This is used in a Lifecycle Rule Filter to apply a logical AND to two or more predicates. The Lifecycle Rule will apply to any object matching all of the predicates configured inside the And operator.

Prefix identifying one or more objects to which the rule applies. This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String.builder()`. When the `Consumer` completes, `String.Builder#build()` is called immediately and its result is passed to `prefix(String)`.

Prefix identifying one or more objects to which the rule applies. When deprecated use `prefix()`.

Prefix identifying one or more objects to which the rule applies.

Prefix identifying one or more objects to which the rule applies.

The ContinuationToken that represents a placeholder from where this request should begin. This is a convenience that creates an instance of the String.Builder avoiding the need to create one manually via String.Builder().

When the Consumer completes, String.Builder#build() is called immediately and its result is passed to #continuationToken(String).

- @param continuationToken a consumer that will call methods on String.Builder
- @return Returns a reference to this object so that method calls can be chained together.

- @see #continuationToken(String)

- @deprecated Use #continuationToken()

- @return The ContinuationToken that represents a placeholder from where this request should begin.
- @deprecated Use #continuationToken(String)

- @return Returns a reference to this object so that method calls can be chained together.
- @deprecated Use #continuationToken(String)

- Returns true if the ContinuationToken property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.

- @param continuationToken The ContinuationToken that represents a placeholder from where this request should begin.
- @return Returns a reference to this object so that method calls can be chained together.

- The ContinuationToken that represents a placeholder from where this request should begin.
- The ContinuationToken that represents a placeholder from where this request should begin.

- The ContinuationToken that represents a placeholder from where this request should begin.

- The ContinuationToken that represents a placeholder from where this request should begin.

- The ContinuationToken that represents a placeholder from where this request should begin.

The marker used to continue an inventory configuration listing that has been truncated. Use the NextContinuationToken from a previously truncated list response to continue the listing. The continuation token is an opaque value that Amazon S3 understands.</p>

This is a convenience that creates an instance of the [@link String.Builder] avoiding the need to create one manually via [@link String#builder()].

When the [@link Consumer] completes, [@link String.Builder#build()] is called immediately and its result is passed to [@link #continuationToken(String)].

A consumer that will call methods on [@link String.Builder] returns a reference to this object so that method calls can be chained together.  

```java
continuationToken(continuationToken)
```

The marker used to continue an inventory configuration listing that has been truncated. Use the NextContinuationToken from a previously truncated list response to continue the listing. The continuation token is an opaque value that Amazon S3 understands.

```java
continuationToken(continuationToken)
```

The marker used to continue an inventory configuration listing that has been truncated. Use the NextContinuationToken from a previously truncated list response to continue the listing. The continuation token is an opaque value that Amazon S3 understands.

```java
continuationToken(continuationToken)
```

The marker used to continue an inventory configuration listing that has been truncated. Use the NextContinuationToken from a previously truncated list response to continue the listing. The continuation token is an opaque value that Amazon S3 understands.

```java
continuationToken(continuationToken)
```
truncated. Use the NextContinuationToken from a previously truncated list response to continue the listing. The continuation token is an opaque value that Amazon S3 understands.

The list of inventory configurations for a bucket.

This is a convenience that creates an instance of the `List<InventoryConfiguration>.Builder` avoiding the need to create one manually via `List<InventoryConfiguration>.Builder#builder()`. When the `List<InventoryConfiguration>.Builder#build()` is called immediately and its result is passed to `List<InventoryConfigurationList>` a consumer that will call methods on `List<InventoryConfiguration>.Builder`.

The list of inventory configurations for a bucket.

Attempts to modify the collection returned by this method will result in an `UnsupportedOperationException`.

You can use `#hasInventoryConfigurationList()` to see if a value was sent in this field.

The list of inventory configurations for a bucket.

Returns a reference to this object so that method calls can be chained together.

The list of inventory configurations for a bucket.

Returns a reference to this object so that method calls can be chained together.

The list of inventory configurations for a bucket.

Returns a reference to this object so that method calls can be chained together.

The list of inventory configurations for a bucket.

Returns a reference to this object so that method calls can be chained together.

The list of inventory configurations for a bucket.

