</ul>

The status of <code>volume-status.details-name</code> (for <code>io-enabled</code>: <code>passed</code> | <code>failed</code>; for <code>io-performance</code>: <code>normal</code> | <code>degraded</code> |
The status of the volume (the `ok` | `impaired` | `warning`) | `insufficient-data`).

This method appends the values to the existing list (if any). Use `@link #setFilters(java.util.Collection)` or `@link #withFilters(java.util.Collection)` if you want to override the existing values.  

```java
<ul>
    <li>
        <p>`volume-status.status` - The status of the volume (the `ok` | `impaired` | `warning`) | `insufficient-data`).
    </p>
    <p>`volume-status.details-name` - The cause for `volume-status.status` (the `io-enabled` | `io-performance`).
    </p>
    <p>`volume-status.details-status` - The status of `volume-status.details-name` (the `io-enabled` | `io-performance`).
    </p>
</ul>

NOTE: This method appends the values to the existing list (if any). Use `@link #setFilters(java.util.Collection)` or `@link #withFilters(java.util.Collection)` if you want to override the existing values.

**getFilters**

*Type:* java.util.List<Filter>

**Setter:**

```java
public List<Filter> getFilters() {
    return filters;
}
```

**Getters:**

```java
public List<Filter> getFilters() {
    return filters;
}
```

**Example:**

```java
List<Filter> filters = new ArrayList<>();
filters.add(new Filter());
instance.getFilters().add(filters.get(0));
```

**Documentation:**

This method returns the list of filters. Supported filters: volume-id, modification-state, target-size, target-iops, target-volume-type, original-size, original-iops, original-volume-type, start-time.

**Notes:**

- This method appends the values to the existing list (if any).
- Use `setFilters(java.util.Collection)` or `withFilters(java.util.Collection)` if you want to override the existing values.

**Additional Notes:**

- This method is part of the AWS SDK for Java, which provides a client-side library for interacting with AWS services.
- The `Filter` class represents a single filter used in paginated requests.
- The `List<Filter>` type allows for multiple filters to be specified in a single request.

**Related Concepts:**

- Paginated requests in AWS SDK for Java
- Using filters in AWS services

---

**getNextToken**

*Type:* String

**Setter:**

```java
public String getNextToken() {
    return nextToken;
}
```

**Getters:**

```java
public String getNextToken() {
    return nextToken;
}
```

**Example:**

```java
String nextToken = instance.getNextToken();
instance = instance.withNextToken(nextToken);
```

**Documentation:**

This method returns the nextToken value returned by a previous paginated request. It is used to retrieve the next page of results in paginated requests.

**Notes:**

- This method is part of the AWS SDK for Java, which provides a client-side library for interacting with AWS services.
- Paginated requests are used to retrieve large amounts of data in manageable chunks.
- The `nextToken` value is returned in the response to a paginated request and used to retrieve the next page.

**Related Concepts:**

- Paginated requests in AWS SDK for Java
- Using `nextToken` in AWS services

---

**setFilters**

*Type:* java.util.List<Filter>

**Setter:**

```java
public List<Filter> setFilters(List<Filter> filters) {
    this.filters = filters;
    return filters;
}
```

**Getters:**

```java
public List<Filter> setFilters(List<Filter> filters) {
    this.filters = filters;
    return filters;
}
```

**Example:**

