    the [MutableMap].  

    *  

    @kotlin.jvm.JvmName("mutableIterator")  

@kotlin.internal.InlineOnly  

public  

inline operator fun <K, V> MutableMap<K, V>.iterator(): MutableIterator<MutableMap.MutableEntry<K, V>> =

```

`entries.iterator()` Populates the given [destination] map with entries having the keys of this map and the values obtained by applying the [transform] function to each entry in this [Map].

`public inline fun <K, V, R, M : MutableMap<in K, in R>> Map<out K, V>.mapValuesTo(destination: M, transform: (Map.Entry<K, V>) -> R): M`

`{\n return entries.associateByTo(destination, { it.key }, transform)}`

 Populates the given [destination] map with entries having the keys obtained by applying the [transform] function to each entry in this [Map] and the values of this map.

 In case if any two entries are mapped to the equal keys, the value of the latter one will overwrite the value associated with the former one.

`public inline fun <K, V, R, M : MutableMap<in R, in V>> Map<out K, V>.mapKeysTo(destination: M, transform: (Map.Entry<K, V>) -> R): M`

`{\n return entries.associateByTo(destination, transform, { it.value })}`

 Puts all the given [pairs] into this [MutableMap] with the first component in the pair being the key and the second the value.

`public fun <K, V> MutableMap<in K, in V>.putAll(pairs: Array<out Pair<K, V>>): Unit`

`{\n for ((key, value) in pairs) {\n put(key, value)\n }}`

 Puts all the elements of the given collection into this [MutableMap] with the first component in the pair being the key and the second the value.

`public fun <K, V> MutableMap<in K, in V>.putAll(pairs: Iterable<Pair<K, V>>): Unit`

`{\n for ((key, value) in pairs) {\n put(key, value)\n }}`

 Puts all the elements of the given sequence into this [MutableMap] with the first component in the pair being the key and the second the value.

`public fun <K, V> MutableMap<in K, in V>.putAll(pairs: Sequence<Pair<K, V>>): Unit`

`{\n for ((key, value) in pairs) {\n put(key, value)\n }}`

 Returns a new map with entries having the keys of this map and the values obtained by applying the [transform] function to each entry in this [Map].

 The returned map preserves the entry iteration order of the original map.

`@sample samples.collections.Maps.Transformations.mapValues`

`public inline fun <K, V, R> Map<out K, V>.mapValues(transform: (Map.Entry<K, V>) -> R): Map<K, R>`

`{\n return mapValuesTo(LinkedHashMap<K, R>(mapCapacity(size)), transform) // .optimizeReadOnlyMap()`

 Returns a new Map with entries having the keys obtained by applying the [transform] function to each entry in this [Map] and the values of this map.

 In case if any two entries are mapped to the equal keys, the value of the latter one will overwrite the value associated with the former one.

 The returned map preserves the entry iteration order of the original map.

`@sample samples.collections.Maps.Transformations.mapKeys`

`public inline fun <K, V, R> Map<out K, V>.mapKeys(transform: (Map.Entry<K, V>) -> R): Map<R, V>`

`{\n return mapKeysTo(LinkedHashMap<R, V>(mapCapacity(size)), transform) // .optimizeReadOnlyMap()`

 Returns a map containing all key-value pairs with keys matching the given [predicate].

 The returned map preserves the entry iteration order of the original map.

`@sample samples.collections.Maps.Filtering.filterKeys`

`public inline fun <K, V> Map<out K, V>.filterKeys(predicate: (K) -> Boolean): Map<K, V>`

`{\n val result = LinkedHashMap<K, V>()\n for (entry in this) {\n if (predicate(entry.key)) {\n result.put(entry.key, entry.value)\n }\n }\n return result}`

 Returns a map containing all key-value pairs with values matching the given [predicate].

 The returned map preserves the entry iteration order of the original map.

`@sample samples.collections.Maps.Filtering.filterValues`

`public inline fun <K, V> Map<out K, V>.filterValues(predicate: (V) -> Boolean): Map<K, V>`

`{\n val result = LinkedHashMap<K, V>()\n for (entry in this) {\n if (predicate(entry.value)) {\n result.put(entry.key, entry.value)\n }\n }\n return result}`

 Appends all entries matching the given [predicate] into the mutable map given as [destination] parameter.

 @return the destination map.

`@sample samples.collections.Maps.Filtering.filterTo`

`public inline fun <K, V, M : MutableMap<in K, in V>> Map<out K, V>.filterTo(destination: M, predicate: (Map.Entry<K, V>) -> Boolean): M`

`{\n for (element in this) {\n if (predicate(element)) {\n destination.put(element.key, element.value)\n }\n }\n return destination}`

 Returns a new map containing all key-value pairs matching the given [predicate].

 The returned map preserves the entry iteration order of the original map.

`@sample samples.collections.Maps.Filtering.filter`

`public inline fun <K, V> Map<out K, V>.filter(predicate: (Map.Entry<K, V>) -> Boolean): Map<K, V>`

`{\n return filterTo(LinkedHashMap<K, V>(), predicate)}`

 Appends all entries not matching the given [predicate] into the given [destination].

 @return the destination map.

`@sample samples.collections.Maps.Filtering.filterNotTo`

`public inline fun <K, V, M : MutableMap<in K, in V>>`

