  Support for Sun logical domain consoles.
  +
  + config LDISC_AUTOLOAD
  + bool "Automatically load TTY Line Disciplines"
  + default y
  + help
  + Historically the kernel has always automatically loaded any
  + line discipline that is in a kernel module when a user asks
  + for it to be loaded with the TIOCSETD ioctl, or through other
  + means. This is not always the best thing to do on systems
  + where you know you will not be using some of the more
  + "ancient" line disciplines, so prevent the kernel from doing
  + this unless the request is coming from a process with the
  + CAP_SYS_MODULE permissions.
  +
  + Say 'Y' here if you trust your userspace users to do the right
  + thing, or if you have only provided the line disciplines that
  + you know you will be using, or if you wish to continue to use
  + the traditional method of on-demand loading of these modules
  + by any user.
  +
  + This functionality can be changed at runtime with the
  + devtty.ldisc autoload sysctl, this configuration option will
  + only set the default value of this functionality.
  +

static int wdm_fsync(struct file *file, loff_t start, loff_t end, int datasync)
{
    return wdm_wait_for_response(file, MAX_SCHEDULE_TIMEOUT);
}
```

Same with wdm_fsync(), except it uses finite timeout in order to react to malicious or defective hardware which ceased communication after close() was implicitly called due to process termination.

```c
static int wdm_flush(struct file *file, fl_owner_t id)
{
    return wdm_wait_for_response(file, WDM_FLUSH_TIMEOUT);
}
```

The following code snippet initializes and manages the device descriptors for the WDM module:

```c
static unsigned int wdm_poll(struct file *file, struct poll_table_struct *wait)
{
    if (!desc->count)
        return 0;
    if (!test_bit(WDM_DISCONNECTING, &desc->flags)) {

/*
 - * USB has unusual DMA-alignment requirements: Although the
 - * starting address of each scatter-gather element doesn't matter,
 - * the length of each element except the last must be divisible
 - * by the Bulk maxpacket value. There's currently no way to
 - * express this by block-layer constraints, so we'll cop out
 - * and simply require addresses to be aligned at 512-byte
 - * boundaries. This is okay since most block I/O involves
 - * hardware sectors that are multiples of 512 bytes in length,
 - * and since host controllers up through USB 2.0 have maxpacket
 - * values no larger than 512.
 - *
 - * But it doesn't suffice for Wireless USB, where Bulk maxpacket
 - * values can be as large as 2048. To make that work properly
 - * will require changes to the block layer.
 + * Some host controllers may have alignment requirements.
 + * We'll play it safe by requiring 512-byte alignment always.

 - * USB has unusual DMA-alignment requirements: Although the
 - * starting address of each scatter-gather element doesn't matter,
 - * the length of each element except the last must be divisible
 - * by the Bulk maxpacket value. There's currently no way to
 - * express this by block-layer constraints, so we'll cop out
 - * and simply require addresses to be aligned at 512-byte
 - * boundaries. This is okay since most block I/O involves
 - * hardware sectors that are multiples of 512 bytes in length,
 - * and since host controllers up through USB 2.0 have maxpacket
 - * values no larger than 512.
 - *
 - * But it doesn't suffice for Wireless USB, where Bulk maxpacket
 - * values can be as large as 2048. To make that work properly
 - * will require changes to the block layer.
 + * The protocol has no requirements on alignment in the strict sense.
 + * Controllers may or may not have alignment restrictions.
 + * As this is not exported, we use an extremely conservative guess.

In the `usb.c` file, the case 'j' is updated to include `US_FL_NO_REPORT_LUNS` and case 'k' is added to include `US_FL_NO_SAME`.

The `Kconfig` file adds a dependency on `I2C` and selects `REGMAP_I2C` when configuring the TI TPS6598x USB Power Delivery controller driver.

In the `fusb302.c` file, the check for the message type before reporting to TCPM is added to ensure correct reporting even if the events are out of order.
