<p>Note: This feature is deprecated in favor of the new network ACL feature.</p>

Abstract:

This API is used to manage and manipulate network ACLs (Access Control Lists).

The API includes operations for creating, updating, and deleting network ACLs, as well as operations to manage the rules within each ACL.

It provides the following operations:

- CreateNetworkAcl: Creates a new network ACL.
- UpdateNetworkAcl: Updates an existing network ACL.
- DeleteNetworkAcl: Deletes an existing network ACL.
- DescribeNetworkAcl: Retrieves information about a network ACL.
- ListNetworkAcls: Lists all network ACLs.
- ImportNetworkAcl: Imports a network ACL from another region.

In addition to these operations, the API includes helpers and models for working with network ACLs.

For more information, please refer to the official documentation for the new network ACL feature.

This documentation is deprecated and will be removed in future releases.

If you need support for the current network ACL feature, please contact your account manager or reach out to our support team.

We apologize for any inconvenience this may cause, and we appreciate your understanding.

Please note that this functionality is subject to change or removal in future releases.

Thank you for your patience and cooperation.

This method appends the values to the existing list (if any). Use \{@link #setCidrs(java.util.Collection)\} or \{@link #withCidrs(java.util.Collection)\} if you want to override the existing values.\n
@method
@para
cidrs
The IP address range of the AWS service.

@return
Returns a reference to this object so that method calls can be chained together.

@method
@withPrefixListId
Get the prefix list.

@return
The ID of the prefix.

@method
@prefixListId
Set the prefix list.

@param
The ID of the prefix.

@return
Returns a reference to this object so that method calls can be chained together.

@deprecated

AMIs. Specifying this option with a PV AMI can make instances launched from the AMI unreachable.

```java
public static class SriovNetSupport {

  private String sriovNetSupport;

  public String getSriovNetSupport() {
    return sriovNetSupport;
  }

  public void setSriovNetSupport(String sriovNetSupport) {
    this.sriovNetSupport = sriovNetSupport;
  }
}
```

- **SriovNetSupport**
  - Set to `simple` to enable enhanced networking with the Intel 82599 Virtual Function interface for the AMI and any instances that you launch from the AMI.
  - This option is supported only for HVM AMIs. Specifying this option with a PV AMI can make instances launched from the AMI unreachable.
  - There is no way to disable `sriovNetSupport` at this time.

```java
public static class SriovNetSupport {

  public static final String SRIOV_NET_SUPPORT_PARAMETER = "sriovNetSupport";

  @Parameter
  public String getSriovNetSupport() {
    return sriovNetSupport;
  }

  public void setSriovNetSupport(String sriovNetSupport) {
    this.sriovNetSupport = sriovNetSupport;
  }
}
```

- **SriovNetSupport**
  - Set to `simple` to enable enhanced networking with the Intel 82599 Virtual Function interface for the AMI and any instances that you launch from the AMI.
  - This option is supported only for HVM AMIs. Specifying this option with a PV AMI can make instances launched from the AMI unreachable.

```java
public static class SriovNetSupport {

  private static final String SRIOV_NET_SUPPORT_PARAMETER = "sriovNetSupport";

  @Parameter
  public String getSriovNetSupport() {
    return sriovNetSupport;
  }

  public void setSriovNetSupport(String sriovNetSupport) {
    this.sriovNetSupport = sriovNetSupport;
  }
}
```

- **SriovNetSupport**
  - Set to `simple` to enable enhanced networking with the Intel 82599 Virtual Function interface for the AMI and any instances that you launch from the AMI.
  - This option is supported only for HVM AMIs. Specifying this option with a PV AMI can make instances launched from the AMI unreachable.

```java
public static class SriovNetSupport {

Set to `<code>simple</code>` to enable enhanced networking with the Intel 82599 Virtual Function interface for the AMI and any instances that you launch from the AMI. There is no way to disable `<code>sriovNetSupport</code>` at this time. This option is supported only for HVM AMIs. Specifying this option with a PV AMI can make instances launched from the AMI unreachable.

```java
@Param sriovNetSupport
```

Set to `<code>simple</code>` to enable enhanced networking with the Intel 82599 Virtual Function interface for the AMI and any instances that you launch from the AMI. There is no way to disable `<code>sriovNetSupport</code>` at this time. This option is supported only for HVM AMIs. Specifying this option with a PV AMI can make instances launched from the AMI unreachable. Returns a reference to this object so that method calls can be chained together.

```java
public Sriov NetSupport withSriovNetSupport(String sriovNetSupport) {
    putSriovNetSupport(sriovNetSupport);
    return this;
}
```

The type of virtualization. Default: `<code>paravirtual</code>`

```java
public VirtualizationType withVirtualizationType(String virtualizationType) {
    putVirtualizationType(virtualizationType);
    return this;
}
```

The type of virtualization. Default: `<code>paravirtual</code>`

