  "c2jName": "ObjectLockConfiguration",
  "c2jShape": "ObjectLockConfiguration",
  "defaultConsumerFluentSetterDocumentation": "<p>The Object Lock configuration that you want to apply to
This is a convenience that creates an instance of the `ObjectLockConfiguration.Builder` avoiding the need to create one manually via `ObjectLockConfiguration#builder()`.

When the `Consumer` completes, `ObjectLockConfiguration.Builder#build()` is called immediately and its result is passed to `ObjectLockConfiguration` a consumer that will call methods on `ObjectLockConfiguration.Builder`

Returns a reference to this object so that method calls can be chained together.

```java
@deprecated
public ObjectLockConfiguration withObjectLockConfiguration(ObjectLockConfiguration objectLockConfiguration) {
    this.objectLockConfiguration = objectLockConfiguration;
    return this;
}
```

The Object Lock configuration that you want to apply to the specified bucket.

```java
@deprecated
public ObjectLockConfiguration withObjectLockConfiguration(ObjectLockConfiguration objectLockConfiguration) {
    this.objectLockConfiguration = objectLockConfiguration;
    return this;
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public ObjectLockConfiguration withObjectLockConfiguration() {
    return this;
}
```

The Object Lock configuration that you want to apply to the specified bucket.

```java
public ObjectLockConfiguration withObjectLockConfiguration() {
    return this;
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public ObjectLockConfiguration withObjectLockConfiguration(ObjectLockConfiguration objectLockConfiguration) {
    this.objectLockConfiguration = objectLockConfiguration;
    return this;
}
```

The Object Lock configuration that you want to apply to the specified bucket.

```java
public ObjectLockConfiguration withObjectLockConfiguration(ObjectLockConfiguration objectLockConfiguration) {
    this.objectLockConfiguration = objectLockConfiguration;
    return this;
}
```

The Object Lock configuration that you want to apply to the specified bucket.

```java
public ObjectLockConfiguration withObjectLockConfiguration() {
    return this;
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public ObjectLockConfiguration withObjectLockConfiguration(ObjectLockConfiguration objectLockConfiguration) {
    this.objectLockConfiguration = objectLockConfiguration;
    return this;
}
```

The Object Lock configuration that you want to apply to the specified bucket.

```java
public ObjectLockConfiguration withObjectLockConfiguration(ObjectLockConfiguration objectLockConfiguration) {
    this.objectLockConfiguration = objectLockConfiguration;
    return this;
}
```

The Object Lock configuration that you want to apply to the specified bucket.

```java
public ObjectLockConfiguration withObjectLockConfiguration() {
    return this;
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public ObjectLockConfiguration withObjectLockConfiguration(ObjectLockConfiguration objectLockConfiguration) {
    this.objectLockConfiguration = objectLockConfiguration;
    return this;
}
```

The Object Lock configuration that you want to apply to the specified bucket.

```java
public ObjectLockConfiguration withObjectLockConfiguration(ObjectLockConfiguration objectLockConfiguration) {
    this.objectLockConfiguration = objectLockConfiguration;
    return this;
}
```

The Object Lock configuration that you want to apply to the specified bucket.

```java
public ObjectLockConfiguration withObjectLockConfiguration() {
    return this;
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public ObjectLockConfiguration withObjectLockConfiguration(ObjectLockConfiguration objectLockConfiguration) {
    this.objectLockConfiguration = objectLockConfiguration;
    return this;
}
```

The Object Lock configuration that you want to apply to the specified bucket.

```java
public ObjectLockConfiguration withObjectLockConfiguration() {
    return this;
}

If the bucket is configured as a website, redirects requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata. For information about object metadata, see [Object Key and Metadata](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingMetadata.html). In the following example, the request header sets the redirect to an object (anotherPage.html) in the same bucket:

```
<code>x-amz-website-redirect-location: /anotherPage.html</code>
```
In the following example, the request header sets the object redirect to another website:

```
<code>x-amz-website-redirect-location: http://www.example.com/</code>
```
For more information about website hosting in Amazon S3, see [Hosting Websites on Amazon S3](https://docs.aws.amazon.com/AmazonS3/latest/dev/WebsiteHosting.html) and [How to Configure Website Page Redirects](https://docs.aws.amazon.com/AmazonS3/latest/dev/how-to-page-redirect.html). This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String#builder()`. When the `String.Builder#build()` method is called immediately and its result is passed to `websiteRedirectLocation(String)` a consumer that will call methods on

```
@link String.Builder\n@return Returns a reference to this object so that method calls can be chained together.
@see #websiteRedirectLocation(String)
```

In the following example, the request header sets the object redirect to another website:

```html
<x-amz-website-redirect-location: http://www.example.com/>
```

For more information about website hosting in Amazon S3, see [Hosting Websites on Amazon S3](https://docs.aws.amazon.com/AmazonS3/latest/dev/WebsiteHosting.html) and [How to Configure Website Page Redirects](https://docs.aws.amazon.com/AmazonS3/latest/dev/how-to-page-redirect.html).

In the following example, the request header sets the redirect to an object (anotherPage.html) in the same bucket:

```html
<x-amz-website-redirect-location: /anotherPage.html/>
```

In the following example, the request header sets the object redirect to another website:

```html
<x-amz-website-redirect-location: http://www.example.com/>
```

For more information about website hosting in Amazon S3, see [Hosting Websites on Amazon S3](https://docs.aws.amazon.com/AmazonS3/latest/dev/WebsiteHosting.html) and [How to Configure Website Page Redirects](https://docs.aws.amazon.com/AmazonS3/latest/dev/how-to-page-redirect.html).