```

Map<out K, V>.filterNotTo(destination: M, predicate: (Map.Entry<K, V>) -> Boolean): M {

```

Returns a list containing only distinct elements from the given collection.

- Among equal elements of the given collection, only the first one will be present in the resulting list.
- The elements in the resulting list are in the same order as they were in the source collection.

@sample
samples.collections.Collections.Transformations.distinctAndDistinctBy

```
public fun <T> Iterable<T>.distinct(): List<T> {
    return this.toMutableSet().toList()
}
```

Returns a list containing only elements from the given collection having distinct keys returned by the given [selector] function.

- Among elements of the given collection with equal keys, only the first one will be present in the resulting list.
- The elements in the resulting list are in the same order as they were in the source collection.

@sample
samples.collections.Collections.Transformations.distinctAndDistinctBy

```
public inline fun <T, K> Iterable<T>.distinctBy(selector: (T) -> K): List<T> {
    val set = HashSet<K>()
    val list = ArrayList<T>()
    for (e in this) {
        val key = selector(e)
        if (set.add(key)) list.add(e)
    }
    return list
}
```

Returns a set containing all elements that are contained by both this collection and the specified collection.

- The returned set preserves the element iteration order of the original collection.
- To get a set containing all elements that are contained at least in one of these collections use [union].

```
public infix fun <T> Iterable<T>.intersect(other: Iterable<T>): Set<T> {
    val set = this.toMutableSet()
    set.retainAll(other)
    return set
}
```

Returns a set containing all elements that are contained by this collection and not contained by the specified collection.

- The returned set preserves the element iteration order of the original collection.

```
public infix fun <T> Iterable<T>.subtract(other: Iterable<T>): Set<T> {
    val set = this.toMutableSet()
    set.removeAll(other)
    return set
}
```

Returns a new [MutableSet] containing all distinct elements from the given collection.

- The returned set preserves the element iteration order of the original collection.

```
public fun <T> Iterable<T>.toMutableSet(): MutableSet<T> {
    return when (this) {
        is Collection<T> -> LinkedHashSet(this)
        else -> toCollection(LinkedHashSet<T>())
    }
}
```

Returns a set containing all distinct elements from both collections.

- The returned set preserves the element iteration order of the original collection.
- Those elements of the [other] collection that are unique are iterated in the end in the order of the [other] collection.
- To get a set containing all elements that are contained in both collections use [intersect].

```
public infix fun <T> Iterable<T>.union(other: Iterable<T>): Set<T> {
    val set = this.toMutableSet()
    set.addAll(other)
    return set
}
```

Returns `true` if all elements match the given [predicate].

@sample
samples.collections.Collections.Aggregates.all

```
public inline fun <T> Iterable<T>.all(predicate: (T) -> Boolean): Boolean {
    if (this is Collection && isEmpty()) return true
    for (element in this) if (!predicate(element)) return false
    return true
}
```

Returns `true` if collection has at least one element.

@sample
samples.collections.Collections.Aggregates.any

```
public fun <T> Iterable<T>.any(): Boolean {
    if (this is Collection) return !isEmpty()
    return iterator().hasNext()
}
```

Returns `true` if at least one element matches the given [predicate].

@sample
samples.collections.Collections.Aggregates.anyWithPredicate

```
public inline fun <T> Iterable<T>.any(predicate: (T) -> Boolean): Boolean {
    if (this is Collection && isEmpty()) return false
    for (element in this) if (predicate(element)) return true
    return false
}
```

Returns the number of elements in this collection.

```
public fun <T> Iterable<T>.count(): Int {
    if (this is Collection) return size
    var count = 0
    for (element in this) checkCountOverflow(++count)
    return count
}
```

Returns the number of elements in this collection.

```
@kotlin.internal.InlineOnly
public inline fun <T> Collection<T>.count(): Int {
    return size
}
```

Returns the number of elements matching the given [predicate].

