For information about configuring using any of the officially supported AWS SDKs and AWS CLI, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingAWSSDK.html#specify-signature-"}
Specifying the Signature Version in Request Authentication in the Amazon S3 Developer Guide.

This is a convenience that creates an instance of the [String.Builder](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingAWSSDK.html#specify-signature-version) avoiding the need to create one manually via [String.builder()](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingAWSSDK.html#specify-signature-version). When the [Consumer](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingAWSSDK.html#specify-signature-version) completes, [String.Builder](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingAWSSDK.html#specify-signature-version) is called immediately and its result is passed to [SSEKMSKeyId(String)](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingAWSSDK.html#specify-signature-version) a consumer that will call methods on [String.Builder](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingAWSSDK.html#specify-signature-version). Returns a reference to this object so that method calls can be chained together.

```java
@Deprecated
public void ssekmsKeyId(String ssekmsKeyId) {
    // Method implementation...
}
```

### Deprecated Documentation

#### Method Name: ssekmsKeyId(String)

Specifies the AWS KMS key ID to use for object encryption. All GET and PUT requests for an object protected by AWS KMS will fail if not made via SSL or using SigV4. For information about configuring using any of the officially supported AWS SDKs and AWS CLI, see [Specifying the Signature Version in Request Authentication](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingAWSSDK.html#specify-signature-version) in the Amazon S3 Developer Guide.

```java
public void ssekmsKeyId(String ssekmsKeyId) {
    // Method implementation...
}
```

#### Method Name: deprecation

```java
public void deprecation(String name, String documentation) {
    // Method implementation...
}
```

### Deprecated Method

#### Method Name: deprecation

Specifies the AWS KMS key ID to use for object encryption. All GET and PUT requests for an object protected by AWS KMS will fail if not made via SSL or using SigV4. For information about configuring using any of the officially supported AWS SDKs and AWS CLI, see [Specifying the Signature Version in Request Authentication](https://docs.aws.amazon.com/AmazonS3/latest/dev/UsingAWSSDK.html#specify-signature-version) in the Amazon S3 Developer Guide.

```java
public void deprecation(String name, String documentation) {
    // Method implementation...
}
```

### Has SSEKMSKeyId

```java
public boolean hasSSEKMSKeyId() {
    // Method implementation...
}
```

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String#builder()`. When the `Consumer` completes, `String.Builder#build()` is called immediately and its result is passed to `contentLanguage(String)`.

Returns a reference to this object so that method calls can be chained together:

```java
@Deprecated
public ContentLanguage withContentLanguage(String contentLanguage) {
    setContentLanguage(contentLanguage);
    return this;
}
```

The language the content is in.

Returns true if the `ContentLanguage` property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.

```java
public boolean hasContentLanguage() {
    return getContentLanguage() != null;
}
```

A standard MIME type describing the format of the object data.

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String.Builder()`. When the `String.Builder#build()` is called immediately and its result is passed to `contentType(String)`.

When the `Consumer` completes, `String.Builder#build()` is called immediately and its result is passed to `#contentType(String)`.

- Parameter `contentType` is a consumer that will call methods on `String.Builder`.
- Returns a reference to this object so that method calls can be chained together.

A standard MIME type describing the format of the object data.

- Returns a reference to this object so that method calls can be chained together.

Returns

- A standard MIME type describing the format of the object data.
- A standard MIME type describing the format of the object data.

#grantFullControl(String)

- **method**: 
- **documentation**: 

```java
public boolean grantFullControl(
    @return Gives the grantee READ, READ_ACP, and WRITE_ACP permissions on the object.

