protected void condition(A container for describing a condition that must be met for the specified redirect to apply. For example, 1. If request is for pages in the <code>/docs</code> folder, redirect to the <code>/documents</code> folder. 2. If request results in HTTP error 4xx, redirect request to another host where you might process the error.

@returns Returns a reference to this object so that method calls can be chained together.

public <code>Condition</code> getCondition()

@deprecated Use <code>Condition</code>.

A container for describing a condition that must be met for the specified redirect to apply. For example, 1. If request is for pages in the <code>/docs</code> folder, redirect to the <code>/documents</code> folder. 2. If request results in HTTP error 4xx, redirect request to another host where you might process the error.

A container for describing a condition that must be met for the specified redirect to apply. For example, 1. If request is for pages in the <code>/docs</code> folder, redirect to the <code>/documents</code> folder. 2. If request results in HTTP error 4xx, redirect request to another host where you might process the error.

Returns true if the Condition property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.

hasCondition()

A container for describing a condition that must be met for the specified redirect to apply. For example, 1. If request is for pages in the <code>/docs</code> folder, redirect to the <code>/documents</code> folder. 2. If request results in HTTP error 4xx, redirect request to another host where you might process the error.

A container for describing a condition that must be met for the specified redirect to apply. For example, 1. If request is for pages in the <code>/docs</code> folder, redirect to the <code>/documents</code> folder. 2. If request results in HTTP error 4xx, redirect request to another host where you might process the error.

A container for describing a condition that must be met for the specified redirect to apply. For example, 1. If request is for pages in the <code>/docs</code> folder, redirect to the <code>/documents</code> folder. 2. If request results in HTTP error 4xx, redirect request to another host where you might process the error.

A container for describing a condition that must be met for the specified redirect to apply. For example, 1. If request is for pages in the <code>/docs</code> folder, redirect to the <code>/documents</code> folder. 2. If request results in HTTP error 4xx, redirect request to another host where you might process the error.
A container for describing a condition that must be met for the specified redirect to apply. For example, 1. If request is for pages in the <code>/docs</code> folder, redirect to the <code>/documents</code> folder. 2. If request results in HTTP error 4xx, redirect request to another host where you might process the error.

If request results in HTTP error 4xx, redirect request to another host where you might process the error.

This is a convenience that creates an instance of the `Condition.Builder` avoiding the need to create one manually via `Condition.Builder()`. When the `Condition.Builder#build()` is called immediately and its result is passed to `#condition(Condition)`. Returns a reference to this object so that method calls can be chained together.

A container for describing a condition that must be met for the specified redirect to apply. For example, 1. If request is for pages in the `/docs` folder, redirect to the `/documents` folder. 2. If request results in HTTP error 4xx, redirect request to another host where you might process the error.

Use `#condition(Condition)`.

A container for describing a condition that must be met for the specified redirect to apply. For example, 1. If request is for pages in the `/docs` folder, redirect to the `/documents` folder. 2. If request results in HTTP error 4xx, redirect request to another host where you might process the error.

- **Amazon S3 error codes**:
  - **Code:** AccessDenied
    - **Description:** Access Denied
    - **HTTP Status Code:** 403 Forbidden
    - **SOAP Fault Code Prefix:** Client

  - **Code:** AccountProblem
    - **Description:** There is a problem with your AWS account that prevents the operation from completing successfully. Contact AWS Support for further assistance.
    - **HTTP Status Code:** 403 Forbidden
      - **SOAP Fault Code Prefix:** Client

  - **Code:** AllAccessDisabled
    - **Description:** All access to this Amazon S3 resource has been disabled. Contact AWS Support for further assistance.

  - **Code:** AmbiguousGrantByEmailAddress
    - **Description:** The email address you provided is associated with more than one account.

  - **Code:** AuthorizationHeaderMalformed
    - **Description:** The authorization header you provided is invalid.

  - **Code:** BadDigest
    - **Description:** The Content-MD5 you specified did not match what we received.

  - **Code:** BadRequest
    - **Description:** The Content-MD5 you specified did not match what we received.
The bucket you tried to create already exists, and you own it. Amazon S3 returns this error in all AWS Regions except in the North Virginia Region. For legacy compatibility, if you re-create an existing bucket that you already own in the North Virginia Region, Amazon S3 returns 200 OK and resets the bucket access control lists (ACLs).

- **http status code:** 409 Conflict (in all Regions except the North Virginia Region)

  - **Description:** The bucket you tried to delete is not empty.

  - **http status code:** 400 Bad Request

  - **Description:** Your proposed upload is smaller than the minimum allowed object size.

  - **http status code:** 400 Bad Request

  - **Description:** You did not provide the number of bytes specified by the Content-Length HTTP header.

  - **http status code:** 400 Bad Request

  - **Description:** You must specify the Anonymous role.

- **http status code:** 403 Forbidden

  - **Description:** Your proposed upload exceeds the maximum allowed size.

- **http status code:** 403 Forbidden

  - **Description:** Indicates that the versioning configuration specified in the request is invalid.

  - **http status code:** 400 Bad Request

  - **Description:** We encountered an internal error. Please try again.

  - **http status code:** 500 Internal Server Error

  - **Description:** The request is not valid with the current state of the bucket.
<p>HTTP Status Code: 400 Bad Request</p>

- **Code:** InvalidRequest
- **Description:** The SOAP request body is invalid.

- **Code:** InvalidSecurity
- **Description:** The provided security credentials are not valid.

- **Code:** InvalidStorageClass
- **Description:** The storage class you specified is not valid.

- **Code:** InvalidToken
- **Description:** The provided token is malformed or otherwise invalid.

- **Code:** MalformedACELError
- **Description:** The XML you provided was not well-formed or did not validate against our published schema.

- **Code:** MalformedPOSTRequest
- **Description:** The body of your POST request is not well-formed multipart/form-data.

- **Code:** MalformedXML
- **Description:** This happens when the user sends malformed XML (XML that doesn't conform to the published XSD) for the configuration. The error message is, "The XML you provided was not well-formed or did not validate against our published schema."

- **Code:** MaxMessageLengthExceeded
- **Description:** Your request was too big.

- **Code:** MissingAttachment
- **Description:** A SOAP attachment was expected, but none were found.

- **Code:** MissingContentLength
- **Description:** You must provide the Content-Length HTTP header.
Code Prefix: Client

Description: This happens when the user sends an empty XML document as a request. The error message is, "Request body is empty." 

Description: Your request is missing a required header.

Description: There is no such thing as a logging status subresource for a key.

Description: The lifecycle configuration does not exist.

Description: Indicates that the version ID specified in the request does not match an existing version.

Description: A header you provided implies functionality that is not implemented.

Description: Your account is not signed up for the Amazon S3 service. You must sign up before you can use Amazon S3. You can sign up at the following URL: https://aws.amazon.com/s3

Description: A conflicting conditional operation is currently in progress against this resource. Try again.

Description: At least one of the preconditions you specified did not hold.

Description: The SOAP 1.1 request is missing a security element.

Description: The specified bucket does not have a bucket policy.

Description: The specified key does not exist.

Description: The lifecycle configuration does not exist.

Description: There is no such thing as a logging status for a key.

Description: The specified bucket does not have a bucket policy.

Description: The specified multipart upload does not exist. The upload ID might be invalid, or the multipart upload might have been aborted or completed.

Description: A conflicting conditional operation is currently in progress against this resource. Try again.

Description: The bucket you are attempting to access must be addressed using the specified endpoint. Send all future requests to this endpoint.

This is a convenience that creates an instance of the {@link String.Builder} avoiding the need to create one manually via {@link String#builder()}.\n\nWhen the {@link Consumer} completes, the result is passed to {#code(String)}\n\n\n"deprecated" : false,
"deprecatedBeanStyleSetterMethodName" : null,
"deprecatedFluentGetterMethodName" : null,
The error code is a string that uniquely identifies an error condition. It is meant to be read and understood by programs that detect and handle errors by type. <p>

Amazon S3 error codes:

- **Code:** AccessDenied
  - **Description:** Access Denied
  - **HTTP Status Code:** 403 Forbidden
  - **SOAP Fault Code Prefix:** Client

- **Code:** AllAccessDisabled
  - **Description:** There is a problem with your AWS account that prevents the operation from completing successfully. Contact AWS Support for further assistance.
  - **HTTP Status Code:** 403 Forbidden
  - **SOAP Fault Code Prefix:** Client

- **Code:** AccountProblem
  - **Description:** The email address you provided is associated with more than one account.
  - **HTTP Status Code:** 403 Forbidden
  - **SOAP Fault Code Prefix:** Client

- **Code:** AuthorizationHeaderMalformed
  - **Description:** The authorization header you provided is invalid.
  - **HTTP Status Code:** 400 Bad Request
  - **SOAP Fault Code Prefix:** Client

- **Code:** BadDigest
  - **Description:** The Content-MD5 you specified did not match what we received.
  - **HTTP Status Code:** 400 Bad Request
  - **SOAP Fault Code Prefix:** Client

- **Code:** BucketAlreadyExists
  - **Description:** The requested bucket name is not available. The bucket namespace is shared by all users of the system. Please select a different name and try again.
  - **HTTP Status Code:** 409 Conflict
  - **SOAP Fault Code Prefix:** Client

- **Code:** BucketAlreadyOwnedByYou
  - **Description:** The bucket you tried to create already exists, and you own it. Amazon S3 returns this error in all AWS Regions except in the North Virginia Region. For legacy compatibility, if you re-create an existing bucket that you already own in the North Virginia Region, Amazon S3 returns 200 OK and resets the bucket access control lists (ACLs).

- **Code:**CredentialsNotSupported
  - **Description:** This request does not support credentials.
  - **HTTP Status Code:** 400 Bad Request
  - **SOAP Fault Code Prefix:** Client

- **Code:** CrossLocationLoggingProhibited
  - **Description:** Buckets in one geographic location cannot log information to a bucket in another location.

- **Code:**EntityTooSmall
  - **Description:** Your proposed upload is smaller than the minimum allowed object size.
  - **HTTP Status Code:** 400 Bad Request
  - **SOAP Fault Code Prefix:** Client

- **Code:**EntityTooLarge
  - **Description:** Your proposed upload exceeds the maximum allowed object size.
  - **HTTP Status Code:** 400 Bad Request
  - **SOAP Fault Code Prefix:** Client

- **Code:**ExpiredToken
  - **Description:** The provided token has expired.
  - **HTTP Status Code:** 400 Bad Request
  - **SOAP Fault Code Prefix:** Client

HTTP Status Code: 403 Forbidden
SOAP Fault Code Prefix: Client
Description: All access to this Amazon S3 resource has been disabled. Contact AWS Support for further assistance.
Description: The email address you provided is associated with more than one account.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
Description: The authorization header you provided is invalid.
HTTP Status Code: 409 Conflict
SOAP Fault Code Prefix: Client
Description: This request does not support credentials.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
Description: The bucket you tried to create already exists, and you own it. Amazon S3 returns this error in all AWS Regions except in the North Virginia Region. For legacy compatibility, if you re-create an existing bucket that you already own in the North Virginia Region, Amazon S3 returns 200 OK and resets the bucket access control lists (ACLs).
HTTP Status Code: 409 Conflict (in all Regions except the North Virginia Region)
SOAP Fault Code Prefix: Client
Description: The bucket you tried to delete is not empty.
HTTP Status Code: 409 Conflict
SOAP Fault Code Prefix: Client
Description: Your proposed upload is smaller than the minimum allowed object size.
HTTP Status Code: 409 Conflict
SOAP Fault Code Prefix: Client
Description: Your proposed upload exceeds the maximum allowed object size.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
Description: The provided token has expired.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
Description: The versioning configuration specified in the request is invalid.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
Description: You did not provide the number of bytes specified by the Content-Length HTTP header.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
Description: POST requires exactly one file upload per request.
Code: 400 Bad Request

Amazon S3 Transfer Acceleration is not supported on this bucket. Contact AWS Support for more information.

HTTP Status Code: 403 Forbidden

Description: InvalidSecurity

Description: The provided security credentials are not valid.

HTTP Status Code: 403 Forbidden

Description: The SOAP request body is invalid.

HTTP Status Code: 400 Bad Request

Description: Amazon S3 Transfer Acceleration endpoint only supports virtual style requests.

HTTP Status Code: 400 Bad Request

Description: Amazon S3 Transfer Acceleration is not configured on this bucket.

HTTP Status Code: 400 Bad Request

Description: Amazon S3 Transfer Acceleration cannot be enabled on this bucket. Contact AWS Support for more information.

HTTP Status Code: 400 Bad Request

Description: The provided security credentials are not valid.

HTTP Status Code: 400 Bad Request

Description: The storage class you specified is not valid.

HTTP Status Code: 400 Bad Request

Description: The target bucket for logging does not exist, is not owned by you, or does not have the appropriate grants for the log-delivery group.

HTTP Status Code: 400 Bad Request

Description: The XML you provided was not well-formed or did not validate against our published schema.

HTTP Status Code: 400 Bad Request

Description: The body of your POST request is not well-formed multipart/form-data.

HTTP Status Code: 400 Bad Request

Description: The XML you provided was not well-formed or did not validate against our published schema. The error message is, "The XML you provided was not well-formed or did not validate against our published schema."

- HTTP Status Code: 400 Bad Request
- Code: InvalidRequest
- Description: Amazon S3 Transfer Acceleration cannot be enabled on this bucket. Contact AWS Support for more information.

- HTTP Status Code: 403 Forbidden
- Code: InvalidSecurity
- Description: The storage class you specified is not valid.

- HTTP Status Code: 400 Bad Request
- Code: InvalidTargetBucketForLogging
- Description: The target bucket for logging does not exist, is not owned by you, or does not have the appropriate grants for the log-delivery group.

- HTTP Status Code: 400 Bad Request
- Code: InvalidToken
- Description: The provided token is malformed or otherwise invalid.

- HTTP Status Code: 400 Bad Request
- Code: MalformedPOSTRequest
- Description: The body of your POST request is not well-formed multipart/form-data.

- HTTP Status Code: 400 Bad Request
- Code: MalformedXML
- Description: This happens when the user sends malformed XML (XML that doesn't conform to the published XSD) for the configuration. The error message is, "The XML you provided was not well-formed or did not validate against our published schema."
Code Prefix: Client

Description: This happens when the user sends an empty XML document as a request. The error message is, "Request body is empty." 

Description: Your request is missing a required header.

Description: There is no such thing as a logging status subresource for a key.

Description: The lifecycle configuration does not exist.

Description: A conflicting conditional operation is currently in progress against this resource. Try again.

Description: The bucket you are attempting to access must be addressed using the specified endpoint. Send all future requests to this endpoint.

Description: At least one of the preconditions you specified did not hold.

Description: At least one of the preconditions you specified did not hold.

Description: The specified bucket does not exist.

Description: A bucket policy has been set on the bucket.

Description: The specified multipart upload does not exist. The upload ID might be invalid, or the multipart upload might have been aborted or completed.

Description: Indicates that the version ID specified in the request does not match an existing version.

Description: A header you provided implies functionality that is not implemented.

Description: Your account is not signed up for the Amazon S3 service. You must sign up before you can use Amazon S3. You can sign up at the following URL: https://aws.amazon.com/s3

Description: The specified bucket does not have a bucket policy.

Description: The specified key does not exist.

Description: The SOAP 1.1 request is missing a security element.

Description: The SOAP 1.1 request is missing a security element.

Description: The SOAP 1.1 request is missing a security element.

Description: The SOAP 1.1 request is missing a security element.

Description: The SOAP 1.1 request is missing a security element.

Description: The SOAP 1.1 request is missing a security element.

Description: The SOAP 1.1 request is missing a security element.

Description: The SOAP 1.1 request is missing a security element.

Description: The SOAP 1.1 request is missing a security element.

Description: The SOAP 1.1 request is missing a security element.

Description: The SOAP 1.1 request is missing a security element.
Amazon S3 error codes

- **AccessDenied**
  - Description: Access Denied
  - HTTP Status Code: 403 Forbidden
  - SOAP Fault Code Prefix: Client

- **AccountProblem**
  - Description: There is a problem with your AWS account that prevents the operation from completing successfully. Contact AWS Support for further assistance.
  - HTTP Status Code: 403 Forbidden
  - SOAP Fault Code Prefix: Client

- **AllAccessDisabled**
  - Description: The bucket POST must contain the specified field name. If it is specified, check the order of the fields.
  - HTTP Status Code: 400 Bad Request
  - SOAP Fault Code Prefix: Client

- **IndexCode:**
  - Description: The error code is a string that uniquely identifies an error condition. It is meant to be read and understood by programs that detect and handle errors by type.
  - HTTP Status Code: 400 Bad Request
  - SOAP Fault Code Prefix: Client
  - HTTP Status Code: 404 Not Found
  - SOAP Fault Code Prefix: Client

- **UserKeyMustBeSpecified**
  - Description: The email address you provided does not match any account on record.
  - HTTP Status Code: 400 Bad Request
  - SOAP Fault Code Prefix: Client

- **UnresolvableGrantByEmailAddress**
  - Description: The email address you provided does not match any account on record.
  - HTTP Status Code: 400 Bad Request
  - SOAP Fault Code Prefix: Client

- **UserKeyMustBeSpecified**
  - Description: The bucket POST must contain the specified field name. If it is specified, check the order of the fields.
  - HTTP Status Code: 400 Bad Request
  - SOAP Fault Code Prefix: Client

- **SignatureDoesNotMatch**
  - Description: The request signature we calculated does not match the signature you provided. Check your AWS secret access key and signing method. For more information, see [REST Authentication](https://docs.aws.amazon.com/AWSS3/latest/dev/RESTAuthentication.html)
  - HTTP Status Code: 403 Forbidden
  - SOAP Fault Code Prefix: Client

We encountered an internal error. Please try again.

