Open Source Used In CISCO IDENTITY SERVICE 12.5(1)SU2  2221
The number of secondary private IPv4 addresses to assign to a network interface. When you specify a number of secondary IPv4 addresses, Amazon EC2 selects these IP addresses within the subnet's IPv4 CIDR range. You can't specify this option and specify more than one private IP address using <code>privateIpAddresses</code>. The number of IP addresses you can assign to a network interface varies by instance type. For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-eni.html#AvailableIpPerENI">IP Addresses Per ENI Per Instance Type</a> in the <i>Amazon Virtual Private Cloud User Guide</i>.

```java
public void setSecondaryPrivateIpAddressCount(int secondaryPrivateIpAddressCount) {
    this.secondaryPrivateIpAddressCount = secondaryPrivateIpAddressCount;
}
```

The number of secondary private IPv4 addresses to assign to a network interface. When you specify a number of secondary IPv4 addresses, Amazon EC2 selects these IP addresses within the subnet's IPv4 CIDR range. You can't specify this option and specify more than one private IP address using <code>privateIpAddresses</code>. The number of IP addresses you can assign to a network interface varies by instance type. For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-eni.html#AvailableIpPerENI">IP Addresses Per ENI Per Instance Type</a> in the <i>Amazon Virtual Private Cloud User Guide</i>.

```java
public void withSecondaryPrivateIpAddressCount(int secondaryPrivateIpAddressCount) {
    return withSecondaryPrivateIpAddressCount(secondaryPrivateIpAddressCount);
}
```

The number of secondary private IPv4 addresses to assign to a network interface. When you specify a number of secondary IPv4 addresses, Amazon EC2 selects these IP addresses within the subnet's IPv4 CIDR range. You can't specify this option and specify more than one private IP address using <code>privateIpAddresses</code>. The number of IP addresses you can assign to a network interface varies by instance type. For more information, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-eni.html#AvailableIpPerENI">IP Addresses Per ENI Per Instance Type</a> in the <i>Amazon Virtual Private Cloud User Guide</i>.

```java
public AmazonVirtualPrivateCloudUserGuide withSecondaryPrivateIpAddressCount(int secondaryPrivateIpAddressCount) {
    return withSecondaryPrivateIpAddressCount(secondaryPrivateIpAddressCount);
}
```

The number of secondary private IPv4 addresses to assign to a network interface. When you specify a number of secondary IPv4 addresses, Amazon EC2 selects these IP addresses within the subnet's IPv4 CIDR range. You can't specify this option and specify more than one private IP address using <code>privateIpAddresses</code>.   "variableSetterType" : "java.util.Collection<String>"
The IDs of one or more resources to tag. For example, ami-1a2b3c4d.

To append the values to the existing list (if any), use the `#setResources(java.util.Collection)` or `#withResources(java.util.Collection)` methods. If you want to override the existing values, use the `#resources` method.

For example, ami-1a2b3c4d.

@returns Returns a reference to this object so that method calls can be chained together.

```

Tags

One or more tags. The <code>value</code> parameter is required, but if you don't want the tag to have a value, specify the parameter with no value, and we set the value to an empty string.

@returns Returns a reference to this object so that method calls can be chained together.

create volume permissions. This method appends the values to the existing list (if any). Use \{ @link #setRemove(java.util.Collection) \} or \{ @link #withRemove(java.util.Collection) \} if you want to override the existing values.

@returns Returns a reference to this object so that method calls can be chained together.

```java

// Example Java code for CreateVolumeRequest

CreateVolumeRequest createVolumeRequest = new CreateVolumeRequest()
    .createVolumePermissionModifications(new CreateVolumePermissionModifications()
        .remove(new com.amazonaws.internal.SdkInternalList<CreateVolumePermission>()
            .add(new CreateVolumePermission()
                .accountId
                .null(),
            )
        )
    )

// Create the service client with appropriate credentials
S3Client s3Client = S3Client.builder().build();

// Execute the request
CreateVolumeResponse response = s3Client.createVolume(createVolumeRequest);
```

**NOTE:** This method appends the values to the existing list (if any). Use \{ @link #setRemove(java.util.Collection) \} or \{ @link #withRemove(java.util.Collection) \} if you want to override the existing values.

