(IPv4) for your network interface. - The association ID returned when the network interface was associated with an IPv4 address. - The status for the EBS volume. - The volume ID of the EBS volume. - The status of the EBS volume. - The ID of the security group for the instance. - The ID of the Dedicated Host on which the instance is running. - The state of the instance, as a 16-bit unsigned integer. The high byte is an opaque internal value and should be ignored. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped). - The type of instance (for example, t2.micro). - The ID of the instance to which the network interface is attached. - The device index to which the network interface is attached. - The status of the attachment.
### Network Interface Details

- **Attachment Attach-Time**: The time that the network interface was attached to an instance.
- **Delete on Termination**: Specifies whether the attachment is deleted when an instance is terminated.
- **Availability Zone**: The Availability Zone for the network interface.
- **Description**: The description of the network interface.
- **Group ID**: The ID of a security group associated with the network interface.
- **Group Name**: The name of a security group associated with the network interface.
- **IPv6 Addresses**: The IPv6 addresses associated with the network interface.
- **MAC Address**: The MAC address of the network interface.
- **Interface Id**: The ID of the network interface.
- **Owner ID**: The ID of the owner of the network interface.
- **Private DNS Name**: The private DNS name of the network interface.
- **Requester ID**: The requestor ID for the network interface.
- **Requester Managed**: Indicates whether the network interface is being managed by AWS.
- **Status**: The status of the network interface.
- **Source Dest Check**: Whether the network interface performs source/destination checking.
- **Subnet ID**: The ID of the subnet for the network interface.
- **VPC ID**: The ID of the VPC for the network interface.
- **Account ID**: The AWS account ID of the instance owner.
- **Placement Group Name**: The name of the placement group for the instance.
- **Platform**: The platform. Use `windows` if you have Windows instances; otherwise, leave blank.
- **Private DNS Name**: The private IPv4 DNS name of the instance.
- **Private IP Address**: The private IPv4 address of the instance.
- **Product Code**: The product code associated with the AMI used to launch the instance.
- **Product Code Type**: The type of product code.
- **Reason**: The reason for the current state of the instance.
- **Reservation Id**: The ID of the instance's reservation.
- **Root Device Name**: The name of the root device for the instance.
- **Root Device Type**: The type of root device that the instance uses.
- **Source Dest Check**: Indicates whether the instance performs source/destination checking.
- **Spot Instance Request Id**: The ID of the Spot instance request.
- **State Reason Code**: The reason code for the state change.
- **State Reason Message**: A message that describes the state change.
- **Tag**: The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in...
the filter value. For example, for the tag Purpose=X, specify `<code>tag:Purpose</code>` for the filter name and `<code>X</code>` for the filter value. </p> 

- `<code>tag-key</code>` - The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `'tag-key=Purpose'` and the filter `'tag-value=X'`, you get any resources assigned both the tag key Purpose (regardless of what the tag’s value is), and the tag value X (regardless of what the tag’s key is). If you want to list only resources where Purpose is X, see the <code>tag</code> filter.</p> 

- `<code>tag-value</code>` - The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter. 

- `<code>tenancy</code>` - The tenancy of an instance

- `<code>virtualization-type</code>` - The virtualization type of the instance (code:paravirtual | code:hvm).

- `<code>vpc-id</code>` - The ID of the VPC that the instance is running in.

- `<code>client-token</code>` - The idempotency token you provided when you launched the instance.

- `<code>dns-name</code>` - The public DNS name of the instance.

- `<code>group-id</code>` - The ID of the security group for the instance.

- `<code>group-name</code>` - The name of the security group for the instance.

- `<code>ip-address</code>` - The public IPv4 address of the instance.

- `<code>kernel-id</code>` - The kernel ID.
<code>requester-id</code> - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on). 

- **<code>reservation-id</code>** - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID.

- **<code>root-device-name</code>** - The name of the root device for the instance (for example, <code>/dev/sda1</code> or <code>/dev/xvda</code>). 

- **<code>root-device-type</code>** - The type of root device that the instance uses (<code>ebs</code> | <code>instance-store</code>). 

- **<code>source-dest-check</code>** - Indicates whether the instance performs source/destination checking. A value of <code>true</code> means that checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the instance to perform network address translation (NAT) in your VPC.

- **<code>spot-instance-request-id</code>** - The ID of the Spot instance request.

- **<code>state-reason-code</code>** - The reason code for the state change.

- **<code>state-reason-message</code>** - A message that describes the state change.

- **<code>subnet-id</code>** - The ID of the subnet for the instance.

- **<code>tag-value</code>** - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. For example, if you use both the filter "]tag-key=Purpose" and the filter "]tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is).

- **<code>tenancy</code>** - The tenancy of an instance (<code>dedicated</code> | <code>default</code> | <code>host</code>). 

- **<code>virtualization-type</code>** - The virtualization type of the instance (<code>paravirtual</code> | <code>hvm</code>). 

- **<code>vpc-id</code>** - The ID of the VPC that the instance is running in.
DNS name of the instance.</li>

- `group-id` - The ID of the security group for the instance. EC2-Classic only.
- `group-name` - The name of the security group for the instance. EC2-Classic only.
- `host-id` - The ID of the Dedicated Host on which the instance is running, if applicable.
- `hypervisor` - The hypervisor type of the instance (ovm | xen).
- `iam-instance-profile.arn` - The instance profile associated with the instance. Specified as an ARN.
- `image-id` - The ID of the image used to launch the instance.
- `instance-id` - The ID of the instance.
- `instance-lifecycle` - Indicates whether this is a Spot Instance or a Scheduled Instance.
- `instance-state-code` - The state of the instance, as a 16-bit unsigned integer. The high byte is an opaque internal value and should be ignored. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped).
- `instance-state-name` - The state of the instance (pending | running | shutting-down | terminated | stopping | stopped).
- `instance-type` - The type of instance (for example, t2.micro).
- `key-name` - The name of the key pair used when the instance was launched.
- `launch-index` - When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on).
- `launch-time` - The time when the instance was launched.
- `monitoring-state` - Indicates whether detailed monitoring is enabled (disabled | enabled).
- `network-interface.addresses.private-ip-address` - The private IPv4 address associated with the network interface.
- `network-interface.addresses.association.ip-owner-id` - The owner ID of the IPv4 address associated with the network interface.
- `network-interface.addresses.association.public-ip` - The ID of the association of an Elastic IP address (IPv4) with a network interface.
- `network-interface.attachment.attachment-id` - The ID of the interface attachment.
- `network-interface.attachment.instance-id` - The ID of the instance to which the network interface is attached.
- `network-interface.attachment.status` - The status of the attachment.
- `network-interface.ipv6-addresses.ipv6-address` - The IPv6 address associated with the network interface.
- `network-interface.mac-address` - The MAC address of the network interface.
- `network-interface.private-dns-name` - The private DNS name of the network interface.
Dedicated Host (<code>default</code> | <code>host</code>). The instance architecture (<code>i386</code> | <code>x86_64</code>). The address of the Elastic IP address (IPv4) bound to the network interface. The owner of the Elastic IP address (IPv4) associated with the network interface. The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
attached.

- The owner ID of the instance to which the network interface is attached.
- The device index to which the network interface is attached.
- The status of the attachment.
- Specifies whether the attachment is deleted when an instance is terminated.
- The Availability Zone for the network interface.
- The description of the network interface.
- The ID of a security group associated with the network interface.
- The name of a security group associated with the network interface.

- The IPv6 address associated with the network interface.
- The MAC address of the network interface.
- The ID of the network interface.
- The ID of the owner of the network interface.
- The private DNS name of the network interface.
- The time that the network interface was attached to an instance.
- The status of the attachment.
- Enables or disables source/destination checking. A value of true means checking is enabled, and false means checking is disabled. The value must be false for the network interface to perform network address translation (NAT) in your VPC.
- The ID of the subnet for the network interface.
- The ID of the VPC for the network interface.
- The AWS account ID of the instance owner.
- The name of the placement group for the instance.
- The platform. Use windows if you have Windows instances; otherwise, leave blank.
- The private IPv4 DNS name of the instance.
- The private IPv4 address of the instance.
- The type of product code.
- The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).
- The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID.
- The name of the root device for the instance (for example, /dev/sda1 or /dev/xvda).
- The type of root device that the instance uses.
- Indicates whether the instance performs source/destination checking. A value of true means that checking is enabled, and false means checking is disabled. The value must be false for the instance to perform network address translation (NAT) in your VPC.

- The ID of the Spot instance request.</p>  
- The ID of the Spot instance request.</p>  
- The ID of the subnet for the instance.</p>  
- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.</p>  
- The tenancy of an instance (<code>dedicated</code> | <code>default</code> | <code>host</code>). The virtualization type of the instance (<code>paravirtual</code> | <code>hvm</code>).</p>  
- The ID of the VPC that the instance is running in.</p>  
- One or more filters.</p>  
- The affinity setting for an instance running on a Dedicated Host (<code>default</code> | <code>host</code>). The instance architecture (<code>i386</code> | <code>x86_64</code>).</p>  
- The address of the Elastic IP address (IPv4) bound to the network interface.</p>  
- The owner of the Elastic IP address (IPv4) associated with the network interface.</p>  
- The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.</p>  
- The association ID returned when the network interface was associated with an IPv4 address.</p>  
- A Boolean that indicates whether the EBS volume is deleted on...
instance termination.</p> <li> <p> <code>client-token</code> - The idempotency token you provided when you launched the instance. </p> </li> <li> <p> <code>dns-name</code> - The public DNS name of the instance. </p> </li> <li> <p> <code>iam-instance-profile.arn</code> - The instance profile associated with the instance. Specified as an ARN. </p> </li> <li> <p> <code>image-id</code> - The ID of the image used to launch the instance. </p> </li> <li> <p> <code>instance-id</code> - The ID of the instance. </p> </li> <li> <p> <code>instance-lifecycle</code> - Indicates whether this is a Spot Instance or a Scheduled Instance (<code>spot</code> | <code>scheduled</code>). </p> </li> <li> <p> <code>instance-state-code</code> - The state of the instance, as a 16-bit unsigned integer. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped). </p> </li> <li> <p> <code>instance-state-name</code> - The state of the instance (<code>pending</code> | <code>running</code> | <code>shutting-down</code> | <code>terminated</code> | <code>stopping</code> | <code>stopped</code>). </p> </li> <li> <p> <code>instance-type</code> - The type of instance (for example, <code>t2.micro</code>). </p> </li> <li> <p> <code>key-name</code> - The name of the key pair used when the instance was launched. </p> </li> <li> <p> <code>launch-index</code> - When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on). </p> </li> <li> <p> <code>launch-time</code> - The time when the instance was launched. </p> </li> <li> <p> <code>monitoring-state</code> - Indicates whether detailed monitoring is enabled (<code>disabled</code> | <code>enabled</code>). </p> </li> <li> <p> <code>network-interface.addresses.private-ip-address</code> - The private IPv4 address associated with the network interface. </p> </li> <li> <p> <code>network-interface.addresses.association.private-ip</code> - The ID of the association of an Elastic IP address (IPv4) with a network interface. </p> </li> <li> <p> <code>network-interface.addresses.association.ip-owner-id</code> - The owner ID of the private IPv4 address associated with the network interface. </p> </li> <li> <p> <code>network-interface.attachment.association-id</code> - The ID of the interface attachment. </p> </li> <li> <p> <code>network-interface.attachment.delete-on-termination</code> - Specifies whether the attachment is deleted when an instance is terminated. </p> </li> <li> <p> <code>network-interface.attachment.device-index</code> - The device index to which the network interface is attached. </p> </li> <li> <p> <code>network-interface.attachment.instance-id</code> - The ID of the instance to which the network interface is attached. </p> </li> <li> <p> <code>network-interface.attachment.owner-id</code> - The owner ID of the instance to which the network interface is attached. </p> </li> <li> <p> <code>network-interface.attachment.status</code> - The status of the attachment (<code>attaching</code> | <code>detaching</code> | <code>attached</code> | <code>detached</code>). </p> </li> <li> <p> <code>network-interface.attachment.delete-on-termination</code> - Specifies whether the attachment is deleted when an instance is terminated. </p> </li> <li> <p> <code>network-interface.availability-zone</code> - The Availability Zone for the network interface. </p> </li> <li> <p> <code>network-interface.description</code> - The description of the network interface. </p> </li> <li> <p> <code>network-interface.group-id</code> - The ID of a security group associated with the network interface. </p> </li>
name</code> - The name of a security group associated with the network interface.</p> </li> <li> <p> <code>network-interface.ipv6-addresses.ipv6-address</code> - The IPv6 address associated with the network interface.</p> </li> <li> <p> <code>network-interface.mac-address</code> - The MAC address of the network interface.</p> </li> <li> <p> <code>network-interface.network-interface-id</code> - The ID of the network interface.</p> </li> <li> <p> <code>network-interface.owner-id</code> - The ID of the owner of the network interface.</p> </li> <li> <p> <code>network-interface.private-dns-name</code> - The private DNS name of the network interface.</p> </li> <li> <p> <code>network-interface.requester-id</code> - The requester ID for the network interface.</p> </li> <li> <p> <code>network-interface.requester-managed</code> - Indicates whether the network interface is being managed by AWS.</p> </li> <li> <p> <code>network-interface.status</code> - The status of the network interface (available)</p> </li> <li> <p> <code>network-interface.source-dest-check</code> - Whether the network interface performs source/destination checking. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the network interface to perform network address translation (NAT) in your VPC.</p> </li> <li> <p> <code>network-interface.subnet-id</code> - The ID of the subnet for the network interface.</p> </li> <li> <p> <code>network-interface.vpc-id</code> - The ID of the VPC for the network interface.</p> </li> <li> <p> <code>owner-id</code> - The AWS account ID of the instance owner.</p> </li> <li> <p> <code>placement-group-name</code> - The name of the placement group for the instance.</p> </li> <li> <p> <code>platform</code> - The platform. Use <code>windows</code> if you have Windows instances; otherwise, leave blank.</p> </li> <li> <p> <code>private-dns-name</code> - The private IPv4 DNS name of the instance.</p> </li> <li> <p> <code>private-ip-address</code> - The private IPv4 address of the instance.</p> </li> <li> <p> <code>product-code</code> - The product code associated with the AMI used to launch the instance.</p> </li> <li> <p> <code>product-code.type</code> - The type of product code (devpay, marketplace, etc.).</p> </li> <li> <p> <code>ramdisk-id</code> - The RAM disk ID.</p> </li> <li> <p> <code>reason</code> - The reason for the current state of the instance (for example, shows "User Initiated [date]" when you stop or terminate the instance). Similar to the state-reason-code filter.</p> </li> <li> <p> <code>reservation-id</code> - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get ten reservation IDs.</p> </li> <li> <p> <code>root-device-name</code> - The name of the root device for the instance (for example, <code>/dev/sda1</code> or <code>/dev/xvda</code>).</p> </li> <li> <p> <code>root-device-type</code> - The type of root device that the instance uses (ebs, instance-store, etc.).</p> </li> <li> <p> <code>source-dest-check</code> - Indicates whether the instance performs source/destination checking. A value of <code>true</code> means that checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the instance to perform network address translation (NAT) in your VPC.</p> </li> <li> <p> <code>spot-instance-request-id</code> - The ID of the Spot instance request.</p> </li> <li> <p> <code>state-reason-code</code> - The reason code for the state change.</p> </li> <li> <p> <code>state-reason-message</code> - A message that describes the state change.</p> </li> <li> <p> <code>tag</code> - A key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>"Purpose=X"</code> for the filter value.</p> </li> <li> <p> <code>tag:tag-value</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag:tag-key</code> filter.</p> </li>
<code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.</p> </li> <li> <p> <code>tenancy</code> - The tenancy of an instance (default | host).</p> </li> <li> <p> <code>virtualization-type</code> - The virtualization type of the instance (paravirtual | hvm).</p> </li> <li> <p> <code>vpc-id</code> - The ID of the VPC that the instance is running in.</p> </li> */

<code>association.public-ip</code> - The address of the Elastic IP address (IPv4) bound to the network interface.</p> </li> <li> <p> <code>association.ip-owner-id</code> - The owner of the Elastic IP address (IPv4) associated with the network interface.</p> </li> <li> <p> <code>availability-zone</code> - The Availability Zone of the instance.</p> </li> <li> <p> <code>block-device-mapping.attach-time</code> - The attach time for an EBS volume mapped to the instance, for example, <code>2010-09-15T17:15:20.000Z</code>.</p> </li> <li> <p> <code>block-device-mapping.delete-on-termination</code> - A Boolean that indicates whether the EBS volume is deleted on instance termination.</p> </li> <li> <p> <code>block-device-mapping.device-name</code> - The device name for the EBS volume (for example, <code>/dev/sdh</code> or <code>/dev/xvdh</code>).</p> </li> <li> <p> <code>block-device-mapping.status</code> - The status for the EBS volume (attaching | attached | detached | attaching | attached | detached).</p> </li> <li> <p> <code>block-device-mapping.volume-id</code> - The volume ID of the EBS volume.</p> </li> <li> <p> <code>client-token</code> - The idempotency token you provided when you launched the instance.</p> </li> <li> <p> <code>dns-name</code> - The public DNS name of the instance.</p> </li> <li> <p> <code>group-id</code> - The ID of the security group for the instance. EC2-Classic only.</p> </li> <li> <p> <code>group-name</code> - The name of the security group for the instance. EC2-Classic only.</p> </li> <li> <p> <code>host-id</code> - The ID of the Dedicated Host on which the instance is running, if applicable.</p> </li> <li> <p> <code>hypervisor</code> - The hypervisor type of the instance (ovm | xen).</p> </li> <li> <p> <code>iam-instance-profile.arn</code> - The instance profile associated with the instance. Specified as an ARN.</p> </li> <li> <p> <code>image-id</code> - The ID of the image used to launch the instance.</p> </li> <li> <p> <code>instance-id</code> - The ID of the instance.</p> </li> <li> <p> <code>instance-lifecycle</code> - Indicates whether this is a Spot Instance or a Scheduled Instance (spot | scheduled).</p> </li> <li> <p> <code>instance-state-code</code> - The state of the instance, as a 16-bit unsigned integer. The high byte is an opaque internal value and should be ignored. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped).</p> </li>
type</code> - The type of instance (for example, <code>t2.micro</code>).  

<code>instance.group-id</code> - The ID of the security group for the instance.  

<code>instance.group-name</code> - The name of the security group for the instance.  

<code>ip-address</code> - The public IPv4 address of the instance.  

<code>kernel-id</code> - The kernel ID.  

<code>key-name</code> - The name of the key pair used when the instance was launched.  

<code>launch-index</code> - When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on).  

<code>launch-time</code> - The time when the instance was launched.  

<code>monitoring-state</code> - Indicates whether detailed monitoring is enabled (<code>true</code> | <code>false</code>).  

<code>network-interface.addresses.primary</code> - Specifies whether the IPv4 address of the network interface is the primary private IPv4 address.  

<code>network-interface.addresses.association.ip-owner-id</code> - The owner ID of the instance to which the network interface is attached.  

<code>network-interface.attachment.delete-on-termination</code> - Specifies whether the attachment is deleted when an instance is terminated.  

<code>network-interface.availability-zone</code> - The Availability Zone for the network interface.  

<code>network-interface.description</code> - The description of the network interface.  

<code>network-interface.owner-id</code> - The ID of the VPC for the network interface.  

<code>placement-group-name</code> - The name of the placement group for the instance.  

<code>private-dns-name</code> - The private IPv4 DNS name of the instance.  

<code>private-ip-address</code> - The private IPv4 address of the instance.  

<code>platform</code> - The platform. Use <code>windows</code> if you have Windows instances; otherwise, leave blank.
<code>product-code</code> - The product code associated with the AMI used to launch the instance.

- <code>product-code.type</code> - The type of product code (<code>devpay</code> | <code>marketplace</code>.
- <code>ramdisk-id</code> - The RAM disk ID.
- <code>reason</code> - The reason for the current state of the instance (for example, shows "User Initiated [date]" when you stop or terminate the instance). Similar to the state-reason-code filter.