**HTTP Status Code:** 500 Internal Server Error

**Description:** The AWS access key ID you provided does not exist in our records.

**HTTP Status Code:** 403 Forbidden

**Description:** The specified bucket is not valid.

**HTTP Status Code:** 400 Bad Request

**Description:** The encryption request you specified is not valid. The valid value is AES256.

**Description:** The content of the form does not meet the conditions specified in the policy document.

**Description:** The requested range cannot be satisfied.

**HTTP Status Code:** 416 Requested Range Not Satisfiable

**Description:** The operation is not valid for the current state of the object.

**HTTP Status Code:** 403 Forbidden

**Description:** One or more of the specified parts could not be found. The part might not have been uploaded, or the specified entity tag might not have matched the part's entity tag.
Amazon S3 Transfer Acceleration is not supported for buckets with non-DNS compliant names. This means that the bucket name must be a valid domain name as per DNS standards. The error message states that Amazon S3 Transfer Acceleration is not supported for buckets with periods (.) in their names.

HTTP Status Code: 400 Bad Request

Description: The provided request body is invalid. The provided security credentials are not valid.

HTTP Status Code: 400 Bad Request

Description: The target bucket for logging does not exist, is not owned by you, or does not have the appropriate grants for the log-delivery group.

HTTP Status Code: 400 Bad Request

Description: The body of your POST request is not well-formed multipart/form-data. The body of your POST request is not well-formed multipart/form-data.

HTTP Status Code: 400 Bad Request

Description: The XML you provided was not well-formed or did not validate against our published schema. The XML you provided was not well-formed or did not validate against our published schema.

HTTP Status Code: 400 Bad Request

Description: Your request was too big.

Description: TooManyBuckets

SOAP Fault Code Prefix: Client

HTTP Status Code: 400 Bad Request

Description: TokenRefreshRequired

SOAP Fault Code Prefix: Client

HTTP Status Code: 409 Conflict

Description: The bucket you have attempted to access must be refreshed.

SOAP Fault Code Prefix: Client

HTTP Status Code: 400 Bad Request

Description: You have attempted to create more buckets than allowed.

SOAP Fault Code Prefix: Client

HTTP Status Code: 400 Bad Request

Description: This request does not support content.

SOAP Fault Code Prefix: Client

HTTP Status Code: 400 Bad Request

Description: The email address you provided does not match any account on record.
<p><i>SOAP Fault Code Prefix:</i> Client</p> 

### Amazon S3 error codes

1. **AccessDenied**
   - **Description:** Access Denied
   - **HTTP Status Code:** 403 Forbidden
   - **SOAP Fault Code Prefix:** Client

2. **AccountProblem**
   - **Description:** There is a problem with your AWS account that prevents the operation from completing successfully. Contact AWS Support for further assistance.
   - **HTTP Status Code:** 403 Forbidden
   - **SOAP Fault Code Prefix:** Client

3. **AllAccessDisabled**
   - **Description:** All access to this Amazon S3 resource has been disabled. Contact AWS Support for further assistance.
   - **HTTP Status Code:** 403 Forbidden
   - **SOAP Fault Code Prefix:** Client

4. **AmbiguousGrantByEmailAddress**
   - **Description:** The email address you provided is associated with more than one account.
   - **HTTP Status Code:** 400 Bad Request
   - **SOAP Fault Code Prefix:** Client

5. **AuthorizationHeaderMalformed**
   - **Description:** The authorization header you provided is invalid.
   - **HTTP Status Code:** 400 Bad Request
   - **SOAP Fault Code Prefix:** Client

6. **BadDigest**
   - **Description:** The Content-MD5 you specified did not match what we received.
   - **HTTP Status Code:** 400 Bad Request
   - **SOAP Fault Code Prefix:** Client

7. **BucketAlreadyExists**
   - **Description:** The bucket you tried to create already exists, and you own it. Amazon S3 returns this error in all AWS Regions except in the North Virginia Region. For legacy compatibility, if you re-create an existing bucket that you already own in the North Virginia Region, Amazon S3 returns 200 OK and resets the bucket access control lists (ACLs).
   - **HTTP Status Code:** 409 Conflict
   - **SOAP Fault Code Prefix:** Client

8. **BucketAlreadyOwnedByYou**
   - **Description:** The bucket you tried to create already exists, and you own it. Amazon S3 returns this error in all AWS Regions except in the North Virginia Region. For legacy compatibility, if you re-create an existing bucket that you already own in the North Virginia Region, Amazon S3 returns 200 OK and resets the bucket access control lists (ACLs).
   - **HTTP Status Code:** 409 Conflict
   - **SOAP Fault Code Prefix:** Client

9. **CrossLocationLoggingProhibited**
   - **Description:** Cross-location logging not allowed. Buckets in one geographic location cannot log information to a bucket in another location.
   - **HTTP Status Code:** 403 Forbidden
   - **SOAP Fault Code Prefix:** Client

10. **EntityTooSmall**
    - **Description:** Your proposed upload is smaller than the minimum allowed object size.
    - **HTTP Status Code:** 400 Bad Request
    - **SOAP Fault Code Prefix:** Client

11. **EntityTooLarge**
    - **Description:** Your proposed upload exceeds the maximum allowed object size.
    - **HTTP Status Code:** 400 Bad Request
    - **SOAP Fault Code Prefix:** Client

12. **ExpiredToken**
    - **Description:** The provided token has expired.
    - **HTTP Status Code:** 400 Bad Request

13. **UserKeyMustBeSpecified**
    - **Description:** The bucket POST must contain the specified field name. If it is specified, check the order of the fields.
    - **HTTP Status Code:** 400 Bad Request
    - **SOAP Fault Code Prefix:** Client

14. **AccessDenied**
    - **Description:** Access Denied
    - **HTTP Status Code:** 403 Forbidden
    - **SOAP Fault Code Prefix:** Client

15. **BadDigest**
    - **Description:** The Content-MD5 you specified did not match what we received.
    - **HTTP Status Code:** 400 Bad Request
    - **SOAP Fault Code Prefix:** Client

16. **BucketAlreadyExists**
    - **Description:** The bucket you tried to create already exists, and you own it. Amazon S3 returns this error in all AWS Regions except in the North Virginia Region. For legacy compatibility, if you re-create an existing bucket that you already own in the North Virginia Region, Amazon S3 returns 200 OK and resets the bucket access control lists (ACLs).
    - **HTTP Status Code:** 409 Conflict
    - **SOAP Fault Code Prefix:** Client

17. **BucketAlreadyOwnedByYou**
    - **Description:** The bucket you tried to create already exists, and you own it. Amazon S3 returns this error in all AWS Regions except in the North Virginia Region. For legacy compatibility, if you re-create an existing bucket that you already own in the North Virginia Region, Amazon S3 returns 200 OK and resets the bucket access control lists (ACLs).
    - **HTTP Status Code:** 409 Conflict
    - **SOAP Fault Code Prefix:** Client

18. **CrossLocationLoggingProhibited**
    - **Description:** Cross-location logging not allowed. Buckets in one geographic location cannot log information to a bucket in another location.
    - **HTTP Status Code:** 403 Forbidden
    - **SOAP Fault Code Prefix:** Client

19. **EntityTooSmall**
    - **Description:** Your proposed upload is smaller than the minimum allowed object size.
    - **HTTP Status Code:** 400 Bad Request
    - **SOAP Fault Code Prefix:** Client

20. **EntityTooLarge**
    - **Description:** Your proposed upload exceeds the maximum allowed object size.
    - **HTTP Status Code:** 400 Bad Request
    - **SOAP Fault Code Prefix:** Client

21. **ExpiredToken**
    - **Description:** The provided token has expired.
    - **HTTP Status Code:** 400 Bad Request
    - **SOAP Fault Code Prefix:** Client

The error message contains a generic description of the error condition in English. It is intended for a human audience. Simple programs display the message directly to the end user if they encounter an error condition they don’t know how or don’t care to handle. Sophisticated programs with more exhaustive error handling and proper internationalization are more likely to ignore the error message. This is a convenience that creates an instance of the String.Builder avoiding the need to create one manually via String.Builder().

When the Consumer completes, when(String,Consumer) is called immediately and its result is passed to when(String).@param message a consumer that will call methods on String.Builder\n@returns a reference to this object so that method calls can be chained together.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

KeyTooLongError

Your key is too long.

The XML you provided was not well-formed or did not validate against our published schema.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: KeyTooLongError

Description: Your key is too long.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: MalformedACLError

Description: This happens when the user sends malformed XML (XML that doesn't conform to the published XSD) for the configuration. The error message is, "The XML you provided was not well-formed or did not validate against our published schema."

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: MalformedPOSTRequest

Description: The body of your POST request is not well-formed multipart/form-data.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: MalformedXML

Description: This happens when the user sends malformed XML (XML that doesn't conform to the published XSD) for the configuration. The error message is, "The XML you provided was not well-formed or did not validate against our published schema."

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: MaxMessageLengthExceeded

Description: Your request was too big.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: MaxPostPreDataLengthExceededError

Description: Your POST request fields preceding the upload file were too large.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: MetadataTooLarge

Description: Your metadata headers exceed the maximum allowed metadata size.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: MissingAttachment

Description: A SOAP attachment was expected, but none were found.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: MissingContentLength

Description: You must provide the Content-Length HTTP header.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: MissingSecurityElement

Description: The SOAP 1.1 request is missing a security element.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: MissingSecurityHeader

Description: Your request is missing a required header.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: NoLoggingStatusForKey

Description: There is no such thing as a logging status subresource for a key.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: NoSuchBucket

Description: The specified bucket does not exist.

HTTP Status Code: 404 Not Found

SOAP Fault Code Prefix: Client

Code: NoSuchBucketPolicy

Description: The specified bucket does not have a bucket policy.

HTTP Status Code: 404 Not Found

SOAP Fault Code Prefix: Client

Code: NoSuchKey

Description: The specified key does not exist.
Status Code: <i>404 Not Found</i><br />

Description: The lifecycle configuration does not exist. The specified multipart upload does not exist. The upload ID might be invalid, or the multipart upload might have been aborted or completed.<br />

Amazon S3 Transfer Accelerate is not configured on this bucket.

HTTP Status Code: 400 Bad Request

Description: Amazon S3 Transfer Accelerate is not configured on this bucket.

HTTP Status Code: 400 Bad Request

Description: Amazon S3 Transfer Acceleration cannot be enabled on this bucket. Contact AWS Support for more information.

HTTP Status Code: 400 Bad Request

Description: The target bucket for logging does not exist, is not owned by you, or does not have the appropriate grants for the log-delivery group.

HTTP Status Code: 400 Bad Request

Description: The SOAP request body is invalid.

HTTP Status Code: 400 Bad Request

Description: The SOAP request body is invalid.

HTTP Status Code: 400 Bad Request

Description: The provided security credentials are not valid.

HTTP Status Code: 400 Bad Request

Description: The provided token is malformed or otherwise invalid.

HTTP Status Code: 400 Bad Request

Description: Your key is too long.

HTTP Status Code: 400 Bad Request

Description: The XML you provided was not well-formed or did not validate against our published schema.

HTTP Status Code: 400 Bad Request

Description: The body of your POST request is not well-formed multipart/form-data.

HTTP Status Code: 400 Bad Request

Description: Your POST request fields preceding the upload file were too large.

HTTP Status Code: 400 Bad Request

Description: Your POST request fields preceding the upload file were too large.

HTTP Status Code: 400 Bad Request

Description: Your POST request fields preceding the upload file were too large.

HTTP Status Code: 400 Bad Request

Description: Your POST request fields preceding the upload file were too large.

HTTP Status Code: 400 Bad Request

Description: The specified method is not allowed against this resource.
Status Code: 405 Method Not Allowed

Description: A SOAP attachment was expected, but none were found.

SOAP Fault Code Prefix: SOAP Fault Code Prefix:
SOAP Fault Code: MissingAttachment

HTTP Status Code: N/A

Description: This happens when the user sends an empty XML document as a request. The error message is, "Request body is empty."

SOAP Fault Code Prefix: SOAP Fault Code Prefix:
SOAP Fault Code: MissingRequestBodyError

HTTP Status Code: 404 Bad Request

Description: The SOAP 1.1 request is missing a security element.

SOAP Fault Code Prefix: SOAP Fault Code Prefix:
SOAP Fault Code: MissingSecurityElement

HTTP Status Code: 404 Not Found

Description: The lifecycle configuration does not exist.

SOAP Fault Code Prefix: SOAP Fault Code Prefix:
SOAP Fault Code: NoSuchLifecycleConfiguration

HTTP Status Code: 404 Not Found

Description: The bucket you are attempting to access must be addressed using the specified endpoint. Send all future requests to this endpoint.

SOAP Fault Code Prefix: SOAP Fault Code Prefix:
SOAP Fault Code: PermanentRedirect

HTTP Status Code: 301 Moved Permanently

Description: Your account is not signed up for the Amazon S3 service. You must sign up before you can use Amazon S3. You can sign up at the following URL: https://aws.amazon.com/s3

SOAP Fault Code Prefix: SOAP Fault Code Prefix:
SOAP Fault Code: NotSignedUp

HTTP Status Code: 403 Forbidden

Description: At least one of the preconditions you specified did not hold.
HTTP Status Code: 412 Precondition Failed

SOAP Fault Code Prefix: i>HTTP Status Code: 307 Moved Temporarily

Description: Object restore is already in progress.

HTTP Status Code: 409 Conflict

Description: Your socket connection to the server was not read from or written to within the timeout period.

HTTP Status Code: 400 Bad Request

Description: The request time and the server's time is too large.

HTTP Status Code: 403 Forbidden

Description: Reduce your request rate.

HTTP Status Code: 503 Service Unavailable

Description: You are being redirected to the bucket while DNS updates.

HTTP Status Code: 307 Moved Temporarily

Description: You have attempted to create more buckets than allowed.

HTTP Status Code: 400 Bad Request

Description: This request does not support content.

HTTP Status Code: 400 Bad Request

Description: The bucket POST must contain the specified field name. If it is specified, check the order of the fields.

HTTP Status Code: 400 Bad Request

Description: The request signature we calculated does not match the signature you provided. Check your AWS secret access key and signing method. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/RESTAuthentication.html"">REST Authentication</a> and <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/SOAPAuthentication.html">SOAP Authentication</a> for details.

HTTP Status Code: 400 Bad Request

Description: The provided token must be refreshed.

HTTP Status Code: 400 Bad Request

Description: The email address you provided does not match any account on record.

HTTP Status Code: 400 Bad Request

Description: The bucket POST must contain the specified field name. It is meant to be read and understood by programs that detect and handle errors by type.
MalformedXML

Description:
This happens when the user sends malformed XML (XML that doesn't conform to the published XSD) for the configuration. The error message is, "The XML you provided was not well-formed or did not validate against our published schema."
<i>Code:</i> NotImplemented

<i>Description:</i> A header you provided implies functionality that is not implemented.

- **HTTP Status Code:** 412 Precondition Failed

- **SOAP Fault Code Prefix:** Client

- **Description:** The bucket you are attempting to access must be addressed using the specified endpoint. Send all future requests to this endpoint.

- **HTTP Status Code:** 501 Not Implemented

- **SOAP Fault Code Prefix:** Client

- **Description:** A header you provided implies functionality that is not implemented.

- **HTTP Status Code:** 500 Internal Server Error

- **SOAP Fault Code Prefix:** Client

- **Description:** The server encountered an unexpected condition which prevented it from fulfilling the request.

- **HTTP Status Code:** 503 Service Unavailable

- **SOAP Fault Code Prefix:** Client

- **Description:** The server is temporarily unable to service the request because it is overloaded or is undergoing maintenance.

- **HTTP Status Code:** 504 Gateway Timeout

- **SOAP Fault Code Prefix:** Client

- **Description:** The gateway did not receive a valid response from the upstream server.

- **HTTP Status Code:** 505 HTTP Version Not Supported

- **SOAP Fault Code Prefix:** Client

- **Description:** The server does not support the HTTP version that was used in the request.

- **HTTP Status Code:** 506 Premature Closure

- **SOAP Fault Code Prefix:** Client

- **Description:** The server is unable to complete the request because it was closed before it could be processed.

- **HTTP Status Code:** 507 Insufficient Storage

- **SOAP Fault Code Prefix:** Client

- **Description:** The server is unable to store the resource temporarily required to complete the request.

- **HTTP Status Code:** 510 Not Extended

- **SOAP Fault Code Prefix:** Client

- **Description:** The server does not support the list of media types provided in the Accept header.

