The state of the NAT gateway.

The NAT gateway is being created and is not ready to process traffic. The NAT gateway could not be created. Check the `failureCode` and `failureMessage` fields for the reason. The NAT gateway is able to process traffic. This status remains until you delete the NAT gateway, and does not indicate the health of the NAT gateway. The NAT gateway is in the process of being terminated and may still be processing traffic. The NAT gateway has been terminated and is no longer processing traffic. The NAT gateway is being created and is not ready to process traffic. The NAT gateway could not be created. Check the `failureCode` and `failureMessage` fields for the reason. The NAT gateway is able to process traffic. This status remains until you delete the NAT gateway, and does not indicate the health of the NAT gateway. The NAT gateway is in the process of being terminated and may still be processing traffic. The NAT gateway has been terminated and is no longer processing traffic. The state of the NAT gateway.

The state of the NAT gateway.

The NAT gateway is being created and is not ready to process traffic. The NAT gateway could not be created. Check the `failureCode` and `failureMessage` fields for the reason. The NAT gateway is able to process traffic. This status remains until you delete the NAT gateway, and does not indicate the health of the NAT gateway. The NAT gateway is in the process of being terminated and may still be processing traffic. The NAT gateway has been terminated and is no longer processing traffic.
has been terminated and is no longer processing traffic.</p>
</li>
<li><p><code>pending</code>: The NAT gateway is being created and is not ready to process traffic.</p>

Any security groups for the network interface. **NOTE:** This method appends the values to the existing list (if any). Use [@link #setGroups(java.util.Collection)] or [@link #withGroups(java.util.Collection)] if you want to override the existing values. @param groups Any security groups for the network interface. @return Returns a reference to this object so that method calls can be chained together.

(calculated as the offering's upfront cost multiplied by the host count). If the total upfront cost is greater than the specified price limit, the request will fail. This is used to ensure that the purchase does not exceed the expected upfront cost of the purchase. At this time, the only supported currency is <code>USD</code>. For example, to indicate a limit price of USD 100, specify 100.00. 

```java
@Return The specified limit is checked against the total upfront cost of the reservation (calculated as the offering’s upfront cost multiplied by the host count). If the total upfront cost is greater than the specified price limit, the request will fail. This is used to ensure that the purchase does not exceed the expected upfront cost of the purchase. At this time, the only supported currency is <code>USD</code>. For example, to indicate a limit price of USD 100, specify 100.00.
```

```java
public class LimitPrice {
    private String limitPrice;

    public String getLimitPrice() {
        return limitPrice;
    }

    public void setLimitPrice(String limitPrice) {
        this.limitPrice = limitPrice;
    }
}
```
The specified limit is checked against the total upfront cost of the reservation (calculated as the offering's upfront cost multiplied by the host count). If the total upfront cost is greater than the specified price limit, the request will fail. This is used to ensure that the purchase does not exceed the expected upfront cost of the purchase. At this time, the only supported currency is <code>USD</code>. For example, to indicate a limit price of USD 100, specify 100.00.

```java
@Param limitPrice The specified limit is checked against the total upfront cost of the reservation (calculated as the offering's upfront cost multiplied by the host count). If the total upfront cost is greater than the specified price limit, the request will fail. This is used to ensure that the purchase does not exceed the expected upfront cost of the purchase. At this time, the only supported currency is <code>USD</code>. For example, to indicate a limit price of USD 100, specify 100.00.

@return Returns a reference to this object so that method calls can be chained together.
```

@Param

tweets: The IP protocol. You can specify <code>all</code> or <code>-1</code> to
mean all protocols. If you specify <code>all</code>, <code>-1</code>, or a protocol number other than
<code>tcp</code>, <code>udp</code>, or <code>icmp</code>, traffic on all ports is allowed, regardless of any
ports or ICMP types or codes you specify. If you specify protocol <code>58</code> (ICMPv6) and specify an IPv4
CIDR block, traffic for all ICMP types and codes allowed, regardless of any that you specify. If you specify protocol
<code>58</code> (ICMPv6) and specify an IPv6 CIDR block, you must specify an ICMP type and
code.

