static inline unsigned long get_nr_restart_syscall(const struct pt_regs *regs)
{
    /*
    * This function is fundamentally broken as currently
    * implemented.
    *
    * The idea is that we want to trigger a call to the
    * restart_block() syscall and that we want in_ia32_syscall(),
    * in_x32_syscall(), etc. to match whatever they were in the
    * syscall being restarted. We assume that the syscall
    * instruction at (regs->ip - 2) matches whatever syscall
    * instruction we used to enter in the first place.
    *
    * The problem is that we can get here when ptrace pokes
    * syscall-like values into regs even if we're not in a syscall
    * at all.
    *
    * For now, we maintain historical behavior and guess based on
    * stored state. We could do better by saving the actual
    * syscall arch in restart_block or (with caveats on x32) by
    * checking if regs->ip points to 'int $0x80'. The current
    * behavior is incorrect if a tracer has a different bitness
    * than the tracee.

+        +/*
+        * This is a bit more complex than the always mode because
+        * it has to handle two cases:
+    */
}
1) Switch from a user space task (potential attacker) which has TIF_SPEC_IB set to a user space task (potential victim) which has TIF_SPEC_IB not set.

2) Switch from a user space task (potential attacker) which has TIF_SPEC_IB not set to a user space task (potential victim) which has TIF_SPEC_IB set.

This could be done by unconditionally issuing IBPB when a task which has TIF_SPEC_IB set is either scheduled in or out. Though that results in two flushes when:

- the same user space task is scheduled out and later scheduled in again and only a kernel thread ran in between.
- a user space task belonging to the same process is scheduled in after a kernel thread ran in between
- a user space task belonging to the same process is scheduled in immediately.

Optimize this with reasonably small overhead for the above cases. Mangle the TIF_SPEC_IB bit into the mm pointer of the incoming task which is stored in cpu_tlbstate.last_user_mm_ibpb for comparison.

```
next_mm = mm_mangle_tif_spec_ib(next);
prev_mm = this_cpu_read(cpu_tlbstate.last_user_mm_ibpb);

if (next_mm != prev_mm && (next_mm | prev_mm) & LAST_USER_MM_IBPB)
  indirect_branch_prediction_barrier();

this_cpu_write(cpu_tlbstate.last_user_mm_ibpb, next_mm);
```

If (static_branch_unlikely(&switch_mm_always_ibpb)) {

Only flush when switching to a user space task with a different context than the user space task which ran last on this CPU.

wrapper to incorporate the list into the kernel. Each <hash> should be a string of hex digits.

+config EFI_SIGNATURE_LIST_PARSER
+bool "EFI signature list parser"
+depends on EFI
+select X509_CERTIFICATE_PARSER
+help
+ This option provides support for parsing EFI signature lists for
+ X.509 certificates and turning them into keys.
+
+config LOAD_UEFI_KEYS
+bool "Load certs and blacklist from UEFI db for module checking"
+depends on SYSTEM_BLACKLIST_KEYRING
+depends on SECONDARY_TRUSTED_KEYRING
+depends on EFI
+depends on EFI_SIGNATURE_LIST_PARSER
+help
+ If the kernel is booted in secure boot mode, this option will cause
+ the kernel to load the certificates from the UEFI db and MokListRT
+ into the secondary trusted keyring. It will also load any X.509
+ SHA256 hashes in the dbx list into the blacklist.
+
+ The effect of this is that, if the kernel is booted in secure boot
+ mode, modules signed with UEFI-stored keys will be permitted to be
+ loaded and keys that match the blacklist will be rejected.
+
+config SYSTEM_REVOCATION_LIST
+bool "Provide system-wide ring of revocation certificates"
+depends on SYSTEM_BLACKLIST_KEYRING
+depends on PKCS7_MESSAGE_PARSER=y
+help
+ If set, this allows revocation certificates to be stored in the
+ blacklist keyring and implements a hook whereby a PKCS#7 message can
+ be checked to see if it matches such a certificate.
+
+config SYSTEM_REVOCATION_KEYS
+string "X.509 certificates to be preloaded into the system blacklist keyring"
+depends on SYSTEM_REVOCATION_LIST
+help
+ If set, this option should be the filename of a PEM-formatted file
+ containing X.509 certificates to be included in the default blacklist
+ keyring.
+