- **HTTP Status Code:** 511 Network Authentication Required

- **SOAP Fault Code Prefix:** Client

- **Description:** The server requires authentication from the client before fulfilling the request.

- **HTTP Status Code:** 512 Precursor Required

- **SOAP Fault Code Prefix:** Client

- **Description:** The server is unable to complete the request because it requires a precursor request to be completed first.

- **HTTP Status Code:** 513 Insufficient Bandwidth

- **SOAP Fault Code Prefix:** Client

- **Description:** The server is unable to complete the request because it does not have enough available bandwidth.

- **HTTP Status Code:** 514 Request Payload Too Large

- **SOAP Fault Code Prefix:** Client

- **Description:** The server is unable to complete the request because the request payload is too large.

- **HTTP Status Code:** 520 Unimplemented

- **SOAP Fault Code Prefix:** Client

- **Description:** The server is unable to complete the request because it does not implement the functionality required by the request.

- **HTTP Status Code:** 521 MG-Media Gateway Unavailable

- **SOAP Fault Code Prefix:** Client

- **Description:** The server is unable to complete the request because the MG-Media Gateway is unavailable.

- **HTTP Status Code:** 522 Network Unavailable

- **SOAP Fault Code Prefix:** Client

- **Description:** The server is unable to complete the request because the network is unavailable.

Acceleration cannot be enabled on this bucket. Contact AWS Support for more information.  

- **HTTP Status Code:** 400 Bad Request  
  - **Code:** InvalidSecurity  
  - **Description:** The provided security credentials are not valid.  
  - **HTTP Status Code:** 403 Forbidden  
  - **SOAP Fault Code Prefix:** Client  

- **HTTP Status Code:** 400 Bad Request  
  - **Code:** InvalidStorageClass  
  - **Description:** The storage class you specified is not valid.  

- **HTTP Status Code:** 400 Bad Request  
  - **Code:** InvalidTargetBucketForLogging  
  - **Description:** The target bucket for logging does not exist, is not owned by you, or does not have the appropriate grants for the log-delivery group.  

- **HTTP Status Code:** 400 Bad Request  
  - **Code:** InvalidToken  
  - **Description:** The provided token is malformed or otherwise invalid.  

- **HTTP Status Code:** 400 Bad Request  
  - **Code:** InvalidURI  
  - **Description:** Couldn't parse the specified URI.  

- **HTTP Status Code:** 400 Bad Request  
  - **Code:** MalformedACLError  
  - **Description:** The XML you provided was not well-formed and did not validate against our published schema.  

- **HTTP Status Code:** 400 Bad Request  
  - **Code:** MaxMessageLengthExceeded  
  - **Description:** Your request was too big.  

- **HTTP Status Code:** 400 Bad Request  
  - **Code:** MaxPostPreDataLengthExceededError  
  - **Description:** Your POST request fields preceding the upload file were too large.  

- **HTTP Status Code:** 400 Bad Request  
  - **Code:** MetadataTooLarge  
  - **Description:** Your metadata headers exceed the maximum allowed metadata size.  

- **HTTP Status Code:** 400 Bad Request  
  - **Code:** MethodNotAllowed  
  - **Description:** The specified method is not allowed against this resource.  

- **HTTP Status Code:** 411 Length Required  
  - **Code:** MissingAttachment  
  - **Description:** A SOAP attachment was expected, but none were found.  

- **HTTP Status Code:** N/A  

- **HTTP Status Code:** 401 Unauthorized  
  - **Code:** MissingContentLength  
  - **Description:** You must provide the Content-Length HTTP header.  

- **HTTP Status Code:** 411 Length Required  
  - **Soap Fault Code Prefix:** Client  

- **HTTP Status Code:** N/A  
  - **Code:** MissingRequestBodyError  
  - **Description:** This happens when the user sends an empty XML document as a request.

SOAP Fault Code Prefix: Client

HTTP Status Code: 400 Bad Request

Description: Your key is too long.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Description: The body of your POST request is not well-formed multipart/form-data.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Description: The XML you provided was not well-formed or did not validate against our published schema.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Description: This happens when the user sends malformed XML (XML that doesn't conform to the published XSD) for the configuration. The error message is:

"The XML you provided was not well-formed or did not validate against our published schema."

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Description: Your request was too big.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Description: The specified method is not allowed against this resource.

HTTP Status Code: 405 Method Not Allowed

SOAP Fault Code Prefix: Client

Description: A SOAP attachment was expected, but none were found.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Description: Your metadata headers exceed the maximum allowed metadata size.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Description: The specified method is not allowed against this resource.

HTTP Status Code: 405 Method Not Allowed

SOAP Fault Code Prefix: Client

Description: A SOAP attachment was expected, but none were found.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Description: You must provide the Content-Length HTTP header.

HTTP Status Code: 411 Length Required

SOAP Fault Code Prefix: Client

Description: This happens when the user sends an empty XML document as a request. The error message is, "Request body is empty."

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Description: The SOAP 1.1 request is missing a security element.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Description: Your request is missing a required header.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Description: There is no such thing as a logging status subresource for a key.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Description: The specified bucket does not exist.

HTTP Status Code: 404 Not Found

SOAP Fault Code Prefix: Client

<i>Code:</i> NoSuchUpload

<i>Description:</i> The specified multipart upload does not exist. The upload ID might be invalid, or the multipart upload might have been aborted or completed. 
Prefix:<i>Client</i> &lt;i&gt;&lt;/i&gt; &lt;i&gt;&lt;/ul&gt;&lt;i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;Code:&lt;/i&gt; ServiceUnavailable&lt;/p&gt;&lt;i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;Description:&lt;/i&gt; Reduce your request rate.&lt;/p&gt;&lt;i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;HTTP Status Code:&lt;/i&gt; 503 Service Unavailable&lt;/p&gt;&lt;i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;SOAP Fault Code Prefix:&lt;/i&gt; Server&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;Description:&lt;/i&gt; Reduce your request rate.&lt;/p&gt;&lt;i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;HTTP Status Code:&lt;/i&gt; 503 Slow Down&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;SOAP Fault Code Prefix:&lt;/i&gt; Server&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;Description:&lt;/i&gt; You are being redirected to the bucket while DNS updates.&lt;/p&gt;&lt;i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;HTTP Status Code:&lt;/i&gt; 307 Moved Temporarily&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;SOAP Fault Code Prefix:&lt;/i&gt; Client&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;Description:&lt;/i&gt; This request does not support content.&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;HTTP Status Code:&lt;/i&gt; 400 Bad Request&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;SOAP Fault Code Prefix:&lt;/i&gt; Client&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;Description:&lt;/i&gt; The provided token must be refreshed.&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;HTTP Status Code:&lt;/i&gt; 400 Bad Request&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;SOAP Fault Code Prefix:&lt;/i&gt; Client&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;Description:&lt;/i&gt; The bucket POST must contain the specified field name. If it is specified, check the order of the fields.&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;HTTP Status Code:&lt;/i&gt; 400 Bad Request&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;SOAP Fault Code Prefix:&lt;/i&gt; Client&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;Description:&lt;/i&gt; The email address you provided does not match any account on record.&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;HTTP Status Code:&lt;/i&gt; 403 Forbidden&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;Description:&lt;/i&gt; Access Denied&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;HTTP Status Code:&lt;/i&gt; 403 Forbidden&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;Description:&lt;/i&gt; AllAccessDisabled.&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;Description:&lt;/i&gt; There is a problem with your AWS account that prevents the operation from completing successfully. Contact AWS Support for further assistance.&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;HTTP Status Code:&lt;/i&gt; 400 Bad Request&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;Description:&lt;/i&gt; The authorization header you provided is invalid.&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;HTTP Status Code:&lt;/i&gt; 400 Bad Request&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;Description:&lt;/i&gt; The Content-MD5 you specified did not match what we received.&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;HTTP Status Code:&lt;/i&gt; 400 Bad Request&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;Description:&lt;/i&gt; The requested bucket name is not available. The bucket namespace is shared by all users of the system. Please select a different name and try again.&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;HTTP Status Code:&lt;/i&gt; 409 Conflict&lt;/p&gt;&lt;/i&gt;&lt;/li&gt;&lt;i&gt;&lt;/p&gt;&lt;i&gt;Description:&lt;/i&gt; The bucket tried to create already exists, and you own it. Amazon S3 returns this error in all AWS Regions except in the North Virginia Region. For legacy compatibility, if you re-create an existing bucket that you already own in the North Virginia Region, Amazon S3 returns 200 OK and resets the
bucket access control lists (ACLs).

The encryption request you specified is not valid. The valid value is AES256.
MissingSecurityElement</p> 
</li> 
<li> <i>Description:</i> The SOAP 1.1 request is missing a security element.</li> 
<li> <i>Description:</i> Your request is missing a required header.</li> 
<li> <i>Description:</i> There is no such thing as a logging status subresource for a key.</li> 
<li> <i>Description:</i> The specified bucket does not exist.</li> 
<li> <i>Description:</i> The specified key does not exist.</li> 
<li> <i>Description:</i> The lifecycle configuration does not exist.</li> 
<li> <i>Description:</i> A header you provided implies functionality that is not implemented.</li> 
<li> <i>Description:</i> At least one of the preconditions you specified did not hold.</li> 
<li> <i>Description:</i> Object restore is already in progress. Send all future requests to this endpoint.</li> 
<li> <i>Description:</i> The bucket you are attempting to access must be addressed using the specified endpoint. Send all future requests to this endpoint.</li>

HTTP Status Code: 301 Moved Permanently

Description: At least one of the preconditions you specified did not hold.

HTTP Status Code: 409 Conflict

Description: Object restore is already in progress.

HTTP Status Code: 400 Bad Request

Description: The request signature we calculated does not match the signature you provided. Check your AWS secret access key and signing method. For more information, see [REST Authentication](https://docs.aws.amazon.com/AmazonS3/latest/dev/RESTAuthentication.html) and [SOAP Authentication](https://docs.aws.amazon.com/AmazonS3/latest/dev/SOAPAuthentication.html) for details.

HTTP Status Code: 400 Bad Request

Description: The bucket POST must contain the specified field name. If it is specified, check the order of the fields.

HTTP Status Code: 400 Bad Request
The error code is a string that uniquely identifies an error condition. It is meant to be read and understood by programs that detect and handle errors by type.

Amazon S3 error codes:

- **AccessDenied**
  - Description: Access Denied
  - HTTP Status Code: 403 Forbidden
  - SOAP Fault Code Prefix: Client

- **AccountProblem**
  - Description: There is a problem with your AWS account that prevents the operation from completing successfully. Contact AWS Support for further assistance.
  - HTTP Status Code: 403 Forbidden
  - SOAP Fault Code Prefix: Client

- **AllAccessDisabled**
  - Description: All access to this Amazon S3 resource has been disabled. Contact AWS Support for further assistance.
  - HTTP Status Code: 403 Forbidden
  - SOAP Fault Code Prefix: Client

- **AmbiguousGrantByEmailAddress**
  - Description: The email address you provided is associated with more than one account.
  - HTTP Status Code: 400 Bad Request
  - SOAP Fault Code Prefix: Client

- **AuthorizationHeaderMalformed**
  - Description: The authorization header you provided is invalid.
  - HTTP Status Code: 400 Bad Request
  - SOAP Fault Code Prefix: Client

- **BadDigest**
  - Description: The Content-MD5 you specified did not match what we received.
  - HTTP Status Code: 400 Bad Request
  - SOAP Fault Code Prefix: Client

- **BucketAlreadyExists**
  - Description: The requested bucket name is not available. The bucket namespace is shared by all users of the system. Please select a different name and try again.
  - HTTP Status Code: 409 Conflict
  - SOAP Fault Code Prefix: Client

- **BucketAlreadyOwnedByYou**
  - Description: The bucket you tried to create already exists, and you own it. Amazon S3 returns this error in all AWS Regions except in the North Virginia Region. For legacy compatibility, if you re-create an existing bucket that you already own in the North Virginia Region, Amazon S3 returns 200 OK and resets the bucket access control lists (ACLs).

- **CredentialsNotSupported**
  - Description: This request does not support credentials.
InvalidStorageClass
Description: The storage class you specified is not valid.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
<ul>
<li>Code: InvalidStorageClass</li>
<li>Description: The storage class you specified is not valid.</li>
<li>HTTP Status Code: 400 Bad Request</li>
<li>SOAP Fault Code Prefix: Client</li>
</ul>

InvalidTargetBucketForLogging
Description: The target bucket for logging does not exist, is not owned by you, or does not have the appropriate grants for the log-delivery group.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
<ul>
<li>Code: InvalidTargetBucketForLogging</li>
<li>Description: The target bucket for logging does not exist, is not owned by you, or does not have the appropriate grants for the log-delivery group.</li>
<li>HTTP Status Code: 400 Bad Request</li>
<li>SOAP Fault Code Prefix: Client</li>
</ul>

InvalidToken
Description: The provided token is malformed or otherwise invalid.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
<ul>
<li>Code: InvalidToken</li>
<li>Description: The provided token is malformed or otherwise invalid.</li>
<li>HTTP Status Code: 400 Bad Request</li>
<li>SOAP Fault Code Prefix: Client</li>
</ul>

InvalidURI
Description: Couldn't parse the specified URL.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
<ul>
<li>Code: InvalidURI</li>
<li>Description: Couldn't parse the specified URL.</li>
<li>HTTP Status Code: 400 Bad Request</li>
<li>SOAP Fault Code Prefix: Client</li>
</ul>

KeyTooLongError
Description: Your key is too long.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
<ul>
<li>Code: KeyTooLongError</li>
<li>Description: Your key is too long.</li>
<li>HTTP Status Code: 400 Bad Request</li>
<li>SOAP Fault Code Prefix: Client</li>
</ul>

MalformedACLError
Description: The XML you provided was not well-formed or did not validate against our published schema.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
<ul>
<li>Code: MalformedACLError</li>
<li>Description: The XML you provided was not well-formed or did not validate against our published schema.</li>
<li>HTTP Status Code: 400 Bad Request</li>
<li>SOAP Fault Code Prefix: Client</li>
</ul>

MalformedPOSTRequest
Description: The body of your POST request is not well-formed multipart/form-data.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
<ul>
<li>Code: MalformedPOSTRequest</li>
<li>Description: The body of your POST request is not well-formed multipart/form-data.</li>
<li>HTTP Status Code: 400 Bad Request</li>
<li>SOAP Fault Code Prefix: Client</li>
</ul>

MalformedXML
Description: This happens when the user sends malformed XML (XML that doesn't conform to the published XSD) for the configuration. The error message is, "The XML you provided was not well-formed or did not validate against our published schema."
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
<ul>
<li>Code: MalformedXML</li>
<li>Description: This happens when the user sends malformed XML (XML that doesn't conform to the published XSD) for the configuration. The error message is, "The XML you provided was not well-formed or did not validate against our published schema."</li>
<li>HTTP Status Code: 400 Bad Request</li>
<li>SOAP Fault Code Prefix: Client</li>
</ul>

MaxMessageLengthExceeded
Description: Your request was too big.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
<ul>
<li>Code: MaxMessageLengthExceeded</li>
<li>Description: Your request was too big.</li>
<li>HTTP Status Code: 400 Bad Request</li>
<li>SOAP Fault Code Prefix: Client</li>
</ul>

MaxPostPreDataLengthExceededError
Description: Your POST request fields preceding the upload file were too large.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
<ul>
<li>Code: MaxPostPreDataLengthExceededError</li>
<li>Description: Your POST request fields preceding the upload file were too large.</li>
<li>HTTP Status Code: 400 Bad Request</li>
<li>SOAP Fault Code Prefix: Client</li>
</ul>

MetadataTooLarge
Description: Your metadata headers exceed the maximum allowed metadata size.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
<ul>
<li>Code: MetadataTooLarge</li>
<li>Description: Your metadata headers exceed the maximum allowed metadata size.</li>
<li>HTTP Status Code: 400 Bad Request</li>
<li>SOAP Fault Code Prefix: Client</li>
</ul>

MethodNotAllowed
Description: The specified method is not allowed against this resource.
HTTP Status Code: 405 Method Not Allowed
SOAP Fault Code Prefix: Client
<ul>
<li>Code: MethodNotAllowed</li>
<li>Description: The specified method is not allowed against this resource.</li>
<li>HTTP Status Code: 405 Method Not Allowed</li>
<li>SOAP Fault Code Prefix: Client</li>
</ul>

MissingAttachment
Description: A SOAP attachment was expected, but none were found.
HTTP Status Code: N/A
SOAP Fault Code Prefix: Client
<ul>
<li>Code: MissingAttachment</li>
<li>Description: A SOAP attachment was expected, but none were found.</li>
<li>HTTP Status Code: N/A</li>
<li>SOAP Fault Code Prefix: Client</li>
</ul>

MissingContentLength
Description: You must provide the Content-Length HTTP header.
HTTP Status Code: 411 Length Required
SOAP Fault Code Prefix: Client
<ul>
<li>Code: MissingContentLength</li>
<li>Description: You must provide the Content-Length HTTP header.</li>
<li>HTTP Status Code: 411 Length Required</li>
<li>SOAP Fault Code Prefix: Client</li>
</ul>

MissingRequestBodyError
Description: This happens when the user sends an empty XML document as a request. The error message is, "Request body is empty."
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
<ul>
<li>Code: MissingRequestBodyError</li>
<li>Description: This happens when the user sends an empty XML document as a request. The error message is, "Request body is empty."</li>
<li>HTTP Status Code: 400 Bad Request</li>
<li>SOAP Fault Code Prefix: Client</li>
</ul>

MissingSecurityElement
Description: The SOAP 1.1 request is missing a security element.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
<ul>
<li>Code: MissingSecurityElement</li>
<li>Description: The SOAP 1.1 request is missing a security element.</li>
<li>HTTP Status Code: 400 Bad Request</li>
<li>SOAP Fault Code Prefix: Client</li>
</ul>

MissingSecurityHeader
Description: Your request is missing a required header.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client
<ul>
<li>Code: MissingSecurityHeader</li>
<li>Description: Your request is missing a required header.</li>
<li>HTTP Status Code: 400 Bad Request</li>
<li>SOAP Fault Code Prefix: Client</li>
</ul>
Requesting the torrent file of a bucket is not permitted.