- <code>requester-id</code> - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).
- <code>reservation-id</code> - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get ten reservation ID.

- <code>root-device-name</code> - The name of the root device for the instance (for example, <code>/dev/sda1</code> or <code>/dev/xvda</code>).
- <code>source-dest-check</code> - Indicates whether the instance performs source/destination checking. A value of <code>true</code> means that checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the instance to perform network address translation (NAT) in your VPC.
- <code>spot-instance-request-id</code> - The ID of the Spot instance request.
- <code>state-reason-code</code> - The reason code for the state change.
- <code>subnet-id</code> - The ID of the subnet for the instance.

- <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.

- <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.</p> <p>\</p> <p>\</p> <p>\</p>
<code>network-interface.ipv6-addresses.ipv6-address</code> - The IPv6 address associated with the network interface.</p> </li> <li> <p> <code>network-interface.mac-address</code> - The MAC address of the network interface.</p> </li> <li> <p> <code>network-interface.network-interface-id</code> - The ID of the network interface.</p> </li> <li> <p> <code>network-interface.owner-id</code> - The ID of the owner of the network interface.</p> </li> <li> <p> <code>network-interface.private-dns-name</code> - The private DNS name of the network interface.</p> </li> <li> <p> <code>network-interface.requester-id</code> - The requester ID for the network interface.</p> </li> <li> <p> <code>network-interface.requester-managed</code> - Indicates whether the network interface is being managed by AWS.</p> </li> <li> <p> <code>network-interface.status</code> - The status of the network interface (<code>available</code> | <code>in-use</code>).</p> </li> <li> <p> <code>network-interface.source-dest-check</code> - Whether the network interface performs source/destination checking. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>true</code> for the network interface to perform network address translation (NAT) in your VPC.</p> </li> <li> <p> <code>network-interface.subnet-id</code> - The ID of the subnet for the network interface.</p> </li> <li> <p> <code>network-interface.vpc-id</code> - The ID of the VPC for the network interface.</p> </li> <li> <p> <code>owner-id</code> - The AWS account ID of the instance owner.</p> </li> <li> <p> <code>placement-group-name</code> - The name of the placement group for the instance.</p> </li> <li> <p> <code>platform</code> - The platform. Use <code>windows</code> if you have Windows instances; otherwise, leave blank.</p> </li> <li> <p> <code>private-dns-name</code> - The private IPv4 DNS name of the instance.</p> </li> <li> <p> <code>private-ip-address</code> - The private IPv4 address of the instance.</p> </li> <li> <p> <code>product-code</code> - The product code associated with the AMI used to launch the instance.</p> </li> <li> <p> <code>product-code.type</code> - The type of product code (<code>devpay</code> | <code>marketplace</code>).</p> </li> <li> <p> <code>ramdisk-id</code> - The RAM disk ID.</p> </li> <li> <p> <code>reason</code> - The reason for the current state of the instance (for example, shows "User Initiated [date]" when you stop or terminate the instance). Similar to the state-reason-code filter.</p> </li> <li> <p> <code>reservation-id</code> - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get ten reservation IDs.</p> </li> <li> <p> <code>root-device-name</code> - The name of the root device for the instance (for example, <code>/dev/sda1</code> or <code>/dev/xvda</code>).</p> </li> <li> <p> <code>root-device-type</code> - The type of root device that the instance uses (<code>ebs</code> | <code>instance-store</code>). The value must be <code>ebs</code> for the instance to perform network address translation (NAT) in your VPC.</p> </li> <li> <p> <code>spot-instance-request-id</code> - The ID of the Spot instance request.</p> </li> <li> <p> <code>state-reason-code</code> - The reason code for the state change.</p> </li> <li> <p> <code>state-reason-message</code> - A message that describes the state change.</p> </li> <li> <p> <code>subnet-id</code> - The ID of the subnet for the instance.</p> </li> <li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code> Purpose=X</code> for the filter value.</p> </li> <li> <p> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter <"tag-key="Purpose"" and the filter "tag-value=X"», you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.</p> </li> <li> <p> <code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-

<td>The ID of a security group associated with the network interface.</td>
</tr>
<tr>
<td>&lt;code&gt;network-interface.group-name&lt;/code&gt;</td>
<td>The name of a security group associated with the network interface.</td>
</tr>
<tr>
<td>&lt;code&gt;network-interface.ipv6-addresses.ipv6-address&lt;/code&gt;</td>
<td>The IPv6 address associated with the network interface.</td>
</tr>
<tr>
<td>&lt;code&gt;network-interface.mac-address&lt;/code&gt;</td>
<td>The MAC address of the network interface.</td>
</tr>
<tr>
<td>&lt;code&gt;network-interface.owner-id&lt;/code&gt;</td>
<td>The ID of the owner of the network interface.</td>
</tr>
<tr>
<td>&lt;code&gt;network-interface.private-dns-name&lt;/code&gt;</td>
<td>The private DNS name of the network interface.</td>
</tr>
<tr>
<td>&lt;code&gt;network-interface.requester-id&lt;/code&gt;</td>
<td>The requester ID for the network interface.</td>
</tr>
<tr>
<td>&lt;code&gt;network-interface.requester-managed&lt;/code&gt;</td>
<td>Indicates whether the network interface is being managed by AWS.</td>
</tr>
<tr>
<td>&lt;code&gt;network-interface.status&lt;/code&gt;</td>
<td>The status of the network interface (available</td>
</tr>
<tr>
<td>&lt;code&gt;network-interface.source-dest-check&lt;/code&gt;</td>
<td>Whether the network interface performs source/destination checking.</td>
</tr>
<tr>
<td>&lt;code&gt;network-interface.subnet-id&lt;/code&gt;</td>
<td>The ID of the subnet for the network interface.</td>
</tr>
<tr>

<td>The ID of the VPC for the network interface.</td>
</tr>
<tr>
<td>&lt;code&gt;placement-group-name&lt;/code&gt;</td>
<td>The name of the placement group for the instance.</td>
</tr>
<tr>
<td>&lt;code&gt;platform&lt;/code&gt;</td>
<td>The platform. Use &lt;code&gt;windows&lt;/code&gt; if you have Windows instances; otherwise, leave blank.</td>
</tr>
<tr>
<td>&lt;code&gt;product-code&lt;/code&gt;</td>
<td>The product code associated with the AMI used to launch the instance.</td>
</tr>
<tr>
<td>&lt;code&gt;product-code.type&lt;/code&gt;</td>
<td>The type of product code (&lt;code&gt;devpay&lt;/code&gt;</td>
</tr>
<tr>
<td>&lt;code&gt;ramdisk-id&lt;/code&gt;</td>
<td>The RAM disk ID.</td>
</tr>
<tr>
<td>&lt;code&gt;reason&lt;/code&gt;</td>
<td>The reason for the current state of the instance (for example, shows &quot;User Initiated [date]&quot; when you stop or terminate the instance). Similar to the state-reason-code filter.</td>
</tr>
<tr>
<td>&lt;code&gt;requester-id&lt;/code&gt;</td>
<td>The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).</td>
</tr>
</tbody>
</table>
A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID.

- `<code>root-device-name</code>` - The name of the root device for the instance (for example, `<code>/dev/sda1</code>` or `<code>/dev/xvda</code>`).
- `<code>root-device-type</code>` - The type of root device that the instance uses (<code>ebs</code> | <code>instance-store</code>). Indicates whether the instance performs source/destination checking. A value of `<code>true</code>` means that checking is enabled, and `<code>false</code>` means checking is disabled. The value must be `<code>false</code>` for the instance to perform network address translation (NAT) in your VPC.
- `<code>spot-instance-request-id</code>` - The ID of the Spot instance request.
- `<code>state-reason-code</code>` - The reason code for the state change.
- `<code>state-reason-message</code>` - A message that describes the state change.

For example, for the tag `Purpose=X`, specify `<code>tag:tag-key</code>` for the filter name and `<code>tag:tag-value</code>` for the filter value. If you want to list only resources where `Purpose` is `X`, see the filter `<code>tag:tag-key</code>` filter. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `"tag-key=Purpose"` and the filter `"tag-value=X"`, you get any resources assigned both the tag key `Purpose` (regardless of what the tag's value is), and the tag value `X` (regardless of what the tag's key is). If you want to list only resources where `Purpose` is `X`, see the filter `<code>tag:tag-key</code>` filter. This filter is independent of the `<code>tag-value</code>` filter.

- `<code>tag-key</code>` - The key of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag `Purpose=X`, specify `<code>tag:Purpose</code>` for the filter name and `<code.Cell value="X" code="/dev/sda1" code="/dev/xvda"></code>` for the filter value. If you want to list only resources where `Purpose` is `X`, see the filter `<code>tag:tag-key</code>` filter. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `"tag-key=Purpose"` and the filter `"tag-value=X"`, you get any resources assigned both the tag key `Purpose` (regardless of what the tag's value is), and the tag value `X` (regardless of what the tag's key is). If you want to list only resources where `Purpose` is `X`, see the filter `<code>tag:tag-key</code>` filter.

- `<code>tag-value</code>` - The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter. The tenancy of an instance (default, host, dedicated), the virtualization type (paravirtual, hvm)
- `<code>state-reason-code</code>` - The reason code for the state change.
- `<code>state-reason-message</code>` - A message that describes the state change.
- `<code>subnet-id</code>` - The ID of the subnet for the instance.
- `<code>tag:tag-key</code>` - The key of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag `Purpose=X`, specify `<code>tag:Purpose</code>` for the filter name and `<code>tag:tag-value</code>` for the filter value. If you want to list only resources where `Purpose` is `X`, see the filter `<code>tag:tag-key</code>` filter. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `"tag-key=Purpose"` and the filter `"tag-value=X"`, you get any resources assigned both the tag key `Purpose` (regardless of what the tag's value is), and the tag value `X` (regardless of what the tag's key is). If you want to list only resources where `Purpose` is `X`, see the filter `<code>tag:tag-key</code>` filter.

- `<code>tag-value</code>` - The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter. The tenancy of an instance (default, host, dedicated), the virtualization type (paravirtual, hvm). The ID of the VPC that the instance is running in.

The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped). </p> </li> <li> <p> <code>instance-state-name</code> - The state of the instance (<code>pending</code> | <code>running</code> | <code>shutting-down</code> | <code>terminated</code> | <code>stopping</code> | <code>stopped</code>). </p> </li> <li> <p> <code>instance-type</code> - The type of instance (for example, <code>t2.micro</code>). </p> </li> <li> <p> <code>ip-address</code> - The public IPv4 address of the instance. </p> </li> <li> <p> <code>kernel-id</code> - The kernel ID. </p> </li> <li> <p> <code>key-name</code> - The name of the key pair used when the instance was launched. </p> </li> <li> <p> <code>launch-index</code> - When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on). </p> </li> <li> <p> <code>launch-time</code> - The time that the instance was launched. </p> </li> <li> <p> <code>monitoring-state</code> - Indicates whether detailed monitoring is enabled (<code>disabled</code> | <code>enabled</code>). </p> </li> <li> <p> <code>network-interface.addresses.private-ip-address</code> - The private IPv4 address associated with the network interface. </p> </li> <li> <p> <code>network-interface.addresses.primary</code> - Specifies whether the IPv4 address of the network interface is the primary IPv4 address. </p> </li> <li> <p> <code>network-interface.addresses.association.public-ip</code> - The ID of the association of an Elastic IP address (IPv4) with a network interface. </p> </li> <li> <p> <code>network-interface.attachment.attachment-id</code> - The ID of the interface attachment. </p> </li> <li> <p> <code>network-interface.attachment.attachment-instance-id</code> - The ID of the instance to which the network interface is attached. </p> </li> <li> <p> <code>network-interface.attachment.instance-owner-id</code> - The owner ID of the instance to which the network interface is attached. </p> </li> <li> <p> <code>network-interface.attachment.device-index</code> - The device index to which the network interface is attached. </p> </li> <li> <p> <code>network-interface.attachment.attachment-status</code> - The status of the attachment (<code>attaching</code> | <code>detaching</code> | <code>detached</code>). </p> </li> <li> <p> <code>network-interface.attachment.attach-time</code> - The time that the network interface was attached to an instance. </p> </li> <li> <p> <code>network-interface.attachment.delete-on-termination</code> - Specifies whether the attachment is deleted when an instance is terminated. </p> </li> <li> <p> <code>network-interface.availability-zone</code> - The Availability Zone for the network interface. </p> </li> <li> <p> <code>network-interface.description</code> - The description of the network interface. </p> </li> <li> <p> <code>network-interface.group-id</code> - The ID of a security group associated with the network interface. </p> </li>
name</code> - The name of a security group associated with the network interface.</li> <li> <code>network-interface.ipv6-addresses.ipv6-address</code> - The IPv6 address associated with the network interface.</li> <li> <code>network-interface.mac-address</code> - The MAC address of the network interface.</li> <li> <code>network-interface.network-interface-id</code> - The ID of the network interface.</li> <li> <code>network-interface.owner-id</code> - The ID of the owner of the network interface.</li> <li> <code>network-interface.private-dns-name</code> - The private DNS name of the network interface.</li> <li> <code>network-interface.requester-id</code> - The requester ID for the network interface.</li> <li> <code>network-interface.requester-managed</code> - Indicates whether the network interface is being managed by AWS.</li> <li> <code>network-interface.status</code> - The status of the network interface.</li> <li> <code>network-interface.available</code> | <code>in-use</code>.</li> <li> <code>network-interface.source-dest-check</code> - Whether the network interface performs source/destination checking. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the network interface to perform network address translation (NAT) in your VPC.</li> <li> <code>network-interface.subnet-id</code> - The ID of the subnet for the network interface.</li> <li> <code>network-interface.vpc-id</code> - The ID of the VPC for the network interface.</li> <li> <code>owner-id</code> - The AWS account ID of the instance owner.</li> <li> <code>placement-group-name</code> - The name of the placement group for the instance.</li> <li> <code>platform</code> - The platform. Use <code>windows</code> if you have Windows instances; otherwise, leave blank.</li> <li> <code>private-dns-name</code> - The private IPv4 DNS name of the instance.</li> <li> <code>private-ip-address</code> - The private IPv4 address of the instance.</li> <li> <code>product-code</code> - The product code associated with the AMI used to launch the instance.</li> <li> <code>product-code.type</code> - The type of product code (<=devpay>=code:p | <code>marketplace</code>).</li> <li> <code>ramdisk-id</code> - The RAM disk ID.</li> <li> <code>reason</code> - The reason for the current state of the instance (for example, shows "User Initiated [date]" when you stop or terminate the instance). Similar to the state-reason-code filter.</li> <li> <code>requester-id</code> - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).</li> <li> <code>reservation-id</code> - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get ten reservation IDs.</li> <li> <code>root-device-name</code> - The name of the root device for the instance (for example, <code>/dev/sda1</code> or <code>/dev/nvda</code>).</li> <li> <code>root-device-type</code> - The type of root device that the instance uses (<code>ebs</code> | <code>instance-store</code>).</li> <li> <code>source-dest-check</code> - Indicates whether the instance performs source/destination checking. A value of <code>true</code> means that checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the instance to perform network address translation (NAT) in your VPC.</li> <li> <code>state-reason-code</code> - The reason code for the state change.</li> <li> <code>state-reason-message</code> - A message that describes the state change.</li> <li> <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code> Purpose=X</code> for the filter value.</li> <li> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.
<code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.</li> <li> <p> <code>tenancy</code> - The tenancy of an instance</li> <li> <p> <code>virtualization-type</code> - The virtualization type of the instance (<code>paravirtual</code> | <code>hvm</code>).</li> <li> <p> <code>vpc-id</code> - The ID of the VPC that the instance is running in.</li> <ul>
  <li> <p> <code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.</li> 
  </ul>

<code>attachment</code> - The attach time for an EBS volume mapped to the instance, for example, <code>2010-09-15T17:15:20.000Z</code>.
multiple instances using the same launch request. For example, if you launch one instance, you’ll get one reservation ID. If you launch ten instances using the same launch request, you’ll also get one reservation ID. If you launch one instance, you’ll get one reservation ID. If you launch ten instances using the same launch request, you’ll also get one reservation ID. If you launch one instance, you’ll get one reservation ID. If you launch ten instances using the same launch request, you’ll also get one reservation ID.

- The name of the root device for the instance (for example, `<code>/dev/sda1</code>` or `<code>/dev/xvda</code>`).
- The type of root device that the instance uses (<code>ebs</code> | <code>instance-store</code>).<p></p>
- Indicates whether the instance performs source/destination checking. A value of <code>true</code> means that checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the instance to perform network address translation (NAT) in your VPC.<p></p>
- The ID of the Spot instance request.<p></p>
- The reason code for the state change.<p></p>
- A message that describes the state change.<p></p>
- The ID of the subnet for the instance.<p></p>
- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify `<code>tag:Purpose</code>` for the filter name and `<code>X</code>` for the filter value.<p></p>
- The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `"tag-key=Purpose"` and the filter `"tag-value=X"`, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the `<code>tag:Purpose</code>` filter.<p></p>
- The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter.<p></p>
- The tenancy of an instance (`<code>dedicated</code> | `<code>default</code>` | `<code>host</code>`).<p></p>
- The virtualization type of the instance (`<code>paravirtual</code> | `<code>hvm</code>`).<p></p>
- The ID of the VPC that the instance is running in.<p></p>
- One or more filters.<p></p>
- The affinity setting for an instance running on a Dedicated Host (`<code>default</code>` | `<code>host</code>`).<p></p>
- The instance architecture (`<code>i386</code>` | `<code>x86_64</code>`).<p></p>
- The instance architecture (`<code>i386</code>` | `<code>x86_64</code>`).<p></p>
- The address of the Elastic IP address (IPv4) bound to the network interface.<p></p>
- The owner of the Elastic IP address (IPv4) associated with the network interface.<p></p>
- The association ID returned when you allocated the Elastic IP address (IPv4) for your network interface.<p></p>
- The association ID returned when the network interface was associated with an IPv4 address.<p></p>
- The Availability Zone of the instance.<p></p>
- The attach time for an EBS volume mapped to the instance, for example, `<code>2010-09-15T17:15:20.000Z</code>`.<p></p>
- A Boolean that indicates whether the EBS volume is deleted on instance termination.<p></p>
- The device name for the EBS volume (for example, `<code>/dev/sdh</code>` or `<code>/dev/xvdh</code>`).<p></p>
- The status for the EBS volume (`<code>attaching</code>` | `<code>attached</code>` | `<code>detaching</code>` | `<code>detached</code>`).<p></p>
- The volume ID of the EBS volume.<p></p>
- The idempotency token you provided when you launched the instance.<p></p>
- The Public DNS name of the instance.<p></p>
- The ID of the security group for the instance. EC2-Classic only.<p></p>
- The name of the security group for the instance. EC2-Classic only.<p></p>
- The ID of the Dedicated Host on which the instance is running, if applicable.<p></p>
- The hypervisor type of the instance (`<code>ovm</code>` | `<code>xen</code>`).<p></p>
- The instance profile associated with the instance. Specified as an ARN.
- The ID of the image used to launch the instance.
- The ID of the instance.
- Indicates whether this is a Spot Instance or a Scheduled Instance.
- The state of the instance, as a 16-bit unsigned integer. The high byte is an opaque internal value and should be ignored.
- The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped).
- The type of instance (for example, t2.micro).
- The ID of the security group for the instance.
- Indicates whether detailed monitoring is enabled.
- The name of the key pair used when the instance was launched.
- When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on).
- The time when the instance was launched.
- Indicates whether the network interface is the primary private IPv4 address.
- The ID of the association of an Elastic IP address (IPv4) with a network interface.
- The owner ID of the private IPv4 address associated with the network interface.
- The ID of the interface attachment.
- The device index to which the network interface is attached.
- Whether the network interface performs source/destination checking. A value of true means checking is enabled, and false means checking is disabled.
disabled. The value must be \code{false} for the network interface to perform network address translation (NAT) in your VPC.</p>
<li>\code{network-interface.subnet-id} - The ID of the subnet for the network interface.</li>
<li>\code{network-interface.vpc-id} - The ID of the VPC for the network interface.</li>
<li>\code{owner-id} - The AWS account ID of the instance owner.</li>
<li>\code{placement-group-name} - The name of the placement group for the instance.</li>
<li>\code{platform} - The platform. Use \code{windows} if you have Windows instances; otherwise, leave blank.</li>
<li>\code{private-dns-name} - The private IPv4 DNS name of the instance.</li>
<li>\code{private-ip-address} - The private IPv4 address of the instance.</li>
<li>\code{product-code} - The product code associated with the AMI used to launch the instance.</li>
<li>\code{product-code.type} - The type of product code (\code{devpay} | \code{marketplace}).</li>
<li>\code{ramdisk-id} - The RAM disk ID.</li>
<li>\code{reason} - The reason for the current state of the instance (for example, shows \"User Initiated [date]\" when you stop or terminate the instance). Similar to the state-reason-code filter.</li>
<li>\code{requester-id} - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).</li>
<li>\code{reservation-id} - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID.</li>
<li>\code{root-device-name} - The name of the root device for the instance (for example, \code{dev/sda1} or \code{dev/xvda}).</li>
<li>\code{root-device-type} - The type of root device that the instance uses (\code{ebs} | \code{instance-store}).</li>
<li>\code{source-dest-check} - Indicates whether the instance performs source/destination checking. A value of \code{true} means that checking is enabled, and \code{false} means checking is disabled. The value must be \code{false} for the instance to perform network address translation (NAT) in your VPC.</li>
<li>\code{spot-instance-request-id} - The ID of the Spot instance request.</li>
<li>\code{state-reason-code} - The reason code for the state change.</li>
<li>\code{state-reason-message} - A message that describes the state change.</li>
<li>\code{subnet-id} - The ID of the subnet for the instance.</li>
<li>\code{tag} - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify \code{tag:Purpose} for the filter name and \code{X} for the filter value.</li>
<li>\code{tenancy} - The tenancy of an instance (\code{dedicated} | \code{default} | \code{host}).</li>
<li>\code{virtualization-type} - The virtualization type of the instance (\code{paravirtual} | \code{hvm}).</li>
<li>\code{vpc-id} - The ID of the VPC that the instance is running in.</li>

The kernel ID.

