If you set this parameter to <code>stop</code>, the instance is stopped rather than terminated. If you set this parameter to <code>stop</code>, the instance is stopped rather than terminated. If you set this parameter to <code>terminate</code>, the instance is terminated rather than stopped. The default value is <code>false</code>.

### disableApiTermination

**Type:** <code>Boolean</code>  
**Default:** <code>false</code>

If you set this parameter to <code>true</code>, you can't terminate the instance using the Amazon EC2 console, CLI, or API; otherwise, you can. To change this attribute to <code>false</code> after launch, use <code>ModifyInstanceAttribute</code>. Alternatively, if you set <code>InstanceInitiatedShutdownBehavior</code> to <code>terminate</code>, you can terminate the instance by running the shutdown command from the instance.

### EbsOptimized

**Type:** <code>Boolean</code>  
**Default:** <code>false</code>

Indicates whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS-optimized instance.

**getter Documentation:**

The access key ID of the owner of the bucket. Before you specify a value for your access key ID, review and follow the guidance in  

```html
Before you specify a value for your access key ID, review and follow the guidance in Best Practices for Managing AWS Access Keys.

@returns

Retrieves a reference to this object so that method calls can be chained together.

```
Best Practices for Managing AWS Access Keys

- **awsAccessKeyId**
  - **Setter Method**: `setAWSAccessKeyId`
  - **Documentation**: Before you specify a value for your access key ID, review and follow the guidance in "Best Practices for Managing AWS Access Keys".

- **Bucket**
  - **Documentation**: The bucket in which to store the AMI. You can specify a bucket that you already own or a new bucket that Amazon EC2 creates on your behalf. If you specify a bucket that belongs to someone else, Amazon EC2 returns an error.

        "documentation" : "/**The number of I/O operations per second (IOPS) that the volume supports. For io1 volumes, this represents the number of IOPS that are provisioned for the volume. For <code>gp2</code> volumes, this represents the baseline performance of the volume and the rate at which the volume accumulates I/O credits for bursting. For more information about <code>gp2</code> baseline performance, I/O credits, and bursting, see <a href="http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumeTypes.html">Amazon EBS Volume Types</a> in the <i>Amazon Elastic Compute Cloud User Guide</i>.

Constraint: Range is 100-20000 IOPS for <code>io1</code> volumes and 100-10000 IOPS for <code>gp2</code> volumes.

Condition: This parameter is required for requests to create <code>io1</code> volumes; it is not used in requests to create <code>gp2</code>, <code>st1</code>, <code>sc1</code>, or <code>standard</code> volumes.

@return Returns a reference to this object so that method calls can be chained together.*/

**@param** IpPermissionsEgress [EC2-VPC] One or more outbound rules associated with the security group.

*NOTE:* This method appends the values to the existing list (if any). Use [setIpPermissionsEgress(java.util.Collection)] or [withIpPermissionsEgress(java.util.Collection)] if you want to override the existing values.

*Returns:* Returns a reference to this object so that method calls can be chained together.

```java
public void setIpPermissionsEgress(IpPermission ipPermission)
public void setIpPermissionsEgress(java.util.Collection<IpPermission> ipPermissions)
public List<IpPermission> getIpPermissionsEgress()
public List<IpPermission> withIpPermissionsEgress(IpPermission ipPermission)
public List<IpPermission> withIpPermissionsEgress(java.util.Collection<IpPermission> ipPermissions)
```

**VpcId [EC2-VPC] The ID of the VPC for the security group.**

*NOTE:* This method appends the values to the existing list (if any). Use [setVpcId(String)] or [withVpcId(String)] if you want to override the existing values.

*Returns:* Returns a reference to this object so that method calls can be chained together.

```java
public void setVpcId(String vpcId)
public void setVpcId(String vpcId)
public String getVpcId()
public String withVpcId(String vpcId)
```

**HttpGet [EC2-VPC] The ID of the VPC for the security group.**

*Returns:* Returns a reference to this object so that method calls can be chained together.

```java
public String getVpcId()
public String withVpcId(String vpcId)
```

"openSourceUsedInCiscoIdentityService12.5(1)SU2" : "8016"
The earliest date and time, in UTC, for the Scheduled Instance to start.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(java.util.Date earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(java.util.Date earliestTime) {
    this.earliestTime = earliestTime;
    return this;
}
```

The earliest date and time, in UTC, for the Scheduled Instance to start.

```java
public java.util.Date getEarliestTime() {
    return earliestTime;
}
```

```java
public java.util.Date getEarliestTime() {
    return this.earliestTime;
}
```

Sets the earliest date and time, in UTC, for the Scheduled Instance to start.