```java
List<Filter> filters = new ArrayList<>();
filters.add(new Filter());
instance.setFilters(filters);
```

**Documentation:**

This method sets the list of filters. Supported filters: volume-id, modification-state, target-size, target-iops, target-volume-type, original-size, original-iops, original-volume-type, start-time.

**Notes:**

- This method allows you to specify multiple filters in a single request.
- The `setFilters(java.util.Collection)` method can be used to set filters if you want to override the existing values.

**Related Concepts:**

- Setting filters in AWS services
- Using the `setFilters` method in AWS SDK for Java

 */

<code>attachment.attach-time</code> - The time stamp when the attachment initiated.

<code>attachment.delete-on-termination</code> - Whether the volume is deleted on instance termination.

<code>attachment.device</code> - The device name that is exposed to the instance (for example, 

<code>/dev/sda1</code>).

<code>attachment.instance-id</code> - The ID of the instance the volume is attached to.

<code>attachment.status</code> - The attachment state.

<code>availability-zone</code> - The Availability Zone in which the volume was created.

<code>create-time</code> - The time stamp when the volume was created.

<code>encrypted</code> - The encryption status of the volume.

<code>size</code> - The size of the volume, in GiB.

<code>snapshot-id</code> - The snapshot from which the volume was created.

<code>status</code> - The status of the volume.

<code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>category</code> for the filter value.

<code>tag-key</code> - The key of a tag assigned to the resource.

<code>tag-value</code> - The value of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value.

<code>volume-id</code> - The volume ID.

<code>volume-type</code> - The Amazon EBS volume type.

<code>gp2</code> for General Purpose SSD, <code>io1</code> for Provisioned IOPS SSD, <code>st1</code> for Throughput Optimized HDD, <code>sc1</code> for Cold HDD, or <code>standard</code> for Magnetic volumes.

One or more filters.
Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. 

The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. 

The volume ID. 

- The Amazon EBS volume type. This can be <code>gp2</code> for General Purpose SSD, <code>io1</code> for Provisioned IOPS SSD, <code>st1</code> for Throughput Optimized HDD, <code>sc1</code> for Cold HDD, or <code>standard</code> for Magnetic volumes.

The name of the AWS service.

The ID of the VPC in which the endpoint resides.

The ID of the VPC in which the endpoint resides.

The state of the endpoint. (pending | available | deleting | deleted)

NOTE: This method appends the values to the existing list (if any). Use @link #setFilters(java.util.Collection) or @link #withFilters(java.util.Collection) if you want to override the existing values.

@overload

One or more filters.

The name of the AWS service.

The ID of the VPC in which the endpoint resides.

The ID of the VPC in which the endpoint resides.

The state of the endpoint. (pending | available | deleting | deleted)

NOTE: This method appends the values to the existing list (if any). Use @link #setFilters(java.util.Collection) or @link #withFilters(java.util.Collection) if you want to override the existing values.

This method returns a reference to this object so that method calls can be chained together.

The maximum number of items to return for this request. The request returns a token that you can specify in a subsequent call to get the next set of results.

Constraint: If the value is greater than 1000, we return only 1000 items.

The maximum number of items to return for this request. The request returns a token that you can specify in a subsequent call to get the next set of results.

<code>requester-vpc-info.vpc-id</code> - The ID of the requester VPC.
</li>
<li>
<code>status-code</code> - The status of the VPC peering connection (pending-acceptance | failed | expired | provisioning | active | deleted | rejected).
</li>
<li>
<code>status-message</code> - A message that provides more information about the status of the VPC peering connection, if applicable.
</li>
<li>
<code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.
</li>
</ul>

\n\n\n{ @link #setFilters(java.util.Collection) } or { @link #withFilters(java.util.Collection) } if you want to override the existing values.
the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; <code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;p&gt; <code>vpc-peering-connection-id</code> - The ID of the VPC peering connection. &lt;/p&gt; &lt;/li&gt; &lt;i&gt;&lt;/i&gt; @return

Returns a reference to this object so that method calls can be chained together.*="/"

- The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. 

### Examples

#### Listing VPCs

```java
List<VPC> vpcs = client.describeVpcs().getVpcs();
```

#### Filtering VPCs

##### By CIDR Block

```java
DescribeVpcsResponse response = client.describeVpcs()
```
<p><code>vpc-id</code> - The ID of the VPC.</p>

```
\n@Retention(RETENTION.RUNTIME)
@Target(TARGET.ANNOTATION_ELEMENT)
@Documented
public @interface Filters {
  Filters[] value();
}
```

@return Returns a reference to this object so that method calls can be chained together."
``
The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify `<code>tag:Purpose</code>` for the filter name and `<code>X</code>` for the filter value.

- The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. For example, use both the filter `\"tag-key=Purpose\"` and the filter `\"tag-value=X\"`, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the `<code>tag</code>:<i>key</i>=<i>value</i>` filter.

- The ID of the VPC.

```java
public interface VpcIds {
  List<String> getVpcIds()
  void setVpcIds(List<String> vpcIds)
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public String withVpcIds(String vpcId)
```

Describes all your VPCs.

```java
@com.amazonaws.annotation.SdkInternalApi
public VpcIdStringList withVpcIds(String... vpcIds)
```

Describes all your VPCs.