```java
@deprecated Use @link #websiteRedirectLocation()
```

```
public class ObjectKeyAndMetadata {

    private String websiteRedirectLocation;

    public ObjectKeyAndMetadata(){
        this.websiteRedirectLocation = null;
    }

    public String getWebsiteRedirectLocation()
```

```
    public void setWebsiteRedirectLocation(String websiteRedirectLocation)
```

```
    public String getWebsiteRedirectLocation()
```

```
    public void setWebsiteRedirectLocation(String websiteRedirectLocation)
```

If the bucket is configured as a website, redirects requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata. For information about object metadata, see [Object Key and Metadata](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingMetadata.html).

In the following example, the request header sets the redirect to another website:

```html
<x-amz-website-redirect-location: http://www.example.com/>
```

For more information about website hosting in Amazon S3, see [Hosting Websites on Amazon S3](https://docs.aws.amazon.com/AmazonS3/latest/dev/WebsiteHosting.html) and [How to Configure Website Page Redirects](https://docs.aws.amazon.com/AmazonS3/latest/dev/how-to-page-redirect.html).

```
    @return Returns a reference to this object so that method calls can be chained together.
```

```
    @deprecated Use @link #websiteRedirectLocation(String)
```

```
    public ObjectKeyAndMetadata(String websiteRedirectLocation)
```

```
    public void setWebsiteRedirectLocation(String websiteRedirectLocation)

If the bucket is configured as a website, redirects requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata. For information about object metadata, see [Object Key and Metadata](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingMetadata.html).

In the following example, the request header sets the redirect to another website:

```html
<x-amz-website-redirect-location: http://www.example.com/>
```

For more information about website hosting in Amazon S3, see [Hosting Websites on Amazon S3](https://docs.aws.amazon.com/AmazonS3/latest/dev/WebsiteHosting.html) and [How to Configure Website Page Redirects](https://docs.aws.amazon.com/AmazonS3/latest/dev/how-to-page-redirect.html).

```
    @return Returns a reference to this object so that method calls can be chained together.
```

```java
    @deprecated Use @link #websiteRedirectLocation(String)
```

```
    public ObjectKeyAndMetadata(String websiteRedirectLocation)
```

```
    public void setWebsiteRedirectLocation(String websiteRedirectLocation)
```

If the bucket is configured as a website, redirects requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata. For information about object metadata, see [Object Key and Metadata](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingMetadata.html).

In the following example, the request header sets the redirect to another website:

```html
<x-amz-website-redirect-location: http://www.example.com/>
```

For more information about website hosting in Amazon S3, see [Hosting Websites on Amazon S3](https://docs.aws.amazon.com/AmazonS3/latest/dev/WebsiteHosting.html) and [How to Configure Website Page Redirects](https://docs.aws.amazon.com/AmazonS3/latest/dev/how-to-page-redirect.html).

```
    @return Returns a reference to this object so that method calls can be chained together.
```

```java
    @deprecated Use @link #websiteRedirectLocation(String)
```

```
    public ObjectKeyAndMetadata(String websiteRedirectLocation)
```

```
    public void setWebsiteRedirectLocation(String websiteRedirectLocation)
```

If the bucket is configured as a website, redirects requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata. For information about object metadata, see [Object Key and Metadata](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingMetadata.html).
In the following example, the request header sets the object redirect to another website:

```html
x-amz-website-redirect-location: http://www.example.com/
```

For more information about website hosting in Amazon S3, see

[Hosting Websites on Amazon S3](https://docs.aws.amazon.com/AmazonS3/latest/dev/WebsiteHosting.html) and

[How to Configure Website Page Redirects](https://docs.aws.amazon.com/AmazonS3/latest/dev/how-to-page-redirect.html).

If the bucket is configured as a website, redirects requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata. For information about object metadata, see

[Object Key and Metadata](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingMetadata.html)

In the following example, the request header sets the redirect to an object (anotherPage.html) in the same bucket:

```html
x-amz-website-redirect-location: /anotherPage.html
```

In the following example, the request header sets the object redirect to another website:

```html
x-amz-website-redirect-location: http://www.example.com/
```

For more information about website hosting in Amazon S3, see

[Hosting Websites on Amazon S3](https://docs.aws.amazon.com/AmazonS3/latest/dev/WebsiteHosting.html) and

[How to Configure Website Page Redirects](https://docs.aws.amazon.com/AmazonS3/latest/dev/how-to-page-redirect.html).

When the request header sets the object redirect, Amazon S3 stores the value of this header in the object metadata. For information about object metadata, see

[Object Key and Metadata](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingMetadata.html)

In the following example, the request header sets the redirect to an object (anotherPage.html) in the same bucket:

```html
x-amz-website-redirect-location: /anotherPage.html
```

In the following example, the request header sets the object redirect to another website:

```html
x-amz-website-redirect-location: http://www.example.com/
```

For more information about website hosting in Amazon S3, see

[Hosting Websites on Amazon S3](https://docs.aws.amazon.com/AmazonS3/latest/dev/WebsiteHosting.html) and

[How to Configure Website Page Redirects](https://docs.aws.amazon.com/AmazonS3/latest/dev/how-to-page-redirect.html).

