  "variableName" : "abortDate",
  "variableType" : "java.time.Instant"}
If the bucket has a lifecycle rule configured with an action to abort incomplete multipart uploads and the prefix in the lifecycle rule matches the object name in the request, then the response includes this header indicating when the initiated multipart upload will become eligible for abort operation. For more information, see [Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle Policy](https://docs.aws.amazon.com/AmazonS3/latest/dev/mpuoverview.html#mpu-abort-incomplete-mpu-lifecycle-config). The response will also include the `x-amz-abort-rule-id` header that will provide the ID of the lifecycle configuration rule that defines this action.

```java
public class AbortRuleId {
    private Instant abortRuleId;

    public Instant getAbortRuleId() {
        return abortRuleId;
    }

    public void setAbortRuleId(Instant abortRuleId) {
        this.abortRuleId = abortRuleId;
    }

    @See
    public static AbortRuleId_abortRuleId(String abortRuleId) {
        return new AbortRuleId(abortRuleId);
    }
}
```

This header is returned along with the `x-amz-abort-date` header. It identifies applicable lifecycle configuration rule that defines the action to abort incomplete multipart uploads.

```java
public class AbortRuleId {
    private Instant abortRuleId;

    public Instant getAbortRuleId() {
        return abortRuleId;
    }

    public void setAbortRuleId(Instant abortRuleId) {
        this.abortRuleId = abortRuleId;
    }

    @See
    public static AbortRuleId_abortRuleId(String abortRuleId) {
        return new AbortRuleId(abortRuleId);
    }
}
```

This header is returned along with the `x-amz-abort-date` header. It identifies applicable lifecycle configuration rule that defines the action to abort incomplete multipart uploads.

```java
public class AbortRuleId {
    private Instant abortRuleId;

    public Instant getAbortRuleId() {
        return abortRuleId;
    }

    public void setAbortRuleId(Instant abortRuleId) {
        this.abortRuleId = abortRuleId;
    }

    @See
    public static AbortRuleId_abortRuleId(String abortRuleId) {
        return new AbortRuleId(abortRuleId);
    }
}

A prefix for all log object keys. If you store log files from multiple Amazon S3 buckets in a single bucket, you can use a prefix to distinguish which log files came from which bucket. 

When the Consumer completes, `String.Builder#build()` is called immediately and its result is passed to `#targetPrefix(String)`.

```java
@deprecated Use 
```

A prefix for all log object keys. If you store log files from multiple Amazon S3 buckets in a single bucket, you can use a prefix to distinguish which log files came from which bucket. 

When the Consumer completes, `String.Builder#build()` is called immediately and its result is passed to `#targetPrefix(String)`.

```java
@deprecated Use 
```

A prefix for all log object keys. If you store log files from multiple Amazon S3 buckets in a single bucket, you can use a prefix to distinguish which log files came from which bucket. 

When the Consumer completes, `String.Builder#build()` is called immediately and its result is passed to `#targetPrefix(String)`.

```java
@deprecated Use 
```
bucket.

@param targetPrefix A prefix for all log object keys. If you store log files from multiple Amazon S3 buckets in a single bucket, you can use a prefix to distinguish which log files came from which bucket.

@return

A prefix for all log object keys. If you store log files from multiple Amazon S3 buckets in a single bucket, you can use a prefix to distinguish which log files came from which bucket.

@return

A prefix for all log object keys. If you store log files from multiple Amazon S3 buckets in a single bucket, you can use a prefix to distinguish which log files came from which bucket.

@returns

A prefix for all log object keys. If you store log files from multiple Amazon S3 buckets in a single bucket, you can use a prefix to distinguish which log files came from which bucket.
A prefix for all log object keys. If you store log files from multiple Amazon S3 buckets in a single bucket, you can use a prefix to distinguish which log files came from which bucket.

Specifies the bucket where you want Amazon S3 to store server access logs. You can have your logs delivered to any bucket that you own, including the same bucket that is being logged. You can also configure multiple buckets to deliver their logs to the same target bucket. In this case, you should choose a different \( <code>TargetPrefix</code> \) for each source bucket so that the delivered log files can be distinguished by key.

This is a convenience that creates an instance of the \( @link \text{String.Builder} \) avoiding the need to create one manually via \( @link \text{String#builder()} \). When the \( @link \text{Consumer} \) completes, \( @link \text{String.Builder#build()} \) is called immediately and its result is passed to \( @link \text{#targetBucket(String)} \).

@returns Returns a reference to this object so that method calls can be chained together. @see #targetBucket(String)

A container specifying replication metrics-related settings enabling metrics and Amazon S3 events for S3 Replication Time Control (S3 RTC). Must be specified together with a `<code>ReplicationTime</code>` block.

This is a convenience that creates an instance of the `{@link String.Builder} avoiding the need to create one manually via `{@link String#builder()}`. When the `{@link String.Builder#build()} is called immediately and its result is passed to `{@link #statusAsString(String)}`. @param status a consumer that will call methods on `{@link String.Builder}`

@returns A reference to this object so that method calls can be chained together.

@see {#status(String)"

Specifies whether the replication metrics are enabled. If the service returns an enum value that is not available in the current SDK version, `{@link #status} will return `{@link MetricsStatus#UNKNOWN_TO_SDK_VERSION}`. The raw value returned by the service is available from `{@link #statusAsString}`.

@returns Specifies whether the replication metrics are enabled.

<p>Date and time at which the multipart upload was initiated.</p>

This is a convenience that creates an instance of the `<link>Instant.Builder</link>` avoiding the need to create one manually via `<link>Instant.Builder()</link>`. When the `<link>Consumer</link>` completes, `<link>Instant.Builder#build()</link>` is called immediately and its result is passed to `<link>#initiated(Instant)</link>`. 

When the `<link>Consumer</link>` completes, `<link>Instant.Builder#build()</link>` is called immediately and its result is passed to `<link>#initiated(Instant)</link>.

- **getInitiated**: false
- **setInitiated**: null
- **initiated(Instant)**

### Method Signature

