parse_vdso.c: Linux reference vDSO parser
Written by Andrew Lutomirski, 2011-2014.

This code is meant to be linked in to various programs that run on Linux. As such, it is available with as few restrictions as possible. This file is licensed under the Creative Commons Zero License, version 1.0, available at http://creativecommons.org/publicdomain/zero/1.0/legalcode

The vDSO is a regular ELF DSO that the kernel maps into user space when it starts a program. It works equally well in statically and dynamically linked binaries.

This code is tested on x86. In principle it should work on any architecture that has a vDSO.

parse_vdso.c: Linux reference vDSO parser
Written by Andrew Lutomirski, 2011-2014.

This code is meant to be linked in to various programs that run on Linux. As such, it is available with as few restrictions as possible. This file
is licensed under the Creative Commons Zero License, version 1.0, available at http://creativecommons.org/publicdomain/zero/1.0/legalcode

The vDSO is a regular ELF DSO that the kernel maps into user space when it starts a program. It works equally well in statically and dynamically linked binaries.

This code is tested on x86. In principle it should work on any architecture that has a vDSO.

This code is tested on x86. In principle it should work on any

This code is released under both the GPL version 2 and BSD licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card...

Various virtualization hardware acceleration techniques allow bypassing or
offloading interrupts received from devices around the host kernel. Posted
Interrupts on Intel VT-d systems can allow interrupts to be received
directly by a virtual machine. ARM IRQ Forwarding allows forwarded physical
interrupts to be directly deactivated by the guest. This manager allows
interrupt producers and consumers to find each other to enable this sort of
bypass.

This code is released under both the GPL version 2 and BSD licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card...

This code is released under both the GPL version 2 and BSD
licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in
the SGI Indigo-2. It currently only supports PIO (forget about DMA
for the time being). This is enough for a low-end ethernet card,
but forget about your favorite SCSI card...

This code is released under both the GPL version 2 and BSD licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card...

This code is released under both the GPL version 2 and BSD licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card.

This code is released under both the GPL version 2 and BSD
licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in
the SGI Indigo-2. It currently only supports PIO (forget about DMA
for the time being). This is enough for a low-end ethernet card,
but forget about your favorite SCSI card...

http://www.embedded.com/showArticle.jhtml?articleID=19205567

Attempts were made, unsuccessfully, to contact the original
author of this code (Michael Morrow, Intel). Below is the original

This code is released under both the GPL version 2 and BSD licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card...

This code is released under both the GPL version 2 and BSD licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card...

The vDSO is a regular ELF DSO that the kernel maps into user space when it starts a program. It works equally well in statically and dynamically linked binaries.

This code is tested on x86. In principle it should work on any architecture that has a vDSO.

parse_vdso.c: Linux reference vDSO parser
Written by Andrew Lutomirski, 2011-2014.

This code is meant to be linked in to various programs that run on Linux.
As such, it is available with as few restrictions as possible. This file
is licensed under the Creative Commons Zero License, version 1.0,
available at http://creativecommons.org/publicdomain/zero/1.0/legalcode

The vDSO is a regular ELF DSO that the kernel maps into user space when
it starts a program. It works equally well in statically and dynamically
linked binaries.

This code is tested on x86. In principle it should work on any
architecture that has a vDSO.

linux-4.4.54.tar.xz\linux-4.4.54.tar\linux-4.4.54\Documentation\vDSO\parse_vdso.c

parse_vdso.c: Linux reference vDSO parser
Written by Andrew Lutomirski, 2011-2014.

This code is meant to be linked in to various programs that run on Linux.
As such, it is available with as few restrictions as possible.  This file
is licensed under the Creative Commons Zero License, version 1.0,
available at http://creativecommons.org/publicdomain/zero/1.0/legalcode

The vDSO is a regular ELF DSO that the kernel maps into user space when
it starts a program.  It works equally well in statically and dynamically
linked binaries.

This code is tested on x86.  In principle it should work on any
architecture that has a vDSO.

parse_vdso.c: Linux reference vDSO parser
Written by Andrew Lutomirski, 2011-2014.

This code is meant to be linked in to various programs that run on Linux.
As such, it is available with as few restrictions as possible. This file
is licensed under the Creative Commons Zero License, version 1.0,
available at http://creativecommons.org/publicdomain/zero/1.0/legalcode

The vDSO is a regular ELF DSO that the kernel maps into user space when
it starts a program. It works equally well in statically and dynamically
linked binaries.

This code is tested on x86. In principle it should work on any
architecture that has a vDSO.

bit 0 is the LSB of an "unsigned long" quantity.

Please note that the code in this file should never be included from user space. Many of these are not implemented in assembler since they would be too costly. Also, they require privileged instructions (which are not available from user mode) to ensure that they are atomic.

This code is released under both the GPL version 2 and BSD licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card...

Various virtualization hardware acceleration techniques allow bypassing or offloading interrupts received from devices around the host kernel.Posted Interrupts on Intel VT-d systems can allow interrupts to be received directly by a virtual machine. ARM IRQ Forwarding allows forwarded physical interrupts to be directly deactivated by the guest. This manager allows interrupt producers and consumers to find each other to enable this sort of bypass.

