}
- To run an L2 guest, we need a vmcs02 based on the L1-specified vmcs12.
- We could reuse a single VMCS for all the L2 guests, but we also want the
- option to allocate a separate vmcs02 for each separate loaded vmcs12 - this
- allows keeping them loaded on the processor, and in the future will allow
- optimizations where prepare_vmcs02 doesn't need to set all the fields on
- every entry if they never change.
- So we keep, in vmx->nested.vmcs02_pool, a cache of size VMCS02_POOL_SIZE
- (>=0) with a vmcs02 for each recently loaded vmcs12s, most recent first.
- The following functions allocate and free a vmcs02 in this pool.

- Get a VMCS from the pool to use as vmcs02 for the current vmcs12. */
- static struct loaded_vmcs *nested_get_current_vmcs02(struct vcpu_vmx *vmx)

-     vmx->nested.vmcs02_num++;
-     return &item->vmcs02;
Free and remove from pool a vmcs02 saved for a vmcs12 (if there is one)

```c
static void nested_free_vmcs02(struct vcpu_vmx *vmx, gpa_t vmptr)
{
    struct vmcs02_list *item;

    list_for_each_entry(item, &vmx->nested.vmcs02_pool, list)
    if (item->vmptr == vmptr) {
        free_loaded_vmcs(&item->vmcs02);
        list_del(&item->list);
        kfree(item);
        vmx->nested.vmcs02_num--;
        return;
    }
}
```

Free all VMCSs saved for this vcpu, except the one pointed by
vmx->loaded_vmcs. We must be running L1, so vmx->loaded_vmcs
must be &vmx->vmcs01.

```c
static void nested_free_all_saved_vmcss(struct vcpu_vmx *vmx)
{
    struct vmcs02_list *item, *n;

    WARN_ON(vmx->loaded_vmcs != &vmx->vmcs01);
    list_for_each_entry_safe(item, n, &vmx->nested.vmcs02_pool, list) {
        if (vmx->loaded_vmcs == &item->vmcs02)
            continue;

        free_loaded_vmcs(&item->vmcs02);
        list_del(&item->list);
        kfree(item);
        vmx->nested.vmcs02_num--;
    }
}
```

```

- **Function Description:**
  - The function `nested_vmx_check_io_bitmaps` is used to check if the IO bitmaps are present and if so, returns the qualifications.
  - It checks the `CPU_BASED_USE_IO_BITMAPS` flag in the VMCS to determine if the bitmaps are enabled.
  - It reads the exit qualification from the VMCS and extracts the port and size information.
  - It then compares the exit reason with predefined cases to determine if the bitmap is dirty.

- **Important Note:**
  - The comments indicate the importance of handling IO bitmaps in a nested environment to prevent out-of-sync issues with dirty tracking.
  - It marks these pages dirty on every exit from L2 to prevent them from getting out of sync with dirty tracking.

Open Source Used In 5GaaS Edge AC-4  7620
Some BIOS implementations support RAM above 4GB, but do not configure the PCI host to respond to bus master accesses for these addresses. These implementations set the TOP_OF_DRAM_SLOT1 register correctly, so PCI DMA works as expected for addresses below 4GB.

bfq_finish_requeue_request hook, if defined, is probably invoked also on this request. So, by exploiting this hook, we could 1) increment rq_in_driver here, and 2) decrement it in bfq_finish_requeue_request. Such a solution would let the value of the counter be always accurate, but it would entail using an extra interface function. This cost seems higher than the benefit.