```java
@com.amazonaws.annotation.SdkInternalApi
public VpcIdStringList withVpcIds(java.util.Collection<String> vpcIds)
```

Describes all your VPCs.

that do not support Border Gateway Protocol (BGP).

- The destination CIDR block. This corresponds to the subnet used in a customer data center.

- The BGP Autonomous System Number (ASN) associated with a BGP device.

- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag **Purpose=X**, specify `<code>tag:Purpose</code>` for the filter name and `<code>X</code>` for the filter value.

- The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `"tag-key=Purpose"` and the filter `"tag-value=X"`, you get any resources assigned both the tag key **Purpose** (regardless of what the tag's value is), and the tag value **X** (regardless of what the tag's key is). If you want to list only resources where **Purpose** is **X**, see the `<code>tag</code>:<i>key</i>=<i>value</i> filter.

- The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter. For example, if you use both the filter `"tag-key=Purpose"` and the filter `"tag-value=X"`, you get any resources assigned both the tag key **Purpose** (regardless of what the tag's value is), and the tag value **X** (regardless of what the tag's key is). If you want to list only resources where **Purpose** is **X**, see the `<code>tag</code>:<i>key</i>=<i>value</i> filter.

- The type of VPN connection. Currently the only supported type is `<code>ipsec.1</code>`.

- The ID of the VPN connection.

- The ID of a virtual private gateway associated with the VPN connection.

- The configuration information for the customer gateway.

- The ID of a customer gateway associated with the VPN connection.

- Indicates whether the connection has static routes only. Used for devices that do not support Border Gateway Protocol (BGP).

- The destination CIDR block. This corresponds to the subnet used in a customer data center.

- The BGP Autonomous System Number (ASN) associated with a BGP device.

- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag **Purpose=X**, specify `<code>tag:Purpose</code>` for the filter name and `<code>X</code>` for the filter value.

- The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `"tag-key=Purpose"` and the filter `"tag-value=X"`, you get any resources assigned both the tag key **Purpose** (regardless of what the tag's value is), and the tag value **X** (regardless of what the tag's key is). If you want to list only resources where **Purpose** is **X**, see the `<code>tag</code>:<i>key</i>=<i>value</i> filter.

- The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter. For example, if you use both the filter `"tag-key=Purpose"` and the filter `"tag-value=X"`, you get any resources assigned both the tag key **Purpose** (regardless of what the tag's value is), and the tag value **X** (regardless of what the tag's key is). If you want to list only resources where **Purpose** is **X**, see the `<code>tag</code>:<i>key</i>=<i>value</i> filter.

- The type of VPN connection. Currently the only supported type is `<code>ipsec.1</code>`.

- The ID of the VPN connection.

- The ID of a virtual private gateway associated with the VPN connection.
configuration - The configuration information for the customer gateway.
<code>customer-gateway-id</code> - The ID of a customer gateway associated with the VPN connection.
<code>state</code> - The state of the VPN connection (<code>pending</code> | <code>available</code> | <code>deleting</code> | <code>deleted</code>).
<code>option.static-routes-only</code> - Indicates whether the connection has static routes only. Used for devices that do not support Border Gateway Protocol (BGP).
<code>route.destination-cidr-block</code> - The destination CIDR block. This corresponds to the subnet used in a customer data center.
<code>bgp-asn</code> - The BGP Autonomous System Number (ASN) associated with a BGP device.
<code>tag</code> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>-purpose</code> for the filter value.
<code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code> filter.
<code>type</code> - The type of VPN connection. Currently the only supported type is <code>ipsec.1</code>.
<code>vpn-connection-id</code> - The ID of the VPN connection.
<code>vpn-gateway-id</code> - The ID of a virtual private gateway associated with the VPN connection.
<code>NOTE:</code> This method appends the values to the existing list (if any). Use {@link #setFilters(java.util.Collection)} or {@link #withFilters(java.util.Collection)} if you want to override the existing values.
<code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code> filter.
<code>type</code> - The type of VPN connection. Currently the only supported type is <code>ipsec.1</code>.
<code>vpn-connection-id</code> - The ID of the VPN connection.