```java
public Instant initiated(Instant initiated)
```

- **getInitiated** method returns a reference to this object so that method calls can be chained together.
- **setInitiated** method allows setting the value of the property.

### Documentation

- **Date and time at which the multipart upload was initiated.**

### Additional Notes

- **Deprecation**: Use `<link>#initiated()</link>` instead.

---

```
public class Initiated {
    private Instant initiated;

    public Instant initiated() {
        return this.initiated;
    }

    public void initiated(Instant initiated) {
        this.initiated = initiated;
    }
}
```

### Example Usage

```java
Instant uploadInitiated = Instant.now();
Initiated initialized = new Initiated();
initialized.initiated(uploadInitiated);```

---

Specifies the number of days an object is noncurrent before Amazon S3 can perform the associated action. For information about the noncurrent days calculations, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/intro-lifecycle-rules.html#non-current-days-calculations">How Amazon S3 Calculates How Long an Object Has Been Noncurrent</a> in the Amazon Simple Storage Service Developer Guide.

### Setters

**setNoncurrentDays**:  
`setNoncurrentDays` specifies the number of days an object is noncurrent before Amazon S3 can perform the associated action. For information about the noncurrent days calculations, see <a href="https://docs.aws.amazon.com/AmazonS3/latest/dev/intro-lifecycle-rules.html#non-current-days-calculations">How Amazon S3 Calculates How Long an Object Has Been Noncurrent</a> in the Amazon Simple Storage Service Developer Guide.

```java
public void setNoncurrentDays(int noncurrentDays)
```

### Default Consumer Fluent Setter

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `{@link String.Builder}.

When the `{@link Consumer}` completes, `{@link String.Builder#build()}` is called immediately and its result is passed to `{@link #storageClassAsString(String)}`.

```java
public Consumer<TransitionStorageClass> storageClass(String storageClass)
```

This method allows you to set the storage class for the object.

### Default Consumer Fluent Setter Documentation

The class of storage used to store the object.

```java
public String storageClass()
```

Refer to the documentation for more information on setting the storage class.
The class of storage used to store the object. If the service returns an enum value that is not available in the current SDK version, \(\text{@link TransitionStorageClass\#UNKNOWN_TO_SDK_VERSION}\) will return \(\text{@link TransitionStorageClass\#UNKNOWN_TO_SDK_VERSION}\). The raw value returned by the service is available from \(\text{@link TransitionStorageClass\#UNKNOWN_TO_SDK_VERSION}\). For responses returned by the SDK, the sender is the AWS service.

  "deprecatedSetterDocumentation" : "<p>Specifies whether Amazon S3 should block public access control lists
(ACLs) for this bucket and objects in this bucket. Setting this element to `<code>TRUE</code>` causes the following behavior:

```xml
<ul>
    <li>`PUT Bucket acl` and `PUT Object acl` calls fail if the specified ACL is public.</li>
    <li>`PUT Object` calls fail if the request includes a public ACL.</li>
    <li>`PUT Bucket` calls fail if the request includes a public ACL.</li>
</ul>
```

Enabling this setting doesn't affect existing policies or ACLs.

```java
public abstract class BlockPublicAcls
```

- `blockPublicAcls` specifies whether Amazon S3 should block public access control lists (ACLs) for this bucket and objects in this bucket. Setting this element to `<code>TRUE</code>` causes the following behavior:

```xml
<ul>
    <li>`PUT Bucket acl` and `PUT Object acl` calls fail if the specified ACL is public.</li>
    <li>`PUT Object` calls fail if the request includes a public ACL.</li>
    <li>`PUT Bucket` calls fail if the request includes a public ACL.</li>
</ul>
```