```
Gives the grantee READ, READ_ACP, and WRITE_ACP permissions on the object.

```
@NotNull @Override
public void setGrantFullControl(String grantFullControl) {
    this.grantFullControl = grantFullControl;
}
```

Gives the grantee READ, READ_ACP, and WRITE_ACP permissions on the object.

```
@NotNull @Override
public String getGrantFullControl() {
    return this.grantFullControl;
}
```

This is a convenience that creates an instance of the `@link Map<String,String>.Builder` avoiding the need to create one manually via `@link Map<String,String>#builder()`. When the `@link Consumer` completes, `@link Map<String,String>.Builder#build()` is called immediately and its result is passed to `@link #metadata(Map<String,String>)`. You can use `@link #hasMetadata()` to see if a value was sent in this field. Returns a reference to this object so that method calls can be chained together. Use `@link #metadata()`.

Attempts to modify the collection returned by this method will result in an `UnsupportedOperationException`. You can use `@link #hasMetadata()` to see if a value was sent in this field. Returns a reference to this object so that method calls can be chained together. Use `@link #metadata()`.
the collection returned by this method will result in an UnsupportedOperationException.

You can use {link hasMetadata()} to see if a value was sent in this field.

@returns A map of metadata to store with the object in S3.

The setter method for `ObjectLockMode` is named `setObjectLockMode`. It is a string variable that specifies the Object Lock mode to be applied to the uploaded object. The method is simple and does not require a timestamp format. The variable declaration type is `String`, and the variable name is `objectLockMode`. The documentation provides information on specifying the Object Lock mode for uploaded objects.

```java
public class ObjectLockMode {
    @Nullable
    public void setObjectLockMode(String objectLockMode) {
        this.objectLockMode = objectLockMode;
    }
}
```

The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms).

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String#builder()`. When the `String.Builder#build()` is called immediately and its result is passed to `ServerSideEncryptionAsString(String)`. The raw value returned by the service is available from `ServerSideEncryptionAsString()`. For responses returned by the SDK, the sender is the AWS service.

```
public ServerSideEncryption serverSideEncryption(String serverSideEncryption)
```

The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms). If the service returns an enum value that is not available in the current SDK version, the `UNKNOWN_TO_SDK_VERSION` value will be returned.

```
@link ServerSideEncryption#UNKNOWN_TO_SDK_VERSION
```

Use `ServerSideEncryptionAsString()`.

```
public ServerSideEncryptionAsString serverSideEncryptionAsString()
```

The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms). This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String#builder()`. When the `String.Builder#build()` is called immediately and its result is passed to `ServerSideEncryptionAsString(String)`. The raw value returned by the service is available from `ServerSideEncryptionAsString()`. For responses returned by the SDK, the sender is the AWS service.

```
public ServerSideEncryptionAsString serverSideEncryptionAsString()
```

Use `ServerSideEncryptionAsString()`.

```
public ServerSideEncryption serverSideEncryption()
```

The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms). If the service returns an enum value that is not available in the current SDK version, the `UNKNOWN_TO_SDK_VERSION` value will be returned.

```
@link ServerSideEncryption#UNKNOWN_TO_SDK_VERSION
```

Use `ServerSideEncryptionAsString()`.

```
public ServerSideEncryptionAsString serverSideEncryptionAsString()
```

The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms). If the bucket has a lifecycle rule configured with an action to abort incomplete multipart uploads and the prefix in the lifecycle rule matches the object name in the request, the response includes this header. The header indicates when the initiated multipart upload becomes eligible for an abort operation. For more information, see [Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle Policy](https://docs.aws.amazon.com/AmazonS3/latest/dev/mpuoverview.html#mpu-abort-incomplete-mpu-lifecycle-config).

The response also includes the `x-amz-abort-rule-id` header that provides the ID of the lifecycle configuration rule that defines this action.

### @return

If the bucket has a lifecycle rule configured with an action to abort incomplete multipart uploads and the prefix in the lifecycle rule matches the object name in the request, the response includes this header. The header indicates when the initiated multipart upload becomes eligible for an abort operation. For more information, see [Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle Policy](https://docs.aws.amazon.com/AmazonS3/latest/dev/mpuoverview.html#mpu-abort-incomplete-mpu-lifecycle-config).