- The name of the key pair used when the instance was launched.
- When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on).
- The time when the instance was launched.
- Indicates whether detailed monitoring is enabled.

- The private IPv4 address associated with the network interface.
- Specifies whether the IPv4 address of the network interface is the primary private IPv4 address.
- The ID of the association of an Elastic IP address (IPv4) with a network interface.
- The owner ID of the private IPv4 address associated with the network interface.
- The ID of the interface attachment.
- The device index to which the network interface is attached.
- The owner ID of the instance to which the network interface is attached.
- The owner ID of the instance to which the network interface is attached.
- The status of the attachment.
- The status of the network interface.

A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID.</p> </li> <li> <p> <code>root-device-name</code> - The name of the root device for the instance (for example, <code>/dev/sda1</code> or <code>/dev/xvda</code>).</p> </li> <li> <p> <code>root-device-type</code> - The type of root device that the instance uses (<code>ebs</code> | <code>instance-store</code>).</p> </li> <li> <p> <code>source-dest-check</code> - Indicates whether the instance performs source/destination checking. A value of <code>true</code> means that checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the instance to perform network address translation (NAT) in your VPC.</p> </li> <li> <p> <code>spot-instance-request-id</code> - The ID of the Spot instance request.</p> </li> <li> <p> <code>state-reason-code</code> - The reason code for the state change.</p> </li> <li> <p> <code>state-reason-message</code> - A message that describes the state change.</p> </li> <li> <p> <code>subnet-id</code> - The ID of the subnet for the instance.</p> </li> <li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.</p> </li> <li> <p> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag:Purpose</code> filter. If you want to list only resources where the tag key is X regardless of what the tag's value is, see the <code>tag-value</code> filter.</p> </li> <li> <p> <code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.</p> </li> <li> <p> <code>tenancy</code> - The tenancy of an instance (<code>dedicated</code> | <code>default</code> | <code>host</code>).</p> </li> <li> <p> <code>virtualization-type</code> - The virtualization type of the instance (<code>paravirtual</code> | <code>hvm</code>).</p> </li> <li> <p> <code>vpc-id</code> - The ID of the VPC that the instance is running in.</p> </li>

<li><code>affinity</code> - The affinity setting for an instance running on a Dedicated Host (<code>default</code> | <code>host</code>). </li>
<li><code>architecture</code> - The instance architecture (<code>i386</code> | <code>x86_64</code>). </li>
<li><code>association.public-ip</code> - The address of the Elastic IP address (IPv4) bound to the network interface. </li>
<li><code>association.ip-owner-id</code> - The owner of the Elastic IP address (IPv4) associated with the network interface. </li>
<li><code>association.allocation-id</code> - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface. </li>
<li><code>block-device-mapping.attach-time</code> - The attach time for an EBS volume mapped to the instance, for example, <code>2010-09-15T17:15:20.000Z</code>. </li>
<li><code>block-device-mapping.delete-on-termination</code> - A Boolean that indicates whether the EBS volume is deleted on instance termination. </li>
<li><code>block-device-mapping.device-name</code> - The device name for the EBS volume (for example, <code>/dev/sdh</code> or <code>/xvdh</code>). </li>
<li><code>block-device-mapping.status</code> - The status for the EBS volume (<code>attaching</code> | <code>attached</code> | <code>detaching</code> | <code>detached</code>). </li>
"
id</code> - The volume ID of the EBS volume.</p> 
</li> 
<li> 
<code>client-token</code> - The idempotency token you provided when you launched the instance.</li> 
<li> 
<code>dns-name</code> - The public DNS name of the instance.</li> 
<li> 
<code>group-id</code> - The ID of the security group for the instance. EC2-Classic only.</li> 
<li> 
<code>group-name</code> - The name of the security group for the instance. EC2-Classic only.</li> 
<li> 
<code>host-id</code> - The ID of the Dedicated Host on which the instance is running, if applicable.</li> 
<li> 
<code>hypervisor</code> - The hypervisor type of the instance.</li> 
<li> 
<code>image-id</code> - The ID of the image used to launch the instance.</li> 
<li> 
<code>instance-id</code> - The ID of the instance.</li> 
<li> 
<code>instance-lifecycle</code> - Indicates whether this is a Spot Instance or a Scheduled Instance.</li> 
<li> 
<code>image-id</code> - The ID of the image used to launch the instance.</li> 
<li> 
<code>ip-address</code> - The public IPv4 address of the instance.</li> 
<li> 
<code>kernel-id</code> - The kernel ID.</li> 
<li> 
<code>key-name</code> - The name of the key pair used when the instance was launched.</li> 
<li> 
<code>launch-index</code> - When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on).</li> 
<li> 
<code>launch-time</code> - The time when the instance was launched.</li> 
<li> 
<code>monitoring-state</code> - Indicates whether detailed monitoring is enabled.</li>

<code>network-interface.attachment.attachment-id</code> - The ID of the interface attachment.</li> 
<li> 
<code>network-interface.attachment.attachment-id</code> - The ID of the interface attachment.</li> 
<li> 
<code>network-interface.attachment.attachment-id</code> - The ID of the interface attachment.</li> 
<li> 
<code>network-interface.attachment.attachment-id</code> - The ID of the interface attachment.</li> 
<li> 
<code>network-interface.attachment.attachment-id</code> - The ID of the interface attachment.
interface.</p> </li> <li> <p> <code>network-interface.owner-id</code> - The ID of the owner of the network
interface.</p> </li> <li> <p> <code>network-interface.private-dns-name</code> - The private DNS name of the
network interface.</p> </li> <li> <p> <code>network-interface.requester-id</code> - The requester ID for the
network interface.</p> </li> <li> <p> <code>network-interface.requester-managed</code> - Indicates whether the
checking. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is
disabled. The value must be <code>true</code> for the network interface to perform network address translation
(NAT) in your VPC.<p> </p></li> <li> <p> <code>network-interface.subnet-id</code> - The ID of the subnet for the
network interface.</p> </li> <li> <p> <code>network-interface.vpc-id</code> - The ID of the VPC for the network
interface.</p> </li> <li> <p> <code>owner-id</code> - The AWS account ID of the instance owner.</p> </li> <li> <p> <code>placement-group-name</code> - The name of the placement group for the instance.<p> </p></li> <li> <p> <code>platform</code> - The platform. Use <code>windows</code> if you have Windows instances; otherwise,
[date]" when you stop or terminate the instance). Similar to the state-reason-code filter.<p> </p></li> <li> <p> <code>reservation-id</code> - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID.<p> </p></li> <li> <p> <code>root-device-name</code> - The name of the root device for the instance (for example,
<code>true</code> means that checking is enabled, and <code>false</code> means checking is disabled. The value
must be <code>false</code> for the instance to perform network address translation (NAT) in your VPC.<p> </p></li> <li> <p> <code>spot-instance-request-id</code> - The ID of the Spot instance request.<p> </p></li> <li> <p> <code>state-reason-code</code> - The state reason code for the state change.<p> </p></li> <li> <p> <code>state-reason-message</code> - A message that describes the state change.<p> </p></li> <li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.<p> </p></li> <li> <p> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.<p> </p></li> <li> <p> <code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.<p> </p></li> <li> <p> <code>tenancy</code> - The tenancy of an instance (<code>dedicated</code> | <code>default</code> | <code>host</code>).<p> </p></li> <li> <p> <code>virtualization-type</code> - The virtualization type of the instance (<code>paravirtual</code> | <code>hvm</code>).<p> </p></li>
<li> <p> <code>vpc-id</code> - The ID of the VPC that the instance is running in.</p> </li> <li> <p> <code>availability-zone</code> - The Availability Zone of the instance.</p> </li> <li> <p> <code>attachment</code> - The attachment status for an instance running on a Dedicated Host (default:available | host).</p> </li> <li> <p> <code>architecture</code> - The architecture of the instance (i386 | x86_64).</p> </li> <li> <p> <code>association-public-ip</code> - The address of the Elastic IP address (IPv4) bound to the network interface.</p> </li> <li> <p> <code>association.ip-owner-id</code> - The owner of the Elastic IP address (IPv4) associated with the network interface.</p> </li> <li> <p> <code>association.allocation-id</code> - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.</p> </li> <li> <p> <code>association.id</code> - The association ID returned when the network interface was associated with an IPv4 address.</p> </li> <li> <p> <code>availability-zone</code> - The Availability Zone of the instance.</p> </li> <li> <p> <code>block-device-mapping.attach-time</code> - The attach time for an EBS volume mapped to the instance, for example, 2010-09-15T17:15:20.000Z.</p> </li> <li> <p> <code>block-device-mapping.delete-on-termination</code> - A Boolean that indicates whether the EBS volume is deleted on instance termination.</p> </li> <li> <p> <code>block-device-mapping.device-name</code> - The device name for the EBS volume (for example, /dev/sdh or /dev/xvdh).</p> </li> <li> <p> <code>block-device-mapping.volume-id</code> - The volume ID of the EBS volume.</p> </li> <li> <p> <code>block-device-mapping.status</code> - The status for the EBS volume (attaching | attached | detaching | detached).</p> </li> <li> <p> <code>client-token</code> - The idempotency token you provided when you launched the instance.</p> </li> <li> <p> <code>dns-name</code> - The public DNS name of the instance.</p> </li> <li> <p> <code>group-id</code> - The ID of the security group for the instance. EC2-Classic only.</p> </li> <li> <p> <code>group-name</code> - The name of the security group for the instance. EC2-Classic only.</p> </li> <li> <p> <code>host-id</code> - The ID of the Dedicated Host on which the instance is running, if applicable.</p> </li> <li> <p> <code>hypervisor</code> - The hypervisor type of the instance (ovm | xen).</p> </li> <li> <p> <code>iam-instance-profile.arn</code> - The instance profile associated with the instance. Specified as an ARN.</p> </li> <li> <p> <code>image-id</code> - The ID of the image used to launch the instance.</p> </li> <li> <p> <code>instance.lifecycle</code> - Indicates whether this is a Spot Instance or a Scheduled Instance (spot | scheduled).</p> </li> <li> <p> <code>instance-state-name</code> - The state of the instance, as a 16-bit unsigned integer. The high byte is an opaque internal value and should be ignored. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped).</p> </li> <li> <p> <code>instance-state-name</code> - The state of the instance (pending | running | shutting-down | terminated | stopping | stopped).</p> </li> <li> <p> <code>instance-type</code> - The type of instance (for example, t2.micro).</p> </li> <li> <p> <code>ip-address</code> - The public IPv4 address of the instance.</p> </li> <li> <p> <code>kernel-id</code> - The kernel ID.</p> </li> <li> <p> <code>key-name</code> - The name of the key pair used when the instance was launched.</p> </li> <li> <p> <code>launch-index</code> - When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on).</p> </li> <li> <p> <code>launch-time</code> - The time when the instance was launched.</p> </li> <li> <p> <code>monitoring-state</code> - Indicates whether detailed monitoring is enabled (disabled | enabled).</p> </li> <li> <p> <code>network-interface.addresses.private-ip-address</code> - The private IPv4 address associated with the network interface.</p> </li> <li> <p> <code>network-interface.addresses.primary</code> - Specifies whether the IPv4 address of the network interface is the primary private IPv4 address.</p> </li> <li> <p> <code>network-interface.addresses.association.public-ip</code> - The ID of the association of an Elastic IP address (IPv4) with a network interface.</p> </li> <li> <p> <code>network-interface.addresses.association.ip-owner-id</code> - The owner ID of the private IPv4 address associated with the network interface.</p>
interface.attachment.attachment-id</code> - The ID of the interface attachment.</p> <li> <p> <code>network-interface.attachment.instance-id</code> - The ID of the instance to which the network interface is attached.</p> <li> <p> <code>network-interface.attachment.instance-owner-id</code> - The owner ID of the instance to which the network interface is attached.</p> <li> <p> <code>network-interface.attachment.device-index</code> - The device index to which the network interface is attached.</p> <li> <p> <code>network-interface.attachment.status</code> - The status of the attachment (<code>attaching</code> | <code>attached</code> | <code>detaching</code> | <code>detached</code>). </p> <li> <p> <code>network-interface.attachment.attach-time</code> - The time that the network interface was attached to an instance.</p> <li> <p> <code>network-interface.attachment.delete-on-termination</code> - Specifies whether the attachment is deleted when an instance is terminated.</p> <li> <p> <code>network-interface.availability-zone</code> - The Availability Zone for the network interface.</p> <li> <p> <code>network-interface.description</code> - The description of the network interface.</p> <li> <p> <code>network-interface.group-id</code> - The ID of a security group associated with the network interface.</p> <li> <p> <code>network-interface.group-name</code> - The name of a security group associated with the network interface.</p> <li> <p> <code>network-interface.ipv6-addresses.ipv6-address</code> - The IPv6 address associated with the network interface.</p> <li> <p> <code>network-interface.mac-address</code> - The MAC address of the network interface.</p> <li> <p> <code>network-interface.network-interface-id</code> - The ID of the network interface.</p> <li> <p> <code>network-interface.owner-id</code> - The ID of the owner of the network interface.</p> <li> <p> <code>network-interface.private-dns-name</code> - The private DNS name of the network interface.</p> <li> <p> <code>network-interface.requester-id</code> - The requester ID for the network interface.</p> <li> <p> <code>network-interface.requester-managed</code> - Indicates whether the network interface is being managed by AWS.</p> <li> <p> <code>network-interface.status</code> - The status of the network interface (<code>available</code> | <code>in-use</code>).</p> <li> <p> <code>network-interface.source-dest-check</code> - Whether the network interface performs source/destination checking. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the network interface to perform network address translation (NAT) in your VPC.</p> <li> <p> <code>network-interface.subnet-id</code> - The ID of the subnet for the network interface.</p> <li> <p> <code>network-interface.vpc-id</code> - The ID of the VPC for the network interface.</p> <li> <p> <code>placement-group-name</code> - The name of the placement group for the instance.</p> <li> <p> <code>platform</code> - The platform. Use <code>windows</code> if you have Windows instances; otherwise, leave blank.</p> <li> <p> <code>private-dns-name</code> - The private IPv4 DNS name of the instance.</p> <li> <p> <code>private-ip-address</code> - The private IPv4 address of the instance.</p> <li> <p> <code>product-code</code> - The product code associated with the AMI used to launch the instance.</p> <li> <p> <code>product-code.type</code> - The type of product code (<code>devpay</code> | <code>marketplace</code>).</p> <li> <p> <code>ramdisk-id</code> - The RAM disk ID.</p> <li> <p> <code>reason</code> - The reason for the current state of the instance (for example, shows "User Initiated [date]" when you stop or terminate the instance). Similar to the state-reason-code filter.</p> <li> <p> <code>requester-id</code> - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).</p> <li> <p> <code>reservation-id</code> - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get ten reservation IDs. </p> <li> <p> <code>root-device-name</code> - The name of the root device for the instance (for example, <code>/dev/sda1</code> or <code>/dev/xvd</code>).</p> <li> <p> <code>root-device-type</code> - The type of root device that the instance uses (<code>ebs</code> | <code>instance-store</code>).</p> <li> <p> <code>source-dest-check</code> - Indicates whether the instance performs source/destination checking. A value of
true means that checking is enabled, and false means checking is disabled. The value must be false for the instance to perform network address translation (NAT) in your VPC. The ID of the Spot instance request. The reason code for the state change. A message that describes the state change. The ID of the subnet for the instance. The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify tag:Purpose for the filter name and tag=X for the filter value.

- The ID of the VPC that the instance is running in.

- One or more filters.

- The affinity setting for an instance running on a Dedicated Host.

- The instance architecture.

- The address of the Elastic IP address (IPv4) bound to the network interface.

- The owner of the Elastic IP address (IPv4) associated with the network interface.

- The association ID returned when you allocated the Elastic IP address (IPv4) for your network interface.

- The association ID returned when the network interface was associated with an IPv4 address.

- A Boolean that indicates whether the EBS volume is deleted on instance termination.

- The device name for the EBS volume (for example, /dev/sdh or /dev/xvdh).

- The status for the EBS volume (the EBS volume is considered attached when the EBS volume is attached to a specified instance, it is considered detached when the EBS volume is detached from a specified instance).

- The volume ID of the EBS volume.

- The IDempotency token you provided when you launched the instance.

- The public DNS name of the instance.