<code>vpn-gateway-id</code> - The ID of a virtual private gateway associated with the VPN connection.
<code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code> filter.
<code>type</code> - The type of VPN connection. Currently the only supported type is <code>ipsec.1</code>.
<code>vpn-connection-id</code> - The ID of the VPN connection.
<code>vpn-gateway-id</code> - The ID of a virtual private gateway associated with the VPN connection.

@ladeq\@param filters One or more filters.
<code>customer-gateway-configuration</code> - The configuration information for the customer gateway.
<code>customer-gateway-id</code> - The ID of a customer gateway associated with the VPN connection.

<code>tag</code>:<i>key</i>=<i>value</i> filter. - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.  
<code>type</code> - The type of VPN connection. Currently the only supported type is <code>ipsec.1</code>.
<code>vpn-connection-id</code> - The ID of the VPN connection.
<code>vpn-gateway-id</code> - The ID of a virtual private gateway associated with the VPN connection.

"enumType": null,
"fluentSetterDocumentation": "One or more filters.
<ul>
<li><code>customer-gateway-configuration</code> - The configuration information for the customer gateway.
</li>
<li><code>customer-gateway-id</code> - The ID of a customer gateway associated with the VPN connection.
</li>
<li><code>state</code> - The state of the VPN connection (<code>pending</code> | <code>available</code> | <code>deleting</code> | <code>deleted</code>).  
</li>
<li><code>option.static-routes-only</code> - Indicates whether the connection has static routes only. Used for devices that do not support Border Gateway Protocol (BGP).
</li>
<li><code>route.destination-cidr-block</code> - The destination CIDR block. This corresponds to the subnet used in a customer data center.
</li>
<li><code>bgp-asn</code> - The BGP Autonomous System Number (ASN) associated with a BGP device.
</li>
<li><code>route.destination-cidr-block</code> - The destination CIDR block. This corresponds to the subnet used in a customer data center.
</li>
<li><code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.
</li>
<li><code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.
</li>
<li><code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.
</li>
<li><code>type</code> - The type of VPN connection. Currently the only supported type is <code>ipsec.1</code>.
</li>
<li><code>vpn-connection-id</code> - The ID of the VPN connection.
</li>
</ul>"
- The ID of a virtual private gateway associated with the VPN connection.

- The state of the VPN connection (pending | available | deleting | deleted).

- Indicates whether the connection has static routes only. Used for devices that do not support Border Gateway Protocol (BGP).

- The destination CIDR block. This corresponds to the subnet used in a customer data center.

- The BGP Autonomous System Number (ASN) associated with a BGP device.

- The type of VPN connection. Currently the only supported type is ipsec.1.

- The ID of a virtual private gateway associated with the VPN connection.

- The ID of a customer gateway associated with the VPN connection.

- The configuration information for the customer gateway.

- The configuration information for the customer gateway associated with the VPN connection.

- The ID of a customer gateway associated with the VPN connection.

- The state of the customer gateway associated with the VPN connection.

- Indicates whether the connection has static routes only. Used for devices that do not support Border Gateway Protocol (BGP).

- The destination CIDR block. This corresponds to the subnet used in a customer data center.

- The BGP Autonomous System Number (ASN) associated with a BGP device.

- The type of VPN connection. Currently the only supported type is ipsec.1.

This method appends the values to the existing list (if any). Use {@link #setValues(java.util.Collection)} or {@link #withValues(java.util.Collection)} if you want to override the existing values. One or more values for the DHCP option.

@returns Returns a reference to this object so that method calls can be chained together.

### Key

The name of a DHCP option.

@returns The name of a DHCP option.

### Fluent Setter Methods

- **withKey(key)**: The name of a DHCP option.
- **getKey()**: The name of a DHCP option.

  "variableDeclarationType" : "com.amazonaws.internal.SdkInternalList<Tag>",
  "variableName" : "tags",
  "variableType" : "java.util.List<Tag>"
Any tags assigned to the DHCP options set.

**NOTE:** This method appends the values to the existing list (if any). Use [@link #setTags(java.util.Collection)] or [@link #withTags(java.util.Collection)] if you want to override the existing values.

@returns Returns a reference to this object so that method calls can be chained together.

