var base64 = require('./base64');

A single base 64 digit can contain 6 bits of data. For the base 64 variable length quantities we use in the source map spec, the first bit is the sign, the next four bits are the actual value, and the 6th bit is the continuation bit. The continuation bit tells us whether there are more digits in this value following this digit.

Continuation | Sign |
V V 101011
var VLQ_BASE_SHIFT = 5;
var VLQ_BASE = 1 << VLQ_BASE_SHIFT;
var VLQ_BASE_MASK = VLQ_BASE - 1;
var VLQ_CONTINUATION_BIT = VLQ_BASE;

* Converts from a two-complement value to a value where the sign bit is placed in the least significant bit. For example, as decimals: 1 becomes 2 (10 binary), -1 becomes 3 (11 binary) 2 becomes 4 (100 binary), -2 becomes 5 (101 binary)

function toVLQSigned(aValue) {
 return aValue < 0 ? ((-aValue) << 1) + 1 : (aValue << 1) + 0;
}

* Converts to a two-complement value from a value where the sign bit is placed in the least significant bit. For example, as decimals: 2 (10 binary) becomes 1, 3 (11 binary) becomes -1 4 (100 binary) becomes 2, 5 (101 binary) becomes -2

function fromVLQSigned(aValue) {
 var isNegative = (aValue & 1) === 1;
 var shifted = aValue >> 1;
 return isNegative ? -shifted : shifted;
}

* Returns the base 64 VLQ encoded value.
exports.encode = function base64VLQ_encode(aValue) {
 var encoded = '';
 var vlq = toVLQSigned(aValue);
 do {
 var digit = vlq & VLQ_BASE_MASK;
 vlq >>= VLQ_BASE_SHIFT;
 if (vlq > 0) {
 // There are still more digits in this value, so we must make sure the continuation bit is marked.
 digit |= VLQ_CONTINUATION_BIT;
 }
 encoded += base64.encode(digit);
 } while (vlq > 0);
 return encoded;
}

* Decodes the next base 64 VLQ value from the given string and returns the value and the rest of the string via the out parameter.
exports.decode = function base64VLQ_decode(aStr, aIndex, aOutParam) {
 var strLen = aStr.length;
 var result = 0;
 var shift = 0;
 var continuation, digit;
 do {
 if (aIndex >= strLen) {
 throw new Error("Expected more digits in base 64 VLQ value.");
 }
 digit = base64.decode(aStr.charCodeAt(aIndex++));
 if (digit === -1) {

var util = require('./util');
var has = Object.prototype.hasOwnProperty;
var hasNativeMap = typeof Map !== 'undefined';

A data structure which is a combination of an array and a set. Adding a new member is O(1), testing for membership is O(1), and finding the index of an element is O(1). Removing elements from the set is not supported. Only strings are supported for membership.

function ArraySet() {
 this._array = [];
 this._set = hasNativeMap ? new Map() : Object.create(null);
}

* Static method for creating ArraySet instances from an existing array.
ArraySet.fromArray = function ArraySet_fromArray(aArray, aAllowDuplicates) {
 var set = new ArraySet();
 for (var i = 0, len = aArray.length; i < len; i++) {
 set.add(aArray[i], aAllowDuplicates);
 }
 return set;
}

* Return how many unique items are in this ArraySet. If duplicates have been added, than those do not count towards the size.
@returns Number
ArraySet.prototype.size = function ArraySet_size() {

```

**SourceMapConsumer.prototype.allGeneratedPositionsFor**  
 Returns all generated line and column information for the original source, line, and column provided. If no column is provided, returns all mappings corresponding to a either the line we are searching for or the next closest line that has any mappings. Otherwise, returns all mappings corresponding to the given line and either the column we are searching for or the next closest column that has any offsets.  
 The only argument is an object with the following properties:  
 - source: The filename of the original source.  
 - line: The line number in the original source.  
 - column: Optional. the column number in the original source.  
 and an array of objects is returned, each with the following properties:  
 - line: The line number in the generated source, or null.  
 - column: The column number in the generated source, or null.

```

This\nmakes sense because C++ will likely remain\n// faster than JS when doing raw CPU-intensive sorting. However,
```

when using a custom comparator function, calling back and forth between the VM's

```
C++ and JIT'd JS is rather slow *and* loses JIT type information, resulting in worse generated code for the
comparator function than would be optimal. In fact, when sorting with a comparator, these costs outweigh the
benefits of sorting in C++. By using our own JS-implemented Quick Sort (below), we get a ~3500ms mean
speed-up in `bench/bench.html`.

/**
 * Swap the elements indexed by `x` and `y` in the array `ary`.
 * @param {Array} ary The array.
 * @param {Number} x The index of the first item.
 * @param {Number} y The index of the second item.
 */

var SourceMapGenerator = require('source-map-generator').SourceMapGenerator;
var util = require('util');

Matches a Windows-style '\r\n' newline or a '\n' newline used by all other
operating systems these days (capturing the result).
var REGEX_NEWLINE = /(\r?\n)/;
var NEWLINE_CODE = 10;
var PrivateSymbol = Symbol;
var PrivateSymbolFor = Symbol.for;

PrivateSymbolFor('SourceNode') when multiple
versions of the source-map library are loaded. This MUST NOT CHANGE across
versions!
var isSourceNode = function (obj) {
 return obj instanceof PrivateSymbolFor('SourceNode');
};

SourceNodes provide a way to abstract over interpolating/concatenating
snippets of generated JavaScript source code while maintaining the line and
column information associated with the original source code.

@param aLine The original line number.
@param aColumn The original column number.
@param aSource The original source's filename.
@param aChunks Optional. An array of strings which are snippets of
generated JS, or other SourceNodes.
@param aName The original identifier.

function SourceNode(aLine, aColumn, aSource, aChunks, aName) {
 this.children = [];
 this.sourceContents = {};
 this.line = aLine == null ? null : aLine;
 this.column = aColumn == null ? null : aColumn;
 this.source = aSource == null ? null : aSource;
 this.name = aName == null ? null : aName;
 this.isSourceNode = true;
 if (aChunks != null) this.add(aChunks);
}

Creates a SourceNode from generated code and a SourceMapConsumer.
```

```

* \n * @param aGeneratedCode The generated code \n * @param aSourceMapConsumer The SourceMap for the
generated code \n * @param aRelativePath Optional. The path that relative sources in the \n *
SourceMapConsumer should be relative to. \n * \n SourceNode.fromStringWithSourceMap = \n function
SourceNode_fromStringWithSourceMap(aGeneratedCode, aSourceMapConsumer, aRelativePath) { \n // The
SourceNode we want to fill with the generated code \n // and the SourceMap \n var node = new
SourceNode(); \n \n // All even indices of this array are one line of the generated code, \n // while all odd indices
are the newlines between two adjacent lines \n // (since `REGEX_NEWLINE` captures its match). \n // Processed
fragments are accessed by calling `shiftNextLine`. \n var remainingLines =
