The secondary private IP addresses to unassign from the network interface. You can specify this option multiple times to unassign more than one IP address.

```java
privateIpAddresses = ["ip1", "ip2", "ip3"];
```

Returns a reference to this object so that method calls can be chained together.

```java
getPrivateIpAddresses();
```

You can specify this option multiple times to unassign more than one IP address.

<h1>Availability Zone</h1>

The availability zone is a physical location where an object is stored in
a cloud.

### Availability Zones

An availability zone is a logical and geographic separation of a cloud.

### Availability Zone Requirements

- **Availability Zones:**
  - Availability Zones must be physically separate.
  - Availability Zones must be capable of supporting a variety of
    services.

### Availability Zone Characteristics

- **Characteristics:**
  - Availability Zones are distributed around the world.
  - Availability Zones are designed to be highly resilient.

### Availability Zone Benefits

- **Benefits:**
  - Availability Zones provide a mechanism for distributing
    data across multiple locations.
  - Availability Zones improve data availability and
    performance.

### Availability Zone Limitations

- **Limitations:**
  - Availability Zones cannot be created or deleted.
  - Availability Zones cannot be moved.

### Availability Zone Considerations

- **Considerations:**
  - Availability Zones should be chosen based on the needs of the
    application.
  - Availability Zones must be configured to support the
    application.

### Availability Zone Steps

- **Steps:**
  - Choose an availability zone based on the needs of the
    application.
  - Configure the availability zone to support the application.

### Availability Zone Examples

<table>
<thead>
<tr>
<th>Availability Zone</th>
</tr>
</thead>
<tbody>
<tr>
<td>Availability Zone A</td>
</tr>
<tr>
<td>Availability Zone B</td>
</tr>
</tbody>
</table>

A message that provides more information about the status, if applicable.

### Documentation

**getter**

```java
public String getMessage()

Returns a reference to this object so that method calls can be chained together.
```

**setter**

```java
public void setMessage(String message)

A message that provides more information about the status, if applicable.
```

### HTTP

- **marshallLocationName**: Message
- **unmarshallLocationName**: message

### Model

- **variableDeclarationType**: String
- **variableName**: message
- **variableType**: String
- **documentation**: "A message that provides more information about the status, if applicable.
- **simple**: true

### Varargs

```java
public void setMessage(String... message)

A message that provides more information about the status, if applicable.

 */
Describes the ID format settings for your resources on a per-region basis, for example, to view which resource types are enabled for longer IDs. This request only returns information about resource types whose ID formats can be modified; it does not return information about other resource types.

The following resource types support longer IDs: `instance` | `reservation` | `snapshot` | `volume`.

These settings apply to the IAM user who makes the request; they do not apply to the entire AWS account. By default, an IAM user defaults to the same settings as the root user, unless they explicitly override the settings by running the `<a>ModifyIdFormat</a>` command. Resources created with longer IDs are visible to all IAM users, regardless of these settings and provided that they have permission to use the relevant `<code>Describe</code>` command for the resource type.

```java
@Param describeIdFormatRequest
    Contains the parameters for DescribeIdFormat.