@return The IP protocol. You can specify <code>all</code> or <code>-1</code> to
mean all protocols. If you specify <code>all</code>, <code>-1</code>, or a protocol number other than
<code>tcp</code>, <code>udp</code>, or <code>icmp</code>, traffic on all ports is allowed, regardless of any ports or ICMP types or
codes you specify. If you specify protocol <code>58</code> (ICMPv6) and specify an IPv4
CIDR block, traffic for all ICMP types and codes allowed, regardless of any that you specify. If you specify protocol <code>58</code> (ICMPv6) and specify an IPv4
CIDR block, you must specify an ICMP type and code.
CIDR block, traffic for all ICMP types and codes allowed, regardless of any that you specify. If you specify protocol <code>58</code> (ICMPv6) and specify an IPv6 CIDR block, you must specify an ICMP type and code.

```java
@Param protocol The IP protocol. You can specify <code>all</code> or <code>-1</code> to mean all protocols. If you specify <code>all</code>, <code>-1</code>, or a protocol number other than <code>tcp</code>, <code>udp</code>, or <code>icmp</code>, traffic on all ports is allowed, regardless of any ports or ICMP types or codes you specify. If you specify protocol <code>58</code> (ICMPv6) and specify an IPv4 CIDR block, traffic for all ICMP types and codes allowed, regardless of any that you specify. If you specify protocol <code>58</code> (ICMPv6) and specify an IPv6 CIDR block, you must specify an ICMP type and code.

"enumType" : null,
When you specify an Availability Zone group in a Spot Instance request, all Spot instances in the request are launched in the same Availability Zone. Instance proximity is maintained with this parameter, but the choice of Availability Zone is not. The group applies only to bids for Spot Instances of the same instance type. Any additional Spot instance requests that are specified with the same Availability Zone group name are launched in that same Availability Zone, as long as at least one instance from the group is still active. If there is no active instance running in the Availability Zone group that you specify for a new Spot instance request (all instances are terminated, the bid is expired, or the bid falls below current market), then Amazon EC2 launches the instance in any Availability Zone where the constraint can be met. Consequently, the subsequent set of Spot instances could be placed in a different zone from the original request, even if you specified the same Availability Zone group.

Default: Instances are launched in any available Availability Zone.

The user-specified name for a logical grouping of bids.
Spot instances in the request are launched in the same Availability Zone. Instance proximity is maintained with this parameter, but the choice of Availability Zone is not. The group applies only to bids for Spot Instances of the same instance type. Any additional Spot instance requests that are specified with the same Availability Zone group name are launched in that same Availability Zone, as long as at least one instance from the group is still active.

If there is no active instance running in the Availability Zone group that you specify for a new Spot instance request (all instances are terminated, the bid is expired, or the bid falls below current market), then Amazon EC2 launches the instance in any Availability Zone where the constraint can be met. Consequently, the subsequent set of Spot instances could be placed in a different zone from the original request, even if you specified the same Availability Zone group. 

@param availabilityZoneGroup The user-specified name for a logical grouping of bids. When you specify an Availability Zone group in a Spot Instance request, all Spot instances in the request are launched in the same Availability Zone. Instance proximity is maintained with this parameter, but the choice of Availability Zone is not. The group applies only to bids for Spot Instances of the same instance type. Any additional Spot instance requests that are specified with the same Availability Zone group name are launched in that same Availability Zone, as long as at least one instance from the group is still active. If there is no active instance running in the Availability Zone group that you specify for a new Spot instance request (all instances are terminated, the bid is expired, or the bid falls below current market), then Amazon EC2 launches the instance in any Availability Zone where the constraint can be met. Consequently, the subsequent set of Spot instances could be placed in a different zone from the original request, even if you specified the same Availability Zone group. 

@return Returns a reference to this object so that method calls can be chained together.
The group applies only to bids for Spot Instances of the same instance type. Any additional Spot instance requests that are specified with the same Availability Zone group name are launched in that same Availability Zone, as long as at least one instance from the group is still active. If there is no active instance running in the Availability Zone group that you specify for a new Spot instance request (all instances are terminated, the bid is expired, or the bid falls below current market), then Amazon EC2 launches the instance in any Availability Zone where the constraint can be met. Consequently, the subsequent set of Spot instances could be placed in a different zone from the original request, even if you specified the same Availability Zone group.

    "documentation" : "<p>The user-specified name for a logical grouping of bids.</p> <p>When you specify an Availability Zone group in a Spot Instance request, all Spot instances in the request are launched in the same Availability Zone. Instance proximity is maintained with this parameter, but the choice of Availability Zone is not. The group applies only to bids for Spot Instances of the same instance type. Any additional Spot instance requests that are specified with the same Availability Zone group name are launched in that same Availability Zone, as long as at least one instance from the group is still active.</p> <p>If there is no active instance running in the Availability Zone group that you specify for a new Spot instance request (all instances are terminated, the bid is expired, or the bid falls below current market), then Amazon EC2 launches the instance in any Availability Zone
where the constraint can be met. Consequently, the subsequent set of Spot instances could be placed in a different
zone from the original request, even if you specified the same Availability Zone group.</p> <p><strong><code>availabilityZoneGroup</code></strong>: The user-specified name for a logical grouping of bids.

When you specify an Availability Zone group in a Spot Instance request, all Spot instances in the request are launched in the same Availability Zone. Instance proximity is maintained with this parameter, but the choice of Availability Zone is not. The group applies only to bids for Spot Instances of the same instance type. Any additional Spot instance requests that are specified with the same Availability Zone group name are launched in that same Availability Zone, as long as at least one instance from the group is still active. If there is no active instance running in the Availability Zone group that you specify for a new Spot instance request (all instances are terminated, the bid is expired, or the bid falls below current market), then Amazon EC2 launches the instance in any Availability Zone where the constraint can be met. Consequently, the subsequent set of Spot instances could be placed in a different zone from the original request, even if you specified the same Availability Zone group.

By default, Spot instances are launched in any available Availability Zone.