```java

For information about the import manifest referenced by this API action, see `<a href="http://docs.aws.amazon.com/AWSEC2/latest/APIReference/manifest.html">VM Import Manifest</a>.

```java
@parameter importManifestUrl A presigned URL for the import manifest stored in Amazon S3. For information about creating a presigned URL for an Amazon S3 object, read the "Query String Request Authentication Alternative" section of the `<a href="http://docs.aws.amazon.com/AmazonS3/latest/dev/RESTAuthentication.html">Authenticating REST Requests</a> topic in the `<i>Amazon Simple Storage Service Developer Guide</i>`.

For information about creating a presigned URL for an Amazon S3 object, see `<a href="http://docs.aws.amazon.com/AWSEC2/latest/APIReference/manifest.html">VM Import Manifest</a>.

```
The `ImportManifestUrl` parameter represents a presigned URL for the import manifest stored in Amazon S3. For information about creating a presigned URL for an Amazon S3 object, read the "Query String Request Authentication Alternative" section of the [Amazon Simple Storage Service Developer Guide](http://docs.aws.amazon.com/AmazonS3/latest/dev/RESTAuthentication.html). For information about the import manifest referenced by this API action, see [VM Import Manifest](http://docs.aws.amazon.com/AWSEC2/latest/APIReference/manifest.html).

```java
public void setImportManifestUrl(String importManifestUrl) {
    this.importManifestUrl = importManifestUrl;
}
```

For information about creating a presigned URL for an Amazon S3 object, read the "Query String Request Authentication Alternative" section of the [AWS SDK for Java Developer Guide](http://docs.aws.amazon.com/AWSEC2/latest/APIReference/manifest.html).

</li> <li> <code>launchSpecTemporarilyBlacklisted</code> - The configuration is not valid and several attempts to launch instances have failed. For more information, see the description of the
event. The event. The following are the <code>error</code> events. The Spot fleet did not have the required permissions either to launch or terminate an instance. The Spot fleet request was modified. The bid price for a launch configuration was adjusted because it was too high. This change is permanent. The Spot fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of Spot instances. The Spot fleet is canceled and its Spot instances are terminating. An instance was terminated by the user. The Spot fleet has expired. A subsequent event indicates that the instances were terminated, if the request was created with. The Spot fleet is canceled and has no running Spot instances. The Spot fleet will be deleted two days after its instances were terminated. The Spot fleet is canceled and will not launch additional Spot instances, but its existing Spot instances continue to run until they are interrupted or terminated. A bid was fulfilled and a new instance was launched. The Spot fleet request has expired. A subsequent event indicates that the instances were terminated, if the request was created with. The bid price for a launch configuration was adjusted because it was too high. This change is permanent. The Spot fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of Spot instances. The Spot fleet has expired. A subsequent event indicates that the instances were terminated, if the request was created with. The bid price for a launch configuration was adjusted because it was too high.

configuration is not valid and several attempts to launch instances have failed. For more information, see the description of the event.

- **iamFleetRoleInvalid** - The Spot fleet did not have the required permissions either to launch or terminate an instance.
- **launchSpecTemporarilyBlacklisted** - The configuration is not valid and several attempts to launch instances have failed. For more information, see the description of the event.
- **spotFleetRequestConfigurationInvalid** - The configuration is not valid. For more information, see the description of the event.
- **spotInstanceCountLimitExceeded** - You've reached the limit on the number of Spot instances that you can launch.
- **The following are the **fleetRequestChange** events.**

- **active** - The Spot fleet has been validated and Amazon EC2 is attempting to maintain the target number of running Spot instances.
- **cancelled** - The Spot fleet is canceled and has no running Spot instances. The Spot fleet will be deleted two days after its instances were terminated.
- **cancelled_running** - The Spot fleet is canceled and will not launch additional Spot instances, but its existing Spot instances continue to run until they are interrupted or terminated.
- **cancelled_terminating** - The Spot fleet is canceled and its Spot instances are terminating.
- **expired** - The Spot fleet request has expired. A subsequent event indicates that the instances were terminated, if the request was created with **terminateInstancesWithExpiration**.

- **price_update** - The bid price for a launch configuration was adjusted because it was too high. This change is permanent.
- **submitted** - The Spot fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of Spot instances.
- **modify_in_progress** - A request to modify the Spot fleet request was accepted and is in progress.
- **modify_successful** - The Spot fleet request was modified.

- **launched** - A bid was fulfilled and a new instance was launched.
- **terminated** - An instance was terminated by the user.

:return Returns a reference to this object so that method calls can be chained together.

"fluentSetterMethodName" : "withEventSubType",
"getterDocumentation" : "The event.