```

```

1.6, the [elements] array may have been converted to a [HashSet] to speed up the operation, thus the elements were required to have a correct and stable implementation of hashCode() that didn't change between successive invocations. On JVM, you can enable this behavior back with the system property kotlin.collections.convert_arg_to_set_in_removeAll set to true. The operation is _intermediate_ and _stateful_.

```

public operator fun <T> Sequence<T>.minus(elements: Array<out T>): Sequence<T> {
    if (elements.isEmpty()) return this
    return object: Sequence<T> {
        override fun iterator(): Iterator<T> {
            val other = elements.convertToSetForSetOperation()
            return this@minus.filterNot { it in other }.iterator()
        }
    }
}

```

Returns a sequence containing all elements of original sequence except the elements contained in the given [elements] collection. Note that the source sequence and the collection being subtracted are iterated only when an iterator is requested from the resulting sequence. Changing any of them between successive calls to iterator may affect the result. Before Kotlin 1.6, the [elements] collection may have been converted to a [HashSet] to speed up the operation, thus the elements were required to have a correct and stable implementation of hashCode() that didn't change between successive invocations. On JVM, you can enable this behavior back with the system property kotlin.collections.convert_arg_to_set_in_removeAll set to true. The operation is _intermediate_ and _stateful_.

```

public operator fun <T> Sequence<T>.minus(elements: Iterable<T>): Sequence<T> {
    return object: Sequence<T> {
        override fun iterator(): Iterator<T> {
            val other = elements.convertToSetForSetOperation()
            if (other.isEmpty()) return this@minus.iterator()
            else return this@minus.filterNot { it in other }.iterator()
        }
    }
}

```

Returns a sequence containing all elements of original sequence except the elements contained in the given [elements] sequence. Note that the source sequence and the sequence being subtracted are iterated only when an iterator is requested from the resulting sequence. Changing any of them between successive calls to iterator may affect the result. The operation is _intermediate_ for this sequence and _terminal_ and _stateful_ for the [elements] sequence. Before Kotlin 1.6, the [elements] sequence may have been converted to a [HashSet] to speed up the operation, thus the elements were required to have a correct and stable implementation of hashCode() that didn't change between successive invocations. On JVM, you can enable this behavior back with the system property kotlin.collections.convert_arg_to_set_in_removeAll set to true.

```

public operator fun <T> Sequence<T>.minus(elements: Sequence<T>): Sequence<T> {
    return object: Sequence<T> {
        override fun iterator(): Iterator<T> {
            val other = elements.convertToSetForSetOperation()
            if (other.isEmpty()) return this@minus.iterator()
            else return this@minus.filterNot { it in other }.iterator()
        }
    }
}

```

Returns a sequence containing all elements of the original sequence without the first occurrence of the given [element]. The operation is _intermediate_ and _stateless_.

```

@kotlin.internal.InlineOnly
public inline fun <T> Sequence<T>.minusElement(element: T): Sequence<T> {
    return minus(element)
}

```

Splits the original sequence into pair of lists, where first list contains elements for which [predicate] yielded true, while second list contains elements for which [predicate] yielded false. The operation is _terminal_.

```

@sample.samples.collections.Sequences.Transformations.partition
public inline fun <T> Sequence<T>.partition(predicate: (T) -> Boolean): Pair<List<T>, List<T>> {
    val first = ArrayList<T>()
    val second = ArrayList<T>()
    for (element in this) {
        if (predicate(element)) first.add(element)
    } else {
        second.add(element)
    }
    return Pair(first, second)
}

```

Returns a sequence containing all elements of the original sequence and then the given [element]. The operation is _intermediate_ and _stateless_.

```

public operator fun <T> Sequence<T>.plus(element: T): Sequence<T> {
    return sequenceOf(this, sequenceOf(element)).flatten()
}

```

Returns a sequence containing all elements of original sequence and then all elements of the given [elements] array. Note that the source sequence and the array being added are iterated only when an iterator is requested from the resulting sequence. Changing any of them between successive calls to iterator may affect the result. The operation is _intermediate_ and _stateless_.