```java

// Example Java code for CreateVolumeRequest

CreateVolumeRequest createVolumeRequest = new CreateVolumeRequest()
    .createVolumePermissionModifications(new CreateVolumePermissionModifications()
        .remove(new com.amazonaws.internal.SdkInternalList<CreateVolumePermission>()
            .add(new CreateVolumePermission()
                .accountId
                .null(),
            )
        )
    )

// Create the service client with appropriate credentials
S3Client s3Client = S3Client.builder().build();

// Execute the request
CreateVolumeResponse response = s3Client.createVolume(createVolumeRequest);
```

**CreateVolumeRequest**

Contains the parameters for CreateVolume.

```java

// Example Java code for CreateVolumeRequest

CreateVolumeRequest createVolumeRequest = new CreateVolumeRequest()
    .createVolumePermissionModifications(new CreateVolumePermissionModifications()
        .remove(new com.amazonaws.internal.SdkInternalList<CreateVolumePermission>()
            .add(new CreateVolumePermission()
                .accountId
                .null(),
            )
        )
    )

// Create the service client with appropriate credentials
S3Client s3Client = S3Client.builder().build();

// Execute the request
CreateVolumeResponse response = s3Client.createVolume(createVolumeRequest);
```

**CreateVolumePermissionModifications**

Removes a specific AWS account ID or group from a volume's list of create volume permissions.

```java

// Example Java code for CreateVolumePermissionModifications

CreateVolumePermissionModifications createVolumePermissionModifications = new CreateVolumePermissionModifications()
    .remove(new com.amazonaws.internal.SdkInternalList<CreateVolumePermission>()
        .add(new CreateVolumePermission()
            .accountId
            .null(),
        )
    );
```

**CreateVolumePermission**

```java

// Example Java code for CreateVolumePermission

CreateVolumePermission createVolumePermission = new CreateVolumePermission()
    .accountId
    .null();
```

**variable**

```java

// Example Java code for CreateVolumePermissionModifications

CreateVolumePermissionModifications createVolumePermissionModifications = new CreateVolumePermissionModifications()
    .remove(new com.amazonaws.internal.SdkInternalList<CreateVolumePermission>()
        .add(new CreateVolumePermission()
            .accountId
            .null(),
        )
    );
```

**variableDeclarationType**

`com.amazonaws.internal.SdkInternalList<CreateVolumePermission>`

**variableName**

`remove`

**variableType**

`java.util.List<CreateVolumePermission>`

**documentation**

Removes a specific AWS account ID or group from a volume's list of create volume permissions.

**simpleType**

`List<CreateVolumePermission>`

**variableSetterType**

`java.util.Collection<CreateVolumePermission>`

`routeTableIds` is a list of one or more route table IDs. It is used to specify which route tables should be updated or deleted. The method `withRouteTableIds` can be used to set or override the existing route table IDs.

`clientToken` is a unique, case-sensitive identifier that ensures the idempotency of the request. This means that if the request is sent multiple times, the response will be the same as if it was sent once.

For more information on these methods, refer to the AWS documentation links provided in the comments.

<p>The <code>host</code> value cannot be used with this parameter. Use the <code>default</code> or <code>dedicated</code> values only.</p>

**Important:** The <code>host</code> value cannot be used with this parameter. Use the <code>default</code> or <code>dedicated</code> values only.

Default: <code>default</code>

### Parameter: `instanceTenancy`<br>

The tenancy options for instances launched into the VPC. For <code>default</code>, instances are launched with shared tenancy by default. For <code>dedicated</code>, instances are launched as dedicated tenancy instances by default. You can only launch instances with a tenancy of <code>dedicated</code> or <code>host</code> into a dedicated tenancy VPC. **Important:** The <code>host</code> value cannot be used with this parameter. Use the <code>default</code> or <code>dedicated</code> values only.

Default: <code>default</code>

### Result:

Returns a reference to this object so that method calls can be chained together.