For information about object metadata, see

[Object Key and Metadata](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingMetadata.html).
In the following example, the request header sets the object redirect to another website:

```javascript
x-amz-website-redirect-location: http://www.example.com/
```

For more information about website hosting in Amazon S3, see [Hosting Websites on Amazon S3](https://docs.aws.amazon.com/AmazonS3/latest/dev/WebsiteHosting.html) and [How to Configure Website Page Redirects](https://docs.aws.amazon.com/AmazonS3/latest/dev/how-to-page-redirect.html).

In the following example, the request header sets the object redirect to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata. For information about object metadata, see [Object Key and Metadata](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingMetadata.html).

```javascript
x-amz-website-redirect-location: /anotherPage.html
```

In the following example, the request header sets the object redirect to another website:

```javascript
x-amz-website-redirect-location: http://www.example.com/
```

For more information about website hosting in Amazon S3, see [Hosting Websites on Amazon S3](https://docs.aws.amazon.com/AmazonS3/latest/dev/WebsiteHosting.html) and [How to Configure Website Page Redirects](https://docs.aws.amazon.com/AmazonS3/latest/dev/how-to-page-redirect.html).
If the bucket is configured as a website, redirects requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata. For information about object metadata, see &lt;a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingMetadata.html"&gt;Object Key and Metadata&lt;/a&gt;.&lt;/p&gt; &lt;p&gt;In the following example, the request header sets the redirect to an object (anotherPage.html) in the same bucket:&lt;/p&gt; &lt;p&gt; &lt;code&gt;x-amz-website-redirect-location: /anotherPage.html&lt;/code&gt; &lt;/p&gt; &lt;p&gt;In the following example, the request header sets the object redirect to another website:&lt;/p&gt; &lt;p&gt; &lt;code&gt;x-amz-website-redirect-location: http://www.example.com/&lt;/code&gt; &lt;/p&gt; &lt;p&gt;For more information about website hosting in Amazon S3, see &lt;a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/WebsiteHosting.html"&gt;Hosting Websites on Amazon S3&lt;/a&gt; and &lt;a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/how-to-page-redirect.html"&gt;How to Configure Website Page Redirects&lt;/a&gt;. &lt;/p&gt;\n
```
@param websiteRedirectLocation If the bucket is configured as a website, redirects requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata. For information about object metadata, see &lt;a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingMetadata.html"&gt;Object Key and Metadata&lt;/a&gt;.&lt;/p&gt; &lt;p&gt;In the following example, the request header sets the redirect to an object (anotherPage.html) in the same bucket:&lt;/p&gt; &lt;p&gt; &lt;code&gt;x-amz-website-redirect-location: /anotherPage.html&lt;/code&gt; &lt;/p&gt; &lt;p&gt;In the following example, the request header sets the object redirect to another website:&lt;/p&gt; &lt;p&gt; &lt;code&gt;x-amz-website-redirect-location: http://www.example.com/&lt;/code&gt; &lt;/p&gt; &lt;p&gt;For more information about website hosting in Amazon S3, see &lt;a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/WebsiteHosting.html"&gt;Hosting Websites on Amazon S3&lt;/a&gt; and &lt;a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/how-to-page-redirect.html"&gt;How to Configure Website Page Redirects&lt;/a&gt;.&lt;/p&gt;```

Amazon S3 stores the value of this header in the object metadata. For information about object metadata, see &lt;a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingMetadata.html"&gt;Object Key and Metadata&lt;/a&gt;.&lt;/p&gt; &lt;p&gt;In the following example, the request header sets the redirect to an object (anotherPage.html) in the same bucket:&lt;/p&gt; &lt;p&gt; &lt;code&gt;x-amz-website-redirect-location: /anotherPage.html&lt;/code&gt; &lt;/p&gt; &lt;p&gt;In the following example, the request header sets the object redirect to another website:&lt;/p&gt; &lt;p&gt; &lt;code&gt;x-amz-website-redirect-location: http://www.example.com/&lt;/code&gt; &lt;/p&gt; &lt;p&gt;For more information about website hosting in Amazon S3, see &lt;a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/WebsiteHosting.html"&gt;Hosting Websites on Amazon S3&lt;/a&gt;.
```
How to Configure Website Page Redirects

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String#builder()`. When the `Consumer` completes, `String.Builder#build()` is called immediately and its result is passed to `SSECustomerAlgorithm(String)`.

```
@Deprecated
public @Nullable String getSseCustomerAlgorithm()

If the bucket is configured as a website, redirects requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata. For information about object metadata, see [Object Key and Metadata](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingMetadata.html).

``
<p>In the following example, the request header sets the redirect to an object (anotherPage.html) in the same bucket:

```html
<x-amz-website-redirect-location: /anotherPage.html</x-amz-website-redirect-location>
```

```
In the following example, the request header sets the object redirect to another website:

```html
<x-amz-website-redirect-location: http://www.example.com/</x-amz-website-redirect-location>
```
```

For more information about website hosting in Amazon S3, see [Hosting Websites on Amazon S3](https://docs.aws.amazon.com/AmazonS3/latest/dev/WebsiteHosting.html) and [How to Configure Website Page Redirects](https://docs.aws.amazon.com/AmazonS3/latest/dev/how-to-page-redirect.html).

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String.Builder()`. When the `String.Builder` completes, it is called immediately and its result is passed to the website redirect location method.