HTTP Status Code: 400 Bad Request

Code: RequestTorrentOfBucketError
Description: Requesting the torrent file of a bucket is not permitted.
HTTP Status Code: 503 Service Unavailable
SOAP Fault Code Prefix: Server

Code: SignatureDoesNotMatch
Description: The request signature we calculated does not match the signature you provided. Check your AWS access key and signing method. For more information, see [REST Authentication](https://docs.aws.amazon.com/AmazonS3/latest/dev/RESTAuthentication.html)
HTTP Status Code: 403 Forbidden
SOAP Fault Code Prefix: Client

Code: SlowDown
Description: Reduce your request rate.
HTTP Status Code: 503 Service Unavailable
SOAP Fault Code Prefix: Server

Code: TemporaryRedirect
Description: You are being redirected to the bucket while DNS updates.
HTTP Status Code: 307 Moved Temporarily
SOAP Fault Code Prefix: Server

Code: TooManyBuckets
Description: You have attempted to create more buckets than allowed.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client

Code: UnexpectedContent
Description: This request does not support content.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client

Code: UnresolvableGrantByEmailAddress
Description: The email address you provided does not match any account on record.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client

Code: UserKeyMustBeSpecified
Description: The bucket POST must contain the specified field name. If it is specified, check the order of the fields.
HTTP Status Code: 400 Bad Request
SOAP Fault Code Prefix: Client

<i>HTTP Status Code:</i> 503 Slow Down

- <i>Description:</i> You are being redirected to the bucket while DNS updates.

- <i>SOAP Fault Code Prefix:</i> HTTP Status Code: 409

- <i>Description:</i> The provided token must be refreshed.

- <i>SOAP Fault Code Prefix:</i> Local

- <i>Description:</i> The email address you provided does not match any account on record.

- <i>SOAP Fault Code Prefix:</i> Client

- <i>Description:</i> There is a problem with your AWS account that prevents the operation from completing successfully.

- <i>Code:</i> UnexpectedContent

- <i>Description:</i> This request does not support content.

- <i>Code:</i> Unauthorized

- <i>Description:</i> The authorization header you provided is invalid.

- <i>Code:</i> N/A

- <i>Description:</i> The requested bucket name is not available. The bucket namespace is shared by all users of the system. Please select a different name and try again.

- <i>Code:</i> Unauthorized

- <i>Description:</i> The bucket you tried to create already exists, and you own it. Amazon S3 returns this error in all AWS Regions except in the North Virginia Region. For legacy compatibility, if you re-create an existing bucket that you already own in the North Virginia Region, Amazon S3 returns 200 OK and resets the bucket access control lists (ACLs).

- <i>Code:</i> 409 Conflict

- <i>Description:</i> The bucket namespace is shared by all users of the system. Please select a different name and try again.

- <i>Code:</i> Unauthorized

- <i>Description:</i> The authorization header you provided is invalid.

- <i>Code:</i> N/A

- <i>Description:</i> The requested bucket name is not available. The bucket namespace is shared by all users of the system. Please select a different name and try again.

- <i>Code:</i> Unauthorized

- <i>Description:</i> The bucket you tried to create already exists, and you own it. Amazon S3 returns this error in all AWS Regions except in the North Virginia Region. For legacy compatibility, if you re-create an existing bucket that you already own in the North Virginia Region, Amazon S3 returns 200 OK and resets the bucket access control lists (ACLs).
<i>Code:</i> InvalidLocationConstraint</p> <i>Description:</i> The specified location constraint is not valid. For more information about Regions, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingBucket.html#access-bucket-intro">How to Select a Region for Your Buckets</a>.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Description: Your request was too big.

SOAP Fault Code Prefix: Client

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Description: Your metadata headers exceed the maximum allowed metadata size.

HTTP Status Code: 405 Method Not Allowed

SOAP Fault Code Prefix: Client

Description: The specified method is not allowed against this resource.

HTTP Status Code: N/A

SOAP Fault Code Prefix: Client

Description: There is no such thing as a logging status subresource for a key.

HTTP Status Code: 404 Not Found

SOAP Fault Code Prefix: Client

Description: The specified bucket does not exist.

HTTP Status Code: 404 Not Found

SOAP Fault Code Prefix: Client

Description: The specified bucket does not have a bucket policy.

HTTP Status Code: 404 Not Found

SOAP Fault Code Prefix: Client

Description: The specified key does not exist.

HTTP Status Code: 404 Not Found

SOAP Fault Code Prefix: Client

Description: The lifecycle configuration does not exist.
<i>SOAP Fault Code Prefix:</i> Client

- **Code:** NotSignedUp
- **Description:** Your account is not signed up for the Amazon S3 service. You must sign up before you can use Amazon S3. You can sign up at the following URL: https://aws.amazon.com/s3

- **Code:** OperationAborted
- **Description:** A conflicting conditional operation is currently in progress against this resource. Try again.

- **Code:** PermanentRedirect
- **Description:** The bucket you are attempting to access must be addressed using the specified endpoint. Send all future requests to this endpoint.

- **Code:** PreconditionFailed
- **Description:** At least one of the preconditions you specified did not hold.

- **Code:** Redirect
- **Description:** Temporary redirect.

- **Code:** RestoreAlreadyInProgress
- **Description:** Object restore is already in progress.

- **Code:** SignatureDoesNotMatch
- **Description:** The request signature we calculated does not match the signature you provided. Check your AWS secret access key and signing method. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/RESTAuthentication.html">REST Authentication</a> and <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/SOAPAuthentication.html">SOAP Authentication</a> for details.

- **Code:** ServiceUnavailable
- **Description:** Reduce your request rate.

- **Code:** SlowDown
- **Description:** You are being redirected to the bucket while DNS updates are being refreshed.

- **Code:** TokenRefreshRequired
- **Description:** The provided token must be refreshed.

- **Code:** TooManyBuckets
- **Description:** You have attempted to create more buckets than allowed.

- **Code:** HTTP Status Code: 403 Forbidden
- **Description:** Your account is not signed up for the Amazon S3 service. You must sign up before you can use Amazon S3. You can sign up at the following URL: https://aws.amazon.com/s3

- **Code:** HTTP Status Code: 301 Moved Permanently
- **Description:** Restore already is in progress.

- **Code:** HTTP Status Code: 409 Conflict
- **Description:** The difference between the request time and the server's time is too large.

- **Code:** HTTP Status Code: 400 Bad Request
- **Description:** Requesting the torrent file of a bucket is not permitted.

- **Code:** SignatureDoesNotMatch
- **Description:** The request signature we calculated does not match the signature you provided. Check your AWS secret access key and signing method. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/RESTAuthentication.html">REST Authentication</a> and <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/SOAPAuthentication.html">SOAP Authentication</a> for details.

Description: Your proposed upload exceeds the maximum allowed object size.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: IncompleteBody

Description: You did not provide the number of bytes specified by the Content-Length HTTP header.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: InlineDataTooLarge

Description: Inline data exceeds the maximum allowed size.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: ExpiredToken

Description: The provided token has expired.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: Code: InvalidAccessKeyId

Description: The AWS access key ID you provided does not exist in our records.

HTTP Status Code: 403 Forbidden

SOAP Fault Code Prefix: Client

Code: InvalidAddressingHeader

Description: You must specify the Anonymous role.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: InvalidBucketState

Description: The request is not valid with the current state of the bucket.

HTTP Status Code: 409 Conflict

SOAP Fault Code Prefix: Client

Code: InvalidDigest

Description: The Content-MD5 you specified is not valid.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: InvalidEncryptionAlgorithmError

Description: The encryption request you specified is not valid. The valid value is AES256.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: InvalidLocationConstraint

Description: The specified location constraint is not valid. For more information about Regions, see

href="https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingBucket.html#access-bucket-intro" How to Select a Region for Your Buckets. Please try again.

HTTP Status Code: 500 Internal Server Error

SOAP Fault Code Prefix: Server

Code: InternalError

Description: We encountered an internal error.

HTTP Status Code: 403 Forbidden

SOAP Fault Code Prefix: Client

Code: InvalidBucketName

Description: The specified bucket is not valid.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Code: InvalidObjectState

Description: The operation is not valid for the current state of the object.

HTTP Status Code: 403 Forbidden

SOAP Fault Code Prefix: Client

Code: InvalidPart

Description: One or more of the specified parts could not be found. The part might not have been uploaded, or the specified entity tag might not have matched the part's entity tag.
Prefix: <i>Client</i> &lt;/i&gt; &lt;/ul&gt; &lt;/li&gt; &lt;i&gt; &lt;li&gt; &lt;p&gt; &lt;i&gt;Code: &lt;/i&gt; InvalidURI &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Description: &lt;/i&gt; Couldn't parse the specified URI. &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;HTTP Status Code: &lt;/i&gt; 400 Bad Request &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;SOAP Fault Code Prefix: &lt;/i&gt; Client &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Code: &lt;/i&gt; KeyTooLongError &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Description: &lt;/i&gt; Your key is too long. &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;HTTP Status Code: &lt;/i&gt; 400 Bad Request &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;SOAP Fault Code Prefix: &lt;/i&gt; Client &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Code: &lt;/i&gt; MalformedACLError &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Description: &lt;/i&gt; The XML you provided was not well-formed or did not validate against our published schema. &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Code: &lt;/i&gt; MaxMessageLengthExceeded &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Description: &lt;/i&gt; Your request was too big. &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;HTTP Status Code: &lt;/i&gt; 400 Bad Request &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;SOAP Fault Code Prefix: &lt;/i&gt; Client &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Code: &lt;/i&gt; MethodNotAllowed &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Description: &lt;/i&gt; The specified method is not allowed against this resource. &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;HTTP Status Code: &lt;/i&gt; 405 Method Not Allowed &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;SOAP Fault Code Prefix: &lt;/i&gt; Client &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Code: &lt;/i&gt; MissingAttachment &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Description: &lt;/i&gt; A SOAP attachment was expected, but none were found. &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;HTTP Status Code: &lt;/i&gt; N/A &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;SOAP Fault Code Prefix: &lt;/i&gt; Client &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Code: &lt;/i&gt; MissingContentLength &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Description: &lt;/i&gt; You must provide the Content-Length HTTP header. &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;HTTP Status Code: &lt;/i&gt; 411 Length Required &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;SOAP Fault Code Prefix: &lt;/i&gt; Client &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Code: &lt;/i&gt; MissingRequestBodyError &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Description: &lt;/i&gt; This happens when the user sends an empty XML document as a request. The error message is, "Request body is empty." &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;HTTP Status Code: &lt;/i&gt; 400 Bad Request &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;SOAP Fault Code Prefix: &lt;/i&gt; Client &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Code: &lt;/i&gt; MissingSecurityElement &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Description: &lt;/i&gt; The SOAP 1.1 request is missing a security element. &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;HTTP Status Code: &lt;/i&gt; 400 Bad Request &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;SOAP Fault Code Prefix: &lt;/i&gt; Client &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Code: &lt;/i&gt; NoSuchBucket &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Description: &lt;/i&gt; The specified bucket does not exist. &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;HTTP Status Code: &lt;/i&gt; 404 Not Found &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;SOAP Fault Code Prefix: &lt;/i&gt; Client &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Code: &lt;/i&gt; NoSuchBucketPolicy &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Description: &lt;/i&gt; The specified bucket does not have a bucket policy. &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;HTTP Status Code: &lt;/i&gt; 404 Not Found &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;SOAP Fault Code Prefix: &lt;/i&gt; Client &lt;/p&gt; &lt;/li&gt; &lt;i&gt; &lt;/i&gt; &lt;p&gt; &lt;i&gt;Code: &lt;/i&gt;

The error message contains a generic description of the error condition in English. It is intended for a human audience. Simple programs display the message directly to the end user if they encounter an error condition they don't know how or don't care to handle. Sophisticated programs with more exhaustive error handling and proper internationalization are more likely to ignore the error message.

This is a convenience that creates an instance of the [String.Builder] avoiding the need to create one manually via [String#builder()]. When the [String] completes, [String.Builder#build()] is called immediately and its result is passed to [message(String)].

@return The error message contains a generic description of the error condition in English. It is intended for a human audience. Simple programs display the message directly to the end user if they encounter an error condition they don't know how or don't care to handle. Sophisticated programs with more exhaustive error handling and proper internationalization are more likely to ignore the error message.

A container of a key-value pair.

Documentation:
This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String#builder()`. When the `Consumer` completes, `String.Builder#build()` is called immediately and its result is passed to `#key(String)`. Returns a reference to this object so that method calls can be chained together. See `#key(String)`.

Deprecated:
Use `#key()` if you want to specify the value.

Documentation:
Returns true if the Key property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.

Specifies the customer-provided encryption key for Amazon S3 to use in encrypting data. This value is used to store the object and then it is discarded; Amazon S3 does not store the encryption key. The key must be appropriate for use with the algorithm specified in the `<code>x-amz-server-side-encryption-customer-algorithm</code>` header. This must be the same encryption key specified in the initiate multipart upload request.

```java
public class SSECustomerKeyMD5 {
    private String sseCustomerKeyMD5;

    public SSECustomerKeyMD5(String sseCustomerKeyMD5) {
        this.sseCustomerKeyMD5 = sseCustomerKeyMD5;
    }

    public String getSseCustomerKeyMD5() {
        return sseCustomerKeyMD5;
    }

    public void setSseCustomerKeyMD5(String sseCustomerKeyMD5) {
        this.sseCustomerKeyMD5 = sseCustomerKeyMD5;
    }

    // ... (other methods)
}
```

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `@link String#builder()`. When the `@link Consumer` completes, `@link String.Builder#build()` is called immediately and its result is passed to `@link SSECustomerKeyMD5(String)`.

@see #sseCustomerKeyMD5(String)

```java
public class SSECustomerKeyMD5 {
    private String sseCustomerKeyMD5;

    public SSECustomerKeyMD5(String sseCustomerKeyMD5) {
        this.sseCustomerKeyMD5 = sseCustomerKeyMD5;
    }

    public String getSseCustomerKeyMD5() {
        return sseCustomerKeyMD5;
    }

    public void setSseCustomerKeyMD5(String sseCustomerKeyMD5) {
        this.sseCustomerKeyMD5 = sseCustomerKeyMD5;
    }

    // ... (other methods)
}
```

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `@link String#builder()`. When the `@link Consumer` completes, `@link String.Builder#build()` is called immediately and its result is passed to `@link SSECustomerKeyMD5(String)`.