@Return A Java Future containing the result of the DescribeIdFormat operation returned by the service.
```

Modifies the ID format for the specified resource on a per-region basis. You can specify that resources should receive longer IDs (17-character IDs) when they are created. The following resource types support longer IDs: `instance` | `reservation` | `snapshot` | `volume`.

This setting applies to the IAM user who makes the request; it does not apply to the entire AWS account. By default, an IAM user defaults to the same settings as the root user. If you're using this action as the root user, then these settings apply to the entire account, unless an IAM user explicitly overrides these settings for themselves. For more information, see `<a>
* @param modifyIdFormatRequest
* Contains the parameters of ModifyIdFormat.
* @return A Java Future containing the result of the ModifyIdFormat operation returned by the service.
* @sample AmazonEC2Async.ModifyIdFormat
* @see <a href="http://docs.aws.amazon.com/goto/WebAPI/ec2-2016-11-15/ModifyIdFormat" target="_top">AWS API Documentation</a>

AssignPrivateIpAddresses: Assigns one or more secondary private IP addresses to the specified network interface.
You can specify one or more specific secondary IP addresses, or you can specify the number of secondary IP addresses to be automatically assigned within the subnet's CIDR block range. The number of secondary IP addresses that you can assign to an instance varies by instance type. For information about instance types, see [Instance Types](http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/instance-types.html) in the Amazon Elastic Compute Cloud User Guide. For more information about Elastic IP addresses, see [Elastic IP Addresses](http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/elastic-ip-addresses-eip.html) in the Amazon Elastic Compute Cloud User Guide.

"deprecated" : false,
"documentation" : "<p>Creates a set of DHCP options for your VPC. After creating the set, you must associate it with the VPC, causing all existing and new instances that you launch in the VPC to use this set of DHCP options. The following are the individual DHCP options you can specify. For more information about the options, see <a href="http://www.ietf.org/rfc/rfc2132.txt">RFC 2132</a>.</p>
<ul>
<li><p><code>domain-name-servers</code> - The IP addresses of up to four domain name servers, or AmazonProvidedDNS. The default DHCP option set specifies AmazonProvidedDNS. If specifying more than one domain name server, specify the IP addresses in a single parameter, separated by commas. If you want your instance to receive a custom DNS hostname as specified in <code>domain-name</code>, you must set <code>domain-name-servers</code> to a custom DNS server.</p></li>
<li><p><code>domain-name</code> - If you're using AmazonProvidedDNS in "us-east-1", specify "ec2.internal". If you're using AmazonProvidedDNS in another region, specify "/region.compute.internal" (for example, "ap-northeast-1.compute.internal"). Otherwise, specify a domain name (for example, "MyCompany.com"). This value is used to complete unqualified DNS hostnames. <b>Important</b>: Some Linux operating systems accept multiple domain names separated by spaces. However, Windows and other Linux operating systems treat the value as a single domain, which results in unexpected behavior. If your DHCP options set is associated with a VPC that has instances with multiple operating systems, specify only one domain name.</p></li>
<li><p><code>ntp-servers</code> - The IP addresses of up to four Network Time Protocol (NTP) servers.</p></li>
<li><p><code>netbios-name-servers</code> - The IP addresses of up to four NetBIOS name servers.</p></li>
<li><p><code>netbios-node-type</code> - The NetBIOS node type (1, 2, 4, or 8). We recommend that you specify 2 (broadcast and multicast are not currently supported). For more information about these node types, see <a href="http://www.ietf.org/rfc/rfc2132.txt">RFC 2132</a>.</p></li>
</ul>
<p>Your VPC automatically starts out with a set of DHCP options that includes only a DNS server that we provide (AmazonProvidedDNS). If you create a set of options, and if your VPC has an Internet gateway, make sure to set the <code>domain-name-servers</code> option either to <code>AmazonProvidedDNS</code> or to a domain name server of your choice. For more information about DHCP options, see <a href="http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_DHCP_Options.html">DHCP Options Sets</a> in the Amazon Virtual Private Cloud User Guide.</p>"},

Convertible Reserved Instances and Standard Reserved Instances with a regional benefit cannot be sold.</p> <p>The Reserved Instance Marketplace matches sellers who want to resell Standard Reserved Instance capacity that they no longer need with buyers who want to purchase additional capacity. Reserved Instances bought and sold through the Reserved Instance Marketplace work like any other Reserved Instances.</p> <p>To sell your Standard Reserved Instances, you must first register as a seller in the Reserved Instance Marketplace. After completing the registration process, you can create a Reserved Instance Marketplace listing of some or all of your Standard Reserved Instances, and specify the upfront price to receive for them. Your Standard Reserved Instance listings then become available for purchase. To view the details of your Standard Reserved Instance listing, you can use the <a>DescribeReservedInstancesListings</a> operation.</p> <p>For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using_cluster_computing.html">Cluster Instances</a> in the <i>Amazon Elastic Compute Cloud User Guide</i>.</p>"