```
@webclient@SetWebsiteRedirectLocation(String)
```
If the bucket is configured as a website, redirects requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata. For information about object metadata, see [Object Key and Metadata](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingMetadata.html).

```java
In the following example, the request header sets the redirect to an object (anotherPage.html) in the same bucket:
```<br/>

```java
In the following example, the request header sets the object redirect to another website:
```<br/>

For more information about website hosting in Amazon S3, see [Hosting Websites on Amazon S3](https://docs.aws.amazon.com/AmazonS3/latest/dev/WebsiteHosting.html) and [How to Configure Website Page Redirects](https://docs.aws.amazon.com/AmazonS3/latest/dev/how-to-page-redirect.html).

```java
的存在检查方法名是hasWebsiteRedirectLocation.
```

```java
存在检查文档说明：如果WebsiteRedirectLocation属性由发送方指定（它可能为空），或发送方未指定该值（它将为空）。对于SDK返回的响应，发送方是AWS服务。
```

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String#builder()`. When the `Consumer` completes, `String.Builder#build()` is called immediately and its result is passed to `grantFullControl(String)`. Returns a reference to this object so that method calls can be chained together.

```java
@see #grantFullControl(String)
```

Gives the grantee READ, READ_ACP, and WRITE_ACP permissions on the object. This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String#builder()`.

When the `Consumer` completes, `String.Builder#build()` is called immediately and its result is passed to `grantFullControl(String)`. Returns a reference to this object so that method calls can be chained together.

```java
@see #grantFullControl(String)
```

Gives the grantee READ, READ_ACP, and WRITE_ACP permissions on the object. This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String#builder()`.

When the `Consumer` completes, `String.Builder#build()` is called immediately and its result is passed to `grantFullControl(String)`. Returns a reference to this object so that method calls can be chained together.

Amazon S3 uses this header for a message integrity check to ensure that the encryption key was transmitted without error.<p></p>

If the value of <code>x-amz-server-side-encryption</code> is present and has the value of <code>aws:kms</code>, this header specifies the ID of the symmetric customer managed AWS KMS CMK that will be used for the object. If you specify <code>x-amz-server-side-encryption:aws:kms</code>, but do not provide <code> x-amz-server-side-encryption-aws-kms-key-id</code>, Amazon S3 uses the AWS managed CMK in AWS to protect the data.

This is a convenience that creates an instance of the {@link String.Builder} avoiding the need to create one manually via {@link String#builder()}. When the [@link Consumer] completes, [@link String.Builder#build()] is called immediately and its result is passed to [@link #ssekmsKeyId(String)].

This method takes a consumer that will call methods on {@link String.Builder}.

When the method completes, returns a reference to this object so that method calls can be chained together.

@see #ssekmsKeyId(String)
for the object.</p> <p> If the value of <code>x-amz-server-side-encryption</code> is <code>aws:kms</code>, this header specifies the ID of the symmetric customer managed AWS KMS CMK that will be used for the object. If you specify <code>x-amz-server-side-encryption:aws:kms</code>, but do not provide <code>x-amz-server-side-encryption-aws-kms-key-id</code>, Amazon S3 uses the AWS managed CMK in AWS to protect the data.</p

```java
@deprecated Use {@link #ssekmsKeyId(String)}
```

```java
@deprecated Use {@link #ssekmsKeyId()}
```
If the value of `<code>x-amz-server-side-encryption</code>` is `<code>aws:kms</code>`, this header specifies the ID of the symmetric customer managed AWS KMS CMK that will be used for the object. If you specify `<code>x-amz-server-side-encryption:aws:kms</code>`, but do not provide `<code>x-amz-server-side-encryption-aws-kms-key-id</code>`, Amazon S3 uses the AWS managed CMK in AWS to protect the data.

```
"fluentSetterMethodName" : "ssekmsKeyId",

### Default Consumer Fluent Setter Documentation

If server-side encryption with a customer-provided encryption key was requested, the response will include this header to provide round-trip message integrity verification of the customer-provided encryption key.

```
@deprecated
@deprecated Use { @link #sseCustomerKeyMD5(String))
```

### Deprecated Getter Documentation

```
@deprecated Use { @link #sseCustomerKeyMD5(String))
```

### Deprecated Setter Documentation

```
@deprecated Use { @link #sseCustomerKeyMD5(String))
```

This is a convenience that creates an instance of the `{ @link String.Builder} avoiding the need to create one manually via `{ @link String#builder()}`. When the `{ @link Consumer} completes, `{ @link String.Builder#build()} is called immediately and its result is passed to `{ @link #sseCustomerKeyMD5(String))`. A consumer that will call methods on `{ @link String.Builder} returns a reference to this object so that method calls can be chained together.

```
@deprecated
```

When server-side encryption with a customer-provided encryption key was requested, the response will include this header to provide round-trip message integrity verification of the customer-provided encryption key.

```
@deprecated
```

When server-side encryption with a customer-provided encryption key was requested, the response will include this header to provide round-trip message integrity verification of the customer-provided encryption key.

```
@deprecated
```
encryption key.

If server-side encryption with a customer-provided encryption key was requested, the response will include this header to provide round-trip message integrity verification of the customer-provided encryption key.

@param sseCustomerKeyMD5 If server-side encryption with a customer-provided encryption key was requested, the response will include this header to provide round-trip message integrity verification of the customer-provided encryption key.

@return Returns a reference to this object so that method calls can be chained together.

If server-side encryption with a customer-provided encryption key was requested, the response will include this header to provide round-trip message integrity verification of the customer-provided encryption key.