Returns a reference to this object so that method calls can be chained together.

The list of inventory configurations for a bucket.

Returns a reference to this object so that method calls can be chained together.

The list of inventory configurations for a bucket.

Returns a reference to this object so that method calls can be chained together.

Tell whether the returned list of inventory configurations is complete. A value of true indicates that the list is not complete and the NextContinuationToken is provided for a subsequent request.

```java
@deprecated Use {@link #isTruncated()}
```

### Documentation
- **Getters**
  - **Documentation**: Tells whether the returned list of inventory configurations is complete. A value of true indicates that the list is not complete and the NextContinuationToken is provided for a subsequent request.
  - **Return Type**: `Boolean`
  - **Java Method**: `isTruncated`
- **Setter**
  - **Documentation**: Tells whether the returned list of inventory configurations is complete. A value of true indicates that the list is not complete and the NextContinuationToken is provided for a subsequent request.
  - **Method Signature**: `isTruncated(Boolean)
```

The marker used to continue this inventory configuration listing. Use the `NextContinuationToken` from this response to continue the listing in a subsequent request. The continuation token is an opaque value that Amazon S3 understands. 

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String.Builder#builder()`. When the `String.Builder#build()` is called immediately and its result is passed to `nextContinuationToken(String)` a consumer that will call methods on `String.Builder#return`.

```java
@see #nextContinuationToken(String)
```

The marker used to continue this inventory configuration listing. Use the `NextContinuationToken` from this response to continue the listing in a subsequent request. The continuation token is an opaque value that Amazon S3 understands.

The continuation token is an opaque value that Amazon S3 understands.

```java
@deprecated
```

The marker used to continue this inventory configuration listing. Use the `NextContinuationToken` from this response to continue the listing in a subsequent request. The continuation token is an opaque value that Amazon S3 understands.

The continuation token is an opaque value that Amazon S3 understands.

```java
@deprecated
```
<code>NextContinuationToken</code> from this response to continue the listing in a subsequent request. The continuation token is an opaque value that Amazon S3 understands.\n
@return The marker used to continue this inventory configuration listing. Use the <code>NextContinuationToken</code> from this response to continue the listing in a subsequent request. The continuation token is an opaque value that Amazon S3 understands.

The marker that is used as a starting point for this metrics configuration list response. This value is present if it was sent in the request.

```java
public String getNextContinuationToken() {
    // Implementation...
}
```

This value is present if it was sent in the request.

The marker that is used as a starting point for this metrics configuration list response. This value is present if it was sent in the request.

```java
public void setNextContinuationToken(String continuationToken) {
    // Implementation...
}
```
is a convenience that creates an instance of the `{@link String.Builder}` avoiding the need to create one manually via `{@link String#builder()}`. When the `{@link Consumer}` completes, `{@link String.Builder#build()}` is called immediately and its result is passed to `{@link #nextContinuationToken(String)}`. A consumer that will call methods on `{@link String.Builder}` returns a reference to this object so that method calls can be chained together. See `{@link #nextContinuationToken(String)}`.

Encoding type used by Amazon S3 to encode object keys in the response.

If you specify `<code>encoding-type</code>` request parameter, Amazon S3 includes this element in the response, and returns encoded key name values in the following response elements:

- `<code>Delimiter</code>`
- `<code>KeyMarker</code>`
- `<code>Prefix</code>`
- `<code>NextKeyMarker</code>`
- `<code>Key</code>`.

The raw value returned by the service is available from `<code>encoding-typeAsString()</code>`.

The service returns an enum value that is not available in the current SDK version, `[ @link EncodingType#UNKNOWN_TO_SDK_VERSION ]`. The raw value returned by the service is available from `<code>encoding-typeAsString()</code>`.

Returns true if the `EncodingType` property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.

Returns a reference to this object so that method calls can be chained together.
If you specify `<code>encoding-type</code>` request parameter, Amazon S3 includes this element in the response, and returns encoded key name values in the following response elements:

```
<code>Delimiter</code>, <code>KeyMarker</code>, <code>Prefix</code>, <code>NextKeyMarker</code>,
<code>Key</code>.
```

@see EncodingType

```
@return Returns a reference to this object so that method calls can be chained together.