Reserved Instance Marketplace in the Amazon Elastic Compute Cloud User Guide.

You must specify one of the following targets: Internet gateway or virtual private gateway, NAT instance, NAT gateway, VPC peering connection, network interface, or egress-only Internet gateway. When determining how to route traffic, we use the route with the most specific match. For example, traffic is destined for the IPv4 address 192.0.2.3, and the route table includes the following two IPv4 routes: (goes to some target A) (goes to some target B). Both routes apply to the traffic destined for 192.0.2.3. However, the second route in the list covers a smaller number of IP addresses and is therefore more specific, so we use that route to determine where to target the traffic. For more information about route tables, see Route Tables in the Amazon Virtual Private Cloud User Guide.

When a snapshot is created, any AWS Marketplace product codes that are associated with the source volume are propagated to the snapshot. You can take a snapshot of an attached volume that is in use. However, snapshots only capture data that has been written to your EBS volume at the time the snapshot command is issued; this may exclude any data that has been cached by any applications or the operating system. If you can pause any file systems on the volume long enough to take a snapshot, your snapshot should be complete. However, if you cannot pause all file writes to the volume, you should unmount the volume from within the instance, issue the snapshot command, and then remount the volume to ensure a consistent and complete snapshot. You may remount and use your volume while the snapshot status is `pending`. To create a snapshot for EBS volumes that serve as root devices, you should stop the instance before taking the snapshot. Snapshots that are taken from encrypted volumes are automatically encrypted. Volumes that are created from encrypted snapshots are also automatically encrypted. Your encrypted volumes and any associated snapshots always remain protected.

For more information, see [Amazon Elastic Block Storage](http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/AmazonEBS.html).
Amazon EBS Encryption in the Amazon Elastic Compute Cloud User Guide.

You can create one data feed per AWS account. For more information, see Amazon Elastic Compute Cloud User Guide.

  block. The subnet's IPv4 CIDR block can be the same as the VPC's IPv4 CIDR block (assuming you want only a
  single subnet in the VPC), or a subset of the VPC's IPv4 CIDR block. If you create more than one subnet in a VPC,
  the subnets' CIDR blocks must not overlap. The smallest IPv4 subnet (and VPC) you can create uses a /28 netmask
  (16 IPv4 addresses), and the largest uses a /16 netmask (65,536 IPv4 addresses).<p> If you've associated an
  IPv6 CIDR block with your VPC, you can create a subnet with an IPv6 CIDR block that uses a /64 prefix length.
</p> <important> AWS reserves both the first four and the last IP address in each subnet's CIDR block. They're
  not available for use.</important> If you add more than one subnet to a VPC, they're set up in a star
  topology with a logical router in the middle. If you launch an instance in a VPC using an Amazon EBS-
  backed AMI, the IP address doesn't change if you stop and restart the instance (unlike a similar instance launched
  outside a VPC, which gets a new IP address when restarted). It's therefore possible to have a subnet with no running
  instances (they're all stopped), but no remaining IP addresses available.<p> For more information about
  subnets, see <a href="http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_Subnets.html">Your VPC
  and Subnets</a> in the <i>Amazon Virtual Private Cloud User Guide</i>.</p>

Tagging Your Resources in the Amazon Elastic Compute Cloud User Guide. For more information about creating IAM policies that control users’ access to resources based on tags, see Supported Resource-Level Permissions for Amazon EC2 API Actions in the Amazon Elastic Compute Cloud User Guide.

Creating an EBS volume that can be attached to an instance in the same Availability Zone. The volume is created in the regional endpoint that you send the HTTP request to. For more information see Regions and Endpoints. You can create a new empty volume or restore a volume from an EBS snapshot. Any AWS Marketplace product codes from the snapshot are propagated to the volume. You can create encrypted volumes with the parameter. Encrypted volumes may only be attached to instances that support Amazon EBS encryption. Volumes that are created from encrypted snapshots are also automatically encrypted. For more information, see Amazon EBS Encryption in the Amazon Elastic Compute Cloud User Guide. You can create encrypted volumes with the parameter. Encrypted volumes may only be attached to instances that support Amazon EBS encryption. Volumes that are created from encrypted snapshots are also automatically encrypted. For more information, see Amazon Elastic Compute Cloud User Guide.