If server-side encryption with a customer-provided encryption key was requested, the response will include this header confirming the encryption algorithm used. This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `{ link String#builder() }`. When the `{ link Consumer }` completes, `{ link String.Builder#build() }` is called immediately and its result is passed to `{ link #sseCustomerAlgorithm(String) }`. When the `{ link String.Builder }` returns, a reference to this object so that method calls can be chained together.

```java
public String build() {
    return sseCustomerAlgorithm.toString();
}
```

The method `build()` is called immediately when the `Consumer` completes, and its result is passed to `#sseCustomerAlgorithm(String)`.

```java
public void sseCustomerAlgorithm(String sseCustomerAlgorithm) {
    if (sseCustomerAlgorithm != null) {
        sseCustomerAlgorithmBuilder.append(buildSseCustomerAlgorithm(sseCustomerAlgorithm));
    }
}
```

The `SSECustomerAlgorithm` is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `{ link String#builder() }`. When the `{ link Consumer }` completes, `{ link String.Builder#build() }` is called immediately and its result is passed to `#sseCustomerAlgorithm(String)`.

```java
public void sseCustomerAlgorithm(String sseCustomerAlgorithm) {
    if (sseCustomerAlgorithm != null) {
        sseCustomerAlgorithmBuilder.append(buildSseCustomerAlgorithm(sseCustomerAlgorithm));
    }
}
```

The `SSECustomerAlgorithm` is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `{ link String#builder() }`. When the `{ link Consumer }` completes, `{ link String.Builder#build() }` is called immediately and its result is passed to `#sseCustomerAlgorithm(String)`.

```java
public String build() {
    return sseCustomerAlgorithm.toString();
}
```

The method `build()` is called immediately when the `Consumer` completes, and its result is passed to `#sseCustomerAlgorithm(String)`.

```java
public void sseCustomerAlgorithm(String sseCustomerAlgorithm) {
    if (sseCustomerAlgorithm != null) {
        sseCustomerAlgorithmBuilder.append(buildSseCustomerAlgorithm(sseCustomerAlgorithm));
    }
}
```

The `SSECustomerAlgorithm` is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `{ link String#builder() }`. When the `{ link Consumer }` completes, `{ link String.Builder#build() }` is called immediately and its result is passed to `#sseCustomerAlgorithm(String)`.

```java
public String build() {
    return sseCustomerAlgorithm.toString();
}
```

The method `build()` is called immediately when the `Consumer` completes, and its result is passed to `#sseCustomerAlgorithm(String)`.

```java
public void sseCustomerAlgorithm(String sseCustomerAlgorithm) {
    if (sseCustomerAlgorithm != null) {

Object key for which the multipart upload was initiated.

This is a convenience that creates an instance of the `{@link String.Builder}` avoiding the need to create one manually via `{@link String.Builder()}`. When the `{@link Consumer}` completes, `{@link String.Builder#build()}` is called immediately and its result is passed to `{@link #key(String)}`.

- **Name**: `key` (Java: `String`)
- **Model**: `{@link String.Builder}`
- **Default Consumer Fluent Setter Documentation**:
  ```
  @param key a consumer that will call methods on `{@link String.Builder}`
  @return Returns a reference to this object so that method calls can be chained together.
  @see #key(String)
  ```
- **Deprecated**:
  ```
  @deprecated Use `{@link #key(String)}`
  ```
- **Getter Documentation**:
  ```
  @param key Object key for which the multipart upload was initiated.
  @return Returns a reference to this object so that method calls can be chained together.
  ```
- **Existence Check Method Name**: `hasKey`
- **Getters**
  ```
  @return Object key for which the multipart upload was initiated.
  ```
- **Return Type**: `{@link String.Builder}`

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String#builder()`. When the `Consumer` completes, `String.Builder#build()` is called immediately and its result is passed to `String#bucket(String)`. The parameter `bucket` is a consumer that will call methods on `String.Builder`. Returns a reference to this object so that method calls can be chained together. See `bucket(String)`.

```java
public String build(String bucket)
```

- **Parameters**
  - `bucket` (Type: `String`)
    - Description: Name of the bucket to which the multipart upload was initiated.
    - Default: `null`
    - Required: `true`

- **Return**
  - Type: `String`
    - Description: Name of the bucket to which the multipart upload was initiated.
    - Default: `null`
    - Required: `true`

- **Documentation**
  - Name of the bucket to which the multipart upload was initiated.
  - Default: `null`
  - Required: `true`
  - See `bucket(String)`.

The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms). If the service returns an enum value that is not available in the current SDK version, `ServerSideEncryption#UNKNOWN_TO_SDK_VERSION` will return. The raw value returned by the service is available from `ServerSideEncryptionAsString()`. Returns a reference to this object so that method calls can be chained together.

## Role

The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms).

### Returns

Returns a reference to this object so that method calls can be chained together.

## Details

The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms). If the service returns an enum value that is not available in the current SDK version, `ServerSideEncryption#UNKNOWN_TO_SDK_VERSION` will return.

Rules that define when a redirect is applied and the redirect behavior.

```java

import java.util.List;
import java.util.Collection;

public class RoutingRules {
    private List<RoutingRule> routingRules;

    public void setRoutingRules(List<RoutingRule> routingRules) {
        this.routingRules = routingRules;
    }
}
```

The name of the error document for the website.

```java

import java.util.List;
import java.util.Collection;

public class ErrorDocument {
    private List<RoutingRule> routingRules;

    public ErrorDocument(List<RoutingRule> routingRules) {
        this.routingRules = routingRules;
    }
}
```

This is a convenience that creates an instance of the `ErrorDocument.Builder` avoiding the need to create one manually via `ErrorDocument.Builder().build()`. When the `Consumer` completes, the `ErrorDocument.Builder#build()` is called immediately and its result is passed to `errorDocument(ErrorDocument)`. a consumer that will call methods on `ErrorDocument.Builder`.

```java

import java.util.List;
import java.util.Collection;

public class ErrorDocument {
    private List<RoutingRule> routingRules;

    public ErrorDocument(List<RoutingRule> routingRules) {
        this.routingRules = routingRules;
    }
}
```

Returns a reference to this object so that method calls can be chained together. @see `errorDocument(ErrorDocument)`

```java

import java.util.List;
import java.util.Collection;

public class ErrorDocument {
    private List<RoutingRule> routingRules;

    public ErrorDocument(List<RoutingRule> routingRules) {
        this.routingRules = routingRules;
    }
}

The redirect behavior for every request to this bucket's website endpoint.

If you specify this property, you can't specify any other property.

```
@Param
redirectAllRequestsTo The redirect behavior for every request to this bucket's website endpoint.

@param
redirectAllRequestsTo The redirect behavior for every request to this bucket's website endpoint.
```

```java
public void setRedirectAllRequestsTo(RedirectAllRequestsTo redirectAllRequestsTo) {
    this.redirectAllRequestsTo = redirectAllRequestsTo;
}
```

The redirect behavior for every request to this bucket's website endpoint.

If you specify this property, you can't specify any other property.

```
<param
redirectAllRequestsTo The redirect behavior for every request to this bucket's website endpoint.

@param
redirectAllRequestsTo The redirect behavior for every request to this bucket's website endpoint.
```
Rules that define when a redirect is applied and the redirect behavior. This is a convenience that creates an instance of the `List<RoutingRule>.Builder` avoiding the need to create one manually via `List<RoutingRule>#builder()`. When the `List<RoutingRule>.Builder#build()` is called immediately and its result is passed to `List<RoutingRule>(List<RoutingRule>)`. You can use `hasRoutingRules()` to see if a value was sent in this field. You return Rules that define when a redirect is applied and the redirect behavior. Returns a reference to this object so that method calls can be chained together.

Attempts to modify the collection returned by this method will result in an `UnsupportedOperationException`. You can use `hasRoutingRules()` to see if a value was sent in this field. You return Rules that define when a redirect is applied and the redirect behavior. Returns a reference to this object so that method calls can be chained together.

Returns true if the `RoutingRules` property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.

Rules that define when a redirect is applied and the redirect behavior. Returns a reference to this object so that method calls can be chained together.

HTTP Status Code: 400 Bad Request

SOAP Fault Code Prefix: Client

Description: The request signature we calculated does not match the signature you provided. Check your AWS secret access key and signing method. For more information, see REST Authentication and SOAP Authentication for details.

HTTP Status Code: 403 Forbidden

SOAP Fault Code Prefix: Client

Code: SignatureDoesNotMatch

Description: The request signature we calculated does not match the signature you provided. Check your AWS secret access key and signing method. For more information, see REST Authentication and SOAP Authentication for details.

HTTP Status Code: 403 Forbidden

SOAP Fault Code Prefix: Client

Code: ServiceUnavailable
* Description: Reduce your request rate.
* HTTP Status Code: 503 Service Unavailable
* SOAP Fault Code Prefix: Server

* Description: Reduce your request rate.
* HTTP Status Code: 503 Slow Down
* SOAP Fault Code Prefix: Server

* Code: SlowDown
  * Description: Reduce your request rate.
  * HTTP Status Code: 503 Slow Down
  * SOAP Fault Code Prefix: Server

* Code: TemporaryRedirect
<li><p><i>Description:</i> You are being redirected to the bucket while DNS updates.</p></li>
<li><p><i>HTTP Status Code:</i> 307 Moved Temporarily</p></li>
<li><ul><li><p><i>Code:</i> TooManyBuckets</p></li></ul></li>
* Description: You have attempted to create more buckets than allowed.
* HTTP Status Code: 400 Bad Request

* Description: This request does not support content.
* HTTP Status Code: 400 Bad Request

* Description: This request does not support content.
* SOAP Fault Code Prefix: Client

* Code: UnresolvableGrantByEmailAddress
<li><i>Description:</i> The email address you provided does not match any account on record.</li>
<p></p>
<li><i>HTTP Status Code:</i> 400 Bad Request</li>
<p></p>
<li><i>SOAP Fault Code Prefix:</i> Client</li>
<p></p>
<li><p><i>Code:</i> UserKeyMustBeSpecified</p></li>
<p></p>
<li><i>Description:</i> The bucket POST must contain the specified field name. If it is specified, check the order of the fields.</li>
<p></p>
<li><i>HTTP Status Code:</i> 400 Bad Request</li>
<p></p>
<li><i>SOAP Fault Code Prefix:</i> Client</li>
<p></p>
<li>@return The error code is a string that uniquely identifies an error condition. It is meant to be read and
understood by programs that detect and handle errors by type.

* <i>Code:</i> BucketAlreadyOwnedByYou
* </p>
* </li>
* </li>
* </li>
* </p>
The bucket you tried to create already exists, and you own it. Amazon S3 returns this error in all AWS Regions except in the North Virginia Region. For legacy compatibility, if you re-create an existing bucket that you already own in the North Virginia Region, Amazon S3 returns 200 OK and resets the bucket access control lists (ACLs).

-i Description: 409 Conflict (in all Regions except the North Virginia Region)

Code: BucketNotEmpty
Description: The bucket you tried to delete is not empty.
HTTP Status Code: 409 Conflict
SOAP Fault Code Prefix: Client

Code: CredentialsNotSupported
* Description: This request does not support credentials.
* HTTP Status Code: 400 Bad Request
* SOAP Fault Code Prefix: Client
* Code: CrossLocationLoggingProhibited
  * Description: Cross-location logging not allowed. Buckets in one geographic location cannot log information to a bucket in another location.

  "documentation":"<p>Completes a multipart upload by assembling previously uploaded parts. After Amazon S3 concatenates all the parts in ascending order by part number to create a new object. In the Complete Multipart Upload request, you must provide the parts list. You must ensure that the parts list is complete. This operation concatenates the parts that you provide in the list. For each part in the list, you must provide the part number and the <code>ETag</code> value, returned after that part was uploaded.</p> <p>You first initiate the multipart upload and then upload all parts using the <a>UploadPart</a> operation. After successfully uploading all relevant parts of an upload, you call this operation to complete the upload. Upon receiving this request, Amazon S3 concatenates all the parts in ascending order by part number to create a new object. In the Complete Multipart Upload request, you must provide the parts list. You must ensure that the parts list is complete. This operation concatenates the parts that you provide in the list. For each part in the list, you must provide the part number and the <code>ETag</code> value, returned after that part was uploaded.</p> <p>Processing of a Complete Multipart Upload request could take several minutes to complete. After Amazon S3 begins processing the request, it sends an HTTP response header that specifies a 200 OK response. While processing is in progress, Amazon S3 periodically sends white space characters to keep the connection from timing out. Because a request could fail after the initial 200 OK response has been sent, it is important that you check the response body to determine whether the request succeeded.</p> <p>Note that if <code>CompleteMultipartUpload</code> fails,
applications should be prepared to retry the failed requests. For more information, see `<a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/ErrorBestPractices.html">Amazon S3 Error Best Practices</a>`.

For more information about multipart uploads, see `<a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/uploadobjusingmpu.html">Uploading Objects Using Multipart Upload</a>`.

For information about permissions required to use the multipart upload API, see `<a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/mpuAndPermissions.html">Multipart Upload API and Permissions</a>`.

`<code>GetBucketLifecycle</code>` has the following special errors:

- **EntityTooSmall**
  - Description: Your proposed upload is smaller than the minimum allowed object size. Each part must be at least 5 MB in size, except the last part.
  - 400 Bad Request

- **InvalidPart**
  - Description: One or more of the specified parts could not be found. The part might not have been uploaded, or the specified entity tag might not have matched the part's entity tag.
  - 400 Bad Request

- **InvalidPartOrder**
  - Description: The list of parts was not in ascending order. The parts list must be specified in order by part number.
  - 400 Bad Request

- **NoSuchUpload**
  - Description: The specified multipart upload does not exist. The upload ID might be invalid, or the multipart upload might have been aborted or completed.
  - 404 Not Found

The following operations are related to `<code>DeleteBucketMetricsConfiguration</code>`:

- `<a>CreateMultipartUpload</a>`
- `<a>UploadPart</a>`
- `<a>AbortMultipartUpload</a>`
- `<a>ListParts</a>`
- `<a>ListMultipartUploads</a>`

`<code>CopyObject</code>`:

- **ObjectNotInActiveTierError**

For more information, see `<a href="https://docs.aws.amazon.com/AmazonS3/latest/API/RESTObjectCOPY.html">Copy Object Using the REST Multipart Upload API</a>`. When copying an object, you can preserve all metadata (default) or specify new metadata. However, the ACL is not preserved and is set to private for the user making the request. To override the default ACL setting, specify a new ACL when generating a copy request. For more information, see `<a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/transfer-acceleration.html">Transfer Acceleration</a>`.

All copy requests must be authenticated.
Additionally, you must have `<i>read</i>` access to the source object and `<i>write</i>` access to the destination bucket. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/RESTAuthentication.html">REST Authentication</a>. Both the Region that you want to copy the object from and the Region that you want to copy the object to must be enabled for your account.</p> <p>To only copy an object under certain conditions, such as whether the `<code>Etag</code>` matches or whether the object was modified before or after a specified date, use the request parameters `<code>x-amz-copy-source-if-match</code>`, `<code>x-amz-copy-source-if-none-match</code>`, `<code>x-amz-copy-source-if-unmodified-since</code>`, or `<code>x-amz-copy-source-if-modified-since</code>`.</p> <p>All headers with the `<code>x-amz-</code>` prefix, including `<code>x-amz-copy-source</code>`, must be signed.</p> <p>You can use this operation to change the storage class of an object that is already stored in Amazon S3 using the `<code>StorageClass</code>` parameter. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/storage-class-intro.html">Storage Classes</a>.</p> <p>The source object that you are copying can be encrypted or unencrypted. If the source object is encrypted, it can be encrypted by server-side encryption using AWS managed encryption keys or by using a customer-provided encryption key. When copying an object, you can request that Amazon S3 encrypt the target object by using either the AWS managed encryption keys or by using your own encryption key. You can do this regardless of the form of server-side encryption that was used to encrypt the source, or even if the source object was not encrypted. For more information about server-side encryption, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/server-side-encryption.html">Using Server-Side Encryption</a>.</p> <p>A copy request might return an error when Amazon S3 receives the copy request or while Amazon S3 is copying the files. If the error occurs before the copy operation starts, you receive a standard Amazon S3 error. If the error occurs during the copy operation, the error response is embedded in the `<code>200 OK</code>` response. This means that a `<code>200 OK</code>` response can contain either a success or an error. Design your application to parse the contents of the response and handle it appropriately.</p> <p>If the copy is successful, you receive a response with information about the copied object.</p> <p>If the request is an HTTP 1.1 request, the response is chunk encoded. If it were not, it would not contain the content-length, and you would need to read the entire body.</p> <p>Consider the following when using request headers:</p> <ul> <li>Consideration 1 – If both the `<code>x-amz-copy-source-if-match</code>` and `<code>x-amz-copy-source-if-unmodified-since</code>` headers are present in the request and evaluate as follows, Amazon S3 returns `<code>200 OK</code>` and copies the data:</li> <li>Consideration 2 – If both of the `<code>x-amz-copy-source-if-none-match</code>` and `<code>x-amz-copy-source-if-modified-since</code>` headers are present in the request and evaluate as follows, Amazon S3 returns the `<code>412 Precondition Failed</code>` response code:</li> </ul> <p>The copy request charge is based on the storage class and Region you specify for the destination object. For pricing information, see <a href="https://aws.amazon.com/s3/pricing/">Amazon S3 Pricing</a>.</p> <p>Following are other considerations when using `<code>CopyObject</code>`:</p> <dt>Versioning</dt> <dd>By default, `<code>x-amz-copy-source</code>` identifies the current version of an object to copy. (If the current version is a delete marker, Amazon S3 behaves as if the object was deleted.) To copy a different version, use the `<code>versionId</code>` subresource.</dd> <dd>If you enable versioning on the target bucket, Amazon S3 generates a unique version ID for the object being copied. This version ID is different from the version ID of the source object. Amazon S3 returns the version ID of the copied object in the `<code>x-amz-version-id</code>` response header in the response.</dd> <dd>If you do not enable versioning or suspend it on the target bucket, the version ID that Amazon S3 generates is always null.</dd> <dd>If the source object's storage class is GLACIER, you must restore a copy of this object before you can use it as a source object for the copy operation. For more information, see.</dd> <dt>Access Permissions</dt> <dd>When copying an object, you can optionally specify the accounts or groups that should be granted specific permissions on the new object. There are
two ways to grant the permissions using the request headers:<p>  <ul>  <li>Specify a canned ACL with the <code>x-amz-acl</code> request header. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/acl-overview.html#CannedACL">Canned ACL</a>.</li>  <li>Specify access permissions explicitly with the <code>x-amz-grant-read</code>, <code>x-amz-grant-read-acp</code>, <code>x-amz-grant-write-acp</code>, and <code>x-amz-grant-full-control</code> headers. These parameters map to the set of permissions that Amazon S3 supports in an ACL. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/acl-overview.html">Access Control List (ACL) Overview</a>.</li>  </ul>  </p><p>You can use either a canned ACL or specify access permissions explicitly. You cannot do both.</p>  <dd>  <dt>Server-Side-Encryption-Specific Request Headers</dt>  <dd>  <p>To encrypt the target object, you must provide the appropriate encryption-related request headers. The one you use depends on whether you want to use AWS managed encryption keys or provide your own encryption key.</p>  <ul>  <li>To encrypt the target object using server-side encryption with an AWS managed encryption key, provide the following request headers, as appropriate.</li>  <li>Specify server-side encryption with an AWS managed encryption key, <code>x-amz-server-side-encryption</code>:awskms</li>  <li>Specify server-side encryption with an AWS managed encryption key, <code>x-amz-server-side-encryption-aws-kms-key-id</code></li>  </ul>  <note>  <p>If you specify <code>x-amz-server-side-encryption:aws:kms</code>, but don't provide <code>x-amz-server-side-encryption-aws-kms-key-id</code>, Amazon S3 uses the AWS managed CMK in AWS KMS to protect the data. If you want to use a customer managed AWS KMS CMK, you must provide the <code>x-amz-server-side-encryption-aws-kms-key-id</code> of the symmetric customer managed CMK. Amazon S3 only supports symmetric CMKs and not asymmetric CMKs. For more information, see <a href="https://docs.aws.amazon.com/kms/latest/developerguide/symmetric-asymmetric.html">Using Symmetric and Asymmetric Keys</a> in the <i>AWS Key Management Service Developer Guide</i>.</p>  </note>  <important>  <p>All GET and PUT requests for an object protected by AWS KMS fail if you don't make them with SSL or by using SigV4.</p>  </important>  <p>For more information about server-side encryption with CMKs stored in AWS KMS (SSE-KMS), see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingKMSEncryption.html">Protecting Data Using Server-Side Encryption with CMKs stored in AWS KMS</a>.</p>  </dd>  <dd>  <dt>Access-Control-List (ACL)-Specific Request Headers</dt>  <dd>  <p>You also can use the following access control–related headers with this operation. By default, all objects are private. Only the owner has full access control. When adding a new object, you can grant permissions to individual AWS accounts or to predefined groups defined by Amazon S3. These permissions are then added to the access control list (ACL) on the object. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/S3_ACLs_UsingACLs.html">Using ACLs</a>.</p>  <p>With this operation, you can grant access permissions using one of the following two methods:</p>  <ul>  <li>Specify a canned ACL (<code>x-amz-acl</code>) — Amazon S3 supports a set of predefined ACLs, known as <code>i</code>canned ACLs</i>. Each canned ACL has a predefined set of grantees and permissions. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/acl-overview.html#CannedACL">Canned ACL</a>.</li>  <li>Specify access permissions explicitly — To explicitly grant access permissions to specific AWS accounts or groups, use the following headers. Each header maps to specific permissions that Amazon
S3 supports in an ACL. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/acl-overview.html">Access Control List (ACL) Overview</a>. In the header, you specify a list of grantees who get the specific permission. To grant permissions explicitly, use: 

```html
<ul>
  <li>x-amz-grant-read</li>
  <li>x-amz-grant-write</li>
  <li>x-amz-grant-read-acp</li>
  <li>x-amz-grant-write-acp</li>
  <li>x-amz-grant-full-control</li>
</ul>
```