```java
public void withAvailabilityZoneGroup(String availabilityZoneGroup) {
    // Set the availabilityZoneGroup parameter
    this.availabilityZoneGroup = availabilityZoneGroup;
}
```

It is possible to specify a different Availability Zone group for each Spot instance request. The group applies only to bids for Spot Instances of the same instance type. Any additional Spot instance requests that are specified with the same Availability Zone group name are launched in the same Availability Zone, as long as at least one instance from the group is still active. If there is no active instance running in the Availability Zone group that you specify for a new Spot instance request (all instances are terminated, the bid is expired, or the bid falls below current market), then Amazon EC2 launches the instance in any Availability Zone where the constraint can be met. Consequently, the subsequent set of Spot instances could be placed in a different zone from the original request, even if you specified the same Availability Zone group.

**BlockDurationMinutes**

The required duration for the Spot instances (also known as Spot blocks), in minutes. This value must be a multiple of 60 (60, 120, 180, 240, 300, or 360). The duration period starts as soon as your Spot instance receives its instance ID. At the end of the duration period, Amazon EC2 marks the Spot instance for termination and provides a Spot instance termination notice, which gives the instance a two-minute warning before it terminates. Note that you can't specify an Availability Zone group or a launch group if you specify a duration.

```java
public void setBlockDurationMinutes(int blockDurationMinutes) {
    this.blockDurationMinutes = blockDurationMinutes;
}
```

The duration period starts as soon as your Spot instance receives its instance ID. At the end of the duration period, Amazon EC2 marks the Spot instance for termination and provides a Spot instance termination notice, which gives the instance a two-minute warning before it terminates. Note that you can't specify an Availability Zone group or a launch group if you specify a duration.

```java
public int getBlockDurationMinutes() {
    return blockDurationMinutes;
}
```

The maximum number of Spot instances to launch. Default: 1

Returns a reference to this object so that method calls can be chained together.

The maximum number of Spot instances to launch. Default: 1

Returns the maximum number of Spot instances to launch.

The maximum number of Spot instances to launch. Default: 1

1*/

The maximum number of Spot instances to launch. 

Default: 1/* */

Declares a reference to this object so that method calls can be chained together.

The instance launch group. Launch groups are Spot instances that launch together and terminate together. 

Default: Instances are launched and terminated individually

Returns a reference to this object so that method calls can be chained together.

The maximum number of Spot instances to launch. 

Default: 1/* */

Declares a reference to this object so that method calls can be chained together.

The instance launch group. Launch groups are Spot instances that launch together and terminate together. 

Default: Instances are launched and terminated individually

Returns a reference to this object so that method calls can be chained together.

The instance launch group. Launch groups are Spot instances that launch together and terminate together. 

Default: Instances are launched and terminated individually

Returns a reference to this object so that method calls can be chained together.

@returns {} A reference to this object so that method calls can be chained together.

```java
public ReservedInstancesModificationId withReservedInstancesModificationId(String reservedInstancesModificationId) {
    setReservedInstancesModificationId(reservedInstancesModificationId);
    return this;
}
```

@returns {java.util.List<ReservedInstancesId>} The IDs of one or more Reserved Instances.

@returns {null} returns a reference to this object so that method calls can be chained together.

```java
public ReservedInstancesModificationId getReservedInstancesModificationId() {
    return reservedInstancesModificationId;
}
```

@returns {null} A unique ID for the Reserved Instance modification.

@returns {com.amazonaws.internal.SdkInternalList<ReservedInstancesId>} A unique ID for the Reserved Instance modification.

@returns {null} a reference to this object so that method calls can be chained together.

```java
public ReservedInstancesModificationId withReservedInstancesIds(java.util.Collection<ReservedInstancesId> reservedInstancesIds) {
    setReservedInstancesIds(reservedInstancesIds);
    return this;
}
```

@returns {List<ReservedInstancesId>} The IDs of one or more Reserved Instances.

@returns {null} returns a reference to this object so that method calls can be chained together.

```java
public void setReservedInstancesIds(java.util.Collection<ReservedInstancesId> reservedInstancesIds) {
    this.reservedInstancesIds = new com.amazonaws.internal.SdkInternalList<ReservedInstancesId>(null);
    this.reservedInstancesIds.addAll(reservedInstancesIds);
}
```

@returns {com.amazonaws.internal.SdkInternalList<ReservedInstancesId>} returns a reference to this object so that method calls can be chained together.