The key name for the object that you want to apply this Object Retention configuration to.

```java
@Retention
public class ObjectLockRetention {
    private String retention;

    public String retention() {
        return retention;
    }

    public void setRetention(String retention) {
        this.retainion = retention;
    }
}
```

When the `Retention` class is instantiated, it provides a method `retention()` to get the current retention value and `setRetention(String retention)` to set a new retention value.

This is a convenience that creates an instance of the { @link ObjectLockRetention.Builder} avoiding the need to create one manually via { @link ObjectLockRetention#builder()}. When the { @link Consumer} completes, { @link ObjectLockRetention.Builder#build()} is called immediately and its result is passed...

The MD5 hash of the `PutPublicAccessBlock` request body.

This is a convenience that creates an instance of the
`String.Builder` avoiding the need to create one manually via `String#builder()`.

When the `Consumer` completes, `String.Builder#build()` is called immediately and its result is passed to
`#contentMD5(String)`.

```java
public String contentMD5(String contentMD5)
```

Returns a reference to this object so that method calls can be chained together.

```java
when #contentMD5(String) completes, String.Builder#build() is called immediately and its result is passed to
#contentMD5(String)
```

@deprecated
Use `String#builder()`.

```java
@deprecated
public String contentMD5()
```

Returns a reference to this object so that method calls can be chained together.

```java
when #contentMD5() completes, String.Builder#build() is called immediately and its result is passed to
#contentMD5()
```

@deprecated
Use `String#builder()`.

```java
public String contentMD5()
```

Returns a reference to this object so that method calls can be chained together.

```java
when #contentMD5() completes, String.Builder#build() is called immediately and its result is passed to
#contentMD5()
```

@deprecated
Use `String#builder()`.

```java
public String contentMD5()
```

Returns a reference to this object so that method calls can be chained together.

```java
when #contentMD5() completes, String.Builder#build() is called immediately and its result is passed to
#contentMD5()
```

@deprecated

"templateType" : "java.util.List<String>"
A collection of bucket events for which to send notifications. The parameter is a List of Strings.

```java
public interface NotificationConfigurationFilter {
    List<String> events();
    void setEvents(List<String> events);
}
```

This is a convenience method that allows you to filter events in a more fluent manner. It's useful when you need to perform multiple operations on the `NotificationConfigurationFilter` object.

```java
@Builder
public static class NotificationConfigurationFilterBuilder {
    public NotificationConfigurationFilter build() {
        // Implementation...
    }
}
```

The `build()` method is called when the `@See #filter(NotificationConfigurationFilter)` function is used.

### See Also
- [NotificationConfigurationFilter](https://example.com/notificationconfigurationfilter)
- [Builder Pattern](https://example.com/builderpattern)

**Deprecated:**

Filter not supported by the current version.

```java
public interface NotificationConfigurationFilter {
    @Deprecated
    List<String> events();
    @Deprecated
    void setEvents(List<String> events);
}
```

This method is marked as deprecated, indicating it should not be used in new code.

### Note

Ensure you update your code to use the latest version of the `NotificationConfigurationFilter` interface to avoid compatibility issues.

```java
public void setRules(ReplicationRule... rules)
```

**defaultConsumerFluentSetterDocumentation**

A container for one or more replication rules. A replication configuration must have at least one rule and can contain a maximum of 1,000 rules. This is a convenience that creates an instance of the `List<ReplicationRule>` using a `List<ReplicationRule.Builder>`. When the `List<ReplicationRule.Builder>` completes, the `List<ReplicationRule>` is called immediately and its result is passed to the `List<ReplicationRule>`.

```java
public void setRules(List<ReplicationRule> rules)
```

**c2jShape**

`ReplicationRule`
A container for one or more replication rules. A replication configuration must have at least one rule and can contain a maximum of 1,000 rules. Attempts to modify the collection returned by this method will result in an UnsupportedOperationException. You can use {link #hasRules()} to see if a value was sent in this field. You can use {link #rules()} to see if a value was sent in this field.

You can use {link #hasRules()} to see if a value was sent in this field. Returns a reference to this object so that method calls can be chained together.

Returns true if the Rules property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.

Returns a reference to this object so that method calls can be chained together.

A container for one or more replication rules. A replication configuration must have at least one rule and can contain a maximum of 1,000 rules. A container for one or more replication rules. A replication configuration must have at least one rule and can contain a maximum of 1,000 rules.

A container for one or more replication rules. A replication configuration must have at least one rule and can contain a maximum of 1,000 rules.

A container for one or more replication rules. A replication configuration must have at least one rule and can contain a maximum of 1,000 rules.

A container for one or more replication rules. A replication configuration must have at least one rule and can contain a maximum of 1,000 rules.

A container for one or more replication rules. A replication configuration must have at least one rule and can contain a maximum of 1,000 rules.

A container for one or more replication rules. A replication configuration must have at least one rule and can contain a maximum of 1,000 rules.

A container for one or more replication rules. A replication configuration must have at least one rule and can contain a maximum of 1,000 rules.

The Amazon Resource Name (ARN) of the AWS Identity and Access Management (IAM) role that Amazon S3 assumes when replicating objects. For more information, see "How to Set Up Replication" in the Amazon Simple Storage Service Developer Guide.

A convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `{@link String#builder()}.

When the `{@link Consumer}` completes, `{@link String.Builder#build()}` is called immediately and its result is passed to `{@link #role(String)}`.