The following are the **error** events.

- **iamFleetRoleInvalid** - The Spot fleet did not have the required permissions either to launch or terminate an instance.
- **launchSpecTemporarilyBlacklisted** - The configuration is not valid and several attempts to launch instances have failed. For more information, see the description of the event.
- **spotFleetRequestConfigurationInvalid** - The configuration is not valid. For more information, see the description of the event.
- **spotInstanceCountLimitExceeded** - You've reached the limit on the number of Spot instances that you can launch.
the required permissions either to launch or terminate an instance.

- `<code>launchSpecTemporarilyBlacklisted</code>` - The configuration is not valid and several attempts to launch instances have failed. For more information, see the description of the event.
- `<code>spotFleetRequestConfigurationInvalid</code>` - The configuration is not valid. For more information, see the description of the event.
- `<code>spotInstanceCountLimitExceeded</code>` - You’ve reached the limit on the number of Spot instances that you can launch.

The following are the `<code>fleetRequestChange</code>` events.

- `<code>active</code>` - The Spot fleet has been validated and Amazon EC2 is attempting to maintain the target number of running Spot instances.
- `<code>cancelled</code>` - The Spot fleet is canceled and has no running Spot instances. The Spot fleet will be deleted two days after its instances were terminated.
- `<code>cancelled_running</code>` - The Spot fleet is canceled and will not launch additional Spot instances, but its existing Spot instances continue to run until they are interrupted or terminated.
- `<code>cancelled_terminating</code>` - The Spot fleet is canceled and its Spot instances are terminating.
- `<code>expired</code>` - The Spot fleet request has expired. A subsequent event indicates that the instances were terminated, if the request was created with `<code>TerminateInstancesWithExpiration</code>` set.
- `<code>modify_in_progress</code>` - A request to modify the Spot fleet request was accepted and is in progress.
- `<code>modify_successful</code>` - The Spot fleet request was modified.
- `<code>price_update</code>` - The bid price for a launch configuration was adjusted because it was too high. This change is permanent.
- `<code>submitted</code>` - The Spot fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of Spot instances.

The following are the `<code>instanceChange</code>` events.

- `<code>launched</code>` - A bid was fulfilled and a new instance was launched.
- `<code>terminated</code>` - An instance was terminated by the user.

cancelled_terminating - The Spot fleet is canceled and its Spot instances are terminating.

expired - The Spot fleet request has expired. A subsequent event indicates that the instances were terminated, if the request was created with TerminateInstancesWithExpiration set.

modify_in_progress - A request to modify the Spot fleet request was accepted and is in progress.

modify_successful - The Spot fleet request was modified.

price_update - The bid price for a launch configuration was adjusted because it was too high. This change is permanent.

submit - The Spot fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of Spot instances.

The following are the instanceChange events.

launched - A bid was fulfilled and a new instance was launched.

terminated - An instance was terminated by the user.

The following are the error events.

iamFleetRoleInvalid - The Spot fleet did not have the required permissions either to launch or terminate an instance.

launchSpecTemporarilyBlacklisted - The configuration is not valid and several attempts to launch instances have failed. For more information, see the description of the event.

spotFleetRequestConfigurationInvalid - The configuration is not valid.

spotInstanceCountLimitExceeded - You've reached the limit on the number of Spot instances that you can launch.

active - The Spot fleet has been validated and Amazon EC2 is attempting to maintain the target number of running Spot instances.

cancelled - The Spot fleet is canceled and has no running Spot instances. The Spot fleet will be deleted two days after its instances were terminated.

cancelled_running - The Spot fleet is canceled and will not launch additional Spot instances, but its existing Spot instances continue to run until they are interrupted or terminated.

cancelled_terminating - The Spot fleet is canceled and its Spot instances are terminating.

expired - The Spot fleet request has expired. A subsequent event indicates that the instances were terminated, if the request was created with TerminateInstancesWithExpiration set.

modify_in_progress - A request to modify the Spot fleet request was accepted and is in progress.

modify_successful - The Spot fleet request was modified.

price_update - The bid price for a launch configuration was adjusted because it was too high. This change is permanent.

submitted - The Spot fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of Spot instances.