```

public operator fun <T> Sequence<T>.plus(elements: Array<out T>): Sequence<T> {
    return this.plus(elements.asList())
}

```

Returns a sequence containing all elements of original sequence and then all elements of the given [elements] collection. Note that the source sequence and the collection being added

are iterated only when an `iterator` is requested from the resulting sequence. Changing any of them between successive calls to `iterator` may affect the result.

`Sequence<T>.plus(elements: Iterable<T>): Sequence<T>` { return sequenceOf(this, elements.asSequence()).flatten() }

Returns a sequence containing all elements of original sequence and then all elements of the given [elements] sequence.

Note that the source sequence and the sequence being added are iterated only when an `iterator` is requested from the resulting sequence. Changing any of them between successive calls to `iterator` may affect the result.

The operation is `_intermediate_ and _stateless_`.

`Sequence<T>.plus(elements: Sequence<T>): Sequence<T>` { return sequenceOf(this, elements).flatten() }

Returns a sequence containing all elements of the original sequence and then the given [element].

The operation is `_intermediate_ and _stateless_`.

`Sequence<T>.plusElement(element: T): Sequence<T>` { return plus(element) }

Returns a sequence of snapshots of the window of the given [size] sliding along this sequence with the given [step], where each snapshot is a list.

Several last lists may have fewer elements than the given [size].

Both [size] and [step] must be positive and can be greater than the number of elements in this sequence.

@param size the number of elements to take in each window

@param step the number of elements to move the window forward by on an each step, by default 1

@param partialWindows controls whether or not to keep partial windows in the end if any, by default `false` which means partial windows won't be preserved

@sample samples.collections.Sequences.Transformations.takeWindows

`Sequence<T>.windowed(size: Int, step: Int = 1, partialWindows: Boolean = false): Sequence<List<T>>` { return windowedSequence(size, step, partialWindows, reuseBuffer = false) }

Returns a sequence of results of applying the given [transform] function to an each list representing a view over the window of the given [size] sliding along this sequence with the given [step].

Note that the list passed to the [transform] function is ephemeral and is valid only inside that function.

You should not store it or allow it to escape in some way, unless you made a snapshot of it.

Several last lists may have fewer elements than the given [size].

Both [size] and [step] must be positive and can be greater than the number of elements in this sequence.

@param size the number of elements to take in each window

@param step the number of elements to move the window forward by on an each step, by default 1

@param partialWindows controls whether or not to keep partial windows in the end if any, by default `false` which means partial windows won't be preserved

@sample samples.collections.Sequences.Transformations.averageWindows

`Sequence<T>.windowed(size: Int, step: Int = 1, partialWindows: Boolean = false, transform: (List<T>) -> R): Sequence<R>` { return windowedSequence(size, step, partialWindows, reuseBuffer = true).map(transform) }

Returns a sequence of values built from the elements of `this` sequence and the [other] sequence with the same index.

The resulting sequence ends as soon as the shortest input sequence ends.

The operation is `_intermediate_ and _stateless_`.

@sample samples.collections.Sequences.Transformations.zip

`Sequence<T>.zip(other: Sequence<R>): Sequence<Pair<T, R>>` { return MergingSequence(this, other) { t1, t2 -> t1 to t2 } }

Returns a sequence of values built from the elements of `this` sequence and the [other] sequence with the same index using the provided [transform] function applied to each pair of elements.

The resulting sequence ends as soon as the shortest input sequence ends.

The operation is `_intermediate_ and _stateless_`.

@sample samples.collections.Sequences.Transformations.zipWithTransform

`Sequence<T>.zip(other: Sequence<R>, transform: (a: T, b: R) -> V): Sequence<V>` { return MergingSequence(this, other, transform) }

Returns a sequence of pairs of each two adjacent elements in this sequence.

The returned sequence is empty if this sequence contains less than two elements.

The operation is `_intermediate_ and _stateless_`.

@sample samples.collections.Collections.Transformations.zipWithNext

`Sequence<T>.zipWithNext(): Sequence<Pair<T, T>>` { return zipWithNext { a, b -> a to b } }

Returns a sequence containing the results of applying the given [transform] function to an each pair of two

adjacent elements in this sequence.

```

 * \n * The returned sequence is empty if this sequence contains less than two
elements.

    return destination
}
Returns a lazy [Iterable] that wraps each character of the original char sequence into an [IndexedValue] containing the index of that character and the character itself.
public fun
CharSequence.withIndex(): Iterable<IndexedValue<Char>> {
    return IndexingIterable { iterator() }
}
Returns `true` if all characters match the given [predicate].
@sample
samples.collections.Collections.Aggregates.all
public inline fun CharSequence.all(predicate: (Char) -> Boolean): Boolean {
    for (element in this) if (!predicate(element)) return false
    return true
}
Returns `true` if char sequence has at least one character.
@sample
samples.collections.Collections.Aggregates.any
public fun CharSequence.any(): Boolean {
    return !isEmpty()
}
Returns `true` if at least one character matches the given [predicate].
@sample
samples.collections.Collections.Aggregates.anyWithPredicate
public inline fun CharSequence.any(predicate:

```

```

(Char) -> Boolean): Boolean {
    for (element in this) if (predicate(element)) return true
    return false
}