- The ID of the security group for the instance. EC2-Classic only.
<li> <p> <code>group-name</code> - The name of the security group for the instance. EC2-Classic only.</p> </li> <li> <p> <code>host-id</code> - The ID of the Dedicated Host on which the instance is running, if applicable.</p> </li> <li> <p> <code>hypervisor</code> - The hypervisor type of the instance (code:ovm) | (code:xen).</p> </li> <li> <p> <code>iam-instance-profile.arn</code> - The instance profile associated with the instance. Specified as an ARN.</p> </li> <li> <p> <code>image-id</code> - The ID of the image used to launch the instance.</p> </li> <li> <p> <code>instance-id</code> - The ID of the instance.</p> </li> <li> <p> <code>instance-lifecycle</code> - Indicates whether this is a Spot Instance or a Scheduled Instance (code:spot) | (code:scheduled).</p> </li> <li> <p> <code>instance-state-code</code> - The state of the instance, as a 16-bit unsigned integer. The high byte is an opaque internal value and should be ignored. The low byte is set based on the state represented. The valid values are: 0 (pending), 16 (running), 32 (shutting-down), 48 (terminated), 64 (stopping), and 80 (stopped).</p> </li> <li> <p> <code>instance-state-name</code> - The state of the instance (code:pending | code:running | code:shutting-down).</p> </li> <li> <p> <code>instance-type</code> - The type of instance (for example, code:t2.micro).</p> </li> <li> <p> <code>instance-group-id</code> - The ID of the security group for the instance.</p> </li> <li> <p> <code>instance-group-name</code> - The name of the security group for the instance.</p> </li> <li> <p> <code>ip-address</code> - The public IPv4 address of the instance.</p> </li> <li> <p> <code>kernel-id</code> - The kernel ID.</p> </li> <li> <p> <code>key-name</code> - The name of the key pair used when the instance was launched.</p> </li> <li> <p> <code>launch-index</code> - When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on).</p> </li> <li> <p> <code>launch-time</code> - The time when the instance was launched.</p> </li> <li> <p> <code>monitoring-state</code> - Indicates whether detailed monitoring is enabled (code:enabled) or disabled (code:disabled).</p> </li> <li> <p> <code>network-interface.association.ip-owner-id</code> - The owner ID of the private IPv4 address associated with the network interface.</p> </li> <li> <p> <code>network-interface.attachment.attachment-id</code> - The ID of the interface attachment.</p> </li> <li> <p> <code>network-interface.attachment.attachment-index</code> - The device index to which the network interface is attached.</p> </li> <li> <p> <code>network-interface.attachment.delete-on-termination</code> - Specifies whether the attachment is deleted when an instance is terminated.</p> </li> <li> <p> <code>network-interface.attachment.status</code> - The status of the attachment (code:attaching | code:attached | code:detaching | code:detached).</p> </li> <li> <p> <code>network-interface.attach-time</code> - The time that the network interface was attached to an instance.</p> </li> <li> <p> <code>network-interface.description</code> - The description of the network interface.</p> </li> <li> <p> <code>network-interface.group-id</code> - The ID of a security group associated with the network interface.</p> </li> <li> <p> <code>network-interface.private-dns-name</code> - The private DNS name of the network interface.</p> </li> <li> <p> <code>network-interface.requester-id</code> - The requester ID for the network interface.</p> </li>
network interface.</p> <li> <p> <code>network-interface.requester-managed</code> - Indicates whether the network interface is being managed by AWS.</p> </li> <li> <p> <code>network-interface.status</code> - The status of the network interface (available, in-use).</p> </li> <li> <p> <code>network-interface.source-dest-check</code> - Whether the network interface performs source/destination checking. A value of true means checking is enabled, and false means checking is disabled. The value must be false for the network interface to perform network address translation (NAT) in your VPC.</p> </li> <li> <p> <code>network-interface.subnet-id</code> - The ID of the subnet for the network interface.</p> </li> <li> <p> <code>network-interface.vpc-id</code> - The ID of the VPC for the network interface.</p> </li> <li> <p> <code>owner-id</code> - The AWS account ID of the instance owner.</p> </li> <li> <p> <code>placement-group-name</code> - The name of the placement group for the instance.</p> </li> <li> <p> <code>platform</code> - The platform. Use windows if you have Windows instances; otherwise, leave blank.</p> </li> <li> <p> <code>private-dns-name</code> - The private IPv4 DNS name of the instance.</p> </li> <li> <p> <code>private-ip-address</code> - The private IPv4 address of the instance.</p> </li> <li> <p> <code>product-code</code> - The product code associated with the AMI used to launch the instance.</p> </li> <li> <p> <code>product-code.type</code> - The type of product code (devpay | marketplace | ramdisk-id | reason | source-dest-check | state-reason-code | state-reason-message | subnet-id | tag | tag-key | tag-value | tenancy | virtualization-type | vpc-id).</p> </li> <li> <p> <code>ramdisk-id</code> - The RAM disk ID.</p> </li> <li> <p> <code>reason</code> - The reason for the current state of the instance (for example, shows "User Initiated [date]" when you stop or terminate the instance). Similar to the state-reason-code filter.</p> </li> <li> <p> <code>reservation-id</code> - The ID of the instance's reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you'll get one reservation ID. If you launch ten instances using the same launch request, you'll also get one reservation ID.</p> </li> <li> <p> <code>root-device-name</code> - The name of the root device for the instance (for example, /dev/sda1 or /dev/xvda).</p> </li> <li> <p> <code>root-device-type</code> - The type of root device that the instance uses (ebs | instance-store).</p> </li> <li> <p> <code>source-dest-check</code> - Indicates whether the instance performs source/destination checking. A value of true means that checking is enabled, and false means checking is disabled. The value must be false for the instance to perform network address translation (NAT) in your VPC.</p> </li> <li> <p> <code>spot-instance-request-id</code> - The ID of the Spot instance request.</p> </li> <li> <p> <code>state-reason-code</code> - The reason code for the state change.</p> </li> <li> <p> <code>state-reason-message</code> - A message that describes the state change.</p> </li> <li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.</p> </li> <li> <p> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag:tag</code> filter.</p> </li> <li> <p> <code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.</p> </li> <li> <p> <code>tag:tenancy</code> - The tenancy of an instance.</p> </li> <li> <p> <code>virtualization-type</code> - The virtualization type of the instance (paravirtual | hvm).</p> </li> <li> <p> <code>vpc-id</code> - The ID of the VPC that the instance is running in.</p> </li> <li> <p> <code>NOTE:</code> This method appends the values to the existing list (if any). Use {@link #setFilters(java.util.Collection)} or {@link #withFilters(java.util.Collection)} if you want to override the existing
values.

```xml
<ul>
  <li><code>affinity</code> - The affinity setting for an instance running on a Dedicated Host (<code>default</code> | <code>host</code>)</li>
  <li><code>architecture</code> - The instance architecture (<code>i386</code> | <code>x86_64</code>)</li>
  <li><code>association.public-ip</code> - The address of the Elastic IP address (IPv4) bound to the network interface.</li>
  <li><code>association.ip-owner-id</code> - The owner of the Elastic IP address (IPv4) associated with the network interface.</li>
  <li><code>associationallocation-id</code> - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.</li>
  <li><code>association-id</code> - The association ID returned when the network interface was associated with an IPv4 address.</li>
  <li><code>availability-zone</code> - The Availability Zone of the instance.</li>
  <li><code>block-device-mapping</code> - The volume ID of the EBS volume mapped to the instance, for example, <code>2010-09-15T17:15:20.000Z</code>.</li>
  <li><code>block-device-mapping.delete-on-termination</code> - A Boolean that indicates whether the EBS volume is deleted on instance termination.</li>
  <li><code>block-device-mapping.device-name</code> - The device name for the EBS volume (for example, <code>/dev/sdh</code> or <code>/dev/xvdh</code>).</li>
  <li><code>block-device-mapping.status</code> - The status for the EBS volume (<code>attaching</code> | <code>attached</code> | <code>detaching</code> | <code>detached</code>).</li>
  <li><code>client-token</code> - The idempotency token you provided when you launched the instance.</li>
  <li><code>dns-name</code> - The public DNS name of the instance.</li>
  <li><code>group-id</code> - The ID of the security group for the instance. EC2-Classic only.</li>
  <li><code>group-name</code> - The name of the security group for the instance. EC2-Classic only.</li>
  <li><code>host-id</code> - The ID of the Dedicated Host on which the instance is running, if applicable.</li>
  <li><code>hypervisor</code> - The hypervisor type of the instance (<code>ovm</code> | <code>xen</code>).</li>
  <li><code>iam-instance-profile.arn</code> - The instance profile associated with the instance. Specified as an ARN.</li>
  <li><code>image-id</code> - The ID of the image used to launch the instance.</li>
  <li><code>instance-lifecycle</code> - Indicates whether this is a Spot Instance or a Scheduled Instance (<code>spot</code> | <code>scheduled</code>).</li>
  <li><code>instance-state-name</code> - The state of the instance (<code>pending</code> | <code>running</code> | <code>shutting-down</code> | <code>terminated</code> | <code>stopped</code>).</li>
  <li><code>instance-type</code> - The type of instance (for example, <code>t2.micro</code>).</li>
  <li><code>instance.state</code> - The state of the instance (<code>pending</code> | <code>running</code> | <code>shutting-down</code> | <code>terminated</code> | <code>stopped</code>).</li>
  <li><code>ip-address</code> - The public IPv4 address of the instance.</li>
  <li><code>kernel-id</code> - The kernel ID.</li>
  <li><code>key-name</code> - The name of the key pair used when the instance was launched.</li>
  <li><code>launch-index</code> - When launching multiple instances, this is the index for the instance in the launch group (for example, 0, 1, 2, and so on).</li>
  <li><code>launch-time</code> - The time when the instance was launched.</li>
  <li><code>network-interface.addresses.private-ip-address</code> - The private IPv4 address associated with the network interface.</li>
  <li><code>network-interface.addresses.primary</code> - Specifies whether the IPv4 address of the network interface is the primary IPv4 address.</li>
  <li><code>network-interface.addresses.association-public-ip</code> - The ID of the association of an Elastic IP address (IPv4) with a network interface.</li>
  <li><code>network-interface.addresses.association.ip-owner-id</code> - The owner ID of the private IPv4 address associated with the network interface.</li>
  <li><code>network-interface.attachment.attachment-id</code> - The ID of the interface attachment.</li>
</ul>
```
must be `<code>false</code>` for the instance to perform network address translation (NAT) in your VPC. </li>
<li>`affinity` - The affinity setting for an instance running on a Dedicated Host (<code>default</code> | <code>host</code>). </li>

  "variableSetterType" : "java.util.Collection<Reservation>"
### Simple DOC:

**Zero or more reservations.**

**NOTE:** This method appends the values to the existing list (if any). Use [@link #setReservations(java.util.Collection)] or [@link #withReservations(java.util.Collection)] if you want to override the existing values.

**returns:** Returns a reference to this object so that method calls can be chained together.

```java
public <T> T withReservations(T reservations)
```

**usage:**

```java
// Example usage
withReservations(reservations)
```

### Fluent DOC:

**The token to use to retrieve the next page of results. This value is null when there are no more results to return.**

```java
public String getNextToken()
```

**getter for:**

```java
public String getNextToken()
```

**returns:** The token to use to retrieve the next page of results. This value is null when there are no more results to return.

## Documented Code:

```java
public <T> T withReservations(T reservations)
```

```java
public String getNextToken()
```

</ul>
</p>
the attachment between the gateway and the VPC (tag:available). Present only if a VPC is attached.

- `<code>attachment.vpc-id</code>` - The ID of an attached VPC.
- `<code>internet-gateway-id</code>` - The ID of the Internet gateway.

- `<code>tag</code>`: `<i>key</i>`=`<i>value</i>` - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=\text{X}, specify `<code>tag:Purpose</code>` for the filter name and `<code>X</code>` for the filter value.

- `<code>tag-key</code>` - The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. If you use both the filter `\text{"tag-key=Purpose"}` and the filter `\text{"tag-value=X"}`, you get any resources assigned both the tag key `Purpose` (regardless of what the tag's value is), and the tag value `X` (regardless of what the tag's key is). If you want to list only resources where Purpose is \text{X}, see the `<code>tag</code>`: `<i>key</i>`=`<i>value</i>` filter.

- `<code>tag-value</code>` - The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter. If you use both the filter `\text{"tag-key=Purpose"}` and the filter `\text{"tag-value=X"}`, you get any resources assigned both the tag key `Purpose` (regardless of what the tag's value is), and the tag value `X` (regardless of what the tag's key is). If you want to list only resources where Purpose is \text{X}, see the `<code>tag</code>`: `<i>key</i>`=`<i>value</i>` filter.

@override
@return

## movingAddressStatuses

The status for each Elastic IP address.

### Returns

A reference to this object so that method calls can be chained together.

```java
@override
public movingAddressStatuses withmovingAddressStatuses(MovingAddressStatus... movingAddressStatuses) {
    this.movingAddressStatuses = movingAddressStatuses;
    return this;
}
```

### parameter

The status for each Elastic IP address.

- **variable**
  - **variableDeclarationType**: `com.amazonaws.internal.SdkInternalList<MovingAddressStatus>`
  - **variableName**: `movingAddressStatuses`
  - **variableType**: `java.util.List<MovingAddressStatus>`
  - **documentation**: `<p>The status for each Elastic IP address.</p>`
  - **simpleType**: `List<MovingAddressStatus>`
  - **variableSetterType**: `java.util.Collection<MovingAddressStatus>`

### fluentSetterMethod

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

```java
@override
public NextToken withNextToken(String nextToken) {
    this.nextToken = nextToken;
    return this;
}
```

### documentation

- `<p>The token to use to retrieve the next page of results. This value is <code>null</code> when there are no more results to return.</p>`
- `<code>null</code>`

## nextToken

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

```java
@override
public String getNextToken() {
    return this.nextToken;
}
```

### getterMethod

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

```java
@override
public String getNextToken() {
    return this.nextToken;
}
```

### http

- `<additionalMarshallingPath>`: `null`
- `<additionalUnmarshallingPath>`: `null`
- `<flattened>`: `false`
- `<greedy>`: `false`
- `<header>`: `false`
- `<isPayload>`: `false`
- `<isStreaming>`: `false`
- `<location>`: `null`
- `<marshallLocationName>`: `NextToken`
- `<queryString>`: `false`
- `<statusCode>`: `false`
- `<unmarshallLocationName>`: `nextToken`
- `<uri>`: `false`

### idempotencyToken

- `false`

```java
@override
public NextToken withNextToken(String nextToken) {
    this.nextToken = nextToken;
    return this;
}

If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter."}
specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value. 

- The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. 

- The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. 

- The ID of the VPC for the network ACL. 

- The start of the port range specified in the entry. 

- The end of the port range specified in the entry. 

- The protocol specified in the entry (\<code>tcp</code> | \<code>udp</code> | \<code>icmp</code> or a protocol number). 

- Allows or denies the matching traffic (\<code>allow</code> | \<code>deny</code>). 

- The number of an entry (in other words, rule) in the ACL's set of entries. 

- The ID of the network ACL for the VPC. 

- Indicates whether the ACL is the default network ACL for the VPC. 

- The IPv4 CIDR range specified in the entry. 

- Indicates whether the entry applies to egress traffic. 

- The ICMP type specified in the entry, if any. 

- The IPv6 CIDR range specified in the entry. 

- The start of the port range specified in the entry. 

- The end of the port range specified in the entry. 

- The protocol specified in the entry (\<code>tcp</code> | \<code>udp</code> | \<code>icmp</code> or a protocol number). 

- Allows or denies the matching traffic (\<code>allow</code> | \<code>deny</code>). 

- The number of an entry (in other words, rule) in the ACL's set of entries. 

- The ID of the network ACL. 

- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value. 

- The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. 

- The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. 

- The ID of the VPC for the network ACL. 

- Indicates whether the ACL is the default network ACL for the VPC. 

- The IPv4 CIDR range specified in the entry. 

- Indicates whether the entry applies to egress traffic. 

- The ICMP type specified in the entry, if any. 

- The IPv6 CIDR range specified in the entry. 

- The start of the port range specified in the entry. 

- The end of the port range specified in the entry. 

- The protocol specified in the entry (\<code>tcp</code> | \<code>udp</code> | \<code>icmp</code> or a protocol number). 

- Allows or denies the matching traffic (\<code>allow</code> | \<code>deny</code>). 

- The number of an entry (in other words, rule) in the ACL's set of entries. 

- The ID of the network ACL. 

- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value. 

- The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. 

- The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. 

- The ID of the VPC for the network ACL. 

- Indicates whether the ACL is the default network ACL for the VPC. 

- The IPv4 CIDR range specified in the entry. 

- Indicates whether the entry applies to egress traffic. 

- The ICMP type specified in the entry, if any. 

- The IPv6 CIDR range specified in the entry. 

- The start of the port range specified in the entry. 

- The end of the port range specified in the entry. 

- The protocol specified in the entry (\<code>tcp</code> | \<code>udp</code> | \<code>icmp</code> or a protocol number). 

- Allows or denies the matching traffic (\<code>allow</code> | \<code>deny</code>). 

- The number of an entry (in other words, rule) in the ACL's set of entries. 

- The ID of the network ACL.
<code>association.association-id</code> - The ID of the subnet involved in the association.

<code>association.subnet-id</code> - Indicates whether the ACL is a default network ACL for the VPC.

<code>entry.cidr</code> - The IPv4 CIDR range specified in the entry.

<code>entry.egress</code> - Indicates whether the entry applies to egress traffic.

<code>entry.icmp.code</code> - The ICMP code specified in the entry, if any.

<code>entry.icmp.type</code> - The ICMP type specified in the entry, if any.

<code>association.association-id</code> - The ID of the association ID for the ACL.

<code>association.subnet-id</code> - The ID of the subnet involved in the association.

<code>default</code> - Indicates whether the ACL is the default network ACL for the VPC.

<code>entry.port-range.from</code> - The start of the port range specified in the entry.

<code>entry.port-range.to</code> - The end of the port range specified in the entry.

<code>entry.protocol</code> - The protocol specified in the entry.

<code>entry.ipv6-cidr</code> - The IPv6 CIDR range specified in the entry.

<code>entry.port-range.from</code> - The start of the port range specified in the entry.

<code>entry.port-range.to</code> - The end of the port range specified in the entry.

<code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.

<code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the

<code>tag:values</code>:<i>key</i>=<i>value</i> filter.

<code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.

<code>vpc-id</code> - The ID of the VPC for the network ACL.

<code>network-acl-id</code> - The ID of the network ACL.

<code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.

<code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the

<code>tag:values</code>:<i>key</i>=<i>value</i> filter.
<code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter <code>\"tag-key=Purpose\"</code> and the filter <code>\"tag-value=X\"</code>, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.</p> </li> <li> <p> <code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.</p> </li> </ul>

NOTE: This method appends the values to the existing list (if any). Use {{code}@link #setFilters(java.util.Collection)} or {{code}@link #withFilters(java.util.Collection)} if you want to override the existing values.{{/code}}

- **vpc-id** - The ID of the VPC for the network ACL.

- **filters** - One or more filters.

- **association.association-id** - The ID of an association ID for the ACL.

- **association.network-acl-id** - The ID of the network ACL involved in the association.

- **association.subnet-id** - The ID of the subnet involved in the association.

- **entry.cidr** - The IPv4 CIDR range specified in the entry.

- **entry.egress** - Indicates whether the entry applies to egress traffic.

- **entry.icmp.code** - The ICMP code specified in the entry, if any.

- **entry.icmp.type** - The ICMP type specified in the entry, if any.

- **entry.ipv6-cidr** - The IPv6 CIDR range specified in the entry.

- **entry.port-range.from** - The start of the port range specified in the entry.

- **entry.port-range.to** - The end of the port range specified in the entry.

- **entry.rule-action** - Allows or denies the matching traffic.

- **entry.rule-number** - The number of an entry (in other words, rule) in the ACL's set of entries.

- **network-acl-id** - The ID of the network ACL.

- **tag:**<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.

- **tag-key** - The key of a tag assigned to the resource. This filter is independent of the <code>tag:value</code> filter. For example, if you use both the filter "\`tag-key=Purpose\`" and the filter "\`tag-value=X\`, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the

- **tag-value** - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. For example, if you use both the filter "\`tag-key=Purpose\`" and the filter "\`tag-value=X\`, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the

- **vpc-id** - The ID of the VPC for the network ACL.
number</code> - The number of an entry (in other words, rule) in the ACL's set of entries. 

- <code>network-acl-id</code> - The ID of the network ACL.

- <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.

- <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "$tag-key=Purpose" and the filter "$tag-value=X"”， you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. For example, if you use both the filter "$tag-key=Purpose" and the filter "$tag-value=X"， you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the

- <code>vpc-id</code> - The ID of the VPC for the network ACL.

**The security groups associated with the network interface.**

*NOTE:* This method appends the values to the existing list (if any). Use `{ @link #setGroups(java.util.Collection) }` or `{ @link #withGroups(java.util.Collection) }` if you want to override the existing values.