A delimiter is a character that you specify to group keys. All keys that contain the same string between the `prefix` and the first occurrence of the delimiter are grouped under a single result element in `CommonPrefixes`. These groups are counted as one result against the max-keys limitation. These keys are not returned elsewhere in the response.

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String#builder()`. When the `Consumer` completes, `String.Builder#build()` is called immediately and its result is passed to `#delimiter(String)`.

```java
public Delimiter(delimiter(String) { ... })
```

Use `@link #delimiter(String)`

All keys that contain the same string between the `prefix` and the first occurrence of the delimiter are grouped under a single result element in `CommonPrefixes`. These groups are counted as one result against the max-keys limitation. These keys are not returned elsewhere in the response.

```java
public boolean hasDelimiter()
```

Returns true if the `Delimiter` property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.

```java
public boolean hasDelimiter()
```

Returns true if the `Delimiter` property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.

"existenceCheckDocumentation" : "Returns true if the MaxKeys property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.\n",
"existenceCheckMethodName" : "hasMaxKeys",
"fluentEnumGetterMethodName" : null,
"fluentEnumSetterMethodName" : null,
Sets the maximum number of keys returned in the response. The response might contain fewer keys but will never contain more. If additional keys satisfy the search criteria, but were not returned because max-keys was exceeded, the response contains &lt;isTruncated&gt;true&lt;/isTruncated&gt;. To return the additional keys, see key-marker and version-id-marker.

Example:

```
@QueryParam maxKeys
```

## Getter

Sets the maximum number of keys returned in the response. The response might contain fewer keys but will never contain more. If additional keys satisfy the search criteria, but were not returned because max-keys was exceeded, the response contains &lt;isTruncated&gt;true&lt;/isTruncated&gt;. To return the additional keys, see key-marker and version-id-marker.

```
public String getMaxKeys() {
    return maxKeys;
}
```

## Setter

Sets the maximum number of keys returned in the response. The response might contain fewer keys but will never contain more. If additional keys satisfy the search criteria, but were not returned because max-keys was exceeded, the response contains &lt;isTruncated&gt;true&lt;/isTruncated&gt;. To return the additional keys, see key-marker and version-id-marker.

```
public void setMaxKeys(String maxKeys) {
    this.maxKeys = maxKeys;
}
```

Marks the last version of the key returned in a truncated response.

```java
public class NextKeyMarker {
    // Properties...
}
```

When the number of responses exceeds the value of `MaxKeys`, `NextKeyMarker` specifies the first key not returned that satisfies the search criteria. Use this value for the key-marker request parameter in a subsequent request.

```java
public class NextKeyMarker {
    // Properties...
}
```

When the number of responses exceeds the value of `MaxKeys`, `NextKeyMarker` specifies the first key not returned that satisfies the search criteria. Use this value for the key-marker request parameter in a subsequent request.

```java
public class NextKeyMarker {
    // Properties...
}
```

When the number of responses exceeds the value of `MaxKeys`, `NextKeyMarker` specifies the first key not returned that satisfies the search criteria. Use this value for the key-marker request parameter in a subsequent request.

```java
public class NextKeyMarker {
    // Properties...
}
```

When the number of responses exceeds the value of `MaxKeys`, `NextKeyMarker` specifies the first key not returned that satisfies the search criteria. Use this value for the key-marker request parameter in a subsequent request.

```java
public class NextKeyMarker {
    // Properties...
}
```

When the number of responses exceeds the value of `MaxKeys`, `NextKeyMarker` specifies the first key not returned that satisfies the search criteria. Use this value for the key-marker request parameter in a subsequent request.

```java
public class NextKeyMarker {
    // Properties...
}
```

When the number of responses exceeds the value of `MaxKeys`, `NextKeyMarker` specifies the first key not returned that satisfies the search criteria. Use this value for the key-marker request parameter in a subsequent request.

```java
public class NextKeyMarker {
    // Properties...
}
```

When the number of responses exceeds the value of `MaxKeys`, `NextKeyMarker` specifies the first key not returned that satisfies the search criteria. Use this value for the key-marker request parameter in a subsequent request.

```java
public class NextKeyMarker {
    // Properties...
}
```
may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.