Returns the length of this char sequence.
@kotlin.internal.InlineOnly
public inline fun CharSequence.count(): Int {
    return length
}

Returns the number of characters matching the given [predicate].
public inline fun CharSequence.count(predicate: (Char) -> Boolean): Int {
    var count = 0
    for (element in this) if (predicate(element)) ++count
    return count
}

Accumulates value starting with [initial] value and applying [operation] from left to right
to current accumulator value and each character.
@param [operation] function that takes current accumulator value and a character, and calculates the next accumulator value.
public inline fun <R> CharSequence.fold(initial: R, operation: (acc: R, Char) -> R): R {
    var accumulator = initial
    for (element in this) accumulator = operation(accumulator, element)

```

Since Kotlin 1.1

```

TYPE_ALIAS
}

```

Contains the list of possible annotation's retentions. Determines how an annotation is stored in binary output.

```

public enum class AnnotationRetention {
    /** Annotation isn't stored in binary output
    SOURCE,
    /** Annotation is stored in binary output, but invisible for reflection
    BINARY,
    /** Annotation is stored in binary output and visible for reflection (default retention)
    RUNTIME
}

```

This meta-annotation indicates the kinds of code elements which are possible targets of an annotation. If the target meta-annotation is not present on an annotation declaration, the annotation is applicable to the following elements: [CLASS], [PROPERTY], [FIELD], [LOCAL_VARIABLE], [VALUE_PARAMETER], [CONSTRUCTOR], [FUNCTION], [PROPERTY_GETTER], [PROPERTY_SETTER].

@property allowedTargets list of allowed annotation targets

```

@Target(AnnotationTarget.ANNOTATION_CLASS)
@MustBeDocumented
public annotation class Target(vararg val allowedTargets: AnnotationTarget)

```

This meta-annotation determines whether an annotation is stored in binary output and visible for reflection. By default, both are true.

@property value necessary annotation retention (RUNTIME, BINARY or SOURCE)

```

@Target(AnnotationTarget.ANNOTATION_CLASS)
public annotation class Retention(val value: AnnotationRetention = AnnotationRetention.RUNTIME)

```

This meta-annotation determines that an annotation is applicable twice or more on a single code element

```

@Target(AnnotationTarget.ANNOTATION_CLASS)
public annotation class Repeatable

```

This meta-annotation determines that an annotation is a part of public API and therefore should be included in the generated documentation for the element to which the annotation is applied.

```

@Target(FUNCTION)
@Deprecated("Use inline extension function with body using dynamic")
public annotation class nativeSetter
@Target(FUNCTION)
@Deprecated("Use inline extension function with body using dynamic")
public annotation class nativeInvoke
@Target(CLASS, FUNCTION, PROPERTY)
internal annotation class library(public val name: String = "")
@Target(CLASS)
internal annotation class marker
/**
 * Gives a declaration (a function, a property or a class) specific name in JavaScript.
 * This may be useful in the following cases:
 * * There are two functions for which the compiler gives same name in JavaScript, you can mark one with `@JsName(...)` to prevent the compiler from reporting error.
 * * You are writing a JavaScript library in Kotlin. The compiler produces mangled names for functions with parameters, which is unnatural for usual JavaScript developer. You can put `@JsName(...)` on functions you want to be available from JavaScript.
 * * For some reason you want to rename declaration, e.g. there's common term in JavaScript for a concept provided by the declaration, which is uncommon in Kotlin.
 * Example:
 * ``` kotlin
 * class Person(val name: String) {
 *     fun hello() {
 *         println("Hello $name!")
 *     }
 *     @JsName("helloWithGreeting") fun hello(greeting: String) {
 *         println("$greeting $name!")
 *     }
 * }
 * ```
 * @property name the name which compiler uses both for declaration itself and for all references to the declaration. It's required to denote a valid JavaScript identifier.
 * @Retention(AnnotationRetention.BINARY)
 * @Target(CLASS, FUNCTION, PROPERTY, CONSTRUCTOR, PROPERTY_GETTER, PROPERTY_SETTER)
 * public actual annotation class JsName(actual val name: String)
 * Denotes an `external` declaration that must be imported from native JavaScript library.
 * The compiler produces the code relevant for the target module system, for example, in case of CommonJS, it will import the declaration via the `require(...)` function.
 * The annotation can be used on top-level external declarations (classes, properties, functions) and files.
 * In case of file (which can't be `external`) the following rule applies: all the declarations in the file must be `external`. By applying `@JsModule(...)` on a file you tell the compiler to import a JavaScript object that contain all the declarations from the file.
 * Example:
 * ``` kotlin
 * @JsModule("jquery") external abstract class JQuery() {
 *     // some declarations here
 * }
 * @JsModule("jquery") external fun JQuery(element: Element): JQuery
 * ```
 * @property import name of a module to import declaration from. It is not interpreted by the Kotlin compiler, it's passed as is directly to the target module system.
 * @see JsNonModule
 * @Retention(AnnotationRetention.BINARY)
 * @Target(CLASS, PROPERTY, FUNCTION, FILE)
 * public annotation class JsModule(val import: String)
 * Denotes an `external` declaration that can be used without module system.
 * By default, an `external` declaration is available regardless your target module system.
 * However, by applying [JsModule] annotation you can make a declaration unavailable to plain module system.
 * Some JavaScript libraries are distributed both as a standalone downloadable piece of JavaScript and as a module available as an npm package.
 * To tell the Kotlin compiler to accept both cases, you can augment [JsModule] with the `@JsNonModule` annotation.
 * For example:
 * ``` kotlin
 * @JsModule("jquery")
 * @JsNonModule
 * @JsName("$") external abstract class JQuery() {
 *     // some declarations here
 * }
 * @JsModule("jquery")
 * @JsNonModule
 * @JsName("$") external fun JQuery(element: Element): JQuery
 * ```
 * @see JsModule
 * @Retention(AnnotationRetention.BINARY)
 * @Target(CLASS, PROPERTY, FUNCTION, FILE)
 * public annotation class JsNonModule
 * Adds prefix to `external` declarations in a source file.
 * JavaScript does not have concept of packages (namespaces). They are usually emulated by nested objects.
 * The compiler turns references to `external` declarations either to plain unprefix names (in case of plain modules) or to plain imports.
 * However, if a JavaScript library provides its declarations in packages, you won't be satisfied with this.
 * You can tell the compiler to generate additional prefix before references to `external` declarations using the `@JsQualifier(...)` annotation.
 * Note that a file

```

marked with the `@JsQualifier(...)` annotation can't contain non-`external` declarations. Example:

```

@file:JsQualifier("my.jsPackageName") package some.kotlinPackage
external fun foo(x: Int)
external fun bar(): String
@property value the qualifier to add to the declarations in the
generated code. It must be a sequence of valid JavaScript identifiers separated by the `.` character.
Examples of valid qualifiers are: `foo`, `bar.Baz`, `_$0.f`
@see JsModule
@Retention(AnnotationRetention.BINARY) @Target(AnnotationTarget.FILE) public annotation class
JsQualifier(val value: String)
** Exports top-level declaration on JS platform.
** Compiled module
exposes declarations that are marked with this annotation without name mangling.
** This annotation can be
applied to either files or top-level declarations.
** It is currently prohibited to export the following kinds of
declarations:
** `expect` declarations
** inline functions with reified type parameters
** suspend
functions
** secondary constructors without `@JsName`
** extension properties
** enum classes
**
annotation classes
** Signatures of exported declarations must only contain "exportable" types:
**
`dynamic`, `Any`, `String`, `Boolean`, `Byte`, `Short`, `Int`, `Float`, `Double`
** `BooleanArray`, `ByteArray`,
`ShortArray`, `IntArray`, `FloatArray`, `DoubleArray`
** `Array<exportable-type>`
** Function types with
exportable parameters and return types
** `external` or `@JsExport` classes and interfaces
** Nullable
counterparts of types above
** Unit return type. Must not be nullable
** This annotation is experimental,
meaning that restrictions mentioned above are subject to change.

rectangular coordinates (x, y) by computing the arc tangent of the value y / x ; the returned value is an angle in the range from $-\pi$ to π radians.

Special cases:

- $\text{atan2}(0.0, 0.0)$ is 0.0
- $\text{atan2}(0.0, x)$ is 0.0 for $x > 0$ and π for $x < 0$
- $\text{atan2}(-0.0, x)$ is -0.0 for $x > 0$ and $-\pi$ for $x < 0$
- $\text{atan2}(y, +\text{Inf})$ is 0.0 for $0 < y < +\text{Inf}$ and -0.0 for $-\text{Inf} < y < 0$
- $\text{atan2}(y, -\text{Inf})$ is π for $0 < y < +\text{Inf}$ and $-\pi$ for $-\text{Inf} < y < 0$
- $\text{atan2}(y, 0.0)$ is $\pi/2$ for $y > 0$ and $-\pi/2$ for $y < 0$
- $\text{atan2}(+\text{Inf}, x)$ is $\pi/2$ for finite x
- $\text{atan2}(-\text{Inf}, x)$ is $-\pi/2$ for finite x
- $\text{atan2}(\text{NaN}, x)$ and $\text{atan2}(y, \text{NaN})$ is NaN