This code is released under both the GPL version 2 and BSD licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card...

Attempts were made, unsuccessfully, to contact the original
author of this code (Michael Morrow, Intel). Below is the original

This code is released under both the GPL version 2 and BSD licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card...

This code is released under both the GPL version 2 and BSD licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card...

Reasonably optimised generic C-code for memcpy on Microblaze
This is generic C code to do efficient, alignment-aware memcpy.

It is based on demo code originally Copyright 2001 by Intel Corp, taken from http://www.embedded.com/showArticle.jhtml?articleID=19205567

Attempts were made, unsuccessfully, to contact the original author of this code (Michael Morrow, Intel). Below is the original copyright notice.

This software has been developed by Intel Corporation.
Intel specifically disclaims all warranties, express or implied, and all liability, including consequential and other indirect damages, for the use of this program, including liability for infringement of any proprietary rights, and including the warranties of merchantability and fitness for a particular purpose. and Marc Zyngier <mzyngier@freesurf.fr>

This code is released under both the GPL version 2 and BSD licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card.

This code is released under both the GPL version 2 and BSD licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card...

This code is released under both the GPL version 2 and BSD licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card...

This code is released under both the GPL version 2 and BSD licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card...

This is an efficient (and small) implementation of the C library "memset()"
function for the alpha.

This routine is "moral-ware": you are free to use it any way you wish, and
the only obligation I put on you is a moral one: if you make any improvements
to the routine, please send me your improvements for me to use similarly.

The scheduling comments are according to the EV5 documentation (and done by
hand, so they might well be incorrect, please do tell me about it..)

parse_vdso.c: Linux reference vDSO parser
Written by Andrew Lutomirski, 2011-2014.

This code is meant to be linked in to various programs that run on Linux.
As such, it is available with as few restrictions as possible. This file is licensed under the Creative Commons Zero License, version 1.0,
The vDSO is a regular ELF DSO that the kernel maps into user space when it starts a program. It works equally well in statically and dynamically linked binaries.

This code is tested on x86. In principle it should work on any architecture that has a vDSO.

The vDSO is a regular ELF DSO that the kernel maps into user space when
it starts a program. It works equally well in statically and dynamically
linked binaries.

This code is tested on x86. In principle it should work on any
architecture that has a vDSO.

parse_vdso.c: Linux reference vDSO parser
Written by Andrew Lutomirski, 2011-2014.

This code is meant to be linked in to various programs that run on Linux. As such, it is available with as few restrictions as possible. This file is licensed under the Creative Commons Zero License, version 1.0, available at http://creativecommons.org/publicdomain/zero/1.0/legalcode

The vDSO is a regular ELF DSO that the kernel maps into user space when it starts a program. It works equally well in statically and dynamically linked binaries.

This code is tested on x86. In principle it should work on any architecture that has a vDSO.

parse_vdso.c: Linux reference vDSO parser
Written by Andrew Lutomirski, 2011-2014.

This code is meant to be linked in to various programs that run on Linux.
As such, it is available with as few restrictions as possible. This file
is licensed under the Creative Commons Zero License, version 1.0,
available at http://creativecommons.org/publicdomain/zero/1.0/legalcode

The vDSO is a regular ELF DSO that the kernel maps into user space when
it starts a program. It works equally well in statically and dynamically
linked binaries.

This code is tested on x86. In principle it should work on any
architecture that has a vDSO.

parse_vdso.c: Linux reference vDSO parser
Written by Andrew Lutomirski, 2011-2014.

This code is meant to be linked in to various programs that run on Linux. As such, it is available with as few restrictions as possible. This file is licensed under the Creative Commons Zero License, version 1.0, available at http://creativecommons.org/publicdomain/zero/1.0/legalcode

The vDSO is a regular ELF DSO that the kernel maps into user space when it starts a program. It works equally well in statically and dynamically linked binaries.

This code is tested on x86. In principle it should work on any architecture that has a vDSO.

parse_vdso.c: Linux reference vDSO parser
Written by Andrew Lutomirski, 2011-2014.

This code is meant to be linked in to various programs that run on Linux. As such, it is available with as few restrictions as possible. This file is licensed under the Creative Commons Zero License, version 1.0, available at http://creativecommons.org/publicdomain/zero/1.0/legalcode

The vDSO is a regular ELF DSO that the kernel maps into user space when it starts a program. It works equally well in statically and dynamically linked binaries.

This code is tested on x86. In principle it should work on any architecture that has a vDSO.

This special exception was added by the Free Software Foundation in version 2.2 of Bison.

parse_vdso.c: Linux reference vDSO parser
Written by Andrew Lutomirski, 2011-2014.

This code is meant to be linked in to various programs that run on Linux. As such, it is available with as few restrictions as possible. This file is licensed under the Creative Commons Zero License, version 1.0, available at http://creativecommons.org/publicdomain/zero/1.0/legalcode

The vDSO is a regular ELF DSO that the kernel maps into user space when it starts a program. It works equally well in statically and dynamically linked binaries.