```java
public java.util.Date setEarliestTime(java.util.Date earliestTime) {
    this.earliestTime = earliestTime;
    return this;
}
```

```java
public java.util.Date setEarliestTime(java.util.Date earliestTime) {
    return this.earliestTime = earliestTime;
}
```

The earliest date and time, in UTC, for the Scheduled Instance to start.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

The earliest date and time, in UTC, for the Scheduled Instance to start.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

The earliest date and time, in UTC, for the Scheduled Instance to start.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

The earliest date and time, in UTC, for the Scheduled Instance to start.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

The earliest date and time, in UTC, for the Scheduled Instance to start.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

The earliest date and time, in UTC, for the Scheduled Instance to start.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

The earliest date and time, in UTC, for the Scheduled Instance to start.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

The earliest date and time, in UTC, for the Scheduled Instance to start.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

The earliest date and time, in UTC, for the Scheduled Instance to start.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

The earliest date and time, in UTC, for the Scheduled Instance to start.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

The earliest date and time, in UTC, for the Scheduled Instance to start.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

The earliest date and time, in UTC, for the Scheduled Instance to start.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

The earliest date and time, in UTC, for the Scheduled Instance to start.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

The earliest date and time, in UTC, for the Scheduled Instance to start.

```java
public ScheduledInstanceWithEarliestTime withEarliestTime(String earliestTime) {
    return builder.withEarliestTime(earliestTime).build();
}
```

Returns a reference to this object so that method calls can be chained together.

Encrypted Amazon EBS snapshots are copied asynchronously. If a snapshot copy operation fails (for example, if the proper AWS Key Management Service (AWS KMS) permissions are not obtained) this field displays error state details to help you diagnose why the error occurred. This parameter is only returned by the <a>DescribeSnapshots</a> API operation.

```java
public class DescribeSnapshotsResult {
    // ... properties and methods...
}
```

The time stamp when the snapshot was initiated.

```java
public class DescribeSnapshotsResult {
    private java.util.Date startTime;
    // ... getters and setters...
}
```

### Fluent Method

```java
public class DescribeSnapshotsResult {
    public DescribeSnapshotsResult withStartTime(java.util.Date startTime) {
        this.startTime = startTime;
        return this;
    }
}
```

### Additional Marshalling/Unmarshalling

```
public class DescribeSnapshotsResult {
    // ... additional marshalling/unmarshalling methods...
}
```

### Idempotency Token

```
public class DescribeSnapshotsResult {
    // ... idempotency token...
}
```
The time stamp when the snapshot was initiated.

A unique, case-sensitive identifier you provide to ensure idempotency of your listings. This helps avoid duplicate listings. For more information, see [Ensuring Idempotency](http://docs.aws.amazon.com/AWSEC2/latest/APIReference/Run_Instance_Idempotency.html).

### `clientToken`

- **Type:** `String`
- **Required:** Yes
- **Default:** None
- **Description:** A unique, case-sensitive identifier you provide to ensure idempotency of your listings. This helps avoid duplicate listings. For more information, see [Ensuring Idempotency](http://docs.aws.amazon.com/AWSEC2/latest/APIReference/Run_Instance_Idempotency.html).

```java
public String clientToken;
```

### Fluent Method

- **Name:** `withClientToken`
- **Return type:** `this`

```java
public SpotPrice withClientToken(String clientToken) { this.clientToken = clientToken; return this; }
```

### Getting the Client Token

- **Name:** `getClientToken`
- **Return type:** `String`