```java
@Param groups The security groups associated with the network interface.
@return Returns a reference to this object so that method calls can be chained together.
```

```java
private List<GroupIdentifier> groups = null;
```

```java
@Element
public List<GroupIdentifier> getGroups() {
    return groups;
}
```

```java
@Element
public void setGroups(List<GroupIdentifier> groups) {
    this.groups = groups;
}
```

```java
@Element
public void withGroups(List<GroupIdentifier> groups) {
    this.groups = groups;
}
```

**The attachment (if any) of the network interface.**

```java
@Param attachment The attachment (if any) of the network interface.
@return Returns a reference to this object so that method calls can be chained together.
```

```java
private NetworkInterfaceAttachment attachment = null;
```

```java
@Element
public NetworkInterfaceAttachment getAttachment() {
    return attachment;
}
```

```java
@Element
public void setAttachment(NetworkInterfaceAttachment attachment) {
    this.attachment = attachment;
}
```

```java
@Element
public void withAttachment(NetworkInterfaceAttachment attachment) {
    this.attachment = attachment;
}

network interface was associated with an IPv4 address. </li> <li> <p> <code>association.allocation-id</code> - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface. </li> <li> <p> <code>association.ip-owner-id</code> - The owner of the Elastic IP address (IPv4) associated with the network interface. </li> <li> <p> <code>association.public-ip</code> - The address of the Elastic IP address (IPv4) bound to the network interface. </li> <li> <p> <code>association.public-dns-name</code> - The public DNS name for the network interface (IPv4). </li> <li> <p> <code>attachment.attachment-id</code> - The ID of the interface attachment. </li> <li> <p> <code>attachment.assign.time</code> - The time that the network interface was attached to an instance. </li> <li> <p> <code>attachment.delete-on-termination</code> - Indicates whether the attachment is deleted when an instance is terminated. </li> <li> <p> <code>attachment.device-index</code> - The device index to which the network interface is attached. </li> <li> <p> <code>attachment.instance-id</code> - The ID of the instance to which the network interface is attached. </li> <li> <p> <code>attachment.instance-owner-id</code> - The owner ID of the instance to which the network interface is attached. </li> <li> <p> <code>attachment.nat-gateway-id</code> - The ID of the NAT gateway to which the network interface is attached. </li> <li> <p> <code>attachment.status</code> - The status of the attachment (attaching | attached | detaching | detached). </li> <li> <p> <code>addresses.private-ip-address</code> - The private IPv4 addresses associated with the network interface. </li> <li> <p> <code>addresses.primary</code> - Whether the private IPv4 address is the primary IP address associated with the network interface. </li> <li> <p> <code>addresses.primary</code> - Whether the private IPv4 address is the primary IP address associated with the network interface. </li> <li> <p> <code>availability-zone</code> - The Availability Zone of the network interface. </li> <li> <p> <code>description</code> - The description of the network interface. </li> <li> <p> <code>group-id</code> - The ID of a security group associated with the network interface. </li> <li> <p> <code>group-name</code> - The name of a security group associated with the network interface. </li> <li> <p> <code>ipv6-addresses.ipv6-address</code> - An IPv6 address associated with the network interface. </li> <li> <p> <code>mac-address</code> - The MAC address of the network interface. </li> <li> <p> <code>network-interface-id</code> - The ID of the network interface. </li> <li> <p> <code>requester-id</code> - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on). </li> <li> <p> <code>requester-managed</code> - Indicates whether the network interface is being managed by an AWS service (for example, AWS Management Console, Auto Scaling, and so on). </li> <li> <p> <code>source-desk-check</code> - Indicates whether the network interface performs source/destination checking. A value of true means checking is enabled, and false means checking is disabled. The value must be false for the network interface to perform network address translation (NAT) in your VPC. </li> <li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value. </li> <li> <p> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get all resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag:Purpose</code> filter. </li> <li> <p> <code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. </li> <li> <p> <code>vpc-id</code> - The ID of the VPC for the network interface. </li> <li> <p> <code>vpc-parameters.filters</code> - Filters for the VPC parameters. You can specify one or more filters. Each filter is a key-value pair, and you can set the value to multiple values (separated by a comma). For example: <code>vpc-parameters.Filters[0].Name=AvailabilityZone,vpc-parameters.Filters[0].Values=['us-east-1a', 'us-east-1b']</code>.
<code>addresses.association.public-ip</code> - The association ID returned when the network interface was associated with the Elastic IP address (IPv4).<p> <li> <p> <code>associations.association-id</code> - The association ID returned when the network interface was associated with an IPv4 address.</p> </li> <li> <p> <code>association.allocation-id</code> - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.</p> </li> <li> <p> <code>association.association-id</code> - The association ID returned when the network interface was associated with the network interface.</p> </li> <li> <p> <code>association.association-id</code> - The association ID returned when the network interface was associated with an IPv4 address.</p> </li> <li> <p> <code>association.ip-owner-id</code> - The owner ID of the Elastic IP address (IPv4) associated with the network interface.</p> </li> <li> <p> <code>association.public-ip</code> - The address of the Elastic IP address (IPv4) bound to the network interface.</p> </li> <li> <p> <code>association.public-dns-name</code> - The public DNS name for the network interface (IPv4).</p> </li> <li> <p> <code>attachment.attachment-id</code> - The ID of the attachment.</p> </li> <li> <p> <code>attachment.attach.time</code> - The time that the network interface was attached to an instance.</p> </li> <li> <p> <code>attachment.delete-on-termination</code> - Indicates whether the attachment is deleted when an instance is terminated.</p> </li> <li> <p> <code>attachment.device-index</code> - The device index to which the network interface is attached.</p> </li> <li> <p> <code>attachment.instance-id</code> - The ID of the instance to which the network interface is attached.</p> </li> <li> <p> <code>attachment.instance-owner-id</code> - The owner ID of the instance to which the network interface is attached.</p> </li> <li> <p> <code>attachment.attachment-id</code> - The ID of the NAT gateway to which the network interface is attached.</p> </li> <li> <p> <code>attachment.nat-gateway-id</code> - The ID of the NAT gateway to which the network interface is attached.</p> </li> <li> <p> <code>attachment.status</code> - The status of the attachment (attaching | attached | detaching | detached).</p> </li> <li> <p> <code>availability-zone</code> - The Availability Zone of the network interface.</p> </li> <li> <p> <code>description</code> - The description of the network interface.</p> </li> <li> <p> <code>group-id</code> - The ID of a security group associated with the network interface.</p> </li> <li> <p> <code>group-name</code> - The name of a security group associated with the network interface.</p> </li> <li> <p> <code>ipv6-addresses.ipv6-address</code> - An IPv6 address associated with the network interface.</p> </li> <li> <p> <code>mac-address</code> - The MAC address of the network interface.</p> </li> <li> <p> <code>network-interface-id</code> - The ID of the network interface.</p> </li> <li> <p> <code>owner-id</code> - The AWS account ID of the network interface owner.</p> </li> <li> <p> <code>private-ip-address</code> - The private IPv4 address or addresses of the network interface.</p> </li> <li> <p> <code>private-dns-name</code> - The private DNS name of the network interface (IPv4).</p> </li> <li> <p> <code>requester-id</code> - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).</p> </li> <li> <p> <code>requester-managed</code> - Indicates whether the network interface is being managed by an AWS service (for example, AWS Management Console, Auto Scaling, and so on).</p> </li> <li> <p> <code>source-des-key-check</code> - Indicates whether the network interface performs source/destination checking. A value of true means checking is enabled, and false means checking is disabled. The value must be false for the network interface to perform network address translation (NAT) in your VPC.</p> </li> <li> <p> <code>status</code> - The status of the network interface. If the network interface is not attached to an instance, the status is available; if a network interface is attached to an instance the status is in-use.</p> </li> <li> <p> <code>subnet-id</code> - The ID of the subnet for the network interface.</p> </li> <li> <p> <code>tag</code>:<code>key</code>=<code>value</code> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.</p> </li> <li> <p> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=value", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<code>key</code>=<code>value</code> filter.</p> </li> <li> <p> <code>vpc-id</code> - The ID of the VPC for the network interface.</p> </li>
value</code> filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the 
<code>tag</code>:<i>tag-key</i>=<i>tag-value</i> filter.\</p>\</li>\</ul>

- The value of a tag assigned to the resource. This filter is independent of the 
<code>tag-key</code>:<i>tag-value</i> filter.\</p>\</li>\</ul>

- The ID of the VPC for the network interface.\</p>\</li>\</ul>

The association ID returned when the network interface was 
associated with the Elastic IP address (IPv4).\</p>\</li>\</ul>

- The owner ID of the addresses associated with the network interface.\</p>\</li>\</ul>

- The association ID returned when the network interface was associated 
with an IPv4 address.\</p>\</li>\</ul>

- The allocation ID returned when you allocated the Elastic IP address 
(IPv4) for your network interface.\</p>\</li>\</ul>

- The owner of the Elastic IP address (IPv4) associated with the network interface.\</p>\</li>\</ul>

- The address of the Elastic IP address (IPv4) bound to the network 
interface.\</p>\</li>\</ul>

- The public DNS name for the network interface (IPv4).\</p>\</li>\</ul>

- The ID of the network interface.\</p>\</li>\</ul>

- The ID of the instance to which the network interface is attached.\</p>\</li>\</ul>

- The ID of the subnet for the network interface.\</p>\</li>\</ul>

- The Amazon account ID of the network interface owner.\</p>\</li>\</ul>

- The private IPv4 address or addresses of the network interface.\</p>\</li>\</ul>

- The private DNS name of the network interface (IPv4).\</p>\</li>\</ul>

- The ID of a security group associated with the network interface.\</p>\</li>\</ul>

- The owner ID of the instance to which the network interface is attached.\</p>\</li>\</ul>

- The ID of the security group associated with the network interface.\</p>\</li>\</ul>

- The ID of the availability zone for the network interface.\</p>\</li>\</ul>

- The time that the network interface was attached to an instance.\</p>\</li>\</ul>

- Indicates whether the attachment is deleted when an instance is terminated.\</p>\</li>\</ul>

- The index to which the network interface is attached.\</p>\</li>\</ul>

- The status of an attached instance.\</p>\</li>\</ul>

- The ID of the network interface attachment.\</p>\</li>\</ul>

- The status of the attachment.\</p>\</li>\</ul>

- The ID of the network address space.\</p>\</li>\</ul>

- The ID of the network interface attached to the instance.\</p>\</li>\</ul>

- The ID of the availability zone for the network interface.\</p>\</li>\</ul>

- Indicates whether the network interface is being managed by an AWS service 
(for example, AWS Management Console, Auto Scaling, and so on).\</p>\</li>\</ul>

- Indicates whether the network interface performs source/destination checking. A value of 
<code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value 
must be <code>true</code> for the network interface to perform network address translation (NAT) in your VPC. 
\</p>\</li>\</ul>

- The status of the network interface. If the network interface is not 
atached to an instance, the status is <code>available</code>; if a network interface is attached to an instance the 
status is <code>in-use</code>.\</p>\</li>\</ul>

- The ID of the subnet for the network interface.\</p>\</li>\</ul>

- The key/value combination of a tag 

assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify `<code>tag:Purpose</code>` for the filter name and `<code>X</code>` for the filter value.

- The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `\tag-key=Purpose` and the filter `\tag-value=X`, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the `<code>tag</code>:<i>key</i>=<i>value</i>` filter.

- The ID of the VPC for the network interface.

  "documentation": "<p>One or more filters.</p> - The private IPv4 addresses associated with the network interface. - Whether the private IPv4 address is the primary IP address associated with the network interface. - The association ID returned when the network interface was associated with the Elastic IP address (IPv4)."
```
addresses.association.owner-id - The owner ID of the addresses associated with the network interface.

addresses.association.association-id - The association ID returned when the network interface was associated with an IPv4 address.

addresses.associationallocation-id - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.

addresses.association.public-ip - The address of the Elastic IP address (IPv4) bound to the network interface.

addresses.association.public-dns-name - The public DNS name for the network interface (IPv4).

association.association-id - The association ID returned when the network interface was associated with an IPv4 address.

association.allocation-id - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.

association.ip-owner-id - The owner of the Elastic IP address (IPv4) associated with the network interface.

association.public-ip - The address of the Elastic IP address (IPv4) bound to the network interface.

association.public-dns-name - The public DNS name for the network interface (IPv4).

.attachment.attachment-id - The ID of the interface attachment.

.attachment.attach.time - The time that the network interface was attached to an instance.

.attachment.delete-on-termination - Indicates whether the attachment is deleted when an instance is terminated.

.attachment.device-index - The device index to which the network interface is attached.

.attachment.instance-id - The ID of the instance to which the network interface is attached.

.attachment.instance-owner-id - The owner ID of the instance to which the network interface is attached.

.attachment.nat-gateway-id - The ID of the NAT gateway to which the network interface is attached.

.attachment.status - The status of the attachment (attaching | attached | detaching | detached).

.availability-zone - The Availability Zone of the network interface.

.description - The description of the network interface.

.group-id - The ID of a security group associated with the network interface.

.group-name - The name of a security group associated with the network interface.

.ipv6-addresses.ipv6-address - An IPv6 address associated with the network interface.

.mac-address - The MAC address of the network interface.

.network-interface-id - The ID of the network interface.

.owner-id - The AWS account ID of the network interface owner.

.private-ip-address - The private IPv4 address or addresses of the network interface.

.private-dns-name - The private DNS name of the network interface (IPv4).

.requester-id - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).

.requester-managed - Indicates whether the network interface is being managed by an AWS service (for example, AWS Management Console, Auto Scaling, and so on).

.source-desk-check - Indicates whether the network interface performs source/destination checking. A value of true means checking is enabled, and false means checking is disabled. The value must be false for the network interface to perform network address translation (NAT) in your VPC.

.status - The status of the network interface. If the network interface is not attached to an instance, the status is available; if a network interface is attached to an instance the status is in-use.

.subnet-id - The ID of the subnet for the network interface.

.tags.key=value - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.

.tag-key - The key of a tag assigned to the resource. This filter is independent of the filter value (tag-value). For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the filter.<code>tag:tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the filter.

.tag-key - The key of a tag assigned to the resource. This filter is independent of the filter value (tag-value). For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the filter.<code>tag:tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the filter.

.vpc-id - The ID of the VPC for the network interface.

The value must be <code>false</code> for the network interface to perform network address translation (NAT) in your VPC.</li>
<li><code>status</code> - The status
of the network interface. If the network interface is not attached to an instance, the status is available. If the network interface is attached to an instance, the status is in-use.

- **subnet-id**: The ID of the subnet for the network interface.

- **tag**: The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify tag:Purpose=X for the filter name and tag-value=X for the filter value. If you use both the filter tag:Purpose and the filter tag-value=X, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the tag:Purpose=X filter.

- **tag-key**: The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter tag-key=Purpose and the filter tag-value=X, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is).

- **tag-value**: The value of a tag assigned to the resource. This filter is independent of the tag-key filter. For example, if you use both the filter tag-key=Purpose and the filter tag-value=X, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is).

- **vpc-id**: The ID of the VPC for the network interface.

- **attachment**: The ID of the interface attachment.

- **attachment:attachment-id**: The ID of the interface attachment.

- **attachment:attach-time**: The time that the network interface was attached to an instance.

- **attachment:delete-on-termination**: Indicates whether the attachment is deleted when an instance is terminated.

- **attachment:device-index**: The device index to which the network interface is attached.

- **attachment:instance-id**: The ID of the instance to which the network interface is attached.

- **attachment:instance-owner-id**: The owner ID of the instance to which the network interface is attached.

- **attachment:nat-gateway-id**: The ID of the NAT gateway to which the network interface is attached.

- **attachment:status**: The status of the attachment (attaching | attached | detaching | detached).

- **availability-zone**: The Availability Zone of the network interface.

- **description**: The description of the network interface.

- **group-id**: The ID of a security group associated with the network interface.

- **group-name**: The name of a security group associated with the network interface.

- **ipv6-addresses**: An IPv6 address associated with the network interface.

- **mac-address**: The MAC address of the network interface.

- **network-interface-id**: The ID of the network interface.

- **owner-id**: The AWS account ID of the network interface owner.

- **private-address**: The private IPv4 address or addresses of the network interface.

- **private-dns-name**: The private DNS name of the network interface (IPv4).

- **requester-id**: The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on). 

- **requester-managed**: Indicates whether the
network interface is being managed by an AWS service (for example, AWS Management Console, Auto Scaling, and so on).<p> </p> <li> <p> <code>source-desk-check</code> - Indicates whether the network interface performs source/destination checking. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>true</code> for the network interface to perform network address translation (NAT) in your VPC.</p> </li> <li> <p> <code>subnet-id</code> - The ID of the subnet for the network interface.</p> </li> <li> <p> <code>tag:*value</code> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.</p> </li> <li> <p> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). <li><code>attachment.delete-on-termination</code> -
</li>
</ul>*/"
Indicates whether the attachment is deleted when an instance is terminated. 

- <code>attachment.device-index</code> - The device index to which the network interface is attached.
- <code>attachment.instance-id</code> - The ID of the instance to which the network interface is attached.
- <code>attachment.instance-owner-id</code> - The owner ID of the instance to which the network interface is attached.
- <code>attachment.status</code> - The status of the attachment (<code>attaching</code> | <code>attached</code> | <code>detaching</code> | <code>detached</code>). 
- <code>availability-zone</code> - The Availability Zone of the network interface. 
- <code>description</code> - The description of the network interface.
- <code>group-id</code> - The ID of a security group associated with the network interface.
- <code>group-name</code> - The name of a security group associated with the network interface.
- <code>ipv6-addresses.ipv6-address</code> - An IPv6 address associated with the network interface.
- <code>mac-address</code> - The MAC address of the network interface.
- <code>network-interface-id</code> - The ID of the network interface.
- <code>owner-id</code> - The AWS account ID of the network interface owner.
- <code>private-ip-address</code> - The private IPv4 address or addresses of the network interface.
- <code>private-dns-name</code> - The private DNS name of the network interface (IPv4).
- <code>requester-id</code> - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).
- <code>requester-managed</code> - Indicates whether the network interface is being managed by an AWS service (for example, AWS Management Console, Auto Scaling, and so on).
- <code>source-desk-check</code> - Indicates whether the network interface performs source/destination checking. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the network interface to perform network address translation (NAT) in your VPC.
- <code>status</code> - The status of the network interface. If the network interface is not attached to an instance, the status is <code>available</code>; if a network interface is attached to an instance the status is <code>in-use</code>.
- <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag <code>Purpose=X</code>, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value. If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.
- <code>subnet-id</code> - The ID of the subnet for the network interface.
- <code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is).
- <code>vpc-id</code> - The ID of the VPC for the network interface.
- <code>association.public-ip</code> - The association ID returned when the network interface was associated with the Elastic IP address (IPv4).

The owner ID of the instance to which the network interface is attached.</p> </li> <li> <p> <code>attachment.nat-gateway-id</code> - The ID of the NAT gateway to which the network interface is attached.</p> </li>
Open Source Used In CISCO IDENTITY SERVICE 12.5(1)SU2 3478
value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>="<i>value</i>" filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag’s value is), and the tag value X (regardless of what the tag’s key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>="<i>value</i>" filter. This filter is independent of the <code>tag-key</code> and <code>tag-value</code> filter. This filter is independent of the <code>tag-key</code> and <code>tag-value</code> filter. If you want to override the existing values.</p> 

### Filters

- **<code>addresses.private-ip-address</code>**
  - The private IPv4 addresses associated with the network interface.

- **<code>addresses.primary</code>**
  - Whether the private IPv4 address is the primary IP address associated with the network interface.

- **<code>addresses.association.public-ip</code>**
  - The association ID returned when the network interface was associated with the Elastic IP Address (IPv4).

- **<code>addresses.association.owner-id</code>**
  - The owner ID of the addresses associated with the network interface.

- **<code>addresses.association-public-id</code>**
  - The association ID returned when the network interface was associated with an IPv4 address.

- **<code>association.allocation-id</code>**
  - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.

- **<code>association.ip-owner-id</code>**
  - The owner of the Elastic IP address (IPv4) associated with the network interface.

- **<code>association.public-ip</code>**
  - The address of the Elastic IP address (IPv4) bound to the network interface.

- **<code>association.public-dns-name</code>**
  - The public DNS name for the network interface (IPv4).

- **<code>attachment.attachment-id</code>**
  - The ID of the interface attachment.

- **<code>attachment.attach.time</code>**
  - The time that the network interface was attached to an instance.

- **<code>attachment.delete-on-termination</code>**
  - Indicates whether the attachment is deleted when an instance is terminated.

- **<code>attachment.device-index</code>**
  - The device index to which the network interface is attached.

- **<code>attachment.instance-id</code>**
  - The ID of the instance to which the network interface is attached.

- **<code>attachment.nat-gateway-id</code>**
  - The ID of the NAT gateway to which the network interface is attached.

- **<code>availability-zone</code>**
  - The Availability Zone of the network interface.

- **<code>description</code>**
  - The description of the network interface.

- **<code>group-id</code>**
  - The ID of a security group associated with the network interface.

- **<code>group-name</code>**
  - The name of a security group associated with the network interface.

- **<code>ipv6-addresses.ipv6-address</code>**
  - An IPv6 address associated with the network interface.

- **<code>mac-address</code>**
  - The MAC address of the network interface.

- **<code>network-interface-id</code>**
  - The ID of the network interface.

- **<code>owner-id</code>**
  - The AWS account ID of the network interface owner.

- **<code>private-ip-address</code>**
  - The private IPv4 address or addresses of the network interface.

- **<code>private-dns-name</code>**
  - The private DNS name of the network interface (IPv4).

- **<code>requester-id</code>**
  - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).

- **<code>requester-managed</code>**
  - Indicates whether the network interface is being managed by an AWS service (for example, AWS Management Console, Auto Scaling, and so on).

- **<code>source-desck-check</code>**
  - Indicates whether the network interface performs source/destination checking. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the network interface to perform network address translation (NAT) in your VPC.

- **<code>status</code>**
  - The status of the network interface. If the network interface is not attached to an instance, the status is <code>available</code>; if a network interface is attached to an instance the
status is `<code>in-use</code>`.

- `<code>addresses.private-ip-address</code>` - The private IPv4 addresses associated with the network interface.
- `<code>addresses.association.public-ip</code>` - The association ID returned when the network interface was associated with the Elastic IP address (IPv4).
- `<code>addresses.association.owner-id</code>` - The owner ID of the addresses associated with the network interface.
- `<code>addresses.association-association-id</code>` - The association ID returned when the network interface was associated with an IPv4 address.
- `<code>addresses.association.allocation-id</code>` - The allocation ID returned when you allocated the Elastic IP address (IPv4) for your network interface.
- `<code>addresses.association.ip-owner-id</code>` - The owner of the Elastic IP address (IPv4) associated with the network interface.
- `<code>addresses.association.public-ip</code>` - The address of the Elastic IP address (IPv4) bound to the network interface.
- `<code>addresses.association.public-dns-name</code>` - The public DNS name for the network interface (IPv4).
- `<code>attachment.attachment-id</code>` - The ID of the interface attachment.
- `<code>attachment.attach.time</code>` - The time that the network interface was attached to an instance.
- `<code>attachment.delete-on-termination</code>` - Indicates whether the attachment is deleted when an instance is terminated.
- `<code>attachment.device-index</code>` - The device index to which the network interface is attached.
- `<code>attachment.instance-id</code>` - The ID of the instance to which the network interface is attached.
- `<code>attachment.instance-owner-id</code>` - The owner ID of the instance to which the network interface is attached.
- `<code>attachment.nat-gateway-id</code>` - The ID of the NAT gateway to which the network interface is attached.
- `<code>attachment.status</code>` - The status of the attachment.
- `<code>attachment.description</code>` - The description of the network interface.
- `<code>addresses.ipv6-addresses.ipv6-address</code>` - An IPv6 address associated with the network interface.
id</code> - The ID of the entity that launched the instance on your behalf (for example, AWS Management Console, Auto Scaling, and so on).<p> </li> <li> <p> <code>requester-managed</code> - Indicates whether the network interface is being managed by an AWS service (for example, AWS Management Console, Auto Scaling, and so on).<p> </li> <li> <p> <code>source-desk-check</code> - Indicates whether the network interface performs source/destination checking. A value of <code>true</code> means checking is enabled, and <code>false</code> means checking is disabled. The value must be <code>false</code> for the network interface to perform network address translation (NAT) in your VPC. <p> </li> <li> <p> <code>status</code> - The status of the network interface. If the network interface is not attached to an instance, the status is <code>available</code>; if a network interface is attached to an instance the status is <code>in-use</code>.<p> </li> <li> <p> <code>subnet-id</code> - The ID of the subnet for the network interface.<p> </li> <li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.<p> </li> <li> <p> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag’s value is), and the tag value X (regardless of what the tag’s key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.<p> </li> <li> <p> <code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.<p> </li> <li> <p> <code>vpc-id</code> - The ID of the VPC for the network interface.<p> </li> </ul>

For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>Y</code> for the filter value. <p><code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter
"tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.

<code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.

<code>usage-price</code> - The usage price of the Reserved Instance, per hour (for example, 0.84).

<code>availability-zone</code> - The Availability Zone where the Reserved Instance can be used.

<code>duration</code> - The duration of the Reserved Instance (one year or three years), in seconds (for example, 31536000).

<code>end</code> - The time when the Reserved Instance expires (for example, 2015-08-07T11:54:42.000Z).

<code>fixed-price</code> - The purchase price of the Reserved Instance (for example, 9800.0).

<code>instance-type</code> - The instance type that is covered by the reservation.

<code>scope</code> - The scope of the Reserved Instance (Region or Availability Zone).

<code>product-description</code> - The Reserved Instance product platform description. Instances that include <code>(Amazon VPC)</code> in the product platform description will only be displayed to EC2-Classic account holders and are for use with Amazon VPC (Linux/UNIX, Linux/UNIX (Amazon VPC), SUSE Linux, SUSE Linux (Amazon VPC), Red Hat Enterprise Linux, Red Hat Enterprise Linux (Amazon VPC), Windows (Amazon VPC), Windows with SQL Server Standard, Windows with SQL Server Web, Windows with SQL Server Enterprise, Windows with SQL Server Enterprise (Amazon VPC)).

<code>start</code> - The time at which the Reserved Instance purchase request was placed (for example, 2014-08-07T11:54:42.000Z).

<code>state</code> - The state of the Reserved Instance (payment-pending, active, payment-failed, retired).

<code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value.

<code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter.

<code>tag-value</code> - The value of a tag assigned to the resource.

<code>usage-price</code> - The usage price of the Reserved Instance, per hour (for example, 0.84).

| <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.</p>  

| <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "<code>tag-keys=Purpose</code>" and the filter "<code>tag-value=X</code>", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the
tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the `<code>tag-value</code>` filter. 

- The usage price of the Reserved Instance, per hour (for example, 0.84).

**NOTE:** This method appends the values to the existing list (if any). Use `[@link #setFilters(java.util.Collection)]` or `[@link #withFilters(java.util.Collection)]` if you want to override the existing values.