```java
public VirtualizationType getVirtualizationType() {
    return getVirtualizationType();
}
```

"fluentSetterDocumentation" : "The IP protocol. You can specify <code>all</code> or <code>-1</code> to mean all protocols. If you specify <code>all</code>, <code>-1</code>, or a protocol number other than <code>tcp</code>, <code>udp</code>, or <code>icmp</code>, traffic on all ports is allowed, regardless of any ports or ICMP types or codes you specify. If you specify protocol <code>58</code> (ICMPv6) and specify an IPv4 CIDR block, traffic for all ICMP types and codes allowed, regardless of any that you specify. If you specify protocol <code>58</code> (ICMPv6) and specify an IPv6 CIDR block, you must specify an ICMP type and code."
IPv4 CIDR block, traffic for all ICMP types and codes allowed, regardless of any that you specify. If you specify protocol <code>58</code> (ICMPv6) and specify an IPv6 CIDR block, you must specify an ICMP type and code.

In the IP protocol. You can specify <code>all</code> or <code>-1</code> to mean all protocols. If you specify <code>all</code>, <code>-1</code>, or a protocol number other than <code>tcp</code>, <code>udp</code>, or <code>icmp</code>, traffic on all ports is allowed, regardless of any ports or ICMP types or codes you specify. If you specify protocol <code>58</code> (ICMPv6) and specify an IPv4 CIDR block, traffic for all ICMP types and codes allowed, regardless of any that you specify. If you specify protocol <code>58</code> (ICMPv6) and specify an IPv6 CIDR block, you must specify an ICMP type and code.

Get the IP protocol. You can specify <code>all</code> or <code>-1</code> to mean all protocols. If you specify <code>all</code>, <code>-1</code>, or a protocol number other than <code>tcp</code>, <code>udp</code>, or <code>icmp</code>, traffic on all ports is allowed, regardless of any ports or ICMP types or codes you specify. If you specify protocol <code>58</code> (ICMPv6) and specify an IPv4 CIDR block, traffic for all ICMP types and codes allowed, regardless of any that you specify. If you specify protocol <code>58</code> (ICMPv6) and specify an IPv6 CIDR block, you must specify an ICMP type and code.

* @return Returns a reference to this object so that method calls can be chained together.*
The IP protocol. You can specify `all` or `-1` to mean all protocols. If you specify `all`, `-1`, or a protocol number other than `tcp`, `udp`, or `icmp`, traffic on all ports is allowed, regardless of any ports or ICMP types or codes you specify. If you specify protocol `58` (ICMPv6) and specify an IPv4 CIDR block, traffic for all ICMP types and codes allowed, regardless of any that you specify. If you specify protocol `58` (ICMPv6) and specify an IPv6 CIDR block, you must specify an ICMP type and code. 

```java
@Param protocol The IP protocol. You can specify `all` or `-1` to mean all protocols. If you specify `all`, `-1`, or a protocol number other than `tcp`, `udp`, or `icmp`, traffic on all ports is allowed, regardless of any ports or ICMP types or codes you specify. If you specify protocol `58` (ICMPv6) and specify an IPv4 CIDR block, traffic for all ICMP types and codes allowed, regardless of any that you specify. If you specify protocol `58` (ICMPv6) and specify an IPv6 CIDR block, you must specify an ICMP type and code.

@Return Returns a reference to this object so that method calls can be chained together.
```

  "documentation" : ""
**SecurityGroupIds**

One or more security group IDs. You can create a security group using `<a>CreateSecurityGroup</a>`. Default: Amazon EC2 uses the default security group.

```java
public List<String> getSecurityGroupIds() {
    return securityGroupIds;
}
```

```java
@withSecurityGroupIds
public void withSecurityGroupIds(List<String> securityGroupIds) {
    this.securityGroupIds = securityGroupIds;
}
```

**SecurityGroupNames**

One or more security group names. For a nondefault VPC, you must use security group IDs instead.

Default: Amazon EC2 uses the default security group.

```java
public List<String> getSecurityGroupNames() {
    return securityGroupNames;
}
```

```java
@withSecurityGroups
public void withSecurityGroups(java.util.Collection<String> securityGroups) {
    this.securityGroups = new com.amazonaws.internal.SdkInternalList<String>(securityGroups);
}
```

**default parameter values**

- For security group names, use the default security group.
- For security group IDs, use the default security group.

**Xml representation**

```xml
<securityGroupIds>...
</securityGroupIds>
```

<p><code>Default: <code>false</code></code>

@param
disableApiTermination If you set this parameter to <code>true</code>, you can't terminate the instance using the Amazon EC2 console, CLI, or API; otherwise, you can. To change this attribute to <code>false</code> after launch, use <code>ModifyInstanceAttribute</code>. Alternatively, if you set <code>InstanceInitiatedShutdownBehavior</code> to <code>terminate</code>, you can terminate the instance by running the shutdown command from the instance.

```java
public void setDisableApiTermination(boolean disableApiTermination) {
    this.disableApiTermination = disableApiTermination;
}
```

**Documentation:**

If you set this parameter to <code>true</code>, you can't terminate the instance using the Amazon EC2 console, CLI, or API; otherwise, you can. To change this attribute to <code>false</code> after launch, use <code>ModifyInstanceAttribute</code>. Alternatively, if you set <code>InstanceInitiatedShutdownBehavior</code> to <code>terminate</code>, you can terminate the instance by running the shutdown command from the instance.

**Default:**<code>false</code>

```
@Parameter(name = "disableApiTermination", type = Boolean.class)

public boolean isDisableApiTermination() {
    return disableApiTermination;
}
```

**Documentation:**

If you set this parameter to <code>true</code>, you can't terminate the instance using the Amazon EC2 console, CLI, or API; otherwise, you can. To change this attribute to <code>false</code> after launch, use <code>ModifyInstanceAttribute</code>. Alternatively, if you set <code>InstanceInitiatedShutdownBehavior</code> to <code>terminate</code>, you can terminate the instance by running the shutdown command from the instance.

```
@Parameter(name = "disableApiTermination", type = Boolean.class)

public void setDisableApiTermination(boolean disableApiTermination) {
    this.disableApiTermination = disableApiTermination;
}
```

**Documentation:**

If you set this parameter to <code>true</code>, you can't terminate the instance using the Amazon EC2 console, CLI, or API; otherwise, you can. To change this attribute to <code>false</code> after launch, use <code>ModifyInstanceAttribute</code>. Alternatively, if you set <code>InstanceInitiatedShutdownBehavior</code> to <code>terminate</code>, you can terminate the instance by running the shutdown command from the instance.