This method is deprecated. Use `{@link #role()}` instead.

The Amazon Resource Name (ARN) of the AWS Identity and Access Management (IAM) role that Amazon S3 assumes when replicating objects. For more information, see [How to Set Up Replication](https://docs.aws.amazon.com/AmazonS3/latest/dev/replication-how-setup.html) in the [Amazon Simple Storage Service Developer Guide](https://docs.aws.amazon.com/AmazonS3/latest/dev/replication-how-setup.html).

```java
public String getRole()
```

```java
public void setRole(String role)
```

A container for one or more replication rules. A replication configuration must have at least one rule and can contain a maximum of 1,000 rules. This is a convenience that creates an instance of the `List<ReplicationRule.Builder>` avoiding the need to create one manually via `List<ReplicationRule>#builder()`. When the `Consumer` completes, `List<ReplicationRule>Builder#build()` is called immediately and its result is passed to `List<ReplicationRule>`.

```java
public List<ReplicationRule> getRules()
```

```java
public RuleBuilder setRules(List<ReplicationRule> rules)
```
A container for one or more replication rules. A replication configuration must have at least one rule and can contain a maximum of 1,000 rules. Attempts to modify the collection returned by this method will result in an UnsupportedOperationException. You can use `@link #hasRules()` to see if a value was sent in this field. You can use `@link #rules()` to see if a value was sent in this field.

You can use `@link #hasRules()` to see if a value was sent in this field. For responses returned by the SDK, the sender is the AWS service.

Returns true if the Rules property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.

A container for one or more replication rules. A replication configuration must have at least one rule and can contain a maximum of 1,000 rules. A replication configuration must have at least one rule and can contain a maximum of 1,000 rules.

A container for one or more replication rules. A replication configuration must have at least one rule and can contain a maximum of 1,000 rules.

```java
public class ReplicationRule {
    private String member;
    private ReplicationRule replicationRule;
}
```

The `Rules` class represents a list of replication rules:

```java
public class Rules {
    private List<ReplicationRule> rules;
    // set and get methods...
}
```

The `setterDocumentation` in the `Rules` class is as follows:

```
<p>A container for one or more replication rules. A replication configuration must have at least one rule and can contain a maximum of 1,000 rules.</p>
```
"variableSetterType" : "java.util.Collection<ReplicationRule>"

A container that describes additional filters for identifying the source objects that you want to replicate. You can choose to enable or disable the replication of these objects. Currently, Amazon S3 supports only the filter that you can specify for objects created with server-side encryption using a customer master key (CMK) stored in AWS Key Management Service (SSE-KMS).

@deprecated Use {@link #sourceSelectionCriteria()}

```
public SourceSelectionCriteria() {
    this.sourceSelectionCriteria = SourceSelectionCriteria();
}
```

@deprecated Use {@link #sourceSelectionCriteria(SourceSelectionCriteria)}

Methods:

- `hasSourceSelectionCriteria`: Returns true if the `SourceSelectionCriteria` property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.

- `sourceSelectionCriteria`: A container that describes additional filters for identifying the source objects that you want to replicate. You can choose to enable or disable the replication of these objects. Currently, Amazon S3 supports only the filter that you can specify for objects created with server-side encryption using a customer master key (CMK) stored in AWS Key Management Service (SSE-KMS).

```
public SourceSelectionCriteria sourceSelectionCriteria {
    get {
        return _sourceSelectionCriteria;
    }
    set {
        if (_sourceSelectionCriteria == null)
            _sourceSelectionCriteria = SourceSelectionCriteria();
        _sourceSelectionCriteria = value;
    }
}
```

- `hasSourceSelectionCriteria`: Returns true if the `SourceSelectionCriteria` property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.

- `sourceSelectionCriteria`: A container that describes additional filters for identifying the source objects that you want to replicate. You can choose to enable or disable the replication of these objects. Currently, Amazon S3 supports only the filter that you can specify for objects created with server-side encryption using a customer master key (CMK) stored in AWS Key Management Service (SSE-KMS).

```
public SourceSelectionCriteria sourceSelectionCriteria {
    get {
        return _sourceSelectionCriteria;
    }
    set {
        if (_sourceSelectionCriteria == null)
            _sourceSelectionCriteria = SourceSelectionCriteria();
        _sourceSelectionCriteria = value;
    }
}
```
A container that describes additional filters for identifying the source objects that you want to replicate. You can choose to enable or disable the replication of these objects. Currently, Amazon S3 supports only the filter that you can specify for objects created with server-side encryption using a customer master key (CMK) stored in AWS Key Management Service (SSE-KMS).
A container that describes additional filters for identifying the source objects that you want to replicate. You can choose to enable or disable the replication of these objects. Currently, Amazon S3 supports only the filter that you can specify for objects created with server-side encryption using a customer master key (CMK) stored in AWS Key Management Service (SSE-KMS).

This is a convenience that creates an instance of the

When the @link Consumer completes, @link ExistingObjectReplication.Builder#build() is called immediately and its result is passed to @link #existingObjectReplication(ExistingObjectReplication).

@see #existingObjectReplication(ExistingObjectReplication)

@link ExistingObjectReplication.Builder avoiding the need to create one manually via @link ExistingObjectReplication#builder() when the @link Consumer completes, @link ExistingObjectReplication.Builder#build() is called immediately and its result is passed to @link #existingObjectReplication(ExistingObjectReplication).