```java
@vararg setter: `setFilters`
```
<code>duration</code> - The duration of the Reserved Instance (one year or three years), in seconds. (31536000 | 94608000).

<code>end</code> - The time when the Reserved Instance expires (for example, 2015-08-07T11:54:42.000Z).

<code>fixed-price</code> - The purchase price of the Reserved Instance (for example, 9800.0).

<code>instance-type</code> - The instance type that is covered by the reservation.

<code>scope</code> - The scope of the Reserved Instance (<code>Region</code> or <code>Availability Zone</code>).

<code>reserved-instances-id</code> - The ID of the Reserved Instance.

<code>start</code> - The time at which the Reserved Instance purchase request was placed (for example, 2014-08-07T11:54:42.000Z).

<code>state</code> - The state of the Reserved Instance (quote pending).

<code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:tagPurpose</code> for the filter name and <code>X</code> for the filter value.

<code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag’s value is), and the tag value X (regardless of what the tag’s key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.

<code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag’s value is), and the tag value X (regardless of what the tag’s key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.

<code>usage-price</code> - The usage price of the Reserved Instance, per hour (for example, 0.84).

@return Returns a reference to this object so that method calls can be chained together.

- The Availability Zone where the Reserved Instance can be used.</li>
- The duration of the Reserved Instance (one year or three years), in seconds (</code>31536000</code>) - The purchase price of the Reserved Instance (for example, 9800.0).<li>
- The instance type that is covered by the reservation.</li>
- The scope of the Reserved Instance
<code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag’s value is), and the tag value X (regardless of what the tag’s key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag’s value is), and the tag value X (regardless of what the tag’s key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.  

### Examples

- **Availability Zone**
  - The Availability Zone where the Reserved Instance can be used.  
- **Duration**
  - The duration of the Reserved Instance (one year or three years), in seconds (
    - <code>1</code> for one year, \( \times 1000 \) for three years)  
- **End**
  - The time when the Reserved Instance expires.  
- **Fixed Price**
  - The purchase price of the Reserved Instance.  
- **Instance Type**
  - The instance type that is covered by the reservation.  
- **Scope**
  - The scope of the Reserved Instance.  
- **Product Description**
  - The Reserved Instance product platform description.  
- **Reserved Instances ID**
  - The ID of the Reserved Instance.  
- **Start**
  - The time at which the Reserved Instance purchase request was placed.  
- **State**
  - The state of the Reserved Instance.  
- **Tag Key**
  - The key of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify "tag:Purpose" for the filter name and "X" for the filter value.  
- **Tag Key**
  - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag’s value is), and the tag value X (regardless of what the tag’s key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag’s value is), and the tag value X (regardless of what the tag’s key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.  

### Usage Price

- The usage price of the Reserved Instance, per hour (for example, 0.84).  

- **NOTE:** This method appends the values to the existing list (if any). Use @link
#setFilters(java.util.Collection)} or { @link #withFilters(java.util.Collection)} if you want to override the existing values.</p>

</li>
<li> <p> <code>availability-zone</code> - The Availability Zone where the Reserved Instance can be used.</p> 
</li>
<li> <p> <code>duration</code> - The duration of the Reserved Instance (one year or three years), in seconds.</p> 
</li>
<li> <p> <code>fixed-price</code> - The purchase price of the Reserved Instance (for example, 9800.0).</p> 
</li>
<li> <p> <code>instance-type</code> - The instance type that is covered by the reservation.</p> 
</li>
<li> <p> <code>scope</code> - The scope of the Reserved Instance (Region or Availability Zone).</p> 
</li>
<li> <p> <code>product-description</code> - The Reserved Instance product platform description. Instances that include <code>(Amazon VPC)</code> in the product platform description will only be displayed to EC2-Class account holders and are for use with Amazon VPC (<code>Linux/UNIX</code> | <code>Windows</code> | <code>Windows (Amazon VPC)</code>).</p> 
</li>
<li> <p> <code>reserved-instances-id</code> - The ID of the Reserved Instance.</p>

<ul>
<li><code>association.route-table-association-id</code> - The ID of an association ID for the route table.<p> 
<li><code>association.route-table-id</code> - The ID of the route table involved in the association.<p> 
<li><code>association.subnet-id</code> - The ID of the subnet involved in the association.<p> 
<li><code>association.main</code> - Indicates whether the route table is the main route table for the VPC (true|false).<p> 
<li><code>route.destination-cidr-block</code> - The IPv4 CIDR range specified in a route in the table.<p> 
<li><code>route.destination-ipv6-cidr-block</code> - The IPv6 CIDR range specified in a route in the route table.<p> 
<li><code>route.destination-prefix-list-id</code> - The ID (prefix) of the AWS service specified in a route in the table.<p> 
<li><code>route.egress-only-internet-gateway-id</code> - The ID
of an egress-only Internet gateway specified in a route in the route table.</p> <li> <p> <code>route.gateway-id</code> - The ID of a gateway specified in a route in the table.</p> <li> <p> <code>route.instance-id</code> - The ID of an instance specified in a route in the table.</p> <li> <p> <code>route.nat-gateway-id</code> - The ID of a NAT gateway.</p> <li> <p> <code>route.origin</code> - Describes how the route was created. <code>CreateRouteTable</code> indicates that the route was automatically created when the route table was created; <code>CreateRoute</code> indicates that the route was manually added to the route table; <code>EnableVgwRoutePropagation</code> indicates that the route was propagated by route propagation.</p> <li> <p> <code>route.state</code> - The state of a route in the route table (<code>active</code> | <code>blackhole</code>). The blackhole state indicates that the route's target isn't available (for example, the specified gateway isn't attached to the VPC, the specified NAT instance has been terminated, and so on).</p> <li> <p> <code>route.vpc-peering-connection-id</code> - The ID of a VPC peering connection specified in a route in the table.</p> <li> <p> <code>tag</code> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.</p> <li> <p> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>="<i>value</i>" filter.</p> <li> <p> <code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. If you want to list only resources where tag key Purpose is X, use the <code>tag</code>:<i>key</i>="<i>value</i>" filter.</p> <li> <p> <code>vpc-id</code> - The ID of the VPC for the route table.
"tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the code:tag(code):<i>key</i>=<i>value</i> filter. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;tag-value&lt;/code&gt; - The value of a tag assigned to the resource. This filter is independent of the &lt;code&gt;tag-key&lt;/code&gt; filter. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;vpc-id&lt;/code&gt; - The ID of the VPC for the route table. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; (ul) &lt;li&gt; &lt;p&gt; code:association-route-table-association-id(code)&lt;/code&gt; - The ID of an association ID for the route table. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;association.route-table-id&lt;/code&gt; - The ID of the route table involved in the association. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;association.subnet-id&lt;/code&gt; - The ID of the subnet involved in the association. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;association.main&lt;/code&gt; - Indicates whether the route table is the main route table for the VPC (&lt;code&gt;true&lt;/code&gt; | &lt;code&gt;false&lt;/code&gt;). (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;route-table-id&lt;/code&gt; - The ID of the route table. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;route.destination-cidr-block&lt;/code&gt; - The IPv4 CIDR range specified in a route in the table. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;route.destination-ipv6-cidr-block&lt;/code&gt; - The IPv6 CIDR range specified in a route in the route table. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;route.destination-prefix-list-id&lt;/code&gt; - The ID (prefix) of the AWS service specified in a route in the table. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;route.egress-only-internet-gateway-id&lt;/code&gt; - The ID of an egress-only Internet gateway specified in a route in the route table. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;route.gateway-id&lt;/code&gt; - The ID of a gateway specified in a route in the table. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;route.instance-id&lt;/code&gt; - The ID of an instance specified in a route in the table. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;route.nat-gateway-id&lt;/code&gt; - The ID of a NAT gateway. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;route.origin&lt;/code&gt; - Describes how the route was created. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;CreateRouteTable&lt;/code&gt; indicates that the route was automatically created when the route table was created; &lt;code&gt;CreateRoute&lt;/code&gt; indicates that the route was manually added to the route table; &lt;code&gt;EnableVgwRoutePropagation&lt;/code&gt; indicates that the route was propagated by route propagation. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;route.state&lt;/code&gt; - The state of a route in the route table (&lt;code&gt;active&lt;/code&gt; | &lt;code&gt;blackhole&lt;/code&gt;). The blackhole state indicates that the route's target isn't available (for example, the specified gateway isn't attached to the VPC, the specified NAT instance has been terminated, and so on). (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;route.vpc-peering-connection-id&lt;/code&gt; - The ID of a VPC peering connection specified in a route in the table. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;tag&lt;/code>:&lt;i&gt;key&lt;/i&gt;=&lt;i&gt;value&lt;/i&gt; - The key/value combination of a tag assigned to the resource. Specify the key of the filter in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify &lt;code&gt;tag:Purpose&lt;/code&gt; for the filter name and &lt;code&gt;X&lt;/code&gt; for the filter value. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;tag-key&lt;/code&gt; - The key of a tag assigned to the resource. This filter is independent of the &lt;code&gt;tag-value&lt;/code&gt; filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the &lt;code&gt;tag&lt;/code>:&lt;i&gt;key&lt;/i&gt;=&lt;i&gt;value&lt;/i&gt; filter. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;tag-value&lt;/code&gt; - The value of a tag assigned to the resource. This filter is independent of the &lt;code&gt;tag-key&lt;/code&gt; filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the &lt;code&gt;tag&lt;/code>:&lt;i&gt;key&lt;/i&gt;=&lt;i&gt;value&lt;/i&gt; filter. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;vpc-id&lt;/code&gt; - The ID of the VPC for the route table. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; (ul) &lt;li&gt; &lt;p&gt; One or more filters. (p) &lt;/ul&gt; &lt;li&gt; &lt;p&gt; &lt;code&gt;association-route-table-association-id&lt;/code&gt; - The ID of an association ID for the route table. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;association.route-table-id&lt;/code&gt; - The ID of the route table involved in the association. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;association.subnet-id&lt;/code&gt; - The ID of the subnet involved in the association. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;association.main&lt;/code&gt; - Indicates whether the route table is the main route table for the VPC (&lt;code&gt;true&lt;/code&gt; | &lt;code&gt;false&lt;/code&gt;). (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;route-table-id&lt;/code&gt; - The ID of the route table. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;route.destination-cidr-block&lt;/code&gt; - The IPv4 CIDR range specified in a route in the table. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;route.destination-ipv6-cidr-block&lt;/code&gt; - The IPv6 CIDR range specified in a route in the route table. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;route.destination-prefix-list-id&lt;/code&gt; - The ID (prefix) of the AWS service specified in a route in the table. (p) &lt;/li&gt; &lt;i&gt; &lt;p&gt; &lt;code&gt;route.egress-only-internet-gateway-
id</code> - The ID of an egress-only Internet gateway specified in a route in the route table.

- <code>route.gateway-id</code> - The ID of a gateway specified in a route in the table.
- <code>route.instance-id</code> - The ID of an instance specified in a route in the table.
- <code>route.nat-gateway-id</code> - The ID of a NAT gateway.

- Describes how the route was created. <code>CreateRouteTable</code> indicates that the route was automatically created when the route table was created; <code>CreateRoute</code> indicates that the route was manually added to the route table; <code>EnableVgwRoutePropagation</code> indicates that the route was propagated by route propagation.

- <code>route.state</code> - The state of a route in the route table

- <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>eq</code> for the filter value.

- <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter.

- <code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.

- <code>vpc-id</code> - The ID of the VPC for the route table.

- <code>vpc-peering-connection-id</code> - The ID of a VPC peering connection specified in a route in the table.

- <code>egress-only-internet-gateway-id</code> - The ID of an egress-only Internet gateway specified in a route in the route table.

- <code>gateway-id</code> - The ID of a gateway specified in a route in the table.

- <code>instance-id</code> - The ID of an instance specified in a route in the table.

- <code>nat-gateway-id</code> - The ID of a NAT gateway.

- <code>origin</code> - Describes how the route was created. <code>CreateRouteTable</code> indicates that the route was automatically created when the route table was created; <code>CreateRoute</code> indicates that the route was manually added to the route table; <code>EnableVgwRoutePropagation</code> indicates that the route was propagated by route propagation.

- <code>state</code> - The state of a route in the route table (<code>active</code> | <code>blackhole</code>). The blackhole state indicates that the route's target isn't available (for example, the specified gateway isn't attached to the VPC, the specified NAT instance has been terminated, and so on).

- <code>vpc-peering-connection-id</code> - The ID of a VPC peering connection specified in a route in the table.

- <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>eq</code> for the filter value.

- <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's
value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.

- The ID of the VPC for the route table.

</li>
propagation.</p> 

- The state of a route in the route table (<code>active</code> | <code>blackhole</code>), The blackhole state indicates that the route's target isn't available (for example, the specified gateway isn't attached to the VPC, the specified NAT instance has been terminated, and so on).</p> 

- The ID of a VPC peering connection specified in a route in the table.</p> 

- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>vpc-id</code> for the filter value.</p> 

- The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag:Purpose=X</code> filter.</p> 

- The state of a route in the route table (<code>active</code> | <code>blackhole</code>), The blackhole state indicates that the route's target isn't available (for example, the specified gateway isn't attached to the VPC, the specified NAT instance has been terminated, and so on).</p>

- The ID of an association ID for the route table.
- The ID of the route table involved in the association.
- The ID of the subnet involved in the association.
- Indicates whether the route table is the main route table for the VPC.
- The ID of the route table.
- The ID of the route table specified in the route table.
- The ID of the gateway specified in the route table.
- The ID of an association ID for the route table.
- The ID of the route table involved in the association.
- The ID of the subnet involved in the association.
- Indicates whether the route table is the main route table for the VPC.
- The ID of the route table.
- The ID of the route table specified in the route table.
- The ID of the gateway specified in the route table.
- The ID of an association ID for the route table.
- The ID of the route table involved in the association.
- The ID of the subnet involved in the association.
- Indicates whether the route table is the main route table for the VPC.
- The ID of the route table.
- The ID of the route table specified in the route table.
- The ID of the gateway specified in the route table.
- The ID of an association ID for the route table.
- The ID of the route table involved in the association.
- The ID of the subnet involved in the association.
- Indicates whether the route table is the main route table for the VPC.
- The ID of the route table.
- The ID of the route table specified in the route table.
- The ID of the gateway specified in the route table.
- The ID of an association ID for the route table.
- The ID of the route table involved in the association.
- The ID of the subnet involved in the association.
- Indicates whether the route table is the main route table for the VPC.
- The ID of the route table.
- The ID of the route table specified in the route table.
- The ID of the gateway specified in the route table.
- The ID of an association ID for the route table.
- The ID of the route table involved in the association.
- The ID of the subnet involved in the association.
- Indicates whether the route table is the main route table for the VPC.
- The ID of the route table.
- The ID of the route table specified in the route table.
- The ID of the gateway specified in the route table.
- The ID of an association ID for the route table.
- The ID of the route table involved in the association.
- The ID of the subnet involved in the association.
- Indicates whether the route table is the main route table for the VPC.
- The ID of the route table.
- The ID of the route table specified in the route table.
- The ID of the gateway specified in the route table.
- The ID of an association ID for the route table.
- The ID of the route table involved in the association.
- The ID of the subnet involved in the association.
- Indicates whether the route table is the main route table for the VPC.
- The ID of the route table.
- The ID of the route table specified in the route table.
- The ID of the gateway specified in the route table.
- The ID of an association ID for the route table.
- The ID of the route table involved in the association.
- The ID of the subnet involved in the association.
- Indicates whether the route table is the main route table for the VPC.
- The ID of the route table.
- The ID of the route table specified in the route table.
- The ID of the gateway specified in the route table.
- The ID of an association ID for the route table.
- The ID of the route table involved in the association.
- The ID of the subnet involved in the association.
- Indicates whether the route table is the main route table for the VPC.
- The ID of the route table.
- The ID of the route table specified in the route table.
- The ID of the gateway specified in the route table.
- The ID of an association ID for the route table.
- The ID of the route table involved in the association.
- The ID of the subnet involved in the association.
- Indicates whether the route table is the main route table for the VPC.
- The ID of the route table.
- The ID of the route table specified in the route table.
- The ID of the gateway specified in the route table.
- The ID of an association ID for the route table.
- The ID of the route table involved in the association.