This code is tested on x86. In principle it should work on any architecture that has a vDSO.

and Marc Zyngier <mzyngier@freesurf.fr>

This code is released under both the GPL version 2 and BSD licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card...

Various virtualization hardware acceleration techniques allow bypassing or
offloading interrupts received from devices around the host kernel. Posted
Interrupts on Intel VT-d systems can allow interrupts to be received
directly by a virtual machine. ARM IRQ Forwarding allows forwarded physical
interrupts to be directly deactivated by the guest. This manager allows
interrupt producers and consumers to find each other to enable this sort of
bypass.

This code offers a very basic support for this EISA bus present in the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card...

This code is released under both the GPL version 2 and BSD licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card...

This code is released under both the GPL version 2 and BSD licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card...

This code offers a very basic support for this EISA bus present in the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card.

This file is under the GPL.

First partition is always sector 0 regardless of if we find a partitiontable or not. In the start of the next sector, there can be a partitiontable that tells us what other partitions to define. If there isn’t, we use a default partition split defined below.

This code is meant to be linked in to various programs that run on Linux. As such, it is available with as few restrictions as possible. This file is licensed under the Creative Commons Zero License, version 1.0,
The vDSO is a regular ELF DSO that the kernel maps into user space when it starts a program. It works equally well in statically and dynamically linked binaries.

This code is tested on x86. In principle it should work on any architecture that has a vDSO.

The vDSO is a regular ELF DSO that the kernel maps into user space when
it starts a program. It works equally well in statically and dynamically
linked binaries.

This code is tested on x86. In principle it should work on any
architecture that has a vDSO.

parse_vdso.c: Linux reference vDSO parser

Written by Andrew Lutomirski, 2011-2014.

This code is meant to be linked in to various programs that run on Linux.

As such, it is available with as few restrictions as possible. This file
is licensed under the Creative Commons Zero License, version 1.0,
available at http://creativecommons.org/publicdomain/zero/1.0/legalcode

The vDSO is a regular ELF DSO that the kernel maps into user space when
it starts a program. It works equally well in statically and dynamically
linked binaries.

This code is tested on x86. In principle it should work on any
architecture that has a vDSO.

parse_vdso.c: Linux reference vDSO parser
Written by Andrew Lutomirski, 2011-2014.

This code is meant to be linked in to various programs that run on Linux. As such, it is available with as few restrictions as possible. This file is licensed under the Creative Commons Zero License, version 1.0, available at http://creativecommons.org/publicdomain/zero/1.0/legalcode

The vDSO is a regular ELF DSO that the kernel maps into user space when it starts a program. It works equally well in statically and dynamically linked binaries.

This code is tested on x86. In principle it should work on any architecture that has a vDSO.

This special exception was added by the Free Software Foundation in Bison.

parse_vdso.c: Linux reference vDSO parser
Written by Andrew Lutomirski, 2011-2014.

This code is meant to be linked in to various programs that run on Linux.
As such, it is available with as few restrictions as possible. This file
is licensed under the Creative Commons Zero License, version 1.0,
available at http://creativecommons.org/publicdomain/zero/1.0/legalcode

The vDSO is a regular ELF DSO that the kernel maps into user space when
it starts a program. It works equally well in statically and dynamically
linked binaries.

This code is tested on x86. In principle it should work on any
architecture that has a vDSO.

As a special exception, you may create a larger work that contains part or all of the Bison parser skeleton and distribute that work under terms of your choice, so long as that work isn't itself a parser generator using the skeleton or a modified version thereof as a parser skeleton. Alternatively, if you modify or redistribute the parser skeleton itself, you may (at your option) remove this special exception, which will cause the skeleton and the resulting Bison output files to be licensed under the GNU General Public License without this special exception.

This special exception was added by the Free Software Foundation in version 2.2 of Bison.

parse_vdso.c: Linux reference vDSO parser
Written by Andrew Lutomirski, 2011-2014.

This code is meant to be linked in to various programs that run on Linux.
As such, it is available with as few restrictions as possible. This file
is licensed under the Creative Commons Zero License, version 1.0,
available at http://creativecommons.org/publicdomain/zero/1.0/legalcode

The vDSO is a regular ELF DSO that the kernel maps into user space when
it starts a program. It works equally well in statically and dynamically
linked binaries.

This code is tested on x86. In principle it should work on any
architecture that has a vDSO.

call_vdso.c: Linux reference vDSO parser
Written by Andrew Lutomirski, 2011-2014.

This code is meant to be linked in to various programs that run on Linux. As such, it is available with as few restrictions as possible. This file is licensed under the Creative Commons Zero License, version 1.0, available at http://creativecommons.org/publicdomain/zero/1.0/legalcode

The vDSO is a regular ELF DSO that the kernel maps into user space when it starts a program. It works equally well in statically and dynamically linked binaries.

This code is tested on x86. In principle it should work on any architecture that has a vDSO.

This code is released under both the GPL version 2 and BSD licenses. Either license may be used.

This code offers a very basic support for this EISA bus present in
the SGI Indigo-2. It currently only supports PIO (forget about DMA for the time being). This is enough for a low-end ethernet card, but forget about your favorite SCSI card...