for special cases. /n * /n @SinceKotlin("1.2") /n @InlineOnly /n public actual inline fun log10(x: Double): Double =

```

`nativeMath.log10(x)` Computes the binary logarithm (base 2) of the value [x]. @see [ln] function for special cases.

`nativeMath.log2(x)` Computes $\ln(x + 1)$. This function can be implemented to produce more precise result for [x] near zero. Special cases: $-\ln1p(\text{NaN})$ is NaN $-\ln1p(x)$ is NaN where $x < -1.0$ $-\ln1p(-1.0)$ is $-\text{Inf}$ $-\ln1p(+\text{Inf})$ is $+\text{Inf}$ @see [ln] function @see [expm1] function

`nativeMath.log1p(x)` Rounds the given value [x] to an integer towards positive infinity. @return the smallest double value that is greater than or equal to the given value [x] and is a mathematical integer. Special cases: $\text{ceil}(x)$ is x where x is NaN or $+\text{Inf}$ or $-\text{Inf}$ or already a mathematical integer.

`nativeMath.ceil(x)` Rounds the given value [x] to an integer towards negative infinity. @return the largest double value that is smaller than or equal to the given value [x] and is a mathematical integer. Special cases: $\text{floor}(x)$ is x where x is NaN or $+\text{Inf}$ or $-\text{Inf}$ or already a mathematical integer.

`nativeMath.floor(x)` Rounds the given value [x] to an integer towards zero. @return the value [x] having its fractional part truncated. Special cases: $\text{truncate}(x)$ is x where x is NaN or $+\text{Inf}$ or $-\text{Inf}$ or already a mathematical integer.

`nativeMath.truncate(x)` Rounds the given value [x] towards the closest integer with ties rounded towards even integer. Special cases: $\text{round}(x)$ is x where x is NaN or $+\text{Inf}$ or $-\text{Inf}$ or already a mathematical integer.

`nativeMath.round(x)` Returns the absolute value of the given value [x]. Special cases: $\text{abs}(\text{NaN})$ is NaN @see absoluteValue extension property for [Double]

`nativeMath.abs(x)` Returns the sign of the given value [x]: -1.0 if the value is negative, 0 if the value is zero, 1.0 if the value is positive. Special case: $\text{sign}(\text{NaN})$ is NaN

`nativeMath.sign(x)` Returns the smaller of two values. If either value is NaN , then the result is NaN .

`nativeMath.min(a, b)` Returns the greater of two values. If either value is NaN , then the result is NaN .

`nativeMath.max(a, b)` Raises this value to the power [x]. Special cases: $\text{b.pow}(0.0)$ is 1.0 $\text{b.pow}(1.0) == b$ $\text{b.pow}(\text{NaN})$ is NaN $\text{NaN.pow}(x)$ is NaN for $x != 0.0$ $\text{b.pow}(\text{Inf})$ is NaN for $\text{abs}(b) == 1.0$ $\text{b.pow}(x)$ is NaN for $b < 0$ and x is finite and not an integer

`Double.pow(x)` Returns this value to the integer power [n]. See the other overload of [pow] for details.

`Double.pow(n)` Returns the absolute value of this value. Special cases: NaN.absoluteValue is NaN @see abs function

`Double.absoluteValue` Returns the sign of this value: -1.0 if the value is negative, 0 if the value is zero, 1.0 if the value is positive. Special case: NaN.sign is NaN

`Double.sign` Returns this value with the sign bit same as of the [sign] value.

`Double.withSign(sign)` Returns the ulp (unit in the last place) of this value. An ulp is a positive distance between this value and the next nearest [Double] value larger in magnitude. Special Cases: NaN.ulp is NaN $x.ulp$ is $+\text{Inf}$ when x is $+\text{Inf}$ or $-\text{Inf}$ $0.0.ulp$ is `Double.MIN_VALUE`

`Double.ulp` Returns the ulp (unit in the last place) of this value.

```

}

```

`replaceAll` Replaces all occurrences of this regular expression in the specified [input] string with the result of

the given function [transform] that takes [MatchResult] and returns a string to be used as a

replacement for that match.