```
<code>association.subnet-id</code> - The ID of the subnet involved in the association.

<code>association.main</code> - Indicates whether the route table is the main route table for the VPC.

<code>true</code> | <code>false</code>. The ID of the route table.</p>
<li> <p> <code>route.destination-cidr-block</code> - The IPv4 CIDR range specified in a route in the table.</p>
<li> <p> <code>route.destination-ipv6-cidr-block</code> - The IPv6 CIDR range specified in a route in the route table.</p>
<li> <p> <code>route.destination-prefix-list-id</code> - The ID (prefix) of the AWS service specified in a route in the table.</p>
<li> <p> <code>association.subnet-id</code> - The ID of the subnet involved in the association.</p>
<li> <p> <code>route.main</code> - Indicates whether the route table is the main route table for the VPC (true | false).

<code>true</code> | <code>false</code>.

<code>route-table-id</code> - The ID of a route table.

<code>route.destination-cidr-block</code> - The IPv4 CIDR range specified in a route in the table.</p>
<li> <p> <code>route.destination-ipv6-cidr-block</code> - The IPv6 CIDR range specified in a route in the route table.</p>
<li> <p> <code>route.destination-list-id</code> - The ID of a prefix list specified in a route in the route table.

<code>@</code> - The key/value combination of a tag associated with the resource.过滤关联的 key 和 value。For example, the tag key Purpose has no value, use the tag name tag:Purpose to filter the resource. If you want to list only resources where purpose is X, you can use the tag name "tag:Purpose=X" to filter the resources.

<code>vpc-id</code> - The ID of the VPC for the route table.

<code></code>

<code>@</code> - The state of a route in the route table.

<code>association.route-table-association-id</code> - The ID of an association ID for the route table.

<code>association.route-table-id</code> - The ID of the route table involved in the association.

<code>association.main</code> - Indicates whether the route table is the main route table for the VPC (true | false).

<code>true</code> | <code>false</code>.

<code>route-table-id</code> - The ID of a route table.

<code>route.destination-cidr-block</code> - The IPv4 CIDR range specified in a route in the table.

<code>route.destination-ipv6-cidr-block</code> - The IPv6 CIDR range specified in a route in the route table.

<code>route.destination-prefix-list-id</code> - The ID (prefix) of the AWS service specified in a route in the table.

<code>association.route-table-association-id</code> - The ID of an association ID for the route table.

<code>association.route-table-id</code> - The ID of the route table involved in the association.

<code>association.main</code> - Indicates whether the route table is the main route table for the VPC (true | false).

<code>true</code> | <code>false</code>.

<code>route-table-id</code> - The ID of a route table.

<code>route.destination-cidr-block</code> - The IPv4 CIDR range specified in a route in the table.

<code>route.destination-ipv6-cidr-block</code> - The IPv6 CIDR range specified in a route in the route table.

<code>route.destination-prefix-list-id</code> - The ID (prefix) of the AWS service specified in a route in the table.

<code>association.route-table-association-id</code> - The ID of an association ID for the route table.

<code>association.route-table-id</code> - The ID of the route table involved in the association.

<code>association.main</code> - Indicates whether the route table is the main route table for the VPC (true | false).

<code>true</code> | <code>false</code>.

<code>route-table-id</code> - The ID of a route table.

<code>route.destination-cidr-block</code> - The IPv4 CIDR range specified in a route in the table.

<code>route.destination-ipv6-cidr-block</code> - The IPv6 CIDR range specified in a route in the route table.

<code>route.destination-prefix-list-id</code> - The ID (prefix) of the AWS service specified in a route in the table.

<code>association.route-table-association-id</code> - The ID of an association ID for the route table.

<code>association.route-table-id</code> - The ID of the route table involved in the association.

<code>association.main</code> - Indicates whether the route table is the main route table for the VPC (true | false).

<code>true</code> | <code>false</code>.

</ul>

NOTE: This method appends the values to the existing list (if any). Use [@link #setFilters(java.util.Collection)] or [@link #withFilters(java.util.Collection)] if you want to override the existing values.</li>

The ID of a route table.</li>

The ID of a VPC peering connection specified in a route in the route table.</li>

The ID of a NAT gateway.</li>

Describes how the route was created. <code>CreateRouteTable</code> indicates that the route was automatically created when the route table was created; <code>CreateRoute</code> indicates that the route was manually added to the route table; <code>EnableVgwRoutePropagation</code> indicates that the route was propagated by route propagation.</li>

The state of a route in the route table</li>

The state of a route in the route table (</code>active</code> | <code>blackhole</code>), The blackhole state indicates that the route's target isn't available (for example, the specified gateway isn't attached to the VPC, the specified NAT instance has been terminated, and so on).</li>

Describes how the route was created. <code>CreateRouteTable</code> indicates that the route was automatically created when the route table was created; <code>CreateRoute</code> indicates that the route was manually added to the route table; <code>EnableVgwRoutePropagation</code> indicates that the route was propagated by route propagation.</li>

The state of a route in the route table</li>

The state of a route in the route table (</code>active</code> | <code>blackhole</code>), The blackhole state indicates that the route's target isn't available (for example, the specified gateway isn't attached to the VPC, the specified NAT instance has been terminated, and so on).
independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `\"tag-key=Purpose\"` and the filter `\"tag-value=X\"`, you get any resources assigned both the tag key Purpose (regardless of what the tag’s value is), and the tag value X (regardless of what the tag’s key is). If you want to list only resources where Purpose is X, see the `<code>tag</code>:<i>key</i>=<i>value</i>` filter. 

The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter.

The ID of the VPC for the route table.

One or more filters.

The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter.

The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter.

The ID of an association ID for the route table.

The ID of the route table involved in the association.

The ID of the subnet involved in the association.

Indicates whether the route table is the main route table for the VPC (true/false).

The ID of a route table specified in a route in the route table.

The IPv4 CIDR range specified in a route in the route table.

The IPv6 CIDR range specified in a route in the route table.

The ID (prefix) of the AWS service specified in a route in the route table.

The ID of an instance specified in a route in the route table.

The ID of a NAT gateway.

Describes how the route was created.

The state of a route in the route table (active/blackhole).

The blackhole state indicates that the route's target isn't available (for example, the specified gateway isn't attached to the VPC, the specified NAT instance has been terminated, and so on).

The ID of a VPC peering connection specified in a route in the route table.

The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify `<code>tag:Purpose</code>` for the filter name and `<code>X</code>` for the filter value.

The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter.

The ID of the VPC for the route table.

This method appends the values to the existing list (if any). Use `@link #setRouteTables(java.util.Collection)` or `@link #withRouteTables(java.util.Collection)` if you want to override the existing values.

```java
public DescribeRouteTablesResult withRouteTables(java.util.List<RouteTable> routeTables)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult withRouteTables(java.util.List<RouteTable> routeTables)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
@link #setRouteTables(java.util.Collection)
```

Use `@link #setRouteTables(java.util.Collection)` or `@link #withRouteTables(java.util.Collection)` if you want to override the existing values.

```java
public DescribeRouteTablesResult setRouteTables(java.util.Collection<RouteTable> routeTables)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult setRouteTables(java.util.Collection<RouteTable> routeTables)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult withRouteTables(java.util.Callable<List<RouteTable>> routeTablesCallable)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult withRouteTables(java.util.Callable<List<RouteTable>> routeTablesCallable)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult setRouteTables(java.util.Callable<List<RouteTable>> routeTablesCallable)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult setRouteTables(java.util.Callable<List<RouteTable>> routeTablesCallable)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult withRouteTables(java.util.function.Function<List<RouteTable>, List<RouteTable>> routeTablesFunction)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult withRouteTables(java.util.function.Function<List<RouteTable>, List<RouteTable>> routeTablesFunction)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult setRouteTables(java.util.function.Function<List<RouteTable>, List<RouteTable>> routeTablesFunction)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult setRouteTables(java.util.function.Function<List<RouteTable>, List<RouteTable>> routeTablesFunction)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult withRouteTables(java.util.function.BiConsumer<List<RouteTable>, List<RouteTable>> routeTablesBiConsumer)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult withRouteTables(java.util.function.BiConsumer<List<RouteTable>, List<RouteTable>> routeTablesBiConsumer)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult setRouteTables(java.util.function.BiConsumer<List<RouteTable>, List<RouteTable>> routeTablesBiConsumer)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult setRouteTables(java.util.function.BiConsumer<List<RouteTable>, List<RouteTable>> routeTablesBiConsumer)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult withRouteTables(java.util.function.BiConsumer<List<RouteTable>, List<RouteTable>> routeTablesBiConsumer)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult setRouteTables(java.util.function.BiConsumer<List<RouteTable>, List<RouteTable>> routeTablesBiConsumer)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult setRouteTables(java.util.function.BiConsumer<List<RouteTable>, List<RouteTable>> routeTablesBiConsumer)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult withRouteTables(java.util.function.BiConsumer<List<RouteTable>, List<RouteTable>> routeTablesBiConsumer)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult setRouteTables(java.util.function.BiConsumer<List<RouteTable>, List<RouteTable>> routeTablesBiConsumer)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult setRouteTables(java.util.function.BiConsumer<List<RouteTable>, List<RouteTable>> routeTablesBiConsumer)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult withRouteTables(java.util.function.BiConsumer<List<RouteTable>, List<RouteTable>> routeTablesBiConsumer)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult setRouteTables(java.util.function.BiConsumer<List<RouteTable>, List<RouteTable>> routeTablesBiConsumer)
```

Information about one or more route tables.

Returns a reference to this object so that method calls can be chained together.

```java
public DescribeRouteTablesResult setRouteTables(java.util.function.BiConsumer<List<RouteTable>, List<RouteTable>> routeTablesBiConsumer)

<code>platform</code> - The platform (<code>Linux/UNIX</code> or <code>Windows</code>.)</p> 

```java
public class Filter {
    //...
    public List<Filter> getFilters() {
        return this.filters;
    }
}
```

The platform attribute is of type Platform enum, which is used to specify the platform type. The Platform enum has two values: Linux/UNIX and Windows.

### Example Usage

```java
Platform platform = Platform.LINUX;
List<Filter> filters = new ArrayList<>();
filters.add(new Filter().withFilters(filters));
```

This code snippet demonstrates how the Platform enum can be used to specify the platform type when creating filters.

### Related Documentation

- [AWS EC2 API Documentation](https://docs.aws.amazon.com/AWSJavaSDK/latest/api/java/com/amazonawssdk/ec2/model/Filter.html)
- [Java SDK for AWS EC2](https://github.com/aws/aws-sdk-java)

---

**NOTE:**
This method appends the values to the existing list (if any). Use {@link #setFilters(java.util.Collection)} or {@link #withFilters(java.util.Collection)} if you want to override the existing values.</p>

The `<code>platform</code>` parameter represents the platform type. It can be set to either `Linux/UNIX` or `Windows`. Usually, this attribute is used when specifying the environment or the operating system for the resource being filtered.

- **Example:**
  ```java
  filters.add(new Filter().withPlatform(Platform.LINUX));
  ```

- **Example:**
  ```java
  filters.add(new Filter().withPlatform(Platform.WINDOWS));
  ```

```
that has been granted permission in a security group rule.

```
- The IP protocol for the permission (<code>tcp</code> | <code>udp</code> | <code>icmp</code> or a protocol number).
- The end of port range for the TCP and UDP protocols, or an ICMP code.
- The ID of an AWS account that has been granted permission.
- The AWS account ID of the owner of the security group.
- The key of a tag assigned to the security group.
- The value of a tag assigned to the security group.
- The ID of the VPC specified when the security group was created.
```

At return One or more filters. If using multiple filters for rules, the results include security groups for which any combination of rules - not necessarily a single rule - match all filters.

```
<code>description</code> - The description of the security group.
<code>group-id</code> - The ID of the security group.
<code>ip-permission.cidr</code> - An IPv4 CIDR range that has been granted permission in a security group rule.
<code>ip-permission.from-port</code> - The start of port range for the TCP and UDP protocols, or an ICMP type number.
<code>ip-permission.group-id</code> - The ID of a security group that has been granted permission.
<code>ip-permission.group-name</code> - The name of a security group.
<code>ip-permission.ipv6-cidr</code> - An IPv6 CIDR range that has been granted permission in a security group rule.
<code>ip-permission.protocol</code> - The IP protocol for the permission (<code>tcp</code> | <code>udp</code> | <code>icmp</code> or a protocol number).
<code>ip-permission.to-port</code> - The end of port range for the TCP and UDP protocols, or an ICMP code.
<code>ip-permission.user-id</code> - The ID of an AWS account that has been granted permission.
<code>owner-id</code> - The AWS account ID of the owner of the security group.
<code>tag-key</code> - The key of a tag assigned to the security group.
<code>tag-value</code> - The value of a tag assigned to the security group.
<code>vpc-id</code> - The ID of the VPC specified when the security group was created.
```

A list of product codes.

A list of product codes.

Returns a reference to this object so that method calls can be chained together.

```java
/*
 * A list of product codes.
 */

@link

@link

NOTE:

NOTE:

Use { @link #setProductCodes(java.util.Collection) } or { @link #withProductCodes(java.util.Collection) } if you want to override the existing values.

@link

@link

A list of product codes.

A list of product codes.

},
"c2jName" : "MaxResults",
"c2jShape" : "Integer",
"deprecated" : false,
"documentation" : "<p>The maximum number of snapshot results returned by <code>DescribeSnapshots</code> in paginated output. When this parameter is used,
<code>DescribeSnapshots</code> only returns <code>MaxResults</code> results in a single page along with a <code>NextToken</code> response element. The remaining results of the initial request can be seen by sending another <code>DescribeSnapshots</code> request with the returned <code>NextToken</code> value. This value can be between 5 and 1000; if <code>MaxResults</code> is given a value larger than 1000, only 1000 results are returned. If this parameter is not used, then <code>DescribeSnapshots</code> returns all results. You cannot specify this parameter and the snapshot IDs parameter in the same request.

### Parameters:

- **MaxResults**: The maximum number of snapshot results returned by <code>DescribeSnapshots</code> in paginated output. When this parameter is used, <code>DescribeSnapshots</code> only returns <code>MaxResults</code> results in a single page along with a <code>NextToken</code> response element. The remaining results of the initial request can be seen by sending another <code>DescribeSnapshots</code> request with the returned <code>NextToken</code> value. This value can be between 5 and 1000; if <code>MaxResults</code> is given a value larger than 1000, only 1000 results are returned. If this parameter is not used, then <code>DescribeSnapshots</code> returns all results.

You cannot specify this parameter and the snapshot IDs parameter in the same request.

### Example:

```java
@Param(maxResults=1000)
```

Returns a reference to this object so that method calls can be chained together.
```

<table>
<thead>
<tr>
<th>Represents the AWS snapshot data that is returned by the DescribeTags operation.</th>
</tr>
</thead>
</table>
| An AWS snapshot is a read-only copy of a volume. You can create an AWS snapshot
  from an Amazon Elastic Block Store (Amazon EBS) volume and then use the
  snapshot to launch new Amazon Elastic Compute Cloud (Amazon EC2) instances.
  You can also use a snapshot to create new volumes.  

The snapshot is a point-in-time copy of the volume data. The snapshot process 
uses the data buffer and performs a copy to the new snapshot. The snapshot 
process has a degree of concurrency depending on the state of the snapshot.  

Use the DescribeSnapshots operation to get information about the 
snapshot, including the snapshot ID, size, and status. You can also use the 
DescribeSnapshots operation to get a list of snapshots. You can then use the 
CreateVolume operation to create a new volume from the snapshot.  

The following is an example of a DescribeSnapshots operation request that
returns the following comma-separated list of snapshot IDs:

The **description** property represents the description of the snapshot. You can use the 
**description** property to describe the purpose of the snapshot, for example, during 
the migration of an Amazon EC2 instance.  The **owner-alias** property represents 
the alias of the owner of the snapshot. You can use the **owner-alias** property to 
identify the owner of the snapshot.  The **owner-id** property represents the 
owner ID of the AWS account that owns the snapshot. You can use the **owner-id** 
property to identify the owner of the snapshot.  The **progress** property represents 
the progress of the snapshot, as a percentage (for example, 80%).  The **status** 
property represents the status of the snapshot. The **status** property can be 
**pending**, **completed**, or **error**.  The **start-time** property represents 
the time stamp when the snapshot was initiated.  

The **tag-key** and **tag-value** properties represent the key-value combination 
of the tags that are assigned to the resource. You can use the **tag-key** and 
**tag-value** properties to filter the snapshots.  

The **volume-id** property represents the ID of the volume the snapshot is for. 

The **volume-size** property represents the size of the volume, in GiB.
- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.

- The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. If you want to list only resources where the tag value is X, see the <code>tag-key</code> filter.

- The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. If you want to list only resources where the tag key is a certain value, see the <code>tag</code>:<i>key</i>=<i>value</i> filter. If you want to list only resources where the tag value is a certain value, see the <code>tag-value</code> filter.

- The ID of the volume the snapshot is for.

- The size of the volume, in GiB.