Enabling this setting doesn't affect existing policies or ACLs.

```java
public abstract class BlockPublicAcls
```

- `blockPublicAcls` specifies whether Amazon S3 should block public access control lists (ACLs) for this bucket and objects in this bucket. Setting this element to `<code>TRUE</code>` causes the following behavior:

```xml
<ul>
    <li>`PUT Bucket acl` and `PUT Object acl` calls fail if the specified ACL is public.</li>
    <li>`PUT Object` calls fail if the request includes a public ACL.</li>
    <li>`PUT Bucket` calls fail if the request includes a public ACL.</li>
</ul>
```

Enabling this setting doesn't affect existing policies or ACLs.

```java
public abstract class BlockPublicAcls
```

- `blockPublicAcls` specifies whether Amazon S3 should block public access control lists (ACLs) for this bucket and objects in this bucket. Setting this element to `<code>TRUE</code>` causes the following behavior:

```xml
<ul>
    <li>`PUT Bucket acl` and `PUT Object acl` calls fail if the specified ACL is public.</li>
    <li>`PUT Object` calls fail if the request includes a public ACL.</li>
    <li>`PUT Bucket` calls fail if the request includes a public ACL.</li>
</ul>
```

Enabling this setting doesn't affect existing policies or ACLs.

```java
public abstract class BlockPublicAcls
```
Enabling this setting doesn't affect existing policies or ACLs.

`BlockPublicAcls` specifies whether Amazon S3 should block public access control lists (ACLs) for this bucket and objects in this bucket. Setting this element to `TRUE` causes the following behavior:

- PUT Bucket acl and PUT Object acl calls fail if the specified ACL is public.
- PUT Object calls fail if the request includes a public ACL.
- PUT Bucket calls fail if the request includes a public ACL.

Enabling this setting doesn't affect existing policies or ACLs.

```java
public class BlockPublicAcls {
    private boolean blockPublicAcls;

    public BlockPublicAcls() {
        this(false);
    }

    public BlockPublicAcls(boolean blockPublicAcls) {
        this.blockPublicAcls = blockPublicAcls;
    }

    public boolean isBlockPublicAcls() {
        return blockPublicAcls;
    }

    public void setBlockPublicAcls(boolean blockPublicAcls) {
        this.blockPublicAcls = blockPublicAcls;
    }
}
```

The `BlockPublicAcls` class includes a public ACL. Including this setting doesn't affect existing policies or ACLs.

This is a convenience that creates an instance of the `String.Builder` avoiding the need to create one manually via `String#builder()`. When the `Consumer` completes, `String.Builder#build()` is called immediately and its result is passed to `#id(String)`. A consumer that will call methods on `String.Builder` returns a reference to this object so that method calls can be chained together.

```
@see #id(String)
```

## id(String)

```
the ID that identifies the analytics configuration.
```

```
when the Consumer completes, String.Builder#build() is called immediately and its result is passed to #id(String).
```

```
@consumer a that will call methods on String.Builder
@return a reference to this object so that method calls can be chained together.
@see #id(String)
```

```
the ID that identifies the analytics configuration.
```

```
when the Consumer completes, String.Builder#build() is called immediately and its result is passed to #id(String).
```

```
@consumer a that will call methods on String.Builder
@return a reference to this object so that method calls can be chained together.
@see #id(String)
```

## jsonId

```
the ID that identifies the analytics configuration.
```

```
when the Consumer completes, String.Builder#build() is called immediately and its result is passed to #id(String).
```

```
@consumer a that will call methods on String.Builder
@return a reference to this object so that method calls can be chained together.

The base64-encoded 128-bit MD5 digest of the data. You must use this header as a message integrity check to verify that the request body was not corrupted in transit. For more information, see RFC 1864.

Sets the value of the ReplicationConfiguration property for this object.

This is a convenience that creates an instance of the ReplicationConfiguration.Builder avoiding the need to create one manually via ReplicationConfiguration#builder().

When the ReplicationConfiguration.Consumer completes, ReplicationConfiguration.Builder#build() is called immediately and its result is passed to a consumer that will call methods on a consumer so that method calls can be chained together.

Returns a reference to this object so that method calls can be chained together.

Sets the value of the ReplicationConfiguration property

The new value for the ReplicationConfiguration property

Returns a reference to this object so that method calls can be chained together.

Use ReplicationConfiguration() to create a new instance of the ReplicationConfiguration property.

Use ReplicationConfiguration(ReplicationConfiguration) to create a new instance of the ReplicationConfiguration property.