```java
public CreateVpcResult createVpcRequest(CreateVpcRequest createVpcRequest) {
    return createVpcRequest;
}
```

**Filters**

- **group-id** - The ID of a VPC security group that's associated with the instance.
- **instance-id** - The ID of the instance.
- **tag**:key=value - The key/value combination of a tag assigned to the resource.
- **tag-key** - The key of a tag assigned to the resource. This filter is independent of the **tag-value** filter.
- **tag-value** - The value of a tag assigned to the resource. This filter is independent of the **tag-key** filter.
- **vpc-id** - The ID of the VPC that the instance is linked to.

**variable**

```java
public @param instanceIds One or more instance IDs. Must be instances linked to a VPC through ClassicLink.

@link #setInstanceIds(java.util.Collection) or @link #withInstanceIds(java.util.Collection) if you want to override the existing values.

@returns Returns a reference to this object so that method calls can be chained together.
```

```java
public @param filters One or more filters.

@link #withFilters(java.util.Collection) or @link #withFilter(java.util.List) if you want to override the existing filters.

@returns Returns a reference to this object so that method calls can be chained together.
```
what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources
where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.     <li><p><code>vpc-id</code> - The ID of the VPC that the instance is linked to.</p>
" */",}
When using the tags in the filter, you can specify a tag key and a tag value: "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>="<i>value</i>" filter. If you want to list only resources where tag key Purpose is X, see the <code>tag</code>:<i>key</i>="<i>value</i>" filter. This is equivalent to filtered by the tag key Purpose and the tag value X. If you want to list only resources where tag key Purpose is X, see the <code>tag</code>:<i>key</i>="<i>value</i>" filter. This is equivalent to filtered by the tag key Purpose and the tag value X.

is X, see the `<code>tag</code>::<i>key</i>=<i>value</i>` filter.

The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter.

The ID of a set of DHCP options.

The key for one of the options (for example, `<code>domain-name</code>`).

The value for one of the options.

The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag `Purpose=X`, specify `<code>tag:Purpose` for the filter name and `<code>X</code>` for the filter value.

The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `\"tag-key=Purpose\"` and the filter `\"tag-value=X\"`, you get any resources assigned both the tag key `Purpose` (regardless of what the tag's value is), and the tag value `X` (regardless of what the tag's key is). If you want to list only resources where `Purpose` is X, see the `<code>tag::key</code>::<i>key</i>=<i>value</i>` filter.

The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter. For example, if you use both the filter `\"tag-key=Purpose\"` and the filter `\"tag-value=X\"`, you get any resources assigned both the tag key `Purpose` (regardless of what the tag's value is), and the tag value `X` (regardless of what the tag's key is). If you want to list only resources where `Purpose` is X, see the `<code>tag::key</code>::<i>key</i>=<i>value</i>` filter.

One or more filters.

The ID of a set of DHCP options.

The key for one of the options (for example, `<code>domain-name</code>`).

The value for one of the options.

The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag `Purpose=X`, specify `<code>tag:Purpose` for the filter name and `<code>X</code>` for the filter value.

The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `\"tag-key=Purpose\"` and the filter `\"tag-value=X\"`, you get any resources assigned both the tag key `Purpose` (regardless of what the tag's value is), and the tag value `X` (regardless of what the tag's key is). If you want to list only resources where `Purpose` is X, see the `<code>tag::key</code>::<i>key</i>=<i>value</i>` filter.

The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter. For example, if you use both the filter `\"tag-key=Purpose\"` and the filter `\"tag-value=X\"`, you get any resources assigned both the tag key `Purpose` (regardless of what the tag's value is), and the tag value `X` (regardless of what the tag's key is). If you want to list only resources where `Purpose` is X, see the `<code>tag::key</code>::<i>key</i>=<i>value</i>` filter.

One or more filters. 

### dhcp-options-id

The ID of a set of DHCP options.

### key

The key for one of the options (for example, `<code>domain-name</code>`).

### value

The value for one of the options.

### tag:key=value

The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag `Purpose=X`, specify `<code>tag:Purpose</code>` for the filter name and `<code>X</code>` for the filter value.

### tag-key

The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `"tag-key=Purpose"` and the filter `"tag-value=X"`, you get any resources assigned both the tag key `Purpose` (regardless of what the tag's value is), and the tag value `X` (regardless of what the tag's key is). If you want to list only resources where `Purpose` is `X`, see the `<code>tag</code>:`<i>key</i>=<i>value</i>` filter.

### tag-value

The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter.

### dhcp-options-id

The ID of a set of DHCP options.

### key

The key for one of the options (for example, `<code>domain-name</code>`).

### value

The value for one of the options.

### tag:key=value

The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag `Purpose=X`, specify `<code>tag:Purpose</code>` for the filter name and `<code>X</code>` for the filter value.

### tag-key

The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `"tag-key=Purpose"` and the filter `"tag-value=X"`, you get any resources assigned both the tag key `Purpose` (regardless of what the tag's value is), and the tag value `X` (regardless of what the tag's key is). If you want to list only resources where `Purpose` is `X`, see the `<code>tag</code>:`<i>key</i>=<i>value</i>` filter.
is X, see the `<code>tag</code>:<i>key</i>=<i>value</i>` filter. The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter. The ID of a set of DHCP options. The key for one of the options (for example, `<code>domain-name</code>`). The value for one of the options. The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the `<code>tag</code>:<i>key</i>=<i>value</i>` filter. The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `"tag-key=Purpose\"` and the filter `"tag-value=X\"`, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the `<code>tag</code>:<i>key</i>=<i>value</i>` filter. The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter.

**Information about one or more DHCP options sets.**

This method appends the values to the existing list (if any). Use [setDhcpOptions(java.util.Collection)] or [withDhcpOptions(java.util.Collection)] if you want to override the existing values.