```

public actual fun
replace(input: CharSequence, transform: (MatchResult) -> CharSequence): String {
    var match = find(input)
    if (match == null) return input.toString()
    var lastStart = 0
    val length = input.length
    val sb =
        StringBuilder(length)
    do {
        val foundMatch = match!!
        sb.append(input, lastStart,
            foundMatch.range.start)
        sb.append(transform(foundMatch))
        lastStart =
            foundMatch.range.endInclusive + 1
        match = foundMatch.next()
    } while (lastStart < length && match
        != null)
    if (lastStart < length) {
        sb.append(input, lastStart, length)
    }
    return
        sb.toString()
}

```

`replaceFirst` Replaces the first occurrence of this regular expression in the specified [input] string with specified [replacement] expression.

- * The replacement string may contain references to the captured groups during a match. Occurrences of ``$index`` in the replacement string will be substituted with the subsequences corresponding to the captured groups with the specified index.
- * The first digit after '\$' is always treated as part of group reference. Subsequent digits are incorporated
- * into ``index`` only if they would form a valid group reference. Only the digits '0'..'9' are considered as potential components
- * of the group reference. Note that indexes of captured groups start from 1, and the group with index 0 is the whole match.

- * Backslash character `'\'` can be used to include the succeeding character as a literal in the replacement string, e.g., `\\$` or `\\\\`.
- * `[Regex.escapeReplacement]` can be used if [replacement] have to be treated as a literal string.

- * Note that referring named capturing groups by name is not supported currently in Kotlin/JS.
- * However, you can still refer them by index.

`@param` input the char sequence to find a match of this regular expression in

`@param` replacement the expression to replace the found match with

`@return` the result of replacing the first occurrence of this regular expression in [input] with the result of evaluating the [replacement] expression

`@throws` RuntimeException if [replacement] expression is malformed, or capturing group with specified ``name`` or ``index`` does not exist

```

public actual fun replaceFirst(input: CharSequence, replacement: String): String {
    if (!replacement.contains("\\\\") && !replacement.contains('$')) {
        val nonGlobalOptions =
            options.toFlags("\"u\")
        return input.toString().nativeReplace(RegExp(pattern, nonGlobalOptions),
            replacement)
    }
    val match = find(input) ?: return input.toString()
    return buildString {
        append(input.substring(0, match.range.first))
        append(substituteGroupRefs(match, replacement))
        append(input.substring(match.range.last + 1, input.length))
    }
}

```

`split` Splits the [input] CharSequence to a list of strings around matches of this regular expression.

- * `@param` limit Non-negative value specifying the maximum number of substrings the string can be split to.
- * Zero by default means no limit is set.

```

@Suppress("ACTUAL_FUNCTION_WITH_DEFAULT_ARGUMENTS")
public actual fun
split(input: CharSequence, limit: Int = 0): List<String> {
    requireNonNegativeLimit(limit)
    val matches =
        findAll(input).let { if (limit == 0) it else it.take(limit - 1) }
    val result = mutableListOf<String>()
    var
        lastStart = 0
    for (match in matches) {
        result.add(input.subSequence(lastStart,
            match.range.start).toString())
        lastStart = match.range.endInclusive + 1
    }
    result.add(input.subSequence(lastStart, input.length).toString())
    return result
}

```

`splitAround` Splits the [input] CharSequence to a sequence of strings around matches of this regular expression.

- * `@param` limit

```

/**
 * Allows to infer generic type arguments of a function from the calls in the annotated function parameter of that function.
 * When this annotation is placed on a generic function parameter of a function, it enables to infer the type arguments of that generic function from the lambda body passed to that parameter.
 * The calls that affect inference are either members of the receiver type of an annotated function parameter or extensions for that type. The extensions must be themselves annotated with @BuilderInference.
 * Example: we declare
 * fun <T> sequence(@BuilderInference block: suspend SequenceScope<T>().->Unit): Sequence<T>
 * and use it like
 * val result = sequence {
 *     yield("result")
 * }
 * Here the type argument of the resulting sequence is inferred to `String` from the argument of the [SequenceScope.yield] function, that is called inside the lambda passed to [sequence].
 * Note: this annotation is experimental, see [ExperimentalTypeInference] on how to opt-in for it.

/**
 * Enables overload selection based on the type of the value returned from lambda argument.
 * When two or more function overloads have otherwise the same parameter lists that differ only in the return type of a functional parameter, this annotation enables overload selection by the type of the value returned from the lambda function passed to this functional parameter.
 * Example:
 * @OverloadResolutionByLambdaReturnType
 * fun create(intProducer: () -> Int): Int
 * fun create(doubleProducer: () -> Double): Double
 * val newValue = create { 3.14 }
 * The annotation being applied to one of overloads allows to resolve this ambiguity by analyzing what value is returned from the lambda function.
 * This annotation is also used to discriminate the annotated overloads in case if overload selection still cannot choose one of them even taking in account the result of lambda parameter analysis. In that case a warning is reported.
 * Note: this annotation is experimental, see [ExperimentalTypeInference] on how to opt-in for it.