The maximum number of snapshot results returned by <code>DescribeSnapshots</code> in paginated output. When this parameter is used, <code>DescribeSnapshots</code> only returns <code>MaxResults</code> results in a single page along with a <code>NextToken</code> response element. The remaining results of the initial request can be seen by sending another <code>DescribeSnapshots</code> request with the returned <code>NextToken</code> value. This value can be between 5 and 1000; if <code>MaxResults</code> is given a value larger than 1000, only 1000 results are returned. If this parameter is not used, then <code>DescribeSnapshots</code> returns all results. You cannot specify this parameter and the snapshot IDs parameter in the same request.

@fluentSetterDocumentation" : "The maximum number of snapshot results returned by <code>DescribeSnapshots</code> in paginated output. Indicates whether the network interface is deleted when the instance is terminated.

- `<code>network-interface.group-id</code>` - The ID of the security group associated with the network interface.
- `<code>network-interface.group-name</code>` - The name of the security group associated with the network interface.
- `<code>network-interface.addresses.primary</code>` - Indicates whether the IP address is the primary private IP address.
- `<code>network-interface.spot-instance-request-id</code>` - The Spot instance request ID.
- `<code>network-interface.spot-price</code>` - The maximum hourly price for any Spot instance launched to fulfill the request.
- `<code>network-interface.state</code>` - The state of the Spot instance request.
- `<code>network-interface.addresses.primary</code>` - Indicates whether the IP address is the primary private IP address.
- `<code>product-description</code>` - The product description associated with the instance.
- `<code>spot-instance-request-id</code>` - The Spot instance request ID.
- `<code>spot-price</code>` - The maximum hourly price for any Spot instance launched to fulfill the request.
- `<code>state</code>` - The state of the Spot instance request.
- `<code>cancelled</code>` - Indicates whether the network interface is deleted when the instance is terminated.
- `<code>closed</code>` - Indicates whether the network interface is deleted when the instance is terminated.
- `<code>failed</code>` - Indicates whether the network interface is deleted when the instance is terminated.
- `<code>Spot Bid Status</code>` - The short code describing the most recent evaluation of your Spot instance request.
- `<code>status-code</code>` - The short code describing the most recent evaluation of your Spot instance request.
- `<code>status-message</code>` - The message explaining the status of the Spot instance request.
- `<code>tag</code>`: `<i>key</i>=<i>value</i>` - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify `<code>tag:Purpose</code>` for the filter name and `<code>Purpose=X</code>` for the filter value.
- `<code>tag-key</code>` - The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `<code>tag-key=Purpose</code>` and the filter `<code>tag-value=X</code>`, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the `<code>tag:tag-key=Purpose</code>` filter.
- `<code>tag-value</code>` - The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter. For example, if you use both the filter `<code>tag-key=Purpose</code>` and the filter `<code>tag-value=X</code>`, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the `<code>tag:tag-key=Purpose</code>` filter.
- `<code>type</code>` - The type of Spot instance request.
- `<code>valid-from</code>` - The start date of the request.
- `<code>valid-until</code>` - The end date of the request.

<li> <p> <code>launch.image-id</code> - The ID of the AMI.</p> </li>
<li> <p> <code>launch.instance-type</code> - The type of instance (for example, <code>m3.medium</code>).</p> </li>
<li> <p> <code>launch.kernel-id</code> - The kernel ID.</p> </li>
<li> <p> <code>launch.key-name</code> - The name of the key pair the instance launched with.</p> </li>
<li> <p> <code>launch.monitoring-enabled</code> - Whether monitoring is enabled for the Spot instance.</p> </li>
<li> <p> <code>launch.ramdisk-id</code> - The RAM disk ID.</p> </li>
<li> <p> <code>launch.request-id</code> - The Spot instance request ID.</p> </li>
<li> <p> <code>launch.price</code> - The maximum hourly price for any Spot instance launched to fulfill the request.</p> </li>
<li> <p> <code>launch.state</code> - The state of the Spot instance request (open | active | closed | cancelled | failed).</p> </li>

<code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=T", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value T (regardless of what the tag's key is). If you want to list only resources where Purpose is "T", see the <code>tag</code> filter.

<code>tag-value</code> - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag</code> filter.

<code>type</code> - The type of Spot instance request (<code>one-time</code> | <code>persistent</code>). (p) <li> <p> <code>launched-availability-zone</code> - The Availability Zone in which the bid is launched. (p) <li> <p> <code>valid-from</code> - The start date of the request. (p) <li> <p> <code>valid-until</code> - The end date of the request. (p) 

NOTE: This method appends the values to the existing list (if any). Use [@link #setFilters(java.util.Collection)] or [@link #withFilters(java.util.Collection)] if you want to override the existing values. (p)

<code>availability-zone-group</code> - The Availability Zone group. (p) <li> <p> <code>create-time</code> - The time stamp when the Spot instance request was created. (p) <li> <p> <code>fault-code</code> - The fault code related to the request. (p) <li> <p> <code>fault-message</code> - The fault message related to the request. (p) 

<code>instance-id</code> - The ID of the instance that fulfilled the request. (p) <li> <p> <code>launch-group</code> - The Spot instance launch group. (p) <li> <p> <code>launch.block-device-mapping.delete-on-termination</code> - Indicates whether the Amazon EBS volume is deleted on instance termination. (p) 

<code>launch.block-device-mapping.device-name</code> - The device name for the Amazon EBS volume (for example, <code>/dev/sdh</code>). (p) 

<code>launch.block-device-mapping.snapshot-id</code> - The ID of the snapshot used for the Amazon EBS volume. (p) 

<code>launch.block-device-mapping.volume-size</code> - The size of the Amazon EBS volume, in GiB. (p) 

<code>launch.block-device-mapping.volume-type</code> - The type of the Amazon EBS volume: <code>gp2</code> for General Purpose SSD, <code>io1</code> for Provisioned IOPS SSD, <code>st1</code> for Throughput Optimized HDD, <code>sc1</code> for Cold HDD, or <code>standard</code> for Magnetic. (p) 

<code>launch.group-id</code> - The security group for the instance. (p) 

<code>launch.image-id</code> - The ID of the AMI. (p) 

<code>launch.instance-type</code> - The type of instance (for example, <code>m3.medium</code>). (p) 

<code>launch.kernel-id</code> - The kernel ID. (p) 

<code>launch.key-name</code> - The name of the key pair the instance launched with. (p) 

<code>launch.monitoring-enabled</code> - Whether monitoring is enabled for the Spot instance. (p) 

<code>launch.ramdisk-id</code> - The RAM disk ID. (p) 

<code>network-interface.network-interface-id</code> - The ID of the network interface. (p) 

<code>network-interface.device-index</code> - The index of the device for the network interface attachment on the instance. (p) 

<code>network-interface.private-ip-address</code> - The primary private IP address of the network interface. (p) 

<code>network-interface.delete-on-termination</code> - Indicates whether the network interface is deleted when the instance is terminated. (p) 

<code>network-interface.group-id</code> - The ID of the security group associated with the network interface. (p) 

<code>network-interface.group-name</code> - The name of the security group associated with the network interface. (p) 

<code>network-interface.addresses.primary</code> - Indicates whether the IP address is the primary private IP address. (p) 

<code>product-description</code> - The product description associated with the instance. (p) 

<code>spot-instance-request-id</code> - The Spot instance request ID. (p) 

<code>spot-price</code> - The maximum hourly price for any Spot instance launched to fulfill the request. (p) 

<code>state</code> - The state of the Spot instance request. (p) 

<code>open</code> | <code>active</code> | <code>closed</code> | <code>cancelled</code> | <code>failed</code> | <code>timedout</code>). Spots bid status information can help you track your Amazon EC2 Spot instance requests. For more information, see <a>
Spot Bid Status</a> in the Amazon Elastic Compute Cloud User Guide.</p> <li> <p> <code>status-code</code> - The short code describing the most recent evaluation of your Spot instance request.</p> <li> <p> <code>status-message</code> - The message explaining the status of the Spot instance request.</p> <li> <p> <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.</p> <li> <p> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=XY\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag:tag-value</code>.<i>key</i>=<i>value</i> filter.</p> <li> <p> <code>tag-value</code> - The value of a tag assigned to the resource. - network-instance.request-id - The Spot instance request ID.

- spot-price - The maximum hourly price for any Spot instance launched to fulfill the request.

- state - The state of the Spot instance request.

- cancelled - The state of the Spot instance request.

- failed - The state of the Spot instance request.

- open - The state of the Spot instance request.

- active - The state of the Spot instance request.

- closed - The state of the Spot instance request.

- Spot bid status information can help you track your Amazon EC2 Spot instance requests. For more information, see Spot Bid Status in the Amazon Elastic Compute Cloud User Guide.

- availability-zone-group - The Availability Zone group.

- create-time - The time stamp when the Spot instance request was created.

- fault-code - The fault code related to the request.

- fault-message - The fault message related to the request.

- instance-id - The ID of the instance that fulfilled the request.

- launch-group - The Spot instance launch group.

- launch.block-device-mapping.delete-on-termination - Indicates whether the Amazon EBS volume is deleted on instance termination.

- launch.block-device-mapping.device-name - The device name for the Amazon EBS volume.

- launch.block-device-mapping.snapshot-id - The ID of the snapshot used for the Amazon EBS volume.

- launch.block-device-mapping.volume-id - The Amazon EBS volume ID.

- launch.block-device-mapping.volume-size - The size of the Amazon EBS volume, in GiB.

- launch.block-device-mapping.volume-type - The type of the Amazon EBS volume.

- launch.image-id - The ID of the AMI.

- launch.instance-type - The type of instance.

- launch.kernel-id - The kernel ID.

- launch.key-name - The name of the key pair the instance launched with.

- launch.monitoring-enabled - Indicates whether the instance has monitoring enabled.
- Whether monitoring is enabled for the Spot instance.
- The RAM disk ID.
- The ID of the network interface.
- The index of the device for the network interface attachment on the instance.
- The ID of the subnet for the instance.
- A description of the network interface.
- The primary private IP address of the network interface.
- Indicates whether the network interface is deleted when the instance is terminated.
- The ID of the security group associated with the network interface.
- The name of the security group associated with the network interface.
- Indicates whether the IP address is the primary private IP address.
- The maximum hourly price for any Spot instance launched to fulfill the request.
- The short code describing the most recent evaluation of your Spot instance request.
- The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.
- The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter \"tag-key\"=Purpose\" and the filter \"tag-value=\"X\", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag:Purpose</code> filter.
- The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter. For example, if you filter by tag-key=\"Availability-Zone\" and the filter \"tag-value=\"us-east-1\", you get any resources assigned tag key Availability-Zone X (regardless of what the tag's value is).
- The start date of the request.
- The valid until date of the request.

Spot bid status information can help you track your Amazon EC2 Spot instance requests. For more information, see the Amazon Elastic Compute Cloud User Guide. Spot Bid Status in the Amazon Elastic Compute Cloud User Guide.

- **state** - The state of the Spot instance request (open | active | closed | cancelled | failed). Spot bid status information can help you track your Amazon EC2 Spot instance requests. For more information, see Spot Bid Status in the Amazon Elastic Compute Cloud User Guide.

- **status-code** - The short code describing the most recent evaluation of your Spot instance request.

- **status-message** - The message explaining the status of the Spot instance request.

- **tag**:key=value - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>X</code> for the filter value.

- **tag-key** - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, you can filter Spot instance requests with Purpose=X, regardless of the tag's value, and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag-key=Purpose</code> filter.

- **tag-value** - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.

- **type** - The type of Spot instance request (one-time | persistent).

- **launched-availability-zone** - The Availability Zone in which the bid is launched.

- **valid-from** - The start date of the request.

- **valid-until** - The end date of the request.

from a prior call.

```java
public void getNextSetOfResults()
```

Returns a reference to this object so that method calls can be chained together.

```
public void getNextSetOfResults(String nextToken)
```

The token for the next set of items to return. (You received this token from a prior call.)

```
public String getNextSetOfResults()
```

The token for the next set of items to return. (You received this token from a prior call.)

```java
public void withMaxResults(int maxResults)
```

The maximum number of items to return for this request. The request returns a token that you can specify in a subsequent call to get the next set of results.

```
public int getMaxResults()
```

The maximum number of items to return for this request. The request returns a token that you can specify in a subsequent call to get the next set of results.

```java
public void withNextToken(String nextToken)
```

The token for the next set of items to return. (You received this token from a prior call.)

```
public String getNextToken()
```

The token for the next set of items to return. (You received this token from a prior call.)

```java
public void withVariable(String variable)
```

The variable to use for a call to the service. You can use a variable to store the results of a previous call to the service to use in a subsequent call to the service.

```
public String getVariable()
```

The variable to use for a call to the service. You can use a variable to store the results of a previous call to the service to use in a subsequent call to the service.

<li> <code>availabilityZone</code> - The Availability Zone for the subnet. You can also use <code>availability-zone</code> as the filter name.</li>
<li> <code>available-ip-address-count</code> - The number of IPv4 addresses in the subnet that are available.</li>
<li> <code>cidrBlock</code> - The IPv4 CIDR block of the subnet. The CIDR block you specify must exactly match the subnet's CIDR block for information to be returned for the subnet. You can also use <code>cidr-block</code> or <code>cidr-block</code> as the filter name.</li>
<li> <code>defaultForAz</code> - Indicates whether this is the default subnet for the Availability Zone. You can also use <code>default-for-az</code> as the filter name.</li>
<li> <code>ipv6-cidr-block-association.ipv6-cidr-block</code> - An IPv6 CIDR block associated with the subnet.</li>
<li> <code>ipv6-cidr-block-association.association-id</code> - An association ID for an IPv6 CIDR block associated with the subnet.</li>
<li> <code>ipv6-cidr-block-association.state</code> - The state of an IPv6 CIDR block associated with the subnet.</li>
<li> <code>state</code> - The state of the subnet (<code>pending</code> | <code>available</code>). </li>
<li> <code>tag</code>:<i>key</i>=<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify <code>tag:Purpose</code> for the filter name and <code>\tag-value=X</code> for the filter value. 
<br>Filter with <code>tag:Purpose</code> and <code>tag-value=X</code> returns all resources assigned both the tag <i>Purpose</i> (regardless of what the tag's value is), and the tag value <i>X</i> (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the <code>tag:Purpose</code>:<i>key</i>=<i>value</i> filter.
</li>
<li> <code>tag-key</code> - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter \"tag-key=Purpose\" and the filter \"tag-value=X\", you get any resources assigned both the tag key <i>Purpose</i> (regardless of what the tag's value is), and the tag value <i>X</i>

*<p>Note: This method appends the values to the existing list (if any). Use [@link #setSubnetIds(java.util.Collection)] or [@link #withSubnetIds(java.util.Collection)] if you want to override the existing values.</p>\n@param subnetIds One or more subnet IDs.

    "deprecated" : false,
    "documentation" : "<p>One or more filters.</p>  
<ul>  
<li> `<code>availabilityZone</code>` - The Availability Zone for the subnet. You can also use `<code>availability-zone</code>` as the filter name.</p>  
```
available-ip-address-count - The number of IPv4 addresses in the subnet that are available.

cidrBlock - The IPv4 CIDR block of the subnet. The CIDR block you specify must exactly match the subnet's CIDR block for information to be returned for the subnet. You can also use <code>cidr</code> or <code>cidr-block</code> as the filter names.

defaultForAz - Indicates whether this is the default subnet for the Availability Zone. You can also use <code>default-for-az</code> as the filter name.

code:ipv6-cidr-block-association.ipv6-cidr-block - An IPv6 CIDR block associated with the subnet.

code:ipv6-cidr-block-association.association-id - An association ID for an IPv6 CIDR block associated with the subnet.

code:ipv6-cidr-block-association.state - The state of an IPv6 CIDR block associated with the subnet.

code:state - The state of the subnet (<code>pending</code> | <code>available</code>). The ID of the subnet.

code:tag:&#<i>key</i>=&#<i>value</i> - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=Amazon, specify <code>tag:Purpose=Amazon</code> for the filter name and <code>Amazon</code> for the filter value.

code:tag-key - The key of a tag assigned to the resource. This filter is independent of the <code>tag-value</code> filter. For example, if you use both the filter <code>tag-key=Purpose</code> and the filter <code>tag-value=Amazon</code>, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value Amazon (regardless of what the tag's key is). If you want to list only resources where Purpose is Amazon, use the filter <code>tag:Purpose=Amazon</code>.

code:tag-value - The value of a tag assigned to the resource. This filter is independent of the <code>tag-key</code> filter.

code:vpc-id - The ID of the VPC for the subnet.

"enumType": null,
IPv4 CIDR block of the subnet. The CIDR block you specify must exactly match the subnet's CIDR block for information to be returned for the subnet. One or more filters.

- **availabilityZone**: The Availability Zone for the subnet. You can also use `availability-zone` as the filter name.

- **available-ip-address-count**: The number of IPv4 addresses in the subnet that are available.

- **cidrBlock**: The IPv4 CIDR block of the subnet. The CIDR block you specify must exactly match the subnet's CIDR block for information to be returned for the subnet. You can also use `cidr-block` or `cidr-block` as the filter names.

- **defaultForAz**: Indicates whether this is the default subnet for the Availability Zone. You can also use `default-for-az` as the filter name.

- **ipv6-cidr-block-association.ipv6-cidr-block**: An IPv6 CIDR block associated with the subnet.

- **ipv6-cidr-block-association.association-id**: An association ID for an IPv6 CIDR block associated with the subnet.

- **ipv6-cidr-block-association.state**: The state of an IPv6 CIDR block associated with the subnet.

- **state**: The state of the subnet (`pending` | `available`).

- **subnet-id**: The ID of the subnet.

- **tag**: The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag `Purpose=X`, specify `tag:Purpose` for the filter name and `X` for the filter value.

- **tag-key**: The key of a tag assigned to the resource. This filter is independent of the `tag-value` filter. For example, if you use both the filter `\tag-key=Purpose\` and the filter `\tag-value=X\`, you get any resources assigned both the tag key `Purpose` (regardless of what the tag's value is), and the tag value `X` (regardless of what the tag's key is).

- **vpc-id**: The ID of the VPC for the subnet.

You can also use the filter `availability-zone` as the filter name.
information to be returned for the subnet. You can also use `<code>cidr</code>` or `<code>cidr-block</code>` as the filter names. `<p>` `<li>` `<p>` `<code>defaultForAz</code>` - Indicates whether this is the default subnet for the Availability Zone. You can also use `<code>default-for-az</code>` as the filter name. `<p>` `<li>` `<p>` `<code>ipv6-cidr-block-association.ipv6-cidr-block</code>` - An IPv6 CIDR block associated with the subnet. `<p>` `<li>` `<p>` `<code>ipv6-cidr-block-association.association-id</code>` - An association ID for an IPv6 CIDR block associated with the subnet. `<p>` `<li>` `<p>` `<code>ipv6-cidr-block-association.state</code>` - The state of an IPv6 CIDR block associated with the subnet. `<p>` `<li>` `<p>` `<code>tag</code>`: `<i>key</i>`=`<i>value</i>` - The key/value combination of a tag assigned to the resource. Specify the key of the tag in the filter name and the value of the tag in the filter value. For example, for the tag Purpose=X, specify `<code>tag:Purpose</code>` for the filter name and `<code>X</code>` for the filter value. `<p>` `<li>` `<p>` `<code>tag-key</code>` - The key of a tag assigned to the resource. This filter is independent of the `<code>tag-value</code>` filter. For example, if you use both the filter `\"tag-key=Purpose\"` and the filter `\"tag-value=X\"`, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the `<code>tag</code>`: `<i>key</i>`=`<i>value</i>` filter. `<p>` `<li>` `<p>` `<code>tag-value</code>` - The value of a tag assigned to the resource. This filter is independent of the `<code>tag-key</code>` filter. If you want to list only resources where Purpose is X, you use both the filters `\"tag-key=Purpose\"` and `\"tag-value=X\"`.`
is X, see the \(<code>tag<code>::<i>key</i>=<i>value</i></code>\) filter.\(<p></li><i>p</i> \(<code>tag-values</code>\) - The value of a tag assigned to the resource.