```java
@Retention(AnnotationRetention.RUNTIME)
@Target(ElementType.METHOD)
@Documented
@inheritDoc
public @Nullable WithDhcpOptionsWithId withDhcpOptions(@Nullable List<DhcpOptions> dhcpOptions) {
    if (this.dhcpOptions == null) {
        this.dhcpOptions = new ArrayList<>(Arrays.asList(dhcpOptions));
    } else {
        this.dhcpOptions.addAll(dhcpOptions);
    }
    return this;
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public List<DhcpOptions> getDhcpOptions() {
    return dhcpOptions == null ? null : new ArrayList<>(dhcpOptions);
}
```

Information about one or more DHCP options sets.

Information about the egress-only Internet gateways.

- **Return Type:** `java.util.List<EgressOnlyInternetGateway>`
- **Documentation:** Information about the egress-only Internet gateways.
- **Getter Method Name:** `getEgressOnlyInternetGateways`
- **Frustrable Setter Method Name:** `withEgressOnlyInternetGateways`

**Java Example:**

```java
public class EgressOnlyInternetGatewaysInfo {
    private List<EgressOnlyInternetGateway> egressOnlyInternetGateways;

    // Getter
    public List<EgressOnlyInternetGateway> getEgressOnlyInternetGateways() {
        return egressOnlyInternetGateways;
    }

    // Frustrable Setter
    public EgressOnlyInternetGatewaysInfo withEgressOnlyInternetGateways(List<EgressOnlyInternetGateway> egressOnlyInternetGateways) {
        this.egressOnlyInternetGateways = egressOnlyInternetGateways;
        return this;
    }
}
```

**MaxResults**

The maximum number of results to return for the request in a single page. The remaining results can be seen by sending another request with the returned `<code>NextToken</code>` value. This value can be between 5 and 1000; if `<code>MaxResults</code>` is given a value larger than 1000, only 1000 results are returned. You cannot specify this parameter and the flow log IDs parameter in the same request.

```java
public void setMaxResults(Integer maxResults) {
    // Implementation
}
```

## Setter Documentation

The maximum number of results to return for the request in a single page. The remaining results can be seen by sending another request with the returned `<code>NextToken</code>` value. This value can be between 5 and 1000; if `<code>MaxResults</code>` is given a value larger than 1000, only 1000 results are returned. You cannot specify this parameter and the flow log IDs parameter in the same request.