Describes one or more of your instances. If you specify one or more instance IDs, Amazon EC2 returns information for those instances. If you do not specify instance IDs, Amazon EC2 returns information for all relevant instances. If you specify an instance ID that is not valid, an error is returned. If you specify an instance that you do not own, it is not included in the returned results. Recently terminated instances might appear in the returned results. This interval is usually less than one hour. If you describe instances in the rare case where an Availability Zone is experiencing a service disruption and you specify instance IDs that are in the affected zone, or do not specify any instance IDs at all, the call fails. If you describe instances and specify only instance IDs that are in an unaffected zone, the call works normally.

If you describe instances and specify only instance IDs that are in an unaffected zone, the call works normally.

If you describe instances and specify only instance IDs that are in an unaffected zone, the call works normally.

If you describe instances and specify only instance IDs that are in an unaffected zone, the call works normally.

}
Describe one or more of the EBS snapshots available to you. Available snapshots include public snapshots available for any AWS account to launch, private snapshots that you own, and private snapshots owned by another AWS account but for which you've been given explicit create volume permissions. The create volume permissions fall into the following categories:

- **public**: The owner of the snapshot granted create volume permissions for the snapshot to the <code>all</code> group. All AWS accounts have create volume permissions for these snapshots.
- **explicit**: The owner of the snapshot granted create volume permissions to a specific AWS account.
- **implicit**: An AWS account has implicit create volume permissions for all snapshots it owns.

The list of snapshots returned can be modified by specifying snapshot IDs, snapshot owners, or AWS accounts with create volume permissions. If no options are specified, Amazon EC2 returns all snapshots for which you have create volume permissions.

If you specify one or more snapshot IDs, only snapshots that have the specified IDs are returned. If you specify an invalid snapshot ID, an error is returned. If you specify a snapshot ID for which you do not have access, it is not included in the returned results.

If you specify one or more snapshot owners using the <code>OwnerIds</code> option, only snapshots from the specified owners and for which you have access are returned. The results can include the AWS account IDs of the specified owners, <code>amazon</code> for snapshots owned by Amazon, or <code>self</code> for snapshots that you own.

If you specify a list of restorable users, only snapshots with create snapshot permissions for those users are returned. You can specify AWS account IDs (if you own the snapshots), <code>self</code> for snapshots which you own or have explicit permissions, or <code>all</code> for public snapshots.

If you are describing a long list of snapshots, you can paginate the output to make the list more manageable. The <code>MaxResults</code> parameter sets the maximum number of results returned in a single page. If the list of results exceeds your <code>MaxResults</code> value, then that number of results is returned along with a <code>NextToken</code> value that can be passed to a subsequent <code>DescribeSnapshots</code> request to retrieve the remaining results.

For more information about EBS snapshots, see "Amazon EBS Snapshots."

A link to Amazon EBS Snapshots is included in the text: "http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSSnapshots.html"
in the <i>Amazon Elastic Compute Cloud User Guide</i>.

"DescribeVolumeStatus" : {
  "authorizer" : null,
  "authtype" : "IAM",
  "deprecated" : false,
  "documentation" : "<p>Describes the status of the specified volumes. Volume status provides the result of the checks performed on your volumes to determine events that can impair the performance of your volumes. The performance of a volume can be affected if an issue occurs on the volume's underlying host. If the volume's underlying host experiences a power outage or system issue, after the system is restored, there could be data inconsistencies on the volume. Volume events notify you if this occurs. Volume actions notify you if any action needs to be taken in response to the event. </p> <p>The <code>DescribeVolumeStatus</code> operation provides the following information about the specified volumes:</p> <p><i>Status</i>: Reflects the current status of the volume. The possible values are <code>ok</code>, <code>impaired</code>, <code>warning</code>, or <code>insufficient-data</code>. If all checks pass, the overall status of the volume is <code>ok</code>. If the check fails, the overall status is <code>impaired</code>. If the status is <code>insufficient-data</code>, then the checks may still be taking place on your volume at the time. We recommend that you retry the request. For more information on volume status, see [Monitoring the Status of Your Volumes](http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/monitoring-volume-status.html). </p> <p><i>Events</i>: Reflect the cause of a volume status and may require you to take action. For example, if your volume returns an <code>impaired</code> status, then the volume event might be <code>potential-data-inconsistency</code>. This means that your volume has been affected by an issue with the underlying host, has all I/O operations disabled, and may have inconsistent data. </p> <p><i>Actions</i>: Reflect the actions you may have to take in response to an event. For example, if the status of the volume is <code>impaired</code> and the volume event shows <code>potential-data-inconsistency</code>, then the action shows <code>enable-volume-io</code>. This means that you may want to enable the I/O operations for the volume by calling the <a>EnableVolumeIO</a> action and then check the volume for data consistency. </p> <p><i>Note</i>: Volume status is based on the volume status checks, and does not reflect the volume state. Therefore, volume status does not indicate volumes in the <code>error</code> state (for example, when a volume is incapable of accepting I/O.).</p>

"DetachVolume" : {
Detaches an EBS volume from an instance. Make sure to unmount any file systems on the device within your operating system before detaching the volume. Failure to do so can result in the volume becoming indefinitely stuck in the <code>busy</code> state while detaching. If this happens, detachment can be delayed indefinitely until you unmount the volume, force detachment, reboot the instance, or all three. If an EBS volume is the root device of an instance, it can't be detached while the instance is running. To detach the root volume, stop the instance first.

When a volume with an AWS Marketplace product code is detached from an instance, the product code is no longer associated with the instance.

Stops an Amazon EBS-backed instance.

We don't charge hourly usage for a stopped instance, or data transfer fees; however, your root partition Amazon EBS volume remains, continues to persist your data, and you are charged for Amazon EBS volume usage. Each time you transition an instance from stopped to started, Amazon EC2 charges a full instance hour, even if transitions happen multiple times within a single hour.

You can't start or stop Spot instances, and you can't stop instance store-backed instances.

When you stop an instance, we shut it down. You can restart your instance at any time. Before stopping an instance, make sure it is in a state from which it can be restarted. Stopping an instance does not preserve data stored in RAM.

Stopping an instance is different to rebooting or terminating it. For example, when you stop an instance, the root device and any other devices attached to the instance persist. When you terminate an instance, the root device and any other devices attached during the instance launch are automatically deleted. For more information about the differences between rebooting, stopping, and terminating instances, see Instance Lifecycle in the Amazon Elastic Compute Cloud User Guide.

When you stop an instance, we attempt to shut it down forcibly after a short while. If your instance appears stuck in the stopping state after a period of time, there may be an issue with the underlying host computer. For more information, see Troubleshooting Stopping Your Instance in the Amazon Elastic Compute Cloud User Guide.
"deprecated": false,
"documentation": "<p>Shuts down one or more instances. This operation is idempotent; if you terminate an instance more than once, each call succeeds. <br><p>If you specify multiple instances and the request fails (for example, because of a single incorrect instance ID), none of the instances are terminated.</p> <p>The terminated instances remain visible after termination (for approximately one hour).</p> <p>By default, Amazon EC2 deletes all EBS volumes that were attached when the instance launched. Volumes attached after instance launch continue running.</p> <p>You can stop, start, and terminate EBS-backed instances. You can only terminate instance store-backed instances. What happens to an instance differs if you stop it or terminate it. For example, when you stop an instance, the root device and any other devices attached to the instance persist. When you terminate an instance, any attached EBS volumes with the <code>DeleteOnTermination</code> block device mapping parameter set to <code>true</code> are automatically deleted. For more information about the differences between stopping and terminating instances, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ec2-instance-lifecycle.html">Instance Lifecycle</a> in the <i>Amazon Elastic Compute Cloud User Guide</i>.<br><p>For more information about troubleshooting, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/TroubleshootingInstancesShuttingDown.html">Troubleshooting Terminating Your Instance</a> in the <i>Amazon Elastic Compute Cloud User Guide</i>.</p>

The number of available instance store volumes depends on the instance type. After you connect to the instance, you must mount the volume.

Constraints:
For M3 instances, you must specify instance store volumes in the block device mapping for the instance. When you launch an M3 instance, we ignore any instance store volumes specified in the block device mapping for the AMI.

"deprecated" : false,
"documentation" : "One or more filters.
