllUpfront).

```java
public FilterList withFilter(Filter... filters)
```

### Filter documentation

The instance family of the offering (e.g., m4). The payment option (NoUpfront | PartialUpfront | AllUpfront).

```java
public Filter instanceFamily(String instanceFamily)
```

### instanceFamily documentation

The instance family of the offering (e.g., m4).

```java
public Filter paymentOption(PaymentOption paymentOption)
```

### paymentOption documentation

The payment option (NoUpfront | PartialUpfront | AllUpfront).

This value can be between 5 and 500; if `<code>maxResults</code>` is given a larger value than 500, you will receive an error.

```java
@param maxResults The maximum number of results to return for the request in a single page. The remaining results can be seen by sending another request with the returned `<code>nextToken</code>` value. This value can be between 5 and 500; if `<code>maxResults</code>` is given a larger value than 500, you will receive an error.

```
reservation you'd like to purchase, specified in seconds. Reservations are available in one-year and three-year terms. The number of seconds specified must be the number of seconds in a year (365x24x60x60) times one of the supported durations (1 or 3). For example, specify 31536000 for one year.

```java
return
```

> Returns a reference to this object so that method calls can be chained together.

```java
public Integer getMinDuration() {
    return null;
}
```

> This is the minimum duration of the reservation you'd like to purchase, specified in seconds. Reservations are available in one-year and three-year terms. The number of seconds specified must be the number of seconds in a year (365x24x60x60) times one of the supported durations (1 or 3). For example, specify 31536000 for one year.

```java
public void setMinDuration(Integer minDuration) {
    this.minDuration = minDuration;
}
```

> This is the minimum duration of the reservation you'd like to purchase, specified in seconds. Reservations are available in one-year and three-year terms. The number of seconds specified must be the number of seconds in a year (365x24x60x60) times one of the supported durations (1 or 3). For example, specify 31536000 for one year.
This is the minimum duration of the reservation you'd like to purchase, specified in seconds. Reservations are available in one-year and three-year terms. The number of seconds specified must be the number of seconds in a year (365x24x60x60) times one of the supported durations (1 or 3). For example, specify 31536000 for one year. The token to use to retrieve the next page of results.

**param:**

minDuration

This is the minimum duration of the reservation you'd like to purchase, specified in seconds. Reservations are available in one-year and three-year terms. The number of seconds specified must be the number of seconds in a year (365x24x60x60) times one of the supported durations (1 or 3). For example, specify 31536000 for one year.

**Returns:**

A reference to this object so that method calls can be chained together.