You specify each grantee as a type=value pair, where the type is one of the following: 

```html
<code>emailAddress</code> – if the value specified is the email address of an AWS account
<code>id</code> – if the value specified is the canonical user ID of an AWS account
<code>uri</code> – if you are granting permissions to a predefined group
```

For example, the following `<code>x-amz-grant-read</code>` header grants the AWS accounts identified by email addresses permissions to read object data and its metadata: 

```html
x-amz-grant-read: emailAddress="xyz@amazon.com", emailAddress="abc@amazon.com"
```

The following operations are related to `<code>CopyObject</code>`: 

```html
<a>PutObject</a>
<a>GetObject</a>
```

For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/CopyingObjectsExamples.html">Copying Objects</a>.
or groups that should be granted specific permissions on the bucket. There are two ways to grant the appropriate permissions using the request headers. </li> <li> <p>Specify a canned ACL using the <code>x-amz-acl</code> request header. Amazon S3 supports a set of predefined ACLs, known as <i>canned ACLs</i>. Each canned ACL has a predefined set of grantees and permissions. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/acl-overview.html" target="_blank">Canned ACL</a>. </p> </li> <li> <p>Specify access permissions explicitly using the <code>x-amz-grant-read</code>, <code>x-amz-grant-write</code>, <code>x-amz-grant-read-acp</code>, <code>x-amz-grant-write-acp</code>, and <code>x-amz-grant-full-control</code> headers. These headers map to the set of permissions Amazon S3 supports in an ACL. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/acl-overview.html" target="_blank">Access Control List (ACL) Overview</a>. </p> </li>

You specify each grantee as a type=value pair, where the type is one of the following: 

- <code>emailAddress</code> – if the value specified is the email address of an AWS account
- <code>id</code> – if the value specified is the canonical user ID of an AWS account
- <code>uri</code> – if you are granting permissions to a predefined group

For example, the following <code>x-amz-grant-read</code> header grants the AWS accounts identified by email addresses permissions to read object data and its metadata:

```plaintext
x-amz-grant-read: emailAddress="xyz@amazon.com", emailAddress="abc@amazon.com"
```

You can use either a canned ACL or specify access permissions explicitly. You cannot do both.

The following operations are related to <code>CreateBucket</code>:</li>

- <a>PutObject</a>
- <a>DeleteBucket</a>
complete or abort the multipart upload. Amazon S3 frees up the space used to store the parts and stop charging you for storing them only after you either complete or abort a multipart upload. </p>  

You can optionally request server-side encryption. For server-side encryption, Amazon S3 encrypts your data as it writes it to disks in its data centers and decrypts it when you access it. You can provide your own encryption key, or use AWS Key Management Service (AWS KMS) customer master keys (CMKs) or Amazon S3-managed encryption keys. If you choose to provide your own encryption key, the request headers you provide in <code>UploadPart</code> and <code>UploadPartCopy</code> requests must match the headers you used in the request to initiate the upload by using <code>CreateMultipartUpload</code>.  

To perform a multipart upload with encryption using an AWS KMS CMK, the requester must have permission to the <code>kms:Encrypt</code>, <code>kms:Decrypt</code>, <code>kms:ReEncrypt*</code>, <code>kms:GenerateDataKey*</code>, and <code>kms:DescribeKey</code> actions on the key. These permissions are required because Amazon S3 must decrypt and read data from the encrypted file parts before it completes the multipart upload. </p>  

If your AWS Identity and Access Management (IAM) user or role is in the same AWS account as the AWS KMS CMK, then you must have these permissions on the key policy. If your IAM user or role belongs to a different account than the key, then you must have the permissions on both the key policy and your IAM user or role. </p>  

For more information, see "Protecting Data Using Server-Side Encryption".  

When copying an object, you can optionally specify the accounts or groups that should be granted specific permissions on the new object. There are two ways to grant the permissions using the request headers:  

Specify a canned ACL with the <code>x-amz-acl</code> request header. For more information, see "Canned ACL".  

Specify access permissions explicitly with the <code>x-amz-grant-read</code>, <code>x-amz-grant-read-acp</code>, <code>x-amz-grant-write-acp</code>, and <code>x-amz-grant-full-control</code> headers. These parameters map to the set of permissions that Amazon S3 supports in an ACL. For more information, see "Access Control List (ACL) Overview".  

You can use either a canned ACL or specify access permissions explicitly. You cannot do both.  

You can optionally tell Amazon S3 to encrypt data at rest using server-side encryption. Server-side encryption is for data encryption at rest. Amazon S3 encrypts your data as it writes it to disks in its data centers and decrypts it when you access it. The option you use depends on whether you want to use AWS managed encryption keys or provide your own encryption key.  

Use encryption keys managed by Amazon S3 or customer master keys (CMKs) stored in AWS Key Management Service (AWS KMS) – If you want AWS to manage the keys used to encrypt data, specify the following headers in the request.  

Use customer-provided encryption keys – If you want to manage your own encryption keys, provide all the following headers in the request.  

For more information about server-side encryption with CMKs stored in AWS KMS (SSE-KMS), see "Protecting Data Using Server-Side Encryption with CMKs stored in AWS KMS".  

For more information about server-side encryption with CMKs stored in AWS KMS (SSE-KMS), see "Protecting Data Using Server-Side Encryption with CMKs stored in AWS KMS".
You also can use the following access control–related headers with this operation. By default, all objects are private. Only the owner has full access control. When adding a new object, you can grant permissions to individual AWS accounts or to predefined groups defined by Amazon S3. These permissions are then added to the access control list (ACL) on the object. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/S3_ACLs_UsingACLs.html">Using ACLs</a>. With this operation, you can grant access permissions using one of the following two methods:

- Specify a canned ACL (<code>x-amz-acl</code>) — Amazon S3 supports a set of predefined ACLs, known as <i>canned ACLs</i>. Each canned ACL has a predefined set of grantees and permissions. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/acl-overview.html#CannedACL">Canned ACL</a>. Specify access permissions explicitly — To explicitly grant access permissions to specific AWS accounts or groups, use the following headers. Each header maps to specific permissions that Amazon S3 supports in an ACL. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/acl-overview.html">Access Control List (ACL) Overview</a>. In the header, you specify a list of grantees who get the specific permission. To grant permissions explicitly, use:</p>

- <code>x-amz-grant-read</code>
- <code>x-amz-grant-write</code>
- <code>x-amz-grant-read-acp</code>
- <code>x-amz-grant-write-acp</code>
- <code>x-amz-grant-full-control</code>

You specify each grantee as a type=value pair, where the type is one of the following:

- emailAddress
- id
- uri

For example, the following <code>x-amz-grant-read</code> header grants the AWS accounts identified by email addresses permissions to read object data and its metadata:

```
x-amz-grant-read: emailAddress="xyz@amazon.com", emailAddress="abc@amazon.com"
```

The following operations are related to <code>CreateMultipartUpload</code>:

- <code>UploadPart</code>
- <code>CompleteMultipartUpload</code>
- <code>AbortMultipartUpload</code>
- <code>ListParts</code>
- <code>ListMultipartUploads</code>

For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/acl-overview.html">Access Control List (ACL) Overview</a>.
<p>Deletes an analytics configuration for the bucket (specified by the analytics configuration ID).</p> <p>To use this operation, you must have permissions to perform the <code>s3:PutAnalyticsConfiguration</code> action.     "requestUri":"/{Bucket}?website",
    "responseCode":204
  },
  "input":{"shape":"DeleteBucketWebsiteRequest"},
  "documentationUrl":"http://docs.amazonwebservices.com/AmazonS3/latest/API/RESTBucketDELETEwebsite.html",
  "documentation":"<p>This operation removes the website configuration for a bucket. Amazon S3 returns a
<code>200 OK</code> response upon successfully deleting a website configuration on the specified bucket. You will get a <code>200 OK</code> response if the website configuration you are trying to delete does not exist on the bucket. Amazon S3 returns a <code>404</code> response if the bucket specified in the request does not exist.</p>

This DELETE operation requires the <code>S3:DeleteBucketWebsite</code> permission. By default, only the bucket owner can delete the website configuration attached to a bucket. However, bucket owners can grant other users permission to delete the website configuration by writing a bucket policy granting them the <code>S3:DeleteBucketWebsite</code> permission. For more information about hosting websites, see [Hosting Websites on Amazon S3](https://docs.aws.amazon.com/AmazonS3/latest/dev/WebsiteHosting.html).

The following operations are related to <code>DeleteBucketWebsite</code>:</p>

- <a>GetBucketWebsite</a>
- <a>PutBucketWebsite</a>

The following operations are related to <code>DeleteObject</code>:</p>

- <a>PutObject</a>

To remove a specific version, you must be the bucket owner and you must use the version Id subresource. Using this subresource permanently deletes the version. If the object deleted is a delete marker, Amazon S3 sets the response header, <code>x-amz-delete-marker</code>, to true. If the object you want to delete is in a bucket where the bucket versioning configuration is MFA Delete enabled, you must include the <code>x-amz-mfa</code> request header in the DELETE request. Requests that include <code>x-amz-mfa</code> must use HTTPS. For more information about MFA Delete, see [Using MFA Delete](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingMFADelete.html). To see sample requests that use versioning, see [Sample Request](https://docs.aws.amazon.com/AmazonS3/latest/API/RESTObjectDELETE.html#ExampleVersionObjectDelete).

You can delete objects by explicitly calling the DELETE Object API or configure its lifecycle (<a>PutBucketLifecycle</a>) to enable Amazon S3 to remove them for you. If you want to block users or accounts from removing or deleting objects from your bucket, you must deny them the <code>s3:DeleteObject</code>, <code>s3:DeleteObjectVersion</code>, and <code>s3:PutLifeCycleConfiguration</code> actions. The following operation is related to <code>DeleteObject</code>: 

- <a>PutObject</a>
<p>Removes the entire tag set from the specified object. For more information about managing object tags, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/object-tagging.html">Object Tagging</a>. To use this operation, you must have permission to perform the <code>DeleteObjectTagging</code> action.</p>

To delete tags of a specific object version, add the <code>versionId</code> query parameter in the request. You will need permission for the <code>DeleteObjectVersionTagging</code> action. The following operations are related to <code>DeleteBucketMetricsConfiguration</code>:</li></ul>

The operation enables you to delete multiple objects from a bucket using a single HTTP request. If you know the object keys that you want to delete, then this operation provides a suitable alternative to sending individual delete requests, reducing per-request overhead. The request contains a list of up to 1000 keys that you want to delete. In the XML, you provide the object key names, and optionally, version IDs if you want to delete a specific version of the object from a versioning-enabled bucket. For each key, Amazon S3 performs a delete operation and returns the result of that delete, success, or failure, in the response. Note that if the object specified in the request is not found, Amazon S3 returns the result as deleted. The operation supports two modes for the response: verbose and quiet. By default, the operation uses verbose mode in which the response includes the result of deletion of each key in your request. In quiet mode the response includes only keys where the delete operation encountered an error. For a successful deletion, the operation does not return any information about the delete in the response body. When performing this operation on an MFA Delete enabled bucket, that attempts to delete any versioned objects, you must include an MFA token. If you do not provide one, the entire request will fail, even if there are non-versioned objects you are trying to delete. If you provide an invalid token, whether there are versioned keys in the request or not, the entire Multi-Object Delete request will fail. For information about MFA Delete, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/Versioning.html#MultiFactorAuthenticationDelete">MFA Delete</a>. Finally, the Content-MD5 header is required for all Multi-Object Delete requests. Amazon S3 uses the header value to ensure that your request body has not been altered in transit. The following operations are related to <code>DeleteObjects</code>:</li></ul>

The operation removes an access block from the bucket. This operation is supported by S3 buckets and supports MFA Delete enabled buckets. The response code is 204 if the operation is successful. If the operation fails, the response code is 404 if the bucket does not exist, and 403 if you do not have permission to perform the <code>DeletePublicAccessBlock</code> action.

"DeletePublicAccessBlock":{
"name":"DeletePublicAccessBlock",
"http":{
"method":"DELETE",

"input": {"shape":"DeletePublicAccessBlockRequest"},

"GetBucketAcl": {"name":"GetBucketAcl","http":{"method":"GET","requestUri":"/{Bucket}?acl"},
"input": {"shape":"GetBucketAclRequest"},
"output": {"shape":"GetBucketAclOutput"},
"documentation": "This implementation of the GET operation uses the <code>accelerate</code> subresource to return the Transfer Acceleration state of a bucket, which is either <code>Enabled</code> or <code>Suspended</code>. Amazon S3 Transfer Acceleration is a bucket-level feature that enables you to perform faster data transfers to and from Amazon S3. To use this operation, you must have permission to perform the <code>s3:GetAccelerateConfiguration</code> action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/using-with-s3-actions.html#using-with-s3-actions-related-to-bucket-subresources">Permissions Related to Bucket Subresource Operations</a> and <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/using-s3-actions.html">Managing Access Permissions to your Amazon S3 Resources</a> in the <i>Amazon Simple Storage Service Developer Guide</i>. You set the Transfer Acceleration state of an existing bucket to <code>Enabled</code> or <code>Suspended</code> by using the <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/transfer-acceleration.html">PutBucketAccelerateConfiguration</a> operation. A GET <code>accelerate</code> request does not return a state value for a bucket that has no transfer acceleration state. A bucket has no Transfer Acceleration state if a state has never been set on the bucket. For more information about transfer acceleration, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/transfer-acceleration.html">Transfer Acceleration</a> in the Amazon Simple Storage Service Developer Guide."}
This implementation of the `GET` operation uses the `acl` subresource to return the access control list (ACL) of a bucket. To use `GET` to return the ACL of the bucket, you must have `READ_ACP` access to the bucket. If `READ_ACP` permission is granted to the anonymous user, you can return the ACL of the bucket without using an authorization header.