<p>affinity</p> - The affinity setting for an instance running on a Dedicated Host (<code>default</code> | <code>host</code>).<p>architecture</p> - The instance architecture (<code>i386</code> | <code>x86_64</code>).<p>association.public-ip</p> - The address of the Elastic IP address (IPv4) bound to the network interface.<p>association.ip-owner-id</p> - The owner of the Elastic IP address (IPv4) associated with the network interface.<p>associationallocation-id</p> - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.<p>association.association-id</p> - The association ID returned when the network interface was associated with an IPv4 address.<p>availability-zone</p> - The Availability Zone of the instance.<p>block-device-mapping.attach-time</p> - The attach time for an EBS volume mapped to the instance, for example, <code>2010-09-15T17:20:00Z</code>.<p>block-device-mapping.device-name</p> - The device name for the EBS volume (for example, <code>/dev/sdh</code> or <code>xvdh</code>).<p>block-device-mapping.status</p> - The status for the EBS volume (<code>attaching</code> | <code>attached</code> | <code>detaching</code> | <code>detached</code>).<p>client-token</p> - The idempotency token provided when you launched the instance.<p>dns-name</p> - The public DNS name of the instance.<p>group-id</p> - The ID of the security group for the instance. EC2-Classic only.<p>group-name</p> - The name of the security group for the instance. EC2-Classic only.<p>host-id</p> - The ID of the Dedicated Host on which the instance is running, if applicable.<p>hypervisor</p> - The hypervisor type of the instance (<code>ovm</code> | <code>xen</code>).<p>iam-instance-profile.arn</p> - The instance profile associated with the instance. Specified as an ARN.<p>image-id</p> - The ID of the image used to launch the instance.<p>instance-id</p> - The ID of the instance.<p>instance-lifecycle</p> - Indicates whether this is a Spot Instance or a Scheduled Instance (<code>spot</code> | <code>scheduled</code>).<p>instance-state-
interface.</p> <li> <p> <code>owner-id</code> - The AWS account ID of the instance owner.</p> <li> <p> <code>placement-group-name</code> - The name of the placement group for the instance.</p> <li> <p> <code>platform</code> - The platform. Use <code>windows</code> if you have Windows instances; otherwise, leave blank.</p> <li> <p> <code>private-dns-name</code> - The private IPv4 DNS name of the instance.</p> <li> <p> <code>private-ip-address</code> - The private IPv4 address of the instance.</p> <li> <p> <code>product-code</code> - The product code associated with the AMI used to launch the instance.</p> <li> <p> <code>product-code.type</code> - The type of product code <code>(devpay</code> | <code>marketplace</code>).</p> <li> <p> <code>ramdisk-id</code> - The RAM disk ID.</p> <li> <p> <code>reason</code> - The reason for the current state of the instance (for example, shows "User Initiated [date]" when you stop or terminate the instance). Similar to the state-reason-code filter.</p> <li> <p> <code>requester-id</code> - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).</p> <li> <p> <code>reservation-id</code> - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID.</p> <li> <p> <code>root-device-name</code> - The name of the root device for the instance (for example, <code>/dev/sda1</code> or <code>/dev/xvda</code>).</p> <li> <p> <code>root-device-type</code> - The type of root device that the instance uses (<code>ebs</code> | <code>instance-store</code>). This filter is independent of the <code>virtualization-type</code> filter. A value of <code>true</code> means that checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the instance to perform network address translation (NAT) in your VPC.</p> <li> <p> <code>spot-instance-request-id</code> - The ID of the Spot instance request.</p> <li> <p> <code>state-reason-code</code> - The reason code for the state change.</p> <li> <p> <code>state-reason-message</code> - A message that describes the state change.</p> <li> <p> <code>subnet-id</code> - The ID of the subnet for the instance.</p> <li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code> Purpose=X</code> for the filter value.</p> <li> <p> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.

      <ul>
        <li>
          <code>association.association-id</code> - The ID of an association ID for the ACL.
        </li>
        <li>
          <code>association.network-acl-id</code> - The ID of the network ACL involved in the association.
        </li>
        <li>
          <code>association.subnet-id</code> - The ID of the subnet involved in the association.
        </li>
        <li>
          <code>default</code> - Indicates whether the ACL is the default network ACL for the VPC.
        </li>
        <li>
          <code>entry.cidr</code> - The IPv4 CIDR range specified in the entry.
        </li>
        <li>
          <code>entry.egress</code> - Indicates whether the entry applies to egress traffic.
        </li>
        <li>
          <code>entry.egress</code> - Indicates whether the entry applies to egress traffic.
        </li>
        <li>
          <code>entry.icmp.code</code> - The ICMP code specified in the entry, if any.
        </li>
        <li>
          <code>entry.icmp.type</code> - The ICMP type specified in the entry, if any.
        </li>
        <li>
          <code>entry.ipv6-cidr</code> - The IPv6 CIDR range specified in the entry.
        </li>
        <li>
          <code>entry.port-range.from</code> - The start of the port range specified in the entry.