is a flag that indicates whether Amazon S3 returned all of the results that satisfied the search criteria. If your results were truncated, you can make a follow-up paginated request using the NextKeyMarker and NextVersionIdMarker response parameters as a starting place in another request to return the rest of the results.

```jsp
A flag that indicates whether Amazon S3 returned all of the results that satisfied the search criteria.
```

If your results were truncated, you can make a follow-up paginated request using the NextKeyMarker and NextVersionIdMarker response parameters as a starting place in another request to return the rest of the results.
A flag that indicates whether Amazon S3 returned all of the results that satisfied the search criteria. If your results were truncated, you can make a follow-up paginated request using the NextKeyMarker and NextVersionIdMarker response parameters as a starting place in another request to return the rest of the results.

Marks the last key returned in a truncated response. This is a convenience that creates an instance of the String.Builder avoiding the need to create one manually via String#builder(). When the Consumer completes, it is called immediately and its result is passed to KeyMarker(String) a consumer that will call methods on String.Builder. return Returns a reference to this object so that method calls can be chained together.

Marks the last key returned in a truncated response. Use KeyMarker(String) Returns a reference to this object so that method calls can be chained together.

 Returns true if the KeyMarker property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String#builder()`. When the `Consumer` completes, `String.Builder#build()` is called immediately and its result is passed to `prefix(String)`.

- param `prefix` a consumer that will call methods on `String.Builder`
  - return Returns a reference to this object so that method calls can be chained together.

The `deprecated` setting is false, and the `hasPrefix` method is called to limit the response to keys that begin with the specified prefix.

```java
@deprecated Use prefix()
```

The `documentation` is limited to keys that begin with the specified prefix.

```java
prefix(String)
```

Sets the maximum number of keys returned in the response. The response might contain fewer keys but will never contain more.

Limits the response to keys that begin with the specified prefix. This is a convenience that creates an instance of the \{@link String.Builder\} avoiding the need to create one manually via \{@link String#builder()\}. When the \{@link Consumer\} completes, \{@link String.Builder#build()\} is called immediately and its result is passed to \{@link #prefix(String)\}. It returns a reference to this object so that method calls can be chained together.

Limits the response to keys that begin with the specified prefix. For responses returned by the SDK, the sender is the AWS service.

Returns true if the Prefix property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.

,
Encoding type used by Amazon S3 to encode object key names in the XML response. If you specify the encoding-type request parameter, Amazon S3 includes this element in the response, and returns encoded key name values in the following response elements:

- Delimiter
- Prefix
- Key
- StartAfter

If the service returns an enum value that is not available in the current SDK version, `EncodingType#UNKNOWN_TO_SDK_VERSION`. The raw value returned by the service is available from `EncodingTypeAsString()`. If you specify the encoding-type request parameter, Amazon S3 includes this element in the response, and returns encoded key name values in the following response elements:

```java
<code>Delimiter, Prefix, Key, </code> and <code>StartAfter</code>
```

@param abortDate If the bucket has a lifecycle rule configured with an action to abort incomplete multipart uploads and the prefix in the lifecycle rule matches the object name in the request, then the response includes this header indicating when the initiated multipart upload will become eligible for abort operation. For more information, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/mpuoverview.html#mpu-abort-incomplete-mpu-lifecycle-config">Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle Policy</a>.

The response will also include the <code>x-amz-abort-rule-id</code> header that will provide the ID of the lifecycle configuration rule that defines this action.

<h2>Setter</h2>

```java
public void setAbortDate(java.time.Instant abortDate) {
    // Set the AbortDate header
}
```

```
<variableDeclarationType>java.time.Instant</variableDeclarationType>
<variableName>abortDate</variableName>
<variableType>java.time.Instant</variableType>
```

```
public java.time.Instant abortDate
```

```
<simpleType>Instant</simpleType>
```

```
<variableSetterType>java.time.Instant</variableSetterType>
```

```
<simple>true</simple>
<timestampFormat>null</timestampFormat>
<variable>
```

```
<variableDeclarationType>java.time.Instant</variableDeclarationType>
```