The response also includes the `x-amz-abort-rule-id` header that provides the ID of the lifecycle configuration rule that defines this action.

### @param abortDate

If the bucket has a lifecycle rule configured with an action to abort incomplete multipart uploads and the prefix in the lifecycle rule matches the object name in the request, the response includes this header. The header indicates when the initiated multipart upload becomes eligible for an abort operation. For more information, see [Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle Policy](https://docs.aws.amazon.com/AmazonS3/latest/dev/mpuoverview.html#mpu-abort-incomplete-mpu-lifecycle-config).

The response also includes the `x-amz-abort-rule-id` header that provides the ID of the lifecycle configuration rule that defines this action.

### @return

Returns a reference to this object so that method calls can be chained together.

### @deprecated Use [@link #abortDate(Instant)]

### [endpointDiscoveryId] false

### [enumType] null

### [eventHeader] false

### [eventPayload] false

### [existenceCheckDocumentation]: Returns true if the AbortDate property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.

}
If the bucket has a lifecycle rule configured with an action to abort incomplete multipart uploads and the prefix in the lifecycle rule matches the object name in the request, the response includes this header. The header indicates when the initiated multipart upload becomes eligible for an abort operation. For more information, see "<a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/mpuoverview.html#mpu-abort-incomplete-mpu-lifecycle-config"> Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle Policy</a>". The response also includes the <code>x-amz-abort-rule-id</code> header that provides the ID of the lifecycle configuration rule that defines this action.

```java
public class AbortDate {

    private Instant abortDate;

    public Instant getAbortDate() {
        return abortDate;
    }

    public void setAbortDate(Instant abortDate) {
        this.abortDate = abortDate;
    }
}
```

For example, if the lifecycle rule defines an action to abort incomplete multipart uploads and the prefix in the lifecycle rule matches the object name in the request, the response includes this header. The header indicates when the initiated multipart upload becomes eligible for an abort operation. For more information, see "<a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/mpuoverview.html#mpu-abort-incomplete-mpu-lifecycle-config"> Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle Policy</a>". The response also includes the <code>x-amz-abort-rule-id</code> header that provides the ID of the lifecycle configuration rule that defines this action.

```java
public class AbortDate {

    private Instant abortDate;

    public Instant getAbortDate() {
        return abortDate;
    }

    public void setAbortDate(Instant abortDate) {
        this.abortDate = abortDate;
    }
}
```
this header. The header indicates when the initiated multipart upload becomes eligible for an abort operation. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/mpuoverview.html#mpu-abort-incomplete-mpu-lifecycle-config"> Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle Policy</a>. The response also includes the <code>x-amz-abort-rule-id</code> header that provides the ID of the lifecycle configuration rule that defines this action.<p>

This is a convenience that creates an instance of the [Integer.Builder] avoiding the need to create one manually via [Integer.builder()]. When the [Consumer] completes, [Integer.build()] is called immediately and its result is passed to [years(Integer)].

When the [Consumer] completes, [Integer.build()] is called immediately and its result is passed to [years(Integer)].

@see #years(Integer)

The number of years that you want to specify for the default retention period.

```
public String getYears() {
    return years;
}
```

It is optional to specify the default retention years. If not specified, the default is 7 years.

The [Years] class contains no state. It is used exclusively for returning the default retention period of an object.

```
public class Years {
    private static final Integer DEFAULT_RETENTION_PERIOD = 7;

    public String getYears() {
        return DEFAULT_RETENTION_PERIOD.toString();
    }
}
```

The [Years] class contains a single method [getYears()] which returns the default retention period as a String.

It is important to note that the default retention period is specified in years and defaults to 7 years. This can be overridden to any number of years by calling the [years(Integer)] method and passing in the desired number of years.

```
public String getYears() {
    return DEFAULT_RETENTION_PERIOD.toString();
}
```

The name of the bucket from which an analytics configuration is deleted.

