The IDs of the security groups for the network interface. Applies only if creating a network interface when launching an instance.

```java
public List<String> getGroups()
```

- **Getter Documentation**: The IDs of the security groups for the network interface. Applies only if creating a network interface when launching an instance.
- **Http**: Additional marshalling path and unmarshalling path are not set. Flattening and greediness are both false. Is payload and streaming are both false. Marshall and unmarshall location name are both set to `SecurityGroupId`.
- **Idempotency Token**: False.
- **List**: True.
- **Impl Type**: `com.amazonaws.internal.SdkInternalList`.
- **List Member Model**: The `c2jName` is `member`, `c2jShape` is `String`, `deprecated` is false, `documentation` is `""`, `enumType` is null.
- **Fluent Setter Documentation**: Returns a reference to this object so that method calls can be chained together.
- **Fluent Setter Method Name**: `withMember`.
- **Getter Documentation**: Return. Method name is `getMember`.
- **Getter Model**: The `returnType` is `String`, `documentation` is `null`.
- **Http**: Additional marshalling path and unmarshalling path are not set. Flattening and greediness are both false. Is payload and streaming are both false.

The low byte represents the state. The high byte is an opaque internal value and should be ignored.

```java
public enum InstanceStateName {
    PENDING(0), RUNNING(16), SHUTTING_DOWN(32), TERMINATED(48), STOPPING(64), STOPPED(80);

    public static InstanceStateName fromValue(int value) {
        return values()[value & 0xFF];
    }
}
```

The current state of the instance.

```java
public InstanceStateName currentState() {
    return currentState;
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public InstanceStateName withName(String name) {
    currentState = InstanceStateName.valueOf(name);
    return this;
}
```

The current state of the instance.

```java
public String getName() {
    return currentState.name();
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public String withName(String name) {
    currentState = InstanceStateName.valueOf(name);
    return this;
}
```

The current state of the instance.

```java
public String getName() {
    return currentState.name();
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public String withName(String name) {
    currentState = InstanceStateName.valueOf(name);
    return this;
}
```

**KeyFingerprint**

The SHA-1 digest of the DER encoded private key.

```java
public String getKeyFingerprint()

public void setKeyFingerprint(String value)
```

**KeyMaterial**

An unencrypted PEM encoded RSA private key.

```java
public String getKeyMaterial()

public void setKeyMaterial(String value)
```

**Other Methods**

- `idempotencyToken`
- `marshallLocationName`
- `marshallLocationName`
- `queryString`
- `statusId`
- `uri`
method calls can be chained together.

An unencrypted PEM encoded RSA private key.

```java
public void setKeyMaterial(String keyMaterial) {
    this.keyMaterial = keyMaterial;
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public String getKeyName() {
    return keyName;
}
```

The name of the key pair.

```java
public void withKeyName(String keyName) {
    this.keyName = keyName;
}
```

WithString keyMaterial

```java
public String getVariable() {
    return keyMaterial;
}
```

An unencrypted PEM encoded RSA private key.

```java
public void setVariable(String keyMaterial) {
    this.keyMaterial = keyMaterial;
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public String getKeyType() {
    return keyType;
}
```

The name of the key pair.

```java
public void withKeyType(String keyType) {
    this.keyType = keyType;
}
```

WithString keyMaterial

```java
public void withKeyId(String keyId) {
    this.keyId = keyId;
}
```

The name of the key pair.

```java
public String getKeyId() {
    return keyId;
}
```

* **Instance ID**

The ID of the instance that you are modifying.

* **InstanceId**

The ID of the instance that you are modifying.

* **return**

Returns a reference to this object so that method calls can be chained together.

```java
@Param instanceId
public void withInstanceId(String instanceId)
```

* **getInstanceId**

The ID of the instance that you are modifying.

```java
public String getInstanceId()
```

The ID of the instance that you are modifying.

```java
public void withInstanceId(String instanceId)
```

* **.marshallLocationName**

The location name for the instance ID.

```java
@Location("InstanceId")
```

The location name for the instance ID.

Valid values are `<code>io1</code> | <code>gp2</code> | <code>sc1</code> | <code>st1</code> The API does not support modifications for volume type `<code>standard</code> You also cannot change the type of a volume to `<code>standard</code> Returns a reference to this object so that method calls can be chained together.

### `volumeType`

- **Type:** `String`
- **Visible Name:** `volumeType`
- **Documentation:**
  
  Valid values are `<code>io1</code> | <code>gp2</code> | <code>sc1</code> | `<code>st1</code>`  
  
  The API does not support modifications for volume type `<code>standard</code> You also cannot change the type of a volume to `<code>standard</code>.

- **Returned:**
  
  Returns a reference to this object so that method calls can be chained together.