The following are the fleetRequestChange events.

active - The Spot fleet has been validated and Amazon EC2 is attempting to maintain the target number of running Spot instances.

cancelled - The Spot fleet is canceled and has no running Spot instances. The Spot fleet will be deleted two days after its instances were terminated.

cancelled_running - The Spot fleet is canceled and will not launch additional Spot instances, but its existing Spot instances continue to run until they are interrupted or terminated.

cancelled_terminating - The Spot fleet is canceled and its Spot instances are terminating.

expired - The Spot fleet request has expired. A subsequent event indicates that the instances were terminated, if the request was created with TerminateInstancesWithExpiration set.

modify_in_progress - A request to modify the Spot fleet request was accepted and is in progress.

modify_successful - The Spot fleet request was modified.

price_update - The bid price for a launch configuration was adjusted because it was too high. This change is permanent.

submitted - The Spot fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of Spot instances.

The following are the instanceChange events.

launched - A bid was fulfilled and a new instance was launched.

terminated - An instance was terminated by the user.

- **Availability Zone:** The availability zone identifier for the dedicated host.

- **autoPlacement:** Whether auto-placement is on or off.

Use the `setAutoPlacement` method to set the auto-placement value. The default value is `false`.

- **IsPayload:** Whether the payload is present. This property is set automatically and is not intended to be modified.

- **IsStreaming:** Whether the streaming is active. This property is set automatically and is not intended to be modified.

- **Location:** The location name where the dedicated host is assigned.

- **MarshallLocationName:** The location name to be used in marshalling operations.

- **QueryString:** Whether the query string is enabled. This property is set automatically and is not intended to be modified.

- **StatusCode:** The status code for the dedicated host. This property is set automatically and is not intended to be modified.

- **UnmarshallLocationName:** The location name to be used in unmarshalling operations.

- **Uri:** The URI for the dedicated host. This property is set automatically and is not intended to be modified.

- **IdempotencyToken:** A token used to ensure the consistency of operations.

- **List:** An array of dedicated hosts.

- **ListModel:** The model for a list of dedicated hosts.

- **Map:** A map of dedicated hosts.

- **MapModel:** The model for a map of dedicated hosts.

- **Name:** The name of the dedicated host.

- **SetterDocumentation:** A description of the setter method.

- **SetterMethodName:** The name of the setter method.

- **SetterModel:** The model for the setter method.

- **Simple:** A boolean indicating whether the property is simple.

- **VarargSetterDocumentation:** A description of the vararg setter method.

- **Variable:** A variable representation of the dedicated host.

- **VariableDeclarationType:** The type of the variable declaration.

- **VariableName:** The name of the variable.

- **VariableType:** The type of the variable.

- **Documentation:** A description of the variable.

- **SimpleType:** The simple type of the variable.

- **VariableSetterType:** The type of the variable setter.

- **XmlNameSpaceUri:** The namespace URI for the dedicated host.

}
The date and time the image was created.

@returns

Returns a reference to this object so that method calls can be chained together.

```java
public String getCreationDate() {
    return creationDate;
}
```

```java
public void setCreationDate(String creationDate) {
    this.creationDate = creationDate;
}
```

### Description

The description of the AMI that was provided during image creation.

@returns

Returns a reference to this object so that method calls can be chained together.

```java
public String getDescription() {
    return description;
}
```

```java
public void setDescription(String description) {
    this.description = description;
}
```

```xml
<param name="creationDate">
    <doc><p>The date and time the image was created.</p></doc>
</param>
<param name="description">
    <doc><p>The description of the AMI that was provided during image creation.</p></doc>

**Simple**

```java
public class LaunchPermissions {
  private List<LaunchPermission> launchPermissions;

  public LaunchPermissions() {
    launchPermissions = new ArrayList<>();
  }

  public void setLaunchPermissions(List<LaunchPermission> launchPermissions) {
    this.launchPermissions.addAll(launchPermissions);
  }

  public List<LaunchPermission> getLaunchPermissions() {
    return launchPermissions;
  }
}
```

**Simple Type**

A simple type in Java is a type that is not a complex type, such as an array, list, or map. It is a basic data type that can be used to store values directly. Examples of simple types include integers, floats, strings, and booleans.

**Java Utility Class**

Java utility classes are classes that provide useful functionality to developers. These classes are often used to perform common tasks that are not included in the core Java libraries. Examples of Java utility classes include `java.util.Collections`, `java.util.HashMap`, and `java.util.List`.
