This is a convenience that creates an instance of the [String.Builder](#) avoiding the need to create one manually via [String.Builder]. When the [Consumer] completes, [String.Builder] is called immediately and its result is passed to [String.Builder](#). Returns a reference to this object so that method calls can be chained together.

```java
public class RequestCharged {
    private String requestChargedAsString;

    public void setRequestChargedAsString(String requestChargedAsString) {
        this.requestChargedAsString = requestChargedAsString;
    }

    public String getRequestChargedAsString() {
        return requestChargedAsString;
    }
}
```

### Default Consumer Fluent Setter Documentation

Sets the value of the RequestCharged property for this object.

```java
public void setRequestCharged(String requestCharged) {
    this.requestCharged = requestCharged;
}
```

### Default Getter Documentation

Returns the value of the RequestCharged property for this object.

```java
public String getRequestChargedAsString() {
    return requestChargedAsString;
}
```

### Deprecated

Sets the value of the RequestCharged property for this object.

```java
public void setRequestCharged(String requestCharged) {
    this.requestCharged = requestCharged;
}
```

Returns a reference to this object so that method calls can be chained together.

```java
public class RequestCharged {
    private String requestChargedAsString;

    public void setRequestCharged(String requestCharged) {
        this.requestChargedAsString = requestChargedAsString;
    }

    public String getRequestChargedAsString() {
        return requestChargedAsString;
    }
}
```

The container element for an object's retention settings. This is a convenience that creates an instance of the ObjectLockRetention.Builder avoiding the need to create one manually via ObjectLockRetention.builder(). When the Consumer completes, ObjectLockRetention.Builder.build() is called immediately and its result is passed to ObjectLockRetention.Builder.retain a consumer that will call methods on ObjectLockRetention.Builder.return Returns a reference to this object so that method calls can be chained together.

The container element for an object's retention settings.

The container element for an object's retention settings.

Returns a reference to this object so that method calls can be chained together.

Returns true if the Retention property was specified by the sender (it may be empty), or false if the sender did not specify the value (it will be empty). For responses returned by the SDK, the sender is the AWS service.

Glacier retrieval tier at which the restore will be processed.

This is a convenience that creates an instance of the \{@link String.Builder\} avoiding the need to create one manually via \{@link String#builder()\}. When the \{@link Consumer\} completes, \{@link String.Builder#build()\} is called immediately and its result is passed to \{@link TierAsString(String)\}. Returns a reference to this object so that method calls can be chained together: \n
```java
Tier tier(String tierString)
```

Returns a reference to this object so that method calls can be chained together.

```java
Tier tier(String tierString)
```

Glacier retrieval tier at which the restore will be processed. If the service returns an enum value that is not available in the current SDK version, \{@link Tier#UNKNOWN_TO_SDK_VERSION\} will return \{@link TierAsString\}. The raw value returned by the service is available from \{@link TierAsString\}.

```java
TierAsString tierAsString()
```

Glacier retrieval tier at which the restore will be processed. Returns a reference to this object so that method calls can be chained together:

```java
TierAsString tierAsString()
```

Glacier retrieval tier at which the restore will be processed if the service returns an enum value that is not available in the current SDK version. If the service returns an enum value that is not available in the current SDK version, \{@link Tier#UNKNOWN_TO_SDK_VERSION\} will return \{@link TierAsString\}. The raw value returned by the service is available from \{@link TierAsString\}.

```java
Tier tier()
```

Glacier retrieval tier at which the restore will be processed if the service returns an enum value that is not available in the current SDK version. Returns a reference to this object so that method calls can be chained together:

```java
Tier tier()
```

Glacier retrieval tier at which the restore will be processed if the service returns an enum value that is not available in the current SDK version. Returns a reference to this object so that method calls can be chained together if the service returns an enum value that is not available in the current SDK version:

```java
Tier tier()
```

Glacier retrieval tier at which the restore will be processed if the service returns an enum value that is not available in the current SDK version. Returns a reference to this object so that method calls can be chained together:

```java
Tier tier()
```

Downloads the specified range bytes of an object. For more information about the HTTP Range header, see [http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.35](http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.35).

```java
package com.amazonaws.services.

public class RequestPayer {
    private String requestPayer;

    public void setRequestPayer(String requestPayer) {
        this.requestPayer = requestPayer;
    }

    public String getRequestPayer() {
        return requestPayer;
    }

    // Additional methods for building and setting requestPayer
}
```

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String#builder()`. When the consumer completes, `String.Builder#build()` is called immediately and its result is passed to `String#toString()`.

```java
@deprecated
public String requestPayer() {
    return requestPayer;
}
```

If the service returns an enum value that is not available in the current SDK version, `RequestPayer#UNKNOWN_TO_SDK_VERSION` will return the raw value returned by the service.

```java
@deprecated
public String requestPayer() {
    return requestPayer;
}
```

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String#builder()`. When the consumer completes, `String.Builder#build()` is called immediately and its result is passed to `String#toString()`.

```java
@deprecated
public String requestPayer() {
    return requestPayer;
}
```

Considerations

If the object is an archived object (an object whose storage class is GLACIER), the response includes this header if either the archive restoration is in progress (see `RestoreObject`) or an archive copy is already restored.