```java
public String getClientToken() { return clientToken; }
```

When you want to maintain a certain target capacity, fleet will place the required bids to meet this target capacity. It will also automatically replenish any interrupted instances. Default: maintain.

- **maintain**: Indicates whether the fleet will only request the target capacity or also attempt to maintain it. When you request a certain target capacity, the fleet will only place the required bids. It will not attempt to replenish Spot instances if capacity is diminished, nor will it submit bids in alternative Spot pools if capacity is not available. When you want to maintain a certain target capacity, fleet will place the required bids to meet this target capacity. It will also automatically replenish any interrupted instances. Default: maintain.

### Fluent Setters
- **withType**: The type of request. Indicates whether the fleet will only request the target capacity or also attempt to maintain it. When you request a certain target capacity, the fleet will only place the required bids. It will not attempt to replenish Spot instances if capacity is diminished, nor will it submit bids in alternative Spot pools if capacity is not available. When you want to maintain a certain target capacity, fleet will place the required bids to meet this target capacity. It will also automatically replenish any interrupted instances. Default: maintain.

- **withMaintain**: The type of request. Indicates whether the fleet will only request the target capacity or also attempt to maintain it. When you request a certain target capacity, the fleet will only place the required bids. It will not attempt to replenish Spot instances if capacity is diminished, nor will it submit bids in alternative Spot pools if capacity is not available. When you want to maintain a certain target capacity, fleet will place the required bids to meet this target capacity. It will also automatically replenish any interrupted instances. Default: maintain.

### Fluent Getters
- **getType**: The type of request. Indicates whether the fleet will only request the target capacity or also attempt to maintain it. When you request a certain target capacity, the fleet will only place the required bids. It will not attempt to replenish Spot instances if capacity is diminished, nor will it submit bids in alternative Spot pools if capacity is not available. When you want to maintain a certain target capacity, fleet will place the required bids to meet this target capacity. It will also automatically replenish any interrupted instances. Default: maintain.
The type of request. Indicates whether the fleet will only request the target capacity or also attempt to maintain it. When you request a certain target capacity, the fleet will only place the required bids. It will not attempt to replenish Spot instances if capacity is diminished, nor will it submit bids in alternative Spot pools if capacity is not available. When you want to maintain a certain target capacity, fleet will place the required bids to meet this target capacity. It will also automatically replenish any interrupted instances. Default: maintain.

### Spot Instance State

The state of the Spot instance request. Spot bid status information can help you track your Spot instance requests. For more information, see [Spot Bid Status](http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/spot-bid-status.html).

```java
public String state;
```

**Getter and Setter**

```java
public SpotInstanceState withState(String state)
```

### Spot Instance State Fault

The fault codes for the Spot instance request, if any.

```java
public Map<String, List<String>> fault;
```

**Getter and Setter**

```java
public SpotInstanceState withFault(String... fault)
```

The status code and status message describing the Spot instance request.

```
@\param status

@\return

Returns a reference to this object so that method calls can be chained together.
```

```java
private String status;

public SpotInstanceStatus withValidFrom(java.util.Date validFrom)
```

The start date of the request, in UTC format (for example, `YYYY-MM-DD'THH:MM:SSZ`). The request becomes active at this date and time.

```java
public java.util.Date getValidFrom()
```

The start date of the request, in UTC format (for example, `YYYY-MM-DD'THH:MM:SSZ`). The request becomes active at this date and time.

@see SpotInstanceState*/"
Spot bid status information can help you track your Spot instance requests. For more information, see Spot Bid Status in the Amazon Elastic Compute Cloud User Guide. Returns a reference to this object so that method calls can be chained together.

```java
public SpotInstanceState withState(String state)
```

This method sets the state of the Spot instance request. Spot bid status information can help you track your Spot instance requests. For more information, see Spot Bid Status in the Amazon Elastic Compute Cloud User Guide.

```java
public SpotInstanceStatus getStatus()
```

This method returns the status code and status message describing the Spot instance request.

```java
public void withStatus(SpotInstanceStatus status)
```

This method sets the status code and status message describing the Spot instance request.

Open Source Used In CISCO IDENTITY SERVICE 12.5(1)SU2 8430
The instance was shut down using the Amazon EC2 API. The instance was shut down using the Amazon EC2 API.
The message for the state change.

```
Server.InsufficientInstanceCapacity`: There was insufficient instance capacity to satisfy the launch request.

```
Server.ScheduledStop`: The instance was stopped due to a scheduled retirement.

```
Server.SpotInstanceTermination`: A Spot instance was terminated due to an increase in the market price.

```
Client.InternalError`: A client error caused the instance to terminate on launch.

```
Client.VolumeLimitExceeded`: The limit on the number of EBS volumes or total storage was exceeded. Decrease usage or request an increase in your limits.

```
Client.InvalidSnapshot.NotFound`: The specified snapshot was not found.

```
Server.InsufficientInstanceCapacity`: There was insufficient instance capacity to satisfy the launch request.

```
Server.ScheduledStop`: The instance was stopped due to a scheduled retirement.

```
Server.SpotInstanceTermination`: A Spot instance was terminated due to an increase in the market price.

```
Client.InternalError`: A client error caused the instance to terminate on launch.

```
Client.VolumeLimitExceeded`: The limit on the number of EBS volumes or total storage was exceeded. Decrease usage or request an increase in your limits.

```
Client.InvalidSnapshot.NotFound`: The specified snapshot was not found.

```
Server.InsufficientInstanceCapacity`: There was insufficient instance capacity to satisfy the launch request.

```
Server.ScheduledStop`: The instance was stopped due to a scheduled retirement.

```
Server.SpotInstanceTermination`: A Spot instance was terminated due to an increase in the market price.

```
Client.InternalError`: A client error caused the instance to terminate on launch.