This is a convenience that creates an instance of the [String.Builder] avoiding the need to create one manually via [String#builder()]. When the [Consumer] completes, [String.Builder#build()] is called immediately and its result is passed to [bucket(String)].

When the consumer that will call methods on [String.Builder] returns a reference to this object so that method calls can be chained together.

Returns a reference to this object so that method calls can be chained together.

The name of the bucket from which an analytics configuration is deleted.

Returns true if the Bucket property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.

The name of the bucket from which an analytics configuration is deleted.

The name of the bucket from which an analytics configuration is deleted.

The name of the bucket from which an analytics configuration is deleted.
The name of the bucket from which an analytics configuration is deleted.

```xml
<bucket>

@param bucket The name of the bucket from which an analytics configuration is deleted.
```

The access point hostname takes the form `<i>AccessPointName</i>-<i>AccountId</i>.s3-accesspoint.<i>Region</i>.amazonaws.com`. When using this operation using an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/using-access-points.html">Using Access Points</a> in the <i>Amazon Simple Storage Service Developer Guide</i>.

This is a convenience that creates an instance of the [@link String.Builder] avoiding the need to create one manually via [@link String#builder()].

When the [@link Consumer] completes, [@link String.Builder#build()] is called
immediately and its result is passed to {link `#key(String)`}. param key a consumer that will call methods on {link `String.Builder`},

}
Using Access Points in the Amazon Simple Storage Service Developer Guide.

@deprecated

Returns a reference to this object so that method calls can be chained together.

@deprecated

When using this API with an access point, you must direct requests to the access point hostname. The access point hostname takes the form &lt;i&gt;AccessPointName&lt;/i&gt;-&lt;i&gt;AccountId&lt;/i&gt;.s3-accesspoint.&lt;i&gt;Region&lt;/i&gt;.amazonaws.com. When using this operation using an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see &lt;a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/using-access-points.html"&gt;Using Access Points in the Amazon Simple Storage Service Developer Guide.&lt;/a&gt;.

@return

When using this API with an access point, you must direct requests to the access point hostname. The access point hostname takes the form &lt;i&gt;AccessPointName&lt;/i&gt;-&lt;i&gt;AccountId&lt;/i&gt;.s3-accesspoint.&lt;i&gt;Region&lt;/i&gt;.amazonaws.com. When using this operation using an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see &lt;a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/using-access-points.html"&gt;Using Access Points in the Amazon Simple Storage Service Developer Guide.&lt;/a&gt;.
Using Access Points

In the Amazon Simple Storage Service Developer Guide, you can refer to the object so that method calls can be chained together.

```
"getterDocumentation" : "The bucket name containing the objects from which to remove the tags."
```

When using this API with an access point, you must direct requests to the access point hostname. The access point hostname takes the form `AccessPointName`-`AccountId`-s3-accesspoint-`Region`.amazonaws.com. When using this operation using an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using Access Points in the Amazon Simple Storage Service Developer Guide.

```
"setterDocumentation" : "The bucket name containing the objects from which to remove the tags."
```

When using this API with an access point, you must direct requests to the access point hostname. The access point hostname takes the form `AccessPointName`-`AccountId`-s3-accesspoint-`Region`.amazonaws.com. When using this operation using an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see Using Access Points in the Amazon Simple Storage Service Developer Guide.
When using this API with an access point, you must direct requests to the access point hostname. The access point hostname takes the form `<i>AccessPointName</i>-<i>AccountId</i>.s3-accesspoint.<i>Region</i>.amazonaws.com. When using this operation using an access point through the AWS SDKs, you provide the access point ARN in place of the bucket name. For more information about access point ARNs, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/using-access-points.html">Using Access Points</a> in the <i>Amazon Simple Storage Service Developer Guide</i>.