If an archive copy is already restored, the header value indicates when Amazon S3 is scheduled to delete the object copy. For example:

```java
<code>x-amz-restore: ongoing-request="false", expiry-date="Fri, 23 Dec 2012 00:00:00 GMT"
</code>
```

If the object restoration is in progress, the header returns the value `ongoing-request="true"`.

For more information about archiving objects, see [Transitioning Objects: General Considerations](https://docs.aws.amazon.com/AmazonS3/latest/dev/object-lifecycle-mgmt.html#lifecycle-transition-general-considerations).

```
@param restore If the object is an archived object (an object whose storage class is GLACIER), the response includes this header if either the archive restoration is in progress (see `RestoreObject`) or an archive copy is already restored.

If an archive copy is already restored, the header value indicates when Amazon S3 is scheduled to delete the object copy. For example:

```java
<code>x-amz-restore: ongoing-request="false", expiry-date="Fri, 23 Dec 2012 00:00:00 GMT"
</code>
```

If the object restoration is in progress, the header returns the value `ongoing-request="true"`.

For more information about archiving objects, see [Transitioning Objects: General Considerations](https://docs.aws.amazon.com/AmazonS3/latest/dev/object-lifecycle-mgmt.html#lifecycle-transition-general-considerations).
```

```
@return Returns a reference to this object so that method calls can be chained together.

For more information about archiving objects, see [Transitioning Objects: General Considerations](https://docs.aws.amazon.com/AmazonS3/latest/dev/object-lifecycle-mgm.html#lifecycle-transition-general-considerations). The response includes this header if either the archive restoration is in progress (see `RestoreObject`) or an archive copy is already restored.

If an archive copy is already restored, the header value indicates when Amazon S3 is scheduled to delete the object copy. For example:

```
<x-amz-restore: ongoing-request="false", expiry-date="Fri, 23 Dec 2012 00:00:00 GMT"
</code>
```

If the object restoration is in progress, the header returns the value `<code>ongoing-request="true"</code>`.

For more information about archiving objects, see [Transitioning Objects: General Considerations](https://docs.aws.amazon.com/AmazonS3/latest/dev/object-lifecycle-mgm.html#lifecycle-transition-general-considerations).
Considerations

- If the object is an archived object (an object whose storage class is GLACIER), the response includes this header if either the archive restoration is in progress (see `RestoreObject`) or an archive copy is already restored.
- If an archive copy is already restored, the header value indicates when Amazon S3 is scheduled to delete the object copy. For example:
  - `x-amz-restore: ongoing-request=false, expiry-date="Fri, 23 Dec 2012 00:00:00 GMT"`
- If the object restoration is in progress, the header returns the value `ongoing-request=true`.

For more information about archiving objects, see [Transitioning Objects: General Considerations](https://docs.aws.amazon.com/AmazonS3/latest/dev/object-lifecycle-mgmt.html#lifecycle-transition-general-considerations).
If the object is an archived object (an object whose storage class is GLACIER), the response includes this header if either the archive restoration is in progress (see `RestoreObject`) or an archive copy is already restored. If an archive copy is already restored, the header value indicates when Amazon S3 is scheduled to delete the object copy. For example: `x-amz-restore: ongoing-request="false", expiry-date="Fri, 23 Dec 2012 00:00:00 GMT"`.

If the object restoration is in progress, the header returns the value `<code>ongoing-request="true"</code>`.

For more information about archiving objects, see [Transitioning Objects: General Considerations](https://docs.aws.amazon.com/AmazonS3/latest/dev/object-lifecycle-transition-general-considerations).

An ETag is an opaque identifier assigned by a web server to a specific version of a resource found at a URL. This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String#builder()`. When the `Consumer` completes, `String.Builder#build()` is called immediately and its result is passed to `#eTag(String)`. A reference to this object so that method calls can be chained together.

```java
@deprecated
```

### Documentation

An ETag is an opaque identifier assigned by a web server to a specific version of a resource found at a URL. Returns a reference to this object so that method calls can be chained together.

```java
@deprecated
```

### Getter

An ETag is an opaque identifier assigned by a web server to a specific version of a resource found at a URL. Returns an ETag.