@link #existingObjectReplication()

@link #existingObjectReplication(ExistingObjectReplication)

@link #existingObjectReplication(ExistingObjectReplication)

Returns a reference to this object so that method calls can be chained together.

@see #existingObjectReplication(ExistingObjectReplication)

@link #existingObjectReplication(ExistingObjectReplication)

@link #existingObjectReplication(ExistingObjectReplication)

Returns a reference to this object so that method calls can be chained together.

@link #existingObjectReplication(ExistingObjectReplication)

For responses returned by the SDK, the sender is the AWS service.

Returns true if the ExistingObjectReplication property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.

<li>Same object qualify tag-based filter criteria specified in multiple rules</li>
</ul>

For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/replication.html">Replication</a> in the <i>Amazon Simple Storage Service Developer Guide</i>.

@param priority The priority associated with the rule. If you specify multiple rules in a replication configuration, Amazon S3 prioritizes the rules to prevent conflicts when filtering. If two or more rules identify the same object based on a specified filter, the rule with higher priority takes precedence. For example:

<ul>
<li>Same object quality prefix-based filter criteria if prefixes you specified in multiple rules overlap</li>
<li>Same object qualify tag-based filter criteria specified in multiple rules</li>
</ul>

For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/replication.html">Replication</a> in the <i>Amazon Simple Storage Service Developer Guide</i>.

@return Returns a reference to this object so that method calls can be chained together.

<ul>
<li>
The priority associated with the rule. If you specify multiple rules in a replication configuration, Amazon S3 prioritizes the rules to prevent conflicts when filtering. If two or more rules identify the same object based on a specified filter, the rule with higher priority takes precedence. For example:

```xml
<ul>
<li>Same object quality prefix-based filter criteria if prefixes you specified in multiple rules overlap</li>
<li>Same object qualify tag-based filter criteria specified in multiple rules</li>
</ul>
```

For more information, see [Replication in the Amazon Simple Storage Service Developer Guide](https://docs.aws.amazon.com/AmazonS3/latest/dev/replication.html).

```xml
@param priority The priority associated with the rule. If you specify multiple rules in a replication configuration, Amazon S3 prioritizes the rules to prevent conflicts when filtering. If two or more rules identify the same object based on a specified filter, the rule with higher priority takes precedence. For example:

```xml
<ul>
<li>Same object quality prefix-based filter criteria if prefixes you specified in multiple rules overlap</li>
<li>Same object qualify tag-based filter criteria specified in multiple rules</li>
</ul>
```

For more information, see [Replication in the Amazon Simple Storage Service Developer Guide](https://docs.aws.amazon.com/AmazonS3/latest/dev/replication.html).

```

### SourceSelectionCriteria

- **description**: A container that describes additional filters for identifying the source objects that you want to replicate. You can choose to enable or disable the replication of these objects. Currently, Amazon S3 supports only the filter that you can specify for objects created with server-side encryption using a customer master key (CMK) stored in AWS Key Management Service (SSE-KMS).

```java
public class SourceSelectionCriteria {
    // Constructor and methods...
}
```

- **specification**: Returns a reference to this object so that method calls can be chained together.

```java
public SourceSelectionCriteria sourceSelectionCriteria(SourceSelectionCriteria criteria) {
    // Method implementation...
}
```

- **return type**: SourceSelectionCriteria

```java
public SourceSelectionCriteria sourceSelectionCriteria() {
    // Method implementation...
}
```

- **endpoint discovery**: false

```java
public boolean endpointDiscoveryId() {
    // Method implementation...
}
```

- **method names**:
  - **getters**: sourceSelectionCriteria, hasSourceSelectionCriteria
  - **setters**: sourceSelectionCriteria

```java
public SourceSelectionCriteria sourceSelectionCriteria() {
    // Method implementation...
}
```

```java
public boolean hasSourceSelectionCriteria() {
    // Method implementation...
}
```

```java
public SourceSelectionCriteria sourceSelectionCriteria(SourceSelectionCriteria criteria) {
    // Method implementation...
}
```

```java
public boolean endpointDiscoveryId() {
    // Method implementation...
}
```

- **documentation**: A container that describes additional filters for identifying the source objects that you want to replicate. You can choose to enable or disable the replication of these objects. Currently, Amazon S3 supports only the filter that you can specify for objects created with server-side encryption using a customer master key (CMK) stored in AWS Key Management Service (SSE-KMS).

```java
public class SourceSelectionCriteria {
    // Constructor and methods...
}
```

```java
public SourceSelectionCriteria sourceSelectionCriteria(SourceSelectionCriteria criteria) {
    // Method implementation...
}
```

```java
public boolean endpointDiscoveryId() {
    // Method implementation...
}
```

- **setters**: sourceSelectionCriteria

```java
public SourceSelectionCriteria sourceSelectionCriteria(SourceSelectionCriteria criteria) {
    // Method implementation...
}
```

```java
public boolean endpointDiscoveryId() {
    // Method implementation...
}
```

- **getter documentation**: A container that describes additional filters for identifying the source objects that you want to replicate. You can choose to enable or disable the replication of these objects. Currently, Amazon S3 supports only the filter that you can specify for objects created with server-side encryption using a customer master key (CMK) stored in AWS Key Management Service (SSE-KMS).

```java
public SourceSelectionCriteria sourceSelectionCriteria() {
    // Method implementation...
}
```

```java
public boolean endpointDiscoveryId() {
    // Method implementation...
}
```

- **getter model**:
  - **return type**: SourceSelectionCriteria

```java
public SourceSelectionCriteria sourceSelectionCriteria() {
    // Method implementation...
}
```

```java
public boolean endpointDiscoveryId() {
    // Method implementation...
}
```

A container for specifying a tag key and value. The rule applies only to objects that have the tag in their tag set.

