+Description: Linux kernel source for version PKGVER with Ubuntu patches
  + This package provides the source code for the Linux kernel version
  + PKGVER.
+This package is mainly meant for other packages to use, in order to build
  + custom flavours.
+If you wish to use this package to create a custom Linux kernel, then it
  + is suggested that you investigate the package kernel-package, which has
  + been designed to ease the task of creating kernel image packages.
+If you are simply trying to build third-party modules for your kernel,
  + you do not want this package. Install the appropriate linux-headers
  + package instead.

This example script retrieves the DHCP state of a given interface. In the interest of keeping the KVP daemon code free of distro specific information; the kvp daemon code invokes this external script to gather DHCP setting for the specific interface.

Input: Name of the interface

Output: The script prints the string "Enabled" to stdout to indicate that DHCP is enabled on the interface. If DHCP is not enabled, the script prints the string "Disabled" to stdout.

Each Distro is expected to implement this script in a distro specific fashion.

Description: Linux kernel source for version 4.15.0 with Ubuntu patches
This package provides the source code for the Linux kernel version
4.15.0.
+ This package is mainly meant for other packages to use, in order to build

+ If you wish to use this package to create a custom Linux kernel, then it
+ is suggested that you investigate the package kernel-package, which has
+ been designed to ease the task of creating kernel image packages.
+ If you are simply trying to build third-party modules for your kernel,
+ you do not want this package. Install the appropriate linux-headers
+ package instead.

+++ linux-4.15.0/debian/docs/README.inclusion-list

+This README describes the reason for, and the use of, module inclusion lists.

The original Hardy release had the notion of sub-flavours, e.g., a flavour that was constructed as a subset of an existing flavour. For example, the virtual flavour was extracted from the server flavour using a subset of the server flavour modules. However, there were some difficult maintenance issues with regard to packaging, make rules, and scripts. This
+re-implementation of the sub-flavours philosophy is hopefully simpler,
+and retrofittable to all releases.
+
+A module inclusion list looks at the problem of of constructing a package
+from the perspective of what modules do we _want_ in the package, as opposed
+to what modules we _don't_ want. As the kernel matures, more and more devices are added
+which makes the problem of configuration maintenance a real pain in the ass.
+If we took the approach of disabling all of the config options that we don't want,
+then the differences between flavours will quickly become quite large, making
+it difficult to quickly compare the individual flavour configs. Each time a
+new config option is added then we also have to make a decision about disabling in
+order to continue to keep the minimal number of modules.
+
+A module inclusion list is applied on a per-flavour basis. For example,
+debian.<BRANCH>/control.d/${flavour}.inclusion-list. For example, the
+config for virtual is very close to server and generic, but the inclusion list
+causes the virtual package to be constructed with _only_ the modules described
+in the inclusion list.
+
+The inclusion list format is a simple bash regular expression list of files. For example,
+
+arch/*/[crypto,kernel,oprofile]
+drivers/acpi/*
+drivers/ata/ahci.ko
+
+These 3 regular expression forms are suitable for expansion by bash and as inputs to 'find'.
+See debian/scripts/module-inclusion for details.
+
+There are 2 log files created as a side effect of the application of the module
+inclusion list: $(flavour).inclusion-list.log and $(flavour).depmod.log.
+
+$(flavour).inclusion-list.log : This log is created while the inclusion list
+modules are being copied. If any are missing, then those warnings go in this log.
+While its not considered a fatal error, you should endeavour to correct your inclusion
+list such that there are no missing modules.
+
+$(flavour).depmod.log : The log is created as a result of running depmod on the
+resulting set of modules. If there are missing symbols then you'll find that information
+here. Again, you should modify your inclusion list such that there are no missing
+symbols.