```java
@deprecated
```

### Setter

An ETag is an opaque identifier assigned by a web server to a specific version of a resource found at a URL. Returns a reference to this object so that method calls can be chained together.

```java
@deprecated
```

### Additional Methods

### Endpoint Discovery

### Event Header

### Event Payload

### Marshalling

### Unmarshalling

### Http

```java
@deprecated
```

### Additional Marshalling Path

```java
@deprecated
```

### Additional Unmarshalling Path

```java
@deprecated
```

The `Filter` property is a convenience that creates an instance of the `NotificationConfigurationFilter.Builder` avoiding the need to create one manually via `NotificationConfigurationFilter.builder()`. When the `NotificationConfigurationFilter.Builder#build()` is called immediately and its result is passed to `NotificationConfigurationFilter.Builder#filter(NotificationConfigurationFilter)`. This method returns a reference to this object so that method calls can be chained together. See `#filter(NotificationConfigurationFilter)`.

Indicates the lifetime, in days, of the objects that are subject to the rule. The value must be a non-zero positive integer. This is a convenience that creates an instance of the `Integer.Builder` avoiding the need to create one manually via `Integer.builder()`. When the `Consumer` completes, `Integer.Builder#build()` is called immediately and its result is passed to `days(Integer)`. A `param` consumer that will call methods on `Integer.Builder` returns a reference to this object so that method calls can be chained together.

```java
@see #days(Integer)
```

The value must be a non-zero positive integer. When the `Consumer` completes, `Integer.Builder#build()` is called immediately and its result is passed to `days(Integer)`. A `param` consumer that will call methods on `Integer.Builder` returns a reference to this object so that method calls can be chained together.

```java
@see #days(Integer)
```

Indicates the lifetime, in days, of the objects that are subject to the rule. The value must be a non-zero positive integer. The value must be a non-zero positive integer.

```java
@deprecated Use #days()
```

Indicates the lifetime, in days, of the objects that are subject to the rule. The value must be a non-zero positive integer.

```java
@deprecated Use #days()
```

Indicates the lifetime, in days, of the objects that are subject to the rule. The value must be a non-zero positive integer.

```java
@deprecated Use #days()
```

Returns a reference to this object so that method calls can be chained together.

```java
@see #days(Integer)
```

Returns a reference to this object so that method calls can be chained together.

```java
@see #days(Integer)
```

Returns a reference to this object so that method calls can be chained together.

```java
@see #days(Integer)
```

Returns a reference to this object so that method calls can be chained together.

```java
@see #days(Integer)
```

Returns a reference to this object so that method calls can be chained together.

```java
@see #days(Integer)
```

Returns a reference to this object so that method calls can be chained together.

```java
@see #days(Integer)
```

Returns a reference to this object so that method calls can be chained together.

```java
@see #days(Integer)
```

Returns a reference to this object so that method calls can be chained together.

```java
@see #days(Integer)
```

Returns a reference to this object so that method calls can be chained together.

```java
@see #days(Integer)
```

Returns a reference to this object so that method calls can be chained together.

```java
@see #days(Integer)
```

Returns a reference to this object so that method calls can be chained together.

```java
@see #days(Integer)
```

Returns a reference to this object so that method calls can be chained together.

```java
@see #days(Integer)
```

Returns a reference to this object so that method calls can be chained together.

```java
@see #days(Integer)
```

Returns a reference to this object so that method calls can be chained together.

```java
@see #days(Integer)
```

Returns a reference to this object so that method calls can be chained together.

```java
@see #days(Integer)
```

Returns a reference to this object so that method calls can be chained together.

"jsonValue": false,
Specifies the expiration for the lifecycle of the object in the form of date, days and, whether the object has a delete marker.

```java
public static class LifecycleExpiration {
    private Date expiration;
    private boolean isDeleteMarker;
    // other lifecycle parameters

    public LifecycleExpiration(Date expiration, boolean isDeleteMarker) {
        this.expiration = expiration;
        this.isDeleteMarker = isDeleteMarker;
    }

    public Date getExpiration() {
        return expiration;
    }

    public void setExpiration(Date expiration) {
        this.expiration = expiration;
    }

    public boolean isDeleteMarker() {
        return isDeleteMarker;
    }

    public void setDeleteMarker(boolean isDeleteMarker) {
        this.isDeleteMarker = isDeleteMarker;
    }
}
```

The `setExpiration` method sets the expiration for the lifecycle of the object in the form of a date and whether the object has a delete marker. The `Expiration` class is defined with parameters for expiration and delete marker, and provides methods to access and modify these values.

This class is used to configure lifecycle management rules in an S3 bucket, allowing objects to be automatically deleted or retained for a specified period.