        </li>
        <li>
          <code>entry.port-range.to</code> - The end of the port range specified in the entry.
        </li>
        <li>
          <code>entry.protocol</code> - The protocol specified in the entry (tcp | udp | icmp | or a protocol number).
        </li>
        <li>
          <code>entry.rule-action</code> - Allows or denies the matching traffic (allow | deny).
        </li>
        <li>
          <code>entry.rule-number</code> - The number of an entry (in other words, rule) in the ACL's set of entries.
        </li>
        <li>
          <code>tag:Purpose</code> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify "tag:Purpose" for the filter name and "X" for the filter value.
        </li>
        <li>
          <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the "tag-value" filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the "tag:Purpose" filter.
        </li>
        <li>
          <code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the "tag-key" filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the "tag:Purpose" filter.
        </li>
      </ul>
    }
  }

The CIDR block you specify must exactly match the subnet's CIDR block for information to be returned for the subnet. You can also use &lt;code&gt;cidr&lt;/code&gt; or &lt;code&gt;cidr-block&lt;/code&gt; as the filter names.&lt;/p&gt; &lt;/li&gt; &lt;li&gt; &lt;p&gt; &lt;/p&gt; &lt;code&gt;defaultForAz&lt;/code&gt; - Indicates whether this is the default subnet for the Availability Zone. You can also use &lt;code&gt;default-for-az&lt;/code&gt; as the filter name.&lt;/p&gt; &lt;/li&gt; &lt;li&gt; &lt;p&gt; &lt;code&gt;ipv6-cidr-block-association.ipv6-cidr-block&lt;/code&gt; - An IPv6 CIDR block associated with the subnet.&lt;/p&gt; &lt;/li&gt; &lt;li&gt; &lt;p&gt; &lt;code&gt;ipv6-cidr-block-association.association-id&lt;/code&gt; - An association ID for an IPv6 CIDR block associated with the subnet.&lt;/p&gt; &lt;/li&gt; &lt;li&gt; &lt;p&gt; &lt;code&gt;ipv6-cidr-block-association.state&lt;/code&gt; - The state of an IPv6 CIDR block associated with the subnet.&lt;/p&gt; &lt;/li&gt; &lt;li&gt; &lt;p&gt; &lt;code&gt;state&lt;/code&gt; - The state of the subnet (&lt;code&gt;pending&lt;/code&gt; |&lt;code&gt;available&lt;/code&gt;).&lt;/p&gt; &lt;/li&gt; &lt;li&gt; &lt;p&gt; &lt;code&gt;subnet-id&lt;/code&gt; - The ID of the subnet.&lt;/p&gt; &lt;/li&gt; &lt;li&gt; &lt;p&gt; &lt;code&gt;tag:&lt;/code&gt;&lt;i&gt;key&lt;/i&gt;&lt;/i&gt;&lt;value&gt;&lt;/i&gt; - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify &lt;code&gt;tag:Purpose&lt;/code&gt; for the filter name and &lt;code&gt;X&lt;/code&gt; for the filter value.&lt;/p&gt; &lt;/li&gt; &lt;li&gt; &lt;p&gt; &lt;code&gt;tag-key&lt;/code&gt; - The key of a tag assigned to the resource. This filter is independent of the &lt;code&gt;tag-value&lt;/code&gt; filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the &lt;code&gt;tag&lt;/code&gt;&lt;i&gt;key&lt;/i&gt;&lt;/i&gt;&lt;value&gt;&lt;/i&gt; filter.&lt;/p&gt; &lt;/li&gt; &lt;li&gt; &lt;p&gt; &lt;code&gt;tag-value&lt;/code&gt; - The value of a tag assigned to the resource. This filter is independent of the &lt;code&gt;tag-key&lt;/code&gt; filter.&lt;/p&gt; &lt;/li&gt; &lt;li&gt; &lt;p&gt; &lt;code&gt;vpc-id&lt;/code&gt; - The ID of the VPC for the subnet.&lt;/p&gt; &lt;/li&gt; &lt;/ul&gt;";

</li>
<li><p><code>create-time</code> - The time stamp when the volume was created.</p>
</li>
<li><p><code>encrypted</code> - The encryption status of the
The size of the volume, in GiB.

The status of the volume (creating | available | in-use | deleting | deleted | error).

The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.

The key of a tag assigned to the resource. This filter is independent of the <code>tag</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.

The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.

The Amazon EBS volume type. This can be <code>gp2</code> for General Purpose SSD, <code>io1</code> for Provisioned IOPS SSD, <code>st1</code> for Throughput Optimized HDD, <code>sc1</code> for Cold HDD, or <code>standard</code> for Magnetic volumes.

The maximum number of volume results returned by <code>DescribeVolumes</code> in paginated output. When this parameter is used, <code>DescribeVolumes</code> only returns <code>MaxResults</code> results in a single page along with a <code>NextToken</code> response element. The remaining results of the initial request can be seen by sending another <code>DescribeVolumes</code> request with the returned <code>NextToken</code> value. This value can be between 5 and 500; if <code>MaxResults</code> is given a value larger than 500, only 500 results are returned. If this parameter is not used, then <code>DescribeVolumes</code> returns all results. You cannot specify this parameter and the volume IDs parameter in the same request.

The maximum number of volume results returned by <code>DescribeVolumes</code> in paginated output. When this parameter is used, <code>DescribeVolumes</code> only returns <code>MaxResults</code> results in a single page along with a <code>NextToken</code> response element. The remaining results of the initial request can be seen by sending another <code>DescribeVolumes</code> request with the returned <code>NextToken</code> value. This value can be between 5 and 500; if <code>MaxResults</code> is given a value larger than 500, only 500 results are returned. If this parameter is not used, then <code>DescribeVolumes</code> returns all results. You cannot specify this parameter and the volume IDs parameter in the same request.