```
@ParamParam
public void setMaxResults(Integer maxResults) {
    // Implementation
}
```

## Vararg Setter Documentation

The maximum number of results to return for the request in a single page. The remaining results can be seen by sending another request with the returned `<code>NextToken</code>` value. This value can be between 5 and 1000; if `<code>MaxResults</code>` is given a value larger than 1000, only 1000 results are returned. You cannot specify this parameter and the flow log IDs parameter in the same request.

```
public void setMaxResults(int... maxResults) {
    // Implementation
}
```

### Returns

Returns a reference to this object so that method calls can be chained together.
are returned. You cannot specify this parameter and the flow log IDs parameter in the same request.

The maximum number of results to return for the request in a single page. The remaining results can be seen by sending another request with the returned `nextToken` value. This value can be between 5 and 500; if `maxResults` is given a larger value than 500, you will receive an error.

```java
public void withMaxResults(int maxResults)
```

Returns a reference to this object so that method calls can be chained together.

- `maxResults`: Integer

**MinDuration**

This is the minimum duration of the reservation you'd like to purchase, specified in seconds. Reservations are available in one-year and three-year terms. The number of seconds specified must be the number of seconds in a year (365x24x60x60) times one of the supported durations (1 or 3). For example, specify 31536000 for one year.

```java
public void withMinDuration(int minDuration)
```

Returns a reference to this object so that method calls can be chained together.

<li><code>block-device-mapping.device-name</code> - The device name for the EBS volume (for example, <code>/dev/sdh</code>).<p>
"<ul>
</ul>"}
mapping.snapshot-id - The ID of the snapshot used for the EBS volume.

block-device-mapping.volume-size - The volume size of the EBS volume, in GiB.

block-device-mapping.volume-type - The volume type of the EBS volume.

gp2

block-device-mapping.volume-type - The volume type of the EBS volume (gp2, io1, st1, sc1, standard).

description - The description of the image (provided during image creation).

ena-support - A Boolean that indicates whether enhanced networking with ENA is enabled.

hypervisor - The hypervisor type (ovm, xen).

image-id - The ID of the image.

image-type - The image type (machine, kernel, ramdisk).

manifest-location - The location of the image manifest.

name - The name of the root device volume (for example, /dev/sda1).

owner-alias - String value from an Amazon-maintained list (amazon, aws-marketplace, microsoft).

owner-id - The AWS account ID of the image owner.

product-code - The product code.

product-code.type - The type of the product code (devpay, marketplace).

ramdisk-id - The RAM disk ID.

root-device-name - The name of the root device volume (for example, /dev/sda1).

root-device-type - The type of the root device volume (ebs, instance-store).

state-change - The reason code for the state change.

state-reason-message - The message for the state change.

tag: key=value - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.

tag-key - The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.

tag-value - The value of a tag assigned to the resource. This filter is independent of the tag-key filter. For example, if you use both the filter "tag-value=Purpose" and the filter "tag-key=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.

virtualization-type - The virtualization type (paravirtual, hvm).

block-device-mapping.delete-on-termination - A Boolean value that indicates whether the Amazon EBS volume is deleted on instance termination.

block-device-mapping.device-name - The device name for the EBS volume (for example, /dev/sdh).

block-device-mapping.device-name - The device name for the EBS volume (for example, /dev/sdh).

block-device-mapping.snapshot-id - The ID of the snapshot used for the EBS volume.

block-device-mapping.volume-size - The volume size of the EBS volume, in GiB.

block-device-mapping.volume-type - The volume type of the EBS volume.

io1

block-device-mapping.volume-type - The volume type of the EBS volume.

st1

block-device-mapping.volume-type - The volume type of the EBS volume.

sc1

block-device-mapping.volume-type - The volume type of the EBS volume.

standard

description - The description of the image (provided during image creation).