"GetBucketLifecycle": {
"name": "GetBucketLifecycle",
"http": {"method": "GET",
"requestUri": "/{Bucket}?lifecycle"},
"input": {"shape": "GetBucketLifecycleRequest"},
"output": {"shape": "GetBucketLifecycleOutput"},
"documentationUrl": "http://docs.amazonwebservices.com/AmazonS3/latest/API/RESTBucketGETlifecycle.html"
For an updated version of this API, see [GetBucketLifecycleConfiguration](https://docs.aws.amazon.com/AmazonS3/latest/dev/object-lifecycle-mgmt.html). If you configured a bucket lifecycle using the `filter` element, you should see the updated version of this topic. This topic is provided for backward compatibility.

To use this operation, you must have permission to perform the `s3:GetLifecycleConfiguration` action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see [Permissions Related to Bucket Subresource Operations](https://docs.aws.amazon.com/AmazonS3/latest/dev/s3-access-control.html) and [Managing Access Permissions to Your Amazon S3 Resources](https://docs.aws.amazon.com/AmazonS3/latest/dev/using-with-s3-actions.html#using-with-s3-actions-related-to-bucket-subresources).

Description: The lifecycle configuration does not exist. HTTP Status Code: 404 Not Found.

The following operations are related to `s3:GetBucketLifecycle`:

- [GetBucketLifecycleConfiguration](https://docs.aws.amazon.com/AmazonS3/latest/dev/object-lifecycle-mgmt.html)
- [PutBucketLifecycle](https://docs.aws.amazon.com/AmazonS3/latest/dev/object-lifecycle-mgmt.html)
- [DeleteBucketLifecycle](https://docs.aws.amazon.com/AmazonS3/latest/dev/object-lifecycle-mgmt.html)

Bucket lifecycle configuration now supports specifying a lifecycle rule using an object key name prefix, one or more object tags, or a combination of both. Accordingly, this section describes the latest API. The response describes the new filter element that you can use to specify a filter to select a subset of objects to which the rule applies. If you are still using previous version of the lifecycle configuration, it works. For the earlier API description, see [GetBucketLifecycle](https://docs.aws.amazon.com/AmazonS3/latest/dev/object-lifecycle-mgmt.html).

To use this operation, you must have permission to perform the `s3:GetLifecycleConfiguration` action. The bucket owner has this permission, by default. The bucket owner can grant this permission to others. For more information about permissions, see [Permissions Related to Bucket Subresource Operations](https://docs.aws.amazon.com/AmazonS3/latest/dev/s3-access-control.html) and [Managing Access Permissions to Your Amazon S3 Resources](https://docs.aws.amazon.com/AmazonS3/latest/dev/using-with-s3-actions.html#using-with-s3-actions-related-to-bucket-subresources).

**GetObject**:

- <code>name</code>: "GetObject"
- <code>http</code>: {
  "method": "GET",
  "requestUri": "/{Bucket}/{Key+}"
},
- <code>input</code>: {
  "shape": "GetObjectRequest"
},
- <code>output</code>: {
  "shape": "GetObjectOutput"
},
- <code>errors</code>: {
  "shape": "NoSuchKey"
},
- <code>documentation</code>: "Retrieves objects from Amazon S3. To use <code>GET</code>, you must have <code>READ</code> access to the object. If you grant <code>READ</code> access to the anonymous user, you can return the object without using an authorization header. An Amazon S3 bucket has no directory hierarchy such as you would find in a typical computer file system. You can, however, create a logical hierarchy by using object key names that imply a folder structure. For example, instead of naming an object <code>sample.jpg</code>, you can name it <code>photos/2006/February/sample.jpg</code>. To get an object from such a logical hierarchy, specify the full key name for the object in the <code>GET</code> operation. For a virtual hosted-style request example, if you have the object <code>photos/2006/February/sample.jpg</code>, specify the resource as <code>/photos/2006/February/sample.jpg</code>. For a path-style request example, if you have the object <code>photos/2006/February/sample.jpg</code> in the bucket named <code>examplebucket</code>, specify the resource as <code>/examplebucket/photos/2006/February/sample.jpg</code>"
For more information about request types, see [Virtual Hosting Specify Bucket](https://docs.aws.amazon.com/AmazonS3/latest/dev/VirtualHosting.html#VirtualHostingSpecifyBucket). For more information about returning the ACL of an object, see [GetObjectAcl](https://docs.aws.amazon.com/AmazonS3/latest/dev/GettingObjectAcl.html). If the object you are retrieving is stored in the GLACIER or DEEP_ARCHIVE storage classes, before you can retrieve the object you must first restore a copy using [Restore Object](https://docs.aws.amazon.com/AmazonS3/latest/dev/restoring-objects.html). For information about restoring archived objects, see [Restore Archival Objects](https://docs.aws.amazon.com/AmazonS3/latest/dev/restoring-objects.html).

To distribute large files to many people, you can save bandwidth costs by using BitTorrent. For more information, see [Amazon S3 Torrent](https://docs.aws.amazon.com/AmazonS3/latest/dev/S3Torrent.html). Encryption request headers, like `x-amz-server-side-encryption`, should not be sent for GET requests if your object uses server-side encryption with CMKs stored in AWS KMS (SSE-KMS) or server-side encryption with Amazon S3–managed encryption keys (SSE-S3). If your object does use these types of keys, you’ll get an HTTP 400 BadRequest error.

If you encrypt an object by using server-side encryption with customer-provided encryption keys (SSE-C) when you store the object in Amazon S3, then when you GET the object, you must use the following headers:

- `x-amz-server-side-encryption-algorithm`
- `x-amz-server-side-encryption-encryption-key`
- `x-amz-server-side-encryption-customer-key-MD5`

Permissions

You need the `s3:GetObject` permission for this operation. For more information, see [Specifying Permissions in a Policy](https://docs.aws.amazon.com/AmazonS3/latest/dev/using-with-s3-actions.html).

Versioning

By default, the GET operation returns the current version of an object. To return a different version, use the `versionId` subresource.

Overriding Response Header Values

There are times when you want to override certain response header values in a GET response. For example, you might override the Content-Disposition response header value in your GET request.

You can override values for a set of response headers using the following query parameters. These response header values are sent only on a successful request, that is, when status code 200 OK is returned. The set of headers you can override using these parameters is a subset of the headers that Amazon S3 accepts when you create an object. The response headers that you can override for the GET response are `Content-Type`, `Content-Language`, `Expires`, `Cache-Control`, `Content-Disposition`, and `Content-Encoding`. To override these header values in the GET response, you use the following request parameters.

You must sign the request, either using an Authorization header or a presigned URL, when using these parameters. They cannot be used with an unsigned (anonymous) request.
Additional Considerations about Request Headers

If both of the `If-Match` and `If-Unmodified-Since` headers are present in the request as follows: `If-Match` condition evaluates to `true`, and; `If-Unmodified-Since` condition evaluates to `false`; then, S3 returns 200 OK and the data requested.

If both of the `If-None-Match` and `If-Modified-Since` headers are present in the request as follows: `If-None-Match` condition evaluates to `false`, and; `If-Modified-Since` condition evaluates to `true`; then, S3 returns 304 Not Modified response code.

The following operations are related to `GetObject`:

- `ListBuckets`
- `GetObjectAcl`
- `DeleteObject`
- `PutObject`

`GetObjectAcl`:

- **name**: `GetObjectAcl`
- **http**:
  - `method`: `GET`
  - `requestUri`:
    - `/{Bucket}/{Key+}?acl`
- **input**:
  - `shape`: `GetObjectAclRequest`
- **output**:
  - `shape`: `GetObjectAclOutput`
- **errors**:
  - `shape`: `NoSuchKey`
- **documentationUrl**: `http://docs.amazonaws.ws.amazonwebservices.com/AmazonS3/latest/API/RESTObjectGETacl.html`
- **documentation**: Returns the access control list (ACL) of an object. To use this operation, you must have READ_ACP access to the object. By default, GET returns ACL information about the current version of an object. To return ACL information about a different version, use the versionId subresource.

The following operations are related to `GetObjectAcl`:

- `Versioning`
- `DeleteObject`
- `PutObject`

`GetObjectLegalHold`:

- **name**: `GetObjectLegalHold`
- **http**:
  - `method`: `GET`
  - `requestUri`:
    - `/{Bucket}/{Key+}?legal-hold`
- **input**:
  - `shape`: `GetObjectLegalHoldRequest`
- **output**:
  - `shape`: `GetObjectLegalHoldOutput`
- **documentation**: Gets an object's current Legal Hold status. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/object-lock.html">Locking Objects</a>.

`GetObjectLockConfiguration`:

- **name**: `GetObjectLockConfiguration`
- **http**:
  - `method`: `GET`
  - `requestUri`:
    - `/{Bucket}?object-lock`
- **input**:
  - `shape`: `GetObjectLockConfigurationRequest`
Gets the Object Lock configuration for a bucket. The rule specified in the Object Lock configuration will be applied by default to every new object placed in the specified bucket. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/object-lock.html">Locking Objects</a>.

Retrieves an object's retention settings. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/object-lock.html">Locking Objects</a>.

Returns the tag-set of an object. You send the GET request against the tagging subresource associated with the object. To use this operation, you must have permission to perform the <code>s3:GetObjectTagging</code> action. By default, the GET operation returns information about current version of an object. For a versioned bucket, you can have multiple versions of an object in your bucket. To retrieve tags of any other version, use the versionId query parameter. You also need permission for the <code>s3:GetObjectVersionTagging</code> action. By default, the bucket owner has this permission and can grant this permission to others. For information about the Amazon S3 object tagging feature, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/object-tagging.html">Object Tagging</a>. The following operation is related to <code>s3:GetObjectTagging</code>: <code>s3:PutObjectTagging</code>.

Return torrent files from a bucket. BitTorrent can save you bandwidth when you're distributing large files. For more information about BitTorrent, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/API/RESTObjectGETtorrent.html">Amazon S3 Torrent</a>. You can get torrent only for objects that are less than 5 GB in size and that are not encrypted using server-side
encryption with customer-provided encryption key. To use GET, you must have READ access to the object. The following operation is related to GetObjectTorrent:

```
<a>GetObject</a> </p> </li> </ul>

"GetPublicAccessBlock":{
  "name":"GetPublicAccessBlock",
  "http":{
    "method":"GET",
    "requestUri":"/{Bucket}?publicAccessBlock"
  },
  "input":{"shape":"GetPublicAccessBlockRequest"},
  "output":{"shape":"GetPublicAccessBlockOutput"},
  "documentation":"Retrieves the <code>PublicAccessBlock</code> configuration for an Amazon S3 bucket. To use this operation, you must have the <code>s3:GetBucketPublicAccessBlock</code> permission. For more information about Amazon S3 permissions, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/using-with-s3-actions.html">Specifying Permissions in a Policy</a>.

When Amazon S3 evaluates the <code>PublicAccessBlock</code> configuration for a bucket or an object, it checks the <code>PublicAccessBlock</code> configuration for both the bucket (or the bucket that contains the object) and the bucket owner's account. If the <code>PublicAccessBlock</code> settings are different between the bucket and the account, Amazon S3 uses the most restrictive combination of the bucket-level and account-level settings.

For more information about when Amazon S3 considers a bucket or an object public, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/access-control-block-public-access.html#access-control-block-public-access-policy-status">The Meaning of "Public"</a>.

The following operations are related to <code>GetPublicAccessBlock</code>:

- <a>Using Amazon S3 Block Public Access</a>
- <a>PutPublicAccessBlock</a>
- <a>GetPublicAccessBlock</a>
- <a>DeletePublicAccessBlock</a>

"HeadBucket":{
  "name": "HeadBucket",
  "http":{
    "method": "HEAD",
    "requestUri": "/{Bucket}" 
  },
  "input":{"shape": "HeadBucketRequest"},
  "errors":[
    {"shape": "NoSuchBucket"}
  ],
  "documentationUrl": "http://docs.amazonwebservices.com/AmazonS3/latest/API/RESTBucketHEAD.html",
  "documentation": "This operation is useful to determine if a bucket exists and you have permission to access it. The operation returns a <code>200 OK</code> if the bucket exists and you have permission to access it. Otherwise, the operation might return responses such as <code>404 Not Found</code> and <code>403 Forbidden</code>.

To use this operation, you must have permissions to perform the <code>s3:ListBucket</code> action. The bucket owner has this permission by default and can grant this permission to others. For more information about permissions, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/using-with-s3-actions-related-to-bucket-subresources.html">Permissions Related to Bucket Subresource Operations</a>.

Managing Access Permissions
The HEAD operation retrieves metadata from an object without returning the object itself. This operation is useful if you're only interested in an object's metadata. To use HEAD, you must have READ access to the object. A HEAD request has the same options as a GET operation on an object. The response is identical to the GET response except that there is no response body.

If you encrypt an object by using server-side encryption with customer-provided encryption keys (SSE-C) when you store the object in Amazon S3, then when you retrieve the metadata from the object, you must use the following headers:

- `x-amz-server-side-encryption-customer-algorithm`
- `x-amz-server-side-encryption-customer-key`
- `x-amz-server-side-encryption-customer-key-MD5`

For more information about SSE-C, see "Server-Side Encryption (Using Customer-Provided Encryption Keys)". Encryption request headers, like `x-amz-server-side-encryption`, should not be sent for GET requests if your object uses server-side encryption with CMKs stored in AWS KMS (SSE-KMS) or server-side encryption with Amazon S3–managed encryption keys (SSE-S3). If your object does not exist, you’ll get an HTTP 404 Bad Request error.

Request headers are limited to 8 KB in size. For more information, see "Common Request Headers". Consider the following when using request headers:

- If both of the `If-Match` and `If-Unmodified-Since` headers are present in the request as follows:
  - `If-Match` condition evaluates to `true`, and;
  - `If-Unmodified-Since` condition evaluates to `false`;
  Then Amazon S3 returns `<code>200 OK</code>` and the data requested.

- `If-Match` condition evaluates to `true`, and;
  `If-Unmodified-Since` condition evaluates to `false`;
  Then Amazon S3 returns `<code>304 Not Modified</code>` response code.

For more information about conditional requests, see "RFC 7232". If you need the `<code>s3:GetObject</code>` permission for this operation. For more information, see "Specifying Permissions in a Policy". If the object you request does not exist, the error Amazon S3 returns depends on whether you also have the `<code>s3:ListBucket</code>` permission.
"ListBucketAnalyticsConfigurations": {
  "name": "ListBucketAnalyticsConfigurations",

Managing Access Permissions to Your Amazon S3 Resources

Permissions Related to Bucket Subresource Operations

Monitoring Metrics with Amazon CloudWatch

Permissions Related to Bucket Subresource Operations

Managing Access Permissions to Your Amazon S3 Resources

Open Source Used In CX Cloud - Control Point 2020-Sep.1 7738
This operation lists in-progress multipart uploads. An in-progress multipart upload is a multipart upload that has been initiated using the Initiate Multipart Upload request, but has not yet been completed or aborted. 

This operation returns at most 1,000 multipart uploads in the response. 1,000 multipart uploads is the maximum number of uploads a response can include, which is also the default value. You can further limit the number of uploads in a response by specifying the `max-uploads` parameter in the response. If additional multipart uploads satisfy the list criteria, the response will contain an `IsTruncated` element with the value true. To list the additional multipart uploads, use the `key-marker` and `upload-id-marker` request parameters. 

In the response, the uploads are sorted by key. If your application has initiated more than one multipart upload using the same object key, then uploads in the response are first sorted by key. Additionally, uploads are sorted in ascending order within each key by the upload initiation time. 

For more information on multipart uploads, see [Uploading Objects Using Multipart Upload](https://docs.aws.amazon.com/AmazonS3/latest/dev/uploadobjusingmpu.html). 

The following operations are related to `ListMultipartUploads`:

- `CreateMultipartUpload`
- `UploadPart`
- `CompleteMultipartUpload`
- `ListParts`
- `AbortMultipartUpload`

This operation lists object versions. Returns metadata about all of the versions of objects in a bucket. You can also use request parameters as selection criteria to return metadata about a subset of all the object versions. 

A 200 OK response can contain valid or invalid XML. Make sure to design your application to parse the contents of the response and handle it appropriately. To use this operation, you must have READ access to the bucket. 

The following operations are related to `ListObjectVersions`:

- `ListObjects`
- `GetObject`
- `PutObject`
- `DeleteObject`

This operation retrieves the metadata about all of the versions of objects in a bucket. 

A 200 OK response can contain valid or invalid XML. Make sure to design your application to parse the contents of the response and handle it appropriately. 

The following operations are related to `ListObjectVersions`:

- `ListObjects`
- `GetObject`
- `PutObject`
- `DeleteObject`

<p>Sets the accelerate configuration of an existing bucket. Amazon S3 Transfer Acceleration is a bucket-level feature that enables you to perform faster data transfers to Amazon S3. To use this operation, you must have permission to perform the s3:PutAccelerateConfiguration action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/using-with-s3-actions.html#using-with-s3-actions-related-to-bucket-subresources">Permissions Related to Bucket Subresource Operations</a> and <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/s3-access-control.html">Managing Access Permissions to Your Amazon S3 Resources</a>. The Transfer Acceleration state of a bucket can be set to one of the following two values: <code>Enabled</code> – Enables accelerated data transfers to the bucket. <code>Suspended</code> – Disables accelerated data transfers to the bucket. The <code>GetBucketAccelerateConfiguration</code> operation returns the transfer acceleration state of a bucket. After setting the Transfer Acceleration state of a bucket to Enabled, it might take up to thirty minutes before the data transfer rates to the bucket increase. The name of the bucket used for Transfer Acceleration must be DNS-compliant and must not contain periods ("."). For more information about transfer acceleration, see</p>"
The following operations are related to PutBucketAccelerateConfiguration:

- GetBucketAccelerateConfiguration
- CreateBucket

"PutBucketAcl": {
  "name": "PutBucketAcl",
  "http": {
    "method": "PUT",
    "requestUri": "{Bucket}?acl"
  },
  "input": {
    "shape": "PutBucketAclRequest"
  },
  "documentationUrl": "http://docs.amazonwebservices.com/AmazonS3/latest/API/RESTBucketPUTacl.html",
  "documentation": "Sets the permissions on an existing bucket using access control lists (ACL). For more information, see [Using ACLs](https://docs.aws.amazon.com/AmazonS3/latest/dev/transfer-acceleration.html). Using ACLs can help you control the access to your objects.

- To set the ACL of a bucket, you must have WRITE_ACP permission.
- You can use one of the following two ways to set a bucket's permissions:
  - Specify the ACL in the request body
  - Specify permissions using request headers

- You cannot specify access permission using both the body and the request headers. Depending on your application needs, you may choose to set the ACL on a bucket using either the request body or the headers. For example, if you have an existing application that updates a bucket ACL using the request body, then you can continue to use that approach.

- Access Permissions
- You can set access permissions using one of the following methods:
  - Specify a canned ACL with the x-amz-acl request header. Amazon S3 supports a set of predefined ACLs, known as canned ACLs.
  - Specify access permissions explicitly with the x-amz-grant-read, x-amz-grant-read-acp, x-amz-grant-write-acp, and x-amz-grant-full-control headers. When using these headers, you specify explicit access permissions and grantees (AWS accounts or Amazon S3 groups) who will receive the permission. If you use these ACL-specific headers, you cannot use the canned ACL name as the value of x-amz-acl. If you use this header, you cannot use other access control-specific headers in your request. For more information, see [Access Control List (ACL) Overview](https://docs.aws.amazon.com/AmazonS3/latest/dev/transfer-acceleration.html#usingACLs).
- Grantee Values
- You can specify the person (grantee) to whom you're assigning access rights (using request elements) in the following ways:
- By Email address
- By CanonicalUser
- By PredefinedGroup

For example, the following x-amz-grant-write header grants create, overwrite, and delete objects permission to LogDelivery group predefined by Amazon S3 and two AWS accounts identified by their email addresses.