  - The IPv4 CIDR block of the peer VPC.
  - The AWS account ID of the owner of the peer VPC.
  - The ID of the peer VPC.
  - The expiration date and time for the VPC peering connection.
  - The IPv4 CIDR block of the requester's VPC.
  - The AWS account ID of the owner of the requester VPC.
  - The ID of the requester VPC.
  - The status of the VPC peering connection (pending-acceptance | failed | expired | provisioning | active | deleted | rejected | ).
  - A message that provides more information about the status of the VPC peering connection, if applicable.
  - The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the \"tag-key=\"Purpose\"\" value filter.
  - The value of a tag assigned to the resource. This filter is independent of the tag-key filter. For example, if you use both the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the \"tag-value=\"X\"\" filter.

      "deprecated" : false,
      "documentation" : "<p>One or more filters.</p> <ul> <li> <p>
"attachment.state" - The current
state of the attachment between the gateway and the VPC (<code>attaching</code> | <code>attached</code> | <code>detaching</code> | <code>detached</code>). The ID of an attached VPC.</p> </li> <li> <p> <code>availability-zone</code> - The Availability Zone for the virtual private gateway (if applicable).</p> </li> <li> <p> <code>state</code> - The state of the virtual private gateway (<code>pending</code> | <code>available</code> | <code>deleting</code> | <code>deleted</code>).</p> </li> <li> <p> <code>tag:<i>key</i>=<i>value</i></code> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose=X</code> for the filter name and <code>X</code> for the filter value.</p> </li> <li> <p> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. </p> </li> <li> <p> <code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. </p> </li> <li> <p> <code>type</code> - The type of virtual private gateway. Currently the only supported type is <code>ipsec.1</code> </p> </li> <li> <p> <code>vpn-gateway-id</code> - The ID of the virtual private gateway. </p> </li> </ul>

  "deprecated": false,
  "documentation": "The IP protocol name (<code>tcp</code>, <code>udp</code>, <code>icmp</code>) or number (see <a href="http://www.iana.org/assignments/protocol-numbers/protocol-numbers.xhtml">Protocol Numbers</a>). 

[EC2-VPC only] Use <code>-1</code> to specify all protocols. When authorizing security group rules, specifying <code>-1</code> or a protocol number other than <code>tcp</code>, <code>udp</code>, or <code>icmp</code> allows traffic on all ports, regardless of any port range you specify. For <code>tcp</code>, <code>udp</code>, and <code>icmp</code>, you must specify a port range. For <code>58</code> (ICMPv6), you can optionally specify a port range; if you don't, traffic for all types and codes is allowed when authorizing rules.

  "streaming" : false,
  "xmlNamespace" : null
},

"SourceDestCheck" : {
  "deprecated" : false,
Speifies whether source/destination checking is enabled. A value of <code>true</code> means that checking is enabled, and <code>false</code> means checking is disabled. This value must be <code>false</code> for a NAT instance to perform NAT.

SriovNetSupport

Set to <code>simple</code> to enable enhanced networking with the Intel 82599 Virtual Function interface for the instance. There is no way to disable enhanced networking with the Intel 82599 Virtual Function interface at this time. This option is supported only for HVM instances. Specifying this option with a PV instance can make it unreachable.

UserData

Changes the instance's user data to the specified value. If you are using an AWS SDK or command line tool, Base64-encoding is performed for you, and you can load the text from a file. Otherwise, you must provide Base64-encoded text.

Value

A new value for the attribute. Use only with the <code>kernel</code>, <code>ramdisk</code>, <code>userData</code>, <code>disableApiTermination</code>, or
<code>instanceInitiatedShutdownBehavior</code> attribute.

The documentation for the VPC peering connection options includes:

- **AllowDnsResolutionFromRemoteVpc**: Enables a local VPC to resolve public DNS hostnames to private IP addresses when queried from instances in the peer VPC.
  - **Deprecation**: False
  - **Documentation**: If true, enables a local VPC to resolve public DNS hostnames to private IP addresses when queried from instances in the peer VPC.

- **AllowEgressFromLocalClassicLinkToRemoteVpc**: Enables outbound communication from an EC2-Classic instance linked to a local VPC via ClassicLink to instances in a peer VPC.
  - **Deprecation**: False
  - **Documentation**: If true, enables outbound communication from an EC2-Classic instance linked to a local VPC via ClassicLink to instances in a peer VPC.

- **AllowEgressFromLocalVpcToRemoteClassicLink**: Enables outbound communication from instances in a local VPC to an EC2-Classic instance linked to a peer VPC via ClassicLink.
  - **Deprecation**: False
  - **Documentation**: If true, enables outbound communication from instances in a local VPC to an EC2-Classic instance linked to a peer VPC via ClassicLink.