ena-support - A Boolean that indicates whether enhanced networking with ENA is enabled.

hypervisor - The hypervisor type (ovm, xen).

image-id - The ID of the image.

image-type - The ID of the image.

"documentation" : "One or more filters.

- architecture
  - The image architecture (i386 | x86_64).
- block-device-mapping.
delete-on-termination
  - A Boolean value that indicates whether the Amazon EBS volume is deleted on instance termination.
- block-device-mapping.device-name
  - The device name for the EBS volume.
- block-device-mapping.snapshot-id
  - The ID of the snapshot used for the EBS volume.
- block-device-mapping.volume-size
  - The volume size of the EBS volume, in GiB.
- block-device-mapping.volume-type
  - The volume type of the EBS volume.
- gp2
  - The Amazon EBS GP2 volume type.
- st1
  - The Amazon EBS ST1 volume type.
- sc1
  - The Amazon EBS SC1 volume type.
- standard
  - The Amazon EBS standard volume type.
- description
  - The description of the image.
- ena-support
  - A Boolean that indicates whether enhanced networking with ENA is enabled.
- image-id
  - The ID of the image.
- image-type
  - The image type.
- machine
  - The virtual machine type.
- kernel
  - The kernel image type.
- ramdisk
  - The RAM disk image type.
- is-public
  - A Boolean that indicates whether the image is public.
- is-windows
  - A Boolean that indicates whether the image is for Windows.
- is-amazon-built
  - A Boolean that indicates whether the image is built by Amazon.
- owner-alias
  - The AWS account alias of the image owner.
- platform
  - The platform.
- product-code
  - The product code.
- devpay
  - The product code for DevPay.
- marketplace
  - The product code for Marketplace.
- root-device-name
  - The name of the root device volume.
- root-device-type
  - The type of the root device volume.
- state
  - The state of the image.
- state-reason
  - The reason code for the state change.
- tag
  - A tag assigned to the resource.
- tag-key
  - The key of a tag assigned to the resource.
- tag-value
  - The value of a tag assigned to the resource.

<code>architecture</code> - The image architecture (<code>i386</code> | <code>x86_64</code>).<p>  

<code>block-device-mapping.delete-on-termination</code> - A Boolean value that indicates whether the Amazon EBS volume is deleted on instance termination.<p>  

<code>block-device-mapping.device-name</code> - The device name for the EBS volume (for example, <code>/dev/sdh</code>).<p>  

<code>block-device-mapping.snapshot-id</code> - The ID of the snapshot used for the EBS volume.<p>  

<code>block-device-mapping.volume-size</code> - The volume size of the EBS volume, in GiB.<p>  

<code>block-device-mapping.volume-type</code> - The volume type of the EBS volume (<code>gp2</code> | <code>io1</code> | <code>st1</code> | <code>sc1</code> | <code>standard</code>).<p>  

<code>description</code> - The description of the image (provided during image creation).<p>  

<code>ena-support</code> - A Boolean that indicates whether enhanced networking with ENA is enabled.<p>  

<code>hypervisor</code> - The hypervisor type (<code>ovm</code> | <code>xen</code>).<p>  

<code>image-id</code> - The ID of the image.<p>  

<code>image-type</code> - The type of the product code (<code>devpay</code> | <code>marketplace</code> | <code>platforms</code>).<p>  

<code>is-public</code> - A Boolean that indicates whether the image is public.<p>  

<code>kernel-id</code> - The kernel ID.<p>  

<code>manifest-location</code> - The location of the image manifest.<p>  

<code>name</code> - The name of the AMI (provided during image creation).<p>  

<code>owner-alias</code> - String value from an Amazon-maintained list (<code>amazon</code> | <code>aws-marketplace</code> | <code>amazon</code> | <code>aws-marketplace</code> | <code>microsoft</code> | <code>example</code>). Of snapshot owners. Not to be confused with the user-configured AWS account alias, which is set from the IAM console.<p>  

<code>owner-id</code> - The AWS account ID of the image owner.<p>  

<code>platform</code> - The platform. To only list Windows-based AMIs, use <code>platform=windows</code>.<p>  

<code>product-code</code> - The type of the product code (<code>devpay</code> | <code>marketplace</code>).<p>  

<code>ramdisk-id</code> - The RAM disk ID.<p>  

<code>root-device-name</code> - The name of the root device volume (for example, <code>/dev/sda1</code>).<p>  

<code>state</code> - The state of the
<code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. </li> <li> <p> <code>tag-value</code> - The value of a tag assigned to the resource.