```
<x-amz-grant-write: uri="http://acs.amazonaws.com/groups/s3/LogDelivery/"
    emailAddress="xyz@amazon.com", emailAddress="abc@amazon.com" />
```
GET Object acl request, appears as the CanonicalUser.<p> </li><li> <p>By the person's ID:<p> </li><li> <p> By the person's ID:</p> </li><li> <p> <code>&lt;Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xsi:type="CanonicalUser"&gt;&lt;ID&gt;&lt;/ID&gt;&lt;/Grantee&gt;</code> </p> </li><li> <p> DisplayName is optional and ignored in the request.<p> </li><li> <p> By URI:</p> </li><li> <p> <code>&lt;Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xsi:type="Group"&gt;&lt;URI&gt;&lt;/Grantee&gt;</code> </p> </li>

### PutBucketAnalyticsConfiguration

- **name**: `PutBucketAnalyticsConfiguration`
- **http**: 
  - **method**: `PUT`
  - **requestUri**: `/{Bucket}?analytics`

Sets an analytics configuration for the bucket (specified by the analytics configuration ID). You can have up to 1,000 analytics configurations per bucket. You can choose to have storage class analysis export analysis reports sent to a comma-separated values (CSV) flat file. See the request element. Reports are updated daily and are based on the object filters that you configure. When selecting data export, you specify a destination bucket and an optional destination prefix where the file is written. You can export the data to a destination bucket in a different account. However, the destination bucket must be in the same Region as the bucket that you are making the PUT analytics configuration to. For more information, see [Amazon S3 Analytics – Storage Class Analysis](https://docs.aws.amazon.com/AmazonS3/latest/dev/analytics-storage-class.html). You must create a bucket policy on the destination bucket where the exported file is written to grant permissions to Amazon S3 to write objects to the bucket. For an example policy, see [Granting Permissions for Amazon S3 Inventory and Storage Class Analysis](https://docs.aws.amazon.com/AmazonS3/latest/dev/example-bucket-policies.html#example-bucket-policies-use-case-9). To use this operation, you must have permissions to perform the `s3:PutAnalyticsConfiguration` action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see [Managing Access Permissions to Your Amazon S3 Resources](https://docs.aws.amazon.com/AmazonS3/latest/dev/s3-access-control.html) and [Permissions Related to Bucket Subresource Operations](https://docs.aws.amazon.com/AmazonS3/latest/dev/s3-access-control.html).
"name":"PutBucketCors",
"http":{
  "method":"PUT",
  "requestUri":"/{Bucket}?cors"
},
"input":{
  "shape":"PutBucketCorsRequest"},
"documentationUrl":"http://docs.amazonwebservices.com/AmazonS3/latest/API/RESTBucketPUTcors.html",
"documentation":"<p>Sets the <code>cors</code> configuration for your bucket. If the configuration exists, Amazon S3 replaces it.</p>

<p>To use this operation, you must be allowed to perform the <code>s3:PutBucketCORS</code> action. By default, the bucket owner has this permission and can grant it to others.</p>

<p>You set this configuration on a bucket so that the bucket can service cross-origin requests. For example, you might want to enable a request whose origin is <code>http://www.example.com</code> to access your Amazon S3 bucket at <code>my.example.bucket.com</code> by using the browser's <code>XMLHttpRequest</code> capability.</p>

<p>To enable cross-origin resource sharing (CORS) on a bucket, you add the <code>cors</code> subresource to the bucket. The <code>cors</code> subresource is an XML document in which you configure rules that identify origins and the HTTP methods that can be executed on your bucket. The document is limited to 64 KB in size.</p>

<p>When Amazon S3 receives a cross-origin request (or a pre-flight OPTIONS request) against a bucket, it evaluates the <code>cors</code> configuration on the bucket and uses the first <code>CORSRule</code> rule that matches the incoming browser request to enable a cross-origin request. For a rule to match, the following conditions must be met:</p>

<ul>
  <li>The request's <code>Origin</code> header must match <code>AllowedOrigin</code> elements.</li>
  <li>The request method (for example, GET, PUT, HEAD, and so on) or the <code>Access-Control-Request-Method</code> header in case of a pre-flight OPTIONS request must be one of the <code>AllowedMethod</code> elements.</li>
  <li>Every header specified in the <code>Access-Control-Request-Headers</code> request header of a pre-flight request must match an <code>AllowedHeader</code> element.</li>
</ul>

```
"PutBucketInventoryConfiguration":{
  "name":"PutBucketInventoryConfiguration",
  "http":{
    "method":"PUT",
    "requestUri":"/{Bucket}?inventory"
  },
  "input":{
    "shape":"PutBucketInventoryConfigurationRequest"
  },
  "documentation":"
This implementation of the <code>PUT</code> operation adds an inventory configuration (identified by the inventory ID) to the bucket. You can have up to 1,000 inventory configurations per bucket. </p>
<p>Amazon S3 inventory generates inventories of the objects in the bucket on a daily or weekly basis, and the results are published to a flat file. The bucket that is inventoried is called the <i>source</i> bucket, and the bucket where the inventory flat file is stored is called the <i>destination</i> bucket. The <i>destination</i> bucket must be in the same AWS Region as the <i>source</i> bucket. </p> <p>When you configure an inventory for a <i>source</i> bucket, you specify the <i>destination</i> bucket where you want the inventory to be stored, and whether to generate the inventory daily or weekly. You can also configure what object metadata to include and whether to inventory all object versions or only current versions. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/storage-inventory.html">Amazon S3 Inventory</a> in the Amazon Simple Storage Service Developer Guide.<p>Important: You must create a bucket policy on the <i>destination</i> bucket to grant permissions to Amazon S3 to write objects to the bucket in the defined location. For an example policy, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/example-bucket-policies.html#example-bucket-policies-use-case-9">Granting Permissions for Amazon S3 Inventory and Storage Class Analysis</a>. To use this operation, you must have permissions to perform the <code>s3:PutInventoryConfiguration</code> action. The bucket owner has this permission by default and can grant this permission to others. <ul>
  <li> <a>GetBucketLifecycle</a> (Deprecated) </li>
  <li> <a>GetBucketLifecycleConfiguration</a> </li>
  <li> </li>
</ul>
By default, a resource owner—in this case, a bucket owner, which is the AWS account that created the bucket—can perform any of the operations. A resource owner can also grant others permission to perform the operation. For more information, see the following topics in the Amazon Simple Storage Service Developer Guide: </p> <p class="note"> <p>Bucket lifecycle configuration now supports specifying a lifecycle rule using an object key name prefix, one or more object tags, or a combination of both. Accordingly, this section describes the latest API. The previous version of the API supported filtering based only on an object key
You specify the lifecycle configuration in your request body. The lifecycle configuration is specified as XML consisting of one or more rules. Each rule consists of the following:

- Filter identifying a subset of objects to which the rule applies. The filter can be based on a key name prefix, object tags, or a combination of both.
- Status whether the rule is in effect.
- One or more lifecycle transition and expiration actions that you want Amazon S3 to perform on the objects identified by the filter. If the state of your bucket is versioning-enabled or versioning-suspended, you can have many versions of the same object (one current version and zero or more noncurrent versions). Amazon S3 provides predefined actions that you can specify for current and noncurrent object versions.

You can also explicitly deny permissions. Explicit deny also supersedes any other permissions. If you want to block users or accounts from removing or deleting objects from your bucket, you must deny them permissions for the following actions:

- s3:DeleteObject
- s3:DeleteObjectVersion
- s3:PutLifecycleConfiguration

You can also implicitly deny permissions. By default, all Amazon S3 resources are private, including buckets, objects, and related subresources (for example, lifecycle configuration and website configuration). Only the resource owner (that is, the AWS account that created it) can access the resource. The resource owner can optionally grant access permissions to others by writing an access policy. For this operation, a user must get the s3:PutLifecycleConfiguration permission.

You can also specify the person (grantee) to whom you’re assigning access rights (using request elements) in the following ways:

- By the person’s ID:
- By Email address:

The following are related to `<a>PutBucketLifecycleConfiguration</a>`:

- `<a>Examples of Lifecycle Configuration</a>`
- `<a>GetBucketLifecycleConfiguration</a>`
- `<a>DeleteBucketLifecycle</a>`

The following is related to `<a>PutBucketLogging</a>`:

- `<a>PutBucketLoggingRequest</a>`
The grantee is resolved to the CanonicalUser and, in a response to a GET Object acl request, appears as the CanonicalUser.

To enable logging, you use LoggingEnabled and its children request elements. To disable logging, you use an empty BucketLoggingStatus request element:

```
<p>To enable logging, you use LoggingEnabled and its children request elements. To disable logging, you use an empty BucketLoggingStatus request element:</p>
```

For more information about server access logging, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/ServerLogs.html">Server Access Logging</a>. For more information about creating a bucket, see <a>CreateBucket</a>. For more information about returning the logging status of a bucket, see <a>GetBucketLogging</a>.</p>

The following operations are related to <code>PutBucketLogging</code>:

- <code>DeleteBucketLogging</code>
- <code>UpdateBucketLogging</code>
- <code>CreateBucket</code>
- <code>GetBucketLogging</code>

The following operations are related to <code>PutBucketMetricsConfiguration</code>:

- <code>DeleteBucketMetricsConfiguration</code>
- <code>PutBucketMetricsConfiguration</code>
- <code>ListBucketMetricsConfigurations</code>
- <code>GetBucketLifecycle</code>

The following special error:

- **Error code: TooManyConfigurations**

Description: You are attempting to create a new configuration but have already reached the 1,000-configuration limit.

For more information about event notifications, see &lt;a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/NotificationHowTo.html"&gt;Configuring Event Notifications&lt;/a&gt;.&lt;/p&gt; &lt;p&gt;Using this API, you can replace an existing notification configuration. The configuration is an XML file that defines the event types that you want Amazon S3 to publish and the destination where you want Amazon S3 to publish an event notification when it detects an event of the specified type.&lt;/p&gt; &lt;p&gt;By default, your bucket has no event notifications configured. That is, the notification configuration will be an empty &lt;code&gt;NotificationConfiguration&lt;/code&gt;.&lt;/p&gt; &lt;p&gt;&lt;code&gt;&amp;lt;NotificationConfiguration&amp;gt;&lt;/code&gt; &lt;p&gt;This operation replaces the existing notification configuration with the configuration you include in the request body.&lt;/p&gt; &lt;p&gt;After Amazon S3 receives this request, it first verifies that any Amazon Simple Notification Service (Amazon SNS) or Amazon Simple Queue Service (Amazon SQS) destination exists, and that the bucket owner has permission to publish to it by sending a test notification. In the case of AWS Lambda destinations, Amazon S3 verifies that the Lambda function permissions grant Amazon S3 permission to invoke the function from the Amazon S3 bucket. For more information, see &lt;a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/NotificationHowTo.html"&gt;Configuring Notifications for Amazon S3 Events&lt;/a&gt;.&lt;/p&gt; &lt;p&gt;By default, only the bucket owner can configure notifications on a bucket. However, bucket owners can use a bucket policy to grant permission to other users to set this configuration with &lt;code&gt;s3:PutBucketNotification&lt;/code&gt; permission.&lt;/p&gt; &lt;note&gt;&lt;p&gt;The PUT notification is an atomic operation. For example, suppose your notification configuration includes SNS topic, SQS queue, and Lambda function configurations. When you send a PUT request with this configuration, Amazon S3 sends test messages to your SNS topic. If the message fails, the entire PUT operation will fail, and Amazon S3 will not add the configuration to your bucket.&lt;/p&gt; &lt;/note&gt; &lt;b&gt;Responses&lt;/b&gt; &lt;/p&gt; &lt;p&gt;If the configuration in the request body includes only one &lt;code&gt;TopicConfiguration&lt;/code&gt; specifying only the &lt;code&gt;s3:ReducedRedundancyLostObject&lt;/code&gt; event type, the response will also include the &lt;code&gt;x-amz-sns-test-message-id&lt;/code&gt; header containing the message ID of the test notification sent to the topic.&lt;/p&gt; &lt;p&gt;The following operation is related to &lt;code&gt;PutBucketNotificationConfiguration&lt;/code&gt;.&lt;/p&gt; &lt;ul&gt; &lt;li&gt; &lt;p&gt;&lt;a&gt;GetBucketNotificationConfiguration&lt;/a&gt; &lt;/p&gt; &lt;/li&gt; &lt;/ul&gt;" 
},
"PutBucketPolicy":{
 "name":"PutBucketPolicy",
"http":{
 "method":"PUT",
 "requestUri":"/{Bucket}?policy" 
};
Applies an Amazon S3 bucket policy to an Amazon S3 bucket. If you are using an identity other than the root user of the AWS account that owns the bucket, the calling identity must have the <code>PutBucketPolicy</code> permissions on the specified bucket and belong to the bucket owner's account in order to use this operation. If you don't have <code>PutBucketPolicy</code> permissions, Amazon S3 returns a <code>403 Access Denied</code> error. If you have the correct permissions, but you're not using an identity that belongs to the bucket owner's account, Amazon S3 returns a <code>405 Method Not Allowed</code> error.

As a security precaution, the root user of the AWS account that owns a bucket can always use this operation, even if the policy explicitly denies the root user the ability to perform this action.

For more information about bucket policies, see [Using Bucket Policies and User Policies](https://docs.aws.amazon.com/AmazonS3/latest/dev/using-with-s3-actions.html).

The following operations are related to <code>PutBucketPolicy</code>:

- <code>CreateBucket</code>
- <code>DeleteBucket</code>

---

Creates a replication configuration or replaces an existing one. For more information, see [Replication](https://docs.aws.amazon.com/AmazonS3/latest/dev/replication.html) in the <i>Amazon S3 Developer Guide</i>.

To perform this operation, the user or role performing the operation must have the <a href="https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_use_passrole.html">iam:PassRole</a> permission. Specify the replication configuration in the request body. In the replication configuration, you provide the name of the destination bucket where you want Amazon S3 to replicate objects, the IAM role that Amazon S3 can assume to replicate objects on your behalf, and other relevant information.

A replication configuration must include at least one rule, and can contain a maximum of 1,000. Each rule identifies a subset of objects to replicate by filtering the objects in the source bucket. To choose additional subsets of objects to replicate, add a rule for each subset. All rules must specify the same destination bucket.