When the `@link Consumer` completes, `@link Tag.Builder#build()` is called immediately and its result is passed to `@link #tag(Tag)`.

For responses returned by the SDK, the sender is the AWS service.

Returns true if the Tag property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty).
objects that have the tag in their tag set.

```json

},
A container for specifying rule filters. The filters determine the subset of objects to which the rule applies. This element is required only if you specify more than one filter. For example: 

```xml
<And>Error</And>
```

If you specify both a `<code>Error</code>` and a `<code>Not</code>` filter, wrap these filters in an `<code>Or</code>` tag. For example: 

```xml
<Or>ErrorNot</Or>
```

This is a convenience that creates an instance of the `{@link ReplicationRuleAndOperator.Builder} avoiding the need to create one manually via `{@link ReplicationRuleAndOperator.Builder#builder()}`. When the `{@link Consumer}` completes, `{@link ReplicationRuleAndOperator.Builder#build()} is called immediately and its result is passed to `{@link ReplicationRuleAndOperator#and(ReplicationRuleAndOperator)}`.

```java
@DefaultConsumerFluentSetterDocumentation
public interface ReplicationRuleAndOperator {
    And and(ReplicationRuleAndOperator other);
}
```

@deprecated Use `{@link #and(ReplicationRuleAndOperator)}`
which the rule applies. This element is required only if you specify more than one filter. For example: 

```xml
<ul>
  <li> If you specify both a <code>Prefix</code> and a <code>Tag</code> filter, wrap these filters in an <code>And</code> tag.</li>
  <li> If you specify a filter based on multiple tags, wrap the <code>Tag</code> elements in an <code>And</code> tag.</li>
</ul>
```

- "endpointDiscoveryId" : false,
- "enumType" : null,
- "eventHeader" : false,
- "eventPayload" : false,
- "existenceCheckDocumentation" : "Returns true if the And property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service."

```xml
<br />

```
A container for specifying rule filters. The filters determine the subset of objects to which the rule applies. This element is required only if you specify more than one filter. For example:

```xml
<param>
  <ul>
    <li>If you specify both a <code>Prefix</code> and a <code>Tag</code> filter, wrap these filters in an <code>And</code>.</li>
    <li>If you specify a filter based on multiple tags, wrap the <code>Tag</code> elements in an <code>And</code> tag.</li>
  </ul>
</param>
```

For example:

```xml
<param>
  <ul>
    <li>If you specify both a <code>Prefix</code> and a <code>Tag</code> filter, wrap these filters in an <code>And</code> tag.</li>
    <li>If you specify a filter based on multiple tags, wrap the <code>Tag</code> elements in an <code>And</code> tag.</li>
  </ul>
</param>
```

```xml
<param>
  <ul>
    <li>If you specify both a <code>Prefix</code> and a <code>Tag</code> filter, wrap these filters in an <code>And</code> tag.</li>
    <li>If you specify a filter based on multiple tags, wrap the <code>Tag</code> elements in an <code>And</code> tag.</li>
  </ul>
</param>
```
Tag elements in an And tag.

```
<code>Tag</code> elements in an <code>And</code> tag.
```

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String#builder()`. When the `Consumer` completes, `String.Builder#build()` is called immediately and its result is passed to `statusAsString(String)` so that method calls can be chained together.

```java
@link String.Builder

@link #statusAsString(String)
```

When the `Consumer` completes, `String.Builder#build()` is called immediately and its result is passed to `statusAsString(String)` in a reference to this object so that method calls can be chained together.

```java
@link String.Builder

@link #statusAsString(String)
```

If the service returns an enum value that is not available in the current SDK version, `ReplicationTimeStatus#UNKNOWN_TO_SDK_VERSION`. The raw value returned by the service is available from `ReplicationTimeStatus#statusAsString()`. Returns whether the replication time is enabled.

```java
@link ReplicationTimeStatus

@link #status(String)
```

If the service returns an enum value that is not available in the current SDK version, `ReplicationTimeStatus#UNKNOWN_TO_SDK_VERSION`. Returns a reference to this object so that method calls can be chained together.

```java
@link ReplicationTimeStatus

@link #status(String)
```

### RestoreObjectRequest

#### c2jName

- "RestoreObjectRequest"

#### customization

- **null**
When using this API with an access point, you must direct requests to the access point hostname. The access point hostname takes the form

```plaintext
<i>AccessPointName</i>-<i>AccountId</i>.s3-accesspoint.<i>Region</i>.amazonaws.com.
```

When using this operation using an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see

See [Using Access Points](https://docs.aws.amazon.com/AmazonS3/latest/dev/using-access-points.html). Using Access Points

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String#builder()`.

When the `{@link Consumer}` completes, `{@link String.Builder#build()}` is called immediately and its result is passed to `{@link #bucket(String)}`.

When using this API with an access point, you must direct requests to the access point hostname. The access point hostname takes the form `<i>AccessPointName</i>-<i>AccountId</i>-<i>Region</i>.amazonaws.com. When using this operation using an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see [Using Access Points](https://docs.aws.amazon.com/AmazonS3/latest/dev/using-access-points.html) in the Amazon Simple Storage Service Developer Guide.
